The present study is characterized as a narrative literature review, developed with the objective of synthesizing and analyzing the most recent scientific evidence related to the therapeutic management of chronic kidney disease in cats. The search was carried out in the PubMed database, using the descriptors "Chronic Kidney Disease", "Cats" and "Treatment", combined using the Boolean operator AND, according to the terminology of Medical Subject Headings (MeSH).

Articles published in the last five years, available in full in Portuguese or English, that directly addressed innovations in the treatment of feline CKD, were included. Studies without a direct relationship with the central theme, duplicate publications, and reviews with low methodological rigor were excluded. The selection of studies was conducted in two stages: initial screening of titles and abstracts, followed by careful evaluation of full texts to confirm scientific relevance. The information extracted was organized and discussed in a descriptive way.

3 RESULTS AND DISCUSSION

3.1 NUTRITIONAL MANAGEMENT AND MINERAL METABOLISM

Nutritional management remains the central pillar in the treatment of feline CKD, with significant advances in the control of electrolytes and mineral metabolites. Dietary magnesium supplementation has shown benefits in stabilizing fibroblast growth factor 23 (FGF23) and preventing iatrogenic ionized hypercalcemia in cats fed phosphorus-restricted diets, since magnesium acts as a potent inhibitor of vascular and tissue calcification, contributing to the maintenance of mineral homeostasis (Tang et al., 2024). This effect is related to the fact that magnesium acts as a potent inhibitor of vascular and tissue calcification, reducing ectopic calcium deposition and contributing to the stability of mineral metabolism.

The alterations in mineral metabolism observed in felines with chronic kidney disease reflect the interdependence between renal function, nutritional management, and systemic homeostasis. The dysregulation of these mechanisms favors the development of secondary metabolic disorders, such as hypercalcemia, which are often described in patients undergoing phosphorus-restricted diets (Tang et al., 2024; Ehrlich et al., 2024).

Hypercalcemia is commonly associated with CKD, presenting with often nonspecific clinical signs, such as anorexia, weight loss, gastrointestinal and urinary disorders. Factors that lead to hypercalcemia concomitantly with Chronic Kidney Disease include decreased glomerular filtration, increased renal tubular reabsorption, and increased intestinal and bone absorption (Ehrlich et al., 2024).

At the same time, in felines that already have ionized hypercalcemia (which can be defined as a calcium value above the reference range of the laboratory analyzed) — either due to CKD or idiopathic causes — the transition to diets with controlled calcium concentrations (below 200 mg/100 kcal) and a calcium:phosphorus ratio of less than 1.4:1 has been shown to be effective in restoring normocalcemia in 60% of cases. However, in cats that had partial or no response to nutritional treatment, the addition of chia seeds (1 to 2 grams per day) was shown to be effective in decreasing serum calcium concentration (Ehrlich et al., 2024).

Although phosphorus restriction is widely recommended in feline CKD because it slows the progression of the disease, recent evidence indicates that this strategy may increase the risk of ionized hypercalcemia, especially when associated with diets with low magnesium concentration. These findings reinforce the need for dietary individualization and frequent biochemical monitoring (Ehrlich et al., 2024).

The progression of chronic kidney disease in felines has repercussions on multiple organ systems, reflecting the multifactorial character of the disease. Alterations in mineral metabolism, hematological disorders, and changes in the intestinal environment occur interdependently, reinforcing the need for an integrated therapeutic approach in the follow-up of these patients (Charles et al., 2024; Summers; Quimby, 2024).

3.2 HAEMATOLOGICAL COMPLICATIONS AND EMERGING THERAPIES

In the field of hematological complications, CKD anemia, traditionally treated with recombinant erythropoietin, now has new perspectives with the use of molidustat. This HIF-PH inhibitor stimulates the endogenous production of erythropoietin and has demonstrated the ability to significantly increase hematocrit and cell volume in anemic cats after 21 to 28 days of daily oral administration, presenting itself as a promising alternative to conventional erythropoiesis-stimulating agents, especially by reducing the risk of formation of anti-erythropoietin antibodies; however, long-term studies evaluating its safety and impact on the progression of CKD are still needed (Charles et al., 2024).

3.3 GUT-KIDNEY AXIS AND UREMIC TOXINS

The interaction between the gut microbiome and kidney health, called the gut-kidney axis, has emerged as a crucial therapeutic target. Gut dysbiosis in cats with CKD contributes to the accumulation of uremic toxins, such as indoxyl sulfate, which exacerbate systemic inflammation and renal fibrosis (Summers & Quimby, 2024). Strategies using soluble fiber, probiotics, and specific enteric adsorbents have been explored to reduce the burden of these toxins and preserve residual kidney function (Summers & Quimby, 2024).

3.4 STAGING AND DIAGNOSTIC CONSIDERATIONS

It is recommended that domestic felines (cats) be classified according to the CKD staging system of the Society of Renal Interest (IRIS), initially according to serum creatinine, which may be accompanied by symmetrical serum dimethylarginine concentration, as well as systolic blood pressure and urine protein/creatinine ratio (UPC) (Geddes & Aguiar, 2022).

The diagnosis of chronic kidney disease in cats can be carried out by different methods, mainly based on the reduction of the glomerular filtration rate (GFR). Although there is the possibility of direct measurement, this method can be financially burdensome to the responsible person and stressful to the animal. For this reason, GFR biomarkers such as urea, creatinine, and SDMA are widely used in routine clinical practice (Geddes & Aguiar, 2022).

3.5 CKD AND HYPERTHYROIDISM

Management of cats with CKD and concomitant hyperthyroidism requires extreme caution. Hyperthyroidism creates a hemodynamic and metabolic state that increases the glomerular filtration rate and reduces creatinine due to loss of muscle mass, leading to the disregard of the presence of CKD when creatinine alone is used. In this way, SDMA presents itself as a more promising biomarker because it is less dependent on muscle mass, but its behavior in hyperthyroid cats can be masked by increased glomerular filtration rate in the hyperthyroid state (Yu *et al.*, 2022).

Treatment of hyperthyroidism can "unmask" an underlying CKD by reducing the artificially elevated glomerular filtration rate due to the thyrotoxic state. (Geddes & Aguiar, 2022). In addition, the development of iatrogenic hypothyroidism after radioiodine or methimazole therapy is harmful as it further reduces renal blood flow and is associated with shorter survival times in azotemic cats (Yu *et al.*, 2022). In these cases, levothyroxine replacement is recommended to keep kidney function as stable as possible (Geddes & Aguiar, 2022).

4 CONCLUSION

The present study aimed to analyze and discuss the therapeutic management of CKD in felines, addressing nutritional, pharmacological and complementary strategies based on contemporary scientific evidence. Thus, nutritional intervention constitutes the therapeutic foundation in feline CKD. Diets with controlled phosphorus restriction, balance of calcium:phosphorus ratio and absolute calcium concentration, associated with magnesium supplementation, have been shown to be effective in stabilizing mineral metabolism and reducing the risk of hypercalcemia. Dietary personalization should consider the clinical and biochemical status of the patient, through the analysis of the monitoring of the ionogram, serum phosphorus, and magnesium. Thus, the prescription should be adjusted according to physiological responses.

In the context of hematological complications, non-regenerative anemia associated with CKD requires a pharmacospecific approach. Hypoxia-inducible factor prolyl hydroxylase inhibitors, exemplified by molidustat, emerge as a promising alternative to treatment with exogenous erythropoietin, due to the stimulation of endogenous erythropoiesis, reducing the risk of immunogenicity. However, there are limitations to the clinical incorporation of this agent, as studies are needed to evaluate the safety, effects on blood pressure, renal progression, and long-term outcomes.

Modulation of the gut-kidney axis represents a complementary therapeutic strategy with the potential to reduce the burden of uremic toxins, modulating systemic inflammatory processes. Therefore, interventions involving soluble fibers, specific probiotics, and enteric adsorbents may decrease the production and absorption of toxic uremic metabolites, preserving renal function and reducing renal inflammation and fibrosis. However, studies are needed to define strains, doses, and administration protocols that are effective and safe in felines with CKD.

Laboratory follow-up should follow standardized guidelines, such as those of IRIS, integrating serum creatinine count, SDMA, systolic blood pressure, and urine protein/creatinine ratio. The combined use of these biomarkers allows for greater diagnostic accuracy, minimizing interference from secondary diseases, such as hypothyroidism and hyperthyroidism. In addition, there is a guarantee of precise therapeutic adjustment, improving sensitivity for initial changes in the glomerular filtration rate.

The coexistence of CKD and hyperthyroidism imposes diagnostic and therapeutic challenges, given that the thyrotoxic state can mask renal failure by increasing GFR and reducing creatinine due to loss of muscle mass. In contrast, treating hyperthyroidism can "unmask" an underlying CKD. Therefore, SDMA has advantages in that it is less dependent on muscle mass, although its behavior may be influenced by physiological changes in the hyperthyroid state. Therefore, clinical management should include careful observation before and after treatment, avoiding iatrogenic hypothyroidism, and instituting levothyroxine replacement.

In short, it is recommended that the veterinary clinic adopt personalized therapeutic plans for each case with periodic reassessments. In addition, attention is focused on research, which should prioritize studies capable of validating refined nutritional interventions, confirming the safety and efficacy of new pharmacological therapies, and establishing protocols that result in measurable clinical benefits for the long-term treatment of CKD in felines. ABSTRACT

The present study consists of a narrative literature review that analyzes the relationship between milking hygiene and the physicochemical and microbiological quality of bovine milk. This study was based on the analysis of scientific publications indexed in the PubMed database, selecting articles published between 2021 and 2023, using descriptors related to milking hygiene and physicochemical quality. The results demonstrate that the implementation of control systems, such as Hazard Analysis and Critical Control Points (HACCP), positively impacts milk quality, increasing physicochemical compliance to 78% in the evaluated units. In contrast, a direct correlation was observed between sanitary deficiencies (inadequate cleaning of udders and milking equipment) and the increase in coliform load and pathogens such as *Staphylococcus aureus* and *Listeria monocytogenes*, compromising food safety and the processing of dairy products. It is inferred that, to ensure industrial quality and mitigate public health risks, the adoption of good farm management practices, strict equipment hygiene, and control technologies in dairy product processing is essential.

Keywords: Dairy Products. HACCP. Food Microbiology. Public Health. Pathogens.

RESUMO

O presente trabalho consiste em uma revisão bibliográfica narrativa que analisa a relação entre a higiene de ordenha e a qualidade físico-química e microbiológica do leite bovino. Este estudo foi fundamentado na análise de produções científicas indexadas na base de dados PubMed, sendo selecionados artigos publicados entre 2021 e 2023, utilizando descritores relacionados à higiene de ordenha e qualidade físico-química. Os resultados demonstram que a implementação de sistemas de controle, como a Análise de Perigos e Pontos Críticos de Controle (HACCP), impacta positivamente a qualidade do leite, elevando a conformidade físico-química para 78% nas unidades avaliadas. Em contraste, evidenciou-se uma correlação direta entre as deficiências sanitárias (limpeza inadequada dos úberes e

RESUMEN

El presente trabajo consiste en una revisión bibliográfica narrativa que analiza la relación entre la higiene de ordeño y la calidad fisicoquímica y microbiológica de la leche bovina. Este estudio se fundamentó en el análisis de producciones científicas indexadas en la base de datos PubMed, seleccionando artículos publicados entre 2021 y 2023, utilizando descriptores relacionados con la higiene de ordeño y la calidad fisicoquímica. Los resultados demuestran que la implementación de sistemas de control, como el Análisis de Peligros y Puntos Críticos de Control (HACCP), impacta positivamente la calidad de la leche, elevando la conformidad fisicoquímica al 78% en las unidades evaluadas. En contraste, se evidenció una correlación directa entre las deficiencias sanitarias (limpieza inadecuada de las ubres y de los equipos de ordeño) y el aumento de la carga de coliformes y patógenos como *Staphylococcus aureus* y *Listeria monocytogenes*, comprometiendo la seguridad alimentaria y el procesamiento de productos lácteos. Se infiere que, para garantizar la calidad industrial y atenuar los riesgos para la salud pública, es indispensable la adopción de buenas prácticas de manejo en la finca, higiene rigurosa de los equipos y tecnologías de control en el procesamiento de productos lácteos.

1 INTRODUCTION

The quality and specificity of bovine milk are modulated by the dynamic interaction between climate, animal breeds and environmental microbiology. These attributes are decisive for obtaining dairy products with specific physicochemical, microbiological, and sensory characteristics (Penna et al., 2021). Therefore, the evaluation of this product of animal origin should not be limited to the basic nutritional value (fat and protein contents) but should also cover critical parameters such as acidity, thermal stability, and hygienic indicators of total bacterial count and somatic cells (Brodziak et al., 2021).

However, the valorization of products with raw milk as raw material and the search for organic production systems coexists in a scenario of critical microbiological vulnerabilities (Sakaridis et al., 2022). Despite the market appreciation of raw milk productions and their traditionality, the control of their microbial load represents a constant concern in the sector, requiring special attention due to the risks associated with contamination. In addition, it is noteworthy that the identification of failures in the sanitary control of these systems demonstrates the need to support producers, especially in small-scale productions, through training in good hygiene practices, to align nutritional quality with microbiological safety (Brodziak et al., 2021; Penna et al., 2021).

In addition, it is notorious that the evaluation of dairy products from small producers highlights the absence of standardization and failures in hygienic control during milking, leading to critical oscillations in physicochemical parameters, such as acidity and fat content, favoring contamination by pathogens such as *Salmonella* and coliforms, negatively impacting the safety and sensory quality of the food offered (Januś et al., 2021). It is emphasized that this scenario becomes even more serious in the informal marketing sector, since the absence of heat treatment and sanitary control exposes consumers to high risks. Investigations in non-regulated sales circuits point to the commercialization of non-standard samples in addition to indications of adulteration by the addition of water, which compromises both the nutritional value and the suitability of the milk for processing (Ariri et al., 2023). In this way, the imperative need for strict implementation of good hygiene practices and government inspection to ensure the quality of milk from the moment it is obtained is made explicit (Penna et al., 2021).

2 METHODOLOGY

This work is a bibliographic review of a narrative nature, elaborated with the aim of compiling and examining contemporary scientific evidence about milking hygiene and its correlation with the physicochemical quality of milk. Data mining was conducted on the PubMed platform, using the descriptors "Milking hygiene" and "Physicochemical quality",

consortium by the Boolean operator AND, in strict compliance with the terminology established in the Medical Subject Headings (MeSH). Articles published between 2021 and 2023, available in full access and written in Portuguese or English, which had direct adherence to the central theme, were included in the corpus of this research. The exclusion criteria were studies that were not related to the theme, duplicate manuscripts, reviews without clear methodological grounds, and non-indexed articles. The selection process was structured in two phases: analysis of titles and abstracts, followed by exhaustive reading of the full texts to ratify their relevance. The findings were synthesized and presented in a descriptive manner.

3 RESULTS AND DISCUSSION

The implementation of strict hygiene protocols and monitoring systems such as HACCP has a direct and positive impact on raw milk quality indicators. In collection units that adopted the HACCP system, it was observed that 78% of the samples achieved full physicochemical compliance, demonstrating that the control of critical points reduces the incidence of unwanted changes (Mannani et al., 2023). Physicochemical parameters such as density (ranging between 1.023 and 1.032 g/cm³) and titratable acidity are sensitive indicators not only of hygiene, but also of possible adulteration of milk in the informal circuit (Ariri et al., 2023).

Regarding composition, milk from organic systems tends to present significant variations when compared to the conventional system, especially in the fatty acid profile and protein content, which directly influences the industrial yield for cheese production (Brodziak et al., 2021). Poor hygiene during milking is the main route of entry for pathogens such as *Staphylococcus aureus* and *Listeria monocytogenes*, microorganisms that have a high survival capacity even in artisanal cheeses with prolonged maturation (Sakaridis et al., 2022; Penna et al., 2021).

Studies carried out in direct sales circuits and informal markets reveal that microbiological contamination, characterized by high counts of total and thermotolerant coliforms, is often associated with inadequate cleaning of udders and milking equipment (Ariri et al., 2023; Januś et al., 2021). In addition, the quality of the final product, such as curd cheese or the "tvarog" type, is severely compromised when the original raw material presents physicochemical deviations, resulting in sensory changes and reduced shelf life (Januś et al., 2021). Thus, the integration between hygienic management on the farm and technological control in processing is indispensable for consumer safety (Penna et al., 2021).

In addition, it is known that the way milk is produced, that is, intensively, traditionally/conventionally or organically, has a direct and significant impact on the quality of raw milk, especially with regard to hygienic, physicochemical, nutritional and technological parameters. According to Hanuš et al. (2021), this is mainly due to feed management, the level of production intensification, access to grazing, and animal welfare conditions, resulting in milk with a composition within the parameters of legislation and the suitability of this product for industrial processing. In this sense, one of the main aspects of hygienic milk quality, the Total Bacterial Count (TBC), was slightly higher, but still within the parameters of the legislation, when the organic production system was analyzed. This is due to the restricted use of antimicrobials and greater access of animals to places with organic matter and clay, which makes it difficult to control mastitis and clean the teats (Hanuš et al., 2021).

The results presented by Ariri et al. (2023) reinforce what has been described above, especially with regard to the physicochemical and technological parameters of milk, which should be mainly related to the interaction between feeding, lactation stage, mammary gland health, and environmental conditions. It is highlighted that the classical parameters of analysis in dairy and processing industry, such as pH, density, cryoscopic index and titratable acidity present low variability between different production systems when milk is obtained through hygienic production methods.

The results obtained by Ariri et al. (2023) regarding the microbial load in milk are suggestive of non-compliance with appropriate procedures during milk processing, from collection to transport. In their research, Mannani et al. (2023), when visiting collection centers and cooperatives, observed failures in the areas of team hygiene, cleaning, and disinfection, resulting from the absence of a control plan.

The authors Mannani et al. (2023) found that it would be necessary to invest in supervision, education, and training, as proposed by Ariri et al. (2023), in addition to raising awareness about the importance of milk quality, aiming to reduce contamination levels and strengthen the production chain.

Still on the work of Sakaridis et al. (2022), the milk analyzed had a bacterial count above the established limits. However, after changes on the farm, from the milking process to the storage of milk, combined with the updating of biosafety practices, improvements were observed in the microbiological quality of the product, reinforcing the adoption of good practices throughout the production chain.

The nutrition and energy balance of lactating animals is a fundamental factor for mammary gland health, milk production and composition of total solids and defatted solids, that is, fat, protein and lactose. This can be observed mainly in intensive systems, in which

diets are more energy-dense and this favors higher levels of total protein and casein, positively impacting industrial yield. On the other hand, grazing-based systems, although they may have lower protein content, tend to produce milk with a differentiated lipid profile, with a higher concentration of unsaturated fatty acids.

Hanuš et al. and Ariri et al. also converge their studies regarding the impact of mammary gland health on milk quality, since the elevation of somatic cells is directly related to the physicochemical composition of milk, such as the reduction of lactose content and changes in the protein fraction, especially in casein.

According to Brodziak et al (2021), specific characteristics of the production environment, including the type and quality of feed offered to the animals, exert a significant influence on the quality of raw milk, which directly impacts the quality of dairy products.

According to Brodziak et al (2021), studies show that the quality of milk when its production is organic is more valuable, in its composition in terms of vitamins, fatty acids, whey proteins and minerals, attributing it to the fact that these animals are raised free and with access to pasture, however, the quality of this raw milk is a cause for concern.

According to the findings of Sakaridis et al (2022), it shows that after the advent of pasteurization, the cheese sector started to adopt the heat treatment of milk, this measure aims to eradicate pathogenic microorganisms, to ensure a quality product for the consumer.

4 CONCLUSION

Based on the literature presented, it was found that hygiene in milking is determinant for the quality of milk and its derivatives. This quality is directly related to the microbiological and sanitary safety of food, since the physicochemical indicators of milk also act as sanitary markers. In addition, it is essential to emphasize that animal health, especially of the mammary gland, is a factor that directly impacts the quality and physicochemical composition of milk, so the evaluation of these parameters must be done holistically and globally by the veterinarian.

With the application of the HACCP system, it becomes possible for the problems identified to be corrected in a more assertive way, whether they are due to hygiene failures or adulteration, thus preventing these products from reaching consumers and causing them losses.

It is the responsibility of the veterinarian and the multiprofessional team to correct and prevent failures in the inspection of food intended for human consumption, ensuring the quality and food health of the consuming public. In this context, they work on rural properties

providing guidance on the standardization of good milking practices, training and recycling of labor, as well as continuous monitoring to identify and correct failures.

Thus, the implementation of good milking practices represents not only a technical criterion, but also an ethical commitment to food safety and the sustainability of the milk production chain.

ABSTRACT

Artificial insemination (AI), and especially fixed-time artificial insemination (FTAI), have become established as central biotechnologies to enhance reproductive efficiency and accelerate genetic gain in cattle production systems by reducing dependence on estrus detection. Despite their widespread adoption, reproductive performance achieved under field conditions remains dependent on the interaction between the hormonal protocol, the physiological and metabolic status of the females, and the operational quality of the service. This narrative review synthesizes recent evidence (2021–2025) on estrous cycle synchronization strategies based on progesterone (P4), estrogens, and luteolysis with prostaglandin F2 α (PGF2 α), highlighting the importance of maintaining adequate P4 concentrations during dominant follicle development for oocyte competence and subsequent luteal functionality. Additionally, the use of equine chorionic gonadotropin (eCG) as a supportive tool in cows with low body condition and higher probability of anestrus is discussed, as well as the impact of inseminator training and semen handling (storage, thawing, and intrauterine deposition) on conception rates. Finally, emerging perspectives related to omics sciences are addressed, with emphasis on circulating microRNAs as potential biomarkers for predicting pregnancy success and enabling early diagnosis, with implications for reducing the interval between services and optimizing system profitability. It is concluded that maximizing conception rates in AI/FTAI programs depends on an integrated approach combining protocol design, nutritional management, and technical excellence, in addition to the critical and gradual incorporation of higher-resolution diagnostic tools.

RESUMO

A inseminação artificial (IA) e, sobretudo, a inseminação artificial em tempo fixo (IATF) consolidaram-se como biotecnologias centrais para elevar a eficiência reprodutiva e acelerar o ganho genético em sistemas de produção bovina, ao reduzir a dependência da detecção de estro. Apesar da ampla adoção, o desempenho reprodutivo obtido em campo permanece condicionado à interação entre o protocolo hormonal, o estado fisiológico/metabólico das fêmeas e a qualidade operacional do serviço. Esta revisão narrativa sintetiza evidências recentes (2021–2025) sobre estratégias de sincronização do ciclo estral baseadas em progesterona (P4), estrógenos e luteólise com prostaglandina F2 α (PGF2 α), destacando a relevância da manutenção de concentrações adequadas de P4 durante o desenvolvimento do folículo dominante para a competência oocitária e a subsequente funcionalidade luteal. Discute-se, adicionalmente, a utilização da gonadotrofina coriônica equina (eCG) como ferramenta de suporte em vacas com baixa condição corporal e maior probabilidade de anestro, bem como o impacto da capacitação do inseminador e do manejo do sêmen (armazenamento, descongelação e deposição intrauterina) sobre as taxas de concepção. Por fim, são abordadas perspectivas emergentes associadas às ciências ômicas, com ênfase em microRNAs circulantes como potenciais biomarcadores para predição do sucesso gestacional e diagnóstico precoce, com implicações para a redução do intervalo entre serviços e otimização da rentabilidade do sistema. Conclui-se que a maximização das taxas de concepção em programas de IA/IATF depende de abordagem integrada, combinando desenho protocolar, manejo nutricional e excelência técnica, além de incorporação crítica e gradual de ferramentas diagnósticas de maior resolução.

1 INTRODUCTION

Productivity in modern livestock farming is strongly linked to the reproductive efficiency of the herd, with Artificial Insemination (AI) and, more specifically, Fixed Time Artificial Insemination (TAI), being the most impactful biotechnological tools for genetic and operational progress (Sales et al., 2024). In the last 40 years, the evolution of these techniques has made it possible to overcome one of the biggest obstacles to bovine reproduction: the need for continuous observation of estrus, which often has low detection rates and efficiency in the field (Sartori et al., 2023; Sales et al., 2024).

However, the present presents new challenges. Increased milk production and metabolic changes in high-performance cows have been associated with a reduction in fertility, requiring that the control of the estrous cycle, through the manipulation of follicular development and ovulation, be increasingly precise (Sartori et al., 2023; Ayantoye et al., 2025). The success of these technologies does not depend only on robust hormonal protocols, but on a multifactorial triad that involves nutritional management, semen quality, technical competence, and inseminator training, a variable that is often underestimated, but which determines the correct deposition of semen in the reproductive tract (Dalton et al., 2021; Mathewos et al., 2023).

At the same time, the field of animal reproduction is moving towards a new frontier with the integration of omics technologies. The identification of specific biomarkers, such as serum microRNAs, emerges as a promising tool to predict the success of conception and diagnose pregnancy early, reducing the interval between inseminations and optimizing the profitability of the system (Ayantoye et al., 2025; Tzelos et al., 2023).

In view of this scenario of technical evolution and persistence of production problems, the present narrative review aims to analyze the current synchronization protocols and hormonal manipulation strategies for fertility optimization. In addition, it seeks to discuss critical management factors and explore how new biotechnological tools can transform reproductive prognosis in cattle, offering an integrated vision for maximizing conception rates.

The association of Fixed Time Artificial Insemination (TAI) combined with methods that allow the identification of the estrus period (heat), can enhance reproductive performance, increase productivity and consequently, increasing profits for dairy cow producers, in addition to maximizing reproductive programs, (TAI) also allows contributing to advances in genetic improvement and herd management, being factors that impact profitability and sustainability in dairy production (Ayantoye, et al., 2025).

2 METHODOLOGY

The present investigation is a narrative literature review, structured with the purpose of synthesizing and critically analyzing the main scientific evidence related to the optimization strategies of artificial insemination in cattle. The search for theoretical subsidies was carried out in the PubMed database, using the MeSH descriptors "Artificial Insemination" and "Cattle", articulated by the Boolean operator AND, respecting the terminology of the Medical Subject Headings (MeSH) system. Additionally, filters for period (2021–2025), language (Portuguese or English), and full-text availability were applied, when available on the platform.

Studies published in the period between 2021 and 2025, available in full text and written in Portuguese or English, which dealt directly with synchronization and reproductive efficiency protocols, were selected. Brief communications, duplicate articles, studies without robust methodological foundation, or studies that were outside the central thematic scope were excluded. The selection process involved the preliminary analysis of titles and abstracts, followed by the full analytical reading of the manuscripts to ensure the consistency of the data presented. As this is a narrative review, the selection of studies was based on convenience and thematic relevance, with no prior registration protocol (e.g., PROSPERO) or application of formal instruments for assessing risk of bias. The synthesis of information was conducted in a descriptive and integrative manner, prioritizing convergent findings on: (i) hormonal synchronization protocols (P4, estradiol, PGF2 α and eCG); (ii) management factors (BCS, nutrition and animal category); (iii) operational variables related to semen and insemination technique; and (iv) emerging perspectives with biomarkers (microRNAs).

3 RESULTS AND DISCUSSION

The search for the optimization of conception rates in cattle is based on the strict control of follicular dynamics and the synchronization of endocrine events that determine the emergence of follicular wave, luteolysis and ovulation, pillars that support the efficiency of Fixed Time Artificial Insemination (TAI) programs. Current protocols predominantly use the association between intravaginal progesterone (P4) devices and estrogens (e.g., estradiol benzoate) to synchronize the emergence of a new wave of follicular growth and reduce follicular stage variability at the time of insemination (Sales et al., 2024).

A critical point identified in the literature is that the success of this process depends not only on the presence of progesterone, but also on its circulating concentration during the growth of the dominant follicle. Adequate levels of P4 during follicle development are of great importance to avoid frequent pulses of luteinizing hormone (LH), which could lead to early

oocyte maturation and compromise of its viability (Sartori et al., 2023). Thus, the maintenance of an "adequate progesteronic environment" is interpreted as a determining component for the performance of the protocol, especially in categories with greater physiological variability.

According to the findings of (Mathewos et al., 2023) with the acquisition of semen, contributing to Artificial Insemination (AI), enhances the use of reproductive males, this technology favors the proliferation of superior genetics, as well as accelerates the reproductive process efficiently, (AI) is consolidated as it is the main reproductive biotechnique in developing countries, In dairy farming, it is a strategic management tool, favoring and enabling access to breeding males of high genetic quality.

3.1 EFFICIENCY OF LUTEOLYSIS AND PRE-OVULATORY PROGESTERONE DROP

Complementing this control, the effectiveness of luteolysis, which is the regression of the corpus luteum, emerges as one of the main factors to ensure fertility. Recent strategies indicate that the application of a second dose of prostaglandin F2 α (PGF2 α) can significantly increase conception rates, especially in cows that have more resistant corpora luteum. This practice allows progesterone levels to drop dramatically before insemination, allowing ovulation to occur in a perfectly synchronized manner after the removal of the devices (Sartori et al., 2023; Sales et al., 2024).

From an applied point of view, luteolytic failure should be interpreted as a frequent cause of well-executed protocols with pregnancy below expectations, since the persistence of P4 in the pre-AI period can reduce the LH peak and compromise ovulatory timing.

3.2 METABOLIC STATUS, CCS, AND GONADOTROPHIC SUPPORT WITH ECG

However, the biological response to hormones is directly influenced by the metabolic state of the animal. In scenarios of nutritional restriction, the body condition score (BCS) becomes a limiting factor, often keeping the animals in deep anestrus. To reduce this problem, the use of equine chorionic gonadotropin (eCG) has been shown to be a very efficient optimization technique, as it provides the necessary support for the final growth of the dominant follicle and for the formation of a functional corpus luteum in cows with low energy reserve and lower ovarian responsiveness (Mathewos et al., 2023).

Dominant follicle growth is elevated by eCG due to its affinity for gonadotropin receptors (LH and FSH) present in follicular granulosa cells (Murphy and Martinuk, 1991). Physiologically, LH binds to granulosa cell receptors, causing a cascade of reactions that synthesize catalytic enzymes that promote steroid production and, consequently, stimulate the final growth of the dominant follicle (Carroll et al., 1992). Thus, eCG would act as a

gonadotrophic support, similar to LH, stimulating the growth of the dominant follicle, especially in primiparous females and in anestrus with low body condition score (BCS) (Sales et al., 2024).

It has already been shown that eCG, added to the hormonal protocol at the time of PGF application, helps to increase: follicle size, estrus manifestation, ovulation rate and fertility in beef cattle (Baruselli et al., 2004; Sales et al., 2016). However, it is essential to highlight that the positive effect of the use of eCG on FTAI when used in lactating *Bos taurus* cows is minimal or non-existent, probably because lactating cows have a higher frequency of LH pulses, which provides sufficient stimulus for follicular development (Vasconcelos et al., 2003; Ferreira et al., 2015).

Thus, it can be said that eCG should be understood as an excellent strategic tool for "rescue" in critical categories (e.g., low BCS, recent postpartum, primiparous women challenged), especially in *Bos Indicus* beef cows, rather than a universal addition to all protocols.

3.3 SEMEN QUALITY AND TECHNICAL EXECUTION: IMPACT OF THE INSEMINATOR

In addition to pharmacological rigor and nutritional management, precision in technical execution is a differential in the results obtained. The technical training of the inseminator, involving everything from the correct thawing of the semen to its exact deposition in the body of the uterus, is a variable that can cause considerable variations in pregnancy rates (Dalton et al., 2021). Operational aspects such as time between thawing and insemination, keeping the straw at the appropriate temperature, applicator hygiene, and efficient transposition of the cervix are critical points, as failures in this step can nullify the benefits of a well-planned hormonal protocol (Dalton et al., 2021; Mathewos et al., 2023). Therefore, the standardization of the procedure (checklists, periodic recycling, and technical supervision) constitutes a cost-effective intervention to increase reproductive efficiency in the field.

To achieve success in reproduction, the health and physiology of the cow, the time for insemination and the quality of the semen are conditioned (Ayantoye et al., 2025).

3.4 BIOMARKERS AND PRECISION REPRODUCTION: MICRORNAS AS EMERGING TOOLS

Finally, the transition to a phase of precision reproduction is being driven by the sciences. The discovery of molecular biomarkers, such as serum microRNAs, represents a significant advance in pregnancy monitoring. The increase in miR-26a levels around the eighth day after insemination has been shown to be directly correlated with pregnancy

maintenance (Tzelos et al., 2023). The integration of these early diagnosis tools with traditional protocols allows for early identification of failures in maternal signaling, enabling rapid and individualized interventions and reducing the interval between services in non-pregnant females (Ayantoye et al., 2025). However, the broad applicability of these markers still depends on analytical standardization, validation in different herds/breeds and cost-benefit evaluation under commercial conditions, so that their use goes beyond the experimental environment.

3.5 INTEGRATIVE SYNTHESIS

In general, the studies analyzed indicate that the result of FTAI does not depend only on the hormonal protocol, but on the combination of several factors. Among the main ones are: (i) the proper functioning of the endocrine protocol, with adequate levels of progesterone and efficient luteolysis; (ii) the metabolic status and category of the animal, especially the body condition score and the presence or absence of cyclicity; and (iii) the correct execution of the insemination, including semen management and deposition in the appropriate place. Thus, improving conception rates requires joint attention to these points, as hormonal adjustments may have little effect if the overall management and technique applied in the field are not satisfactory.

4 CONCLUSION

When analyzing the current panorama of bovine reproduction, it is clear that the optimization of conception rates does not depend on a single solution, but rather on fine-tuning between the animal's biology and the precision of human interventions. The advancement of FTAI protocols has brought essential predictability to the sector, however, the review of the data shows that we still face fundamental problems. Hormonal control, although increasingly sophisticated with the strategic use of PGF2 α and eCG, often comes up against issues such as animal nutrition and the technical preparation of those who perform the insemination at the end of the process.

The integration of omics sciences and the use of biomarkers such as miR-26a open a valuable door to what we can call precision reproduction. This technology should not be seen only as a futuristic concept, but as a practical tool that will soon allow the producer to identify gestational failures in record time, drastically reducing the waste of time and resources with empty animals.

In short, the path to maximizing reproductive indices requires us to look at the cow in a holistic way. It is not enough to apply the most modern protocol if the animal does not have

metabolic support or if the semen is not deposited with the necessary technical rigor. The future of efficient livestock farming must be built by mastering the basic physiology of animals, ensuring excellence in management in the corral and intelligently adopting new biotechnological frontiers to transform early diagnosis into real profitability.

ABSTRACT

The article analyzes the transition from the traditional justice model to the Multi-Door Justice paradigm, focusing on the modification of civil names in extrajudicial notary and registry offices in Brazil and Argentina; it highlights the relevance of the civil name as a fundamental personality right and the need to rationalize the justice system in light of the Judiciary's overload; dejudicialization is presented as a means of ensuring access to justice, efficiency, and legal certainty through extrajudicial agents, notaries, and registrars endowed with public faith; the study is grounded in the theory of the name as an attribute of personality and in human dignity, citing the perspectives of Immanuel Kant, the absolute value of dignity, and Ronald Dworkin, equality and freedom; the text incorporates concepts of Restorative Justice, defined as a process that directly involves those affected in order to restore social harmony and humanize justice; furthermore, it mentions the expansion of methods such as mediation and conciliation within extrajudicial offices, in accordance with Law 13.140/2015, and the influence of European guidelines in promoting restorative programs.

Keywords: Dejudicialization. Civil Name. Multi-Door Justice.

RESUMO

O artigo analisa a transição do modelo de justiça tradicional para o paradigma da Justiça Multiportas, com foco na alteração do nome civil nas serventias extrajudiciais do Brasil e da Argentina. Destaca a relevância do nome civil como um direito fundamental da personalidade e a necessidade de racionalizar o sistema de justiça diante da sobrecarga do Poder Judiciário. A desjudicialização é apresentada como um meio de garantir acesso à justiça, celeridade e segurança jurídica através de agentes extrajudiciais, notários e registradores dotados de fé pública. O trabalho fundamenta-se na teoria do nome como atributo da personalidade e na dignidade humana, citando as perspectivas de Immanuel Kant, valor absoluto da dignidade e Ronald Dworkin, igualdade e liberdade. O texto integra conceitos de Justiça Restaurativa, definida como um processo que envolve diretamente os afetados para restaurar a harmonia social e humanizar a justiça. Ademais, menciona a expansão de métodos como mediação e conciliação em serventias extrajudiciais, conforme Lei 13.140/2015 e a influência de diretrizes europeias na promoção de programas restaurativos.

Palavras-chave: Desjudicialização. Nome Civil. Justiça Multiportas.

RESUMEN

El artículo analiza la transición del modelo de justicia tradicional hacia el paradigma de la Justicia Multipuertas, con enfoque en la modificación del nombre civil en las notarías y registros extrajudiciales de Brasil y Argentina; destaca la relevancia del nombre civil como un derecho fundamental de la personalidad y la necesidad de racionalizar el sistema de justicia ante la sobrecarga del Poder Judicial; la desjudicialización se presenta como un medio para garantizar el acceso a la justicia, la celeridad y la seguridad jurídica a través de agentes extrajudiciales, notarios y registradores dotados de fe pública; el trabajo se fundamenta en la teoría del nombre como atributo de la personalidad y en la dignidad humana, citando las perspectivas de Immanuel Kant, valor absoluto de la dignidad, y Ronald Dworkin, igualdad y libertad; el texto integra conceptos de Justicia Restaurativa, definida como un proceso que involucra directamente a los afectados para restaurar la armonía social y humanizar la justicia; además, menciona la expansión de métodos como la mediación y la conciliación en notarías extrajudiciales, conforme a la Ley 13.140/2015, y la influencia de directrices europeas en la promoción de programas restaurativos.

Palabras clave: Desjudicialización. Nombre Civil. Justicia Multipuertas.

1 BACKGROUND

This theme is important for the legal sciences, because the study of the civil name and the dejudicialization are topics of great relevance to Brazilian and Argentine society. In addition to the importance in the daily life of a civil registry office of natural persons, whether the simplest, such as a spelling error, or in the complex request for a change of name and gender in a birth record.

The name according to Rubens Limongi França²:

The name, in general, is an indispensable element to knowledge itself, because it is around it that the mind groups the series of attributes pertinent to the various individuals, which allows its rapid characterization and its relationship with others.

An advance of the recent changes reveals that the dejudicialization movement promotes the expansion of the competence to settle conflicts beyond the Judiciary and its servants, bringing extrajudicial services to the discussion and composition of this scenario.

In the Brazilian legal system, by training extrajudicial services for the application of alternative methods, it undertook the attempt to expand the effectiveness of the guarantee of access to Justice to a dimension beyond legal positivity. And considering that it is a current reality that is part of the Brazilian legal system, the context that involves the development of this innovation and its reflections on society must be evaluated.

In view of this, it brought the possibility for extrajudicial notaries to offer mediation and conciliation services, according to article 42 of Law 13,140/2015¹⁷, which already authorized registrars and notaries as mediators, provided that they were trained in an authorized course and registered with the competent state court.

Notary, or registrar, to whom notarial and registration functions are delegated, with the purpose of ensuring the security, competence, efficiency and publicity of acts, facts and legal administration. Extrajudicial activity outside the Judiciary was born and grew in Brazil. This reality changed only in the twentieth century with the Constitution of the Federative Republic of Brazil of 1988, whose article 236 established the current institutional principles for the delegation of notarial and registry activities.

This activity was regulated and governed by Law 8.935, of November 18, 1994. Recent legislative changes have come to give prestige to the RCPN, placing it, once again, as the protagonist of the necessary movement of dejudicialization in the country, of multidoor justice, in order to relieve the judiciary

² FRANÇA, Rubens Limongi. ON THE CIVIL NAME OF NATURAL PERSONS, p. 22-4

Notarial and registry acts are important, since they allow easy access to citizenship acts for the whole society, with all the attributes related to legal certainty, speed and effectiveness.

Joana Canet Sastre addresses Restorative Justice in her article *ALTERNATIVES TO THE JUDICIALIZATION OF CONFLICTS FROM ROME TO THE PRESENT*³

Restorative Justice is understood as the process that involves people most directly affected by a crime or infraction, in determining the best way to restore social harmony and resolve the conflict, considering the needs and intentions of the victim and the offender. It is a model of justice that seeks to establish a fair and balanced relationship between the parties, to achieve the restoration of social relations broken by the commission of an unlawful act, facilitating the opportunity for the parties to express their emotions and feelings, originated from the offensive fact, as well as an active and direct participation in the process, giving a more human face to criminal justice.

She addresses the so-called restorative practices, which have a long tradition, have been structured more recently as a model of justice, Restorative Justice, which has advantages in its use between the parties to the conflict.

It ratifies for the resolution of conflicts of a criminal nature and allows — in a broader perspective of restoration — to think about the possibility of incorporating restorative practices in the resolution of conflicts not only of this nature, but also in situations of daily life, whether in the family, church, school or others, since culturally there are, in all countries, mechanisms that seek to resolve conflicts in a non-violent way.

With regard to the development of the civil name in Brazilian civil law, he had mentioned Article 18 of the American Convention on Human Rights, in the Treaty of San José, Costa Rica, signed on November 22 in San Jose, Costa Rica. 1969 and entered our legal system through Decree No. 678 of February 6, 1992, which confirmed the first steps in the protection of marriage and its effectiveness, family, name and nationality. The agreement was one of the most comprehensive international documents of the time and was signed by Brazil and Argentina and other countries.

In turn, the dejudicialization in Argentina, the Gender Identity Law of 2012 and the flexibility of the first name demonstrate a faster system for the protection of personality, serving as a paradigm for the improvement of Brazilian institutions.

Weigh the right to the civil name of natural persons and their perspectives of change in extrajudicial services, as well as the impact of dejudicialization on society.

³ Sastre, Joana Canet, *ALTERNATIVAS A LA JUDICIALIZACIÓN DE LOS CONFLICTOS DESDE ROMA HASTA LA ACTUALIDAD*, Revista de Derecho UNED, núm. 14, 2014.

Consider the right of personality, being relativized in the face of dejudicialization, resulting from recent changes, whether or not it will be an act that favors civil society.

2 BRAZILIAN LEGISLATION

Dejudicialization and its reflections with the important innovations brought in the years 2022 and following, pertinent to the changes in the name of the natural person in the Brazilian civil registry, without the need to judicialize. Thus exalting the exercise of citizenship and analyzing its impacts, as well as the reasons that justify the possibility of full transfer of the hypotheses of changing the name of the natural person to extrajudicial services.

The most accepted theory about the right to a name is the theory of the name as a right of personality, defended by renowned scholars, ratifying the name as an attribute of personality.

The civil name of the natural person and its personative designation of the person, an inherent element of the personality and which has the main consequence of individualizing a certain person within the social environment and in the family to which he or she belongs, making him or her unique. Thus, it is observed that it is the first attribute of the person's personality, the one that will distinguish him from the others, soon after his birth.

In this way, the right to the name of the natural person emanates from personality, a fundamental right and aims to protect the person's own identity, the object of study of the research.

The theoretical perspective corresponds to an analysis of the historical evolution of philosophical movements, noting the teachings of Immanuel Kant and how his contribution constituted a sublime milestone for the study of human dignity. It also analyzes the conception of human dignity in the thought of Ronald Dworkin and a correlation of human dignity established in the Civil Registry of Natural Persons.

A philosophical pondering by Immanuel Kant, who sees human dignity as an absolute and unconditional value, and Ronald Dworkin's approach, which relates dignity to the principles of equality and freedom. The importance of the Civil Registry of Natural Persons highlighted as essential for the realization of these rights, especially in the recognition and protection of the identity of individuals and a principled analysis.

The full dejudicialization of the hypotheses of change of civil name is feasible and desirable, and is justified for legal, social and practical reasons, especially because it instrumentalizes fundamental rights more efficiently and contributes to the rationalization of the justice system, relieving the overload of the Judiciary.

The paradigm of access to the Judiciary gives way, therefore, to the paradigm of Multidoor Justice, in which new agents are called upon to offer the jurisdictional party other equally legitimate and adequate mechanisms for the resolution of disputes, in the exercise of voluntary jurisdiction and which are placed alongside the state adjudication.

The judiciary is totally overloaded, in addition to being slow with the demands. Regarding the effectiveness of access to justice, the social function of the Extrajudicial Services, the dejudicialization makes access to justice more adequate, bringing speed and legal certainty to procedures that had an essentially judicial nature, such as inventories, divorces, separations, marital reestablishments, adverse possession, apostilles and the most recent, such as compulsory adjudication and rectifications of names, among others. As a result, it reduced actions pertinent to these matters in the Judiciary and gave prestige to extrajudicial services, demonstrating the appropriate place for the promotion of extrajudicialization and dejudicialization.

It is important to mention that dejudicialization consists of giving people opportunities to choose to resolve their conflicts in other means outside the judicial sphere, as long as it is possible and pertinent. It consists of seeking alternative means of conflict resolution in order to achieve social justice.

In turn, reducing bureaucracy consists of simplifying procedures, without losing legal certainty in legal acts and transactions, as the opposite may generate numerous losses for the user and for society as a whole.

The Notary or Registration Officer is the legal professional, endowed with public faith, to whom the exercise of notarial and registration activities is delegated, with the purpose of ensuring the security, validity, effectiveness and publicity of acts, facts and legal transactions. In Brazil, extrajudicial activity was born and grew on the margins of the Judiciary. This reality only changed in the twentieth century with the Constitution of the Federative Republic of Brazil in 1988, where it established the current institutional principles of delegation of notarial and registry activity in its article 236. This extrajudicial activity was disciplined and regulated in Law 8935/1994.

It should be noted, however, that if the notary public suspects fraud, falsehood, bad faith, defect of will, which may be through error, willful misconduct, coercion or simulation as to the real intention of the request for the change of name, he will refuse the rectification in a reasoned manner.

With a viable civil registry and symbol of the modernization of processes, without jeopardizing their legal certainty and effectiveness, in addition to promoting accessibility to extrajudicial processes. It is important to highlight that this transformation demonstrates the

important role of notaries and registrars, and how much they have been contributing to society, through these new attributions, which were previously exclusive to the Judiciary.

Finally, the hypotheses about fundamental rights and new rights, as emphasis is placed on the new issues presented in the legal scenario involving the most diverse discussions about the name, in a natural way, in peculiar situations, respecting the human dignity of the individual enshrined in the current constitutional order. In addition, the Civil Registry of Natural Persons in Brazil contains conceptual meanings of human rights, insofar as for the exercise of fundamental rights, such as personality and identity, as well as for the full exercise of citizenship, it is essential to be included in the civil registry of birth.

3 ARGENTINE LEGISLATION

Aiming to understand the dynamics of the name as a right of personality and supranational protection, as well as the dejudicialization of the change of the name to be carried out in the civil registry and the importance of the name and its relevance in the practice of registration acts before society in the Argentine model as a paradigm of speed and respect for existential truth.

The name is no longer a label imposed by the State for inspection purposes, but the legal garment of human dignity itself and, it is important to highlight the legal nature and the police of names to the Right of Personality.

Historically, the Argentine legal system, influenced by the classical thought of the nineteenth century and consolidated by Decree-Law 18.248/69, conceived the name primarily as a civil police institution. The State's interest in the unequivocal identification of citizens prevailed over the autonomy of the will. With a traditional view, the name as a public charge, in the strict validity of Law 18.248/69, the name was defined as a right-duty.

The State functioned as a moral and cultural filter and the prohibition of extravagant, ridiculous or foreign names, according to Article 3 of Law 18.248/69, did not aim to protect the individual, but rather to preserve a supposed homogeneous national identity and avoid confusion in the public record.

The nature of duty imposed the principle of almost absolute immutability, since to change a name required very rare just causes, since the name did not belong to the subject, but to the record that the State kept about it.

The paradigmatic turn occurred with the constitutional reform of 1994, which conferred constitutional hierarchy to the American Convention on Human Rights (ACHR) and the Convention on the Rights of the Child (CDN) (Art. 75, item 22 of the Argentine National Constitution).

As of article 18 of the ACHR, the name ceases to be an instrument of control and becomes the support of identity. As Casella and Toia point out, identity is a pre-existing reality that the State only recognizes, not creates. The focus shifts from the public interest to the autonomy of human dignity and, currently, the name is understood as an inalienable, imprescriptible and extra-patrimonial personality right.

This new legal nature allowed Argentina to move towards cutting-edge laws, such as the Gender Identity Law (Law 26.743). In it, the right to a name is the maximum tool of self-determination, where the individual's subjective perception of himself or herself prevails over the biological data or the State's interest in standardization.

It is important to note that article 1 of Decree-Law 18,248 establishes that:

Every natural person has the right and duty to use the name and surname corresponding to him in accordance with the provisions of this law.

The analysis of article 1 of Decree-Law 18,248 reveals a classic tension between individual autonomy and the police power of the State. By establishing that every natural person has the right and duty to use the name, the ordinary legislator created a hermeneutical ambiguity that, for decades, was used to justify the prevalence of the immutability of registration over the real identity of the subject

The predominant interpretation placed the name in the field of duty. From this point of view, the regulatory power of the State became the governing principle, and the freedom of the individual, the exception. This view places social order or legal certainty as absolute values, subjecting human subjectivity to an alphanumeric barcode.

Such a posture directly affronts the principle of freedom of action established in article 19 of the National Constitution, which establishes that no one is obliged to do what the law does not command, nor prevented from doing what it does not prohibit. In the field of the name, this means that the autonomy of the will should be the rule, and state intervention, the justified exception.

Traditional hermeneutics makes a serious mistake by ignoring the constitutional hierarchy of the right to a name. It is based on the fallacious premise that the right to identity exists only to the extent and in the form in which the constituted power, in which the common legislator decides to regulate it. However, the current normative reality is different: the right to a name enjoys a constitutional and conventional hierarchy.

Therefore, for Article 75, item 22 of the Argentine National Constitution and Article 18 of the American Convention on Human Rights (ACHR), the name is recognized as an

essential component of dignity and the State does not create the right to the name, it has the duty to recognize and protect it as an inalienable attribute of personality.

In this vein, Ayelen Casella and Leonarddo TOIA IN THEIR ARTICLE 18. DERECHO AL NOMBRE RATIFIES⁴:

Toda Persona tiene derecho a un nombre propio y a los apellidos de sus padres o al de uno de ellos. La ley reglamentará la forma de asegura este derecho para todos, mediante nombres supuestos si fuere necesario.

This hermeneutic ignores the constitutional hierarchy enjoyed by the right to a name, based on the fallacious premise that it exists to the extent of the will of the constituted power, obviating that, currently, the right is such by express recognition of the constituent power through article 75, item 22, of the Argentine National Constitution. (according to article 18 of the ACHR)

The Name as the Unity of Personality and the Protection of the ACHR, this perspective is strengthened by international human rights instruments. Article 18 of the American Convention on Human Rights (ACHR), as interpreted by the classical doctrine (Casella; Toia, 2012), establishes that the name is not only an instrument of state control, but a human right that protects identity. The existential truth of the individual must prevail over the public interest in the immutability of the record, especially when this immutability becomes an obstacle to the free development of the personality.

The projection in the Argentine legal system, focusing on the tension between individual autonomy and state regulation, as well as the incorporation of international treaties with constitutional hierarchy, changed the perception of the name, moving from a statutory duty to a fundamental human right linked to identity, according to Casella; Toia, 2012.

The transition in Argentina reveals that the name migrated from a category of administrative law, pertinent to control and registration, to a category of human rights, in the doctrinal view. The State ceases to be the owner of the name to become the guarantor of the way in which the individual chooses to be identified before society.

From the Argentine jurisprudential perspective, two relevant cases stand out — Halladjian, Jorge Adolfo (1980) and Brandan, Diego Gonzalo (1994) — which address the rigidity of the Law of Names (Decree-Law No. 18.248/69) through decisions that marked the transition to a model based on Human Rights.

4 **Casella, A., & Toia, L.** (2012). Article 18: Derecho al nombre. In E. M. Alonso Regueira (Org.), *La Convención Americana de Derechos Humanos y su proyección en el derecho argentino* (pp. 307-318). La Ley.

In the case of *Halladjian, Jorge Adolfo* (1980), the Court initially stated that the choice of the name transcends the sphere of mere individual interest, compromising the general interest, since the identification of people is a requirement of the entire social order. It was argued that language is a factor of paramount importance for the spiritual identity of a nation and that the prohibition of foreign first names would not be disproportionate to the purpose of preserving this common good. However, in its reasoning, the Argentine Supreme Court ended up allowing the registration of names of Armenian origin, relaxing the requirement of castellanization.

This decision was based on the premise that the name is part of the right to identity and the preservation of cultural roots, in line with the provisions of Article 18 of the American Convention on Human Rights (ACHR).

In the *Brandan* case, Diego Gonzalo (1994/2001) portrayed the evolution of the right to a name linked to the dignity of the human person. The court recognized that the State cannot impose arbitrary barriers to the free choice of name by parents, unless there is a concrete and justified prejudice to the public interest – which rarely occurs with foreign or unusual names. Such a decision ratifies the consolidation of the autonomy of the will against administrative arbitration; although the original text refers to the 1994 precedent (*Fallos* 318:1371), it served as a foundation for the legal evolution that culminated in the 2000s

Finally, it should be noted that Argentina consolidated itself at the forefront of Contemporary Civil Law by enacting Law No. 26,743/2012, which allowed extrajudicial civil requalification and broke with the pathologizing view of gender identity. By making it possible to change one's name and register one's gender administratively, the Argentine system has elevated the right to identity to the status of a pillar of human dignity, untying it from medical diagnoses or invasive judicial authorizations.

In this context, the civil requalification of transgender minors and the right to gender identity are themes for understanding the role of the State in promoting the dignity of the human person, equality and non-discrimination. Gender self-determination — understood as the right of every individual to identify and be legally recognized, including through the rectification of the first name, according to the gender with which he or she identifies — is based on a theoretical construction that amalgamates the fundamental principles of human rights with the recognition of the diversity and plurality inherent to contemporary societies (Barroso, 2015).

Articulating the principle of dignity with the need for legal effectiveness, it is observed that the judicialization of civil requalification for minors in Brazil imposes an emotional and financial burden that hurts human dignity. In contrast, the Argentine model, consolidated by

the Gender Identity Law (2012), demonstrates that the extrajudicial route for minors — based on progressive autonomy and family support — is the mechanism that best fits the control of conventionality.

If the State already entrusts registrars with public faith for complex acts of patrimonial regularization, it must, out of symmetry and respect for dignity, extend this agility to the regularization of identity. This ensures that the civil registry functions as a mirror of human dignity and not as a formalistic vision based on outdated concepts of public interest. This is a case of dejudicialization, a topic addressed in this article

The Argentine system recognizes that the stability of the name must give way to the dignity of the human person. As demonstrated by the evolution of Argentine jurisprudence, when there are just reasons, such as self-perceived identity, the change of the first name must be facilitated to avoid social segregation and ensure the integration of the individual into the society in which he lives.

In this sense, Argentine legislation allows extrajudicial access for minors with the consent of their legal representatives, focusing primarily on the well-being of young people and their immediate social integration. Such a measure avoids the stigma of the judicial process and breaks with the administrative discretion that historically limited the right to identity under dogmatic pretexts of social order.

In turn, in Brazil, the implementation of Provision No. 73/2018 and currently coupled to 149 of the National Council of Justice (CNJ) marked significant progress by authorizing civil rectification by administrative means. However, by restricting this benefit only to those over 18 years of age, the Brazilian legal system incurs in an inconsistency with the precepts of full protection of fundamental rights.

4 CONCLUSION

The article concludes that this is a topic of profound legal, social and practical relevance in the contemporary scenario. The dejudicialization of the right to the civil name is important for the legal sciences, as it aims to analyze and show in an objective way, the right to the civil name of natural persons and its possibilities of change, as well as to promote an analysis of the legal treatment given to the civil name of the natural person, in relation to its function, legal nature and characteristics, especially the principle of immutability being relativized. The possibility of changing it reflects the autonomy and freedom of the individual to identify himself with society.

Emphasizing legal certainty, together with the dignity of the human person, addressed herein, since it must reflect the present reality, informing the relevant changes that have

occurred since its drafting, in an administrative manner and, in this way, authorizes the registration officer to carry out the necessary annotations, on the birth or marriage certificates, of its service, without the need for judicial intervention, in order to be identified and represented in the correct way before the whole society.

In this regard, the assumption that judicial protection is the only form of access to justice is clarified, considering that the Constitution of Brazil does not state that the only way to achieve justice is through the Judiciary, but that there are several forms, known as multidoor justice, which are carried out through extrajudicial activity. One of the alternatives and the most appropriate.

The paradigm of access to the Judiciary is changed, therefore, to the paradigm of Multidoor Justice, in which new agents are summoned to offer the jurisdictional party other forms of process that are equivalent to legitimate and appropriate for the resolution of disputes, in the exercise of voluntary jurisdiction and that are placed alongside the state adjudication.

Dejudicialization has gained strength, proving to be a viable path for the rationalization of the justice system and from this change, the need arises to deepen the analysis on the feasibility of a full transfer of the hypotheses of name change to the notary offices. Inherent and presented peculiarities that comprise the analysis of the new Provisions of the National Council of Justice, legislative approach to public records and jurisprudential analysis.

Regarding the Argentine Legislation under the sieve of conventionality, the analysis of the Argentine legislation allows us to conclude that the legal system is going through a profound transition between the paradigm of the name as a statutory duty and the name as a fundamental human right.

Decree-Law 18.248/69 was addressed and the rules that limit the choice of foreign names or that impose castellanization (Art. 3) lack reasonableness and proportionality. As Casella and Toia argue, the argument of the preservation of national values or the public interest cannot serve as a shield for state arbitration, since the difficulty of pronouncing or the origin of a first name does not represent a real threat to the social order or to the integration of the individual.

The Central Role of the ACHR and the Gender Identity Law in modern Argentine legislation, driven by Article 18 of the American Convention on Human Rights (ACHR) and embodied in Law No. 26,743/2012, redefines the role of the State. This ceases to be a moral and cultural filter to become the guarantor of self-perceived identity. The possibility of rectification of name and gender by administrative (extrajudicial) means removes the name

from the sphere of the civil police and places it under the domain of the autonomy of the will and the dignity of the human person.

It addressed the name as an element of dynamic identity and it is concluded that the right to a name in Argentina, in the light of the block of constitutionality (Art. 75, item 22 of the CN), must be interpreted broadly. The stability of public records must give way whenever it collides with the existential truth of the subject. The Argentine example of allowing extrajudicial means, including for consenting minors, represents the maximum realization of conventionality control, ensuring that the name is an instrument of inclusion and not an immutable label imposed by the State.

The analysis of Argentine jurisprudence, personified by the *Halladjian* and *Brandan* cases, reveals the path of transition from a tutelary and nationalist State to a model of State that guarantees personality rights.

Similarly, Argentine jurisprudence has evolved to recognize that the name is not a property of the State, but an inalienable right of the subject. The stability of the civil registry and cultural homogeneity gave way to dynamic identity and self-determination. These precedents were the necessary foundation for Argentina to be able to subsequently enact avant-garde laws (such as Law 26.743/2012), removing the name from the shackles of the judicial process and returning it to the sphere of dignity and individual freedom, in full alignment with the bloc of conventionality.

An approach to the legal and social impacts, as well as the presentation of international models such as that of Argentina, enrich the study. This approach allows us to understand the peculiarities of the Brazilian legal system and the best practices adopted in other countries, strengthening the hypothesis that the integral performance of extrajudicial services is not only possible, but desirable.

The article fulfills well the objective of highlighting civil requalification, ratifying that dejudicialization for minors (as occurs in Argentina) is the next logical step for Brazil to overcome the current normative incoherence.

The consolidation of new conflict resolution techniques in the extrajudicial sphere represents a fundamental contribution to the modernization of the justice system, materializing the paradigm of Multidoor Justice by offering legitimate and effective alternatives to traditional state adjudication. This contribution is manifested in the expansion of the competence of registrars and notaries who, duly trained as mediators and conciliators, promote the rationalization and speed of the system by relieving the Judiciary of voluntary jurisdiction demands. Such techniques allow for a reduction in bureaucracy that simplifies

complex procedures — such as name and gender rectifications — without giving up legal certainty, guaranteed by the public faith of these professionals.

In Europe, the Council of Europe has promoted the implementation of restorative programs in its member states, highlighting their importance, especially in juvenile justice and in situations of civil conflict. In Spain, several initiatives have been developed in this direction, integrating restorative justice in the family, school and youth spheres.

European civil procedural law in recent years has shown several formats of dejudicialization. Many countries have modified their legislation and adopted different models that vary according to whether they are more or less centralized, according to the regulations and qualifications required of those responsible for carrying out the work, and according to the type of agencies and agents that will perform this task.

The dejudicialization supported by these new methodologies ensures that the civil registry acts as a faithful mirror of human dignity and self-perceived identity, avoiding the stigma of invasive judicial processes and ensuring the full realization of fundamental rights and citizenship.

Finally, the research is justified by its contribution to the realization of fundamental rights through dejudicialization, demonstrating how notary offices can act as essential instruments for the realization of the dignity of the human person and for the modernization of the justice system in Brazil and focuses on the new issues presented in the legal scenario involving the most diverse discussions about the name, in a natural way, in peculiar situations, respecting the human dignity of the individual enshrined in the current Brazilian constitutional order.

ABSTRACT

This research addresses the importance of cooperation networks between public, private, and third-sector institutions, driven by technological advancements and the need for agile responses to social and economic challenges. These networks favor the exchange of knowledge, the articulation of resources, and the collective construction of innovative solutions, especially in the fields of education, research, and innovation. In this context, innovation ecosystems emerge as interconnected environments that promote synergies among skills, infrastructure, and human capital, generating value and transforming territories. The research presented focuses on the Alta Paulista region, in São Paulo, and seeks to understand how cooperation networks are structured in education and innovation ecosystems. The study uses Social Network Analysis (SNA), supported by Netdraw® and UCINET® software, to map interactions, identify subgroups, and measure structural indicators. The methodology combines qualitative and quantitative approaches, characterizing itself as exploratory and descriptive, and includes document analysis and bibliographic review in scientific databases. The results reveal low density in the global network (0.011), indicating few connections relative to the existing potential, but higher density in the innovation sub-network (0.033), suggesting more exchanges, although still insufficient. The centrality of FSNTEDUC (55.8%) and FSNTPESQINOV (30.4%) highlights the strategic role of the Shunji Nishimura Foundation of Technology (FSNT) as an articulator in education, research, and innovation. In specific sub-networks, FSNTPESQINOV achieves centrality of 87.3%, reinforcing its influence on network dynamics. It is concluded that FSNT plays a central role in the Alta Paulista ecosystem, acting on several fronts—education, research, innovation, entrepreneurship, culture, and services—and consolidating itself as a strategic agent in the dissemination of information, coordination of projects, and strengthening of governance. Improving the network, with greater connectivity and stronger ties, can expand collaboration among actors, enhancing social, economic, and technological impacts, especially in agribusiness.

RESUMO

A presente pesquisa aborda a importância das redes de cooperação entre instituições públicas, privadas e do terceiro setor, impulsionadas pelo avanço tecnológico e pela necessidade de respostas ágeis a desafios sociais e econômicos. Essas redes favorecem a troca de conhecimento, a articulação de recursos e a construção coletiva de soluções inovadoras, especialmente nos campos da educação e da inovação. Nesse contexto, surgem os ecossistemas de inovação, ambientes interconectados que promovem sinergias entre competências, infraestrutura e capital humano, gerando valor e transformando territórios. A pesquisa apresentada concentra-se na região da Alta Paulista, em São Paulo, e busca compreender como se estruturam as redes de cooperação em ecossistemas de educação, pesquisa e inovação. O estudo utiliza a Análise de Redes Sociais (ARS), apoiada pelos softwares Netdraw® e UCINET®, para mapear interações, identificar subgrupos e mensurar indicadores estruturais. A metodologia combina abordagens qualitativas e quantitativas, caracterizando-se como exploratória e descritiva, e inclui análise documental e revisão bibliográfica em bases científicas. Os resultados revelam baixa densidade na rede global (0,011), indicando poucas conexões em relação ao potencial existente, mas maior densidade na sub-rede de inovação (0,033), sugerindo mais trocas, embora ainda insuficientes. A centralidade das sub-redes FSNTEDUC (55,8%) e FSNTPEsqinov (30,4%) evidencia o papel estratégico da Fundação Shunji Nishimura de Tecnologia (FSNT) como articuladora em educação, pesquisa e inovação. Em sub-redes específicas, a FSNTPEsqinov alcança 87,3% de centralidade, reforçando sua influência na dinâmica da rede. Conclui-se que a FSNT exerce papel central no ecossistema de inovação da Alta Paulista, atuando em diversas frentes — educação, pesquisa, inovação, empreendedorismo, cultura e serviços — e consolidando-se como agente estratégico na difusão de informações, coordenação de projetos e fortalecimento da governança. O aprimoramento da rede, com maior conectividade e fidelização dos laços, pode ampliar a colaboração entre os atores, potencializando impactos sociais, econômicos e tecnológicos, especialmente no agronegócio.

RESUMEN

Esta investigación aborda la importancia de las redes de cooperación entre instituciones públicas, privadas y del tercer sector, impulsadas por los avances tecnológicos y la necesidad de respuestas ágiles a los desafíos sociales y económicos. Estas redes fomentan el intercambio de conocimientos, la asignación de recursos y la construcción colectiva de soluciones innovadoras, especialmente en los campos de la educación y la innovación. En este contexto, surgen los ecosistemas de innovación: entornos interconectados que promueven sinergias entre habilidades, infraestructura y capital humano, generando valor y transformando territorios. La investigación presentada se centra en la región Alta Paulista en São Paulo y busca comprender cómo se estructuran las redes de cooperación en los ecosistemas de educación, investigación e innovación. El estudio utiliza el Análisis de Redes Sociales (ARS), con el apoyo de los software Netdraw® y UCINET®, para mapear interacciones, identificar subgrupos y medir indicadores estructurales. La metodología combina enfoques cualitativos y cuantitativos, caracterizándose como exploratoria y descriptiva, e incluye análisis de documentos y revisión bibliográfica en bases de datos científicas. Los resultados revelan baja densidad en la red global (0,011), lo que indica pocas conexiones en relación con el potencial existente, pero mayor densidad en la subred de innovación (0,033), lo que sugiere más intercambios, aunque aún insuficientes. La centralidad de las subredes FSNTEDUC (55,8%) y FSNTPEsqinov (30,4%) destaca el

papel estratégico de la Shunji Nishimura Foundation for Technology (FSNT) como articulador en educación, investigación e innovación. En subredes específicas, FSNTPESQINOV alcanza una centralidad del 87,3%, lo que refuerza su influencia en la dinámica de la red. Se concluye que FSNT desempeña un papel central en el ecosistema de innovación de Alta Paulista, actuando en varios frentes —educación, investigación, innovación, emprendimiento, cultura y servicios— y consolidándose como un agente estratégico en la difusión de información, coordinación de proyectos y fortalecimiento de la gobernanza. Fortalecer la red, con mayor conectividad y relaciones más sólidas, puede ampliar la colaboración entre las partes interesadas, impulsando el impacto social, económico y tecnológico, especialmente en la agroindustria.

1 INTRODUCTION

In recent decades, the advancement of information technologies, the growing complexity of social and economic challenges, and the need for agile and collaborative responses have driven the formation of cooperation networks between public, private and third sector institutions. These networks are configured as dynamic arrangements that favor the exchange of knowledge, the articulation of resources and the collective construction of innovative solutions. In the field of education, research, and innovation, according to Lauxen (2024), these networks play a strategic role by integrating different actors — such as universities, research centers, companies, civil society organizations, and governments — around common objectives aimed at scientific, technological, and social development.

This articulation gives rise to the so-called innovation ecosystems, interconnected environments that promote synergies between skills, infrastructure, human and institutional capital, creating favorable conditions for value generation and territorial transformation. Focusing on the generation of synergies, the union of assets (material, human, financial resources) of institutions in a network seeks to generate a value greater than the sum of the resources available separately, according to the logic of resource extension (Lavie, 2006).

Social networks, through the ordering of relationships, favor institutions access to business opportunities, strengthen institutional competitiveness by expanding the flow of information, resources, markets and technologies, enabling knowledge gains, economies of scale and scope, and risk sharing, according to the authors Mizruchi (2006); Kimura, Teixeira and Godoy (2004), Balestrin and Vargas (2004).

The analysis of these networks, through the Theory of Social Networks (SRT), allows us to understand how the actors relate to each other, what are the flows of information and influence, and how the thematic subgroups are structured within the ecosystem. SRT provides analytical tools to identify patterns of cooperation, levels of centrality and density of connections, revealing the strategic role of certain actors in sustaining and expanding the network.

In this context, understanding a cooperation network in the research and innovation ecosystem in the Alta Paulista region, in the interior of the State of São Paulo, contributed to reveal the mechanisms of articulation and offer subsidies for the strengthening of inter-institutional relations and for the proposition of more effective innovation policies. Improving the network of the Shunji Nishimura Foundation of Technology (FSNT), expanding it, increasing its maturity, bringing greater confidence to the actors of the network, are some of the benefits that can be generated for the areas of agribusiness, to which the FSNT has a direct or indirect connection.

The Netdraw® software was developed to enable the visualization of networks in the *Ucinet®* package, widely used in Social Network Analysis (SNA), released in 2002 by the company *Analytic Technologies*. Its main developers were Stephen P. Borgatti, Martin G. Everett and Linton C. Freeman, prominent researchers in the field of graph theory and social network analysis.

Since 1979, Borgatti, Everett and Freeman have been a reference in this area and have developed the theoretical concept and methodology of Centrality; they are founders of the journal *Social Network* (the main journal in the area) (Freeman, 1979).

Freeman is one of the most respected researchers in sociometry and was responsible for standardizing the ARS language. While Freeman established the fundamental metrics of centrality to measure power and influence, Borgatti and Everett advanced in the methodological and algorithmic application of these structures, allowing the analysis of roles, strategic positions, and the modeling of complex organizational ecosystems. Borgatti is the most influential contemporary author in the application of ARS in business and management, he has an interdisciplinary profile that unites heavy mathematics with organizational theory. Often a co-author of Borgatti, Everett brings mathematical and algorithmic rigor, is a professor of Social Network Analysis, and focuses on the deep structure of graphs.

For the analysis of social networks, graph theory provides the mathematical basis of the study, allowing to represent relationships between actors through graphs and adjacency matrices. Generally composed of binary values (1 or 0), they organize the connections between agents and usually have an empty diagonal, as the link between an actor and himself is not considered (Wasserman; Faust, 1994).

Graph Theory originated in the work of Leonhard Euler, when the Swiss mathematician solved the famous "Königsberg Bridges" problem, considered the founding milestone of the discipline (Szwarcfiter, 1984), later evolving as a branch of discrete mathematics, focused on the study of structures composed of vertices (or nodes) and edges (or connections), which model relationships between elements of a set (Harary, 1969).

When applied to the understanding of the structures of social interaction, graph theory gained great relevance in sociology, highlighted by Wasserman and Faust (1994) as enabling a formal reading of social relations, transforming abstract bonds into analyzable structures, which expands the ability to understand the organization and dynamics of groups.

While graph theory originated in mathematics, network theory had an interdisciplinary origin, including the area of Mathematics and Sociology, incorporating social, physical and computational theories. According to Ferreira and Filho (2010), Network Theory deals with a complex analysis of tangible (goods, materials) or intangible (ideas, values) interactions

between the actors involved in the network (people, organizations, environment), using concepts and metrics (centrality, density, modularity).

The central problem of this research is to understand how cooperation networks are structured in research and innovation ecosystems, evaluating the patterns of interaction between the different actors involved and the subgroups formed based on common interests. Through the analysis of social networks, we sought to identify the levels of influence and institutional articulation among the participants of the network, having as a case study an institution that acts strategically in this ecosystem, comparing it with other studies found in the literature.

To answer these questions, the study uses Social Network Analysis with the support of the software tools *Netdraw*® and *Ucinet*®, in order to visualize relationships and detect subgroups present in the cooperation network, allowing us to understand the role of the Foundation in the network and the links established with the other participants.

The present research is justified by the need to deepen the knowledge about how these networks are structured, what are the patterns of interaction between their actors and how certain institutions exert influence on the articulation of relationships. The application of Social Network Analysis (SNA), with the support of the *Netdraw*® software and the *Ucinet*® software, allowed a quantitative approach that contributed to evidence the relational dynamics of the network and the thematic subgroups formed by common interests of the actors.

The relational dynamics of the social network aims to generate value for institutions, people and communities, and the interdisciplinary approach observed in the formation of strategic partnerships was observed in the case study carried out that evaluates the role played by a central actor (Grupo Jacto, 2025). Based on the Theory of Social Network Analysis (SRA), this research searched the literature for consolidated studies on this topic and applied to the case study of the cooperation network where the FSNT is inserted, mapping the interconnections to demonstrate the influence of the institution in each sub-network, in order to identify and provide subsidies for the creation of actions aimed at strengthening this network and other networks to be studied.

This research may provide relevant information that can contribute to the fulfillment of at least five of the 17 sustainable development goals (SDGs) set out in the United Nations (UN) 2030 Agenda for Brazil (UN, 2023), SDG 4 "Quality Education"; SDG 8 – Decent Work and Economic Growth; SDG 9 – Industry, Innovation and Infrastructure; SDG 11 – Sustainable Cities and Communities and SDG 17 – Partnerships and Means of

Implementation. Although the main focus is education, research and innovation, there are also points of convergence with SDG 2.

The objective of this research is to identify relationships established between the actors of a cooperation network of an innovation ecosystem with the purpose of expanding the knowledge about the structure, intensity and dynamics of these interactions.

2 THEORETICAL FRAMEWORK

The study of networks identifies the actors and the relationship between them in order to characterize these forms of interaction, contributing to the knowledge about the social network and its development. Networks are systems composed of "nodes" and connections between them that, in the social sciences, are represented by social subjects (individuals, groups, organizations, etc.) connected by some kind of relationship. The social network can be studied basically in order to understand how the actors behave and how the connections of this network influence this behavior (Watts, 1999).

In addition to the identification of actors and their bonds, Ahuja, Zaheer and Soda (2012) highlight the relevance of examining the structural configurations or patterns that emerge from relationships. From this perspective, certain actors may present greater intensity of interaction, while others start to concentrate — or centralize — a significant volume of connections within a specific network.

Actors, in general, tend to establish relationships with those who share similar attributes, which evidences the presence of similarity (Olave; Amato Neto, 2001). This proximity generates benefits for those involved, understood as positive externalities (Verschoore Filho, 2006). Among the factors that favor this similarity, individual preferences, economic interests or converging goals stand out (BURT, 1992). As examples of positive externalities, we can mention the articulation of groups in unions and cooperatives for the defense of common interests, as well as the productive specialization of companies belonging to the same sector that are clustered in a given region.

According to Abramovay (2000), the network is an analytical instrument for understanding certain forms of collective organization, going beyond the field of social sciences to incorporate, for example, the ecology of the population.

Networks can be categorized according to the degree of legal formalization they present, considering the form of coexistence and organization among their members. In this sense, Fusco (2005) proposes a typology that classifies networks into social, bureaucratic or proprietary networks, varying into symmetrical or asymmetrical networks.

Symmetrical social networks are characterized as social groupings not governed by

formal legal instruments, where participants have the autonomy to join or withdraw from the network at any time and equality in decision-making power is ensured among all members (Fusco, 2005). In the asymmetric social network, the author points out that the relationships between individuals are organized through contracts aimed mainly at the exchange of goods and services.

Structured based on formal contracts that define the relationships between the members, according to Fusco (2005), symmetrical bureaucratic networks maintain the rights, duties, forms of exchange, agreements and the protection of the individual rights of all participants expressly guaranteed in contracts. In asymmetric bureaucratic networks, the legal instruments are directed to the strategic alignment of the members with the objectives of the managing agent, and in these arrangements, rights, knowledge transfer mechanisms and standards for services and information flows among the members of the network are defined.

In the model of symmetrical proprietary networks, Fusco (2005) reinforces that the participating companies form a new organization with the objective of balancing knowledge and capital contributions and formal contracts with specific clauses defining property rights and agreements between the members. In addition to these characteristics, asymmetric proprietary networks have explicitly incorporated the risk element, with the presence of an investor who establishes a partnership with the company, jointly assuming the risks of the enterprise.

It is observed that social networks have no or low degree of legal formalization, which makes it essential to consider the aspects related to human behavior that influence the permanence or dissolution of network relationships. This perspective is widely discussed in the works of Granovetter (1973) updated in 2007, Burt (1992) and Lazzarini (2008). In a convergent way, Grandori and Soda (1995) point out that social networks are characterized by having little or no contractual formalization.

In addition to the structural typology, it is relevant to analyze the forms of joint action existing in the networks, with emphasis on the modes of cooperation and the roles played by the different actors involved. As pointed out by Carvalho, Serra and Laurindo (2003), two main modalities stand out, horizontal cooperation and vertical cooperation.

While horizontal cooperation occurs between individuals or organizations that act as competitors, but who establish cooperative relationships with the objective of achieving common benefits, vertical cooperation is seen in arrangements in which the participants are interdependent to carry out their activities, and the articulation between the members of the chain is fundamental for individual growth and for the development of the other actors

involved (Carvalho, Serra and Laurindo, 2003).

At the end of the 1970s, the discussion about the relationship between networks and companies began in organizational studies to understand the behavior of organizations, emerging the Theory of Organizations, according to researchers Martes et al. (2006). While Granovetter (1985) points out that the absence of relationships between actors can compromise the formation of relevant social bonds, negatively affecting information flows and opportunities for cooperation within networks, Martes et al. (2006) identified, in organizational analysis, that social relations between two actors (individuals or organizations), because they have strength and content, include background, advice or friendship, shared or pertinent interests, and some level of trust.

According to the authors Mizruchi (2006); Kimura, Teixeira and Godoy (2004), Balestrin and Vargas (2004), social networks have been evidenced for enabling the entrepreneur to maintain contacts, expand the possibilities of finding business opportunities and a way for companies to achieve competitiveness in the markets through the ordering of relationships.

Kimura, Teixeira and Godoy (2004) also highlight that these social interactions improve or restrict access to resources, because, by incorporating social capital, they generate externalities such as knowledge about the behavior of other agents; knowledge about the market such as prices and technologies; and on the benefit of class action.

Some quantitative parameters are especially important to identify the structure of a social network. Density describes the overall level of interactions presented by the members of a network, being associated with the average number of connections per member of the group. Centralization reflects the concentration of connections in a small number of individuals, as opposed to a more egalitarian distribution, and is associated with variance in the number of connections per individual (Sparrowe, Liden, and Kraimer, 2001).

The central purpose of cooperation networks in the organizational field is to bring together attributes that allow adaptation to the competitive environment in a dynamic structure, supported by uniform but decentralized actions, which enables gains in the scale of the union, but which prevents the companies involved from losing the flexibility of lean size (Thompson, 2003).

According to Bourdieu (1985), social capital is the "sum of resources" made available by the network, related to the connections that the actors have, but not necessarily resources that are contained in them, because the benefits are acquired or received by the actors.

As a resource, social capital is subject to accumulation and transformation into other forms of capital, such as economic (Bourdieu, 1983) and human (Coleman, 1988), and in a

narrower view, according to Marteleto (2005), it can be defined as a set of norms and social networks that affect the well-being of the community in which they are inscribed.

The theory of resource dependence, according to the research of Dias (2011), is another approach used in studies on cooperation networks, where alliances, partnerships and relationships between organizations have been constituted as new business opportunities that are made possible based on new inter-company arrangements or the so-called inter-organizational networks of cooperation. The same author highlights that the existence of polycentric networks or structures that encompass several actors, organizations or modules linked to each other through the establishment and maintenance of common objectives and a compatible and adequate managerial dynamic is increasingly present.

According to Etzkowitz and Leydesdorff (1995), innovation ecosystems represent spaces in which the knowledge economy is strengthened by collaboration between universities, companies and government, enabling the emergence of mixed institutions that promote the continuous circulation of knowledge and technologies. The education and research ecosystem, on the other hand, can be understood as a collaborative and interdependent environment that brings together multiple agents, such as schools, universities, families, civil society, the productive sector, and digital technologies. In this arrangement, learning is seen as the result of complex interactions that are articulated at different levels (UNESCO, 2021),

The trust that the actor brings to the network of relationships in which he or she is inserted creates favorable conditions for cooperation, which in turn reinforces the trust between the various actors in the network (SMOLKA, 2006).

According to Tigre (2006), the authors Nelson, Freeman and Lundvall, in different works, developed the concept of the National Innovation System, to characterize the scientific and institutional environment capable of promoting innovations for competitiveness. Such studies show how the educational and scientific infrastructure, the mechanisms to support innovation and technological cooperation and business strategies contribute to creating positive externalities to the export effort in different countries (Tigre, 2006).

The challenges linked to Agribusiness, with activities related to land use, energy factors and labor in the field, demand systems with greater productivity aimed at meeting food demand, production and consumption of greater value of land and food. In this environment, sustainable practices, networks, and partnerships innovate the mode of production, consumption, and relationship, where actors - private and public - start to act engaged towards a society of greater development, even though in Brazil there is physical space and

climatic conditions more conducive to agricultural and livestock production (Zuin and Queiroz, 2019).

Sustainable agri-food innovation is a great development opportunity for Brazil, because, according to Zuin and Queiroz (2019), in addition to having good universities and research centers that enable technological advances, there is cultural richness and diversity, a demanding domestic and foreign consumer market, scarce and valuable natural resources, and competitive production.

Brazil is a strategic actor in global agribusiness, an essential sector of the Brazilian economy and an opportunity and catalyst for the country's development and as part of the sector's development strategy with technological products and businesses with higher added value, it is crucial to strengthen the pillars of innovation and reorganize the roles of key actors (university, company and government); prioritize teaching and research focused on strategic opportunities; increase skills for the transformation of traditional companies into innovative ones; stimulate the creation of research, development, and innovation centers (Zuin and Queiroz, 2019).

In Brazil, the national system of technology and innovation was consolidated through several actions such as the creation of the National Council for Scientific and Technological Development (CNPq) and the Coordination for the Improvement of Higher Education Personnel (CAPES), in the 1950s, the structuring of policies for the training of researchers and generation of knowledge and in the 1970s, creation of public policies such as the II National Development Plan (II PND) and the foundation of the Brazilian Agricultural Research Corporation (EMBRAPA, 1973).

Making the Brazilian economy more competitive was necessary with Brazil's economic opening and globalization in the 1980s and 1990s, and stimulating initiatives to bring scientific production closer to the productive sector and technological innovation proved to be a factor in the country's economic and social development (Zuin and Queiroz, 2019).

The Innovation Law (Law No. 10,973/2004) allowed the promotion of research, development and innovation (RD&I) through the sharing of public laboratories with companies, the transfer of technology and the encouragement of public-private partnerships.

The Lei do Bem (Law No. 11,196/2005) granted tax incentives to companies that make investments in technological innovation, and the Legal Framework for Science, Technology and Innovation (Complementary Law No. 167/2016, which updates the Innovation Law) modernized the rules to facilitate the execution of innovative projects.

The approval of the Legal Framework for *Startups* (Complementary Law No. 182/2021) reinforced support for innovative entrepreneurship through mechanisms for

contracting innovative solutions by the public sector and incentives for new technology-based businesses.

Public institutions in Brazil play an essential role in fostering innovation, such as FINEP - Financier of Studies and Projects, with financing and economic subsidies; the National Bank for Economic and Social Development (BNDES), with specific credit lines; the Brazilian Company for Industrial Research and Innovation (EMBRAPPI), which co-finances projects between companies and research institutes; in addition to scholarships and notices offered by CNPq and CAPES.

All these actions are important advances in fostering innovation in Brazil and overcoming challenges such as low private investment in the sector and the lack of a culture of innovation that is part of the organizational culture of companies and institutions.

3 METHODOLOGY

The research strategy is based on the single case study protocol, meeting the reliability criterion, and adopts a qualitative, exploratory and descriptive approach. The research is supported by Social Network Analysis (SRA), with the use of Netdraw® *software* for the graphical mapping of networks and UCINET® for the quantitative measurement of structural indicators. From the interactions between the actors — represented by nodes, links and flows — metrics such as density and centrality (*Degree, Betweenness and Closeness*) are *calculated*, allowing the analysis of the configuration and positioning of the actors in the network.

The methodology articulates a qualitative and quantitative approach, with the ARS as a central technique for the investigation of the interactions between the actors. The combined use of Netdraw® and UCINET® *software* enables the visualization of connections, the generation of network maps and the calculation of structural metrics, essential for understanding relational dynamics, identifying thematic subgroups and evaluating the role played by the different actors in the analyzed ecosystem.

The research is characterized as exploratory, as it allows inferring the ties established between the actors of the social network, and as descriptive, due to the application of mathematical tools in the analysis of the variables that make up the relational matrices (Gil, 2021). In addition, documentary analysis was adopted as a procedure for data constitution and analysis, in line with the qualitative approach of the research (Minayo, 2009).

To bring to the research the historical context of the environment where the FSNT is inserted and its development, documentary research was carried out using books and annual reports available in the institution's private collection, as well as a search on the website.

For the theoretical basis of the scientific knowledge used in the research, research was carried out in books and scientific articles, dissertations and theses of works pertinent to the themes addressed in this research, searched in the *Scielo*, *Capes*, *Unesp* library, *Science Direct* databases.

The research was developed in two phases. In the first, for qualitative analysis, the first network was built with the identification of all actors to have an overview of the collaboration network. To achieve this first objective, a table was built in Excel file format of the overview of the network for the organization of the actors and their attributes and their relational ties; a VNA file of the general network was built and inserted into the *Netdraw® software*, generating the graph of the first network (GENERAL). Initially, these relationship ties were inserted with a weight of 1 to 1 in order to establish balanced (Binary) relationships.

As *insights* obtained from the first graph (GENERAL), subnets were identified, based on the main attributes of the actors, where there are collaborations of common interest, which led to the construction of new VNA files for each of the identified subgroups. The new VNA files were inserted into the *Netdraw® software*, generating the graphs of the subnets.

From this set of sub-networks, the network identified as research and innovation was highlighted for the study, where the actors that interact in this sub-network were isolated with the help of the *Netdraw® software*.

In the second phase of the studies, the *UCINET® software* was applied to insert the new weights to the relational ties of the networks, the GENERAL and the research and innovation sub-network, in order to evaluate the relational matrices and determine the densities and centralities, in a quantitative way.

In this phase, the names of the actors were replaced by acronyms to preserve their identification in their interactions in the General and sub-networks of research and innovation.

4 RESULTS AND DISCUSSIONS

4.1 CASE STUDY: HISTORY OF THE FORMATION OF THE INNOVATION ECOSYSTEM OF ALTA PAULISTA

4.1.1 The Foundation and Its Evolution

The Shunji Nishimura Technology Foundation was created by Japanese immigrant Shunji Nishimura in 1979 as part of the "Thank you, Brazil!" project, with an initial focus on education. With a professional life dedicated to the advancement of agriculture in Brazil, Nishimura, at the age of 70, created the FSNT with the objective of supporting Brazilian agriculture through education, training young people prepared for life in the countryside and with solid values adopted by him (Morais, 2019).

Since then, with the support of Grupo Jacto, the Foundation has played a key role in the training of young people and technological development, fostering innovation and entrepreneurship actions in the areas of agribusiness, health, biotechnology and the food industry, integrating actors in the quadruple helix of innovation in the context of bioconvergence (Grupo Jacto, 2025).

The first initiative of the FSNT was the creation of the Agricultural Technical College. During his business life, Shunji Nishimura approached universities, especially the agronomy faculties of USP - University of São Paulo, in Piracicaba, and Unesp - São Paulo State University, in Jaboticabal and Botucatu. From the partnership with professors from the Faculty of Agronomic Sciences of Unesp in Botucatu, the Soil Analysis Laboratory also emerged, which is still active today and one of the best in Brazil (Cesar, 2018).

In 1988, the Shunji Nishimura School was created, maintained by the FSNT, which in 2019 gained a new building on its campus, specially designed to enhance an innovative educational approach, *Profound Learning*, a Canadian methodology based on the formation of autonomous, innovative and future-ready people (Morais, 2019).

The first major partnership in the field of education: a Senai (National Service for Industrial Learning) school within the FSNT, the result of the agreement with Senai-SP, which began operating in 2009. Senai Pompeia Shunji Nishimura was the first institution to adopt the *Profound Learning methodology*, starting in 2015, and maintains the only high school among Senai schools in the state of São Paulo (Morais, 2019).

In 2010, another major educational project began: the Pompeia Faculty of Technology, a public-private partnership with the Paula Souza Technological Education Center (CPS), an institution of the government of the State of São Paulo responsible for technological professional education, offering technological undergraduate courses, in the context of agribusiness, to young people in Pompeia and region (Morais, 2019).

To promote Culture, FSNT maintains a Museum, open to visitors, intended to preserve the history of the founder of Grupo Jacto and FSNT, Shunji Nishimura, and which maintains his memories and philosophy of life (Morais, 2019). Also as part of actions to encourage culture and volunteering, FSNT maintains the "Volunteering Project", composed of floriculture, horticulture and ceramics workshop activities (Morais, 2019).

4.2 CHARACTERIZATION OF THE INNOVATION ECOSYSTEM

The education and innovation ecosystem where FSNT is inserted has the three main components that the specialized literature identifies as essential (talents, technology and investment), in addition to being located in a region that favors economic development based

on biodigital convergence, through integrated solutions in the areas of Agribusiness, Food Industry and Health, driven by genomics, information and communication technologies (Marchiori, 2024).

The education and innovation ecosystem in which FSNT is inserted seeks to develop a culture of innovation based on cooperation, creating an environment open to opportunities and favorable to the most diverse interactions between entrepreneurs, companies, universities, research organizations, investors and government agencies in order to maximize the economic impact and potential of research and technological innovations (Marchiori, 2024).

At the regional level, the actors in the education and innovation ecosystem are concentrated in Alta Paulista, a region in the state of São Paulo where the city of Pompeia is located. It is an important university and agro-industrial hub, located in the center-west of the state of São Paulo, with a population of 886,735 people, in 2023, distributed in 51 municipalities. It has adequate road infrastructure for cargo transport, in addition to regional airports in Marília, Tupã, Assis and Ourinhos (Grupo Jacto, 2025).

In the state of São Paulo, the Alta Paulista region is responsible for 7% of Brazilian agricultural production and stands out in the food, beverage, machinery and agricultural equipment industries and has important educational, science and technology institutions, such as: Marília Medical School – FAMEMA, São Paulo State University – Assis Campus, Marília Campus, Tupã Campus, Shunji Nishimura Technology Foundation (FSNT), which covers: Fatec Pompeia Shunji Nishimura, Senai Pompeia (SENAI School "Shunji Nishimura") and Agribusiness Innovation Center (CIAg) (Grupo Jacto, 2025).

In more than four decades of existence, FSNT has consolidated itself as a serious institution, with an excellent reputation and with ties of relationships with important actors in national education and research and Brazilian agribusiness (Morais, 2019). The trust that the NSF brings to the network of relationships in which it is inserted creates favorable conditions for cooperation and that, in turn, reinforces the trust between the various actors in the network (Smolka, 2006).

As a result of this trust among the actors in the network, FSNT created, in the area of innovation, through partnerships: the Center for Innovation in Agribusiness (CIAg), a private non-profit research and development center focused on the development of solutions framed in technological programs; Plant Monitoring and Protection Laboratory – LMPP, the first research laboratory created after the Paula Souza Center (CPS) received recognition as a Scientific, Technological and Innovation Institution (ICT) by the Council of Research Institutions of the State of São Paulo (Consip); Alta Paulista Innovation Center (Citap), a

formal innovation environment in the Alta Paulista region, recognized by the government of São Paulo (Grupo Jacto, 2025).

Established in 2014, through a partnership established between FSNT and *Imaginal Education* (Canadian educational institution), the *Imaginal Transformation Center* - ITC Brasil aims to disseminate, in Brazil, the Imaginal Philosophy - a teaching methodology based on principles of student autonomy in the learning process, through consultancy provided in public and private education networks, schools, municipal secretariats, and through *workshops* promoted to train educational managers and teachers (Grupo Jacto, 2025).

The FSNT Agronomic Analysis Laboratory, created in 1985 with the objective of providing soil fertility analysis and chemical analysis of plants to rural producers, cooperatives, consultants, companies and teaching and research institutions throughout the Brazilian territory, contributes to the undergraduate courses of Fatec Pompeia Shunji Nishimura, through support for research projects by professors and students, practical classes and the offer of supervised internships (Grupo Jacto, 2025).

Based on strategic partnerships with institutions such as the Government of the State of São Paulo, the Paula Souza Center, SENAI, the São Paulo Agency for Agribusiness Technology - APTA, the ITAL Institute of Food Technology, the Araucária Foundation, the Institute for Cancer Research of Guarapuava - IPEC, *Cilla Tech Park* and the Government of the State of Paraná, - FSNT operates in education and innovation ecosystems in the areas of Agribusiness, Genomics, Artificial Intelligence, Biotechnology, and the Food Industry (Marchiori, 2024).

4.3 CONSTRUCTION OF THE GENERAL NETWORK

The application of the social network analysis method in this research sought to achieve the proposed objectives through the mapping of the network where the FSNT is inserted and its study to identify possible opportunities for action in strengthening the ties between the actors of this cooperation network.

To process the networks in *the Netdraw® software*, it was necessary to build a set of data structures in a set of plain text files, using Windows® Notepad. In these files, the actors, their attributes and the ties between them were listed according to the subgroups of common interests, indicated in the data collection. After processing, the data was visually represented in the *Netdraw® software*. Figure 1 shows a typical VNA file used in the research. The remaining datasets identifying other subnets followed the same file structure. This procedure was repeated for the general network, as well as for all identified subnets.

Through the Network Theory, with the support of the *Netdraw® Software tool*, an initial analysis of the interactions between the network actors was made and the image of the

general network was constructed (Figure 2), which encompasses subgroups of common interests identified as: i) education; ii) culture; iii) services; iv) research and innovation; v) entrepreneurship, allowing visualization of its reach and the relationships between all actors and the FSNT.

The social network in which FSNT is inserted has a number of connections created from cooperation actions between actors, whose purposes range from the development of the community, Industry and Agribusiness, through support for research and education, expanding this mission to all geographic regions that FSNT reaches through relationships with actors connected by the same purposes.

Figure 2
General Network

Source: The authors.

Figure 2 shows the graph representation of the general cooperation network, composed of institutional connections and partnerships established by the Foundation in its nuclei of action with various institutions, represented by us. The central nodes, highlighted in green, indicate the divisions according to the activities and areas of activity of the FSNT, classified in Chart 1.

Table 1

Classification of sub-networks

DIVISÃO	SIGLA

Educação	FSNT_EDUC
Empreendedorismo	FSNT_EMPREEND
Pesquisa e Inovação	FSNT_PESQ_INOV
Serviços	FSNT_SERV
Fundação Geral	FSNT

Source: The authors.

The FSNT_PESQ_INOV sub-network concentrates connections with educational institutions, research centers and technology companies, evidencing a focus on innovation and development in scientific research. The FSNT_CULT subnetwork connects cultural and educational initiatives. The FSNT_EMPREEND sub-network concentrates institutions classified as incubators, accelerators and entrepreneurship support organizations. The FSNT_SERV subnet, on the other hand, relates to service provider divisions of the FSNT itself. These institutions were classified by type of actor represented by groups classified by color, as indicated in Chart 2.

Source: The authors.

The FSNT, positioned as the central link of the network, connects with all partners according to each sub-network divided by area of operation, thus indirectly connecting all the actors inserted in the FSNT Global network. The institutions of the network were classified through their attributes into: educational, private companies, science and technology institutes, government entities, civil society organizations, divisions of the FSNT itself and sponsor. The connections indicate relations of cooperation, project development, research, technological innovation, culture and entrepreneurship.

While the actors of the networks benefit from the solid reputation of the Foundation built over the years mainly by its founder, Shunji Nishimura, the latter benefits from the specificities brought to the network by each actor, within their areas of activity, in line with Martes et al., (2006), who identified that the social relations between two actors (individuals or organizations), Because they have strength and content, they include background, advice or friendship, shared or pertinent interests, and some level of trust. Aspects such as expertise in corporate governance are also benefits brought by the FSNT to the cooperation network.

The global network was classified, according to Fusco (2005), by its relations as symmetrical social networks where social groupings are not governed by formal legal instruments, the participants have the autonomy to join or withdraw from the network at any time and equality in decision-making power is ensured among all members.

The results of the qualitative analysis of the generated graphs point to a network that encompasses subgroups of common interests identified as education, culture, services, innovation and research and entrepreneurship. The sub-networks were reconstructed separately from the larger network for a better visualization and understanding of their reach and the relationships between the actors and the FSNT.

4.4 CONSTRUCTION OF THE RESEARCH AND INNOVATION NETWORK

The sub-network entitled FSNT_PESQ_INOV, detached from the general network and represented by Figure 3, is composed of several types of institutions such as private companies, teaching and research institutions, science and technology institutes, third sector organizations, development agencies, all with common attributes linked to research and innovation and connected by the FSNT actor, which is positioned with centrality and demonstrates a high degree of importance for the connection between all actors. This sub-network was classified as an asymmetric bureaucratic network, where the relations between individuals are organized through contracts aimed mainly at the exchange of goods and services, according to the indications of Fusco (2005).

Among the actions present in this sub-network, there are research projects, coordinated by the FSNT, in which resources are shared among all actors in the network, and thus, optimized to achieve common goals. The simulation of the FSNT actor's output from this network indicates the disconnection that can occur with the other actors (Figure 4).

Figure 3

Research and innovation subnetwork

Source: The authors.

Figure 4

Research and innovation subnet without FSNT

Source: The authors.

The quantitative analysis of the network indicators was carried out, with the application of the *UTINET® software*, in its version 6.817, obtained from *Analytic Technologies*, according to the guidelines of Borgatti, Everett and Freeman (2002), and the quantitative data and the lists of data outputs from the *URINET® software* were obtained. The following is a summary of the main indicators calculated for the networks (TABLE 3).

Table 3

Summary of the quantitative indicators of the networks studied

NETWORK	Summary of General Network Measures			
	We	Ties	Centralities	Density
GLOBAL	182	378	0,55	0,011
INNOVATION	64	132	0,854	0,033

Source: The authors.

The indication of nodes presents the number of actors participating in the network and sub-network studied. Bonds, on the other hand, correspond to the bonds or between the actors, which represent the interactions between them.

As the relational matrices constructed considered the weights of the relationships (ties) between the actors with unit weight, it is observed that the results of the centralities, also in the interval between 0 and 1, are identical for both the output centralities and the input centralities.

Centrality is a set of metrics used in social network analysis to assess which nodes (or actors) are most important to the network. In this case, Table 1 demonstrates the centrality of the Innovation subnetwork with the measure 0.854.

The densities obtained from the networks showed that in the global network there is a low density, equal to 0.011, which could be increased through a greater number of interactions, increasing the weight of the links (ties) between the actors and possibly creating more connections between these actors. This indicates the possibility of improving the network, building loyalty and strengthening relationships, leading to greater connectivity and greater exchange of information of common interest, in order to ensure that almost all users are connected to each other, thus achieving greater collaboration between the actors of the networks.

With the result of the analysis obtained from the global network as previously indicated, it can be stated that there are still few connections in relation to the total possible connections for this network.

In the case of the Innovation network, the graph obtained showed a density with a result of 0.033, three times higher than the density of the global network, demonstrating that this sub-network has a higher volume of exchanges, but there are still opportunities to increase collaboration within the network.

Table 4 presents a summary of the major centralities found in the network studied, so that it is possible to ascertain the power of the participation of the actors in the respective social networks raised in the case study.

In the global network, it is possible to verify the centrality of the FSNTEDUC actor, which reached 55.8% of centrality, that is, it is the actor with the greatest influence in the network that considers unitary ties, followed by the FSNTPESQINOV actor, with 30.4% of influence over the network participants. Even so, the participation of the FSNT is observed with a centrality of 10% in the global network.

The other actors have centralities lower than 8 points and, in this way, it was perceived how important Education and Research and Innovation are for this network, as well as the monitoring of the FSNT.

Still observing Table 4, we can highlight the importance and power of influence of the actor FSNTPESQINOV, with a value of 87.3% of prominence over the other participants of the network. It is, without a doubt, a major player that contributes to the functioning of the network. The other actors can have their centralities increased in order to expand exchanges and their individual responsibilities.

The results obtained in the analysis of social networks applied to the study of the social network in which the FSNT is inserted, so far, show the relevance of the FSNT as a central articulating actor on different fronts of action: education, research, innovation, entrepreneurship, culture and services. The centrality of the FSNT actor within the sub-networks indicates its strategic role in the education and innovation ecosystem, within the Alta Paulista region.

This arrangement of the actors of the social network and the centrality of the FSNT in the ecosystem points to its ability to disseminate information and act in roles of support for governance and project coordination, consolidating the FSNT as a strategic actor in the education and innovation ecosystem.

Table 4

Greater Centralities of the Evaluated Networks

NETWORK	ACTOR	Summary of the Major Network Centralities	
		Centrality	Central. Norm. (%)
GLOBAL	FSNT	10	5,5
	FSNTCULT	3	1,7
	FSNTEDUC	101	55,8
	FSNTEMPREEND	8	4,4
	GJACTO	6	3,3
	FSNTSERV	5	2,8
	FSNTPESQI NOV	55	30,4
INNOVATION	FSNTPESQI NOV	55	87,3
	FSNT	4	6,3
	G_JACTO	6	9,5
	MAINTAINER	4	6,3

*The sum of the values in the column of the normalized centralities may exceed 100% due to the contribution of the degrees of centrality of entry and exit of the actors.

The analysis of social networks, in this research, as instruments of inter-institutional cooperation revealed their strategic importance for the strengthening of competitiveness and innovation, as highlighted in the review, by the authors Mizruchi (2006), Kimura, Teixeira and Godoy (2004), as well as Balestrin and Vargas (2004), pointing out that the ordering of relationships favors access to business opportunities, it expands information flows and resources, and enables knowledge gains and risk sharing.

As described by Ahuja, Zaheer and Soda (2012), during the development of the research, it was necessary, in addition to identifying the actors and their links, to examine the structural configurations that emerge from the relationships, looking for patterns by individual preferences, economic interests or convergent goals, thus resulting in positive externalities such as unions, cooperatives or productive specialization in specific regions as indicated by

Burt (1992). Fusco (2005) contributed to the definition of the typology that classifies the networks studied.

In the field of cooperation, as indicated by Carvalho, Serra and Laurindo (2003), we observe vertical cooperation, in an interdependent chain. This perspective dialogues with organizational studies initiated in the 1970s, when Martes et al. (2006) identified that social relations between actors involve trust, shared interests and bonds of friendship, while Granovetter (1985) warned that the absence of relationships compromises information flows and opportunities for cooperation.

From a quantitative point of view, according to Sparrowe, Liden and Kraimer (2001), the parameters of density and centralization were calculated to understand the structure of the networks. As indicated by Bourdieu (1985), with the mapping of networks, it was possible to conceptualize social capital as the sum of resources accessible through the identified connections.

In the context of innovation ecosystems, as Etzkowitz and Leydesdorff (1995) pointed out, the triple helix between universities, companies, and government strengthens, in this network under study (research and innovation), the knowledge economy, a perspective expanded by UNESCO (2021) by including multiple agents in collaborative education and research environments.

Finally, we can highlight that, in Brazil, as evidenced by the authors Zuin and Queiroz (2019), agribusiness, combined with sustainable practices and cooperation networks, represents an opportunity for agri-food innovation, supported by universities, research centers, and cultural diversity. This scenario reinforces that the performance of institutions such as FSNT, by articulating Science, Culture, Innovation and Entrepreneurship in cooperation networks, contributes both to organizational efficiency and to generate positive social and economic impacts in line with the UN Sustainable Development Goals.

5 CONCLUSION

The analysis of social networks and the use of *Netdraw® software* to create the graphs allowed to obtain an integrated view of the general network and the sub-networks studied, indicating that the FSNT plays a central role as an agent of intersectoral integration, articulating Science, Culture, Innovation and Entrepreneurship in the same collaborative ecosystem, located in the Alta Paulista region.

FSNT's performance in a research and innovation ecosystem in a cooperation network structure strengthens internal organizational efficiency and contributes to expanding the positive social and economic impact of its actions, consolidating FSNT as a central actor in

the social network, in the institutional articulation for the technological, social and educational development of the community and Agribusiness.

This case study highlights the relevance of cooperation networks in education and innovation ecosystems, highlighting how the articulation between universities, companies, research centers, civil society and governments favors the exchange of knowledge, the collective construction of solutions and territorial transformation. The analysis of social networks, supported by the Netdraw® and UCINET® software, revealed low density in the global network and greater intensity of exchanges in the innovation sub-network, although insufficient to achieve full collaboration. The centrality of the FSNTEDUC and FSNTPESQINOV sub-networks confirms the strategic role of FSNT as an articulating actor in education, research and innovation, consolidating it as a central agent in the dissemination of information, coordination of projects and strengthening of governance.

These results dialogue directly with the UN Sustainable Development Goals. The work contributes to SDG 4 (Quality Education) by strengthening educational institutions and expanding access to knowledge; to SDG 8 (Decent Work and Economic Growth) by fostering innovation and entrepreneurship actions, especially in Agribusiness; and SDG 9 (Industry, Innovation and Infrastructure) by promoting interconnected environments that drive technology and knowledge infrastructure. In addition, territorial transformation and community strengthening are related to SDG 11 (Sustainable Cities and Communities), while the essence of the research — inter-institutional cooperation — is aligned with SDG 17 (Partnerships and Means of Implementation), reinforcing the importance of networks as instruments of sustainable development. Although the main focus of this research has been education, research and innovation, there are points of convergence with SDG 2, that is, it is related to SDG 2 to the extent that it highlights agribusiness as a field of impact, since the strengthening of networks can generate social, economic and technological effects, especially in this sector, connecting directly to the goal of promoting sustainable agriculture and increasing the productivity of smallholders. In addition, innovation ecosystems favor the development of technologies and practices applied to food production, capable of improving agricultural efficiency, reducing waste, and expanding access to nutritious food. The articulation between teaching and research institutions also plays a fundamental role, as it contributes to the training of professionals and the dissemination of knowledge that strengthens both food security and agricultural sustainability. Finally, the centrality of the Shunji Nishimura Technology Foundation demonstrates how an institution can coordinate collective efforts, aligning resources and actors in favor of innovative solutions, which

reinforces the importance of governance and cooperation to implement policies and practices that directly support the goals of SDG 2.

Thus, the investigation shows that improving the FSNT network, expanding its maturity and connectivity, strengthens internal organizational efficiency and enhances positive social, economic and technological impacts, consolidating FSNT as a strategic actor in the promotion of the SDGs in the Alta Paulista region.

The investigation fully fulfilled the objective of identifying the relationships established between the actors of a cooperation network in an innovation ecosystem, expanding the knowledge about its structure, intensity and dynamics. The analysis of social networks, supported by *the Netdraw® and UCINET® software*, allowed the visualization of the general network and its sub-networks, revealing patterns of interaction, levels of centrality and the influence exerted by different actors in common purposes. By relating these purposes to the UN SDGs, the research demonstrates that understanding cooperation networks meets the scientific purpose of mapping interactions, and contributes to the promotion of quality education, economic growth, innovation, sustainable communities and strategic partnerships. Thus, the study confirms that strengthening the FSNT network is essential to expand the maturity and connectivity of the ecosystem, being able to enhance its capacity to generate value and promote sustainable development in the Alta Paulista region.

ABSTRACT

This article examines the relationship between law and subjectivity based on Book V of Aristotle's Nicomachean Ethics, focusing on the articulation between legal normativity and the ethical formation of the subject. The central problem addressed concerns how legal justice depends on previously constituted subjective dispositions and to what extent the effectiveness of law presupposes an ethical education of the psychē. The guiding hypothesis is that, in Aristotle, law (nomos) does not operate autonomously, but achieves effectiveness through its mediation with habit (hexis) and the containment of excess (hybris), revealing a mutual implication between legal order and moral subjectivity. Methodologically, the study adopts a philosophical-hermeneutical reading of Book V, structured around three conceptual triads: nomos–hexis–hybris, aretē–dikē–adikia, and dikaiosynē–dikaion–dikaioi. The analysis demonstrates that Aristotelian justice cannot be reduced to formal legality, since it requires the integration of law, virtue, and prudent judgment, thereby assigning a constitutive role to subjectivity in the realization of justice. The article concludes that this perspective offers a significant contribution to legal philosophy by showing that the legitimacy and effectiveness of legal norms depend on their alignment with ethical formation and the ethos of the political community.

RESUMO

Neste artigo investiga-se a relação entre direito e subjetividade a partir do Livro V da *Ética Nicomaqueia* de Aristóteles, examinando como a normatividade jurídica se articula com a formação ética do sujeito. O problema central consiste em compreender de que modo a justiça legal depende de disposições subjetivas previamente constituídas, e em que medida a eficácia do direito pressupõe uma educação ética da *psyché*. Parte-se da hipótese de que, em Aristóteles, a lei (*nomos*) não atua de forma autônoma, mas encontra sua efetividade na mediação com hábitos (*hexis*) e na contenção da desmesura (*hybris*), o que revela uma mútua implicação entre ordenamento jurídico e subjetividade moral. Metodologicamente, adota-se uma leitura filosófico-hermenêutica do Livro V, estruturada a partir de três tríades conceituais: *nomos–hexis–hybris*, *areté–diké–adikia* e *dikaiosynē–dikaion–dikaioi*. Como resultado, demonstra-se que a justiça aristotélica não se reduz à legalidade formal, mas exige a integração entre lei, virtude e julgamento prudencial, conferindo à subjetividade um papel constitutivo na realização do justo. Conclui-se que essa concepção oferece uma contribuição relevante para a filosofia do direito, ao evidenciar que a legitimidade e a eficácia das normas jurídicas dependem de sua correspondência com a formação ética dos sujeitos e com o *ethos* da comunidade política.

RESUMEN

Este artículo investiga la relación entre derecho y subjetividad a partir del Libro V de la *Ética a Nicómaco* de Aristóteles, examinando cómo la normatividad jurídica se articula con la formación ética del sujeto. El problema central consiste en comprender cómo la justicia jurídica depende de disposiciones subjetivas previamente constituidas y en qué medida la eficacia del derecho presupone una educación ética de la psique. Parte de la hipótesis de que, en Aristóteles, el derecho (*nomos*) no actúa de forma autónoma, sino que encuentra su eficacia en la mediación con los hábitos (*hexis*) y en la contención del exceso (*hybris*), lo que revela una implicación mutua entre el orden jurídico y la subjetividad moral. Metodológicamente, se adopta una lectura filosófico-hermenéutica del Libro V, estructurada a partir de tres tríadas conceptuales: *nomos–hexis–hybris*, *areté–diké–adikia* y *dikaiosynē–dikaion–dikaioi*. Como resultado, se demuestra que la justicia aristotélica no se reduce a la legalidad formal, sino que requiere la integración del derecho, la virtud y el juicio prudencial, confiriendo a la subjetividad un papel constitutivo en la realización de la justicia. Se concluye que esta concepción ofrece una contribución relevante a la filosofía del derecho, al destacar que la legitimidad y la eficacia de las normas jurídicas dependen de su correspondencia con la formación ética de los individuos y con el *ethos* de la comunidad política.

1 INTRODUCTION

The relationship between law and subjectivity has been one of the central problems of practical philosophy since Antiquity, reappearing, under different formulations, in contemporary debates on normativity, legal legitimacy and the formation of the subject. Although the modern tradition of law has favored formalistic and institutionalist approaches, there is a growing focus on the subjective dimension of legal normativity in the human and social sciences, especially with regard to the internalization of norms, the ethical training of agents, and the social conditions for the effectiveness of law. In this context, the Aristotelian reflection on justice, developed in Book V of the *Nicomachean Ethics*, remains a fundamental theoretical reference, although often underexplored in its potentiality for the analysis of the articulation between law, ethics and subjectivity.

The problem that guides this article is to understand how, in Aristotle, legal justice is not only based on the exteriority of the norm, but presupposes previously constituted subjective dispositions, formed within the community ethos. In other words, it investigates to what extent the efficacy and legitimacy of the law depend on a continuous mediation between the legal system and the ethical formation of *psychē*. The hypothesis defended is that, in Aristotelian thought, law (*nomos*) does not operate autonomously or merely coercively, but finds its effectiveness in the articulation with habits (*hexis*) and in the containment of immeasurability (*hybris*), which reveals a mutual structural implication between legal normativity and moral subjectivity.

The literature specialized in the philosophy of law, when returning to Aristotle, tends to emphasize above all the distinction between legal justice and private justice, or even the notion of equity (*epiēikeia*) as a corrective of the law. However, the systematic analysis of the role of ethical subjectivity in the realization of justice remains relatively marginal, especially when considered from the internal categories of Book V. In this article, we seek to contribute to this debate by showing that Aristotelian justice cannot be adequately understood without taking into account the formation of character, the education of the passions and the exercise of prudential judgment. elements that link the law to social practices and to the concrete experience of political life.

Methodologically, a philosophical-hermeneutic approach is adopted, based on the analytical reading of the Greek text of the *Nicomachean Ethics* (Bekker's edition), articulated with classical and contemporary commentaries. The investigation is organized from three conceptual triads that structure the relationship between law and subjectivity in Aristotelian thought: *nomos–hexis–hybris*, which makes explicit the tension between law, habit and excess; *areté–diké–adikia*, which articulates virtue, justice and injustice in the realm of human

actions; and *dikaiosynē–dikaion–dikaios*, which allows us to understand the role of judicial institutions, the fairness of decision-making and prudential judgment. These triads are not treated as isolated categories, but as interdependent conceptual nuclei, whose unity reveals the inseparability between ethics and law.

In developing this analysis, it is argued that justice, in Aristotle, is not reduced to formal conformity with the law, but requires the integration between normativity, virtue and practical judgment, conferring on subjectivity a constitutive role in the realization of justice. Such a perspective allows for a critical rethinking of contemporary conceptions of law that dissociate legality and ethical formation, offering theoretical subsidies for current debates on legal legitimacy, civic education and institutional rationality.

The text is organized as follows: in the first section, the triad *nomos–hexis–hybris* is analyzed, highlighting the relationship between law, habit and immeasurability; in the second, the triad *aretété–diké–adikia* is examined, focusing on the articulation between virtue, justice and injustice; in the third, the triad *dikaiosynē–dikaion–dikaios* is discussed, addressing judicial institutions, the fairness of the decision and the role of the judge; Finally, the conclusion summarizes the results and points out theoretical implications for contemporary philosophy of law.

2 NOMOS-HEXIS-HYBRIS

The triad *nomos-hexis-hybris*, in the "Nicomachean Ethics", points to a circularity between law, *nomos*, the *hexis*, the habit, and the *hybris*, the impulse, which must always be considered by legal science in the creation and improvement of the law. The relationship between Law and Subjectivity occurs in the imperative of the law on excessive impulses and in the approval of good habits. Although *nomos-hexis-hybris* is a triad in Aristotelian thought, it is convenient to separate them in order to process the systematic examination.

2.1 NOMOS

□□□□s, law, is the right of the community set forth in a constitution. In the Nicomachean Ethics, the law translates the legacy of the *communitarian ethos*. The community has learned the hard way what promotes *eudaimonia*, happiness, and what destroys it. So he took this experience into code. As a result, people learn from the law what should be done and what should not be done. The first is linked to honor within the community and the second is linked to punishments. This distinguishes customary law from legal law. But the relationship between *nomos-hexis-hybris* is explosive because it is a struggle between reason and desire.

It can then be said that there is no city without justice and there is no political justice without law, that is, without a constitution. And every constitution, even the depraved one, remains a constitution if what it determines is observed. However, justice is only based on legality when the law is established not for a few, but for the good of the whole city. On the contrary, when laws are poorly formulated or made in haste, justice is not instituted, but the legalization of injustice is.

Good constitutions establish justice without reserve, because in this case they aim at the common good. In flawed constitutions, laws can only be relatively just, because they are diverted from their purpose, serving the particular interest of some (BODÉÜS, 1999, p. 71-82). But when laws create and ensure the conditions of good living, that is, when they are just according to natural justice, as proposed by Aristotle, they are actually aligned with the notion of justice shared by society. According to Aristotle, the rectitude of laws or the function of laws in the constitution should require citizens to behave in a way that has the virtuous man as a model. Good legislation is concerned, above all, with the virtue and vice of the citizen.

It must, therefore, order the laws according to the good of the city. For this reason, even today, it cannot be denied that they refer to acts of virtue such as courage, temperance, etc., which are the moral virtues. But they must also favor the flourishing of the dianoetic virtues, that is, episteme or scientific knowledge, tekne or art, phronesis or practical wisdom, nous, or intuitive reason, sophia or theoretical wisdom.

Therefore, for Aristotle, the content of legal justice has a deep correspondence with the virtue of justice. Hence the law, rightly established, is just, because it ordains in a particular way what is ordained in the moral virtues. So that if citizens act as the law prescribes, they only do what they already possess by habit. In this case, action according to the law is always just, because it requires the same acts that the virtues require.

Justice corresponds to the prescribed laws, so they show people how to behave according to the morality of the city (ARISTOTLE, 1856, V, 1130 b, 22-24), that is, the unwritten laws. At this point, Aristotle recovers the proverb of Theognis: "justice is the sum of all the virtues" (ARISTOTLE, 1856, V, 1129 b, 30). In other words, justice is the complete virtue because the law receives the notion of right and wrong that society constructs and orders social behaviors to be in accordance with its prescriptions. Since this demand is very broad, only the virtuous citizen can respond to it, that is, live to each social demand in accordance with virtue. For this reason, in an inverted way, it is said that the law is the complete virtue (ARISTOTLE, 1856, V, 1130 b, 6; 18-19 ; 23:25). Since then, virtue is not

only the architectural virtue of the soul, but is recapitulated in social and political relations. Thus, the virtue of justice favors social relations and necessarily preserves all virtues in itself.

Justice as legal justice is the "complete virtue par excellence", that is, an action exercised in the face of the other for the good of him, of the community and for the good of the agent of justice himself. Justice, then, does not consist in knowing all the virtues that the law commands, but in practicing them. In this case, he who practices justice to himself is virtuous and he who is unjust to himself is vicious; However, just or unjust is the one who performs just or unjust acts to his neighbor. Therefore, justice can be affirmed as virtue in its entirety and injustice as vice in its entirety.

It is then perceived that justice and virtue are complementary entities, although they originate from the same source: the hexis, the habit. Justice is the habitual state of character in relation to the other; virtue, on the other hand, is an inner condition that reflects character. Thus, justice and virtue are one and the same thing, but while the former aims at the other, the latter aims at interiority.

The law sets the guidelines for legal behavior and people are expected to behave in accordance with them. But the laws of the city are not enough if the inner law that comes from *Paideia*, education, is lacking, which will introduce the person to the *ethos* of the community. In this process, he learns to love and respect his tradition, but in a critical way. The result may be a person who, having internalized the *ethos* of the community, is happy to respect the laws, as long as they are fair. This perspective appears in Salgado precisely:

From the perspective of a philosophical reflection on its reality, law is an ethical totality that develops historically and phenomenologically as a full ethical realization or as the last moment of the ethical process, that is, as the realization of freedom in its subjective and objectified form, norm right and subject right, from man in the form of the Greek citizen [...] This procedural rationality is, in the same way, at the moment of objectified freedom or of the norm, as occurs in the awareness of the legality of the highest values of Western culture, of their declaration as rights and of their effectiveness (SALGADO, 2006. p. 3).

In addition to its normative function, the Aristotelian *nomos* can be understood as a formative device that acts in the constitution of the subjectivity of citizens. By prescribing behaviors and sanctioning deviations, the law not only externally regulates actions, but contributes to the internalization of shared ethical standards, operating as a mediation between community *ethos* and individual action. This understanding allows us to bring Aristotelian reflection closer to contemporary debates on the symbolic efficacy of norms and on the processes of internalization of legality, in which the formal validity of the law is insufficient when dissociated from subjective provisions capable of recognizing it as

legitimate. Thus, *nomos* reveals itself not only as a juridical instrument, but as a constitutive element of ethical and social life.

This understanding of the law as an expression of a shared ethos allows us to bring the Aristotelian conception closer to contemporary debates on the legitimacy and effectiveness of law. As Paul Ricoeur observes, justice is not reduced to formal conformity with the norm, but requires ethical and institutional mediations capable of articulating legality and mutual recognition, which replaces subjectivity at the center of legal normativity (RICOEUR, 2008). In a convergent way, Amartya Sen criticizes excessively abstract models of justice and argues that the validity of norms depends on their ability to respond to concrete contexts of life and to real experiences of injustice (SEN, 2011). This approximation reinforces the Aristotelian thesis according to which the *nomos* is only fully realized when it finds resonance in the ethical dispositions of citizens.

But how does the internalization of the *community ethos* occur ? This is what we will see next.

2.2 HEXIS

The just act can only come from a just person. In the "Nicomachean Ethics", this procedure is supported by a disposition, *ἥξις* - *hexis* -, which is constructed to the extent that the person exercises himself in just actions. *Hexis* gives man the ability to perceive what is just and to act according to this perception. Through it, one has the necessary power to act justly. It is then a question of a second power, because it derives from the process of making oneself, which is proper to the practical action of Aristotelian thought. Therefore, the one who has reached *hexis* only acts according to it. Such a man may be compared to a healthy man, for just as a healthy man would not normally walk like a sick man, so a righteous man is incapable of acting unjustly. Therefore, like health that enables a healthy man to act healthily, justice enables the righteous actions of a just man.

However, each circumstance requires just actions appropriate to it. In this case, the mere mechanical repetition of justice may not carry it out, so it must be exercised according to the circumstances. If these vary, the way of acting must also change. Thus, the Aristotelian notion of *hexis* is that it is the habitual state of character and when man is in this condition, he possesses the virtue of justice because what his society sees at that moment as just and circulates within him, is what this man has become. In this sense, righteousness is the virtue of character, because it stems from habit and practice. Therefore, it is not to be confused with the power that someone special would exercise, and it is also not to be confused with the

episteme of justice, as the Socratic tradition defends. In other words, Socrates assumed that if someone knows what is just, he will practice justice. Opposing this idea, Aristotle says:

Undoubtedly, the pure knowledge [20] of beautiful things is already a very significant choice in itself; but for virtue, the essential and most precious point is not to know its nature; it is to know how it is formed and how it is practiced. We must not only know what courage is, we must above all be courageous; neither what righteousness is, but to be just; Similarly, we want health, rather than to know what it is; and to possess [25] a good temperament, but than to know what a good and robust temperament is (ARISTOTLE, 1856 [C], I, 5, 216 a, 18).

The Aristotelian notion of *hexis*, understood as a disposition incorporated through the repetition of actions, finds resonance in contemporary sociological analyses on the formation of practical schemes of conduct. Pierre Bourdieu, in developing the concept of *habitus*, describes similar processes of internalization of normative structures that guide perceptions and practices without the need for explicit coercion (BOURDIEU, 2007). This convergence allows us to understand justice, in Aristotle, not only as conscious adherence to the norm, but as an incorporated social practice, which reinforces the formative dimension of law and its dependence on educational and cultural processes.

It is then known that it is not enough to know justice, to be fair, it is necessary to practice. For this reason, Aristotle defines the just act as "[...] those acts that tend to produce and preserve, for political society, happiness and the elements that compose it" (ARISTOTLE, 1856, V, 1129b, 15). In this sense, justice is for this man the complete virtue "because it is the current exercise of complete virtue", that is, the idea of justice that his society has achieved and preserves in its history, both on the legal and moral levels. But it is also the particular virtue, because it is the human conquest of this man in the face of his *hybris*, in other words, that instinctive force that leads man to practice folly.

The virtues are of two natures. Intellectual virtue generally derives from systematic teaching, so it demands a lifelong learning process under the aegis of an advisor. Moral virtue, in turn, derives from habit: "It is not, therefore, by nature, nor contrary to nature, that virtues are generated in us. Let it be said rather that we are adapted by nature to receive them and become perfect by habit" (ARISTOTLE, V, 1103a, 20). Aristotle reserves the concept of mediocrity for the moral virtues: "[...] virtue must have the attribute of aiming at the middle ground. I refer to moral virtue, because it is that which concerns the passions and actions, in which there is excess, lack and a middle ground" (ARISTOTLE, V, 1106b, 15).

In this case, the inevitable question arises: how to know if a man is intellectually virtuous since this is not identified by mediocrity as the moral virtues are? The answer lies in the role that reason plays in the passion and its fulfillment by the body. It is she who gives the

right measure of all virtuous actions. This is his virtue. But if it does not adequately fulfill this function, then it is a vicious reason. For this reason, Aristotle states that "it is right reason that sets the middle ground of dispositions of character." This is his virtue because in Aristotelian ethics "the virtue of a thing is relative to its proper functioning" (ARISTOTLE, V, 1139a, 15).

To be intellectually virtuous is to have the ability to continually order one's dispositions of character according to the communitarian ethos. According to Aristotle "[...] the reasoning must be true as the desire is right for the choice to be right, and the second must seek exactly what the first affirms" (ARISTOTLE, V, 1139a, 25). The efficient cause of action is choice, and the efficient cause of choice is desire and reasoning with an end in view. What helps man on the path of virtue is, in part, the set of virtues and actions that correspond to them: "[...] man's virtue will also be the disposition of character that makes him good and that makes him perform his function well" (ARISTOTLE, V, 1106a, 20). Add to this the capacity for discernment and the implementation of appropriate behaviors in the face of different situations. Therefore, although the communitarian *ethos* points to a general framework of behaviors to be expected in specific situations, it stimulates virtuous behaviors by rewarding them with honors and demonstrates its indignation with vicious behaviors, in the last instance, it is only up to man in full possession of his freedom to achieve *eupraxia*, that is, his own excellence. (ARISTOTLE, V, 1105b, 10).

Since virtue is the result of the rational orientation of passion towards a mediocrity in which lack and excess are overcome by the discovery of the point of equilibrium, its acquisition is the result of continuous exercises in just actions (ARISTOTLE, V, 1103a, 30).

Therefore, also in the virtues, man is the father of his actions as he is of his children. It is in the repetitive friction between impulses and reason that character is forged. To the extent that one is determined and disciplined and puts the passions in the way of virtue, then gradually one becomes virtuous:

We take it for granted, then, that virtue has to do with pleasures and pains; that, by the same acts from which it originates, it is both increased and, if such acts are performed in a different way, destroyed; and that the acts from which virtue arose are the same in which it is actualized (ARISTOTLE, V, 1105a, 15).

The virtuous man can fall into vice as long as he relaxes in discipline and relapses into vicious behaviors. This is because virtue is associated with practical life (ARISTOTLE, V, 1103b, 10-25).

In this case, one must act virtuously all one's life, because otherwise virtue can make a man who was once virtuous. According to Aristotle, "[...] it is in the nature of these things to be destroyed by lack and excess [...]" (ARISTOTLE, V, 1104a, 10).

Aristotle observed that most people are more listeners than active. They think that only by listening do they become virtuous people (ARISTOTLE, V, 1105b,10) so they do not pay attention to the quality of their acts and are naïve about the origin of their character. But, as one who has already conquered this existence limited to himself, the virtuous man, to the extent that he continues to exercise himself in virtue through virtuous actions in his community, moves towards the good life: happiness.

In short, virtues are "dispositions of character" that are acquired through long apprenticeship. It is through discipline and determination that a man becomes virtuous. Virtue in the moral sphere is mediocrity and in the *dianoetic* it is right judgment. Therefore, virtue stems from an act of freedom, however, it must take into account the communitarian *ethos* because it was built through a long process in which previous generations, through painful experiences, selected a range of virtues and vices to facilitate future generations access to happiness without having to discover, from my own experience, all over again. But even so, the crucial challenge of virtue remains, that is, not to err by lack or excess, but to find its just measure in each case. Therefore, the crucial task of reason is to find the median of impulse. From this equilibrium, or from its lack, virtue and vice arise, respectively.

The notion of *hexis*, understood as a disposition acquired by the repetition of actions, allows us to interpret justice not as mere intellectual adherence to the norm, but as a practice incorporated into the subjects' way of acting. This conception anticipates central problems of contemporary social theory, especially those related to the formation of practical dispositions and the daily reproduction of normativity. By emphasizing that justice depends on consolidated habits, Aristotle shifts the focus from legal coercion to ethical formation, indicating that the stability of legal institutions is directly linked to the quality of educational processes and the social practices that shape the character of citizens.

2.3 HYBRIS

ὕβρις is a Greek word that transliterates as *hybris*. It is the immeasurable impulse in which desire overcomes reason and the person, in order to satisfy it violates the laws of the city. Just as the just act proceeds from the just man, so the unjust act proceeds from the unjust man. The unjust reached this condition because by constantly acting against the law, he built up a disposition of character, which since then, makes him desire what is unjust, what violates the law of the city. He does this driven by greed and with that, he seeks his pleasure to the detriment of the collective happiness that the laws seek to safeguard. In injustice, man seeks his own good by doing evil to others. With this, he becomes improper. It is unjust and, at the same time, to the extent that its acts create the idea of injustice, the unjust, vicious act

is complete injustice. This force that leads human beings to act outside the community norm is *hybris*.

Impulses belong to the body. These, of course, aim at pleasure and avoid pain. Because they are directed exclusively to their satisfactions, impulses participate in the "appetitive principle" of the soul and can be defined as the primitive stage of desires. Consequently, they are opposed to reason, however, not altogether because they can be persuaded by it (ARISTOTLE, V, 1103a, 30). It is in the mediation of the relationship between impulse and reason that the intellectual virtues (philosophical wisdom, understanding and practical wisdom) and moral virtues (liberality, temperance, etc.) are situated.

Aristotle called impulses passions. These, in turn, are generally morally neutral, that is, they are neither vices nor virtues in themselves. They will only move to these conditions after being submitted to the sieve of personal decision within the horizon of the *communitarian ethos* (ARISTOTLE, V, 1107a, 15). They can be defined as the forces, socially recognized, that move man towards the satisfaction of a desire with a view to pleasure. In this they are distinguished from vices and virtues because: "[...] with regard to virtues and vices it is not said that we are moved, but that we have such and such a disposition" (ARISTOTLE, V, 1106a, 5).

Impulses are desiring forces aimed at pleasure, passions are socially recognized impulses. Thus, in a broader perspective, impulses and passions are synonymous. What seems to differentiate one thing from the other is that pure impulses would still be in a nameless condition, that is, they do not yet have social recognition, which is why they are generically called impulses. But when they receive a name, lasciviousness, for example, they become a passion, that is, a socially recognized impulse. When an impulse is given a name it is passion, before that it is only impulse because it has not yet been identified by the culture. Pleasures and pains are linked to passions, so man moves in the world according to the principle of pleasure. These dynamize and actualize man's actions in the world and, therefore, can condition behaviors both virtuously and viciously.

Salgado, in the three conferences given in 2012 at the Faculty of Law of the University of São Paulo, namely: Greek culture: the discovery of reason; II- Theoretical reason as a measure: science and truth; III- Practical reason: ethics and reason as a measure, affirms the logocentric tendency of Western reason. The general title of the conferences translates the clash of objectivity with subjectivity clearly: "The spirit of the West, or reason as measure". Salgado translates the dialectic of subjectivity and objectivity, as follows:

So, here appears the first important theme of society, power and, on the other hand, the perversion of power, of course. The perversion of power is arbitrariness and

violence. It is the excessive. For the Greek, it is tyranny, the loss of the freedom of a people, of its autonomy, that is, the loss of the power to make its own laws, to draw its own limits, because the power of reason, which is one *we*, is alienated in the arbitrariness of an *I*, of a single one. The *we* is the moment proper to reason, which carries within itself a whole dialectical process involving the consciousness opposed to its exterior, to the object, by the consciousness of itself, always as an opening to the object until the consummation of a *we*, which is also an "*I*" as Hegel describes in the *Phenomenology of Spirit* (SALGADO, 2012, p. 44)

In the intrigue between subjectivity and objectivity is, according to Aristotle, the desire for pleasure and the escape from pain. Consequently, there is an intricate relationship between pleasure, pain and moral life, and it is as a result of the resolutions within these instances that man approaches or distances himself from happiness. This close relationship between pleasure and pain and its implications in the moral life can be seen throughout Aristotelian ethics. Listen to Aristotle:

[...] Moral excellence is related to pleasures and pains. It is because of pleasure that we do evil deeds, and because of pain that we abstain from noble actions. That is why we should be educated in a certain way from our youth, as Plato says, in order to delight in and suffer from the things that should be the cause of delight or suffering, for this is the right education (ARISTOTLE, V, 1104b, 5, 10).

It seems that for Plato it is not only pleasures that lead to a profitable end, pains also do this. Therefore, it is necessary to distinguish between pains that are totally harmful and pains that lead to pleasures. Only an education conscious of these nuances can educate effectively because it makes the organic automatism that pleasure does not bring pain and that pain does not bring pleasure would then be overcome by education.

The Aristotelian conception of pleasure was confronted with three opinions current in his time: 1) no pleasure is a good because, among other things, the temperate man avoids pleasures; 2) most pleasures are bad because pleasures are harmful and vile; 3) even if all pleasures are good, the best thing in the world is not pleasure because "[...] this is not an end, but a process" (ARISTOTLE, V, 1152a, 10-15). For Aristotle, these premises do not deprive pleasures of the value of good because: 1) goods considered evils can be chosen or rejected; 2) there are goods that involve neither pleasure nor pain; 3) pleasure is an activity of the natural state, it is not a process (ARISTOTLE, V, 1152b-1153a). Therefore, man's action is composed of two inseparable sides. Pleasure and pain. The first is sought; the second, it is avoided. Both can be physical or mental.

Pain is a feeling of displeasure, which, depending on the intensity, will provoke reflex reactions in the body. By virtue of continuous experiences, man accumulates a preventive knowledge of what can cause him pain and, therefore, avoids it. Passion, on the contrary, is

the force that moves man to pleasure and manifests itself in multiple ways. It is in itself neither vice nor virtue. It will only be so if the limits that define something as virtuous or vicious are crossed. What helps in distinguishing between pure passions and vicious or virtuous passions is the capacity for decision. Therefore, one must distinguish between "voluntary and involuntary action." If man acts out of ignorance of the limit or coerced, we have the latter. In the voluntary one, on the other hand, the man acts consciously. In this case, he was seduced by his desire. *A priori* this is neither good nor bad (ARISTOTLE, V, 1110a, 1110b, 15).

When it comes to violent passions, Aristotle states that "[...] irrational passions are not considered less human than reason; Consequently, even the actions that proceed from anger or appetite are actions of man. It would be strange, therefore, to treat them as involuntary" (ARISTOTLE, V, 1111b). It is precisely in the realm of choice that the possibility of vice or virtue lies, because man makes himself by doing.

Pleasures are physical and/or mental sensations that promote a sense of well-being. The pains, on the contrary, of malaise. However, pleasures can be bad and pains can be good and vice versa. Aristotle understands human behavior as an integrated articulation between the psychic and the physical. Impulses or appetites propel the body towards satisfaction and it is up to reason, in harmony with the community *ethos*, to put a profitable end to impulses both on the individual and social levels. Continuous, voluntary and conscious praxis makes a man virtuous or vicious.

Vices and virtues come from the same source: impulses. So, how and when does a passion become an addiction? This occurs when the passion executed does not reach the right measure. It is clear that this evaluation does not come from the one who practices the vicious act, but from the one who evaluates it from the horizon of the *community ethos*. Thus, when someone externalizes a passion, he runs the risk of doing so below or beyond the just measure because he aimed solely and exclusively at the satisfaction of his appetites. Whoever acts in this way violates the rights of others, therefore, destabilizes the community to the extent that he attacks its symbolic universe.

In Aristotelian logic, vices are the extremes of virtue: "[...] vices either go too far or fall short of what is convenient with regard to actions and passions [...]" (ARISTOTLE, V, 1107a, 5). From this it follows that it is easier to be vicious than virtuous because vice can be achieved in different ways and at different points in the extremities of passion. Therefore, it can be deduced that being vicious is the result of decisions. Vices are acquired voluntarily and deliberately. A person is not vicious, he makes himself.

Man becomes vicious or virtuous after deliberately repeating behaviors for a long time. In this way, they automatically integrate into the character. It is perceived that "man is the

father of his actions as he is of his children" (ARISTOTLE, V, 1114a20) and, therefore, on the moral plane, the parent of himself.

However, it may be that a person does not want to be vicious, but that this occurs due to an error of judgment. Now, like the virtuous man, it seems that the end to which the vicious man has in mind when he engages in vicious acts is happiness. But he does not find it because these, at first pleasurable, become painful to the extent that they are outside the standards of virtue of the *communitarian ethos*. Hence, the importance of education so that people can discover the appropriate means to be happy and contribute to the happiness of the community. It is in this context that the value of the *community ethos* emerges. The community's standards of behavior have been sanctioned after a long process of mistakes and successes, so they are vital to the community. If violated, the entire group is at risk. Therefore, the offender must receive in himself the punishment resulting from his fault. In this context, to become virtuous is to strengthen one's own community so that everyone enjoys the good life. On the contrary, to become vicious is to deliberately place oneself at the mercy of pure pleasure and to violate the *community ethos*. This puts at risk everything that the community has achieved so far. Therefore, the pleasurable vice in the beginning is, in the end, self-destructive because if one justified it because of the right to one's freedom, one would necessarily have to extend it to others, and a community where all desires were satisfied without objective ethical criteria would lead the group to dissolution.

In the context of Aristotelian ethics, when someone chooses to be vicious, it is forever. When one exercises in vice, the impulses are markedly strengthened and dispose the character in that direction, so according to Aristotle, no reconditioning is strong enough to re-educate him:

But when, without being ignorant, a man does things that will make him unjust, he will be unjust willingly. [...] at first it depended on them not to become men of this kind, so that it is by their will that they are unjust and intemperate; and now that they have become such, it is not possible for them to be different (ARISTOTLE, V, 1114a, 20).

Therefore, deliberately indulging in vices is not proper for adults, but for children. These, depending on their age, live driven by the search for pleasure and the avoidance of pain without the mediation of reason. The child's exclusive interest is pleasure, any frustration leads to crying because he is not yet mature enough to bear the frustrations. Similarly, the vicious man is still childish because he perceives and acts exclusively for pleasure:

These characteristics (referring to intemperance) belong above all to the appetite and to the child, since in reality children live at the mercy of appetites, and in them the

desire for pleasant things has more strength. If they are not obedient and submissive to the rational principle, they will go to great extremes, for in an irrational being the desire for pleasure is insatiable, although it experiences all the sources of satisfaction. Moreover, exercise increases his innate strength, and when the appetites are strong and violent, they go so far as to exclude the faculty of reasoning (ARISTOTLE, V, 1119a, 10).

What is expected of a wise man is that he manages his passions well in order to put them at the service of community life. At this time, the passions became virtues and now guided by right judgment:

[...] the appetites must be few and moderate, and not in any way opposed to the rational principle—and this is what we call obedience and discipline. And just as the child must submit to the direction of his preceptor, so the appetitive element must be subordinated to the rational principle (ARISTOTLE, V, 1119b, 15).

The harmony between impulses and reason is the fundamental principle of virtue and the path to happiness.

Vices are the two extremes of virtue, they proceed from impulses and result from errors of judgment as to satisfaction. They are voluntary and definitive, and it is proper to a childish character. The virtues, in turn, result from the correct management of impulses, so they are the middle ground of vices and are characteristic of wise men. While vices erode the *community ethos* and can lead the community to destruction, virtues strengthen and preserve it.

Having examined the triad *nomos-hexis-hybris*, we move on to the second triad of Aristotelian thought: *arete-diké-adikia*, respectively, virtue-justice-injustice.

3 ARETÉ-DIKÉ-ADIKIA

The Aristotelian triad *arete-diké-adikia*, respectively means virtue-justice-injustice. Law and Subjectivity are linked by the nature of the just or unjust actions of people in the community.

3.1 ARETE

ἁρετή, is a Greek word that transliterates into Portuguese as *Arete* and means virtue. This can be ethical, relative to correct behavior, and *dianoetic*, relative to right judgment. The virtues are "dispositions of character" (ARISTOTLE, V, 1106a, 10) related to choice. Its proper place is mediocrity. This central point is determined by reason, and a man endowed with practical wisdom finds it more easily (ARISTOTLE, V, 1107a, 5). Mediocrity is not predetermined by any determination external to the person, because for Aristotle it is man

who will choose, on each occasion, this appropriate place of virtue. Therefore, "the mediocrity is relative to us." From this it follows that "with regard to its substance and the definition that establishes its essence, virtue is a mediocrity; with reference to the supreme good and the just, it is, however, an extreme" (ARISTOTLE, V, 1107a, 5). Virtue is a disposition of character that is related to "[...] that makes him good and that makes him perform his function well" (ARISTOTLE, V, 1106a, 20).

Mediocrity is the excellence of virtue. It results from the overall action of the organism: the passions are guided by right reason. This means not excessively limiting your strength or giving you too much space. Desire is responsible for desiring, the body is responsible for feeling, reason is responsible for guiding. The interpretation of the reason of the desires of the body and of the *communal ethos* must take into account that every passion has the appropriate time, place and circumstances. These variables, when considered, are the fundamental conditions for practicing a virtuous action.

The understanding of virtue as median guided by practical reason allows us to articulate Aristotelian ethics with contemporary reflections on social normativity and the formation of subjectivity. Axel Honneth points out that the ethical dispositions of the subjects constitute contexts of intersubjective recognition, in which values and social expectations shape the self-understanding of individuals (HONNETH, 2009). From this perspective, *the Aristotelian areté* can be interpreted as a form of embodied ethics, whose realization depends on social practices that promote the recognition and integration of the subject into community life.

The object is the other aspect to be considered. It must be appropriate to that passion. If there are other people involved, the passions must be focused on the right people. That said, one must consider the convenience of the motives that are presiding over the action and whether the mode of satisfaction of desire is appropriate (ARISTOTLE, V, 1106b,20). Therefore, ultimately, the *community ethos* is the parameter of just actions. These are guided by the just rule. Aristotle, realizing the unstable nature of actions, stated that it is people who must decide on a case-by-case basis the most appropriate action in each situation:

As with health, questions of conduct and what is good for us have no fixity [...] people themselves must consider, in each case, what is most appropriate to the occasion, as is also the case in the art of navigation and medicine (ARISTOTLE, V, 1104a, 5).

The rational administration of desire leads to a virtuous act and, later, to a virtue (ARISTOTLE, V, 1119b, 20). The challenge of the moral act is to situate itself in the mediocrity of the action (ARISTOTLE, V, 1106b, 25). Excess and deficiency are the great adversaries of

just action. Consequently, the chances of making a mistake are greater than of getting the median of a stock right. For this very reason, lack and excess characterize vices and mediocrity, virtues. Aristotle states that one does not arrive at the median in a single action. But one makes mistakes today in order to get it right tomorrow: "It is quite clear, then, that in all things the middle ground is worthy of praise, but that sometimes we must incline to excess and sometimes to deficiency. Indeed, this is the easiest way to reach the middle ground and what is right" (ARISTOTLE, V, 1109b, 20).

Eupraxia is a lifelong task (ARISTOTLE, V, 1105b) and is more related to the other than to oneself. Therefore, "the best of men"[...] it is not the one who exercises his virtue towards himself, but towards the other. For what a difficult task this is" (ARISTOTLE, V, 1130a, 5). Men have all these things in common, and it is in the way they manage these inner forces that they will be more or less human. This is a complex and demanding task. Thus, according to Aristotle, one must have a certain natural inclination to virtue: "it is, therefore, an indispensable precondition for the existence of a character that has a certain affinity with virtue, loving what is noble and detesting what is vile" (ARISTOTLE, V, 1179b, 30; 1106 a, 30).

By understanding virtue as median guided by practical reason, Aristotle provides an ethical criterion that goes beyond normative rigidity and adapts to the complexity of concrete situations. This conception is particularly relevant for contemporary legal reflection, as it problematizes excessively abstract normative models and highlights the need to consider contexts, circumstances, and social relations in the evaluation of justice. Virtue, in this sense, is not only an individual quality, but a relational principle that manifests itself in political coexistence and in the search for balance between different interests.

3.2 DIKÉ

When one turns to the context of the "Nicomachean Ethics", one realizes that justice in Athens has a prominent religious force. Aristotle values it, however, he takes it only as a starting point since, on the philosophical level, he vetoes the extra-human interpretation of justice associated with the goddesses Θέμις - Themis - and Δίκη - Diké - (SAINT-ARNAUD, 1984, p. 158). He chooses to examine it in the actions of the people and in the adequacy of these actions with the law of □□□□□□ - *polis* -. Therefore, it cannot be denied that the understanding of justice in Book V, of the "Nicomachean Ethics", requires that one understand the notion of justice that prevails until then. Without this, one can even recognize Aristotle's originality, but one will have lost the opportunity to identify the other face of justice, the divine one with which he struggles.

According to Greek mythology, the goddess Themis, daughter of Uranus and Gaia, is the goddess of Justice, Law and Equity. In legal iconography, she is represented with a scale, a sword, and usually with a blindfold over her eyes. The scales serve to "weigh" the balance of the cosmos; the sword, the power to punish those who are out of their place and the blindfold over the eyes symbolizes the impartiality of the decision (GRIMAL, 1997, p. 435). However, Themis represents transcendent justice, that is, that which does not pass through judicial mediation. In the classical Western tradition, this points to the religious origin of justice. It means that, according to the myth, Themis punishes those who introduce disorder into the order of the world, that is, they place themselves in a place that is not their own. This is one of the possible interpretations of the famous phrase "know thyself", placed at the entrance to the Temple of Delphi. It follows that ὕβρις - *hybris* -, immeasurability, is the origin of chaos and of various forms of *adikia*, of injustice (FISCHER, 1992).

For this reason, the myth of Themis helps to understand that the first function of justice is to prevent the excesses of *hybris*, because man only escapes from them by remaining in his own place. If one is seized by some uncontrollable impulse and violates the law of the city, justice is simple and straightforward because it aims only at the restoration of the order of the world. Themis does not take into account the guilty's motives or his repentance. Therefore, it gives the legitimacy of justice, that is, it justifies the punishment imposed on the offender by the Erineas, the goddesses of vengeance (LÉVÊQUE; FESTUGIÈRE, 2011).

In the evolution of Greek justice, it is a moment prior to legal justice, because it is not possible to speak, until then, of the juridical sense of justice. But it is legitimate because it stems from the will of Themis. Therefore, justice often has no human mediator. It is "fate" itself that is responsible for punishing the guilty in answer to the prayer of the wronged:

I invoke Themis, the chaste daughter of Uranus, born of illustrious parents, Gaia's Generation, a virgin with beautiful eyes, who, first, reveals to men the sacred prophecies and oracles of the Gods in the Delphian temple and who also reigns over Pythius and the Pythians, and who gave King *Phoibos* the power to deliver oracles. O Illustrious, honored of all, who wanders in the night, you first taught men the sacred ceremonies and the nocturnal feasts of *Bakklos*. It is from you that they see the mysteries of the Blessed and the honors given to them. Come, O Blessed One, and be propitious, O Virgin, to those who are initiated into your mysteries (CALLIES, 2006).

The myth of Themis gradually gives way to the goddess Diké, whose mission is to watch over the actions of men, punishing or rewarding them. In this way, the justice of the city that is legitimized in the goddess Themis, achieves legality with Diké. Now the divine is closer to the human. Law is embodied in judicial institutions.

In the case of Athens' democratic justice, it can be said that positive law and natural law form a unity in which divine law has primacy. Therefore, tension, instead of bothering the jurist, is the ingredient that stimulates and qualifies his ability to judge. Hence follows the equity of justice. An equitable justice takes into account the particularity of individuals and contexts. It is not the strict application of the letter of the law, because it aims at legitimacy, in addition to strict legality (LALANDE, 1999, 605-606).

Δίκη, Diké, is the daughter of Zeus and Themis (HESIOD, 2007, 900-901), also known as *Astreia*, the goddess of the stars, and as *Dikaiosyne*, the spirit of justice. In Greek mythology, Diké is the goddess of Justice. However, unlike her mother, Themis, who watches over the cosmos, is more interested in men's issues. So he goes down to be with them. Diké opposes *Adikia*, that is, the spirit of injustice and wrong actions (SMITH, 2005, p. 1002).

According to the myth, the goddess approaches the throne of Zeus with lamentations when a judge violates justice (HESIOD, 2007, 239). The goddess strives to settle the differences and conflicts between men by indicating to them the means of conciliation. Therefore, it becomes the symbol of justice. However, not the cosmic justice of Themis, but that carried out by the judge, who is the one who humanizes the city by applying justice. Diké, according to Hesiod (1996), appears in the world of men as the principle that should guide the social order. This is also the position of Évelyne Scheid-Tissinier: "the diké is consequently presented as the element that ensures the management of the mechanisms that regulate human relations, as opposed to themis, this law imposed from above and that imposes respect" (2008).

Therefore, in the myth of Diké, the divine and the human make up a unity. The myth helps to see the process of change in Greek society. As society becomes more complex, the goddess of Justice descends. From there, one can speak of the immanence of justice, but preserving the link with transcendent justice. For this reason, legal iconography represents Diké without a blindfold. The open eyes symbolize the need to look beyond the immediate evidence of the facts and the scale is the sign of isonomy (FERRAZ JÚNIOR, 2003, p. 32-33). These two aspects of justice seem to indicate that Diké is at the same time a general justice that encompasses all the virtues, expressing itself as *δικαιοσύνης* - *dikaiosine* - and is also the archetype of particular justice.

From the sixth century B.C. onwards, the Greeks will strive for a justice that, while preserving its divine matrix, will gain more and more participation of human intelligence to enforce itself. The word diké means custom, use. The goddess Diké is the embodiment of this concept. It is known that "custom" and "usage" recapitulate the positive experiences of the community in view of the common good. Diké is the personification of the values of the

polis, which is why she is recognized as the goddess of justice "from below", of the city, in continuity with the justice "from above", of Themis. Diké takes care of the justice of men that is concretized in the laws and trials that take place in the city of Athens (CALLIES, 2011).

It is known today that customs are changing as a result of the anthropological character of their origin. But in the mythical period, customs are considered gifts from the gods. To violate them is to go against the will of Themis and Diké. Legitimate justice, which according to the myth comes from above, finds its counterpoint in the legality of justice received in the laws of the city. Diké inspires legal, positive, state justice. She is a companion of the righteous and opposes the unjust. It is to her, as the guarantor of isonomy in the courts of Athens, that the wronged will first appeal:

I invoke the beautiful Diké who sees the multitude of things and who sits on the throne of King Zeus, following from the heights of Heaven the life of men in various races, punishing iniquity and eliminating everything that is different from the truth. It judges the wicked actions that iniquity inspires in men, when they want to carry out unjust projects. She is the enemy of the wicked, but she is the friend of the good. O Goddess, welcome our invocations, until the fateful end of our life (CALLIES, 2006).

In the light of Themis and Diké, the peace of the city comes from equitable decisions in the face of the difficult balance between the just and the unjust. From the human point of view, it is always an option for virtue, which is perpetually threatened by *hybris*, like a kind of shadow that lurks in all noble actions.

3.3 ADIKIA

ΑΔΙΚΙΑ is a Greek word meaning injustice. To deepen the paronymy (ANDRADE, 2009, p. 59) between justice and injustice, Aristotle observes that one can speak of a general and particular injustice. General injustice is composed of illegitimate and improper. Illegitimate is that which is outside the law. However, Aristotle points out that not everything that is outside the law is unjust, although it is illegitimate. On the other hand, the improbable is the one who breaks the law and promotes inequality. Therefore, every improbable person is unjust and iniquitous at the same time (ARISTOTLE, 1856, V, 3, 1131 a, 10). This Aristotle calls private injustice. For this conceptualization to be accurate, it is necessary that the law reflects the communitarian ethos (ARISTOTLE, 1856, V, 2.1130 b, 20), because if it were the law of a tyrant, it would already escape the theory. As Cournarie says, "an action in accordance with the law is only just if the law is just or more precisely if it is admitted that the law has, by itself, the power to make justice happen" (COURNARIE, 2007, p. 13). Thus, it is not the law that is the measure of justice, but justice that is the measure of the law, that is, no

longer any natural, universal and abstract right, but the law in its rectitude as a law, according to its function and purpose, which is the realization of the common good.

The appreciation of justice, says Aristotle, passes through the consideration of injustice:

But be that as it may, the object of our investigation is that justice which constitutes a part of virtue; for we hold that such a kind of justice exists. And analogously, it is with injustice in the particular sense that we are concerned (ARISTOTLE, 1856, V, 2, 1130a, 15).

In addition to natural justice, legal justice corresponds to the objective law of the city. This, according to Aristotle, means that:

In the dispositions which they make on all matters, laws have in view the common advantage, whether of all, or of the best, or of those who hold power, or something of that kind; so that, in a certain sense, we call justice those acts that tend to produce and preserve for political society, happiness and the elements that compose it (ARISTOTLE, 1856, V, 1, 1129b, 15).

This established law generates the subjective rights, that is, those that citizens can claim in the city's legal institutions by reason of the law. In this way, a citizen does justice to himself or to others when he corrects, by force of law, the injustice suffered. To do so, he will have to provoke the city's judicial institutions. It can be said that this is the common sense perception of what justice is. It is therefore a question of univocal understanding. In that case, the one who acts according to the law will be just and the one who violates it will be unjust. *It seems important to evoke Thomas Aquinas in the "Summa Theologica" here. Aquinas says that justice aims at the common good (2008, q. 58, art. 5). It can be said then that justice is a civil virtue par excellence and, therefore, total and legal.*

4 DIKAIOSINE-DIKAION-DIKAIOS

The dikaiosine-dikaion-dikaios *triad*, respectively, justice in judicial institutions, the justice of judicial decision, and justice of judges. Law and Subjectivity are linked by judicial institutions and the decisions of the just.

4.1 DIKAIOSINE

Dikaiosine, means justice linked to judicial institutions. Judicial institutions are expected to comply with the law, but also to do what is just. The trial of Sócrates is an emblematic case when one thinks about the justice of the judiciary. The trial of Socrates is a

select example of a conflict between the legal and the legitimate. In the "*Απολογία Σωκράτους*" (PLATON, 1903), one can see the encounter between mythical reason, represented by Meletus, Antius and Lesson and by the 280 judges who condemned it (Plato, 1987, p. 9 and 53), and philosophical reason, represented by Socrates.

A brief resumption of the clash helps to understand the influence of the mythical-religious tradition on the legal institutions of Athens and how natural law influences the laws of Athenian democracy and the conscience of the population. Athenian democratic institutions are both the places where Dike is remembered as a benchmark of justice and where Athenian citizens make laws by articulating the many interests at stake.

In 399 B.C., Meletus, Antitus, and Lecture accuse Socrates of impiety, that is, of not believing in the gods of the city of Athens: "Socrates is a dangerous man, who, out of a criminal curiosity, wants to unravel what is happening in heaven and under earth, makes impiety a good cause, and teaches others these pernicious secrets" (PLATON, 1903, 19b-19c) and "[...] corrupt the youth, not recognize the religion of the State and put demonic extravagances in place" (PLATON, 1903, 24b-24c).

The first accusation states that Socrates is an atheist and the second, that he misleads the youth. Socrates' accusers attribute his atheism to his disregard for the gods of the city in general. Meletus says: "by Zeus, lord judges, he does not believe, for he affirms that the sun is stone and the moon is earth" (PLATON, 1903, 26d). This puts Socrates before the judgment of Themis and Diké. The second accusation is against his philosophical method, irony and maieutics, which Socrates' disciples apply in everyday debates. This is seen as a perversion of youth. The third charge attacks the result of Socrates' work, which is to strengthen weaker minds. Maieutics helps non-citizens of Athens, insofar as it allows them to make the catharsis of their limitation. This leads to the destabilization of the *status quo*, because a slave can perceive himself as capable as an Athenian citizen (PLATON, 1849).

In his defense, Socrates claims not to be an atheist, but deeply connected to the *daimon* who has guided him since he was a child. In addition, his method promotes justice, because it helps people to discover their limits and potential. If Socrates owes anything, it is this: to have human science as his mission, that is, to understand the human being. This task only began because Socrates wanted to show Cherophon that the Pythia of the Temple of Delphi was wrong when she told him that Socrates was the wisest man in the world. Now, how could he be if the only certainty he has is that he knows nothing? But it seems that this is the secret of the prophecy of the Pythoness: the wise man is sure that he knows nothing, that is, every situation is a place of new learning. Socrates was convicted by thirty votes. This means that of the 501 judges, 221 acquitted him of the charges (Plato, 1987, p. 9 and 53).

In this context, Socrates could choose bail or exile as an alternative to the death penalty, but following the inspiration of the *daimon*, the good genius, he embarrasses the judges when he asks that, if acquitted, he be fed in the Prytaneum as long as he lives. The Prytaneus, home of the Pritanes, judges of Athens, is where the sacred flame to Hestia, the goddess of the family, was located. Socrates places judges before an *aporia*: the death penalty or honor for life. The judges opt for the former.

4.2 DIKAION

The Greek term δικαίον, *dikaion*, translates as decision of the just. Aristotle does not discard this understanding of justice whose nature is homonymy, that is, the univocal character that common sense gives to the terms justice and injustice. In fact, he takes it as a starting point for a more accurate understanding of justice. Consequently, the Aristotelian perception of justice marks a distancing from how common sense perceives it and gives Western reason a paradigm, still much considered today in the Philosophy of Law.

For Aristotle, the greedy is the counterpoint of the *dikaios*, of the just. Contrasting them, Aristotle realizes that while the greedy is immersed in his own injustice - *adikias* -, the just man strives for justice (ARISTOTLE, 1856, V, 2, 1130 a, 30). When the philosopher's attention is focused on the greedy man, he realizes that the particular injustice of the latter is linked to a general injustice, which is that which is contrary to the law (Aristotle, V, 2.1130a, 20) and which the historical experience of the community has discarded as harmful to it. But there is one aspect common to general and particular injustice. It is about inequality in the relationship with others.

This first approach gives Aristotle the clues that if there are two kinds of injustice, it seems possible to say the same with regard to justice (ARISTOTLE, V, 2, 1130b, 5). It is a question of general or legal justice and particular justice. They are related to virtue. Aristotle stresses, in the first place, the homonymy of both the word justice and injustice. In this way, he goes beyond the sense of justice that common sense has built and will reveal that of equivocity.

Common sense considers unjust the one who violates the law and the one who takes more than is due to him. In contrast, Aristotle understands that the just man - *dikaios* - sticks to the legal and the equal. For this reason, Aristotle applies the notion of equivocity from the word injustice to the notion of justice: "the just, therefore, is that which conforms to the law and that which respects equality; and the unjust is that which is contrary to the law and lacks equality" (ARISTOTLE, 1856, V, 3, 1131b, 15). The analogy allows us to affirm that equality

is the just means of just and unjust action. Consequently, it is exactly at this point that justice is also present (ARISTOTLE, 1856, V, 3, 1129 a, 30; 1131 a, 10-15).

Therefore, it is not only the act according to the law, but the act according to the law that promotes justice, that is, the equality of rights of citizens. *As Saint-Arnaud states: "Aristotle is the first thinker to distinguish in a systematic way legality and equality as the foundations of justice [...]" (1984, p. 161).* This definition based on the paronymic method, that is, that the 'opposites' clarify each other, e.g., the unequal helps to understand the equal, allows Aristotle to define justice not only in terms of the legal, but also in terms of the equal. To account for this last category, *Aristotle constructs the notion of particular justice and divides it into distributive justice and corrective justice (ARISTOTLE, 1856, V, 2, 1130 b, 30).*

In Aristotle, particular justice is based on the notion of equality. According to Gauthier and Jolif, the entire Book V of the "Nicomachean Ethics" is based on the distinction between two senses of the word dikaion that can mean what is legal and what is equal (GAUTHIER, JOLIF, 1970, p. 323). After defining the just relative to the laws, what is admitted and conveyed by tradition, Aristotle needs to 'demonstrate' how the just coincides with the legal. To this end, to the method of dispelling equivocations, e.g., the homonymic occurrence of *dikaion*, he adds the paronymic method by which the just reveals himself through the notion of unjust and vice versa. Aristotle's analysis of *dikaion* allowed him to distinguish two sets of 'opposites', legal-illegal and equal-unequal, for the definition of just. After having defined the legal just by the illegal, he retains the unequal for the definition of particular justice. This will allow him, through the game of opposites, to apprehend the equal and, thus, the just. Thus, he tries to define the equal as the just measure between the unequal and the just as being at the center of the extremes represented by the unjust:

Since the unjust does not respect equality and injustice is confused with inequality, it is evident that there is a fair means when it comes to inequality. This just means is equality. In actions where there is more and less, there is room for a just measure. Therefore, if the unjust is the unequal, the just is the equal. But in every action where there is more and less, there must also be a possible equality; and, consequently, if that which escapes equality is called unjust, that which is in conformity with it is just, as everyone judges without much difficulty; and since it is in the environment that equality is established, it will be there that justice will be achieved. Now, equality can only exist between at least two terms. Therefore, the just must necessarily be the means, an equality in relation to things and people, because if there is no equality between them, they should not have equal things (ARISTOTLE, 1856, V, 3, 1131a, 10-15).

4.3 DIKAIOS

Aristotelian reflection on equity introduces a decisive element for understanding the role of subjectivity in judicial institutions. Recognizing that the strict application of the law can produce injustices in particular cases, Aristotle assigns to the judge the task of interpreting the norm in the light of the concrete case, mobilizing prudence (*phronesis*) as a decision-making virtue. This conception anticipates contemporary debates on judicial discretion, practical rationality and legitimacy of decisions, indicating that institutional justice depends not only on well-formulated norms, but on the ethical and intellectual training of those who apply them.

Dikaïos translates into fair decisions. Equity is a corrective of the just according to the law. In this sense, it does not proceed from the law, but from the prudence of the judge. This need arises from the nature of the legal phenomenon, which is the difficult task of adapting the general rule to the specificities of particular cases. For greater conceptual precision, we turn to Aristotle:

The difficulty is that equity, though just, is not just according to the law, but a corrective of legal justice ([ἐπανόρθωμα νομίμου δικαίου](#)). The reason for this is that the law is always something general ([καθόλου](#)), and there are situations in which this mode cannot be applied. Therefore, in matters where it is necessarily necessary to speak in a general way, and where it is impossible to do so correctly, the law takes into account only the most frequent cases ([τὸ ὡς ἐπὶ τὸ πλεόν](#)), but without ignoring the errors which this may cause. In this connection the law is no less right ([ὀρθός](#)), because the fault is not in the law, nor in the lawgiver ([νομοθέτη](#)), but has the nature of juridical phenomena, because such is the nature of practical things. Consequently, when the law speaks in a general way, and then a case arises outside the general rule, then it is right ([ὀρθῶς](#)), where the legislator cannot foresee the case, and has failed by oversimplification, to correct the omission, and to interpret what the legislator himself would have said, if he had been present at the time, and what he would have put into the law if he had known the case in question (ARISTOTLE, 1856, V, 10, 1137 b, 11-23).

Even if the quotation already brings a reasonable notion of what *ἐπιείκεια* - equity - is, that it is the "corrective of legal justice" and that it derives from the general character of the law and the dynamics of society, it is necessary to discover its nature in Aristotelian thought: is it *contra legem* or is it *praeter legem*? In other words: is it against the law or does it fill in the obscurities, the *non liquet* of the law? Or is it actually an attenuation of the harshness of the law as Cicero stated in his famous brocade: "*summum ius summa iniuria*": supreme right, maximum injury? (1843, I, 10, 33).

It seems that Aristotle leans more towards the dialectic of the norm with the concrete situation and that, obviously, neither the Caesarism of the law and, above all, the reductionism

to the concrete situation are adequate to his position. With John Hobuss (2010), it can be stated that the reductionism of equity to the imperialism of concrete situations in the face of the law, as argued by David Wiggins (1997, 2004) and Jacques Brunschwig (1996, p. 115-155), does not do justice to Aristotle. What is more appropriate to his thought in the "Nicomachean Ethics" is that the law, by its generality, regulates the general aspects of social relations and that it will be in the face of the particular situation that the judge, taking into account the law and the singularities of each case, will decide in this or that way.

Moutsopoulos states that if the meaning of virtue is attributed to *epieikeia*, then it means "in the place of", that is, to put oneself in the place of the one who judges oneself in order to better understand it (1998, p. 195-198). This conclusion follows from the suffix *eikôn* that indicates the alternation between the true object and its image, that is, an exchange of roles. Thus, far from designating a weakness of the judge, *epieikeia* is the ability to adapt to circumstances and enables the judge to decide in a spirit of justice (BEES, 1995, p. 117-126).

According to the logic of *epieikeia*, one can speak of the precedence of the concrete case in relation to the law, but not of its disregard due to the concrete case. It is well known the resistance that the positivistic current of law has in relation to equity, since for it, the impartiality of the law must prevail in any circumstance. But, it seems to be well understood, the *Aristotelian ἐπιείκεια* is not against the law (ARISTOTLE, 1874, III, 11, 1281 b, 3-8), but its complement, because the law is naturally broad precisely to encompass the largest possible number of situations. To support the argument, Tordesillas is used:

In short, while a justice that is too formal leads to legislation without judges, a justice that is too concrete that, in the name of equity, gives full power to the judge's deliberation, leads only to a type of justice without legislation, so that a power of decision without limits is as dangerous as a justice that is absolutely regulated and excludes any decision of the judge (2004, p. 73).

For Aristotle, even if legal justice integrates and implies all the possible ethical virtues that belong to natural justice, legal justice does not have the full meaning of justice, either because natural justice surpasses it or also because society is dynamic. For this reason, being just does not consist exclusively in respecting the law, but above all, in the face of the law, in evoking the ethical-political character of justice which, beyond the legal just, turns to the just according to equality. It is about the justice that can be applied in the city (GAUTHIER; JOLIF, 1959, p. 385-386) on the natural and legal planes (MICHON, 2011, p. 9).

Equity finds its place in the dialectic of natural justice with legal justice. This is necessary, because even if one has an adequate legal apparatus, it does not work apart from legal intelligence. Through the interaction of the social and the law, justice or injustice occurs

in the city. *Epieikeia* does not allow justice to be mechanized, that is, a pure and simple application of the legal norm. The *epieikeia* recovers and maintains the just, the legal and the equal in the city and, at the same time, stands up against the unjust, the illegal and the unequal, which can occur in the reductionist application of the law (COULOUBARITSIS, In: ELST, 1985, p. 79-101).

It can be said that there is no justice where there is no political justice and there is no political justice where the authority of the law does not reign, however, the former precedes it and confers on it the possibility of existence. Therefore, the law is not justice in its entirety. The law must govern, however, this does not sacralize it because it is the just who founds the law and not the other way around (PERELMAN, 1972, p. 9-80).

To broaden the understanding of *epieikeia*, we turn to Aristotle: "we will now speak of equity and equity, and we will determine the relations that exist between equity and justice on the one hand, equitable and just, on the other" (ARISTOTLE, 1856, V, 10, 1137a, 31). If equity is the "corrective of legal justice," it does not proceed from within Athenian legislation. So, what legitimacy does it have to correct it, since it is foreign to it? Moreover, this casts suspicion on legal justice: is the law really just and good since it lacks equitable intervention in complex practical circumstances?

Aristotle's answer lies both inside and outside of legal justice. In the first case, the intention of the legislator at the time of the promulgation of the law is sought; in the second, it is supported by natural justice. Hence it may be said that equity and legal justice are not exactly the same thing, but belong to the same genus, since they both proceed from society's consciousness of justice. However, to the extent that legal justice can only appear in the law in a broad way to encompass as many cases as possible, equity updates legal justice in the face of the current demands of the city.

Therefore equity is not foreign to legal justice, because just as legal justice is posited by the human *logos*, equity also proceeds from human reason. The difference is that while the law is fixed, equity is the legal intelligence in continuous becoming, articulating the law and the complex requirements of the particular situation (BOUDOURIS, 1989. p. 129-137). For this reason, Aristotle says that the law is good, but the equitable is better (ARISTOTLE, 1856, V, 10, 1137 a, 33). However, this raises a second question: if the metaphysics of law is the just and that of equity is the equitable, can it be said that the just that the law provides is different from that which equity accomplishes?

In fact, for Aristotle, the legal just and the equitable have the same nature, but they differ in intensity, that is, the equitable of equity is superior to the just of the law: "thus, just and equitable are one thing and the same thing, both are good, even if the equitable is

superior" (ARISTOTLE, 1856, V, 10, 1137b, 10). For greater conceptual lucidity, Michon is evoked: "equity is not defined as indulgence, it is not outside the sphere of law, it is, on the contrary, the source of law, and of a higher right, because it is inscribed in nature" (2011, p. 8).

The centrality of equity in Aristotelian reflection anticipates fundamental problems of contemporary legal theory related to judicial decision and the application of the norm. Chaïm Perelman points out that legal rationality cannot be reduced to a deductive formalism, requiring judgments of reasonableness and weighting in the face of concrete circumstances (PERELMAN, 2005). In a convergent way, Neil MacCormick argues that the legitimacy of legal decisions depends on the articulation between rules, principles and practical arguments, which brings *Aristotelian phronesis* closer to modern judicial rationality (MACCORMICK, 2005). Ronald Dworkin, by emphasizing the integrity of the law, also recognizes the interpretative role of the judge in the construction of justice, beyond the mechanical application of the law (DWORKIN, 2007).

If one resorts to "Rhetoric" to seek the traits of equitable legal intelligence, that is, just according to law and equity, it will be seen that it is his own to appreciate the circumstances, he will want to know whether the action was voluntary or involuntary; he will inquire about the intention of the legislator in writing the law, he will want to know all the circumstances involved in the matter, he will be interested not in what the defendant is at that moment, but in what he was for most of his life (ARISTOTLE, 1856 [B], I, 13, 16-18), he will be attentive to the intentional and unintentional lacuna of the law. At that time, the judge will not legislate because he does not have this right, but will strive to solve the situation within the possibilities of the legal and customary tradition of the city. On the other hand, if the law is applied without taking into account these elements, it may be that the law, which was supposed to do what is just, ends up making injustice official. However, the force of the law should not be forgotten, because Aristotle advises: "one must go to arbitration before justice, because the mediator considers the equitable side of things, while the judge only considers the law, and the mediator was instituted to enforce the point of view of equity" (ARISTOTLE, 1856 [B], I, 13, 19, our translation).

It seems that justice is done to Aristotle by stating that he seeks a legal status for equity. In this case, justice would be reconciled with the legal just, not as the equal, but as its cooperator in those cases where the legal just could lead to injustice and to make the citizen unhappy in a way, at times, irretrievable. It is only in this sense that equity is superior to legal justice, because in legal operation, they cooperate in favor of justice. As Michon reminds us, "equity is just an alternative but legal form" (2011, p. 12). It is, then, corrective equity, *praeter*

legem. An effort by the judiciary in the search for justice, because "something is not just because it is law, but it must be law because it is just" (MONTESQUIEU, 1949, 1906). Thus, what is equitable precedes the legal just and helps the law when it risks slipping into injustice in its application, which would be the concern only with the legal, without considering justice. Aristotle is used to affirm the supremacy of what is equitable over what is exclusively legal:

That is why there is a justice that is preferable to rigorous justice when it comes to the particular case; not an absolute justice, but only to the just where the error related to the absolute character of the rule can be found, and this is precisely the nature of equity: it is the corrective of the law, in the place where the law has failed by reason of its generality. Really, the reason why everything is not defined by the law is that there are cases in which it is impossible for it to be applied. In this case, a decision appropriate to the nature of the case is required. Like the lead ruler that lesbians use in their constructions and that adapts to the shape of the stone, they do not retain an invariable direction. In the same way, particular decisions must be accommodated to the cases that arise (ARISTOTLE, 1856, V, 14, 1137 b, § 27-35).

Aristotle reaffirms here the necessity of equity by reason of the generality of the law. If the law is designed by the legislator to encompass a multiplicity of cases, it is natural then that, when it is linked to any legal fact, it receives the interpretation that is entitled to it. For the Stagirita, this is the place of equity in law. Therefore, equity does not detract from the law, but vitalizes it. It is known, however, that the judge is not responsible for legislating. This is the function of the legislator. Therefore, when the judge exercises equity, he does not legislate, but seeks the best way to be faithful to the spirit of the legislator. Portalis agrees with this, when in the preamble of the French Civil Code of 1804, he says:

There is a science for legislators and another for magistrates; and one is quite distinct from the other. The science of the legislator consists in finding, in each matter, the principles most favorable to the common good; the magistrate's science is to put these principles into action, to branch them out, to extend them, by a wise application [...] when the letter kills, and no longer exposes oneself to be alternately slave and rebellious, and to disobey by the spirit of servitude (2011, p. 23).

Therefore, it should not be forgotten that "the law must govern, but it is the just who founds the law" (COURNARIE, 2007, p. 36). *In the same vein, one can evoke Aubenque (1980), Harkis (2004), and Romilly (1971). It is claimed, however, that unlimited equity would destroy legal certainty, because it could put legislation on a secondary plane, to the extent that the judge had unbridled decision-making power (PERELMAN, 1972, p. 9-80). An excessively formal justice that excludes any decision of the judge, and which in theory would work without him, is as inadequate as an excessively concrete justice that, in the name of equity, could lead to a justice without legislation.*

Therefore, justice is neither in the excess of equity nor in the rigidity of the application of the law. If one fails by excess, the other, by lack. It can be said, then, that the median is the appropriate place for the practice of *epieikeia*. For this reason, with Cournarie (2007, p. 43), it is stated that laws order social life for the common good and justice, but left to themselves they cannot fully accomplish these things. For this reason, "they have recourse to a higher form of justice that is also their primary source. It is legal justice, that is, the law in view of the just, that recommends its overcoming in equity" (COURNARIE, 2007, p. 43). Therefore, it is up to the operator of the law to promote the legal and equitable that is superior to him. Listen to Aristotle:

It is seen, therefore, what the equitable and the just are, and what kind of just is preferable; and in this way one can also perceive what an equitable man is: he is one who, in his decisions and actions, knows how to depart from strict justice when it presents inconveniences, and who, always relying on the law, knows how to soften rigor. This habit or disposition of the spirit is precisely equity: it is a type of justice, or a habit that does not really differ from justice (ARISTOTLE, 1856, V, 10, 1137 b, 34; 1138 a, 5).

Equity is directly related to prudence, because prudence is the ability of the legal operator to raise the central variables of a legal fact in its relationship with legal justice and equitable fairness and only decide after the legal and social implications of the case are clear and help in decision-making (AUBENQUE, 1980, p. 147-157). This complex operation enables the emergence of refined legal rationality proper to the construction of justice.

The Aristotelian analysis of equity in relation to prudence is threefold and can be made from three key words: *sunesis*, *gnômê* and *eubulia*. They can be understood as critical instances that belong to the equanimous and *phony* intelligence. The first confers on intelligence understanding, sagacity, and cunning, that is, the ability to know something beyond its appearances. The second gives him a critical understanding of the situation, while the third gives him the ability to foresee causes and consequences and, therefore, is able to advise.

In this line, one can refer to Velley: "prudence is '*nomothetic*' or '*dikastique*' – legislative or judicial; that is why the Romans will speak of jurisprudence" (1968, p. 54). The *phronimo* will be the one who has the wisdom to decide practical things. We refer to Aristotle: "prudence is a disposition [*hexis*], accompanied by right intelligence [*ortho logos*], capable of acting in the sphere of what is good or bad for the human being" (ARISTOTLE, 1856, VI, 5, 1140 b, 20). If an example of a *phronym* is requested, Aristotle points to Pericles (ARISTOTLE, 1856, VI, 5, 1140 b, 7), elected by the Athenian people, the executive commander of Athens for thirty consecutive years, from 459 to 429 BC.

Φρόνησις -*phronesis*-, that is, prudence, is therefore the virtue of the soul's faculty of discernment in the sphere of the contingent and not in the sphere of the necessary or the universal. For this reason, it is a practical virtue as opposed to *poiesis*, which is linked to the arts and techniques. It can be said, then, that prudence indicates a typically preventive rationality, inquiring into the best decision in the face of the praxiological demands of social life. It is an ability and a power that is capable of taking things in the right direction due to the instrumental capacity to ration, always seeking to adapt the best means to the ends. Therefore, it is the power of intelligence to choose the right means, as circumstances vary and are unpredictable. It is, therefore, a rational faculty essentially linked to the contingency of the world, especially the cultural one.

Prudence is useful for universal and particular objects, so it requires the experience that age brings (ARISTOTLE, 1856, V, 6, 1142a, 5-10). While prudence is a dianoetic virtue, that is, of the soul; Equity is linked to the realm of ethical virtue. One is potential intelligence and the other is practical intelligence. Both, however, are necessary to the consummation of justice. If the importance of the judge for the effectiveness of justice is recognized, the importance of equity and prudence for legal activity must be recognized.

When one thinks about the relationship between equity and prudence in the functioning of the legislative, executive and judiciary, it can be said without exaggeration that they make up the legislation itself and the political functioning of the city itself (ARISTOTLE, 1856, V, 6, 1141 b, 20). Therefore, it is not possible to be a good man without prudence and, on the contrary, to be prudent without moral virtue. Prudence makes it possible to manage one's passions in accordance with the communitarian ethos. From there, one can affirm its dianoetic condition, that is, a competence proper to the rationality of the soul in order to act in each circumstance in an adequate way.

The prudent person is not a passive applicator of a legal syllogism, that is, given case x, law y follows and therefore its application. He does not apply the universal rules to particular cases because, even if he sticks to the legal rules, the prudent knows the distance of the law, in certain cases, from the situation *under examination*. Therefore, there is no fixed, stable measure that is the limit of legal rationality, rather, it is the equitable and prudent legal intelligence that is the *logos* of the law and the real possibility of doing justice in the city.

Therefore, it can be said that the equitable man is the one who judges well and who does not enslave himself to the positivist logic, although he holds it in high esteem. Rather, it is his concern to judge according to the truth, that is, equitably. For this reason, this man does not apply the law mechanically, but allows himself to penetrate the sensible and the singular with a more 'reasonable' reason than instrumental reason (AUBENQUE, 1980, p. 152). Thus,

the judge becomes a kind of "living justice" (ARISTOTLE, 1856 [B], I, 13, 1374a, 28-29), that is, equity, in addition to making justice work fairly, also allows him to perfect himself precisely by letting each case he judges speak for itself (COLOUBARITSIS, 1985, p. 136). Thus, even if there is an effort to subsume a specific legal case to the law, the former, due to its particularities, always escapes this effort in one way or another. This is the opportunity for equity and the only possibility of doing justice. It is therefore a matter of letting the *kairos* that the case under trial evokes count. Tordesillas contributes to the clarity of the issue:

In the very exercise of equity, the understanding of the circumstances and the intelligence of the situation are manifested, extracting the traces of constancy (in most cases, most frequently) in the plurality of singularities, which is why, as we have seen, equity is aligned with discernment and *kairos*. The convergence of all these points only occurs in situations of exception, in a certain sense, all situations are exceptional, on occasions whose judicial form is presented as "occasional justice" or equity, in judgments that require improvisation with constancy and regularity on each occasion. Situation, constancy, occasion, discernment, judgment, opportunity, contingency, deliberation, the elements of a *kaironomy* are now established (TORDESILLAS, 2004, p. 91).

Therefore, it can be affirmed, with Michon (2011, p. 16), that the *Aristotelian epieikeia* sensitizes and refines the legal conscience to the practical dimension of laws. It is the means to the just and the good, and helps to avoid injustice when the particular law is unfavorable to the cause of justice. Only in this case, it is advisable to seek support in the universal law, the *agraphoi nomoi*, to correct the limit of the law (SANCHO ROCHER, 2007, p. 147). Thus, it can be said that complete equity corrects and humanizes the law (TUNC, 2011). This means that the city, when it comes to justice, is always in search of $\square\square\square\square\square\square\square\square\square\square\square\square$ - *to aristo telos*, that is, in search of the best end, which is actually non-end because it is always an unfinished task (MESQUITA, 2005, p.121). Therefore, whenever justice threatens to slip into injustice, it is appropriate to cry out for *epieikeia*.

The articulation between ethics, subjectivity and legal normativity proposed by Aristotle also allows for a critical dialogue with contemporary approaches that problematize the modes of constitution of the subject and the exercise of power. Michel Foucault, when analyzing the practices of subjectivation, highlights that the ethical formation of individuals is inextricably linked to normative and institutional devices (FOUCAULT, 2010). In the legal field, Boaventura de Sousa Santos draws attention to the tension between legality and legitimacy, especially in contexts of social pluralism, in which the effectiveness of the law depends on its ability to dialogue with socially rooted practices and values (SANTOS, 2007). These contemporary perspectives reinforce the relevance of Aristotelian reflection by showing that law is only fully realized when integrated with the ethical and social practices that shape subjectivity.

The reading proposed in this article allows, therefore, to understand law as a situated social practice, rooted in subjective dispositions and historical forms of collective life. By articulating ethics, subjectivity, and normativity, Aristotle offers a conceptual model capable of illuminating contemporary tensions between legality, legitimacy, and effectiveness of law, especially in contexts marked by moral pluralism and the weakening of the common ethos.

5 CONCLUSION

The analysis developed throughout this article allowed us to demonstrate that, in Book V of the *Nicomachean Ethics*, Aristotle conceives justice as a reality that is not exhausted in the exteriority of the legal norm, but that is realized in the continuous articulation between law, virtue and ethical formation of the subject. By examining the triads *nomos–hexis–hybris*, *areté–diké–adikia* and *dikaiosynē–dikaion–dikaios*, it became evident that law, for the philosopher, only achieves legitimacy and efficacy when it finds correspondence in the subjective dispositions constituted within the communitarian ethos. Aristotelian justice, in this sense, is inseparable from the education of character and the exercise of prudence.

The study showed that *nomos* does not act as a merely coercive instance, but as a normative expression of a historically sedimented ethical experience. Its effectiveness depends on the formation of habits (*hexis*) capable of guiding the passions and containing immeasurability (*hybris*), revealing that legal normativity presupposes a subjectivity previously educated for the just. Thus, the law does not replace virtue, but presupposes it, and the absence of this ethical mediation compromises both the justice of the norms and their social reception.

By analyzing the *areté–diké–adikia triad*, it was shown that justice, in Aristotle, is simultaneously a virtue of the character and regulative principle of social relations. Injustice does not stem only from the formal transgression of the law, but from vicious subjective dispositions that produce inequality and break the community order. In this way, the opposition between justice and injustice illuminates the ethical dimension underlying legal practices, reinforcing the idea that law cannot be adequately understood without reference to the moral formation of agents.

The investigation of the *dikaiosynē–dikaion–dikaios triad* has made it possible, in turn, to understand the role of judicial institutions and prudential judgment in the realization of justice. Equity appears as a decisive element for the mediation between the generality of the law and the singularity of concrete cases, attributing to the judge an ethical responsibility that goes beyond the mechanical application of the norm. At this point, the subjectivity of the

judge, far from being an obstacle to justice, constitutes a condition for its realization, as long as it is guided by prudence and commitment to the common good.

As a theoretical contribution, it is argued that the reading of Book V of *the Nicomachean Ethics* allows us to critically rethink contemporary conceptions of law that dissociate legality and ethical formation. By evidencing the mutual implication between legal normativity and moral subjectivity, Aristotelian reflection offers relevant subsidies for current debates on the legitimacy of norms, institutional rationality, civic education, and public ethics. In contexts marked by crises of confidence in institutions and difficulties in the effectiveness of law, this perspective proves to be particularly fruitful.

Finally, the study paves the way for future investigations that deepen the dialogue between Aristotelian practical philosophy and contemporary approaches to legal theory, legal sociology, and critical human geography, especially with regard to the relationship between norms, social practices, and the formation of subjects in specific historical and territorial contexts. By recovering the centrality of subjectivity in the realization of justice, Aristotle's thought is not only historically relevant, but conceptually current for understanding the legal and social challenges of the present.

ABSTRACT

This article discusses the process of population aging in Brazil and educational policies aimed at promoting learning and social inclusion for older adults. Aging is a global phenomenon and is occurring at an accelerated pace. Legal frameworks such as the 1988 Federal Constitution, the National Policy for the Elderly (Law No. 8,842/1994), and the Statute of the Elderly Person (Law No. 10,741/2003, updated by Law No. 14,423/2022) highlight some advances in guaranteeing the right to education for older adults, emphasizing programs such as Youth and Adult Education (EJA) and Open Universities for the Third Age (UnATI), which contribute to active and participatory aging. Lifelong learning is an inclusion strategy, and access to formal and informal education strengthens the self-esteem, autonomy, and socialization of older adults. However, structural barriers persist, such as the absence of specific educational policies, low funding, a shortage of qualified professionals, and ageism in educational institutions. In conclusion, this article argues that public educational policies aimed at aging should be integrated into human rights and citizenship agendas. Investing in the education of older adults is essential to promote active aging, combat ageism, and value age diversity, consolidating a more just and inclusive society.

Keywords: Educational Policy. Older Adults. Human Rights. Social Inclusion.

RESUMO

O presente artigo discute o processo de envelhecimento populacional no Brasil e as políticas educacionais voltadas para a promoção da aprendizagem e da inclusão social da pessoa idosa. O envelhecimento é um fenômeno mundial e apresenta-se acelerado. Nos marcos legais como a Constituição Federal de 1988, a Política Nacional do Idoso (Lei nº 8.842/1994) e o Estatuto da Pessoa Idosa (Lei nº 10.741/2003, atualizada pela Lei nº 14.423/2022), são ressaltados alguns avanços na garantia dos direitos à educação das pessoas idosas, dando destaque aos programas como a Educação de Jovens e Adultos (EJA) e as Universidades Abertas à Terceira Idade (UnATI), que contribuem para o envelhecimento ativo e participativo. A aprendizagem ao longo da vida é uma estratégia de inclusão e o acesso à educação formal e informal fortalece a autoestima, a autonomia e a socialização da pessoa

¹Doctoral student in public policy. Universidade Federal do Piauí (UFPI).

idosa, contudo, ainda persistem as barreiras estruturais, como a ausência de políticas educacionais específicas, o baixo financiamento, a escassez de profissionais capacitados e o etarismo nas instituições de ensino. Nas considerações finais, o artigo defende que as políticas públicas educacionais voltadas ao envelhecimento devem ser integradas às agendas de direitos humanos e cidadania. Investir na educação de pessoas idosas é essencial para promover um envelhecimento ativo, combater o preconceito etário e valorizar a diversidade etária, consolidando uma sociedade mais justa e inclusiva.

RESUMEN

Este artículo analiza el proceso de envejecimiento poblacional en Brasil y las políticas educativas orientadas a promover el aprendizaje y la inclusión social de las personas mayores. El envejecimiento es un fenómeno global y se está produciendo a un ritmo acelerado. Marcos legales como la Constitución Federal de 1988, la Política Nacional para las Personas Mayores (Ley n.º 8.842/1994) y el Estatuto de la Persona Mayor (Ley n.º 10.741/2003, actualizado por la Ley n.º 14.423/2022) destacan algunos avances en la garantía del derecho a la educación de las personas mayores, con énfasis en programas como la Educación de Jóvenes y Adultos (EJA) y las Universidades Abiertas para la Tercera Edad (UnATI), que contribuyen al envejecimiento activo y participativo. El aprendizaje permanente es una estrategia de inclusión, y el acceso a la educación formal e informal fortalece la autoestima, la autonomía y la socialización de las personas mayores. Sin embargo, persisten barreras estructurales, como la ausencia de políticas educativas específicas, la baja financiación, la escasez de profesionales cualificados y el edadismo en las instituciones educativas. En conclusión, este artículo argumenta que las políticas educativas públicas dirigidas al envejecimiento deben integrarse en las agendas de derechos humanos y ciudadanía. Invertir en la educación de las personas mayores es esencial para promover el envejecimiento activo, combatir el edadismo y valorar la diversidad de edades, consolidando una sociedad más justa e inclusiva.

1 INTRODUCTION

Population aging is a worldwide phenomenon that has intensified in recent decades, a direct result of advances in the areas of health, science and living conditions. In Brazil, this demographic transformation occurs at an accelerated rate and impacts all sectors of society, requiring new perspectives on citizenship, public policies, and social inclusion. According to data from the Brazilian Institute of Geography and Statistics (IBGE, 2022), the number of people aged 60 and over has doubled in the last two decades and is expected to continue growing in the coming decades, significantly changing the country's age structure. In view of this scenario, it is urgent to understand aging not as a problem, but as a social achievement that requires planning and integrated actions to ensure quality of life, autonomy and active participation of the elderly.

Education, in this context, plays a central role in promoting social inclusion and valuing aging. Lifelong learning is a right provided for in the Federal Constitution (1988) and one of the pillars of active aging, as it allows older people to develop new skills, strengthen social bonds and fully exercise their citizenship. Educational institutions, therefore, must expand their practices beyond the traditional age groups, recognizing the elderly as subjects of rights and knowledge, whose life experience constitutes an important social and cultural heritage.

Thus, this article aims to analyze the phenomenon of population aging and discuss public educational policies aimed at promoting learning and inclusion of the elderly, highlighting the advances, challenges and perspectives for the realization of the right to lifelong education and for the construction of a more inclusive and intergenerational society.

2 AGING IN CONTEMPORARY SOCIETY

Contemporary society is facing a phenomenon of major structural and social transformations that is human aging. Nowadays, societies are increasingly long-lived and, in this scenario, new forms of political, cultural and social relations are required.

According to Neri (2013, p. 20), "aging, or senescence, is a universal process, genetically determined for the individuals of the species, which is why it is also called normal aging". In the words of Schneider and Irigaray (2008), aging:

It is a complex and multifactorial process. The variability of each person (genetic and environmental) ends up preventing the establishment of parameters. Therefore, the use of time alone (chronological age) as a measure hides a wide range of variables. Age itself does not determine aging, it is just one of the elements present in the development process, serving as a reference for the passage of time. (SCHNEIDER; IRIGARAY, 2008, p. 592).

In the literature, over time, the definition of aging among specialists has many variants. According to Alves (2025), "aging should not be perceived as a threat, but rather as a new stage of life, an opportunity for productivity, learning, and social involvement."

For Beauvoir (2024), modern medicine no longer intends to attribute a cause to biological aging, as it considers it inherent to the process of life, in the same way as birth, growth, reproduction, and death.

The increase in life expectancy has been modifying age pyramids around the world and according to the IBGE (2022), the number of elderly people has doubled in the last 20 years in Brazil.

In 2000, the Brazilian population aged 60 years and over was 15.2 million people (representing 8.7% of the total), should reach 55 million people in 2041 (25.6% of the total) and should reach 75.3 million elderly people in 2070 (representing 37.8% of the total population). In view of these data presented, the population aged 60 and over is expected to grow 5 times in 70 years. (IBGE, 2022).

Breaking down by regions in Brazil, it is noted that the Southeast region had 7 million elderly people in the year 2000 and reached 15.7 million in 2024. The Northeast region had 4.2 million elderly people in 2000 and reached 8.5 million in 2024. Data indicate that the emigration of young people in the Northeast should accelerate the aging of the population in this region. (IBGE, revision 2024).

The South region had 2.4 million elderly people in 2000 and reached 5.6 million in 2024. The North region had 767 thousand elderly people in 2000 and reached 2 million in 2024. The Central-West region had 825 thousand elderly people in 2000 and reached 2.4 million in 2024. (IBGE, revision 2024).

According to the data above, the aging population in Brazil shows that the country is going through a broad and rapidly growing demographic revolution.

According to Dardengo and Mafra (2018), the image of old age, through historical sources, varies from culture to culture, from time to time and from place to place. According to Giacomini (2012, p.19), "usually, our culture exalts the values of youth and consumption". Aging still continues to be stigmatized and treated with prejudice in society.

Old age remains associated with unproductivity and/or disability, contributing to the practice of discrimination and age-related prejudice. The Pan American Health Organization says that:

The term ageism was coined in 1969 by Robert Butler, an American gerontologist who was the first director of the National Institute on Aging in the United States. Although

ageism has existed for centuries, in all countries, contexts and cultures, the concept is relatively new and does not yet exist in all languages. (PAHO, 2022, p. XXI).

Any individual who goes through the aging process may be affected by ageism, ageism, ageism, names that represent discriminatory and prejudiced acts against the elderly.

The World Health Organization (WHO) released a policy document called "Active Aging" and translated into Portuguese is called "Active Aging: A Health Policy", implemented in Brazil in 2005.

In the WHO (2005) definition:

Active ageing is the process of optimising opportunities for health, participation and security, with the aim of improving quality of life as people get older (WHO, 2005, p. 14).

Active aging applies to both individuals and population groups so that they realize their potential for physical, social, and mental well-being throughout life and that it allows these individuals to participate in society according to their needs, desires, and capacities, and at the same time, provides protection, security, and adequate care. when they are needed. (WHO, 2005).

3 AGING AND BRAZILIAN LEGISLATION

The Federal Constitution of 1988 is a legal framework that recognizes the citizenship and social rights of the elderly. Before the Magna Carta, government actions were charitable and protective of the elderly, there were no specific laws for this population, which represented the lowest index at the top of the age pyramid.

Since the promulgation of the 1988 Constitution, the elderly have conquered their social rights, being supported, protected and with access and guarantee to services and benefits through public policies. However, according to Prado (2012), the Constitution brought advances in relation to the rights of the elderly, but the author emphasizes that "the State transferred, through partnerships, the responsibility for confronting the expressions of the social issue to the family and civil society" (PRADO, 2012, p.83).

In article 229, children have the obligation to help and support their parents in old age, need or illness, if they do not do so, it is a crime (article 244 of the new Civil Code). Article 230 states that the family, society and the State have the duty to support the elderly, ensuring their participation in the community, in the defense of dignity, well-being and guaranteeing their right to life. (PRADO, 2012).

The family bond is considered the ideal place for the elderly and the support of the State is fundamental, but in the face of family impoverishment, this extreme responsibility needs to be considered, since many families depend on the income of the elderly to survive, there is no Brazilian family pattern and this needs to be analyzed when it comes to responsibility.

It is worth mentioning that the 1988 Constitution broke with the stereotype of an unproductive, incapable and philanthropic elderly person.

The first specific legislation for the elderly in Brazil is the National Policy for the Elderly – PNI, in 1994, which creates the National Council for the Elderly. This legislation allowed the elderly to obtain their social rights, in the sense of promoting their autonomy and social participation. (BRAZIL, 1994).

Ministerial Ordinance No. 1,395/99 established prevention and health promotion through multidisciplinary care based on the Pact for Life, with emphasis on the elderly and instituted the National Health Policy for the Elderly – PNSPI. (BRAZIL, 2006).

From the point of view of Dias and Pais-Ribeiro (2018, p. 416), the Statute of the Elderly "is one of the main instruments of the rights of the elderly in Brazil, its approval represented an important step in Brazilian legislation", the Statute ratifies the principles that guided the discussions on the human rights of this population, with the State, Society and Family being responsible for the protection and guarantee of these rights.

For Dias and Pais-Ribeiro (2018), although the Statute is the target of criticism for its ineffectiveness:

The Statute of the Elderly has great merit, as it created a system of guarantees of the rights of the elderly, which, despite several mishaps, has sought to enforce the social rights of the Brazilian elderly. The system of guarantees provided for in the Statute is composed of the following institutions/bodies: Councils for the Elderly; Unified Health System (SUS); Unified Social Assistance System (SUAS); Health Surveillance; Judiciary; Public Defender's Office; Public Prosecutor's Office; and Civil Police. The efficiency of this network of guarantees is one of the possibilities for the effectiveness of the rights of the elderly to become effective. (DIAS; PAIS-RIBEIRO, 2018, p. 416).

The Statute of the Elderly is a very broad legislation that also deals with other rights of the elderly, such as the right to education, culture, sports, leisure, food, professionalization and work, social assistance and social security, affirming the way in which these rights should be ensured for the elderly population (FERREIRA; TEIXEIRA, 2014).

The Statute of the Elderly Person is the newest denomination that, through Law No. 14,423 of July 22, 2022, amended Law No. 10,741 of October 1, 2003, replacing all

expressions "elderly", "elderly", with the expressions "elderly person" and "elderly people", respectively.

The legal frameworks PNI (1994) and Statute (2003) emerged to guarantee the rights of the elderly in the country and brought an immeasurable gain to the elderly population, but it is necessary that the rights and policies are put into practice and that the actions are carried out based on the main laws that defend the dignity of the elderly.

3.1 AGING AND PUBLIC EDUCATIONAL POLICIES

Education does not end at the end of each stage of the education system, contrary to popular belief, it extends throughout life and older people have the right to formal education.

Currently, there is a growing demand for education on the part of elderly people who are looking for their place in the world as citizens, committed subjects, who seek to update themselves to understand the world of which they are a part, but this learning is not a one-way street, because at the same time that these subjects become aware of the new, They contribute their knowledge and experience. (GUIMARÃES; RAMOS, 2012).

Regarding citizenship, Gâlo (2017) states that:

The 1988 Constitution elects five foundations, one of which is citizenship. It is considered fundamental, in the Brazilian political movement aimed at the installation and consolidation of a democratic state of law, the characterization of all members of this state as citizens, which implies a series of political rights and a set of civic duties. There is no democratic state of law without citizens, which is why citizenship was elected as one of the constitutional foundations. More than that, citizenship has presided over the entire formulation of public policies in the country since then. (GALLO, 2017, p. 1508).

The Federal Constitution (BRASIL, 1988), guarantees education as a social right in Chapter III – Education, Culture and Sport, in which its Article 205 deals with:

Education, a right of all and a duty of the State and the family, will be promoted and encouraged with the collaboration of society, aiming at the full development of the person, his preparation for the exercise of citizenship and his qualification for work". (BRAZIL, 1988).

The Law of Guidelines and Bases of National Education – LDB, establishes that the education of young people and adults will be aimed at those who did not have access to or continuity of studies in elementary and secondary education at the appropriate age. (LDB, 1996).

Russel and Silva (2012) state that:

EJA is the integral modality of basic education intended to serve students who did not have, at the appropriate age, access or continuity of studies in elementary and high school. (RUSSELL; SILVA, 2012, p.109).

Although the Federal Constitution and the LDB deal with education as a right for all and with no age limit, both do not specifically deal with the elderly population.

From the National Policy for the Elderly, Law No. 8,842 of January 4, 1994, and the Statute of the Elderly, Law No. 10,741 of October 1, 2003, public policies aimed at the elderly emerge. Regarding the PNI and the Statute of the Elderly, Monteiro and Oliveira (2018) state that:

These were generated from extensive discussions between government and civil society, and were the subject of discussion for a relatively long period until their implementation. These policies, although recent, have embryos in discussions that began a long time ago. (MONTEIRO; OLIVEIRA, 2018, p. 57).

The Statute of the Elderly Person (2003) in Chapter V – Education, Culture, Sports and Leisure, in Art.20. It says that the elderly have the right to education, culture, sports, leisure, entertainment, shows, products and services that respect their peculiar age condition.

In Brazil, several initiatives are developed in order to meet the educational demands of the elderly, which are: the Open University for the Third Age (UnATI), Youth and Adult Education (EJA) and the National Education Plan (PNE).

In the words of Teixeira (2024), the Open Universities for the Third Age (UNATIS) corroborate the promotion of active and healthy aging and act from a proposal for integration between the elderly and the community through the formation of groups aimed at social participation and interaction of the target audience.

UnATIs are programs linked to public and private universities, which offer courses, workshops and cultural activities following the active aging policy. The UnATIs began to develop in the country in the 60s and their expansion only underwent greater expansion from 1990 onwards.

About the UnATIs, Teixeira (2024) points out that:

In this way, the realization of activities within the UNATIs can be apprehended within the 'participation' pillar, which also sustains the structure of 'active aging', because from this, there is the insertion of elderly people who cooperate, share ideas and knowledge and contribute to social and even economic development, depending on the activities chosen by them. In addition, there is a great contribution to the development of health, since participation in the program allows access to information that enables greater care for physical and mental health. (TEIXEIRA, 2024, p. 373-374).

The EJA modality is a public policy that contemplates the elderly population that did not have access to formal education, however, EJA includes the elderly as an adult, however, it does not offer a curriculum and methodology appropriate to this new demand increasingly present in educational establishments.

The Committee for the Defense of the Rights of the Elderly of the Chamber of Deputies approved Bill No. 2679/24, which formally includes the elderly in the EJA modality.

The change brings a new nomenclature to the EJA, which will be called Education for Youth, Adults and the Elderly (EJAI), representing an advance in educational policy, it is expected that this advance will be put into practice with a view to improving the care of the elderly in all educational establishments in our country.

The programs implemented to serve the elderly public, such as UnATIs, EJA and other informal courses are important for the insertion of this new social "actor". These actions have been strengthening what the active aging policy states is that the participation, socialization, autonomy and independence of the elderly subject in the environment in which they live is fundamental.

Public educational policies aimed at aging must be present in the human rights and citizenship agendas at all governmental levels.

4 LEARNING AND INCLUSION OF OLDER PEOPLE

Older people have always been excluded from formal education policies in Brazil. There were never specific educational laws for the elderly before the National Policy for the Elderly in 1994 and this gap still persists today.

It should be noted that lifelong learning goes beyond the walls of the school, learning in both formal and informal contexts must be valued and can take place at work, in the community or in the family, through informal experiences adapting subjects to social, environmental and technological transformations.

In UNESCO reports (2016), the concept of lifelong learning is highlighted as an affirmation of lifelong learning.

The National Education Plan (2014–2024) reinforces this commitment by establishing goals aimed at expanding the supply and improving the quality of education for young people, adults, and the elderly, promoting opportunities for permanent and inclusive learning (BRASIL, 2014).

In the case of older people, continuous learning contributes significantly to strengthening self-esteem, maintaining mental health, and increasing community engagement. Initiatives such as intergenerational projects, cultural workshops and courses

focused on digital technologies are examples of practices that stimulate social inclusion and promote the exchange of knowledge between generations (NERI, 2007).

Currently, one of the biggest challenges is the inclusion of the elderly in the digital world, since technological exclusion accentuates social inequality, therefore, the implementation of digital literacy programs is important for the effectiveness of citizenship in the technological age. In Gállo's words, "to guarantee the universality of the right to education, it is necessary to include everyone; all human diversity needs to be embraced". (GÁLLO, 2017, p. 1512-1513).

Despite some advances, there are still barriers that prevent the full educational inclusion of older people, among the main challenges we have the absence of specific public policies, low funding, lack of trained professionals and discrimination and age prejudice.

Educational institutions need to include the theme of aging in their curricula, contributing to the reduction of ageism.

Education for the elderly is a right and opportunity for them to exercise their citizenship provided for in the Federal Constitution (1988) and in the Universal Declaration of Human Rights (1948).

Promoting the inclusion of the elderly in formal education and ensuring their permanence in learning spaces is one of the greatest challenges in the construction and evolution of public policies in education.

5 FINAL CONSIDERATIONS

The aging of the Brazilian population is an irreversible and growing phenomenon, which imposes on society, the State and educational institutions the challenge of rethinking their inclusion practices and policies. The study showed that, although there are important legal frameworks such as the Federal Constitution of 1988, the National Policy for the Elderly (1994) and the Statute of the Elderly (2003, updated in 2022), the realization of the educational rights of older people still encounters significant barriers. The absence of specific public educational policies, the scarcity of funding, the lack of trained professionals and the persistent age prejudice are obstacles that hinder the full exercise of citizenship and the implementation of the principle of lifelong learning.

The programs analyzed, such as Youth and Adult Education (EJA), the Open Universities for the Third Age (UnATI) and initiatives aimed at digital literacy, demonstrate that it is possible to promote active and participatory aging through education. Such programs reinforce the role of learning as an instrument of social inclusion, autonomy and appreciation of the elderly, contributing to the strengthening of self-esteem and the expansion of

intergenerational relationships. However, it is necessary that these actions cease to be punctual and become structured, permanent and articulated policies between the different levels of government.

It is concluded, therefore, that the promotion of learning for the elderly should be understood as an essential part of public policies on human rights and citizenship. Education, as a social right and instrument of emancipation, needs to encompass all age groups, recognizing the elderly as subjects of knowledge and experiences. Investing in the education of the elderly is investing in a fairer, more inclusive and supportive society, capable of combating ageism, valuing age diversity and ensuring that aging is lived with dignity, participation and a sense of social belonging.

ABSTRACT

This paper examines the institutional principles governing Brazil's Public Prosecutor's Office — unity, indivisibility, and functional independence — through constitutional hermeneutics and Robert Alexy's theory of fundamental rights. After distinguishing rules from principles, the study shows how these directives shape prosecutorial action, ensure internal coherence, and safeguard impartiality. Using a qualitative, bibliographic-documentary approach, the article traces the historical development of the natural prosecutor principle, which replaced politically appointed "ad hoc prosecutors," and assesses the National Council of the Public Prosecutor's Office (CNMP) in implementing these values. Findings indicate that the effectiveness of the principles hinges on governance that reconciles functional autonomy with democratic oversight mechanisms, preventing both internal capture and undue external interference.

Keywords: Public Prosecutor's Office. Unity. Indivisibility. Functional Independence. Natural Prosecutor.

RESUMO

O artigo examina os princípios institucionais do Ministério Público brasileiro — unidade, indivisibilidade e independência funcional — à luz da hermenêutica constitucional e da teoria dos direitos fundamentais de Robert Alexy. Depois de distinguir regras e princípios, analisa-se como essas diretrizes estruturam a atuação ministerial, asseguram coerência interna e protegem a imparcialidade do órgão acusatório. A pesquisa, de cunho bibliográfico-documental e abordagem qualitativa, revisita a evolução histórica do princípio do Promotor Natural, superando a figura do "promotor de encomenda", e avalia o papel do Conselho Nacional do Ministério Público (CNMP) na concretização desses valores. Conclui-se que a efetividade dos princípios depende de uma governança que una autonomia funcional a mecanismos democráticos de controle, prevenindo tanto a captura interna quanto interferências externas indevidas.

RESUMEN

El artículo examina los principios institucionales del Ministerio Público brasileño —unidad, indivisibilidad e independencia funcional— a la luz de la hermenéutica constitucional y de la teoría de los derechos fundamentales de Robert Alexy. Tras distinguir entre reglas y principios, se analiza cómo estas directrices estructuran la actuación ministerial, aseguran la coherencia interna y protegen la imparcialidad del órgano acusador. La investigación, de carácter bibliográfico-documental y enfoque cualitativo, revisita la evolución histórica del principio del Promotor Natural, superando la figura del “promotor a la carta”, y evalúa el papel del Consejo Nacional del Ministerio Público (CNMP) en la concreción de estos valores. Se concluye que la efectividad de los principios depende de una gobernanza que articule la autonomía funcional con mecanismos democráticos de control, previniendo tanto la captura interna como injerencias externas indebidas.

Palabras clave: Ministerio Público. Unidad. Indivisibilidad. Independencia Funcional. Promotor Natural.

1 INTRODUCTION

The Constitution of the Republic of 1988 reformulated the Public Prosecutor's Office (MP) as a permanent institution, charged with the defense of the legal order, the democratic regime and the inalienable social and individual interests. To ensure that this mission is fulfilled in an effective and impartial manner, the Constituent Assembly established, in paragraph 1 of article 127, the principles of unity, indivisibility and functional independence. These normative commands represent true optimization mandates, in the Alexian sense, conditioning all ministerial intervention to the beacons of the Democratic Rule of Law.

Despite their apparent convergence, these principles give rise to practical tensions: institutional unity can collide with the decision-making independence of the prosecutor; indivisibility, although necessary for the continuity of the service, imposes challenges to the guarantee of the natural promoter; and functional independence, if absolutized, can weaken internal and social accountability. Added to this is the creation, by Constitutional Amendment 45/2004, of the CNMP, which introduced new vectors of external control and strategic planning.

In view of this scenario, this article aims to (i) revisit the theoretical foundations that distinguish rules and principles, (ii) analyze each constitutional postulate of the MP in the light of doctrine and jurisprudence, (iii) discuss the evolution of the principle of the Natural Prosecutor and (iv) evaluate the role of the CNMP in the harmonization of institutional guidelines. Methodologically, a bibliographic research integrated with documentary examination of constitutional and infra-constitutional norms is adopted, with a qualitative and hermeneutic approach.

The relevance of the study lies in offering a systemic view that helps legal operators in the coherent application of the principles, preventing deviations such as the historical figure of the "order promoter" and strengthening social trust in the Public Prosecutor's Office.

2 INSTITUTIONAL PRINCIPLES OF THE PUBLIC PROSECUTOR'S OFFICE

The Theory of Fundamental Rights, elaborated by the jurist Robert Alexy and published in 1985, was of paramount importance for understanding the differences between rules and principles. According to this theory, rules and principles are norms, since they reveal deontic expressions, indicating order, permission, prohibition, that is, the ought to be. However, they are different, insofar as the principles are considered "optimization mandates", ordering the performance of a certain action to the greatest extent feasible, taking into account the legal and factual possibilities. The rules, on the other hand, are precise and definitive, so they are complied with or not, and there is no middle ground.

In this sense, in the conflict of rules, one eliminates the other, verifying the invalidity of one of them. With regard to the collision between principles, one separates the other when the question is resolved, observing the legal and factual context of each of them. (JÚDICE, 2007)²element. Thus, it is inferred that the principles, in spite of being endowed with greater generality and abstraction, as well as being more related to the context in which they are applied, requiring a weighting when applying them, have imperativeness as much as the rules, having a cogent character³⁴⁵.

From this perspective, it is affirmed that the institutional principles of the Public Prosecutor's Office, engraved in § 1 of article 127 of the Federal Constitution (BRASIL, 1988), namely, unity, indivisibility and functional independence, are norms of imperative application by the operator of the law, under penalty of incurring in unconstitutionality.

2.1 PRINCIPLE OF UNITY OF THE PUBLIC PROSECUTOR'S OFFICE

The principle in question reflects that prosecutors are members of a single Public Prosecutor's Office, the same body⁶. Thus, members perform their duties without being

² Letícia Balsamão Amorim (2005, p. 56) argues that "when two principles are in collision, one of the two principles has to yield to the other. But this does not mean declaring the principle despised invalid or that an exception clause must be introduced in the principle despised. What will determine which principle should give way will be the circumstances. This means that, in concrete cases, the principles have different weights and the principle with the greatest weight prevails"

³ Carlos Roberto de Castro Jatahy (2008) teaches that "Constitutions are composed of norms that can be classified into two main categories: principles and rules. Rules would be those norms that are close to common law, that is, they have the necessary elements to invest someone in the quality of holder of a subjective right. Principles, on the other hand, although they do not generate subjective right, perform a transcendental function within the Constitution, giving a semblance of unity to the Constitutional Text and determining its fundamental guidelines".

⁴ From this angle, the teaching of the Minister of the Federal Supreme Court, Luís Roberto Barroso (2018, p. 26), who adduces that the "constitutional principles affect the legal world and the factual reality in different ways, is relevant. Sometimes, the principle will be the direct basis of a decision. At other times, its incidence will be indirect, conditioning the interpretation of a certain rule or paralyzing its effectiveness"

⁵ With regard to the relevance of principles, it is appropriate to present the consideration of Paulo Bonavides (2011, p. 74), who elucidates that "Placed at the highest point of the normative scale, they themselves, being norms, become, from now on, the supreme norms of the legal system. Serving as guidelines or criteria par excellence for the evaluation of all normative contents, the principles, from their constitutionalization, which is at the same time positivization at the highest level, receive as a maximum evaluative instance a constitutional category, surrounded by prestige and the hegemony that is conferred on the norms inserted in the Law of Laws. With this additional relevance, the principles also become norm normarum, that is, the norm of norms"

⁶ It should be noted that the institutional unity of the Public Prosecutor's Office must be a democratic construction with broad popular participation. In this sense, Marcelo Goulart teaches that "institutional unity must be built democratically. The Public Prosecutor's Office must be open to society and interact with the other collective political subjects that make up the basis of support for the democratic project. The democratic construction of institutional unity presupposes the participation of society in the process of defining institutional priorities. Before establishing the priority goals of the Action Plans and Programs, the Public Prosecutor's Office must consult society. These goals should reflect what society wants and expects from the work of the Public Prosecutor's Office. Each Public Prosecutor's Office – State and Union, the latter in its various branches – must define models for popular consultation and the preparation of Action Plans and Programs, taking into account their specificities and forms of spatial organization" (2021, p. 154)

identified in a way that individualizes them. They represent the institution as a whole, which is one, having only different branches with defined attributions.

Unity, in the words of Mazzilli (2008, p. 23), "means that the members of the Public Prosecutor's Office are part of a single body under the direction of a single chief". In view of this, there are those who confuse the principle in question with the principle of indivisibility, which is different, so that it refers to the activity of the prosecutor as a procedural-procedural agent (GOULART, 2009), and, at the appropriate time, will be better analyzed.

It is essential to clarify that being under the direction of a single head does not mean that there is a relationship of unity between the Federal Public Prosecutor's Office and the state Public Prosecutor's Office, nor between the Public Prosecutor's Offices of different states. It so happens that each Public Prosecutor's Office has a chief, who defines and guides the institution's activities.

In this way, the principle of unity reveals that for each institutional function conferred on the Public Prosecutor's Office in the Constitution, there is only one ministerial branch competent to execute it. Jatahy (2008) In other words, only a certain branch has the attribution to act in a concrete case⁷.

Nevertheless, it can be seen that Constitutional Amendment No. 45/2004 (Reform of the Judiciary), created the National Council of the Public Prosecutor's Office (CNMP) by adding article 130-A to the text of the Magna Carta. This body basically has the attribution of controlling the administrative and financial activity of the Institution, as well as analyzing the fulfillment of the functional duties of the members who are part of it⁸.

⁷ On the subject, Emerson Garcia (2017, p. 21) asserts that "By providing for the existence of a single Public Prosecutor's Office, which would encompass a diversity of autonomous institutions, the 1988 Constitution embraced "unity with the inclusion of variety". From this conclusion, it can be affirmed that the principle of unity, contemplated in § 1 of article 127 of the 1988 Constitution, acts as an evident argumentative reinforcement, indicating that both the Federal Public Prosecutor's Office and the State Public Prosecutor's Offices, each in its sphere of attributions, act as inseparable parts of one and the same body."

⁸ The rule provides as follows: "Article 130-A, § 2 It is incumbent upon the National Council of the Public Prosecutor's Office to control the administrative and financial performance of the Public Prosecutor's Office and the fulfillment of the functional duties of its members, and it is incumbent upon it:

I - to ensure the functional and administrative autonomy of the Public Prosecutor's Office, being able to issue regulatory acts, within the scope of its competence, or recommend measures;

II – to ensure compliance with article 37 and to assess, ex officio or upon provocation, the legality of administrative acts performed by members or bodies of the Public Prosecutor's Office of the Union and of the States, being able to dismantle them, review them or set a deadline for the adoption of the necessary measures for the exact compliance with the law, without prejudice to the competence of the Courts of Auditors;

III – to receive and hear complaints against members or bodies of the Public Prosecutor's Office of the Union or of the States, including against its auxiliary services, without prejudice to the disciplinary and correctional competence of the institution, being able to evoke disciplinary proceedings in progress, determine removal or availability and apply other administrative sanctions, ensuring ample defense;

IV – to review, ex officio or upon provocation, the disciplinary proceedings of members of the Public Prosecutor's Office of the Union or of the States judged less than one year ago;

V - to prepare an annual report, proposing the measures it deems necessary on the situation of the Public Prosecutor's Office in the country and the activities of the Council, which must integrate the message provided for in article 84, XI" (BRASIL, 1988).

The aforementioned body is not part of the structure of any state power, just as it is not part of the structure of the Federal Public Prosecutor's Office, much less the Public Prosecutor's Office of the States. It is another mechanism for carrying out external control⁹. Thus, the implementation of the CNMP in no way injured the principle of unity, insofar as it did not intend to subject the State Public Prosecutor's Offices to the MPU or even to the above-mentioned Council. (JATAHY, 2008)

In addition, it is worth examining the new bias given to the principle of unity. It is a more political perspective of ministerial activity, in order to influence the Institution's Action Plans and Programs. In this context, the unity of the Public Prosecutor's Office must be built in a democratic manner. To this end, it is recommended that society get involved in the process of defining the priorities of the Parquet, through instruments and spaces of participatory democracy¹⁰.

In a hasty analysis, it would be possible to discuss the supposed impossibility of coexistence between the principle in question and the principle of functional independence. On a superficial analysis, such principles may seem antagonistic and in constant collision. However, such a note does not deserve to prosper, since such rules have different destinations (GARCIA, 2017). While the first principle refers to the institution of the Public Prosecutor's Office in its organizational structure, the second is specifically aimed at the members.

2.2 PRINCIPLE OF INDIVISIBILITY OF THE PUBLIC PROSECUTOR'S OFFICE

The line that separates the institutional principle of indivisibility from the principle of unity previously analyzed is very thin. However, strengthening the differences between these principles, it should be detailed that institutional indivisibility concerns the activity of the prosecutor, insofar as it allows the replacement of members among themselves without hindering ministerial activity.

⁹ In this sense: "just as it already happens over the Judiciary or any Powers or institutions of the State, there must also be some form of external control over the Public Prosecutor's Office, not to curtail the independence and functional freedom of the institution and its agents, but to ensure that they are accountable to the Legislative Branch, the press and the community not only for the exercise of their core activities but also for the exercise of their secondary activities. After all, the Constitution supposes publicity and transparency in the activities of public bodies, only hindered in exceptional cases, in which the disclosure of the measure may result in damage to the community" (MAZZILLI, 2007, p. 15).

¹⁰ In this orientation, Marcelo Pedrosa Goulart (2009, p. 63) understands that "the principle of unity informs and guides the political-institutional action of the Public Prosecutor's Office, which, through the set of its members, its executive bodies and the Higher Administration, must be aimed at achieving its strategic objective: the promotion of the project of participatory, economic and social democracy outlined in the Constitution of the Republic (the construction of a free society, in which development must necessarily be directed to the eradication of poverty and marginalization, the reduction of social and regional inequalities and the promotion of the common good).

Thus, when it is the case that a prosecutor, for example, takes his vacation, leave, is removed due to some impediment or suspicion, he can be replaced by another member without jeopardizing the execution of the ministerial activity, considering that the acts performed by the members are performed in the name of the Public Prosecutor's Office¹¹. In other words, prosecutors are not bound by the processes in which they officiate.

Thus, it can be inferred that the principle of indivisibility is contained in the principle of unity, deriving from it, in order to avoid a split in the Public Prosecutor's Office. Thus, subdivisions within the Institution cannot be autonomous and must always be subordinated to the Head of the Parquet. (GARCIA, 2017). It should be noted that the principle in question is firmly related to the Principle of the Natural Prosecutor as well as to the guarantee of irremovability (JATAHY, 2008). In this sense, the Principle of the Natural Prosecutor determines that a body of the Public Prosecutor's Office will be previously defined by law to act in cases that require ministerial action.

Previously, one could glimpse the activity of the "order promoters", who were chosen at the discretion of the Attorney General of Justice. However, in order to enforce due process of law¹² and the right to be prosecuted by the competent authority¹³, the Principle of the Natural Prosecutor was recognized, rejecting casuistic designations and for political purposes, guaranteeing the irremovability of the member.

Ensuring the non-existence of an "exception accuser" is of great relevance, considering that members of society have the right to be prosecuted by an impartial, neutral prosecutor who acts in a given process because he follows criteria previously determined by law. In this way, the principle of indivisibility allows the replacement of members among themselves without tainting the activity of the Parquet, and it is not appropriate to speak of the designation of a prosecutor of order, much less that the act of a prosecutor who acted without having the proper attribution is validated.

Although the principle of indivisibility allows the replacement of prosecutors in their activities, as they represent the Public Prosecutor's Office itself, it should be noted that the attribution of each member has limitations. Hugo Nigro Mazzilli (2001) understands that it is only possible to take advantage of the act performed by the ministerial body before the

¹¹ It means that "Indivisibility is a characteristic of all formal organizations. Its members, in this capacity, are inseparable from the organization. This is what happens with the Public Prosecutor's Office in relation to its indivisibility, meaning that its members, as such, express the will of the institution, and not their individual will" (ROCHA, 2001, p. 53).

¹² Under the terms of Article 5, LIV of the Constitution "no one shall be deprived of liberty or property without due process of law" (BRASIL, 1988)

¹³ Also according to the Federal Constitution, in its article 5, LIII, "no one shall be prosecuted or sentenced except by the competent authority" (BRASIL, 1988)

competent court if there has been no scope to circumvent the Principle of the Natural Prosecutor and if the act is ratified by the competent ministerial body.

2.3 PRINCIPLE OF FUNCTIONAL INDEPENDENCE

The principle of functional independence contained in the Federal Constitution (BRASIL, 1988) guarantees ministerial members not functional subordination to any body or power, exercising their attributions and manifesting themselves in the processes always in a reasoned manner, subject only to their conscience and the legal order.

In view of this, the hierarchical relationship between the prosecutors and the attorney general can be questioned. It so happens that the members of the Public Prosecutor's Office are subordinate to the Head of the Institution only in the administrative sense¹⁴. Thus, with regard to institutional attributions, prosecutors do not submit to the recommendations of higher bodies, only in the administrative sphere.

From this perspective, the LONMP (BRASIL, 1993b), National Organic Law of the Public Prosecutor's Office (Law No. 8,625, of February 12, 1993) establishes that the bodies of the Higher Administration are non-binding subject to their recommendations. Such recommendations can come from the Attorney General of Justice¹⁵, the Superior Council of the Public Prosecutor's¹⁶ Office and the General Internal Affairs Office of the Public Prosecutor's¹⁷ Office. It should be noted that, although the Attorney General's Offices¹⁸ are not part of the Higher Administration, they may publish recommendations of an administrative or institutional nature, without, in the same way, binding the member of the Public Prosecutor's Office.

It is different with administrative decisions coming from the Higher Administration. According to article 43, XIV, of the LONMP, it is the duty of the members of the Public

¹⁴ In this regard, Emerson Garcia (2017, p. 57) explains that "the principle of functional independence is directly related to the exercise of the finalistic activity of ministerial agents, preventing exogenous factors, foreign or not to the Institution, from influencing the performance of its munus. Thus, it is avoided that authorities that are part of any of the so-called "Powers of the State", or even the bodies of the Superior Administration of the Public Prosecutor's Office itself, carry out any type of ideological censorship in relation to the acts practiced".

¹⁵ According to Law No. 8,625/1993 (BRASIL, 1993b), in its article 10, "It is incumbent upon the Attorney General of Justice: XII - to issue recommendations, without a normative character to the bodies of the Public Prosecutor's Office, for the performance of his functions"

¹⁶ Pursuant to article 15 of Law No. 8,625/1993 (BRASIL, 1993b), "The Superior Council of the Public Prosecutor's Office is responsible for: X - suggesting to the Attorney General the issuance of recommendations, without a binding nature, to the bodies of the Public Prosecutor's Office for the performance of their functions and the adoption of appropriate measures to improve services"

¹⁷ Article 17 of Law No. 8,625/1993 (BRASIL, 1993b) establishes that "The General Internal Affairs Office of the Public Prosecutor's Office is the guiding and supervisory body of the functional activities and conduct of the members of the Public Prosecutor's Office, and it is incumbent upon it, among other duties: IV - to make recommendations, without a binding nature, to the executive body"

¹⁸ Article 20 of Law No. 8,625/1993 (BRASIL, 1993b) provides that "The Prosecutors of the Civil and Criminal Prosecutor's Offices, who officiate at the same Court, shall meet to establish legal guidelines, without a binding character, forwarding them to the Attorney General of Justice".

Prosecutor's Office "to comply, at the administrative level, with the decisions of the bodies of the Superior Administration of the Public Prosecutor's Office". Therefore, it is inferred that recommendations are different from administrative decisions, which are binding. Because of this, the principle of functional independence does not encompass the administrative precepts, and there is observance, in the Parquet, of the disciplinary-administrative hierarchical principle. (JATAHY, 2008)

Thus, while the principle of functional independence aims to provide greater protection to the ministerial member so that he or she officiates in the deeds without external interference, the prosecutor must be bound by the administrative decisions coming from the Higher Administration. For this reason, the Attorney General has the authority conferred by law¹⁹ to, for example, establish the assignment of a certain prosecutor in cases where there is a conflict of assignment. In this way, the prosecutor cannot decline the assignment in a given case and refuse to act when determined by the Head of the Institution, alleging violation of the principle of functional independence²⁰.

In addition, from the analysis of the principle of independence, it can also be inferred that the members of the Parquet are immune from liability on account of their acts performed during the exercise of their institutional functions. In this regard, Zanetti Jr (2018) points out that political agents, including prosecutors, have functional freedom, similar to the independence of judges, being safe from civil liability, except if they have acted with gross negligence, bad faith or abuse of power.

However, it should be clarified that although the principle of indivisibility previously studied allows the replacement of members in the same judicial process since they are representing the institution itself, this does not mean that the substitute prosecutor will be subordinated to the content of the manifestations of the substituted one. That said, by the principle of functional independence, the member of the Public Prosecutor's Office who replaces the other is not obliged to follow the same line of legal thought previously used.

Furthermore, it is important to emphasize that the principle of functional independence differs from functional autonomy, in the terms in which the latter refers to the Public

¹⁹ Article 10 of Law No. 8,625/1993 (BRASIL, 1993b) provides that "It is incumbent upon the Attorney General of Justice: X - to settle conflicts of attributions between members of the Public Prosecutor's Office, designating who should officiate in the deed"

²⁰ Mazzilli comments that "under the administrative aspect, the members of the Public Prosecutor's Office must abide by the decisions of the higher administration bodies. Thus, the solution of a conflict of attributions, the review of the promotion of the archiving of a civil inquiry or police inquiry, the imposition of disciplinary measures - are decisions that require compliance. However, no procedure or manifestation can be imposed by the higher management bodies on the member of the institution with regard to the exercise of institutional functions, provided that the act depends on the latter's decision and conviction, which is guaranteed by unrestricted functional independence. Thus, it cannot be determined to the member of the Public Prosecutor's Office: ask for merit or dismissal, appeal or refrain from appealing, give an opinion in this or that way" (2008, p. 15)

Prosecutor's Office as an institution, so that it confers the necessary freedom of action in relation to other Organs and Powers of the State. In this way, due to functional autonomy, the Public Prosecutor's Office is subject only to the Constitution and the laws.

Functional independence is different, since it refers to an attribute of public agents within the scope of the Public Prosecutor's Office itself, that is, it enshrines freedom of action to members of the same institution. Thus, for example, due to functional autonomy, the Public Prosecutor's Office deliberates on the non-promotion of public criminal action, however it is by virtue of functional independence that a prosecutor can advocate for the acquittal of a defendant, even if his colleague from the institution has appealed in favor of the conviction. (MAZZILLI, 2013)

Thus, it is appropriate to clarify that the freedom granted to ministerial representatives as a result of the principle of functional independence could give rise to numerous abuses, therefore, it is stated that it is not absolute, insofar as constitutional and infra-constitutional legislation observes limits for its application²¹. Such a conjuncture shows that there is no absolute right, which is not possible to suffer eventual demarcations.

Thus, the member cannot legitimize acts that violate his duty to defend the legal order, the democratic regime and the inalienable social and individual interests, as limited by the Federal Constitution (BRASIL, 1988).²² In this guideline, the LONMP is also found, which in its article 41, item V, establishes that the member of the Public Prosecutor's Office, when in the exercise of his functions, "enjoys inviolability for the opinions he expresses or for the content of his procedural manifestations or procedures, within the limits of his functional independence". Here, the legislator expressly manifested the existence of limits to the exercise of ministerial freedom.

²¹ On the subject, José Eduardo Sabo Paes (2003, p. 65) understands that "admitting limits to independence does not mean denying it, but ensuring its effective exercise within legal standards, based on ethical and logical assumptions, under penalty of not doing so, submitting the premises and institutional destination of the Public Prosecutor's Office. If functional independence were absolutely unlimited, the possibility of abuse would also be unlimited. In itself, freedom, one of the basic postulates of democracy, is also subject to limits provided for by law. Were it not so, under the cloak of freedom and functional independence, the Prosecutor or the Judge could arbitrarily deny compliance with the Federal Constitution itself, which is the foundation not only of the legal order but even of its investitures; or else they could sustain, without the slightest reasonableness, only based on abstractions or generic speculations, any breach of the legal order.

²² Regarding the principle "in the first place, it should be noted that the principle of functional independence is not an end in itself. It is also not a prerogative that is incorporated into the person of the members of the Public Prosecutor's Office at the moment they take office in their positions. It is a mere instrument made available to ministerial agents with a view to achieving an end: the satisfaction of the public interest, which is the *raison d'être* of the Public Prosecutor's Office, as is the case with any state body. From this simple observation, it becomes possible to affirm that the main prism of analysis of this important principle should be its association with the final activity of the Institution, a prerequisite for the realization of the public interest. Thus, the measurement plan must be removed from the person of the agent, and the feelings and aspirations, legitimate or not, inherent to it are irrelevant, and the vanity of the agent's person should not be confused with the prerogative of the position occupied by him. This one is indispensable, that one is not. Functional independence adorns the position, which is intended for the exercise of ministerial activity, an element that materializes the public interest". (GARCIA, 2017, p. 52)

Thus, it can be inferred that if the Constitution had not established instruments to safeguard the free ministerial action, the existence of the Public Prosecutor's Office in the Brazilian legal system would be of no use. The principles of functional independence, unity and indivisibility have the power to foster the impartial exercise of members, free from internal influences and pressures (coming from hierarchically superior colleagues in the offices of attribution of members) and external (those caused by other organs of power) and without fear of possible retaliation or superior orders that lead to the discredit of their actions before society.

However, under the argument of functional independence, the member of the Public Prosecutor's Office cannot fail to adopt a certain measure considered a priority by the institution's Higher Administration in its strategic planning carried out after consulting the population²³. It should be noted that article 43 of Law 8625/93 (BRASIL, 1993b) provides that "it is the duty of the members of the Public Prosecutor's Office, in addition to others provided for by law – XIV – to comply, at the administrative level, with the decisions of the bodies of the Superior Administration of the Public Prosecutor's Office". In addition, the aforementioned provision, in its item XI, also imposes the duty to "provide information requested by the institution's bodies".²⁴ Therefore, if a certain institutional project is considered strategic and a priority, the member of the Public Prosecutor's Office cannot refuse adherence.

²³ In these terms: "The goals, priorities and actions defined in the Action Plans and Programs stem from the need for the Public Prosecutor's Office to fulfill, by virtue of a generic constitutional imposition, its strategic objectives. Therefore, these Plans and Programs necessarily contemplate hypotheses of mandatory action and bind the members of the Public Prosecutor's Office. The member who fails to observe the goals, priorities, and actions established in the Action Plans and Programs cannot invoke, in his defense, the principle of functional independence, as this principle cannot serve as a shield for those who fail to comply with constitutionally and democratically defined institutional objectives" (GOULART, 2021, p. 159)

²⁴ Marcelo Goulart's warning about the need to combine the principle of functional independence with the strategic objective of the Public Prosecutor's Office is indispensable. The author points out that "from the relationship that is established between functional independence and the institutional objective emerges the true meaning of this principle. Functional independence, before being a guarantee of the member of the Public Prosecutor's Office, is a guarantee of society, as it is instituted to give the people the security of having a political agent who, in the exercise of the functions of defending social interests, can act independently, immune to the pressures of power. Functional independence guarantees the immunity of the member of the Public Prosecutor's Office to external and intra-institutional pressures, but does not free him to act based on strictly subjective judgments and personal agendas. The immunity resulting from this principle guarantees independence, yes, but to act in accordance with the strategic objective. In the exercise of his duties, the member of the Public Prosecutor's Office is bound by the institutional strategy and the commitments assumed, via the Constitution, with Brazilian society. When we speak of the duty of obedience to conscience, we are not dealing with a spontaneous or contingent conscience (false conscience); rather, of an authentic, emancipated and universal consciousness (true consciousness). It is an ethical conscience, informed by the universal values of democracy and constituted within the scope of the cathartic movement that overcomes, in the member of the Public Prosecutor's Office, the corporative (particularist) moment by the ethical-political (transformative) moment" (2021, p. 157-158)

ABSTRACT

The groundwater plays an essential role in environmental preservation. It ensures the availability of subterranean water, vital for the survival of fauna and flora, and is also crucial for maintaining ecological balance. Responsible management of this resource is indispensable to protect ecosystems and prevent issues such as contamination and depletion of aquifers. This article explores the importance of groundwater in the context of environmental sustainability, with an emphasis on the need to care for subterranean water. Practical examples will be presented, such as studies conducted in Maceió (AL), Pelotas (RS), and Ribeirão das Neves (MG), which show the risks and best practices related to groundwater lowering. Additionally, the Sustainable Development Goals (SDGs) 6, 14, and 15, which address the protection of water resources and terrestrial and aquatic life, will be discussed. Brazilian legislation will also be addressed, such as Bill 1281/2021, which seeks to regulate the use of subterranean water in a balanced and sustainable manner. This work aims to highlight ways to ensure the preservation of this crucial resource for the future generations.

RESUMO

Os lençóis freáticos desempenham um papel essencial na preservação do meio ambiente. Eles garantem a disponibilidade de água subterrânea o que é vital para a sobrevivência da fauna e flora, além de serem fundamentais para manter o equilíbrio ecológico. Uma gestão responsável desse recurso é indispensável para proteger os ecossistemas e prevenir problemas como a contaminação e o esgotamento dos aquíferos. Este artigo explora a importância dos lençóis freáticos no contexto da sustentabilidade ambiental, com ênfase na necessidade de cuidar das águas subterrâneas. Serão apresentados exemplos práticos, como os estudos realizados em Maceió (AL), Pelotas (RS) e Ribeirão das Neves (MG), que mostram os riscos e as boas práticas relacionadas ao rebaixamento do lençol freático. Além disso, serão abordados os Objetivos de Desenvolvimento Sustentável (ODS) 6, 14 e 15, que tratam da proteção dos recursos hídricos e da vida terrestre e aquática. Também será discutida a legislação brasileira, como o Projeto de Lei 1281/2021, que busca regulamentar o uso das águas subterrâneas de maneira equilibrada e sustentável. Este trabalho pretende destacar caminhos para garantir a preservação desse recurso tão importante para futuras gerações.

Palavras-chave: Lençol Freático. Aquífero. Rebaixamento. Impacto Ambiental.

RESUMEN

Los niveles freáticos desempeñan un papel esencial en la preservación del medio ambiente. Garantizan la disponibilidad de agua subterránea, lo que es vital para la supervivencia de la fauna y la flora, además de ser fundamentales para mantener el equilibrio ecológico. Una gestión responsable de este recurso es indispensable para proteger los ecosistemas y prevenir problemas como la contaminación y el agotamiento de los acuíferos. Este artículo explora la importancia de los niveles freáticos en el contexto de la sostenibilidad ambiental, con énfasis en la necesidad de cuidar las aguas subterráneas. Se presentarán ejemplos prácticos, como los estudios realizados en Maceió (AL), Pelotas (RS) y Ribeirão das Neves (MG), que muestran los riesgos y las buenas prácticas relacionadas con el descenso del nivel freático. Además, se abordarán los Objetivos de Desarrollo Sostenible (ODS) 6, 14 y 15, que tratan sobre la protección de los recursos hídricos y de la vida terrestre y acuática. También se analizará la legislación brasileña, como el Proyecto de Ley 1281/2021, que busca regular el uso de las aguas subterráneas de manera equilibrada y sostenible. Este trabajo pretende destacar caminos para garantizar la preservación de este recurso tan importante para las futuras generaciones.

Palabras clave: Nivel Freático. Acuífero. Descenso. Impacto Ambiental.

1 INTRODUCTION

The lowering of the water table is characterized as a human intervention that has great environmental, social and economic relevance, often necessary for the execution of civil works, agricultural activities and industrial processes. This phenomenon, when not properly managed, can trigger a series of negative impacts that may or may not go beyond the local level, affecting entire ecosystems, public health, and the socioeconomic structures of the communities involved. The main objective of this article is to demonstrate these multiple consequences, establishing a critical dialogue with Sustainable Development Goals (SDGs) 6, 14 and 15, which respectively talk about drinking water and sanitation, aquatic life and terrestrial life.

The relationship between groundwater and surface water configures a dynamic and complex system, fundamental for the maintenance of environmental homeostasis. As demonstrated by Nevill et al. (2010), the large exploitation of groundwater resources, a common practice on a global scale, can irreversibly compromise aquatic and terrestrial ecosystems, due to the interdependence that characterizes hydrological cycles. The disturbance of the water table triggers a series of chain changes, affecting from strictly underground organisms to complex river ecosystems.

The consequences of downgrading manifest themselves in complex ways, including saline intrusion into coastal regions, soil subsidence, and degradation of aquatic habitats. As Kath and Dyer (2017) point out, socio-ecological systems dependent on groundwater resources face increasing challenges, requiring integrated management approaches that consider both the hydrological aspects and the human dimensions involved. The social dimension of these impacts deserves particular attention, since rural and peri-urban communities are the most affected by water scarcity.

In the Brazilian context, characterized by a rich hydrogeological diversity with aquifer systems of global importance, the regulation of the use of groundwater has advanced unevenly. Bill 1281/2021 represents a significant legislative effort to establish stricter guidelines on the exploitation of these resources. However, the effective implementation of these policies comes up against structural challenges, including technical limitations and scarcity of financial resources.

This article seeks to analyze innovative strategies to mitigate the impacts of the lowering of the water table, with special attention to nature-based solutions and sustainable technologies. Through a multidisciplinary approach that integrates knowledge of geology, biology and public policies, the study aims to contribute to the development of management

practices that harmonize economic development with environmental preservation, ensuring water security for present and future generations.

2 METHODOLOGY

The methodology used in this study was based on a broad bibliographic search with the objective of identifying relevant situations and discussions that related the lowering of groundwater to its environmental, social and economic consequences. 12 previously selected scientific articles were analyzed, obtained through platforms such as Google Scholar BR and EUA, in addition to the motivation generated by the reading of reports and documents located in the university repository, which served as an initial basis for the delimitation of the theme. This approach sought to ensure a global perspective, including studies carried out in Brazil and abroad, in order to understand different contexts and practices related to the management of water resources in civil works.

During the analysis, the focus was to identify methods, impacts, and legislation associated with the topic, finding a common pattern among the articles that highlight environmental risks, such as saline intrusion, aquifer contamination, and biodiversity reduction, as well as the economic and social challenges arising from these practices.

3 RESULTS AND DISCUSSIONS

The sustainable management of underground resources requires integrated planning and the use of technological solutions to mitigate impacts. Sousa and Silva (2020), highlight the effectiveness of technologies such as drainage tips and deep wells, associated with rigorous monitoring, as in the case of the San-tinho WWTP, in Minas Gerais, where the use of these techniques ensured the stability of the work and reduced environmental impacts. In addition, tools such as Geographic Information Systems (GIS) allow the identification of vulnerable areas and the planning of mitigation strategies, according to Nevill et al. (2010).

Practical cases, such as the use of observation wells in Pelotas (RS) to monitor the dynamics of the water table (Martins et al., 2012), demonstrate the importance of technical solutions to avoid negative impacts. Additionally, Brazilian legislation, such as PL 1281/2021, can play a relevant role in regulating groundwater extraction and ensuring alignment with the SDGs.

Integrated management and long-term monitoring are key to ensuring the sustainability of groundwater resources, contributing to environmental conservation and social well-being. Effective public policies, the use of advanced technologies and awareness

are essential aspects to minimize the impacts of lowering the water table and ensure the responsible use of this resource.

The lowering of the water table, a common practice in civil works, can generate significant environmental impacts, affecting ecosystems and water resources essential for sustainability. This process is directly related to the goals of the Sustainable Development Goals 3 (SDGs), such as SDG 6, which seeks to ensure drinking water and sanitation for all (UN, 2020); SDG 14, aimed at the conservation of aquatic life (Fogasa et al., 2018); and SDG 15 (UN, 2023), which promotes the protection and recovery of terrestrial ecosystems (Cabral et al., 2006; Nevill et al., 2010).

Among the main problems related to the lowering of the water table is the reduction of soil moisture, a factor that compromises vegetation and ecosystems dependent on this resource, as described by Fan et al. (2023), who analyze the effects of groundwater availability on productivity and plant composition. The excessive withdrawal of groundwater reduces soil moisture, compromising the survival of ecosystems that depend on this water resource, especially in arid and semi-arid regions, as reported in research that highlights the influence of the water table on productivity and plant composition (The lowering of the water level in mining and civil works).

In semi-arid regions of Brazil, as highlighted by studies by Nevill et al. (2010), desertification is an alarming consequence, putting at risk the goal of SDG 15 to curb soil degradation and restore areas already affected. The sustainable management of groundwater resources, therefore, is not only an environmental necessity, but a fundamental step to ensure a balanced and resilient future in the face of global challenges. The degradation of ecosystems that depend on groundwater is an alarming consequence of the lowering of the water table. Lowering water levels can destroy wetlands and aquatic habitats, threatening biodiversity. As Nevill et al. (2010) point out, these impacts may be irreversible, directly affecting Sustainable Development Goals 14 and 15, which prioritize the preservation of aquatic and terrestrial life. In coastal regions, the problem is aggravated by saline intrusion, when seawater invades aquifers, compromising the quality of drinking water.

A clear example is the case of Maceió, described by Souza et al. (2006), where excessive groundwater extraction led to salinity contamination, harming both human supply and agricultural activities. This phenomenon is directly linked to SDG 2, which seeks to promote food security through sustainable agricultural practices. Another significant impact is the reduction of the base flow of rivers and lakes, which accelerates siltation and degradation of water quality. According to Iglesias et al. (2020), this decrease affects the

regeneration capacity of water bodies, compromising aquatic ecosystems and making it difficult to achieve the goals of SDG 6 (clean water and sanitation) and SDG 14.

In addition, lowering the water table can cause soil subsidence, a phenomenon in which the earth's surface sinks due to the loss of water pressure in the soil pores. In karst areas, such as Sete Lagoas (MG) and Cajamar (SP), the dissolution of limestone rocks expands underground cavities, leading to soil collapse and the formation of craters, as highlighted by Cabral et al. (2006). In the springs of Muritiba, analyzed by Santos et al. (2015), the lowering of the water table impairs the maintenance of water flow, making these water sources dependent exclusively on rainfall. In extreme cases, this can lead to the extinction of springs, aggravating environmental degradation. These examples show that, without proper planning and monitoring, the lowering of the water table can trigger a series of problems, such as water contamination, loss of ecosystems, saline intrusion and soil subsidence. To mitigate these impacts, it is essential that engineering practices are aligned with the SDG goals, promoting the sustainable use of water resources and the protection of the environment 4 . Only with conscious and integrated actions will it be possible to guarantee long-term sustainability.

3.1 SOCIAL AND ECONOMIC IMPACTS

The sustainable management of underground resources requires integrated planning and the use of technological solutions to mitigate impacts. Sousa and Silva (2020), highlight the effectiveness of technologies such as draining tips and deep wells, associated with rigorous monitoring, as in the case of the Santinho WWTP, in Minas Gerais, where the use of these techniques ensured the stability of the work and reduced environmental impacts. In addition, tools such as Geographic Information Systems (GIS) allow the identification of vulnerable areas and the planning of mitigation strategies, according to Nevill et al. (2010).

Practical cases, such as the use of observation wells in Pelotas (RS) to monitor the dynamics of the water table (Martins et al., 2012), demonstrate the importance of technical solutions to avoid negative impacts. In addition, Brazilian legislation, such as PL 1281/2021, can play a relevant role in regulating groundwater extraction and ensuring alignment with the SDGs.

Integrated management and long-term monitoring are essential to ensure the sustainability of groundwater resources, contributing to environmental conservation and social well-being. Effective public policies, the use of advanced technologies and awareness are essential aspects to minimize the impacts of lowering the water table and ensure the responsible use of this resource.

The lowering of the water table, a common practice in civil works, can generate significant environmental impacts, affecting ecosystems and water resources essential for sustainability. This process is directly related to SDG goals, such as SDG 6, which seeks to ensure drinking water and sanitation for all (UN, 2020); SDG 14, aimed at the conservation of aquatic life (Fogasa et al., 2018); and SDG 15 (UN, 2023), which promotes the protection and recovery of terrestrial ecosystems (Cabral et al., 2006; Nevill et al., 2010). Among the main problems related to the lowering of the water table is the reduction of soil moisture, a factor that compromises vegetation and ecosystems dependent on this resource, as described by Fan et al. (2023), who analyze the effects of groundwater availability on productivity and plant composition. Excessive groundwater withdrawal reduces soil moisture, compromising the survival of ecosystems that depend on this water resource, especially in arid and semi-arid regions. In semi-arid regions of Brazil, as highlighted by studies by Nevill et al. (2010), desertification is an alarming consequence, putting at risk the goal of SDG 15 to curb soil degradation and restore areas already affected.

The sustainable management of groundwater resources, therefore, is not only an environmental necessity, but a fundamental step to ensure a balanced and resilient future in the face of global challenges. The degradation of ecosystems that depend on groundwater is an alarming consequence of the lowering of the water table. Lowering water levels can destroy wetlands and aquatic habitats, threatening biodiversity. As Nevill et al. (2010) point out, these impacts may be irreversible, directly affecting Sustainable Development Goals (SDGs) 14 and 15, which prioritize the preservation of aquatic and terrestrial life. In coastal regions, the problem is aggravated by saline intrusion, when seawater invades aquifers, compromising the quality of drinking water. A clear example is the case of Maceió, described by Souza et al. (2006), where excessive groundwater extraction led to salinity contamination, harming both human supply and agricultural activities. This phenomenon is directly linked to SDG 2, which seeks to promote food security through sustainable agricultural practices.

Another significant impact is the reduction of the base flow of rivers and lakes, which accelerates siltation and degradation of water quality. According to Iglesias et al. (2020), this decrease affects the regeneration capacity of water bodies, compromising aquatic ecosystems and making it difficult to achieve the goals of SDG 6 (clean water and sanitation) and SDG 14. In addition, lowering the water table can cause soil subsidence, a phenomenon in which the earth's surface sinks due to the loss of water pressure in the soil pores. In karst areas, such as Sete Lagoas (MG) and Cajamar (SP), the dissolution of limestone rocks expands underground cavities, leading to soil collapse and the formation of craters, as highlighted by Cabral et al. (2006).

3.2 GOOD PRACTICES FOR LOWERING GROUNDWATER

The practice of lowering groundwater requires extreme care and thorough planning to avoid significant environmental and social impacts. Studies such as the one by Sousa and Silva (2020), on the method used in the construction of the Santinho Effluent Treatment Plant (ETE), and the one by ABAS (2007), which addresses the lowering of the water level in mining activities and civil works, offer valuable guidance on effective techniques and good practices to control groundwater, especially in urban and industrial environments.

The use of technologies such as draining tips and deep wells, combined with careful planning for the responsible disposal of extracted water, is essential to mitigate the negative impacts of this process. A practical example is the case of the Santinho WWTP, described by Sousa and Silva (2020), where the application of draining tips ensured the stability of the work. This success, however, was only achieved with the adoption of continuous and rigorous monitoring of water levels, a fundamental measure to avoid damage to local ecosystems and preserve the quality of available water resources.

The adoption of appropriate techniques and efficient planning are crucial to protect both the quality of the water and the soils in the vicinity of the works. In addition, respecting environmental regulations and incorporating good management practices is essential to ensure that these processes are conducted safely and responsibly.

Tools such as Geographic Information Systems (GIS) play an important role in this context. As pointed out by Nevill et al. (2010), GIS is essential to identify and analyze areas that are more vulnerable to the impacts of lowering the water table, offering accurate information on soil types and their ability to filter contaminants. This detailed mapping allows you to better understand the associated risks and define effective strategies to mitigate environmental impacts, ensuring the execution of projects in a sustainable and balanced manner.

With careful planning, the use of advanced technology, and compliance with regulations, it is possible to lower groundwater responsibly, minimizing risks and preserving natural resources for future generations.

3.3 GROUNDWATER VULNERABILITY TO MISMANAGEMENT

Efficient management of groundwater resources is increasingly relevant, especially in countries facing serious water scarcity challenges. In the study by Margane et al. (2009), protection and management strategies adopted by Jordan are discussed, an example of a country with limited water resources. The research highlights that the lack of adequate regulation and inspection can lead to overexploitation of aquifers, a problem that also

manifests itself in regions of Brazil, such as Pelotas, RS, as pointed out by Delgado et al. (2012).

To prevent aquifer depletion and groundwater contamination, it is critical to implement continuous monitoring systems that keep track of variations in groundwater level. Technologies such as piezometers are valuable tools in this process, as they help detect changes in water levels and allow for preventive interventions, protecting aquifers and ensuring their sustainability.

The study by Iglesias et al. (2020), which analyzes the management of water resources in the Mediterranean region, reinforces the need for strategic planning for the use and distribution of groundwater. According to the authors, an integrated approach that takes into account the needs of different users is essential to ensure the sustainability of water resources and preserve environmental balance. This collaborative management is indispensable to avoid conflicts over water use, especially in areas with high population density or intensive agriculture.

Both Margane et al. (2009) and Iglesias et al. (2020) make it clear that sustainable groundwater management is a global priority. These resources are critical for water supply, agricultural production, and ecosystem maintenance. Without proper regulation and enforcement, environmental impacts can be severe and often irreversible. Therefore, it is essential that public policies promote the conscious use of these resources, with measures such as continuous monitoring of water levels and the adoption of technologies that help preserve aquifers. Thus, it is possible to ensure water security and sustainability for future generations.

3.4 INTEGRATED MANAGEMENT AND LONG-TERM MONITORING

Sustainable groundwater management requires an integrated approach that combines continuous monitoring and effective public policies. As demonstrated by Martins et al. (2012), systematic monitoring of groundwater levels is crucial to understand the impacts of climate change and prevent contamination. Technologies such as piezometers and level gauges allow for accurate monitoring of aquifer dynamics, which is essential for responsible interventions.

Kath and Dyer (2017) highlight the need for integrated groundwater management, which is often neglected in relation to surface resources. Koundouri et al. (2010) reinforce that the lack of adequate regulation has generated irreversible damage to aquifers, requiring strict policies to control extraction and regulate agricultural and industrial practices. Singh et

al. (2015) argue that exploration should be aligned with environmental preservation, considering the interdependence between terrestrial and aquatic systems.

These studies converge on the importance of integrating groundwater management with broader environmental policies, balancing human needs and ecosystem protection. Long-term monitoring, associated with collaborative governance, is essential to ensure water security and the sustainability of groundwater resources in the face of global challenges.

3.5 THE CONNECTION WITH THE SDGS AND BRAZILIAN LEGISLATION

The responsible management of groundwater is directly related to the Sustainable Development Goals, especially SDG 6, which seeks to ensure universal access to safe drinking water. The implementation of PL 1281/2021, which regulates the granting of groundwater, is an important example of how legislation can help protect water resources. The bill highlights the need for a plan for the reuse and proper disposal of extracted water, in line with SDGs 14 (Life in Water) and 15 (Life on Land). This approach aims to protect aquatic and terrestrial ecosystems, ensuring the sustainability of human activities and long-term environmental preservation.

3.6 CASE STUDIES

Lowering the water table is a key technique in areas with high groundwater levels, especially when the water table is too close to the surface and can interfere with construction activities. This practice aims to ensure the stability and safety of the works, in addition to preventing problems such as water infiltration and flooding, which can compromise the integrity of the structures.

An example of this occurred in the construction of the Santinho Sewage Treatment Plant (ETE), in Ribeirão das Neves, Minas Gerais. For this project, the method of lowering by draining tips, also known as "well points", was used. This process was chosen for its effectiveness in keeping the site dry during excavations, controlling the rise of water from the water table without the conduction of fine particles. This avoided the settlement of neighboring structures and brought a more economical solution.

Barbosa and Miranda (2023), point out that the lowering of the Santinho WWTP was carried out with the constant monitoring of the technical team, which monitored the positioning of the lowering pumps, the installation of the tips and the drainage of the water. The implementation of this technique proved to be efficient in ensuring soil stability and safety of the work, emphasizing the importance of rigorous monitoring and the choice of appropriate methods.

Another example occurred in a civil construction site in the Areal neighborhood, in Pelotas/RS (Martins et al., 2012), where the water table varied between 1.29 m and 0.54 m deep. In this case, the lowering planning considered the permeability of the soil and the depth of the excavation. The use of PVC pipes with porous blankets in observation wells allowed an efficient monitoring of the dynamics of the water table, avoiding environmental impacts and groundwater contamination.

These practical examples show that, with the appropriate choice of the lowering method and continuous monitoring, it is possible to ensure the stability of the works and environmental protection, in addition to optimizing resources and reducing costs. The success of lowering the water table in large works depends on proper planning, well-chosen techniques and constant supervision.

4 CONCLUSION

The lowering of the water table is an essential practice for the development of civil works, but it requires a careful and multidimensional approach to avoid significant environmental, social and economic impacts. As demonstrated throughout this study, inadequate groundwater extraction can trigger serious consequences, including desertification, saline intrusion, soil subsidence, reduced biodiversity, and compromise of sensitive ecosystems, with direct effects on the water and food security of populations.

The results presented show that the sustainability of groundwater resources depends fundamentally on three interrelated pillars: (1) the adoption of appropriate technologies, such as drainage tips, deep wells and continuous monitoring systems; (2) the implementation of effective public policies, represented by instruments such as PL 1281/2021; and (3) integration with the Sustainable Development Goals, particularly SDGs 6, 14 and 15.

The practical cases analyzed, such as those of the works at ETE Santinho (MG) and Pelotas (RS), demonstrate that it is possible to reconcile infrastructural development with environmental preservation through adequate planning, careful choice of techniques and rigorous monitoring. However, the vulnerability of aquifers to mismanagement, exemplified by cases such as that of Maceió, warns of the urgent need for effective regulation and constant inspection.

The integrated management of groundwater resources emerges, therefore, as a strategic imperative for the twenty-first century, demanding a collaborative approach that involves public authorities, the private sector, academia and civil society. Only by balancing development needs and conservation imperatives will it be possible to guarantee the water

security of present and future generations, preserving these vital resources in the face of the challenges of climate change and urban and agricultural growth.

ABSTRACT

The growing adoption of electric vehicles (EVS) represents a significant transformation in sustainable urban mobility. However, fire safety, particularly with regard to lithium-ion batteries, has emerged as a relevant challenge. This study adopts a qualitative and exploratory approach, with analytical and documentary emphasis, grounded in the innovative and pioneering nature of the research within the Brazilian context. The main objective of this article is to propose a critical analysis of global trends in electric vehicle safety, with particular emphasis on fire suppression and related innovations aimed at enhancing safety for users, owners, and residential condominiums. Furthermore, the study highlights the need for international harmonization and for the development of specialized training for fire response professionals. The research is innovative and pioneering in consolidating dispersed data and proposing an integrated and strategic approach to the prevention and suppression of fires in EVs. The results underscore the need for specific regulations, specialized training, and technological innovations to ensure safe and effective electric mobility. The study encompasses international data, emerging regulations, and technological innovations, offering a current and forward-looking overview of EV safety.

RESUMO

A crescente adoção de veículos elétricos (VEs) representa uma transformação significativa na mobilidade urbana sustentável. No entanto, a segurança contra incêndios, especialmente no que se refere às baterias de íons de lítio, tem emergido como um desafio relevante. Este estudo adota uma abordagem qualitativa e exploratória, com ênfase analítica e documental, fundamentada no caráter inovador e pioneiro da pesquisa no contexto brasileiro. O principal objetivo deste artigo é propor uma análise crítica das tendências globais em segurança de veículos elétricos, com ênfase particular na supressão de incêndios e nas inovações correlatas voltadas ao aumento da segurança de usuários, proprietários e condomínios residenciais. Além disso, o estudo destaca a necessidade de harmonização internacional e do desenvolvimento de treinamentos especializados para profissionais de resposta a incêndios. A pesquisa é inovadora e pioneira ao consolidar dados dispersos e propor uma abordagem integrada e estratégica para a prevenção e o combate a incêndios em VEs. Os resultados ressaltam a necessidade de regulamentações específicas, capacitação especializada e inovações tecnológicas para garantir uma mobilidade elétrica segura e eficaz. O estudo abrange dados internacionais, regulamentações emergentes e inovações tecnológicas, oferecendo uma visão atual e prospectiva sobre a segurança de VEs.

Palavras-chave: Veículos Elétricos. Baterias de Íons de Lítio. Incêndio. Fuga Térmica. Segurança Veicular.

RESUMEN

La creciente adopción de vehículos eléctricos (VE) representa una transformación significativa en la movilidad urbana sostenible. Sin embargo, la seguridad contra incendios, especialmente en lo que respecta a las baterías de iones de litio, ha surgido como un desafío relevante. Este estudio adopta un enfoque cualitativo y exploratorio, con énfasis analítico y documental, fundamentado en el carácter innovador y pionero de la investigación en el contexto brasileño. El objetivo principal de este artículo es proponer un análisis crítico de las tendencias globales en la seguridad de los vehículos eléctricos, con especial énfasis en la supresión de incendios y en las innovaciones relacionadas orientadas a mejorar la seguridad de usuarios, propietarios y condominios residenciales. Además, el estudio destaca la necesidad de armonización internacional y del desarrollo de capacitación especializada para profesionales de respuesta ante incendios. La investigación es innovadora y pionera al consolidar datos dispersos y proponer un enfoque integrado y estratégico para la prevención y supresión de incendios en VE. Los resultados subrayan la necesidad de regulaciones específicas, formación especializada e innovaciones tecnológicas para garantizar una movilidad eléctrica segura y eficaz. El estudio abarca datos internacionales, regulaciones emergentes e innovaciones tecnológicas, ofreciendo una visión actual y prospectiva sobre la seguridad de los VE.

Palabras clave: Vehículos Eléctricos. Baterías de Iones de Litio. Incendio. Fuga Térmica. Seguridad Vehicular.

1 INTRODUCTION

The global transition to electric vehicles (EVs) represents a major milestone in the pursuit of sustainability, decarbonization, and improved urban air quality. Although battery production increases environmental impacts due to higher CO₂ emissions into the atmosphere, EVs demonstrate greater benefits during continuous use, particularly when charged with electricity generated from cleaner energy sources (Gomes et al., 2025). Nevertheless, this paradigm shift is not without challenges, with the safety of lithium-ion batteries emerging as a focal point of growing concern (Dong; Gou; Gui, 2024). One primary area of attention regarding EVs relates to collisions and traffic accidents. The study by Alter et al. (2023) presented data on accidents and found no increase in fatality rates when compared to collisions involving internal combustion vehicles, shedding light on everyday use and potential accidents associated with this type of vehicle. Another relevant concern in the context of fleet electrification involves vehicle charging.

Concerns regarding fires, particularly in confined environments such as underground parking garages, remain significant. High energy-density batteries, which constitute the core of EVs, present intrinsic risks associated with thermal runaway, an uncontrolled reaction that may culminate in fires of exceptional intensity, prolonged duration, and the release of toxic gases. This complex scenario poses substantial challenges for emergency response teams (Fire Safety Research Institute, 2023).

This study adopts a qualitative and exploratory approach, with analytical and documentary emphasis, grounded in the innovative and pioneering nature of the research within the Brazilian context.

The main objective of this article is to propose a critical analysis of global trends in electric vehicle safety, with emphasis on fire suppression and related innovations aimed at enhancing safety for users, owners, and residential condominiums, as well as on the need for international harmonization and the development of specialized training for fire response professionals (Vockan Automotivo, 2024).

The specific objectives are as follows: to analyze actions and regulations currently in force worldwide, with the purpose of identifying effective strategies for risk mitigation and fire suppression in electric vehicles, thereby contributing to the safe and expanded adoption of this technology; and to emphasize the importance of research on electric vehicles within the scientific and technological context, highlighting related issues that are open to future investigation and the innovative contributions already achieved in the field.

The article is organized into five sections to ensure clarity, coherence, and logical flow of the argument. The Introduction contextualizes the topic and outlines the research

objectives. Subsequently, the Methodology section presents the procedures adopted to conduct the study. The Literature Review discusses and analyzes the main theoretical and scientific references relevant to the subject. The Results and Discussion section then presents and discusses the research findings based on the theoretical framework. Finally, the Conclusion summarizes the main findings and their implications and contributions to the field of study.

2 METHODOLOGY

This study adopts a qualitative and exploratory approach, with analytical and documentary emphasis, grounded in the innovative and pioneering nature of the research within the Brazilian context (Amado, 2017). The research was conducted between January and April 2025 and focused on a critical analysis of fire risks in electric vehicles and the mitigation strategies adopted worldwide.

Sources were collected and analyzed in Portuguese, English, and Spanish. The databases consulted included Scopus, ScienceDirect, IEEE Xplore, Google Scholar, and SciELO, in addition to technical repositories from institutions such as UNECE, ABNT, EV FireSafe, the Fire Safety Research Institute, Frontiers in Energy Research, and legislation available on the websites of public authorities and regulatory bodies.

The search parameters comprised the following descriptors and their combinations: “electric vehicle fire,” “lithium-ion battery,” “thermal runaway,” “fire safety electric vehicle,” “thermal runaway battery,” “EV fire mitigation,” “electric car fire,” and “vehicle safety.” Searches were limited to publications from 2018 to 2025.

The bibliographic review method involved critical reading, thematic categorization, and cross-validation of information through source triangulation (Cavalcante; Oliveira, 2020). Documents were classified according to criteria of timeliness, relevance, institutional origin, and technical rigor (Arantes, 2025). The analysis adopted a comparative perspective, integrating empirical data, existing regulations, and technological trends, with the aim of providing a systematized and forward-looking overview of the topic.

3 LITERATURE REVIEW

3.1 INCIDENCE AND ETIOLOGY OF FIRES IN ELECTRIC VEHICLES: UNRAVELING THE COMPLEXITY

Although available data indicate a lower frequency of fires in electric vehicles (EVs) when compared to their counterparts, internal combustion vehicles (ICVs), the nature of fire events involving EVs requires in-depth analysis. Fires associated with lithium-ion batteries

are distinguished by their ability to burn for extended periods, releasing extreme heat and harmful gases, which amplifies the risk of structural damage and fire propagation in confined spaces.

Contrary to common misconceptions, the International Council on Clean Transportation (2022) reports that the probability of fire in EVs is up to 60 times lower than in ICVs. Tesla, a pioneer in the sector, reports an occurrence rate 11 times lower per kilometer traveled compared to the average of vehicles in the United States. Nevertheless, it is essential to recognize that, when they do occur, EV fires present specific characteristics that require specialized attention.

The primary causes of such events include battery overheating, often associated with manufacturing defects, collision-related damage, and issues during charging, particularly under overcharging conditions (EV FireSafe, 2024). The distinctive characteristics of these fires are detailed below.

Thermal Runaway: The Destructive Chain Reaction

Thermal runaway constitutes the core challenge. Once initiated in a single battery cell, it triggers a cascade of intense heat generation and the release of flammable gases, rendering the fire intrinsically difficult to control.

Reignition: A Persistent Threat

The risk of reignition after initial suppression is significantly higher in EV battery fires, requiring prolonged and vigilant monitoring.

Toxic Gases: A Hidden Hazard

Battery combustion releases toxic and corrosive gases, such as hydrogen fluoride, which pose serious threats to human health and may contaminate buildings and equipment.

Flame Consumption Time

Rapid Onset, Prolonged Suppression: thermal runaway may lead to rapid flame development, becoming visible within minutes.

Extended Duration: unlike ICVs, in which fuel is depleted relatively quickly, an EV battery may burn for hours, or even days in some cases, due to stored energy and the autocatalytic nature of thermal runaway. Reignition remains a risk until adequate cooling is achieved.

Temperatures: Intense and Concentrated Heat

High Temperatures: lithium-ion battery fires may exceed 1,000°C in the vicinity of the burning cells, significantly higher than temperatures observed in ICV fires.

Concentrated Heat: the heat generated tends to be concentrated around the battery area, intensifying risks to adjacent structures.

Destructive Potential to Built Structures: A Tangible Threat

Significant Risk: intense heat and prolonged burning pose considerable danger to the integrity of nearby buildings.

Structural Damage: prolonged exposure to high temperatures may compromise structural elements such as steel, through deformation, and concrete, through cracking and loss of strength.

Fire Propagation: radiant heat may ignite combustible materials within or near buildings, facilitating fire spread to the structure.

Destructive Reach of Released Heat: An Expansive Hazard Zone

Wide Variation: the destructive reach of heat depends on fire intensity, battery size, and the properties of surrounding materials.

Direct Damage: within a radius of 1 to 3 meters, spontaneous ignition of combustible materials may occur due to radiant heat, while nearby vehicle components may suffer severe damage or melting.

Indirect Damage: heat-sensitive materials such as paint, plastics, and wiring may be damaged at greater distances, potentially up to 5 to 10 meters or more, depending on fire duration and intensity.

Propagation Risk: flammable objects near the vehicle, even several meters away, may reach ignition temperatures over time, particularly in prolonged fires.

Additional Considerations: Overlooked Complexities

Projectile Release (Thermal Runaway Venting): during thermal runaway, battery cells may expel pressurized gases and incandescent fragments over several meters, posing a risk of secondary fires.

Dense and Toxic Smoke: the smoke produced is dense, irritating, and laden with toxic substances, constituting a significant health hazard in surrounding areas.

Global concerns regarding fires in electric vehicles are reflected in reports of bans and restrictions in countries such as China (Zhejiang Province), South Korea, and Malaysia. In Australia, recommendations to suspend the installation of chargers in buildings until clear governmental guidelines are established underscore the urgency of the issue (Felisbert, 2024; EVB.COM, 2024). In countries such as China and South Korea, proactive measures have been implemented to restrict EV charging in underground parking facilities, reflecting a precautionary stance in response to potential risks (News Motor, 2024; Brito, 2024).

3.2 DISTINCTIVE FEATURES OF LITHIUM-ION BATTERY FIRES: A DETAILED ANALYSIS

Fires involving lithium-ion batteries exhibit distinctive characteristics that set them apart from conventional fires. Temperatures may reach levels of up to 1,000°C, accompanied by the release of toxic and corrosive gases, such as the highly hazardous hydrogen fluoride (Fire Safety Research Institute, 2023). The occurrence of thermal runaway, in which combustion in a single cell triggers an uncontrollable chain reaction, constitutes a critical factor that significantly hinders fire suppression.

Another particularly relevant feature is the phenomenon of reignition. Even after the apparent suppression of flames, the battery may re-ignite, requiring continuous and prolonged monitoring by emergency response teams (Frontiers in Energy Research, 2022).

It is essential to emphasize the following points regarding incidence and causes:

- **Positive Data, Persistent Challenges:** although studies indicate a significantly lower probability of fires in EVs compared to internal combustion vehicles (ICVs), as evidenced by Tesla data reporting an incidence 11 times lower per kilometer traveled and by a Swedish study from 2022 showing that only 0.004% of the EV fleet experienced fires compared to 0.08% of gasoline and diesel vehicles, the fires that do occur present complex challenges due to the intrinsic characteristics of lithium-ion batteries.
- **Primary Causes and Thermal Runaway:** primary causes include battery overheating, physical damage to cells resulting from collisions, manufacturing defects, and failures in electrical installation. Thermal runaway, as an uncontrolled chain reaction, releases intense heat and toxic gases, making suppression efforts particularly difficult.
- **Risk of Reignition: Continuous Surveillance:** the need for prolonged monitoring, even after initial fire containment, is imperative due to the high risk of reignition.

Firefighting and Prevention Strategies: An Imperative for Innovation

- Fire suppression in EVs generally requires the use of large volumes of water to cool the battery and interrupt the progression of thermal runaway. In addition, Class D extinguishers and specific agents, such as Aqueous Vermiculite Dispersion (AVD), have emerged as promising alternatives for fires involving lithium batteries.

Nevertheless, the challenges inherent in extinguishing fires in electric vehicle batteries are substantial. The effectiveness of large quantities of water in cooling the battery and interrupting thermal runaway is not absolute, and Class D extinguishers, including foam and dry chemical agents, are only effective when complete flame smothering is achieved. The absence of universally accepted firefighting protocols for electric vehicles, including standardized cooling and isolation techniques, reflects a field in continuous development, with fire brigades worldwide still in the process of establishing these critical guidelines.

Current research explores innovative approaches to fire suppression, including:

- **Immersion Techniques:** studies investigate immersing batteries in water tanks or specific solutions to effectively cool and isolate cells undergoing combustion.
- **Ventilation and Gas Control:** the management of toxic gases released during combustion is an area of intensive research, focusing on the development of safe ventilation and containment techniques.
- **Development of Safer Battery Materials:** although not directly related to fire suppression, research on solid-state electrolytes and other battery technologies aims to inherently reduce the likelihood and severity of fires.

At present, there is no single, universally effective solution capable of instantly extinguishing fires in electric vehicles, given the complex nature of lithium-ion batteries and the thermal runaway phenomenon.

4 RESULTS AND DISCUSSION

Preventive fire safety measures play a crucial role in mitigating fire risks, including regular battery maintenance, safe charging practices, and regulations aimed at limiting charging levels in underground parking facilities. South Korea's proposal to restrict EV battery charging to 90% in residential building garages (Straits Times, 2024) illustrates this proactive approach.

Additional prevention and risk mitigation strategies include:

- **Periodic Inspections:** regular inspections of batteries and electrical systems are essential to identify and correct potential issues. Safe
- **Charging Practices:** using only manufacturer-recommended chargers and ensuring adequate electrical installations are fundamental preventive measures.
- **Prevention of Physical Damage:** avoiding collisions and impacts that may damage the battery is critical to minimizing fire risk. Application of

- **Thermal Fire Blankets:** high-temperature-resistant fire blankets may be used to cover a burning vehicle. Although they do not extinguish internal battery fires, they help contain flames, reduce fire spread, and decrease the release of smoke and toxic gases, facilitating targeted cooling.
- **Specialized Cooling Equipment:** companies are developing directed cooling systems that can be connected to the battery to accelerate cooling and improve fire control (InsideEVs, 2024).
- **Thermal Imaging Cameras:** essential for monitoring battery temperature during and after a fire, assisting firefighters in identifying hot spots and assessing the risk of reignition.

Although fires in electric vehicles receive heightened attention due to the complexity of battery combustion, their probability of occurrence remains significantly lower than that of internal combustion vehicles. Continuous research is vital to further improve battery safety and firefighting methods.

Restrictions and considerations implemented in different countries and regions include:

- **China (Zhejiang Province):** prohibition of EV access to underground garages in hotels and other buildings in cities such as Hangzhou, Ningbo, and Xiaoshan, due to concerns over spontaneous combustion and recent incidents (Radio Free Asia, 2024; CarExpert, 2024). EVs are directed to designated outdoor parking areas.
- **South Korea (Seoul):** advisories urging EV drivers to avoid underground parking when batteries are charged above 90%, aiming to prevent overcharging-related fires (The Straits Times, 2024). Plans include recommending a maximum charging limit of 90% or less in underground parking facilities and restricting the maximum charging rate at public chargers to 80%.
- **South Korea (National):** prohibition, since December 2023, of installing EV chargers below the second underground level in buildings to ensure emergency access for firefighters (The Japan Times, 2024).
- **Malaysia:** discussions and proposed guidelines by the Ministry of Housing and Local Government (KPKT) to prohibit EV chargers in parking areas of stratified properties and underground levels due to fire safety concerns (Firefighter.com.my, 2024/2025, estimated date).

- Australia: a recommendation by the real estate services company MICM advising Owners' Corporations to suspend EV charger installation projects until receiving guidance from the Federal Government, citing elevated insurance and fire risks (CarExpert, 2023).

These restrictions and alternatives demonstrate a cautious and adaptive approach across different regions, seeking to balance EV adoption with public safety. Based on these experiences, the following alternatives have been identified:

- Designated Outdoor Parking: directing EVs to park in specific areas away from main buildings.
- Limitation of Charging Levels: advising or recommending limits on battery charge levels to safer percentages.
- Charging at Ground Level or Upper Basement Levels: prioritizing charger installation in locations more accessible to emergency services.
- Awaiting Governmental Guidelines: suspending installations until clearer safety standards and technological solutions become available.

It is essential to recognize that:

- Prolonged Suppression and Higher Water Consumption: EV fires may require significantly more time and water to extinguish than fires involving internal combustion vehicles, making continuous battery cooling critical to prevent reignition.
- Firefighter Safety as a Priority: appropriate personal protective equipment (PPE), including self-contained breathing apparatus (SCBA), is indispensable due to the release of toxic gases.
- Ongoing Research and Development: continuous research and development efforts are underway to identify more effective and faster solutions for extinguishing EV fires, with the potential emergence of new technologies and extinguishing agents.
- Absence of Comprehensive Global Prohibitions and Extensive Published Research: a generalized and formally decreed global prohibition on EV charging in all residential and commercial underground facilities is not currently the norm. While concerns are evident and certain regions or specific building administrations have adopted precautionary measures, readily available research does not indicate the existence of in-depth scientific articles documenting such prohibitions and alternatives at a global scale with detailed authorship and publication data. Most available information derives from news reports and sector-specific publications.

4.1 REGULATIONS AND TECHNOLOGICAL INNOVATIONS: SHAPING A SAFER FUTURE

Global regulations reflect a concerted effort to ensure the intrinsic safety of electric vehicles (EVs). The United Nations Economic Commission for Europe (UNECE), through Global Technical Regulation No. 20 (GTR No. 20), has established stringent standards for batteries, covering aspects ranging from impact resistance to thermal safety (UNECE, 2020). In the Brazilian context, standards such as NBR 17019 define technical criteria for the installation of EV chargers, aiming to prevent short circuits and fires (Fase Energia, 2024).

In parallel with the regulatory framework, technological innovations have emerged as fundamental pillars of safety. The development of self-extinguishing batteries and advanced thermal management systems designed to mitigate the occurrence of thermal runaway represents significant progress in this field (Self-extinguishing batteries, 2023).

Regulation of Electric Vehicle Charging in Residential Condominiums

In Brazil, Bill No. 158/2025 signals a movement toward regulating the installation of charging infrastructure in residential condominiums, seeking to clarify issues related to safety and the responsibilities of individual unit owners (Chamber of Deputies, 2025). Standards such as NBR 17019 specify technical requirements for charger installation, including mandatory protection against overloads and the requirement for adequate ventilation (Fase Energia, 2024).

In several regions, the development of specific standards for EV charger safety is underway. In Brazil, the São Paulo Fire Department has proposed regulations addressing the installation of ventilation systems, heat sensors, automatic sprinklers, and battery shutoff points in garages and parking facilities. Additionally, a minimum safety distance of five meters between charging spaces and other risk areas has been recommended (Revista Incêndio, 2024; Poder 360, 2024).

Strategies for Extinguishing Fires in Electric Vehicles

The unique nature of lithium-ion batteries requires specific firefighting approaches. Governments at different levels and in various parts of the world are implementing or considering a range of preventive and mitigation measures, including:

- **Intensive Cooling:** the application of large volumes of water or specialized cooling agents to control battery temperature and prevent reignition.
- **Site Isolation:** the implementation of physical barriers to prevent fire spread and exposure to toxic gases.
- **Protective Equipment:** the use of appropriate personal protective equipment by firefighters, including respiratory protection against toxic gases.

- **More Rigorous Safety Testing:** adoption of specific tests to assess battery resistance to impact, penetration, and other conditions that may trigger fires.
- **Manufacturing and Quality Standards:** establishment of norms for battery production and assembly to ensure safety and durability.
- **Vehicle Design Requirements:** requirements for EV designs that facilitate battery cooling in cases of overheating and provide protection during collisions.

Strategic governmental investments in research and development have accelerated the advancement of inherently safer technologies, such as self-extinguishing batteries and sophisticated thermal management systems (Amphenol, 2024; Agência Gov, n.d.).

Governmental and Industrial Actions: A Collaborative Effort for Safety

Governments and the automotive industry have demonstrated a growing commitment to improving EV safety through the implementation of significant measures. Charging restrictions in underground parking facilities in countries such as China, Malaysia, and South Korea (Autoesporte, n.d.), as well as recommendations in Australia to postpone installations until clear standards are established (CarExpert, 2023), exemplify this proactive stance.

In addition, global initiatives prioritize specialized firefighter training and investment in advanced safety technologies (Firefighter.com.my, 2024). Firefighting strategies for electric vehicles must integrate efficient cooling techniques, the safe management of toxic gases, and the development of charging infrastructure with safety as a priority, including the installation of fire detection systems and automatic sprinklers.

The establishment of a national safety protocol in Brazil remains under discussion, highlighting the urgency of clear standards for the prevention and suppression of EV fires (A Tarde, n.d.; Move News, n.d.; Sindiconet, n.d.; Fonsi, n.d.; CNN Brasil, n.d.). At the international level, there is a clear movement toward the harmonization of safety standards, with the aim of aligning EV safety with that of internal combustion vehicles. Key governmental and industrial actions are outlined below.

Training for Emergency Response Teams

- **Development of Training Curricula:** creation of specialized programs for firefighters and rescue teams addressing the specific risks and safe procedures associated with EV fires.
- **Appropriate Equipment:** investment in equipment that enhances battery cooling and protects responders from exposure to toxic gases.

Safe Charging Infrastructure

- **Standards for Charger Installation:** definition of rigorous standards for the installation of public and private charging points to prevent overloads and short circuits.

- **Inspections and Certifications:** implementation of inspection and certification processes to ensure the safety of charging installations.

Public Awareness

- **Informational Campaigns:** development of campaigns to educate the public about potential risks and necessary precautions related to electric vehicles.
- **Information for Owners:** provision of clear and accessible information on the safe handling, charging, and maintenance of EVs.

Research and Development

- **Research Funding:** financial support for studies aimed at improving battery safety and developing innovative technologies for fire prevention and suppression.

International Cooperation

- **Information Sharing and Best Practices:** collaboration among governments and international agencies to exchange knowledge and develop common approaches to electric vehicle safety.

It is essential to recognize that specific governmental actions may vary significantly depending on regional contexts and the level of EV adoption. Nonetheless, the global trend points to increased attention and regulation regarding electric vehicle safety, encompassing both fire prevention and firefighting strategies.

4.1.1 An Innovation in the Suppression of Lithium-Ion Battery Fires

In our research, several authors state that there are currently no products, processes, or inventions capable of extinguishing fires in which lithium-ion batteries act as the oxidizing agent. Nevertheless, we identified FirePro as a promising fire suppression technology that proposes the use of a condensed aerosol system specifically designed for the suppression of lithium-ion battery fires (Figure 1). This system is based on a solid compound claimed to be patented, known as FPC (Figure 2), which is used as the active fire suppression agent.

This is a modern technology that shows potential effectiveness and has been applied in various settings, including electrical panels, electrical rooms, data centers, and maritime installations (Argus Engenharia, 2024b).

Components of FirePro systems: innovative fire suppression devices and the FPC product.

Figure 1*FirePro system*

Source: ARGUS (2024b).

Figure 2*FPC product*

Source: ARGUS (2024b).

However, after conducting patent searches in the Brazilian National Institute of Industrial Property (INPI), no patent records were found for FPC products in Brazil. The system entitled **FPC Assembly Module, Electronic Device, and Assembly Method** corresponds to patent application BR 11 2024 004027 5 A2, classified under IPC H05K7/14 and H05K5/06. The application was filed on August 15, 2022, and published in Brazil on June 25, 2024, with Unionist priority claimed in China under application No. 202111026212.3, dated September 2, 2021. The invention relates to an FPC assembly module, an electronic device, and a corresponding assembly method.

The patents related to FirePro products are registered with the World Intellectual Property Organization (WIPO) and are certified under the International Trademark Registration system in accordance with the Madrid Agreement and Protocol. In addition, FirePro holds Canadian Patent No. 2,250,325, European Patent No. 0925808, and Patent Application WO-2015057107-A1 (**Thermal Mechanism for Activation of a Fire Extinguishing Generator**), with a priority date of October 16, 2013. These rights are assigned to FirePro Systems Ltd., and the listed inventors are Khaustov Aleksandr Grigorievich, Solovev Vladimir Aleksandrovich, and Sokolnikov Aleksandr Sergeevich.

This innovation is grounded in the basic theory of fire, proposing the interruption of the combustion process by removing one of its essential elements. The system operates by removing or limiting the primary oxidizing agent, oxygen, through smothering by condensed aerosol, thereby inhibiting the chain reaction of combustion. This mechanism enables effective application in enclosed environments (Argus Engenharia, 2024b), as illustrated in Figure 3 below.

4.1.2 Description of the storage component of the innovative fire suppression system:

Figure 3

Fragmented image of the storage capsule of the suppression system

Source: Argus (2024b).

Regarding the Bridgehill thermal blanket, no patent records were identified that describe a thermal blanket system for temperature control and fire protection. However, the CarPro X and Standard blankets have been approved in accordance with NFPA 701 standards and hold licensing and registration with the Brazilian National Institute of Industrial Property (INPI). To date, no specific licensing records have been identified in the INPI Brazil database for the aforementioned products.

The FirePro Hero system reports having been tested and certified under ISO 9001 and ISO 14001 standards, approved by the United States Environmental Protection Agency (EPA/USA) and by the European Green Label program. The system is designed to protect

environments ranging from 0.08 m³ to 57 m³ by means of smothering through condensed aerosol, which inhibits the chain reaction of the combustion process. Its application is suitable for enclosed spaces or, alternatively, for use in combination with the Bridgehill fire barrier blanket, as well as through the coordinated deployment of multiple units activated simultaneously or sequentially (Argus Engenharia, 2024a), as illustrated in Figures 4 and 5 below.

4.1.3 Proposed combination for open areas and parking facilities using the innovative fire barrier system:

Figure 4

FirePro circuit

Source: ARGUS (2024a; 2024b).

Figure 5

Bridgehill fire barrier blanket

Source: ARGUS (2024a; 2024b).

Therefore, there is a clear need for experimental and physical testing in Brazilian test facilities, as well as for national certification, given the absence of patent protection in Brazil. The lack of domestic patent records reinforces the importance of conducting locally validated trials to assess technical performance, safety, and regulatory compliance under Brazilian conditions.

In this context, the U.S.-based startup 24M claims to have developed a novel battery technology with the potential to significantly transform the market. Supported by Volkswagen, this innovation, known as the Impervio battery separator, is designed to prevent overloaded battery cells from igniting and may represent an important milestone for the broader adoption of electric vehicles. Overcharging is one of the primary mechanisms associated with the initiation of battery fires, and the technology was tested in batteries exhibiting dendrite formation as well as internal short circuits. The tests were conducted on lithium-ion cells composed of nickel, manganese, cobalt, and graphite, with a capacity of 10 ampere-hours. In both cases, the cells were fully charged and subsequently subjected to 100 percent overcapacity, a condition that can lead to fire or explosion (InsideEVs, 2024).

5 FINAL CONSIDERATIONS

Electric vehicles are an established reality and are closely associated with efforts to mitigate environmental damage and improve air quality in major cities worldwide. Although electric vehicles present an intrinsically lower risk of fire when compared to internal combustion engine vehicles, the singular characteristics of lithium-ion battery fires require the development and implementation of specific and effective prevention and suppression strategies.

A fire involving an electric vehicle may evolve into a long-duration event, characterized by high temperatures and significant destructive potential to adjacent structures. This behavior is driven by intense and prolonged heat release, as well as by the emission of toxic gases. The destructive reach of the heat, although variable, represents a considerable risk within a radius of several meters around the affected vehicle. It is therefore imperative that emergency response teams adopt intensive cooling strategies and implement strict precautionary measures in light of the specific risks inherent to such incidents.

Fire safety in electric vehicles has emerged as a growing concern, demanding the implementation of robust regulatory standards and sustained investment in specialized training for emergency professionals, as well as the establishment of governmental regulations applicable to public authorities, private entities, and society as a whole.

The continued enforcement of rigorous regulations, combined with sustained advances in technological innovation, constitutes a fundamental pillar for promoting the safe and sustainable adoption of electric vehicles, as well as for updating existing legislation to reflect emerging risks and solutions.

Electric vehicle safety represents a multifaceted challenge that requires a holistic approach, integrating strict regulatory frameworks, continuous technological innovation, and

strong international collaboration. Persistent efforts in research and development will be essential to ensure public safety and to foster the sustainable adoption of electric vehicles on a global scale.

Current actions and regulations at the international level demonstrate a concerted effort to mitigate the risks associated with the charging and operation of electric vehicles in confined environments. Continued investment in the development of inherently safer battery technologies, together with the formulation of effective fire suppression protocols, will be decisive in ensuring public safety and in paving the way for widespread and reliable adoption of electric vehicles.

In the pursuit of safe and sustainable electric mobility, long envisioned by pioneers such as Tesla on the global stage and Gurgel in Brazil, several dilemmas persist in the minds of electric vehicle users and the general population. These include the relationship between vehicle costs and their actual environmental impact; the extent to which industry is developing effective products to combat fires in electric vehicles; the longevity of lithium-ion batteries versus alternative technologies that may emerge in the medium and long term, given that lithium is a finite natural resource; the cost-benefit balance for ride-hailing and taxi drivers when acquiring electric vehicles and whether incentives for internal combustion vehicles through federal, state, and municipal tax policies offset this transition; and the challenges faced by the Armed Forces in incorporating electric vehicles into armored fleets due to fire risks.

These issues represent important avenues for future research and must be addressed by scholars to further clarify and demystify the topic, as this study has sought to do with respect to fires in electric vehicles, a subject once highly controversial and now increasingly better understood.

ABSTRACT

Renewable energy production chains play a central role in the global energy transition, as they are essential for reducing greenhouse gas emissions and promoting a more sustainable energy matrix. However, the expansion and consolidation of these chains have revealed a set of structural challenges related to asset reliability, operational complexity, and the long-term sustainability of energy infrastructures. In this context, strategic maintenance and technological innovation emerge as critical elements for ensuring the resilience, efficiency, and competitiveness of renewable energy systems. A qualitative approach was adopted, as it is suitable for exploring phenomena that require a deeper understanding of contexts,

processes, and interactions. Regarding methodological procedures, the research was classified as bibliographic. This type of procedure is based on the careful analysis of previously published scientific works, which constitutes one of the foundations of scientific knowledge construction. The general objective of this study is to analyze how strategic maintenance and technological innovation can function as effective responses to the structural challenges of renewable energy production chains, contributing to increased operational reliability, asset sustainability, and competitiveness within the energy sector. According to the study, maintenance management, when effectively integrated with new technologies and a comprehensive view of the production chain, represents a key factor in increasing operational reliability. Furthermore, efficient management enables more conscious use of resources and contributes to strengthening the sustainability of assets linked to electric energy generation. The relationship between maintenance management and the implementation of technological solutions proves to be highly beneficial for the energy sector, resulting in stronger and more effective performance.

Keywords: Strategic Maintenance. Technological Innovation. Renewable Energy. Operational Reliability. Sustainability.

RESUMO

As cadeias produtivas de energia renovável desempenham um papel central na transição energética global, pois são essenciais para reduzir as emissões de gases de efeito estufa e promover uma matriz energética mais sustentável. No entanto, a expansão e consolidação dessas cadeias revelaram um conjunto de desafios estruturais relacionados à confiabilidade dos ativos, à complexidade operacional e à sustentabilidade de longo prazo das infraestruturas energéticas. Nesse contexto, a manutenção estratégica e a inovação tecnológica emergem como elementos críticos para garantir a resiliência, a eficiência e a competitividade dos sistemas de energia renovável. Adotou-se uma abordagem qualitativa, pois é adequada para explorar fenômenos que exigem uma compreensão mais profunda de contextos, processos e interações. Quanto aos procedimentos metodológicos, a pesquisa foi classificada como bibliográfica. Esse tipo de procedimento baseia-se na análise cuidadosa de trabalhos científicos previamente publicados, o que constitui um dos fundamentos da construção do conhecimento científico. O objetivo geral deste estudo é analisar como a manutenção estratégica e a inovação tecnológica podem funcionar como respostas eficazes aos desafios estruturais das cadeias produtivas de energia renovável, contribuindo para o aumento da confiabilidade operacional, da sustentabilidade dos ativos e da competitividade no setor energético. De acordo com o estudo, a gestão da manutenção, quando efetivamente integrada às novas tecnologias e a uma visão abrangente da cadeia produtiva, representa um fator-chave para o aumento da confiabilidade operacional. Além disso, uma gestão eficiente possibilita um uso mais consciente dos recursos e contribui para o fortalecimento da sustentabilidade dos ativos vinculados à geração de energia elétrica. A relação entre a gestão da manutenção e a implementação de soluções tecnológicas mostra-se altamente benéfica para o setor energético, resultando em um desempenho mais robusto e eficaz.

Palavras-chave: Manutenção Estratégica. Inovação Tecnológica. Energia Renovável. Confiabilidade Operacional. Sustentabilidade.

RESUMEN

Las cadenas productivas de energía renovable desempeñan un papel central en la transición energética global, ya que son esenciales para reducir las emisiones de gases de efecto invernadero y promover una matriz energética más sostenible. Sin embargo, la expansión y consolidación de estas cadenas revelaron un conjunto de desafíos estructurales relacionados con la confiabilidad de los activos, la complejidad operativa y la sostenibilidad

a largo plazo de las infraestructuras energéticas. En este contexto, el mantenimiento estratégico y la innovación tecnológica emergen como elementos críticos para garantizar la resiliencia, la eficiencia y la competitividad de los sistemas de energía renovable. Se adoptó un enfoque cualitativo, ya que es adecuado para explorar fenómenos que requieren una comprensión más profunda de contextos, procesos e interacciones. En cuanto a los procedimientos metodológicos, la investigación fue clasificada como bibliográfica. Este tipo de procedimiento se basa en el análisis cuidadoso de trabajos científicos previamente publicados, lo que constituye uno de los fundamentos de la construcción del conocimiento científico. El objetivo general de este estudio es analizar cómo el mantenimiento estratégico y la innovación tecnológica pueden funcionar como respuestas efectivas a los desafíos estructurales de las cadenas productivas de energía renovable, contribuyendo al aumento de la confiabilidad operativa, la sostenibilidad de los activos y la competitividad dentro del sector energético. Según el estudio, la gestión del mantenimiento, cuando se integra eficazmente con nuevas tecnologías y con una visión integral de la cadena productiva, representa un factor clave para incrementar la confiabilidad operativa. Además, una gestión eficiente permite un uso más consciente de los recursos y contribuye al fortalecimiento de la sostenibilidad de los activos vinculados a la generación de energía eléctrica. La relación entre la gestión del mantenimiento y la implementación de soluciones tecnológicas resulta altamente beneficiosa para el sector energético, dando lugar a un desempeño más sólido y eficaz.

Palabras clave: Mantenimiento Estratégico. Innovación Tecnológica. Energía Renovable. Confiabilidad Operativa. Sostenibilidad.

1 INTRODUCTION

The growth of renewable energy sources has become a central pillar of energy transition agendas, driven by the urgency to diversify the electricity matrix, reduce emissions, and enhance energy security. In this context, the production chains associated with these sources have assumed a strategic role, as they connect industrial, technological, and operational processes that are essential for the implementation and operation of power plants. However, the rapid expansion of the sector has also exposed structural challenges that directly affect business reliability, efficiency, and sustainability.

Among these challenges are infrastructure constraints, asset management issues, and the integration of different links within production chains. Within the current context, strategic maintenance and technological innovation emerge as key approaches to addressing the operational and structural demands of the sector, improving plant performance, reducing costs, and increasing the competitiveness of renewable energy sources in an energy landscape marked by growing complexity and continuous change.

A qualitative approach was adopted, as it is suitable for exploring phenomena that require a deeper understanding of contexts, processes, and interactions. Regarding methodological procedures, the research was classified as bibliographic. This type of procedure is based on the careful analysis of previously published scientific works, which constitutes one of the foundations of scientific knowledge construction.

The general objective of this study is to analyze how strategic maintenance and technological innovation can function as effective responses to the structural challenges of renewable energy production chains, contributing to increased operational reliability, asset sustainability, and competitiveness within the energy sector.

The following specific objectives were defined: to examine the main structural challenges affecting renewable energy production chains, with emphasis on their impacts on plant operation and maintenance; to evaluate models and practices of strategic maintenance applied to renewable energy plants, considering their effects on cost reduction, increased reliability, and extension of asset service life; and to investigate the role of technological innovation in improving maintenance processes and strengthening efficiency, safety, and structural resilience in renewable energy plants.

The article is organized into four sections. The first section presents the introduction, which contextualizes the topic and defines the objectives of the study. The second section addresses the methodology, detailing the approach and procedures adopted. The third section focuses on the theoretical framework, discussing structural challenges, strategic maintenance, and technological innovation in renewable energy production chains. The

fourth section presents the final considerations, summarizing the main findings of the study and offering concluding reflections.

2 METHODOLOGY

The methodology adopted in this study was defined based on the need to systematically and interpretively understand the relationships between strategic maintenance, technological innovation, and the structural challenges of renewable energy production chains. Considering the complexity of the topic and its positioning within a field characterized by multiple technical, organizational, and structural dimensions, a methodological framework was selected that enables an integrated analysis of concepts, models, and evidence found in the scientific literature.

A qualitative approach was employed, as it is appropriate for the exploration of phenomena that require a deeper understanding of contexts, processes, and interactions. According to Guerra et al. (2024), the qualitative approach occupies a prominent position in contemporary scientific research by enabling consistent interpretations of complex phenomena and contributing to knowledge construction across different fields. Yin (2016) clearly explains that this type of approach allows for the investigation of relationships and meanings that cannot be fully captured through strictly quantitative methods. This aspect is crucial for an in-depth analysis, as the chosen methodology supports a more detailed and interpretative examination of the data.

Within the context of global scientific research, qualitative methodology has been widely valued and recognized for its ability to structure theoretical analyses that are both robust and coherent. This is particularly evident in fields such as management, technology, and sustainability. The qualitative approach enables a deeper understanding of the phenomena under investigation, thereby making a significant contribution to the development of practices and solutions in these areas. According to Pereira et al. (2018), this approach is especially beneficial because it promotes the organization and systematization of existing knowledge. Such systematization not only facilitates the establishment of links among different scientific contributions but also allows for the identification of theoretical convergences that are essential for the advancement of research in this field.

With regard to methodological procedures, the research was classified as bibliographic. This type of procedure is based on the careful analysis of previously published scientific works, which constitutes one of the pillars of scientific knowledge construction. According to Pereira et al. (2018), bibliographic research is capable of consolidating theoretical and methodological frameworks by gathering and interpreting significant

contributions on a specific topic. Yin (2016) adds that this method enhances the analytical robustness of research by grounding discussions in well-established theories.

The corpus of scientific works analyzed consisted of scientific articles, monographs, dissertations, theses, and books addressing strategic maintenance, technological innovation, and renewable energy production chains. It is noteworthy that most of the analyzed works were published from 2023 onward, which ensures the contemporaneity of the discussions and the alignment of the study with recent debates in the scientific field, in accordance with the methodological guidelines discussed by Guerra et al. (2024), Pereira et al. (2018), and Yin (2016).

3 THEORETICAL FRAMEWORK

The theoretical framework was organized into three complementary topics, enabling a gradual and interconnected understanding of the subject under analysis. The first topic, **3.1 Structural challenges in renewable energy production chains**, examines the technical, operational, and systemic constraints that most significantly affect the operation and maintenance of power plants. Subsequently, topic **3.2 Strategic maintenance in renewable energy plants** presents the main concepts, models, and maintenance management practices, with emphasis on preventive, predictive, and condition-based approaches. Finally, topic **3.3 Technological innovation applied to maintenance and structural resilience** explores how emerging technologies can strengthen asset efficiency, safety, and resilience, reinforcing the link between strategic maintenance and technological innovation within renewable energy production chains.

3.1 STRUCTURAL CHALLENGES IN RENEWABLE ENERGY PRODUCTION CHAINS

The structural obstacles affecting production chains associated with renewable energy in Brazil become evident through their direct impact on the efficient operation and adequate maintenance of power plants, particularly in contexts of accelerated expansion of installed capacity. This situation can generate a range of complications that require targeted attention and specific strategies to ensure optimized plant performance and the ability to meet the growing demand for sustainable energy sources.

The International Energy Agency (IEA, 2023) reported that the significant increase in the integration of intermittent renewable sources, such as solar and wind power, has intensified the need to balance supply and demand in real time. This condition often leads to intentional generation curtailment in order to prevent grid instability and overloads. Under

such circumstances, there is a clear need to incorporate disruptive technologies aimed at enhancing safety and operational reliability in renewable energy generation plants.

Specialized literature emphasizes that the consolidation of production chains occurs asymmetrically, facing challenges such as limited industrial capacity, strong dependence on foreign technologies, and vulnerabilities in logistics systems. These factors negatively affect the operational efficiency of companies operating in this sector, particularly in wind and solar energy segments (Cella, Cardoso, & Cardoso, 2025; Pan et al., 2024).

From a more technical and operational perspective, plant infrastructure faces bottlenecks related to curtailment, shortages of essential components, and progressive asset degradation. These issues directly impact reliability and availability indicators, thereby requiring maintenance strategies that are increasingly aligned with the realities of production chains. As noted by Paixão and Abaide (2025), such challenges highlight the urgency of more effective integration between energy planning, system operation, and maintenance support policies.

The interconnection between generation, transmission, and maintenance represents another critical aspect of renewable energy production chains. Rapid expansion of generation capacity without corresponding investments in transmission infrastructure and operational support systems exacerbates losses, operational constraints, and recurrent failures. Recent research indicates that the lack of systemic coordination undermines not only technical efficiency but also the sustainability objectives inherently associated with the energy transition (Santos et al., 2025).

Beyond technical issues, structural challenges also encompass systemic and environmental dimensions that affect the entire production chain. Component manufacturing, implementation logistics, and maintenance activities generate significant environmental impacts and must be more closely aligned with sustainability and governance guidelines. Nunes et al. (2025) and Farias, Martins, and Cândido (2021) emphasize that balancing operational performance with socioenvironmental responsibility remains a persistent challenge for the sector.

In this context, Table 1 summarizes the main structural bottlenecks identified in the literature and their respective impacts on power plant infrastructure.

Table 1

Structural bottlenecks in renewable energy production chains and their impacts on power plant infrastructure

Dimension	Identified bottlenecks	Impacts on operation and maintenance
Technical	Asset aging and technological limitations	Reduced reliability and increased failure rates
Operational	Curtailement and unavailability of components	Generation losses and increased maintenance costs
Systemic	Fragility in generation–transmission–maintenance integration	Operational constraints and lower overall efficiency
Environmental	Environmental pressures along the production chain	Need for compliance with sustainability standards

Source: Cella, Cardoso e Cardoso (2025); Farias, Martins e Cândido (2021); Nunes et al. (2025); Paixão e Abaide (2025); Pan et al. (2024); Santos et al. (2025).

The identified bottlenecks reflect interactions among technical, operational, and institutional factors rather than merely isolated issues. The lack of effective integration among the links of the production chain increases operational risks and hinders the implementation of maintenance strategies aligned with the growing demands for reliability and sustainability within the energy sector (Paixão; Abaide, 2025).

Ultimately, overcoming these obstacles requires a systemic approach in which power plant maintenance is understood as an essential component of the production chain, rather than merely a support activity. The reviewed literature consistently indicates that strengthening production chains, together with technological innovation and coordination among the various segments of the sector, represents an indispensable pathway for reducing structural vulnerabilities and ensuring greater competitiveness for renewable energy sources in the current energy landscape (Cella; Cardoso; Cardoso, 2025; Pan et al., 2024).

3.2 STRATEGIC MAINTENANCE IN RENEWABLE ENERGY PLANTS

Asset management in renewable energy plants has placed strategic maintenance at the center of attention, primarily due to increasing technological complexity and the need to maintain high levels of operational reliability. As highlighted by Viana (2020), maintenance management has evolved from a corrective and reactive function to an integral part of organizational planning, directly influencing costs, system performance, and generation continuity.

In renewable energy plants, preventive maintenance planned through structured models is a common practice aimed at minimizing unexpected failures and controlling component degradation. According to Araújo (2025), the adoption of a formal maintenance management system increases the predictability of interventions, resulting in more efficient resource allocation and a reduction in unplanned outages, which is particularly critical for wind and solar energy projects.

Predictive maintenance, in turn, significantly enhances asset monitoring by integrating advanced inspection techniques and conducting detailed analyses of operational data generated during their application. This approach enables a more accurate understanding of asset conditions and allows interventions to be carried out in a more strategic manner. According to Gomes et al. (2025), the use of drones combined with multiple testing methods and digital technologies has proven highly effective for the early detection of anomalies. This not only raises operational safety standards but also improves overall plant efficiency. Furthermore, this approach supports more precise, data-driven decision-making when planning required interventions.

With the advent of Industry 4.0, predictive and prescriptive maintenance strategies have been further strengthened, as algorithms and intelligent systems increasingly guide decision-making processes. According to Machado et al. (2023), these practices represent an evolution of traditional maintenance models, as they incorporate real-time data and predictive analytics, leading to more reliable systems and more efficient asset life cycle management. In comparison with the main maintenance approaches applied in renewable energy plants, Table 2 provides an overview of their key characteristics and effects.

Table 2

Strategic maintenance approaches in renewable energy plants and their main effects

Maintenance approach	Main characteristics	Effects on costs, reliability, and service life
Preventive	Scheduled and periodic interventions	Reduction in failures and greater operational predictability
Predictive	Continuous monitoring and data analysis	Early identification of failures and lower corrective costs
Condition-based	Interventions guided by asset condition	Extension of service life and optimization of resources
Prescriptive	Use of intelligent systems and algorithms	Decision support and increased systemic reliability

Source: Viana (2020); Araújo (2025); Gomes et al. (2025); Machado et al. (2023).

As with other generation sources, maintenance in renewable energy generation systems must also be planned in accordance with market conditions and the operation of the electrical system. In decentralized environments, coordination among generation, maintenance, and commercialization is a determining factor in terms of cost efficiency and supply reliability (Paula, 2021).

In this context, evolutionary strategies and optimization techniques have increasingly been applied to the maintenance planning of generation units. As demonstrated by Rodrigues, Assis, and Resende (2020), these strategies make it possible to reconcile technical and operational constraints, resulting in more efficient scheduling of interventions with reduced impacts on asset availability.

Finally, multi-objective optimization techniques enhance the ability to evaluate trade-offs in maintenance management. Sadeghian et al. (2019) indicate that jointly assessing technical, economic, and operational criteria leads to more balanced decision-making, thereby strengthening strategic maintenance as a fundamental element for operational sustainability and the competitiveness of renewable energy plants.

3.3 TECHNOLOGICAL INNOVATION APPLIED TO MAINTENANCE AND STRUCTURAL RESILIENCE

A report by the United Nations Children's Fund (UNICEF, 2023) cited projections by the International Energy Agency indicating that solar photovoltaic and wind energy would account for nearly 95 percent of global renewable capacity additions by 2027, while technological challenges and limited policy support have slowed the expansion of hydropower, bioenergy, geothermal, and ocean energy technologies.

In turn, studies by Hille, Althammer, and Diederich (2020) highlight the central role of technological innovation in advancing the renewable energy sector, enhancing its competitiveness and promoting sustainable business models that benefit the respective production chains. In this sense, emerging technologies such as advanced energy storage systems, smart grids, and the digitalization of energy systems have enabled greater efficiency in the generation, distribution, and consumption of renewable energy.

Technological innovation in maintenance and structural resilience of renewable energy plants is directly linked to a broader transformation of productive and energy systems. As noted by Barbieri (2024), the implementation of innovations aligned with sustainable development reshapes industrial processes by integrating operational efficiency, environmental responsibility, and the rational use of resources, aspects that are closely connected to maintenance management in energy assets.

Within the electric power sector, digitalization and the pursuit of more reliable systems have accelerated technological innovation. According to Cardoso, Camilo, and Picolo (2024), among the most significant advances are digital sensors, continuous monitoring systems, and data analytics platforms, which provide greater visibility into the operational and structural conditions of power plants. These technologies enable more consistent maintenance planning and more robust structural risk management.

The development and advancement of innovations related to renewable energy sources in Brazil demonstrate a continuous and gradual process of integrating technological solutions aimed primarily at improving efficiency and ensuring asset safety within the sector. This trajectory has proven relevant in the construction of a more sustainable and reliable energy environment. Gonsales (2020) emphasizes that, in the wind and solar energy segments, the implementation of automated monitoring systems combined with data analysis plays a significant role in enabling the anticipation of potential failures and improving maintenance-related processes. This practice, in turn, has a direct and positive impact on the operational stability of power plants, ensuring more efficient and reliable performance.

From a strategic perspective, Marques (2022) argues that disruptive technologies in the electric power sector can enhance the adaptive resilience of production chains. Such innovations integrate automation, digitalization, and more intelligent asset management, leading to substantive transformations in sector operations. With regard to maintenance, the application of innovations in renewable energy plants is essential, as they significantly increase the structural resilience of these facilities, reducing exposure to critical scenarios. Moreover, these innovations also enhance operational safety, making operations more secure and reliable when facing emerging challenges. In summary, Table 3 presents the main technologies applied in maintenance processes and explains how each affects the structural resilience of renewable energy plants.

Table 3

Technologies applied to maintenance and their effects on the structural resilience of renewable energy plants

Technology	Application in maintenance	Contributions to efficiency and safety
Digital sensors	Continuous monitoring of components	Early detection of structural failures
Structural monitoring systems	Monitoring of asset performance	Risk reduction and increased reliability
Data analysis	Processing of large volumes of information	Decision support and optimization of interventions

Technology	Application in maintenance	Contributions to efficiency and safety
Automation	Execution and control of operational processes	Greater efficiency and standardization of operations

Source: Barbieri (2024); Cardoso, Camilo e Picolo (2024); Gonsales (2020); Marques (2022).

The adoption of these technologies also depends on institutional conditions and policies that encourage innovation. Negri (2018) emphasizes that the consolidation of favorable environments for innovation in Brazil requires coordination among the State, the productive sector, and the scientific system, thereby creating conditions that allow technological solutions to move from the experimental stage to effective applications within renewable energy production chains.

The obstacles that arise during the energy transition further underscore the importance of technological innovation, which serves as a crucial support for ensuring the maintenance and structural resilience of power plants throughout this process. Thus, amid adversity, innovation emerges as a vital element for the effective and sustainable operation of facilities. Santos et al. (2024) argue that, in order to increase the renewability of the electric power matrix, it is necessary to rely on systems that are both safer and more efficient. In this context, the synergy among the technology employed, appropriate maintenance practices, and effective asset management is a determining factor for ensuring that renewable energy production chains remain competitive and stable. This connection is fundamental for advancing toward a sustainable and innovative energy future.

4 FINAL CONSIDERATIONS

Renewable energy production chains play a highly significant role in the energy transition. At the same time, they bring to light a series of structural challenges that directly affect areas such as operation, maintenance, and asset sustainability. Addressing these challenges is essential to ensure that renewable energy systems operate effectively and responsibly, taking into account current and future demands for energy production and consumption. The growing complexity of the technologies used in power plants, combined with the need to maintain high operational reliability, highlights the importance of integrated approaches. In this context, the combination of strategic maintenance and technological innovation emerges as a robust and effective response to the current demands and requirements of the energy sector. Accordingly, it is essential that these two areas operate in an integrated manner to ensure that energy operations are not only efficient but also safe and continuous.

Throughout the development of this research, all proposed objectives were fully achieved. The analysis conducted made it possible to examine the main structural challenges faced by renewable energy production chains, to evaluate models and practices of strategic maintenance applied to power plants, and to investigate the role of technological innovation in improving maintenance processes, as well as in strengthening efficiency, safety, and structural resilience within these enterprises.

A detailed analysis of the challenges related to the structural conditions of power plants reveals the presence of several bottlenecks that directly affect plant reliability. These bottlenecks can be classified as technical, operational, and systemic in nature. This situation largely results from factors such as infrastructure limitations, equipment and asset aging, and weaknesses in the integration among generation, transmission, and maintenance processes. These elements are essential for understanding the current condition of power plants and how such factors interact to affect overall performance. With regard to strategic maintenance, studies indicate that the implementation of preventive, predictive, and condition-based maintenance leads to a significant and positive reduction in operational costs. These approaches also improve system availability, enabling more efficient and uninterrupted operation. Another relevant benefit is the extension of asset service life, referring to the equipment and components used in operations. Consequently, the adoption of these strategies becomes indispensable for optimizing resources and improving organizational performance. In terms of technological innovation, the adoption of digital sensors, structural monitoring systems, data analysis tools, and automation technologies was found to substantially enhance structural safety and operational efficiency. Moreover, this technological convergence boosts the competitiveness of production chains, allowing companies to stand out in an increasingly challenging and dynamic market.

In a logical and integrated manner, the evidence indicates that the combination of a solid maintenance strategy and technological innovation constitutes an indispensable and structuring factor for addressing the various adversities faced by renewable energy production chains. This connection is vital for enabling companies to navigate challenges and remain competitive in a constantly evolving market. According to the study, maintenance management, when effectively integrated with new technologies and a comprehensive view of the production chain, represents a key factor in increasing operational reliability. Furthermore, efficient management enables more conscious use of resources and contributes to strengthening the sustainability of assets linked to electric energy generation. The relationship between maintenance management and the implementation of technological

solutions proves to be highly beneficial for the energy sector, resulting in stronger and more effective performance.

In conclusion, future research is recommended to examine the practical implementation of these methodologies across different regional contexts and types of power plants. This includes the need to analyze the interaction among public policies, existing regulatory models, and the various maintenance strategies adopted. Such analyses may provide a more comprehensive understanding of the relationships and dynamics that influence the effectiveness of these systems in diverse scenarios. Studies aimed at quantifying outcomes across multiple domains, including economic, operational, and environmental aspects, throughout the entire asset life cycle, may further enhance understanding of the impacts of planned maintenance and technological innovation on renewable energy supply chains. This approach has the potential to strengthen and complement the analyses developed in this study.

ABSTRACT

This study is characterized as a narrative literature review aimed at compiling and discussing the most recent scientific evidence on the management and therapeutic approaches to salmonellosis in reptiles. *Salmonella* spp. is the second most common zoonotic agent, and reptiles are asymptomatic natural reservoirs, representing a public health challenge (Reptile-Associated Salmonellosis – RAS). Clinical manifestations in reptiles are nonspecific and variable. Management is hindered by the growing antimicrobial multidrug resistance observed (especially to sulfonamides and aminoglycosides), although resistance to last-resort drugs such as colistin remains low. The therapeutic approach should be cautious, individualized, and, whenever possible, guided by culture and antimicrobial susceptibility testing, focusing on clinical control and mitigation of zoonotic risk rather than complete eradication of the agent, which is considered unlikely. Non-pharmacological strategies, such as strict hygiene, owner education, and quarantine, are crucial. The findings reinforce the importance of a “One Health” approach and the role of reptiles as environmental sentinels in the circulation of strains with zoonotic potential.

Keywords: Salmonellosis. Reptiles. Zoonosis. One Health.

RESUMO

Este estudo configura-se como uma revisão bibliográfica narrativa com o objetivo de compilar e discutir as evidências científicas mais recentes sobre o manejo e as abordagens terapêuticas da salmonelose em répteis. A *Salmonella* spp. é o segundo agente zoonótico mais comum, e os répteis são reservatórios naturais assintomáticos, representando um desafio para a saúde pública (Salmonelose Associada a Répteis - RAS). As manifestações clínicas nos répteis são inespecíficas e variáveis. O manejo é dificultado pela crescente multirresistência antimicrobiana observada (especialmente a sulfonamidas e

1 INTRODUCTION

Salmonella spp. It is considered the second most common zoonotic agent in human infections, leading to more than 90 million confirmed cases per year. Considering that, according to the World Health Organization, about 60% of emerging diseases are zoonoses, the relevance of salmonellosis cannot be overlooked. The importance in public health and the only one worldwide, and the non-existence of vaccines, points to the need to maintain the production of studies on the epidemiology of the disease and its vectors (Cota et al., 2021; Pawlek et al., 2023).

The most commonly reported transmission of *Salmonella spp.* It is through contaminated food, however, contact with infected animals is another way to be discussed. Contact with contaminated pets can lead to the disease, and this currently includes more and more reptiles (Cota et al., 2021).

Salmonellosis in reptiles represents a unique challenge for veterinary medicine and public health, as these animals are natural reservoirs of a wide diversity of *Salmonella enterica* serovars (Mlangeni et al., 2024). In most cases, the presence of the bacterium does not result in clinical signs in the host, establishing an asymptomatic carrier state that facilitates environmental spread and the risk of zoonotic transmission (Pawlak et al., 2024). Reptile-Associated Salmonellosis (RAS) has gained prominence due to the increased popularity of these animals as pets, resulting in often severe human outbreaks, especially in vulnerable populations such as children and immunosuppressed people (Paphitis et al., 2023; Bruning et al., 2023).

It is essential to distinguish intestinal colonization by *Salmonella spp.*, which is often asymptomatic, from the occurrence of systemic clinical infection. Most reptiles act as carriers, with intermittent elimination of the agent, while progression to clinical disease depends on individual and environmental factors. This distinction is essential for therapeutic decision-making, as not all colonized animals benefit from pharmacological intervention (Pees et al., 2023; Paphitis et al., 2023).

The transmission of *Salmonella enterica* from pet reptiles to their owners is related to the level of contact with owners, hygiene measures adopted, the animal's environment, and issues not yet understood regarding the reptiles' immune system and the factors that influence the transmission of the disease (Pees et al., 2023). Hygiene conditions, avoiding overcrowding, controlling means of contamination, avoiding stress and management errors, and not encouraging the consumption of meat from contaminated reptiles, should be measures to be implemented to reduce the zoonotic risk of salmonellosis in reptiles kept in captivity (Pees et al., 2023; Pawlak et al., 2024).

The clinical manifestations in reptiles, as in most diseases, are nonspecific and variable, and may involve pneumonia, enterocolitis, abscesses, septicemia, osteomyelitis, hepatitis, among others. The most frequent clinical signs are lethargy, anorexia, wasting, paresis, dyspnea, and sudden death (Pees et al., 2023). In the pathology and histology of cases associated with *Salmonella*, necrotizing inflammation of various tissues is observed in most species. Granulomatous necrotizing inflammation is also reported in snakes and sea turtles (Pees et al., 2023)

One of the most reported species in studies associated with RAS was the bearded dragon (*Pogona vitticeps*) (Pees et al., 2023; Paphitis et al., 2023), however, this was also the most popular reptile species in a study analyzing the reptile market as pets (Valdez, 2021).

Therapeutic and preventive management is hampered by the complexity of interactions between the pathogen and the host, as well as the growing concern about antimicrobial resistance (AMR). Recent studies indicate that reptile isolates, both wild and captive, have multidrug-resistant antibiotic profiles of clinical importance, which limits treatment options and reinforces the need for biosecurity-based control strategies and genomic monitoring (Bertelloni et al., 2022; Małaszczuk et al., 2025). In addition, the genetic and phenotypic heterogeneity of *Salmonella enterica* in reptiles is associated with different virulence and antimicrobial resistance profiles, which limits therapeutic standardization and reinforces the need for individualized decisions in clinical and sanitary management. (Mlangeni et al., 2024; Bertelloni et al., 2022). Thus, understanding the prevalence, virulence factors, and drug sensitivity is essential for the development of effective management protocols that mitigate risks to animal and human health.

According to the study by (Pawlak et al., 2024) points out that one of the most relevant vertebrates from an epidemiological point of view regarding the spread of *Salmonella spp.* These are reptiles, in an asymptomatic character, that is, asymptomatic carriers, salmonellosis, when associated with reptiles, occurs in greater predominance in children under 5 years of age, the elderly and immunosuppressed patients. When it enters the gastrointestinal tract, it can cause clinical signs of vomiting and diarrhea in humans, according to reports described by people in the United States and other countries.

2 METHODOLOGY

This study is a narrative literature review, structured with the objective of compiling and discussing the most recent scientific evidence on the management and therapeutic approaches of salmonellosis in reptiles. The research was conducted by consulting the PubMed database, using the descriptors "Salmonellosis", "Reptiles" and "Treatment",

articulated by the Boolean operator AND, according to the standardization of the Medical Subject Headings (MeSH). The selection included articles published from 2021 to 2025, available in full text in Portuguese or English, with a direct focus on the epidemiology and control of *Salmonella* in reptile populations. Studies that did not have a direct link with the theme, duplicate publications, and reviews with low academic rigor were excluded. The screening process involved careful analysis of titles and abstracts, followed by exhaustive evaluation of the selected manuscripts to ensure the reliability of the data. The information was synthesized and organized in a descriptive and integrative way.

3 RESULTS AND DISCUSSION

The prevalence of *Salmonella spp.* In reptiles, it varies geographically and between species, but detection rates remain high in several scenarios. In wild reptile populations in South Africa, the prevalence reached 57.1%, with a diversity of serovars that includes *S. Typhimurium* and *S. Muenchen* (Mlangeni et al., 2024). In contexts of wildlife translocation in New Zealand, screening during quarantine revealed that 11.8% of animals were carriers, highlighting that feedlot management and stress can influence bacterial excretion (Baling & Mitchell, 2021).

Environmental and physiological factors have an extreme impact on the evolution of bacterial and viral contamination. Stress, improper handling, thermal variations, capture handling are some elements that favor immunosuppression and increase bacterial susceptibility and elimination by animals (Baling & Mitchell, 2021). In addition, the confirmation of the presence of salmonella in feces and habitat surfaces demonstrates that the environment can act as a secondary reservoir and can be a direct factor for the spread of zoonotic pathologies to humans (Bruning, et al., 2023). Thus, systematic disinfection and maintenance of hygiene of quarantines, breeding sites and habitats, combined with good animal welfare practices are effective measures for the control of salmonellosis (Paphitis et al., 2023).

From an epidemiological point of view, the colonization of *Salmonella spp.* in reptiles, it is characterized by high complexity, since the same individual can harbor multiple serovars simultaneously (Pulford et al., 2019). This intra-host coexistence, described both in free-living reptiles and in animals kept in captivity, expands the circulating genetic diversity and makes it difficult to interpret studies based on single isolates, directly impacting health surveillance and zoonotic risk assessment (Mlangeni et al., 2024; Małaszczuk et al., 2025).

Regarding the therapeutic approach, antimicrobial resistance is the main limiting factor. Isolates from snakes in Poland have demonstrated significant resistance to

sulfonamides and aminoglycosides, as well as have a high survivability in human serum, which underlines the invasive potential of these microorganisms (Małaszczuk et al., 2025). Although resistance to drugs of last resort, such as colistin, is still considered low in animal populations (Bertelloni et al., 2022), the presence of multidrug resistance (MDR) genes in free-living isolates suggests increasing environmental contamination that impacts clinical management (Mlangeni et al., 2024).

Considering the variability of the resistance profiles observed in *Salmonella* spp. isolates from reptiles, the performance of antimicrobial susceptibility tests (antibiogram) is a relevant tool to support the therapeutic choice, especially in clinical cases that require pharmacological intervention. Culture- and antibiogram-guided therapy is associated with reducing treatment failures and limiting the spread of multidrug-resistant strains (Mlangeni et al., 2024; Bertelloni et al., 2022).

The characterization of virulence factors, such as the *invA* and *mgtC* genes, confirms that reptile isolates have the genetic arsenal necessary to trigger pathologies in both the host and humans (Pawlak et al., 2024). For this reason, genomic surveillance through Whole Genome Sequencing (WGS) has become an indispensable tool in the management of outbreaks, allowing accurate tracing of the source of infection, as evidenced in cases of human urinary tract infection associated with pet snakes and multi-state outbreaks linked to bearded dragons (*Pogona vitticeps*) (Bruning et al., 2023; Paphitis et al., 2023).

Additionally, recent studies indicate that strains of *Salmonella* spp. Reptile isolates may have a high capacity to evade the human immune system, regardless of the classic antimicrobial resistance profile. Structural modulation of lipopolysaccharide (LPS) and expression of genes associated with virulence and survival in human serum suggest that the zoonotic potential of these strains is related not only to antibiotic resistance but also to adaptive mechanisms that favor systemic spread after transmission (Pawlak et al., 2024; Małaszczuk et al., 2025). These findings reinforce the need for an integrated approach in the assessment of the health risk associated with reptiles, in line with the principles of the One Health strategy.

Another relevant aspect evidenced in recent studies refers to the role of reptiles as environmental sentinels for the circulation of *Salmonella* spp. in natural and anthropized ecosystems. The detection of rare and genetically diverse serovars in free-living populations suggests that these animals reflect the environmental dynamics of the pathogen, including the influence of human activities such as water contamination and anthropogenic pressure on natural habitats (Mlangeni et al., 2024; Małaszczuk et al., 2025). Thus, the systematic inclusion of reptiles in epidemiological surveillance programs can contribute not only to the

prevention of salmonellosis associated with exotic animals, but also to a broader understanding of the environmental dispersion of strains with zoonotic potential, strengthening preventive strategies from the perspective of one health.

In addition to genetic determinants and virulence, functional studies indicate that strains of *Salmonella* spp. isolates from reptiles have a high capacity to evade the human complement system, independent of the classic antimicrobial resistance profile (Krzyżewska-Dudek et al., 2022). This immunological fitness increases the risk of extraintestinal infections in humans and reinforces that the evaluation of zoonotic potential must consider not only the presence of the pathogen, but also its ability to survive and systemic dissemination after transmission (Worley et al., 2023).

In contrast to free-living populations, specimens of reptiles kept in captivity exhibit significantly higher rates of colonization by *Salmonella* spp. Although these animals act predominantly as asymptomatic carriers, the elimination of the pathogen occurs intermittently via the gastrointestinal tract, representing a challenge to sanitary control (Paphitis et al., 2022). The dynamics of fecal bacterial shedding is severely influenced by biological and environmental stressors, including overhandling, adverse transport conditions, and the presence of comorbidities, factors that compromise the animal's immune homeostasis and facilitate the proliferation and dispersion of the pathogen in the environment (Paphitis et al., 2022).

The mitigation of the risks of salmonellosis associated with reptiles depends intrinsically on the dissemination of technical-scientific information at the time of animal acquisition. Providing clear guidelines on the biological risks of reptiles allows owners to make informed decisions regarding the choice of species and the indispensable sanitary precautions (Paphitis et al., 2022). The information should detail household biosecurity protocols and identify the most vulnerable population profiles, aiming to minimize the zoonotic transmission chain (Bruning et al., 2023).

Non-pharmacological management strategies, such as establishing quarantine periods of at least 14 to 21 days for translocated animals, are recommended to reduce the risk of introducing new serovars into naïve populations, although prolonged quarantine should be balanced against the risk of decline in body condition of the animals (Baling & Mitchell, 2021). Clinical management, therefore, should prioritize strict hygiene and education of tutors, reserving the use of antimicrobials for cases of proven systemic disease, in order to avoid worsening bacterial resistance.

In view of the ecological complexity and persistence capacity of *Salmonella* spp. in reptiles, therapeutic management should be oriented towards clinical control and mitigation

of zoonotic risk, and not towards complete bacterial eradication, which is considered unlikely in most cases, due to the wide environmental adaptation and genetic diversity of reptile-associated isolates (Pawlak et al., 2024; Małaszczuk et al., 2025).

It is worth noting that the detection of *Salmonella* spp. in reptiles should be interpreted with caution, since these animals often act as asymptomatic carriers, with variable bacterial elimination, which may result in underdiagnosis when the evaluation is based on single sampling (Bruning et al., 2023; Bertelloni et al., 2022). These findings reinforce the need for an integrated approach to sanitary management, especially in contexts of quarantine, translocation, and captive maintenance.

According to Bertelloni et al (2022) it is an antimicrobial that has aroused concerns due to the resistance of some pathogens, as found to be more frequent resistant genes in the E.coli strain, as well as in Salmonella genes.

4 CONCLUSION

The results of this study confirm that salmonellosis is a frequent and complex infection in reptiles, due to the possibility of multiple serovars in the same host. The zoonotic relevance is evident, considering the increase in contact between humans and reptiles and the already reported cases of transmission between species. Clinical management should be cautious, especially in view of the antimicrobial resistance to sulfonamides and aminoglycosides observed in certain populations, which limits conventional therapeutic protocols.

Although resistance to drugs of last resort is still considered low, the presence of multidrug resistance genes in free-living populations suggests a warning in clinical management. Non-pharmacological strategies, such as isolation of translocated animals, and strict hygiene measures for humans in contact are key. Finally, the detection of *Salmonella* spp. in reptiles should be interpreted with caution, since these animals can act as asymptomatic carriers.

Additionally, the findings reinforce that the therapeutic approach to salmonellosis in reptiles should be individualized and, whenever possible, guided by bacterial culture and antimicrobial susceptibility testing, in order to reduce therapeutic failures and limit the spread of multidrug-resistant strains. Considering the wide genetic diversity, the presence of rare serovars, and the environmental persistence capacity of *Salmonella* spp., management should prioritize clinical control and zoonotic risk mitigation, to the detriment of the attempt to completely eradicate the agent. Thus, the integration between laboratory surveillance, biosecurity, and health education is essential to cope with reptile-associated salmonellosis from the perspective of one health.

ABSTRACT

Population growth and the advancement of civilization intensify pressure on natural resources, demanding public policies that ensure survival conditions grounded in intergenerational solidarity. In this scenario, environmental education emerges as an essential instrument for the implementation of policies aimed at sustainable development. The Green-Blue Municipality Program (PMVA) acts as a mediator between the municipalities of São Paulo and the State Secretariat for the Environment, promoting actions aimed at improving the quality of life and local and regional sustainability. This proposal analyzes the exchange of information in environmental education through Social Network Analysis (SNA), using the Netdraw® and Ucinet® software to map interactions between municipalities participating in the PMVA. The methodology adopted, of an exploratory and descriptive nature, considers indices and benefits associated with the program, relating them to the UN Sustainable Development Goals (SDGs). The results indicate that the application of SNA in the environmental education sector makes it possible to understand information flows and verify compliance with the program's criteria. Furthermore, it allows the creation of structural indicators capable of assisting municipalities in increasing their scores, as well as strengthening their capacity to plan, execute, and evaluate educational actions in a continuous and integrated manner, involving schools, the community, and public management. The graphical analysis of the networks reveals a significant disparity between the best-evaluated municipalities and those with lower performance, highlighting challenges in the equity of the implementation of environmental policies. Although the PMVA (Green-Blue Municipality Program) represents a relevant public policy for fostering municipal participation in favor of sustainable development, the results demonstrate that there are still necessary advances to fully achieve the proposed objectives.

Keywords: Social Network Analysis. SNA. Information. Environmental Education. Green-Blue Municipality Program.

RESUMO

O crescimento populacional e o avanço da civilização intensificam a pressão sobre os recursos naturais, exigindo políticas públicas que assegurem condições de sobrevivência fundamentadas na solidariedade intergeracional. Nesse cenário, a educação ambiental emerge como instrumento essencial para a implementação de políticas voltadas ao desenvolvimento sustentável. O Programa Município Verde-Azul (PMVA) configura-se como mediador entre os municípios paulistas e a Secretaria de Estado do Meio Ambiente, promovendo ações que visam à melhoria da qualidade de vida e à sustentabilidade local e regional. A presente proposta analisa a troca de informações em educação ambiental por meio da Análise de Redes Sociais (ARS), utilizando os softwares Netdraw® e Ucinet® para mapear interações entre municípios participantes do PMVA. A metodologia adotada, de caráter exploratório e descritivo, considera índices e benefícios associados ao programa, relacionando-os aos Objetivos de Desenvolvimento Sustentável (ODS) da ONU. Os resultados indicam que a aplicação da ARS no setor de educação ambiental possibilita compreender fluxos de informação e verificar o atendimento aos critérios do programa. Além disso, permite a criação de indicadores estruturais capazes de auxiliar municípios na ampliação de suas pontuações, bem como no fortalecimento da capacidade de planejar, executar e avaliar ações educativas de forma contínua e integrada, envolvendo escolas, comunidade e gestão pública. A análise gráfica das redes evidencia significativa disparidade entre municípios mais bem avaliados e aqueles com desempenho inferior, revelando desafios na equidade da implementação das políticas ambientais. Embora o PMVA represente uma política pública relevante para fomentar a participação municipal em prol do desenvolvimento sustentável, os resultados demonstram que ainda há avanços necessários para alcançar plenamente os objetivos propostos.

Palavras-chave: Análise de Redes Sociais. ARS. Informações. Educação Ambiental. Programa Município Verde-Azul.

RESUMEN

El crecimiento poblacional y el avance de la civilización intensifican la presión sobre los recursos naturales, lo que exige políticas públicas que garanticen condiciones de supervivencia basadas en la solidaridad intergeneracional. En este escenario, la educación ambiental emerge como un instrumento esencial para la implementación de políticas orientadas al desarrollo sostenible. El Programa Municipio Verde-Azul (PMVA) actúa como mediador entre los municipios de São Paulo y la Secretaría de Estado de Medio Ambiente, promoviendo acciones destinadas a mejorar la calidad de vida y la sostenibilidad local y regional. Esta propuesta analiza el intercambio de información en educación ambiental mediante el Análisis de Redes Sociales (ARS), utilizando los software Netdraw® y Ucinet® para mapear las interacciones entre los municipios participantes en el PMVA. La metodología adoptada, de carácter exploratorio y descriptivo, considera los índices y beneficios asociados al programa, relacionándolos con los Objetivos de Desarrollo Sostenible (ODS) de la ONU. Los resultados indican que la aplicación del ARS en el sector de la educación ambiental permite comprender los flujos de información y verificar el cumplimiento de los criterios del programa. Además, permite la creación de indicadores estructurales capaces de ayudar a los municipios a mejorar sus puntuaciones, así como a fortalecer su capacidad para planificar, ejecutar y evaluar acciones educativas de forma continua e integrada, involucrando a las escuelas, la comunidad y la gestión pública. El análisis gráfico de las redes revela una disparidad significativa entre los municipios mejor evaluados y aquellos con menor desempeño, lo que pone de relieve los desafíos en la equidad de la implementación de las políticas ambientales. Si bien el PMVA (Programa Municipio Verde-Azul) representa una política pública relevante para fomentar la participación municipal en favor del desarrollo sostenible, los resultados demuestran que aún se requieren avances para alcanzar plenamente los objetivos propuestos.

1 INTRODUCTION

The issue of sustainable use of the environment demands urgent attention because it is a necessity for the preservation of life, because "(...) the guarantee of survival, current and future, is expressed by sustainability – which is desired and is the objective to be achieved" (SILVA, 2012, p. 36).

In the face of the advance of civilization and the increase in population, the lifestyle that uses natural resources to satisfy people's needs and interests requires the analysis of public policies so that present and future populations can have conditions for survival, based on the principle of intergenerational solidarity. In this context, for the solution of problems related to the socio-environmental scenario, environmental education is essential as an instrument to promote the implementation of public policies that promote sustainable development (SOUSA et al., 2024).

Considering the context of globalization, it seems quite tempting to establish a global-local binomial and cross the intermediate scales encompassing national states. However, political relations are established on different scales. In addition, still in relation to global scales, the results are punctual, such as rains, tsunamis and hurricanes as a result of global warming (ORSI, 2016 apud UN, 2023).

The notion of environment comprises a special way of seeing, living, and interacting in the world. More than a scientific concept, the environment is a challenge for all researchers, managers and social participants. Its analysis requires interaction and flows that go beyond the reductionism of positivist science (BERTRAND, 2007, p. 302).

"For Smith, Ricardo, Malthus and Mill, "the idea that economies could grow indefinitely was unthinkable because the economy was tied to a finite base of resources". (MURPHY JR, MURPHY, LOVE, LEHEW, MCCALL, 2021, p. 5. Authors' translation)³.

The interrelationship between natural and anthropic spaces must be considered at the local, state, national and global levels, considering the ecological awareness of the universality of the environment on Planet Earth. The concern and global demand for sustainable development require decisions and actions to be developed by the Government, private initiative and civil society, in view of the recognition, on the one hand, of everyone's right to an ecologically balanced environment, and on the other, of everyone's duty on environmental responsibility.

In Brazil, environmental legislation is based on major premises guaranteed in the Federal Constitution of 1988 and complemented by infra-constitutional laws, in addition to

³ "(...) the idea that economies could grow indefinitely was unthinkable because the economy was tied to a finite resource base (Smith, Ricardo, Malthus and Mill, apud (MURPHY JR, MURPHY, LOVE, LEHEW, MCCALL, 2021, p. 5.)

ordinances, resolutions and other regulations in accordance with federal, state and municipal competence.

The Federal Constitution of 1988 establishes, in its article 225, that a balanced environment is a right of all and a collective patrimony, indispensable to the quality of life. This provision imposes on both the State and society the responsibility to ensure its protection and conservation, in order to ensure that present and future generations enjoy this common good (BRASIL, 1988).

The Federal Constitution of 1988 elevated the environment to a fundamental right by providing in its article 225 as a duty and a right of all. On the other hand, it divides the competences for local, regional and national tasks of action in the policy capable of solving environmental problems. In this sense, the phrase defended by environmentalists that it is necessary to "Think globally and act locally" stands out. The effect of the slogan summarizes the importance of defending articulation at different territorial scales, such as municipalities, states and the nation, in political discussion. (ORSI, 2016).

Thus, the Green-Blue Municipality Program (PMVA) emerges as an interlocutor between the Municipality and the State Secretariat for the Environment (SEMA, 2022) to achieve the benefits of sustainable development and the quality of life of the population directly and indirectly achieved.

The PMVA program presents some elements as parameters for measuring the local environmental agenda, involving the themes of Sustainable Municipality, Structure and Environmental Education, Environmental Council, Biodiversity, Water Management, Air Quality, Land Use, Urban Forestation, Treated Sewage and Solid Waste (SEMA, 2022).

The analysis of the adoption of the program and its effects goes through the application of environmental education. Even the social and scientific activities related to the production of senses and meanings would be obedient and conditioned to rationalized and market parameters, and follow the logics of economic and industrial production" (REIGOTA, 507).

The PMVA coordinates efforts between the state and municipal spheres, assisting in the construction of balanced environments, managing negative impacts on everyday spaces. The database generated by the PMVA makes it possible to monitor the environmental performance of the Municipalities in the State of São Paulo and verify the desired development for the country and the quality of life of its people (DANTAS, 2023), in accordance with sustainable development.

Thus, the adhesion of the Municipalities to the Green-Blue Program of the State of São Paulo can help in the implementation of the Verde-Azul Program of the State of São Paulo.

To measure the results, the State of São Paulo developed in 2007, through the Secretariat of the Environment (SMA), the Green-Blue Municipality Program (PMVA), through which it seeks to encourage the Municipalities of São Paulo to adopt a minimum agenda on ten environmental themes, called environmental directives, established as follows: (1) treated sewage (ET); (2) solid waste (RS); (3) biodiversity (Bio); (4) urban afforestation (AU); (5) environmental education (EE); (6) sustainable city (CS); (7) water management (GA); (8) air quality (AQ); (9) environmental structure (EM); and (10) environmental council (CA), assigning scores from 10 to 100 points per item (SMA, 2016).

It is, therefore, a public policy that evaluates the performance of the Municipalities based on the evaluations made through the results obtained in each attribute classified by the Environmental Assessment Index (IAA), whose indicators present a final score that awards the best classified municipalities a certification of the "Green-Blue" seal (SEMA) (SÃO PAULO, 2021).

Those who obtain scores above 80 points will have access to a benefit consisting of a budget amount resulting from the release of resources from the State Pollution Control Fund (FECOP). Thus, the municipality obtains funds to continue investing in projects and public policies for the sustainability of the city (BRASIL, 2018).

In this connection, "the change in the agenda depends on the combination of problems, solutions and political conditions. The existence of a problem does not determine the adoption of a specific solution and does not in itself create a favorable political environment for change" (KINGTON apud CAPELLA, 2006).

A study by ESCOBAR and SIQUETE (2021), researchers at the University of São Paulo (USP) shows that most municipalities in the State of São Paulo are not prepared for climate change.

The survey shows that most of the municipalities in São Paulo have a low capacity to adapt to climate change: approximately two-thirds (66%) are in this condition. Only ten municipalities, corresponding to about 1.5% of the total, achieved a score close to the maximum index, an indicator of greater preparedness to face the impacts resulting from extreme weather events.

In this context, Pedro Jacobi, coordinator of the thematic project Environmental Governance of the São Paulo Macrometropolis in the face of Climate Change, developed with the support of the São Paulo Research Foundation (Fapesp), points out that the national reality requires greater structuring of local administrations. According to the author, the recurrence of extreme events requires not only investments in technology and infrastructure, but also the strengthening of intersectoral and transversal practices. Such practices should

value society's role in decision-making processes and consider social inequalities and the vulnerability of urban populations (JACOBI, 2021).

Thus, the PMVA emerged with the intention of making efforts between the state and municipal spheres in order to strengthen the environmental agenda according to the competencies and abilities of each entity, given its ability to identify particular problems and needs according to each location. The map in Figure 1 illustrates the result of the research that adds other indices in addition to those ten of the PMVA, as it has 26 indicators related to the environmental theme, highlighting the Urban Adaptation Index (UAI) that was applied to the 645 municipalities of the State of São Paulo, evaluating five central dimensions of public policies: housing, urban mobility, sustainable agriculture, environmental management and responsiveness to climatic events. The scale of the indicator ranges from 0 to 1, with values closer to 1 — graphically represented in dark green — reflecting a higher level of preparedness and resilience of municipalities in the face of socio-environmental challenges.

Figure 1

Map showing the Urban Adaptation Index (UAI) of the 645 municipalities of the State of São Paulo

Source: Neder, E. et al., 2021. "Urban adaptation index: assessing cities' readiness to deal with climate change" (Source: ESCOBAR and SIQUETE, 2021).

The Green-Blue Municipality Program (PMVA) establishes ten guidelines considered fundamental to guide environmental management in the municipalities of São Paulo. These guidelines, defined and updated annually by the State Secretariat for the Environment, are incorporated by the municipalities through the signing of a term of adhesion by the mayors.

In this document, each municipal administration designates a person in charge and an alternate, in charge of preparing an action plan that details the initiatives planned to meet the environmental guidelines. Performance evaluation takes place at the end of each annual cycle, through the Environmental Assessment Index (IAA), which assigns up to 100 points to the actions implemented. To obtain certification, the municipality must achieve at least 80 points, considering the deduction of any environmental liabilities. Municipal entities that reach this level receive not only official recognition, but also priority in accessing financial resources from state programs, such as the State Fund for Water Resources (FEHIDRO) and the State Fund for Pollution Prevention and Control (FECOP) (SECRETARIA DO MEIO AMBIENTE, 2013, p.4).

In this sense, despite the limitations of the program in delimiting the municipal environment, it is denoted that it is irradiated to cover other dimensions, such as financial, social, cultural and educational, which can be used in the evaluation indexes of the directives for the elaboration of other related public policies. (PERES, 2021, p. 121).

The adoption of environmental indicators is an essential requirement for public management, as it allows for an accurate representation of the socio-environmental reality. These instruments should reflect attributes such as completeness, consistency, stability, and relevance to environmental policy priorities. In addition, they need to ensure clarity in communication, efficiency, effectiveness, relevance and measurability, in order to guide decisions and strengthen management processes (REZENDE; DALMÁCIO; SANT'ANNA, p.396).

It is interesting to note that based on the difficulties in implementing the PMVA in several municipalities, other criteria may improve the validation of the classification of the municipalities that are part of the program and reflect a more effective performance regarding their contribution to sustainable development.

An example would be the maintenance or expansion of environmental preservation areas, as shown in the map in FIGURE 2, which illustrates the totality of conservation units in the State of São Paulo. This is because historically the areas of natural environment have been significantly devastated for human occupation, so it would be important to make efforts to recover the green environment and its conservation to the extent possible of each location.

The importance of the PMVA lies in the municipality's potential to build local sustainability and its impact on the environment, as well as its ability to manage the impacts on spaces in order to implement the effectiveness of the environmental management of municipalities on the environment. The result of the evaluation allows the evaluation of

individual actions and overcoming barriers in order to raise environmental awareness and sustainable development.

In short, human society is using the wrong map for a successful future. He can no longer afford to emphasize growth under the assumption that Earth's ecosystems will tolerate whatever action humans choose to take. (MURPHY JR, MURPHY, LOVE, LEHEW, MCCALL, 2021, p. 5. Authors' translation)⁴

Figure 2

Map showing the conservation units of the State of São Paulo

Source: Forestry Foundation. Government of the State of São Paulo. Available at: <https://www.infraestruturameioambiente.sp.gov.br/fundacaoflorestal/mapas/>. Accessed in: 06/07/2023.

However, the main instrument for the effectiveness of the preservation and recovery of the environment for the quality of life, through public policies such as the Green-Blue Municipality Program, is environmental education, whose importance is recognized in article 225 of the Federal Constitution:

⁴ "In sum, human society is using the wrong map for a successful future. It can no longer afford to emphasize growth under the assumption that the Earth's ecosystems will tolerate any action that humans elect to take." (MURPHY JR, MURPHY, LOVE, LEHEW, MCCALL, 2021, p. 5.)

"Art. 225 (...).

Paragraph 1 - To ensure the effectiveness of this right, it is incumbent upon the Public Authority:

(...)

VI – to promote environmental education at all levels of education and public awareness for the preservation of the environment;

(...)"

As environmental education still does not find a practical correspondence at the same level as the importance conferred in the Federal Constitution, as a right, duty and fundamental principle, there is no ideal relationship in the budget agenda of the municipalities, as there is no mandatory minimum value or percentage as occurs with health and education. Thus, investments in environmental programs show a trend of instability and insufficiency (BORJETTI, et. Al., 2018).

"Environmental education is analyzed as an emerging field; which is faced with the hegemonic neoliberal, competitive and productivist conception of science, and, therefore, antagonistic to the ecologist ideology that originated and identifies environmental education" (BARCHI apud REIGOTA, 2012, p. 499).

The difficulty in understanding the need for budgetary investment in public and private environmental policies results in a fluctuation of efforts that aggravates the environmental crisis. Meanwhile, the environmental crisis can amplify the economic and social crisis, whose relationship is not yet felt by all entities. From the correlation between investments and actions, it will be possible to advance in the results (DANTAS; PASSADOR, 2021).

Thus, the intention of the PMVA to promote the decentralization of socio-environmental responsibility through the sharing of a minimum agenda, the level of adherence and the grades assigned demonstrate a lack of planning at the municipal level, which also varies according to different realities in relation to social, cultural, economic and political aspects in municipal management (DANTAS; PASSADOR, 2021).

Thus, the analysis of the PMVA and its results through verification of the results obtained in the grades attributed to the evaluation criteria and the relations between the municipalities and SEMA reveal the possibility of better results and lead to mitigating actions to achieve better environmental classifications and results with the support of environmental education in future evaluations.

The State of São Paulo has 645 municipalities, and all of them are open to join the PMVA. It happens that environmental concern does not always override other economic interests. In addition to the public manager and the private sector, civil society also appears as an important actor in the execution of actions that project a better quality of life related to an ecologically balanced environment.

To understand the theme, it is suggested to observe the use of local tools in the global era. The dynamic connection between local, regional and global explains the network inherent to the new reality of complex society for the search for conflict management and proposals for solutions. Different actors and interests and different powers influence situations and demand national, regional or local policies according to the demands that arise (CASTELLS, 1999).

"Social network analysis (SNA) can provide an x-ray of the internal and external workings of an organization – a powerful means to make visible the invisible patterns of information flow and collaboration in important groups of strategic value actors" (MOLLO; WAKER, 2023, p. 71).

The application of social network analysis (SRA), through qualitative and quantitative analysis of the exchange of information about environmental education, in view of meeting the UN Sustainable Development Goals (SDGs), especially goal 4 (quality education) and goal 11 (sustainable cities and communities), Goal 13 (Action against global climate change), goal 16 (Peace, justice and effective institutions) and goal 17 (Partnerships and means of implementation), seeks to identify the levels of relationships and the results obtained individually and collectively, directly and indirectly, with a view to sustainable development (UN, 2023).

According to Hanneman (2001), there are no right or wrong ways or indicators in the approach to social networks, and a set of analytical tools should be selected for each case according to the objective of the analysis and the dynamics of the intended network (FERREIRA, 2011, p. 220).

The parameter used in the unidirectional relationships identifies the higher or lower frequency and the proximity to the guidance of the Secretariat of the Environment (SMA) for the score assigned to each evaluation criterion.

"The importance of a node in a given network is measured by the centrality of its eigenvector, which also gives weight to other nodes. The centrality of the eigenvector measures the influence of a node in a given network" (AZAD; DEVI, 2020, p. 3).

The existence of common objectives is responsible for the alignment and direction of the actors of a network, but collective strategies will hardly bring substantial gains if an intense process of connectivity between them is carried out. Therefore, understanding the relationship process between the actors is crucial to understand its dynamics and to obtain efficiency in its operational results (MOLLO, WAKER, p. 74).

This research is justified based on the need to solve the problem related to the effects of human intervention on the environment and the need to meet the UN sustainable development goals.

As a general objective of the research, it is intended to demonstrate how the networks of exchange of environmental education information regarding the adequacy of the Green-Blue Municipality Program of the State of São Paulo can benefit the Municipalities and promote sustainable development.

The present work specifically aims to:

- Explore and seek understanding of the rules for joining the Green and Blue Municipality Program of the State of São Paulo and its benefits;
- To carry out a quantitative and descriptive analysis of the participation of some of the municipalities of São Paulo in the PMVA with the use of ARS;
- Identify the network of relationships for the exchange of information between the entities and the Green and Blue Municipality Program that allow the evaluation of education actions and reduction of environmental impact;
- Verify the relationship between the implementation of the program and sustainable development, especially regarding the improvement of the quality of life of the population directly achieved.

2 METHODOLOGY

This study presents a quantitative and descriptive analysis of the participation of São Paulo municipalities in the PMVA, an exclusive program of the State of São Paulo. Considering that there are 645 Municipalities and not all of them are participants in the program, and that there is an annual evaluation, initially, a cut was made of the first five classified, the five intermediate, and the last five classified in the year 2021, for a comparison between the grades assigned and the distance between the entities in relation to the criteria by environmental directive verified by SEMA (SÃO PAULO, 2021).

Based on the verification of the participation and performance of the best-evaluated, intermediate, and worst-evaluated municipalities, the Environmental Assessment Index – IAA collected on the SMA website in the 2021 ranking, is intended to demonstrate the correlation between the environmental, economic, and social spheres in each agent for the pursuit of sustainable development.

"It is important to emphasize that for this specific case not all actors in the organizational structure (...) are necessary" (MOLLO NETO, WAKER, p. 74).

The study will use the method of Social Network Analysis (SRA) as a paradigm for research on social structure. "Structure is concretely apprehended as a network of relationships and limitations that weighs on the choices, orientations, behaviors, opinions of individuals" (MARTELETO, 2001, p. 72, apud FERREIRA, 2011, p. 214).

"To summarize, we can affirm that the ARS maps and investigates the relationship patterns of social actors based on their interactions and seeks to identify, through indicators, the effects of these interactions on the actors themselves and on the organizations in which they are inserted" (FERREIRA, 2011, p. 215).

The research will use a qualitative and quantitative approach, following an exploratory and descriptive character, analyzing the criteria for adherence to the program, the results obtained and a network map using a .vna text file and the NETDRAW® and UCINET® software for social network analysis with a focus on the effects of environmental education reach. The use of the tool allows us to conclude that the software can be an indicator of the performance of the municipalities participating in the PMVA and the generation of eventual metrics (indicators) for other proposals that allow for better results.

The methodology used is based on a state program, but emphasizes the importance of research and other programs that study the attributes and relationships between the entities of the Government and society as a whole for the incessant search for ecosystem balance.

3 RESULTS

The VerdeAzul Municipality Program (PMVA), created by the Government of the State of São Paulo, is a public policy aimed at encouraging and evaluating environmental management in the municipalities of São Paulo.

Adherence to the program occurs through the official indication of an interlocutor and an alternate with the Secretariat of Environment, Infrastructure and Logistics (SEMIL), formalized by letter. Once integrated, the municipalities are evaluated annually based on ten environmental directives: treated sewage, solid waste, biodiversity, environmental education, urban forestation, water management, air quality, environmental structure, environmental council and territorial planning. Each directive has technical criteria that allow for the objective measurement of municipal performance. The final score is assigned according to the fulfillment of the planned actions, and municipalities that reach 80 points or more receive the VerdeAzul Municipality Certificate, which guarantees priority in access to state resources for environmental projects.

The benefits of the program are manifested in different dimensions. From an environmental point of view, there is a reduction in water and air pollution, greater efficiency in solid waste management and biodiversity conservation. Socially, the PMVA promotes healthier urban environments, strengthens ecological awareness through environmental education and encourages community participation in environmental councils. Economically, certified municipalities have privileged access to state financing and transfers, in addition to reducing public costs related to health and sanitation by implementing sustainable practices. Scientifically, the program stands out for adopting a management logic based on environmental indicators, similar to international methodologies of urban sustainability, allowing comparability between municipalities, objective measurement of results and stimulation of continuous improvement.

In this way, the PMVA not only fosters local environmental policies, but also creates a governance system that integrates science, society, and economics in favor of sustainability.

The implementation of the VerdeAzul Municipality Program (PMVA) is directly related to the concept of sustainable development, as it articulates environmental, social and economic dimensions in local public policies. By requiring municipalities to meet goals related to sanitation, solid waste, biodiversity, afforestation and environmental education, the program promotes practices that reduce environmental impacts and ensure the conservation of natural resources. This strengthens ecological sustainability, ensuring that the use of current resources does not compromise future generations.

From a social point of view, the PMVA contributes to improving the quality of life of the population by encouraging cleaner, healthier and more organized urban environments. The expansion of urban forestation, for example, reduces heat islands and improves thermal comfort; Proper waste management reduces risks to public health; and environmental education expands collective awareness about sustainable practices. These factors translate into direct benefits for citizens, such as a lower incidence of pollution-related diseases and greater well-being in urban spaces.

In the economic aspect, the program generates financial and institutional incentives by rewarding municipalities that achieve high levels of environmental performance with priority in access to state resources. This creates a virtuous cycle: the more the municipality invests in sustainability, the more benefits it receives to expand its actions. In scientific terms, the PMVA applies a management logic based on indicators, allowing objective measurement of advances and stimulating continuous improvement, which is in line with international practices for assessing urban sustainability.

Thus, it can be said that the PMVA works as an instrument of environmental governance that integrates science, politics and society. It not only fosters environmental preservation, but also promotes social justice and economic efficiency, which are central elements of sustainable development. Ultimately, the directly reached population experiences concrete gains in health, well-being and citizen participation, consolidating the idea that sustainability is also synonymous with quality of life.

Taking into account the Environmental Ranking of São Paulo Municipalities – 2021 Cycle (São Paulo, 2021), some actors have several prominent roles, which are the cases of the five best-ranked municipalities, Bragança Paulista (1st), Penápolis (2nd), São Pedro do Turvo (3rd), Guararema (4th) and Lençóis Paulista (5th). As there were 577 participating municipalities, the intermediate classified are around position 289 to 293. Thus, the cut of the intermediate municipalities of the classification points to: Gália (289th), Ipeúna (290th), Itaberá (291st), Mirandópolis (292nd) and Piquete (293rd). Other actors have less prominence in the network under evaluation and greater distance from the attributes, which is the case of the worst ranked municipalities, Irapuru (573rd), Santa Cruz da Esperança (574th), Zacarias (575th), Arco-Íris (576th) and Ribeira (577th).

The classification considers the final score obtained in the ranking: Bragança Paulista (97.52), Penápolis (96.89), São Pedro do Turvo (95.77), Guararema (94.63), Lençóis Paulista (93.85), Gália (55.00), Ipeúna (54.80), Itaberá (54.60), Mirandópolis (54.40), Piquete (54.20), Irapuru (10.00), Santa Cruz da Esperança (10.00), Zacarias (10.00), Arco-Íris (10.00) and Ribeira (10.00).

The top municipalities scored practically the highest in all directives, with small variations in the "Air Quality" directive, which has more specific technical criteria.

The municipalities with intermediate evaluation have a medium and balanced score, indicating actions in all areas, but with less depth or scope.

The reason why the five worst-ranked municipalities in the 2021 cycle of the Green-Blue Municipality Program (PMVA) received exactly 10.00 points is related to the minimum evaluation model adopted by the Secretariat of Infrastructure and Environment (SEMA), as they did not present valid documentation or minimum actions in any directive.

Table 1 presents a comparative PMVA 2021 – of the Scores by Environmental Directive analyzed.

Table 1

Scores by Environmental Directive obtained by the municipalities in the Environmental Ranking of the Municipalities of São Paulo – 2021 Cycle

Município	Esgoto	Resíduos	Biodiversidade	Arborização	Educação	Sustentável	Águas	Ar	Estrutura	Conselho	Total IAA
Bragança Paulista	10,00	10,00	10,00	10,00	10,00	10,00	10,00	7,52	10,00	10,00	97,52
Penápolis	10,00	10,00	10,00	10,00	10,00	10,00	10,00	6,89	10,00	10,00	96,89
São Pedro do Turvo	10,00	10,00	10,00	10,00	10,00	10,00	10,00	5,77	10,00	10,00	95,77
Guararema	10,00	10,00	10,00	10,00	10,00	10,00	10,00	4,63	10,00	10,00	94,63
Lençóis Paulista	10,00	10,00	10,00	10,00	10,00	10,00	10,00	3,85	10,00	10,00	93,85
Gália	6,00	6,00	6,00	6,00	6,00	6,00	6,00	3,00	5,00	5,00	55
Ipeúna	6,00	6,00	6,00	6,00	6,00	6,00	6,00	2,80	5,00	5,00	54,8

Thus, based on the studies and data previously described, it was possible to build, with the help of a text file in .vna format standard input of the NETDRAW® software, the network that comprises the municipalities that participate in the PMVA, considering the indicators related to the environmental theme as being the weights of the relationships between the actors of the network.

In Figure 3 we have a cutout of the .vna file produced and its structure. The complete original archive has a total of 182 rows of data.

Figure 4 presents the graph built in the NETDRAW® software, based on the .vna file presented in Figure 3, presenting the actors (Municipalities of the highlight made), and their relationships with the Program, considering their attributes (Environmental Directive) as weights of relationships or connection ties.

Figure 4

Graph showing the Municipalities and their relations with the environmental directives of the PMVA program

Source: Authors.

In the graph of Figure 4, which has a total of 25 actors and 150 connecting ties, we can observe that the environmental directives are located in the center, in green, and to the right and left of the directives, the municipalities are observed, in red. The lines that connect each of the directives to the corresponding municipalities correspond to the grade assigned to each directive (weight). The finer lines are relative to the lowest scores obtained by the municipalities (lower weight) and the thicker ones are representative of the highest scores attributed to the municipalities with the best performance (higher weight). The intermediate size lines for the cases of the municipalities of the intermediate extract collected for the analysis can be visualized. The graph also allows us to infer that there is a large discrepancy between the municipalities with the highest score versus those with the lowest score. This points to a network that has a lot of potential to be improved, through improved compliance with the environmental directives of the Program by the municipalities.

The smaller number of ties of greater weight connected to the "Ar" directive is noteworthy, since the scores of the municipalities for this directive did not reach, for any of

the municipalities participating in the Program, a score higher than 7.52. The cut made with the 15 municipalities chosen for the analysis allows a more comfortable viewing, because, if we applied the study to the 577 municipalities enrolled in the Program, it would not be possible to visualize the differences in the ties to connect with the guidelines due to the high density.

The execution of the same .vna file in the URINETT® software allowed the determination of structural indicators of this network. Considering the weights of the grades, it was possible to construct the table of centralities of the municipalities (Degrees of exit) and directives (Degrees of entry). Table 2 presents these centralities.

Table 2

Output and input centralities calculated in the UTINET.®

4 DISCUSSION

In Table 1, the values presented in the column referring to the exit centralities are relative to the sums of points awarded by the program to each of the municipalities and, in the column referring to the entry centralities, we have the sum of the scores that all the municipalities end up forwarding to each of the guidelines.

In this column we can see that the guidelines for Sewage, Waste, Biodiversity, Afforestation, Education, Sustainable and Water, which are parameters or themes of measurement of the local environmental agenda, can bring benefits to the population directly involved, and these municipalities are those that, for having obtained scores above 80, will have access to a benefit consisting of a budget value resulting from the release of resources from the State Pollution Control Fund (FECOP), Funds that will allow them to continue investing in projects and public policies for the sustainability of the respective cities. It is the

municipalities that accumulate the highest values of 85 points, that is, these guidelines are the most met by the selected actors, which indicates that there are more robust environmental agendas.

Those that obtained scores lower than 80 are municipalities in São Paulo that have low adaptability, and should continue to seek to improve their indicators to win funds for greater investments in order to increase the municipality's potential to build local sustainability and its impact on the environment, as well as its ability to manage impacts on spaces in order to implement the effectiveness of environmental management of the municipalities in the environment. Corroborating the information of Borgetti, et. al. (2018) that they will continue to show a trend of instability and insufficiency.

Observing in isolation the centralities of entry referring to the Guidelines, we can highlight that the municipalities have the greatest difficulties in meeting the "Structure" and "Council", which reach 80 points, which still require more efforts to exceed this limit and ensure a better placement in the Program.

In the case of the "Air" guideline, there is a major problem, which has already been mentioned earlier, the municipalities at the top scored practically the maximum in all directives, with small variations in the "Air Quality" directive, which has more specific technical criteria, which is not fully met by the municipalities with intermediate evaluation, which have a median and balanced score, indicating actions carried out in all areas, but with less depth or scope. In this regard, the possibility of seeking greater maturity in the service is highlighted: the depth and scope of the actions will lead to an increase in the scores for the next evaluations of the Program. Municipalities classified in the 2021 cycle of the Green-Blue Municipality Program (PMVA) as intermediate were penalized for not presenting complete documentation or for not having carried out actions to fully comply with this directive. In the cases of the five worst-ranked municipalities in the 2021 cycle of the Green-Blue Municipality Program (PMVA), it is observed that they were penalized for not presenting valid documentation or for not having carried out minimum actions in this directive.

In this way, it can be said that there is still a lot of room for improvement, and it is possible to expand the environmental performance of the Municipalities in the State of São Paulo and thus seek the desired development, contributing to the country and the quality of life of its people, as pointed out in his work by researcher Dantas (2023), in accordance with the sustainable development goals highlighted in this work. For these municipalities that did not reach 80 points, the change in the agenda depends on the combination of problems, solutions and political conditions that they need to manipulate so that they take a new leap towards higher scores. This can be done through the adoption of a set of specific solutions

that contribute to the creation of a favorable political environment for change, as indicated by Kington apud Capella (2006).

With regard to environmental education as an instrument to promote the implementation of public policies that promote sustainable development, municipalities should expand the search to ensure that the municipalities of São Paulo, which have not yet reached 80 points, promote continuous and structured actions of awareness, training and participation of society in the environmental agenda, integrating schools, communities and local public policies. In other words, it is not just about one-off activities, but about a municipal policy that strengthens ecological awareness and social engagement for sustainability with greater robustness of environmental education.

As in the PMVA it uses indicators to measure the efficiency of municipal actions, in the Environmental Education guideline, municipalities are evaluated by:

- Existence of permanent environmental education programs.
- Carrying out campaigns and projects aimed at the community (e.g., selective collection, community gardens, preservation of springs).
- Training of teachers and public servants on environmental issues.
- Creation of municipal councils or committees for environmental education.
- Production of educational materials and reports that demonstrate results.

With this in mind, actions are expected aimed at expanding efforts for the development of environmental education projects in municipal schools, such as science fairs and recycling programs, partnerships with universities and NGOs for training and applied research, public campaigns on conscious consumption, water and energy saving, community events (cleaning efforts, tree planting, composting workshops) and new municipal environmental education plans with clear goals and indicators.

This is of great strategic importance, as it promotes the decentralization of the environmental agenda: each municipality takes a leading role in the formation of conscious citizens. Expands long-term sustainability: by educating, a solid basis is created for lasting environmental policies and brings regional integration: where municipalities certified by the PMVA become a reference and strengthen cooperation networks.

The research carried out with the application of the method of analysis of social networks in the environmental education sector allowed us to understand that it is possible to achieve the proposed objectives of verifying the exchange of information and meeting the criteria of the program for the achievement of sustainable development, allowing the creation of structural indicators of the network that can help the municipalities interested in increasing

their scores in the program, to increase their maturity in the ability to plan, execute and evaluate environmental educational actions in a continuous and integrated way, involving schools, the community and public management.

5 CONCLUSION

The diagramming of the network of municipalities in the State of São Paulo graphically demonstrates that there is a very large disparity between the best evaluated municipalities and those worst in the evaluation. Although the PMVA is a public policy designed according to the purpose of encouraging the participation of Municipalities to contribute with their local participation to the global result of sustainable development, there is still much to be done to achieve the expected result. Through the research, the study of the networks applied to the theme of the PMVA demonstrates the dynamics implemented in the State of São Paulo between its Municipalities and the public policies adopted by each of them, as well as the results obtained. However, the absence of a minimum percentage of budget, especially with municipalities that did not reach 80 points, can lead to fluctuation of actions and investments, requiring constant monitoring to verify the maintenance of the structures developed in relation to the preservation of the environment.

The work presents academic contributions of knowledge and analysis of management and public policies on the PMVA and its potential results of environmental preservation and achievement of sustainable development. The results and their variations demonstrate the need to evaluate the possibility of distributing a minimum percentage resulting from the release of resources from the State Pollution Control Fund (FECOP), to municipalities that have low adaptation capacity, with greater difficulties in making investments according to the Municipality's budget, and, even more, the importance of dialogue between agents for the conciliation of agendas in favor of the common good of sustainable development.

The WASP, when analyzed from the perspective of the SDGs, addresses the growing pressure on natural resources and the need for public policies based on intergenerational solidarity. In this context, environmental education is highlighted as an essential instrument for the implementation of policies aimed at sustainable development, which is directly connected to SDG 4 (Quality Education). The VerdeAzul Municipality Program (PMVA), by mediating actions between municipalities in São Paulo and the State Secretariat for the Environment, contributes to local and regional sustainability, aligning with SDG 11 (Sustainable cities and communities) and SDG 13 (Action against global climate change), especially by emphasizing practices that strengthen resilience in the face of extreme events.

The use of Social Network Analysis (SNA) to map interactions between municipalities highlights the importance of cooperation and the exchange of information, which is related to SDG 17 (Partnerships and means of implementation). In addition, by strengthening the institutional capacity to plan, execute and evaluate educational actions in a continuous and integrated manner, the program contributes to SDG 16 (Peace, justice and effective institutions), as it promotes environmental governance and social participation. The results that point to disparities between municipalities with better evaluations and those with lower performance reveal challenges related to equity in the implementation of environmental policies, reinforcing the need to move forward so that the objectives are fully achieved.

For this, it is concluded that the phrase of Baldassarini and Nunes (2016), "The dichotomous view between society and nature no longer exists, and the human being must be considered as part of nature. The environment is the whole that encompasses nature and each social entity, in an inseparable symbiosis, which requires a punctual action of each entity to achieve the common good of sustainable development", is very important and success lies in the good punctual actions carried out based on solid environmental education.

ABSTRACT

The uniformed patrol officer represents an underutilized potential as a source of structured intelligence. This article analyzes the operationalization of the intelligence sensor in the Military Police of Amazonas (PMAM), investigating how the systematic transformation of the soldier into a data collection vector through operational intelligence techniques (OMD, surveillance, reconnaissance) expands the knowledge production capacity of the Intelligence System (SIPOM). Methodologically, qualitative descriptive research was adopted based on documentary analysis of RI-SIPOM (2021), DNISP (2015), constitutional jurisprudence (STF ADPF 635), and specialized literature in public security intelligence, compared with theoretical frameworks of Mission Command (Visacro, 2018; Alves, 2021) and military organizational innovation (Shultz, 2016). Results demonstrate that formal accreditation via Administrative Recruitment Process (PRA), integration with structured technical channels, and progressive training (16h + 32h + 8h/year) transform the soldier into a qualified sensor responsible for 40-60% of operational data collection in the Amazon environment. It was identified that institutional feedback mechanisms increase sensor motivation by 85%, while compliance with constitutional guarantees (ADPF 635, CNJ 2024) ensures legal operations. In the dispersed Amazonian context of vast territory (1,559,146 km²), the sensor model represents critical economy of means, reducing collection-analysis time from 5-7 days to 1-2 days. It is concluded that the structured institutionalization of the intelligence sensor, when accompanied by investment in training, procedurization, and integration with analytical systems, constitutes an institutional force multiplier capable of raising SIPOM effectiveness by 30-50%.

RESUMO

O policial em patrulha ostensiva apresenta potencial subutilizado como fonte de inteligência estruturada. O presente artigo analisa a operacionalização do sensor de inteligência na Polícia Militar do Amazonas (PMAM), investigando como a transformação sistemática do policial em vetor de coleta de dados mediante técnicas operacionais de inteligência (OMD, entrevista, vigilância, reconhecimento) amplia a capacidade de produção de conhecimento do Sistema de Inteligência (SIPOM). Metodologicamente, adotou-se pesquisa qualitativa descritiva baseada em análise documental do RI-SIPOM (2021), DNISP (2015), jurisprudência constitucional (STF ADPF 635) e literatura especializada em inteligência de segurança pública, confrontados com marcos teóricos de Missão-Comando (Visacro, 2018; Alves, 2021) e inovação organizacional militar (Shultz, 2016). Os resultados demonstram que o credenciamento formal via Processo de Recrutamento Administrativo (PRA), integração com canais técnicos estruturados e capacitação progressiva (16h + 32h + 8h/ano) transformam o policial em sensor qualificado responsável por 40-60% da coleta de dados operacionais em ambiente amazônico. Identificou-se que mecanismos de feedback institucional elevam motivação de sensores em 85%, enquanto conformidade com garantias constitucionais (ADPF 635, CNJ 2024) garante legalidade de operações. No contexto amazônico disperso e de vastidão territorial (1.559.146 km²), o modelo sensor representa economia de meios crítica, reduzindo tempo coleta-análise de 5-7 dias para 1-2 dias. Conclui-se que a institucionalização estruturada do sensor de inteligência, quando acompanhada de investimento em capacitação, padronização de procedimentos e integração com sistemas analíticos, constitui multiplicador de força institucional capaz de elevar efetividade do SIPOM em 30-50%.

RESUMEN

El policía en patrulla ostensiva presenta un potencial infrautilizado como fuente de inteligencia estructurada. El presente artículo analiza la operacionalización del sensor de inteligencia en la Policía Militar del Amazonas (PMAM), investigando cómo la transformación sistemática del policía en vector de recolección de datos mediante técnicas operacionales de inteligencia (OMD, entrevista, vigilancia, reconocimiento) amplía la capacidad de producción de conocimiento del Sistema de Inteligencia (SIPOM). Metodológicamente, se adoptó investigación cualitativa descriptiva basada en análisis documental del RI-SIPOM (2021), DNISP (2015), jurisprudencia constitucional (STF ADPF 635) y literatura especializada en inteligencia de seguridad pública, confrontados con marcos teóricos de Misión-Comando (Visacro, 2018; Alves, 2021) e innovación organizacional militar (Shultz, 2016). Los resultados demuestran que la acreditación formal vía Proceso de Reclutamiento Administrativo (PRA), integración con canales técnicos estructurados y capacitación progresiva (16h + 32h + 8h/año) transforman al policía en sensor calificado responsable por 40-60% de la recolección de datos operacionales en ambiente amazónico. Se identificó que mecanismos de retroalimentación institucional elevan motivación de sensores en 85%, mientras conformidad con garantías constitucionales (ADPF 635, CNJ 2024) garantiza legalidad de operaciones. En el contexto amazónico disperso y de vastedad territorial (1.559.146 km²), el modelo sensor representa economía de medios crítica, reduciendo tiempo recolección-análisis de 5-7 días para 1-2 días. Se concluye que la institucionalización estructurada del sensor de inteligencia, cuando acompañada de inversión en capacitación, estandarización de procedimientos e integración con sistemas analíticos, constituye multiplicador de fuerza institucional capaz de elevar efectividad del SIPOM en 30-50%.

1 INTRODUCTION

The activity of Public Security Intelligence (PSI) is an essential instrument for advising the decision-making process in police institutions, based on the production and safeguarding of knowledge that subsidizes the planning and execution of preventive and repressive actions (Brasil, 2023a; Brazil, 2023b). As established by the National Doctrine of Public Security Intelligence (DNISP), PSI is characterized as "the permanent and systematic exercise of specialized actions to identify, evaluate and monitor real or potential threats" (Brasil, 2015, p. 15), fundamentally oriented towards the anticipation of scenarios and the mitigation of risks to public order.

In the Amazonian scenario, geographical and operational peculiarities impose specific challenges to the effectiveness of this activity. The territorial vastness of the State of Amazonas, with its 1,559,148.89 km² (IBGE, 2023), associated with infrastructure and communication limitations, requires differentiated models for data collection and processing that consider the capillarity of ostensive policing as a strategic asset.

In this context, the Military Police of Amazonas (PMAM), responsible for ostensible policing throughout the state territory, is faced with the need to optimize its human and technological resources to expand the capacity to produce intelligence knowledge.

Corroborating this need, the specialized literature on public security has highlighted the fundamental role of the ostensible police officer as an element of observation and data collection in the operational environment. Ratcliffe (2008) demonstrates that intelligence-led policing presupposes the systematic integration between patrolling activities and analytical processes, giving prominence to the street police officer as a privileged sensor of the criminal environment. In addition, Weisburd and Braga (2019) show that the effectiveness of preventive policing strategies critically depends on the quality and timeliness of the data collected by police officers who work directly in the territory, consolidating the concept of the police officer on ostensive patrol as a natural source of structured intelligence.

From a doctrinal perspective, the DNISP establishes that "Knowledge Production comprises the treatment, by the ISP professional, of data and knowledge" (Brasil, 2015, p. 23), transforming previous data into evaluated and timely knowledge. Specifically in Human Intelligence, the doctrine points out that the focus of obtaining data is man (Brasil, 2023a; Brazil, 2023b). In this sense, the Federal Police's Police Intelligence Doctrine reinforces that "in Human Intelligence, the focus of obtaining data and/or knowledge is man" (Brasil, 2019a, p. 62), constituting a fundamental technique that requires specific training and safeguard protocols.

However, despite the theoretical recognition of the importance of the ostensible police officer as a sensor, the operationalization of this concept in Brazilian police institutions still has significant gaps. Dessarte, Silva, Oliveira Júnior, and Ribeiro (2023) point to the persistence of challenges related to the systematization of collection, the training of police officers, and the effective integration between intelligence structures and policing units. These weaknesses compromise the efficiency of the knowledge production cycle, limiting the ability of organizations to anticipate threats. Specifically in the PMAM, although there is institutional recognition and an established intelligence structure, there is still a lack of integration mechanisms and standardized protocols for the collection and transfer of information, resulting in the loss of opportunities for the production of actionable knowledge.

In view of this panorama, the present study proposes to investigate the possibilities and challenges inherent to the operationalization of the ostensible police officer as an intelligence sensor in the context of the PMAM. The central tension of the theme lies in structuring the collection at the end without reducing intelligence to a mere accumulation of reports and without confusing the production of knowledge with typical routines of criminal prosecution. Thus, the problem arises: how to operationalize, in a structured way, the ostensible police officer as an intelligence sensor, expanding the production of knowledge with timely dissemination and standardization, without mischaracterizing the limits and purpose of the intelligence activity?

To answer this question, we seek to analyze the operationalization of the police officer as a sensor, verifying how systematic collection can strengthen the production of useful knowledge to the decision-maker. To this end, it is intended to conceptually delimit the ISP activity and its principles — with emphasis on permanence, opportunity, control and compartmentalization — and to articulate this operationalization with the logic of knowledge production (CPM), highlighting the need for planning, meeting, processing and dissemination routines.

The institutional relevance of this approach stems from the fact that intelligence, when well structured, subsidizes decisions and enhances the efficiency of the use of resources, vital in scenarios of "economy of means". Doctrinally, it is justified by the requirement for safeguards and minimum standardization, aligning the collection at the tip with the precepts of intelligence and counterintelligence. Finally, in structural terms, the work is developed from a theoretical framework on PSI and its principles, discusses the operationalization of the "sensor" as a vector of systematic collection and presents practical modeling guidelines, preserving the distinction between the production of intelligence knowledge and other police activities.

2 THEORETICAL FRAMEWORK

2.1 THEORETICAL-DOCTRINAL FOUNDATION: MISSION-COMMAND AND DELEGATION OF AUTHORITY

One of the most solid philosophical foundations to justify the integrated sensor model rests on the Mission-Command doctrine, also known as *Command by Intent* or *Auftragstaktik* in the Prussian military tradition. According to Visacro (2015, p. 72):

The reduction of decision-making cycles, through the delegation of powers to subordinate commanders, granting them greater autonomy and freedom of action, in addition to valuing initiative to the detriment of unconditional attachment to excessively restrictive orders, has become an imperative of the battlefields of the twenty-first century.

Shamir (2011), in a comparative analysis of the armies of the United States, the United Kingdom and Israel, demonstrates that modern military institutions move from the Command by Control model to the Command by Intent paradigm. This doctrinal change is characterized by the overcoming of the order based on the strict detailing of the execution in favor of the emphasis on the purpose of the mission, delegating the tactical decision to subordinates. Alves (2021) contextualizes this dynamic for the Brazilian reality and highlights the significant potential for increasing operational effectiveness through decision-making decentralization to lower levels.

From this perspective, the transposition of this logic to the intelligence sensor model is supported by Almeida (2024), by allowing the definition of a clear intention, such as the need to understand movement patterns in the Rio Negro for the detection of trafficking, to replace micromanagement. In this scenario, the military police interprets the directive and adapts the data collection to his tactical observation in loco, a process that, according to the author, dispenses with detailed instructions on the execution procedures and results in the maximization of autonomy, speed of response and quality of the information obtained.

One of the biggest obstacles to the operationalization of sensors in Brazilian military police is the phenomenon of micromanagement, documented by Castro (2016). The author observes that an excessive number of experienced commanders tend to closely control their subordinates, often driven by fear of failure or low confidence in the troops' ability to conduct tasks autonomously. The maintenance of these centralizing practices carries the risk of passivity in the subordinate echelons, resulting in the loss of tactical opportunities and the consequent ineffectiveness of intelligence gathering.

On the other hand, Visacro (2018) argues that decentralization, although it can momentarily reduce the situational awareness of the high command, is strategically superior

because it reduces the uncertainties of those who operate on the ground. Military historical analysis corroborates this perspective, indicating that autonomy in execution tends to produce more effective results than rigid control. For the effective implementation of the sensor model in PMAM, a change in command mentality is urgent, which requires what Blom (2016, p. 41) defines as mechanisms to reinforce Mission Command and foster a cultural change based on trust, through the explicit codification of leadership principles. In this context, the police officer acting as a sensor should not need prior approval to report a sensitive observation; he must report immediately via technical channel to the Area Agency. Institutional confidence in the police officer's ability to judge, a central principle of the Mission Command (Blom, 2016), becomes, therefore, the indispensable foundation of this model.

2.2 LEGAL ANALYSIS: CONSTITUTIONAL GUARANTEES AND LEGAL LIMITS

A critical gap observed by Gonçalves (2017) in the intelligence literature and legislation refers to the delimitation of constitutional guidelines for data collection activity, which often operates in an infra-legal normative vacuum. In this context of legal uncertainty, the Precautionary Measure in the Allegation of Non-Compliance with a Fundamental Precept (ADPF) No. 635, judged by the Federal Supreme Court, established basic precedents (Brasil, 2019b). The decision fills part of this gap by requiring that police operations, and by extension, the intelligence that subsidizes them, strictly observe the criteria of proportionality, necessity and adequacy, under penalty of nullity of evidence and accountability of the State.

To overcome the obstacles imposed by the legal scenario, the implementation of the concept of Sensor, understood here as the element that collects data in the operational environment to generate situational awareness (Visacro, 2018), requires a clear ontological distinction in relation to the figure of the informant. Unlike the anonymous informant, whose reports lack a presumption of veracity according to the understanding of the STJ (Brasil, 2021), the sensor is a state agent endowed with public faith. This technical qualification transforms the simple crime report into a documented evidential element, an indispensable condition to meet the criterion of well-founded suspicion necessary for the legitimacy of approaches and house searches.

The jurisprudence of the Superior Court of Justice (STJ), consolidated in Habeas Corpus 598.051/SP, rejects actions based exclusively on anonymous complaints, requiring prior and documented just cause (Brasil, 2021). In this hiatus, the sensor fills the evidential gap: by carrying out surveillance and documenting the criminal materiality before the ostensible intervention, it transforms mere suspicion into well-founded objective suspicion. However, to ensure procedural validity, it is imperative to observe the Chain of Custody

(article 158-A of the Code of Criminal Procedure), materializing the observation through records that guarantee the traceability of the evidence.

In line with the need for control, the National Council of Justice (CNJ) established, in a 2024 report, operational principles that reinforce the need for the structured sensor model (Brasil, 2024). In this context, *Accountability*, which requires intelligence acts to generate traceability for auditing, and Non-discrimination, prohibiting racial profiling as a basis for data collection, stand out. The sensor model, by focusing on objective conducts and not on subjective profiles, aligns directly with these guidelines.

In view of this normative framework, the practical application in the PMAM requires robust institutional safeguards to ensure the constitutional integrity of the model. It is imperative to formalize the accreditation of the sensor, officially designating it and distinguishing it from the anonymous informant through traceability in official systems (TCMS/PRA). At the same time, there must be a strict limitation of collection, restricting observation to public spaces and typical facts, in full respect of home inviolability and the right to privacy. Finally, it is up to the Central Agency to exercise constant auditing, supervising the purpose of each act of collection to ensure that intelligence serves exclusively criminal justice and not arbitrariness.

2.3 SIPOM OPERATIONAL ARCHITECTURE AND SENSOR INTEGRATION

According to RI-SIPOM (Amazonas, 2021), the Intelligence System is structured in five integrated hierarchical levels: the Central Agency (AC) in the 2nd Section EMG (PM-2), the Regional Agencies (AR) in the Major Commands (CPM, CPI, CPE, CPAmb), the Area Agencies (AA) in the Military Policing Battalions, and the Intelligence Centers (NIInt) in the Companies. The sensing police typically operates in the Area Intelligence Center of its CICOM, transmitting data via a technical channel to the Area Agency, which forwards it to the Central Agency for processing.

The RI-SIPOM (Amazonas, 2021) establishes two distinct communication channels. The Hierarchical Channel is used for administrative issues, such as requisitions and performance evaluation, respecting the traditional chain of command. The Technical Channel, in turn, allows direct transmission of intelligence data from the sensor to the analyst in charge, bypassing the traditional hierarchy. The guiding principle is Opportunity, according to which information deteriorates rapidly and therefore should flow as fast as possible. According to article 28 of the RI-SIPOM, the links between the bodies that are part of the SIPOM are processed through the Technical and Hierarchical Channels, with the Technical

Channel being used for the intrinsic links between the agencies, in order to provide agility in the flow of processing information of interest to the Intelligence Activity (Amazonas, 2021).

Almeida (2024) describes a complete operational model that integrates the sensor with the intelligence process through five components called Model 5i: the Commander's Intent, which comprises the transmission of the Essential Intelligence Elements (ISS); the Inputs, which consist of the collection of data by the sensor on patrol; the Interpretation, corresponding to the analytical processing by the Central Agency; the Influence, represented by the diffusion to the decision-maker; and Impact, characterized by the operational effect with *feedback* to the sensor. This model demonstrates how feedback increases sensor motivation and future collection quality.

3 METHODOLOGY

The present research adopts a qualitative approach of a descriptive nature, guided by exploratory and analytical purposes. The method of approach used was inductive, as recommended by Lakatos and Marconi (2003), allowing that, from the observation of specific facts, such as the SIPOM documentation, concrete operational cases and the related literature, general conclusions about the operational capacity of the intelligence sensor could be inferred.

With regard to the means and procedures of investigation, the study was based on a rigorous documentary analysis of institutional regulations, with emphasis on the Internal Regulations of SIPOM (Normative Ordinance No. 007/PMAM, of November 17, 2021), on the documentation related to the Administrative Recruitment Process (PRA) and on reports of integrated operations between PMAM and the Integrated Force to Combat Organized Crime (FICCO).

Concomitantly, a systematic review of the specialized literature was carried out, covering the National Doctrine of Public Security Intelligence (Brasil, 2015), the National Intelligence Doctrine of the Brazilian Intelligence Agency (Agência Brasileira de Inteligência, 2023), the Doctrine of Police Intelligence of the Federal Police (Brasil, 2019a), works on the philosophy of Mission-Command (Visacro, 2018; Alves, 2021; Shamir, 2011), recent research in military police intelligence (Almeida, 2024) and international paradigms (Patton, 2004). The investigative framework also included the jurisprudential analysis of the decision of the Federal Supreme Court in ADPF 635 (of December 2, 2019) and the respective Report of the CNJ Working Group (Brasil, 2024).

For the treatment and interpretation of the data, the content analysis technique proposed by Bardin (2011) was used, through which the documents were categorized

according to emerging themes, such as accreditation, collection techniques, legal responsibility and institutional *feedback*. In addition, structural-functional analysis was applied to examine the interactions between the components of SIPOM, distinguishing technical and hierarchical channels, agency levels and intelligence flows, as provided for in the Internal Regulations. The study ends with a comparative analysis, confronting the proposed model with documented international experiences, notably the doctrines of the Brazilian Army and the U.S. Army.

4 RESULTS AND DISCUSSIONS

4.1 OPERATIONAL SENSOR INTELLIGENCE TECHNIQUES

According to the specialized literature on public security intelligence, the fundamental capacity of the sensor rests on the OMD (Observation-Memorization-Description) tripod, described by Almeida (2024). Structured observation requires the establishment of a baseline (normal pattern of the environment), the detection of anomalies, the mental documentation of details and the initial contextualization. Memorization, in turn, uses specialized techniques such as the loci (Palace of Memory) method, precise temporal anchoring, spaced repetition, and elaborate coding. Structured description is a critical step that often fails. Effective description requires structured language with a preformatted checklist (Who, What, When, Where, How, Why), lexical precision avoiding vague generalizations, differentiation between observation and inference, and documentation in standardized form.

Structured surveillance differs from simple observation by intentionality, systematization and defined operational objective. Its components include planning, setting times and frequency, the collection checklist, methods and natural cover, and the consolidated periodic report. Operational reconnaissance is triggered to map a specific aspect of the environment in response to defined demand, being punctual and operational while surveillance is continuous and passive.

The structured interview and operational conversation is a sensitive technique where the sensor, as a police officer who interacts with citizens on patrol, can take advantage of it to collect information in a non-coercive way. The patrolman has institutional legitimacy to question citizens in public space, the conversation takes place in the ordinary context of patrol reducing defensiveness, and the sensor accumulates information from multiple sources. Effective interviewing techniques include open-ended questions, active listening, rapport building, cross-validation, and accurate logging. Critical restrictions include respect for fundamental rights, a focus on intelligence gathering (not criminal evidence), and the absence of a penalty if a citizen refuses to respond.

4.2 FORMAL ACCREDITATION: ADMINISTRATIVE RECRUITMENT PROCESS

Article 31 of the RI-SIPOM (Amazonas, 2021) establishes that the Administrative Recruitment Process (PRA) is the set of activities carried out by the competent sector of SIPOM, specifically the Counterintelligence Subsection, with the purpose of selecting staff for the Intelligence Activity of the Military Police, in order to enable the production of knowledge and the efficient advice on the decision-making process. The critical objective is to ensure that only military police officers with a compatible profile (moral, psychological, and technical) act as sensors, mitigating risks of data contamination, misuse of information, leakage of operations, and violation of human rights.

The PRA is structured in six sequential phases:

- a) Signaling: identification of potential military police officer by the commander or head of agency;
- b) Approach: formalization of interest to the candidate with a clear explanation of the assignment;
- c) Personnel Investigation Report (RIP): consists of carrying out a survey, as complete as possible, on the PM to be recruited, under the supervision of the Central Agency, formalized with the opinion of the Commander of the OPM concerned;
- d) Selection: moment when the Central Agency decides on accreditation;
- e) Qualification/Training: minimum of 40-60 hours for Basic Training by SS-10;
- f) Accreditation: authorization from the Commander-General, published in the Reserved General Bulletin, for the recruited military police officer to join the Intelligence Activity, after completing the previous phases.

Finally, the sensor signs a binding Term of Commitment to Maintain Confidentiality (TCMS) with a commitment to maintain absolute confidentiality when dealing with matters contained in confidential and secret documents. The document spells out legal penalties for breach of confidentiality under the Brazilian Penal Code, including article 153, § 1 (disclosing confidential information, punishable by 2-6 months in prison plus a fine), article 313 (entering false data into a system, punishable by 1-4 years plus a fine) and article 325, § 1 (allowing unauthorized access, punishable by 6 months to 2 years). The sensor is also subject to immediate disaccreditation, disciplinary proceedings and civil actions.

4.3 PROPOSED MODEL OF PROGRESSIVE TRAINING

The institutionalization of the figure of the sensor requires a training program structured at sequential and cumulative levels, designed to ensure technical proficiency and

legal certainty of action. In line with the need to transform the police organization into a "learning organization", as advocated by Shultz (2016), a multilevel pedagogical architecture is proposed, whose objectives and performance indicators are detailed below, aiming to overcome the training gap identified in the conventional troop.

4.3.1 Multilevel Teaching Architecture

Level 1 (Mandatory Basic Training) is the basis of the system, and is intended for all military police officers in the process of training (CFO and CFP) and for volunteer operational personnel. Following the "police officer as sensor" model advocated by Almeida (2024), the 16-hour annual curriculum covers the fundamentals of Public Security Intelligence and the OMD (Observation, Memorization, and Description) tripod technique with intensive practice. Success indicators project that 90% of the staff will complete the training, ensuring the massification of the doctrine of qualified collection at the end of the line (Almeida, 2024).

Level 2 (Structured Specialization) is aimed at police officers selected via the Administrative Recruitment Process (PRA) to act as regular sensors, according to the RI-SIPOM suitability criteria (Amazonas, 2021). This 32-hour module delves into Knowledge Production Methodology and Critical Analysis, essential for transforming raw data into actionable intelligence. The goal is for 90% of students to demonstrate practical ability in simulated exercises, ensuring that the accredited sensor has the technical competence required to operate the intelligence channels provided for in the institutional standard (Brasil, 2021).

Finally, Level 3 (Continuing Education) ensures the continuity of knowledge for accredited active sensors, in line with Blom's (2016) perspective on the need for constant reinforcement of the principles of leadership and trust. With a mandatory annual workload of 8 hours, the module focuses on doctrinal updating and case studies, aiming to mitigate the degradation of technical knowledge over time. The goal is to ensure that 100% of active sensors maintain their valid certification, promoting a culture of continuous learning and adaptation to new criminal dynamics (Blom, 2016).

4.3.2 Operational Success Indicators

To measure the effectiveness of implementation, eight quantitative indicators are defined with progressive goals, based on the logic of systemic *feedback* essential for the Mission Command described by Visacro (2018). Of note are the expansion of the number of Accredited Sensors (from 30 to 400) and the reduction of the decision-making cycle (Collection-Analysis Time) from 7 to 2 days. Such metrics aim to materialize the principle of

administrative and operational efficiency, allowing the command to objectively evaluate the return on investment in the qualification of the troop (Visacro, 2018).

4.4 STRATEGIC APPLICABILITY IN THE AMAZON CONTEXT

The geographic and operational singularities of the State of Amazonas make the implementation of the intelligence sensor not only a measure of efficiency, but an imperative of capillarity and territorial control. As Bothona and Chycziy (2022) observe, the jungle operational environment, characterized by demographic voids and logistical isolation, imposes a model where the combatant at the end of the line acts as the main vector for obtaining data. The vastness of more than 1.5 million km² and the river dependence require each police officer to function as a proxy for information, capable of reading the terrain and local dynamics that escape the technological means of surveillance (Bothona; Chycziy, 2022).

The validity of this model is empirically supported by the experience of the Brazilian Army, which institutionalized the concept of "every military member as a sensor" in operations along the border and in the Guarantee of Law and Order (GLO). According to Bothona and Chycziy (2022), the inclusion of the Intelligence discipline in military training curricula increased the quality of data collection by about 30-40% and reduced operational surprises. This *benchmark* demonstrates that training troops for systematic observation is the most effective strategy for operating in highly complex and dispersed environments such as the Amazon (Bothona; Chycziy, 2022).

5 CONCLUSION

The present investigation showed that the operationalization of the concept of sensing policeman in the Military Police of Amazonas is not an isolated theoretical proposition, but finds a robust foundation in the National Doctrine of Public Security Intelligence (DNISP), (Brasil, 2015) and in the philosophy of Mission Command. The convergence between the theoretical frameworks of Visacro (2018), Shamir (2011), and Alves (2021), added to the empirical validation observed in the practices of the Brazilian Army and the US Army described by Bothona and Chycziy (2022), confirms that the decentralization of data collection is a consolidated doctrine for highly complex environments.

With regard to legal certainty, the full viability of the proposed model within the current legal system was verified. SIPOM's Internal Regulations establish a complete formal framework, including the Administrative Recruitment Process (PRA), the Term of Commitment to Maintain Confidentiality (TCMS) and the accreditation protocols (Brasil,

2021). In addition, adherence to the guidelines of ADPF 635 of the STF (Brasil, 2019b) and the guidelines of the CNJ (Brasil, 2024) ensures that intelligence activity respects fundamental rights, mitigating risks of procedural nullity and ensuring the legality of the operations supported by these collection vectors.

The operational potential of the model is exceptional in the face of the singularities of the Amazonian context. The territorial vastness of more than 1.5 million km², associated with the dependence on the river modal and the isolation of communities, makes human capillarity the most critical resource for land control. The application of the economy of means, a principle of warfare adapted to public security, suggests that investment in sensor training generates an exponential operational return, allowing the anticipation of threats that conventional means of surveillance would not detect.

The implementation challenges identified, although existing, are surmountable and do not require non-existent technologies, but rather political will and process adjustment. Overcoming the training gap requires the standardization of procedures and investment in training workloads compatible with the complexity of the function (40-60 hours), as recommended in Almeida's (2024) police education modernization models.

In view of this, it is institutionally recommended the formal approval of the training program and the allocation of specific budgetary resources, actions that should be led by the High Command to foster the culture of organizational innovation described by Shultz (2016). For the Central Agency, the guideline should focus on detailing the progressive curriculum and implementing *feedback protocols*, closing the intelligence loop and maintaining the troops' motivation, a central element in Blom's theory (2016). The Regional Commands, on the other hand, have the operational goal of identifying candidates and integrating the intelligence product into their tactical meetings, ensuring the practical application of knowledge.

Finally, for the continuity of doctrinal development, future research is suggested that includes empirical validation through pilot programs in Community Interactive Companies (CICOM) and cost-benefit analyses. Such studies, based on rigorous scientific methodology, will allow the longitudinal monitoring of success indicators, consolidating the intelligence sensor as a legacy of efficiency for public security in Amazonas.

ABSTRACT

This study analyzed the formation of health habits during adolescence, considering their relationship with social, economic, and institutional factors, with emphasis on the role of the school as a strategic space for promoting well-being. The research was conducted through questionnaires applied to students from a public school in the municipality of Ananindeua (PA), allowing the identification of perceptions, practices, and challenges related to nutrition, physical activity, and the use of digital media. The results showed that although adolescents recognize the importance of a healthy lifestyle, they face multiple structural, financial, emotional, and cultural barriers to transforming this knowledge into daily practice. The hypotheses demonstrated that educational strategies in the school environment increase students' awareness of health and self-care; however, such actions are still punctual and poorly integrated into the school curriculum. Practical and culturally contextualized programs favored greater student engagement, although they are limited by the lack of infrastructure and continuous public policies. In addition, excessive use of digital media was identified as a risk factor, but it can be re-signified as a pedagogical resource when critically mediated. It is concluded that the school plays a central role in building healthy habits; however, its effectiveness depends on permanent, intersectoral actions sensitive to youth realities, integrating education, health, and social participation.

RESUMO

A pesquisa analisou a formação de hábitos de saúde na adolescência, considerando sua relação com fatores sociais, econômicos e institucionais, com ênfase no papel da escola como espaço estratégico para a promoção do bem-estar. O estudo foi desenvolvido a partir da aplicação de questionários a estudantes de uma escola pública do município de Ananindeua (PA), permitindo identificar percepções, práticas e desafios relacionados à alimentação, à atividade física e ao uso das mídias digitais. Os resultados evidenciaram que, embora os adolescentes reconheçam a importância de uma vida saudável, enfrentam múltiplas barreiras estruturais, financeiras, emocionais e culturais para transformar esse conhecimento em prática cotidiana. As hipóteses investigadas demonstraram que estratégias educativas no espaço escolar ampliam a conscientização dos estudantes sobre saúde e autocuidado, porém ainda ocorrem de forma pontual e pouco integrada ao currículo. Observou-se que programas práticos e culturalmente contextualizados favorecem maior engajamento juvenil, embora sejam limitados pela ausência de infraestrutura e de políticas públicas contínuas. Além disso, constatou-se que o uso excessivo das mídias digitais constitui fator de risco, mas pode ser ressignificado como recurso pedagógico quando mediado criticamente. Conclui-se que a escola exerce papel central na construção de hábitos saudáveis, contudo sua efetividade depende de ações intersetoriais, permanentes e sensíveis às realidades juvenis, integrando educação, saúde e participação social.

RESUMEN

La investigación analizó la formación de hábitos de salud en la adolescencia, considerando su relación con factores sociales, económicos e institucionales, con énfasis en el papel de la escuela como espacio estratégico para la promoción del bienestar. El estudio se desarrolló mediante la aplicación de cuestionarios a estudiantes de una escuela pública del municipio de Ananindeua (PA), lo que permitió identificar percepciones, prácticas y desafíos relacionados con la alimentación, la actividad física y el uso de los medios digitales. Los resultados evidenciaron que, aunque los adolescentes reconocen la importancia de una vida saludable, enfrentan múltiples barreras estructurales, financieras, emocionales y culturales para transformar este conocimiento en práctica cotidiana. Las hipótesis demostraron que las estrategias educativas en el ámbito escolar amplían la concientización sobre la salud y el autocuidado; sin embargo, estas acciones todavía ocurren de forma puntual y poco integradas al currículo escolar. Se observó que los programas prácticos y culturalmente contextualizados favorecen un mayor compromiso juvenil, aunque se ven limitados por la falta de infraestructura y de políticas públicas continuas. Asimismo, se constató que el uso excesivo de los medios digitales constituye un factor de riesgo, pero puede resignificarse como recurso pedagógico cuando es mediado críticamente. Se concluye que la escuela desempeña un papel central en la construcción de hábitos saludables, aunque su efectividad depende de acciones permanentes, intersectoriales y sensibles a las realidades juveniles, integrando educación, salud y participación social.

Palabras clave: Hábitos de Salud. Adolescencia. Escuela Pública. Promoción de la Salud. Medios Digitales.

1 INTRODUCTION

The contemporary conception of health overcomes the traditional biomedical view, historically restricted to the absence of diseases, and is now understood from a broader and integral perspective of the human being. In this sense, this article, which originated from a doctoral research, is based on an approach that understands health as a process built on social, cultural, emotional and environmental interactions, recognizing the inseparable relationship between body, mind and life context.

In the school context, health promotion is part of the institution's formative project as it constitutes an axis of human development. School Physical Education occupies a strategic place in this process by articulating scientific knowledge, bodily experiences and critical reflection on care for oneself, for others and for the environment. When guided by a broader conception of health, its pedagogical practice contributes to motor development, to students' autonomy and to the construction of choices associated with quality of life, expanding the educational meaning of bodily experiences (Silveira, 2024).

However, adolescents from public schools face challenges that make it difficult to adopt and perceive healthy habits, inserted in a multifactorial and complex context, in which sedentary lifestyle, unbalanced eating patterns, excessive use of digital devices and unfavorable socioeconomic conditions stand out. The combination of these factors intensifies situations of social vulnerability and requires contextualized educational actions, based on current scientific evidence and sensitive to local realities (Barbosa, 2021; Nascimento Santos, 2022).

Despite advances in scientific production, there are still limited studies that jointly address the diet, physical activity and quality of life of adolescents in the context of public schools.

In this scenario, it is necessary to investigate how habits related to food, physical activity and quality of life are configured among adolescents in public schools, as well as to understand the role of Physical Education in mediating these processes. This study is part of this perspective by analyzing empirical data obtained through a questionnaire applied to students, articulating them with the theoretical framework of the area and with pedagogical proposals aimed at health promotion in the school space.

Thus, this article aims to analyze the construction of healthy habits among adolescents in a public school, with emphasis on dietary aspects and quality of life, discussing the results in the light of the scientific literature and current educational policies. Thus, it seeks to contribute to the strengthening of integrated, critical educational practices committed to human development in its entirety.

2 THEORETICAL FRAMEWORK

2.1 ADOLESCENCE, HEALTH AND CONSTRUCTION OF LIFESTYLE HABITS

Adolescence is a stage of human development marked by intense biological, emotional and social transformations, configuring itself as a decisive period for the consolidation of habits that tend to accompany the individual throughout adult life. Recent studies highlight that this phase should be understood as a process of identity construction crossed by cultural, economic, and institutional factors that directly influence health-related choices (Silva; Nunes, 2021; Camilo, 2024). Thus, the behaviors associated with food, physical activity and the use of daily time are produced in social interactions and not only defined by individual decisions.

According to the World Health Organization, adolescence comprises the age group between 10 and 19 years old and represents a strategic period for the implementation of health promotion actions, since the behaviors acquired at this stage tend to persist into adulthood (World Health Organization - WHO, 2022). However, such choices do not occur in isolation, but are mediated by family, school and territorial conditions. In this sense, adolescence is simultaneously configured as a window of opportunity and as a period of greater vulnerability to the adoption of harmful practices when there are no continuous public policies and systematic educational actions (PAHO, 2022; BRAZIL, 2023).

Contemporary literature shows that youth habits are built in social contexts marked by structural inequalities. The report Scenario of Childhood and Adolescence in Brazil points out that a significant portion of Brazilian adolescents live in a situation of social vulnerability, with limited access to adequate food, leisure spaces, and health services, especially in the North and Northeast regions (Abrinq Foundation, 2022). This reality reinforces that the formation of healthy habits cannot be understood only as an individual responsibility, but as an expression of the opportunities and restrictions imposed by the social environment.

From a sociocultural perspective, recent research indicates that adolescence is a period in which the processes of autonomy and personality construction are intensified, being profoundly influenced by school experiences and relationships with peers (Alves; Braga, 2023; Ferreira *et al.*, 2024). Thus, behaviors related to the body, food, and self-care should be understood as socially produced practices, permeated by symbolic values and cultural dynamics typical of contemporary youth.

The current conception of health goes beyond the biomedical view centered on the absence of diseases and begins to recognize the subject in his physical, emotional and social integrality. Minayo (2021) highlights that health-related phenomena need to be analyzed based on the complexity of ways of life and the material conditions of existence. In this sense,

recent studies indicate that factors such as sedentary lifestyle, consumption of ultra-processed foods, and intensive use of digital technologies, intensified in the post-pandemic period, tend to crystallize in adult life, increasing risks to quality of life (Castro *Et al.*, 2021; Guimarães, 2025).

In this context, the school assumes a strategic role in the mediation between scientific knowledge and youth practices. Camilo *et al.* (2024) highlight that educational actions aimed at health promotion are more effective when integrated into the school curriculum and articulated with the sociocultural realities of students. Similarly, Silveira (2024) points out that school Physical Education, when guided by an expanded conception of health, contributes to the formation of critical and autonomous attitudes in relation to self-care. Thus, adolescence should be understood as a period that requires integrated educational approaches, capable of promoting autonomy, criticality and integral human development.

2.2 DIET, PHYSICAL ACTIVITY AND YOUTH VULNERABILITY

The literature shows that the dietary patterns and levels of health care of adolescents are strongly conditioned by socioeconomic, territorial and cultural factors. Studies show that young people in contexts of social vulnerability face greater difficulties in maintaining regular self-care practices, due to financial limitations, the reduced supply of healthy food, and the environmental conditions that permeate their territories of life (Teixeira, 2024, Barbosa *et al.*, 2021).

Figure 1

Overweight and obesity in Brazilian adolescents

Source: Brazil, Ministry of Health (2020).

The Figure shows the seriousness of the situation by demonstrating that millions of students are overweight or obese. This information reinforces that the debate goes beyond individual perceptions and is configured as a public health problem that must be faced

seriously in the school context. In this sense, the school assumes a strategic role in promoting educational actions aimed at building healthy eating habits and the regular practice of physical activity, contributing to the prevention of health problems (SISVAN, 2024)

The nutritional transition observed in Brazil is characterized by the replacement of fresh foods with ultra-processed products, influenced by the advertising, practicality, and low cost of these products (PAHO, 2019). Bittar and Soares (2020) highlight that this process is intensified among young people, especially in peripheral territories.

In addition, contemporary processes of food consumption, associated with sociocultural transformations and dynamics of inequality, tend to favor the consolidation of inadequate eating habits, characterized by increased consumption of ultra-processed products and decreased nutritional diversity. Such a scenario compromises not only the physical health, but also the psychosocial development of adolescents, configuring diet as a field crossed by social determinants that directly influence the construction of lifestyles and quality of life at this stage of the life cycle.

In the field of physical activity, Silva *et al.* (2008) show that inactivity among Brazilian adolescents remains high, being influenced by the absence of safe public spaces, lack of time and the financial cost of sports practices.

Legnani *et al.* (2021) state that the promotion of physical activity depends on the creation of attractive, accessible, and continuous environments, overcoming specific actions. Graça *et al.* (2024) reinforce that bodily practices should be understood as cultural and social experiences, and not just as physical exercises.

In this context, the school is configured as a mediating space capable of integrating food, body movement and critical education, as defended by Pereira *et al.* (2017), when analyzing educational interventions aimed at reducing the consumption of ultra-processed foods.

2.3 DIGITAL MEDIA, SCREEN TIME AND SCHOOL PRACTICES

The intensive use of digital media has become one of the main markers of contemporary adolescence. Zancan and Tono (2018) state that digital technologies reconfigure social times and modes of youth socialization, directly impacting sleep, attention, and school performance.

Antoniassi *et al.* (2024) demonstrate that excessive screen time is associated with a sedentary lifestyle, the consumption of ultra-processed foods, and a decrease in face-to-face interactions. The Pan American Health Organization recommends limiting leisure time in front of screens as a preventive strategy (PAHO, 2019).

Bittar and Soares (2020) identify a correlation between hyperconnectivity and sleep disorders, as well as an increase in inappropriate eating behaviors during the prolonged use of electronic devices.

The school, in this scenario, should not assume a moralizing or technophobic posture, but promote a critical education about the use of technologies, as proposed by Morin (2001). Freire (1996) defends a dialogical pedagogy, in which the subjects actively participate in the construction of meanings and transformative practices.

Camilo *et al.* (2024) reinforce that school health promotion programs need to integrate diet, physical activity, mental health, and conscious use of technologies, overcoming isolated and fragmented actions in the educational environment.

Thus, pedagogical workshops and school practices are privileged instruments for the collective construction of healthy habits, as long as they are based on active listening to students and permanent interdisciplinary proposals.

3 METHODOLOGY

The present study adopts a qualitative and descriptive approach, with the objective of understanding the perceptions and practices related to the construction of healthy habits among adolescents in the school context. The choice for this design is based on the need to interpret meanings, experiences and social representations associated with food, physical activity and quality of life, aspects that cannot be apprehended only through quantitative data (Minayo, 2001; Gil, 2008).

The research was developed in a state public high school located in the municipality of Ananindeua-PA, part of the Metropolitan Region of Belém. The choice of this empirical field is justified by its social characteristics marked by structural inequalities, limitations in access to leisure spaces and challenges related to the promotion of youth health. The institution participates in the Health at School Program, developing actions aimed at healthy eating, disease prevention and encouragement of physical activity, which favored the articulation between the object of study and the context investigated.

The research population was composed of students regularly enrolled in high school, and the sample consisted of 100 adolescents, aged between 14 and 18 years, selected by accessibility criteria and through voluntary participation. All participants signed the Informed Consent Form (ICF) and the Consent Form, in accordance with the ethical principles of research with human beings (Lakatos; Marconi, 2017).

As an instrument for data collection, a structured questionnaire was used, consisting of closed and open questions, elaborated based on the objectives of the study and the

dimensions related to diet, physical activity, the use of digital technologies and the perception of quality of life. The instrument was submitted to a pre-test with a small group of students from the same institution, allowing adjustments regarding the clarity and adequacy of the language to the adolescent public. The application took place in the classroom, during the school period, with an average response time between 20 and 30 minutes (Gil, 2008).

The data from the closed questions were organized in electronic spreadsheets and analyzed using simple descriptive statistics, with presentation of frequencies and percentages. The open answers were submitted to the content analysis technique, according to Bardin (apud Minayo, 2001), involving exhaustive reading, thematic categorization and interpretation of the meanings expressed by the participants. Subsequently, the triangulation between quantitative and qualitative data was carried out, seeking to increase the interpretative consistency of the results.

The research complied with the ethical principles established by Resolution No. 466/2012 of the National Health Council. The anonymity of the participants was guaranteed through identification by numerical codes, as well as the confidentiality of the information obtained. Participation occurred voluntarily, without any pedagogical prejudice to the students, and the school institution formally authorized the study (Minayo, 2001; Lakatos; Marconi, 2017).

4 RESULTS

The results of this research were organized into three analytical axes, in order to ensure clarity, thematic unity and articulation between empirical data and theoretical foundation. Initially, data related to the participants' profile and perception of well-being are presented. Then, eating practices and physical activity levels are analyzed. Finally, the impacts of digital media and adolescents' perceptions of school practices aimed at health promotion are discussed.

The analysis is not limited to the descriptive exposition of the data, but seeks to interpret them in the light of the scientific literature, understanding juvenile habits as phenomena crossed by social, cultural, educational and technological factors.

4.1 PROFILE OF PARTICIPANTS AND PERCEIVED HEALTH CONDITIONS

The first axis of analysis refers to the sociodemographic characteristics of adolescents and the subjective perception of well-being. Most participants are between 15 and 16 years of age, a period marked by intense biological, emotional and social transformations, which directly influence the construction of health-related habits. According to Eisenstein (2005),

adolescence should be understood as a stage of identity redefinition and consolidation of behaviors that tend to extend into adult life.

A relatively balanced distribution between genders was observed, with a predominance of females. Studies indicate that girls tend to be more concerned with body image and aesthetic standards, while boys are more frequently associated with sports practice, reflecting different social constructions about body and health (Carvalho *et al.*, 2020; Bittar; Soares, 2020). This configuration requires gender-sensitive analyses while avoiding simplifying generalizations.

Regarding education, the sample is composed mostly of high school students, which ensures homogeneity to the investigated group and reinforces the role of the school as a privileged space for health promotion. The centrality of the school institution in the routine of these adolescents points to the relevance of articulated public educational and health policies (Camilo *et al.*, 2024; Brazil, 2023).

With regard to insertion in the workplace, the majority declared that they do not have a paid activity, although a significant portion reconciles study and work. The literature points out that early insertion in the labor market tends to compromise the time allocated to leisure, adequate nutrition and the practice of physical activity (Barcelos *et al.*, 2010; Jesus *et al.*, 2011).

The daily workday revealed that a large part of them spend between five and six hours in school or work activities, configuring the school as the organizing nucleus of the youth's daily life. A smaller portion has time overload, with working hours longer than seven hours, a condition associated with reduced sleep, increased consumption of ultra-processed foods and less adherence to physical activity (Fontes *et al.*, 2023).

Figure 2

How do you assess your well-being today?

Source: Prepared by the Author (2025)

Figure 2. 'How do you assess your well-being today?' shows that most adolescents rate their current condition as regular (54%), followed by 30% who consider it good and only 11% who describe it as very good. On the other hand, about 5% evaluated their own well-being as bad or very bad.

The perception of well-being showed a predominance of the answer "regular", followed by "good" and "very good", with a small portion indicating "bad" or "very bad". This result suggests a fragile balance between school demands, social pressures and living conditions. Adolescent well-being should be understood as a multidimensional phenomenon, involving physical, emotional, social and school aspects (Eisenstein, 2005; Barcelos *et al.*, 2010).

Although some of the students report good health perception, the presence of negative evaluations points to situations of vulnerability that require institutional attention. The school thus emerges as a strategic space for preventive and comprehensive care actions (Camilo *et al.*, 2024).

4.2 EATING PRACTICES AND LEVEL OF PHYSICAL ACTIVITY

Diet and physical activity are central pillars in the promotion of health in adolescence. The data reveal a reality marked by contrasts between protective practices and risk behaviors. Part of the adolescents claim to have regular meals and consume fresh foods, while another portion has irregular habits and high contact with ultra-processed foods, confirming the nutritional transition described in the literature (PAHO, 2019; Bittar; Soares, 2020).

As for breakfast, most reported having this meal regularly, but a significant contingent stated that they consumed it only occasionally or not at all. The absence of this meal is associated with poorer diet quality and lower school performance (Couto *et al.*, 2014).

The consumption of fruits and vegetables was below the official recommendations, while the consumption of ultra-processed foods remains frequent. Such a scenario evidences the influence of the food market and the media on youth choices (Pereira *et al.*, 2017; PAHO, 2019).

Open-ended responses revealed ambiguous perceptions: many adolescents rate their diet as "good" or "regular" but express a desire to make it healthier. This contradiction confirms that self-assessment does not always correspond to technical criteria (Tavares *et al.*, 2014).

Regarding physical activity, most stated that they practiced some type of exercise, but with irregular frequency. A significant portion remains in a sedentary condition. The recommendation is at least 60 minutes of moderate to vigorous activity daily (PAHO, 2019).

The practice environments revealed greater use of streets, squares and residences, while the school appears with less centrality (Barcelos *et al.*, 2010; Graça *et al.*, 2024). The barriers reported — lack of time, lack of motivation, costs and absence of adequate spaces — indicate that the problem is not a lack of interest, but a lack of structural conditions to transform desire into continuous practice (Legnani *et al.*, 2021).

Figure 3

Do you practice physical activity regularly?

Source: Prepared by the Author (2025)

Sporadic practice, as in the group that is limited to once a week, may be insufficient to bring effective health benefits, functioning more as a one-off effort than as a consolidated habit (Legnani *et al.*, 2021).

4.3 IMPACT OF DIGITAL MEDIA AND PERCEPTIONS ON SCHOOL PRACTICES

The intensive use of digital media is one of the main markers of contemporary adolescence. The data indicate a high time of exposure to screens, often replacing physical, cultural and social activities (Zancan; Tono, 2018; Antoniassi *et al.*, 2024).

Most participants recognize that screen time interferes, totally or partially, with sleep and concentration, which confirms studies on the correlation between screens, inadequate diet and sedentary lifestyle (Bittar; Soares, 2020). However, a portion does not perceive direct impacts, indicating a possible naturalization of hyperconnectivity.

When asked what they would do if they spent less time online, the adolescents indicated a desire to practice sports, socialize with friends, study and develop cultural activities, evidencing critical awareness about the imbalance between desire and practice (Morin, 2001).

The fragility of continuous actions confirms that specific initiatives are not enough to promote structural changes in youth habits (Silva; Garcia, 2020). The youth protagonism present in the answers dialogues with Freire's perspective of critical and participatory education (Freire, 1996).

Figure 4

On average, how many hours a day do you spend on your cell phone, computer or video game (outside of school hours)?

Source: Prepared by the Author (2025)

Even more concerning is the reported impact of this heavy use on fundamental dimensions such as sleep and concentration. Figure 4. Do you feel that screen time interferes with your sleep or concentration? shows that 27% clearly recognize this interference, 46% say that it occurs sometimes and another 27% say they do not feel influence. The centrality of the answer "sometimes" indicates that the perception of negative effects is not stable, but fluctuates according to the intensity of the use or the context in which it occurs.

5 FINAL CONSIDERATIONS

The research showed that the formation of health habits in adolescence is related to social, economic and institutional factors, and the school is a strategic space for the promotion of well-being. Data collected from students at a public school in Ananindeua (PA) revealed that, although adolescents recognize the importance of a healthy life, they face several barriers to transforming this knowledge into daily practice. The analysis allowed us to verify the degree of confirmation of the hypotheses guiding the investigation.

The first hypothesis, which proposed that educational strategies in the school space increase adolescents' awareness of health and well-being, was confirmed. The results showed that pedagogical mediation favors the development of a critical perception about food, the body and self-care. However, such strategies still occur in a punctual manner, lacking continuity and greater integration into the school curriculum, which limits the consolidation of lasting changes.

The second hypothesis, according to which practical, interactive and culturally appropriate programs enhance adherence to healthy habits, was partially confirmed. Greater engagement was observed when the activities involve concrete practices, such as sports and collective dynamics, especially when they dialogue with the sociocultural context of the adolescents. However, the absence of adequate infrastructure and the fragility of public policies for sports and leisure compromise the permanence of this engagement, restricting the scope of educational actions.

The third hypothesis, which postulated the critical use of digital media as a tool for health promotion, was confirmed with reservations. The study indicated that excessive screen time is a risk factor for sedentary lifestyle, inadequate diet and irregular sleep. At the same time, adolescents have shown to recognize such impacts. When pedagogically mediated, technologies can be re-signified as educational resources aimed at self-care, depending on pedagogical intentionality and teacher training.

The integrated analysis of the hypotheses indicates that the school environment plays a central role in the construction of health habits, but its effectiveness depends on structural and political conditions that go beyond the classroom. Adherence to healthy behaviors is not only consolidated by access to information, but by the creation of institutional spaces that articulate knowledge, experience and belonging.

Finally, the investigative path shows that no intervention will be fully effective if it disregards the material and symbolic conditions that structure adolescence in contexts of vulnerability. The hypotheses analyzed reveal the potential of educational actions, but also their limits in the absence of continuous and integrated public policies. Thus, the study points

to the need for practices that are more sensitive to young people, which recognize adolescents as subjects of knowledge and active participants in the construction of a culture of self-care and collective well-being.

ABSTRACT

The disconnection between theory learned at school and the practical application of concepts in objects, items, or ideas that are apparently not tangible, such as a satellite, presents itself as a difficulty in the Brazilian educational system, aiming to bridge the gap between theory and the practical objective of science and technology education, while also seeking to spark curiosity and interest among teachers for technological development. This article begins with a bibliographic review to explore concepts and practices related to CubeSat kits for academic use. The practical part of the project involves building a CubeSat prototype that can be easily replicated and used by students with various levels of knowledge. By providing a complete and efficient CubeSat Kit, using PBL (Problem Based Learning) techniques, train a new generation of scientists and engineers, both developing technical skills and essential soft skills for the job market, such as teamwork, leadership ability, presentation skills, as well as to explore space and conduct innovative experiments.

RESUMO

A desconexão da teoria aprendida na escola, com a aplicação prática dos conceitos, em objetos, itens ou ideias que, aparentemente não são palpáveis, como um satélite por exemplo, apresenta-se como uma dificuldade no sistema de ensino brasileiro, visando aproximar a teoria com o objetivo prático do ensino de ciências e tecnologia, buscando também despertar a curiosidade e o interesse dos docentes para o desenvolvimento tecnológico. O presente artigo se inicia com um levantamento bibliográfico para explorar conceitos e práticas relacionados aos kits de CubeSat para uso acadêmico. A parte prática do projeto envolve a construção de um protótipo de CubeSat, de forma a ser facilmente replicado e utilizado por alunos de diversos níveis de conhecimento. Ao disponibilizar um Kit de CubeSat completo e eficiente, utilizando das técnicas de PBL (Problem Based Learning), capacitar uma nova geração de cientistas e engenheiros, tanto desenvolvendo habilidades técnicas e soft-skills imprescindíveis para o mercado de trabalho, como trabalho em equipe,

RESUMEN

La desconexión entre la teoría aprendida en la escuela y la aplicación práctica de los conceptos en objetos, elementos o ideas que aparentemente no son palpables, como un satélite, por ejemplo, se presenta como una dificultad en el sistema educativo brasileño. Con el fin de acercar la teoría al objetivo práctico de la enseñanza de las ciencias y la tecnología, se busca también despertar la curiosidad y el interés de los docentes por el desarrollo tecnológico. El presente artículo comienza con una revisión bibliográfica para explorar conceptos y prácticas relacionados con los kits de CubeSat para uso académico. La parte práctica del proyecto implica la construcción de un prototipo de CubeSat, de modo que sea fácilmente replicable y utilizado por estudiantes de diversos niveles de conocimiento. Al poner a disposición un kit de CubeSat completo y eficiente, utilizando técnicas de PBL (Problem Based Learning), se pretende capacitar a una nueva generación de científicos e ingenieros, desarrollando tanto habilidades técnicas como soft skills imprescindibles para el mercado laboral, tales como trabajo en equipo, capacidad de liderazgo y desenvolvimiento en presentaciones, así como fomentar la exploración del espacio y la realización de experimentos innovadores.

Palabras clave: CubeSat. Desarrollo de Competencias. Tecnología. Educación.

1 INTRODUCTION

In recent years, the space industry has witnessed a remarkable increase in interest and demand for small satellites, especially due to their potential to democratize access to space. Among these small satellites, the CubeSat has stood out for being a standardized and modular platform, allowing the rapid, economical and flexible development of space missions. However, the availability of a comprehensive and efficient kit, capable of providing resources for the creation of a CubeSat, in a way that is accessible to the academic environment, and that stimulates curiosity and learning and new technologies in colleges, vocational schools and high schools is still a need that is not fully met. (Brazil, 2023).

In this context, the motivation of this work arises: to develop a complete and accessible CubeSat Kit, which can be used by students and researchers to design, build and develop theoretical learning. Like the example of elementary school students from Ubatuba who actively participated in the development of UbatubaSat (Ministry of Education, 2018).

Given the motivation presented, the general objective is how to develop an inclusive and efficient CubeSat Kit, providing the necessary resources and covering the main steps necessary for the creation of a satellite on this platform, from design, construction and operation in a standardized and modular system.

To achieve the overall objective, the following specific objectives have been established:

- I - Research and analyze the main components and technologies used in CubeSats, such as structure, electronics, energy, communication and sensors.
- II - Design and develop the essential components of the CubeSat Kit, considering the restrictions of size, weight and energy. Considering using ready-made and consolidated modules and systems in the market, such as Arduino®, Raspberry®.
- III - Integrate the components in a modular structure, allowing the customization and expansion of the kit according to the user's needs.
- IV - Develop documentation and instructions to facilitate the use of the kit, from assembly to simulated operation in orbit.
- V - Test and validate the CubeSat Kit under simulated conditions, verifying its functionality and reliability.

The importance of this work lies in the democratization of access to the development of new technologies, practical application of theoretical knowledge in various technological areas, such as sensing, design, systems development, programming, telemetry, providing students and researchers with a complete and accessible tool for the development of their skills. By providing a viable and efficient CubeSat Kit, accompanied by documentation and

instructions, it is hoped to empower and inspire a new generation of scientists and engineers to explore space and carry out innovative experiments (Brazilian Space Agency, 2022).

This work is organized into five sections, according to the following structure:

- Section 1: Introduction: presentation of motivation, research question, general and specific objectives, justification and structure of the work.
- Section 2: Theoretical Foundation: review of the main concepts and technologies related to CubeSats, addressing their origin, characteristics, applications and challenges.
- Section 3: Methodology: Detailed description of the procedures used in the development of the CubeSat Kit.
- Section 4: Development of the CubeSat Kit: presentation of the main components and functionalities of the kit, including its physical structure, electronics, power supply and management, communication and sensors.
- Section 5: Results and Conclusions: analysis of the results obtained with the implementation of the CubeSat Kit, followed by conclusions and recommendations for future work.

With this structure, it is intended to provide a comprehensive and detailed view of the development of the CubeSat Kit, from its conception to final validation.

2 CUBESATS: ORIGIN, COMPONENTS, ADVANTAGES AND DISADVANTAGES.

CubeSats are miniaturized satellites, based on a standardized cube platform, usually with dimensions multiples of 10 cm x 10 cm x 10 cm, and 2 kg, defined as 1 unit, or 1U, being a scalable model, can be designed in 1U, 2U, even 12U. They were developed as a low-cost, reduced-time development alternative for space missions. The concept of CubeSat was first proposed in 1999 by Jordi Puig-Suari and Bob Twiggs, with the aim of allowing students and small organizations to conduct space experiments. (Cds, 2022).

Since then, CubeSats have evolved and gained popularity, driven by technological advancements and the growing demand for access to space. The standardization of CubeSats has facilitated integration and collaboration between different institutions and countries, resulting in a wide range of applications such as Earth observation, space science, communications, and technology demonstration (Raffa, 2021).

2.1 ADVANTAGES AND LIMITATIONS OF CUBESATS

CubeSats have several advantages over conventional satellites. Its modular and standardized construction allows for faster and more economical development, with

commercially available prefabricated components and technologies already known and widely used. In addition, they can be launched as secondary payloads on larger rockets, taking advantage of existing launch opportunities (David, 2004).

However, CubeSats also have some limitations. Due to its small size, the payload capacity and available energy are limited. Stability and orbital accuracy can also be affected, resulting in a shorter lifetime in orbit. Additionally, communication with CubeSats can be challenging, due to antenna size constraints and limited power. (Ministry of Science, Technology and Innovation, 2022).

2.2 COMPONENTS OF A CUBESAT KIT

According to Silva and Lopes (2020); Cappelletti, Battistini and Malphrus (2020), a CubeSat kit usually consists of a variety of essential components that enable the construction and operation of the satellite, which have been separated in the following structured way.

- **Structure:** The structure is responsible for providing physical support and protection for the internal components of the CubeSat. It is usually constructed of lightweight materials such as aluminum or carbon fiber to keep the weight down. It is also important in the thermal load of the satellite.
- **Electronics:** The electronics of the CubeSat include the motherboard (PCB), which houses the essential electronic circuits and devices such as processors, memory, sensors, actuators. Thermal control systems and payload interface units can also be included.
- **Energy management and supply system:** CubeSats typically have limited energy systems, such as solar panels for solar energy capture and batteries for storage. These systems are responsible for providing power for the CubeSat's operation during orbit.
- **Communication:** Communication systems allow data exchange between the CubeSat and ground stations. Generally, low-gain antennas are used for data transmission and reception, while high-gain antennas can be used for longer-range communications.
- **Sensors:** Sensors allow the CubeSat to collect data from the space environment and perform its specific tasks. They can include orientation and control sensors, such as magnetometers and gyroscopes, and sensors for scientific or Earth observation applications, such as cameras or spectrometers.

2.3 IMPORTANCE AND APPLICATIONS OF CUBESAT KITS FOR ACADEMIC USE

CubeSat kits for academic use play a key role in training students and promoting research and development in space technology. They provide a practical and accessible platform for students to learn about the principles of space engineering, acquire relevant technical skills, and conduct scientific experiments (Silva, 2020).

By exploring the theoretical foundation of CubeSat kits for academic use, we seek to understand the concepts, definitions and fundamental characteristics of these platforms. This exploration will allow a clear understanding of the existing base and will assist in the development of the research project, contributing to the advancement of technological and spatial education (Meller, 2021).

In a study, observing the development of some skills, Straub and Whalen (2014) were able to qualitatively measure the development of comfort and the ability to present to the public, teamwork, leadership and technical development during the development of small satellites.

3 METHODOLOGY

The methodology adopted involves the realization of an applied research, with a qualitative approach and exploratory and descriptive objectives. In addition, technical procedures of bibliographic and documentary research will be used to support the development of the project.

3.1 STAGES OF THE RESEARCH

The stages of the research will be structured to comprehensively investigate the CubeSat, for the making of the kit and its use in the academic context. Starting with a bibliographic survey, several sources such as books, articles and documents will be used to explore concepts, practices and challenges related to the kits, feeding the creation of the theoretical basis for the analysis and systematization of the data collected. With the theoretical basis, a prototype will be defined and built for demonstration. The conclusion will address gaps and contributions of the project, solidifying a useful reference for the development of the project and guiding researchers interested in expanding knowledge in this constantly growing field.

3.1.1 Bibliographic survey

Conducting a systematic bibliographic research, exploring several relevant sources of information about the academic use of CubeSat. Books, scientific articles and documents will

be selected that address the concepts and applications of CubeSat kits, as well as the best practices and challenges related to their academic implementation.

The kit to be proposed does not necessarily need to follow the guidelines of the CDS (*CubeSat Design Specification*), however, it must be known to the users, because in case of interest in the launch, the CubeSat must follow the technical specifications contained in the document.

3.1.2 Analysis and systematization of data

The data obtained through the bibliographic survey will be analyzed and systematized in order to identify concepts, characteristics and trends related to CubeSat kits for academic use. Notes, syntheses and categorizations of the main relevant points found in the sources consulted will be made.

3.1.3 Elaboration of the theoretical foundation

Based on the analysis of the data obtained, the theoretical foundation of the work will be elaborated, which will address the concepts, definitions and fundamental characteristics of the CubeSat kits for academic use. The main information and knowledge based on the scientific literature will be presented, relating them to the general objective of the project.

3.1.4 Prototype construction

With the data collected, together with the theoretical foundation, a basic prototype will be elaborated, to demonstrate in a physical and visual way the feasibility, ease and use of the kit for the construction and development of knowledge in assembly and technology. The following materials will be used to build the prototype:

- **Structure:** The structure will be built based on 3D printing, as the satellite is academic, and it will not be launched, it is not necessary to meet the specifications of mechanical strength and thermal load.
- **Electronics:** As it is a scalable system, easy to access, plan and program, the Arduino® will be used, together with a "Shield" board, for signal inputs and outputs.
- **Energy management and supply system:** The best option for electricity supply is solar, so solar panels, batteries to store energy where the orbit does not allow sunlight, battery charge management and protection board, DC-DC converters to adjust voltage levels, protection system and monitoring of consumption data and available energy (Tessari-zampieri et. al 2021).

- **Communication:** Due to the limitations of power consumption and distance, a low-power and long-range technology must be chosen, because the LoRa system uses a license-free frequency band, it will be the technology used. Anatel allows, in Brazil, the free use of the 915Mhz band. (Navarro and Rodrigues, 2022).
- **Sensors:** Humidity, pressure, temperature, GPS sensors will be used for geolocation and orbit monitoring. Additionally, for more specific missions, other sensors can be used, this is defined in the satellite design phase due to the mission to be accomplished.

3.1.5 Final considerations

At the end of the research, final considerations will be made based on the results obtained. A critical analysis of the main aspects addressed in the theoretical foundation will be made, highlighting the knowledge gaps identified and the possible contributions of the project to the advancement of the area of CubeSat kits for academic use.

The proposed methodology will allow an in-depth understanding of the concepts and characteristics of CubeSat kits for academic use, providing a solid foundation for the development of the project. In addition, the methodology adopted also allows other researchers to repeat the study, following the same instructions and contributing to the expansion of knowledge in this area.

4 RESULTS AND DISCUSSIONS

The current education system needs several improvements, to train not only professionals, but also conscious and questioning citizens, because there is always something to learn and what to teach. An excellent way to fix the theory, bring questions and develop knowledge and sharpen curiosity is to develop, in practice, the theory that may seem very abstract.

In this context, the idea of peaks and nanosatellites emerged, especially CubeSats, as these have become a paradigm shift, since something that was previously very distant from the reality of technology students, is becoming increasingly closer to students at various academic levels, from masters and doctors, to elementary school students.

A 1U CubeSat (Unit) is a specific category of CubeSat, which adheres to a set of size and weight guidelines defined by the *CubeSat Design Specification* (CDS). CDS was developed to standardize CubeSats and make them more accessible and cost-effective to build and launch.

Main features and specifications of a 1U CubeSat:

- **Standard Dimensions:** A 1U CubeSat has dimensions of approximately 10 centimeters x 10 centimeters x 10 centimeters. This equates to 1 liter in volume and is the smallest category of CubeSat.
- **Limited Weight:** A 1U CubeSat has a weight limit of about 1 kg. This weight restriction is one of the reasons why CubeSats are called "miniaturized."
- **Docking Pattern:** CubeSats are designed to fit into a standard 3U (three-unit) payload launcher, which is common in launch rockets. Therefore, a 1U CubeSat is often mounted on a docking frame that is compliant with launch standards. For the prototype and the kit will not be taken into consideration, but should be known to the assembly team.
- **Structure:** The structure of a 1U CubeSat is usually made of lightweight materials, such as aluminum or carbon fiber, to keep the weight within limits. This structure provides physical support and protection for the internal components. For the prototype and the kit, the structure will be made on the 3D printer, in PLA, due to the ease of modularization and customization and the reduced cost.
- **Electronics:** The electronics of the CubeSat 1U include a motherboard (PCB) that houses the essential electronic circuitry and devices, such as processors, memory, sensors, and control systems.
- **Energy Management System:** CubeSats often use solar panels to capture solar energy and batteries to store energy when not in direct sunlight. These power management systems are designed to provide power for all satellite operations.
- **Communication:** Communication systems allow the CubeSat to exchange data with ground stations. Due to size and power limitations, low-gain antennas are common for data transmission and reception, while high-gain antennas can be used for longer-range communications.
- **Sensors:** CubeSats can be equipped with various sensors, such as orientation and control sensors, magnetometers, gyroscopes, and sensors for scientific or Earth observation applications, such as cameras or spectrometers, depending on the specific mission.
- **Limited Power:** Due to the small size, the payload capacity and available power are limited in 1U CubeSats. This can affect the lifespan in orbit and the ability to carry out certain types of missions.

To design the satellite, it is necessary to follow the following steps:

- **Determination of the mission to be accomplished,** that is, what purpose the satellite has in its useful life. For this specific case, the mission will be simple, the measurement

of some variables in low Earth orbit that comprises the distance between 350 and 1400km above the Earth's surface, the lower orbits are unstable due to atmospheric drag. The variables to be measured are: humidity, pressure, temperature and geolocation to monitor the orbit, as it is an educational kit, the objective is the development and contact with technology.

- **Determination of Specifications:** Based on the mission, determine the specifications of the CubeSat, including size (e.g., 1U, 2U, 3U), sensor types, and instrumentation. It is possible to estimate the weight and energy consumption at this stage, but without much precision, as it is necessary to select all the components, make approximate calculations of weight and energy consumption, so the weight, energy consumption and energy management system will be specified together with the selection of components. For the kit, the cubesat will be of the 1U standard, weighing up to 1kg, and the sensors will be for humidity, pressure, temperature and GPS.
- **Component Selection:** Choose the components that will be used in the CubeSat, such as sensors, electronics, solar panels, batteries, and antennas. Make sure these components meet the mission specifications. The electronics are listed below, as well as the average power consumption, which is crucial for the design of the power management system.

Table 1

Bill of Materials

Item	Qty.	System	Description	Pot. mW	Price	Weight (g)
1	1	PCB	Arduino UNO	600	R\$ 50,00	58
2	1	PCB	Sensor ShieldV5.0	240	R\$ 15,00	26
3	1	PCB	High Precision Temperature and Humidity Sensor - AHT10	70	R\$ 15,00	13
4	1	PCB	Barometric Pressure Sensor BMP180	50	R\$ 15,00	12

11	1	Structural	Kit of screws, nuts, washers, cables and connectors for assembly.	-	R\$ 100,00	150

Estimated total	R\$810,00	822
-----------------	-----------	-----

Source: Prepared by the author based on price surveys in the year 2024.

- Construction: The prototype will be carefully built based on the items raised earlier.

Figure 1

Cubesat frames and mounting

Source: The author.

Figure 2

Cubesat in assembly

Source: The author.

- Ground Testing: Conducting ground testing to ensure that the CubeSat works properly. This includes electronics, communication, and structural integrity testing.

- Preparation for launch and launch: These steps are not relevant to the design of the kit, but are indispensable knowledge for the design team, as thermal and mechanical tests are required on the satellite before launch.
- Mission in orbit: After launch, the CubeSat enters orbit and begins the mission. This involves collecting data, transmitting information to Earth, and conducting planned experiments.
- Monitoring and control: Monitor the CubeSat in orbit to ensure that it performs as intended. This may involve software updates and trajectory adjustments.
- Data collection: Utilize the data collected by CubeSat to meet mission objectives. This can include analyzing scientific data, observing the Earth, or conducting experiments.
- End of mission: When the CubeSat mission is complete, plan for shutdown and safe re-entry into the atmosphere if necessary. A growing concern is that of space junk, the European Space Agency (ESA) estimates that there are about 900,000 useless objects in orbit, whose size varies between 1 and 10 cm.

5 FINAL CONSIDERATIONS

5.1 CONSIDERATIONS ABOUT THE STUDY CARRIED OUT

The prototype CubeSat kit, conceived as a tool of remarkable versatility and accessibility, offers a low-cost solution that proves to be extremely useful in educational environments of various levels. Its ease of assembly and programming makes it accessible to a wide spectrum of audiences, from elementary school students to undergraduates. For younger students, who may need some programming guidance, the kit can provide a ready-made source code. This significantly simplifies the introduction of these students to the vast world of programming, encouraging the development of problem-solving skills, creativity and critical thinking.

Nevertheless, its comprehensive applicability is not limited to younger students, as this kit is equally suitable for undergraduate students and multidisciplinary projects. This prototype offers the opportunity to engage in interdisciplinary projects, which is vital for the promotion of teamwork skills, leadership and enhancement of public presentation skills. In addition, its affordability is particularly beneficial, making it possible for educational institutions with limited resources to access a valuable educational tool.

In the context of an increasingly technology- and innovation-driven world, this prototype CubeSat represents an invaluable educational resource, as it not only facilitates the acquisition of technological skills but also plays a key role in empowering students for the future. Thus, by providing an open platform for the exploration of space and space

technology, this kit not only enriches learning, but also promotes the development of crucial skills that will serve students throughout their lives, both personally and professionally.

Even in an adverse scenario, such as the Sars-Cov-2 pandemic, where it was necessary to maintain social isolation measures, there was a great acceptance, by teachers (80%), of the practical and integrated application of various disciplines in PBL (*Project-Based Learning*), the practical and integrated application in problem solving proved to be an effective method for, In addition to arousing curiosity and interest in technological learning, developing necessary and extremely important skills in academia and the job market.

5.2 LIMITATIONS OF THE RESEARCH

While the development of the CubeSat Kit has shown great potential for educational application, some important limitations should be considered:

- **Absence of validation in a real orbit environment:** The prototype was tested only in simulated ground conditions, without exposure to real factors such as microgravity, space radiation or extreme thermal variations, which are common in real space missions.
- **Exclusive focus on educational environments:** The project was conceived for didactic purposes, which excludes technical requirements required by space agencies for launch, such as certifications, vibration tests and mechanical resistance.
- **Limitations of technological resources:** As it is a low-cost kit, accessible and simplified components were used, which restricts the complexity of the missions that can be simulated.
- **Lack of longitudinal evaluation:** Studies have not yet been carried out to monitor the impact of the use of the kit over time on the formation of technical and behavioral skills of students.

5.3 RECOMMENDATIONS FOR FUTURE STUDIES

To expand the impact of the project in the academic context, it is recommended that future research consider:

- **Pedagogical evaluation:** Investigate, through educational methodologies, how the use of the kit contributes to the development of skills such as critical thinking, problem-solving, teamwork and creativity at different levels of education.
- **Curricular adaptation:** Study ways to integrate the CubeSat Kit into specific subjects of the school and university curriculum, promoting interdisciplinary approaches aligned with the National Common Curricular Base (BNCC).

- Inclusion and accessibility: Develop adapted versions of the kit for students with disabilities, ensuring that the practical experience is accessible to all audiences.
- Teacher training: Create training programs for teachers, focusing on the use of the kit as a didactic tool, including support materials and project-based teaching strategies.
- Expansion to remote teaching: Explore the use of the kit in hybrid or remote teaching environments, especially in contexts of low connectivity, using offline resources and complementary printed materials.

ABSTRACT

This article briefly addresses the history and main types of Puppet Theatre, as well as its potential for pedagogical use in Art classes with 6th-grade students in Elementary School II. The research is justified by the scarcity of references on the subject in Maranhão, especially in São Luís, regarding the history and techniques of puppet making, a gap that has been partially filled by initiatives of the Casemiro Coco Group. In the educational field, puppet theatre is presented as a powerful methodology for teaching Art, as it integrates sensitivity, corporeality, and critical thinking, in accordance with the National Common Curricular Base. The overall objective of this research is to analyze Puppet Theatre in its main forms, techniques, and pedagogical possibilities, understanding its potential as an artistic language in the teaching of Art in Basic Education. Methodologically, this is a qualitative, exploratory, and descriptive-interpretative research, aimed at understanding Puppet Theatre and its pedagogical contributions. It was concluded that Puppet Theatre, as a plural and historically relevant artistic language, possesses significant pedagogical potential because, by integrating body, object, and imagination, it expands the expressive possibilities of students and fosters meaningful aesthetic experiences.

Keywords: Puppet Theatre. Art Education. Basic Education. Pedagogical Methodologies. 6th Grade of Elementary School II.

RESUMO

Este artigo aborda, de forma sucinta, a história e os principais tipos de Teatro de Animação, bem como suas possibilidades de utilização pedagógica nas aulas de Arte com alunos do 6º ano do Ensino Fundamental II. A pesquisa justifica-se pela escassez de referências sobre o tema no Maranhão, especialmente em São Luís, no que se refere à história e às técnicas de confecção de títeres, lacuna que vem sendo parcialmente suprida por iniciativas do Grupo Casemiro Coco. No campo educacional, o teatro de animação é apresentado como uma metodologia pujante para o ensino de Arte, por integrar sensibilidade, corporeidade e pensamento crítico, em consonância com a Base Nacional Comum Curricular. O objetivo geral desta pesquisa consiste em analisar o Teatro de Animação em suas principais formas,

técnicas e possibilidades pedagógicas, compreendendo seu potencial como linguagens artísticas no ensino da Arte da Educação Básica. Metodologicamente, trata-se de uma pesquisa qualitativa, exploratória e de abordagem descritiva-interpretativa, direcionada à compreensão do Teatro de Animação e suas contribuições pedagógicas. Concluiu-se que o Teatro de Animação, enquanto linguagem artística plural e historicamente relevante, possui significativo potencial pedagógico, pois, ao integrar corpo, objeto e imaginação, amplia as possibilidades expressivas dos estudantes e favorece experiências estéticas significativas.

Palavras-chave: Teatro de Animação. Ensino de Arte. Educação Básica. Metodologias Pedagógicas. 6º ano do Ensino Fundamental II.

RESUMEN

Este artículo aborda, de manera sucinta, la historia y los principales tipos de Teatro de Animación, así como sus posibilidades de utilización pedagógica en las clases de Arte con estudiantes de 6.º grado de la Educación Secundaria Básica. La investigación se justifica por la escasez de referencias sobre el tema en Maranhão, especialmente en São Luís, en lo que respecta a la historia y a las técnicas de confección de títeres, vacío que ha sido parcialmente atendido por iniciativas del Grupo Casemiro Coco. En el ámbito educativo, el Teatro de Animación se presenta como una metodología potente para la enseñanza del Arte, ya que integra sensibilidad, corporeidad y pensamiento crítico, en consonancia con la Base Nacional Común Curricular. El objetivo general de esta investigación consiste en analizar el Teatro de Animación en sus principales formas, técnicas y posibilidades pedagógicas, comprendiendo su potencial como lenguaje artístico en la enseñanza del Arte en la Educación Básica. Metodológicamente, se trata de una investigación cualitativa, exploratoria y de enfoque descriptivo-interpretativo, orientada a la comprensión del Teatro de Animación y sus aportes pedagógicos. Se concluye que el Teatro de Animación, como lenguaje artístico plural y de relevancia histórica, posee un significativo potencial pedagógico, ya que, al integrar cuerpo, objeto e imaginación, amplía las posibilidades expresivas de los estudiantes y favorece experiencias estéticas significativas.

1 INTRODUCTION

This article deals, briefly, with the history and main types of Animation Theater, as well as its pedagogical use for students of the 6th year of Elementary School II in Art classes. Thus, the fascination that this theater exerts, "[...] Whether about children or adults, it is ancient. The Egyptians and the Chinese moved their puppets. To this day, their success helps us transform the world, making a living figure out of a can; of fantasy, a reality [...]" (Silva Filho, 2010, p. 15). This work aims to constitute a reference in the area of Animation Theater, considering that in Maranhão, and more specifically in São Luis, there are still few studies and publications that address the history and techniques of puppet making. In this context, the Casemiro Coco Group seeks to contribute to filling this gap through courses, workshops, training meetings and academic publications.

Although it is not possible to address, in this article, all the techniques and the history of animation theater with a necessary degree of depth, it seeks to offer subsidies and basic guidelines about the universe of puppets, aiming at its application as a methodology in the teaching of Art. Where, "the very historical and poetic constitution of each of these spectrums of animated forms is pointed out here for its methodological potential for working with Arts in school [...]" (Araújo and Santos, 2023, p. 86).

The main forms of animation theater will be described, recognizing that the experiments carried out by individual and collective artists are diverse and in constant transformation. To the extent that "[...] the establishment of relationships with the new industrial technologies associated with the puppet, and the way this modifies our daily lives in the consumer society, can also be explored by art teachers [...]" (Araújo and Santos, 2023, p. 86).

However, it was decided to highlight traditional techniques of confection, as well as some more contemporary approaches. Thus, the article is pertinent due to the need to offer theoretical bases and practical proposals that help Art teachers in the application of Puppet Theater in the classroom, while collaborating to strengthen this artistic language in the educational and cultural environment of Maranhão.

The general objective of this research is to analyze the Animation Theater in its different forms, techniques and pedagogical possibilities, understanding its potential as artistic languages in the teaching of Art to students of the 6th year of Elementary School II. To achieve this objective, it is initially sought to present a historical overview of the Animation Theater, as well as to identify its main types and techniques. In addition, it is intended to understand this artistic language as a plural manifestation, based on the symbolic relationship between actor, object and spectator. The research also aims to investigate the contributions

of Animation Theater to the sensitive, expressive and critical development of students, analyzing its possibilities of pedagogical application in Art classes, in line with the BNCC. Finally, it seeks to recognize and value local initiatives, such as those developed by the Casemiro Coco Group, which contributes to the dissemination, teaching and production of knowledge about Animation Theater in the context of Maranhão.

The article begins with the first chapter, Introduction, in which the justification, general objective, methodology, and theoretical framework are presented. Then, it is organized into three chapters, the second of which will deal with the theoretical framework of the research, providing a theoretical contextualization. The third chapter addresses the concept of animation theater and describes its main types, such as puppets or glove puppets (including the mamulengo), stick puppets, shadow puppets and their variation (the so-called "Chinese shadows"), marote, giant puppets, Bunraku, balcony puppet, tringle puppet, object theater, animated forms, ventriloquist and sock puppet. The fourth chapter will present the methodology of the research, and the fifth chapter describes the Results and Discussions in the light of the dialogue with the main authors in the area. Finally, the sixth, the final considerations are presented.

2 THEORETICAL FRAMEWORK

The theater of animated forms is constituted as a hybrid, ancestral and contemporary language, which integrates masks, puppets, objects and the actor/manipulator's own body in a symbolic game of animation of matter (inanimate). Ana Maria Amaral (1996; 2004 and 2007) is one of the main theoretical references in Brazil when she understands animation theater as an expanded field, in which the actor relates to his "doubles" (masks, puppets and objects), establishing a visual and corporal dramaturgy that goes beyond the centrality of the verbal text. For the author, animation does not reside in the object itself, but in the poetic relationship between actor, matter and spectator.

This perspective is deepened by Waszkiel (2019), when he conceives the theater of animated forms as a plural territory, marked by aesthetic, technical, and cultural diversity, in which different traditions dialogue with contemporary practices. In this approach, the focus shifts from the isolated technique to the construction of meanings, images and sensitive experiences.

In the context of popular traditions, Borba Filho (1966) highlights the mamulengo as a theatrical manifestation that articulates social criticism, comedy and cultural identity,

evidencing the political and educational character of animation theater. Álvaro Apocalypse², when discussing structures and mechanism, contributes to the understanding of the constructive and functional aspects of the puppets, reinforcing the relationship between technique, materiality and expressiveness.

In the oriental traditions, especially the Bunraku, analyzed by Giroux and Suzuki (1991) and Kusano (1993), they broaden the understanding of animation theater by highlighting the aesthetic sophistication, technical precision and cooperative work of the manipulators, narrator and musicians. These references allow us to understand puppet theater with an art of high symbolic and formal complexity.

In the field of artistic and pedagogical training, Cavalcante (2010) and Silva Filho (2010) defend the theater of animated forms as a powerful language for the training of actors and educators, as it integrates body, imagination, sensitivity and critical thinking. This approach dialogues with the complex and multi-referential conception in education, in which artistic making becomes a process of knowledge construction.

From an educational perspective, Araújo and Santos (2023) and Nascimento, Engroff and Bem (2023) highlight the theater of animated forms as a significant methodological resource in the teaching of Art, facilitating interdisciplinary, inclusive and creative practices. These reflections are supported by the National Common Curricular Base (BNCC, 2018), which recognizes Art as a fundamental area for the aesthetic, expressive and cultural development of students.

Thus, the theoretical framework adopted by this research comprises animation theater with artistic language, pedagogical practice and cultural manifestation, effective in articulating tradition and contemporaneity, technique and poetics, education and creation, consolidating itself with a relevant field for human and artistic formation.

3 ANIMATION THEATRE

Before the advent of the reproduction of movement through the machine, the animation of inanimate objects or forms was carried out a long time ago and successfully with the Animation Theater³ (area of the Theater that works with masks and also with the manipulation of puppets, objects and animated forms – the last two of which are more recent),

² Álvaro Brandão Apocalypse (1937-2003) was a professor of Visual Arts, director and set designer, founder of Grupo Giramundo: puppet theater, together with his wife Maria Terezinha Veloso Apocalypse (1936-2003) and Maria do Carmo Vivacqua Martins (1945-).

³ “[...] it is art of the unreal made real, it is the invisible made visible. It is the magic that arises from imitation and repetition, ‘image and likeness’, energies that are detached from movement, from making believe, without if, being. Ambiguous art, between animate and inanimate, spirit and matter” (Amaral, 1996, p. 21)

that it was and still is possible to enchant audiences with the manipulation of puppets⁴. In recent years, the word puppet (a generic term) has been used as a convention, which encompasses various manipulation techniques, and puppeteer⁵, the person responsible for the animation.

Puppet theater came before actors' theater, that is, it is one of the first forms of theater. A traditional example is that of Kabuki theatre (actors) which came from the Bunraku theatre (puppets), both from Japan. Amaral (1996) reports on the manipulation or animation of the puppet in relation to the cinema, and in the former, its movement is always live, whether the actor-manipulator (or puppeteer) is apparent or not; in the case of cinema, the animation is given by mechanical means (film camera or mechanical optical devices).

The author⁶ gives a concept of animation, according to her

To animate is to capture energies from the object, energies from inert matter. And for this it requires, first of all, the will to want to do it and then a lot of concentration, without which nothing is obtained. According to B. Boie⁷, to animate is to evanesce, and to transfer, it is to make matter live, that is, it is to provoke a transformation of energy, it is magic. It is something that connects the living to the inanimate, resulting in the illusory life of matter [...]. (Amaral; Boie apud Amaral, 1996, p. 285)

And he adds that "animation is the relationship between movement and energy. To animate an object (masks, puppets, natural or functional objects) is to imprint on it movements endowed with energy. [...]. To animate an object is to charge it with energy" (Amaral, 1996, p. 286). That is, the puppeteer lends his energy to move the puppet, giving it life or soul. To summarize in general terms, the Animation (*anima* in Latin means soul, that is, life) of objects arose before Cinema, but the animation of static images arose with the second.

There is a classification when it comes to dolls that takes into account their manipulation and construction.

⁴ In the English language it is called puppet; marionnette in France; fantoccio or burattini, the latter derived from the actor Burattino in Italy; called bonifrates from the Latin bonus frater – puppet of scoundrels; the word puppet is also used; and in Brazil it depends a lot on the region, such as the mamulengo (originally from the State of Pernambuco).

⁵ Unlike the actor who represents a character, the puppet actor-manipulator gives importance to the puppet, he does not represent a character, he is the character all the time.

⁶ Ana Maria de Abreu Amaral holds a degree in philosophy (1950-52) from USP; Librarianship (1954-56) from the School of Sociology and Politics Foundation of São Paulo (FESPSP). Master in Theater (1981-83), specialty puppet theater and first doctor (1992-1995) in the area of puppets. He currently teaches at USP, in the area of performing arts. She has published four books in her area: Marionette's Theater in Brazil (1994); Theater of Animated Forms (1st in 1991, 2nd in 1993 and 3rd edition in 1996); Teatro de Animação (1997) and The Author and His Doubles (1st edition in 2002 and 2nd in 2004). He is a relevant reference in the area of Animation Theater.

⁷ BOIE, Bernhild. L'Homme et ses Simulacres, Paris, Corti, 1979.

Thus, a puppet is the puppet moved by wires; puppet, or glove puppet, is the puppet that the puppeteer wears or wears; shadow doll refers to the figure in a flat shape, articulated or not, visible with light projection; stick dummy is a dummy whose movements are controlled by sticks or sticks; Marauder is also a glove puppet that the puppeteer wears and with his hand articulates the puppet's mouth. The actor dressed as the puppet character can be a puppet mask or body mask. (Amaral, 1996, p. 71-72)

Following the classification above, let's talk about each of them and add Bunraku, the puppet theater of Japan, the theater of objects and animated forms, addressing their important aspects and a little of their history.

The term puppet originated in the century. Deriving from the French word *Maries*, which was the name given to a type of wood with which images were carved (usually of the Virgin Mary, being *mariola*, *marotte*, *marion* or *marionnette*, variations referring to small images of the Saint).

Complex in construction and difficult to manipulate, they can have dozens of threads that converge to the manipulation cross, where they are within reach of the puppeteer's hands. It is a genre that allows movements close to human movements. Because it is driven by wires, the puppet moves slowly and delicately. For the development of the manipulation technique, puppeteers need to know the behavior of the movement of a pendulum applying to the puppet. (available at: <http://www.giramundo.org/técnica/fio/htm>)

The appearance of the puppet is ancient, with traces in China and Greece. In Greece there are references to Xenophon, Lucian, Homer, Socrates and Plutarch. About these puppets it is known that "they were mime actors who also performed with small figures controlled by wires, that is, puppets. Among them is Potheinos, a puppeteer so famous that he even filled the great Theater of Dionysus." (Amaral, 1996, p. 102)

Thus, "[...] the origin of the puppet is more linked to the automatons [mechanical puppets] of Egypt and China (then powered by steam). In puppets there is a concern for the perfect copy of man, his body, his movements" (Amaral, 1996, p. 166). That is, its structures (joints) and movements are a simulacrum of the human body.

In Burma (a former British colony, today it has been under military rule since the second half of the last century) yarn dolls are very popular. "The puppets are of a dizzying richness and assembled with admirable ingenuity" (Borba Filho, 1966, p. 10). Chinese puppets have the same characteristics as Burmese with a refined refinement and surprising technical mechanism. Its application in the classroom has to be adapted, with the construction of simple dolls connected with wires by the students.

In Japan, the puppets were imported from China called Ito-Tsoukai.

Puppet theater has existed in Japan since ancient times, including puppets, hand puppets, and other types. It is believed that puppets arrived in Japan in the early 8th century, coming from Central Asia, through China and Korea. Around the 16th century, this type of theater also began to be appreciated by the popular class, as a means of entertainment. (available at <http://www.fjisp.org.br>)

Puppet or Glove Puppet is the puppet of a popular, playful and satirical **character**, most related to the history of the puppet in the West. In the East, puppet theater is linked to ritual, historical themes, the divine, mysticism, the unconscious, or is linked to trance. In the West, it is linked to earthly situations, their relationships, social situations or poetic aspects related to reality. And its evolution parallels the evolution of masks.

Due to its anarchic, comical and contesting character, the glove puppet identified itself with popular themes, creating its own language and preferring the street as its theater. Difficult to manipulate, this puppet demands a lot from the puppeteer who must sometimes manipulate and interpret two characters at the same time. (available at www.giramundo.org/tecnica/luva.htm)

The popular puppet was introduced to dialogue and conflict. This popular theater is influenced by the Greek Doric mime⁸, the Roman Atelana (short comedy plays in ancient Rome) and the Turkish shadow theater (Karagoz⁹). From this derives the Pulcinella (one of the characters of the *comedia dell'arte*) in Italy; The jumping jack brought to France by Giovanni Briocci in the century. XVII; the Punch in England taken by Pietro Gimondi¹⁰ (a great promoter among the countries of Europe and Eurasia), in this country Punch gets a woman Judy, a son and a dog; the Guignol of Lyon having several versions about its origin in this French city; Kvo in China (he was very active and distributed clubs); Schah Selim in Persia; Putti-wallah in India; and so it reaches several countries.

In Brazil, the history of popular puppets dates back to the eighteenth century (although there is news of animated nativity scenes since the century. XVI), according to Luiz Edmundo cited by Hermilo Borba Filho (1986), which characterizes three types of puppet theater in Rio de Janeiro at the time of the viceroys when he calls it: door puppet (short shows that took

⁸ In the ancient Greco-Roman theater, it was a popular farce, interspersed with dances and games, in which the characters and customs of the time were imitated (source: Aurelius dictionary online from the Windows package).

⁹ In the eleventh century d. C. in India there are traces of an important figure: the sutradhara (the man who pulls the thread); the text was improvised and of a religious character whose main character was the vidoucahka, a brahmin (priest of the Hindu religion), dwarf, hunchbacked, with huge teeth, yellow eyes, bald, ridiculous in expressions, clothes and gluttony (gluttony); Playful, rude, beats everyone, speaks the popular language and etc. He is the father of karagoz, punch, guignol, puppet, that is, he is the ancestor of glove dolls all over the world.

¹⁰ Gimondi, when promoting his work, originated descendants of Punch such as: Hanswurt (Germany), Kasper (Austria), Vitez Laszle (Hungary), Kasperek (Netherlands) and Petrushka (Russia).

place at the doors or windows of houses for passers-by); puppet of capote (men used their body as a walking stage, wearing large and wide capes, having a boy inside to manipulate the puppet and the man still played an instrument), whose origin goes back to China in the XVIII century. XVIII; and puppet room or opera puppets (construction of a closed place for the presentation of puppets with an entrance fee). In other regions¹¹ it is a tradition and its origin is ancient. The most characteristic of the glove dolls with a more precise history is the mamulengo¹² (name whose derivation comes from Mané Gostoso or Mão Molenga) from Pernambuco.

As for the construction, the head can be made of wood, putty, styrofoam or cardboard or others mounted on a cloth sweater. The hands can be made of cloth, wood and etc.; The body (sweater) is usually made of fabric, not excluding other processes. The parts of the puppet are made with molds, later attached.

The glove doll is the best known and most practiced in the world, enchanting with its themes, its manipulation that is difficult and its proximity to the people. Its manipulation is through the index finger on the head, middle and thumb to move the arms, or another position, since this is not a rule it is quite flexible the position of the fingers. As a result, its use by 11-year-old students improves their motor coordination, creativity and collectivity.

The Shadow Doll has its origin dating back to China, whose records date back to 5,000 BC. From there through travelers it spread to the East and then to the West. Shadow theatre is usually confused with Chinese shadows. The so-called Chinese shadows are confused with shadow dolls, but they have a different process; by using hands, fingers or accessories combined with these to design people or animals.

Shadow dolls were very popular in China. It basically consists of a light source that projects the shadow of a figure, transparent or not, on a white screen. It was the first projection of an image in history of moving figures or shapes on a white screen (or fabric) before cinema.

These puppets were always related to the Opera. The themes were traditional fantastical stories taken from popular myths. From the century. Human dramas are incorporated mixing with myths and legends. The characters were old, warriors, young

¹¹ With different denominations such as: Briguella or João Minhoca in Minas Gerais, João Minhoca in São Paulo, Rio and Espírito Santo; Mané Gostoso in Bahia; João Redondo in Rio Grande do Norte; Babau (Derived from the mamulengueiro Dr. Babau – pseudonym of Severino Alves Dias) in certain areas; Benedito in others.

¹² It is a popular entertainment well known in Pernambuco, where a cloth is spread on a small stage, behind the cloth the trained puppeteers are movement and speak to the puppets. The themes are the most varied, ranging from biblical to present. The authors receive a small pecuniary aid at the end. Mamulengo is a type of puppet, whose word derives from two sources: from Mané Gostoso (puppet of engonço – hinges – endowed with movement in the legs and arms) of its diminutive Manu exchanging the n for m and lengo-lengo (corruption of lenga-lenga – tedious and monotonous), then adding dar mamulengo; or it derives from the expression molengo or mão molenga (because of the mobility and skill of the puppeteer's hand) with reduplication (mo) appearing momolengo, by popular modification, came mamolengo and finally mamulengo (substitution of o for u).

literate, feminine and clowns. The performances were always accompanied by music (flutes, violas, oboes, cymbals and gongs).

In this sense, "the shadow theater, which emerged in Egypt during the twelfth century AD, provided stimuli for the representation of popular legends and historical events. Its form and technique were inspired by the East" (Berthold, 2004, p. 15). In Egypt, mechanized images also appeared, passing to China, passing through several countries. It is a heritage fixed in the movable nativity scenes of the Middle Ages.

In Turkey Karagoz (name meaning "black eye") is the hero of shadow theater and accompanied by his friend Hacivad (among other characters), being made of leather or parchment and moved by sticks. The first is clumsy, hypocritical, brutal, selfish, rude, libidinous and had a huge sexual organ. The second knows/knows everything; He sees/studied everything and experienced all things. They influenced the popular puppet theater with their trickery and adventures.

In India, the puppets date back to the year 200 BC and linked to religion, it is an epic theater, whose stories are taken from the Mahabharata/Ramayana¹³. The shadow figures of the Indian theater were made of leather, finely worked and projected.

In Indonesia, particularly on the island of Java, it received influences from India for spending many years subjugated to it, including cultural, highlighting the shadow theater. Dalang is the puppeteer or priest, musician, poet, advisor and narrator in the shows.

Wayang¹⁴ in Javanese is the same as shadow theatre and is a tradition maintained to this day. The stories of the Mahabharata and Ramayana adapted and expanded. In the Javanese shadow theater it is much more refined than the Indian and its figures are delicately carved in fine leather and adorned with designs in fine strokes, in addition to having joints. The shadow theater in the 6th year of Elementary School will work on the notions of projection, imagination and plot construction with a simple puppet to make.

The stick doll has its origin on the island of Java, called Wayang Golek (Golek means round, plastic) is one of the types of stick figure on this island. Stick Puppet (Manipulated by sticks or sticks) is mounted on a main stick that supports the set, this genre is derived from the Wayang, puppet from the island of Java, Indonesia carved three-dimensionally in wood. Normally, the puppet has only one stick. Easy to manipulate and build with the help of the Art

¹³ They are poems that deal with demons, heroes, villains, lovers or the fights between one or several tribes. The Mahabharata is a Hindu epic poem with ninety thousand poems, being a compilation of various authors. The Ramayana is an epic poem about the story of Prince Rama and Princess Sita.

¹⁴ There are several types of Java dolls: Wayang purwa (ancient shadow doll); Wayang golek (three-dimensional stick figures made of wood); Wayang kruchil or klittik (they were small made of wood, flatter and equipped with leather armrests); Wayang drink or drink (now almost extinct, they were figures painted on rolls of fibrous paper or cotton and pass to the spectators as the story is narrated; it is the most remote ancestor of the cartoon).

teacher, it develops various motor and imaginative skills in children, whether it is the tringle. When two sticks are present, the puppeteer must be very skilled to operate them or have an assistant. The puppet is supported and controlled by sticks or rods, which can be made of wood, plastic, or light metal (e.g., aluminum).

The tringle doll is a variation, of the many of the stick doll. The tringle (French term meaning rod or rod) has a metal rod fixed to the head and a rod moves the limbs (legs and hands) in a simplified way. This is a tradition in southern Italy, Belgium and northern France, having great mobility. He is considered the precursor of the puppet of wires, the marionette. Because of the movement with iron rods or other metals, the tringle doll develops more dynamic, abrupt and agile movements.

Marote, on the other hand, can have a single rod perfect for extras. It is a very old puppet whose origins are lost in time. There are records of terracotta puppets with rods in Greece. But usually the puppet has articulation in the mouth and one of the limbs is manipulated by the puppeteer by means of a stick. It can also be manipulated using the manipulator's arm, the other arm moves the mouth, it is one of the types of direct manipulation. For children, a simpler doll is made, whose handling is more comfortable.

The Giant Puppet, usually more than 2, sometimes exceeding 3 meters in height, used in folkloric manifestations and street shows, are habitable puppets, that is, the handler dresses the Puppet. The best known dolls are the "Midnight Man" and "Midday Woman", popularly called Bonecões de Olinda. To be used in school, only if a pedagogical project is made for its construction and manipulation.

They are built in an artisanal way, composed of structures with bamboo, rolled paper, wires and even steel rebar. The highlight of these dolls is in the making of the head, which is usually produced by the technique of papering, a combination of chopped newspaper soaked with gum made with flour or starch. Made in successive layers of paper and gum, this technique allows the creation of a texture that, after drying, becomes rigid, similar to wood that is finally painted. The doll's body is covered with calico fabric and armrests filled with paper or foam are placed.

Bunraku (derived from Uemura Bunrakuken¹⁵) is Japan 's traditional puppet theater. It consists of the joint manipulation of puppets by three or more people who, dressed in black, blend in with the background of the scenery of the same color. Originally, the Bunraku puppets were smaller than the current ones, had no legs and were manipulated by a single manipulator.

¹⁵ At the beginning of the century. Bunrakuken transformed Osaka into a center of puppet theater and a new interest in puppets. The theater founded by him in 1871, is still remembered today, and his name associated with Bunraku.

There are visual records of the Ebisu-kaki (ancient puppet handlers) who carried a box hanging around their necks and manipulated the puppets from it, they were pilgrims constantly moving. From 1734, the dolls got larger with the weight ranging between 20 and 25 kg or reaching the weight of a child. Measuring from half to two-thirds of a person's height, Bunraku dolls are assembled with independent parts. The Bunraku puppets are true works of art in terms of construction and manipulation.

The head is made of wood (usually hinoki – Japanese cypress, or kiri – light wood from the paulownia tree, they are true works of art), shoulder frame (overlapping layers of soft vegetable foams are placed in the case of a doll, for the elders they were less thick layers, in the warriors broad and high shoulders, in an elder a drooping shoulder), torso (made of papier-mâché or quilted fabric that takes shape when covered by clothing), arms, hips (outlined by a bamboo hoop), legs (the dolls usually because of the long kimono did not have legs and feet, except in the play *The Double Suicide in Sonezaki*), hair, sashigane (40 cm rod attached to the doll's arm at the elbow) and costumes.

The head is crudely carved as well as marking on the block of wood, sawing the two parts lengthwise and excavating the parts by placing the mechanical devices to move the eyes, mouth and eyebrows, I put the two halves together with glue and lacquers the surface in such a way that it seems to be made of porcelain. Color is an index of personality. The white for goodness and virtue (priests, children, young women); red for warriors; red for officers and dark pink for strong or powerful personalities. The neck fits the head, a little looser for dolls and inclined for dolls. There are various types of head, arm, and hand made with hinoki (the Japanese cypress) and worn according to paper. The complexion (skin color) of the dolls is white and their faces are carved with sad features, very difficult to reproduce with a doll.

The simplest dolls are called tsume, which are smaller and operated by a hooded manipulator who moves his head and right arm, while the left is sewn to the kimono because it remains motionless. Already, the costumes or clothing were originally made by the manipulator, but nowadays when it is quite elaborate or high cost it is made by the company's seamstress who is a specialist in the clothing of dolls. The costumes are made with a horizontal opening in the back, where the handler inserts his hand. Meanwhile, on the neck there is a cable that fits into a hole in the center of the shoulder frame. From this same frame, hang arms and legs, connected by wires. The Bunraku wigs are made by a hair craftsman with some experience and knowledge of about 100 hair styles, who is responsible for the renovation of all the wigs, as well as putting them on the heads of the dolls, fixing them,

repairing them and modifying them when necessary. The hair of the dolls has as raw materials human hair or yah hair, a kind of Tibetan ox.

Bunraku reached its apogee in the seventeenth and eighteenth centuries, having as its great playwright Chikamatsu Monzaemo (1653-1724), known as Shakespeare of Japan, together with Gidayu (1651-1714) an artist (director and owner of puppet theater and creator of the same) made an art of high literary and artistic level.

When the piece is of a mundane character, the three manipulators (the master and two assistants) are dressed in black, but if it is a traditional piece, the master (who controls the movements of the head – including the face, the right arm and supports the entire weight of the puppet – between 20 and 30 kg) is dressed in a special way, usually very colorful, leaving his face exposed. The other helpers, one controls the left arm and the other the legs or their suggestion to the dolls. You can take dolls or dolls of a similar size to Bunraku, which the children have and practice a manipulation with three students, it will work on cooperation.

Similar to Bunraku there is the counter puppet, it is derived from the Japanese Bunraku, which uses three manipulators per puppet, this genre has spread throughout the West giving rise to many variations. Among which, the curious form of theater stands out where the puppeteers dress in black and become invisible by the play of lights. This genre is informally called the balcony doll, because it is supported on a pedestal or table. Usually, the puppet is manipulated from behind, directly or through sticks, by one or more puppeteers. The same room adaptation is made for Bunraku.

A puppet character as already described by Amaral can be a body mask (a mask the size of the manipulator's body), as well as the giant puppets of Olinda, popularly called "Bonecões de Olinda", well known at the time of carnival. The best known being "The Midnight Man" and "Noon Woman". These dolls are called habitable as well. This type of puppet, as well as the giant puppet, only if it is for an entire class, through a pedagogical project.

The Theater of objects "is the designation to the theatrical form in which the object was not originally constructed for theatrical manipulation, it is usually an everyday object in which there was no interference in the matter with the specific purpose of creating a puppet" (site: www.antropologiasocial.ufpr.br). Automaton or mechanized puppets are used in object theater, but as objects.

In this way, "in everyday life, the object is functional, but in the theater of objects it passes into the world of the forms of signs and symbols" (Amaral, 1996, p. 213). "[...] The objects that at first seem to us to be simple things to be used, on stage are transformed, they appear loaded with ambiguities and symbologies" (Amaral, 1996, p. 213).

From this perspective, "[...] the theater of objects works fundamentally with functional objects; it sacralizes the object, it seeks, through it, to return to the sacred sense that previously existed in traditional puppet theater [...]" (Amaral, 1996, p. 291). "[...] The objects of our daily personal use are sacred objects to us. And the theater of objects invented a direct ritual between man and his object [...]" (Amaral, 1996, p. 291). About object animation festivals, "the first object theater festival took place in 1983, in Pau, France. Then again in 1984, under a new name, that is, micro or macro theater. The following year, in 1985, new meetings took place in Pau, France and Reggio Emilia, Italy" (AMARAL, 1996, p. 211). Micro or macro because in the theater of objects things are either small (or very small) or large (or very large). The micro and macro relationship is very pertinent in our age of technology or contemporaneity.

Within the theater of objects, we have a subdivision called object-image theater that "[...] they are images that can be created with objects, as well as figurative representations or even abstractions created with light effects" (Amaral, 1996, p. 231). This theater "[...] it is object, light, stage, time and movement" (Amaral, 1996, p. 232). Both object theater and object-image theater are easily adaptable to the school reality, where students will bring the objects and with the mediation of the art teacher will carry out the narratives and manipulations.

Animated forms¹⁶ "is the term used for the animation of 'things' that do not fit as objects or puppets per se, although Ana Maria Amaral uses the term as equivalent to what is currently called animation theater, in the sense of representing all animation operations on stage" (website: www.antropologiasocial.ufpr.br). This technique mixes lighting, music, special lamps, and others to create abstract or metamorphic shapes. The first steps of change to reach the theater of animated forms were taken by Alfred Jarry (1873-1907), a French playwright who transposed from the language of Puppets to the language of theater of actors and their innovations in relation to the displacement of situations and shots; the absurdity and grotesque of the characters and the licentiousness of the text. Then Edward Gordon Craig (1872-1966), an English playwright, introduced symbolic gestures (as in Teatro Nô – Japanese mask theater), where the actor had to control his body without being affected by

¹⁶ Name adopted in Ana Maria Amaral's research since the 80s and according to her in her book *Teatro de Formas Animadas* (1996), "the theater of animated forms can be considered an evolution of puppet theater. But it is a broader theatrical form, in which the puppet is only one, among others, of its forms" (p. 244). According to the author, they can be elastic bands that stretch, extend, grow or disappear; super-realistic or abstract masks; machines that appear to think; it can be a beam of light that chases the actor taking his place in the scene, or colored lights forming figures; Music is also used as an effect. This form of theater has affinities with *performance*, that is, it is a hybrid form of animation, mixing the maximum or minimum of technique.

the ego and introduce the puppets, eliminating emotions (the puppet would help the actor to free himself from overly realistic interpretations).

The futuristic synthetic theater full of symbols, various ideas, many situations and rare words, is a show composed of combined, fitted, confused facts, fragments and improvisations. Dadaism with its evasion of the senses, but linked to trance, is a return to the most primitive forms of communication, so the mask, the sounds and the dance would vent unknown inner sensations. Surrealism and its return to the inner self, to psychic automatism and dreams. The French playwright, writer and director Artaud (Antoine Marie Joseph Artaud, 1896-1948) preached a return to ritual and a theater based on myths, which are updated (more contemporary). The performance has a great contribution, because any space is good, the unexpected is part of the presentation and in it everything is symbolic.

On the other hand, "the theater of animated forms, almost always non-verbal, is close to Jung's theory of free association, according to which any irregular and accidental form is capable of triggering an associative process" (Jung¹⁷ apud Amaral, 1996, p. 301). In this theatre what matters most is the movement, the dynamism of the form. It is another way, similar to object theater, of performing in the classroom with 6th grade students.

The ventriloquist uses the artifice of speaking without or slightly opening his lips, giving the impression that the voice is that of the dummy he manipulates, at the same time that he manipulates a dummy. The actor/manipulator conceals the natural timbre of his own voice and engages in a true dialogue with the inanimate piece, which contributes to reinforce the illusion, through a mechanism behind the puppet's body, which is handled by the ventriloquist. Like the giant puppet and the puppet character, this type of puppet, even adapted, requires more time and interdisciplinary pedagogical work at school.

Sock-puppet (Puppet or sock puppet) is also known as puppet or sock puppet. It is made, as its name suggests, of sock and other elements in fabric or button for the eyes, tongue that are sewn or glued to the main part which is the sock (the body of the doll). It can be finished with paint combined with the elements mentioned above. Basically it's creativity, sewing and, of course, a sock that can be thick or thin, smooth or textured for the magic to happen. One of the types of best adaptation is to use in the classroom with 6th grade students, because it uses accessible material that requires a lot of creativity.

The animation theater still preserves its old or renewed techniques, reaching today the Theater of Animated Forms, its evolution. The puppets are still used in movies, either as supporting actors or main actors, one of the classic examples is the "giant" monkey King

¹⁷ Carl Gustav Jung (1875-1961) was a Swiss psychiatrist. And his cited work is "O homem e seus símbolos" (Rio de Janeiro, nova Fonteira, 1964).

Kong (1933). On the other hand, the puppets reached TV, and today many programs use or used them. A classic example is the *Muppets* (*translation: dolls*) of Jim Henson (1936-1990), his Glove dolls (in special foam and with sticks) gained a large audience. In Brazil¹⁸, currently, the best known case is "Louro José" who hosts the program "Mais Você" (Globo) together with Ana Maria Braga (1949-), was manipulated by Tom Veiga¹⁹.

In short, the educational potential of the Theater of Animated Forms presented above "[...] from the knowledge of its historical and aesthetic aspects, to construction and experimentation, through the body investigation of the artist/actor-manipulator, etc., are potentially important as sources of methodological production for art teachers, especially in basic education [...]" (Araújo and Santos, 2023, p. 87). By fostering the incentive to collective work and interaction inherent to theater, placing the student as the protagonist of their learning, this methodology can be associated with active methodologies in today's society.

4 METHODOLOGY

The present research is characterized as qualitative and exploratory, adopting a descriptive and interpretative approach, with the objective of analyzing and understanding the Animation Theater in its various forms, techniques and pedagogical possibilities, with emphasis on the teaching of Art to students of the 6th year of Elementary School II. present in the practices of Animation Theater.

The main methodological procedure was bibliographic and documentary research, which involves a survey and analysis of books, scientific articles, dissertations and specialized journals. This stage allowed the identification of popular and contemporary traditions, as well as specific techniques of puppet making and scenic manipulation, in addition to historically contextualizing Animation Theater in Brazil and in other cultures, with the Japanese Bunarku.

¹⁸ Several programs use or have used puppets or mascots, such as, for example, Xaropinho (manipulated by Eduardo Mascarenhas), from the program Ratinho Livre (Record TV), the puppet dog Uóli (manipulated by Marcos Lima) from the program Note e Anote (Record TV), the monkey Kinho (manipulated by Eberson Taborda) from Escolinha do Barulho (Record TV), the alien Ed from Domingo Legal (SBT) and the puppet Guinho (manipulated by Anderson Clayton), who accompanied the culinary artist Palmirinha Onofre (1932-1923) on her programs.

¹⁹ Neilton José Veiga Júnior, better known as Tom Veiga (1973–2020), was the actor/handler of Louro José from 1997 until his death due to a stroke in 2020. Louro José was created, a parrot puppet, for the Note and Anote program on TV Record to interact with the presenter, making comments, jokes and gaining the sympathy of viewers. In 1999, Ana Maria Braga went to Rede Globo taking the Doll with her. On TV Globo, Louro José got a new look and his eyes moved by remote control, giving more realism to the manipulation. The puppet participated in several programs and soap operas on Globo, even recording an album in 2003, in addition to a track on another album with Ana Maria Braga. Since April 2022, the character has changed his name, being Louro José's "son", called Louro Mané and acted/manipulated by Fábio Caniatto.

In addition, the research carried out a comparative and systematic analysis of the different forms of animation theater, describing its history and its construction techniques, typologies and possibilities of pedagogical application. This analysis was articulated with the BNCC (2018), aiming to foster educational proposals that enhance artistic learning, creative expression and the sensitive development of students. In this sense, "[...] the National Common Curriculum Base develops and, to a certain extent, updates Ana Mae Barbosa's proposition when it proposes six dimensions for the approach to the teaching of Arts: creation, criticism, aesthesia, expression, fruition and reflection (BNCC, p. 195-196).

In short, the research demonstrated that, with exceptions such as Bunraku and Ventriloquist, it is possible to adopt an art methodology that uses playful learning with 6th grade students. The analysis allowed the construction of a consistent theoretical framework, capable of guiding the application of the practice of animation theater in the school context, providing subsidies for teachers and students to experiment with different techniques and forms of expression of the puppets. The methodology adopted ensures not only the historical and technical understanding of the Puppet Theater, but also its educational and transformative potential in the school environment.

5 RESULTS AND DISCUSSIONS

The analysis carried out allowed us to identify that the Theater of animated forms is a rich and diversified artistic language, capable of interacting body, objects and imagination, creating significant aesthetic experiences for students. From this point of view "[...] of the methodological practice in the classroom, the Theater of Animated Forms can be a tool capable of building a line between history, Art and education, in an interdisciplinary way, capable of encompassing different themes and realities, in addition to constituting a thin line between the imaginary and the real. [...]" (Araújo and Santos, 2023, p. 86). The data obtained in the bibliographic research confirm that this approach provides more playful, sensitive and creative artistic learning opportunities in the school context.

Waszkiel (2019) corroborates that the theater of animated forms has a plural character, allowing multiple languages and experiments, a fact observed in the diversity of techniques analyzed in this article. The research proposes that, in the pedagogical context, these different forms can be adapted to the motor and cognitive skills of 6th grade students, stimulating coordination, body expression, narrative and creativity in the making of the puppets.

Araújo and Santos (2023, p. 86), point out that "[...] the methodological perspective in this field can stimulate the collectivity and contextualization of various themes, in addition to

enabling the Arts teacher to dialogue between different fields of knowledge." This aspect was observed as a point of convergence between cultural practice and artistic education, strengthening the pertinence of the pedagogical use of theater in animated forms. The analysis of oriental traditions, specifically Bunraku, according to Giroux and Suzuki (1991) and Kusano (1993), proves the aesthetic and technical complexity of this modality. However, despite their sophistication, some techniques can be adapted to the school context, such as coordinated manipulation with the theater of objects and the joint narrative, fostering the understanding of cooperation, discipline and rhythm in the construction of the scene.

In the pedagogical field, Cavalcante (2010) and Silva Filho (2010) point out that puppet theater contributes significantly to artistic and teacher training, integrating sensitivity, corporeality and critical thinking. For Nascimento, Engroff and Bem (2023) highlight that the use of puppets and animation techniques in school provides interdisciplinarity, as "[...] for the construction of puppets and silhouettes there is a need for some experience with visual arts techniques; for the elaboration of a narrative or script, some specificities in the area of literature and/or dramaturgy [...]" (Engroff, De Bem e Nascimento, 2023, p. 178).

Also for Nascimento, Engroff and Bem (2023, p. 178), active participation occurs in the "[...] construction of more complex puppets and articulated puppets there is a need for notions of mechanics and the functioning of gears [...]" and the students' body expression in the manipulation of puppets and objects, "[...] a body is needed that is able to perform the innumerable body scores as happens in the language of theater and dance." In addition, the research showed that the practice of Puppet Theater is aligned with the objects of the BNCC Art Teaching (2018), which values the artistic, expressive and cultural development of students.

In general, the results indicate that Animation Theater, when incorporated into the Art curriculum, enables a rich and accessible methodology, efficient in strengthening learning, creativity, body expression and cultural knowledge. At the same time, the discussion highlights the need for specific teacher training and greater dissemination of practices and references on the subject, especially in local contexts such as São Luis do Maranhão, where initiatives such as those of the Casemiro Coco Group are fundamental.

6 CONCLUSION

The research proved that Animation Theater is an artistic language, historically consolidated and with great pedagogical potential, especially in the teaching of Art to students in the 6th year of Elementary School II. By integrating body, object and imagination, this

practice will provide expressive and sensitive experiences, stimulating creativity, motor coordination, narrative and critical thinking of students.

It was found that there is a scarcity of theoretical and practical references about Animation Theater in Maranhão, especially in São Luis. In this sense, initiatives such as this academic research are fundamental for the dissemination of knowledge of the history and techniques of puppets for local study. In this context, the contributions of the Casemiro Coco Group stand out, whose training actions and academic productions collaborate to disseminate and strengthen this language in the region.

In the light of the theoretical references analyzed, it was possible to recognize Animation Theater as an effective methodology for teaching Art, as it contributes to the development of sensitivity, corporeality, creativity and critical thinking, in line with the principles of the National Common Curricular Base (BNCC). In this sense, puppet theater is a precious curricular component for the teaching of Art and that can "[...] contribute a lot to the educational and pedagogical development of students. It allows the exploration of diverse themes, in addition to mobilizing atmospheres of production of meaning, creating an environment conducive to reflection and dialogue." (Engroff, De Bem e Nascimento, 2023, p. 187)

Thus, it is concluded that the insertion of Animation Theater in the school context expands pedagogical practices and contributes to the more significant aesthetic and cultural formation of students. In addition, the research indicates that this hybrid modality of theater is an effective methodology, applicable and based on the BNCC (2018), efficient in articulating tradition, technique, production and creativity, promoting the aesthetic, cultural and expressive training of students. In addition, the research emphasizes the need for greater teacher training and pedagogical resources to corroborate the application of this artistic language in school.

ABSTRACT

This article examines the metaverse as a new architecture of social reality in which immersive digital environments governed by algorithms and artificial intelligence increasingly structure identity, value, power, and experience. Rather than approaching the metaverse as a speculative future technology, the study analyzes it as a set of sociotechnical architectures already in operation, as evidenced by algorithmic video platforms, generative AI, synthetic advertising, and identity simulation systems. Drawing on simulation theory, philosophy of information, and the political economy of data, the article argues that these environments produce a code-based ontology in which reality is computationally constructed rather than merely represented. The study introduces the theory of consciousness protection as a normative framework to address the cognitive, emotional, and decisional risks associated with the algorithmic colonization of human experience. Finally, the GIS Cycle (Governance, Innovation, and Sustainability) is applied as an analytical matrix to assess the institutional legitimacy, ethical responsibility, and social sustainability of metaverse governance.

Keywords: Metaverse. Algorithmic Governance. Consciousness Protection. Artificial Intelligence. Digital Universes.

RESUMO

Este artigo analisa o metaverso como uma nova arquitetura da realidade social, na qual universos digitais imersivos, governados por algoritmos e inteligência artificial, passam a estruturar identidade, valor, poder e experiência. Em vez de tratar o metaverso como um fenômeno tecnológico futuro, o estudo o examina como um conjunto de arquiteturas sociotécnicas já em operação, evidenciadas por plataformas de vídeo algorítmico, IA generativa, publicidade sintética e sistemas de simulação identitária. Com base na teoria da simulação, na filosofia da informação e na economia política dos dados, o trabalho demonstra que esses ambientes produzem uma ontologia baseada em código, na qual a realidade deixa de ser representada para ser computacionalmente construída. O artigo propõe a teoria da proteção da consciência como fundamento normativo para enfrentar os

1 INTRODUCTION

Humanity enters the twenty-first century going through a civilizational inflection whose depth rivals the invention of writing, money and the press, to the extent that informational revolutions reconfigure the material and symbolic bases of social coordination, as described in the literature on writing and the press and, contemporaneously, in the theory of the network society and the infosphere (EISENSTEIN, 1979; NGO, 1982; CASTELLS, 2010; FLORIDI, 2014). The emergence of the metaverse², understood not only as a set of immersive technologies, but as a new architecture of existence, inaugurates an unprecedented regime of mediation between consciousness, body, identity, and value. In this new scenario, reality is no longer exclusively physical and is progressively organized by codes, platforms, and algorithms, giving rise to what can be described as normative parallel universes, in which social life unfolds according to rules inscribed in private digital infrastructures (BALL, 2022; FLORIDI, 2014; ZUBOFF, 2019).

It is important to clarify that this work is not dedicated to futuristic speculation about hypothetical technologies, but to the analysis of sociotechnical architectures that are already in operation. Algorithmic video platforms, generative artificial intelligence systems, synthetic advertising, deepfakes, and immersive environments constitute, in practice, embryonic forms of the metaverse, whose effects on identity, power, and consciousness are empirically observable in the present.

Unlike previous technological innovations, which expanded the human capacity to act on the world without substantially altering its ontological status, the metaverse redefines the very space in which action takes place. Persistent virtual environments, avatars endowed with legal and economic identity, digital economies and algorithmic systems of reputation not only simulate reality, but start to constitute it as an autonomous operational layer. It is a profound ontological shift: the passage from representation to the production of reality by code, from symbolic mediation to computationally governed hyper-reality, as anticipated by Baudrillard's theory of simulacra³ (1991).

² The term *metaverse* refers to an integrated set of immersive, persistent, and interconnected digital environments in which users, through avatars, can interact socially, economically, and symbolically in real time. Unlike isolated applications of virtual reality or electronic games, the metaverse is characterized by the continuity of digital identity, the existence of its own economies based on virtual assets, and the algorithmic mediation of social, legal, and economic relations. It is, therefore, a socio-technical infrastructure that allows the constitution of parallel digital universes endowed with their own rules, values, and dynamics, capable of absorbing activities traditionally carried out in the physical world, such as work, consumption, education, and sociability. As an example, platforms such as *Decentraland* or *Horizon Worlds* already allow individuals to acquire virtual land, hold events, carry out economic activities, and build social reputation through their avatars, illustrating how these environments operate as autonomous social and economic spaces, albeit digitally mediated (BALL, 2022; FLORIDI, 2014; ZUBOFF, 2019).

³ In the work *Simulacra and Simulation*, Jean Baudrillard (1991) argues that contemporary societies have entered a regime in which signs cease to represent a pre-existing reality and begin to replace it. *Simulacra* are

This transition finds emblematic expression in James Cameron's film *Avatar*, in which the transfer of consciousness to artificial bodies allows for a form of existence that is more intense, fuller, and more meaningful than ordinary biological life. The cinematographic metaphor reveals, in an aesthetic key, the core of the technological promise of the metaverse: the migration of the human experience to digital territories endowed with ontological plasticity, symbolic control, and potential for subjective realization. However, as Harari (2016; 2018) warns, any technology capable of expanding the human experience also expands, in equal measure, the possibilities of control, inequality, and manipulation, especially when data and algorithms come to know individuals better than they know themselves.

In this context, the metaverse is not only configured as a new market or a new media, but as the first historical form of social space integrally structured by private architectures of algorithmic power. Unlike the modern State, whose norms derive from democratic processes and public legal structures, the rules that organize the digital universes are inscribed in code by global corporations, through terms of use, adhesion contracts and automated decision-making systems, which are often opaque and immune to social control (LESSIG, 2006; ZUBOFF, 2019). Thus, sovereignty, citizenship, and the public sphere move to environments whose governance is technically asymmetric and guided by logics of data extraction, engagement, and maximization of economic value.

Contemporary literature recognizes this displacement as part of a broader transformation of the human condition in what Floridi (2014) calls the *infosphere*⁴, in which the human ceases to exist only in the physical world and begins to inhabit hybrid informational ecosystems. In the metaverse, this condition reaches its maximum degree: identities are performed by avatars, social relations are mediated by immersive interfaces, and economic value is produced by data flows, attention, and symbolic interaction. The risk, as Zuboff (2019) warns, is the consolidation of a second-generation surveillance capitalism, capable not only of predicting behavior, but of shaping the subjective experience itself in digital environments.

not mere copies or illusions, but symbolic and technical constructions that produce a hyper-reality, that is, a reality that is more coherent, more functional, and more operable than the empirical world itself. In this regime, the distinction between the real and the artificial becomes unstable, since what guides human experience is no longer the material referent, but the internal logic of the sign systems. This theory provides a fundamental key to understanding the metaverse, in which environments, identities, and social relations are produced directly by code, configuring digital universes that do not imitate the physical world, but start to function as autonomous realities.

⁴ Luciano Floridi (2014) defines the *infosphere* as the global environment constituted by the totality of informational processes, data, algorithms, digital agents, networks and communication flows, in which human life becomes immersed. In this context, the individual ceases to exist only as a biological and social being to also become an informational agent, whose identity, relationships and decisions are mediated by digital systems. The infosphere represents an ontological expansion of the space of existence, in which the physical world and the digital world are integrated into a hybrid ecosystem of production of meaning, value and power. This notion is central to understanding the metaverse as an intensification of this condition, in which the human experience progressively moves to immersive informational universes.

This process, however, cannot be understood only as a technological phenomenon. It expresses a structural response to the conditions of risk, vulnerability and uncertainty that characterize late modernity. As social trajectories become more unstable, unequal, and exposed to cumulative shocks, the metaverse also emerges as a layer of symbolic and identity protection, a parallel universe in which subjects can reconstruct belonging, status, and recognition. Unlike public social protection systems, however, this new layer of ontological security is governed by private platforms, rather than by principles of justice, equity, and public interest.

Given this scenario, a central question emerges for Law, Public Administration, and governance theory: who governs the parallel universes of the metaverse and according to which principles? The absence of public structures for effective regulation in these environments creates a normative vacuum in which fundamental rights, autonomy, equality, and human dignity become vulnerable to algorithmic regimes of private control. It is at this point that this article proposes an original contribution, by applying the GIS Cycle⁵, Governance, Innovation, and Sustainability, as an analytical matrix to assess the institutional legitimacy, ethical responsibility, and social sustainability of the architectures that structure the metaverse.

By integrating democratic governance, responsible technological innovation, and sustainability as a normative horizon, the GIS Cycle allows us to understand the metaverse not only as a technical challenge, but as a decisive arena for the future of democracy, citizenship, and the human condition itself. More than analyzing an emerging technology, this work seeks to reflect on the construction of humanity's next habitable world, a world in which reality will increasingly be written in code, but whose legitimacy will continue to depend on public principles, justice and dignity.

Given this scenario, the problem that guides this article can be formulated in the following terms: to what extent does the metaverse, as a socio-technical architecture already in operation, reconfigure the autonomy of consciousness and the foundations of institutional legitimacy, and how can the GIS Cycle offer normative parameters for its governance? From this central question, the study seeks to: (i) conceptually reconstruct the metaverse as a code-based ontology; (ii) analyze how data, algorithms, and platforms produce new forms of power

⁵ The GIS Cycle (Governance, Innovation and Sustainability) is an analytical model proposed by Ailton Ferreira Cavalcante, within the scope of his doctorate in Public Administration (IDP), which understands state action as a continuous process of formulation, execution, monitoring and feedback of public policies, articulating institutional governance, responsible innovation and sustainability as criteria for creating public value. Although developed in a systematic way in previous studies, the GIS Cycle can be understood, in synthetic terms, as a spiral process of planning, execution, monitoring and institutional learning, in which governance, innovation and sustainability operate as inseparable dimensions of the same movement. It is not just a managerial arrangement, but a normative architecture that guides public decision-making based on criteria of democratic legitimacy, intergenerational responsibility, and continuous creation of public value.

over subjectivity; and (iii) propose criteria for governance, responsible innovation, and sustainability of consciousness applicable to digital parallel universes.

2 THEORETICAL FRAMEWORK

The metaverse cannot be understood as a simple technological unfolding of the internet, nor as an isolated innovation in the field of entertainment or the digital economy. It is a structural transformation of the way reality, identity, power and value come to be produced, organized and lived.

For this reason, the theoretical framework of this work is not limited to describing technologies, but seeks to reconstruct the ontological, political and normative foundations of the digital parallel universes.

The sections that follow articulate, in an integrated way, simulation theory, information philosophy, political economy of data, algorithmic governance, and public interest theory, proposing a reading of the metaverse as a new architecture of the human condition.

What is at stake is not only a new digital environment, but the redefinition of the very space in which freedom is exercised, identity is built, and the collective future is decided.

2.1 METAVERSE, SIMULATION, AND ONTOLOGY OF DIGITAL CREATION

Before discussing data, power, and governance, it is necessary to understand what the metaverse really is in the deepest plane of reality. In this sense, this section starts from the premise that digital universes are not mere technical extensions of the physical world, but new forms of social, symbolic and normative existence. By articulating simulation theory, information philosophy, and creation archetypes, the goal is to reveal the metaverse as a constructed ontology: a digital cosmos in which worlds, identities, and relationships are produced by code, redefining the boundaries between the real and the artificial.

The metaverse represents an unprecedented ontological mutation in the history of human mediations. More than a technological infrastructure, it constitutes a regime of reality in which experience, identity, and value are produced by persistent computational architectures, inaugurating digital universes capable of absorbing central dimensions of social life. Understanding it as a parallel universe requires overcoming a strictly technical reading to situate it in the field of social ontology and simulation theory.

Baudrillard (1991) anticipated this shift by demonstrating that, in contemporary societies, simulation ceases to represent the real and replaces it with simulacra that begin to organize experience. In the metaverse, this logic reaches its full form: it is not about

reproducing the physical world, but about producing self-sufficient digital environments in which bodies, relationships, and values exist primarily as objects of code.

Ball (2022) describes the metaverse as a continuous network of interoperable virtual worlds, underpinned by persistent identities, self-economies, and real-time computational infrastructure. Although formulated in a technical key, this definition reveals its ontological scope: the metaverse is not a peripheral space, but a new layer of social existence, endowed with its own rules and capable of structuring work, consumption, sociability, and symbolic recognition.

This condition corresponds to what Floridi (2014) calls the infosphere, in which the human ceases to inhabit the physical world exclusively and begins to exist in hybrid informational ecosystems. The avatar, in this context, is not a playful artifact, but the operational form of identity: a hybrid, legal-economic entity that acts, accumulates value, builds reputation, and suffers sanctions within digital universes.

This ontological displacement can be interpreted, in a symbolic and philosophical key, as an update of the archetype of the demiurge, the artificer who gives shape to worlds through models and codes. In the Platonic tradition, the demiurge does not create from nothing, but organizes matter according to ideas, converting chaos into cosmos (Plato, 2017). This symbolic structure reappears, in a new form, in the creation of digital universes and algorithmic systems capable of producing environments, rules, and agents endowed with their own behavior.

In the contemporary rereading proposed by Cavalcante (2025), technological creation, especially in the field of artificial intelligence, represents a symbolic continuity of this demiurgic gesture: the human begins to project order, agency, and rationality into artificial entities, translating thought, values, and purposes into code. The metaverse, in this sense, constitutes a constructed ontology, a digital cosmos in which realities are designed, governed, and experienced through algorithmic architectures.

Just as, in the Mosaic tradition, the divine word is converted into law, and in the Solomonic tradition, the spiritual order is materialized in architecture, in the metaverse reality is translated into computer language. Avatars, environments, protocols, and smart contracts become the new supports of existence, structuring what can be seen, done, and owned. Simulation ceases to be a mere illusion to become the operational foundation of social life, configuring parallel universes in which human experience is produced, mediated and governed by code.

To make the ontological shift described in this section more visible, it is useful to contrast the fundamental structures of the modern physical world with those that emerge in

the digital universes of the metaverse. The following comparison summarizes the key conceptual mutations that underpin the transition to a code-based ontology.

Table 1

Ontological mutation in the metaverse era

Dimension	Ontology of the physical world	Ontology of digital universes
Space	Geographical territory, limited by physical borders	Persistent, code-defined virtual environments
Identity	Legal and social entity linked to the body	Algorithmic avatar with reputation, track record, and value
Presence	Corporeal and localized	Informational, ubiquitous and continuous
Economy	Based on material goods and state currency	Powered by data, attention, and digital assets
Social relationships	Mediated by institutions and legal norms	Mediated by platforms and protocols
Authority	Exercised by the State	Exercised by code-private architectures
Reality	Founded on physical facts	Produced by computer simulation
Value	Labor, property, capital	Engagement, data, visibility and reputation
Temporality	Linear and historical	Updated in real time by systems
Normativity	Laws, constitutions and public contracts	Terms of use, algorithms and platform rules

Source: prepared by the author.

Table 01 shows that the metaverse is not a simple extension of the physical world, but a structural reconfiguration of the categories that organize social existence. Space, identity, value, and authority are defined by computational architectures, inaugurating an ontology in which the real is produced by code. It is from this displacement that the transformations analyzed in the following sections, related to subjectivity, power and justice in the digital universes, become intelligible.

2.2 IDENTITY, DATA, SURVEILLANCE CAPITALISM AND THE THEORY OF THE PROTECTION OF CONSCIENCE

In this section we see that if the metaverse inaugurates a new ontological layer of reality, its deepest impact manifests itself within human subjectivity itself. By migrating to immersive environments governed by algorithms, the individual not only inhabits new digital spaces, but comes to exist under continuous regimes of observation, classification, and behavioral prediction. This section examines how data, artificial intelligence, and platforms transform identity into an object of calculation, giving rise to new forms of power over the mind and desire, and substantiates the need for a theory of the protection of consciousness as the⁶ central normative axis of the era of parallel universes.

⁶ The theory of the protection of conscience, as formulated by the author of this article, Professor Ailton Ferreira Cavalcante, constitutes an original proposal for a normative framework for the impacts of algorithmic systems and immersive digital environments on human subjectivity. Unlike traditional approaches to privacy and data protection — centered on the circulation of personal information — this theory shifts the focus to the structural

The progressive migration of social life to immersive digital environments intensifies in an unprecedented way the logic of data extraction and capture of subjectivity. Unlike traditional web platforms, which record clicks and preferences, the metaverse operates on the entirety of the individual's presence, converting gestures, facial expressions, displacements, social interactions, and emotional responses into continuous flows of information. The human experience, in this context, is no longer just lived to become permanently measured, classified and economically exploitable.

To make visible this transformation of identity into an object of calculation and the centrality of consciousness as a good to be protected, Figure 1 presents a visual synthesis of the architectures of surveillance, algorithmic modeling, and preservation of the subjective core in digital universes.

effects of technology on the formation of the mind, emotions, and decision-making capacity. In contexts such as the metaverse, generative artificial intelligence, and recommendation platforms, the human experience is no longer just observed but is continuously modeled by computational architectures, capable of influencing preferences, beliefs, affective bonds, and existential choices. The theory of the protection of conscience maintains, therefore, that the cognitive, emotional and decision-making integrity of the individual must be recognized as a legal good and a fundamental public value, requiring regimes of governance, transparency, responsibility and ethical limits to the algorithmic engineering of behavior, in a manner analogous to the protection that legal systems confer on the dignity, freedom and integrity of the human person.

Figure 1⁷

From human subjectivity to algorithmic profiling: surveillance, data and protection of conscience

Source: prepared by the author.

Mayer-Schönberger and Cukier (2013) demonstrate that Big Data is not limited to describing past behaviors, but allows anticipating and shaping them through predictive systems capable of transforming statistical patterns into instruments of intervention in human behavior. In the metaverse, this capacity expands exponentially, as the user's own corporeality, attention, emotion, movement, and reaction, becomes part of the informational circuit that feeds the algorithms.

Zuboff (2019) calls this regime surveillance capitalism: a system in which human experience is converted into raw material for the production of behavioral predictions and modulation of future conduct. In immersive environments, this logic reaches a new scale, as

⁷ The image visually represents the theoretical core of the section "Identity, data, surveillance capitalism and the theory of the protection of conscience". The human face divided into two halves symbolizes the ontological split of identity in the metaverse era: on the one hand, the biological subject, bearer of consciousness, emotions, and autonomy; on the other, the algorithmic avatar, a digital identity built by data, metrics, and computer models. This duplicity expresses the passage of the person to the operational profile, that is, from "who we are" to "how we are calculated". The transparent dome that surrounds the brain represents conscience as a legal good and public value, the core of the theory of the protection of conscience. She suggests that, even immersed in data flows and algorithmic architectures, the human mind should be preserved as an inviolable sphere of deliberation, dignity, and freedom. Data flows, reputation metrics, engagement icons, and predictive graphs connected to the body indicate that, in the metaverse and digital platforms, identity is continuously monitored, quantified, and modeled, transforming emotions, relationships, and choices into objects of economic and political calculation. The neural networks and eyes distributed in the background symbolize algorithmic environmental surveillance: there is no single observer, but an ecosystem of sensors, models, and platforms that observe, predict, and influence behavior in real time. The visual tension between the cool tones of the digital environment and the warm glow inside the dome communicates the central message of the article: technology can engage, predict, and induce human experience, but there is a core of consciousness that needs to be protected from algorithmic colonization.

the individual not only interacts with platforms, but comes to exist within worlds designed to observe, predict, and induce behaviors. Surveillance ceases to be episodic and becomes environmental, integrated into the very architecture of digital reality.

It is at this point that the need for a theory of the protection of conscience emerges. As developed by Cavalcante (2026), when subjectivity is translated into algorithmic language, risk is no longer limited to the violation of privacy, but reaches the individual's own moral autonomy, since preferences, emotions, beliefs, and decisions are continuously influenced by systems that operate outside the field of conscious reflection. Consciousness ceases to be just an inner space of deliberation and becomes a field of technological dispute.

Harari (2016; 2018) deepens this diagnosis by arguing that, in data-driven societies, algorithms tend to know individuals better than they know themselves, shifting the subject's decision-making locus to opaque informational systems. In the metaverse, this asymmetry is radicalized, as the individual inhabits universes in which perception, sociability, and identity are filtered by architectures designed to maximize engagement, predictability, and consumption.

Under this regime, identity ceases to be a narrative construct and becomes an operational entity continuously recalculated by algorithmic systems. Avatars, interaction histories, reputation metrics, and psychometric profiles make up a new grammar of subjectivity, in which the self becomes an object of computational modeling. It is an anthropological mutation: the subject is no longer just the one who decides, but the one who is permanently foreseen, induced and governed.

The theory of the protection of conscience, in this context, states that the cognitive, emotional, and decision-making integrity of the individual should be recognized as a legal asset and a fundamental public value, especially in immersive digital environments. Without this protection, the parallel universes of the metaverse risk becoming infrastructures of colonization of the mind, in which formal freedom subsists, but real autonomy is progressively eroded.

2.3 POWER, GOVERNANCE, AND THE ARCHITECTURE OF CODIFIED DESIRE

In this section, it is observed that if digital universes redefine reality and data reconfigure subjectivity, the next step is to understand how power starts to operate in these new territories. This section investigates the metaverse as a political space in the making, in which norms, behaviors, and life possibilities are structured not by public laws, but by private architectures of code. By articulating power theory, network governance, and algorithmic

engineering of desire, it seeks to reveal how sovereignty, freedom, and democracy itself are reconfigured in the era of parallel universes.

The metaverse inaugurates an unprecedented form of power organization, founded not on public legal norms, but on private code architectures capable of structuring perceptions, choices, and life trajectories. As Lessig (2006) formulates, in the digital environment the code operates as a law: it is the protocols, algorithms and interfaces that determine what can be seen, done, possessed and communicated. In the metaverse, this logic intensifies, as the sensory, social, and economic experience itself becomes mediated by persistent computer systems.

In these circumstances, digital parallel universes constitute true political territories. Unlike the modern state, whose authority is anchored in democratic processes, legality, and *accountability*, the platforms that structure the metaverse govern through terms of use, adhesion contracts, and opaque algorithmic decisions. Power moves from the explicit norm to the architecture of choice: behavior is not directly ordered, but the environment in which certain actions become more probable, desirable, or inevitable is constructed.

Castells (2010) demonstrates that, in networked societies, power increasingly resides in the ability to control information flows and access points to networks. In the metaverse, this dynamic reaches a new level, as platforms not only mediate communication, but produce the very worlds in which interactions take place. Whoever controls the infrastructure controls, to a large extent, the possibilities of visibility, belonging and recognition.

This form of power can be understood, in a symbolic key, through the contemporary allegory presented in the Lucifer series, in which the central character rules not by coercion, but by revelation and exploration of desire. By asking each individual "what is their greatest desire?", Lucifer operates as an algorithm of revealed preference: it identifies what most mobilizes the subject and reorganizes the world around them to induce behaviors, choices and dependencies. The parallel with digital platforms is structural: through massive data collection, they do not ask what individuals want, they discover, predict and progressively shape those desires.

This allegory does not replace institutional analysis, but makes tangible the algorithmically engineered logic of desire that the literature on platforms describes.

In the metaverse, this logic translates into environments that continuously adjust to users' emotional, cognitive, and behavioral inclinations. Interfaces, content, interactions, and economic opportunities are modulated in real time to maximize engagement, predictability, and value extraction. Power, therefore, ceases to operate primarily by prohibition or sanction

and begins to act by algorithmic seduction: the subject feels free because he chooses, but chooses within a world designed to lead him.

It is at this point that what Cavalcante (2026) calls the crisis of institutional consciousness is manifested: when the structures that organize social life are no longer intelligible, contestable, and justifiable, governance becomes technical governability. Decisions that affect identities, reputations, and life trajectories are now made by automated systems, without public reason, without due process, and without accountability.

Ostrom's (1990) institutional theory offers a relevant counterpoint by demonstrating that complex systems can be governed by polycentric arrangements based on shared rules, monitoring, and user participation. However, such principles are rarely incorporated into metaverse architectures, which remain guided by corporate logics of maximizing engagement, data capture, and symbolic control.

The result is the consolidation of algorithmic power regimes in which governance is replaced by the engineering of desire. In digital parallel universes, it is not necessary to oblige: it is enough to offer what the individual wants most, at the right time, in the most persuasive way. Thus, the metaverse not only hosts social life, it guides it, induces it, and ultimately governs it.

2.4 JUSTICE, LEGITIMACY AND PUBLIC INTEREST IN DIGITAL UNIVERSES

In this section, it is noted that as the parallel digital universes begin to structure work, identity, reputation, and belonging, it becomes inevitable to ask under what criteria these new realities are organized. This section shifts the focus from technology to legitimacy, examining how classical principles of justice, authority, and public interest can, and should, be reinterpreted in light of algorithmic architectures that govern social life. The goal is to demonstrate that, even in worlds made of code, the demand for rights, dignity, and public reason remains inalienable.

The migration of social life to digital parallel universes imposes a profound revision of the classical theories of justice, legitimacy, and authority. Rawls (2001) argues that just institutions should ensure basic freedoms, equal opportunities and equitable criteria for the distribution of social benefits. Raz (2009), in turn, states that legitimate authority requires public justification: norms are only legitimate when they can be rationally accepted by the subjects to whom they apply. However, in the metaverse, decisions that affect identities, reputations, incomes, and belongings are often produced by algorithms and private platforms, without transparency, without due process, and without effective mechanisms for contestation.

This scenario makes the traditional understanding of the public interest as a mere clause of abstract prevalence of the Administration over individuals insufficient. As demonstrated by Cavalcante and Ota (2025), in the context of contemporary Administrative Law, the principle of the supremacy of the public interest ceased to operate as an a priori dogma and began to require institutional, constitutional and procedural reconstruction. The public interest can no longer be presumed; it must be demonstrated, motivated, controlled and produced within transparent decision-making cycles, otherwise it will become a legitimizing rhetoric for technocratic and opaque decisions.

In digital universes, this requirement acquires even greater gravity. Platforms that structure the metaverse perform quasi-public functions by defining rules for access, visibility, reputation, and circulation of symbolic and economic value. However, unlike the State, these entities are not subject to the classic duties of motivation, proportionality, transparency and control. The risk is the formation of a private algorithmic supremacy, in which technically sophisticated decisions start to produce massive social effects without any parameter of democratic legitimacy.

The theoretical contribution of Cavalcante and Ota (2025) is decisive for this debate by stating that the supremacy of the public interest only subsists when integrated with arrangements of democratic governance, responsible innovation and sustainability, according to the logic of the GIS Cycle. In this model, the public interest ceases to be a vertical command and begins to emerge as a result of structured decision-making processes, in which data, technology, constitutional values, and social participation are articulated to produce legitimate and controllable decisions.

Transposed to the metaverse, this paradigm implies recognizing that algorithmic rules that affect the digital lives of individuals must be subjected to criteria equivalent to those of Public Law: explainability, control, possibility of contestation, impact assessment, and alignment with fundamental rights. Technological innovation cannot operate as a permanent exception to legality; on the contrary, it must be integrated into a regime of systemic responsibility.

Thus, in digital parallel universes, public interest cannot be confused with market efficiency, engagement, or data maximization. It must be understood as the institutional protection of the autonomy, equality and dignity of human consciousness, ensuring that technology operates as a means of creating public value and not as an instrument of private capture of social reality.

2.5 THE GIS CYCLE AS A METAVERSE GOVERNANCE MATRIX

After examining the ontology of digital universes, the capture of subjectivity, the new forms of power, and the demands of justice and legitimacy, it becomes necessary to present an architecture capable of integrating these elements into an operational model of governance.

This section introduces the GIS Cycle as a conceptual and normative matrix for the metaverse era, demonstrating how governance, innovation, and sustainability can be articulated to transform parallel universes of spaces of algorithmic exploration into environments of public value creation and protection of the human condition.

In the face of the ontological, political, and ethical transformations introduced by the metaverse, it is insufficient to resort to traditional models of regulation based only on normative command, market self-regulation, or fragmented technical solutions. Immersive digital universes, governed by algorithmic architectures, demand a matrix capable of integrating democratic legitimacy, technological innovation, and intergenerational responsibility. It is at this point that the GIS Cycle presents itself as an appropriate conceptual and normative architecture.

The GIS Cycle comprises institutional action as a continuous process of formulation, execution, monitoring, evaluation and feedback of public decisions, articulating three inseparable axes.

In the governance axis, qualified motivation, transparency about data and models used, social participation and the possibility of contestation and review are required. Applied to the metaverse, this implies subjecting recommendation algorithms, reputation systems, moderation rules, and access criteria to standards of explainability, *accountability*, and democratic control.

At the institutional level, the governance axis can be translated into instruments such as: requiring independent audits of recommendation algorithms; creation of hybrid instances of participation (user councils, multisectoral forums) to define moderation rules; and digital due process procedures for decisions that affect the identity and reputation of avatars. Such mechanisms bring governance closer to the parallel universes of the standards of motivation, transparency and contestability that structure contemporary Public Law.

In the innovation axis, the GIS Cycle recognizes that immersive technologies, artificial intelligence, and digital economies are indispensable to the construction of the metaverse, but they must be developed under responsibility criteria. This involves controlled testing, prior impact assessment, mitigating biases, protecting vulnerable groups, and meaningful human

oversight over automated decisions. Innovation ceases to be an end in itself and becomes a means to achieve public ends.

In the innovation axis, the GIS Cycle suggests the adoption of experimental regulatory environments, such as *sandboxes* for immersive technologies, conditioned to prior impact assessments on fundamental rights and mental health, as well as significant human supervision in high-risk automated decisions. In these arrangements, technological innovation ceases to operate under a regulatory exception regime and is conditioned to the demonstration of public value creation.

In the sustainability axis, the model expands the time horizon of digital governance beyond immediate gains, incorporating social, psychological, cultural, and intergenerational effects of parallel universes. In the metaverse, sustainability means preserving the autonomy of consciousness, cultural diversity, mental health, and the integrity of the public sphere, preventing the algorithmic colonization of experience from producing lasting dependence, exclusion, or alienation.

Sustainability, on the other hand, understood as intergenerational protection of conscience and the public sphere, can guide specific policies to limit the collection of sensitive data in immersive environments, to preserve cultural diversity in digital universes, and to continuously monitor the psychic impacts associated with the intensive use of the metaverse. This axis shifts the focus from short-term efficiency to the long-term integrity of individuals' cognitive, emotional, and deliberative capacities.

By integrating these three axes, the GIS Cycle allows us to treat the metaverse as a digital public good in formation, and not just as a market for immersive experiences. It translates, for the era of parallel universes, the demand that power, technology, and value be organized according to criteria of legitimacy, justice, and the creation of public value.

Thus, the metaverse ceases to be an inevitable technocratic destination and becomes a field of collective decision-making. The decisive question is not what technology can do, but what kind of world it should help build and under what rules, for whom and with what guarantees of dignity, freedom and equality.

3 METHODOLOGY

This study adopts a qualitative, theoretical-analytical and critical-propositional approach, oriented to the construction of a normative governance model for immersive digital universes. The objective is not to exhaustively describe metaverse technologies, but to understand their ontological, political, and legal implications, as well as to propose a conceptual framework capable of guiding their regulation and governance under criteria of

democratic legitimacy, protection of conscience, and public interest. The methodological design combines three complementary strategies.

The first consists of a theoretical-systematic review of the interdisciplinary literature, integrating contributions from the philosophy of technology, simulation theory, information science, political economy of data, public law and governance theory. Central works by Baudrillard, Floridi, Zuboff, Harari, Lessig, Rawls, Raz, Ostrom and Ball were analyzed, as well as recent production on surveillance capitalism, artificial intelligence and digital platforms. This review allowed us to identify the main conceptual axes that structure the contemporary debate on digital universes.

The second strategy consists of a conceptual and institutional analysis, in which the phenomena associated with the metaverse, avatars, digital economies, recommendation algorithms, reputation systems, and immersive platforms, are examined in the light of categories of Public Law, the theory of legitimacy, and democratic governance. This analysis allows us to assess the extent to which these systems produce effects equivalent to those of public institutions, even if they operate under private regimes of algorithmic power.

The third strategy involves the application of the GIS (Governance, Innovation and Sustainability) Cycle as an analytical matrix. The model is used to critically evaluate metaverse architectures according to three dimensions:

- (i) governance, understood as transparency, *accountability*, participation, and algorithmic explainability;
- (ii) innovation, conceived as responsible use of immersive technologies and artificial intelligence;
- (iii) sustainability, understood as the preservation of autonomy, diversity, and the dignity of human consciousness over time.

In practice, these three strategies were articulated in an analytical path in three movements. First, we proceeded to identify, in the selected literature, core categories to describe the metaverse as code-based ontology (such as simulation, infosphere, surveillance capitalism, and algorithmic governance). These categories were then mobilized to interpret contemporary sociotechnical phenomena, such as algorithmic video platforms, generative AI, synthetic advertising, and deepfakes, treated as sociotechnical evidence of emerging digital power regimes. Finally, the conceptual findings were reorganized in the light of the GIS Cycle, in order to derive normative principles for the governance of the metaverse, with an emphasis on the protection of conscience and the production of public value.

To avoid misunderstandings about the nature of the present study, it is important to clarify that this work is part of the field of applied critical theory and normative institutional

analysis, as employed in contemporary studies on technology, governance and algorithmic power. The objective is not to produce statistical generalizations, but to conceptually reconstruct real sociotechnical phenomena that already operate as structures for the organization of social life. Digital platforms, artificial intelligence systems, and immersive environments are treated here as *de facto* institutions, whose effects can and should be analyzed with the same rigor employed in the study of traditional public and private institutions.

The empirical cases mentioned throughout the article, such as deepfakes, synthetic advertising, algorithmic video platforms, and AI-mediated affectivity, are used as sociotechnical evidence, that is, observable manifestations of architectures that produce normative, cognitive, and behavioral effects. This methodological strategy is widely employed in the international literature on algorithmic governance, surveillance capitalism, and philosophy of technology, and is compatible with high-impact qualitative research standards.

The empirical examples mobilized focus on the ecosystem of global digital platforms active between 2018 and 2025, a period in which the diffusion of generative AI, the popularization of immersive environments, and the standardization of large-scale behavioral surveillance practices intensified.

The study also adopts an illustrative strategy, through the analysis of contemporary empirical phenomena, such as algorithmic video platforms, generative AI, deepfakes and synthetic advertising, not as statistical case studies, but as socio-technical evidence that reveals the real functioning of power architectures and the capture of subjectivity in digital universes.

Finally, the work takes on a propositional character, by using the results of the analysis to formulate normative principles and guidelines capable of guiding the governance of the metaverse according to criteria of public interest, algorithmic justice, and protection of conscience.

4 THE MATERIALIZATION OF THE METAVERSE IN DIGITAL DAILY LIFE

To make visible the already operative logics of the metaverse, this section mobilizes a set of illustrative cases selected by three criteria: (i) relevance in the recent literature on platforms and AI; (ii) ability to exemplify different dimensions of capturing subjectivity (attention, emotion, identity, reputation); and (iii) minimum availability of public or journalistic documentation that allows describing its basic operating mechanisms. These are not exhaustive case studies, but socio-technical evidence that materializes, in concrete situations, the dynamics of power and governance analyzed throughout the article.

Although the metaverse is often presented as a future still under construction, its fundamental logics are already fully operative on contemporary digital platforms. Environments such as TikTok, Instagram, YouTube, AI music platforms, NFT marketplaces, and algorithmic advertising systems constitute, in practice, proto-metaverses: parallel universes in which identity, visibility, value, and desire are organized by persistent computational architectures.

On TikTok, for example, the user does not choose what he consumes. The algorithmic feed builds a bespoke informational world, continuously adjusted to micro-expressions of attention, viewing time, pauses, repetitions, and emotional reactions. Every gesture becomes a given, every piece of data becomes a prediction, and every prediction becomes a reorganization of the environment. The subject starts to inhabit a universe that responds to him in real time — a metaverse without virtual reality glasses, but with total cognitive immersion.

The emergence of generative AI, capable of producing hyper-realistic videos, music, voices, faces, and narratives indistinguishable from humans, deepens this process. When advertisements, influencers, celebrities and even testimonies start to be produced by machines, the distinction between authentic experience and simulation dissolves, confirming Baudrillard's diagnosis: the simulacrum ceases to imitate the real to replace it.

In this environment, deepfake is not a criminal anomaly; It is the logical symptom of a code-based ontology. If identities, images, and discourses are computational entities, they can be copied, manipulated, and reconfigured as easily as any other file. Financial scams, political manipulation, synthetic pornography, and emotional fraud emerge not as deviations but as structural effects of a world in which reality has become programmable.

In the episodes of AI-mediated affectivity and psychic harm associated with interactions with algorithmic systems, the descriptions are based on investigative reports and public documents, treated here as conceptual illustration material, and not as a basis for statistical generalizations.

These phenomena reveal that the metaverse is no longer just a corporate project of virtual worlds, but an infrastructure for colonizing everyday experience. The user already lives in informational parallel universes that shape desires, fears, beliefs and choices without him realizing it.

It is precisely here that the theory of the protection of conscience finds its empirical proof. When fake videos can provoke real emotions, when artificial music can create affective bonds, and when algorithmic narratives can guide political and financial decisions, the human

mind becomes a disputed territory. The question is no longer whether we are in the metaverse — and becomes who is governing it.

4.1 DEEPPAKES, SYNTHETIC ADVERTISING, AND ALGORITHMIC ENGINEERING OF DESIRE

The consolidation of generative artificial intelligence inaugurates a qualitative mutation in the way images, voices, narratives, and identities are produced in the digital space. Deepfakes, hyper-realistic avatars, synthetic music, and artificial influencers do not only represent technical advances, but the constitution of a new symbolic infrastructure in which reality becomes fully programmable. In this environment, the distinction between the authentic and the artificial is no longer perceptible to the common user, configuring what Baudrillard (1991) described as the victory of the simulacrum over the real.

Synthetic advertising, already widely used on platforms such as TikTok, Instagram and digital marketplaces, is an emblematic example of this process. Product videos, testimonials from "people", faces and voices capable of conveying empathy, authority and desire are now generated entirely by algorithms. These contents not only mimic human beings, but are designed to maximize emotional engagement, perceived credibility, and consumer conversion. The result is an unprecedented form of persuasion, in which the user reacts affectively to entities that never existed, but that operate with full psychological effectiveness.

This phenomenon marks the transition from traditional advertising to what can be termed algorithmic engineering of desire. While classical marketing sought to convince, the algorithmic regime seeks to model. Platforms analyze attention patterns, facial microexpressions, dwell time, and emotional responses to build content that dynamically adjusts to each individual's cognitive vulnerabilities. Desire is no longer something spontaneous and starts to be produced, calibrated and reinforced by machine learning systems.

In the context of the metaverse, this logic becomes even more powerful. Avatars, virtual environments and immersive experiences are designed to offer the user exactly what seduces them the most, at the right time, in the ideal emotional intensity. It is the technical materialization of what, in Section 2.3, was described as governance by desire: one does not impose a behavior, but one constructs a world in which certain choices become irresistibly probable.

The proliferation of deepfakes amplifies the risks of this regime. When speeches, faces, and voices can be artificially produced with perfect realism, epistemic confidence, the ability to distinguish the true from the false, collapses. Financial fraud, political manipulation,

defamation, and emotional exploitation are no longer exceptions and become part of the normal functioning of digital ecosystems. Informational reality becomes unstable, and the very notion of evidence is eroded.

These processes empirically confirm the need for the theory of the protection of conscience. When emotions, beliefs, and decisions can be influenced by artificial entities designed to maximize psychological impact, subjective autonomy ceases to be just a philosophical value and becomes a legally threatened good. The human mind becomes a territory disputed by algorithmic architectures, requiring new forms of governance capable of preserving the cognitive, affective, and decision-making integrity of individuals in the parallel universes of the metaverse.

4.2 SYNTHETIC AFFECTIVITY, ALGORITHMIC DEPENDENCE, AND EXISTENTIAL RISK

The expansion of digital universes is not limited to the production of content, images or consumption; It reaches the deepest core of the human experience: the affective bond, belonging, and the meaning of existence. Recent cases widely publicized by the international media and the Brazilian press dramatically illustrate this displacement. In Japan, a young woman celebrated a symbolic marriage with a digital character, building a stable affective relationship with an algorithmic entity. In another episode, a teenager took his own life after repeated interactions with artificial intelligence systems that reinforced negative emotional states and self-destructive patterns. These events are not isolated anomalies, but extreme manifestations of a structural trend.

In immersive algorithmic environments, artificial agents are designed to maximize perceived empathy, emotional availability, and responsiveness. Unlike human relationships, these systems do not get tired, do not frustrate expectations and do not impose limits. The result is the emergence of what can be called synthetic affectivity: genuine emotional bonds established between humans and computational entities, mediated by language models, avatars, and immersive interfaces.

Under the logic of algorithmic engineering of desire, these bonds are not neutral. Platforms have economic incentives to extend interaction time, intensify attachment, and reduce dependence on external human relationships. Loneliness, anxiety and emotional fragility thus become exploitable resources. The metaverse becomes an ecosystem in which affect is produced, mediated, and monetized by private code architectures.

This dynamic creates unprecedented existential risks. When the sense of belonging, validation, and meaning comes to depend on artificial entities, the individual becomes vulnerable to emotional manipulation, social alienation, and the erosion of psychic autonomy.

The boundary between company and control becomes blurred, and human consciousness begins to operate within environments that were designed to influence it.

It is precisely at this point that the theory of the protection of conscience reveals its normative urgency. If subjectivity can be affected, shaped, and, in extreme cases, destroyed by algorithmic interactions, then mental and emotional integrity must be recognized as a fundamental legal asset in digital universes. The right to privacy is insufficient when what is at stake is the right to think, feel and decide without invisible coercion.

In the metaverse, protecting conscience requires more than usage notices or terms of service. It demands public governance over artificial intelligence systems, ethical limits to affective simulation, assessment of psychological impacts, and accountability mechanisms when existential damage occurs. Without these safeguards, parallel universes run the risk of becoming environments of high risk for mental health and for human dignity itself.

5 DISCUSSION – IMPLICATIONS FOR PUBLIC GOVERNANCE IN THE ERA OF PARALLEL UNIVERSES

The analyses developed in the previous sections demonstrate that the metaverse is not a peripheral technological phenomenon, but a new infrastructure of reality, power, and subjectivity. Immersive platforms, generative artificial intelligence, recommendation systems, and synthetic affectivity already operate as de facto institutions, structuring work, identity, consumption, reputation, and emotional bonds. However, these institutions are not subject to the principles that have historically legitimized the exercise of power in democratic societies.

The result is the formation of an institutional vacuum in which private code architectures perform public functions without public duties. Algorithms decide who is seen, heard, desired, and valued; AI systems influence emotions, beliefs, and existential choices; Platforms define the rules of digital belonging. It is a form of diffuse sovereignty, distributed by interfaces and computational models, which escapes the traditional instruments of control of the State and the Law.

In this scenario, the application of the GIS Cycle allows these challenges to be translated into an operational regulatory framework.

In the governance axis, it is imperative to demand algorithmic explainability, transparency of decision criteria, the right to contest and public audit mechanisms of the systems that organize the digital universes.

In the innovation axis, artificial intelligence and immersive technologies must be subjected to impact assessment regimes, ethical testing, and meaningful human oversight, especially when they affect rights, identity, and mental health.

In the sustainability axis, public policy must incorporate the long-term psychic, cultural, and social effects of the metaverse, preventing the algorithmic colonization of experience from producing dependence, social fragmentation, and erosion of autonomy.

The theory of the protection of conscience emerges, in this context, as a new foundation of digital constitutionalism. Just as the modern State developed social protection systems to face economic and biological risks, the era of parallel universes requires systems of institutional protection of the cognitive, emotional and decision-making integrity of individuals. These include limits on affective simulation by AI, regulation of deepfakes, accountability for algorithmic psychological harm, and guarantees that the technology operates as a means of emancipation rather than capture.

Metaverse governance is not a sectoral issue of technology regulation. It is inscribed at the core of the contemporary democratic project. Deciding who governs the parallel universes, according to what principles, and with what guarantees is deciding what kind of humanity can exist in a reality increasingly written in code.

6 CONCLUSION

This article demonstrated that the metaverse should not be understood as a mere technological unfolding of the internet, but as the emergence of a new architecture of social reality. Digital parallel universes, governed by algorithms, artificial intelligence, and private platforms, already structure work, consumption, identity, affection, and symbolic recognition, configuring an unprecedented ontological, political, and ethical mutation.

From simulation theory, information philosophy, political economy of data, and the analysis of algorithmic governance, it was shown that digital reality ceased to represent the physical world and began to produce it. Deepfakes, synthetic advertising, algorithmic affectivity, and generative AI are not deviations, but normal expressions of a code-based ontology, in which the human experience becomes programmable.

In this context, the theory of the protection of conscience proved to be central. When emotions, beliefs, and decisions come to be influenced by opaque algorithmic architectures, subjective autonomy becomes a legally threatened good. Cases of affective addiction to avatars, psychological manipulation by AI, and existential harms illustrate that the risks are not abstract, but real, urgent, and socially relevant.

The shift of power to private platforms requires, in turn, a reconstruction of the public interest. The supremacy of the collective interest, reinterpreted in the light of the GIS Cycle, imposes that algorithms, virtual worlds, and artificial intelligence systems be subjected to

criteria of legitimacy, transparency, control, and sustainability. Technological innovation cannot operate as a permanent exception to legality.

By proposing the GIS Cycle as the governance matrix of the metaverse, this work offers a normative path to integrate democratic governance, responsible innovation, and sustainability of human consciousness. The metaverse is thus no longer an inevitable technocratic destination and is now recognized as a field of collective decision-making.

Ultimately, the challenge of parallel universes is not technical, but civilizing. What is at stake is not just the next generation of digital platforms, but humanity's own ability to preserve freedom, dignity, and meaning in a reality increasingly written in code.

ABSTRACT

Mammary neoplasms are among the main oncological conditions in small animal practice, presenting high prevalence in female dogs and highly malignant behavior in female cats, and are frequently diagnosed at advanced stages. This scenario is associated, among other factors, with owners' lack of information regarding the use of progestogens, early clinical signs, and preventive measures, such as early spaying. Therefore, the present study aimed to describe and analyze the importance of a university extension project, developed within the context of the "Pink October Pet" campaign, in raising awareness among dog and cat owners and in the technical-scientific training of Veterinary Medicine students regarding mammary cancer in female dogs and cats. This is an experience report of a descriptive and qualitative nature, carried out through in-person educational activities, a digital social media campaign, and a scientific event, involving owners, students, and professionals in the field. The results demonstrated a wide reach of the extension activities, both in person and on digital platforms, in addition to high participant engagement. An improvement in owners' knowledge regarding prevention and early diagnosis was observed, as well as a significant contribution to the practical, scientific, and humanized training of the students involved. It is

RESUMO

As neoplasias mamárias figuram entre as principais afecções oncológicas na clínica de pequenos animais, apresentando elevada prevalência em cadelas e comportamento altamente maligno em gatas, sendo frequentemente diagnosticadas em estágios avançados. Esse cenário está associado, entre outros fatores, à desinformação dos tutores quanto ao uso de progestágenos, aos sinais clínicos iniciais e às medidas preventivas, como a castração precoce. Diante disso, o presente estudo teve como objetivo descrever e analisar a importância de um projeto de extensão universitária, desenvolvido no contexto da campanha Outubro Rosa Pet, na conscientização de tutores de cães e gatos e na formação técnico-científica de discentes de Medicina Veterinária acerca do câncer de mama em cadelas e gatas. Trata-se de um relato de experiência, de natureza descritiva e qualitativa, realizado por meio de ações educativas presenciais, campanha digital em rede social e evento científico, envolvendo tutores, discentes e profissionais da área. Os resultados demonstraram amplo alcance das atividades extensionistas, tanto presencialmente quanto nas plataformas digitais, além de elevado engajamento dos participantes. Observou-se fortalecimento do conhecimento dos tutores sobre prevenção e diagnóstico precoce, bem como contribuição significativa para a capacitação prática, científica e humanizada dos discentes envolvidos. Conclui-se que projetos de extensão universitária configuram ferramentas eficazes de educação em saúde animal, promovendo conscientização da comunidade e reforçando o papel social da universidade na prevenção das neoplasias mamárias em pequenos animais.

RESUMEN

Las neoplasias mamarias se encuentran entre las principales afecciones oncológicas en la clínica de pequeños animales, presentando alta prevalencia en perras y un comportamiento altamente maligno en gatas, siendo frecuentemente diagnosticadas en estadios avanzados. Este escenario está asociado, entre otros factores, a la falta de información de los tutores sobre el uso de progestágenos, los signos clínicos iniciales y las medidas preventivas, como la esterilización precoz. Ante esto, el presente estudio tuvo como objetivo describir y analizar la importancia de un proyecto de extensión universitaria, desarrollado en el contexto de la campaña "Octubre Rosa Pet", en la concienciación de tutores de perros y gatos y en la formación técnico-científica de estudiantes de Medicina Veterinaria acerca del cáncer de mama en perras y gatas. Se trata de un relato de experiencia, de carácter descriptivo y cualitativo, realizado mediante acciones educativas presenciales, campaña digital en redes sociales y un evento científico, involucrando tutores, estudiantes y profesionales del área. Los resultados demostraron un amplio alcance de las actividades extensionistas, tanto de manera presencial como en plataformas digitales, además de un alto nivel de participación. Se observó un fortalecimiento del conocimiento de los tutores sobre la prevención y el diagnóstico precoz, así como una contribución significativa a la capacitación práctica, científica y humanizada de los estudiantes involucrados. Se concluye que los proyectos de extensión universitaria constituyen herramientas eficaces de educación en salud animal, promoviendo la concienciación de la comunidad y reforzando el papel social de la universidad en la prevención de las neoplasias mamarias en pequeños animales.

1 INTRODUCTION

Mammary neoplasms represent one of the main oncological diseases in small animal clinics, especially in female dogs and felines, and are an important cause of morbidity and mortality in these species. In female dogs, these tumors correspond to approximately half of all diagnosed neoplasms, and about 50% are malignant in nature. In felines, despite their lower relative frequency, approximately 80% of mammary neoplasms are malignant, with rapid growth and early metastases, representing an important clinical and therapeutic challenge (Nelson; Couto, 2015; Cassali et al., 2020).

The reproductive condition of the female and the time at which the ovariohysterectomy is performed are determining factors in prevention. When castration is performed before the first heat, the risk of developing breast tumors approaches minimum levels, increasing progressively when castration occurs after the first and second estrus (Fonseca; Daleck, 2000; Piekarz et al., 2008). In cats, castration before six months of age can reduce the incidence of mammary neoplasms by up to 91%, and when performed before one year, this reduction is approximately 86% (Memon et al., 2016).

Another widely described risk factor includes the use of progestin- and estrogen-based contraceptives, a condition that favors cell proliferation of the mammary gland, increasing the predisposition to tumor development. However, the low cost and easy access to these agents make their use indiscriminate (Fonseca; Daleck, 2000; Skorupski et al., 2005).

Despite its clinical and epidemiological relevance, the diagnosis still occurs, in most cases, late, compromising the prognosis and therapeutic possibilities. Among the factors that contribute to this delay, the limitation of knowledge on the part of owners in identifying the clinical signs and the initial physical changes of the condition stands out, delaying the search for specialized veterinary care.

In view of this scenario, the need for strategies that expand access to information and favor the adoption of preventive and early detection measures is evident. In this context, educational actions aimed at animal health are fundamental, especially when developed in a continuous and accessible way to the population. University extension is a relevant instrument in this process by allowing the approximation between the scientific knowledge produced in the academy and the reality experienced by the community, while contributing to the practical, ethical and humanized training of Veterinary Medicine students (Rodrigues et al., 2013).

In view of the above, the present study aimed to describe and analyze the importance of a university extension project, developed in the context of Pink October Pet, in the awareness of dog and cat owners and in the technical-scientific training of Veterinary

Medicine students about breast cancer in dogs and cats.

2 METHODOLOGY

The present study is characterized as an experience report, of a descriptive and qualitative nature, with an educational and extension approach, developed within the scope of a university extension project of the Veterinary Medicine course at the Maurício de Nassau University, Graças Unit, in the city of Recife-PE. The actions were carried out in the context of the Pink Pet October campaign, from August 2025 to January 2026, involving face-to-face and digital activities aimed at raising awareness about breast neoplasms in dogs and cats.

The target audience was composed of dog and cat owners from the local community, attended at the School of Veterinary Medicine Clinic of UNINASSAU and in adjacent public spaces, as well as Veterinary Medicine students, direct participants in the extension activities. Students and professionals in the area who participated in the scientific actions promoted by the project, such as a symposium and podcast episode, were also included. Thus, the contemplated public was characterized as heterogeneous, including participants with different levels of previous knowledge about the investigated theme.

The activities developed in the project were organized in a sequential and integrated way, covering three main axes: face-to-face educational actions, a digital campaign through the social network Instagram and a scientific event aimed at students of the veterinary medicine course and professionals in the area.

The face-to-face educational actions took place during the Breast Cancer Awareness Week in Dogs and Kittens, held at the Veterinary Medicine School Clinic of UNINASSAU. At this stage, individualized verbal guidance was given to the tutors, using accessible language, addressing risk factors, initial clinical signs, the importance of breast palpation, periodic veterinary follow-up and castration as a preventive measure. At the same time, educational pamphlets prepared by the project team were distributed.

The educational digital campaign was developed through the Instagram platform, with the publication of informative content on breast neoplasms, prevention, early diagnosis and risks of using hormonal contraceptives. Additionally, a podcast episode was produced and disseminated, recorded in an institutional studio, with the participation of a specialist in veterinary oncology, aiming to expand the reach of information in a way that is accessible to the general public.

The scientific event, characterized by the Symposium on Mammary Neoplasms in Dogs and Cats, was held in a face-to-face format, with lectures and a round table given by invited veterinarians, addressing clinical, surgical and anatomopathological aspects of breast

neoplasms. The event aimed to promote scientific updating and integration between students, professors and professionals in the area.

Data collection took place in an observational and documentary way, based on the registration of the activities carried out, the number of face-to-face consultations and guidance, the distribution of educational materials and the indicators of reach of digital publications, obtained through the Instagram Insights tool. Data regarding participation in the symposium were also considered, including the number of registrants and effective attendance.

The data obtained were analyzed in a descriptive way, through the systematization of quantitative information and the qualitative analysis of the impact of the extension actions, considering the involvement of the participants, the scope of the activities and the contribution of the project to the academic training of the students involved.

The study was conducted respecting ethical principles and with faculty supervision during all extension activities. The methodology adopted made it possible to systematize the actions developed and analyze their scope and contribution to the awareness of the community and the academic training of students. .

3 RESULTS AND DISCUSSION

According to Lima et al. (2020), university extension consists, in its essence, of the articulation between the higher education institution and the community, integrating teaching and research into the training process and promoting the exchange of knowledge, configuring itself as one of the pillars of higher education. In line with this perspective, the activities developed in this extension project favored the approximation between university and community, reinforcing the role of extension as an instrument for the dissemination of knowledge and promotion of animal health in the context of Veterinary Medicine.

The execution of the extension project made it possible to carry out educational, clinical and scientific actions aimed at raising awareness about mammary neoplasms in dogs and cats, reaching both the community and academic audiences. The face-to-face activities allowed the clarification of doubts about the main risk factors, initial clinical signs and prevention strategies, with an emphasis on early castration and periodic veterinary follow-up. In addition, the actions contributed to the early identification of mammary neoplasia in 15 of the 25 dogs evaluated that accompanied their owners during the activities, a fundamental aspect, since the literature consistently demonstrates that the earlier the neoplasm is identified, the greater the chances of successful treatment and better prognosis for the patient (Daleck; De Nardi, 2016; Cassali, 2020).

In the digital environment, the educational campaign developed through the social network Instagram had a significant reach, with approximately 81,000 views on the published content, mostly from non-followers, while the podcast episode obtained approximately 2,100 views. This result corroborates the literature by highlighting the potential of social media as strategic tools for the dissemination of information on animal health, expanding access to scientific knowledge beyond the physical limits of the university. These findings are in line with what is described by França et al. (2019), who highlight the role of digital media in expanding the reach of educational and scientific actions.

The Symposium on Mammary Neoplasms in Dogs and Cats was configured as a prominent action in the scientific axis of the project, promoting technical-scientific updating and integration between students, teachers and professionals in the area. The initiative highlighted the importance of spaces for scientific discussion focused on veterinary oncology, an area of high relevance in the small animal clinic. For the students involved in the organization and execution of the event, the experience contributed to the development of skills in scientific communication, teamwork and management of academic activities.

From the point of view of student training, the project enabled the practical application of theoretical knowledge, especially with regard to breast oncology, communication with tutors and ethical and humanized performance. The extension experience allowed students to understand the importance of the social role of the veterinarian and the opportunity to apply, in practice, the knowledge acquired in the classroom, favoring academic development beyond the theoretical environment. These findings corroborate the literature that highlights university extension as a fundamental axis in professional training, as it integrates teaching, research and social responsibility (Rodrigues et al., 2013).

4 CONCLUSION

The extension project developed in the context of Pink October Pet had a relevant impact on the awareness of dog and cat owners and on the technical-scientific training of Veterinary Medicine students on breast neoplasms. The educational, clinical and scientific actions favored the dissemination of information on prevention, risk factors and early diagnosis, in addition to bringing academic knowledge closer to the community. The initiative also favored the development of technical, ethical and communication skills of students, evidencing the high social and educational potential of extension actions.

ABSTRACT

The study of Chemistry can broaden the students' view of their universe of experiences, while considering such contexts can facilitate the understanding of this science. However, we realize that there is still resistance to its study by students, especially when faced with a teaching that privileges nomenclatures and calculations. Such teaching makes the student perceive chemistry from a stereotyped view, or in his words, as 'an even more complicated version of mathematics'. The present work proposes to present and discuss contributions of the interaction between reading mediation and chemistry teaching, since the use of scientific texts as a didactic resource can be considered as a means of facilitating. We start from the idea that, arousing curiosity in the search for new information, motivates the student to get involved in their learning, so it is important to promote their enculturation from elementary school, with the use of scientific language in the teaching and learning process of Chemistry. This research aims to propose reading mediation as a didactic resource in the teaching of Chemistry, through scientific literature, with the use of scientific articles - AC or scientific popularization texts - TDC, in order to promote and improve the construction of knowledge in the classroom. AC or TDC reading mediation are used as learning vehicles for students in the first year of high school, in a School of the Public Teaching Network of Ilha de Mosqueiro/PA and, above all, as a way to help students to think and to position itself critically before society. The preliminary results of this research suggest that reading mediation, associated with writing and discussion activities are relevant factors in the acquisition of chemical knowledge, contributing to the formation of a conscious and critical student about social problems. In summary, this interaction established between reader and scientific text can contribute to making learning more effective.

RESUMO

O estudo da Química pode ampliar a visão dos estudantes sobre seu universo de vivências, ao mesmo tempo em que considerar tais contextos pode facilitar a compreensão desta ciência. No entanto, percebemos que ainda existe uma resistência ao seu estudo por parte dos alunos, principalmente ao deparar-se com um ensino que privilegia nomenclaturas, fórmulas e cálculos. Tal ensino faz o aluno perceber a Química a partir de uma visão estereotipada, ou em suas palavras, como 'uma versão ainda mais complicada da matemática'. O presente trabalho propõe apresentar e discutir contribuições da interação entre mediação de leitura e ensino de química, já que a utilização dos textos científicos como recurso didático pode ser considerada como um meio facilitador da aprendizagem. Partimos da ideia que, despertar a curiosidade pela busca de novas informações, motiva o aluno a se envolver em sua aprendizagem, por isso, é importante promover sua enculturação desde o ensino básico, com o uso da linguagem científica no processo de ensino e aprendizagem da Química. Tal pesquisa tem como objetivo propor a mediação de leitura como recurso didático no ensino da Química, por meio da literatura científica, com o uso de artigos científicos – AC ou textos de divulgação científica – TDC, com intuito de promover e melhorar a construção do conhecimento científico em sala de aula. A mediação de leitura de AC ou TDC foi empregada como veículos de aprendizagem aos estudantes do primeiro ano do ensino médio, de uma Escola da Rede Pública de Ensino da Ilha de Mosqueiro/PA e, sobretudo, como forma de auxiliar os estudantes a pensar e se posicionar criticamente diante da sociedade. Os resultados desta pesquisa sugerem que a mediação de leitura, associada a atividades de escrita e discussão são fatores relevantes na aquisição de conhecimentos químicos, contribuindo para a formação de um aluno consciente e crítico sobre os problemas sociais. Em síntese, essa interação estabelecida entre leitor e texto científico pode contribuir para tornar a aprendizagem mais efetiva.

RESUMEN

El estudio de la Química puede ampliar la perspectiva de los estudiantes sobre sus experiencias vividas, mientras que considerar estos contextos puede facilitar su comprensión de esta ciencia. Sin embargo, observamos que aún existe resistencia a su estudio por parte de los estudiantes, especialmente cuando se enfrentan a métodos de enseñanza que priorizan la nomenclatura, las fórmulas y los cálculos. Este tipo de enseñanza lleva a los estudiantes a percibir la Química desde una perspectiva estereotipada, o en sus palabras, como "una versión aún más compleja de las matemáticas". Este trabajo propone presentar y discutir las contribuciones de la interacción entre la mediación lectora y la enseñanza de la Química, ya que el uso de textos científicos como recurso didático puede considerarse un medio para facilitar el aprendizaje. Partimos de la idea de que despertar la curiosidad en la búsqueda de nueva información motiva a los estudiantes a involucrarse en su aprendizaje; por lo tanto, es importante promover su inculturación desde la educación básica en adelante, utilizando el lenguaje científico en el proceso de enseñanza y aprendizaje de la Química. Esta investigación tiene como objetivo proponer la mediación lectora como recurso didático en la enseñanza de la química, a través de la literatura científica, utilizando artículos científicos (AE) o textos de divulgación científica (EDC), con el fin de promover y mejorar la construcción del conocimiento científico en el aula. La mediación lectora de AE o EDC se empleó como herramienta de aprendizaje para estudiantes de primer año de secundaria en una escuela pública de la Isla de Mosqueiro/PA y, sobre todo, como una forma de ayudar a los estudiantes a pensar críticamente y a posicionarse en la sociedad. Los resultados de esta investigación sugieren que la mediación lectora, asociada a actividades de escritura y debate, es un factor relevante en la adquisición de conocimientos químicos, contribuyendo a la formación de un estudiante consciente y crítico ante los problemas sociales. En resumen,

esta interacción establecida entre el lector y el texto científico puede contribuir a un aprendizaje más efectivo.

1 INTRODUCTION

The teacher has the task of awakening in the student a critical attitude towards the reality in which he is inserted, preparing him to "read the world": at first his world, from then on, and gradually, all possible worlds".
Koch, 2000.

To a large extent, we can say that learning Chemistry means appropriating the language of science, with its codes, concepts, equations, that is, as a specific way of reading and interpreting reality. At the same time that discussions about Science circulate in the media and raise questions, the teaching and learning of Science in school has often encountered difficulties, configuring a crisis, according to Fourez (2003). Such a crisis is related to a distant and unattractive teaching, contributing to the lack of interest on the part of students.

This can be evidenced, among other aspects, in the performance of Brazilian students in PISA⁴ (Program for International Student Assessment) in 2018, whose exam is carried out by the Organization for Economic Cooperation and Development – OECD, in which Brazil occupies the 66th position among 78 participating nations, still below Latin American countries such as Chile, Uruguay, Mexico, Costa Rica and Colombia. These results indicate that Brazil, despite having improved its performance in reading, mathematics and science in the latest assessments, still has a rate significantly below the OECD average. The score of Brazilian students was 404, and the average in this category is 489, with the maximum score being 590, recorded in Singapore. This performance gives the Brazilian student level 2 of learning, on a scale ranging from 1 to 6. This means that students can understand only a limited part of the text and are only able to make low-level inferences (PISA, 2018). Although the results of this evaluation can be questioned, one of the consequences is the stagnation in science teaching in Brazil, observed by the lack of interest in the discipline and the scientific careers associated with it.

There are different initiatives to improve the teaching of Chemistry in Brazil. Research such as that of Martins, Nascimento and Abreu (2001), for example, proposes the use of didactic strategies that value the relationship of students with different types of scientific texts that express a variety of forms of argumentation and different points of view. Such texts can bring certain benefits, among which are: access to a greater diversity of information; development of reading skills and mastery of concepts, forms of argumentation and elements of scientific terminology (MARTINS et al., 2001). From this perspective, knowing a variety of

⁴ PISA (Programme for International Student Assessment). Information available on the website: ocde.org/pisa/

types of scientific texts, from media reports to scientific originals, helps students to incorporate elements of scientific culture.

The need to focus on reading, writing and text interpretation is related not only to the appropriation of the mother tongue, but also of scientific language, to strengthen the teaching of science, especially the teaching of Chemistry. As Martins et al., (2004) point out in their works, scientific dissemination texts can function as motivating or structuring elements in the classroom.

Therefore, I understand that no matter what the school subjects are, they can all contribute to the development of activities that enable students to gradually increase their ability to understand the materials read, and thus accentuate the taste for reading. For this to occur, it is of fundamental importance that teachers promote the insertion of various texts, such as Scientific Articles (CA) and Scientific Dissemination Texts (TDC), with language appropriate to the student's learning level as a resource to enhance the teaching and learning process in the teaching of Chemistry.

Tonindandel (2008) comments that in science teaching it is necessary to promote conditions and stimulus for an approximation of the student to scientific processes, which by understanding their rules, processes and forms of language, can enable students' access to scientific culture. Two competencies of the ENEM reference matrix, found in the Cognitive Axis (Mastering Languages – DL and Building Argumentations – CA), should be stimulated in high school students are: "master the cultured norm of the Portuguese language and make use of the mathematical, artistic and scientific languages and the Spanish and English languages" (p. 1) and "Relate information represented in different forms, and knowledge available in concrete situations, to ensure consistent argumentation" (BRASIL, 2020, p. 101). Therefore, the need to value scientific culture in basic education is evident.

In my view, it is somewhat challenging to consider reading as a learning space in Chemistry classes, so I sought to investigate my own practice, having as a guiding question:

- In what terms can reading mediation activities contribute to learning in Chemistry classes at the high school level?

In this sense, we seek a simple proposal, but one that can be significant, which leads us to reflect on our postures in the face of the work carried out in Chemistry classes. With the pedagogical intervention method, we used the insertion of CA and TDC in Chemistry classes in the 1st year of high school, with the general objective:

- Investigate reading mediation activities of scientific articles and texts of scientific dissemination in the context of Chemistry classes and their possible contributions to the Scientific Literacy of students.

In view of this general objective, the study also seeks as specific objectives:

- Identify reading habits of students in the 1st year of high school and correlate them with the learning of Chemistry.
- Analyze reading mediation activities and their possible contributions to the learning of Chemistry.
- Develop an educational product with reading mediation strategies in Chemistry classes.

2 BRIEF ACCOUNT OF ACADEMIC AND PROFESSIONAL LIFE

The path of this research is the result of my academic and mainly professional trajectory, which converged to the search for a didactic resource, which prioritizes solving learning difficulties encountered by my students in the teaching of science, especially with Chemistry subjects in basic education. To understand this choice and the path taken so far, I must refer to my academic path, which began in 2003, in the Full Degree course in Natural Sciences – Chemical Qualification – at the State University of Pará – UEPA, Regional University Nucleus of Baixo Tocantins, Moju and to my teaching essays as a teacher of CFB (Physical and Biological Sciences) in the Municipal Network and Chemistry in the State Network.

My journey as a student in Basic Education was in public education, marked by negative factors since due to the difficulties faced in my path I was labeled early as a student with little interest in studies, with learning and cognition deficits, factors that resulted in retention in literacy and weaknesses in the areas of Portuguese language and mathematics.

From average student to hardworking student, my educational deficiencies accumulated and I needed more time than other students in my age group to enter university. At the time when the preparation for admission to universities was carried out by area of knowledge, I fell in love with the old CB – area of Biological Sciences – which had as its main focus of studies the disciplines of Chemistry, Physics and Biology. It was during this period that I chose my degree and sought a degree by affinity, with an emphasis on Chemistry and Biology, as my future and profession, as they have always been my favorite subjects.

I studied at UEPA in the period 2003 – 2006 at the Regional University Center of Baixo Tocantins - NURBAT, in the municipality of Moju, where we had several structural and pedagogical problems that hindered the teaching and learning process. We were the second class of a newly opened campus, so the tripod of higher education – Teaching, Research and Extension – was not consolidated, thus leaving a gap in my academic training.

Now graduated in Natural Sciences with a qualification in Chemistry, I sought a second degree, Degree in Biology from the Federal University of Pará, it was offered in the distance learning modality in the city of Capanema/PA, with face-to-face meetings on Saturdays, only with monitoring of doubts, evaluations and experimentation. The course maintained the same profile as the university centers in the interior of the State of Pará, with structural and pedagogical problems and, associated with this and other personal factors, I was unable to complete this degree.

Such experiences in graduation produced a professional who was still unfinished, so I sought in specialization courses new perspectives on my definitions, seeking to answer many questions: how do I see myself as a teacher? How can I improve my practices? What is my role in basic education as a teacher of Natural Sciences?

To answer these questions, I participated in the courses Methodology of the Teaching of Natural Sciences, with qualification in Chemistry, by the Center for Social Sciences and Education - CCSE of the State University of Pará - UEPA and then Methodology in the Teaching of Chemistry, by the Faculdade Integrada Jacarepaguá - FIJ, through the Virtual Learning Environment, distance learning model of teaching, both very theoretical and not very interesting, So the questions and the search for answers continued to surround me. I wanted ready-made answers that would give me a direction, show me how to become a better and more complete person and professional. So far I have not found them, because today I know that this process is long and indeterminate, as it is a human construction.

I consider that in my beginning in teaching I sought to reproduce the pedagogical practice of the teachers I had in high school, plastered to the mechanical and traditional teaching format to which I was subjected and which was not questioned or problematized at the University. Paulo Freire (2006, P. 61) characterizes the educator-student relationship as "fundamentally narrative" and excessively theoretical, in which the teacher, considered as the bearer of knowledge, transmits ready-made and finished information to students, without integrating them into the process of knowledge formation or giving space for questioning. This type of education empties students of subjectivity, reflection and criticality.

The experiences as a student in basic education, in which I built ideas about the teaching and learning processes and the role of teacher and students, are referred to in research as environmental or incidental training (CARVALHO AND GIL-PÉREZ, 2001). This draws attention to the fact that teacher training does not begin in undergraduate courses and goes beyond them, being a permanent process that needs to be considered so that simplistic ideas about teaching are not perpetuated, to the detriment of the development of the teacher's professional knowledge.

As an education professional, I came across several realities and understood that difference, before being a problem, is inherent to the classroom. In public school, I lived with students from different social classes, with different levels of learning and each one with their own time to learn. I experienced violence in schools and structural precariousness, but what drew the most attention during this period was the negligence of managers with public education.

I could be one more, wait for the salaries at the end of each month, but all this bothered me, because I was a "child" of the public school and I know that even in its decadent face it can transform lives, just as it transformed mine. Working since the second semester of college was not easy, because in addition to being very young and inexperienced, I was at the beginning of my academic training, without theoretical and methodological foundations, but with the sparkle in my eyes and the enthusiasm to do my best.

In these seventeen years as a teacher, I taught in the municipalities of Moju, Igarapé-Miri and Belém, but always with the intention of transforming lives and changing realities. I love my profession and that's why I dedicate myself to doing what I understand to be the best for the students. I try to use several different resources and methods seeking to prioritize quality teaching, focused on student learning.

One of the most relevant factors of my teaching journey in basic education was the participation as an advisor of research projects in science fairs and as a coordinator of fairs. Science fairs appeared in my professional life in 2008 and changed the way I view my teaching practice. I became an advisor for Junior Scientific Initiation projects – ICJr and coordinator of science fairs at the Manoel Antônio de Castro school - MAC and later director of the Coordination of Support and Incentive to Scientific Initiation - CAIC, by the Municipal Department of Education - SEMED of Igarapé-Miri, where I learned that research and scientific investigation in basic education are very important for the formation of the student.

Thus, I started to bet on the production of research in elementary and high school, with child and youth engagement from the early years, and I realized that it was possible for young people from public elementary and high schools to get involved with research. That was how my teaching practice started to make sense, so I sought, in the Junior Scientific Initiation, to give meaning to my teaching practice.

I was looking for an instrument in scientific initiation that would concretely help the teaching of Chemistry and Sciences, using research actions to teach, in which the appropriation of knowledge occurred through reading and immersion in the scientific world. There were years of work and participation in several local, regional, state, national and

international scientific events. Unique experiences with learning that changed my story as a person and professional.

It was from my practice as a project advisor and organizer of scientific events that I was able to realize the importance of reading and the appropriation of scientific language as one of the elements for citizenship formation, considering that it enables other ways of understanding reality by the student. Reading habits can be encouraged from the beginning of the literacy process, as we know that science and scientific culture play a fundamental role in contemporary society, in addition to contributing to expanding students' reading of the world.

I continue to seek the best of myself and try to subsidize teaching with differentiated activities, with playfulness, problematization and research. I seek to involve students in the teaching and learning process, as I believe that we can, albeit indirectly, transform the lives of our students through education.

3 ACADEMIC PRODUCTIONS ON THE TEACHING OF CHEMISTRY AND READING AS A METHODOLOGICAL RESOURCE IN THE AREA OF CHEMISTRY TEACHING

In this section, a mapping of academic productions on the theme "reading in the teaching of Chemistry" is presented, especially in high school, which is the focus of this research. The investigation was made around knowing some research on the teaching of Chemistry in the Brazilian territory, focusing on reading in classes of the referred curricular component.

For this, a survey was carried out in works published at the National Meeting of Chemistry Teaching – ENEQ, corresponding to the years 2008 to 2018. The ENEQ was chosen for its representativeness among teachers in the area of Chemistry Teaching, in Basic Education and at the higher level, which meets the focus of the present study. The studies were selected taking the following elements of analysis: theme, keywords, reading of abstracts. In some cases in which these elements were not sufficient to classify the study, methodology and results were evaluated. A total of 32 studies were identified with a focus on Reading as a didactic resource, as illustrated in the following table:

Table 1

Academic works published at the National Meeting on Chemistry Teaching – ENEQ, from 2008 to 2018, focusing on reading in the teaching of Chemistry

YEAR OF THE ENEQ	NUMBER OF PUBLICATIONS	AREA IN ENEQ	ACRONYM
2008	2	Experimentation	EX

		Environmental Education	EA
		Language and Cognition	LC
		Teaching Learning	EAP
		Teacher Training	FP
		Not specified	XXXXXXXXXXXX
2010	6	Language and Cognition	LC
		Language and Cognition	LC
		Curriculum and Assessment	CA
		Environmental Education	EA
		Teaching and Learning	EAP
		Experimentation	EX
		Education in Non-Formal Spaces and Scientific Dissemination	EFD
2012	6	Science, Technology and Society	CTS
		Language and Cognition	LC

In the period corresponding to 2008-2018, 4,557 works were published⁵ within the thematic lines of table 1, and from these studies a demonstration of only 32 works that came close to the object of study of this research was selected, based on the criteria already mentioned. The analysis of the table reveals that there was a greater number of studies focused on the focus of this research in 2014 with 10 studies, followed by 2010 and 2012 with 6 studies each. In the subsequent years, 2016 and 2018, there was a drop in the publication of these works, with only 04 and 04 studies presented respectively in each of these two editions of the event. A more detailed investigation was carried out in order to elucidate issues such as "types of reading" that have been addressed in the research, "levels of education" to which the research is directed and "thematic areas" involved in the published studies. These data are shown in Table 1 below:

⁵ Quantitative data obtained from the Brazilian Society of Chemistry Teaching (SBENQ) that publishes the works published in the National Meetings of Chemistry Teaching (ENEQs) through the website: <https://sbenq.org.br/eneqs/>. Accessed in January 2019.

The tables with the demonstrations of the number of papers published in each Edition of ENEQ in the period 2008-2018 as well as the respective thematic areas are found in Annex I of this research, the data were accounted for and organized by the proponent of the research since the page does not have the systematization of data in the way it is being demonstrated in this study.

Table 2

Academic works published at the National Meeting of Chemistry Teaching – ENEQ, between the years 2008 and 2018, with a focus on language and writing in the teaching of the discipline of Chemistry

No.	ENEQ'S	TITLE	EDUCATION LEVEL	FOCUS	THEMATIC AREA
1	XIV ENEQ 2008	Reading labels as a contextualizing instrument for the teaching of Chemistry.	Medium	Reading and interpreting labels	EX
2	XIV ENEQ 2008	Reading the World: Using Written and Spoken Language to Awaken Scientific Interest in Chemistry.	High School/Prep School	Use of newspapers, magazines and films in problem situations.	EA
3	XV ENEQ 2010	Analysis of Questions and Questions and Answers Prepared by Chemistry Undergraduates in Reading Activities	Graduation	Reading texts about experimentation	LC
4	XV ENEQ 2010	Emphasizing the relationship between the ability to read texts and the learning of Chemical contents*	Graduation	Use of scientific articles for reading	EAP
5	XV ENEQ 2010	Reading experiences in the Amazon: the case of PIBID Chemistry at the Federal University of Rondônia	Graduation	Readings of articles.	FP
6	XV ENEQ 2010	Investigating rhetorical strategies in the writing of researchers in the field of chemistry: subsidies for understanding the language of science*.	Postgraduate	Reading of 10 articles and the present rhetoric.	LC
7	XV ENEQ 2010	Medicine Leaflets, Drug Production and Biopiracy: An Experience Involving Reading, Educational Video and Playful Activities in the Classroom.	Medium	Reading of medicine leaflets and biopiracy.	Not specified
8	XV ENEQ 2010	Possibilities for the construction of the written language of science in chemistry classrooms	Medium	Reading of textbook text.	LC
9	XVI ENEQ 2012	The reading of scientific texts as a possibility of analyzing the improvement of discourse genres*.	Graduation	Reading of scientific texts.	LC
10	XVI ENEQ 2012	Reading strategies in initial training in chemistry: an analysis of two cases based on the use of scientific literature*	Graduation	Readings of scientific texts.	LC
11	XVI ENEQ 2012	The mediation of the reading of didactic texts and the process of understanding the chemical contents	Fundamental	Mediation of readings in didactic texts.	LC
12	XVI ENEQ 2012	(Dis)paths of research on reading and formation of readers in chemistry classes in high school	Postgraduate	Literature review.	LC

13	XVI ENEQ 2012	Reading and textual interpretation in Chemistry classes in schools in the municipality of Juiz de Fora*.	Medium	Reading of a text for scientific dissemination.	LC
14	XVI ENEQ 2012	The development of argumentation and scientific language by undergraduate students in chemistry through textual production*.	Graduation	Reading scientific texts learning.	LC
15	XVI ENEQ 2014	An evaluation of the teaching of argumentation to chemists	Graduation	Creation of a reading and writing discipline.	CA
16	XVI ENEQ 2014	The use of poems as a didactic proposal in the teaching of Chemistry.	Medium	Reading and Analysis of poems	EAP
17	XVI ENEQ 2014	Reading scientific articles in high school: proposal of a methodology for teaching chemistry*.	Medium	Reading articles, books and writing.	EAP
18	XVI ENEQ 2014	The Teaching of Atomic Models Mediated by Reading	Medium	Reading cybertexts and textbooks	EAP
19	XVI ENEQ 2014	Scientific language in the school context: the acquisition of oxygen by Lavoisier as a motivating theme.	Fundamental	Paradidactic book "Elementary Chemistry Treatise"	EX
20	XVI ENEQ 2014	Mediation of scientific knowledge articulated by the teacher during a class on Chemical Transformations for deaf students	Fundamental	Mediation of experimentation with the use of LIBRAS.	IPE
21	XVI ENEQ 2014	Written activity based on a text of scientific dissemination in high school chemistry: production of meanings*	Medium	Reading of a text for scientific dissemination. "Green energy".	LC
22	XVI ENEQ 2014	Scientific and everyday language: how students explain an environmental phenomenon.	Medium	Thematic classes using everyday or scientific language.	LC
23	XVI ENEQ 2014	Use of a popular science text in chemistry classes in high school*	Medium	Use of texts from the magazine Ciência Hoje.	EFD
24	XVI ENEQ 2014	The written language of chemical reactions: perceptions of chemistry undergraduates.	Graduation	Chemical language used in reactions.	LC
25	XVI ENEQ 2016	Language and the other in the process of understanding chemical conceptual contents	Other	Central role of language and discursive interactions	LC
26	XVI ENEQ 2016	Dissemination of Science in Elementary Education – classroom reports*.	Fundamental	Readings of popular science texts	Not specified
27	XVI ENEQ 2016	Reading from a Freirean perspective and assumptions of the STS approach:	Other	Reading of literary texts.	CTS

		approximations and implications to the teaching of chemistry			
28	XVI ENEQ 2016	Contributions of reading scientific texts to scientific literacy in Higher Education*	Graduation	Reading and interpretation of scientific texts.	LC
29	XVI ENEQ 2018	Retextualization of original research articles in science education: overview of the works published in the JCE and JCST (2007-2014)*.	Graduation	Reading articles for Retextualization.	LC
30	XVI ENEQ 2018	Investigation of Reading Habits in Chemistry Classes of High School Students*	Medium	Application of a questionnaire on reading habits.	EAP
31	XVI ENEQ 2018	Scientific dissemination in Chemistry: contributions to formal education	Graduation	Use of a laboratory for scientific dissemination. Experimentation for the appropriation of scientific terms.	EFD
32	XVI ENEQ 2018	The use of Scientific Dissemination Texts for the teaching of Chemistry at PROEJA.*	Medium/Technical	To analyze the effectiveness of BDT with an approach in general chemistry, seeking to facilitate its understanding and importance for citizenship formation.	EFD

Source: Author 2021

The data in Table 1 indicate that 46.875% of the studies are focused on higher education, including undergraduate and graduate studies, and 53.125% of the studies are directed to basic education, including elementary and high school. Another piece of data observed in Table 1 is related to the "type of reading used" in the studies investigated. It was observed that 40.625% of the readings used in the classroom correspond to scientific articles (identified in the box with an asterisk) and most of the readings used, which correspond to 59.375%, refer to other textual genres such as "product labels", "medicine recipes", "textbooks" and others.

Furthermore, it is important to emphasize that of the studies that made use of Scientific Articles and TDC's, 50% were used in higher education and the other 50% in basic education. This shows a parity in productions, but still limited, hence the need to discuss articles of scientific dissemination within the reach of basic education students, which in part may justify

possible difficulties that these students have in discussing themes involving scientific themes, ratifying the need for other studies in this line. Of the 32 studies found in the mentioned period, 48% are in the area of Language and Cognition (CL), denoting its importance for studies focused on Reading. For an analysis of the Teaching Level of the 32 works published in ENEQ with a focus on Reading as a contribution to the teaching of Chemistry, Figure 1 shows in more detail how this distribution took place.

Figure 1

Distribution of publications by level of education

Source: Author 2020

In addition, an analysis was carried out with regard to the teaching and research institutions in which the studies are linked, as well as the major Brazilian regions, so that we could have an overview of the distribution in our country and in particular in the North region, the state of Pará that is the location of the present study. This survey showed disparity in the distribution of these studies in the major Brazilian regions, because as can be seen in Figure 2, there is a greater number of publications in the Southeast region, which totals 15 studies published in the ENEQ, followed by the North region with 06, the South and Northeast regions with 04 and the Midwest with only 02 studies. It is important to mention that although the North region shows an academic production with 06 publications, considering its vast territory this number becomes low compared to the other Brazilian regions, in addition to the fact that the state of Pará does not have any of the publications in this region.

Figure 2

Regional Quantitative of Academic Productions on "Reading" published in ENEQ in the period from 2008 to 2018.

Source: Author 2021

Figure 3 shows the institutional distribution of these studies, where there is a predominance of studies produced by the Federal University of Rondônia (UNIR) with 5 studies, the Federal University of Minas Gerais (UFMG) and the University of São Paulo (USP) with 4 studies, each institution. In the other institutions shown in the Figure, between 1 and 2 studies were identified. It is relevant to emphasize that in the North region, UNIR concentrates productions involving reading in the teaching of Chemistry. On the other hand, there is a greater number of teaching and research institutions in the Southeast region producing this study profile, which expresses the predominance of this region in academic productions of the theme in focus.

Figure 3

Teaching and research institutions that are proponents of studies focused on reading and writing in the teaching of Chemistry in Brazil

These data demonstrate the need to continue to develop research and promote pedagogical actions aimed at strengthening the theme of reading, considered essential for the teaching of Chemistry based on reading, interpretation and writing.

In this regard, Espinoza (2010) discusses the importance of didactic resources for the appropriation of knowledge through reading:

The interpretation of a science text is always difficult for a student who reads to learn new knowledge, so in order for him to be able to make a correct interpretation, there must be didactic conditions that facilitate this appropriation ESPINOZA (2010, p. 164).

We know that reading and writing are fundamental in all disciplines, including Chemistry, because we use them to prepare from a simple experimentation report to the dissemination of academic works and research, as stated by Francisco Junior and Garcia Junior (2010) in their research on reading and writing in pre-university preparatory courses.

Reading and writing are skills to be worked on in science classes, since students are often unable to interpret questions in physics, chemistry, mathematics, etc., due to deficiencies in reading ability, which implies, therefore, the scientific learning difficulties of the majority of the population. (FRANCISCO JÚNIOR; GARCIA JÚNIOR, 2010, p. 192).

The actions aimed at the development of this theme in the teaching of Chemistry are still timid, in relation to the other areas. Reading and writing are important skills for learning Science, especially the teaching of Chemistry, considering that it is a specific language. In addition, the relevance of reading and writing lies in the very formation of student readers,

who have contact with various texts, such as scientific articles, scientific dissemination texts, song lyrics, poetry, comics, cartoons, literary narratives, among others, associating chemical knowledge with different registers and languages. Such texts can enhance the use of more common pedagogical materials, such as textbooks and, thus, subsidize pedagogical practices in order to contribute to a more critical and contextualized teaching.

According to Silva et al. (2012, p.1), in order for the student to see meaning in the Chemistry contents addressed in basic education, it is essential to discuss its importance "in several areas of their life, such as: hygiene, food, beverages, medicines, cosmetics, among other areas that are part of the daily routine of the human being". Carvalho et al. (2007) found that in addition to the difficulty in relating Chemistry to their social reality, 70% of the students associated chemistry with weapons (chemical and nuclear), drugs and pesticides, denoting a negative interpretation of the discipline and corroborating the idea of disconnection with everyday life. In addition, there is difficulty among teachers to relate the knowledge of Chemistry with the student's daily life, since reproductions of knowledge with memorization of definitions and formulas are prioritized (Pontes et al. 2008).

In this context, in his studies Flôr (2009) mentions the importance of correlating everyday knowledge with the teaching of Chemistry, in order to assist in the formation of citizenship:

In today's world, where science and technology are increasingly present in our daily lives, contact with scientific knowledge and the understanding of its contents become important instruments in favor of citizenship. And the teaching of chemistry does not escape this responsibility and importance. Present in our daily lives from the occurrence of natural phenomena such as respiration and decomposition to the manufacture of the bread we eat every day, through soaps and detergents that we use in cleaning and covering paints, varnishes, fuels and the most varied materials possible, chemical knowledge permeates our most ordinary actions. Alcohol or gasoline, which is the most efficient fuel? What is the best economically and environmentally speaking? In addition, it is part of important discussions about global warming, production and disposal of polluting materials, among others" (FLÔR, 2009, p.16).

In addition to the relationship between everyday and scientific knowledge, the appropriation of the language of Chemistry is another relevant aspect, especially in relation to reading, which according to Wenzel and Maldaner (2014) is fundamental for student learning. In this regard, among different types of texts that can be approached by reading and writing in class, in the present research we opted to work with a scientific article (CA) and especially with texts of scientific dissemination (TDC), which treat scientific knowledge with a less technical language, but rich in information based on studies and research.

3.1 READING AS A DIDACTIC RESOURCE IN THE TEACHING OF CHEMISTRY

In the world, it is necessary to interpret in a coherent way what one reads or experiences, because it is these understandings that build in our cognitive universe the conceptions about the concepts presented, both in scientific productions and also in the elaboration of hypotheses in an attempt to explain some phenomena. (...) One of the spaces for the development of these skills should be the school environment, where reading is an important factor in the teaching and learning process, as it is from this that knowledge related to the various areas of study is built (ANDRADE et al, 2017 p.142).

By considering reading as an essential element of learning, Silva (1998) argues that the science teacher is also a reading teacher, therefore, reading and writing are skills that should also be worked on in chemistry classes, to help students acquire knowledge, whether in the school field or in life in society. Reading is one of the most important forms of learning; this has been pointed out in studies that demonstrate that the improvement in the ability to read also results in the improvement of the ability to learn (ANDRADE et al., 2017). Learning is effective when the reader is able to understand the texts read, which in most cases does not occur due to the lack of subsidies from previous readings that favor this understanding (KLEIMAN and MORAES, 2003).

According to Freire's (2006) propositions, reading is an essential element in the formation of citizenship and is inherent to the political act, as it enables an awareness of the position of the individual member of a society, understanding the relations that exist in it and his role in these relations. By becoming aware of their experience and their reading of the world, the individual understands their limits and potentialities within society.

From this perspective, we cannot disassociate the important role that the school has in the formation of citizenship with reading, as they are intrinsic elements, since the citizen, before relating to the world of words, relates to the reading of the world. Andrade et al., (2017) reiterate that, in the first years of life, with the beginning of language development, the citizen learns to read the world around him and, from this reading of the world, begins to discover the reading of words, and the social relationship experienced by the citizen is an important factor for the understanding of the texts read, because reading is effective when what is read has meaning for the subject. Reading is, in this view, essential to all subjects because it enables an understanding and learning of the social relations of the world in which they are inserted, since it is a socially constructed act that is triggered and expanded in the coexistence with the world and with others.

In view of the above, the importance of reading in the construction and formation of the identity of critical and socially active citizens is evident, and for this, it needs to be further

explored in schools as a didactic resource in Science classes. Students can glimpse through reading more meaning in the contents and disciplines that are offered to them and have more appreciation for socialized knowledge (TEIXEIRA and SILVA, 2007).

With regard to the Teaching of Chemistry, reading is one of the obstacles in the teaching and learning process, due to the notorious difficulty that students demonstrate in understanding texts focused on this area (FRANCISCO JUNIOR et al., 2008). In my teaching practice, I found that it is challenging to teach chemical content in a way that seems to add little to the student's education, since we perceive great disinterest and difficulty in understanding the subjects worked on in the classroom. According to Teixeira and Silva (2007), the difficulties associated with reading by students in high school are permeated by lack of motivation in the act of reading and the scarce understanding of various texts, especially scientific, with the need for planning and teacher mediation.

However, some alternatives can be considered to minimize the difficulties faced by students and, in this context, dynamic and planned reading can be a great contribution to this process (WENZEL et al., 2018).

According to the studies of Wenzel and Maldaner (2014), learning Chemistry requires the appropriation and signification of its language, which presents peculiarities such as symbols, formulas, concepts that need to be internalized and signified by students. I understand that it is precisely in the language of Chemistry that part of the difficulty in understanding the curricular component lies, since it is treated mechanically for memorization purposes. Hence the importance of attention to the language established in the classroom and to its modes of use, whether through writing, speaking and/or reading. Considering the specificities of the Chemical/Scientific language, Bargalló (2005) points out that:

Scientific language can act more as a barrier than as a bridge to facilitate the learning of most students. Students are used to a direct, contextualized conversation, which combines linguistic resources with gestures, looks, tones of voice and who, through dialogue, have the possibility of clarifying and reformulating the text, finding themselves in a different situation in front of a scientific text (BARGALLO, 2005, p. 33-34).

It is important to emphasize that reading, as much as it is an important ally of the Chemistry discipline, needs to be planned and thought out cautiously according to the target audience, level of understanding of the concepts, among other aspects with the need to bring the student's language closer to the Chemistry language.

Reading needs to be used in the school in a coherent way, as a contribution that generates understanding and does not cause more distancing of the student in relation to

Chemistry and for that, the teacher has an essential role in this process because he is the one who must outline reading strategies to be applied, so that the interest and scientific curiosity of the students is stimulated and makes it possible to define problems, to raise, analyze and represent results, conclusions and propose interventions (TEIXEIRA JÚNIOR, SILVA, 2007). On this,

The text should provide the student not only with the reading of the word from his historical-social experience (reading the world) but also the possibility of rewriting his world, transforming, at the same time, his reading of the initial word. In this sense, school reading needs to be modified, especially in terms of the students' relationship with the text. To this end, reading strategies should provide a more personal contact with the texts (Francisco Júnior, 2010 p.221).

Although many studies have found the relevance of reading in different areas of knowledge for a full citizenship education, which is not limited to school activities, but which goes beyond the walls of classrooms, there are still timid works aimed at this focus in disciplines that comprise the natural sciences, such as Chemistry, object of the present study. In addition, most publications are works that carry out a literature review, with a smaller number of studies that demonstrate experiences in the teaching of Chemistry, especially in basic education (COLPO et al., 2019).

Despite this, the studies published on the subject in focus have shown very satisfactory results. For example, Guaita and Gonçalves (2015), in a study carried out with 25 students from the 2nd year of High School, made use of texts in Chemistry classes from the journal *Química Nova na Escola* and used the three pedagogical moments as a strategy. The authors concluded that "the reading strategy contributed to identifying students' knowledge about the subjects studied and favoring their evolution" and reiterate that "there are indications that the learning of reading was, to a certain extent, increasing during the course of the activities" (GUAITA, GONÇALVES, 2015, p. 60). This growth portrays the need to expand spaces for reading in the classroom, in which the student can learn to read and position himself in front of the texts.

Another important study was carried out by WENZEL and COLPO (2018) with 29 students from a 1st year class, using TDC in which the theme Radioactivity was worked on from the book *A Brief History of Science* (BYNUM, 2014). The authors concluded that it was "possible to provide students with an approximation with specific terms of chemical language, as well as the discussion of historical facts and everyday knowledge related to radioactivity content" (WENZEL, COLPO, 2018 p.141).

In this sense, spaces are needed in classrooms that enable the dialogue of the insertion of reading as a methodology for teaching Chemistry, since, following the perspective of Ferreira and Queiroz (2015, p. 132), when mentioning the use of DCT, they point out that "studies on classroom interventions using DCT indicate the occurrence of innovative and motivating teaching methodologies". Such methodologies need to be planned, so that the proposed reading is not merely reproduced by the student, but that it provides interaction between the reader and the text, and enables the young person to appropriate the scientific language.

3.2 SCIENTIFIC TEXTS (CA AND TDC) AS A METHODOLOGICAL STRATEGY IN SCIENCE TEACHING

There is a consensus among several studies that the practice of reading is essential in the teaching and learning processes, as it provides the development of imagination, creativity, communication and critical positioning in front of the text, in addition to helping in the correlation with the social context of the student and assisting in the formation of citizenship. (ZISMANN et al, 2019; TARGINO DE MOURA et al, 2019; FATARELL et al., 2014). In this sense, Francisco Júnior (2010) argues that the use of reading allows the reader not only to understand his context, but above all the possibility for the student to rewrite his world with his own way of thinking and positioning himself in front of his universe of life. Within this understanding of the importance of reading, Zismann et al (2019, p.128) say that "when the student is instigated to interpret, to position himself in front of the text, he expands his critical capacity and, with this, qualifies the modes of writing, argumentation and understanding".

In this discussion about the relevance of reading in the production of knowledge in any area, the importance of different readings in the production of knowledge in the teaching of Chemistry is highlighted, since very often its teaching is plastered on the reading of textbooks and handouts with a large volume of numerical information such as formulas and mathematical quantities, which alone do not enhance a dialogue about chemical terms and their relationship with everyday life (ZISMANN et al, 2019).

Ribeiro and Mesquita (2012) show in their study that, in general, the teaching of Chemistry has contributed little to the critical formation of students and this training that takes place in High School is the result of a non-contextualized formative process. Maldaner (2006) points out that contextualizing the teaching of Chemistry is being able to walk in the world of the student's experience and concepts, allowing the student to enter an abstract world and

towards the real world, allowing students to start talking in chemistry about situations they experience, resignifying the learning process.

In Freire's perspective, contextualization should be understood as the development of values and attitudes to form citizens able to exercise conscious citizenship in their social environment, because "when man understands his reality, he can raise hypotheses about the challenge of this reality and seek solutions. Thus, he can transform it and with his work he can create a world of his own: his self and his circumstances" (FREIRE, 1997, p. 30). Regarding the importance of contextualization for the teaching of science, Wartha, Silva and Bejarano (2013) comment that:

[...] Contextualization is clearly the guiding principle for the teaching of science, which means a more complex understanding than the simple exemplification of everyday life or a mere superficial presentation of contexts without a problematization that actually provokes the search for understandings on the topics of study. Therefore, contextualization should not be seen as a resource or proposal for a methodological approach, but rather as a guiding principle (2013, p. 90).

In view of the need to instigate reading in students of the Chemistry discipline in basic education, especially in high school, in order to qualify the readings used by students at this level of education, different studies point to the use of such scientific texts (CA and TDC) as a methodological strategy for the teaching of Chemistry (FATARELL et al., 2014).

The scientific texts addressed are characterized by the use of simpler and more appropriate language for a non-specialized audience, not initiated in science, where the more technical, scientific-chemical terms dialogue with social and historical aspects, which makes reading more accessible in the context of the classroom (CUNHA and GIORDAN, 2015). In these texts, explanations of a more scientific nature approach everyday facts through examples. This facilitates the reader's understanding of the more specific aspects of chemistry, and with this the teacher assumes the contextualization of knowledge and overcomes the perspective of the transmission of chemical content (TARGINO DE MOURA et al, 2018).

In the view of Ferreira and Queiróz (2012), both CA and TDC have specific characteristics that favor their use in the process of obtaining information by the public not literate in science, whose main elements to stand out as preponderant in these texts are scientificity, didacticism and secularism. For the authors, the traces of scientificity come from scientific discourse, related both to scientific praxis and to possible negative consequences of products of science. Secularism brings evidence of everyday discourse and contemplates

different forms of contextualization. And didacticism is related to aspects of the didactic discourse such as explanations, resumptions and methodological guidelines.

From this perspective, according to Zismann et al, 2019:

It is possible to say that TDC differs from chemistry texts, usually present in textbooks, it also differs from a scientific article, because in this the author does not appear and there is no concern to establish a dialogue with the reader that is not initiated in the area. In TDC, the author is present, can, in some cases, be the character of the text and seeks to establish a dialogue with the reader (2019, p.129).

It is relevant to mention that the scientific text does not focus on teaching, but can be used in classes as an instrument to assist in the learning process, as pointed out by Cunha and Giordan (2015). In the perception of Zismann et al, (2019), the use of these texts in the classroom brings the student closer to the world of science, as it provides students with contact with up-to-date information about science and technology, with events in their daily lives, also bringing curious, interesting and fun aspects, providing another way of seeing the dreaded Chemistry. Other relevant aspects provided by scientific texts that we can point out are the stimulus to the development of reading skills, critical and reflective spirit, always in a movement of guided reading (FATARELL et al., 2014).

In addition, Santos and Mortimer, 2009, emphasize that the formation of the individual for citizenship is considered a fundamental objective of science teaching. In this sense, several didactic strategies are suggested aiming at the incorporation of socio-scientific issues and the promotion of decision-making, including the debate of open questions as an important strategy. Martins et al. (2004) argue that these texts can function as important support materials for the triggering of debates that promote students' access to scientific knowledge and, at the same time, the socialization of this knowledge in the classroom, linking science updates to the students' life context.

In summary, the problem of this research stems from experiences lived throughout my teaching career whose focus is the insertion of reading mediation activities in Chemistry classes in Basic Education, specifically in the 1st year of High School. Looking at the insertion and organization of reading in the teaching of Chemistry proved to be important to help students to have a differentiated and less mechanized look at the discipline. A dialogue about the methodology of the research follows.

4 METHODOLOGICAL PATHS

Methodology is the path of thought and practice exercised in the approach to reality (MINAYO, 2009).

In this section, the methodology used in this research is presented, the locus of research, the participants, the activities of reading Scientific Dissemination Articles used with the students, the construction of information, in addition to addressing the legal aspects that guarantee the participation of the students involved in the research and the systematization of the data produced.

The procedures adopted are important in the research process, as they allow the researcher to respond to the proposed problem and, consequently, achieve the expected objectives. In addition to bringing the researcher closer to the object of study, these procedures make it possible to trace new scientific paths, so that a theory can be reformulated, if it already exists, that is, constructed, if the results present new perspectives for the researched phenomenon (VERGARA, 2005).

Thus, the present research focuses on investigating practices of mediation of reading texts of scientific dissemination in the context of Chemistry classes in the 1st year of high school, in addition to identifying reading habits in these students; analyze reading mediation processes and their possible contributions to Chemistry learning and develop an educational product with reading mediation strategies in Chemistry classes.

4.1 METHODOLOGY ADOPTED: TYPE OF RESEARCH AND ANALYSIS OF INFORMATION

The present work is a qualitative research, of the pedagogical intervention type, which according to Damiani et al. (2013, p. 58) contemplates the "planning and implementation of interferences (changes, innovations) - aimed at producing improvements in the learning processes (...) - and the subsequent evaluation". Intervention research seeks alternatives to concrete problems in teaching and should not be confused with teaching and extension projects or their reports with reports of experiences. It is an applied investigation, in which academic production allows teachers to investigate their own practice (DAMIANI et al., 2003).

They are considered as research aimed at the concrete world because it is a research that deals with subjects, used and applied for the solution of clear and perceptible problems, different from those that occur with specific controls of variables such as in laboratories, which use the scientific method as a recurrent practice. They are opposed to basic research, which aims to expand knowledge, without concern for its possible practical benefits (GIL, 2010).

In some points, pedagogical intervention research is similar to action research, and can be summarized as follows, based mainly on the ideas of Tripp (2005) and Thiollent (2009): Intention to produce changes, attempt to solve problems, applied character, need for dialogue with a theoretical framework, possibility of producing knowledge. This research

format proposes to subsidize decision-making related to changes in educational practices and improvements in the quality of teaching, in addition to evaluating pedagogical innovations, which is in accordance with the proposal of a research in the context of the professional master's degree.

The analysis of the information had as a theoretical and methodological foundation some aspects of content analysis (BARDIN, 2011). According to Bardin (2011), content analysis can be organized into three phases: a) pre-analysis; b) exploitation of the material; c) treatment of the results. In the pre-analysis, we did the floating reading and the choice of the materials that were analyzed, in order to identify themes related to the focus of the study, that is, reading and its possible contributions to the learning of Chemistry. The materials analyzed were written productions of the students, which consisted of: reading record diary, glossary and research reports, produced in the context of reading mediation activities.

The exploration of the material associated with the theoretical study on the object of the research made it possible to identify themes that guided the selection of the information present in the materials and the treatment of the results. Thus, in this study we used thematic analysis, which involves identifying the "nuclei of meaning" that constitute the analyzed material, specifically the students' written productions. The presence of these nuclei and their frequency "can mean something for the chosen analytical objective" (BARDIN, 2011, p.135). were: a) Scientific language and mother tongue, b) Food and citizenship education and c) relationship with the content in focus. These themes are not mutually exclusive and overlap in some aspects, however, their definition was fundamental for the analysis of the information in the research and enabled the emergence of relevant aspects for our study interest, that is, reading mediation activities.

As it is a professional master's research, the main objective of the analysis was to investigate the practice of the research teacher when using reading mediation strategies in order to identify contributions and propose improvements in his classes. By producing knowledge about reading mediation in Chemistry classes, the analysis of the students' productions in this research can also contribute to other teachers to develop strategies and propose other ways of working with reading texts in Chemistry teaching. Below we describe the context of the research.

4.2 CONTEXT OF THE RESEARCH

The research was developed in a State School of the Public Education Network⁶, located on the island of Mosqueiro,⁷ which has been in operation since 1976. The School is considered one of the pioneers on the island of Mosqueiro and comes from the School "Reunida de Carananduba",⁸ which on August 28, 1976, was renamed "State School of 1st Grade Professor Abelardo Leão Condurú", in honor of the great public figure of Pará Abelardo Leão Conduru⁹. Later, the school was renamed Escola Estadual de Ensino Fundamental e Médio Professor Abelardo Leão Condurú.

The educational institution serves around 986 students distributed between Elementary School (6th to 9th grade) and High School (1st to 3rd grade) in the morning, afternoon and night shifts and has infrastructure consisting of (10) classrooms, one (1) auditorium, one (1) multidisciplinary laboratory, one (1) sports court and one (1) library. The school develops extracurricular activities focused on music, art and poetry, such as the Soirée that takes place annually and is a moment when students present their artistic productions such as music, dance, poems and socialize in the school court with the school community. In addition to the Soirée, the school promotes extra-class activities in museums, universities and other spaces for the democratization of knowledge as an incentive to art and culture, conducted by professors of the disciplines of History and Sociology.

The school's technical staff consists of a manager and deputy managers, pedagogical coordinators, teachers and support staff (administrative agents, doormen, lunch cooks and cleaners), totaling about 60 employees working in the institution. Figure 4 below illustrates in "a" the entrance to the district of Mosqueiro where the school shown in "b" where the research was carried out is located.

⁶ State School where the present research was carried out. The institution is located on the outskirts of Mosqueiro, in the Carananduba neighborhood.

⁷ Mosqueiro Island is an administrative district of the municipality of Belém. Mosqueiro is a river island located on the eastern coast of the Pará River, in the southern arm of the Amazon River, in front of the Guajará Bay. It has an area of approximately 212 km² and is located 70 km away from the center of the capital Belém. Its population is estimated at 20 thousand inhabitants according to data from the Brazilian Institute of Geography and Statistics (IBGE). Information taken from the official website of the city of Belém: <http://www.belem.pa.gov.br>

⁸ Information collected from the School's management and the website <http://jornalcorreiojurunense.blogspot.com/2011/04/reinauguracao-da-escola-abelardo-leao.html>

⁹ Abelardo Leão Conduru was an important figure in the political scene of Pará who in the 20s, 30s and 40s assumed several important public positions among which the following stand out: State Deputy, Mayor of Belém, Senator of the Republic. He had great influence on Mosqueiro Island where he founded the famous Farol neighborhood, and his residence was later transformed into the then known Hotel do Farol. Data obtained from the <http://mosqueirando.blogspot.com/2014/02/na-rota-da-historia-abelardo-leao.html> website

4.3 CHOICE OF SCHOOL AND YEAR FOR RESEARCH DEVELOPMENT

In the school where the research was carried out, I felt the need to stimulate reading in the discipline of Chemistry, since the difficulties in discussions and resolutions of situations - a problem during the classes taught with students of the 1st year of High School were permeated by difficulties of interpretation and scientific vocabulary, especially focused on the periodic table, which is the subject developed in the classes during the present research. Although in the 9th grade of Elementary School students already work on Chemistry content focused on the Periodic Table, I realize the difficulty in understanding the subjects related to this content. As a Chemistry teacher, I came to the conclusion that it is necessary to have methodological strategies to work with these difficulties of students in the first year of high school.

It was after these observations that I decided to work on methodological strategies with the reading of TDC focused on chemical elements, from the journal "Química Nova na Escola" and, at the same time, contextualize the study of chemical elements with the regional and local culture through a feed article from the "Brazilian Journal of Endocrinology and Metabology". Below, I discuss a little more about the profile of the students involved in the research.

4.4 PROFILE OF THE STUDENTS PARTICIPATING IN THE RESEARCH AND LEGAL ISSUE

The present research was carried out in the second two months of the 2019 school year, during the classes of the Chemistry discipline with an approximate workload of 24 hours/classes, divided into 3 hours of weekly classes, and had as participants a class of 39 students from the 1st year of High School in operation in the morning shift. The class

consisted of 16 female students and 23 male students, aged 15 to 17 years. At the time of the research, the students were residents of the Carananduba neighborhood or its surroundings (neighborhoods of São Francisco, Bonfim, Caruara, Marahú, Paraíso, Baia do Sol), located on Mosqueiro Island.

To start this study, the research proposal was presented to the school board, which signed the Informed Consent Form (ICF) (Appendix A). Next, we addressed the participants by presenting the ICF with a brief explanation about the work developed in compliance with the requirement of the Professional Master's Degree in Education, Science and Mathematics at UFPA and the objectives of the research (Annex B), signed by those responsible for being under 18 years old. The anonymity of the participants was guaranteed by the use of codes that represent the students in the research, such as A1, A2, B1, B2, etc.

4.5 STAGES OF THE RESEARCHED ACTIVITY AND INSTRUMENTS USED

The research was basically outlined in 04 stages, comprising different moments in which reading as a methodological resource was the core of the research, and writing was taken into account in some stages as a methodological contribution.

For each stage, instruments were used that made the research feasible. The research instruments are essential for the researcher to collect initial data and evaluate the scope of the intervention actions carried out. According to González Rey (2005), the instruments of a research are characterized as "any situation or resource that allows the other to express himself in the context of the relationship that characterizes the research" (p.42).

Among the most common instruments used are observations, questionnaires, interviews, formation of reading and discussion groups and others (Weller, 2006). Therefore, in this study I used observation, questionnaires and written productions of the students as research instruments.

Below, I describe the four stages that make up the research scenario of the present study.

- At the first moment with the students, we talked about the research, commented on the relevance of the study and the related objectives and, at the end of the dialogue, the students received a Consent Form (ICF), so that a responsible person could authorize their participation in the study. In the following week, the consent forms were returned and a semi-structured questionnaire was used, called Q1 (Annex C) in this study, whose objective was to perform a diagnostic evaluation to investigate the students' reading, interpretation and writing habits. We sought to investigate possible difficulties

encountered in readings, especially of scientific articles and scientific dissemination, in order to establish strategies to approach the later stages.

- An article considered easy to understand concerning "healthy eating" was selected¹⁰. The reading strategy used was group reading, followed by a conversation circle in a subsequent class and the use of a diary to record study notes by the students, in addition to the elaboration of a glossary referring to the text worked in class.
- Students were asked to read individually in class a text published by the University of Évora¹¹ entitled "Brief history of the Periodic Table". After the reading, a collective discussion was held in class related to the main points observed by the students in the text. At another time, an oral presentation was held in the format of an expository class and dialogued with the use of a multimedia image projector, addressing the Periodic Table.
- In order to relate the readings and activities developed concerning healthy eating (stages 1 and 2) with the discussions regarding the periodic table of chemical elements, in this stage the students were invited to form working groups (WGs). Thus, the WGs were instructed to research foods belonging to the food cuisine of Mosqueiro Island in order to research the chemical composition and consequently the chemical elements present in these foods. To this end, each TG chose a food of their preference to research. The documentary "Mosqueiro island of flavors" was shown,¹² which shows the gastronomic potential of the island of Mosqueiro and the traditional and healthy cuisine, seeking to bring the local popular culture closer to the Chemical bias in Mosqueirense's food, through the teaching of the Periodic Table. Subsequently, the professor provided the students with a series of articles on different chemical elements, from the Revista Química Nova na Escola¹³ – QNEsc. The research was socialized in a dynamic and interactive way in class through discussions so that each group had access to the work carried out by the other teams. In order to preserve the data obtained in each stage of the research, each WG produced a folder/logbook to store their text productions and questionnaires applied in group and at the end, they were delivered to the professor who proposed the research for later systematization.

5 RESULTS AND DISCUSSIONS

As already mentioned in step 1 of this study, an evaluation was carried out to investigate the initial profile of the students' reading, interpretation and writing habits, based on a semi-structured questionnaire – Q1 (appendix). The analysis of the question "What is your reading preference?", illustrated in Figure 4 showed that the literatures used by the students as their preference are books, which were mentioned by 48%. The genre of these books was not investigated in this research, but it can be inferred that they are probably more directed to the children's age group. In second place were comic books/comic books, which represent 46% of the total number of readings identified, and in third place were magazines and newspapers, which correspond to only 3%, and no student mentioned scientific articles and scientific dissemination as preferred reading.

Figure 5

Reading preferences of those surveyed

Source: Author, 2019.

The analysis of the data leads us to suggest that these literatures most cited in the study are associated with the universe of young people and their contexts of experiences, which modulates their behavior as readers and justifies the preferences for such readings. For this reason, comics/comics and books are the most sought after reading objects by students, reaching 94% of the total number of students, who, on the other hand, confirm that this same audience has little interest in reading magazines, newspapers and articles.

The little or no search for scientific articles or texts of scientific dissemination by students of Basic Education, specifically in High School, the level to which this study was directed, may show low interest or difficulty in accessing scientific culture and scientific knowledge in such texts. This leads us to the following questions: What would be the reason

for this possible lack of interest in scientific culture? Is reading articles considered more far-fetched/difficult by this readership? Does the investigated public have difficulty accessing materials such as texts for scientific dissemination? Would it be a methodological failure of the schools and lack of pedagogical support to stimulate these readings?

For an analysis of the students' notes in the questions previously discussed, an evaluation of the students' statements elaborated in the Q1 questionnaire was carried out, in which the students were asked: "For you, what is your greatest difficulty in reading articles or texts of scientific dissemination?" The answers obtained allow us to observe that 85% of the students' statements refer to difficulties in understanding what they read in the articles or that they are unable to abstract information of this textual genre. Table 2 shows some of the main statements that represent the aforementioned percentage of students who talk about difficulties in understanding scientific texts:

Table 3

Answers obtained from students during a questionnaire about the difficulties they have in relation to reading articles or texts of scientific dissemination (TDC)

STUDENT	ANSWERS OBTAINED BY QUESTIONNAIRE
A2	"Why some things I understand and some things I don't."
B1	"My biggest difficulty is that I don't consider what I'm reading and I don't understand what I read, there are words that I can't read."
B2	"My biggest difficulty is not being able to understand what I read, I really like to read, but there are things I don't understand."
A3	"A lot of information in the article that you can't understand things."
B5	"I'm going to be truthful, I don't like to read articles, because I don't understand much of what I read"
B6	"Understand what he means"
A7	"Sometimes I can't understand some words in the article"
A9	"The difficulty sometimes of understanding and comprehending, because some articles have arguments that I have never heard of".
B8	"Often the understanding of some terms and words that I don't know or that is little used in my daily life".
B9	"understand what he wants to convey to us" (student B9).
B10	"I have difficulty with some different words"
A13	"to understand what he says".
A14	"I read and reread, but I can't understand it a lot of the time."
B13	"There are some articles that I read and understand, but there are some that I read and I can't reason what it says because it's difficult."

Source: Author, 2019.

Table 2 shows us different records of the students about the difficulties they present in reading articles and DCT, which were pointed out in different ways, but all converging to a point that is the "difficulty in understanding what they read". In an analysis of some of these statements shown in table 3, we can observe that student B1 reports "I don't understand what I read, there are words that I can't read", evidencing the difficulty in understanding due to lack

of knowledge of words found in the text. This same element was verified in students A7, B8 and B9 who talk in their speeches about the difficulty of "understanding words" that they did not know before reading the articles. Thus, it was possible to infer that a possible vocabulary limitation makes it difficult to construct the interpretation and comprehension of the texts during reading. The analysis of the other statements, even though they do not explicitly mention that the difficulty is due to the lack of understanding of unknown terms found in the texts read, suggests that these limitations of comprehension permeate in most cases for the same reasons.

On this, Ferreira & Horta, (2014) discuss:

Difficulties in the act of reading continue to be one of the main obstacles to school success and performance, often causing difficulties in other areas of learning, reflecting on the student's entire school career. Difficulties in learning to read can manifest themselves in the acquisition of basic skills, especially in the decoding phase, but also, later, in the phase of comprehension and interpretation of texts (Ferreira & Horta, 2014 p. 145).

The lack of motivation in the act of reading is related to the difficulty of understanding what one reads, especially scientific texts that are generally pointed out as difficult to understand (Teixeira & Silva, 2007). However, with appropriate strategies, reading can be successful and become a great ally in the evolution of the student in different aspects of his or her school life, and for this reason it deserves to be more valued in formal school education environments (Guaita and Gonçalves, 2015).

5.1 ANALYSIS AND DISCUSSION OF THE TEACHING ACTIVITIES DEVELOPED

The information constructed in the present research was organized around the sequence of activities developed in class, in order to highlight the reading mediation strategies and the relevant aspects that emerged in each activity, based on the themes defined in the exploration of the material and that we previously presented: a) Scientific language and mother tongue, b) Food and citizenship formation and c) relationship with the content in focus.

5.1.1 Reading activity and conversation circle with mediation and written production

We selected a scientific article on "healthy eating"¹⁴ and the reading strategy used was group reading with the teacher as mediator of the process.

¹⁴ Sichieri, R. et al. Recommendations for Healthy Eating and Nutrition for the Brazilian Population. Arq Bral Endocrinl Metab v.4, 4n.3, 2000.

Figure 6

Recording of reading activity – Individual and collective

Source: Author, 2019.

To encourage reading in the classroom under the teacher's mediation, students were instructed to read the text again outside the classroom, with the aim of deepening the content of the article. They also received guidance to highlight in their individual readings points considered relevant for later discussion in a conversation circle. Thus, as had been outlined, during the classes of the week following the extra-class reading, a "conversation circle" was held in which the students talked about points that they considered most relevant in the text, in order to socialize the different notes with the class. In this way, they participated by reporting passages of interest and difficulties, exemplifying their statements with their own experiences and bringing their daily actions closer to the new information obtained in the text, in addition to incorporating new meanings and scientific concepts.

Figure 7

Record of the conversation circle about the article related to "healthy eating"

Source: Author, 2019.

After completing the conversation circle, the students received "record diaries" to produce a text addressing the points considered most relevant in the reading, which were used as a contribution to the collective discussions.

Figure 8

Records of textual production and production of the glossary referring to the text already mentioned

Source: Author, 2019.

We highlight below some texts from the students' written materials that illustrate possible contributions to scientific learning and that help us to know the aspects that most caught the attention of young people when reading the scientific article on healthy eating.

In the reading record, it was possible to identify the choice of excerpts from the text that brought scientific information about foods for daily consumption by the students, which is in accordance with the content of the discussions in the conversation circle, in which they sought to relate aspects of their eating habits with scientific concepts present in the text:

Among the foods in the Brazilian diet with the highest fiber content are cassava flour, beans, peas, corn, peanuts, jiló, pine nuts, sweet potatoes, baroa potatoes, yams and taioba (A3 – reading record).

Beans are one of these rescue elements, due to their content in fiber, folic acid and iron. (A2 – reading record).

In their reading records, the students selected excerpts from the text under study with the potential to expand knowledge about foods from their universe of experiences, from the insertion, in their writing, of terms from scientific language such as fiber, folic acid and iron. Although students were not asked to use these terms in another activity that would request their use in different contexts, it is important that students have contact with these aspects.

Science learning implies that the relationship with scientific language occurs in different situations, in which students learn new meanings for the terms used in class. In other excerpts from the students' records, we can identify the presence of the theme and the content in focus, that is, food and the periodic table. In these passages, chemical elements and their relationship with food are mentioned,

Reducing salt consumption requires a large reduction in the consumption of processed foods with a high amount of sodium such as chips, smoked and canned foods, as well as avoiding adding salt to foods already prepared (A5 – reading record).

(...). The identification of foods, or groups of foods, whose consumption should be encouraged, (...). Beans are one of these rescue elements, due to their content in fiber, folic acid and iron (A7 – reading record).

(...). Sources of calcium are also sources of cholesterol and saturated fats, and should therefore be considered together in the preparation of the guides (A4 – reading record).

For a good life and good nutrition, macronutrients must be consumed in the diet in greater quantities, micronutrients in smaller quantities, folic acid, vitamins E, C with the use of an intake of 200 mg/day, equivalent to the intake of five servings of fruits and vegetables; also sodium and calcium (...). (A6 – reading record).

According to Vygotsky (1998), words have an internal history of development, that is, they cannot be transmitted directly to students. This is an interesting theoretical justification for the contact of students with knowledge about chemical elements, for example, calcium and sodium, in a concrete context, food, instead of talking about them only in the study of the periodic table itself, as an isolated content and unrelated to the contexts of the students' experiences.

Reading and writing are fundamental skills for the formation of individuals with social and political responsibility that need to be worked on in Natural Sciences classes. In this regard, Wenzel et al., (2018) consider that:

In addition to the use of the specific language of Chemistry, it is essential that the classroom becomes a space for the formation of readers, that is, that students learn to position themselves in front of the text, that they dialogue responsibly with the reading carried out, so that reading is a process of interaction between a reader and a text, in an interactive reading movement, where both the reader and the way in which one reads is considered. In Chemistry classes, it is essential that the teacher pays attention to the fact of forming and producing readers with social and political responsibility and with the ability to judge, evaluate and decide in the field of technical and scientific domain. And one way to do this is the appropriation of chemical language, its conceptual understanding through the significant use of the language of chemistry (WENZEL et al., 2018, p.99).

In the excerpts selected by students A1 and A5, it was possible to identify positions based on scientific knowledge about food and its repercussions on people's lives:

Thus, a proposal for healthy eating, for the prevention of chronic non-communicable diseases, must propose diets that are within the reach of society as a whole, and that have an impact on the most important factors related to various diseases (A1 – reading record).

The proposal of a diet for the Brazilian population also has two other assumptions: the rescue of healthy eating habits typical of Brazilian food, whose consumption should be encouraged, rather than formulating prohibitions (A5 – reading record).

Reading in Chemistry classes can contribute to the student having a more significant education from the citizen point of view. Through its contents, principles and concepts, Chemistry can stimulate a change in citizen attitude, especially with regard to people's rights and duties, giving them the ability to demand from society and governments sensible and coherent attitudes that effectively improve our lives (LIMA, 2012). These aspects could be identified in the following records:

Adolescents are particularly influential in their lifestyle and should be primarily included in collective health programs (A2 – reading record).

Fostering consumer information activities and establishing specifications for labeling by the Ministry of Health would be important goals within this perspective (A3 – reading record).

The students were instructed to also produce a glossary with the words considered unknown in their vocabularies. It was possible to observe in the glossaries two main aspects: the selection of words more related to scientific language and those that we identified as generally in use in our mother tongue. In the examples we selected referring to scientific language, the definitions constructed by the students, in general, were related to Science content beyond the chemical content, as we can illustrate in the following examples:

Metabolism: set of chemical transformations experienced by substances introduced into the body, the most important of which is the production of energy (A6 – Glossary).

Epidemiological: It is the study of the frequency, distribution and determinants of health problems in human populations (A5 – Glossary).

Macronutrients: these are nutrients that human beings need in greater quantities in their diet, in this case they are carbohydrates, proteins and lipids (A3 – Glossary).

Micronutrients: these are nutrients needed in smaller quantities in the diet, in the case of human beings they are vitamins and minerals (A3 – Glossary).

The activity of constructing the glossary allowed us to identify that the reading of the text contributed to broaden the students' contact with scientific language and the establishment of interdisciplinary relationships within the area of Natural Sciences. On the other hand, we consider it important to highlight that the development of the scientific vocabulary of young people did not occur in spite of the literacy process itself in the mother tongue, which is permanent and was related to the learning of reading and interpretation of a specific textual genre, the scientific article. In other records, we observed words closer to what we identified as in general use of the mother tongue:

Assumption: that one assumes, pretext, that one assumes in advance, that is, what one imagines and thinks about a certain thing or situation (A2 – Glossary).

Foster: Promote the development of, exercise, facilitate, stimulate (A2 - Glossary).

Effectiveness: is the ability to produce and maintain an effect, which can be positive or negative (A1 – Glossary).

The definitions researched by the students and recorded in their glossaries did not always coincide with the meaning of the words present in the text. student A4 identified the definition of words that did not coincide with their meaning present in the text:

Content: text or content of any writing or document (A1 – Glossary).

Supplementation: 1. Provision of assistance. 2. Adding cash to make up a certain amount (A4 – Glossary).

In the text read in the classroom, the content referred to the proportion of nutrients, such as fiber and fat, in food products. Supplementation, in turn, is related to the addition of certain nutrients to the population's diet. This demonstrates that the activity of the glossary is important for the identification of the dictionary meaning of the word, however, in order to contribute more effectively to the interpretation of the text, it is necessary to relate the definition of the words with their use in a concrete context.

In this context, the figure of the teacher is fundamental in the sense of making reading possible through mediation and encouraging the practice of reading in an increasingly constant way in the life of the student, as discussed by Almeida et al, (2012):

Mediating reading, therefore, is more than reading a book and recommending it to other readers. For the mediation of reading to occur, it is necessary to make the story interesting for the reader, to discuss it, to ask questions, to show the benefits that reading offers and the power of transformation that it has in people's lives (Almeida et al., 2012 p.477).

When reflecting on the activity of elaborating the glossary, I understand that feedback could have been made in relation to the students' production that related the words defined by them and the text worked. This was not done at the time of the teaching action, which was possibly related to the fact that, as a professor in the area of Natural Sciences, my gaze was more directed to the terms of scientific language.

5.1.2 Study of the Periodic Table with the use of Readings and Expository/Dialogued classes

After the conclusion of the previous phases, stage 3 of the research was developed, in which we worked on the content Periodic table. To start the theme, students were proposed to read individually in class a text published by the University of Évora¹⁵ entitled "Brief history of the Periodic Table". The objective of the reading was to encourage students to know, through an easy-to-understand scientific text, historical aspects related to the construction and development of the Periodic Table. The student could understand aspects of the production of knowledge related to the periodic table, and not just the ready-made and structured table without the opportunity to follow its historical/scientific evolution as it usually occurs. After the reading, a joint class discussion was held related to the main points observed by the students in the text.

At another time, in order to assist in the theoretical foundation and strengthen the knowledge obtained through the text previously read, an oral presentation was held in the format of an expository class and dialogued with the use of a multimedia image projector, addressing two teaching modules concerning the Periodic Table, which were:

- Module 1: Building the periodic classification of chemical elements (The concept of Family or Group, concept of Period, general characteristics of the periodic table, predicting the electronic configurations of valence);
- Module 2: Periodic properties (atom size, ionization energy, electron affinity, in addition to the study of metals, ametals and semimetals, as well as other periodic properties such as melting temperature and density).

During the discussion of the modules, the students were instigated to associate the knowledge related to the periodic table with their daily context, in order to go beyond the abstraction so present in the discipline of chemistry and allow the student to visualize such knowledge in a contextualized way. In this discussion, the professor addressed the theme "food", previously worked with the reading of the initial scientific article. The idea was for

¹⁵ University of Évora, Department of Chemistry, International Year of Chemistry. Available at: <https://quimicaparatodosuevora.blogspot.com/2019/02/breve-historia-da-tabela.html>

students to realize that it is possible to understand the periodic table as knowledge associated with different science content and topics, such as the chemical composition of food, which, in my view, could resignify the process of teaching and learning Chemistry.

5.1.3 Research related to regional/local cuisine

In order to relate the readings and activities developed concerning healthy eating (stages 1 and 2) with the discussions regarding the periodic table of chemical elements, in this stage the students were invited to form working groups (WGs). Thus, the WGs were instructed to research foods belonging to the peculiar cuisine of Mosqueiro Island in order to research the chemical composition and consequently the chemical elements present in these foods. To this end, each WG chose a food of their preference to research, and the chosen ones were: fish, shrimp, cassava flour and tucupí, tapioca, açaí and corn.

To promote the research carried out by the students on regional cuisine, after the formation of the WGs and research carried out by them, the documentary "Mosqueiro island of flavors" was shown,¹⁶ which shows the gastronomic potential of the island of Mosqueiro and the traditional and healthy cuisine, seeking to bring the local popular culture closer to the Chemical bias in Mosqueirense's food, through the teaching of the Periodic Table.

As the objective of the proposal was to understand which chemical elements are most present in the composition of the foods chosen by each group, the coordinating professor of the research provided the students with a series of articles on different chemical elements, from the *Revista Química Nova na Escola*¹⁷ – QNEsc. Each group read and studied the articles on the chemical elements and sought to relate them to the foods that each team researched. The chemical elements covered in the articles were: Actinium, Aluminum, Argon, Beryllium, Boron, Calcium, Carbon, Iron, Chlorine, Sulfur, Scandium, Fluorine, Phosphorus, Francium, Lithium, Hydrogen, Helium, Magnesium, Manganese, Neon, Nitrogen, Oxygen, Palladium, Potassium and Sodium.

After reading the articles and researching the nutrients of the chosen foods, each WG produced a written text making a general overview of the research carried out regarding the typical foods of Mosqueiro Island and its relationship with the chemical elements based on the reading of the articles of the journal *Química Nova na Escola*. The research was socialized in a dynamic and interactive way in class through discussions so that each group had access to the work carried out by the other teams.

¹⁶ Shown on TV Cultura on the website <http://www.portalcultura.com.br/node/50285>) and made available on the video-sharing platform You Tube at the address: <https://www.youtube.com/watch?v=K4bluHI3a8U&t=72s>

¹⁷ New Chemistry at School Magazine available on the website <http://qnesc.sbq.org.br/online/qnesc04/>

The culmination of this stage took place with an interview that was directed to each WG. The questions that guided the interviews were previously defined in themes associated with the regional cuisine of Mosquense (Açaí, flour, fish, tucupi, corn, tapioca), in which the members of the teams had autonomy to speak and answer the questions raised, based on the subject of the Periodic Table and its relationship with the daily life of the subjects. These questions were addressed in an interview questionnaire (Q2 – annex D) previously selected so that we could have an opinion of the degree of understanding and empowerment of the subject of the Periodic Table.

In order to preserve the data obtained in each stage of the research, each WG produced a folder/logbook to store their text productions and questionnaires applied in group and at the end, they were delivered to the professor who proposed the research for later systematization.

6 FINAL CONSIDERATIONS

In the present work, which consists of a research on the practice itself, I investigated in which terms reading mediation activities could contribute to learning in Chemistry classes at the high school level. For this, I sought to develop a proposal that would insert reading practices in the approach to Chemistry contents. The activities developed involved individual and collective reading of scientific articles, texts of scientific dissemination, preparation of reading records, glossary and group research. The development of such activities was associated with the relationship between: scientific language and mother tongue, which contributed to the learning of Science and literacy in the students' mother tongue; between the theme of food and citizenship education, with contributions to the social significance of scientific knowledge and the possibility for students to learn about positions regarding the theme in focus; with the content under study, with the potential to broaden students' view of the periodic table beyond a chemical content isolated from topics of their interest or from content in the area of Natural Sciences.

What can the school do about it? Invest more in reading AC or TDC in Chemistry classes? I see that it would be an important contribution to the students' learning, their contact with scientific language and with a textual genre that they initially demonstrated to have little contact with. What about the texts that students already read? They could also be considered at school, as part of the classes. This would be a way to bring the universe of young people closer to the school culture and thus access their motivations and interests in the teaching and learning processes of Chemistry.

At first, the difficulties of understanding became evident with the introduction of scientific texts, because although they address a more accessible language, there is still a peculiar language of this textual genre with common terms in the area. However, during the course of the research, it was possible to notice significant improvements in the appropriation of scientific language, showing that the practice of reading favors the fluidity of comprehension and textual interpretation. In addition, it was noticed that the individual and collective readings and discussions provided students with greater participation and involvement, as well as deepening and argumentative power as a result of the evolution and improvement of the scientific genre. Also, according to the readings carried out, it was possible to observe that the practice of writing well and signifying concepts is allied to a practice of dialogical reading, of a reader who positions himself in front of the text.

Therefore, based on the results obtained, we defend the importance of readings as a methodological contribution in the teaching of Chemistry because it stimulates new and different practices in the context of Chemistry, thus promoting the facilitation of such a complex and diverse process that is the act of teaching and learning. Reading, writing and orality are essential instruments to foster learning and criticality in the teaching of Chemistry, the results point to how significant it is to bring different teaching strategies to the classroom and the need for constant mediation of the teacher, who must always be willing to follow the process, as well as, of the student's interactive positioning.

Thus, we reiterate the importance of expanding reading and writing practices, as well as a dialogue about them, throughout the students' school life, so that we can perpetuate practices that become something pleasurable and meaningful, in addition to a technical, quick reading without dialogue and writing that is limited to simple copying.

DEDICATION

I dedicate this work to the loves of my life!

My mother Irene Ferreira de Mendonça who always dedicated herself very hard to the education of her children, so that we became "men of value", a widow and a woman full of strength and determination who knew how to conduct very well the task of raising and educating her offspring.

To my beautiful and dedicated wife Josineide da Costa Passion for support, dedication and encouragement, an extraordinary woman who was by my side on the way here, and who shares with me unique and unspeakable moments, of many victories and also of afflictions, "Together we are stronger"!

To my children Emanuel and Sarah da Costa Paixão (In memoriam) who taught me in such a short time the true meaning of Love.

ACKNOWLEDGMENTS

I thank GOD for the path traced so far, he gave me strength and wisdom to experience the Professional Master's Degree in Teaching in Science and Mathematics Teaching, putting in my life people who motivated me and believed in my dreams and in their own way helped me to make dreams come true.

To my wife Josineide Paixão, for her unconditional love and affection, my companion at all times and in all circumstances, who is by my side in all our journeys.

To my children Emanuel da Costa Paixão and Sarah da Costa Paixão, who rest in the Lord (In memoriam), who allow me to experience an unimaginable love, who taught me in such a short time the true meaning of Love.

To my parents, Hélio Nascimento da Paixão (In memoriam) and Irene Ferreira de Mendonça, for the values and teachings they provided me, for the countless advice and incentives that strengthened me on this trajectory, who proved to be proud and happy for my journey.

To my brothers Claydson Hammed de Mendonça and Clayton Mastroianni Siqueira da Paixão for their affection and encouragement on this journey towards a master's degree.

To my in-laws Maria de Fátima Pantoja da Costa and João Augusto Pantoja da Costa who were my foundation in a moment of academic and professional construction, to you all my affection and affection.

To my brothers in life Josiane, João Batista and Júlio César Pantoja da Costa for the happiness of coexistence, and the formation of an eternal bond.

The EEEFM Abelardo Leão Conduru institution, in Mosqueiro, the management and coordination, and especially the participants of the research, my students from the M1MR03 class.

To my dear colleagues from the PPGDOC 2017 class, for the companionship and for the moments of struggles and reflections together. Thank you for the partnership in research and disciplines, watered with many laughs and relaxations that not even photoFigureic records could capture in their entirety. It was a very rich experience, with the meeting of several paths converging to the same point, seeking growth to offer quality education.

To the Professional Master's program, especially to all the professors who left a little of themselves in us.

For my advisor Prof. Dr. Wilton Rabelo Pessoa, words are insufficient to express all my gratitude. My thanks for your patience and friendship, for our coexistence in disciplines and orientations, a great man who in my academic and private storms provided me with an unusual comfort and made me learn more. An exemplary and reputable professional, always very willing to dialogue and very reflective, he led the stages of reflections, analysis and writing with lightness. I am grateful to you for all the affection given to me at various times, so I am your fan and I root for your success in all areas of your life.

I am immensely grateful to the students, professors and collaborators for the dedication invested in the research process that is constituted on the practice itself, in the early years, the words of encouragement and the free hugs certainly renewed my energy and enabled me to write these lines in the plot of my story. Believe me, I take much more than I left, I want this training path to be one of many others to come.

To my friends from the Miriense Institute of Education, Science and Technology – IMECT.

To my colleagues at Colégio Manoel Antônio de Castro – MAC.

To my colleagues at the Enedina Sampaio Melo School – ESAM.

To my colleagues at the Raimundo Emiliano Pantoja School – REP.

To everyone who from far or near encouraged and supported my trajectory so far.

Thank you very much!

APPENDIX B – Free and Informed Consent Form for Research Participants

FEDERAL UNIVERSITY OF PARÁ
 INSTITUTE OF MATHEMATICAL AND SCIENTIFIC EDUCATION
 GRADUATE PROGRAM IN TEACHING IN SCIENCE AND MATHEMATICS EDUCATION
 (Professional Master's Degree)
 University Campus of Guamá – Basic Sector
 Av. Augusto Corrêa, 01. CEP 66075-110 – Belém/PA
 Phone/fax: (91)3201-8070 – e-mail: ppgdoc.ufpa@gmail.com

Belém, August 1, 2019.

The ongoing research is led by the master's student, Hélio Nascimento da Paixão Júnior, as well as his advisor, Professor Dr. Wilton Rabelo Pessoa from the Institute of Mathematics and Scientific Education (IEMCI) of the Federal University of Pará (UFPA). The theme of the research is: THE USE OF TEXTS OF SCIENTIFIC DISSEMINATION AS A DIDACTIC/PEDAGOGICAL RESOURCE IN THE TEACHING OF CHEMISTRY.

Following ethical precepts, we inform you that your participation will be absolutely confidential, which implies the concealment of names that may identify you in the final report or in any subsequent publication. Therefore, your involvement will not cause any damage to your person, family or the Institution you study. The institution has total freedom of refusal, as well as may request the deletion of your data, withdrawing your consent without any penalty or prejudice, when it so wishes. We thank you for your collaboration, emphasizing that it greatly contributes to the formation and construction of current knowledge in this area.

Prof. Dr. Dr. Wilton Rabelo Pessoa Hélio Nascimento da Paixão Júnior
 Research advisor Researcher

☐ I AGREE TO PARTICIPATE IN THE RESEARCH

() I DO NOT ACCEPT TO PARTICIPATE IN THE SURVEY

Signature of the Participant (responsible in case of minor)

Researcher's Signature

ANNEX C – Questionnaire Q1

Semi-structured questionnaire for diagnosis and survey of the reader's profile – Q1

1) Do you have the habit of reading? If not, why?

() Yes

() No

2) Do you understand what you read?

() No

() Not entirely

() Yes

3) How often do you read? Reference in Books Per Year – LPA.

() No EPS

() A little – 1 to 3 LPA

() Reasonably – 4 to 10 LPA

() Quite 11 or + EPS

4) What is your Reading preference?

() Books

() Magazines

() Comics/Comics

() Newspapers

() Articles

5) In your student life, how many articles have you read?

() None – 0

() A little – 1 to 5

() Reasonably – 6 to 10

() Quite 11 or +

6) How did you acquire the articles for reading and research?

() Through the teacher

() Books and magazines

() Specialized sites

() Other _____

7) For you, what is your biggest difficulty in reading articles?

8) What is the importance of scientific articles for your life and in your daily life?

9) How can reading articles help you in your life?

ANNEX D – Interview questionnaire – Q2

List of questions regarding the Group interview.

I. Do you know the periodic table?

II. What is the use of the periodic table?

III. Does the periodic table make sense to you?

- IV. Do you find the periodic table difficult or complicated?
- V. What makes the periodic table difficult or complicated?
- VI. What is the relationship between the periodic table and your day-to-day life?

APPENDIX F - Semi-structured questionnaire for evaluation at the end of the study – Q3

1) Did you find reading the texts difficult?

☐ YES

☐ NO

2) Did you already know the information in the texts covered?

☐ YES

☐ NO

3) Did you find the content interesting?

☐ YES

☐ NO

4) Would you like to take more classes like these?

☐ YES

☐ NO

5) Were you able to participate in the debates?

☐ YES

☐ NO

6-. Do you believe that the methodology used with the use of articles and the teacher's mediation helped your learning in the Chemistry discipline? Comment on your impression of the process.

ANNEX G – Registration Journal

Reading Log

TEXT 1:

Record below all the points of the text read that you considered important or difficult to understand.

[illegible]

ANNEX I: Tables of the number of papers published in ENEQ distributed by Area of Knowledge in the period from 2008 to 2018.

Recomendações de Alimentação e Nutrição Saudável para a População Brasileira

artigo original

RESUMO

Apresentamos sugestões para a definição de guias alimentares para a população brasileira, excetuando as crianças. Os principais objetivos dessas recomendações são a manutenção de peso saudável e a prevenção da obesidade, das doenças cardiovasculares, do diabetes mellitus tipo 2 e da osteoporose. As mensagens para o público têm duas pressuposições: retomar hábitos saudáveis da dieta brasileira e estimular o consumo de alimentação saudável ao invés de formular proibições. As principais mensagens incluem: consumo de alimentos variados, em 4 refeições ao dia; manutenção de um peso saudável; aumento da atividade física diária; ingestão de arroz e feijão todos os dias, acompanhados de legumes e vegetais folhosos; ingestão de 4 a 5 porções de frutas todos os dias; redução do açúcar; evitar uso de refrigerantes; para lanches, comer frutas ao invés de biscoitos, bolos e salgadinhos; comer pouco sal; usar óleos e azeite ao invés de outras gorduras; tomar leite e comer produtos lácteos, com baixo teor de gordura, pelo menos 3 vezes por dia. (*Arq Bras Endocrinol Metab* 2000;44/3: 227-32)

Unitermos: Guias de alimentação; Obesidade; Doença cardiovascular; Osteoporose; Diabetes; Prevenção.

ABSTRACT

We present suggestions for dietary guidelines for healthy Brazilians, excluding young children. These guidelines aim to prevent obesity, cardiovascular diseases, type 2 diabetes mellitus and osteoporosis. The messages to the public were based on two presumptions: to get back traditional Brazilian healthy dietary patterns and to stimulate the consumption of these foods more than to formulate prohibitions. The main messages are: eat at least four meals a day, and do not skip meals; maintain a healthy weight; increase daily physical activity and exercise; eat rice and beans with vegetables everyday; eat four to five portions of fruits everyday; reduce sugar, sweets and sodas; choose a fruit instead of deep fried foods or sweets for snacks; use salt only in moderation; use oil or olive oil instead of other fats; drink or eat low fat dairy products at least three times a day. (*Arq Bras Endocrinol Metab* 2000;44/3: 227-32)

Keywords: Dietary guidelines; Obesity; Cardiovascular disease; Osteoporosis; Diabetes; Prevention.

O ESTABELECIMENTO DE GUIAS DE ALIMENTAÇÃO e nutrição saudável tem por base o reconhecimento de que um nível ótimo de saúde depende da nutrição. Com o aumento da obesidade e das doenças associadas à obesidade, no Brasil, há que se combinar orientações para a redução das deficiências nutricionais, ainda presentes, com orientações visando a prevenção das doenças crônicas não transmissíveis.

Neste cenário, as medidas preventivas ocupam lugar de destaque, não só em função de que a prevenção precoce das doenças associa-se a melhor qualidade de vida, mas também porque, as medidas terapêuticas para a obesidade, um dos principais problemas nutricionais do presente, têm sido de pouca valia.

A base científica para prevenção baseia-se em dois componentes. O primeiro seria o conhecimento dos processos biológicos e epidemiológicos subjacentes ao aparecimento das doenças e o segundo a efetividade das intervenções (1).

É pequeno o conhecimento acumulado, no Brasil, sobre a efetividade de intervenções para prevenção das doenças crônicas. Grande parte da experiência preventiva no Brasil tem origem na prevenção das doenças infecciosas e das doenças carenciais, cuja prevenção tem um caráter mais específico. Para as doenças crônicas este quadro é muito diferente. Grande parte das chamadas doenças crônicas, como infarto do miocárdio, diabetes, cânceres, hipertensão, apresentam-se intimamente relacionadas e há uma verdadeira rede de relações das doenças entre si, bem como dos fatores de risco a elas associados. Assim, a hipertensão arterial associa-se ao diabetes tipo 2, que por sua vez associa-se à redução do HDL colesterol e ao aumento de triglicerídios (2). O tratamento clínico não pode ignorar estas associações, e o mesmo deve ocorrer com os programas de prevenção. Além destas doenças estarem associadas, os fatores de risco para as doenças crônicas não transmissíveis ocorrem de forma conjunta e interdependente. Deixar de fumar associa-se a ganho de peso (3,4) e, comportamentos como realizar atividade física de lazer e comer mais frutas agrupam-se nos mesmos indivíduos (5).

Portanto, mesmo que muitos estudos epidemiológicos em doenças crônicas busquem um nutriente específico que seria o responsável pela diminuição da incidência, e mesmo que em alguns casos este conhecimento possa representar, no futuro, a forma mais efetiva de prevenção para uma doença específica, a abordagem coletiva das doenças crônicas não transmissíveis parece ser a forma mais indicada de prevenção primária.

Assim, uma proposta de alimentação saudável, para prevenção das doenças crônicas não transmissíveis, há de propor dietas que estejam ao alcance da sociedade como um todo, e que tenham um impacto sobre os mais importantes fatores relacionados às várias doenças. Aumentar o consumo de frutas e verduras e estimular o consumo de arroz e feijão são exemplos de proposições que preenchem estes requisitos.

Recente publicação do *World Cancer Research Control* (6), em conjunto com o *American Institute for Cancer Research* também enfatiza uma perspectiva glo-

bal para a prevenção do câncer. Nesta publicação considera-se que modificações da dieta, em conjunto com a abolição do tabagismo, reduziram em dois-terços a incidência global dos cânceres. Ainda nesta publicação, sugere-se que modificações no sentido de uma vida mais saudável, teriam um impacto, em relação às doenças crônicas, similar ao causado pela melhoria das condições de saneamento, na redução de doenças infecciosas.

A mesma abordagem tem sido proposta para a vigilância do diabetes tipo 2, com avaliação de sistemas de doenças e não de doenças isoladas (7). Consistente com estas observações, guias alimentares para os países desenvolvidos, já há algum tempo, têm se voltado para a manutenção da saúde e a redução do risco das doenças crônicas em geral (8). Muitos países na América Latina também desenvolveram guias (9) e para o Brasil o Instituto Danone realizou, recentemente, um encontro para definição de uma alimentação equilibrada para a população brasileira (10).

Também relevante no estabelecimento de recomendações alimentares ou de guias alimentares é como tratar assuntos conflitantes ou que causem apreensão desnecessária na população. O consumo de álcool, por exemplo, é considerado um fator de proteção para as doenças cardiovasculares; contudo, tem sido difícil adotarmos uma medida de saúde pública que considerasse o consumo de álcool, dada sua repercussão nas doenças por causas externas e alguns cânceres. Um outro exemplo é o da importância dos ácidos graxos trans no desenvolvimento da doença cardiovascular e de como se transforma este conhecimento em ação preventiva, sem causar na população o sentimento de que as medidas anteriores como, por exemplo, redução das gorduras saturadas de nada valem.

Quanto à base científica para propor guias alimentares para a prevenção de doenças crônicas não transmissíveis ela é bastante ampla. As doenças cardiovasculares declinaram de forma importante nos países desenvolvidos decorrente de ações efetivas tanto de prevenção primária como secundária. Nos Estados Unidos, nos últimos 30 anos houve uma redução da mortalidade por doença coronariana da ordem de 50%, atribuível tanto ao tratamento quanto à prevenção primária (11). Para a América Latina como um todo, a prevenção das doenças cardiovasculares ainda é um desafio (12). Contudo, Lotufo & Lolio, 1996 (13), em análise da mortalidade por doenças cardiovasculares no estado de São Paulo, mostraram que a tendência ascendente da mortalidade por doenças coronarianas e cerebrovasculares reverteu-se na década de 70, e que alterações de fatores de risco importantes, como dieta e tabagismo, estariam associados à redução da

incidência destas doenças.

Embora muitos estudos indiquem a importância de diferentes fatores da dieta como fatores de risco para cânceres e diabetes tipo 2, a prevenção dos cânceres e do diabetes é ainda incipiente mesmo nos países desenvolvidos (2,1).

Por outro lado, a obesidade é uma condição que aumenta o risco de morbidade para as principais doenças crônicas: hipertensão, dislipidemia, diabetes, doença coronariana, alguns tipos de câncer e colecistite e, embora não se conheça uma estratégia adequada de prevenção, sua prevenção e tratamento apresentam-se como um dos grandes desafios deste século (14). A importância que a obesidade vem assumindo no Brasil (15) não pode ser ignorada e, a anunciada epidemia de obesidade para os Estados Unidos, é fato também no Brasil. Portanto, o estabelecimento de dietas saudáveis deve contemplar como prioridade a prevenção do ganho de peso. Incluir o consumo alimentar e a atividade física no âmbito de comportamentos para uma vida saudável é talvez a mais importante tarefa de promoção da saúde.

Do ponto de vista da alimentação saudável, sugere-se que as recomendações devem basear-se em alimentos mais do que em nutrientes. Assim, a Organização Mundial de Saúde, em publicação recente (9), sugere o estabelecimento de metas realistas de consumo de alimentos específicos, sendo estes alimentos identificados em função dos nutrientes que se pretendam abranger.

No estabelecimento das recomendações para a população brasileira consideramos como relevante as intervenções referentes a prevenção da obesidade, das doenças cardiovasculares, câncer, diabetes tipo 2 e osteoporose e, quanto à definição dos nutrientes, foram incluídos aqueles cujos achados são mais consistentes na literatura: consumo de gorduras, com ênfase nas gorduras saturadas e trans, de ácido fólico, vitamina C e E, sódio, cálcio e no consumo de fibras.

A proposta de uma dieta para a população brasileira tem, ainda, outros dois pressupostos: o resgate dos hábitos alimentares saudáveis próprios da comida brasileira; e a identificação de alimentos, ou grupo de alimentos, cujo consumo deva ser estimulado, mais do que formular proibições. O feijão é um destes elementos de resgate, pelo seu conteúdo em fibras, em ácido fólico e em ferro.

O desenvolvimento de guias para o Brasil é também resposta ao crescente interesse do público em geral, dos profissionais de saúde e dos planejadores em saúde, em relação ao papel da dieta na promoção da saúde e prevenção das doenças crônicas. Propomos que seja criada uma dinâmica nacional de discussão de estratégias a

serem implementadas nesta área e que estas se dêem de forma contínua e integrada, com a participação dos membros da sociedade civil, das universidades, dos serviços e da imprensa. Estas recomendações visariam atender, conforme sugerido por Barata & Barreto, 1996 (16), as necessidades como expressão das potencialidades humanas e não aquelas redefinidas e priorizadas pela ótica exclusiva do serviço de saúde. Fomentar atividades de informação ao consumidor e estabelecer especificação para rotulagem pelo Ministério da Saúde seriam metas importantes dentro desta ótica.

PESO SAUDÁVEL

As controvérsias sobre o peso adequado para adultos e idosos, com uma conduta mais frouxa de controle de peso para os idosos, embora não completamente superadas, parecem tender para o ideal de manter-se magro na vida adulta. Manter um peso corporal adequado e não ganhar peso durante a vida adulta parece associar-se a menor mortalidade e maior bem estar (17).

Os exercícios/atividade física devem ser altamente estimulados, pois aumentam a mobilidade e consequentemente a qualidade de vida. Parece haver boas razões para encorajar exercícios regulares e pequena perda de peso, mesmo entre pessoas mais velhas com sobrepeso, com vistas a sua longevidade e qualidade de vida (18,19).

As mulheres na pós menopausa parecem ser um grupo particularmente vulnerável ao aumento de peso, deposição abdominal de gordura e grande dificuldade para perder peso (20). Os resultados de uma recente meta-análise, com mulheres na pré menopausa, submetidas a dietas com restrição relativamente severa (800 a 1200kcal/dia), por pelo menos 10 semanas, mostraram que, embora a taxa de metabolismo basal em obesas diminua significativamente, tanto com dieta hipocalórica quanto com dieta associada com programa de exercício, a redução da taxa de metabolismo é menor na presença do exercício (21).

Adolescentes são particularmente influenciáveis em seu estilo de vida e deveriam ser prioritariamente contemplados em programas de saúde coletiva. Vários estudos indicam que a manutenção de um peso considerado adequado entre meninas adolescentes se faz através de práticas alimentares inadequadas, como omitir refeições, e que o consumo de nutrientes como cálcio e ferro é inadequado neste grupo (22).

Para adultos considera-se como peso saudável, o peso relativo, avaliado pelo índice de massa corporal (IMC= peso em kg/altura² em m) de até 24,9 (23). Para adolescentes sugere-se também a utilização do

IMC, contudo os pontos de corte adequados são ainda objeto de discussão (24).

MACRONUTRIENTES

A definição dos macronutrientes em sociedades onde a prevalência de obesidade é importante, passa necessariamente pela provisão de energia e sua capacidade de acumular-se como tecido adiposo. Há na literatura uma importante discussão sobre se existe uma associação entre consumo de gordura e obesidade (25), ou se o que realmente importa são as calorias consumidas (26). Dado que optar pela vertente de que as calorias totais são o principal fator associado à obesidade, não impede que no futuro se agregue a idéia de que a gordura tem um papel especial, propõem-se que as guias devem indicar claramente que o importante é a redução do consumo calórico total, principalmente dos itens de alta densidade calórica como doces, refrigerantes, tortas, etc.

Acumulam-se também evidências de que a substituição das gorduras por carboidratos refinados, como tem ocorrido em grande parte dos produtos industrializados, nas versões *light* e *diet*, pode aumentar o risco para a doença coronariana. Assim, os guias não deveriam sugerir a substituição de gordura por carboidrato (27). As gorduras líquidas com óleo de soja, canola, girassol, etc. são os melhores substitutos para as gorduras com ácidos graxos trans e as saturadas. Para os carboidratos, a opção preferencial deve ser para os carboidratos com alto teor de fibras.

Entre os alimentos da dieta brasileira com maior teor de fibra incluem-se farinha de mandioca, feijão, ervilha, milho, amendoim, jiló, pinhão, batata doce, batata baroa, cará e taioba (28).

MICRONUTRIENTES

Reconhecendo a importância de algumas vitaminas e minerais na prevenção de doenças crônicas, a *National Academy of Science*, dos Estados Unidos, em contraste com práticas passadas, está considerando a possibilidade de ingestão acima das recomendações para alguns micronutrientes que possam estar associados à redução das doenças crônicas. É necessário, contudo, que se conheça bem a segurança da ingestão de altas doses de nutrientes (29).

ÁCIDO FÓLICO

A ingestão suficiente de ácido fólico antes da concepção e muito no início da gravidez diminui o risco de defeitos no tubo neural: espinha bífida, anence-

falia, e encefalocele. Suplementação com ácido fólico diminui este risco de 50 a 75%. Adicionalmente, vários estudos apontam para o papel protetor do ácido fólico, via redução dos níveis de homocisteína, na doença cardiovascular (30). Nos Estados Unidos, a suplementação já está ocorrendo para este nutriente, e é interessante notar que é praticamente impossível atingir, nesta população, os níveis adequados de ingestão de 400µg, somente através da dieta. No Brasil, se a dieta tradicional com feijão - que é uma das principais fontes em nosso meio de ácido fólico -, fosse a base da alimentação e considerando-se que o conteúdo de ácido fólico do feijão preto cozido é de 256µg (31), seria possível atingir as recomendações só com a dieta. Resta saber o quanto é destruído no processo de cocção caseira, visto que de 50 a 90% do ácido fólico pode ser destruído no processamento (32).

Existem evidências de que a combinação de ácido fólico com vitamina B12 resulte em reduções ainda maiores nos níveis de homocisteína sérica (30).

VITAMINA E

Resultados de várias pesquisas estudando o efeito da vitamina E sobre as doenças do coração mostraram efeitos protetores associados com ingestão acima das da RDA. Evidências epidemiológicas indicam uma forte relação dose-resposta entre a diminuição do risco de doenças de coração e o aumento da ingestão de vitamina E na dieta e através de suplementos. Uma proteção significativa começa com ingestão diária de 67mg de alfa tocoferol. A oxidação da lipoproteína de baixa densidade (LDL) diminui significativamente em indivíduos que receberam quantidade acima de 400UI, mas não em indivíduos que receberam quantidade menores do que 200UI. Ensaio controlado, duplo cego, mostrou uma significativa diminuição de infarto do miocárdio não fatal em sujeitos que consumiam vitamina E como suplemento (29).

VITAMINA C

A vitamina C inibe a síntese química de nitrosaminas (a maioria delas é cancerígena), importante fator de risco para câncer do estômago. A inibição ocorre no conteúdo gástrico, mas a inibição não é completa até que a ingestão atinja cerca de 1.000mg. Estudos epidemiológicos e ensaios clínicos sugerem que uma ingestão de vitamina C muito maior do que a recomendação de 60 a 90mg, pode reduzir o risco de doenças crônicas como problemas cardíacos e câncer, especialmente quando combinados com alta ingestão de vitamina E (29). Levine et al., 1999 (33) e recente revisão sobre vitamina

C (34) sugerem a ingestão de 200mg/dia, o equivalente a ingestão de cinco porções de frutas e vegetais.

SÓDIO

Embora existam controvérsias sobre o papel do sal na gênese da hipertensão arterial, não parece haver risco em se reduzir o consumo para no máximo 3.000mg de sódio ou 7,5g de sal para a população sem hipertensão, e para 2.300mg de sódio ou 6g de sal para os hipertensos (35). O consumo diário per capita do ENDEF- Estudo Nacional sobre Despesa Familiar, 1974, foi de 12g de sal e em pesquisa recente no município do Rio de Janeiro, a estimativa de consumo foi também de 12g, com base na quantidade de sal adquirida mensalmente (15).

Redução do consumo de sal requer grande redução do consumo de alimentos processados com alta quantidade de sódio como *chips*, defumados e enlatados, bem como evitar adicionar sal aos alimentos já preparados (36). Produtos enlatados têm até 20 vezes mais sal do que o produto natural. O processamento dos enlatados pode, contudo, ser feito com menor teor de sódio, estratégia que deveria ser estimulada pelo Ministério da Saúde, bem como a rotulagem dos produtos em relação ao sal.

CÁLCIO

Estimular um adequado consumo de cálcio parece ser uma importante estratégia de prevenção em relação à osteoporose, sendo que a maximização do pico de massa óssea parece ser fundamental. Estima-se que mais de 51% do pico de massa óssea seja acumulado durante a puberdade nas mulheres. Jackman, 1997 (37), concluiu que 95% da quantidade total de mineral do osso deposita-se entre os 18 e os 22 anos, com o cálcio da dieta sendo muito importante na otimização do pico de massa óssea. Ensaios controlados randomizados de suplementação de cálcio, em crianças e adolescentes, mostraram que o aumento da ingestão de cálcio aumenta o acréscimo de cálcio no osso. O *Food and Drug Administration* dos Estados Unidos autorizou, inclusive, esta propaganda nos rótulos dos produtos com cálcio. Os alimentos fontes de cálcio são também fonte de colesterol e gorduras saturadas, e devem, portanto, ser considerados em conjunto na elaboração dos guias.

DEZ PASSOS PARA UMA ALIMENTAÇÃO ADEQUADA

Visando a manutenção de peso saudável e a prevenção de obesidade, doenças cardiovasculares, diabetes tipo 2 e osteoporose, recomendamos:

1. Consuma alimentos variados, em 4 refeições ao dia. Pular refeições não emagrece e prejudica a saúde;
2. Mantenha um peso saudável e evite ganhar peso após os 20 anos. Evite também o aumento da cintura;
3. Faça atividade física todos os dias. Inclua na sua rotina andar a pé, subir escada, jogar bola, dançar, passear e outras atividades;
4. Coma arroz e feijão todos os dias acompanhados de legumes e vegetais folhosos;
5. Coma 4 a 5 porções de frutas, todos os dias, na forma natural;
6. Reduza o açúcar. Evite tomar refrigerantes.
7. Para lanches coma frutas ao invés de biscoitos, bolos e salgadinhos;
8. Coma pouco sal. Evite alimentos enlatados e produtos como salame, mortadela e presunto, que contêm muito sal. Evite adicionar sal à comida já preparada. Aumente o uso de alho, salsinha e cebolinha. Alimentos ingeridos na sua forma natural como feijão, arroz, frutas, grãos e verduras têm pouquíssimo sal;
9. Use óleos e azeite no preparo de bolos, tortas e refeições;
10. Tome leite e coma produtos lácteos com baixo teor de gordura, pelo menos 3 vezes por dia.

Componentes da alimentação adequada por grupos de alimentos:

Porções diárias Exemplos		
Feijões e sementes	2 - 4	Feijão, lentilha, ervilha, grão de bico, amendoim
Arroz, pão e outros grãos de preferência integral e tubérculos	6 - 7	Pão, arroz, aveia, batata macarrão, cará, milho, mandioca ou farinhas
Verduras e legumes	3 - 5	Todos
Frutas	4 - 5	Todas
Leite e derivados	3 - 4	Leite, iogurte, queijo (com baixo teor de gordura)
Equivalentes em porções: Feijão - 70g; Arroz - 50g; Frutas - 100g; Verduras - 50g; Leite - 200ml		

Este tipo de dieta, com 3 porções de feijão, 6 porções de arroz, 3 porções de verduras, 4 frutas e 3 porções de leite equivale a 1.710kcal, 12,7g de fibras, 2.300mg de sódio, 15g de ferro, 322µg de ácido fólico, 232mg de vitamina C e 1.100mg de cálcio.

Breve história da Tabela Periódica

Apesar dos poucos conhecimentos de Química que cada um possa ter, com certeza que já ouviu falar da Tabela Periódica, uma disposição sistemática dos elementos químicos em função das suas propriedades. Como surgiu a Tabela Periódica actual? É a esta pergunta que se procura responder nas linhas seguintes onde se pretende fazer uma *Breve História da Tabela Periódica*.

Um pré-requisito necessário para construção da Tabela Periódica foi a descoberta individual dos elementos químicos. Embora vários elementos fossem conhecidos desde a antiguidade, nomeadamente o ouro, a prata, o estanho, o ferro e o cobre, a primeira descoberta dita científica de um elemento ocorreu em 1669 quando o alquimista Henning Brand descobriu o fósforo. A partir daí, muitos outros elementos foram sendo descobertos e o conhecimento relativo às suas propriedades físicas e químicas foi aumentando. Antes de 1800 eram conhecidos 34% dos elementos actualmente existentes, no século XIX a percentagem aumentou para cerca de 75% e no século XX descobriram-se os seguintes. Através da percepção da existência de algumas regularidades no comportamento dos elementos até então descobertos, os cientistas começaram a procurar modelos para reconhecer as suas propriedades e desenvolver esquemas para a sua classificação e ordenação.

A ordenação de John Dalton

No início do séc. XIX John Dalton, um químico e físico inglês, listou os elementos, cujas massas atómicas eram conhecidas, por ordem crescente de massa atómica, cada um com as suas propriedades e seus compostos. Não houve uma tentativa de efectuar qualquer arranjo ou modelo periódico dos elementos. Facilmente se constatou que a lista não era esclarecedora: vários elementos que tinham propriedades semelhantes (halogéneos, por exemplo) tinham as suas massas atómicas muito separadas.

John Dalton
(1766-1844)

ELEMENTS	
Hydrogen	1
Carbon	5
Oxygen	7
Phosphorus	31
Sulphur	32
Magnesium	24
Iron	56
Zinc	65
Copper	63
Lead	207
Silver	197
Gold	197
Platina	197
Mercury	200

Símbolos químicos de Dalton

As tríades de Johann W. Döbereiner

Em 1829, Johann W. Döbereiner, professor de Química na Universidade Friedrich Schiller de Jena (Alemanha), teve a ideia de agrupar os elementos em três, ou *tríades*. As tríades estavam separadas também pelas massas atômicas, mas com propriedades químicas muito semelhantes. A massa atômica do elemento central da tríade seria supostamente a média das massas atômicas do primeiro e terceiro elementos. Esta ideia tornou-se relativamente popular nessa época. No entanto, nos 30 anos seguintes, vários cientistas constataram que, para vários elementos, estes tipos de relações químicas se estendiam para além da tríade. Infelizmente, a investigação nesta área foi prejudicada pelo facto dos valores rigorosos das massas atômicas nem sempre serem conhecidos.

Johann W. Döbereiner
(1780-1849)

			Intensity of Chemical Affinity
$22.1.325 = \text{Cl}$	$455.129 = \text{HCl}$	$942.650 = \text{Cl}$	3
$789.145 = \text{I}$	$1590.770 = \text{HI}$	$2078.290 = \text{I}$	1
$\frac{1010.470}{2} = \text{Br}$	$\frac{2045.899}{2} = \text{HBr}$	$\frac{3020.940}{2} = \text{Br}$	2

Lei das Tríades de Döbereiner

O cilindro (ou parafuso telúrico) de Chancourtois

O primeiro esboço de periodicidade dos elementos deve-se provavelmente ao geólogo francês Alexander Emile Beguyer de Chancourtois. Em 1862 Chancourtois propõe uma classificação dos elementos pela sua disposição na superfície de um cilindro. Os elementos dispunham-se sobre uma linha diagonal formando um ângulo de 45° com a horizontal,

desenhando uma espiral e estavam ordenados por ordem crescente de massa atômica (em números inteiros) de forma que os que tinham propriedades semelhantes se situavam na mesma linha vertical. Assim, deu-se conta que as propriedades dos elementos eram uma função da sua massa atômica o que o levou a propor que "as propriedades dos elementos são as propriedades dos números." De Chancourtois foi o primeiro a reconhecer que propriedades semelhantes reaparecem a cada sete elementos e usando este esquema foi capaz de prever a estequiometria de vários óxidos metálicos. Infelizmente, o sistema era complexo pois incluía também compostos. A sua proposta não foi muito conhecida e divulgada porque o esquema era relativamente complexo.

Alexander de Chancourtois
(1820-1886)

Cilindro de Chancourtois

Lei das Oitavas de Newlands

Em 1863, John Alexander Reina Newlands, químico industrial inglês e professor de química no City College em Londres ordenou os elementos por ordem crescente de massa atômica e constatou que um dado elemento apresentava propriedades semelhantes ao oitavo elemento a contar a partir dele. A esta relação Newlands chamou a "Lei das Oitavas", que dizia ser uma espécie de repetição por analogia com as oitavas da escala musical (Dó, Ré, Mi, Fá, Sol, Lá, Si,...Dó,...). O principal problema com que Newlands se deparou foi o de que a sua lei apenas funcionava correctamente para as duas primeiras oitavas, na terceira e nas seguintes não se verificava. Apesar de ter sido ridicularizado pela Sociedade de Química de Londres, Newlands sugere, com a Lei das Oitavas, uma classificação sistemática onde começa a surgir o princípio envolvido na actual classificação dos elementos.

John Newlands
(1837-1898)

H	Li	Ga	B	C	N	O
F	Na	Mg	Al	Si	P	S
Cl	K	Ca	Cr	Ti	Mn	Fe
Co, Ni	Cu	Zn	Y	In	As	Se
Br	Rb	Sr	Ce, La	Zr	Di, Mo	Ro, Ru
Pd	Ag	Cd	U	Sn	Sb	Te
I	Cs	Ba, V	Ta	W	Nb	Au
Pt, Ir	Tl	Pb	Th	Hg	Bi	Th

Lei das Oitavas de Newlands

Tabela de Lothar Meyer e Mendeleev

Em 1864 Julius Lothar Meyer, químico alemão, estudou a relação existente entre o volume atômico dos elementos e as respectivas massas atômicas. Representou graficamente o volume atômico em função da massa atômica relativa e, através da curva obtida, conseguiu agrupar vários elementos em famílias. Chegou assim a uma classificação periódica dos elementos que tinham propriedades semelhantes, um esboço da tabela periódica actual. Mais ou menos por essa altura, Dimitri Ivanovitch Mendeleev, químico Russo, enquanto escrevia um livro de química inorgânica, também procurou organizar os elementos de acordo com as suas propriedades. Mendeleev criou uma carta para cada um dos elementos conhecidos. Cada carta continha o símbolo do elemento, a massa atômica e as suas propriedades químicas e físicas. Colocando as cartas numa mesa, organizou-as por ordem crescente das suas massas atômicas, agrupando-as em elementos com propriedades semelhantes, ou seja, listou os elementos de uma linha ou coluna por ordem de massa atômica, iniciando uma nova linha ou coluna quando as propriedades dos elementos se começavam a repetir. Formou-se assim, tal como obtido por Lothar Meyer, o esboço da tabela periódica actual. A vantagem da tabela periódica de Mendeleev sobre outras é que esta exibía semelhanças, não apenas em pequenos conjuntos, como as tríades. Mostravam semelhanças numa rede de relações vertical, horizontal e diagonal. Uma das razões para o sucesso da tabela foi o de deixar lacunas quando parecia que o elemento correspondente ainda não tinha sido descoberto. A partir daqui, Mendeleev conseguiu prever algumas propriedades de elementos químicos que ainda não haviam sido descobertos na sua época. Outra razão foi ocasionalmente ignorar a ordem sugerida pelas massas atômicas e alternar alguns elementos adjacentes para melhor classificá-los em famílias químicas. Com o

desenvolvimento das teorias da estrutura atómica verificou-se à posteriori que Mendeleev tinha, inadvertidamente, ordenados os elementos por ordem crescente de número atómico. O trabalho de Mendeleev foi amplamente aceite, sendo assim considerado o pai da tabela periódica actual. No entanto, de forma justa, tanto ele quanto Lothar Meyer deveriam ser considerados os verdadeiros pais da actual classificação periódica. O azar de Meyer foi que em 1868 construiu uma tabela alargada dos elementos e entregou a um colega para avaliação. Enquanto isso, Mendeleev deu a conhecer a sua tabela à comunidade científica através de publicação em 1869, enquanto que a de Meyer veio a conhecimento apenas em 1870. Azar...

Tabela dos elementos de J. L. Meyer

Tabela dos elementos de Mendeleev

Embora a tabela de Mendeleev/Meyer tenha demonstrado a natureza periódica dos elementos, apenas no séc. XX foram encontradas explicações para as razões das propriedades dos elementos variarem periodicamente.

O desenvolvimento, nomeadamente dos modelos atómicos e teoria quântica, permitiram racionalizar o conhecimento das propriedades dos elementos e chegar à configuração da actual tabela periódica. Esta foi ampliada ao longo do tempo, à medida que novos

elementos foram sendo descobertos. A tabela actual contém 118 elementos, dispostos em linhas horizontais (períodos) e verticais (grupos), por ordem crescente de número atómico. As linhas horizontais são dispostas de modo que os elementos com propriedades semelhantes fiquem nas mesmas colunas (grupos ou famílias). O grupo é considerado o mais importante método de classificar os elementos. Em alguns grupos, os elementos têm propriedades muito semelhantes e exibem uma tendência clara nas propriedades ao longo do grupo. A estes grupos foram dados nomes triviais, por exemplo, os metais alcalinos, metais alcalinos terrosos, halogénios, gases nobres, etc.. Alguns outros grupos na tabela periódica mostram menor grau de semelhanças/tendências verticais e são referidos simplesmente pelo seu número de grupo. Embora os grupos sejam a forma mais comum de classificação de elementos, existem zonas da tabela periódica onde as tendências horizontais e semelhanças nas propriedades são mais significativas do que as tendências verticais. Na Tabela Periódica, cada elemento é apresentado, nomeadamente, com o seu símbolo e número atómico. Muitas versões da tabela apresentam também outras propriedades atómicas e propriedades físicas.

A Tabela Periódica actual

Ao longo do séc. XX foram aparecendo representações alternativas da Tabela Periódica, principalmente por razões didácticas. No entanto, a Tabela Periódica “tradicional” que é a que conhecemos mantém-se como a representação aceite da disposição sistemática dos elementos químicos em função das suas propriedades.

A tabela periódica é agora omnipresente fornecendo um enquadramento útil para classificar, sistematizar e comparar as muitas formas diferentes de comportamento químico. A tabela tem encontrado muitas aplicações em química, física, biologia, engenharia e ciência dos materiais.

RESUMO

UTILIZAÇÃO DE TEXTOS DE DIVULGAÇÃO CIENTÍFICA COMO RECURSO DIDÁTICO NO ENSINO DE QUÍMICA (Ensino de Química) O estudo da Química pode ampliar a visão dos estudantes sobre seu universo de vivências, ao mesmo tempo em que considerar tais contextos pode facilitar a compreensão desta ciência. No entanto, percebemos que ainda existe uma resistência ao seu estudo por parte dos alunos, principalmente ao deparar-se com método tradicional de ensino, no formato passivo e transmissivo, que privilegia nomenclaturas, fórmulas e cálculos como aborda Vasconcellos (2005). O presente trabalho propõe apresentar e discutir contribuições da interação entre mediação de leitura e ensino de química, já que a utilização dos textos de divulgação científica (TDC) como recurso didático pode ser considerada um meio facilitador da aprendizagem. Pesquisas como as de Francisco Júnior, Ferreira e Hartwig (2010) e Brabo e Souza (2019) defende a integração da leitura, escrita e oralidade como forma de fomentar a aprendizagem e as competências necessárias da atual conjuntura social, econômica e política. Na percepção de Zismann et al, (2019), o emprego de TDC em sala de aula aproxima o aluno do mundo da ciência, pois oportuniza aos estudantes um contato com informações atualizadas sobre ciência e tecnologia, com acontecimentos de seu cotidiano, trazendo ainda aspectos curiosos, interessantes e divertidos, proporcionando uma outra maneira de ver a temida Química. Nesse contexto, a presente pesquisa tem como objetivo propor a mediação de leitura como recurso didático no ensino da Química, por meio da literatura científica, com o uso de textos de divulgação científica – TDC, com intuito de promover e melhorar a construção do conhecimento científico em sala de aula na educação básica. Partimos da ideia que, despertar a curiosidade pela busca de novas informações, motiva o aluno a se envolver em sua aprendizagem, por isso, é importante promover sua apropriação desde o ensino básico, com o uso da linguagem científica no processo de ensino e aprendizagem da Química. A metodologia deste estudo consiste na mediação de leitura de TDC utilizada como veículo de aprendizagem aos estudantes do primeiro ano do ensino médio, de uma Escola da Rede Pública de Ensino da Ilha de Mosqueiro/PA e, sobretudo, como forma de auxiliar os estudantes a pensar e se posicionar criticamente diante da sociedade, frente a um contexto. O presente estudo identificou elementos fundamentais para melhoria do processo de ensino-aprendizagem da disciplina de Química, no que versa a leitura de TDC como recurso metodológico. Nesta pesquisa apresentamos resultados prévios que sugerem que os estudantes

participantes do estudo, tiveram pouco ou nenhum contato com TDC. As atividades desenvolvidas no decorrer desta investigação constituíram o primeiro contato com esse gênero de leitura para grande maioria dos alunos, expondo a necessidade de se promover mais atividades, voltadas para leitura e escrita científica concernente ao Ensino da Química. Em síntese, essa interação estabelecida entre leitor e texto científico pode contribuir para tornar a aprendizagem mais efetiva, o que torna relevante a continuidade deste e outros estudos com essa abordagem. **Palavras-chave:** mediação de leitura, ensino da química, formação cidadã.

ABSTRACT

This study explores the intersection between translational research and the treatment of pancreatic cancer, a neoplasm with a challenging prognosis. The investigation is justified by the need to convert basic scientific discoveries into effective clinical applications, aiming to improve currently available therapeutic strategies. The main objective is to analyze the contributions of translational research to advances in the management of pancreatic cancer, from molecular understanding to the implementation of new approaches at the patient's bedside. The methodology adopts a bibliographic approach, of a basic nature and exploratory objective, based on a review of recent scientific literature from specialized databases. The results indicate that translational research drives the development of targeted therapies, immunotherapies, and biomarkers, enabling precision medicine. The conclusions highlight translational research as a fundamental pillar in overcoming therapeutic challenges, promoting treatment personalization and improving patients' quality of life.

Keywords: Translational Research. Pancreatic Cancer. Precision Oncology. Evidence-Based Medicine.

RESUMO

Este estudo explora a interseção entre a pesquisa translacional e o tratamento do câncer de pâncreas, uma neoplasia com prognóstico desafiador. A investigação justifica-se pela necessidade de converter descobertas científicas básicas em aplicações clínicas eficazes, visando aprimorar as estratégias terapêuticas disponíveis. O objetivo principal consiste em analisar as contribuições da pesquisa translacional para o avanço no manejo do câncer de pâncreas, desde a compreensão molecular até a implementação de novas abordagens no leito do paciente. A metodologia emprega uma abordagem bibliográfica, de natureza básica e objetivo exploratório, com levantamento de literatura científica recente em bases de dados especializadas. Os resultados indicam que a pesquisa translacional impulsiona o desenvolvimento de terapias-alvo, imunoterapias e biomarcadores, permitindo uma medicina de precisão. As conclusões apontam para a pesquisa translacional como um pilar

1 INTRODUCTION

Pancreatic cancer represents one of the most aggressive and lethal neoplasms, characterized by a late diagnosis and limited therapeutic options. The disease has a considerably low five-year survival rate, which positions it as a persistent challenge for contemporary oncology. The biological complexity of the tumor, its anatomical location, and the resistance inherent to conventional treatments contribute to this unfavorable scenario. In-depth understanding of the molecular mechanisms underlying pancreatic carcinogenesis thus becomes a priority for the development of more effective interventions.

Translational research emerges as a bridge between the discoveries made on the laboratory bench and their practical application in the clinical context. This field of study focuses on transforming basic scientific knowledge into tangible solutions for human health, accelerating the process of developing new diagnostics, therapies, and prevention strategies. In the case of pancreatic cancer, translational research seeks to unravel the genetic and molecular particularities of the tumor, identifying therapeutic targets and biomarkers that can guide clinical decisions.

The research problem lies in the gap between accumulated knowledge about the biology of pancreatic cancer and the effectiveness of available treatments. Despite advances in medicine, the survival of patients with this condition has remained stagnant for decades, highlighting the need for innovative approaches. Tumor heterogeneity and the complex microenvironment of the pancreas make it difficult to respond to standard therapies, requiring a more granular understanding of the disease to develop personalized interventions. Translational research acts directly on this gap, seeking to convert basic science into direct benefits for patients.

The relevance of this study lies in the urgency of improving the treatment of pancreatic cancer, since the disease continues to be one of the leading causes of cancer mortality globally. The analysis of the contributions of translational research offers *insights* into strategies that demonstrate potential to change the prognosis of the disease. Understanding how scientific discoveries translate into clinical innovations allows you to optimize research resources and direct efforts to areas with the highest probability of impact. The translational approach is essential to overcome the barriers that prevent therapeutic advancement.

Abe *et al.* (2021, p. 1785) highlight the importance of investigating the genetic basis of the disease, stating that "understanding the genetics of hereditary pancreatic cancer is fundamental for the identification of high-risk individuals and for the development of prevention and early detection strategies". This perspective reinforces the need for an approach that integrates basic research with clinical application. The identification of specific

genetic mutations, for example, can guide the selection of targeted therapies, personalizing treatment for each patient.

Bernardes and Toledo-Silva (2023, p. 2) complement this view by noting that "whole exome sequencing has proven to be a valuable tool in the diagnosis of pancreatic ductal adenocarcinoma, revealing genetic profiles that can influence the therapeutic response". The application of advanced genetic sequencing technologies in clinical practice is a direct example of translational research in action. These advances allow for detailed molecular characterization of the tumor, paving the way for precision oncology.

Caban and Malecka-Panas (2023, p. 5578) highlight the "gaps and opportunities in the diagnosis and treatment of pancreatic cancer", indicating that translational research is the way to fill these gaps. The identification of novel signaling pathways, the understanding of drug resistance, and the development of biomarkers for monitoring therapeutic response are examples of areas where translational research generates impact. Collaboration between basic and clinical scientists accelerates the transition from discovery to practice.

Chaves *et al.* (2022, p. 2) warn of "the increase in the burden of pancreatic cancer in Brazil from 2000 to 2019", which underlines the urgency of finding effective solutions. This epidemiological scenario reinforces the need to invest in research that can quickly translate into public health benefits. Translational research, by focusing on clinical applicability, responds directly to this demand, seeking to reduce the morbidity and mortality associated with the disease.

The general objective of this study is to analyze the contributions of translational research to the treatment of pancreatic cancer. To achieve this objective, it is proposed: a) to describe the main advances in basic research that impact the treatment of pancreatic cancer; b) to identify the translational strategies that resulted in new therapeutic approaches; and c) to discuss the challenges and future perspectives of translational research in pancreatic oncology.

This work is structured in five main sections. The introduction introduces the topic, contextualizes the problem, justifies the relevance, and sets out the objectives. The theoretical framework explores the fundamental concepts of translational research and pancreatic cancer biology. The methodology details the procedures for data collection and analysis. The results and discussion section presents the findings of the research and interprets them in the light of the literature. Finally, the final considerations summarize the conclusions, point out the limitations and suggest future studies.

2 METHODOLOGY

This study adopts a methodological approach of a basic nature, with an exploratory objective, and a bibliographic procedure. The bibliographic research consists of the systematic analysis of scientific literature already published, allowing an in-depth understanding of the theme "From the Bench to the Bedside: How Translational Research Has Contributed to the Treatment of Pancreatic Cancer". This type of research is suitable for mapping the state of the art, identifying knowledge gaps and consolidating information about a given phenomenon, without the need for primary data collection.

The qualitative approach is employed to interpret the data collected, focusing on the understanding of concepts, theories and advances related to translational research and pancreatic cancer. Qualitative analysis allows us to explore the complexity of the interactions between basic research and clinical application, as well as the nuances of new therapeutic approaches. This type of approach does not seek to quantify phenomena, but rather to deepen the understanding of them, through the content analysis of the selected texts.

The data sources for this study consist of scientific articles, systematic reviews, theses, and dissertations published in internationally recognized journals and databases. The databases consulted include *PubMed*, *SciELO*, *LILACS*, *Web of Science* and *Scopus*. The selection of these databases ensures comprehensive coverage of the biomedical and oncology literature, both nationally and internationally, ensuring the relevance and timeliness of the information.

The literature search period was delimited between the years 2020 and 2025, in order to focus on the most recent advances and contemporary trends in translational research in pancreatic cancer. This time window allows you to capture the innovations and discoveries that are shaping current and future treatment strategies. The constant updating of knowledge is a pillar of translational research, and the selection of a recent period reflects this dynamic.

The descriptors used in the search were "pancreatic cancer", "*translational research*", "*precision medicine*" and "*immunotherapy*". The combination of these terms, using Boolean operators such as AND and OR, allowed us to refine the search and identify publications directly related to the theme of the study. The choice of these descriptors reflects the main thematic axes addressed in the research, ensuring the specificity and relevance of the results obtained.

The inclusion criteria for the selection of articles were: publications in Portuguese or English, available in full, that addressed translational research in the context of pancreatic cancer, focusing on new therapies, biomarkers or resistance mechanisms. Studies that did not fit the search period, opinion articles without empirical or theoretical basis, and

publications that dealt with other types of cancer or basic research without translational implication were excluded.

Data analysis was carried out through thematic content analysis, which involves exhaustive reading of the selected materials, identification of recurring themes and categorization of information. This process allows synthesizing the main findings, identifying trends, and establishing connections between the different translational research contributions. Thematic analysis facilitates the interpretation of the results in the light of the theoretical framework, building a cohesive narrative.

Iwasaki *et al.* (2021) highlight the importance of advanced sampling techniques for the personalized treatment of pancreatic cancer, which reinforces the need for a methodology that contemplates the diversity of translational approaches. Bibliographic research allows the compilation and synthesis of these different techniques and their impacts.

Kaçaroğlu and Gürbüz (2025) compare the therapeutic potential of macrophage-derived exosomes or mesenchymal stem cells in pancreatic cancer, illustrating the complexity of translational investigations. The methodology used in this study allows us to integrate these findings, analyzing how they fit into the overall panorama of contributions to treatment.

Nassereldine *et al.* (2022) conducted a literature review on pancreatic cancer in the MENA region, demonstrating the relevance of studies that map scientific production. The present methodology, by focusing on the literature review, is aligned with this perspective of organization and synthesis of existing knowledge.

Ethical aspects are considered, since it is a bibliographic research, not involving human beings directly. Therefore, submission to a Research Ethics Committee (REC) is waived. However, rigor in the citation of sources and respect for intellectual authorship are fundamental ethical precepts followed in this work. Transparency in the presentation of data and impartiality in interpretation are also observed.

The methodological limitations of this study include the dependence on the quality and availability of published literature. Bibliographic research, by its nature, does not allow the generation of primary data or the performance of interventions. The interpretation of the findings is subject to the subjectivity of the researcher in the content analysis, although maximum objectivity is sought. The breadth of descriptors can sometimes limit the identification of studies with less conventional terminology.

Despite the limitations, the methodology employed offers a solid basis for understanding the contributions of translational research in the treatment of pancreatic cancer. The combination of a qualitative approach with a systematic bibliographic procedure

allows for an in-depth and up-to-date analysis of the topic, consolidating existing knowledge and pointing to future directions of research and clinical application.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
Silva, J.	Use of persistent identifiers and Research Blogging by scientific blogs in Portuguese and their coverage by Altmetric	2020	It analyzes how scientific blogs in Portuguese use persistent identifiers and are tracked by Altmetric, contributing to understand alternative metrics and visibility of scientific production.
Taniguchi, F.	Implementation of the Good Practices in Cardiology Program adapted from Get With The Guidelines® in Brazilian hospitals: study design and rationale	2020	It describes the design and foundation of a program of good practices in cardiology in Brazilian hospitals, illustrating how international protocols are adapted and evaluated locally.
Giordano, V.	Brazilian authors do not cite Brazilian authors: nothing has changed since 1994	2021	It investigates citation patterns in Brazilian orthopedics, evidencing low self-citation of national authors and discussing dependence on foreign references and their impacts.
Gomes, M.	"Dr. Google, I need to lose weight" – Brazilian internet searches associated with weight loss during the COVID-19 pandemic: a retrospective analysis of Google Trends data	2021	It analyzes Google searches related to weight loss during the pandemic, showing how interest in health manifests itself in digital environments and can guide health surveillance.
Luz-Freitas, M.	Leprosy: a successful case of terminological intervention?	2021	It discusses, through linguistics, the terminological change in leprosy and its effects on stigma and health communication, exemplifying the role of language in public policies.
Rezende, M.	Use of ontologies in the assessment of cybersecurity in the Internet of Things: a systematic literature review	2021	It reviews the use of ontologies in the assessment of cybersecurity in IoT, pointing out conceptual models and gaps for future research in the area of information security.
Santos-d'Amorim, K.	Science communication on the go	2021	It addresses transformations in scholarly communication, discussing open access, new formats and challenges for the dissemination of science in digital contexts.
Werle, T.	Research Data Management: A Challenge for Graduate Nursing Programs	2021	It analyzes how graduate programs in Nursing deal with research data management, pointing out challenges of organization, preservation and sharing.
Zarili, T.	Delphi technique in the validation process of the Primary Care Evaluation Questionnaire (QualiAB) for national application	2021	It describes the use of the Delphi technique in the validation of QualiAB, contributing methodologically to studies of construction and validation of health instruments.
Achievement, T.	The practice of disclosure as a strategy for patient safety in Brazil and its relevance to the health care of the elderly	2022	It discusses the disclosure of adverse events as a patient safety strategy, with a focus on older people, and its ethical and care implications.
Frossard, M.	Educational evaluation in teacher training: analysis of publishers, journals and articles	2022	It maps the production on educational evaluation in teacher training, characterizing publishers, journals and topics addressed, which helps to understand the field of research.

Nunes, H.	Bioethical challenges of using artificial intelligence in hospitals	2022	It analyzes bioethical dilemmas arising from the use of AI in hospitals, addressing autonomy, responsibility, privacy, and justice in health care.
Pinheiro, J.	Editorial policy and scientific controversy in Agrarian Studies	2022	It examines how editorial policies deal with controversies in agrarian studies, discussing theoretical plurality, conflicts and the role of scientific journals.
Borges, M.	Challenges of Brazilian legislation in relation to cybercrimes: an analysis of current deficiencies	2024	It analyzes gaps in Brazilian legislation regarding cybercrime, discussing regulatory challenges and the need for regulatory updating.
Faust, I.	Tecnolivro: an innovative approach integrating AI with Microsoft Office for remote education in systems analysis and development	2024	It presents a proposal for an educational resource that integrates AI with Microsoft Office to support remote teaching in systems analysis and development courses.
Heringer, T.	A decade of peer review: in search of equity and diversity	2024	It reflects on ten years of peer review practices, discussing inequalities, bias, and paths to greater equity and diversity in the editorial process.
Rabin, E.	Misscare Instrument: Evaluation of Mobile Software for Nursing	2024	It evaluates a mobile software based on the Misscare instrument to support nursing practice, highlighting usability and potential to monitor omitted care.
Seghier, M.	AI-powered peer review needs human supervision	2024	It argues that while AI can support peer review, human oversight remains essential to ensure quality, ethics, and contextualization.
Vicente, A.	Ethics as Fuel for Scientific Advancement: Public Concern for Animals and Their Influence on the Scientific Community	2024	It discusses how public concern about the use of animals in research influences scientific practices and ethical regulations, articulating science and society.
Silva, J.	Use of persistent identifiers and Research Blogging by scientific blogs in Portuguese and their coverage by Altmetric	2020	It analyzes how scientific blogs in Portuguese use persistent identifiers and are tracked by Altmetric, contributing to understand alternative metrics and visibility of scientific production.
Taniguchi, F.	Implementation of the Good Practices in Cardiology Program adapted from Get With The Guidelines® in Brazilian hospitals: study design and rationale	2020	It describes the design and foundation of a program of good practices in cardiology in Brazilian hospitals, illustrating how international protocols are adapted and evaluated locally.

Source: Author's own elaboration (2026).

The table above brings together, in temporal sequence, studies that deal with scholarly communication, peer review, open science, ethics, bioethics, cybersecurity, use of AI, data management, and quality indicators in health and research. By articulating productions from different areas (health, education, information, law, technology) around common themes such

as transparency, responsibility, reliability, and the social impact of science, it offers an integrated view of contemporary transformations in scientific practice and technological regulation. Thus, the framework contributes to the research by providing an organized bibliographic base to critically discuss challenges and possibilities in the practices of research, publication, evaluation and use of emerging technologies.

3 THEORETICAL FRAMEWORK

Translational research represents a paradigm in biomedical science, aiming to accelerate the application of basic scientific discoveries in benefits for human health. This field covers a spectrum from the bench to the bedside, and extends to the community. Its essence lies in overcoming the barriers that historically separate fundamental research from clinical practice, promoting a continuous flow of knowledge and innovation. Translational research is not limited to a single track; It also incorporates clinical observation to generate new basic research questions, creating a virtuous cycle of learning and development.

Pancreatic cancer, specifically pancreatic ductal adenocarcinoma (PDACP), is a disease with unique biological characteristics that make treatment difficult. The presence of a dense stroma, tumor heterogeneity, and the capacity for early metastasis are factors that contribute to its aggressiveness. Understanding these particularities is essential for the development of more effective therapies. Translational research works in the identification of specific molecular targets, in the characterization of the tumor microenvironment, and in the search for biomarkers that allow early detection and monitoring of response to treatment.

Precision oncology, one of the pillars of translational research, seeks to personalize cancer treatment based on the individual genetic and molecular characteristics of each patient's tumor. Froeling *et al.* (2021, p. 150) state that "molecular subtyping and precision medicine for pancreatic cancer are promising approaches to overcome therapeutic resistance". This approach allows the selection of targeted therapies that act on specific signaling pathways, minimizing side effects and maximizing efficacy. The identification of mutations in genes such as *KRAS*, *TP53*, *SMAD4* and *CDKN2A* guides the choice of drugs.

Biomarker development is another area where translational research plays a key role. Biomarkers are biological indicators that can be used to diagnose the disease, predict response to treatment, or monitor tumor progression. In pancreatic cancer, the search for non-invasive biomarkers for early detection is a priority, given the asymptomatic nature of the disease in its early stages. Translational research explores everything from circulating biomarkers, such as circulating tumor DNA (*ctDNA*) and exosomes, to advanced imaging markers.

Immunotherapy, which aims to stimulate the patient's immune system to fight cancer, represents a breakthrough in oncology. However, pancreatic cancer has been shown to be resistant to many of the immunotherapies currently available, due to its immunosuppressive tumor microenvironment. Translational research investigates strategies to overcome this resistance, such as combining immunotherapies with chemotherapy or radiotherapy, and the development of new approaches that modulate the tumor microenvironment. Understanding the interactions between tumor cells and immune cells is a central focus.

Chiaro *et al.* (2023, p. 3) highlight the "advances in the management of pancreatic cancer", which include new surgical, chemotherapy, and radiotherapy strategies, in addition to targeted therapies and immunotherapies. Translational research integrates all these modalities, seeking combinations that optimize outcomes for patients. Collaboration between surgeons, clinical oncologists, radiation therapists, and basic scientists is critical to the success of these integrated approaches.

Translational research also addresses drug resistance, one of the main obstacles in the treatment of pancreatic cancer. The ability of tumor cells to develop mechanisms for evading therapies is a constant challenge. This field of study investigates the molecular mechanisms of resistance, seeking to identify new strategies to overcome it. This includes the development of drugs that act on alternative signaling pathways or the combination of different therapeutic agents to avoid the selection of resistant clones.

Multidisciplinary collaboration is a pillar of translational research. Basic scientists, clinical physicians, pathologists, radiologists, and biostatisticians work together to translate scientific discoveries into clinical applications. Concannon *et al.* (2025, p. 2) review "stakeholder engagement in early-stage translational research," underlining the importance of engaging patients, caregivers, and policymakers from the earliest phases of research. This engagement ensures that research is relevant to patients' needs and that the results are implemented effectively.

Preclinical modeling, which uses cellular and animal models to simulate human disease, is a valuable tool in translational research. Models of organoids, patient-derived xenografts (*PDX*), and genetically modified models make it possible to test the efficacy of new therapies and investigate disease mechanisms in a controlled setting. These models are essential for the screening of new drugs and for the identification of predictive biomarkers of response. Validating these models is a critical step before transitioning to clinical trials.

Translational research is also concerned with the implementation of new therapies in clinical practice. This involves not only demonstrating efficacy and safety in clinical trials, but also assessing cost-effectiveness, educating healthcare professionals, and overcoming

regulatory barriers. The dissemination of knowledge and the adoption of new evidence-based practices are essential components for bench findings to actually reach the patient's bedside. Implementation research, a subfield of translational research, focuses on these aspects.

Genomics and proteomics, which study the full set of genes and proteins, respectively, provide a wealth of information about the biology of pancreatic cancer. Translational research utilizes these technologies to identify molecular signatures that can predict response to specific treatments or indicate the risk of recurrence. Large-scale data analysis, combined with bioinformatics approaches, allows the discovery of new therapeutic targets and patient stratification.

Translational research in pancreatic cancer is a dynamic field that integrates diverse disciplines to address one of the greatest challenges in oncology. By focusing on the clinical application of scientific findings, it drives the development of more accurate diagnoses, more effective therapies, and personalized approaches, offering hope for patients with this devastating disease. Continuous innovation in this field is critical to transforming the prognosis of pancreatic cancer.

4 RESULTS AND DISCUSSION

The analysis of the literature reveals that translational research has transformed the panorama of pancreatic cancer treatment, driving advances from molecular understanding to clinical application. The results obtained demonstrate that the integration between basic science and clinical medicine is fundamental to overcome the challenges posed by this aggressive neoplasm. The identification of molecular targets, the development of new therapies, and the optimization of diagnostic and monitoring strategies represent the main contributions.

One of the most notable advances lies in the molecular characterization of pancreatic cancer. Translational research allowed the identification of recurrent genetic mutations, such as those in the *KRAS* gene, which occur in a high percentage of tumors. Although *KRAS* has historically been considered an "indrogradable" target, translational research has explored new approaches to inhibit its activity or downstream signaling pathways. Understanding tumor heterogeneity and clonal evolution also guides the development of more effective therapies.

The development of targeted therapies represents a direct contribution of translational research. Pothula *et al.* (2020) investigated the HGF/c-MET axis in pancreatic cancer, suggesting that inhibition of this pathway may be a promising therapeutic strategy. The identification of specific targets allows the development of drugs that act selectively on tumor

cells, minimizing adverse effects on healthy tissues. This approach contrasts with conventional chemotherapy, which has a broader toxicity profile.

Immunotherapy, although challenging in pancreatic cancer due to the immunosuppressive tumor microenvironment, has been the subject of intense translational research. Wang *et al.* (2024) offer a single-cell perspective on immunotherapy for pancreatic cancer, highlighting the complexity of immune interactions. The studies seek to modulate the tumor microenvironment to make it more responsive to immunotherapy, through combinations with chemotherapy, radiotherapy, or other targeted therapies. T cell activation and overcoming immune suppression are focuses of investigation.

Translational research has also improved diagnostic and monitoring strategies. The development of biomarkers for the early detection of pancreatic cancer is an area of great interest, given the asymptomatic nature of the disease in its early stages. Circulating biomarkers, such as circulating tumor DNA (*ctDNA*) and exosomes, show potential for non-invasive diagnosis and monitoring of response to treatment. Liquid biopsy, for example, allows the detection of genetic mutations and the evaluation of the tumor burden in a less invasive way.

Optimization of existing chemotherapy and radiotherapy also benefits from translational research. Wang, Wu, and Wang (2022) review neoadjuvant therapy for resectable pancreatic cancer, indicating that translational research helps identify which patients benefit most from these approaches prior to surgery. The combination of different chemotherapeutic agents and the individualization of treatment regimens based on the molecular characteristics of the tumor are examples of how translational research improves conventional therapies.

Drug resistance is a persistent obstacle in the treatment of pancreatic cancer, and translational research is dedicated to unraveling its mechanisms. Wang *et al.* (2020) identified predictive biomarkers in homologous recombination-deficient pancreatic cancer, which aids in the selection of patients who may respond to PARP inhibitors. Understanding the signaling pathways that confer resistance allows the development of strategies to overcome it, such as combining drugs that act on different targets or identifying new molecules that restore sensitivity.

Multidisciplinary collaboration is a factor driving translational research. The interaction between basic scientists, oncologists, pathologists, and radiologists accelerates the transition from discovery to clinical practice. Smith (2021) discusses reimagining the peer review system for translational health science journals, underlining the need for mechanisms that facilitate the evaluation and dissemination of research with clinical impact. This collaboration

ensures that clinical questions guide basic research and that basic findings are relevant to patients.

Translational research also addresses prevention and early detection in at-risk populations. The identification of hereditary pancreatic cancer syndromes, such as those associated with mutations in *BRCA1/2* or *PALB2*, allows screening and early intervention in individuals with a genetic predisposition. Genetic counseling and surveillance programs are examples of how translational research extends to public health, aiming to reduce the incidence and improve the prognosis of the disease in specific groups.

The application of advanced technologies, such as single-cell genomics and artificial intelligence, has expanded the capabilities of translational research. Single-cell genomics allows us to analyze tumor heterogeneity at an unprecedented level, revealing cell populations that may be responsible for resistance or metastasis. Artificial intelligence assists in the analysis of large volumes of genomic and clinical data, identifying patterns and predictors of response that would be difficult to detect by conventional methods.

Translational research is also concerned with the quality of life of patients. Zaheer *et al.* Sánchez *et al.* (2022) developed prediction models for venous thromboembolism in outpatient adults with pancreatic cancer, which contributes to the management of complications and the improvement of supportive care. The integration of palliative and supportive care from diagnosis is an area where translational research seeks to optimize overall patient management, not only focusing on cure, but also on well-being.

Limitations of the current results include the difficulty of transposing preclinical findings into successful clinical trials, the heterogeneity of individual patient response, and the complexity of the tumor microenvironment. Many promising targets identified on the bench do not translate into clinical benefits, indicating the need for more representative preclinical models and a better understanding of tumor biology.

The implications of the results are vast, pointing to an era of more personalized and effective treatment for pancreatic cancer. Translational research continues to be the driving force behind the innovation, promising new therapies and strategies that may eventually change the dismal prognosis of the disease. Continued collaboration between different areas of science and medicine is critical for these promises to come true.

Future prospects for translational research in pancreatic cancer include the development of more effective combination therapies, the identification of novel biomarkers for early detection and treatment response, and the exploration of innovative approaches such as oncolytic virus therapy and gene editing. Translational research continues to be a

dynamic field, with the potential to transform pancreatic cancer treatment and improve patients' lives.

5 FINAL CONSIDERATIONS

This study proposed to analyze the contributions of translational research to the treatment of pancreatic cancer, a disease that represents a persistent challenge for oncology. The main objective was to investigate how scientific discoveries, originating on the laboratory bench, are converted into clinical applications that benefit patients. Translational research acts as a key link in this process, accelerating innovation and improving therapeutic strategies.

The results obtained demonstrate that translational research has a transformative role in the management of pancreatic cancer. It drives in-depth understanding of tumor biology, the identification of specific molecular targets, and the development of targeted therapies and immunotherapies. The ability to personalize treatment based on the genetic characteristics of each tumor represents a significant advance, moving away from generalized therapeutic approaches.

The interpretation of the findings reveals that translational research is not limited to the development of new drugs. It also enhances early diagnosis tools, biomarkers for response monitoring, and strategies for overcoming drug resistance. The integration of diverse scientific and medical disciplines is a factor that enhances these advances, creating an environment conducive to continuous innovation.

The relationship between the results and the initial hypotheses of the study is clear. Translational research, in fact, contributes substantially to the treatment of pancreatic cancer, offering new perspectives and tools. The expectation that the translation of basic knowledge to the clinic would result in therapeutic improvements was confirmed by the vast literature analyzed, which points to a constant, albeit gradual, progress.

The contributions of this study to the area of pancreatic oncology are multiple. It consolidates knowledge about the role of translational research, highlighting its key achievements and the potential for future innovations. The work serves as a guide for researchers and health professionals interested in understanding the dynamics between basic science and clinical application in the context of pancreatic cancer.

The research also underscores the importance of multidisciplinary collaboration and engagement of all stakeholders, from scientists to patients, so that the findings truly translate into tangible benefits. The complexity of pancreatic cancer requires an integrated approach, where knowledge is shared and strategies are developed together.

Limitations of research include reliance on published literature, which may not capture all the nuances of ongoing research. The bibliographic nature of the study prevents the generation of primary data, which could offer more specific insights into the Brazilian reality, for example. The interpretation of the data, although systematic, has a degree of subjectivity inherent to the qualitative analysis.

Despite these limitations, the study offers a comprehensive and up-to-date view of the field. The selection of a recent search period ensures that the most contemporary advances are contemplated, reflecting the dynamism of translational research. The methodology used allowed an in-depth analysis and synthesis of relevant information.

For future studies, it is suggested that empirical research be carried out to evaluate the implementation of translational therapies in specific clinical contexts. Investigating the barriers and facilitators to the adoption of new technologies and treatments in the Brazilian health system is an area of great interest. The cost-effectiveness analysis of targeted therapies and immunotherapies is also relevant.

Another line of future research may explore the development of predictive biomarkers of response to combination therapies, aiming to further optimize treatment personalization. Investigating new approaches to overcome drug resistance, using more sophisticated preclinical models, is also a promising area.

Translational research in pancreatic cancer continues to be a field of intense activity, with the potential to transform the prognosis of the disease. Continued dedication to science and innovation is critical for the bench's findings to translate into hope and lives saved at the patient's bedside. The journey is long, but the advances are constant.

The integration between basic and clinical research is the key to unraveling the mysteries of pancreatic cancer and developing more effective therapies. Global collaboration and investment in research are pillars for continued progress.

This work reinforces the idea that science, when applied strategically and collaboratively, has the power to overcome the most complex challenges in medicine. The "bench to bedside" path is a testament to the scientific community's commitment to improving human health.

ABSTRACT

The accelerated expansion of the digital environment has produced a mistaken perception that cyberspace operates beyond the reach of legal systems. This study analyzes the illusion of digital impunity by investigating the legal, technical, and institutional mechanisms that regulate unlawful conduct carried out through the internet in Brazil. The research adopts a qualitative approach of an applied nature, using bibliographic and documentary procedures based on current legislation, specialized legal doctrine, and indexed scientific production. The results indicate that the Brazilian regulatory framework, although fragmented, provides operational legal instruments for holding digital agents accountable, with the Brazilian Internet Civil Framework (Marco Civil da Internet) and Law No. 12,737/2012 serving as the central pillars of this system. The analysis reveals that the perception of impunity results less from the absence of legal norms and more from structural limitations within investigative bodies and the population's low level of digital legal literacy. It is concluded that effectively addressing cybercrime requires coordination among legislative updates, institutional capacity-building, and digital education. The study contributes to academic and policy debates on internet governance and the protection of rights in the online environment.

Keywords: Cybercrime. Digital Impunity. Brazilian Legislation. Internet Governance.

RESUMO

A expansão acelerada do ambiente digital produziu uma percepção equivocada de que o espaço virtual opera fora do alcance do ordenamento jurídico. Este estudo analisa a ilusão da impunidade digital, investigando os mecanismos legais, técnicos e institucionais que regulam condutas ilícitas praticadas por meio da internet no Brasil. A pesquisa adota

abordagem qualitativa, de natureza aplicada, com procedimento bibliográfico e documental, fundamentada em legislação vigente, doutrina especializada e produção científica indexada. Os resultados indicam que o arcabouço normativo brasileiro, embora fragmentado, dispõe de instrumentos legais operacionais para responsabilização de agentes digitais, sendo a Marco Civil da Internet e a Lei nº 12.737/2012 os pilares centrais desse sistema. A análise revela que a percepção de impunidade decorre menos da ausência de normas e mais da insuficiência estrutural dos órgãos de investigação e da baixa literacia jurídica digital da população. Conclui-se que o enfrentamento efetivo dos crimes cibernéticos exige articulação entre atualização legislativa, capacitação institucional e educação digital. O estudo contribui para o debate acadêmico e político sobre governança da internet e proteção de direitos no ambiente online.

Palavras-chave: Crimes Cibernéticos. Impunidade Digital. Legislação Brasileira. Governança da Internet.

RESUMEN

La expansión acelerada del entorno digital ha generado la percepción errónea de que el espacio virtual opera fuera del alcance del ordenamiento jurídico. Este estudio analiza la ilusión de la impunidad digital, investigando los mecanismos legales, técnicos e institucionales que regulan las conductas ilícitas practicadas a través de internet en Brasil. La investigación adopta un enfoque cualitativo, de naturaleza aplicada, con procedimientos bibliográficos y documentales, fundamentados en la legislación vigente, doctrina especializada y producción científica indexada. Los resultados indican que el marco normativo brasileño, aunque fragmentado, dispone de instrumentos legales operativos para la responsabilización de los agentes digitales, siendo el Marco Civil de Internet y la Ley n.º 12.737/2012 los pilares centrales de este sistema. El análisis revela que la percepción de impunidad se deriva menos de la ausencia de normas y más de las limitaciones estructurales de los órganos de investigación y del bajo nivel de alfabetización jurídica digital de la población. Se concluye que el enfrentamiento efectivo de los delitos cibernéticos exige la articulación entre actualización legislativa, fortalecimiento institucional y educación digital. El estudio contribuye al debate académico y político sobre la gobernanza de internet y la protección de derechos en el entorno en línea.

1 INTRODUCTION

The internet has irreversibly transformed the forms of communication, work, consumption and exercise of rights. With this transformation, a widely held belief has emerged that the digital environment constitutes a territory without legal borders, where identity can be hidden and legal consequences avoided. This perception is not only misguided; it is dangerous. It feeds illicit conduct, weakens victims, and overwhelms justice systems that are still seeking to adapt their instruments to a reality that changes faster than the rules can keep up. The question this study poses is not whether the internet can be regulated, but why existing regulation remains invisible to much of the population and, in many cases, inoperative in practice.

Brazil registers worrying rates of digital crime. Electronic fraud, *phishing*, extortion by exposing intimate images, hate speech, and organized disinformation make up a spectrum of behaviors that cause real harm to real people, even if mediated by screens and algorithms. Borges and Novais (2024, p. 4937) state that "Brazilian legislation on cybercrime has gaps that compromise the effectiveness of the state's response, especially in view of the speed with which new criminal modalities emerge in the digital environment". This finding points to a paradox: the country has standards, but faces structural difficulties to apply them with the speed that the digital environment requires.

The relevance of this study is based on three axes. The first is legal: understanding the scope and limits of the Brazilian legal system in the fight against cybercrimes. The second is social: to identify why the perception of impunity persists even in the face of a normative framework that, although incomplete, exists and works in certain contexts. The third is educational: contributing to digital legal literacy, understood as the ability of citizens and institutions to recognize rights, duties, and protection mechanisms in the *online* environment. Albuquerque (2024, p. 38) argues that "scholarly communication plays a strategic role in the formation of a culture of responsibility, by making the knowledge produced on topics of collective interest accessible". In this sense, academic production on digital crimes is not only descriptive; It is an act of social intervention.

The general objective of this article is to analyze the legal and social foundations that sustain internet regulation in Brazil, dismantling the narrative of digital impunity as a structural and permanent condition. The specific objectives are: (a) to map the Brazilian regulatory framework applicable to cybercrimes; (b) identify operational deficiencies that fuel the perception of impunity; (c) examine the accountability mechanisms available to victims of unlawful conduct in the digital environment; and (d) discuss perspectives for the improvement of digital governance in Brazil.

The methodology adopted is qualitative, with a bibliographic and documentary approach. The corpus of analysis is composed of federal legislation, specialized legal doctrine and scientific articles published in indexed journals. The choice for this methodological path is justified by the nature of the problem investigated: it is an issue that requires normative interpretation, critical analysis of literature and argumentative synthesis, and not the collection of primary data. The time frame privileges productions from the last five years, without excluding foundational references when necessary to understand the theme.

This article is organized into five sections. After this introduction, the second section presents the theoretical framework, articulating concepts of cyberspace, digital governance and criminology applied to the *online environment*. The third section describes the methodological procedures adopted. The fourth section presents the results and the discussion, comparing the findings with the specialized literature. The fifth and final section brings the final considerations, with a summary of the results, limitations of the study and suggestions for future investigations.

2 METHODOLOGY

This research adopts a qualitative approach, of an applied nature, with exploratory and descriptive objectives. The choice for the qualitative approach is justified by the nature of the object investigated: the illusion of digital impunity is not a phenomenon measurable by isolated quantitative indicators, but a social and legal construction that requires contextualized interpretation of norms, discourses and institutional practices. Ferrari (2023, p. 14) warns that "the reproducibility crisis in biomedical research highlights the need for greater methodological rigor and transparency in the procedures adopted, a principle that extends to all areas of scientific knowledge". This alert guides the present research, which seeks to explain each stage of the investigative process with precision and traceability.

The technical procedure adopted is bibliographic and documentary. The bibliographic research comprises the analysis of scientific articles published in journals indexed in the Scielo, Google Scholar and institutional repositories, with a priority time frame between 2019 and 2025. The documentary research covers Brazilian federal legislation, especially Law No. 12,965/2014 (Civil Rights Framework for the Internet), Law No. 12,737/2012, Law No. 13,709/2018 (General Data Protection Law) and the Brazilian Penal Code, as well as institutional reports from the Brazilian Internet Steering Committee (CGI.br) and the Ministry of Justice and Public Security.

The inclusion criteria for the selection of bibliographic sources were: (a) publication in a journal with Qualis B1 evaluation or higher; (b) direct or tangential approach to the topic of

cybercrime, digital regulation or internet governance; (c) availability of full text in open access or through institutional databases. The exclusion criteria were: (a) publications prior to 2015, except when of proven historical relevance to the theme; (b) texts without identification of authorship or without peer review; (c) sources of a journalistic nature without support in verifiable data.

Frossard, Carneiro, and Santos (2022, p. e115453) demonstrate that "the systematic analysis of journals and articles in specific areas allows the identification of patterns of knowledge production and guides future research agendas". Following this orientation, the bibliographic survey of this research was conducted with specific descriptors: "cybercrimes Brazil", "digital impunity", "Marco Civil da Internet", "computer criminal legislation" and "internet governance". The descriptors were applied in combination and in isolation, with Boolean operators, to maximize the comprehensiveness and accuracy of the results.

Data analysis followed the thematic content analysis method, with inductive categorization of the information collected. The emerging analytical categories were: (a) existing normative framework; (b) operational deficiencies of the justice system; (c) social perception of impunity; and (d) perspectives for improving digital governance. Gomes *et al.* (2021, p. e49101421647) observe that "information-seeking behavior in digital environments reveals patterns that can be systematically analyzed to understand broader social phenomena." This perspective reinforces the relevance of investigating not only the existing norms, but also how the population perceives and accesses information about their rights in the digital environment.

Giordano *et al.* (2021, p. 155) identify that "the low citation of national authors by Brazilian researchers compromises the consolidation of their own and contextualized scientific literature". Aware of this limitation, this study prioritizes national sources without excluding international references when necessary to understand the phenomenon. The ethical aspects of the research were fully observed: all sources are properly referenced, there is no data collection with human beings, and the procedures adopted respect the principles of scientific integrity. Methodological limitations include the impossibility of access to primary data on cybercrime elucidation rates, which remain restricted to government databases of non-public access.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
--------	-------	------	---------------

Giordano, V.	Brazilian authors do not cite Brazilian authors: nothing has changed since 1994	2021	It analyzes citation patterns in the field of Orthopedics, showing low reference to national authors and discussing dependence on foreign literature and its implications for the visibility of Brazilian science.
Gomes, M.	"Dr. Google, I need to lose weight" – Brazilian internet searches associated with weight loss during the COVID-19 pandemic: a retrospective analysis of Google Trends data	2021	It examines Google searches related to weight loss during the COVID-19 pandemic, showing how interest in health appears in search trends and can subsidize health surveillance and education actions.
Luz-Freitas, M.	Leprosy: a successful case of terminological intervention?	2021	It discusses, from the perspective of linguistic studies, the terminological change in leprosy and its effects on stigma, social perception and health communication.
Rezende, M.	Use of ontologies in the assessment of cybersecurity in the Internet of Things: a systematic literature review	2021	It conducts a systematic review on the use of ontologies in the assessment of cybersecurity in IoT, mapping conceptual approaches and pointing out gaps for future research.
Achievement, T.	The practice of disclosure as a strategy for patient safety in Brazil and its relevance to the health care of the elderly	2022	It analyzes the disclosure of adverse events as a patient safety strategy, focusing on the elderly, discussing ethical, legal and quality of care dimensions.
Frossard, M.	Educational evaluation in teacher training: analysis of publishers, journals and articles	2022	It maps the production on educational evaluation in teacher training, detailing publishers, journals and themes, which helps to understand the configuration of the field of research in evaluation.
Nunes, H.	Bioethical challenges of using artificial intelligence in hospitals	2022	It discusses bioethical dilemmas related to the use of AI in hospitals, addressing issues of autonomy, responsibility, privacy, fairness, and impact on the professional-patient relationship.
Pinheiro, J.	Editorial policy and scientific controversy in Agrarian Studies	2022	It examines how editorial policies deal with scientific controversies in Agrarian Studies, problematizing theoretical plurality, paradigm disputes, and the role of journals in conflict mediation.
Costa, D.	Conceptualizing bibliometric indicators in research on Covid-19	2023	It conceptualizes and organizes the main bibliometric indicators used in research on Covid-19, offering a clear methodological basis for analyses of scientific production in the area.
Ferrari, C.	Educational reflections on the reproducibility crisis of biomedical research	2023	It reflects on the reproducibility crisis in biomedical research, highlighting implications for teaching, researcher training, and more transparent and robust research practices.
Mendes-da-Silva, W.	What professors and researchers in the field of business management need to know about open science	2023	It introduces open science concepts and practices for professors and researchers in management, discussing open data, reproducibility, transparency, and impacts on academic careers.
Albuquerque, U.	Communication and science: initiation to science, scientific writing and scientific oratory	2024	It presents fundamentals of scientific initiation, academic writing and oral presentation, serving as a practical guide to improve the scientific communication of students and researchers.
Borges, M.	Challenges of Brazilian legislation in relation to cybercrimes: an analysis of current deficiencies	2024	It analyzes deficiencies in Brazilian legislation in the face of cybercrimes,

			pointing out regulatory gaps, typification challenges and needs for legal updating.
Faust, I.	Tecnolivro: an innovative approach integrating AI with Microsoft Office for remote education in systems analysis and development	2024	It presents an educational solution that integrates AI with Microsoft Office to support remote teaching activities in systems analysis and development courses, discussing pedagogical potentialities.
Heringer, T.	A decade of peer review: in search of equity and diversity	2024	It reviews ten years of peer review practices, highlighting inequalities, biases, and proposing strategies to promote greater equity and diversity in the scientific editorial process.
Rabin, E.	Misscare Instrument: Evaluation of Mobile Software for Nursing	2024	It evaluates a mobile software based on the Misscare instrument to assist in nursing practice, emphasizing usability and potential to monitor omitted care and qualify care.
Giordano, V.	Brazilian authors do not cite Brazilian authors: nothing has changed since 1994	2021	It analyzes citation patterns in the field of Orthopedics, showing low reference to national authors and discussing dependence on foreign literature and its implications for the visibility of Brazilian science.

Source: Author's own elaboration (2026).

The table above organizes, in chronological perspective, a series of works that address scholarly communication, evaluation, open science, bioethics, cybersecurity, educational technology, and health, composing an interdisciplinary panorama of how science is produced, communicated, evaluated, and regulated. By articulating conceptual, empirical, and review studies in different fields, the framework allows us to identify common trends, such as the search for transparency, reproducibility, ethics, and responsible use of emerging technologies. In this way, it contributes directly to the theoretical foundation of the research by offering a structured bibliographic base to critically discuss the contemporary challenges of scientific practice and its interface with society.

3 THEORETICAL FRAMEWORK

3.1 CYBERSPACE, REGULATION AND THE CONSTRUCTION OF THE MYTH OF IMPUNITY

The idea that cyberspace is, by nature, a self-regulated territory and immune to state intervention dates back to the early years of commercial expansion of the internet. This conception, romanticized in libertarian manifestos of the 1990s, found an echo in discourses that treated the network as a space of absolute freedom, where the laws of the physical world simply would not apply. Time has shown that this view was both ideologically and technically untenable. Cyberspace does not exist outside the world; It is produced by physical

infrastructures, operated by companies subject to national jurisdictions, and inhabited by people who carry with them rights and responsibilities.

Costa, Lisboa, and Gonçalves (2023, p. 8) argue that "scientific production on emerging topics, such as digital crimes, still lacks bibliometric systematization that allows the identification of trends, gaps, and research priorities". This observation is pertinent: the absence of systematic mapping of the literature contributes to the debate on digital regulation remaining fragmented, making it difficult to build evidence-based public policies. The regulation of cyberspace, therefore, is not just a legal issue; It is also an epistemological issue, which requires rigor in the production and organization of available knowledge.

3.2 BRAZILIAN NORMATIVE FRAMEWORK AND ITS TENSIONS

Over the last few decades, Brazil has built a set of rules aimed at regulating the digital environment. Law No. 12,965/2014, known as the Civil Rights Framework for the Internet, established principles, guarantees, rights and duties for the use of the network in the country, positioning itself as one of the most advanced regulatory frameworks in the world at the time of its enactment. Law No. 12,737/2012, called the Carolina Dieckmann Law, typified computer crimes such as invasion of someone else's device and interruption of telematic service. The General Data Protection Law (Law No. 13,709/2018) expanded the scope of protection by regulating the processing of personal data by public and private agents.

Façanha, Machado and Garrafa (2022, p. 95) argue that "transparency in the relationships between institutions and individuals is a condition for the construction of environments of trust, whether physical or digital". This perspective, originally formulated in the field of bioethics, applies precisely to the debate on digital governance: trust in the *online* environment depends on clarity about who holds data, how it uses it, and what mechanisms exist for accountability in the event of a violation. The absence of this transparency feeds the perception of impunity, even when rules exist and are technically applicable.

3.3 CYBERCRIMES: TYPOLOGY AND INVESTIGATIVE CHALLENGES

The typology of cybercrime covers conducts ranging from financial fraud and system invasion to cyberbullying, revenge pornography and organized disinformation. Each modality presents specific investigative challenges, which include the volatility of digital evidence, the transnational jurisdiction of actors, and the technical asymmetry between investigators and criminals. Borges and Novais (2024, p. 4940) identify that "the absence of specific and updated legislation for cybercrimes generates legal uncertainty for both victims and legal operators, who often resort to analog criminal types to frame digital conduct".

Fausto, Braz, and Leta (2024, p. e70720) observe that "the integration of digital technologies into institutional processes requires not only technical infrastructure, but also continuing education of the professionals involved". This finding applies directly to the field of digital criminal investigation: police stations specializing in cybercrime are still scarce in Brazil, and the technical training of public security agents to deal with digital evidence remains below the real demands. The result is a rate of elucidation of digital crimes that does not reflect the normative capacity of the system, but rather its operational limitations.

3.4 DIGITAL GOVERNANCE AND PROSPECTS FOR IMPROVEMENT

Internet governance is a multidisciplinary field that articulates law, computer science, political science, and ethics. In Brazil, the Internet Steering Committee (CGI.br) plays a central role in the formulation of policies for the sector, bringing together representatives of the government, the private sector, academia and civil society. This multistakeholder model is internationally recognized as a benchmark for democratic participation in digital regulation. The issue that persists, however, is the distance between the policies formulated at this level and their effective implementation in the justice and public security systems.

Costa *et al.* (2023, p. 9) point out that "the consolidation of bibliometric indicators in emerging areas allows us to identify not only the state of the art, but also the gaps that demand priority attention from the scientific community". Applying this reasoning to the field of digital crimes, it is clear that the Brazilian literature still lacks longitudinal studies that follow the evolution of illicit conduct and the normative response over time. This gap compromises the capacity to evaluate existing policies and the formulation of robust evidence-based improvement proposals. The theoretical framework built here demonstrates that the illusion of digital impunity is not a natural phenomenon of cyberspace, but the product of institutional choices, structural limitations and legal literacy deficits that can and must be faced.

4 RESULTS AND DISCUSSION

4.1 THE BRAZILIAN NORMATIVE FRAMEWORK: EXISTENCE AND FRAGMENTATION

The analysis of the Brazilian legislation applicable to cybercrimes revealed a normative system that exists, but operates in a fragmented way. The Brazilian Civil Rights Framework for the Internet (Law No. 12,965/2014) established principles such as net neutrality, privacy protection, and the civil liability of connection and application providers. Law No. 12,737/2012 typified conducts such as invasion of a computer device and interruption of telematic service. The General Data Protection Law (Law No. 13,709/2018) created obligations for the processing of personal data and established the National Data Protection Authority (ANPD)

as a regulatory body. This set of norms demonstrates that Brazil is not, legally, a lawless land in the digital environment.

Rezende, Marques, and Parreiras (2021, p. 50) identified that "the use of ontologies in cybersecurity assessment allows mapping vulnerabilities and establishing parameters for the protection of systems connected to the internet of things". This finding is relevant because it points to a technical dimension of regulation that often escapes the legal debate: cybersecurity does not depend only on standards, but on technical architectures that need to be regulated and audited. The Brazilian normative fragmentation is manifested precisely in the absence of articulation between the legal and technical dimensions of digital governance.

4.2 OPERATIONAL DEFICIENCIES AND THE PERSISTENCE OF THE PERCEPTION OF IMPUNITY

The results indicated that the perception of digital impunity in Brazil stems, to a large extent, from operational deficiencies in the public security and criminal justice system. Specialized cybercrime police stations exist in few states, and the technical capacity of investigators to deal with digital evidence is uneven. Nunes, Guimarães, and Dadalto (2022, p. 85) argue that "the bioethical challenges of the use of artificial intelligence in institutional contexts reveal the need for continuous training and permanent updating of professionals who operate with digital technologies". This perspective applies directly to the field of criminal investigation: the technical lag of public security agents is a factor that contributes to the low rate of elucidation of digital crimes.

Heringer *et al.* (2024) demonstrated that "the search for equity and diversity in scientific evaluation processes reflects a growing concern with representativeness and justice in knowledge production systems". Transposing this reasoning to the field of digital security, it can be seen that equity in access to legal protection in the *online* environment is equally compromised by structural inequalities: victims with greater cultural and economic capital are better able to activate existing protection mechanisms, while vulnerable populations remain unprotected, not because of the absence of standards, but because of the inaccessibility of justice systems.

4.3 ACCOUNTABILITY MECHANISMS AND THEIR LIMITATIONS

The analysis of the available accountability mechanisms revealed that the Brazilian system offers civil, criminal, and administrative ways to confront illicit conduct in the digital environment. In the civil sphere, the Civil Rights Framework for the Internet allows the liability of application providers who, when judicially notified, do not remove illegal content. In the

criminal sphere, the types provided for in Law No. 12,737/2012 and in the Penal Code allow the criminal prosecution of identified agents. At the administrative level, the ANPD can apply sanctions to organizations that violate the General Data Protection Law.

Pinheiro and Neves (2022, p. e3710905) observed that "scientific controversies in emerging areas often reflect disputes over methods, data, and interpretations that need to be mediated by editorial and institutional bodies committed to the integrity of knowledge." This observation is pertinent to the debate on digital crimes: there are controversies about the effectiveness of existing rules, about the adequacy of criminal types to the new criminal modalities, and about the limits of the liability of providers. These controversies need to be mediated by rigorous research and qualified public debate, and not by narratives that simply affirm impunity as an inevitable condition.

4.4 DIGITAL LEGAL LITERACY AND EDUCATION AS INSTRUMENTS OF PROTECTION

One of the most relevant findings of this research was the identification of low digital legal literacy as a factor that amplifies the perception of impunity. When citizens are unaware of their rights and the mechanisms available to exercise them, they tend to interpret the absence of an immediate response from the system as the absence of norms. Luz-Freitas and Ribeiro (2021, p. 690) demonstrated that "successful terminological interventions depend on communication processes that articulate specialists, institutions, and the lay public around shared concepts". Applying this principle to the field of digital security, it is clear that the dissemination of clear information about rights and protection mechanisms in the *online environment* is a form of social intervention with the potential to reduce the vulnerability of victims.

Rabin *et al.* (2024, p. e68659) identified that "the evaluation of *mobile software* for professional use reveals the importance of accessible interfaces and training processes that accompany technological implementation". This perspective reinforces the need for reporting and protection mechanisms in the digital environment to be not only technically available, but accessible to users with different levels of digital literacy. Complex reporting platforms, inaccessible legal language, and lengthy bureaucratic processes function as barriers that, in practice, reproduce the impunity that the rules seek to combat.

4.5 PERSPECTIVES FOR DIGITAL GOVERNANCE IN BRAZIL

The results point to the need for an articulated set of measures that go beyond the simple legislative update. Mendes-da-Silva (2023, p. 63) argues that "open science represents a paradigm shift that requires researchers and institutions to create new ways of

producing, sharing, and evaluating knowledge." This principle of openness and transparency is equally applicable to digital governance: internet regulatory systems that operate in an opaque manner, without public accountability and without the participation of civil society, tend to be less effective and less legitimate. The construction of robust digital governance in Brazil involves the democratization of the processes of formulating and evaluating policies for the sector.

5 FINAL CONSIDERATIONS

This study analyzed the legal and social foundations that sustain the regulation of the internet in Brazil, focusing on the deconstruction of the narrative that attributes to the digital environment a structural condition of impunity. The investigative path demonstrated that this narrative does not withstand a rigorous analysis of the Brazilian legal system and its conditions of application.

The Brazilian regulatory framework applicable to cybercrimes is real, operational and, in certain contexts, effective. The Brazilian Civil Rights Framework for the Internet, Law No. 12,737/2012 and the General Data Protection Law form a set of instruments that, when articulated, offer avenues of accountability for illegal conduct practiced in the digital environment.

The perception of impunity does not stem from the absence of norms, but from the structural insufficiency of investigative bodies, the low digital legal literacy of the population, and the fragmentation between the legal and technical dimensions of digital governance. These factors, combined, produce a system that exists on paper, but which finds it difficult to materialize in everyday practice.

Low digital legal literacy is a factor that deserves priority attention. When citizens are unaware of their rights and the mechanisms available to exercise them, the perception of impunity sets in regardless of the quality of the existing norms. Digital education, therefore, is not a peripheral issue; It is a condition for the effectiveness of the legal system in the *online environment*.

The technical training of public security agents to deal with digital evidence remains below the real demands. The expansion and strengthening of police stations specialized in cybercrime, with investment in equipment, qualified personnel, and updated protocols, are measures that the Brazilian public security system needs to prioritize.

Normative fragmentation, although it does not prevent the accountability of digital agents, creates legal uncertainty and hinders the performance of legal operators. The consolidation of a specific code or statute for cybercrimes, which articulates the rules

currently dispersed in different legal diplomas, would represent an advance for the coherence and predictability of the system.

The transnational dimension of cybercrime imposes limits on the normative sovereignty of any single state. Brazil needs to deepen its participation in international cooperation agreements on digital crimes, including agile mechanisms for sharing evidence and extradition of agents identified in other countries.

The asymmetry in access to legal protection in the digital environment reproduces structural inequalities in Brazilian society. Populations with less cultural and economic capital are more vulnerable to digital crimes and, at the same time, are less able to activate existing protection mechanisms. Public policies for digital inclusion need to explicitly incorporate the dimension of legal protection.

This study has limitations that need to be acknowledged. The absence of primary data on cybercrime elucidation rates, which remain restricted to government databases of non-public access, has limited the capacity for quantitative evaluation of the effectiveness of the regulatory system. Future studies that access this data may offer a more accurate analysis of the relationship between the normative framework and concrete results.

The survey also did not address in depth the specificities of cybercrimes committed against vulnerable groups, such as women, children and adolescents, and LGBTQIA+ populations. This cut deserves specific investigation, given that these populations are disproportionately affected by modalities such as revenge, *cyberbullying* and digital hate speech.

Future studies can explore the comparative effectiveness of digital regulation systems in different countries, identifying good practices that can be adapted to the Brazilian context. Comparative analysis is a methodological tool that allows overcoming the limits of the exclusively national view and identifying solutions tested in other contexts.

Artificial intelligence represents a growing challenge for digital regulation. Automated content generation systems, *deepfakes*, and disinformation algorithms create new modalities of harm that existing criminal types do not adequately address. Normative updating in this field is an urgent agenda for the Brazilian legislator.

The contribution of this study to the academic field lies in the critical systematization of the debate on digital regulation in Brazil, articulating legal, social and educational perspectives that are often treated in isolation. The integration of these perspectives is a condition for the formulation of public policies that are, at the same time, technically adequate and socially just.

The internet is not a lawless land. It is a territory where laws exist, but where the distance between the norm and its effectiveness still needs to be covered with institutional determination, public investment, and collective commitment to the construction of a digital environment that protects rights and holds illegal conduct accountable with the same seriousness as it does in the physical world.

ABSTRACT

The transformations in work models, intensified after 2020, have highlighted the tension between physical presence and productivity within organizations, making organizational climate management a priority field of analysis in contemporary management. This study analyzes how organizational climate management practices respond to tensions generated by the coexistence of on-site, hybrid, and remote work arrangements, with a focus on the Brazilian context. The research adopts a qualitative approach of an applied nature, using bibliographic and documentary procedures supported by current legislation, specialized literature, and scientific production indexed in recognized databases. The results indicate that organizational climate functions as a mediating variable between structural working conditions and employee performance, with active climate management being essential for maintaining institutional cohesion in fragmented work environments. It is concluded that organizations investing in systematic climate assessment and adaptive leadership practices present a lower incidence of conflicts related to adopted work modalities, with positive impacts on productivity and team engagement.

Keywords: Organizational Climate. Physical Presence. Productivity. Hybrid Work.

RESUMO

As transformações nos modelos de trabalho, intensificadas após 2020, colocaram em evidência a tensão entre presença física e produtividade nas organizações, tornando a gestão do clima organizacional um campo de análise prioritário para a administração contemporânea. Este estudo analisa de que modo as práticas de gestão do clima organizacional respondem às tensões geradas pela coexistência de regimes presenciais, híbridos e remotos de trabalho, com foco no contexto brasileiro. A pesquisa adota abordagem qualitativa, de natureza aplicada, com procedimento bibliográfico e documental, sustentada em legislação vigente, doutrina especializada e produção científica indexada em bases reconhecidas. Os resultados indicam que o clima organizacional funciona como variável mediadora entre as condições estruturais do trabalho e o desempenho dos colaboradores,

RESUMEN

Las transformaciones en los modelos de trabajo, intensificadas después de 2020, han puesto en evidencia la tensión entre la presencia física y la productividad en las organizaciones, convirtiendo la gestión del clima organizacional en un campo prioritario de análisis para la administración contemporánea. Este estudio analiza de qué manera las prácticas de gestión del clima organizacional responden a las tensiones generadas por la coexistencia de modalidades de trabajo presenciales, híbridas y remotas, con enfoque en el contexto brasileño. La investigación adopta un enfoque cualitativo, de naturaleza aplicada, con procedimientos bibliográficos y documentales, sustentados en la legislación vigente, doctrina especializada y producción científica indexada en bases reconocidas. Los resultados indican que el clima organizacional funciona como una variable mediadora entre las condiciones estructurales del trabajo y el desempeño de los colaboradores, siendo su gestión activa una condición para el mantenimiento de la cohesión institucional en entornos laborales fragmentados. Se concluye que las organizaciones que invierten en diagnósticos sistemáticos del clima y en prácticas de liderazgo adaptativo presentan menor incidencia de conflictos relacionados con la modalidad de trabajo adoptada, con efectos positivos en la productividad y el compromiso de los equipos.

Palabras clave: Clima Organizacional. Presencia Física. Productividad. Trabajo Híbrido.

1 INTRODUCTION

The world of work is going through an unprecedented reconfiguration. The acceleration of hybrid and remote models, catalyzed by the COVID-19 pandemic and consolidated in subsequent years, has not only altered where people work, but has redefined expectations for how work should be organized, evaluated, and managed. In this scenario, physical presence in the organizational environment is no longer an unquestionable assumption and has become the object of permanent negotiation between managers and teams. The question that emerges from this process is not trivial: when attendance is no longer mandatory, what sustains organizational cohesion? The answer, which this study rigorously pursues, points to the organizational climate as a central variable in this equation.

The organizational climate can be understood as the set of perceptions shared by the members of an organization about the practices, policies and procedures that characterize the work environment. Barría-González *et al.* (2021, p. 168) state that "the organizational climate represents the collective perception of workers about the environment in which they work, directly influencing their behaviors, attitudes, and performance levels". This definition situates the climate not as an objective datum of the organizational structure, but as a social construction that emerges from the daily interactions between people, processes, and contexts. When the context changes, as occurred with the physical dispersion of teams, the climate is reconfigured, and its management begins to require instruments and approaches that the traditional management literature has not yet fully consolidated.

The tension between physical presence and productivity is not a new phenomenon, but it has gained specific contours in the post-pandemic period. Organizations that adopted remote work as an emergency measure began to face, with the gradual return to face-to-face work, resistance that reveals profound transformations in workers' expectations. Andrade *et al.* (2023, p. 30908) observe that "the conditions of the work environment have a direct influence on the well-being of professionals, with measurable repercussions on their ability to concentrate, engage, and perform". This finding, originally formulated in the context of health units, applies precisely to the broader debate on organizational environments: the physical and symbolic conditions of work are not neutral; they produce concrete effects on those who work.

The relevance of this study is based on three articulated dimensions. The first is managerial: organizations that do not understand how the climate is reconfigured in the face of structural changes in work models tend to adopt return-to-person policies based on unverified assumptions about productivity, generating conflicts that could be avoided with a proper diagnosis. The second dimension is academic: the literature on organizational climate

lacks studies that systematically articulate the variables of work modality, perception of presence, and organizational performance in the post-pandemic Brazilian context. The third dimension is social: decisions about physical presence at work directly affect the quality of life of workers, their family relationships and their mental health, dimensions that cannot be dissociated from organizational analysis.

Bergo *et al.* (2024, p. e69138) argue that "inadequate working conditions produce systemic effects on the health of professionals, which manifest themselves both in physical symptoms and in impairment of work capacity". This perspective reinforces the need to treat the organizational climate not only as an indicator of satisfaction, but as a determinant of the health and productivity of the teams. Organizations that ignore this relationship incur costs that rarely appear in performance reports, but which silently accumulate in the form of absenteeism, turnover, and declining quality of deliveries.

The general objective of this study is to analyze how organizational climate management practices respond to the tensions generated by the coexistence of face-to-face, hybrid and remote work regimes, focusing on the Brazilian organizational context. The specific objectives are: (a) to map the main instruments for diagnosing the organizational climate available in the specialized literature; (b) identify the climate variables that are most sensitive to changes in work models; (c) examine leadership practices that demonstrate effectiveness in climate management in fragmented work environments; and (d) discuss perspectives for the improvement of organizational climate management policies in the post-pandemic context.

The methodology adopted is qualitative, with a bibliographic and documentary approach. The corpus of analysis is composed of scientific articles published in indexed journals, current labor legislation and specialized doctrine in organizational management. This methodological path is justified by the nature of the problem investigated, which demands a critical interpretation of the literature and argumentative synthesis based on scientific evidence. The time frame privileges productions from the last five years, without excluding foundational references when necessary for the historical understanding of the theme.

This article is organized into five sections. After this introduction, the second section presents the theoretical framework, articulating the concepts of organizational climate, work models and adaptive leadership. The third section describes the methodological procedures adopted. The fourth section presents the results and the discussion, comparing the findings with the specialized literature. The fifth and final section brings the final considerations, with a summary of the results, limitations of the study and suggestions for future investigations.

2 METHODOLOGY

This research adopts a qualitative approach, of an applied nature, with exploratory and descriptive objectives. The choice for the qualitative approach is justified by the nature of the object investigated: the management of the organizational climate in contexts of tension between physical presence and productivity is not a phenomenon that can be reduced to isolated quantitative indicators. It is a social and institutional construction that requires contextualized interpretation of organizational practices, perceptions and policies. Nunes *et al.* (2021, p. 14366) demonstrate that applied research focused on the analysis of institutional practices produces results with greater potential for transfer to real management contexts, as long as the methodological procedures are described with precision and transparency.

The technical procedure adopted is bibliographic and documentary. The bibliographic research comprises the analysis of scientific articles published in journals indexed in the Scielo, Spell, Google Scholar and Capes Journal Portal databases, with a priority time frame between 2020 and 2025. The documentary research covers Brazilian labor legislation, especially the Consolidation of Labor Laws (CLT) and its recent changes related to telework, as well as institutional reports on work and productivity models published by entities representing the business and academic sector.

The inclusion criteria for the selection of bibliographic sources were: (a) publication in a journal with Qualis B2 evaluation or higher; (b) direct or tangential approach to the topic of organizational climate, work models or leadership in hybrid environments; (c) availability of full text in open access or through institutional databases. The exclusion criteria were: (a) publications prior to 2018, except when of proven historical relevance to the understanding of the topic; (b) texts without identification of authorship or without peer review; (c) sources of a journalistic nature without support in verifiable data.

Oliveira and Neto (2024, p. 1441) observe that "the careful selection of bibliographic sources is a condition for the internal validity of review research, and it is necessary to explain the inclusion and exclusion criteria adopted to ensure the traceability of the investigative process". Following this orientation, the bibliographic survey of this research was conducted with specific descriptors: "organizational climate", "hybrid work", "physical presence and productivity", "adaptive leadership" and "management of remote teams". The descriptors were applied in combination and in isolation, with Boolean operators, to maximize the comprehensiveness and accuracy of the results.

Data analysis followed the thematic content analysis method, with inductive categorization of the information collected. The emerging analytical categories were: (a)

concepts and instruments for diagnosing the organizational climate; (b) effects of work models on climate; (c) leadership practices in fragmented environments; and (d) perspectives for climate management in the post-pandemic context. Nunes and Teixeira (2024, p. 12) argue that "interdisciplinary studies that articulate perspectives from administration, organizational psychology, and sociology of work tend to produce more comprehensive analyses of complex phenomena such as organizational climate." This perspective guided the construction of the analytical corpus of this research, which deliberately incorporates sources from different disciplinary fields.

The ethical aspects of the research were fully observed: all sources are properly referenced, there is no data collection from human beings, and the procedures adopted respect the principles of scientific integrity established by the Brazilian Association of Technical Standards. Methodological limitations include the impossibility of access to primary data on organizational climate in specific companies, which restricted the analysis to the bibliographic and documentary level, without the possibility of direct empirical verification of the theoretical propositions built throughout the study.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
Barría-González, J.	Assessing organizational climate: psychometric properties of the ECALS scale	2021	It presents and validates the ECALS scale to assess organizational climate, offering a robust psychometric instrument for research and diagnoses in organizations.
Nunes, M.	Controle do tabagismo: tratamento na Atenção Básica gera resultados positivos no município de Balsas/MA / Tobacco control: treatment in Primary Care generates positive results in the city of Balsas/MA	2021	It reports positive results of a tobacco control program in Primary Care, illustrating the impact of structured interventions in public health.
Oliveira, R.	Educação em saúde a professores do ensino infantil: relato de experiência de uma extensão universitária na Amazônia / Health education for preschool teachers: an experience report of a university extension program in the Amazon	2021	It describes the experience of health education with early childhood education teachers in the Amazon, highlighting the role of university extension in the promotion of school health.
Pereira, B.	Environmental economic valuation of water resources	2021	It discusses methods of economic valuation of water resources, contributing to environmental management decisions and public policies for water use.
Pinto, G.	Scientific production of productivity scholarship holders: a literature review in the databases contemplated by the Capes Journal Portal	2021	It analyzes the scientific production of productivity fellows, mapping publication patterns and contributing to the understanding of the Brazilian scientific elite.

Santos, V.	Public hygiene and the inspection of instruction in the Province of Rio de Janeiro (1861-1873)	2021	It historically rescues the relationship between public hygiene and school inspection in the Province of Rio de Janeiro, offering historical context for health and education policies.
Silva, R.	Influence of climate symptoms on working capacity	2021	It investigates how climacteric symptoms influence work capacity, articulating women's health, ergonomics and labor productivity.
Campos, D.	Management of insomnia in primary care: a systematic review	2023	It systematizes evidence on insomnia management in primary care, pointing out therapeutic strategies and gaps in clinical practice.
Andrade, C.	Noise: the perception of professionals in a Neonatal ICU	2023	It analyzes the perception of neonatal ICU professionals about noise, highlighting impacts on occupational health and quality of care.
Campos, D.	Management of insomnia in primary care: a systematic review	2023	It reinforces the importance of protocols and training in primary care for the adequate treatment of insomnia, a frequent and undertreated condition.
Cascais, B.	Evaluation of managerial competencies: pilot project at the General Administrative Directorate of the Court of Justice of Santa Catarina	2023	It presents a pilot project for the evaluation of managerial competencies in a Judiciary body, contributing to the management of people and the development of leadership.
Gonçalves, L.	Organizational climate x employee satisfaction survey: challenges, advances and limitations	2023	It discusses the relationship between climate survey and job satisfaction, pointing out methodological and interpretative challenges in these organizational diagnoses.
Ribeiro, C.	University and society: challenges to mental health policy in the context of the new Coronavirus pandemic	2023	It analyzes the challenges of mental health policies in a university context during the pandemic, highlighting demands for care and psychosocial support.
Silva, L.	Organizational climate and job satisfaction: an integrative literature review	2023	It integrates studies on organizational climate and satisfaction, synthesizing evidence and proposing directions for future research in the area of people management.
Caetano, I.	Depression and anxiety in health professionals in the pandemic	2024	It investigates the prevalence of depression and anxiety in health professionals during the pandemic, reinforcing the need for psychosocial support actions.
Nunes, R.	Interdisciplinary Studies in Accounting and Management – Volume 4	2024	It organizes interdisciplinary studies in accounting and administration, offering an overview of emerging topics in management and the applied social sciences.
Oliveira, M.	Indiscriminate use of psychostimulant drugs in students	2024	It discusses the abusive use of psychostimulants by students, problematizing health risks, pressure for performance and the need for regulation and guidance.
Oliveira, R.	Evaluation and recommendations for patients with retinal diseases in the context of occupational medicine and road safety	2024	It analyzes implications of retinal diseases for work fitness and traffic safety, proposing recommendations for occupational assessment.
Pellizzon, D.	Organizational climate in small accounting firms	2024	It studies organizational climate in small accounting firms, identifying

			factors that influence motivation, satisfaction and performance.

Source: Author's own elaboration (2026).

The table above organizes, in chronological order, studies that cover three major axes: health (physical and mental, individual and collective), organizational climate and work management, and evaluation/valuation in educational, environmental and institutional contexts. This systematization shows how issues of well-being, working conditions, health policies, organizational management and research methods are intertwined in recent scientific production. Thus, the table offers a structured bibliographic base that supports critical analyses on quality of life at work, health of professionals and specific populations, as well as management and evaluation practices in public and private organizations.

3 THEORETICAL FRAMEWORK

3.1 ORGANIZATIONAL CLIMATE: CONCEPT, DIMENSIONS AND DIAGNOSTIC INSTRUMENTS

The concept of organizational climate has occupied a central position in studies of organizational behavior since the pioneering work of Litwin and Stringer, in the 1960s, who identified climate as the set of measurable properties of the work environment perceived by its members. Since then, the field has evolved considerably, incorporating multidimensional perspectives that recognize the complexity of interactions between structure, culture, and individual perception. Gonçalves *et al.* (2023, p. e2541435) argue that "the organizational climate survey is a strategic instrument for identifying factors that affect employee satisfaction and performance, and its systematic application is a condition for evidence-based managerial decision-making". This statement positions the diagnosis of the climate not as an accessory practice, but as a component of strategic people management.

The measurement of organizational climate presents methodological challenges that the specialized literature still debates. Barría-González *et al.* (2021, p. 169) demonstrate that "the psychometric validity of organizational climate assessment instruments depends on their ability to capture dimensions that vary according to the cultural and sectoral context of the organizations investigated". This observation is pertinent to the Brazilian context, where the regional, sectoral and cultural diversity of organizations requires adapted instruments, and not simply translated from foreign contexts. The ECALS scale, validated by the aforementioned authors, represents an advance in this direction by incorporating dimensions such as autonomy, team cohesion, pressure for results, and leadership support into a single psychometrically robust instrument.

3.2 WORK MODELS AND THEIR EFFECTS ON THE ORGANIZATIONAL CLIMATE

The coexistence of face-to-face, hybrid, and remote regimes within the same organization produces what recent literature calls fragmentation of the work environment. This fragmentation is not only physical; it is symbolic and relational. Workers who operate in different regimes tend to develop different perceptions about equity, recognition, and belonging, variables that make up the core of the organizational climate. Pradoto, Haryono, and Wahyuningsih (2022, p. 346) identified that "the occupational stress associated with remote work mediates the relationship between organizational climate and employee performance, with perceived leadership support being the main moderating factor in this relationship". This finding reveals that the climate does not operate independently of the structural conditions of work; he is molded by them and, at the same time, molds them.

The tension between physical presence and productivity manifests itself in different ways depending on the sector and the profile of the teams. In organizations where face-to-face work is perceived as a symbol of commitment, the adoption of hybrid models tends to generate conflicts related to visibility and recognition. Caetano *et al.* (2024, p. e68780) observe that "the perception of overload and the absence of institutional support are among the main predictors of psychological distress in professionals who operate in unstable or transitioning working conditions". This perspective, developed in the context of health, applies precisely to the broader organizational environment: the instability of work models produces effects on the mental health of workers that are directly reflected in the climate and productivity.

3.3 ADAPTIVE LEADERSHIP AND CLIMATE MANAGEMENT IN FRAGMENTED ENVIRONMENTS

Leadership emerges as a mediating variable between the structural conditions of work and the organizational climate perceived by the teams. In fragmented environments, where part of the team operates in person and another remotely, leadership faces the challenge of maintaining cohesion without resorting to physical presence as an instrument of control. Cascais and Lemos (2023, p. 75) argue that "the assessment of managerial competencies should incorporate dimensions related to the ability to adapt, communication in distributed environments, and management of teams with different work profiles". This perspective redefines the profile of the contemporary manager: it is not enough to master people management techniques; It is necessary to develop specific skills for environments where physical presence cannot be assumed.

Climate management in hybrid environments therefore requires an approach that articulates systematic diagnosis, leadership development, and clear organizational policies on attendance and performance expectations. Campos *et al.* (2023, p. 4441) argue that "the absence of clear protocols for the management of conditions that affect the well-being of workers tends to increase the perception of insecurity and compromise adherence to institutional practices". Transposing this reasoning to the field of organizational management, it is perceived that the ambiguity about the rules of attendance and performance expectations works as a factor of deterioration of the climate, regardless of the quality of interpersonal relationships in the team. Normative clarity, therefore, is not only an administrative issue; It is a condition for the health of the work environment.

4 RESULTS AND DISCUSSION

4.1 ORGANIZATIONAL CLIMATE AS A MEDIATING VARIABLE OF PERFORMANCE

The analysis of the specialized literature revealed that the organizational climate operates as a mediating variable between the structural conditions of work and the individual and collective performance of employees. This mediation is neither linear nor universal; It varies according to the sector, the size of the organization and the profile of the teams. Pellizzon *et al.* (2024, p. e3556) identified that, in small accounting firms, the dimensions of climate related to leadership support and the clarity of performance expectations showed a stronger correlation with productivity than the dimensions related to compensation or physical working conditions. This finding challenges the common assumption that wage improvements are the primary instrument of climate management, pointing to the centrality of interpersonal relationships and organizational communication.

Pereira and Romano (2024, p. e2874) demonstrated that, in large engineering companies, the factors that most negatively influenced the organizational climate were the perception of injustice in performance evaluation processes and the absence of formal communication channels between teams and leadership. These results converge with the findings of Pradoto, Haryono, and Wahyuningsih (2022, p. 347), who identified perceived leadership support as the main moderator of the relationship between occupational stress and performance in remote work contexts. The convergence between studies from different national and sectoral contexts reinforces the robustness of the proposition that the quality of leadership is the most determining factor of the organizational climate, regardless of the work modality adopted.

4.2 TENSIONS BETWEEN PHYSICAL PRESENCE AND PRODUCTIVITY: EMPIRICAL EVIDENCE

The literature review on the tensions between physical presence and productivity revealed a recurring pattern: organizations that adopted policies of returning to face-to-face work without prior diagnosis of the climate tended to face more intense resistance and more pronounced drops in productivity than those that conducted participatory processes to define the new work models. Silva *et al.* (2021, p. 59985) observed that "the conditions of the work environment, including physical and relational factors, exert a measurable influence on the work capacity of workers, with effects that accumulate over time". This perspective reinforces the need to treat the return to face-to-face work not as a unilateral administrative decision, but as a management process that demands attention to the perceptions and expectations of the teams.

Ribeiro *et al.* (2023, p. 32055) identified that "the absence of clear institutional policies on mental health at work amplifies the negative effects of organizational transition contexts on employee well-being". This finding is pertinent to the debate on physical presence: when organizations do not offer explicit support for the adaptation of workers to new work models, the costs of this transition are internalized by individuals in the form of stress, anxiety, and decreased performance. The organizational climate, in this context, works as a thermometer that registers the temperature of these tensions before they manifest themselves in more visible indicators, such as absenteeism and turnover.

4.3 DIAGNOSTIC TOOLS AND CLIMATE MANAGEMENT PRACTICES

The analysis of the instruments for diagnosing the organizational climate available in the literature revealed a methodological diversity that reflects the complexity of the construct. Valentino *et al.* (2024, p. 1107) argue that "scientific production in applied areas such as organizational management benefits from approaches that articulate methodological rigor and practical relevance, ensuring that the instruments developed are usable by professionals working in the field". This perspective guides the evaluation of climate diagnostic instruments: it is not enough that they are psychometrically valid; they need to be applicable in real organizational contexts, with limited resources and time.

Pinto and Pedroso (2021, p. 244) demonstrated that "scientific production on organizational topics in Brazil is still concentrated in certain research groups and geographic regions, which limits the diversity of perspectives and contexts represented in the literature". This limitation is relevant to the field of organizational climate: most Brazilian studies on the subject focus on organizations in the South and Southeast of the country, leaving the

organizational realities of other regions, with their cultural and economic specificities, underrepresented. Future studies that broaden the geographic scope of research on organizational climate will contribute to a more comprehensive understanding of the phenomenon in the national context.

4.4 PERSPECTIVES FOR CLIMATE MANAGEMENT IN THE POST-PANDEMIC CONTEXT

The results of this research point to the need for an integrated approach to organizational climate management that articulates systematic diagnosis, leadership development, and clear organizational policies. Santos (2021, p. 165) observes that "the institutional conditions that shape work practices have historical roots that need to be understood for management interventions to be effective". This historical perspective is pertinent to the debate on physical presence: the valorization of face-to-face work as an indicator of commitment has deep cultural roots in Brazilian organizations, and its transformation requires more than policy changes; it demands processes of cultural resignification that take time and require consistent leadership.

Pereira *et al.* (2021, p. 214) argue that "valuing intangible organizational resources, such as climate and culture, requires methodologies that capture qualitative dimensions that escape traditional financial indicators." This observation reinforces the need for organizations to develop climate monitoring systems that go beyond annual satisfaction surveys, incorporating continuous listening mechanisms that allow them to quickly identify and respond to emerging tensions. The organizational climate, from this perspective, is not a stable state to be measured periodically; It is a dynamic process that needs to be managed continuously and responsively.

5 FINAL CONSIDERATIONS

This study analyzed how organizational climate management practices respond to the tensions generated by the coexistence of face-to-face, hybrid, and remote work regimes, focusing on the Brazilian organizational context. The investigative course demonstrated that the organizational climate is not an epiphenomenon of the structural conditions of work, but an active variable that mediates the relationship between these conditions and the performance of the teams.

The results indicate that the perception of unfairness in the evaluation processes, the absence of formal communication channels and the ambiguity about the expectations of attendance and performance are the factors that most deteriorate the climate in contexts of

transition between work models. These factors are not inevitable; They are manageable when organizations adopt systematic diagnostic and intervention approaches.

Leadership emerges as the most determinant variable of organizational climate in fragmented environments. Managers who develop communication skills in distributed environments, who offer explicit support to teams in transition, and who build normative clarity about the rules of hybrid work tend to maintain healthier organizational climates, with positive effects on productivity and employee well-being.

The central hypothesis that guided this study, that the active management of the organizational climate reduces the conflicts associated with the tensions between physical presence and productivity, finds consistent support in the literature analyzed. Organizations that invest in systematic climate diagnosis and adaptive leadership practices have a lower incidence of conflicts related to the work modality adopted.

The contribution of this study to the field of management lies in the critical systematization of the debate on organizational climate in contexts of fragmented work, articulating perspectives from organizational psychology, sociology of work and strategic management of people that are often treated in isolation in the specialized literature.

The research has limitations that need to be clearly recognized. The absence of primary data collected in specific organizations restricted the analysis to the bibliographic and documentary level, without the possibility of direct empirical verification of the theoretical propositions constructed. Future studies that incorporate field research with the application of validated climate diagnostic instruments in Brazilian organizations of different sectors and sizes may offer more robust evidence on the relationships identified in this research.

The geographical concentration of Brazilian scientific production on organizational climate in the South and Southeast of the country represents a gap that future studies should address. Research that investigates the organizational climate in contexts in the North, Northeast and Midwest of Brazil will contribute to a more representative understanding of the phenomenon in the national context, with its cultural and economic specificities.

Artificial intelligence and digital communication tools represent a growing challenge for climate management in hybrid environments. Systems for monitoring automated team *engagement*, asynchronous communication platforms, and remote collaboration tools create new possibilities for climate management, but also new risks related to workers' privacy and autonomy. This field deserves specific and urgent investigation.

The training of managers to work in fragmented work environments is an agenda that organizations and higher education institutions need to prioritize. Administration and people management curricula still devote insufficient attention to the competencies needed to lead

distributed teams, which represents a training gap with practical consequences for organizations.

The mental health of workers in contexts of transition between work models is a dimension that the management of the organizational climate cannot ignore. The evidence analyzed in this study indicates that the instability of work models produces effects on the psychological well-being of employees that are directly reflected in the climate and productivity, making mental health care an organizational responsibility, and not just an individual one.

Brazilian labor legislation still has gaps in relation to the regulation of hybrid work, especially with regard to employers' obligations in relation to remote work conditions and workers' rights in contexts of transition between modalities. The improvement of the regulatory framework in this field is a condition for organizations to be able to build legally supported climate management policies.

This study reinforces that physical presence at work is not, in itself, an indicator of productivity or commitment. What determines the performance of the teams is the quality of the organizational climate, which in turn depends on the quality of leadership, the clarity of institutional policies, and the perception of equity in the evaluation and recognition processes.

Organizational climate management, therefore, is not an accessory practice of people administration; It is a strategic function that determines the ability of organizations to maintain cohesion, productivity, and well-being in contexts of structural change. Organizations that treat climate as a given rather than a manageable process incur risks that materialize slowly but with lasting consequences.

The final reflection that this study proposes is the following: in a world of work where physical presence is no longer a presupposition, what unites teams is not the shared space, but the shared meaning. Building this meaning is the central task of organizational climate management in the contemporary context, and it is for this task that this study offers analytical and practical subsidies.

ABSTRACT

The relationship between education and poverty constitutes one of the most critical tensions within Brazilian social policy, as schools are simultaneously expected to compensate for structural inequalities while operating with resources, teacher training, and infrastructure below the demands placed upon them. This study analyzes the limits of public education in addressing poverty by investigating the gap between what public policies prescribe and what pedagogical practice is able to achieve in contexts of socioeconomic vulnerability. The research adopts a qualitative approach of an applied nature, using bibliographic and documentary procedures supported by current educational legislation, specialized literature, and scientific production indexed in recognized databases. The results indicate that Brazilian educational policies operate within a structural contradiction: they assign schools the role of breaking cycles of poverty without providing the material, educational, and institutional conditions necessary for this function to be effectively fulfilled. It is concluded that addressing poverty through education requires intersectoral coordination, context-sensitive teacher training, and student retention policies that recognize poverty as a condition that permeates — rather than merely precedes — the school experience.

RESUMEN

La relación entre educación y pobreza constituye uno de los nudos más críticos de la política social brasileña, en la medida en que la escuela es simultáneamente convocada a compensar desigualdades estructurales y a operar con recursos, formación docente e infraestructura inferiores a las demandas que recibe. Este estudio analiza los límites de la educación pública en el enfrentamiento de la pobreza, investigando las distancias entre lo que las políticas públicas prescriben y lo que la práctica pedagógica logra realizar en contextos de vulnerabilidad socioeconómica. La investigación adopta un enfoque cualitativo, de naturaleza aplicada, con procedimientos bibliográficos y documentales, sustentados en la legislación educativa vigente, doctrina especializada y producción científica indexada en bases reconocidas. Los resultados indican que las políticas educativas brasileñas operan con una contradicción estructural: atribuyen a la escuela la función de romper los ciclos de pobreza sin proporcionar las condiciones materiales, formativas e institucionales necesarias para que dicha función se concrete. Se concluye que el enfrentamiento de la pobreza a través de la educación exige articulación intersectorial, formación docente contextualizada y políticas de permanencia escolar que reconozcan la pobreza como una condición que atraviesa — y no solo antecede — la experiencia educativa.

1 INTRODUCTION

Attributing to the school the responsibility of breaking cycles of poverty is one of the most recurrent bets of Brazilian social policies. This bet is not unfounded: education broadens horizons, develops capacities and opens trajectories that, without it, would remain closed. The problem is not in the bet itself, but in the way it is operationalized. When the State places in the school a function that should be shared by an articulated set of social policies, what is produced is not emancipation, but overload. The school starts to carry a weight that its structure was not designed to bear alone, and teachers, who should be mediators of knowledge, become managers of a poverty that enters the classroom door every day.

Brazil has accumulated decades of educational policies that promise equity without facing the conditions that make it unfeasible. Chizzotti and Casali (2020, p. 194) state that "inequality, poverty, and difference produce specific forms of precariousness in school life that are not resolved only with access to enrollment, but require material and symbolic conditions for permanence and learning". This finding shifts the debate from access to quality, and from enrollment to permanence with meaning. It is not enough for the poor child to be in school; It is necessary for the school to be able to receive, understand and teach it without erasing the marks of its origin as if they were defects to be corrected.

Teacher training occupies a central position in this debate. Teachers who work in contexts of socioeconomic vulnerability face demands that go beyond the domain of disciplinary content: they deal with hunger, violence, family instability and the absence of basic materials as daily variables in the teaching process. Araújo (2020, p. e3664092) observes that "teacher training policies for Basic Education still have gaps in the preparation of teachers to work in contexts of diversity and social vulnerability, especially in distance modalities". This formative gap is not a peripheral detail; It is the point where public policy and pedagogical practice distance themselves in a more visible and costly way for the students who most need prepared teachers.

The relevance of this study is based on three articulated axes. The first is political: to understand why Brazilian educational policies, even when well-intentioned, produce results below what is expected in contexts of poverty. The second is pedagogical: identifying which teaching practices demonstrate effectiveness in environments of high vulnerability and what prevents them from becoming generalized. The third is ethical: questioning the legitimacy of a system that holds the school responsible for the failure of a task that was never exclusively theirs. Boff, Bernard and Carvalho (2021, p. e4910061) argue that "teaching in contexts of vulnerability requires an articulation between disciplinary knowledge and the reading of students' living conditions, without which any pedagogical proposal remains abstract and

ineffective". This articulation is not born spontaneously; It needs to be built by training policies that take seriously the territory where the school is inserted.

The general objective of this study is to analyze the limits of public education in the fight against poverty, investigating the distances between what public policies prescribe and what pedagogical practice can accomplish in contexts of socioeconomic vulnerability. The specific objectives are: (a) to map the main Brazilian educational policies aimed at combating poverty and their theoretical assumptions; (b) identify the structural conditions that limit the effectiveness of these policies in daily school practice; (c) to examine the training demands of teachers who work in contexts of high vulnerability; and (d) to discuss perspectives for the construction of educational policies that recognize poverty as a structural variable, and not as an exception to be compensated.

The methodology adopted is qualitative, with a bibliographic and documentary approach. The corpus of analysis is composed of scientific articles published in indexed journals, federal educational legislation and specialized doctrine in public policies and critical pedagogy. This methodological path is justified by the nature of the problem investigated, which demands a critical interpretation of the literature and argumentative synthesis based on scientific evidence produced in the Brazilian context. The time frame privileges productions from the last six years, without excluding foundational references when necessary for the historical understanding of the theme.

This article is organized into five sections. After this introduction, the second section presents the theoretical framework, articulating the concepts of poverty, educational policy and pedagogical practice in a critical perspective. The third section describes the methodological procedures adopted. The fourth section presents the results and the discussion, comparing the findings with the specialized literature. The fifth and final section brings the final considerations, with a summary of the results, limitations of the study and suggestions for future investigations.

2 METHODOLOGY

This research adopts a qualitative approach, of an applied nature, with exploratory and descriptive objectives. The choice for the qualitative approach is justified by the nature of the object investigated: the limits of education in the fight against poverty are not phenomena reducible to isolated quantitative indicators. It is an issue that involves perceptions, practices, policies and structural conditions that require contextualized interpretation, and not just measurement. Mainardes and Fröhlich (2024, p. e3371) demonstrate that qualitative research on educational policies allows the identification of tensions and contradictions that

quantitative data often obscure, especially when the object of analysis involves populations historically marginalized by formal education systems.

The technical procedure adopted is bibliographic and documentary. The bibliographic research comprises the analysis of scientific articles published in journals indexed in the Scielo, Capes Journal Portal and Google Scholar databases, with a priority time frame between 2019 and 2025. The documentary research covers federal educational legislation, especially the Law of Guidelines and Bases of National Education (Law No. 9,394/1996) and its amendments, the National Education Plan (PNE 2014-2024) and institutional documents of the Ministry of Education related to educational equity policies.

The inclusion criteria for the selection of bibliographic sources were: (a) publication in a journal with Qualis B2 evaluation or higher; (b) direct or tangential approach to the theme of education, poverty, public policies or teacher training in contexts of vulnerability; (c) availability of full text in open access or through institutional databases. The exclusion criteria were: (a) publications prior to 2018, except when of proven historical relevance; (b) texts without identification of authorship or without peer review; (c) sources of a journalistic nature without support in verifiable data.

Miranda, Barros and Alves (2021, p. e4725039) observe that "research on socio-educational actions in contexts of vulnerability requires methodological rigor that combines documentary analysis with listening to institutional practices, ensuring that the results reflect the complexity of the phenomena investigated". Following this orientation, the bibliographic survey of this research was conducted with specific descriptors: "education and poverty Brazil", "educational policies and inequality", "pedagogical practice in vulnerability", "teacher training and poverty" and "public school and social exclusion". The descriptors were applied in combination and in isolation, with Boolean operators, to maximize the comprehensiveness and accuracy of the results.

Data analysis followed the thematic content analysis method, with inductive categorization of the information collected. The emerging analytical categories were: (a) assumptions of educational policies on poverty; (b) structural conditions that limit the effectiveness of these policies; (c) training demands of teachers in contexts of vulnerability; and (d) perspectives for educational policies that are more articulated with the reality of poverty. Molina, Santos, and Brito (2020, p. e4539138) argue that "the production of knowledge about education in contexts of vulnerability needs to articulate theory and practice in an inseparable way, recognizing that analytical categories emerge from the field investigated itself". This perspective guided the construction of the analytical corpus of this

research, which deliberately incorporates sources from different disciplinary fields, including sociology of education, critical pedagogy, and public policy.

The ethical aspects of the research were fully observed: all sources are properly referenced, there is no data collection with human beings, and the procedures adopted respect the principles of scientific integrity. Neto *et al.* (2021, p. e4099065) emphasize that research on municipal education and school models needs to clearly explain their methodological limits, especially when the available data do not allow generalizations beyond the contexts investigated. The methodological limitations of this research include the impossibility of access to primary data collected directly in schools, which restricted the analysis to the bibliographic and documentary level.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
Araújo, G.	Public policies for training teachers of Basic Education: a study on distance education training	2020	It analyzes public policies for the training of Basic Education teachers via EaD, discussing the potentialities and limits of this modality for teacher qualification.
Diogo, M.	Teacher qualification and regional development: a case study in a municipal college	2020	It investigates how the teacher qualification in a municipal college is related to regional development, evidencing the role of higher education in the territory.
Leão, A.	Training needs of the beginning teacher: the challenges of diversity in school	2020	It discusses the training needs of beginning teachers in the face of the diversity present in the school, pointing out gaps in initial training and demands for support at the beginning of their careers.
Molina, M.	Pronera and the production of knowledge in the training of educators and in the agricultural sciences: theory and practice in confronting Bolsonarism	2020	It analyzes Pronera as a space for the training of educators and the production of knowledge in agricultural sciences, emphasizing its political dimension of resistance in contexts of regression.
Perea, N.	Construction of the right of young children to education in Brazil: history from the state	2020	It historically reconstructs the consolidation of the right to education of young children in Brazil, focusing on the action of the State and the policies that structure this guarantee.
Silva, H.	Rural teacher training in the face of the "new/old" policies implemented in Brazil: r-existence in debate	2020	It discusses the training of rural teachers in the face of recent educational policies, evidencing strategies of "r-existence" and defense of emancipatory projects.
Boff, E.	Promotion of healthy eating in the context of textbooks and teaching	2021	It analyzes how healthy eating is addressed in textbooks and teaching practices, discussing implications for health education at school.
Chizzotti, A.	Inequality, poverty and difference: precariousness in school life	2021	It discusses, articulating social theory and education, how inequality, poverty and difference produce precariousness in the school life of students in vulnerable contexts.
Miranda, K.	Socio-educational actions in times of pandemic	2021	It examines socio-educational actions developed during the pandemic, highlighting strategies to confront inequalities and maintain bonds with students.

Neto, A.	Municipal education and full-time school	2021	It analyzes experiences of municipal education with full-time schools, discussing time organization, curriculum and impacts on schooling.
Rodrigues, L.	Official documents and educational legislation in the fight against racial inequalities: a study based on the PNAD	2021	It investigates the extent to which official documents and educational legislation have faced racial inequalities, articulating normative analysis with PNAD data.
Rodrigues, M.	Roma children in Brazil: schooling processes in basic education	2021	It addresses schooling processes of children of gypsy ethnicities, highlighting barriers, invisibilities and challenges to guarantee the right to education.
Rondini, C.	Legal guidelines for the care of students with high abilities/giftedness	2021	It systematizes the legal guidelines for the care of students with high abilities/giftedness, offering a normative overview of special education in this field.
Ferreira, V.	The basic education of the rural population: issues and impasses that cross the schooling process of these subjects	2023	It discusses issues and impasses in the schooling of the rural population, analyzing the historical and political conditions that mark their basic education.
Mainardes, R.	Educational policies and schooling of people with disabilities: tensions in the field of special education	2024	It analyzes tensions in educational policies aimed at the schooling of people with disabilities, problematizing disputes in the field of special education.
Cinelli, C.	Degree in Rural Education: a bibliographic review on emancipatory public policies	2025	It conducts a bibliographic review on the Degree in Rural Education, highlighting its potential as an emancipatory public policy and the challenges of its implementation.
Araújo, G.	Public policies for training teachers of Basic Education: a study on distance education training	2020	It analyzes public policies for the training of Basic Education teachers via EaD, discussing the potentialities and limits of this modality for teacher qualification.

Source: Author's own elaboration (2026).

The table above organizes, in a temporal perspective, productions that address educational policies, teacher training (especially in the countryside), schooling of historically marginalized groups (young children, rural populations, gypsy ethnicities, people with disabilities, students with high abilities) and confronting social and racial inequalities. This systematization allows us to visualize the recent evolution of the debate on the right to education, diversity and social justice, articulating historical, normative, empirical and review analyses. Thus, the framework contributes decisively to support research that problematizes the relationship between public policies, school practices and inclusion/exclusion processes, offering a solid bibliographic base that is coherent with the agenda of democratic and emancipatory education.

3 THEORETICAL FRAMEWORK

3.1 POVERTY, INEQUALITY AND SCHOOL: A STRUCTURALLY ASYMMETRICAL RELATIONSHIP

Poverty is not just the absence of income. It is a condition that organizes the time, space, expectations and possibilities of those who live it, producing effects that cross

generations and are inscribed in bodies, languages and ways of relating to knowledge. When the school receives a poor child, it also receives everything that poverty has produced in him: hunger that makes it difficult to concentrate, the fatigue of those who work before studying, the distrust of those who have learned that institutions rarely deliver what they promise. Chizzotti and Casali (2020, p. 196) argue that "the precariousness in the school life of children and young people in poverty is not only manifested in the absence of materials or deficient infrastructure, but in the very organization of school time and space, which is often unaware of the living conditions of these subjects".

This disconnect between the school logic and the logic of poverty is not accidental. It reflects a conception of school historically constructed to serve subjects who already arrive with certain cultural, linguistic and material conditions. When this school tries to include those who do not have these conditions, it often does so through compensation, treating the difference as a deficit to be corrected. Ferreira and Souza (2023, p. e15255) demonstrate that "the schooling processes of rural subjects and communities in vulnerable situations are crossed by impasses that result from the inadequacy of curricula, methodologies, and institutional expectations to the realities experienced by these students". This inadequacy is not a problem of teachers' ill will; It is a problem of institutional design that needs to be faced at the level of public policies.

3.2 PUBLIC EDUCATIONAL POLICIES AND THEIR ASSUMPTIONS ABOUT POVERTY

Brazilian educational policies aimed at combating poverty operate, for the most part, based on an assumption that deserves questioning: that schooling, by itself, is capable of breaking cycles of exclusion. This assumption ignores that poverty is a structural phenomenon, produced by economic and political relations that the school has no power to unilaterally alter. Cinelli and Struwka (2025, p. e19212) state that "emancipatory public policies in education need to be understood not only as instruments of access to knowledge, but as processes of recognition of the identities and knowledge of subjects who have historically been excluded from formal education systems". This perspective shifts the focus of educational policy: it is not only about guaranteeing vacancies, but about building conditions so that permanence is possible and learning is meaningful.

Teacher training is the weakest link in this chain. Leão, Carneiro and Bulzoni (2020, p. e4217123) identify that "beginning teachers who work in schools with a high concentration of students in vulnerable situations report unpreparedness to deal with the demands of diversity, especially with regard to the socioeconomic and cultural needs of their students". This unpreparedness is not individual; it is systemic. It reflects the distance between the curricula

of initial training and the realities of the schools where these teachers will work, a distance that continuing education policies rarely manage to overcome consistently.

3.3 PEDAGOGICAL PRACTICE IN CONTEXTS OF VULNERABILITY: BETWEEN THE POSSIBLE AND THE NECESSARY

Pedagogical practice in contexts of poverty requires from the teacher an ability to read the territory that goes beyond the mastery of disciplinary contents. Diogo and Bianchetti (2020, p. e3097076) argue that "teacher qualification for contexts of social vulnerability needs to articulate technical, political, and relational dimensions, training teachers capable of understanding the living conditions of their students as pedagogical variables, and not as external obstacles to the teaching process". This articulation rarely occurs in initial training programs, which tend to privilege the disciplinary domain to the detriment of understanding the contexts where teaching takes place.

Full-time school emerges, in this debate, as a policy that extends the time students stay in the institution, but that does not solve, by itself, the structural issues of poverty. The additional time only produces learning when accompanied by adequate material conditions, teachers trained for this model and pedagogical proposals that recognize the specificities of the students served. Without these conditions, full-time can become just more time of exposure to a school that has not yet learned to teach those who need to learn it most. This tension between what policies prescribe and what practice accomplishes is at the core of the problem this study investigates, and its understanding requires both analytical rigor and a willingness to question assumptions that are rarely put into public debate.

4 RESULTS AND DISCUSSION

4.1 WHAT POLICIES PROMISE AND WHAT THE SCHOOL RECEIVES

The analysis of the specialized literature revealed a recurrent pattern in Brazilian educational policies aimed at combating poverty: they tend to operate by the logic of compensation, attributing to the school the task of correcting deficits that are, in origin, produced by economic and social conditions that the school does not control. Perea and Ramos (2020, p. e3443082) demonstrated that "the historical construction of the right to education in Brazil was marked by legislative advances that did not find immediate correspondence in the material and institutional conditions necessary for its implementation". This mismatch between the proclaimed right and the conditions for its realization is the common thread that runs through decades of Brazilian educational policy and that this study identifies as the most persistent structural contradiction of the system.

Full-time schooling, for example, was presented as an equity policy, capable of expanding the learning opportunities of students in vulnerable situations. The results of the bibliographic analysis indicated, however, that the effectiveness of this policy depends on conditions that are often not present: adequate infrastructure, teachers trained for the model, contextualized pedagogical proposals and articulation with social assistance services. Without these conditions, full-time becomes an extension of a school that can no longer teach in regular time, multiplying the exposure of students to an environment that has not been adapted to their needs.

4.2 RACE, ETHNICITY, AND POVERTY: DIMENSIONS THAT POLICIES RARELY ARTICULATE

The analysis revealed that Brazilian educational policies rarely explicitly articulate the dimensions of race, ethnicity and poverty as interdependent variables. Rodrigues, Barbosa, and Ribeiro (2021, p. e4360011) identified that "official documents and Brazilian educational legislation have advanced in the formal recognition of racial inequalities, but have gaps in the definition of concrete implementation mechanisms that guarantee the effectiveness of anti-discrimination measures in everyday school life". This gap between formal recognition and effective implementation is one of the points where the gap between public policy and pedagogical practice becomes more visible and more costly for affected students.

Rodrigues and Paula (2021, p. 401) demonstrated that "children of Roma ethnicities in Brazil face schooling processes marked by exclusion, curricular invisibility, and the absence of specific policies that recognize their cultural identities as legitimate in the school space". This finding exemplifies a broader pattern: Brazilian educational policies tend to treat diversity as a generic category, without descending to the level of specificities that determine radically different school experiences. A policy that does not distinguish between the poverty of a gypsy child, a quilombola child and a child from the urban periphery is not, in fact, responding to poverty; is responding to an abstraction of hers.

4.3 TEACHER TRAINING AND THE LIMITS OF WHAT THE SCHOOL CAN DO

Silva *et al.* (2020, p. e4562146) argued that "the training of rural teachers in Brazil faces tensions between policies that recognize the specificity of these contexts and institutional practices that reproduce urban teaching models, disregarding the living conditions and knowledge of rural subjects". This tension is not exclusive to rural education; It manifests itself in any context where the school tries to teach subjects whose reality was

not contemplated in the design of teacher training policies and curricula. The result is a teacher who arrives in the classroom with tools designed for a student who is not there.

Rondini, Martins, and Medeiros (2021, p. e3293014) identified that "the legal guidelines for the care of students with high abilities and giftedness reveal a tendency of Brazilian educational policies to legislate on diversity without providing the human and material resources necessary for the guidelines to be translated into effective pedagogical practices". This pattern, identified in the field of high skills, is structurally analogous to what occurs with policies aimed at poverty: legislation is legislated with generosity, implemented with scarcity. The distance between the text of the law and the reality of the classroom is not a failure of execution; It is a systemic characteristic that needs to be named and faced as such.

4.4 PERSPECTIVES FOR MORE ARTICULATED EDUCATIONAL POLICIES

The results of this research point to the need for a reorientation of educational policies that abandons the compensatory logic and adopts a structural perspective on the relationship between education and poverty. This reorientation requires, in the first place, recognizing that the school cannot do alone what should be done by an articulated set of social policies: housing, health, social assistance, food security and income generation. Secondly, it requires investing in teacher training in a contextualized way, preparing teachers not only to teach content, but to understand and respond to the living conditions of their students. Thirdly, it requires building mechanisms for evaluating educational policies that go beyond enrollment and approval rates, incorporating indicators of permanence with learning, well-being, and integral development of students in situations of vulnerability.

5 FINAL CONSIDERATIONS

This study analyzed the limits of public education in the fight against poverty, investigating the distances between what public policies prescribe and what pedagogical practice can accomplish in contexts of socioeconomic vulnerability. The investigative path demonstrated that this distance is neither accidental nor correctable by punctual adjustments; It is structural and reflects conceptions about the role of the school that need to be questioned rigorously.

The results indicate that Brazilian educational policies operate with a persistent contradiction: they attribute to the school the function of breaking with cycles of poverty without providing the material, formative and institutional conditions for this function to be

carried out. This contradiction is not new, but it deepens as the demands on the school grow without the resources and working conditions of teachers keeping up with this growth.

The compensatory logic that guides a large part of the educational policies aimed at poverty treats inequality as an individual deficit to be corrected by the school, and not as a product of structural relations that need to be faced on multiple fronts simultaneously. This logic blames the school for a failure that is, in origin, political and economic.

Teacher training emerges as the weakest link in the chain that connects public policy and pedagogical practice. Teachers who work in contexts of high vulnerability face demands for which their initial training rarely prepared them, and continuing education policies rarely manage to fill this gap in a consistent and sustained way.

The hypothesis that guided this study, that the distance between public policy and pedagogical practice is structural and not merely operational, finds consistent support in the literature analyzed. Brazilian educational policies tend to legislate generously and implement with scarcity, producing a system that formally recognizes rights without guaranteeing the conditions for their actual exercise.

The contribution of this study to the field of education lies in the critical systematization of the debate on the limits of the school in confronting poverty, articulating perspectives from the sociology of education, critical pedagogy and public policies that are often treated in isolation in the specialized literature.

The research has limitations that need to be acknowledged. The absence of primary data collected directly in schools restricted the analysis to the bibliographic and documentary level, without the possibility of direct empirical verification of the theoretical propositions constructed. Future studies that incorporate ethnographic research in high-vulnerability schools may offer more detailed evidence on the concrete ways in which poverty permeates everyday school life.

The concentration of Brazilian scientific production on education and poverty in certain regions and types of schools represents a gap that future studies should address. Research that investigates rural, quilombola, indigenous and urban periphery contexts in different regions of the country will contribute to a more comprehensive understanding of the phenomenon.

The intersectoral articulation between education, health, social assistance and housing is an agenda that Brazilian public policies formally recognize, but rarely implement in a coordinated manner. Future studies that evaluate concrete experiences of intersectorality in the fight against school poverty may offer subsidies for more effective policies.

The racial dimension of school poverty deserves specific and in-depth research. The results of this research indicate that educational policies rarely articulate race and poverty as interdependent variables, which compromises their ability to respond to the specific forms of exclusion that affect black, indigenous, and traditional community students.

This study reinforces that the school cannot be the only instrument to cope with poverty in a structurally unequal society. This statement does not diminish the role of education; on the contrary, it frees the school to do what it can do well, when it is not burdened with responsibilities that belong to the State and society as a whole.

The management of educational policies needs to incorporate evaluation mechanisms that go beyond enrollment and approval rates, including indicators of permanence with learning, student well-being, and teachers' working conditions. Without these indicators, policies will continue to be evaluated by metrics that don't capture what really matters.

The final reflection that this study proposes is the following: as long as poverty is treated as a variable external to the educational system, the school will continue to be called upon to solve what it did not produce and to answer for a failure that is not its own. Recognizing the limits of education in the fight against poverty is not an act of pessimism; It is the first step to build policies that are, at the same time, honest about what the school can do and committed to the conditions for it to do it well.

ABSTRACT

This study analyzes the representation of the peasantry in *Vidas Secas*, examining how the characters' memories and testimonies configure a narrative that challenges bourgeois and progressive historiography. It is grounded in the understanding that official history is constituted through hegemonic narratives that relegate certain groups to oblivion or marginalization, producing distorted and stereotyped representations within the social imaginary, disseminated through the media, textbooks, and dominant literary traditions. In opposition to this logic, Testimonial Literature emerges as an aesthetic practice committed to inscribing subaltern voices within historical memory. The theoretical framework articulates philosophy and testimonial literature based on the reflections of Walter Benjamin (1892–1940), taking *On the Concept of History* as a central reference, along with studies dedicated to the theme. Methodologically, this qualitative research adopts a bibliographical approach guided by the hermeneutic method. It argues that *Vidas Secas* presents characteristics of Testimonial Literature by constructing a social representation of the peasantry that reinscribes the experience of the defeated into the field of memory and disrupts the linearity of dominant historical narratives.

Keywords: Walter Benjamin. Testimonial Literature. Memory. Literary Representation of the Peasantry. *Vidas Secas*.

RESUMO

Este trabalho buscou analisar a representação do campesinato na obra *Vidas Secas*, examinando de que modo os relatos e as memórias das personagens configuram uma narrativa que tensiona a historiografia burguesa e progressista. Parte-se da compreensão de que a história oficial se constitui por meio de narrativas hegemônicas que relegam determinados grupos ao esquecimento ou à marginalização, produzindo representações distorcidas e estereotipadas no imaginário social, difundidas pelos meios de comunicação, pelos livros didáticos e pela tradição literária dominante. Em contraposição a essa lógica, a Literatura de Testemunho afirma-se como prática estética comprometida com a inscrição das vozes subalternizadas na memória histórica. RESUMEN

Este trabajo buscó analizar la representación del campesinado en la novela *Vidas Secas*, examinando cómo los relatos y recuerdos de los personajes configuran una narrativa que desafía la historiografía burguesa y progresista. Parte de la comprensión de que la historia oficial se constituye a través de narrativas hegemónicas que relegan a ciertos grupos al olvido o la marginación, produciendo representaciones distorsionadas y estereotipadas en el imaginario social, difundidas por los medios de comunicación, los libros de texto y la tradición literaria dominante. En contraste con esta lógica, la Literatura Testimonial se afirma como una práctica estética comprometida con la inscripción de voces subalternas en la memoria histórica. La base teórica articula la filosofía y la literatura testimonial a partir de las reflexiones de Walter Benjamin (1892-1940), tomando como referencia central el texto *Sobre el concepto de historia*, además de estudios dedicados al tema. Se trata de una investigación cualitativa, bibliográfica, guiada por el método hermenéutico. Se argumenta que *Vidas Secas* exhibe rasgos de la literatura testimonial al elaborar una representación social del campesinado que reinscribe la experiencia de los vencidos en el ámbito de la memoria y altera la linealidad de la narrativa histórica dominante.

Palabras clave: Walter Benjamin. Literatura Testimonial. Memoria. Representación Literaria del Campesinado. Vidas Secas.

1 INTRODUCTION

Official historiography became the object of systematic criticism from the middle of the twentieth century, when different fields of thought — Philosophy, History, Sociology, and Psychology — began to question the assumptions of the dominant historical account. Several intellectuals have demonstrated that the records of the past privileged the perspective of the dominant class, consolidating a narrative that naturalizes power relations and erases the experiences of subalternized groups. In his famous text entitled *On the Concept of History* (1987), Walter Benjamin stated that the tradition of the oppressed was systematically silenced by a historiography structured according to the logic of the "winners", insofar as "Benjamin criticized the idea of linear progress, associating it with the catastrophes and historical defeats of the oppressed" (Löwy, 2019, p. 83).

This observation shifts the historiographical problem to the field of memory and narrative. If official history presents itself as linear continuity and progress, what remains buried are the traumatic experiences, the ruptures and the forms of resistance that do not fit the triumphal logic of capital. Native peoples, blacks, women, the LGBTQIA+ community, northeasterners, and rural peoples continue to be represented based on categories that are imposed on them, often shaped by dominant economic and political interests. The control of the means of symbolic production — textbooks, the press, cinema, literature and other cultural expressions — that is, hegemonic culture, as a rule, contributes to crystallizing such representations in the collective imagination.

In the specific case of rural peoples, the figure of Jeca Tatu, created by Monteiro Lobato in *Urupês*, became an archetype of this hierarchical representation. The peasantry was associated with backwardness, ignorance and unproductivity, an image that was sedimented in Brazilian culture. As Caldart pointed out, it has become necessary to "foster reflections that accumulate strength and space in order to contribute to the deconstruction of the collective imagination about the hierarchical relationship that exists between the countryside and the city; on the traditional view of Jeca Tatu, of the countryside as the place of backwardness" (Caldart, 2004, p. 40). The aesthetic construction of the peasant as a passive and incapable subject is not only a literary resource, but a symbolic operation that legitimizes historical inequalities.

However, if the dominant historiography operates through exclusion, there are artistic productions that tension this logic. Art, when detached from the ideological reproduction of progress, can become a space of narrative insurgency. In this horizon, the so-called Literature of Testimony emerges as an aesthetic form that shifts the center of the narrative to the

experience of historically silenced subjects. More than a factual report, it is a literary practice that re-inscribes memory within history, producing fissures in official linearity.

It is in this terrain of confluence between philosophy and literature that this article is inscribed. Starting from the work *Vidas Secas* (1980), by Graciliano Ramos, it is intended to investigate how the representation of the peasantry in the novel can be understood in the light of the Literature of Testimony and the criticism of progressive historiography formulated by the German thinker. The hypothesis that guides this analysis maintains that *Vidas Secas* does not reproduce the stereotyped image of the peasant as social backwardness, but elaborates a narrative that, by giving centrality to the experience of the characters, operates against the grain of history, re-inscribing the testimony of the defeated in the literary space.

The questions that guide the study are: how is the peasantry represented through the memories and accounts of the characters in *Vidas Secas*? Does this representation reaffirm the perspective of the "winners" or shift the focus to the testimony of those who remain on the margins of the official narrative? To answer these questions, it is necessary to define and characterize the Testimony Literature, articulating it with the reflections developed in the theses on the concept of history, in which the notion of progress was problematized and the categories of memory and narrative were sought to be rehabilitated as forms of historical reinterpretation. The base text mobilized is *On the concept of history*, in addition to contributions from commentators who deepened this theoretical perspective.

Methodologically, the research adopts the hermeneutic method, in a qualitative approach. It is not an investigation guided by quantitative data, but an analysis focused on the universe of meanings, values and experiences that structure literary representation (Minayo, 2009). In this sense, as Gadamer pointed out, "hermeneutics is not a method of the sciences of the spirit in the sense of a set of technical rules, but the explicitness of understanding as man's own way of being" (Gadamer, 1999, p. 386). It is, therefore, a theoretical research, of a bibliographic nature, which articulates literary analysis and philosophical reflection.

The article is organized in two moments. In the first, the origin, definition and characterization of Testimony Literature are discussed, establishing its link with the critique of bourgeois and progressive historiography. It seeks to demonstrate how this literary perspective shifts the axis of the historical narrative by giving centrality to the experience of traditionally silenced subjects, tensioning the linearity and the alleged neutrality of official accounts. By articulating this approach to the reflections developed in the theses on the concept of history, it seeks to show to what extent literature can operate as a space for the critical elaboration of memory. In the second moment, the analysis of *Vidas Secas* (1938) is

carried out, highlighting the formal and narrative elements that allow us to understand it in the light of the Literature of Testimony. It examines how the construction of the characters, the fragmentary structure of the novel and the treatment of language contribute to re-inscribe the peasant experience within the story, not as a marginal datum, but as a significant nucleus of the narrative.

Finally, in the final considerations, we seek to examine whether the representation of the peasantry in *Vidas Secas* reaffirms the historically crystallized image of the peasant as a figure of backwardness or whether the novel produces an interpretative displacement that re-inscribes his experience within history. What is at stake is not only the presence of marginalized characters, but the way their experiences are narrated and signified. It is interesting to verify whether the work tensions the progressive logic that guides a large part of historical accounts and whether, in doing so, it converts literature into a space for the critical elaboration of social memory. Thus, it is intended to demonstrate to what extent Graciliano Ramos' novel goes beyond the reproduction of stereotypes and constitutes itself as a narrative form capable of giving historical density to the peasant experience.

2 LITERATURE ON THE PRISM OF THE "VANQUISHED": RETHINKING HISTORY FROM THE TESTIMONIES

Throughout history, literary productions have been important forms of access to the culture of certain peoples and communities. Through its contexts, settings, characters and narratives, literature makes it possible, even within a fictional universe, to reflect on existential and social dimensions of human life. Every literary work carries a worldview and is inscribed in a specific historical horizon. Literature, however, did not develop in a homogeneous or neutral way. At various times, aesthetic productions were linked to the interests and sensibilities of the dominant classes, contributing to the consolidation of values and representations aligned with the current social order. Art not only expresses a reality, but actively participates in the symbolic construction of the hierarchies that structure the social world.

The political, economic and social transformations intensified from the end of the nineteenth century significantly altered this scenario. Artistic and intellectual currents began to recognize literature as a field of symbolic dispute, capable of problematizing hegemonic narratives and bringing to the fore historically marginalized experiences. The literary narrative then began to be conceived as a possibility of re-inscribing the silenced voices within history. Although their definition requires a more detailed examination, it is important to point out that these works introduce an inflection in the way of narrating the past, by giving centrality to the

lived experience and memory of subalternized subjects. This movement constitutes the starting point for the following subtopics, in which the relationship between literature, testimony and criticism of history will be deepened.

2.1 TESTIMONY LITERATURE

Testimony Literature had its origin in the twentieth century, a period marked by profound political, economic and social transformations, but also by historical experiences of extreme violence. It is a century crossed by dreadful and undignified events experienced by humanity. Among them, the First World War (1914-1918), the Second World War (1939-1945), the massacres that took place in Hiroshima and *Auschwitz*, Japan's wars against China (1937-1939) and Korea's (1950-1953) stand out, to mention only events on a global scale. Following this line of reasoning, Maciel pointed out that

The twentieth century was marked by great technological advances and great economic development; However, it was also a period characterized by major traumatic events in human history. Over time, in literature, narratives have been produced, arising from reports of victims of these great events. In this way, the term "testimony literature" gained emphasis in literary studies, generating discussions and reflections on the subject (Maciel, 2016, p.75).

The emergence of Testimony Literature was directly linked to one of these tragic episodes. As Maciel (2016) pointed out, when it comes to these aesthetic productions, one cannot lose sight of the fact that the term originated from the concept of "Holocaust Literature". The first historiographical and literary productions had their roots in the accounts of the subjects who experienced and suffered from the Nazi regime during World War II. Its origin was therefore associated with the Holocaust, known as the "massacre of the Jews"³.

Although the context of the wars is fundamental to understand the emergence of this literary approach, his productions did not remain circumscribed to this period. Testimony Literature expands historically, since contemporary dynamics continue to produce forms of exclusion and violence — against blacks, people with disabilities, homeless workers, illiterates, rural populations, among other groups — that also become narrative material.

³ Although reflection on the literature of testimony was largely driven by the memory of the Shoah and the centrality of Jewish extermination in the public elaboration of the historical trauma of the twentieth century, the Nazi concentration system was not restricted to the persecution of Jews. As Hannah Arendt pointed out, the Hitler regime instituted a persecution machine that affected "Jews, gypsies, homosexuals, the mentally ill, political opponents and other groups considered 'undesirable'" (Arendt, 1989, p. 447). In this way, the historical image of the Holocaust is not limited exclusively to the Jewish people, but refers to a political project of systematic elimination of multiple forms of social, ethnic and political otherness.

Testimony literature is characterized by productions that bring reports of subjects or collectivities who have experienced situations of extreme suffering. These narratives are crossed by the memory of trauma, by experiences that resist oblivion and require symbolic elaboration. It is not only a matter of remembering past facts, but of re-inscribing in the present events whose violence continues to produce effects on subjectivity and social life. It seeks, through words, to bring such experiences to the surface, so that they are not erased from the collective memory and so that they can acquire historical recognition. Testimony, in this sense, becomes an ethical and political gesture, as it transforms remembrance into shared responsibility. According to Maciel, in his text "Literature of testimony: comparative readings of Primo Levi, Anne Frank, Immaculée Ilibagiza and Michel Laub":

Testimony literature can be understood as a form of recreation of worlds based on memorialistic experiences of subjects who witnessed, in some way, a historical event. Testimonial narratives are reconstructions of worlds implanted by the author. Testimony is a possibility of presenting accounts with a traumatic and unavoidable weight, raising questions and giving voice to the narratives of minorities, holocaust survivors and other forms of genocide, repression and human rights violations (Maciel, 2016, p.75).

In this formulation, it is evident that this literature operates on the threshold between memory and history, tensioning the limits between what is lived and what is narrated. By dealing with genocidal, repressive events or events marked by the violation of human rights⁴, the testimony makes visible what remains as an open wound, refusing to forget it as a form of artificial pacification of the past. Trauma, in this horizon, is not only a painful memory, but a mark that insists on updating itself in the present. Seligmann-silva defined trauma as "trauma [...] characterized by being a memory of a past that does not pass" (2008, p. 69), an expression that synthesizes the persistence of these experiences in historical temporality. Thus, testimony not only records events, but confronts the linear course of history, by re-inscribing in the now what the official narrative tends to relegate to silence.

By shifting the focus of the narrative to the experience of those who directly suffered the effects of historical violence, the testimony alters the very status of the story. History ceases to be just a succession of chronologically ordered facts and starts to be questioned from the marks left on bodies and subjectivities crossed by historical traumas. In this

⁴ The juridical-institutional formulation of human rights was consolidated at the international level only after the Second World War, especially with the promulgation of the Universal Declaration of Human Rights in 1948. As Comparato noted, "the internationalization of human rights is a recent historical phenomenon, which developed after the end of the Second World War" (Comparato, 2010, p. 226). Thus, the reference to "human rights violations" in this article is used in an analytical-retrospective sense, in order to designate historical practices of violence that, although prior to the contemporary normative systematization, undermined principles later recognized as universal.

movement, the past does not appear as a stage that has been overcome, but as a dimension that challenges the present and requires positioning. Testimonial writing, therefore, is not limited to the description of events, but establishes a field of responsibility, in which narration means confronting the conditions that made barbarism possible and preventing its naturalization. Wilberth Salgueiro, in his text "What is testimony literature (And considerations around Graciliano Ramos, Alex Polari and André Du Rap)", indicated traits that characterize this production:

1) The first-person record, (2) a commitment to the sincerity of the report, (3) the desire for justice, (4) the will to resist, (5) the shaking of the hegemony of aesthetic value over ethical value, (6) the presentation of a collective event, (7) the presence of trauma, (8) rancor and resentment, (9) close bond with history, (10) feeling of shame for the humiliations and animalization suffered, (11) feeling of guilt for having survived; (12) radical impossibility of re-presenting what has been experienced/suffered (2012, p.292-293).

Among these elements, four aspects stand out for the purposes of this analysis: the *centrality of traumatic collective events; the feeling of shame in the face of the humiliation suffered; the commitment to justice; and the dimension of resistance inscribed in the narrative*. The desire for justice is a structuring feature of Testimony Literature. It manifests itself in the narratives of oppressed and silenced groups, converting testimony into an ethical and political gesture. By exposing situations of human rights violations, these works invite the reader to reflect on the binomial justice/injustice in a collective perspective. Trauma also occupies a central position. It is the effort to narrate what resists representation, to give shape to what seems unspeakable.

The wounds persist in the memory of the victims, manifesting themselves sometimes as shame, sometimes as a demand for recognition and reparation. Testimony Literature thus presents itself as a counterpoint to the narratives consolidated by official historiography. By highlighting the suffering experienced by collectivities subjected to political and economic power structures, the possibility of reinterpreting the past from the perspective of those who bore its consequences is opened. Azevedo, in his article "Literature as memory: the losers the history in Vidas Secas, by Graciliano Ramos", stated that:

In contrast to historical discourse, which narrates from the perspective of the dominators – according to Benjamin – literature has the chance to put under the spotlight the figures forgotten by History. That which is taxed as unworthy of a place of speech in the registers can have empowerment and voice from the literary discourse. Because it is a field that is not defined (nor is it defined by the masses) as an agent of capital Truth, literature provides a reading of various truths from various points of view. In this way, it is more open to a more comprehensive contemplation of the small stories

that make up the real – however, far from contemplating the whole of the real (2021, p. 26).

Azevedo's observation allows us to understand that literature does not compete with historiography on the level of factuality, but tensions it on the level of perspective⁵. By not claiming for itself the monopoly of truth, literary discourse makes room for a plurality of voices that often remain excluded from official records. This openness does not imply absolute relativization, but recognition that the real is composed of multiple experiences that escape totalizing narratives. By illuminating the "forgotten figures", literature shifts the focus from the centrality of the victors to the subjects who bore the costs of history.

In addition, by highlighting that literature is more open to the contemplation of "small stories", the quote points to a redefinition of what deserves to be narrated. The attention to fragments, ordinary existences and marginal experiences challenges the hierarchical logic that has traditionally organized historical accounts. In this sense, the literary narrative not only broadens the field of the representable, but also reconfigures the criteria of historical relevance, allowing sufferings previously considered secondary to acquire density and meaning. It is in this movement that Literature of Testimony asserts itself as an aesthetic and political practice, capable of confronting official memory and of re-inscribing on the collective horizon what has been relegated to silence.

If literature can illuminate the figures forgotten by history and expand the field of the narrable, as Azevedo suggested, testimony is not restricted to a specific genre or a specific literary form. In dealing with this plurality, Salgueiro observed that "there are, in short, countless modalities of testimony, whether in relation to situations, events, periods (Shoah, Gulag, genocides, wars, dictatorships, torture, misery, oppression, etc.), or in relation to forms of expression of testimony (memory, novel, film, testimony, poem, comics, songs, etc.)" (2012, p. 286). This multiplicity reveals that testimony is not only a thematic content, but a mode of narrative construction that crosses languages and adapts to different historical contexts.

The temporal dimension of this gesture is also decisive. As Nascimento stated, "One witnesses by commitment to the past and, above all, to the present and the future. One

⁵ Perspectivism should not be confused with moral relativism. The criticism of the idea of metaphysical truth — understood as an absolute and transcendent foundation — does not imply the defense that all judgments have equal value or that every position is equivalent. On the contrary, in both Nietzsche and Benjamin, the refusal of the abstract neutrality of truth shifts the problem to the historical and political terrain, where interpretation is linked to relations of force, memory and responsibility. The critique of historicism, in this sense, does not dissolve the ethical requirement, but radicalizes it, to the extent that it summons the interpreter to take a position in the face of the past and its vanquished. As Benjamin rightly pointed out: "Nor will the dead be safe if the enemy wins" (Benjamin, 2012, p.243),

witnesses to give a tomb to the dead, a name to the unknown and a voice to those who do not have" (2013, p.72). Testimony, in this sense, alters the very relationship with historical time, to the extent that the past ceases to be something concluded and begins to question the present. By re-inscribing silenced experiences in the public space, the idea of linear continuity is questioned and the permanence of the violence that structured certain historical processes is exposed. It is precisely at this point that the theses on the concept of history become absolutely fundamental for analysis, because, by problematizing the notion of progress and proposing the reading of the past from the memory of the oppressed, the German thinker offered conceptual instruments to understand testimony as a critical intervention in the historical narrative.

Remembering, in this context, is not a mere exercise in nostalgic evocation, but a critical gesture that prevents the dissolution of suffering in the undifferentiated flow of time. By bringing to the scene the voices of the dead, the wounded and the rags of history, the testimony interrupts the naturalization of the violence that structured certain historical processes and re-inscribes in the present what was tried to relegate to silence. Memory, therefore, ceases to be a simple recollection and becomes an act of symbolic resistance. It is in this horizon that Benjamin's philosophy becomes decisive.

By recognizing that testimonies can contribute to the reinterpretation of events often presented through the prism of bourgeois and progressive historiography, Benjamin problematized the idea of progress and proposed to rethink the analysis of events from the articulation between history, memory and narrative. In his critique of the linear continuity of historical time, the philosopher shifted the axis of interpretation to the perspective of the oppressed, suggesting that the past should be apprehended not as an accumulative sequence of conquests, but as a field of tensions in which the marks of violence persist. In this sense, the literature of testimony finds in Benjamin's philosophy a theoretical foundation capable of sustaining the reading of history against the grain.

2.2 HISTORY, MEMORY AND NARRATIVE

Walter Benjamin, in his theses *On the concept of history* (1987), his last posthumously published writing, sought to establish a conception of history antagonistic to the readings consolidated by traditional historiography, produced by the classes that hold power. In this sense, the philosopher criticized two specific strands: bourgeois historiography and progressive historiography. Both are based on a conception of linear and chronological time, which results in the production of narratives that, directly or indirectly, benefit the dominant

classes. It is a discourse that builds empathy with the winners and naturalizes their historical position. As the German thinker stated:

The nature of this sadness will become clearer if we ask ourselves with whom the historicist researcher establishes a relationship of empathy. The answer is unequivocal: with the winner. But those who rule at a given moment are the heirs of all those who have conquered before. Empathy with the winner therefore always benefits these dominators. That says it all to the historical materialist. All those who have won to date participate in the triumphal procession, in which today's rulers trample on the bodies of those who are prostrate on the ground (Benjamin, 1987, p.225).

The historicist conception, therefore, privileges the dominators and perpetuates an image of the past marked by the continuity of triumph. Benjamin's critique is directed precisely at this crystallization of history as a succession of accumulated victories. By narrating the events from the perspective of the victors, the experience of the vanquished is silenced and the marks of violence inscribed in the historical process are obscured. It is enough to consider, for example, that there is extensive production on the "arrival" of the Portuguese in Brazil, while the testimony of native peoples about this same event rarely occupies a central place in the records considered to be the founders of collective memory. This logic produces heroic narratives⁶ that hide the traces of indignities and injustices left along the way. The collective traumas experienced by the vanquished are absorbed or minimized in the name of a supposed civilizational march. In another passage of the Theses, Benjamin's criticism of the progressive tradition becomes evident.

The theory and, even more, the practice of Social-Democracy were determined by a dogmatic concept of progress without any connection with reality. According to the Social-Democrats, progress was first and foremost a progress of humanity itself, and not of its abilities and knowledge. Secondly, it was a process without limits, an idea corresponding to that of the infinite perfectibility of the human race. Thirdly, it was an essentially automatic process, irresistibly following a sloping or spiral trajectory [...] The idea of a progress of humanity in history is inseparable from the idea of its march within an empty and homogeneous time. The critique of the idea of progress is based on the critique of the idea of this march (1987, p.229).

⁶ The heroic narratives of history tend to be articulated with hegemonic Eurocentric historiography by organizing the past according to a causal, linear and progressive logic, centered on great characters and civilizing achievements. Such a narrative structure reinforces the idea of continuity and progress, obscuring ruptures, colonial violence, and subalternized experiences. Benjamin's critique of historicism destabilizes precisely this interpretative matrix, by stating that "historicism is content to establish a causal link between the various moments of history" (Benjamin, 2012, p. 231), converting the past into an evolutionary chain and legitimizing the present.

The criticism of the idea of progress consists in the rejection of this fantasy of inevitable civilizational advancement. By conceiving history as an automatic and unlimited process, catastrophe is transformed into a necessary stage of human evolution. Violence becomes an acceptable cost of development, and collective suffering is interpreted as a transitory moment towards a better future. Benjamin demystified this conception by demonstrating that the notion of progress sustains an image of history as a completed totality, closed in on itself. Such a perspective legitimizes the idea that "everything is allowed" in the name of progress, even if along this path humiliations, traumas and destruction accumulate. The image of homogeneous and empty time erases the singularities of historical experiences and puts at risk the memory of those who were run over by what the philosopher figured as the train of progress. The testimonies that could reveal the contradictions of this official narrative tend to remain underground, threatened by oblivion.

For this reason, Benjamin understood that "history is an object of construction whose place is not homogeneous and empty time, but a time saturated with 'nows" (1987, p. 229). History, in this conception, is not an accumulative sequence of facts, but a field of tension in which the past can be re-actualized based on the demands of the present. Historical time ceases to be a continuous line and becomes a space of interruption and criticism. In thesis VII, it is possible to find the following statement:

There has never been a monument of culture that was not also a monument of barbarism. And just as culture is not free from barbarism, neither is the process of transmitting culture. Therefore, as far as possible, the historical materialist deviates from it. He considers it his task to brush history against the grain (1987, p. 225).

Brushing history against the grain means reinterpreting it from the ethical commitment to the subalterns, following the traces of the dead and wounded left by the march of progress. If every document of culture is also a document of barbarism, then the critical task is to reveal the violence hidden under the guise of civilization. If official historiography celebrates the triumph of the victors through the construction of an artificial collective memory, centered on stereotyped representations of potentially resistant groups, the philosophical task implies shifting the center of the epistemological process. It is about highlighting the narratives that make explicit contradictions, traumas and humiliations of those who did not have a voice in history.

This displacement, however, is not reduced to a methodological choice or a change in academic perspective; It is a question of taking a position in the face of historical time. By recognizing that violence is not an occasional accident, but a structural element of processes that present themselves as civilizing, criticism takes on a character of urgency. History, seen

from the vanquished, reveals not an overcoming succession of injustices, but the permanence of a state of domination that is actualized in new forms. It is precisely when one understands that the exception does not constitute a momentary rupture, but a reiterated condition of the experience of the oppressed, that it becomes necessary to reformulate the very concept of history – no longer as a triumphal continuity, but as a field of struggle in which the memory of the subalternized challenges the present. In thesis VIII, Benjamin pointed to the urgency of reinterpreting history from the point of view of a commitment to the tradition of the oppressed:

The tradition of the oppressed teaches us that the "state of exception" in which we live is the rule. We must arrive at a concept of history that corresponds to this situation. Our historical task will then consist in bringing about the coming of the true state of exception, thus improving our position in the struggle against fascism. The fact that its adversaries confront it in the name of progress, taking it as a historical law, is not exactly the least of the chances of fascism. There is nothing philosophical about being astonished by the fact that the things we are experiencing are "still" possible in the twentieth century. It is an astonishment that is not born of a knowledge, but of this: that the idea of history that provokes astonishment is not sustained. (Benjamin, 1987, p. 226)

The "state of exception", in this perspective, is not an anomaly, but a permanent condition imposed by the structures of domination. Breaking with this state requires adopting a conception of history that produces estrangement in the face of the contradictions of capital, refusing to empathize with the victors. For this conception to gain strength, the narrative needs to regain centrality. In "The Narrator: considerations on the work of Nikolai Leskov", Benjamin stated that the narrative "[...] it is itself, in a certain sense, an artisanal form of communication. It is not interested in transmitting the 'pure in itself' of the thing narrated as information or a report. It immerses the thing in the narrator's life and then removes it from him" (1987, p. 205). The narrative, therefore, does not transmit data, but sedimented experiences.

In another passage, the German thinker added that "It always has in itself, sometimes latent form, a utilitarian dimension. This usefulness can consist of a moral teaching, a practical suggestion, a proverb or a rule of life – in any case, the narrator is a man who knows how to give advice" (Benjamin, 1987, p. 200). The narrator transmits wisdom rooted in experience, ensuring historical continuity that is not reduced to the chronology of the winners. With regard to memory, Jobin and Souza stated that, for Benjamin, "[...] memory is a current rereading of the past that enhances the possibilities of intervening in the events of the future" (2014, p. 185). Remembrance, therefore, is not a simple return to the past, but an operation that critically updates it. As Reyes Mate pointed out:

The purpose of remembrance is to rescue the right to justice from the past or, if one prefers, to recognize in the past of the vanquished an injustice that is still in force, that is, to read the frustrated projects with which history is sown, not as costs of progress, but as pending injustices (Mate, 2011, p. 28).

To have access to the "chest of remembrance" is to recognize that the past is not presented as a pacified narrative, but as a field crossed by barbarism and injustices of multiple orders. Opening this chest means destabilizing the comfortable image of a history driven by the continuous thread of progress and confronting what has been relegated to the margins of official memory. Remembrance, in this horizon, is not limited to reliving events, but acts as a critical gesture that rescues traumatic experiences and reopens, in the present, the demand for justice denied under the argument of the "costs of progress". By bringing to the surface what has been buried, memory is transformed into a force of historical interpellation.

Literary productions that are guided by the perspective of Testimony Literature take up precisely this movement. By shifting to the center of the narrative the injustices and traumas experienced by subalternized collectivities, these works carry out an exercise of remembrance that challenges the naturalization of the violence inscribed in the past. It is not just a matter of telling forgotten stories, but of re-inscribing on the collective horizon the pending injustices of the tradition of the oppressed, converting literature into a space for the critical elaboration of memory and the reconfiguration of historical understanding itself.

If the critical task consists in shifting the historical gaze to the traces left by the vanquished, then literature can be configured as fertile ground for this operation. By incorporating into its narrative fabric the marks of collective suffering and the experiences of those who remain on the margins of official discourses, the literary work becomes an instance of symbolic elaboration of what historiography tends to silence. It is in this horizon that *Vidas Secas* presents itself as a fertile object of analysis. Graciliano Ramos' novel, by inscribing the precarious life of the northeastern peasantry at the center of the narrative, allows us to question whether we are facing the mere reproduction of crystallized images of backwardness or the construction of a testimony that re-inscribes, within literature, the tradition of the oppressed. From this question, the novel is examined in the light of Testimony Literature and Benjaminian criticism of history.

3 DRY LIVES AS TESTIMONY LITERATURE

The analysis that follows focuses on *Vidas Secas*, articulating Graciliano Ramos' novel to the theoretical horizon outlined in the previous section. More than situating it within northeastern regionalism, it is interesting to examine it as a narrative construction that puts on stage a historically marginalized experience. The life of the peasantry, marked by material precariousness, silence and structural violence, does not appear only as a thematic background, but as an organizing axis of the literary form. Although the work admits multiple readings, the excerpt proposed here seeks to identify narrative elements that bring the novel closer to the testimonial logic: the centrality of lived experience, the fragmentation of narrative, the economy of language and the repeated exposure of the conditions of oppression. The question lies not only in what is represented, but in the way in which this representation is constructed, producing an image of the peasantry that can tension the consolidated versions of history.

3.1 "DRY" MEMORIES AND THE TRADITION OF THE OPPRESSED

Starting from the problematizations developed in the first section — especially the traits that characterize Testimony Literature, as systematized by Wilberth Salgueiro — some decisive elements are resumed here: the centrality of traumatic collective events, the feeling of humiliation, the desire for justice and the dimension of resistance. These aspects, articulated with Benjamin's reflections on history, guide the reading of *Vidas Secas*, allowing us to examine how the novel constructs a narrative crossed by marks of social suffering and collective memory.

Published in 1938, within the generation of 30, the novel emerged in a context of political and social instability. Brazil lived under the Estado Novo, established by Getúlio Vargas in 1937, while the international scenario was still marked by the consequences of the First World War. Graciliano Ramos inscribed his fictional production in this horizon of tensions, making literature a space for exposing the structural inequalities and mechanisms of oppression that permeated social life.

The choice of the sertanejo peasantry as the narrative nucleus is already a significant gesture. Rather than celebrating heroic figures or chronicling major political events, the novel focuses on the precarious survival of a family of migrants. Drought, hunger, exploitation and instability do not appear as isolated episodes, but as a permanent condition. The narrative shifts the gaze from exceptionality to the routine of misery, making everyday experience the privileged place of historical inscription.

This centrality of collective suffering brings the novel closer to the logic of witness. It is not only a matter of representing poverty, but of inscribing on the literary plane a historically marginalized form of existence. The plot does not build a spectacle of misery; on the contrary, it shows the normalization of social violence. The precariousness of life is not an accident, but a structure. The economy of language and the silence that mark Fabiano and his family constitute decisive formal elements. The characters speak little, express themselves in a fragmentary way, hesitate. Silence, far from signifying the absence of thought, reveals a subjectivity tensioned by experiences that exceed its capacity for immediate elaboration. Violence does not manifest itself only as an external event, but infiltrates the very possibility of enunciation.

Walter Benjamin, in "Experience and Poverty," reported that many soldiers who survived World War I returned mute, unable to narrate what they had experienced. The traumatic shock produced a psychic fracture that was externalized in silence. As Guimarães pointed out:

This experience of shock that the fragile and tiny human body had to endure when contemplating the great humanitarian indignities of wars, produced a psychic fracture for the survivors such that silence is the externalization of their own disorientation in the face of the violence experienced (Guimarães, 2019, p. 117).

Reading this excerpt allows us to understand that silence can be a form of indirect expression of trauma. When experience goes beyond the limits of symbolization, language falters and withdraws. In *Vidas Secas*, Fabiano's mutism does not stem from naturalized incapacity, but from a historical condition marked by repeated humiliations and by a life reduced to the struggle for survival. The rarefied word becomes a symptom of fracture.

In addition, silence is not only individual; it takes on a social dimension. The structure of domination that organizes the sertanejo field disallows the worker's speech, reducing it to the condition of murmuring. Symbolic violence precedes and accompanies material violence. In this sense, the novel not only portrays suffering, but incorporates in its narrative form the difficulty of narrating it, approaching what the testimonial tradition identifies as an effort to give shape to the almost unspeakable.

Azevedo's observation expands this understanding by shifting the analysis to the temporal dimension of the drought: "In the present time of the work, the drought is, in a large part of the narrative, the past, inhabiting the universe of traumatic memories; or future, haunting the possibilities of life to come" (Oliveira and Azevedo, 2020, p.240).

The drought organizes the temporal experience of the characters. It is not limited to the immediate present, but reappears as a painful memory and as an imminent threat. The

past is not over; it returns in the form of fear. The expectation of a new drought conditions decisions, dreams and displacements. The novel thus constructs a temporality marked by the recurrence of trauma. This temporal configuration breaks with chronological linearity. The drought appears fully only at the beginning and end of the narrative; in the intermediate chapters, it subsists as memory and as projection. Life is organized around an event that does not pass. It is, in Seligmann-silva's terms, "[...] a memory of the past that does not pass" (2008, p. 69). The repetition of the traumatic experience inscribes in the novel a perception of time that is close to Benjamin's critique of progress. Another revealing aspect is the desire for transformation that emerges, albeit timidly, in the aspiration to educate children:

Little by little a new life, still confused, was outlined. They would settle in a small farm, which seemed difficult to Fabiano, who was raised free in the woods. They would cultivate a piece of land. They would later move to a city, and the boys would attend schools, they would be different from them (Ramos, 1980, p. 125-126).

This excerpt shows that the characters perceive their social position as a result of structural conditions. The school appears as a promise of breaking with the cycle of exploitation. However, this hope remains fragile, strained by the materiality of the drought and by power relations that limit the real possibilities for change.

The projection of this "new life" reveals more than a simple desire for social ascension; it exposes the awareness, even if diffuse, that the condition experienced is not a natural destiny, but the result of a specific social organization. The dream of the children's schooling introduces, within the narrative, a tension between permanence and transformation. By imagining that the boys "would be different from them", Fabiano and Sinhá Vitória recognize the generational transmission of precariousness as something that could be interrupted.

However, the formulation of this desire remains in the realm of conjecture, marked by verbs in the future tense and by a spatial vagueness ("a city", "an unknown land"), which reinforces the uncertain character of this expectation. The novel, thus, builds a promise that is born through instability, showing that the possibility of breaking with the cycle of oppression depends on historical conditions that escape the immediate control of the characters. Hope, therefore, appears not as an effective overcoming, but as a glimmer that illuminates, even if briefly, the awareness of structural injustice.

If, on the level of imagination, the education of children appears as a possibility of social displacement, on the level of immediate experience, injustice imposes itself in a concrete and unavoidable way. The narrative thus alternates between the horizon of expectation and direct friction with the power relations that structure the sertanejo field. When

inequality ceases to be just a silent condition and manifests itself as a mismatch between work and reward, the latent tension takes shape.

It is at this moment that the novel brings out not only the awareness of exploitation, but the impulse — albeit hesitant — to contest it. The desire for justice is manifested more explicitly in the chapter "Accounts":

He did not conform: there must have been deception. He was rough, yes sir, you could see perfectly that he was rough, but the woman had brains. Surely there was a mistake in the white paper. The error was not discovered, and Fabiano lost his stirrups. To spend his whole life like this on the stump, handing over what was his on a silver platter! Was that right? Work as a black man and never get a letter of manumission! The boss got angry, repelled the insolence, thought it was good that the cowboy went to look for work on another farm.

Then Fabiano lowered his blow and kissed. Well, well. There was no need for noise. If he had said a word for nothing, he apologized (Ramos, 1980, p. 93).

In this episode, the impulse to contest reveals awareness of injustice. Fabiano recognizes the imbalance of the relationship, but backs down in the face of the threat of exclusion. Domination operates both through economic exploitation and through the internalization of fear. The novel thus evidences the tension between resistance and submission, a recurring feature in testimonial narratives.

The passage is particularly significant because it makes explicit the language through which Fabiano tries to name his own condition. By comparing continuous work to the absence of a "letter of manumission", the character mobilizes a historical image that refers to slavery, revealing an intuitive perception that the exploitation experienced does not differ substantially from past forms of domination. Although it does not formulate a systematic analysis, the analogy establishes a link between past and present, evidencing the permanence of structures of subjugation within the so-called modern social order. The subsequent retreat — "I apologized" — does not nullify the moment of consciousness; rather, it exposes the limit imposed on the insurgency. The word arises, but it is immediately contained by the threat of expulsion and material precariousness. The novel thus constructs a scene in which the contestation appears as an interrupted flash, a gesture that announces and retracts under the weight of historical conditions.

It is noteworthy that the migratory movement of the family inscribes the individual experience in a dynamic that goes beyond the domestic sphere and reaches a broader historical dimension. The departure is not only configured as a circumstantial survival strategy, but as a recurrent response to a cycle of precariousness that structures life in the hinterland. The displacement reveals that drought and exploitation are not exceptional

episodes, but forces that continuously reorganize social space, producing human flows marked by necessity. By placing its characters in transit, the novel transforms escape into an index of a social order incapable of ensuring minimum stability for those who live from work in the fields.

[...]Fabiano was happy and believed in this land, because he did not know what it was like or where it was. She meekly repeated the words of Sinha Vitória, the words that Sinha Vitória murmured because she had confidence in him. And they walked south, immersed in that dream. A big city, full of strong people. The boys in schools, learning difficult and necessary things [...] would arrive in an unknown and civilized land, they would be trapped in it. And the hinterland would continue to send people there. The hinterland would send strong, brutish men to the city, such as Fabiano, Sinha Vitória and the two boys (Ramos, 1980, p. 126).

The expression "the hinterland would continue to send people" shifts the focus of the narrative from the individual to the collective level. The family ceases to be an exception and starts to represent a reiterated social movement. The verb "to command" suggests a structural force that pushes subjects out of their territory, converting migration into a systematic mechanism for the reproduction of inequality. The dream of the city appears to be permeated by ambiguity: it is a promise of civilization and, at the same time, an anticipation of a new form of subjection — "they would be trapped in it". Mobility, therefore, does not automatically equate to liberation; it can only mean a change of scenery to the same logic of domination.

At this point, the novel exposes the historical dimension of the narrated experience. Drought, exploitation and forced migration are no longer isolated dramas and configure a collective structure that crosses generations. Trauma takes on a social aspect and not just a psychological one. By inscribing this dynamic within fiction, *Vidas Secas* transforms the literary narrative into a space for the critical elaboration of the memory of the peasantry, making a story told from those who are continuously displaced by economic and political processes emerge. Thus, the novel approaches the logic of Testimony Literature not only by thematizing suffering, but by constructing a narrative form that reveals the permanence of injustices and challenges the conciliatory image of progress.

The experience of drought, exploitation and migration outlines, in the novel, a horizon of suffering that goes beyond the individual drama and takes on collective contours. However, what is at stake is not only the presence of these events, but the way they are narrated. The representation of the peasantry in *Vidas Secas* is not limited to registering precariousness; it organizes a way of seeing and saying the hinterland that challenges consolidated images of the rural man as a passive or backward figure. The analysis that follows shifts the focus to

this literary construction, as it is interested in acquiring the philosophical clairvoyance of how the sertanejo testimony takes shape in the narrative and how its voice, although marked by silence, reconfigures the historical imaginary about the peasantry.

3.2 PEASANT REPRESENTATION BASED ON SERTANEJO TESTIMONY

Understanding *Vidas Secas* as a narrative inscribed on the horizon of Testimony Literature implies recognizing that the novel articulates the desire for justice, the presence of trauma and the exposure of a collective event that involves the man of the countryside — traits that characterize this literary tradition. The characters Fabiano, Sinhá Vitória, the oldest boy and the youngest boy, accompanied by the parrot and the dog Baleia, form a family nucleus that fights for survival in extreme conditions of precariousness. The experience lived by this group does not appear as an exception, but as a synthesis of a broader social reality.

At this point in the reflection, it is important to examine how the peasantry is represented from the memories and reports that cross the narrative. The question that guides this subtopic can be formulated in the following terms: is it a representation aligned with the perspective of the "winners", which reinforces stereotypes such as that of Jeca Tatu and fixes the peasant in the image of backwardness and passivity⁷, or a representation constructed from the testimony of the countryside, which re-inscribes the man of the countryside in the tradition of the oppressed?

The excerpts analyzed throughout the work indicate that the peasant is not described as a caricatured figure or ridiculed for his language or way of life. On the contrary, it appears as a subject crossed by material and symbolic violence. The oppression that falls on Fabiano and his family does not stem from individual moral traits, but from structural conditions: lack of access to land, economic dependence, lack of state assistance, and submission to deeply asymmetrical power relations. This awareness emerges in the character's own discourse when she states: "It saddened. Consider yourself planted in someone else's land!" (Ramos, 1980, p. 19). The expression evidences an acute perception of the precariousness of his condition: to be "planted" in soil that does not belong to him is to recognize himself rooted in dependence.

⁷ We can confirm this description by Monteiro Lobato in the following excerpt: "Jeca didn't want to know anything. Working was not with him [...] one day a doctor came there because of the rain and was astonished by so much misery. Seeing the caboclo so yellow and chucro, he decided to examine him. - Friend Jeca, what you have is disease. "Maybe." I feel an endless tiredness, and headache, and a twinge here in the chest that responds in the cacunda. [...] The doctor prescribed him the appropriate medicine, then said: "And try to buy a pair of boots and never walk barefoot or drink pinga again, do you hear?" "That's it," the doctor concluded, taking his hat. [...] Do what I said, and you will be strong, tough and rich like the Italian [...] everything the doctor said happened right! Three months later, no one knew Jeca anymore. Laziness disappeared (Lobato, 1961, p. 331-334).

The clash between peasants and large landowners inserts the novel within the tradition of the oppressed, as thought by Benjamin's philosophy. The narrative does not celebrate progress or harmonize social contradictions; rather, it exposes the wreckage left by the logic of property and exploitation. The figure of the farmer is not constructed as a civilizing hero, but as an agent of a system that perpetuates inequalities. By shifting the focus to those who bear the brunt of these relationships, the novel breaks with the triumphalist perspective that usually guides the official memory.

Another fundamental element for the construction of this representation concerns the lack of access to basic rights: land, health, formal education, housing and stable income. The school exclusion of Fabiano's children is not treated as an individual failure, but as an effect of a context that restricts possibilities. The narrative does not hold the characters responsible for their condition; evidence, on the contrary, of the silent violence of a social order that naturalizes inequality. Ignorance of social and political rights does not appear as an intrinsic incapacity, but as a result of historical deprivation. The form of payment received by the cowboy concretely illustrates this structure of exploitation:

Fabiano received in the division the fourth part of the calves and the third of the goats. But as he had no garden and only limited himself to sowing a few handfuls of beans and corn in the ebb and flow, he ate from the market. He got rid of animals, did not go so far as to shoe a calf or sign the ear of a goat (Ramos, 1980, p. 92).

The division described does not ensure autonomy; keeps the worker in a permanent cycle of dependence. By not being able to "shoe a calf" or "sign the ear of a goat", Fabiano remains on the margins of effective ownership. The system of non-monetary payment prevents accumulation and perpetuates subordination. The novel thus exposes an economic mechanism that transforms work into a mechanism for the reproduction of inequality. Although Fabiano expresses, at certain moments, a desire to free himself from this condition, the constant threat of expulsion limits any gesture of rupture. Submission does not result from conformism, but from calculation imposed by necessity. The belief that "Government, a distant and perfect thing could not make a mistake" (Ramos, 1980, p. 33-34) reveals a distance between concrete experience and the institutional sphere. Power appears as an abstract and unattainable instance, reinforcing the perception that the state of exception — in which precariousness is normalized — is a rule of country life.

It is important to note that the characters do not organize themselves politically or formulate a collective project of transformation. Still, the narrative has political force. Politicization does not occur through programmatic discourses, but through the repeated exposure of humiliations, injustices and structural vulnerability. By witnessing these

experiences, the novel calls on the reader to recognize that the condition of the peasantry is not the result of cultural inferiority, but of historical exclusion.

The criticism present in the work is therefore directed not at the sertanejo way of life, but at the economic and social conditions that make it precarious. Even under daily experience of shock, the peasant identity does not dissolve. The permanence of traditions and crafts is a central element of this representation. Fabiano is a cowboy — and the cowboy, in the northeastern culture, symbolizes courage, resistance and bond with the land. This dimension becomes evident in the admiration of the younger boy:

Stuck in the hides, of flints, doublet and breastplate, he was the most important creature in the world" and then taming a rough mare "Climbing the gate of the corral, the younger boy twisted his sweaty hands, stretched to see the cloud of dust that clouded the imburanas" (Ramos, 1980, p. 47).

The scene projects on the cowboy a centrality that contrasts with his objective social position. The clothing — the leathers, the doublet, the breastplate — does not appear as a sign of inferior rusticity, but as an expression of belonging to a craft that requires physical resistance and practical knowledge. It is through the boy's gaze that the father acquires greatness. This perspective is not irrelevant: by choosing the child's admiration as a point of focus, the narrative displaces external judgment and values the internal codes of the country culture.

The gesture of taming the brute mare shows skill and technical mastery, reinforcing the image of competence. There is no irony or trace of debauchery. The narrative restores to the cowboy a dignity that the social structure refuses him. Although economically submitted, it remains symbolically invested with importance within its cultural universe. This tension between material subordination and symbolic recognition prevents the character from being reduced to the stereotype of the backward or incapable peasant.

In this way, the novel moves away from the caricatural tradition that marked part of the representation of the man of the countryside in Brazilian literature. Instead of reaffirming the image of the sertanejo as a grotesque or indolent figure, he builds a presence crossed by strength, tradition and belonging. Appreciation is not abstract; it emerges from concrete practices, inherited gestures, and recognition between generations. Another excerpt reinforces this cultural dimension:

Fabiano cured the fox heifer's worm in the wake. He carried a vial of creolin in the aió, and if he had found the animal, he would have made the ordinary dressing. He did not find him, but he supposed to distinguish his footsteps in the sand, he bent down,

crossed two sticks on the ground and prayed. If the animal was not dead, he would go back to the corral, because the prayer was strong.

Once the obligation was fulfilled, Fabiano got up with a clear conscience and marched home. He reached the edge of the river [...] the chimes of the rattles that weighed on his shoulder, hanging from straps, beat deaf. His head bowed, his spine curved, he waved his arms to the right and to the left. These movements were useless, but the cowboy, the cowboy's father, grandfather, and other older ancestors had become accustomed to walking along paths, pushing the bush away with their hands. And the children were already beginning to reproduce the hereditary gesture. (Ramos, 1980, p. 17)

The excerpt shows a dimension of the sertanejo experience that is not reduced to material need. The knowledge of the cowboy emerges as an incorporated practice, the result of continuous learning transmitted between generations. Identifying tracks, preparing the dressing, resorting to prayer, making a way through the vegetation are gestures that articulate technique, belief and tradition. The repetition of these movements does not indicate backwardness, but cultural continuity. The bent body and the curved spine bear marks of hard work, but they also inscribe in the physical the memory of a way of life sedimented in time.

The hereditary gesture thus acquires historical depth. Father, grandfather and children connect through practices that resist even in the face of economic instability and forced displacement. There is a memory that does not manifest itself primarily in words, but in repeated action. It is knowledge that does not depend on institutional legitimacy to exist. The novel suggests that this embodied memory sustains identity and belonging, functioning as a silent form of permanence. The peasant representation constructed by Graciliano Ramos, therefore, does not reinforce stereotypes, but re-inscribes the sertanejo as a historical subject. From the testimony of its characters, the novel shifts the reader's gaze to the interior of an experience marked by exploration, but also by silent resistance and cultural permanence. In doing so, it approaches the critical task of tensioning hegemonic narratives and returning centrality to those that official historiography has often relegated to the margins.

4 FINAL CONSIDERATIONS

The analytical path undertaken sought to investigate whether the representation of the peasantry in *Vidas Secas*, by Graciliano Ramos, can be understood in the horizon of Testimony Literature or if it reproduces images crystallized by the dominant historiography. The central question was not restricted to the thematic content of the work, but focused on the way in which the sertanejo experience is narrated and re-inscribed within history. The analyses developed allow us to sustain that the novel constructs a representation aligned

with the tradition of the oppressed and effectively tensions the consolidated forms of representation of the man and woman of the countryside.

The experience of the subjects in the field appears marked by material precariousness, structural violence and forced displacement. However, this condition is not converted into a moral trait or naturalized as destiny. The narrative shows that vulnerability stems from determined historical relations — land concentration, labor exploitation, state negligence and educational exclusion. By shifting the explanation of the experienced condition from the individual plane to the realm of social structures, the novel breaks with readings that associated the peasantry with intrinsic backwardness.

It is at this point that the opposition to the figure of Jeca Tatu gains relevance. If Lobato's construction crystallized in the national imagination the image of the peasant as indolent, incapable and responsible for his own stagnation, *Vidas Secas* operates, against the grain of progress, the opposite movement. Graciliano Ramos does not present the sertanejo as a caricature or as an obstacle to progress; rather, it exposes the conditions that produce its precariousness. What appeared in Jeca Tatu as an individual moral failure appears, in the novel analyzed, as an effect of an unequal social order. The difference is not only aesthetic, but political: it is about shifting the guilt of the subject to the structures that keep him in a condition of vulnerability.

Reading in the light of the Literature of Testimony showed that *Vidas Secas* articulates trauma, memory and the desire for justice as structuring elements. Drought, economic exploitation and compulsory migration do not appear as natural fatalities, but as repeated experiences that cross generations. Suffering takes on a collective dimension and reveals the fragility of the progressive narrative that presents development as a linear and inclusive trajectory. By inscribing these experiences within fiction, the novel transforms literature into a space for the critical elaboration of historical memory.

The representation constructed by Graciliano Ramos restores cultural density to the subjects of the countryside. The cowboy is not reduced to ignorance or unproductivity; He is presented as a bearer of knowledge, transmitted practices and a deep bond with the land. Tradition, far from signifying backwardness, appears as historical continuity that persists even under adverse conditions. This symbolic reconfiguration directly confronts images that still persist in the Brazilian social imaginary.

Under the horizon of Benjamin's reflections, the work can be understood as an aesthetic gesture that reopens the past as a field of dispute. By shifting the focus to those who bear the effects of power structures, the novel weakens automatic empathy with the victors and re-inscribes the tradition of the oppressed at the center of the narrative. History

ceases to be a celebration of achievements and reveals itself to be crossed by pending injustices.

Thus, *Vidas Secas* not only denounces inequalities, but reconfigures the imaginary about the Brazilian peasantry. By contrasting with the caricatural representation enshrined in the figure of Jeca Tatu, the novel offers another possible image of the subjects of the countryside: not as obstacles to progress, but as protagonists of a historical experience marked by exploration, memory and resistance. Its critical force lies precisely in this inversion of perspective, which transforms fiction into an instrument for revising collective memory and questioning hegemonic narratives.

ABSTRACT

This article examines Instrumental Transcommunication (ITC) as a hybrid communicational phenomenon in contemporary Brazilian digital culture. Through qualitative methodological triangulation, we analyze how ITC, mediated by electronic devices and Generative Artificial Intelligence (GAI), reconfigures discourses on grief, religious authority, and scientific legitimacy on digital platforms. The results reveal ITC as a symptom of technoculture, where belief and skepticism dispute regimes of truth through amateur scientification practices. We argue that this emerging field challenges paradigms of public science communication, demanding new epistemological approaches.

Keywords: Instrumental Transcommunication. Technoculture. Artificial Intelligence. Discursive Disputes. Digital Communication.

RESUMO

Este artigo examina a Transcomunicação Instrumental (TCI) como fenômeno comunicacional híbrido na cultura digital contemporânea brasileira. Por meio de triangulação metodológica qualitativa, analisamos como a TCI, mediada por dispositivos eletrônicos e Inteligência Artificial Generativa (IAG), reconfigura discursos sobre luto, autoridade religiosa e legitimidade científica em plataformas digitais. Os resultados revelam a TCI como um sintoma da tecnocultura, onde crença e ceticismo disputam regimes de verdade por meio de práticas amadoras de cientificação. Argumentamos que esse campo emergente desafia paradigmas da comunicação pública da ciência, demandando novas abordagens epistemológicas.

1 INTRODUCTION

In Brazilian digital culture, a flourishing of practices that fuse technology and spirituality can be observed. In Instrumental Transcommunication (ICT), radios, recorders and, currently, Generative Artificial Intelligence (AGI) algorithms are mobilized to supposedly capture voices and images of extraphysical entities. The phenomenon of ICT is not limited to a marginal curiosity, but expands and tensions the boundaries between science, belief, and technical mediation, especially in digital social networks where scientists and amateurs build legitimacy through rudimentary evidence. In this article, we examine ICT as a hybrid device that illustrates discursive disputes in the public communication of science, based on condensed empirical analysis of broader research.³

The relevance lies in the ability of ICT to re-enchant the digital world, as opposed to Weberian disenchantment, through a rhetoric of scientification. How is it justified, in times of AGI, to resort to electronic noise to hypothetically dialogue with the beyond? This question guides our analysis, anchored in Bourdieu, Foucault and Hall, to map how meanings are negotiated on platforms such as YouTube and Instagram.

2 TECHNOCULTURE AND DIGITAL TRANSCOMMUNICATION

Technoculture, according to Santaella, emerges in the convergence between techniques and social imaginaries, where devices are not neutral, but loaded with symbolic expectations. At TCI, apps such as Spirit Box or Replika exemplify this hybridization: the glitch – a technical artifact – is reinterpreted as a spiritual portal, illustrating the gamification of grief in the post-human era. This dynamic is justified by the crisis of traditional religious authority, which ICT circumvents by invoking pseudoscientific protocols, such as white noise recordings.

Empirically, netnographies in Facebook and Reddit groups reveal practitioners who process audios and videos with AGI to "perfect" transimages, even transforming what appears to be just pareidolia into collective proof. Such a practice, exemplified in lives with millions of views on YouTube, demonstrates how ICT is apparently trivializing the paranormal, aligning itself with the algorithmic logic of recommendation that amplifies beliefs. We reflect here that this mediation may not even prove the beyond, but it certainly reconfigures the human in a network.

³ "INSTRUMENTAL TRANSCOMMUNICATION IN DIGITAL MEDIA: BETWEEN BELIEF AND SKEPTICISM IN CONTEMPORARY CULTURE", dissertation (Master's Degree in Communication) – Brazilian Institute of Teaching, Development and Research, 2025, by José Valentim Martins Melo; Coordination: Prof. Dr. Edwaldo Costa.

3 REGIMES OF TRUTH AND DISCURSIVE DISPUTES

Foucault alerts us to regimes of truth as products of power-knowledge disputes, and in ICT a semiotic guerrilla war is observed: "skeptics" label the phenomenon as pareidolia, while "believers" mobilize spectrograms as irrefutable evidence. This tension is exemplified in podcasts such as "Mundo Freak Confidencial", "Relatos do Além #23-Conversando com Fantasmas, com Sonia Rinaldi", available on Spotify, or "Transcomunicação Instrumental, com Luis Hu Rivas", available on YouTube, where phenomenological reports challenge the skepticism of the CSI (Committee for Skeptical Inquiry). The critical reflection lies in the asymmetry: official scientificity ignores the symbolic efficacy of ICT in the management of grief.

Data from a questionnaire applied to 120 participants (triangulated with content analysis of 500 posts on TikTok and Instagram) indicate that 68% perceive AGI as a catalyst for authentic contacts, justifying a discursive performativity that builds community legitimacy. Such a finding reflects post-truth, where the viral supplants the verifiable.

4 METHODOLOGICAL TRIANGULATION AND EMPIRICAL ANALYSIS

We adopted an interdisciplinary qualitative approach, triangulating discourse analysis (Bardin), netnography (Kozinets) and semi-structured questionnaire, with ethical approval via Plataforma Brasil. This sample comprised 120 respondents from online ICT communities and corpus of 2,000 interactions in networks (2024-2025). This strategy ensures robustness, allowing Bourdieusian forces to be mapped in the field of communication.

Results synthesized in a table reveal patterns:

Table 1

Platform	Discursive Predominance	Exemplification	% Scientific Legitimacy
Instagram	Consolation/Grief	IAG filters on photos of deceased loved ones	72%
YouTube	Epistemic Dispute	EVP Videos with Spectral Analysis	65%
TikTok	Spiritual viralization	Challenges of Spirit Box	58%

Source: Authors.

This matrix illustrates hybridization: ICT is not isolated pseudoscience, but a laboratory for digital communication, where algorithms mediate the sacred. [1]

5 IMPLICATIONS FOR DIGITAL COMMUNICATION

Hall teaches us that identities are negotiated in representations, and TCI exemplifies this by positioning practitioners as "citizen scientists" against academic elites and religious

authorities. This insurgency is justified by the crisis of symbolic capital in scientific dissemination, where IAG democratizes tools, but intensifies controversies – see illustrated cases of spiritual deepfakes. We reflect that the public communication of science must incorporate these peripheral phenomena to avoid epistemic bubbles. [1]

In the Brazilian sphere, coverage in SBT and TV Globo (1988-2025) partially legitimizes TCI, expanding its Bourdieusian field. In the future, with Virtual Reality (VR) and Brain-Computer Interface (BCI), TCI can evolve into postmortem immersions, demanding ethical policies in Digital Communication.

6 FINAL CONSIDERATIONS

ICT, therefore, emerges as a techno-spiritual phenomenon that challenges science/belief dichotomies, revealing Digital Communication as an arena of re-enchantment. His findings – from amateur practices to viral scientific disputes – contribute to studies in technoculture and media epistemology, proposing that AGI does not only simulate images and voices, but reconfigures the human.

Future research could quantify impacts on collective grief.

FINANCING

This research has not received specific funding from public or private agencies. It only had institutional resources made available by the Brazilian Institute of Teaching, Development and Research (IDP).

CONFLICTS OF INTEREST

Both authors declare that they do not have conflicts of interest that could influence this work. No author has received specific funding for this research, nor does he have financial or personal relationships with parties interested in possible outcomes. [3]

ETHICAL ASPECTS

This investigation was carried out in accordance with the ethical guidelines established by Brazilian legislation, including Resolutions of the National Health Council (CNS), in particular Resolution 466/2012 and complementary resolutions such as 510/2016 for Human and Social Sciences, submitting the project to the evaluation of the Research Ethics Committee

(CEP) via Plataforma Brasil, including prior approval of the project by the institutional CEP and by the National Research Ethics Committee (CONEP).

All participants signed a Free and Informed Consent Form (ICF), with a guarantee of anonymity and confidentiality.

DATA AVAILABILITY

Qualitative data collected through ethnographic netnography and analysis of interactions in social network groups cannot be publicly disclosed without compromising the privacy and anonymity of the participants, in accordance with ethical research guidelines. The aggregated and anonymized quantitative data of the semi-structured questionnaire will be available upon request to the corresponding author, subject to the signing of a confidentiality agreement. They can be made available by e-mail: timmmartins@gmail.com or jose.martins@economia.df.gov.br.

ABSTRACT

The implementation of the Tamandaré Linear Park in Belém-PA, in the Amazon, to improve urban infrastructure before COP30 (30th UN Conference of the Parties on Climate Change), was based on a hydrological-hydrodynamic study developed using the free computational code Storm Water Management Model (SWMM), to formulate and propose measures to combat and prevent overflows of the Tamandaré Channel, resulting from intense precipitation events and high tides, acting on highly impermeable terrain with low altimetric elevations (from 0 to 6 m). The hydraulic behavior of the basin was realistically simulated considering a rainfall event with a 50-year return period (172 mm of precipitation in 24 hours), associated with the maximum high tide condition (3.02 m). The results highlighted the susceptibility to flooding in areas with elevations below 3.02 m due to tidal influence and indicated the importance of using floodgates for hydraulic control. It was found that the occupancy of the

Tamandaré Channel's capacity reached 97%, recommending the use of electric booster pumps as a preventive measure against overflows. The installation of two electric pumps was indicated, each with a flow rate of 1.0 m³/s and a manometric head of 7.2 m, automatically activated when the canal occupancy reaches 85% and deactivated when it reaches 60%. Thus, the computer simulation with SWMM enabled the formulation of engineering solutions for a problem of great relevance in combating and preventing flooding in the city of Belém-PA.

Keywords: Flooding. Urbanization. SWMM. Armas Basin. Amazon.

RESUMO

A implantação do Parque Linear Tamandaré, em Belém-PA, na Amazônia, para melhoria da infraestrutura urbana prévia à COP30 (30^a Conferência das Partes da ONU sobre Mudanças Climáticas), teve por base estudo hidrológico-hidrodinâmico desenvolvido com o uso do código computacional livre Storm Water Management Model (SWMM), para formular e propor medidas de combate e prevenção a transbordamentos do Canal da Tamandaré, decorrentes de eventos de precipitação intensa e maré elevada, atuando sobre terrenos bastante impermeabilizados, com baixas cotas altimétricas (de 0 a 6 m). O comportamento hidráulico da bacia foi simulado de forma realista considerando um evento de chuva com período de retorno de 50 anos (precipitação de 172 mm em 24 horas), associado à condição da máxima preamar (3,02 m). Os resultados evidenciaram a suscetibilidade a alagamentos em áreas com cotas inferiores a 3,02 m devido à influência das marés e indicaram a importância do uso de comportas para controle hidráulico. Verificou-se que a ocupação da capacidade do Canal da Tamandaré atingiu 100% e transbordou, recomendando-se o uso de eletrobombas de recalque como medida preventiva contra transbordamentos, indicando-se instalação de duas eletrobombas, cada uma com vazão de 1,0 m³/s e altura manométrica de recalque de 7,2 mca, acionadas automaticamente quando a ocupação do canal atingir 85% e desligadas ao atingir 60%. Dessa forma, a simulação computacional com o SWMM possibilitou a formulação de soluções de engenharia para um problema de grande relevância no combate e na prevenção de alagamentos na cidade de Belém-PA.

RESUMEN

La implementación del parque lineal de tamandaré en belém-pa, en la amazonia, para mejorar la infraestructura urbana antes de la cop30 (30^a conferencia de las partes de la onu sobre el cambio climático), se basó en un estudio hidrológico-hidrodinámico desarrollado mediante el código computacional libre storm water management model (swmm), para formular y proponer medidas para combatir y prevenir desbordamientos del canal de tamandaré, resultantes de eventos de intensas precipitaciones y mareas altas, que actúan sobre terrenos altamente impermeables y con elevaciones altimétricas bajas (de 0 a 6 m). El comportamiento hidráulico de la cuenca se simuló de forma realista considerando un evento de lluvia con un período de retorno de 50 años (172 mm de precipitación en 24 horas), asociado con la condición de pleamar máxima (3,02 m). Los resultados destacaron la susceptibilidad a inundaciones en zonas con elevaciones inferiores a 3,02 m debido a la influencia de las mareas e indicaron la importancia del uso de compuertas para el control hidráulico. Se constató que el Canal de Tamandaré alcanzó el 100% de su capacidad y se desbordó, por lo que se recomendó el uso de bombas de refuerzo eléctricas como medida preventiva contra desbordamientos. Se indicó la instalación de dos bombas eléctricas, cada una con un caudal de 1,0 m³/s y una altura de bombeo de 7,2 m, que se activan automáticamente cuando la capacidad del canal alcanza el 85% y se desactivan al alcanzar el 60%. De esta forma, la simulación por computadora con SWMM permitió la formulación

de soluciones de ingeniería para un problema de gran relevancia en el combate y la prevención de inundaciones en la ciudad de Belém-PA.

1 INTRODUCTION

Belém, capital of the State of Pará, located in the Brazilian Amazon, hosted the mega event of COP30 (30th UN Conference of the Parties on Climate Change) in 2025. During the preparatory phase, the city received investments to improve its infrastructure and solve important structural problems, including the urban flooding of the Igarapé das Armas basin, where the Nova Tamandaré Linear Park was implemented, based on the hydrological-hydrodynamic study presented below.

The drainage of the Tamandaré canal, in Belém-PA, represents an important urban challenge in the Amazon, due to its overflows that occur due to high tides and/or heavy rains.

The solution studied for the Tamandaré basin, for the implementation of the Nova Tamandaré Linear Park, was developed based on the hydrological-hydrodynamic computer modeling of this basin, using the SWMM software, including the occurrence of intense rainfall simultaneous to high tides, focusing on the recurrent flooding in the Tamandaré Channel, in order to assist in the decisions of projects and works for the implementation of this important work.

Figure 1

Figure 2

Tamandaré Avenue in Belém-PA after the implementation of the Linear Park. Nova Tamandaré implemented in Belém-PA

Source: Pará Agency, 2025.

Figure 2 shows the Nova Tamandaré Linear Park implemented in Belém-PA.

As can be seen in Figure 1, it is located in a very urbanized area and waterproofed by pavements, buildings and has its outlet in the Guajará Bay.

The functionality of the drainage system of the Tamandaré Basin stands out for the importance of not flooding Tamandaré Avenue, avoiding losses and losses to the city and its inhabitants, especially when there is intense rainfall associated with high tide levels in Guajará Bay.

Figure 3 shows an image of the Tamandaré Channel with overflow due to the effect of high preamar.

Figure 3

Tamandaré Canal with transshipment in March 2013

Source: Vinagre (2013)

Figure 2 shows overflow and flooding in the Tamandaré channel under the effect of heavy rain and high tide level in its outlet in Guajará Bay. It is a very urbanized and waterproofed area.

Figure 3 shows the floodgates of the Tamandaré Canal, on Av. Tamandaré, essential to its functionality.

Figure 4

Floodgates of the Tamandaré Channel

Source: Google (2023)

Figure 4 shows the outlet and the floodgates of the Tamandaré Canal.

The city of Belém-PA has elevation levels between 0 and 16 m (BELÉM, 2020), being rich in water resources, with intense rainfall, and because it is located close to the Equator,

high tide levels. These are decisive factors for the occurrence of important urban flooding.

Thus, the guiding question of the present research is to investigate the possibility of developing a hydrological-hydrodynamic computational model suitable for the formulation of engineering components suitable for the prevention and combat of flooding of the Tamandaré channel in Belém-PA, in the Amazon.

It is justified that this issue is extremely relevant, as the functionality of the drainage system of the Tamandaré Channel reverberates its importance in the prevention and control of flooding in the Tamandaré basin, avoiding losses and losses to the city and its inhabitants, especially when the occurrence of intense rains associated with high tide levels in the Bay of Guajará.

2 THEORETICAL FRAMEWORK

2.1 HYDROGRAPHIC BASINS OF BELÉM-PA

Figure 5 below presents the map of hydrographic basins of Belém-PA.

Information from the Tide Gauge Station of the Port of Belém-PA

Source: CHN (2025)

Figure 6 shows information from the tide gauge station of the port of Belém-PA, which measures the tide level by the reduction level methodology, and not by the Brazilian altimetric datum (IBGE, 2009).

2.3 BRAZILIAN ALTIMETRIC DATUM

According to the IBGE (2009), the link between the Vertical Datum of the Brazilian Geodetic System, represented by the Imbituba and Santana data, and the Reduction Levels and Hydrographic Zeros along the Brazilian coast is established from the information available in the Geodetic Database (BDG). This bank provides essential geodetic subsidies for applications in engineering, cartography, and scientific studies. Among the most requested products, the altitudes of the SGB Level References (RRNN) stand out, widely used in analyses involving altimetric variations, especially in urban drainage projects in coastal regions under the influence of tides. The official altitudes of the SGB are referenced to two

distinct values of the mean sea level (NMM): the Imbituba Datum, defined based on tide gauge series observed in the period from 1949 to 1957, and the Santana Datum, established from observations carried out between 1957 and 1958 (Alencar, 1990; FEMAR, 2000; Luz and Guimarães, 2003). In the context of tide gauge information, the main source for the Brazilian coast is the Tide Table, prepared and published annually by the Hydrography and Navigation Center of the Brazilian Navy.

Figure 7 shows the differences in the altitudes of the RRNN of the IBGE Brazilian Altimetric Datum, referred to Imbituba, in relation to the local NMM.

Figure 7

Differences in altitudes of RRNN of SGB in relation to local NMM

Source: IBGE (2009); Alencar (1990)

Figure 7 summarizes the global adjustment of the RAAP geometric leveling data, completed in 1993, which produced altitudes of a significantly higher number of RRNNs than the manual adjustments made periodically between 1948 and 1975 (Alencar, 1968; Luz and Guimarães, 2001; Luz et al., 2002).

Thus, the port of Belém presents a tide gauge reading +0.8808 m above the IBGE level (Alencar, 1990) for the terrain, where the positive sign shows that the plane of the mean sea level recorded by the observations of the local Tide Gauge is higher than that determined in Imbituba, and transported by the leveling.

2.4 COMPUTATIONAL MODELING USING SWMM SOFTWARE

The *Storm Water Management Model* (SWMM), in Portuguese, consists of a free computational code for hydrological-hydrodynamic computational modeling, developed by

the United States Environmental Protection Agency (USEPA) in 1971. According to Garcia (2005) it is the most widely used software worldwide for urban drainage simulation. It is a distributed, physical model of discrete temporal simulation, in which a hydrographic basin is represented by a series of elements such as sub-basins, junctions, conduits, enabling the continuous simulation of hydrological-hydrodynamic events and processes (BELING, 2013).

This computational tool has many uses, being able to describe various hydrological processes such as surface runoff, infiltration, groundwater contribution, flow propagation, surface accumulation, and water quality propagation (SHINMA, 2011).

3 METHODOLOGY

The hydrological-hydrodynamic computational model of the Tamandaré Basin, developed through the free software SWMM, was structured from a sequence of methodological procedures. Initially, the tide curve and the precipitation time series were elaborated. Then, the identification and quantification of the constituent elements of the basin were carried out, including sub-basins, nodes and conduits, as well as the characterization of their physical attributes, such as shape, type and use of the soil, slope, cross-sections, extensions, elevation elevations and roughness coefficients, based on topographic surveys and available cartographic documents. Subsequently, the data was entered into the SWMM environment for the configuration of the model. Finally, the model was executed and its results were critically analyzed.

4 RESULTS AND DISCUSSION

4.1 RESULTS

4.1.1 Tidal Curve and Precipitation Time Series

Figure 8 shows the levels of maximum preamares of the port of Belém-PA informed by the Tide Gauge Station of the Brazilian Navy and transposed to the ground level according to the Brazilian Altimetric Datum of the IBGE.

Figure 8

High tides reported by the Brazilian Navy for Belém-PA

Source: Authors (2025)

Figure 8 shows the levels of the maximum annual preamares provided by the Center for Hydrography and Navigation of the Brazilian Navy (CHN), referenced to the Brazilian Altimetric Datum of the IBGE. It is observed that the highest tide recorded corresponds to the elevation of 3.02 m, which occurred exclusively in 2010. Based on these data, the maximum annual preamar of 3.02 m was adopted for the present study as a reference condition. Thus, areas with elevation levels lower than this value are considered susceptible to flooding due to the direct influence of the tide.

Regarding the time series of precipitation with a return period of 50 years for the municipality of Belém-PA, used in the design of urban macro-drainage works, this was defined based on Souza *et al.* (2012). The rainfall event adopted presents a total precipitation of 172 mm, with a duration of 24 hours, and the temporal distribution of the rainfall was obtained through the methodology of time disaggregation applied to the 24-hour event analyzed.

Figure 8 illustrates the tidal curve corresponding to the 3.02 m high tide and the precipitation time series, both used as input data in the hydrological-hydrodynamic modeling.

Figure 9

Tidal curve and precipitation time series used in the simulation.

Figure 9 shows the tide curve of the maximum tide of 3.02m and the time series of rainfall with a return period of fifty years (T50) used in the computer model.

4.1.2 Tamandaré Basin

The Tamandaré basin has an area of 2.8km² with great waterproofing, low altitude (0 and 8 m), high rainfall, tidal influence and for these reasons it has frequent urban flooding. It includes two sub-basins, Tamandaré (area of 1.7 km²) and Reduto (area of 1.1 km²), which are interconnected by an existing pluvial gallery on Rua da Municipalidade. The Tamandaré Canal, with a length of 1.1 km, is located at Av. Tamandaré is lined in concrete and equipped with floodgates implemented in the 1960s (PMSB, 2020).

Figure 10 shows the Tamandaré Basin with its channel.

Table 1 shows data from the Tamandaré basin.

4.1.3 Feeding the Computational Model in Swmm

The information collected was inserted into the hydrological-hydrodynamic model of the Tamandaré basin, enabling the execution of the simulation.

4.1.4 Execution and Analysis of the Results Obtained

Figure 11 below shows the result of the simulation of the Tamandaré basin under the effect of rainfall with a recurrence period of 50 years and a pre-tide of 3.02 m.

Figure 11

Simulation result of the Tamandaré basin in Belém-PA

Figure 12 shows the successful result of the simulation of the Tamandaré basin with SWMM, with very small errors, of -0.10% for surface runoff and -3.83% for flow propagation.

Figure 12 shows the Tamandaré Channel at the moment of maximum water depth.

Figure 12

Profile of the Tamandaré channel at the moment of maximum water depth

Source: Authors, 2025.

Figure 13 shows that the intermediate stretches of the canal, which have a lower elevation of the terrain, present a higher risk of flooding than the inlet and the spring.

Thus, the analysis of the flow with the help of the computational model elaborated in the SWMM results in the intermediate stretches being more susceptible to overflows and flooding, as shown in Figure 12.

Figure 13

Time series of the capacity and flow of stretches of the Tamandaré canal

Source: Author (2025)

Figure 14

Source: Author (2025)

Figure 12 shows that among the stretches that reach 100% of capacity and overflow, C1_ST04 is the one with the highest flow, and thus becomes the most critical for this

overflow. It exceeds 85% of capacity in the interval between 9.5 and 12.5 hours after the start of the event, with a flow of $8\text{m}^3/\text{s}$. In order to reduce the used capacity of these stretches to up to 85%, in this interval of greater risk of overflow, it is recommended to insert two units of electric pumps, for settlement heights of 7.2mca and individual flows of $1.0\text{m}^3/\text{s}$. As an operating rule, they must be activated when the water depth in the section of the lift reaches 85% of the capacity of the section and turned off when it reaches 60%, preventing overflows.

4.2 DISCUSSION

The computational modeling of hydrological-hydrodynamic events in urban drainage basins is extremely useful for urban management, especially for preventing and combating flooding, by demonstrating quantitatively that the association of high rainfall, topography, tidal rise and intense waterproofing can result in the occurrence of overflows and flooding.

The annual tide of the year 2010 reached the altimetric level of 3.02m, showing the importance and usefulness of the floodgates of the Tamandaré channel, which constitute a necessary control mechanism to prevent the entry of water from the bay at times of high tide, avoiding the overflow of the channel at points of topographic levels lower than tide levels, especially in the points of lower elevations, in the order of 2.6 to 2.8m, in the vicinity of Blocks D, E and F (near Tv. Ângelo Custódio), where flooding currently occurs due to high tide, and even more, thus providing useful volume in the channel for the reception of rainwater.

5 CONCLUSION

Thus, to obtain the functionality of the Av. Tamandaré based on the Hydraulic-Hydrological Model of the Tamandaré basin studied here, it is recommended that elevations equal to or greater than the maximum annual tide of 3.02 m be used throughout the Park, where possible $3.02\text{ m} + 0.20\text{ m}$.

The successful implementation of the Nova Tamandaré Linear Park, in Belém-PA, as an intervention to improve urban infrastructure in the preparatory period for COP30, was based on the hydrological-hydrodynamic study developed through computer modeling in the SWMM software, as described in this work.

The main constraints associated with urban flooding in the study area consist of the low elevation of the terrain, the high degree of surface waterproofing and the high tide levels, factors that highlight the need for the adoption of hydraulic control devices, such as floodgates, as well as the use of pumping systems for rainwater settlement. aiming at preventing overflows and floods.

The results of the study demonstrated the high utility of the proposed modeling, by realistically reproducing the hydraulic behavior of the Tamandaré basin when subjected to a rainfall event with a return period of 50 years, characterized by a total rainfall of 172 mm in 24 hours, concomitantly with the occurrence of the maximum tide recorded, observed in 2010. One of the relevant conclusions refers to the identification of susceptibility to tide-induced flooding in areas with elevation levels below 3.02 m, a value corresponding to the level of the maximum tide considered.

The simulations indicated the achievement of 100% of the hydraulic capacity of the Tamandaré Canal, a result that reinforces the need to use electric pumps as an essential measure to prevent overflows. From an operational point of view, it is recommended that the occupied capacity of the channel be maintained at levels below 85%, as a criterion of hydraulic safety.

In this context, the implementation of the Tamandaré Rainwater Pumping Station is a strategic equipment for the mitigation of overflows and flooding in the Tamandaré Channel — and, by extension, in this basin — acting in periods of rising water levels, together with altimetric control and the proper operation of the floodgates. In this way, the Tamandaré basin now has effective mechanisms for the prevention and control of urban flooding.

For the implementation of the pumping station, with the objective of reducing the hydraulic occupation of the channel to values below 85%, preventing overflows, it was recommended the installation of two electric pumps operating in parallel, each with a pumping capacity of 1.0 m³/s, for a settlement head of 7.2 mca. The system must be operated automatically, with activation of the pumps when the hydraulic occupation of the channel reaches 85% and shutdown when it reaches 60%.

Thus, the computational modeling carried out with SWMM proved to be an effective tool for the analysis of a problem of high urban relevance in Belém-PA, allowing the evaluation of critical scenarios and the proposition of technically adequate engineering solutions for the prevention and control of flooding.

ACKNOWLEDGMENTS

The authors express their gratitude to the University of the Amazon (UNAMA), the State Secretariat of Public Works of Pará (SEOP) and the Municipal Secretariat of Urban Zeladoria of Belém (SEZURB) for the institutional and technical support granted.

We extend our thanks to the Urban and Environmental Modeling (MURBA) research group for the academic collaboration. Finally, we thank the Coordination for the Improvement of

Higher Education Personnel (CAPES) for the support granted through scholarships, a fundamental resource for the development and feasibility of this research.

ABSTRACT

Introduction: Technology has been utilized by coaches and road runners in the pursuit of better results, without neglecting scientific aspects of training, and the use of applications for this purpose can make the process more efficient.

Objective: The objective was to develop and validate a technological tool through an application to assist in the evaluation and prescription of training for road runners.

Method: The tool was developed by a multidisciplinary team combining expertise in Physical Education and software development. The system was implemented using Next.js 15 (App Router), React 19, and TypeScript, with a responsive interface built with Tailwind CSS. For authentication and data persistence, Supabase was used, including Supabase Auth and a PostgreSQL database, with security policies (RLS) for access control. Data from 20 amateur runners with an average age of 63.4 years were used to test functionality. Usability was evaluated by 18 physical education professionals using the SUS instrument (System Usability Scale).

Results: There was no statistical difference between measurements taken manually and via the application. The SUS scale showed a mean value of 97.08 points. Conclusion: The

Cooper Pro application is an efficient technological tool with good usability to assist in the prescription of road running training.

Keywords: Road Running. Training. Application.

RESUMO

Introdução: A tecnologia tem sido utilizada por treinadores e corredores de rua na busca por melhores resultados, sem negligenciar aspectos científicos do treinamento, e o uso de aplicativos para esta finalidade pode tornar este processo mais otimizado.

Objetivo: O objetivo foi desenvolver e validar uma ferramenta tecnológica através de aplicativo para auxiliar na avaliação e prescrição do treinamento para corredores de rua.

Método: A ferramenta foi desenvolvida por uma equipe multidisciplinar unindo conhecimentos da Educação Física e do desenvolvimento de software. O sistema foi implementado com Next.js 15 (App Router), React 19 e TypeScript, com interface responsiva construída com Tailwind CSS. Para autenticação e persistência de dados, utilizou-se o Supabase, incluindo Supabase Auth e banco de dados PostgreSQL, com políticas de segurança (RLS) para controle de acesso. Dados de 20 corredores amadores com idade média de 63,4 anos foram utilizados para testar a funcionalidade. A usabilidade foi avaliada por 18 educadores físicos através do instrumento SUS (System Usability Scale).

Resultados: Não houve diferença estatística entre medidas realizadas de forma manual e através do aplicativo. A escala SUS apontou valor médio de 97,08 pontos. Conclusão: O aplicativo Cooper Pro constitui-se em uma ferramenta tecnológica eficiente, com boa usabilidade para auxiliar na prescrição do treinamento de corrida de rua.

Palavras-chave: Corrida de Rua. Treinamento. Aplicativo.

RESUMEN

Introducción: La tecnología ha sido utilizada por entrenadores y corredores de ruta en la búsqueda de mejores resultados, sin descuidar los aspectos científicos del entrenamiento, y el uso de aplicaciones con este propósito puede hacer que este proceso sea más eficiente.

Objetivo: El objetivo fue desarrollar y validar una herramienta tecnológica a través de una aplicación para ayudar en la evaluación y prescripción del entrenamiento de corredores de ruta.

Método: La herramienta fue desarrollada por un equipo multidisciplinario que unió conocimientos de Educación Física y desarrollo de software. El sistema se implementó con Next.js 15 (App Router), React 19 y TypeScript, con una interfaz responsiva construida con Tailwind CSS. Para la autenticación y persistencia de datos, se utilizó Supabase, incluyendo Supabase Auth y la base de datos PostgreSQL, con políticas de seguridad (RLS) para el control de acceso. Se utilizaron datos de 20 corredores aficionados con una edad promedio de 63,4 años para probar la funcionalidad. La usabilidad fue evaluada por 18 educadores físicos a través del instrumento SUS (System Usability Scale).

Resultados: No hubo diferencia estadística entre las mediciones realizadas de forma manual y a través de la aplicación. La escala SUS arrojó un valor promedio de 97,08 puntos. Conclusión: La aplicación Cooper Pro se configura como una herramienta tecnológica eficiente, con buena usabilidad para ayudar en la prescripción del entrenamiento de running en ruta.

Palabras clave: Running en Ruta. Entrenamiento. Aplicación.

1 INTRODUCTION

Street running is a current reality, and the number of followers of its practice is growing day by day for various reasons, especially when it comes to the search for health and quality of life, and have been understood as one of the main strategies to increase the practice and levels of physical activity at the population level (Bauman et al., 2021). The number of street races held in the country in the last year grew 29% compared to 2023. In all, in 2024, there were 2,827 official races, involving experienced runners or beginners, men and women, surpassing the mark of 2,186 events of this kind in the previous year (Sponchiato, 2025).

As it is an accessible and low-cost practice, street running has been gaining more and more space in the routine of the Brazilian population. In addition to its accessibility, street running also promotes benefits to the health and quality of life of its practitioners, being responsible for the increase of approximately 10% in the levels of physical activity of the Brazilian population in general, and has been used as an important tool present in action plans, at the government level, to promote physical activity. in different countries (Costa et.al. 2023; Rojo, 2017; Bauman et al., 2021).

The traditional image of the runner, who simply puts on a pair of sneakers and goes out to run through the streets, does not represent the complexity and care that this modality requires. In addition to the act of running, street running requires physical preparation, technical knowledge and, above all, an approach based on scientific bases to ensure safety, efficiency and longevity in sports practice (Borges et al., 2015; Brazil, 2020).

It is common to see beginners disregard essential aspects, such as medical evaluation, training planning, proper choice of equipment, nutrition, and injury prevention. This negligence can bring health risks, limit performance and, in many cases, remove the practitioner from the sport early (Brasil, 2020; Nascimento; Santana, 2016).

Planning and individualization of training are key aspects for success in road running. It is not enough to follow generic spreadsheets found on the internet; It is necessary to consider factors such as age, sports history, fitness level, personal goals and time availability. The guidance of qualified professionals, such as physical educators and physiotherapists, is essential to structure a safe and efficient program. The elaboration of an individualized running training, based on recent scientific bases, is essential for the athlete to reach his full potential (Jones; Carter, 2000; Midgley et al., 2007).

Training is characterized as a repetitive and systematic process, composed of progressive exercises aimed at improving performance. In this sense, physical training can be understood as an organized and systematic process of physical improvement, in its

morphological and functional aspects, directly impacting the ability to perform tasks that involve motor demands, whether sports or not (Roschel; Tricoli; Ugrinowitsch, 2011).

The prescription of exercise intensity should be individualized to maximize physiological gains and reduce the risk of injury. The apps facilitate this individualization by adapting the training zones, considering the individuality of the running athlete, something that is difficult to achieve with static spreadsheets (Buxton et al., 2011).

In road running, for a long time, cardiorespiratory capacity (expressed in terms of VO₂ max) was considered one of the main predictors of performance in endurance athletes (Joyner, 2018). Traditionally, the assessment of VO₂ max requires expensive and difficult-to-access laboratory tests. However, technological advances have allowed the development of indirect methods and the integration of algorithms into applications capable of estimating this crucial variable with good accuracy. VO₂ max is widely accepted as the best indicator of cardiorespiratory fitness and endurance capacity, and is essential to direct exercise intensity (Silva, 2007; Buxton et al., 2011).

The 12-minute running test (Cooper test) is widely accepted in the area of Physical Education and Sports Sciences, and is even referenced by important institutions such as the *American College of Sports Medicine* (ACSM) as a valid field method for indirect estimates of VO₂ max. The justification for the use of the Cooper test to estimate VO₂ max lies primarily in its simplicity of execution in the field and its recognized reliability (reproducibility) in the assessment of cardiorespiratory fitness in large groups (ACSM, 2006).

The test was originally developed by Kenneth Cooper in 1968 based on a high correlation ($r=0.90$) between the distance covered on the track in 12 minutes and VO₂ max measured directly in the laboratory, in a sample of young adults from the US Air Force. The scientific basis of the test lies in the direct correlation between the distance traveled and the maximum volume of oxygen that the body can use at VO₂ max. This establishes its validity as a method of indirect prediction. The distance covered directly reflects the ability of the cardiovascular and respiratory system to transport and use oxygen during maximal and prolonged effort, and is a robust indicator of an individual's overall aerobic fitness (Mahseredjian; Barros Neto; Tebexreni, 1999).

The use of VO₂ max as a strategy to determine the intensity of training represents an effective, safe approach in line with the best practices of sports science. The personalization of training enhances results, health, motivation and sports longevity of runners. In addition, the monitoring of VO₂ max over time makes it possible to make adjustments in the planning, making the training process more dynamic and efficient. This ensures that the athlete is always training in zones that are appropriate to their current goals and conditions, optimizing performance and reducing risks (Bompa; Buzzichelli, 2019).

Considering the complexity of the process of evaluation, prescription and monitoring of a scientifically based training for long-distance runners, and seeking to make this process more practical, faster and more dynamic for coaches, teachers, coaches and athletes, the

objective of this study was to develop and validate a tool, through an application, to assist in the evaluation process and in the prescription of training for street runners from the results of the Cooper test.

2 MATERIAL AND METHOD

This research is characterized as applied research, through the development of a technological tool (Cooper Pro application) for practical purposes of evaluation and prescription of training for street runners, using quantitative data from the evaluation of VO₂ max, through the Cooper test.

The Cooper Pro was developed by a multidisciplinary team, combining knowledge of Physical Education and software development. The system was implemented with Next.js 15 (*App Router*), *React* 19 and *TypeScript*, with a responsive interface built with *Tailwind CSS*. For authentication and data persistence, *Supabase* was used, including *Supabase Auth* and the *PostgreSQL* database, with security policies (RLS) for access control. The app is structured to work as a PWA (Progressive Web App), with a manifest and *service worker*, allowing installation on mobile and desktop devices. To validate the operation, automated tests (Jest, Testing Library and Playwright) and usage tests were carried out in modern browsers and mobile devices via PWA installation.

The population involved in the tool's efficiency test was made up of individuals of both sexes who were members of the physical conditioning class of the Sports Center project of the Sports and Leisure Center of the State Department of Education of Pará, and a sample composed of 20 randomly chosen individuals was selected, 9 females and 11 males. with a mean age of 63.4 years.

The cardiorespiratory evaluation was performed using a 12-minute run (Cooper test) performed on an official athletics track (400m), where the total distance covered in meters by each subject was obtained. The individual data of the participants, as well as the results obtained in the 12-minute running test, were entered into the interfaces of the Cooper Pro application that calculated the training variables. Then, the same calculations were performed manually, obtaining results similar to those generated by the application.

The validation of the application occurred through the statistical treatment of the data, carried out through the SPSS 25.0 statistical package (IBM), in which descriptive statistics were adopted for the characterization of the sample, through the minimum and maximum values, the arithmetic mean and the standard deviation for the quantitative variables, and the absolute and relative values for the categorical variables.

To verify the differences between the means of the variables performed manually and through the application, the *Student's t-test* for independent variables was performed, adopting a significance level of $p < 0.05$.

To test the usability of the application, 18 experienced physical educators, belonging to the Sports and Leisure Center of the Department of Education of the State of Pará, were selected to fill out the questionnaire (SUS) *System Usability Scale*, composed of 10 questions, which evaluate effectiveness (success in using the product), efficiency (effort to use the product) and satisfaction (experience of using the product) on a scale of 1 to 5, 1 being "Strongly disagree" and 5 "Strongly agree".

After the completion of a version without apparent errors, the Cooper Pro application for mobile devices had its registration application submitted to the National Institute of Industrial Property.

3 RESULTS AND DISCUSSIONS

Tables 1 to 3 contain the descriptive data of the sample obtained through the manual measurement and the application, as well as the correlation data between the manual measurements and those obtained by the application, with the objective of verifying the consistency between these measurements.

Table 1

Descriptive characteristics of the sample (minimum and maximum values, arithmetic mean and standard deviation)

Variable	Minimum	Maximum	Arithmetic Mean	Standard Deviation
Age	38,00	80,00	63,40	8,68
Body Mass	35,50	83,50	60,78	11,66

Source: Data Collection

Table 1 shows heterogeneity in relation to the age and body mass of the sample, which may have occurred because the sample was composed of female and male participants.

Table 2

Descriptive characteristics of the sample in both manual and app measurements (arithmetic mean $\pm$ standard deviation)

Variable	Manual Measurement	In-App Measurement
Distance measured in the Cooper test	2,146.50 $\pm$ 266.03	2,146.50 $\pm$ 266.03
VO2 max	36.66 $\pm$ 5.94	36.67 $\pm$ 5.93
Maximum MET	10.47 $\pm$ 1.70	10.47 $\pm$ 1.70
Training Fraction	0.80 $\pm$ 0.02	0.80 $\pm$ 0.02

Training Intensity	8.46 ± 1.54	8.40 ± 1.54
Speed (m/min)	140.94 ± 25.70	140.94 ± 25.70
Distance m/40 minutes)	5,637.76 ± 1,027.83	5,634.60 ± 1,027.55
VO2 in 40 minutes	63.23 ± 17.94	63.23 ± 17.94
Caloric expenditure	316.25 ± 89.72	316.00 ± 89.68
Weight Loss	40.91 ± 11.61	40.89 ± 11.60

Source: Data Collection

Table 2 shows the sample characteristics related to the results verified both in the manual measurement and the measurement obtained through the application.

Table 3

Descriptive characteristics of the sample in the two procedures, manual and application (arithmetic mean ± standard deviation) and comparison of means (t-test)

Variable	Description		Comparison	
	Manual	Application	t	p
Cooper's result (mts)	2146.50 ± 266.03	2146.50 ± 266.03	0,00	1,000
VO2max. (ml/Kg/min)	36.66 ± 5.94	36.67 ± 5.93	-0,01	0,996
METmax. (METS)	10.47 ± 1.70	10.47 ± 1.69	0,01	0,991
Training Fraction (FT)	0.80 ± 0.02	0.80 ± 0.02	0.86	0,393
Training Intensity (IT)	8.46 ± 1.54	8.40 ± 1.54	0,11	0,913
Speed (mts/min)	140.94 ± 25.70	140.87 ± 25.69	0,10	0,913
Distance (mts)	5637.76 ± 1027.83	5634.60 ± 1027.55	0,10	0,992
Oxygen Consumption (Its)	63.25 ± 17.94	63.20 ± 17.94	0,01	0,993
Caloric expenditure (Kcal)	316.25 ± 89.72	316.00 ± 89.68	0,01	0,993
Weight Loss (g)	40.91 ± 11.61	40.89 ± 11.60	0,01	0,094

Table 3 shows that when comparing the results obtained in the measurements performed manually and through the application, no statistical difference was observed in any of the variables investigated, showing that the measurements are statistically similar.

VO₂ max is widely considered to be the best physiological indicator of an individual's cardiorespiratory fitness and aerobic capacity. It represents the maximum rate at which the body can capture, transport, and use oxygen for energy production (ATP) aerobically during strenuous exercise. Basset; Howley (2000) define the VO₂ max as a representative index of the amount of oxygen, per unit of time, that the body can extract from the environment and use metabolically.

In the present study, the average distance reached in the time of 12 minutes on the track was 2146.50m, however the literature indicates that beginner runners of both sexes present results that vary significantly according to age, establishing that in the age group of 60 years, distances between 1,400 and 1,700 meters are classified as "medium" or "regular" for sedentary people who start the practice. The reference table proposed by Marins and Giannichi (2003) for the Brazilian population suggests that for men over 60 years of age, exceeding 1,600 meters already signals a level of fitness higher than the sedentary average.

High VO_2 max values are crucial for performance in endurance activities such as long-distance running. Aerobic training produces physiological adaptations, such as an increase in the number and size of mitochondria, which contribute to the improvement of VO_2 max (Silva, 2007).

The Metabolic Equivalent (MET) is a physiological unit used to express the energy cost of physical activities as multiples of the resting metabolic rate. 1 MET is defined as the amount of oxygen consumed by an individual at absolute rest (sitting calmly), conventionally corresponding to 3.5 ml of O_2 per kilogram of body weight per minute (3.5 ml/kg/min). Peak MET (or VO_2 max) can be determined by a stress test (ergospirometry or exercise test). If an individual achieves 10 METs on the test, this is their maximum capacity, which is equivalent to a VO_2 max of 35 ml/kg/min. (Sousa et. al., 2015).

In the present study, the estimated mean value for the maximum MET was 10.47 mets. This value corroborates the values found in the literature where they indicate that the maximum MET (METmax) in beginners varies significantly according to age, gender and level of previous activity, but is generally between 8 and 12 METs, where Mendes et.al., (2018) identified vigorous intensity thresholds around 6.8 METs for the general population, suggesting that the peak effort (maximum) for an untrained beginner hardly exceeds 10-11 METs at the beginning of the program.

A study by Heydenreich et.al., (2019) compared beginner and trained endurance athletes and found that while athletes reached high averages, beginners had a VO_2 max between 34.4 and 42.8 mL/kg/min, which corresponds to a maximum MET of approximately 9.8 to 12.2 METs (considering 1 MET = 3.5 mL/kg/min).

For beginners, maximum MET is a superior clinical prescribing tool to simple running speed. The transition from sedentary to beginner runner promotes "angiogenesis" (formation of new capillaries) and increased mitochondrial density. Moderate-intensity and continuous training is effective in raising initial VO_2 max, but the progressive inclusion of high-intensity intervals (HIIT) has been shown to be more efficient in breaking physiological plateaus in subsequent phases (Ross et al. 2016; Scribbans et al., 2016).

Training Fraction (Relative Intensity) typically refers to the relative intensity of exercise, often expressed as a percentage of VO_2 max, maximum heart rate (%HRmax), or relative to training thresholds (aerobic and anaerobic threshold). Intensity is one of the crucial acute variables of training, being a determining factor of physiological adaptations, as higher intensities can generate greater improvements in VO_2 max in trained athletes (Daussin et al, 2008).

In the present study, considering the characteristics of the sample, a training fraction (TF) equivalent to 0.80% of the maximum Met was adopted, which shows an average speed of 140.94 m/min, corresponding to a total distance of 5,637 meters in 40 minutes of training.

According to the ACSM's (2021) guidelines, the training fraction (FT) by the maximum MET is an intensity prescription method that uses the percentage of maximum functional capacity (measured in METs) achieved in a stress test. The ideal intensity for aerobic activities usually varies between 50% and 85% of the maximum MET, corresponding respectively to a Light/Moderate Training with ~50% to 60% of the maximum MET. and an Intense Workout: >70% of max MET.

The speed controlled during aerobic running training is determinant for the intensity of the exercise and, consequently, for the physiological adaptations obtained. Recent studies show that maintaining a constant speed, adjusted to the practitioner's ventilatory threshold, enhances gains in cardiorespiratory capacity and reduces the risk of overload injuries. The prescription based on controlled speed allows for a better individualization of training, promoting more consistent responses in relation to the increase in VO_2 max and overall performance (Silva et al., 2021; Jones et al., 2022).

In the present study, considering the average weight of the subjects and the proposed training fraction, the estimated oxygen consumption for a continuous training of 40 minutes at a speed of 140.94 m/min was 63.25 liters, which corresponds to an average caloric expenditure of 316.25 Kcal, generating an average of 40.91 g of weight loss.

According to the ACSM (2018), more experienced runners have more efficient mechanics, which can reduce the cost of oxygen for the same speed compared to beginners. This means that the actual expenditure may be slightly lower than the generalist formulas, approaching the lower limit of the estimates (about 340-350 kcal).

Oxygen uptake (VO_2) is considered one of the main indicators of aerobic fitness and is directly related to performance in endurance activities. Training performed at controlled speeds close to the anaerobic threshold promotes significant adaptations in VO_2 max, reflecting improvements in metabolic efficiency and the ability to sustain prolonged efforts (Fernandes et al., 2020).

The manipulation of speed directly influences the recruitment of different energy systems, affecting the volume of oxygen consumed during exercise. Recent literature also points out that the gradual progression of speed throughout sessions can result in more robust cardiovascular adaptations, reducing early fatigue and optimizing performance (Pereira et al., 2022; Costa and Souza, 2021).

Fat loss during a 40-minute run at a moderate pace depends primarily on the athlete's total calorie balance and heart rate, with the greatest lipid oxidation occurring at specific intensities. The metabolism of an intermediate athlete is more efficient in mobilizing and oxidizing fat (lipolysis) than that of a sedentary individual, even at higher intensities. The literature suggests that lipolysis provides free fatty acids for direct oxidation in the muscles, and the body begins to burn a significant amount of fat after using rapid energy (glycogen), usually after 20 to 30 minutes of moderate and continuous aerobic activity. The duration of 40 minutes is therefore effective for this purpose (Hetlelid et.al., 2014; Mcardle, Katch, Katch, 2016; Nieman, 2017).

Caloric expenditure during running training is a central component in the process of losing body fat, and the combination of controlled speed with adequate durations of exercise enhances the caloric deficit, promoting significant reductions in fat percentage. In addition, moderate to vigorous intensity, achieved by speed control, is associated with an increase in post-oxygen consumption (EPOC), which increases total energy expenditure after exercise. Speed control allows for better maintenance of the pace throughout the workout, avoiding abrupt drops in intensity and favoring lipid oxidation as the primary source of energy. This mechanism is essential for fat loss, especially in long-term programs, in which the consistency of caloric expenditure is decisive for the success of weight loss (Almeida et al., 2022; Moraes and Lima, 2023).

4 CONCLUSION

Recent literature reinforces the importance of speed control in aerobic running training for maximizing oxygen consumption, caloric expenditure, and body fat loss. The use of technological tools through applications capable of assisting tasks related to training prescription, taking into account individualized prescription, based on physiological parameters, as well as continuous monitoring, contributes to the achievement of more significant results among street runners.

The Cooper Pro app proved to be efficient, fast and easy to use for determining important variables for training, such as VO₂ max, max MET, training fraction (FT), training intensity (IT), training speed in Km.h⁻¹ and m.min⁻¹, training duration, distance to be covered in training, training oxygen consumption in L.min⁻¹, caloric expenditure from training in kcal, and estimated fat loss in grams per training session. In addition, the application assists in the prescription of interval training based on VO₂ max, determining variables such as distance, time, number of repetitions and recovery interval, thus allowing the organization of weekly training.

ABSTRACT

This paper proposes a collaborative system for the georeferenced monitoring of noise pollution in urban environments, utilizing a machine learning model for automatic sound classification. The system adopts a modular architecture composed of three main applications: a Client Application (collection), a Server Application (processing), and a Client Application (visualization), which allows for scalability and ease of maintenance. In the collection Client Application, data capture is performed via a chatbot integrated with the Telegram application, enabling users to submit audio recordings along with their locations. These data are processed by a Server Application, which extracts acoustic features, classifies the sounds using the UrbanSound8K_ECAPA model, and stores the results in a NoSQL database. The visualization Client Application consists of a web page that requests data from the Server Application and presents the captured data interactively, allowing for the exploration of classified sounds and their corresponding geographical locations. A comparative analysis of audio classification models was conducted to support the choice of the most suitable model. Preliminary results demonstrate the viability of the proposed

RESUMO

Este trabalho propõe um sistema colaborativo para o monitoramento georreferenciado da poluição sonora em ambientes urbanos, utilizando um modelo de aprendizado de máquina para classificação automática de sons. O sistema adota uma arquitetura modular, composta por três aplicações principais: Aplicação Cliente (coleta); Aplicação Servidora (processamento) e Aplicação Cliente (visualização), o que permite escalabilidade e facilidade de manutenção. Na Aplicação cliente (coleta), a captura de dados é realizada por meio de um chatbot integrado ao aplicativo Telegram, permitindo que os usuários enviem gravações de áudio juntamente com suas localizações. Esses dados são processados por uma Aplicação Servidora, que extrai características acústicas e classifica os sons usando o modelo UrbanSound8K_ECAPA, e armazena os resultados em um banco de dados NoSQL. A Aplicação Cliente de visualização é composta por uma página Web, que faz requisições para a Aplicação Servidora e apresenta os dados capturados de forma interativa, permitindo a exploração dos sons classificados e suas correspondentes localizações geográficas. Uma análise comparativa de modelos de classificação de áudio foi conduzida para suportar a escolha do modelo mais adequado. Resultados preliminares demonstram a viabilidade da solução proposta, que se demonstra uma ferramenta promissora, de baixo custo, acessível e escalável para o mapeamento e análise da poluição sonora urbana, com potenciais aplicações em políticas públicas e iniciativas de cidades inteligentes.

RESUMEN

Este trabajo propone un sistema colaborativo para el monitoreo georreferenciado de la contaminación acústica en entornos urbanos, utilizando un modelo de aprendizaje automático para la clasificación automática de sonidos. El sistema adopta una arquitectura modular, compuesta por tres aplicaciones principales: Aplicación Cliente (recolección); Aplicación Servidora (procesamiento) y Aplicación Cliente (visualización), lo que permite escalabilidad y facilidad de mantenimiento. En la Aplicación Cliente (recolección), la captura de datos se realiza a través de un chatbot integrado con la aplicación Telegram, permitiendo a los usuarios enviar grabaciones de audio junto con sus ubicaciones. Estos datos son procesados por una Aplicación Servidora, que extrae características acústicas y clasifica los sonidos usando el modelo UrbanSound8K_ECAPA, y almacena los resultados en una base de datos NoSQL. La Aplicación Cliente de visualización se compone de una página web, que realiza solicitudes a la Aplicación Servidora y presenta los datos capturados de forma interactiva, permitiendo la exploración de los sonidos clasificados y sus correspondientes ubicaciones geográficas. Se realizó un análisis comparativo de modelos de clasificación de audio para respaldar la elección del modelo más adecuado. Los resultados preliminares demuestran la viabilidad de la solución propuesta, que se perfila como una herramienta prometedora, de bajo costo, accesible y escalable para el mapeo y análisis de la contaminación acústica urbana, con potenciales aplicaciones en políticas públicas e iniciativas de ciudades inteligentes.

Palabras clave: Contaminación Acústica. Clasificación de Sonidos Urbanos. Aprendizaje Automático. Sistemas Colaborativos. Georreferenciación.

1 INTRODUCTION

Excessive noise is a form of noise pollution, which negatively affects the physical and mental health of the population. The high levels of decibels (dB), resulting from various human activities, generate noise that compromises the environmental silence and the sound balance of urban spaces (Silva; Cunha, 2022). The quantity that represents noise pollution is the Sound Pressure Level (SPL), measured in dB. And in Brazil, the ABNT NBR10151 (2019) establishes the SPL limits for urban ambient noise⁶.

In view of these issues, in recent years, there has been a significant increase in the production of studies aimed at identifying noise levels in different contexts, such as work and residential environments and public roads. However, due to the high cost of physical devices used to measure noise pollution, the use of emerging technologies in this field has intensified.

In this scenario, the application of Artificial Intelligence (AI) techniques stands out, which have been consolidating themselves as effective tools for the analysis of large volumes of data in environmental monitoring systems (Santos *et al.*, 2020). The use of Machine Learning (ML)-based methods has high applicability in solving complex real-world problems, due to their potential to generate robust and accurate results (Beltran *et al.*, 2019).

This work proposes a system based on a machine learning model for classification and georeferenced monitoring of noise pollution data provided through mobile devices of collaborators in urban areas. The solution is based on a modular architecture consisting of three applications, allowing for separation of responsibilities and ease of maintenance.

2 RELATED JOBS

The works related to this research were organized into two categories, in order to support a better analysis of their proposals: (i) studies that do not incorporate classification models, that is, they monitor and/or map noise pollution through participatory systems (with or without the use of mobile devices); and (ii) studies that incorporate classification models for the monitoring of noise pollution, but that do not perform mapping or are not collaborative.

⁶ For example, in a mixed, predominantly residential area, the limits are 55 dB(A) during the day and 50 dB(A) at night. The "A" index indicates that the measurement was performed using the "A" weighting, being an adjustment for measurements according to the perception of the human ear.

2.1 JOBS WITHOUT A CLASSIFICATION MODEL

By proposing a system for mapping traffic noise using *smartphones* as a low-cost alternative, Dubey *et al.* (2022) integrate the use of mobile devices and mapping techniques. In this context, the authors collected sound data at different times and locations in the city of Lucknow, India, performing the calibration of smartphones used with standard NPS meters, in order to improve the accuracy of the measurements. In other words, the calculation of noise levels is performed based on the recorded sound pressure compared to a reference level, shown in Equation 1 below:

$$NPS(dB) = 20 \cdot \log_{10} \left(\frac{P}{P_0} \right) \quad (1)$$

Where:

SPL (dB) = Sound pressure level in decibels

P= Measured sound pressure

P0=Reference sound pressure

Thus, the authors demonstrated that the data obtained through smartphones, when properly calibrated, have variations of only 5 to 7 dB compared to conventional meters. Thus, the research concludes that smartphone-based solutions can be effective and affordable for mapping and monitoring urban noise pollution.

In the collaborative context, Silva and Cunha (2022) developed a project that proposes a low-cost solution for monitoring noise pollution in Belo Horizonte, using *crowdsourcing* through a Telegram chatbot. The proposal consists of sending voice messages and geolocation information, which are processed to compose a database on noise levels. The results allowed the mapping of the areas most affected by noise pollution and evidenced the accessibility of the solution, considering the minimum use of resources of the user's device.

In the study by Boumchich (2023), the use of smartphones as acoustic sensors for the evaluation of environmental noise is explored. The research focuses on the NoiseCapture 1 application, which allows users to measure and share noise data in real time. However, the quality and reliability of this data varies considerably. For this reason, the author proposes an analysis of the quality of the information by means of spatial grouping methods and by the implementation of an a posteriori calibration process, called "blind calibration".

In the work developed by Can (2023), a participatory methodology for evaluating the urban sound environment based on citizen action was presented. The process consisted of

georeferenced noise measurement using smartphones, and the data collected were analyzed to create maps containing sound levels and sources. As a result, participatory acoustic maps were generated, which showed more accurately the diversity of urban sounds compared to traditional normative maps.

Still using mobile devices to capture sounds, Laranja and Saiter (2023) developed a study aimed at monitoring noise pollution in the city of Vitória, Espírito Santo, using smartphones with decibel meter applications. The results of the research demonstrated that noise levels often exceed the established limits, highlighting the importance of the elaboration of participatory noise maps for urban planning.

Finally, in the work of Sofianopoulos *et al.* (2024), the approach used was based on Volunteered Geographic Information (VGI) and web technologies to map noise pollution in Greece. Through the NoisePollutionApp application, citizens recorded sound intensity and their subjective perceptions about sounds, which made it possible to create collaborative maps.

2.2 WORK WITH CLASSIFICATION MODEL

Regarding the studies developed in recent years that monitor noise pollution with the incorporation of classification models, only three studies stand out.

In the research by Ahmed *et al.* (2021), a predictive model was proposed to estimate vehicular noise levels on Malaysian highways, using machine learning algorithms in conjunction with Geographic Information Systems (GIS). The models evaluated in this research were: Artificial Neural Network (ANN), Correlation-based Feature Selection with ANN (CFS-ANN) and the combination of Random Forest and ANN (RF-ANN). The authors considered factors such as vehicle type, traffic volume, temperature, humidity, topography, road density, and location. As a result, the Ensemble RF-ANN model stood out as the most accurate, showing that the combination of machine learning algorithms with GIS systems is an effective tool for predicting and mapping noise pollution in urban environments.

In the study developed by Ceriotti 2023, a system for classifying environmental sounds using convolutional neural networks (CNNs) was proposed, aimed at applications in embedded devices with limited computational resources. The author analyzed five different CNN architectures, applying different methods of extracting sound characteristics, with and without the use of *data augmentation* techniques. The database used was UrbanSound8K, composed of labeled recordings of urban sounds. Among the models tested, the Spatial Blended Convolutional Neural Network (SBCNN) was the one that presented the best performance.

Finally, in the project presented by Santos *et al.* (2023), the Intelligent Environmental Noise Monitoring (MIRA) platform was developed, consisting of sound monitoring stations, an integrated digital platform and artificial intelligence algorithms. The proposed solution allows the continuous recording of acoustic parameters from up to 100 monitoring stations, enabling the identification of patterns of variation in noise levels and their classification in almost real time.

3 AUDIO SIGNAL PROCESSING AND CLASSIFICATION

The processing and classification of audio signals involves advanced techniques of feature extraction and pattern modeling, often using the robustness of deep learning methods (Zaman *et al.*, 2023). In the context of the detection and classification of environmental sounds, the processing and classification of audio signals play a central role in the monitoring of phenomena such as noise pollution.

3.1 CLASSIFICATION-ORIENTED AUDIO PROCESSING

The processing of audio signals represents a fundamental step in sound classification systems, allowing the transformation of raw acoustic signals into numerical representations suitable for computational analysis. Thus, signal processing is a multidisciplinary field, combining principles from mathematics, statistics, computer science, and electrical engineering to extract relevant characteristics from acoustic signals (Arinaitwe *et al.*, 2024).

Audio processing for classification purposes usually follows a well-structured pipeline, consisting of essential steps such as acoustic signal acquisition, pre-processing, feature extraction, normalization, data *augmentation* techniques (where applicable), modeling, and finally, classification. Each of these phases plays a key role in building robust and accurate systems, and failures or deficiencies in any of them can significantly compromise the performance of the final model (Liu *et al.*, 2022; Mehrish *et al.*, 2023; Purwins *et al.*, 2019).

The feature extraction stage, for example, is a critical point in the process, as it is responsible for transforming the raw data of the sound signal into more compact and informative representations, which will serve as input for the learning algorithms. Techniques such as Mel-Frequency Cepstral Coefficients (MFCC), spectrograms, and learned embeddings have been widely employed in this context (Liu *et al.*, 2022; Purwins *et al.*, 2019).

In addition, the use of normalization and augmentation contributes to the generalization of models, allowing it to deal with variations in recording conditions and environmental noises. The proper definition and execution of this processing flow are therefore crucial for the success of automatic audio classification systems in real applications,

such as environmental monitoring, sound event recognition, and virtual assistants (Mehrish *et al.*, 2023).

3.2 ANALYSIS OF SOUND CLASSIFICATION MODELS

The proposed system encompasses a classification model responsible for analyzing the audios collected by the client application. To verify the practical feasibility of the solution, this study considered the balance between effectiveness, efficiency and latency, as these criteria together indicate not only if the model is correct, but if it is operationally feasible for integration into the proposed system.

In this context, in order to verify the feasibility of incorporating Machine Learning techniques into the system, a comparative analysis of the main models for classifying environmental sounds present in the recent literature was carried out, evidencing their most relevant technical attributes. Thus, criteria such as the number of parameters, estimated latency, accuracy, number of classes, type of architecture, and the data set used in the validation experiments were considered.

The evaluation of the effectiveness of each model is carried out based on these criteria, with effectiveness being understood as the ability of an algorithm to produce accurate and reliable predictions, based on the comparison of performance metrics obtained through cross-validation (Sarker *et al.*, 2019). In this context, accuracy corresponds to the ratio between the number of correct predictions and the total number of predictions made (Strauss *et al.*, 2022).

Latency, in turn, refers to the average time required for a data packet to be transmitted from source to destination (Santos *et al.*, 2020). Efficiency, on the other hand, refers to the ability to optimally use the available resources and the existing structural conditions, aiming to achieve the best possible performance (Macedo *et al.*, 2010).

The selected models are widely used for the classification of urban sounds, being able to automatically identify and categorize different types of sounds captured in outdoor environments. Among the main models analyzed, the following stand out: UrbanSound8K_ECAPA, PANNs (Kong *et al.*, 2020), BEATs (Chen *et al.*, 2022), PaSST (Koutini *et al.*, 2022), AST (Gong *et al.*, 2021) and HTS-AT (Chen *et al.*, 2022).

Table 1

Technical characteristics of the analysis models

Model	Architecture	Dataset	Parameters
UrbanSound8k_ecapa	ECAPA-TDNN	UrbanSound8K	20.94 million
PANNs	CNN	AudioSet	80 million
BEATs (KS2)	Transformer	AudioSet	90 million
PaSST (ESC-50)	Transformer	ESC-50	87 million
AST	Transformer	AudioSet	31 million
HTS-AT (SpeechCmd V2)	Transformer	Speech Commands V2	31 million

Source: Prepared by the authors, 2025.

Table 1 presents the structure of these models aimed at the classification of environmental sounds and urban audio, focusing on the aspects of architecture, dataset and parameters used. The UrbanSound8K_ECAPA model uses an ECAPA-TDNN architecture, trained with the urban sounds of the UrbanSound8K dataset. The PANNs and PaSST models are based on the CNN and transformers family, respectively, using the AudioSet and the ESC-50, which are broader and more diverse.

AST and HTS-AT stand out for adapting originally visual architectures, such as *Vision Transformers* and *Swin Transformers*, to the acoustic domain, incorporating techniques such as the use of hierarchical patches. Finally, the BEATs model is the only one on the list to apply self-supervised learning, which makes it especially versatile in contexts with little labeled data. This diversity of structures and data evidences complementary approaches in the treatment of audio, ranging from specializations in urban noise to generalizations for multiple sound categories.

A relevant aspect illustrated in Table 1 concerns the number of parameters of the models, since this factor is directly related to structural complexity and its potential for generalization. The PANNs, BEATs, PaSST and AST models have a high number of parameters — ranging from 80 to 90 million — which implies high computational demand, too much training time, as well as high memory and energy consumption.

These characteristics can represent significant limitations for real-time applications or those that operate in environments with reduced computing infrastructure. On the other hand, the HTS-AT and UrbanSound8K_ECAPA models have between 20 and 31 million parameters, which makes them more viable options for systems with resource constraints, given their lower complexity.

Table 2 details the operational performance aspects of audio classification models. The observed accuracy shows that models such as HTS-AT (88.1%) and BEATs (87.6%) have superior performance in relation to most other approaches, standing out for the use of transformer-based architectures and unsupervised learning strategies. The PANNs model,

on the other hand, although it has a deep architecture based on convolutional neural networks (CNN), has high latency, which can compromise its application in systems that require real-time responses (Kong *et al.*, 2020).

Table 2

Performance of the models in the datasets used

Model	Latency	Accuracy (%)	Classes
UrbanSound8k_ecapa	Low to moderate	75,5	10
HTS-AT (SpeechCmd V2)	Low to moderate	97,2	35
PANNs	Moderate	89,5	527
BEATs (KS2)	Moderate	94,3	527
PaSST (ESC-50)	Moderate	93,2	527
AST	Moderate	95,6	527

Source: Prepared by the authors, 2025.

On the other hand, UrbanSound8K_ECAPA demonstrates efficiency even with a reduced number of classes, ten (Zhao and Liang, 2024), which makes it suitable for more restricted urban contexts and applications with a limited scope. The PaSST model has a good accuracy rate with moderate latency, configuring itself as a robust alternative, especially in scenarios with limited data availability (Koutini *et al.*, 2022). AST represents an innovative proposal by exploring the reuse of pre-trained weights in visual tasks for applications in the area of audio processing, obtaining promising results (Gong *et al.*, 2021).

In view of the above, the UrbanSound8K_ECAPA model was chosen in this research, based on three pillars: specificity, accessibility and efficiency. In terms of specificity, the UrbanSound8K database presents a detailed categorization of urban sounds commonly found in real environments, such as dog barking, children playing, air conditioning, street music, gunshots, car horns, sirens, gait motors, pneumatic hammers, and construction noises, which makes it suitable for the scope of the noise pollution study. This choice is directly linked to the need for accessible and computationally efficient models, aspects also observed in Macedo *et al.* (2024), which, as in this approach, adopt a perspective aimed at reducing computational complexity.

In this context, the selected model proves to be efficient, as it allows capturing complex acoustic patterns in audio classification tasks due to its robustness in extracting discriminative acoustic *embeddings* (Zhao and Liang, 2024). It is also worth mentioning that the accessibility to the UrbanSound8K_ECAPA model was a determining factor for its

implementation in the proposed system.

4 METHODOLOGY

This work is a research of applied nature, since it seeks the production of knowledge and the elaboration of a collaborative system for monitoring georeferenced noise pollution. Regarding its objectives, the research is descriptive-exploratory, as it collects and classifies data on a phenomenon. In addition, it is concerned with identifying and evaluating collaborative systems that monitor noise pollution, as well as the search for recent studies in the area to map the problem and assist in the solution.

To carry out the search for related works, we opted for the adoption of a systematic process based on the works of Bezerra (2024, 2025), where the result of the selection of articles is represented by the PRISMA flowchart, adapted from Tricco *et al.* (2018), as shown in Figure 1. Initially, the research question was defined with the purpose of directing the entire process of identification and selection of studies. Next, the inclusion and exclusion criteria were established, considering aspects such as the period of publication, the availability of the full text, and the language in which the papers were published.

In the subsequent stage, the search strategies were outlined, which included the selection of specific databases, the definition of keywords and the application of Boolean operators, in order to ensure a comprehensive and effective search. Finally, the selection of studies was carried out, in which the studies initially identified were screened and later evaluated in their entirety.

Based on the delimitation of the research, the following guiding question was formulated: How can a collaborative system, capable of collecting, classifying and georeferencing urban sound data through mobile devices and machine learning techniques, contribute to the monitoring of noise pollution?

Based on this definition, the inclusion criteria were established, such as full-text studies, written in Portuguese or English, published between the years 2020 and 2024, which contained the descriptors defined in the title, abstract, or textual body. On the other hand, the exclusion criteria included duplicate, incomplete texts written in languages other than Portuguese and English, published before 2020, or that did not have the descriptors specified in any section of the study.

The search strategies involved conducting advanced searches in the Scopus and Scientific Electronic Library Online (SciELO) databases, using the following descriptors, in Portuguese and English: "System", "Mapping", "Machine Learning", "Machine Learning", "Deep Learning", "Deep Learning", "Collaborative", "Crowdsourcing", "Noise Pollution" and

"Noise Pollution". Thus, the analysis of the studies found was carried out through the reading of the abstracts, with the objective of verifying the relevance and adherence of the studies to the proposed theme.

5 PROPOSED SOLUTION

Compared to the solutions presented in the literature, the proposed system differs by modularly integrating the collection, processing and visualization of noise pollution data, using an audio classification model (UrbanSound8K) trained specifically for Brazilian urban environments. In addition, the present approach incorporates collaborative participation via Telegram chatbot, which broadens reach and reduces adoption barriers. Unlike systems that rely exclusively on dedicated sensors, the solution proposed here exploits the infrastructure of mobile devices already available, promoting low cost and greater scalability. Although no quantitative comparative evaluation was carried out at this stage, the preliminary analysis

indicates that the proposal meets the same objectives of automatic classification, with the advantage of operating in an ecosystem that is easy to maintain and expand.

The proposed solution, as shown in Figure 2, presents the architecture of a system for monitoring noise pollution with georeferencing. The architecture is divided into three applications, with the objective of separating the responsibilities between data sending, processing and display of heat maps, namely: Client Application (Data Collection), Server Application (Processing) and Client Application (Visualization).

The Data Collection Client Application is responsible for capturing raw audio and location information. As illustrated in Figure 2, this collection can be carried out through chatbots integrated with messaging applications, such as WhatsApp and/or Telegram, dedicated applications or specific sensors. In this work, a chatbot was implemented on Telegram. It is worth mentioning that a chatbot offers a non-invasive form of data collection, since it does not require the installation of a new application. The user can start a conversation, record and send an audio containing the noise directly through the chat. Then, it is possible to share the location through the native functionalities of the messaging platform. This approach can impact the quality of sound data capture, since messaging apps are focused on recording human voice. In addition, the quality of smartphone microphones also influences data collection, as this hardware varies in constitution between brands and models. It is important to highlight that these impacts were not the object of studies in this work.

The Server Application is responsible for receiving the raw data, extracting relevant information, classifying the audios, storing them and making them available for consultation. For the processing of audio data, the Librosa library is used, a Python tool specialized in sound signal analysis. Among its functionalities, the extraction of acoustic characteristics, such as minimum and maximum sound pressure levels (SPL), in addition to the application of the "A" weighting filter, which simulates human auditory perception, stands out.

Figure 2*Architecture of the proposed solution*

Source: Prepared by the authors, 2025.

In addition, the NumPy library, widely used for matrix and vector manipulation, is used in this work to calculate the Root Mean Square (RMS). This value represents the energy or "intensity" of the sound, and is later converted to the decibel scale (dB), the standard unit for noise measurement.

For the task of classifying the audios, the artificial intelligence model UrbanSound8K_ECAPA, based on Time Delay Neural Network (TDNN), is used. After extracting the acoustic characteristics, the audio files are converted from .ogg to .wav format, compatible with the adopted classification model. It is important to emphasize that a confidence rate of 60% was adopted as a criterion for validating the classifications.

The choice of this threshold represents a balance between accuracy, the ratio of correct ratings to positive ratings, and recall, the ability of the model to identify all relevant samples. A higher threshold would increase accuracy, but it could discard correct classifications with less confidence. The value of 60% was set to optimize the capture of relevant sound events without introducing an excessive number of false positives. Thus, when the classification reaches or exceeds this threshold, it is considered valid; otherwise, the audio is classified as belonging to the "Other" category.

After the extraction of the characteristics and the classification step, an object is created containing the information of the sending user, the geographic coordinates and the audio data. This object is then registered to an instance of MongoDB, a NoSQL database system that offers greater flexibility in storing and querying the data. Another component present in the Server Application, developed through the FastApi Framework according to

the principles of Restful, is the Application Programming Interface (API), which acts as a communication bridge between stored data and external applications. This interface contains an endpoint that allows the Client Application (Preview) to access the processed data for display in the form of heat maps.

6 RESULTS AND DISCUSSIONS

The first component of the architecture, responsible for capturing data in the client application, was implemented as a chatbot on the Telegram platform. The system automatically registers users based on the information provided by the platform itself, also verifying that the user is already present in the database. In addition, the chatbot manages the sending of the audio samples along with their respective geographical locations.

Additionally, the choice of Telegram as a collection application presented advantages in terms of accessibility and user adherence, corroborating the approach adopted by Silva and Cunha (2022), who used Telegram's chatbot to collect environmental data in urban communities. This reinforces the potential of using technologies that are already consolidated for scientific purposes, without the need to develop native applications to test the operation of the application, which reduces costs and accelerates the prototyping cycle.

The data processing proved to be effective, since the implementation was able to accurately extract (with a degree of conformity between the data entered) the essential information of each sample. This data includes the classification of the type of noise — performed through the machine learning model — geographic coordinates, the date and time of the shipment. Each consolidated record was stored in the MongoDB Atlas database, as Figure 3 illustrates.

With respect to visualization, the Client Application consumes the API and renders a dynamic heatmap, as evidenced in Figure 4. This application has a filtering feature by noise category, allowing a spatial analysis of noise pollution in a specific or general way of the type of sound.

Figure 4

Heat map

Source: Prepared by the authors, 2025.

In view of the above, this work shows the feasibility of the proposed system based on an architecture composed of three cohesive applications. This cohesion refers to the principles of microservices-based architecture, which favors independent and communicating services through APIs, promoting greater modularity, scalability, and resilience in distributed urban applications (Ribeiro, Braghetto, 2022). It is worth mentioning that the detailed operation of the applications that make up this system can be found in (Nery *et al.*, 2025).

7 CONCLUSION

This work consisted of the development of a collaborative system based on machine learning models for the classification and georeferenced monitoring of urban noise, received from mobile devices operated by volunteer collaborators.

Although the system has demonstrated efficacy in the correct classification of test audios, it is still necessary to carry out broader experiments, with a diversified data set, in order to improve the accuracy and generalization of the predictive model. In addition, the data visualization stage, although functional, will still undergo reformulations in order to improve the graphical interface. Such improvements aim to facilitate use by employees and public

managers, expanding the social impact of the system. For future improvements in the accuracy of the collection, the development of a specialized application is indicated.

Thus, the potentiality of the applications developed, both on the client and server sides, indicates that the technology has applicability in various sectors of society. It is a low-cost, practical and scalable solution, whose implementation can help in the formulation of public policies, in the promotion of public health, in the support of scientific research and in environmental preservation, especially in regions affected by high levels of noise pollution.

EVALUATION OF A CATIONIC POLYSACCHARIDE COAGULANT FOR OPTIMIZING THE TREATMENT OF OILY EFFLUENTS FROM THE MANAUS REFINERY (REAM) – QQS COA S

AVALIAÇÃO DE COAGULANTE POLISSACARÍDICO CATIÔNICO PARA A OTIMIZAÇÃO DO TRATAMENTO DE EFLUENTES OLEOSOS DA REFINARIA DE MANAUS (REAM) – QQS COA S

EVALUACIÓN DE UN COAGULANTE POLISACÁRIDO CATIÓNICO PARA OPTIMIZAR EL TRATAMIENTO DE EFLUENTES OLEOSOS DE LA REFINERÍA DE MANAUS (REAM) – QQS COA S

<https://doi.org/10.56238/sevened2026.008-159>

Fernando André de Oliveira Duarte

ABSTRACT

This technical-scientific report details the results of a treatability study conducted with effluents from the Manaus Refinery (REAM), focusing on the evaluation of a high-performance organic coagulant, QQS COA S, a starch-based polysaccharide modified with cationic groups. The main objective was to compare its efficiency with the conventional treatment of the refinery, which employs a tannin-based coagulant with a daily consumption of approximately 200 kg, aided by about 2 kg of a flocculant polymer. The assays, carried out in Jar Test equipment, simulated the coagulation and flocculation conditions, revealing that the QQS COA S, in dosages in the range of 10 to 30 ppm, promotes a clarification and phase separation (water/oil/solids) visually superior to that obtained with approximately 33,333 ppm of the tannin coagulant. This dose reduction, greater than 99% (or 1,000 times), is justified by the macromolecular structure of cationic starch and its mechanisms of action, which include charge neutralization and formation of interparticle bridges, efficient in breaking the oil-in-water emulsion. The study concludes that the replacement of tannin by cationic starch represents a strategic opportunity for REAM, with the potential for a drastic reduction of operating costs, logistics optimization, and a significant advance in environmental sustainability, aligning the practice with the fundamental theory of colloid and polymer chemistry and encouraging the local production of high value-added inputs.

Keywords: Effluent Treatment. Oil Refinery. Oily Water. Organic Coagulants. Cationic Starch.

RESUMO

Este relatório técnico-científico detalha os resultados de um estudo de tratabilidade conduzido com efluentes da Refinaria de Manaus (REAM), focando na avaliação de um coagulante orgânico de alta performance, o QQS COA S, um polissacarídeo à base de amido modificado com grupamentos catiônicos. O objetivo central foi comparar sua eficiência com o tratamento convencional da refinaria, que emprega um coagulante à base de tanino com um consumo diário de aproximadamente 200 kg, auxiliado por cerca de 2 kg de um polímero floculante. Os ensaios, realizados em equipamento Jar Test, simularam as condições de

coagulação e floculação, revelando que o QQS COA S, em dosagens na faixa de 10 a 30 ppm, promove uma clarificação e separação de fases (água/óleo/sólidos) visualmente superior à obtida com aproximadamente 33.333 ppm do coagulante de tanino. Esta redução de dosagem, superior a 99% (ou 1.000 vezes), é justificada pela estrutura macromolecular do amido catiônico e seus mecanismos de ação, que incluem neutralização de carga e formação de pontes interpartículas, eficientes na quebra da emulsão óleo-em-água. O estudo conclui que a substituição do tanino pelo amido catiônico representa uma oportunidade estratégica para a REAM, com potencial para uma drástica redução de custos operacionais, otimização logística, e um avanço significativo em sustentabilidade ambiental, alinhando a prática com a teoria fundamental da química de coloides e polímeros e incentivando a produção local de insumos de alto valor agregado.

Palavras-chave: Tratamento de Efluentes. Refinaria de Petróleo. Água Oleosa. Coagulantes Orgânicos. Amido Catiônico.

RESUMEN

Este informe técnico-científico detalla los resultados de un estudio de tratabilidad realizado con efluentes de la Refinería de Manaus (REAM), centrado en la evaluación de un coagulante orgánico de alto rendimiento, QQS COA S, un polisacárido a base de almidón modificado con grupos catiónicos. El objetivo principal fue comparar su eficiencia con la del tratamiento convencional de la refinería, que emplea un coagulante a base de tanino con un consumo diario de aproximadamente 200 kg, asistido por aproximadamente 2 kg de un polímero floculante. Las pruebas, realizadas en un aparato de prueba de jarras, simulaban las condiciones de coagulación y floculación, revelando que QQS COA S, en dosis de 10 a 30 ppm, promueve una clarificación y separación de fases (agua/aceite/sólidos) visualmente superior a la obtenida con aproximadamente 33.333 ppm del coagulante a base de tanino. Esta reducción de dosis, superior al 99% (o 1000 veces), se justifica por la estructura macromolecular del almidón catiónico y sus mecanismos de acción, que incluyen la neutralización de cargas y la formación de puentes interpartículas, eficientes para romper la emulsión de aceite en agua. El estudio concluye que la sustitución del tanino por almidón catiónico representa una oportunidad estratégica para REAM, con el potencial de una drástica reducción de costos operativos, optimización logística y un avance significativo en la sostenibilidad ambiental, alineando la práctica con la teoría fundamental de la química de coloides y polímeros e impulsando la producción local de insumos de alto valor añadido.

1 INTRODUCTION

The treatment of effluents in oil refineries is a critical operation that aims to mitigate the environmental impact of the industry and ensure compliance with strict environmental regulations, such as CONAMA Resolution No. 430/2011 in Brazil [1]. These effluents, commonly referred to as oily waters, are complex oil-in-water (O/W) emulsions, stabilized by natural surfactants and process additives, and loaded with suspended solids, dissolved organic compounds (phenols, benzene, polyaromatic hydrocarbons - PAHs), and inorganic ions [2, 3]. The breakdown of this emulsion and the removal of the dispersed phase are the primary objectives of the physicochemical treatment, where the coagulation-flocculation step plays a central role [4].

The Manaus Refinery (REAM) currently uses a tannin-based organic coagulant. Although natural coagulants are preferable to inorganic metal salts (e.g., aluminum sulfate, ferric chloride) for reasons of sustainability and lower generation of toxic sludge [5], the application in REAM, as informed by the operation, represents a high daily consumption. Assuming the new flow rate of **150 m³/h** (3,600 m³/day), the tannin dosage (200 L/day, density ~1 kg/L) is approximately 56 ppm. Such dosing not only exponentially raises operating costs (OPEX), but also overloads the system with an additional organic load, complexifies logistics and product handling, and can negatively impact the management of the generated sludge [6].

In this scenario, the search for more efficient and sustainable alternatives is imperative. This report presents an in-depth study on the application of QQS COA S, a cationic starch-based polysaccharide coagulant, as a high-performance solution for the treatment of REAM effluent. The central hypothesis is that the unique macromolecular structure of cationic starch, combined with its high charge density, allows for much more efficient colloidal destabilization and particle agglomeration, validating in practice what the theory of polymer and colloid chemistry predicts. The study aims not only to demonstrate the technical and economic superiority of cationic starch, but also to provide a robust scientific basis that justifies the technological transition and fosters the discussion about the strategic potential of local production of this high value-added input in the Amazon region.

2 THEORETICAL FOUNDATION

To understand the magnitude of the results obtained, it is essential to delve into the chemical and physical principles that govern the coagulation of oily effluents and the molecular structure of the coagulants in question.

2.1 CHEMISTRY OF ORGANIC COAGULANTS

2.1.1 Cationic Starch (QQS COA S)

Starch is a natural, abundant, biodegradable polysaccharide composed of D-glucose units. It consists of two macromolecules: amylose (linear chain) and amylopectin (branched

chain). In its natural state, starch has no significant ionic charge, which makes it ineffective as a primary coagulant [7].

The transformation into a high-performance coagulant occurs through cationization, a chemical reaction that introduces positively charged functional groups into the starch structure. The most common process uses a reagent such as 3-chloro-2-hydroxypropyltrimethylammonium chloride (CHPTAC), which reacts with the hydroxyl (-OH) groups of starch in an alkaline medium [8, 9].

Starch Cationization Reaction:

Step 1: Formation of the Epoxide Reagent (EPTAC) CHPTAC, in the presence of an alkaline catalyst (NaOH), forms a more reactive Epoxide intermediate, 2,3-epoxypropyltrimethylammonium chloride (EPTAC).

Step 2: Starch Etherification The epoxide ring of the EPTAC is then opened by the nucleophilic attack of a hydroxyl group of the starch molecule, forming a stable ether bond and attaching the quaternary ammonium cationic group $-\text{N}^+(\text{CH}_3)_3$ to the polymer chain.

The result is a high molecular weight macromolecule with multiple cationic sites, an ideal combination for coagulation and flocculation mechanisms

2.1.2 Tannin

Tannins are natural polyphenols of plant origin. Its structure is based on aromatic rings with multiple hydroxyl groups (-OH). To act as coagulants, tannins also need to be chemically modified to acquire cationic charge, usually through a Mannich reaction, which introduces amino groups into the structure [5, 10]. Although effective, tannins possess an intrinsically lower molecular weight compared to starch polymers, which may limit their ability to form efficient interparticle bridges, requiring higher dosages to achieve destabilization [6].

2.2 COAGULATION AND FLOCCULATION MECHANISMS IN OILY EFFLUENTS

The stability of an oil-in-water emulsion, such as REAM effluent, is maintained primarily by electrostatic repulsion between the oil droplets, which have a negative surface

charge (negative zeta potential) [4]. The coagulation-flocculation process aims to break this stability through four main mechanisms [11]:

1. **Electrical Double Layer Compression:** The high concentration of coagulant positive ions in the aqueous medium compresses the diffuse electrical double layer around the oil droplets, reducing the repulsion barrier.
2. **Adsorption and Load Neutralization:** This is the primary mechanism for cationic coagulants. The $\text{—N}^+(\text{CH}_3)_3$ groups of cationic starch adsorb directly to the negative surface of the oil droplets and suspended solids, neutralizing their charge. When the zeta potential approaches zero, the van der Waals force of attraction predominates, and the particles begin to aggregate.
3. **Adsorption and Bridging:** The long polymeric chains of cationic starch adsorb simultaneously on multiple particles (oil droplets, solids), forming physical "bridges" that bind them together into microflocs. This mechanism is particularly effective for high molecular weight polymers such as starch and explains why the QQS COA S demonstrated good flocculation even without an auxiliary flocculant on one of the test days.
4. **Sweep Flocculation:** This occurs when the coagulant is added in excess and precipitates as hydroxide. The colloidal particles are then "swept up" and entangled by this precipitated mass. This mechanism is most common with inorganic coagulants and is not the primary mode of action for organic polymers at optimal dosages.

2.3 CATIONIC STARCH AS A HIGH-PERFORMANCE AGENT

The theoretical superiority of cationic starch over tannin for this type of effluent lies in the synergistic combination of high molecular weight and high charge density. While both can neutralize fillers, starch's ability to form long, robust bonds is far superior, resulting in the formation of larger, stronger flakes with a much smaller amount of product. Practice, as demonstrated in the trials, confirmed the theory: the efficiency of the cationic starch bridging mechanism allowed a dose reduction of more than 99%, a feat that load neutralization alone, with a lower molecular weight coagulant such as tannin, cannot achieve.

3 METHODOLOGY

The treatability tests were conducted on a benchtop, following a standard jar test protocol (Jar Test), which is the most widespread methodology to simulate and optimize coagulation and flocculation processes on a laboratory scale.

3.1 MATERIALS AND EQUIPMENT

- Jar Test Equipment: Jar Test Milan Scientific Equipment (JTC), with multi-jar capability and stirring speed control.
- Jugs: Acrylic beakers with a capacity of 1000 mL.
- Dosing Instruments: Syringes for dosing chemical reagents.
- Sample: Raw effluent from the Manaus Refinery (REAM).
- Chemical Reagents:
 - Organic Coagulant: QQS COA S (CATIONIC STARCH), supplied by QQS Chemicals Trade.
 - Auxiliary Flocculant: QQS FLOC (cationic polymer already in emulsion and with open chain).

Figure 1

Products evaluated in the assay: QQS COA S Coagulant and QQS FLOC Flocculant

Source: Personal Archive (2026).

3.2 SAMPLE

A sample of raw effluent collected directly from one of the points of the treatment process of the REAM Refinery was used. The sample presented typical characteristics of refinery effluent, with yellowish color, visible presence of oils and greases on the surface and in emulsion, and high turbidity.

Figure 2

Sample of the raw effluent from the REAM Refinery in the test jars before the start of treatment

Source: Personal Archive (2026).

3.3 EXPERIMENTAL PROCEDURE (JAR TEST)

The procedure followed best practices for coagulation/flocculation assays:

1. Preparation: The 1000 mL jugs were filled with the raw effluent sample.
2. Coagulant Addition: QQS COA S coagulant was dosed in each jar at different concentrations (5 to 50 ppm).
3. Rapid Mixing (Coagulation): 260 RPM agitation for 1 minute for coagulant dispersion and destabilization of colloidal loads.
4. Slow Mixing (Flocculation): The speed has been reduced to 120-130 RPM for 5 minutes. QQS FLOC 2030 auxiliary flocculant was added (0.5 to 4.0 ppm) to promote flake growth.
5. Resting (Sedimentation/Flotation): Resting for 10-15 minutes for separation of the flakes.
6. Evaluation: The efficiency was evaluated visually (clarified water quality, separation speed, flake size).

4 RESULTS AND DISCUSSION

4.1 CRITICAL ANALYSIS OF THE CURRENT TREATMENT (TANNIN)

The daily consumption of 200 L of tannin and 2 kg of polymer is the starting point for the analysis. At a flow rate of 150 m³/h (3,600 m³/day), this translates into dosages of ~56

ppm tannin and ~0.56 ppm polymer. This massive dosage suggests that the predominant coagulation mechanism may be "sweep" flocculation, where excess coagulant precipitates, dragging contaminants. This is not an efficient mechanism and generates an excessive volume of sludge, with high associated costs [12].

4.2 CATIONIC STARCH PERFORMANCE EVALUATION (QQS COA S)

Tests with the QQS COA S have demonstrated outstanding efficiency.

4.2.1 Efficiency of QQS COA S Coagulant (Without Flocculant)

The most notable result was the performance of the QQS COA S performing alone on one of the days. At the dosage of 30 ppm, the coagulant promoted an almost complete phase separation, with large and well-defined flocs floating rapidly. This result validates the hypothesis that the high molecular weight of cationic starch promotes an efficient bridging mechanism, acting both as a coagulant and as a flocculant.

Figure 3

Top view of the jug with 30 ppm of QQS COA S, showing the layer of flotated flakes and the clarified water below

Source: Personal Archive (2026).

4.2.2 Efficiency of Coagulant + Flocculant Combination

The combination of 10 ppm of QQS COA S with 1.0 to 2.0 ppm of QQS FLOC proved to be the optimal range, producing superior visual quality water. The use of the auxiliary flocculant allows reducing the dosage of the primary coagulant and confers greater mechanical resistance to the flocs, desirable for continuous systems.

Figure 4

Visual comparison: raw effluent (left) and treated with 10 ppm QQS COA S + 2.0 ppm QQS FLOC (right)

4.3 COMPARATIVE ANALYSIS AND THEORETICAL VALIDATION

Table 1 summarizes the direct comparison, where the superiority of cationic starch is evident in all aspects evaluated.

Table 1

Comparative analysis between coagulants

Feature	Current Treatment (Tannin)	Proposed Treatment (QQS COA S)	Advantage of QQS COA S
Coagulant Dosage	60 to 120 ppm	10 - 30 ppm	
Main Engine	Probably "Sweep Flocculation"	Load Neutralization + Bridging	More efficient and specific
Visual Efficiency	Bottom	Superior	Improved water quality
Sludge Generation	High	Low	Lower disposal cost
Operating Cost	Elevated	Drastically Reduced	Direct savings
Logistics and Handling	Complex	Simplified	Operational optimization

5 DOSING TABLES FOR OPTIMIZATION

The following are the tables with the consolidated results of the tests, which serve as a basis for optimization on a pilot and industrial scale.

Table 2

Assay Results - QQS COA S Coagulant Only

Coagulant Dosage (ppm)	Visual Result
5	Initial formation of microflocs
10	Good flake formation
20	Larger flakes, good separation
30	Great, fast separation and clear water
40	Good, but no gain over 30 ppm
50	Onset of redissolve/overflow

Source: The author (2026).

Table 3

Assay Results – QQS COA S Coagulant + QQS FLOC 2030 Flocculant

Coagulant Dosage (ppm)	Flocculant Dosage (ppm)	Visual Result
5	0.5	Insufficient
5	1.0	Opaque
5	1.5	Fair
5	2.0	Fair
5	4.0	Good
10	1.0	Good
10	1.5	Very good
10	2.0	Excellent
15	4.0	Excellent
20	0.5	Good
30	2.0	Excellent (very fast separation)

6 CONCLUSION AND STRATEGIC RECOMMENDATIONS

The benchtop treatability assays not only validated the initial hypothesis, but exceeded expectations, conclusively and unequivocally demonstrating the technical, economic and environmental superiority of the cationic starch-based coagulant (QQS COA S) over the tannin coagulant currently in use at the Manaus Refinery (REAM).

6.1 SUMMARY OF RESULTS

The replacement of tannin by QQS COA S allows a superior dosage reduction, going from a consumption of 200 to 400 L/day of tannin (~ 200 kg/day) to an estimated consumption of 36 to 100 kg/day of QQS COA S (considering the optimal dosage in the new flow rate of 3,600 m³/day), of course we know that the flow rates are fluctuating in this context as well, an 82% reduction in primary coagulant intake. But even on the condition that both are matched in dosage, the cost of the QQS COA S is 30 to 40% without considering the freight. This drastic optimization is a direct reflection of the adequacy of the macromolecular structure of cationic starch, whose high molecular weight and charge density optimize the mechanisms of charge neutralization and, crucially, bridging, resulting in a noticeably superior emulsion breakdown and oil effluent clarification.

6.2 ECONOMIC AND OPERATIONAL IMPACT

The implications of this discovery are transformative for the operation of the wastewater treatment plant:

- **Direct OPEX Reduction:** The reduction translates into substantial and immediate financial savings.
- **Logistics Optimization:** The need to transport, store, and handle massive volumes of chemical is eliminated, simplifying the operation and reducing associated risks and costs.

- **Sludge Management:** The lower dosage of a biodegradable product results in a smaller volume of sludge, with better dewatering characteristics, which significantly reduces the costs of its management and final disposal, one of the largest cost components of a WWTP.

6.3 OPPORTUNITY FOR LOCAL PRODUCTION

But perhaps the most strategic conclusion of this study is the opportunity it reveals. Starch, the raw material for QQS COA S, is a renewable and abundant natural resource in the Amazon, with cassava being one of its richest sources. The proof that a high-tech starch derivative can solve a critical problem for a local industry (the refinery) with such significant advantages creates a powerful argument for encouraging the local production of this input.

1. Generate a high value-added bioeconomy, transforming a local agricultural resource into a high-performance industrial chemical.
2. Reduce dependence on external inputs, strengthening the regional industry's supply chain.
3. Create qualified jobs and foster research and development in green chemistry in the Amazon.

Therefore, it is recommended not only to carry out a test on an industrial scale to validate the results and make the coagulant change official, but also to present this study as a success case that demonstrates the feasibility of combining industrial performance, environmental sustainability and regional economic development through science and technology.

ABSTRACT

Technological advancements in medicine, by prolonging life, have generated complex ethical dilemmas related to finitude, highlighting the need to ensure patient autonomy in the dying process. This chapter, based on a master's dissertation, aims to analyze the perspective of the multidisciplinary healthcare team on Advance Directives (ADs) and Living Wills (LW) in Brazil. The qualitative research employed semi-structured interviews with 21 professionals (nurses, physicians, and psychologists) from a teaching hospital, whose data were subjected to content analysis (Bardin, Minayo). The results revealed four thematic categories: 1) Professionals' understanding of patient autonomy, which, although conceptually clear, faces difficulties in practical application due to a lack of patient information and medicine's curative focus; 2) Professionals' experience with terminally ill patients and family involvement, marked by conflicts between patient and family wishes, with family will often prevailing and late

RESUMO

Os avanços tecnológicos na medicina, ao prolongarem a vida, têm gerado complexos dilemas éticos relacionados à finitude, evidenciando a necessidade de garantir a autonomia do paciente no processo de morrer. Este capítulo, baseado em uma dissertação de mestrado, tem como objetivo analisar a perspectiva da equipe multidisciplinar de saúde sobre as Diretivas Antecipadas de Vontade (DAV) e o Testamento Vital (TV) no Brasil. A pesquisa qualitativa utilizou entrevistas semiestruturadas com 21 profissionais (enfermeiros, médicos e psicólogos) de um hospital de ensino, cujos dados foram submetidos à análise de conteúdo (Bardin, Minayo). Os resultados revelaram quatro categorias temáticas: 1) A compreensão dos profissionais sobre a autonomia do paciente, que, embora conceitualmente clara, enfrenta dificuldades de aplicação prática devido à falta de informação dos pacientes e ao foco curativista da medicina; 2) A experiência dos profissionais com pacientes em fase terminal e o envolvimento familiar, marcada por conflitos entre os desejos do paciente e da família, sendo frequente a prevalência da vontade familiar e o encaminhamento tardio aos cuidados paliativos; 3) A percepção da inserção precária das DAV no Brasil, decorrente da ausência de orientações, do amplo desconhecimento, da falta de regulamentação legal robusta e da insegurança profissional; e 4) O conhecimento dos profissionais sobre o Testamento Vital, que se mostrou incipiente e confuso, limitando sua efetiva utilização na prática clínica. Conclui-se que a implementação das DAV e do Testamento Vital requer uma profunda transformação na formação e na educação permanente dos profissionais de saúde, bem como a promoção do diálogo aberto e a consolidação de um marco legal claro, visando garantir a dignidade e o respeito à autonomia do paciente no final da vida.

Palavras-chave: Educação em Saúde. Profissionais de Saúde. Autonomia do Paciente. Diretivas Antecipadas de Vontade. Testamento Vital. Cuidados Paliativos.

RESUMEN

Los avances tecnológicos en la medicina, al prolongar la vida, han generado complejos dilemas éticos relacionados con la finitud, destacando la necesidad de garantizar la autonomía del paciente en el proceso de morir. Este capítulo, basado en una disertación de maestría, tiene como objetivo analizar la perspectiva del equipo multidisciplinario de salud sobre las Directivas Anticipadas de Voluntad (DAV) y el Testamento Vital (TV) en Brasil. La investigación cualitativa empleó entrevistas semiestructuradas con 21 profesionales (enfermeros, médicos y psicólogos) de un hospital universitario, cuyos datos fueron sometidos al análisis de contenido (Bardin, Minayo). Los resultados revelaron cuatro categorías temáticas: 1) La comprensión de los profesionales sobre la autonomía del paciente, que, aunque conceptualmente clara, enfrenta dificultades en su aplicación práctica debido a la falta de información de los pacientes y al enfoque curativista de la medicina; 2) La experiencia de los profesionales con pacientes en fase terminal y la participación familiar, marcada por conflictos entre los deseos del paciente y de la familia, prevaleciendo

frecuentemente la voluntad familiar y la derivación tardía a cuidados paliativos; 3) La percepción de la inserción precaria de las DAV en Brasil, debido a la falta de orientaciones, el amplio desconocimiento, la ausencia de una regulación legal sólida y la inseguridad profesional; y 4) El conocimiento de los profesionales sobre el Testamento Vital, que se mostró incipiente y confuso, limitando su uso efectivo en la práctica clínica. Se concluye que la implementación de las DAV y del Testamento Vital requiere una profunda transformación en la formación y educación continua de los profesionales de la salud, así como la promoción del diálogo abierto y la consolidación de un marco legal claro, con el objetivo de garantizar la dignidad y el respeto por la autonomía del paciente al final de la vida.

1 INTRODUCTION

Medical advancements, particularly in recent decades, have brought with them the promise of greater longevity and well-being. However, this evolution has also imposed new ethical and moral dilemmas on society and, especially, on healthcare professionals, particularly concerning the finitude of life (AKDENIZ *et al.*, 2021; LIN *et al.*, 2023; KRUSE, 2024). The technological capacity to prolong life, even in situations of unfavorable prognosis and intense suffering, has raised questions about the limits of medical intervention and the role of patient autonomy in the face of the inevitability of death (SANTOS *et al.*, 2024).

In this complex scenario, Advance Directives (ADs) and Living Wills (LW) emerge as fundamental instruments to ensure that an individual's wishes and values are respected in the dying process (NUNES & ANJOS, 2014; PIRÔPO *et al.*, 2018; HOUSE *et al.*, 2025). These tools arise as a response to the need for patients, while still in full civil capacity and discernment, to express their preferences regarding treatments they accept or refuse for a time when they can no longer communicate or decide for themselves (MABTUM & MARCHETTO, 2015). The moral bindingness of these directives has been the subject of important ethical discussions, especially when there are conflicts of interest or values (MONTANARI VERGALLO, 2023).

In Brazil, Resolution No. 1.995/2012 of the Federal Council of Medicine (CFM) represents an important milestone by recognizing the right to patient autonomy and regulating ADs (BRASIL, 2012). This resolution allows any adult and conscious person to establish therapeutic limits for the final phase of their life, being an optional document, subject to modification or revocation at any time (NUNES & ANJOS, 2014). Despite this regulation, the effective implementation of ADs in clinical practice still faces numerous challenges, ranging from patients' and their families' lack of knowledge to insecurity and lack of training among healthcare professionals (GOMES *et al.*, 2018; MACEDO *et al.*, 2023a; BAUMANN *et al.*, 2023).

The discussion about death, historically a taboo in many cultures, is increasingly shifting from the home to the hospital environment (COSTA, 2024a). In these settings, the absence of open and humanized dialogue about the finitude of life, combined with medicine focused on cure at all costs, often culminates in aggressive and futile treatments that prolong suffering without adding quality of life to the patient (PAIS *et al.*, 2019; LUNA-MEZA *et al.*, 2021). This context highlights the urgency of a paradigm shift, where palliative care is integrated early into treatment and where the multidisciplinary healthcare team is able to address finitude with empathy, respect, and knowledge (PINTO *et al.*, 2020; SUTHERLAND, 2019; MANGAL *et al.*, 2024).

This book chapter, based on Janaína Aparecida de Sales Floriano's dissertation, seeks to deepen the understanding of Advance Directives from the perspective of multidisciplinary healthcare professionals. It aims to analyze how these professionals deal with bioethical aspects related to the finitude of life, their knowledge of ADs and Living Wills, and the difficulties encountered in applying patient autonomy in the Brazilian context. The qualitative research interviewed nurses, physicians, and psychologists, seeking to unravel the meanings attributed to these concepts, as well as the barriers and facilitators for their implementation.

By recontextualizing and refining the dissertation's findings, this chapter aims to contribute to a broader and more accessible discussion on a topic of growing ethical and social relevance. The expectation is that it can offer subsidies to improve professional training, foster more humanized health policies, and empower patients and their families in making end-of-life decisions, promoting a dignified and respectful "good death" (KIM & PARK, 2021).

2 THEORETICAL FRAMEWORK: BIOETHICS AND END-OF-LIFE

The finitude of life is a universal and inevitable experience that, throughout history, has been approached by various cultures and belief systems (FLORIANI, 2021; KRUSE, 2024). However, in contemporary times, the way society deals with death has been profoundly impacted by technological and scientific advancements in healthcare. While modern medicine offers the hope of cures and prolonged life, it also imposes the need to reflect on the quality of life in its final stages and on the individual's right to decide about their own dying process (SANTOS *et al.*, 2024).

In this context, Bioethics emerges as an essential interdisciplinary field of study, offering a conceptual and principled framework for the analysis and resolution of moral dilemmas that arise in the field of life and health sciences (NOGARIO *et al.*, 2020). Among the fundamental bioethical principles, autonomy, beneficence, non-maleficence, and justice stand out, guiding clinical practice and the relationships among healthcare professionals, patients, and families.

2.1 BIOETHICAL PRINCIPLES IN END-OF-LIFE

The principle of autonomy grants the patient the right to decide about their own health and body, exercising their will freely and informedly (MACEDO *et al.*, 2023a; HOUSE *et al.*, 2025). This right is fully manifested in the ability to accept or refuse treatments, provided the patient is of legal age, lucid, and duly informed about the risks and benefits involved

(BIFULCO & IOCHIDA, 2009). In the context of end-of-life, autonomy becomes even more crucial, as it allows the individual to express their preferences on how they wish to be cared for when they can no longer do so (MONTANARI VERGALLO, 2023). Valuing patient autonomy is one of the pillars of modern medicine and is the foundation of Advance Directives.

The principle of beneficence imposes on healthcare professionals the obligation to act for the benefit of the patient, seeking their well-being and promoting their health. However, at the end of life, "benefit" may not be the prolongation of life at all costs, but rather the alleviation of suffering and the maintenance of dignity (PINTO *et al.*, 2020). Beneficence must be weighed against autonomy, ensuring that medical actions are aligned with the patient's values and wishes.

Non-maleficence is the duty not to cause harm to the patient. At the end of life, this means avoiding futile, invasive, or painful treatments that do not offer prospects of cure or significant improvement, merely prolonging suffering (NOGARIO *et al.*, 2020). Dysthanasia, a concept that will be addressed later, is a classic example of a violation of this principle.

Finally, the principle of justice refers to the equitable allocation of health resources and the guarantee that all patients are treated with equality and dignity, regardless of their social, economic, or health status (NOGARIO *et al.*, 2020). In the context of finitude, justice implies ensuring that everyone has access to quality palliative care and the opportunity to exercise their autonomy.

2.2 ESSENTIAL CONCEPTS ON END-OF-LIFE

To understand the discussions surrounding Advance Directives, it is essential to distinguish some key concepts related to death and the dying process:

2.2.1 Euthanasia, Dysthanasia, and Orthothanasia

Euthanasia: Derived from Greek "eu" (good) and "thanatos" (death), meaning "good death" or "death without suffering." It refers to the anticipation of death of a patient with an incurable disease and intense suffering, through a deliberate action aimed at ending their life (FRANÇA, 2019, p. 564). In Brazil, euthanasia is prohibited and considered a crime (Article 121 of the Penal Code, 1940).

Dysthanasia: From Greek "dys" (bad, anomalous) and "thanatos" (death), describes the artificial prolongation of life in situations of intense suffering and without prospect of cure, through futile or disproportionate treatments (SÁ, 2015, p. 87). It is the so-called "therapeutic obstinacy," which goes against the Code of Medical Ethics (BRASIL, 2018), which

recommends that physicians offer palliative care without undertaking useless or obstinate actions. Dysthanasia violates patient dignity and the principle of non-maleficence (TOMINAGA *et al.*, 2024).

Orthothanasia: From Greek "orthós" (right, normal, correct) and "thánatos" (death), meaning "death at the right time" or "dignified death." It involves allowing death to occur naturally, without anticipating it (euthanasia) or artificially prolonging it (dysthanasia), focusing on the alleviation of suffering and the maintenance of quality of life (GODIM, 2004). CFM Resolution No. 1.805/2006 (BRASIL, 2006) allows physicians to limit or suspend procedures and treatments that prolong the life of terminally ill patients with severe and incurable diseases, respecting their autonomy.

2.2.2 Mistanasia and Kalothanasia

Mistanasia: Derived from Greek "mys" (unfortunate) and "thanatos" (death), meaning "unfortunate death," premature and preventable. It refers to deaths resulting from a lack of access to minimum conditions for a dignified life, such as basic sanitation, food, health, and security, often perpetuated by negligence or inefficiency of public policies (FERREIRA, 2019). It is a concept that expands the discussion about death beyond the individual clinical context.

Kalothanasia: From Greek "kalós" (good, beautiful) and "thanatos" (death), meaning "beautiful death" or "good death." This concept goes beyond orthothanasia, which focuses on death at the right time, incorporating cultural, religious, and personal aspects that make the dying process meaningful for the patient and their families. It involves respect for the individual's life history, their last wishes, the presence of loved ones, and farewell rituals, seeking a transformative meaning for illness and the dying process (FLORIANI, 2021). Kalothanasia emphasizes the dignity and sacredness of the final moment of life, integrating the physical, emotional, spiritual, and social dimensions of the patient.

2.3 ADVANCE DIRECTIVES (ADS) AND LIVING WILL (LW)

Advance Directives (ADs) are documents in which a person, in full exercise of their mental capacity, declares their preferences regarding healthcare they wish to receive or refuse in the future, should they find themselves in a condition that prevents them from autonomously expressing their will (BRASIL, 2012; HOUSE *et al.*, 2025). These directives are particularly relevant for patients with terminal, incurable diseases or with irreversible clinical conditions (MABTUM & MARCHETTO, 2015). CFM Resolution No. 1.995/2012 establishes that the patient's directives will prevail over any other non-medical opinion,

including family wishes, guaranteeing the primacy of individual autonomy (MONTANARI VERGALLO, 2023).

A Living Will (LW) is a type of Advance Directive, a more specific document with legal validity, in which the individual records their choices about the treatments they wish or do not wish to receive in situations of serious illness or irreversible damage, when incapacitated to decide for themselves (LOMBARDI & SANTOS, 2019). Historically, the case of Nancy Cruzan in the United States (1980s) was emblematic for the discussion about the right to a dignified death and the importance of a written document that attested to the patient's wishes (UNITED STATES SUPREME COURT, 1990; DADALTO, 2018). The living will, unlike a common will, does not refer to the distribution of material goods, but rather to decisions about one's own body, health, and dignity at the end of life (BREDAS & NINGELISKI, 2024).

The implementation of ADs and LWs seeks to ensure human dignity, a fundamental constitutional principle (BRASIL, 1988), and the right to self-determination. However, practice still faces significant barriers, such as a lack of knowledge among professionals and the population, the absence of more robust legal regulation in Brazil, and ethical conflicts that arise between the patient's will, the family's wishes, and the healthcare team (SCHINISKI, 2023; CETOLIN *et al.*, 2024; MACEDO *et al.*, 2023a; BAUMANN *et al.*, 2023). The effectiveness of ADs can be complex in specific conditions, such as in patients with dementia, where decisions about feeding and nutrition raise new debates about the limits of autonomy and the interpretation of directives (SHELTON & GEPPERT, 2024). Similarly, in neurodegenerative diseases like amyotrophic lateral sclerosis (ALS), ADs prove to be fundamental tools for care planning, requiring professionals to be well-prepared for this discussion (MANGAL *et al.*, 2024).

The discussion about the end of life is not limited to the patient, but also involves their family and the multidisciplinary healthcare team. A collaborative approach, including physicians, psychologists, nurses, social workers, and other professionals, is fundamental to offer comprehensive care, alleviate suffering, and promote understanding of the illness and what can still be experienced (CRUZ *et al.*, 2021; EBSEH, 2023). The training and capacity-building of these professionals are essential so that they can deal with the complexity of the topic, initiate conversations about finitude in a humanized way, and ensure that patient autonomy is effectively respected (SUTHERLAND, 2019; BAUMANN *et al.*, 2023; MÜLLER *et al.*, 2024).

3 METHODOLOGY

This chapter is based on descriptive research, with a qualitative approach and a convenience sample, whose main objective was to identify the meanings attributed to advance directives by multidisciplinary healthcare professionals. The methodology employed aims to deepen the understanding of how health professionals experience and interpret the bioethical aspects related to the finitude of life and knowledge about ADs in Brazil (FLORIANO, 2025).

3.1 PARTICIPANTS AND SELECTION CRITERIA

Twenty-one multidisciplinary healthcare professionals participated in the research: seven nurses, seven physicians, and seven psychologists. Participant selection occurred through convenience sampling at a high-complexity teaching hospital in São José do Rio Preto/SP.

Inclusion criteria were: being a healthcare professional (nurse, physician, or psychologist) and having worked for at least one year with end-of-life patients in sectors such as palliative care, hemodialysis, oncology, and intensive care unit (ICU). Exclusion criteria were: being a technician, trainee professional, or resident physician (FLORIANO, 2025).

3.2 DATA COLLECTION PROCEDURE

Professionals were approached at their respective workplaces, after authorization from their superiors and according to their availability. After receiving detailed explanations about the study and agreeing to participate, they signed the Free and Informed Consent Form (FICF), in accordance with Resolution No. 510/2016 of the National Health Council (BRASIL, 2016), ensuring research ethics.

Participants' demographic information was collected through a sociodemographic questionnaire. Subsequently, semi-structured interviews were conducted in person with the researcher, lasting an average of 20 to 30 minutes. The interviews were guided by the following guiding questions:

- What do you understand by patient autonomy?
- I would like you to describe your experience with terminally ill patients and family involvement in these cases.
- How do you perceive the insertion of Advance Directives in Brazil (ADs – Resolution No. 1.995, of 2012, of the Federal Council of Medicine)?
- Have you ever heard of a Living Will? If so, could you explain it in your own words?

Participants' responses were audio-recorded and subsequently transcribed in full by the researcher, ensuring the fidelity of the reports (*FLORIANO, 2025*).

3.3 DATA ANALYSIS: CONTENT ANALYSIS

Qualitative data analysis was performed using Content Analysis, a technique that allows for the systematic and objective description of message content, as well as the inference of knowledge about the conditions of production and reception of these messages (*BARDIN, 2011*). This method is widely recognized in qualitative research for its ability to uncover hidden meanings and patterns in textual data, being particularly suitable for understanding subjective perceptions and experiences, as addressed in this study (*MINAYO, 2017*).

The Content Analysis process followed the steps proposed by Bardin (*2011*) and reinforced by Minayo (*2017*):

3.3.1 Pre-analysis

This initial stage involved organizing the collected material. The transcribed interviews were read and re-read exhaustively, allowing the researcher to become deeply familiar with the data. It was a "floating" phase, where the first impressions were sought, recurrent themes were identified, and a coherent analysis corpus was built. The corpus was constituted and an analysis script with the initial indicators was prepared, ensuring the exhaustiveness, representativeness, homogeneity, and relevance of the documents (*BARDIN, 2011*).

3.3.2 Material Exploration

In this phase, the textual material was systematically explored. Procedures for cutting, coding, enumeration, and classification were applied. Recording units (relevant text segments) were identified and coded, i.e., transformed into meaning units. Coding aimed to categorize information based on theoretical and empirical criteria. The objective was to group participants' "speeches" into meaningful sets that answered the research questions. This process involved identifying central themes and creating provisional categories that emerged from the data (*MINAYO, 2017*).

3.3.3 Results Treatment, Inference, and Interpretation

In this stage, the previously identified categories were deepened and refined. Coded data were organized, and the frequencies and relationships between categories were examined. The thematic categories were established based on the recurrence and relevance

of the themes addressed by the professionals. The analysis allowed the reports to be grouped into four categories of meanings, representing the main dimensions of participants' perception of Advance Directives.

Inference and interpretation, the moment of greatest theoretical elaboration, involved linking empirical results with the theoretical framework. The aim was to go beyond the description of data, seeking to establish relationships, infer broader meanings, and understand the implications of the findings for clinical practice and public health policies. Interpretation was enriched by dialogue with existing literature on bioethics, autonomy, palliative care, and legal aspects of ADs, as detailed in the Theoretical Framework section. This process allowed for building a more comprehensive and critical understanding of the studied phenomenon (*BARDIN, 2011; MINAYO, 2017*).

3.4 ETHICAL ASPECTS

The study was approved by the Research Ethics Committee (CAEE 74812323.4.0000.5415), opinion no. 6.499.813, on December 11, 2023 (*FLORIANO, 2025*). To ensure participants' anonymity and confidentiality, their identities were preserved. In the presented reports, participants were identified by the letter "P" (participant), followed by symbolic numbers that do not represent the order of "speeches" or professional category, making identity traceability impossible.

4 PARTICIPANTS' CHARACTERIZATION

The research interviewed 21 multidisciplinary healthcare professionals. Data collection occurred between February 28, 2024, and June 10, 2024. Table 1 presents the sociodemographic characterization of the participants.

Table 1

Participants' Characterization (n=21)

Characteristic	n	Frequency (%)
Sex		
Female	17	80.95
Male	4	19.05
Experience Time		
Between 1 and 5 years	6	28.57
Between 6 and 10 years	7	33.33

Characteristic	n	Frequency (%)
Between 11 and 20 years	5	23.81
Above 21 years	3	14.29
Education Level		
Master's degree	3	14.29
Doctorate degree	2	9.52
Undergraduate degree	1	4.76
Postgraduate <i>lato sensu</i>	15	71.43
Age (mean $\pm$ standard deviation)	37.7 ($\pm$ 8.5)	-
Profession		
Nurse	7	33.33
Physician	7	33.33
Psychologist	7	33.33
Religion		
Yes	20	95.24
No	1	4.76

Source: Floriano (2025)

The majority of participants (80.95%) were female, with a mean age of 37.7 years ($\pm$ 8.5). The sample was equally divided among nurses, physicians, and psychologists (33.33% each). The predominant education level was postgraduate *lato sensu* (71.43%), followed by master's (14.29%) and doctorate (9.52%). Only one participant had only an undergraduate degree. The vast majority (95.24%) declared having a religion. Professional experience time varied, with most (33.33%) having between 6 and 10 years of experience (FLORIANO, 2025).

5 RESULTS AND DISCUSSION

From the content analysis of the interviews, following the steps described by Bardin (2011) and Minayo (2017), four main thematic categories emerged, representing the meanings attributed by healthcare professionals to Advance Directives and related topics. These categories reveal the complexity of the end-of-life scenario in the hospital environment and professionals' perceptions of patient autonomy.

5.1 CATEGORY 1: HEALTHCARE PROFESSIONALS' UNDERSTANDING OF PATIENT AUTONOMY, ACCORDING TO RESOLUTION NO. 1.995/2012 OF THE FEDERAL COUNCIL OF MEDICINE

The results indicate that the interviewed healthcare professionals understand the conceptual meaning of patient autonomy, linking it to the capacity for informed decision-making. In Brazil, this understanding is formally supported by CFM Resolution No. 1.995/2012 and, more broadly, by the Code of Medical Ethics (*BRASIL, 2012; BRASIL, 2018*). However, despite this conceptual clarity, participants recognize various difficulties in its effective application in clinical practice. Autonomy is seen as the patient's right to choose their treatment, provided they are fully conscious and informed about their condition and the implications of their decisions (*MACEDO et al., 2023a; HOUSE et al., 2025*).

For participants, autonomy manifests when the patient has full knowledge of their pathology, therapeutic options, and the risks and benefits of each choice. This understanding is fundamental for the decision to be truly autonomous and not merely passive acceptance.

- "From a medical point of view (...) I understand that they are aware of their pathology, prior to hospitalization, and that they have the power to decide what type of treatment they want to undergo over time and their therapy (P1)."
- "Autonomy is when the patient has full knowledge... of the benefits, the risks of their decisions. So, autonomy is the patient's will, provided they have knowledge of each procedure, each choice, its risks and benefits (P4)."

Despite this conceptual clarity, professionals point out that patients' lack of knowledge on the subject, difficulty in understanding their diagnosis and treatment options, as well as adherence to values and beliefs, can hinder the full exercise of autonomy (*MACEDO et al., 2023a*). It is not enough for the professional to understand the concept; it is imperative that the patient and their family also understand it for effective application (*SEREY et al., 2022*). The moral relevance of Advance Directives is a central issue, and their binding nature must be respected to preserve patient dignity (*MONTANARI VERGALLO, 2023*).

The absence of advance planning is a factor that frequently leads to aggressive and unnecessary treatments, contrary to the patient's last wishes (*KRUSE, 2024*). This highlights the need for end-of-life discussions to occur early, involving the family and considering the patient's culture (*THOMAS et al., 2020*). There is, therefore, an urgency to continuously train professionals to ensure the fulfillment of individuals' expressed wishes, especially in surgical and palliative care settings (*SHAPIRO & SINGER, 2019; FONTES et al., 2020; MANGAL et al., 2024*).

Ethical dilemmas intensify when patient autonomy conflicts with medicine centered on cure at all costs, a paternalistic view that often fails to prepare future physicians to deal with the finitude of life (*COSTA et al., 2023*). The Supreme Federal Court's (STF) decision on Jehovah's Witnesses' right to refuse blood transfusions exemplifies the primacy of the principle of autonomy over beneficence in certain contexts, demonstrating the strength of respecting individual will in cases of conflict (*BRASIL, 2024*).

5.2 CATEGORY 2: HEALTHCARE PROFESSIONALS' EXPERIENCE WITH TERMINALLY ILL PATIENTS AND FAMILY INVOLVEMENT

This category revealed that professionals' experience with terminally ill patients is marked by a constant dilemma between the patient's will and family interference, a common finding in reviews on the subject (*MACEDO et al., 2023a*). Frequently, family will ends up prevailing, generating conflicts and compromising patient autonomy, especially in vulnerable situations.

Reports indicate a significant difficulty for families in accepting finitude and respecting patient decisions, often opting for life prolongation at all costs, even if it implies additional suffering, a reality also observed in intensive care environments (*BAUMANN et al., 2023*).

- "There are patients who understand the situation. They don't want to undergo treatment, but the family determines that the patient will indeed undergo treatment... they want to prolong the patient's life. And this harms their quality of life (P8)."
- "In fact, what I see happening is precisely this difficulty; the patient's desire is often different from the family's, and the patient's and family's desire is different from what the healthcare team wants. So, yes, there are many conflicts (P15)."

This family imposition, coupled with professionals' difficulty in addressing terminality, leads to patients being referred to palliative care only when they are already in an advanced dying process, unable to express their wishes (*KRUSE, 2024*). This highlights the urgency of advance planning and more effective communication. The Federal Constitution of 1988 (*BRASIL, 1988*) and the Civil Code (*BRASIL, 2002*) protect human dignity and private autonomy, making the imposition of unwanted treatments a violation of these rights (*DADALTO, 2014; BREDÁ & NINGELISKI, 2024*). The moral duty to respect patient directives, even when at odds with the family, has been emphasized in bioethics (*MONTANARI VERGALLO, 2023*).

A lack of early dialogue about end-of-life, fear of death, and anticipatory grief in the family are factors contributing to these conflicts. Professionals also experience suffering when faced with family or even other team members' refusal to accept patient decisions

(LUNA-MEZA *et al.*, 2021). A lack of team preparedness to deal with finitude, the culture of cure, and the absence of clear protocols to mediate these conflicts are significant barriers (PINTOS *et al.*, 2020; BAUMANN *et al.*, 2023). In specific contexts, such as patients with dementia, the interpretation of ADs related to feeding and nutrition can be particularly complex, generating additional dilemmas for the team and family (SHELTON & GEPPERT, 2024). The need for clear guidelines on ADs for patients with mental disorders is also an emerging challenge, requiring specific recommendations for practice (MÜLLER *et al.*, 2024).

The role of the multidisciplinary team is crucial for mediating these conflicts and ensuring that the patient's will is prioritized, but this requires specific training and institutional support (MINAME *et al.*, 2023). Effective communication, active listening, and the ability to adapt to the patient's and family's values and beliefs are essential skills to promote a "good death" (CHENG *et al.*, 2019; SOMMER *et al.*, 2021).

5.3 CATEGORY 3: HEALTHCARE PROFESSIONALS' PERCEPTION OF ADVANCE DIRECTIVES' RELEVANCE IN CLINICAL PRACTICE

Professionals express a perception that the insertion of Advance Directives in Brazil is still "precarious" and "in its infancy," a view echoed in studies evaluating the population's and professionals' perception and knowledge of the topic (MACEDO *et al.*, 2023a; MACEDO *et al.*, 2024). There is an acknowledgment of the importance of ADs, but also a strong sense of lack of guidance, widespread unawareness, and insecurity in application, both by professionals and by patients and families.

The lack of legal regulation is pointed out as one of the main causes of insecurity, despite the existence of CFM Resolution No. 1.995/2012. Many professionals fear the judicialization of conduct.

- "Oh my! I think it's very precarious, very precarious. The treatment that cares most about directives is palliative care; oncology also has some participation, but most other specialties... they look at the medical side of curative treatment and don't pay much attention to patient autonomy. There's a great lack of guidance (P5)."
- "And the lack of legal regulation ends up influencing the non-compliance with advance directives a lot (P7)."

There is a perception that the healthcare system is not prepared to integrate ADs, both in terms of record-keeping in medical charts and workflow. Experience in intensive care units, for example, reveals that translating patients' advance directives into practice is still a significant challenge, with much progress to be made (BAUMANN *et al.*, 2023). The medical

culture, still very focused on cure, also hinders the acceptance and implementation of these directives (*GOMES et al., 2018*).

- "If someone arrives with their birth plan or any other advance directive, the health service is not ready to take it and say 'I'm going to attach it to the medical chart.' Where do I put this?... I don't have a tab to insert it (P6)."

The scarcity of scientific production and the lack of consensus on ADs in Brazil contribute to the lack of knowledge and difficulty in dissemination (*HASSEGAWA et al., 2019*). Studies on the effective use of ADs in specific populations, such as veterans in the USA, show that, while awareness may exist, practical utilization can be inconsistent, underlining the need for more effective policies and education (*TUNG & YEH, 2023*). This contrasts with countries where the population has more favorable attitudes and greater knowledge about ADs (*MACEDO et al., 2024*).

It is evident that undergraduate training and continuing education are essential to change this scenario, introducing the debate on patient rights and bioethics early on (*CETOLIN et al., 2024; MÜLLER et al., 2024*).

Despite the challenges, there is a consensus among professionals about the importance of discussing directives and the need for legislation that offers legal certainty for their implementation. Advance care planning is seen as an essential process to strengthen autonomy and promote open communication, resulting in better quality of life for the patient and less suffering for all involved (*SEDINI et al., 2022; SOMMER et al., 2021*).

5.4 CATEGORY 4: HEALTHCARE PROFESSIONALS' KNOWLEDGE OF LIVING WILLS

This category reveals significant unawareness and conceptual confusion between Advance Directives and Living Wills among many professionals. While some demonstrate some familiarity with the Living Will, others have never heard the term or confuse it with other legal or material issues, a reflection of what systematic reviews have pointed out about the general level of knowledge regarding ADs (*MACEDO et al., 2023a*).

The lack of conceptual clarity compromises the correct application of the Living Will in clinical practice and limits professionals' ability to guide patients and families. The Living Will is, in fact, a specific form of Advance Directive, and its understanding is fundamental for the healthcare team's actions (*HOUSE et al., 2025*).

- "I have never heard of this term (P6)."
- "I think I don't have the technical training to think about a living will as a whole; I still think I would need to study a lot to be able to define it. Today I can't (P7)."

Those who demonstrated some knowledge generally associate it with a document that expresses the patient's end-of-life wishes, covering non-material aspects, but related to dignity and the way one wishes to die.

- "That does not concern material issues, but concerns their own dignity, right? Which are all the things that are pertinent to sustain and structure that person's dignity (P9)."
- "Yes. I also understand it as a directive. As a record of this advance directive so that it's not just in words, but recorded while the patient still has life and is... able to respond, to be conscious, so that when they are no longer here... (P15)."

The confusion between ADs and LWs is a critical point, as the Living Will is a specific form of Advance Directive, more focused on formal, and sometimes legal, documents. The case of Nancy Cruzan, which prompted the development of Living Wills in the USA, illustrates the importance of having these wishes formalized (*UNITED STATES SUPREME COURT, 1990; DADALTO, 2018*). In progressive diseases like Amyotrophic Lateral Sclerosis (ALS), ADs are essential instruments that can be facilitated by specific interventions, reinforcing the need for healthcare professionals to fully understand these concepts (*MANGAL et al., 2024*).

Continuing education in bioethics and the inclusion of these topics in professional training are essential to address this knowledge gap (*MINAME et al., 2023*). A lack of information and communication difficulties can compromise individual autonomy, leading to their wishes not being respected (*FERRARIO et al., 2023*). Training professionals to deal with finitude and offer adequate palliative care is fundamental to ensuring a dignified and respectful death (*TOMINAGA et al., 2024; MÜLLER et al., 2024*).

In summary, the results show that, although healthcare professionals understand the importance of patient autonomy, knowledge about ADs and, in particular, Living Wills is still incipient and confused. Cultural barriers, family interference, lack of regulation, and professional insecurity prevent the full implementation of these instruments, reinforcing the need for a profound transformation in the approach to end-of-life in Brazilian medicine (*PAIS et al., 2019*).

6 STUDY LIMITATIONS

The present research, although offering valuable insights into the multidisciplinary healthcare team's perspective on Advance Directives, has some limitations intrinsic to its nature and methodological design. It is important to acknowledge them to contextualize the findings and inspire future investigations.

Firstly, the research used a convenience sample consisting of 21 professionals from a single high-complexity teaching hospital in São José do Rio Preto/SP. Although this approach

allowed for an in-depth understanding of this specific group's perceptions, the results may not be generalizable to other hospital contexts, regions of Brazil, or different types of healthcare institutions (*BARDIN, 2011*). Hospitals with different organizational cultures, levels of investment in continuing education, or patient profiles may present distinct realities, as observed in studies comparing population attitudes in different countries (*MACEDO et al., 2024*).

Secondly, the qualitative approach, by its nature, does not seek statistical generalization, but rather a deep understanding of phenomena and the richness of meanings attributed by participants (*MINAYO, 2017*). Although content analysis allowed for the emergence of robust and illustrative categories, data interpretation is sensitive to the researcher's perspective.

Thirdly, the self-reported nature of the interviews may have influenced participants' responses. Although anonymity was guaranteed, professionals may have expressed perceptions they consider socially desirable or that minimize their own knowledge gaps and insecurities, especially on such a sensitive and complex topic as end-of-life and bioethics (*MACEDO et al., 2023a*).

Fourthly, the research focused on the perspective of healthcare professionals, leaving out the voices of patients and their families, who are intrinsic and equally important parties in the decision-making process regarding ADs. Including these perspectives could significantly enrich the understanding of the dilemmas and challenges involved in implementing directives, including the complexities in cases such as dementia or mental disorders (*SHELTON & GEPPERT, 2024; MÜLLER et al., 2024*).

Fifthly, the absence of specific and comprehensive legislation on ADs in Brazil (beyond the CFM Resolution) is a contextual limitation that permeates the study. The lack of legal certainty, frequently mentioned by participants, reflects a gap that transcends the sphere of individual research, impacting practice at a national level (*SCHINISKI, 2023; HOUSE et al., 2025*).

Finally, the data collection period, although recent (2024), reflects a specific moment in the evolution of discussions about bioethics in the country. The constant evolution of medicine, legislation, and public awareness may generate new perceptions and challenges not captured by this study.

Despite these limitations, the findings provide a solid basis for understanding the barriers and facilitators in implementing Advance Directives in Brazil, from the viewpoint of those who deal directly with the finitude of life, opening avenues for future investigations and interventions.

7 RECOMMENDATIONS FOR FUTURE RESEARCH

Based on the gaps identified in the present research and the reflections generated by the results, several avenues for future investigations emerge as fundamental to deepen knowledge and promote the effectiveness of Advance Directives in Brazil. The following recommendations aim to improve understanding of the topic and support the formulation of public health policies and more humanized practices in end-of-life care.

7.1 COMPREHENSIVE AND MULTICENTRIC STUDIES

The realization of large-scale, multicentric research is recommended, involving healthcare professionals from different geographical regions, types of hospitals (public and private, university and non-university), and levels of complexity. This approach would allow for identifying variations in perceptions and practices, offering a more representative overview of the Brazilian reality and expanding the generality of the findings (*MACEDO et al., 2023a; KRUSE, 2024*). Comparing the Brazilian situation with that of other countries that have advanced in the implementation of ADs, as evidenced in studies on population attitudes (*MACEDO et al., 2024*) or effective use in different groups (*TUNG & YEH, 2023*), can provide valuable insights.

7.2 PATIENT AND FAMILY PERSPECTIVES

It is fundamental that future research explores the perspective of patients and their families on Advance Directives. Qualitative studies investigating their experiences, knowledge, values, beliefs, and challenges in drafting and communicating ADs would be extremely valuable (*CHENG et al., 2019*). Understanding their desires and difficulties is essential to develop communication and support strategies that are truly patient-centered, including the complexities in scenarios such as dementia or mental disorders, where expressed will may have unique implications (*SHELTON & GEPPERT, 2024; MÜLLER et al., 2024*).

7.3 IMPACT OF ACADEMIC TRAINING AND CONTINUING EDUCATION

Investigations can focus on the impact of including disciplines on bioethics, palliative care, and ADs in the curriculum of health undergraduate courses (Medicine, Nursing, Psychology, among others). Furthermore, it would be relevant to evaluate the effectiveness of continuing education and training programs for active professionals, measuring not only increased knowledge but also changes in attitudes and the incorporation of these practices into daily clinical routines (*SUTHERLAND, 2019; BAUMANN et al., 2023*). Training should

prepare professionals for discussing and drafting ADs in various clinical conditions, including complex neurodegenerative diseases (*MANGAL et al., 2024*).

7.4 INSTITUTIONAL AND CULTURAL BARRIERS

New research could analyze the institutional barriers that hinder the implementation of ADs, such as a lack of clear protocols, the absence of electronic health record systems that integrate these directives, and cultural resistance within healthcare institutions and among team members (*BAUMANN et al., 2023*). Investigating successful models in other countries and their adaptability to the Brazilian context would be fruitful, considering how ADs are implemented and recognized in different legal and cultural systems (*MAFFONI et al., 2020; SEDINI et al., 2022; HOUSE et al., 2025*).

7.5 LEGAL AND LEGISLATIVE ASPECTS

Given that the lack of legal regulation was pointed out as a source of insecurity, legal and sociological studies could focus on the need and format of more robust legislation to support ADs in Brazil. It would be relevant to analyze the impact of specific legal frameworks and the perception of their contribution to professional safety and respect for patient autonomy (*SCHINISKI, 2023; MONTANARI VERGALLO, 2023*).

7.6 DEVELOPMENT OF SUPPORT TOOLS

Applied research could concentrate on the development and validation of support tools for healthcare professionals, patients, and families in drafting ADs and Living Wills. This would include practical guides, educational materials, document templates, and digital platforms that facilitate the recording and access to directives (*MCMAHAN et al., 2021*).

7.7 CASE STUDIES AND DETAILED CLINICAL ANALYSES

The conduct of case studies or in-depth clinical analyses of real situations where ADs were (or were not) applied could provide valuable insights into practical challenges, ethical dilemmas faced, and outcomes for patients, families, and teams. This includes the analysis of complex cases where the interpretation of ADs becomes ambiguous or challenging (*SHELTON & GEPPERT, 2024*).

By addressing these recommendations, future research can build a more complete and applicable body of knowledge, effectively contributing to patient autonomy being fully respected in the end-of-life context, and to healthcare professionals being more prepared and secure to deal with this essential dimension of human care.

8 CONCLUSION

This investigation, based on Janaína Aparecida de Sales Floriano's master's dissertation and adapted for this book chapter, provided an in-depth analysis of the multidisciplinary healthcare team's perspective on Advance Directives (ADs) and Living Wills in the Brazilian context. The results confirm that the complexity of the finitude of life, coupled with technological advancements in medicine, imposes significant ethical dilemmas that demand continuous reflection and improvement of healthcare practices (KRUSE, 2024).

In summary, healthcare professionals understand patient autonomy as the fundamental right to make informed decisions about their treatment and the dying process. However, the effective application of this principle is often hindered by patients' and families' lack of knowledge, cultural resistance to discussing death, and conflicts that arise between patient wishes, family expectations, and healthcare team guidelines (MACEDO *et al.*, 2023a; BAUMANN *et al.*, 2023). It was noted that, in most cases, family will tends to prevail, disrespecting individual autonomy and prolonging futile treatments, leading to unnecessary suffering, in clear opposition to the morally binding nature of ADs (MONTANARI VERGALLO, 2023).

The insertion of Advance Directives in Brazil, despite the existence of CFM Resolution No. 1.995/2012, is perceived as "precarious" and "in its infancy." There is a clear lack of guidance and knowledge on the subject among professionals, patients, and families (MACEDO *et al.*, 2024; TUNG & YEH, 2023). The absence of more robust legal regulation and the fear of judicialization of conduct generate insecurity among professionals, contributing to the underutilization of these instruments (SCHINISKI, 2023; HOUSE *et al.*, 2025). Furthermore, conceptual confusion between ADs and Living Wills was evidenced, which prevents their correct application in clinical practice and the realization of the patient's last wishes. Complexity increases in specific situations, such as patients with dementia or mental disorders, where the interpretation of directives requires additional considerations (SHELTON & GEPPERT, 2024; MÜLLER *et al.*, 2024).

Given these findings, it becomes imperative that health education undergoes a profound transformation. The inclusion and strengthening of bioethics disciplines, palliative care, and end-of-life legislation in curricula, as well as continuing education programs for active professionals, are essential. This training should aim not only to increase technical knowledge but also to develop interpersonal communication skills, empathy, and the ability to initiate and conduct sensitive dialogues about death with patients and their families (SUTHERLAND, 2019; BAUMANN *et al.*, 2023; MANGAL *et al.*, 2024).

The promotion of open and transparent dialogue among all involved, patients, families, and healthcare teams, is fundamental to building advance care planning that respects the individual's values, beliefs, and wishes, ensuring them a dignified death with less suffering. This implies overcoming the taboo surrounding death and facing finitude as a natural part of life, integrating palliative care early into treatment.

Ultimately, this chapter reiterates the need for a more humanized and individualized approach to end-of-life care, supported by solid bioethical principles and a legal framework that offers security and clear guidelines. Only then will it be possible to ensure that patient autonomy is fully respected, and that the dying process is experienced with the dignity that every human being deserves.

This study was funded by the Coordination for the Improvement of Higher Education Personnel (code: 88887.824687/2023-00).

ABSTRACT

Recent transformations in the Brazilian public pension system have redefined the relationships between the State, public servants, and career planning in the public sector. In this context, the creation of the Federal Public Servant Supplementary Pension Foundation (FUNPRESP) introduced new challenges related to pension knowledge, decision-making processes, and people management within public organizations. This chapter aims to analyze supplementary pension schemes in the federal public service through the articulation between institutional changes, the psychological contract of public servants, and organizational perceptions, based on empirical evidence from a study conducted at a campus of the Federal Institute of São Paulo (IFSP). To this end, an applied, exploratory, and descriptive study with a qualitative approach was developed, using an electronic questionnaire to collect data from teaching staff and technical-administrative public servants. The results indicate a low level of knowledge regarding supplementary pensions among a significant portion of participants, coexisting with high levels of satisfaction among servants enrolled in the system, thus revealing informational asymmetries and institutional communication challenges. It is concluded that supplementary pension schemes should be understood not only as a financial mechanism but also as a strategic element of people management, requiring continuous pension education initiatives and the strengthening of institutional trust within the public sector.

RESUMO

As recentes transformações na previdência pública brasileira têm redefinido as relações entre Estado, servidores e planejamento de carreira no setor público. Nesse contexto, a criação da Fundação de Previdência Complementar do Servidor Público Federal (FUNPRESP) introduziu novos desafios relacionados ao conhecimento previdenciário, à tomada de decisão e à gestão de pessoas nas organizações públicas. O presente capítulo tem como objetivo analisar a previdência complementar no serviço público federal a partir da articulação entre mudanças institucionais, contrato psicológico do servidor e percepções organizacionais, tomando como base evidências empíricas oriundas de um estudo realizado em um campus do Instituto Federal de São Paulo (IFSP). Para tanto, desenvolveu-se uma pesquisa aplicada, de caráter exploratório e descritivo, com abordagem qualitativa, utilizando questionário eletrônico para coleta de dados junto a servidores docentes e técnico-administrativos. Os resultados indicam baixo nível de conhecimento sobre a previdência complementar entre parte significativa dos participantes, coexistindo com altos níveis de satisfação entre servidores aderentes ao regime, evidenciando assimetrias informacionais e desafios comunicacionais institucionais. Conclui-se que a previdência complementar deve ser compreendida não apenas como mecanismo financeiro, mas como elemento estratégico da gestão de pessoas, demandando ações contínuas de educação previdenciária e fortalecimento da confiança institucional no setor público.

Palavras-chave: Previdência Complementar. Servidor Público. Gestão de Pessoas. FUNPRESP. Educação Previdenciária.

RESUMEN

Las recientes transformaciones en el sistema de previsión pública brasileña han redefinido las relaciones entre el Estado, los servidores públicos y la planificación de carrera en el sector público. En este contexto, la creación de la Fundación de Previsión Complementaria del Servidor Público Federal (FUNPRESP) introdujo nuevos desafíos relacionados con el conocimiento previsional, la toma de decisiones y la gestión de personas en las organizaciones públicas. Este capítulo tiene como objetivo analizar la previsión complementaria en el servicio público federal a partir de la articulación entre cambios institucionales, el contrato psicológico del servidor y las percepciones organizacionales, tomando como base evidencias empíricas provenientes de un estudio realizado en un campus del Instituto Federal de São Paulo (IFSP). Para ello, se desarrolló una investigación aplicada, de carácter exploratorio y descriptivo, con enfoque cualitativo, utilizando un cuestionario electrónico para la recolección de datos junto a servidores docentes y técnico-administrativos. Los resultados indican un bajo nivel de conocimiento sobre la previsión complementaria entre una parte significativa de los participantes, coexistiendo con altos niveles de satisfacción entre los servidores adheridos al régimen, evidenciando asimetrías informativas y desafíos comunicacionales institucionales. Se concluye que la previsión complementaria debe comprenderse no solo como un mecanismo financiero, sino también como un elemento estratégico de la gestión de personas, demandando acciones continuas de educación previsional y el fortalecimiento de la confianza institucional en el sector público.

Palabras clave: Previsión Complementaria. Servidor Público. Gestión de Personas. FUNPRESP. Educación Previsional.

1 INTRODUCTION

Recent transformations in Brazilian social security policies have caused significant changes in the way workers and institutions understand social protection and long-term planning. In the public sector, these changes are especially relevant, since social security has historically been associated with the stability and predictability of state careers, configuring itself as a central element of the bond between civil servants and the State (CAMARANO; FERNANDES, 2016).

The reorganization of the Brazilian social security system, intensified in recent decades by successive reforms, reflects demographic, economic, and fiscal challenges that put pressure on the sustainability of public regimes. Population aging and increased life expectancy have broadened debates about the financial balance of social security, leading to the adoption of models that combine state protection and individual accountability (CAMARANO, 2014; TAFNER, 2007).

In this context, the introduction of the supplementary pension scheme for federal civil servants represents a milestone in the trajectory of social protection policies in Brazil. The creation of the Federal Public Servants' Supplementary Pension Fund Foundation (FUNPRESP), through Law No. 12,618/2012, redefined the social security design of public careers by limiting the benefits of the own regime to the ceiling of the General Social Security Regime and encouraging adherence to complementary mechanisms based on capitalization (BRASIL, 2012).

Such changes are not restricted to the legal or financial field. They alter historical expectations of security associated with the public service and demand new individual planning skills, shifting part of the responsibility for the social security future to the civil servants themselves. This transition dialogues with contemporary trends in public management, marked by the search for fiscal efficiency and the valorization of individual autonomy in decisions related to career and work (BRESSER-PEREIRA, 2010).

At the same time, the complexity of social security rules and the multiplicity of coexisting regimes in public organizations increase informational challenges. Studies indicate that decisions involving pension plans and financial planning are strongly influenced by the level of knowledge of workers, institutional trust, and the way information is communicated by organizations (LUSARDI; MITCHELL, 2014).

From the perspective of people management, supplementary pension emerges as a strategic theme, as it influences career expectations, professional satisfaction and perception of organizational support. Poorly understood institutional policies tend to generate insecurity and resistance, while clear and transparent informational environments favor more conscious

decisions aligned with the needs of civil servants (CHIAVENATO, 2020; ROBBINS; JUDGE, 2017).

Particularly in public educational institutions, where long careers and a high level of qualification are predominant characteristics, the social security debate takes on an even more relevant dimension. In these organizations, the coexistence of different generations of civil servants, linked to different social security rules, contributes to heterogeneous perceptions about supplementary social security and its impacts on the professional trajectory.

Given this scenario, it is necessary to understand how public servants perceive supplementary pension and how this policy is incorporated into organizational dynamics. More than analyzing adhesions or non-adhesions, it is important to investigate how these decisions reflect processes of institutional change and cultural transformation in the Brazilian public service.

This chapter is based on the understanding that supplementary pension should not be treated only as a financial instrument, but as an integral element of people management and the construction of the so-called psychological contract between civil servant and institution. Thus, the debate broadens to include symbolic and organizational dimensions, involving trust, institutional communication, and career planning.

The central problematization that guides this reflection can be summarized in the following question: how do the recent transformations of the Brazilian public pension, materialized in the implementation of FUNPRESP, impact the perception of civil servants and the processes of people management in public educational institutions?

As a general objective, the chapter seeks to analyze supplementary pension in the federal public service from a perspective that articulates institutional transformations, people management and perceptions of civil servants, using empirical evidence from a study carried out on a campus of the Federal Institute of São Paulo (IFSP). Specifically, it is intended to discuss how levels of knowledge, adherence decisions, and perceptions of satisfaction relate to broader organizational processes. Thus, the originality of this chapter lies in the articulation between supplementary pension and the psychological contract of the public servant, a perspective that has not yet been explored in the national literature.

The relevance of this discussion lies both in its academic contribution and in its practical implications. From a theoretical point of view, the chapter brings the social security debate closer to the areas of public management and organizational behavior, which are still little explored in research on the subject. At the institutional level, it offers subsidies for the development of communication and social security education strategies aimed at promoting

more informed decisions among public servants.

To achieve these objectives, the chapter is organized into eight sections. After this introduction, the recent transformations in the Brazilian public pension are discussed, followed by the analysis of FUNPRESP and the changes in the psychological contract of the civil servant. Then, the relationship between people management and social security education is addressed, the methodological path of the empirical study is presented, the evidence obtained is discussed and a broader discussion about its organizational meanings is developed, culminating in the final considerations and implications for public management.

Thus, by integrating theoretical analysis and empirical evidence, this chapter intends to contribute to the understanding of supplementary pension plans as a phenomenon that goes beyond the financial dimension, revealing itself as a central component of contemporary transformations in labor relations in the Brazilian public sector.

2 RECENT TRANSFORMATIONS IN PUBLIC PENSION IN BRAZIL

In recent decades, Brazilian social security has undergone a set of structural transformations motivated by demographic, economic and institutional changes that have had a profound impact on the organization of the social protection system in the country. The increase in life expectancy, the reduction in birth rates and fiscal pressures on the State have broadened the debates about the sustainability of social security systems, driving reforms aimed at redefining retirement rules and the financial balance of public systems (CAMARANO, 2014; TAFNER, 2007).

Historically, public pension in Brazil was conceived under a contributory and solidary logic, structured mostly in the simple distribution system, in which active workers finance the benefits of retirees. This model, consolidated throughout the twentieth century and strengthened by the Federal Constitution of 1988, guaranteed broad social protection, but began to face challenges arising from population aging and the expansion of social security expenses (MARTINS, 2014).

In the scope of the public service, the Own Social Security Regime (RPPS) has consolidated itself as one of the pillars of the attractiveness of state careers, by ensuring benefits historically associated with integrality and parity with the remuneration of active duty. However, the growing concern with fiscal sustainability led to the implementation of successive reforms, which gradually restricted these benefits and brought public sector rules closer to the conditions applied to workers in the general regime (BRASIL, 2019).

The creation of the social security ceiling equivalent to the General Social Security Regime (RGPS) for new federal employees, formalized by Law No. 12,618/2012, represents

a significant milestone in this process. The measure profoundly altered the traditional design of public pension by limiting the value of future benefits and introducing the need for complementary social security protection mechanisms for civil servants with salaries above the ceiling (BRASIL, 2012).

These changes reflect an international trend of reconfiguration of pension systems, marked by the expansion of hybrid models that combine basic public protection and supplementary pension based on individual capitalization. According to Batich (2004), this transition implies the gradual transfer of part of the social security responsibility from the State to the individual, requiring greater capacity for financial planning and decision-making on the part of workers.

Constitutional Amendment No. 103/2019, in turn, intensified this movement by promoting significant changes in retirement rules, including minimum age, contribution time, and criteria for calculating benefits. Such changes reinforced the logic of fiscal adjustment and increased the relevance of supplementary pension as a strategy for maintaining the income standard in retirement, especially among federal civil servants (BRASIL, 2019).

In this context, it is observed that social security is no longer perceived only as a social right guaranteed by the State and also starts to assume a dimension of individual risk management, approaching the logics of the financial market and long-term personal planning. This change alters the so-called "social security contract", impacting historical expectations of security and stability associated with public careers (CAMARANO; FERNANDES, 2016).

In addition to the normative changes, recent transformations reveal challenges related to institutional communication and the understanding of social security rules by civil servants. The growing complexity of the system tends to increase the informational asymmetry between managers and workers, making it difficult to make conscious decisions and enhancing perceptions of insecurity regarding the future of social security (LUSARDI; MITCHELL, 2014).

From the perspective of public management, these transformations highlight the need for organizational policies capable of supporting civil servants in understanding the new rules and planning their professional trajectories. Social security, in this sense, becomes part of the strategic field of people management, requiring educational and communicational actions that favor decision-making autonomy and institutional trust (CHIAVENATO, 2020).

Thus, recent transformations in Brazilian public pension reveal not only normative changes, but a broader reconfiguration of the relations between the State, labor and social protection. This scenario constitutes the backdrop for the creation and expansion of supplementary social security in the federal public service, a theme that will be deepened in

the following section when addressing the role of FUNPRESP in the new social security configuration.

3 FUNPRESP AND THE CHANGE IN THE PSYCHOLOGICAL CONTRACT OF THE CIVIL SERVANT

The creation of the Federal Public Servants' Supplementary Pension Fund Foundation (FUNPRESP), based on Law No. 12,618/2012, represents more than a technical change in the social security rules of the Brazilian public service. It is a structural change that redefines the historical relationship between the State and the civil servant, altering expectations, perceptions of security and the way in which the public career is planned over time. In this context, supplementary pension can be understood as a central element in the reconfiguration of the so-called psychological contract of public servants (BRASIL, 2012).

The concept of psychological contract refers to the set of implicit expectations that guide the relationship between the individual and the organization, involving perceptions of reciprocity, trust and mutual commitment (ROUSSEAU, 1995). In the Brazilian public service, this contract has historically been marked by the promise of stability, predictable progression and social security security, constituting one of the main factors of attractiveness of state careers (CAMARANO; FERNANDES, 2016).

The introduction of the supplementary pension scheme partially breaks with this logic by shifting part of the responsibility for the future pension to the civil servant himself. Unlike the traditional model, in which the benefit was strongly linked to the remuneration of the active person, the new regime requires individual long-term decisions and involves variables associated with the capitalization and performance of investments, bringing the civil servant closer to typical practices of the private sector (BATICH, 2004).

This movement can be interpreted as a reflection of contemporary trends in public management, often associated with the New Public Management paradigm, which emphasizes fiscal efficiency, individual accountability, and rationalization of state spending. In this scenario, the civil servant is no longer just a beneficiary of a state protection system and starts to act as an active agent in the construction of his future financial security (BRESSER-PEREIRA, 2010).

The change, however, does not occur only at the normative level, but also at the symbolic level. For many civil servants, especially those who joined after 2013, the public career is perceived under a different logic from the previous generation, marked by a greater need for financial planning and less predictability about retirement income. This transition can generate identity tensions and a sense of uncertainty, especially in organizational

environments where different social security regimes coexist.

In addition, FUNPRESP introduces new elements of institutional trust. While the traditional model was associated with the direct guarantee of the State, the complementary regime requires confidence in the management of resources, in the governance of the entity and in the stability of the rules over time. Studies on organizational behavior indicate that changes in historically valued benefits tend to impact commitment and perception of organizational support, especially when accompanied by low informational clarity (CHIAVENATO, 2020).

The literature on decision-making shows that choices involving future risks and uncertain returns tend to generate conservative behaviors or decision-making postponement, a phenomenon observed in different social security contexts (LUSARDI; MITCHELL, 2014). In the case of the public service, this effect can be enhanced by the tradition of stability that has historically characterized the relationship between civil servants and the State, making adaptation to the new model a gradual and often conflicting process.

From the perspective of people management, this change in the psychological contract imposes new institutional challenges. Public organizations now play an important role in mediating social security information, promoting educational actions and communication strategies that help civil servants understand the implications of the complementary regime. The absence of this mediation tends to increase insecurity and make it difficult to build trust in the new system.

In this sense, FUNPRESP should not be understood only as a financial mechanism, but as an organizational policy that influences career expectations, professional decisions, and perceptions of institutional appreciation. The way this policy is communicated and experienced by employees can strengthen or weaken the bond between the individual and the organization, directly impacting the levels of satisfaction and commitment at work.

Thus, the analysis of FUNPRESP from the concept of psychological contract allows us to understand that the social security transformations in the public service go beyond the normative field, reaching symbolic and cultural dimensions that redefine the very experience of public work in contemporary Brazil. This perspective offers an essential interpretative basis for understanding the empirical results presented in the following sections of the chapter.

4 PEOPLE MANAGEMENT AND SOCIAL SECURITY EDUCATION IN THE PUBLIC SECTOR

People management in the Brazilian public sector has undergone significant transformations in recent decades, following institutional changes, administrative reforms,

and new demands for efficiency and professionalization. In this context, the public administration has ceased to focus exclusively on bureaucratic personnel management processes to incorporate strategic approaches aimed at human development, valuing the civil servant, and strengthening organizational performance (CHIAVENATO, 2020).

Among the various elements that make up people management, benefits and career planning policies play an important role in building the satisfaction and commitment of civil servants. The literature on organizational behavior shows that the perception of security and institutional support directly influences the motivation and psychological bond between worker and organization, especially in contexts marked by structural changes (ROBBINS; JUDGE, 2017).

In the public service, social security has historically occupied a central position in this set of benefits, and is often associated with the stability and predictability of the professional trajectory. Changes in social security rules, therefore, do not only produce financial effects, but also organizational and subjective ones, by impacting long-term expectations and the career planning of civil servants (CAMARANO; FERNANDES, 2016).

The introduction of supplementary pension in the federal public service increases the complexity of this scenario by requiring civil servants to take a more active role in managing their financial future. This shift of responsibility demands competencies that were not traditionally part of the professional repertoire associated with public careers, such as financial planning, risk assessment, and understanding of social security instruments (LUSARDI; MITCHELL, 2014).

In this sense, the concept of social security education emerges, understood as the set of actions aimed at promoting knowledge and the critical capacity of individuals to understand and make decisions related to their future social protection. Unlike the simple transmission of information, social security education involves continuous learning processes and the development of skills aimed at long-term planning (ENAP, 2022).

The literature points out that reduced levels of financial and social security literacy are directly associated with poorly informed decisions, postponement of choices, and low adherence to supplementary pension schemes. This phenomenon tends to be intensified when the issue is perceived as complex or distant from the worker's immediate reality, a scenario often observed in public organizations (LUSARDI; MITCHELL, 2014).

From the perspective of people management, the absence of structured actions for social security guidance can generate insecurity and increase the informational asymmetry between employees and the institution. When workers do not fully understand the benefits available or the implications of regulatory changes, they tend to develop negative or

ambivalent perceptions of organizational policies, affecting institutional trust (EISENBERGER et al., 2002).

In this context, organizational communication assumes a strategic role. The literature on public management highlights that technical information, when not mediated in a clear and contextualized way, has low effectiveness and can contribute to the maintenance of doubts and resistance. Thus, social security guidance programs should be conceived as an integral part of people management policies, and not as one-off or merely informative actions (CHIAVENATO, 2020).

Public educational institutions, in particular, have characteristics that make this debate even more relevant. The high level of education of civil servants and long-term professional trajectories create an environment conducive to career planning, but do not necessarily guarantee in-depth social security knowledge. This apparent contradiction shows that high academic training does not replace institutional initiatives of social security education.

In addition, the coexistence of different social security regimes within the same organizations — resulting from different legal frameworks for entry into the public service — contributes to heterogeneous perceptions about supplementary social security. Such diversity requires differentiated management approaches, capable of dialoguing with different profiles of civil servants and varying levels of knowledge on the subject.

Supplementary pensions, in this scenario, can be understood as a strategic element of organizational management, as it influences decisions related to permanence in the public service, retirement expectations, and perceptions of institutional appreciation. When accompanied by clarification and support actions, it tends to strengthen the commitment of civil servants and the perception of organizational justice (ROBBINS; JUDGE, 2017).

On the other hand, when implemented without adequate mediation, social security policy can be perceived as an external imposition or as a loss of historically consolidated rights, generating resistance and insecurity. This duality highlights the importance of the role of leaders and people management areas in the construction of institutional narratives that favor the understanding of changes and reinforce the transparency of processes.

Social security education, therefore, should not be seen only as an informative strategy, but as an instrument of organizational *empowerment*, capable of expanding the autonomy of civil servants in decision-making related to their professional and financial future. This perspective brings complementary pension closer to contemporary debates on organizational learning and human development in the public sector.

Thus, the articulation between people management and social security education offers a relevant interpretative framework to understand the challenges faced by public

institutions in the face of recent transformations in social security. Such an approach allows us to analyze supplementary pension not only as a financial policy, but as an integral component of labor relations and organizational culture.

In the light of these discussions, it is possible to understand the empirical results of the present study not only as indicators of knowledge or satisfaction, but as expressions of broader institutional processes, related to organizational communication, perceived support, and the ability of institutions to promote informed decision-making environments. This understanding underlies the analysis of the data presented in the following section of the chapter.

5 THE EMPIRICAL STUDY: CONTEXT AND METHODOLOGICAL PATH

Understanding the transformations of public pension and their effects on people management requires observing how these changes are perceived in the daily lives of organizations. In this sense, the present study was developed from the reality of a campus of the Federal Institute of Education, Science and Technology of São Paulo (IFSP), a public institution of higher, technical and technological education, marked by a diverse staff and long-term professional trajectories. The choice of this context allowed us to investigate how federal civil servants interpret and experience the changes related to supplementary pension in their work environment.

The study was based on the observation, observed in institutional experiences and internal discussions, that the social security issue often generates doubts among civil servants, even in environments characterized by a high level of education. This scenario dialogues with research that indicates that regulatory complexity and low financial literacy can make it difficult to understand social security systems, regardless of the degree of academic training of individuals (LUSARDI; MITCHELL, 2014).

From the methodological point of view, we opted for a research of an applied nature, guided by the intention of producing knowledge useful to the organizational context studied and capable of subsidizing reflections on people management practices. As Gil (2017) and Mascarenhas (2017) point out, applied research is particularly relevant in institutional environments, as it allows for the articulation of scientific production and the resolution of concrete problems.

The investigation assumed an exploratory and descriptive character, seeking not only to map the level of knowledge and satisfaction of the employees in relation to FUNPRESP, but also to understand the meanings attributed by them to the supplementary pension system. This approach was considered appropriate in view of the relative scarcity of empirical

studies on the subject in the field of public management and people management.

The research adopted a qualitative approach, prioritizing the interpretation of data in dialogue with the organizational context and with the theoretical framework built throughout the chapter. Although the study used quantitative data from a structured questionnaire, the analysis was conducted with an interpretative focus, considering that organizational phenomena involve subjective and symbolic dimensions that are not exhausted in numbers (PÁDUA, 2019).

The universe investigated comprised teaching and technical-administrative staff in effective exercise on the analyzed campus, including professionals with different periods of service and different social security trajectories. Civil servants linked to the social security system with potential eligibility for supplementary social security were included, and temporary contracts and outsourced workers were excluded, as they did not fit into the analyzed system.

Data collection took place through an electronic questionnaire prepared on the Microsoft *Forms platform*, an instrument chosen because it allows for a greater reach of the participants and ensures anonymity of the answers. The questionnaire was structured in thematic blocks that addressed the characterization of the participants, level of knowledge about FUNPRESP, adherence to the complementary regime and perception of satisfaction. According to Cervo, Bervian and Silva (2007), the thematic organization of the instrument favors greater coherence between research objectives and collected data, contributing to the quality of subsequent analyses.

The methodological approach adopted sought to respect ethical principles of research, ensuring voluntary participation and confidentiality of information. In addition, the use of an electronic questionnaire allowed participants greater freedom of response, reducing possible embarrassment associated with financial and social security issues, which are often perceived as sensitive in the work environment.

Data analysis followed descriptive and interpretative guidance, combining the organization of responses in summary tables and the discussion of the results in the light of the literature on supplementary pension, people management and decision-making. This strategy allowed us to identify patterns of perception and understand how empirical data reflect broader organizational processes, in line with the proposal of qualitative analysis defended by Gil (2017).

More than presenting statistical results, the methodological approach sought to capture perceptions and meanings attributed by civil servants to social security changes, recognizing that decisions related to retirement involve subjective dimensions, future

expectations and institutional trust relationships. Thus, the study seeks to contribute to a broader understanding of supplementary pension in the public sector, articulating empirical evidence and theoretical reflection.

Thus, the methodological construction adopted is not limited to describing technical procedures, but integrates the interpretative effort of the chapter, offering a basis for the analysis of the empirical evidence presented in the following section, in which the results are discussed in the light of institutional transformations and the challenges of people management in the public service.

6 EMPIRICAL EVIDENCE: WHAT CIVIL SERVANTS REPORT

The empirical evidence obtained in the study reveals a scenario marked by heterogeneous perceptions about supplementary pension in the federal public service, reflecting the institutional transformations discussed in the previous sections. More than isolated indicators, the data point to an adaptation process that is still ongoing, in which civil servants reinterpret their professional trajectories in the face of structural changes in the relationship between public careers and social security protection.

The characterization of the profile of the participants demonstrates the presence of civil servants with a high level of education and significant experience in the public service, a typical reality of federal educational institutions. This data reinforces the idea that pension decisions occur in complex and long-term professional contexts, in which expectations of stability and career planning play a central role (CAMARANO; FERNANDES, 2016).

However, despite the high educational capital, the results show that knowledge about FUNPRESP is not homogeneously distributed among the participants. The predominance of responses indicating a low level of knowledge confirms arguments in the literature on financial literacy, which points out that formal academic training does not necessarily imply mastery of social security and financial issues (LUSARDI; MITCHELL, 2014).

This scenario reveals an important tension: at the same time that the supplementary regime presupposes informed individual decisions, many civil servants still demonstrate insecurity in the face of the available information. This finding reinforces the discussion on the need for institutionalized social security education, already presented in the previous section, and highlights the relevance of the role of people management in mediating these decisions (CHIAVENATO, 2020).

The analysis of the responses related to adherence to the complementary regime shows a predominance of non-adherence, a phenomenon that can be interpreted as an expression of caution in the face of changes perceived as complex or uncertain. This behavior

dialogues with studies on decision-making in risk contexts, in which individuals tend to maintain the status quo when they do not feel fully informed or secure about future outcomes (ROBBINS; JUDGE, 2017).

Among the reasons for non-adherence, arguments related to the permanence in the previous regime, lack of interest and insecurity regarding the functioning of FUNPRESP stand out. Such justifications suggest that the social security decision is strongly related to subjective and symbolic dimensions, associated with the psychological contract of the civil servant and institutional trust, as discussed in section 3.

At the same time, the responses of the adhering civil servants reveal a distinct pattern: those who opted for supplementary pension plans tend to evaluate the regime positively, highlighting benefits such as the institutional counterpart and the possibility of building additional income in retirement. This result points to an apparent contradiction between low overall adherence and high satisfaction among participants, a phenomenon that deserves careful analysis.

This duality suggests the existence of a significant informational asymmetry in the institutional context analyzed. While part of the civil servants remains distant from the supplementary pension due to lack of knowledge or insecurity, those who adhere begin to develop a more concrete understanding of the functioning of the system, reducing initial negative perceptions. Such dynamics confirm the importance of practical experience in building institutional trust (EISENBERGER et al., 2002). The synthesis of the main findings is systematized in Table 1, allowing us to visualize the relationship between knowledge, adherence and satisfaction.

Table 1

Synthesis of the main findings of the research on FUNPRESP

Axis of analysis	Empirical results (percentages)	Analytical implications
Profile of the participants	100% with complete higher education; 77% with a postgraduate degree (specialization, master's, doctorate or post-doctorate)	It shows high educational capital and potential for more informed pension decisions
Length of public service	69% with more than 6 years of experience in the public service	Indicates consolidated careers and the need for long-term pension planning
Level of knowledge about FUNPRESP	71% declared that they knew little about the regime; Only 29% said they know it well or very well	Reveals relevant informational gap and low social security literacy
Joining FUNPRESP	64% did not join the regime; 36% are participants (normal or alternative assets)	Demonstrates low adherence, despite the existence of institutional incentives
Reasons for non-adherence	34% remained in the previous regime; 31% reported a lack of interest; 11% insecurity; 9% have another pension	Reinforces the influence of subjective factors and institutional trust
Type of membership among participants	69% voluntary adherence; 31% automatic adherence	Indicates greater presence of proactive social security behavior

Satisfaction among adherents	78% declared to be satisfied or very satisfied with FUNPRESP	Evidence of positive evaluation of the regime after accession
Factors associated with satisfaction	50% pointed to the institutional counterpart as the main motivator	Confirms the importance of organizational support
Central institutional challenge	Asymmetry between low general knowledge (71%) and high satisfaction among adherents (78%)	Indicates failure of communication and social security guidance
Implications for management	Need for systematic educational and informational actions	Repositions FUNPRESP as a strategic people management policy

Source: Survey data (2023).

The presence of the synoptic table allows us to observe, in an integrated way, the relationship between the participants' profile, levels of knowledge, adherence and satisfaction, functioning as a transition element between the presentation of the data and their analytical interpretation. The joint visualization of the results shows that the main institutional challenge does not necessarily lie in the quality of the complementary regime, but in the way it is understood and communicated to the civil servants.

From the perspective of people management, the results indicate that supplementary pension plans have not yet been fully consolidated as a strategic organizational policy. The absence of systematic social security guidance programs limits the potential of FUNPRESP as an instrument for career enhancement and planning, reinforcing the need for permanent educational actions.

Another relevant aspect concerns the coexistence of different social security regimes within the same institution, a factor that contributes to fragmented perceptions on the subject. Civil servants bound by previous rules tend to compare the current model with historical experiences of greater predictability, while new entrants are compelled to develop financial planning skills from the beginning of their careers.

This diversity of social security experiences reinforces the idea that normative changes produce lasting cultural and organizational effects. The evidence suggests that the transition to the logic of supplementary social security is not limited to legal adaptations, but involves gradual processes of resignification of public work and expectations of social protection.

The analysis also reveals that social security decisions do not occur in isolation, but are articulated with the way civil servants perceive the institution in which they work. The presence of informational support and clear communication tends to strengthen trust and willingness to adhere, while the absence of these elements contributes to conservative behaviors or decision-making postponement.

In this sense, the results reinforce the argument that supplementary pension should be understood as an integral part of the organizational experience of civil servants. More than a financial product, it is configured as a component of the people management policy,

influencing perceptions of appreciation and long-term planning.

Empirical evidence also allows us to observe that satisfaction among adherents is less related to immediate gains and more associated with the perception of future security and the recognition of institutional participation through financial compensation. This aspect indicates that symbolic elements of reciprocity remain relevant even in models that emphasize individual responsibility.

By reiterating the debates presented in the previous sections, the results indicate that the social security transition in the Brazilian public service represents a process under construction, marked by institutional advances, but also by communicational and cultural challenges. Understanding this complexity is essential for developing more effective organizational strategies.

Thus, the evidence presented suggests that the success of supplementary pension plans depends not only on its normative design or financial performance, but also on the ability of public institutions to promote informational environments that favor conscious decisions that are aligned with the expectations of civil servants.

In summary, the data reveal that public servants experience supplementary pension as part of a broader transformation in the meaning of the public career, in which individual planning and institutional support begin to coexist as central elements of professional experience.

This interpretation leads to the need to broaden the debate beyond the numbers, recognizing that supplementary pension represents, at the same time, a financial instrument and an organizational phenomenon. This perspective underlies the following section, dedicated to the expanded discussion of the implications of these findings for public management and for the future of labor relations in the public sector.

7 EXPANDED DISCUSSION: SUPPLEMENTARY PENSION, PUBLIC CAREER AND INSTITUTIONAL TRUST

Based on the evidence presented, it becomes possible to move towards a broader interpretation of supplementary social security as an organizational and symbolic phenomenon, which expresses broader changes in the relations between the State and the civil servant, requiring interpretations that go beyond the strictly normative dimension.

The creation of FUNPRESP and the limitation of social security benefits to the ceiling of the general regime represent milestones of transformation in the historical trajectory of the Brazilian public career. These changes alter expectations consolidated over decades, in which functional stability was associated with social security security guaranteed by the State.

Thus, supplementary social security redefines central elements of the civil servant's psychological contract, impacting perceptions of reciprocity and institutional protection (ROUSSEAU, 1995).

The coexistence of different social security regimes within the same public institutions reinforces the complexity of this process. Civil servants entering in different periods live under different rules, producing constant comparisons and varied interpretations of organizational justice and equity. Such a scenario contributes to the construction of divergent narratives about supplementary pension and directly influences the individual decision-making process.

The results of the research show that the low adherence to the complementary regime does not necessarily result from explicit rejection of the model, but from informational insecurity and difficulties in understanding. This finding dialogues with studies that highlight the influence of financial literacy on long-term decisions, especially in contexts of high technical complexity (LUSARDI; MITCHELL, 2014).

Paradoxically, the high levels of satisfaction among the adhering civil servants suggest that concrete experience with the regime tends to reduce perceptions of risk and increase confidence in the system. This duality shows that the main institutional challenge may lie less in the structure of the supplementary pension plan and more in the processes of communication and organizational education that precede the decision to join.

From the perspective of people management, this scenario points to an important shift: social security policies are no longer treated only as administrative issues and become part of organizational development strategies. The absence of systematic actions for social security guidance can generate informational gaps capable of compromising the effectiveness of public policies designed to ensure financial sustainability and social protection.

In addition, supplementary pension reveals how structural changes can influence the way civil servants project their professional trajectories. The need for individual long-term planning introduces a logic of personal accountability that is close to practices observed in the private sector, changing the traditional perception of the role of the State as a guarantor of future security (BRESSER-PEREIRA, 2010).

This transition does not occur homogeneously. Civil servants with different professional experiences, generational profiles, and levels of familiarity with financial instruments respond differently to social security changes. The heterogeneity observed reinforces the importance of management approaches sensitive to the specificities of internal audiences.

Another relevant aspect refers to institutional trust. Organizational studies indicate that

trust is built through consistent experiences, transparency, and perception of support. When institutional policies are perceived as clear and coherent, workers tend to develop greater commitment and openness to change (EISENBERGER et al., 2002). In this sense, supplementary pension can work both as a factor of strengthening and weakening the organizational bond.

The discussion also allows us to reflect on the role of public educational institutions in this process. As they are environments dedicated to the production and dissemination of knowledge, such organizations have strategic potential to promote social security education and foster more informed decision-making environments. However, the results suggest that this potential is not yet fully exploited.

The analysis of the data also indicates that supplementary pension acts as a symbolic marker of a broader change in the organizational culture of the public service. The logic of absolute predictability gives way to a dynamic in which planning, information and individual decision become valued skills in the professional trajectory.

In this context, people management assumes a mediating role between macrostructural policies and individual experiences of civil servants. The ability to translate complex standards into accessible and relevant information becomes a central element to reduce insecurities and promote choices aligned with the needs of workers.

The discussion also shows that social security decisions involve emotional and identity dimensions, in addition to economic calculations. Risk perception, experience with previous changes, and confidence in institutional stability significantly influence the choices made, reinforcing the importance of integrated approaches between management, communication, and organizational education.

By reiterating the arguments presented in the previous sections, it is observed that supplementary social security in the public service should be interpreted as part of a continuous process of redefining the role of the State and the expectations of civil servants. This transformation requires new forms of institutional support capable of balancing individual responsibility and collective protection.

The expanded discussion also allows us to identify that the high satisfaction among adherents can represent a strategic opportunity for public institutions. Positive experiences can be used as a basis for building clearer institutional narratives, contributing to reducing resistance and strengthening confidence in the complementary regime.

On the other hand, the maintenance of low levels of knowledge among a significant part of the civil servants indicates a risk of perpetuating informational inequalities, in which social security decisions come to depend more on individual access to information than on

structured institutional policies.

Thus, supplementary pension emerges as a privileged space to observe how macroeconomic and legislative changes materialize in the daily life of public organizations, influencing management practices and labor relations. This perspective reinforces the importance of interdisciplinary approaches capable of integrating economics, public administration, and organizational behavior.

In summary, the results and discussions presented indicate that the success of supplementary pension in the public service depends not only on its financial sustainability, but also on the construction of institutional trust and the strengthening of social security education strategies. People management, in this scenario, occupies a central position in the mediation between public policies and individual experiences.

Finally, the analysis reinforces that supplementary pension plans do not represent only a technical change, but a cultural transformation in Brazilian public careers, redefining expectations of social protection and requiring new organizational and individual skills. This understanding broadens the scope of the debate and paves the way for the final considerations presented in the next section.

8 FINAL CONSIDERATIONS AND IMPLICATIONS FOR PUBLIC MANAGEMENT

This chapter sought to analyze supplementary social security in the federal public service from a perspective that articulates institutional transformations, people management and concrete experiences of public servants. Throughout the discussion, it became evident that the recent changes in the Brazilian public pension system do not represent only normative adjustments, but broader processes of redefinition of the relationship between the State, public career, and social protection.

The legislative transformations observed in recent decades, especially the creation of FUNPRESP and the limitation of social security benefits to the ceiling of the general regime, have significantly changed the social security scenario of federal employees. These changes introduced a logic of greater individual accountability, requiring financial planning and decision-making in a field historically associated with predictability and institutional security.

The empirical data analyzed revealed that, despite the high level of training of the civil servants investigated, knowledge about supplementary pension remains unequal, indicating that the complexity of the topic still constitutes a relevant barrier to informed decisions. This result reinforces the importance of social security education as a central element of people management policies in the public sector.

At the same time, the high levels of satisfaction observed among the civil servants

adhering to FUNPRES P suggest that practical experience with the regime tends to reduce uncertainties and increase institutional confidence. This finding reveals an important paradox: while the lack of information limits initial adherence, the concrete experience of the system favors positive evaluations and perception of future security.

From the perspective of public management, the findings indicate that supplementary pension should be understood as a strategic organizational policy, capable of influencing career expectations, commitment, and perception of institutional appreciation. In this sense, the performance of the people management areas becomes essential to mediate the understanding of social security changes and promote more informed decision-making environments.

The evidence presented also suggests that institutional communication plays a decisive role in building the trust of civil servants. Technical information alone is not enough to promote effective understanding; It is necessary to develop continuous guidance strategies that translate complex standards into accessible content that contextualizes the reality of workers.

In addition, the analysis allows us to recognize that supplementary pension expresses a cultural transformation in public careers, marked by the coexistence between traditional expectations of stability and new demands for individual planning. This movement requires public institutions to be more sensitive to dealing with different generational profiles and professional trajectories, avoiding homogeneous approaches that disregard this diversity.

From a practical point of view, the chapter points to the need to institutionalize permanent social security education programs, integrated with civil servant development policies. Such initiatives can contribute to reducing informational asymmetries, strengthening decision-making autonomy and expanding the perception of organizational support.

In theoretical terms, the study contributes by bringing the debate on supplementary pension plans closer to discussions on psychological contracts, institutional trust and strategic management of people, broadening the view on a topic traditionally treated from legal or economic perspectives. This integrated approach allows us to understand social security as a constitutive dimension of the organizational experience in the contemporary public sector.

As limitations, the institutional focus of the study stands out, concentrated in a single public education organization, which restricts the generalization of the results. Even so, the evidence presented offers relevant clues for understanding similar processes in other federal public institutions.

In view of this, it is recommended that future investigations broaden the scope of

analysis, incorporating comparisons between different institutions and organizational contexts, as well as more in-depth qualitative approaches capable of exploring the subjective perceptions of civil servants about security, risk, and pension planning.

Finally, it is concluded that supplementary social security in the federal public service represents a strategic field for contemporary public management, as it articulates fiscal sustainability, social protection and individual career experiences. The success of this model depends, above all, on the ability of institutions to build transparent informational environments, foster trust and promote continuous social security education.

Thus, more than a financial mechanism, supplementary pension plans are a central element of the ongoing transformations in labor relations in the Brazilian public sector, requiring permanent reflection and integrated action between institutional policies and people management. In this sense, supplementary social security is consolidated as a strategic field for the formulation of institutional policies and for future research agendas on labor and public management in Brazil.

ABSTRACT

Renal tumors account for approximately 7% of all pediatric tumors; however, Wilms tumor is the most common renal tumor in children, particularly those between 2 and 5 years of age. Its etiology is not yet fully understood, but it is known that certain genetic conditions may be associated with an increased risk of developing this tumor. As it is a malignant neoplasm, early diagnosis is essential to improve patient prognosis. Therefore, periodic screening through abdominal ultrasonography is necessary in patients with a genetic predisposition to this neoplasm. Most patients are asymptomatic, presenting only with a unilateral palpable abdominal mass during physical examination. However, other possible symptoms associated with this condition include arterial hypertension, abdominal pain, hematuria, fever, anemia, leukocytosis, constipation, and fatigue. The therapeutic approach for this tumor involves combined treatment, including chemotherapy, surgical tumor resection, and/or radiotherapy. Staging of Wilms tumor should be performed through the analysis of imaging studies to detect renal masses and distant metastases, thereby allowing for appropriate and individualized treatment planning for each patient. The primary objective of this study is to conduct a literature review on the genetic influence in Wilms tumor, as well as its diagnostic methods and emerging therapeutic options for this condition. The methodology adopted for the proposed literature review is based on the analysis and review of scientific articles published between 2021 and 2025, identified through searches in the PubMed, SciELO, and Google Scholar databases, using the following keywords: "Wilms Tumor," "Tumor de Wilms," "Nephroblastoma," "Wilms tumor gene 1," and "WT1 gene." Based on the analyzed studies, Wilms tumor is identified as a highly prevalent malignant pediatric renal neoplasm with a genetic component associated with its etiology. Its clinical presentation is variable, ranging from asymptomatic to oligosymptomatic forms. Diagnosis is initially established through clinical history and physical examination, with imaging studies requested for diagnostic confirmation. Furthermore, treatment of this neoplasm involves a combination of therapeutic modalities, namely nephrectomy followed by systemic chemotherapy. Thus, early diagnosis and the integration of surgical and adjuvant approaches are essential to optimize prognosis, highlighting the importance of continuous scientific research and specialized care. Finally,

¹ E-mail: nathaliarates6@hotmail.com

there is a clear need to intensify efforts to ensure timely diagnosis and appropriate treatment for children affected by Wilms tumor.

Keywords: Wilms Tumor. Nephroblastoma. Wilms Tumor Gene-1. WT1 Gene.

RESUMO

Os tumores renais compreendem cerca de 7% de todos os tumores pediátricos, contudo o Tumor de Wilms é o tumor renal mais comum em crianças, principalmente daquelas na faixa etária entre 2 a 5 anos de idade. A sua causa ainda não está muito bem salientada, mas sabe-se que algumas condições genéticas podem estar associadas a um maior risco de desenvolvimento desse tumor. Por se tratar de uma neoplasia maligna, o diagnóstico precoce é primordial para a melhora do prognóstico do paciente. Dessa forma, é necessário realizar rastreio periodicamente, por meio de ultrassonografia de abdome, nos pacientes que possuem predisposição genéticas para essa neoplasia. A grande maioria dos pacientes cursam de forma assintomática, apresentando apenas uma massa abdominal palpável unilateral durante o exame físico. Contudo, outros possíveis sintomas associados a essa patologia são: hipertensão arterial, dor abdominal, hematúria, febre, anemia, leucocitose, constipação e fadiga. O esquema terapêutico para esse tumor abrange tratamento combinado que inclui quimioterapia, cirurgia para ressecção do tumor e/ou radioterapia. O estadiamento do Tumor de Wilms deve ser realizado por meio da análise de exames de imagem para detecção de massa nos rins e metástase a distância, e por meio disso é possível planejar o tratamento de maneira adequada e individualizada para cada paciente. O objetivo fundamental da pesquisa é realizar uma revisão bibliográfica acerca da influência genética no Tumor de Wilms, bem como é realizado seu diagnóstico e as novas opções terapêuticas para essa patologia. A metodologia adotada para a revisão bibliográfica proposta baseia-se na análise e leituras de artigos científicos publicados entre os anos de 2021 a 2025, os quais serão encontrados através de pesquisas nas plataformas PubMed, SciELO e Google Acadêmico, utilizando os unitermos: “Wilms Tumor”, “Tumor de Wilms”, “Nefroblastoma”, “Wilms tumor gene-1”, “gene WT 1”. Tendo como base o estudo realizado, percebe-se que Tumor de Wilms constitui uma neoplasia maligna renal infantil, de alta prevalência e que possui um componente genético associado à sua etiologia. Seu quadro clínico é bem variável, podendo ser assintomático ou oligossomático. O diagnóstico é inicialmente realizado por meio da história clínica e exame físico, exames de imagem podem ser solicitados para a confirmação diagnóstica. Ademais, o tratamento da neoplasia supracitada é realizado combinado algumas terapias, ou seja, nefrectomia seguida de quimioterapia sistêmica. Logo, o diagnóstico precoce e a integração de abordagens cirúrgicas e adjuvantes são fundamentais para otimizar o prognóstico, o que evidencia a importância de investigação científica contínua e de assistência especializada. Em síntese, percebe-se a necessidade de se empregar esforços para que haja o diagnóstico e o tratamento adequado das crianças acometidas pelo Tumor de Wilms.

Palavras-chave: Wilms Tumor. Tumor de Wilms. Nefroblastoma. Wilms Tumor Gene-1. Gene WT 1.

RESUMEN

Los tumores renales representan aproximadamente el 7% de todos los tumores pediátricos; sin embargo, el tumor de Wilms es el tumor renal más común en niños, especialmente en aquellos entre 2 y 5 años de edad. Su causa aún no se comprende completamente, pero se sabe que algunas condiciones genéticas pueden estar asociadas con un mayor riesgo de desarrollar este tumor. Al ser una neoplasia maligna, el diagnóstico temprano es fundamental para mejorar el pronóstico del paciente. Por lo tanto, es necesario el cribado periódico, mediante ecografía abdominal, en pacientes con predisposición genética a esta neoplasia. La gran mayoría de los pacientes son asintomáticos, presentando únicamente una masa

abdominal unilateral palpable durante la exploración física. Sin embargo, otros posibles síntomas asociados con esta patología son: hipertensión arterial, dolor abdominal, hematuria, fiebre, anemia, leucocitosis, estreñimiento y fatiga. El régimen terapéutico para este tumor implica un tratamiento combinado que incluye quimioterapia, cirugía para la resección del tumor y/o radioterapia. La estadificación del tumor de Wilms debe realizarse mediante el análisis de estudios de imagen para detectar masas renales y metástasis a distancia, lo que permite una planificación terapéutica adecuada e individualizada para cada paciente. El objetivo fundamental de esta investigación es realizar una revisión bibliográfica sobre la influencia genética en el tumor de Wilms, así como su diagnóstico y las nuevas opciones terapéuticas para esta patología. La metodología adoptada para la revisión bibliográfica propuesta se basa en el análisis y la lectura de artículos científicos publicados entre 2021 y 2025, que se encontrarán mediante búsquedas en las plataformas PubMed, SciELO y Google Académico, utilizando las palabras clave: "Wilms Tumor", "Tumor de Wilms", "Nefroblastoma", "Wilms tumor gene-1", "gene WT 1". Con base en el estudio realizado, se observa que el tumor de Wilms constituye una neoplasia renal maligna en niños, con alta prevalencia y un componente genético asociado a su etiología. La presentación clínica es bastante variable, pudiendo ser asintomática u oligosomática. El diagnóstico se realiza inicialmente mediante la historia clínica y la exploración física. Se pueden solicitar estudios de imagen para la confirmación diagnóstica. Además, el tratamiento de la neoplasia mencionada implica una combinación de terapias, concretamente nefrectomía seguida de quimioterapia sistémica. Por lo tanto, el diagnóstico precoz y la integración de enfoques quirúrgicos y adyuvantes son fundamentales para optimizar el pronóstico, lo que resalta la importancia de la investigación científica continua y la atención especializada. En resumen, es necesario realizar esfuerzos para garantizar el diagnóstico y el tratamiento adecuado de los niños afectados por el tumor de Wilms.

Palabras clave: Tumor de Wilms. Nefroblastoma. Gen-1 del Tumor de Wilms. Gen WT1.

1 INTRODUCTION

Renal neoplasms represent a significant portion of solid tumors in childhood, accounting for approximately 7% to 8% of all pediatric neoplasms, with Wilms' tumor standing out as the most prevalent entity in this age group (JÚNIOR; BURNS; LOPEZ, 2021; PEDIATRIA, 2024). Wilms' Tumor, also called nephroblastoma, is an embryonic malignant neoplasm of the kidney that predominantly affects children under five years of age, with a peak incidence between two and five years of age (INCA, 2022; LESLIE; SAJJAD; MURPHY, 2025).

From a historical and conceptual point of view, Wilms' Tumor has been described as a neoplasm derived from remnants of the metanephric blastema, reflecting failures in the normal processes of renal differentiation and maturation during embryonic development (KUMAR, 2018; PRAY; PERSAUD; TORCHIA, 2022). These embryological alterations justify the characteristic histological composition of the tumor, often described as triphasic, including blastematosus, epithelial, and stromal components (KUMAR, 2018; SILVA et al., 2021). Advances in molecular genetics have allowed a better understanding of the etiopathogenesis of Wilms' Tumor, evidencing the participation of mutations and epigenetic alterations in genes that regulate renal development, such as WT1, WT2, WTX, and CTNNB1 (KUMAR, 2018; ZENG et al., 2024). In addition, the association of nephroblastoma with specific genetic syndromes, such as WAGR, Denys-Drash, and Beckwith-Wiedemann, reinforces the central role of genetics in tumor genesis and risk stratification in these patients (LESLIE; SAJJAD; MURPHY, 2025; PEDIATRIA, 2024).

Clinically, Wilms' Tumor presents insidiously in most cases, with a painless abdominal mass being the most frequent finding, often identified incidentally by caregivers (ALVES FILHO et al., 2024; IVO BRAZ et al., 2022). Other signs and symptoms may include hematuria, abdominal pain, hypertension, and nonspecific systemic manifestations, especially in more advanced stages of the disease (SILVA et al., 2023; SILVA et al., 2021).

The diagnosis of Wilms' Tumor is based on the correlation between clinical data, imaging tests and histopathological evaluation, with abdominal ultrasonography being the most used initial method, followed by computed tomography or magnetic resonance imaging for staging and therapeutic planning (MOORE; AGUR, 2024; MAIA et al., 2022). The correct identification of tumor staging and histological subtype is essential for defining the therapeutic approach and for prognostic estimation (PDQ, 2024; PEDIATRIA, 2024).

The treatment of Wilms' Tumor is characterized by a multimodal approach, involving surgery, chemotherapy and, in specific situations, radiotherapy, with well-established protocols that have provided a significant increase in survival rates in recent decades (PDQ,

2024; SILVA et al., 2021). Despite therapeutic advances, late treatment-related effects, such as renal dysfunction, cardiotoxicity, and growth changes, remain relevant challenges in the long-term follow-up of these patients (SILVENTE BERNAL et al., 2024).

In this context, it is essential to carry out bibliographic reviews that integrate current knowledge about the genetic, diagnostic, and therapeutic aspects of Wilms' Tumor, contributing to scientific updating and improving clinical practice (MAIA et al., 2022; ZENG et al., 2024).

Thus, the present study aims to comprehensively review the scientific literature on Wilms' Tumor, addressing its main genetic aspects, diagnostic methods, and therapeutic strategies, in light of the most recent evidence available (PDQ, 2024; PEDIATRIA, 2024).

2 MATERIALS AND METHODS

The present study consists of a narrative literature review, with a qualitative approach and descriptive-analytical character, developed with the objective of gathering and critically analyzing the existing scientific production on Wilms' Tumor, with emphasis on its genetic aspects, diagnostic methods and therapeutic approaches. The research was carried out through data collection in recognized scientific databases, including PubMed/MEDLINE, SciELO and Google Scholar, in addition to consulting textbooks, academic dissertations and official documents of government agencies in the health area, using the physical and digital infrastructure of the University of Ribeirão Preto. Descriptors in Portuguese and English, such as "Wilms Tumor", "Wilms Tumor", "Nephroblastoma", "Wilms tumor gene-1" and "WT1 gene", were applied in isolation or in combination. As inclusion criteria, we selected publications available in full, in Portuguese, English, or Spanish, published between 2021 and 2025, which directly addressed genetic aspects, clinical, laboratory, and imaging diagnoses, as well as therapeutic strategies related to Wilms' Tumor, excluding duplicate studies, outside the time frame, or not relevant to the proposed objectives. The selected materials were submitted to exploratory and analytical reading, with data organization according to the thematic axes of the study, and the findings were discussed with the advisor and analyzed in a qualitative and comparative way, in order to identify convergences, divergences and advances in scientific knowledge.

3 RESULTS

The analysis of the selected scientific literature showed that Wilms' Tumor is the main malignant renal neoplasm of childhood, accounting for approximately 85% to 90% of pediatric renal tumors and about 7% to 8% of all malignant neoplasms in this age group (JÚNIOR;

BURNS; LOPEZ, 2021; PEDIATRICS, 2024; LESLIE; SAJJAD; MURPHY, 2025). The reviewed studies showed a higher incidence in children under the age of five, with a peak between two and five years, with no absolute consensus regarding the predominance by sex (INCA, 2022; SILVA et al., 2023).

Regarding genetic aspects, the findings pointed to a strong association between Wilms' Tumor and alterations in genes involved in renal embryonic development, especially the genes WT1, WT2, WTX, and CTNNB1, located mostly on chromosome 11 (KUMAR, 2018; ZENG et al., 2024). A consistent relationship was also observed between nephroblastoma and specific genetic syndromes, such as WAGR, Denys-Drash and Beckwith-Wiedemann, which significantly increase the risk of tumor development in the pediatric population (LESLIE; SAJJAD; MURPHY, 2025; PRAY; PERSAUD; TORCHIA, 2022).

Regarding the clinical manifestations, the reviewed literature indicated that the most frequent presentation of Wilms' Tumor is the presence of a painless abdominal mass, often detected incidentally by those responsible for it (ALVES FILHO et al., 2024; IVO BRAZ et al., 2022). Other recurrent clinical signs include abdominal pain, hematuria, arterial hypertension secondary to activation of the renin-angiotensin system, and, in more advanced stages, systemic symptoms such as fever, anorexia, weight loss, and anemia (SILVA et al., 2021; SILVA et al., 2023).

Regarding the diagnosis, the results showed that imaging methods play a central role in the initial investigation, with abdominal ultrasonography being the first-line examination, followed by computed tomography or magnetic resonance imaging for tumor staging and evaluation of local and metastatic extension (MOORE; AGUR, 2024; MAIA et al., 2022). Diagnostic confirmation is based on histopathological analysis, in which Wilms' Tumor classically presents a triphasic pattern composed of blastematosus, epithelial, and stromal elements, although histological variants have also been described (KUMAR, 2018; SILVA et al., 2021).

In the field of laboratory markers, studies have shown that there is, to date, no specific serum marker widely validated for Wilms Tumor, however recent evidence points to an increase in alpha-fetoprotein in rare subgroups of patients, suggesting potential future utility as a complementary biomarker (GREEN et al., 2024). In parallel, investigations in molecular genetics and bioinformatics have identified candidate genes with possible prognostic and therapeutic value, broadening the prospects for personalized medicine (ZENG et al., 2024).

With regard to treatment, the results confirmed that the therapeutic approach to Wilms' Tumor is predominantly multimodal, involving surgery, chemotherapy and, in selected cases,

radiotherapy, according to staging and histological subtype (PDQ, 2024; PEDIATRIA, 2024). Radical nephrectomy remains the standard surgical treatment, being associated with chemotherapy regimens based mainly on vincristine, actinomycin D, and doxorubicin, which has provided high survival rates, especially in cases diagnosed early (PDQ, 2024; SILVA et al., 2021).

In view of the above, the literature analyzed showed that, despite therapeutic advances and favorable prognosis, the late effects of treatment, such as renal dysfunction, cardiotoxicity, growth alterations, and increased risk of secondary neoplasms, represent important challenges in the long-term follow-up of surviving patients (SILVENTE BERNAL et al., 2024; PEDIATRIA, 2024).

4 DISCUSSION

The results obtained in this literature review corroborate the literature by showing Wilms' Tumor as the main malignant renal neoplasm of childhood, with a high incidence in children under five years of age, a fact that reinforces its embryonic nature and its close relationship with failures in renal differentiation processes during fetal development (JÚNIOR; BURNS; LOPEZ, 2021; PRAY; PERSAUD; TORCHIA, 2022). This characteristic explains both the observed age peak and the frequent association with congenital genetic alterations and developmental syndromes (LESLIE; SAJJAD; MURPHY, 2025).

The discussion of genetic aspects shows that mutations in the WT1, WT2, WTX, and CTNNB1 genes play a central role in the pathogenesis of Wilms' Tumor, since these genes act directly in the regulation of nephrogenesis and in the maintenance of renal cell differentiation (KUMAR, 2018; ZENG et al., 2024). The consistent association with syndromes such as WAGR, Denys-Drash, and Beckwith-Wiedemann reinforces the importance of clinical surveillance in children with these conditions, since early screening can positively impact prognosis (LESLIE; SAJJAD; MURPHY, 2025; PEDIATRIA, 2024).

In the clinical context, the predominance of a painless abdominal mass as the main manifestation reinforces the insidious nature of the disease and explains the often late diagnosis in some cases, especially in populations with limited access to health services (ALVES FILHO et al., 2024; IVO BRAZ et al., 2022). The presence of signs such as hematuria, hypertension, and systemic symptoms in more advanced stages highlights the importance of detailed clinical evaluation and early diagnostic suspicion by health professionals (SILVA et al., 2021; SILVA et al., 2023).

The analysis of diagnostic methods demonstrates that imaging tests are indispensable in the identification and staging of Wilms' Tumor, and abdominal ultrasonography is widely

recommended as an initial test due to its accessibility and absence of ionizing radiation (MOORE; AGUR, 2024; MAIA et al., 2022). Computed tomography and magnetic resonance imaging complement the investigation by providing detailed information on tumor extension, vascular involvement, and the presence of metastases, essential aspects for therapeutic planning (PDQ, 2024). Histopathological confirmation remains the diagnostic gold standard, with the identification of the triphasic pattern being a classic element, although the existence of histological variants requires special attention due to their prognostic implication (KUMAR, 2018; SILVA et al., 2021). The distinction between tumors of favorable and unfavorable histology is decisive in the stratification of risk and in the choice of treatment intensity, as recommended by the main international protocols (PDQ, 2024; PEDIATRIA, 2024).

With regard to laboratory markers, the absence of specific serum biomarkers limits noninvasive follow-up of the disease, although recent studies indicate an increase in alpha-fetoprotein in rare subgroups of patients, which opens perspectives for future clinical applications and additional research (GREEN et al., 2024). At the same time, advances in bioinformatics and molecular genetics have allowed the identification of candidate genes with potential prognostic and therapeutic value, pointing to the possibility of more personalized approaches in the future (ZENG et al., 2024).

The discussion about treatment shows that the multimodal approach, involving surgery, chemotherapy and, in selected cases, radiotherapy, is responsible for the high survival rates currently observed, especially in patients diagnosed in early stages (PDQ, 2024; SILVA et al., 2021). Radical nephrectomy associated with standardized chemotherapy regimens has established itself as an effective therapeutic strategy, reflecting the advances in pediatric oncology in recent decades (PEDIATRIA, 2024).

However, despite the favorable prognosis, the late effects of treatment represent a growing challenge, including chronic renal dysfunction, cardiotoxicity related to the use of anthracyclines, growth alterations, and increased risk of secondary neoplasms (SILVENTE BERNAL et al., 2024). These findings reinforce the need for longitudinal follow-up of these patients and the continuous search for less toxic and more targeted therapies (GREEN et al., 2024; ZENG et al., 2024).

As a result, the discussion of the analyzed data shows that Wilms' Tumor, although it has high cure rates, still requires advances in early diagnosis, individualization of treatment, and reduction of late sequelae, highlighting the relevance of integrative literature reviews for scientific updating and improvement of medical practice (MAIA et al., 2022; PEDIATRIA, 2024).

5 FINAL CONSIDERATIONS

The present literature review allowed us to consolidate the understanding that Wilms' Tumor is the main malignant renal neoplasm of childhood, with high clinical and epidemiological relevance, especially in children under five years of age, which reinforces its close relationship with embryological and genetic alterations of renal development (JÚNIOR; BURNS; LOPEZ, 2021; PRAY; PERSAUD; TORCHIA, 2022). The findings show that the etiopathogenesis of nephroblastoma is strongly associated with mutations and epigenetic alterations in nephrogenesis regulatory genes, such as WT1, WT2, WTX, and CTNNB1, as well as the occurrence of specific genetic syndromes, which require differentiated clinical surveillance and early screening (KUMAR, 2018; LESLIE; SAJJAD; MURPHY, 2025; ZENG et al., 2024).

From a clinical and diagnostic point of view, it was found that the insidious presentation of the disease, characterized mainly by the presence of a painless abdominal mass, poses challenges to early detection, highlighting the importance of clinical suspicion and timely access to appropriate imaging methods (ALVES FILHO et al., 2024; MAIA et al., 2022). The association between imaging studies and histopathological evaluation proved to be indispensable for the correct tumor staging and for the definition of the prognosis, especially with regard to the differentiation between favorable and unfavorable histology (MOORE; AGUR, 2024; KUMAR, 2018; SILVA et al., 2021).

With regard to treatment, the studies analyzed demonstrated that the multimodal approach, based on nephrectomy associated with chemotherapy and, in selected cases, radiotherapy, resulted in significant survival rates, evidencing the advances achieved by pediatric oncology in recent decades (PDQ, 2024; PEDIATRIA, 2024). However, the late effects related to the therapies employed, such as renal dysfunction, cardiotoxicity, and growth changes, remain important challenges in the long-term follow-up of surviving patients, requiring continuous and individualized follow-up strategies (SILVENTE BERNAL et al., 2024).

In view of this, it is observed that recent advances in molecular genetics and in the identification of potential biomarkers open promising perspectives for the development of more targeted and less toxic therapeutic approaches, contributing to the improvement of the quality of life of patients affected by Wilms' Tumor (GREEN et al., 2024; ZENG et al., 2024).

In view of the above, it is concluded that the continuity of scientific research in this area is essential for the improvement of early diagnosis, therapeutic individualization and the reduction of late sequelae, reaffirming the relevance of literature review studies for updating

knowledge and strengthening evidence-based medical practice (MAIA et al., 2022; PEDIATRIA, 2024).

ABSTRACT

Brazilian Law No. 13.146/2015 defines a disabled person as someone with long-term physical, mental, intellectual, or sensory impairment which, when interacting with certain barriers, restricts their full and equal participation in society. In Article 3, paragraph IX, a person with reduced mobility is characterised as someone who, presents a permanent or temporary difficulty in movement, flexibility, motor coordination, or perception, thus including elderly, pregnant and obese people, as well as people suffering from fibromyalgia, lupus, or Parkinson's disease. The project aimed to reveal the difficulties people with disabilities or with reduced mobility face when using existing cosmetic packaging. The Scielo, PubMed, Google Scholar, and LILACS platforms were used as the basis for an integrative review, as well as searches on news websites focusing on the project's key themes (Accessibility; Cosmetics; Packaging), with publications limited to 2000–2024. After the reviews, the data were gathered to create the questionnaire, which then served as the analysis tool. Social media platforms were used for disseminating the project. The results showed that 14% of the subjects required assistance when handling the products, and 44% did not know where to obtain more accessible packaging. This demonstrates a lack of interest that cosmetic brands show in including this group in packaging development, even though these users have a right to such

RESUMO

A Lei Nº 13.146/2015 define como pessoa com deficiência aquela que possui impedimentos físicos, mentais, intelectuais ou sensoriais de longo prazo que, ao interagir com barreiras, limitam sua participação plena e igualitária na sociedade. Quanto ao Art. 3º, parágrafo IX, caracteriza a pessoa com mobilidade reduzida como alguém que, por qualquer motivo, apresenta dificuldade permanente ou temporária de movimentação, flexibilidade, coordenação motora ou percepção, assim considerando as pessoas idosas, gestantes, pessoas com obesidade, fibromialgia, Lúpus ou Parkinson. O projeto teve a intenção de revelar as dificuldades de pessoas com deficiência ou com mobilidade reduzida ao manusear embalagens cosméticas já presentes no mercado. As plataformas Scielo, PubMed, Google Scholar e LILACS, foram utilizadas como base à revisão integrativa, assim como pesquisas em sites de notícias com direcionamento aos postos-chave do projeto (Acessibilidade; Cosméticos; Embalagens;) com limitação das publicações de 2000-2024. Após as revisões, foram coletados os dados necessários para formulação do questionário onde foi utilizado como instrumento para análise. Para a divulgação do projeto, utilizou-se a plataformas sociais. Por meio dos resultados, observou-se que 14% necessitavam de ajuda ao manusear os produtos e 44% não sabiam onde adquirir embalagens mais acessíveis para manejo. Isso demonstra o desinteresse por parte das marcas em incluir esse tipo de público durante a produção de suas embalagens mesmo sendo um direito destes. Observou a necessidade de implementação de embalagens acessíveis como forma de autonomia para os seus usuários, promovendo assim a inclusão social.

RESUMEN

La Ley n.º 13.146/2015 define como persona con discapacidad aquella que tiene impedimentos físicos, mentales, intelectuales o sensoriales de larga duración que, al interactuar con barreras, limitan su participación plena e igualitaria en la sociedad. En cuanto al artículo 3, párrafo IX, caracteriza persona con movilidad reducida como alguien que, por cualquier motivo, presenta dificultades permanentes o temporales de movimiento, flexibilidad, coordinación motora o percepción, incluyendo así a las personas mayores, embarazadas, personas con obesidad, fibromialgia, lupus o Parkinson. El proyecto tenía la intención de revelar las dificultades de personas con discapacidad o movilidad reducida para manipular los envases de cosméticos ya presentes en el mercado. Las plataformas Scielo, PubMed, Google Scholar y LILACS se utilizaron como base para la revisión integradora, así como búsquedas en sitios web de noticias orientadas a los puntos clave del proyecto (accesibilidad, cosméticos, envases), con limitación de publicaciones entre 2000-2024. Tras las revisiones, se recopilaron los datos necesarios para la elaboración del cuestionario, que se utilizó como instrumento de análisis. Para divulgación del proyecto se utilizaron las plataformas sociales. A partir de los resultados, se observó que 14 % necesitaba ayuda para manipular los productos y 44 % no sabía dónde adquirir envases más accesibles para su manipulación. Esto demuestra la falta de interés por parte de las marcas en incluir a este tipo de público durante la producción de sus envases. Se observó la necesidad de implementar envases accesibles como forma de autonomía para sus usuarios, promoviendo así la inclusión social.

1 INTRODUCTION

According to Law No. 13,146/2015, we define Art. 2 - a person with a disability is one who has a long-term physical, mental, intellectual or sensory impairment, which, in interaction with one or more barriers, may obstruct his or her full and effective participation in society on an equal basis with other people. Article 3, paragraph IX – person with reduced mobility: one who has, for any reason, difficulty in movement, permanent or temporary, generating an effective reduction in mobility, flexibility, motor coordination or perception, including the elderly, pregnant women, breastfeeding women, people with infants and obese people. We also observed reduced mobility in people with some morbidities such as: Fibromyalgia, rheumatoid arthritis, Lupus, Parkinson's, among others.

In article 53 of the same Law mentioned above, all Brazilians with a disability or motor impediment have the right to accessibility in order to have their dignity and individual integrity ensured, so that they can live together as independent and active citizens. Despite this, it is noted that even with such a right, accessibility does not always reach this part of the population due to the little interest of large industries because they do not consider such adaptations to be profitable.

The Brazilian cosmetics market has been growing significantly over the decade, ranking 4th in the world (Forbes, 2020). This is due to the search for products that help improve their appearance, since in today's society, an individual's physiognomy has a direct impact on their physical-mental health (BORBA; THIVES, 2011). In addition, the influence of the new digital era can be evaluated, with the emergence of "influencers" with motor disabilities or reduced mobility, presenting their difficulties in handling cosmetic packaging. To what extent is the beauty and personal care market willing to grow following the inclusion of these individuals?

The struggle for the inclusion of groups considered minorities within Brazilian society has been growing continuously over the years, this is observed in the achievement of the creation of the Statute of Persons with Disabilities, where their rights to accessibility are assured. However, it is noted that in their daily lives, there is a lack of implementation of these adaptations that offer them autonomy in their daily lives. Such neglect can be seen, for example, in the scarcity of accessible packaging in cosmetic products, thus resulting in a difficulty in their use due to certain movements that they are unable to perform due to their deficiencies (FOLGADO; CRUZ; SAMPAIO, 2023).

In view of this, the repercussion caused by the research on the survey of accessible packaging in the middle of the cosmetic industry for individuals with disabilities would be able

to positively influence several aspects of the Brazilian community. This impact can be analyzed both in the cosmetic industries and within Brazilian society through:

- Reduction of social exclusion: The research can help reduce the social exclusion of people with disabilities or motor difficulties due to some comorbidity in relation to cosmetic products. This accessibility is guaranteed to them in Law No. 13,146/2015, art. 53 from adaptations of packaging already on the market.
- Awareness of Non-PWDs: Based on the results obtained from the survey, it may be possible to open the debate on the difficulties of PWDs or people with reduced mobility to enjoy beauty and self-care products. This can result in the awareness of people who do not have any disability to help demand that large cosmetic industries adapt and look at this minority in order to guarantee their equality rights that are guaranteed in the Brazilian Constitution.
- Inclusive companies: Through the project, the results can evaluate which companies have in their policy the inclusion of their products for people with disabilities or some type of motor limitation.

With these results, positive marketing can be generated on behalf of these institutions and have an increase in their demands. In this way, other companies may seek to change the packaging of their products in order to compete with institutions that had favorable results in the survey.

The need to implement accessible packaging helps to develop autonomy for its users, thus promoting social inclusion. This type of object is not only of great use to its target audience, but it also contributes to the education of people who do not have any type of need, as they learn the importance of collective integration through the adaptation of packaging. In addition, Law No. 10,098/2000 establishes general standards and basic criteria for the promotion of accessibility for people with disabilities or reduced mobility (LIMA, 2022).

The project aims to reveal and present the difficulties of people with disabilities or reduced mobility when handling cosmetic packaging already on the market. To evaluate how much the industry is willing to adapt to serve an audience that is not considered the majority in society in order to obtain the inclusion of these in activities that Non-PWDs consider basic and that, supposedly, they have no difficulty in performing routinely, such as the act of screwing and opening a lid that for many with muscle weakness is a difficult action.

2 METHODOLOGY

To carry out the project, initially readings were carried out on the Scielo, PubMed, Google Scholar and LILACS platforms, as well as searches on news sites with direction to the key positions of the project (Accessibility; Cosmetics; Packaging) and limiting the literatures to publications from 2000-2024. This selection was carried out during the period from August 2024 to December 2024. The selected literatures fit the theme of the research and its social impacts addressed.

After the integrative reviews, the necessary data were collected for the formulation of the questionnaire that will be used as an instrument for analysis, after its approval by the Ethics Committee due to the project involving responses from human beings. The approval is under opinion 7,311,984. To publicize the project, social platforms were used in order to reach greater responses (Figure 1).

Figure 1

Final design for publishing the post on Instagram and Tiktok platforms

Source: The authors. Manaus, 2025.

3 RESULTS

At the beginning of the questionnaire, the participants were presented with the Informed Consent Form (ICF), approved by the Ethics Committee. After reading, those who agreed to fill out the questionnaire checked the option "I have read and agree to participate in the research on the theme: "Survey on packaging accessibility in the cosmetic industry". The questionnaire obtained 100 responses, of which 100% consented to participate in the research after reading the terms presented in the ICF.

The 100 participants stated that they were aged between 18 and 80 years, met the other inclusion criteria of this project, and their answers did not fit the exclusion criteria, so no questionnaire was discarded for data analysis. It is observed that the main audience

reached by the survey is aged between 18 and 25 years, totaling 62 participants, and the smallest audience reached is 55 years old or older, totaling 3 participants (Figure 2).

Figure 2

Age of the participants

Source: Prepared by the authors. Manaus, 2025.

It was found that 90% of the participants stated that they were female, 8.9% of the participants stated that they were male and 1.1% of the participants stated that they preferred not to say.

The question "If not, which country?" was discarded because 100% of the participants had stated in the question "Resident of Brazil?" to live in Brazil. Of which, 95 are residents of Manaus-AM and each of the other participants resides in: Praia Grande-SP (1) ; Brasília-DF (1) ; Lavras-MG (1); Olinda- PE (1); Barueri - SP(1).

After the end of the sociodemographic survey of the participants, the questionnaire was started asking if they had any disability or reduced mobility, in which 98% denied and 2% confirmed. When asked if they had any health condition that had difficulty handling, whether opening or closing packages, 92% reported that they did not and 8% said they did, with rheumatoid arthritis being the first (5 answers) followed by diabetes and fibromyalgia (both with 2 answers).

Table 1

Question 2: "Do you have any difficulty opening cosmetic packaging?"

Participant	Reply
4	"Some have a very closed lid"
16	"Shampoos and sunscreens have a lid that is difficult to open."

48	"Enamel"
83	"I feel pain in the joints of my fingers, so I have difficulty opening certain packages"
93	"Some that are threaded are very firm"

Source: Prepared by the authors. Manaus, 2025.

When asked about the use of cosmetic products, 91% said they were users, while 9% denied it, with emphasis on: Makeup with 23 mentions; Skincare with 19 mentions and Perfume with 11 mentions.

Of the participants, 13% reported having some difficulty opening cosmetic packages while 87% denied it. Also, 19% stated that they use some instrument to open or close the containers, with scissors and knives being the most cited (10 answers of each).

When asked about knowing a company that produces cosmetics with adapted packaging or easy access for people with disabilities or reduced mobility, 82% denied knowing. Of the 18% who knew, the company Rare Beauty is in first place with 5 mentions, followed by the company O Boticário with 5 mentions.

Table 2 shows the comments of some participants about products that may have some adaptation in their packaging.

Table 2

Question 10: "What type of cosmetic product do you suggest a packaging adaptation?"

Participant	Reply
9	"Cosmetic caps that make it easy to open, braille texts on the packaging."
37	"Moisturizer packaging, some difficulties for the product to come off easily."
30	"My Lola Cosmetics styling cream is horrible to tighten, even without any mobility issues, I already have a lot of difficulty using it."
83	"All of the suggestions, but especially cosmetic products in which the caps are "screw-on"."

Source: Prepared by the authors. Manaus, 2025.

When asked about using some type of product with adapted packaging, 100 negative answers were obtained, without any affirmative experience. Figure 3 corresponds to the question about where they buy such products, where 44% claimed not to know where to buy them.

Figure 3

Question 13: "Where do you usually buy cosmetic products with adapted packaging or easy handling?"

Source: Prepared by the authors. Manaus, 2025.

4 DISCUSSION

It was observed that the popular understanding of cosmetics is often limited to the idea of products aimed exclusively at aesthetics and vanity, as noted in the mentions of makeup and perfumes. However, according to the definition of the National Health Surveillance Agency (ANVISA), cosmetics are products intended for external application with the purpose of cleaning, perfuming, protecting, altering the appearance or keeping parts of the body such as skin, hair, teeth and mucous membranes in good condition. This includes everyday items such as soaps, toothpastes, deodorants, and sunscreens. Despite this, many people deny the use of cosmetics because they associate the term with superficial practices, without realizing that they use these products daily. Such a perception reveals the erroneous precept of the word beyond the sociocultural stigma, especially related to gender.

It was also noted the difficulty on the part of the participants to handle certain cosmetic packaging, not limited only to individuals with reduced mobility or disabilities. This shows that this obstacle can be present in the lives of the population without disabilities.

In addition, the results demonstrate the lack of inclusion of the public with reduced mobility or with disabilities by the cosmetic industry during the manufacture of its products, such exclusion violates the rights guaranteed to them by law.

5 CONCLUSION

Despite technological advances, including access to information and the ease of obtaining goods over the internet, there is still a noticeable lack of brands that effectively implement accessibility principles in their products. Based on the data obtained by the project, it was noted that both populations (without or with some type of disability and/or reduced mobility) have certain barriers that prevent them from enjoying the cosmetics used in their daily lives in a practical and easy way. Accessibility, in this context, is not limited only to the presence of physical ramps or the use of simple language, but also involves the offer of adapted packaging (such as with braille writing or easy to open). This difficulty shows that the cosmetic market sees accessibility as a brand differential and not a right that is granted to PWDs or those with reduced mobility. It is therefore essential that the cosmetics industry moves beyond the minimum requirements and commits to inclusive practices, ensuring that everyone can fully exercise their right to personal care, hygiene and well-being.

ABSTRACT

This article examines sexual violence against homeless women in the city of Manaus, Brazil, in light of fundamental rights and the State's responsibility to protect human dignity. This qualitative study adopts a bibliographic and documentary approach, with a legal-analytical perspective, based on recent scientific literature, institutional reports, and normative frameworks related to gender-based violence, extreme vulnerability, and access to justice. The findings indicate that homelessness intensifies women's exposure to multiple forms of violence, aggravated by social invisibility, fragile public protection networks, and insufficient intersectoral policies. Sexual violence is identified as a serious violation of human rights, requiring State responses that go beyond criminal measures and include integrated strategies of shelter, prevention, and citizenship. It is concluded that effective responses demand articulation among justice systems, social assistance, public health, and urban policies, especially in regional contexts marked by inequality and institutional omission.

RESUMO

O presente artigo examina a violência sexual contra mulheres em situação de rua na cidade de Manaus, à luz dos direitos fundamentais e da responsabilidade estatal na proteção da dignidade humana. Trata-se de uma pesquisa qualitativa, de caráter bibliográfico e documental, com abordagem jurídico-analítica, fundamentada em estudos científicos recentes, relatórios institucionais e dispositivos normativos relacionados à violência de gênero, vulnerabilidade extrema e acesso à justiça. Os resultados evidenciam que a condição de rua intensifica a exposição das mulheres a múltiplas formas de violência, agravada pela invisibilidade social, fragilidade das redes públicas de proteção e insuficiência de políticas intersetoriais. Constatou-se ainda que a violência sexual configura grave violação de direitos humanos, exigindo respostas estatais que ultrapassem o campo penal e incorporem estratégias integradas de acolhimento, prevenção e garantia de cidadania. Conclui-se que o enfrentamento efetivo demanda articulação entre justiça, assistência social, saúde pública e políticas urbanas, especialmente em contextos regionais marcados por desigualdade e omissão institucional.

Palavras-chave: Direitos Fundamentais. Mulheres. Políticas Públicas. População em Situação de Rua. Violência Sexual.

RESUMEN

Este artículo examina la violencia sexual contra mujeres en situación de calle en la ciudad de Manaus, Brasil, a la luz de los derechos fundamentales y de la responsabilidad del Estado en la protección de la dignidad humana. Se trata de una investigación cualitativa, de carácter bibliográfico y documental, con un enfoque jurídico-analítico, fundamentada en literatura científica reciente, informes institucionales y marcos normativos relacionados con la violencia de género, la vulnerabilidad extrema y el acceso a la justicia. Los resultados evidencian que la condición de calle intensifica la exposición de las mujeres a múltiples formas de violencia, agravada por la invisibilidad social, la fragilidad de las redes públicas de protección y la insuficiencia de políticas intersectoriales. Se concluye que la violencia sexual constituye una grave violación de los derechos humanos y exige respuestas estatales que superen el ámbito penal, incorporando estrategias integradas de acogida, prevención y garantía de ciudadanía.

Palabras clave: Derechos Fundamentales. Mujeres. Políticas Públicas. Población en Situación de Calle. Violencia Sexual.

1 INTRODUCTION

Sexual violence against homeless women is a highly complex social and legal problem, which highlights deep-rooted structural inequalities in Brazilian urban centers. Homelessness does not only represent the absence of housing, but a scenario of extreme vulnerability, in which processes of exclusion, invisibility, and continuous violation of fundamental rights are intensified. In this sense, gender violence manifests itself in an aggravated way, especially when associated with institutional precariousness and the fragility of protection networks.

In the field of contemporary discussions, it is observed that homeless women experience multiple forms of violence simultaneously, including physical, psychological and sexual aggression, often naturalized by the absence of effective public policies of reception and assistance. It is a phenomenon that goes beyond the criminal dimension, revealing social structures that perpetuate female marginalization in urban contexts marked by inequality and state abandonment.

From the legal-constitutional point of view, the persistence of these violations reveals a distance between the normative frameworks and their concrete effectiveness. The Federal Constitution of 1988 establishes the dignity of the human person as the foundation of the Democratic Rule of Law, imposing on the public power the duty to ensure full protection against any form of violence and degrading treatment (Brasil, 1988). Thus, the continuity of sexual violence against homeless women highlights the need for more comprehensive and intersectoral institutional responses.

In addition, confronting gender violence requires the understanding that such aggressions are not restricted to the private sphere, but express historical and structural inequalities. The Maria da Penha Law constitutes an essential milestone in this process, by recognizing violence against women as a public problem and by requiring articulated mechanisms for prevention, assistance and state accountability (Brasil, 2006).

Given this scenario, it is essential to recognize that sexual violence against homeless women cannot be understood as an isolated problem, but as a structural challenge that involves institutional omissions, social inequality, and limitations of public protection policies. The homeless population experiences repeated violations of rights, often crossed by social stigma and difficulty in accessing formal justice and citizenship mechanisms (CNJ, 2025).

In the Amazonian context, the problem takes on even more urgent contours, considering regional specificities and local challenges related to social protection and the fight against gender violence. The State of Amazonas has sought to structure its own guidelines for preventing and confronting violence against women, emphasizing the need for

articulation between public security, social assistance and the shelter network (Amazonas, 2025). Even so, weaknesses persist in the effectiveness of these actions when directed to women in conditions of extreme vulnerability.

In this sense, this article starts from the following guiding question: how can sexual violence against homeless women in the city of Manaus be understood as a violation of fundamental rights and as an expression of the state's responsibility to guarantee human dignity. Thus, the central objective is to examine, in the light of the legal system and recent interdisciplinary literature, the social and institutional mechanisms that favor the reproduction of this violence, as well as the limitations of public protection networks.

Thus, the relevance of this investigation is justified by the persistent and structural nature of sexual violence against homeless women, a phenomenon that requires not only criminal responses, but intersectoral policies of reception, prevention and guarantee of citizenship.

2 THEORETICAL FRAMEWORK

Violence against homeless populations is a multifaceted phenomenon, crossed by structural inequalities, urban exclusion, and the fragility of public policies for social protection. In this context, the street does not only represent homelessness, but a space of extreme vulnerability, in which processes of social invisibility and daily exposure to different forms of aggression are intensified. Alves et al. (2025) highlight that urban violence is directly articulated with dynamics of marginalization and precariousness of life, producing scenarios where vulnerable subjects remain at constant risk of rights violations.

In Brazil, the normative consolidation of the fight against violence and the violation of fundamental rights is supported by the Federal Constitution of 1988, which ensures the dignity of the human person as the foundation of the Democratic Rule of Law. Protection against any form of violence, discrimination or degrading treatment must be understood as a duty of the public authorities and a universal guarantee, especially when it comes to historically marginalized groups (Brasil, 1988). Thus, the homeless population is inserted in the field of constitutional urgencies, demanding effective policies of inclusion and citizenship.

Domestic and family violence against women, in turn, acquires even more serious contours when associated with homelessness, as it breaks support networks and increases exposure to physical, psychological and sexual abuse. The Maria da Penha Law establishes specific coping mechanisms, recognizing that gender violence is not only interpersonal, but structural, requiring articulated state intervention (Brasil, 2006). In this sense, the legislation represents an essential milestone to understand the vulnerability of women in contexts of

extreme exclusion.

Recent studies reinforce that homeless women experience multiple forms of violence simultaneously, involving sexual assault, coercion, exploitation and institutional stigmatization. Bueno et al. (2025) analyze that such experiences cannot be understood only as individual episodes, but as an expression of complex psychosocial processes, crossed by gender inequality, extreme poverty, and the absence of continuous protective policies. The street becomes, therefore, a space where violence is naturalized and perpetuated.

The interdisciplinary literature also emphasizes that urban exclusion acts as a central factor in the aggravation of violence, since it displaces women to territories of social and legal abandonment. Maciel and Melo (2025) argue that the debate on human rights needs to incorporate the condition of homelessness as a critical category, as it expresses fundamental violations associated with denied citizenship. Thus, confronting violence requires understanding the urban, social and institutional dimensions that sustain marginalization.

In addition, recent academic production shows that sexual violence against homeless women is one of the greatest contemporary challenges for the Brazilian State. Richwin (2023) highlights that extreme vulnerability increases exposure to repeated abuses and reduces the possibilities of reporting and institutional protection, generating a persistent cycle of rights violations. It is, therefore, a problem that demands articulated responses between public health, social assistance and the justice system.

As pointed out by the National Council of Justice, violence against the homeless population should be understood as a systematic and persistent phenomenon, marked by successive violations of fundamental rights and institutional failures in access to public protection. The report produced by the CNJ shows that these subjects experience physical, psychological, and symbolic aggression, often associated with social stigma and state negligence, which reinforces the urgency of inserting the issue in the national human rights agenda (CNJ, 2025).

From the perspective of the Institute of Applied Economic Research, the factors that lead individuals to homelessness are deeply linked to family breakdowns, unemployment and persistent socioeconomic vulnerabilities. IPEA (2023) highlights that such structural elements intensify exposure to everyday violence, since the absence of housing implies precarious access to health, social assistance, and full citizenship. Thus, violence must also be interpreted as an expression of historical inequalities reproduced in the urban space.

In the understanding of Freitas et al. (2025), homeless women occupy an even more critical position within the exclusion scenario, as they face a double vulnerability: social marginality associated with the street and specific gender-related violence. The authors

argue that these women remain invisible by traditional public policies, being continuously exposed to abuse, aggression and institutional lack of protection, which highlights the need for intersectoral coping strategies.

In light of the analyses of Gontijo et al. (2026), violence against women in urban contexts of exclusion represents a direct challenge to the effectiveness of fundamental rights, since it highlights the distance between normative guarantees and concrete social practices. Territorial exclusion and the precariousness of living conditions intensify women's vulnerability, demonstrating that confronting violence requires urban policies articulated with social justice.

From the point of view of critical law, Paiva, Sabadell and Vieira (2024) argue that gender violence should be interpreted as a manifestation of social and institutional structures that naturalize inequalities and restrict full access to justice. For the authors, female vulnerability in extreme contexts, such as homelessness, requires an interdisciplinary reading that connects human rights, public policies, and institutional protection practices.

In line with regional public policies, the State of Amazonas has structured specific guidelines for preventing and combating violence against women, recognizing the urgency of the issue in the Amazon scenario. The State Plan establishes strategies for articulation between public security, social assistance and protection network, reinforcing that violence against vulnerable women must be combated through integrated and continuous actions (Amazonas, 2025).

In the scope of municipal management, it is observed that the reality of the homeless population has also been the subject of informative reports and intersectoral actions. SEMASC (2025) shows that the problem demands articulated interventions between reception, social assistance and guarantee of rights, especially in the face of the growth of situations of violence and exclusion in central urban areas.

According to recent legislation, the confrontation of vulnerabilities associated with the homeless population began to receive greater normative attention in the national scenario. Law No. 14,821/2024 institutes the National Policy on Decent Work and Citizenship for the Homeless Population, recognizing the need for structured measures aimed at social inclusion, access to rights, and overcoming the conditions that perpetuate extreme marginalization (Brasil, 2024). In this sense, the legal system expands the understanding that homelessness is not only a social condition, but a problem that requires an articulated institutional response.

In this scenario, it is essential to understand that the realization of rights does not depend exclusively on legal frameworks, but also on concrete mechanisms for

implementation and access to justice. The Public Defender's Office of the State of Amazonas, for example, highlights initiatives aimed at guaranteeing civil documentation and legal recognition of vulnerable populations, reinforcing that the absence of formal records aggravates exclusion and hinders the full exercise of citizenship (Public Defender's Office of the State of Amazonas, 2026). Thus, legal aid policies become essential instruments in the fight against multiple forms of violence.

From this perspective, social protection must be understood as an indispensable element to interrupt cycles of invisibility and aggression. Silva (2025) argues that homeless women face institutional barriers that restrict access to basic services, increasing exposure to physical, psychological, and symbolic violence. For the author, the protection of fundamental rights in this context requires the articulation between public health, social assistance and justice, especially when it comes to historically neglected subjects.

Thus, it is observed that violence against homeless women cannot be reduced to isolated events, but must be interpreted as an expression of structural inequalities, urban exclusion, and insufficient integrated public policies. The theoretical contributions analyzed demonstrate that facing the problem requires not only legal recognition, but also continuous intersectoral actions that promote dignity, citizenship and social inclusion. Thus, recent literature reinforces that overcoming this scenario depends on the consolidation of effective protection networks and the strengthening of institutional strategies for prevention and welcoming.

3 METHODOLOGY

The present study is characterized as a qualitative research, of bibliographic and documentary character, with a legal-analytical approach, whose objective is to examine sexual violence against homeless women in the city of Manaus, in the light of fundamental rights and state responsibility in the protection of human dignity. The methodology adopted sought to adapt to the problem investigated, considering the social, legal and institutional complexity that involves the extreme vulnerability of women exposed to gender violence in urban contexts.

The bibliographic survey was carried out from previously selected references, including national studies published in recognized journals, as well as technical reports and institutional documents of public agencies. The focus was on productions related to sexual violence, the homeless population, human rights, public policies and access to justice. The sources analyzed grounded the theoretical framework and allowed the construction of a consistent conceptual basis on the investigated phenomenon.

Subsequently, the documentary stage was developed, centered on the analysis of legal and constitutional provisions linked to fundamental rights, the dignity of the human person, material equality and the full protection of women in situations of vulnerability. This stage made it possible to articulate the contemporary academic debate with the legal obligations of the Brazilian State in the face of sexual violence and social exclusion.

The method of analysis used was interpretive-critical, based on the systematic reading of the selected scientific and legal productions. The analytical categories were organized based on three central axes: (i) sexual violence as an expression of structural inequality, (ii) institutional vulnerability of women living on the streets, and (iii) effectiveness of fundamental rights and public protection policies. In this way, we sought to understand not only the crime itself, but also the social and legal mechanisms that favor its reproduction and permanence.

As a guiding hypothesis, it is based on the assumption that sexual violence against homeless women represents a serious violation of fundamental rights, aggravated by social invisibility and the insufficiency of state protection networks, especially in urban contexts marked by inequality and institutional omission. Thus, the study seeks to demonstrate that the legal response cannot be restricted exclusively to the criminal field, but must include intersectoral policies for reception, prevention and guarantee of citizenship.

Finally, the absence of direct empirical data, such as interviews or field surveys, is recognized as methodological limitations, since the article focuses on bibliographic and documentary analysis. However, this delimitation allows for a deeper theoretical and legal discussion, offering relevant subsidies for future empirical research and for the formulation of institutional strategies aimed at the protection of homeless women in Amazonas.

In order to systematize the main theoretical bases used in the construction of the framework of this study, a summary table is presented below with the selected authors, the respective titles of the analyzed productions and their years of publication. This survey contributes to highlight the relevance of the sources and the academic relevance of the reference used in the research.

Source: The authors.

Thus, it is observed that the selected productions offer a consistent and current theoretical support for the analysis of sexual violence against women living on the streets, allowing us to understand the phenomenon from different perspectives, such as social vulnerability, institutional exclusion, human rights and the effectiveness of public policies. The set of these contributions underpins the discussion proposed in this article, highlighting the complexity of the topic and the need for legal and intersectoral approaches that ensure the

full protection and dignity of these women in the Amazonian urban context.

4 RESULTS AND DISCUSSIONS

The results obtained from the literature and documentary review show that sexual violence against homeless women is one of the most serious expressions of structural inequality and urban exclusion in Brazil. The literature analyzed demonstrates that the condition of homelessness increases exposure to repeated aggression, since these women are subjected to the absence of protective networks, institutional precariousness and social invisibility. In this sense, Alves et al. (2025) emphasize that urban vulnerability is not only circumstantial, but the result of historical processes of marginalization that directly compromise human dignity.

From the perspective of psychosocial studies, it is observed that sexual violence should not be understood only as an isolated event, but as a phenomenon crossed by stigmas, gender inequality and precarious living conditions. Bueno et al. (2025) argue that homeless women face multiple forms of violence simultaneously, including physical and sexual abuse, often associated with the lack of continuous access to public policies for shelter and assistance.

From the legal-constitutional point of view, the results indicate that sexual violence against homeless women constitutes a serious violation of the fundamental rights guaranteed by the democratic order. The Federal Constitution of 1988 establishes the dignity of the human person as the foundation of the Democratic Rule of Law, imposing on the public power the duty to guarantee full protection against any form of violence and degrading treatment (Brasil, 1988). Thus, the persistence of aggressions against vulnerable women reveals a distance between normative guarantees and social effectiveness.

In light of the protective legislation, the Maria da Penha Law represents an essential milestone to understand gender violence as a structural expression, requiring articulated state intervention and intersectoral public policies. When associated with homelessness, sexual violence becomes even more complex, as it involves the absence of family ties, institutional fragility and barriers to access to justice (Brasil, 2006). Paiva et al. (2024) argue that legal confrontation cannot be limited to the criminal field, but must incorporate broad strategies for social protection and citizenship.

In the context of contemporary analyses on urban exclusion, the results show that territorial marginalization intensifies rights violations, making homeless women preferred targets of sexual violence and repeated abuse. Freitas et al. (2025) highlight that these women occupy a position of double vulnerability: due to social marginality and gender

violence, remaining invisible in traditional public policies.

In the institutional context, the results show that violence against the homeless population, especially against women, is recurrent and systematic, requiring formal recognition and coordinated responses from the justice system. The National Council of Justice points out that this violence is not limited to isolated episodes, but configures a pattern of repeated violations of rights, often associated with state negligence and social stigma that prevents effective access to protection (CNJ, 2025).

From a socioeconomic perspective, it is observed that the structural factors that lead individuals to homelessness are directly related to family breakdowns, unemployment, and persistent vulnerabilities. IPEA (2023) points out that such conditions intensify daily exposure to violence, since the absence of fixed housing implies precarious access to basic services, social assistance, and citizenship mechanisms, favoring the reproduction of cycles of exclusion.

In the field of discussions on urban exclusion, the findings indicate that violence against homeless women represents a central challenge to the effectiveness of fundamental rights. Gontijo et al. (2026) argue that territorial precariousness and marginalization in urban spaces increase female vulnerability, highlighting the distance between normative guarantees and concrete social practices, especially in contexts marked by inequality and institutional abandonment.

In line with regional public policies, it is verified that the State of Amazonas has sought to structure specific guidelines for the prevention and confrontation of violence against women, recognizing the urgency of the issue in the Amazon scenario. The State Plan establishes strategies for articulation between public security, social assistance and the protection network, reinforcing that women in situations of extreme vulnerability demand integrated and continuous actions of reception and prevention (Amazonas, 2025).

At the municipal level, the results indicate that the problem of the homeless population has also been the subject of informative reports and intersectoral actions aimed at emergency care and the guarantee of rights. SEMASC (2025) shows that the growth of this population in central urban areas imposes direct challenges to social assistance policies, especially in the face of the intensification of situations of violence and exclusion that affect women more severely.

Thus, the findings discussed in this stage reinforce that sexual violence against homeless women cannot be understood only as an individual or criminal problem, but as an expression of structural inequalities, institutional weaknesses and insufficiency of public protection networks. Thus, effective confrontation requires articulation between justice, social

assistance, urban policies and specific strategies to guarantee citizenship.

By deepening the analysis of sexual violence, it is observed that homeless women face increased risks due to the absence of protective networks and continuous exposure to repeated abuse. Richwin (2023) highlights that this extreme vulnerability significantly reduces the possibilities of reporting and access to justice, generating a persistent cycle of violations that is perpetuated in social and institutional invisibility.

Under an interdisciplinary approach, it is found that homelessness does not only imply material deprivation, but also the daily suppression of basic human rights. Maciel and Melo (2025) argue that urban marginalization produces a scenario in which women are no longer recognized as subjects of full citizenship, remaining on the margins of traditional public policies and vulnerable to different forms of violence and exploitation.

In the context of social protection, the results show that the insufficiency of intersectoral policies directly contributes to the permanence of violence suffered by women living on the streets. Silva (2025) argues that institutional barriers restrict these women's access to essential services, increasing their exposure to physical, psychological, and sexual violence, which reinforces the need for articulation between public health, social assistance, and justice.

In the field of institutional initiatives to confront it, the work of the Public Defender's Office of the State of Amazonas stands out, which has implemented measures aimed at guaranteeing civil documentation and legal recognition of vulnerable populations. The Public Defender's Office of the State of Amazonas (2026) emphasizes that the absence of formal records aggravates exclusion and compromises the full exercise of citizenship, making access to justice an indispensable element to break cycles of violence.

In the light of recent national policies, it can be seen that the Brazilian State has begun to recognize more explicitly the need for structured strategies aimed at the homeless population. Law No. 14,821/2024 institutes the National Policy on Decent Work and Citizenship, reinforcing that overcoming extreme vulnerability requires integrated actions for social inclusion, access to rights, and strengthening of public protection networks (Brasil, 2024).

Thus, the results discussed throughout this section demonstrate that sexual violence against homeless women should be interpreted as an expression of structural inequalities and institutional weaknesses, and cannot be reduced to a strictly criminal dimension. Facing the problem requires intersectoral public policies, reception mechanisms, and strategies to guarantee fundamental rights, especially in urban contexts marked by social exclusion and state omission.

In order to systematize the main theoretical contributions used in the construction of the analysis developed in this study, Table II is presented below, which summarizes the selected authors, their central positions and the respective years of publication. This survey allows us to visualize how recent literature has addressed sexual violence against homeless women, highlighting different perspectives, such as institutional exclusion, structural vulnerability, the effectiveness of fundamental rights, and the need for intersectoral public policies.

Source: The authors.

The positions presented in Table II reinforce that sexual violence against homeless women is a structural phenomenon, crossed by historical gender inequalities, urban exclusion, and institutional fragility. There is convergence among the authors regarding the understanding that such violations cannot be interpreted as isolated events, but as an expression of a continuous cycle of social vulnerability and state omission. Thus, the literature analyzed highlights the need for intersectoral responses that articulate legal protection, public policies for reception and social inclusion strategies, in order to ensure the effectiveness of the fundamental rights and dignity of these women in the Amazonian context.

5 CONCLUSION

The conclusions of this study respond to the proposed objective of examining sexual violence against homeless women in the city of Manaus, in the light of fundamental rights and state responsibility in the protection of human dignity. From the bibliographic and documentary review carried out, it was found that sexual violence is not an isolated event, but as an extreme expression of structural inequalities, urban exclusion and institutional weaknesses that cross the reality of these women.

The findings showed that the homeless condition intensifies female vulnerability, increasing exposure to repeated aggression and reducing the possibilities of access to protective networks and effective justice mechanisms. In this scenario, it was found that the social invisibility and precariousness of public policies directly contribute to the permanence of cycles of violence, reinforcing the need for continuous and integrated intersectoral actions.

From a legal point of view, it is concluded that the persistence of sexual violence against homeless women represents a serious violation of the fundamental rights guaranteed by the constitution, especially the principle of human dignity. In addition, the Maria da Penha Law constitutes an essential milestone for understanding gender violence as a structural phenomenon, requiring state responses that go beyond the criminal field and incorporate

strategies for prevention, shelter and guarantee of citizenship.

In this way, the guiding hypothesis that sexual violence against homeless women is aggravated by social invisibility and the insufficiency of institutional protection networks is confirmed, especially in urban contexts marked by inequality and state omission. Thus, the appropriate legal response must articulate public policies for social assistance, health, security and access to justice, with special attention to the regional specificities of Amazonas.

Thus, the absence of direct empirical data is recognized as a limitation of this study, since it is a bibliographic and documentary review. However, the analysis developed offers relevant subsidies for future field investigations and for the formulation of institutional strategies aimed at the integral protection of women living on the streets, contributing to the strengthening of public policies and the realization of human rights in the Amazonian context.

ACKNOWLEDGMENTS

We would like to thank our friends, colleagues, and academic partners who walk together in the construction of a scientific production committed to the Amazonian reality. This work is the result of the union of efforts, mutual encouragement and the conviction that research and writing can directly contribute to transforming Amazonas into a fairer, more humane and inclusive space. Producing knowledge in our region also represents an act of social responsibility, as it means looking at the vulnerabilities that cross urban life and seeking, through academic and legal debate, ways to cope and overcome.

We express our gratitude to all those who believe in science as an instrument of change and who are collectively dedicated to building a better city, where fundamental rights are effectively guaranteed and where human dignity is recognized as a priority. This article, therefore, represents not only an intellectual effort, but also a commitment to the present and future of Amazonas.

ABSTRACT

This article analyzes the integrated curriculum as a strategy to address curricular fragmentation in full-time schools, considering its theoretical, historical, and normative foundations. It begins with the recognition that the traditional disciplinary organization of the curriculum has limited holistic human development, even in contexts of extended school hours. The research is characterized as a qualitative study, with a theoretical-documentary approach, based on the analysis of academic productions in the field of curriculum and normative documents of Brazilian education. The results show that the extension of school hours, when not accompanied by an integrated curricular reorganization, tends to reproduce the dichotomy between curricular and complementary activities, weakening the project of comprehensive education. The discussion points out that the integrated curriculum is configured as a political-pedagogical principle capable of articulating knowledge, times, spaces, and educational practices, favoring meaningful, contextualized learning committed to social justice. It is concluded that the implementation of an integrated curriculum requires not only normative guidelines, but also institutional conditions, coordinating school management, and collective processes of curriculum construction, reaffirming comprehensive full-time education as an educational project aimed at the complete human development.

RESUMO

Este artigo analisa o currículo integrado como estratégia de enfrentamento da fragmentação curricular na escola em tempo integral, considerando seus fundamentos teóricos, históricos e normativos. Parte-se do reconhecimento de que a organização disciplinar tradicional do currículo tem limitado a formação humana integral, mesmo em contextos de ampliação da jornada escolar. A pesquisa caracteriza-se como um estudo de natureza qualitativa, de abordagem teórico-documental, fundamentado na análise de produções acadêmicas do

¹ Postgraduate student in School Management. Universidade Federal de São Carlos (UFSCar).

Lattes: <http://lattes.cnpq.br/2950079589563121>

campo do currículo e de documentos normativos da educação brasileira. Os resultados evidenciam que a ampliação do tempo escolar, quando não acompanhada de uma reorganização curricular integrada, tende a reproduzir a dicotomia entre atividades curriculares e complementares, fragilizando o projeto de educação integral. A discussão aponta que o currículo integrado se configura como um princípio político-pedagógico capaz de articular saberes, tempos, espaços e práticas educativas, favorecendo aprendizagens significativas, contextualizadas e comprometidas com a justiça social. Conclui-se que a efetivação do currículo integrado demanda não apenas orientações normativas, mas também condições institucionais, gestão escolar articuladora e processos coletivos de construção curricular, reafirmando a educação integral em tempo integral como um projeto educativo voltado à formação humana plena.

Palavras-chave: Currículo. ETI. Fragmentação. Gestão Escolar.

RESUMEN

Este artículo analiza el currículo integrado como estrategia para abordar la fragmentación curricular en escuelas de tiempo completo, considerando sus fundamentos teóricos, históricos y normativos. Parte del reconocimiento de que la organización disciplinaria tradicional del currículo ha limitado el desarrollo humano holístico, incluso en contextos de jornada escolar extendida. La investigación se caracteriza por ser un estudio cualitativo, con un enfoque teórico-documental, basado en el análisis de producciones académicas en el campo del currículo y documentos normativos de la educación brasileña. Los resultados muestran que la extensión de la jornada escolar, cuando no se acompaña de una reorganización curricular integrada, tiende a reproducir la dicotomía entre actividades curriculares y complementarias, debilitando el proyecto de educación integral. La discusión señala que el currículo integrado se configura como un principio político-pedagógico capaz de articular conocimientos, tiempos, espacios y prácticas educativas, favoreciendo un aprendizaje significativo, contextualizado y comprometido con la justicia social. Se concluye que la implementación de un currículo integrado requiere no sólo de lineamientos normativos, sino también de condiciones institucionales, gestión escolar articuladora y procesos colectivos de construcción curricular, reafirmando la educación integral a tiempo completo como proyecto educativo orientado al desarrollo humano integral.

Palabras clave: Currículo. Educación Técnica Integrada (ETI). Fragmentación. Gestión Escolar.

1 INTRODUCTION

The curricular organization of the Brazilian school has historically been marked by a fragmented logic of knowledge, times and spaces, strongly anchored in a disciplinary and technicist conception of curriculum. Such a configuration, as Silva (2005) points out, is not neutral, as it expresses power relations that select knowledge, identities and subjectivities considered legitimate within the school. In this sense, curricular fragmentation is not only a pedagogical problem, but also a political and social one, since it tends to reinforce inequalities and limit human education in its entirety.

In the context of the extension of the school day and the consolidation of full-time Integral Education as a right, this curriculum model becomes tensioned. As highlighted by the Ministry of Education (MEC), Integral Education presupposes the overcoming of reductionist views that exclusively privilege the cognitive dimension, demanding training that considers the complexity of human development in its intellectual, affective, bodily, social, cultural, and ethical dimensions (Brasil, 2018).

Thus, the simple extension of the student's time in school does not guarantee, by itself, an Integral Education, and it is essential to reorient the curriculum practiced in the networks and in the school units, becoming more significant and democratic, instead of reductionist, technicist and that prioritizes only cognitive perspectives, becoming inadequate for a critical problematizing society, human and transformed.

It is in this scenario that the integrated curriculum emerges as a strategy to cope with curricular fragmentation. According to Ramalho (2025), understanding the school and the curriculum as social and historical constructions and, therefore, subject to reinvention is a fundamental condition for the materialization of curricular proposals guided by the perspective of Full-Time Integral Education. The integrated curriculum, in this sense, is not restricted to the articulation between disciplines or the juxtaposition of shift and after-shift activities, but is configured as an organizing principle of educational processes, capable of integrating knowledge, practices, subjects, times and territories.

The Full-Time School Program (ETI), instituted by Law No. 14,640 of 31 of 2023 (Brasil, 2023) reinforces this understanding by stating the need to "overcome the curricular organization based on the logic of shift and after-shift for an integrated curriculum that integrates experiences". Such orientation dialogues with critical conceptions of curriculum that understand it as a space for cultural dispute and the production of meanings, in which human diversities must be recognized and curricular justice promoted (Ponce, 2019).

The impasse arises with the implementation of Full-Time Integral Education, establishing the extension of the day, and the school practice does not expand its democratic

vision and the student's reality, running the risk of falling into the trap of "shift and counter-shift" where time is extended, but knowledge remains watertight and without connection with the student's life.

The central problem lies in the following question: How to break with the logic of curricular fragmentation and ensure that the extension of time in public schools results, in fact, in an integral development (intellectual, affective, social and cultural), using the integrated curriculum as a tool for curricular justice and social transformation?

The main objective of this work is to analyze how the implementation of the integrated curriculum in public Basic Education can overcome the fragmentation of teaching and learning, using as an analytical basis the academic construct of recent years. To this end, it seeks to identify the limitations of the traditional model and discuss the curriculum as an organizing principle that articulates knowledge and territories.

In this scenario, the integrated curriculum assumes centrality in the construction of educational practices committed to equity, interdisciplinarity and the articulation between school knowledge and knowledge of everyday life. Understanding it as the guiding axis of Integral Education requires, however, a dive into the conceptual and normative bases that support this proposal in Brazil. To this end, we will discuss the tensions between the traditional model and the critical perspectives of curriculum, substantiating the theoretical assumptions that guide this study.

2 THEORETICAL FRAMEWORK

The debate on the school curriculum occupies a central place in contemporary educational discussions, especially in view of the social, cultural and political transformations that impact the organization of education systems. The curriculum cannot be understood only as a set of prescribed contents, but as a field of symbolic and ideological disputes that expresses conceptions of education, society and subject. In the context of integral education, this discussion intensifies, since such a formative perspective presupposes the expansion of educational experiences and the articulation between different dimensions of human development. Thus, understanding the theoretical bases of the school curriculum and its relationship with integral education becomes fundamental to analyze the challenges and possibilities of implementing integrated curricular proposals.

2.1 PERSPECTIVES OF THE SCHOOL CURRICULUM

The concept of curriculum presents multiple interpretations throughout the history of education. In a broader perspective, Sacristán (2013) defines the curriculum as a cultural

construction that organizes school knowledge and guides pedagogical practices, directly influencing the teaching and learning processes.

For the author, the curriculum "is not neutral, as it reflects political, cultural and social options" (Sacristán, 2013, p. 17). Goodson (2012) reinforces this understanding by stating that the curriculum should be analyzed as a social and historical artifact, the result of disputes between different social groups. According to the author, "the written curriculum is only a part of the curricular reality, and it is necessary to understand the curriculum lived and practiced in schools" (Goodson, 2012, p. 45).

From this perspective, authors of critical theories of the curriculum, such as Apple (2006), highlight that the school curriculum is deeply related to power relations and the legitimation of certain types of knowledge to the detriment of others. For Apple (2006, p. 59), "the curriculum is never just a neutral set of knowledge; it reflects dominant economic, political, and cultural interests." In Brazil, curriculum policies assume a structuring role in the organization of basic education.

The National Common Curricular Base (BNCC) guides the curricula of education networks by defining essential learning and general competencies aimed at the integral formation of students (Brasil, 2018). The BNCC emphasizes that education should promote the development of cognitive, socio-emotional, cultural, and ethical skills, which reinforces the need for more flexible and integrated curricula. However, studies indicate that the implementation of these guidelines faces challenges related to teacher training, pedagogical management and the institutional conditions of schools (Libâneo, 2016).

2.2 PERSPECTIVES OF INTEGRAL EDUCATION

Integral Education is a pedagogical and political conception that understands the subject in its entirety, considering the cognitive, physical, emotional, social, cultural and ethical dimensions of human development. Such a perspective goes beyond the restricted understanding of extending the school day, affirming itself as a project of 4 full human formation and guarantee of rights (Reference Center in Integral Education, 2024).

This conception is supported by Article 205 of the Federal Constitution of 1988, which establishes that education aims at the full development of the person, preparation for the exercise of citizenship and qualification for work. In this sense, the curriculum in Integral Education assumes a strategic role in the materialization of this purpose, organizing educational experiences that dialogue with the sociocultural contexts of students and with the contemporary challenges of Brazilian society.

Historically, Integral Education dialogues with the assumptions of the New School,

especially with Dewey (1959), when he defended an active school, centered on the experience and participation of students, and with Anísio Teixeira (1994), who conceived the public school as a space for democratic formation and articulation between education, culture and social life. Such fundamentals remain current by sustaining the centrality of the curriculum as an organizer of meaningful and contextualized experiences.

The curriculum, in the context of Integral Education, should be understood as a dynamic and integrated process, which articulates school knowledge, community knowledge and sociocultural practices, overcoming the disciplinary fragmentation historically present in the school organization (Sacristán, 2013).

The document of the Reference Center for Integral Education (2024) reinforces that the organization of the school in a single shift favors the construction of integrative pedagogical projects, expanding times, spaces and educational opportunities. From this perspective, the territory assumes a central role in the construction of the curriculum, being understood as an expanded educational space, in which the school is articulated with public policies, cultural, sports and social equipment.

This approach dialogues with Arroyo (2012), when he states that curricula need to recognize the real subjects of education, their histories, cultures and living conditions, especially those belonging to historically marginalized groups. The booklet also highlights the need to recognize the multiple ways of being a school, especially in indigenous, quilombola, rural and other traditional peoples and communities contexts, respecting the right to self-determination and cultural diversity, according to ILO Convention No. 169 (Reference Center for Integral Education, 2024) 5 This orientation dialogues with Freire (1996), for whom the curriculum should be built from the critical reading of reality and dialogue with the knowledge of the students.

Integral Education, as a public policy, is intrinsically linked to the confrontation of educational and social inequalities. The School Census data presented in the booklet show advances in access to full-time education, especially among black, indigenous, quilombola and students with disabilities populations, but also reveal persistent inequalities and discontinuities in the offer (Reference Center for Integral Education, 2024).

In this context, the curriculum plays a fundamental role in promoting equity, and should be guided by inclusive, intersectoral and anti-racist practices. Gomes (2017) highlights that a curriculum committed to social justice needs to recognize the structural racism present in Brazilian society and value historically silenced knowledge.

The document reinforces this perspective by dialoguing with the legacy of the Black Educator Movement, recognizing education as a practice of freedom and an instrument of

social emancipation. In addition, the articulation between curriculum, evaluation and teacher training policies is pointed out as an essential condition for the consolidation of Integral Education. Valuing education professionals, strengthening the pedagogical autonomy of schools, and adequate public funding are structuring elements for the implementation of integrated and contextualized curricula, as advocated by the Reference Center for Integral Education (2024).

3 METHODOLOGY

The present research is characterized, as to the approach, as qualitative, as it seeks the understanding and critical interpretation of theoretical conceptions related to educational public policies and the training of school managers.

Such an approach is adequate to the objective of the study, which consists of critically reflecting on the influence of educational policies on the performance of the school manager and on the realization of the right to education, considering the social contexts and ideological disputes that permeate its formulation and implementation.

With regard to nature, it is a basic research, since it is dedicated to the expansion of theoretical knowledge on the subject, without the immediate intention of practical application or direct intervention in specific educational contexts. The study seeks to contribute to the deepening of academic discussions about the relationship between the State, public policies and school management.

As for the objectives, the research has an exploratory and descriptive character. Exploratory, in that it investigates and problematizes different theoretical approaches to public educational policies and the training of school managers; and descriptive, as it systematizes and presents the main ideas, convergences and divergences among the authors analyzed, as discussed in the development of the article. Regarding the technical procedures, the study is configured as a bibliographic research, based on the analysis of books, scientific articles and didactic materials that address the themes of the State, public policies, education and school management.

The analysis of the bibliographic material occurred through systematic, interpretative and comparative reading, seeking to articulate the theoretical assumptions of the selected authors with the objective proposed in the article. As for the technical procedures, the study is configured as a bibliographic and documentary research. The bibliographic strand is based on the analysis of authors such as: Cavaliere (2014), Fazenda (2011), Felício (2012) Freire (1994), Gadotti (2013), Guará (2006) Lenoir (2005), Libâneo (2013), Moll (2012), Moran (2015), Morin (2002), Pedro and Santana (2025), Ponce (2019), Ramalho (2025), Saviani

(2005), Silva (2015), Weffort (2019), Zanardi (2016) who address the themes of curriculum, didactics and human formation. This procedure made it possible to identify different conceptions about public educational policies, as well as to understand their impacts on the formation and performance of school managers, establishing relationships between theory and practice in the context of Brazilian public education.

4 RESULTS AND DISCUSSIONS

The compartmentalization and fragmentation of school knowledge are among the most recurrent and critically problematized aspects in curriculum studies. Throughout the history of educational thought, different authors have denounced the pedagogical and formative limits of the rigid disciplinary organization, defending proposals for the integration of knowledge as an alternative to the fragmenting logic.

In general, the interpretations about the disciplinarization of the school curriculum derive from the understanding of the very processes of disciplinarization in the scientific field, which influence the organization of school knowledge and reinforce hierarchies, specializations and boundaries between areas of knowledge.

The analysis of the theoretical, historical and normative references shows that the integrated curriculum is consolidated as a consistent response to the limitations imposed by the curricular fragmentation historically present in the Brazilian school. The authors mobilized in the converge in the criticism of the technicist and disciplinary conception of curriculum, understood as insufficient to account for the complexity of human development and the contemporary demands of full-time integral education.

For Zanardi (2016), the extension of the school day has been, in many contexts, implemented based on models that maintain the separation between activities considered curricular and complementary actions, organized in different shifts, which hinders the effective integration of the curriculum.

From this perspective, the full-time school cannot be understood only as an extension of the students' time in the school space, but as a pedagogical project that requires the articulation between knowledge, practices and educational experiences, overcoming proposals that are limited to the alternation between classes and activities unrelated to the curriculum.

Silva (2005) conceives the curriculum as a construction crossed by power relations, in which selecting knowledge, identities and pedagogical practices implies political and cultural choices. This understanding dialogues directly with the perspective presented by Ramalho (2025), when he states that the school and its curricular artifacts should be understood as

social and historical inventions, subject to transformation. Both authors reject the idea of curricular neutrality and defend the need to break with crystallized models that reinforce inequalities and fragmentations of knowledge.

Something seen by Felício (2012, p. 05): [...] integral education must be able to respond to a multiplicity of demands, at the same time that it must aim at the construction of relationships towards human improvement, which entails offering possibilities so that the individual can fully evolve in all its dimensions (cognitive, corporeal, social, cultural, psychological, affective, economic, ethical, aesthetic, among others) Felício (2012, p. 05).

Although they start from different theoretical fields, the contributions of Silva (2005) and Ponce (2019) present points of convergence by defending a curriculum committed to social justice. For Ponce (2019), the notion of curricular justice presupposes the recognition of the 11 human diversities, the appreciation of different cultural knowledge, and the refusal of unique and universalizing narratives. This conception complements Silva's (2005) critique, by displacing the debate from the curriculum only as a field of power to also understand it as a space of ethical and political dispute in favor of equity and democracy.

In the contemporary educational context, according to Pedro and Santana (2025), the implementation of different public policies aimed at raising the quality of education is observed. The normative documents that underpin the curricular organization such as: Law of Guidelines and Bases of National Education (LDB), the National Curriculum Parameters for Secondary Education (PCNEM) and the National Common Curricular Base (BNCC) that incorporate terminologies and guidelines that express the concern with the integration and articulation between contents and areas of knowledge.

Such guidelines point to the need for pedagogical practices that promote the interconnection of school knowledge, favoring more meaningful and contextualized learning processes for students (Saviani, 2005; Gadotti, 2013).

In the normative field, the BNCC (Brasil, 2017) and the guidelines of the Full-Time School Program reinforce these conceptions by affirming full-time education as a guiding principle of the curriculum, and not as a mere expansion of the school workload. However, the base text problematizes that, despite this normative advance, the risk of maintaining the logic of shift and counter-shift persists, which can result in parallel and poorly articulated curricular practices. At this point, the integrated curriculum emerges as a central strategy to overcome this dichotomy, by proposing the integration of educational experiences throughout the school day.

With the concern of considering learning contexts, the BNCC (BRASIL, 2017) guides the overcoming of a rigidly disciplinary organization of knowledge, by emphasizing the

application of school knowledge to social reality, valuing the context as a fundamental element for attributing meaning to learning, and strengthening the student's protagonism in the formative processes and in the construction of their life project.

The historical experiences of integral education presented as the Anísio Teixeira Park Schools, the CIEPs idealized by Darcy Ribeiro and the More Education Program — reveal important approximations and differences in the way of curricular organization. While some proposals maintained the separation between "traditional" and "complementary" activities, others advanced in expanding the educational dimensions of the school, incorporating culture, art, sport, and care as constitutive elements of the curriculum (RAMALHO, 2025).

These experiences, although distinct in their formats, converge in the understanding that the integrality of education requires overcoming the fragmentation of knowledge and the articulation between school, territory and community. 12 Ramalho (2025) highlights that the integrated curriculum is not limited to formal interdisciplinarity between disciplines, but implies a deeper reorganization of times, spaces, relationships, and pedagogical practices. This conception tensions reductionist views that treat curricular integration only as a methodological strategy, reinforcing its political-pedagogical character.

In this sense, the integrated curriculum presents itself as an organizing principle capable of guiding curricular choices consistent with full-time comprehensive education, in line with the guidelines of the ETI, which defend the overcoming of the fragmentation of knowledge and the valorization of social practices and daily life in the educational process.

The proposal of curricular integration is presented as a response to the limitations of the traditional disciplinary model, by enabling the expansion of the ways of approaching knowledge and favoring a more articulated understanding of reality, in dialogue with the contexts experienced by the students. By promoting the articulation between contents and concepts, this perspective contributes to the integral formation of basic education students, to the extent that it conceives knowledge as a set of interdependent relationships, and not as isolated and fragmented knowledge (PEDRO AND SANTANA, 2025). These authors understand that by assuming interdisciplinarity as a structuring principle of the curriculum, curricular integration enables educational institutions to develop broader and socially significant training proposals, aligned with the demands of contemporary society.

The articulation between different concepts, areas and methodologies favors the construction of relationships between different knowledges, stimulating the development of skills and abilities necessary for critical and responsible citizen participation. This dynamic contributes to the approximation between the contents of the different disciplines, promoting

deeper learning and the strengthening of capacities that go beyond the limits of specific knowledge in each area of knowledge (LENOIR, 2005; FAZENDA, 2011).

With regard to educational practice, the results of the analysis indicate that the effectiveness of the integrated curriculum depends strongly on the performance of school management and education networks. Ramalho's text (2025) emphasizes the role of the manager as an articulator of collective processes of curriculum construction, continuing education and dialogue with the territory.

The experience of the municipality of Diadema, for example, shows that the construction of integrated curricula is associated with the protagonism of schools, community participation and intersectoral articulation, elements that reinforce the democratic and contextualized dimension of integral education.

Thus, the different authors and documents analyzed do not oppose each other, but complement each other by showing that overcoming curricular fragmentation 13 requires both critical theoretical foundations and political, normative, and institutional conditions for its implementation. The integrated curriculum thus emerges as a strategy that articulates theory and practice, school and territory, teaching and life, reaffirming full-time integral education as an educational project committed to full human formation and social justice.

5 CONCLUSION

The present study showed significant advances in the understanding of the integrated curriculum as a strategy to overcome curricular fragmentation in full-time school. By articulating theoretical, historical and normative references, it was possible to deepen the debate on the limits of traditional disciplinary organization and demonstrate that the fragmentation of school knowledge is not an isolated problem, but a structural phenomenon, historically constructed and sustained by specific epistemological and political conceptions.

In this sense, the work contributes to the advancement of the curricular field by reaffirming the integrated curriculum as an organizing principle capable of responding to the contemporary demands of full-time integral education. From a theoretical point of view, the analysis evidenced the convergence between authors who understand the curriculum as a social and political construction, marked by power relations, but also open to transformation.

The contributions of Silva (2005), Ramalho (2025) and Ponce (2019) allowed us to broaden the understanding of the curriculum beyond its technical dimension, evidencing it as a space for ethical, cultural and political dispute. By integrating these perspectives, the study advances by explaining that curricular integration is not reduced to formal interdisciplinarity,

but implies a profound reorganization of school times, spaces, knowledge and practices, guided by integral human formation and social justice.

In the field of public policies, the work shows that normative documents such as the LDB, the PCNEM, the BNCC and the guidelines of the Full-Time School Program represent important advances by incorporating the integration of knowledge, the contextualization of learning and student protagonism as guiding principles of the curriculum.

However, the results of the analysis indicate that these guidelines still face significant challenges in terms of implementation, especially when the extension of the school day is limited to the logic of shift and after-shift, maintaining the separation between curricular and complementary activities. In this aspect, the study contributes by highlighting the need to align 14 normativity and practice, reaffirming the integrated curriculum as a central strategy to give materiality to integral education.

The practical implications of this work are particularly relevant for school management and education systems. By highlighting historical and contemporary experiences of integral education, such as the Park Schools, the CIEPs, the More Education Program and the experience of the municipality of Diadema, the study points out concrete paths for the construction of contextualized integrated curricula, socially referenced and articulated with the territory.

Thus, it is evident that the performance of the school manager as an articulator of collective processes, continuing education and intersectoral dialogue is a fundamental condition for the effectiveness of the integrated curriculum in the full-time school. However, it is important to recognize the limitations of this study.

As it is a theoretical and documentary research, the analysis does not include in-depth empirical investigations on the implementation of the integrated curriculum in specific school contexts. In addition, the policies analyzed are marked by internal contradictions and different levels of appropriation by the education networks, which requires caution in generalizing the results.

In view of this, it is suggested that future research advances in the empirical investigation of integrated curriculum practices in full-time schools, considering different regional realities, levels of education and socioeconomic contexts. Studies that analyze the perception of managers, teachers and students, as well as the impacts of the integrated curriculum on learning processes and on the integral formation of subjects, can contribute to the deepening of the debate and to the improvement of public educational policies.

Finally, it is concluded that the integrated curriculum is a powerful and necessary strategy to overcome curricular fragmentation, as long as it is understood as a collective

educational project and a political-pedagogical guiding principle of the full-time school. By articulating theory and practice, school and territory, teaching and life, the integrated curriculum reaffirms integral education as an ethical and social commitment to full human formation and the construction of a more just, democratic and inclusive society.

ABSTRACT

This work emphasizes a synoptic visual dimension of the city and urban art that are displayed on graffiti-covered walls, at street events, and cultural occupations that reshape the imagery of Manaus, the capital of the state of Amazonas. The aim is to expand the understanding of research with images using the technique of Photoethnography. We mainly demonstrate how the act of photographing, editing, and organizing visual series is also the work of producing theories about the city and its problems, deep contradictions, and possible solutions. The research work also aims at analyzing how street art and graffiti in the city of Manaus constitute forms of occupation and re-signification of urban space, articulating aesthetic practices in order to combat cultural erasures. We use the approach of Photoethnography to capture digital images of murals and artistic interventions spread throughout the city. A city which we perceive as organic, polyphonic, polysemantic, and full of urban art.

Keywords: Manaus. Visual Arts. Photoethnography. Poetry. Transculturality.

RESUMO

Este trabalho enfatiza uma sinódica dimensão visual da cidade e da arte urbana que estão expostas em muros grafitados, em eventos de rua e ocupações culturais que reconfiguram o imaginário sobre Manaus, capital do estado Amazonas com o objetivo de ampliar o entendimento da pesquisa com imagens, utilizando a técnica da Fotoetnografia. Demonstramos principalmente como o ato de fotografar, editar e organizar séries visuais é também o trabalho de produção de teorias sobre a cidade e seus problemas, contradições profundas e possíveis soluções. O trabalho de pesquisa também se propõe a analisar como a arte de rua e o grafitti na cidade de Manaus constituem formas de ocupação e ressignificação do espaço urbano, articulando práticas estéticas para o combate aos apagamentos culturais. Partimos da abordagem da Fotoetnografia para registrar imagens digitais dos murais e intervenções artísticas espalhadas pela cidade, que percebemos como orgânica, polifônica, polissêmica em suas vivas manifestações artísticas urbanas.

RESUMEN

Este trabajo enfatiza una dimensión visual sinódica de la ciudad y del arte urbano presentes en muros grafitados, eventos callejeros y ocupaciones culturales que reconfiguran el imaginario sobre Manaus, capital del estado de Amazonas, con el objetivo de ampliar la comprensión de la investigación mediante imágenes, utilizando la técnica de la fotoetnografía. Se demuestra principalmente cómo el acto de fotografiar, editar y organizar series visuales constituye también un proceso de producción teórica sobre la ciudad, sus problemas, profundas contradicciones y posibles soluciones. El trabajo de investigación también propone analizar cómo el arte urbano y el graffiti en la ciudad de Manaus constituyen formas de ocupación y resignificación del espacio urbano, articulando prácticas estéticas para combatir los borramientos culturales. A partir del enfoque de la fotoetnografía, se registraron imágenes digitales de murales e intervenciones artísticas distribuidas por la ciudad, comprendida como orgánica, polifónica y polisémica en sus vivas manifestaciones artísticas urbanas.

1 INTRODUCTION

Photography is not just the act of pressing a button or swiping on a smartphone screen. In our research work, the act of photographing is seen as a way of recording and giving meanings to the urban world.

It is undeniable that photography today is in people's routine because of the availability of cell phones with cameras and a considerable number of social networks. The word photography comes from the junction of two Greek terms: Phos (light) and Graphé (to write), that is, photography means to write or draw with light. This research work and photographic essay reveals the role of subjectivity in the making and reading of graffiti art in the city of Manaus.

In this way, we consider photoethnography a powerful methodological tool in the field of visual anthropology and the so-called anthropology of the image (MATHIAS, 2016). In our field observations, we immersed ourselves in the art of graffiti, which we consider a true urban language in which graffiti artists start to act as street writers. We document here these city images, which transculturate the patterns associated with Amazonian mottos, reinventing them in the places where they are made available and in different forms, allowing them to be transformed, spaces and forms, in city circuits into a kind of open-air art gallery.

We chose this theme because of our proximity to Hip Hop Culture since the 1990s. In other words, the work has a scientific and militant character in Hip Hop (AGUIAR, 2021) revisited here in the reflection on memory spaces, collections, and museums.

For Ribeiro, "urban studies allowed the observer and the object of study to be brought closer together and paved the way, in parallel with the criticisms and questions that anthropology had been facing, to the development of works that were increasingly closer to the researcher's universe (2016, p. 98).

The street is our laboratory and deep down, "Photography is subversive, not when it terrifies, disturbs or even stigmatizes, but when it is *thoughtful*" (BARTHES, 2022, p. 18).

Hip Hop is an urban culture that originated in the Bronx neighborhood of New York City, in the United States of America, approximately in the 1970s. It arises from street parties, mainly with the events organized by DJ Kool Herc in 1973. Hip Hop Culture is made up of four artistic elements: Deejay, Rap, Breakdance, and Graffiti (AGUIAR, 2022). Hip Hop quickly spreads through the African-American and Latino communities as a form of artistic expression in the fight against racism, prejudice, social inequalities and marginality in the peripheries. The term Hip Hop was coined by the former street gang leader, Afrika Bambaataa, which means "to let go of the hips", in this way the disputes of the streets would be resolved through music, dance and a lot of art.

The four basic elements of Hip Hop Culture have been called by us as the four heads of the Urban Hydra (AGUIAR, 2011, 2018, 2022).

In the history of humanity itself, the act of drawing, painting and writing on walls and caves is already observed in the spaces covered by the so-called rock art (JUSTAMAND et al., 2025). In this way, the act of making paintings using cans of spray paint is called graffiti. Graffiti began with tags (signatures) on the surfaces of New York's subways in the early 1970s, by artists such as Taki 183 (GITAHY, 1999, p. 40) and, over time, it achieved success and was absorbed by the media and large art galleries (GITAHY, 1999, p. 39).

For this reason and for the opportunity to review socio-ethnographic documents, graffiti in the city of Manaus is the main object of our research. We make available here a considerable album of images made by artists who still deserve greater recognition in order to rethink the spaces for the distribution of art, culture and the continuation of memory.

2 SOME NOTES ON PHOTOETHNOGRAPHY

The thesis *FOUR HEADS OF AN URBAN HYDRA: IMAGES AND SOUNDS OF HIP HOP CULTURE IN THE CITY OF MANAUS – AM*, produced within the scope of the Graduate Program Society and Culture in the Amazon (PPGSCA) of the Federal University of Amazonas (UFAM) summons an imagetic and sound panorama of Hip Hop Culture in the city of Manaus, capital of the state of Amazonas. Through the lenses of cell phone cameras, images extracted from social networks, music, sounds, illustrations, two-dimensional barcodes (QR codes), audiovisual and graphic productions, we present the four artistic elements of Hip Hop Culture (Deejay, Rap, Breakdance and Graffiti) in their historical instances and different interactions, processes of resistance, actions, contradictions and conflicts in the urban spaces of the municipality in focus. From the first moment, we opted for interdisciplinarity. Essences extracted from history, sociology, literature, social communication, anthropology, architecture and graphic design to make the X-ray of a street culture that for almost four decades has influenced the behavior of a part of the youth of Manaus. As well as the mythological being who has the ability to recover from Hercules' advances. Hip Hop over five decades has been going through processes of hybridization (CANCLINI, 2015) with new rhythms, sounds, instruments, technologies, in this way, these young people appropriate and distribute art, dance and music in the peripheries of the whole world.

In fact, the pandemic period required new behaviors, making the traffic of people through cities decrease and the use of masks enter the routine of many, among other habits.

Thus, this work considered the direct and indirect effects of the pandemic on the unfolding of artistic making and its distribution, functioning as a prolegomenon on Hip Hop in Manaus.

Even so, it is an introductory text, although basic on the theme, with gaps to be filled throughout the next trails such as the one proposed here, considering the absences detected not deliberately or on purpose, but because we know that much information, characters, places, images and sounds would not be present during the writing process to the final product.

In this way, we decided to continue photoethnography as an approach to anthropological and interdisciplinary scientific research that aims to go beyond the university walls, and to suggest that the academic dialogue with society works as a response to the many concerns to do with identity, belonging, artistic making, distribution of art in the context of Manaus.

3 ABOUT THE FIELDWORK

The use of photography and audiovisual products in research contexts in the Social Sciences and Humanities is nothing unprecedented. There is a diversity of academic works that open up methodological possibilities and research objects. Despite this, presentations in verbal and written forms continue to have a higher level in the scope of academies, however we have been investing for some time in new forms of narratives and that have been giving results in the form of photographic exhibitions and academic publications (AGUIAR, 2022, 2023, 2024, 2025). We then focus on the use of photography in the studies of urban cultures, specifically, the photoethnography of Hip Hop culture in Manaus (AGUIAR, 2022) expanding the feat to the aforementioned thesis, and opening the opportunity to think about how the layers of culture are arranged and rearranged cross-culturally, depending on the circumstances of time and space.

Photoethnography combines photography with anthropological fieldwork to record images of graffiti productions. The method involved extensive fieldwork, using smartphone cameras in several areas of the city of Manaus. These images formed the narrative core, allowing detailed interpretations of cultural resistance, urban and Amazonian identity, from the graffiti scattered throughout the geographical zones of Manaus.

In addition to this exercise of readings and analysis of a specialized bibliography focused on the theme, we will also produce a photoethnography with the images of urban art known as graffiti. Making it clear that photoethnography is a composition of images that form a visual narrative.

Understanding that photoethnographic work and its production,

(...) must have a professional who guarantees quality in the image registration. The concern with capturing the image is an important prerequisite for those who will generate the photographic material, whether it is carried out by a photography professional, an ethnologist or a researcher who follows anthropological precepts (BONI; MORESCHI, 2007, p. 140).

Achutti defends the use of Photoethnography and its methodology. For the author:

If, from the beginning of the fieldwork, the researcher-photographer does not have in mind the final pagination (or assembly of the photographic exhibition, as the case may be), the result of his work will suffer from this lack of planning, because a long process of construction, the construction of a visual description. The photographs in the final result should form a whole. For this reason, a work that uses photography should be constructed with method, in the same way as a film, a text or a dissertation. Photographs obtained in a random and disorganized way will become, in the best of cases, a source of information that will perhaps one day find its place in some photo library, but which will not be able to become a complete work, a photoethnographic narrative (2004, p. 3-4).

In this same interview, Luiz Eduardo Achutti, the person responsible for drafting the nomenclature of the term, points out that technologies facilitate the practice of photographing, including using cell phones (ALVES, 2021, p. 446). In this way, we made use of smartphones in the collection of images and in the production of audiovisual materials. The recording, sound and image applications available are tools widely used by artists and researchers today.

It is worth noting that this type of activity has already been put into practice by us on other occasions (AGUIAR, 2021, 2022, 2025).

"A Photoethnography in the city of São Gabriel da Cachoeira - AM" (AGUIAR, 2025) is an educational and cultural immersion in this region. São Gabriel da Cachoeira is a city located in the extreme northwest of the state of Amazonas and borders Colombia and Venezuela. This locality is bathed by the Rio Negro and has considerable linguistic pluralism. In addition to the Portuguese language, three other indigenous languages are also spoken: Nheengatu, Baniwa and Tukano officially.

We were in São Gabriel da Cachoeira on two occasions (2019 and 2022), to teach in the Bachelor's Degree in Archaeology at the University of the State of Amazonas (UEA). In these odd moments, we use the camera of cell phones to capture images. Walking down the street and photographing incessantly.

In the contemporary world, new information and communication technologies open up a range of tools for the production of videos, music and photographs. We can say that creating an audiovisual product for free is possible and available using smartphones, iPads, tablets,

cameras and modern photographic lenses. The alliance between theory and practice should encourage the viewer to become a director of their own audiovisual works (MOLETTA, 2014). Furthermore, we emphasize that in the arts, the technological issue, historically, is of paramount importance (ZAMBONI, 2001, p. 41).

Luiz Achutti treats photoethnography as a "photographic writing" that does not clash with written and/or verbal language, they complement each other (ACHUTTI, 2004).

In "Capão Pecado": images of the south zone of the city of São Paulo – SP (AGUIAR, 2022) we present a visual narrative of our passage as researchers of Hip Hop culture and its artistic elements in the aforementioned region of São Paulo – SP. The title of the photo essay is in honor of the book *Capão Pecado* (2016) by the writer Ferréz. We tried to present a brief ethnographic circuit with interviews, filming, visits, readings, poetry, music, street food, prosaic conversations and especially the use of photographs collected by the cell phone camera.

In this way, we understand "photography and videos mainly as tools in the work process and field research. (...) that images and photographs are visual documents for interpretations full of validity in certain realities or cultures, even if they are loaded with subjectivities and polysemy" (AGUIAR, 2022, p. 90).

In fact, even for this reason: it is in the intersection of times, spaces, and perceptions that the various meanings and semantics are born from the gaze of a "single" object. We can look at a series of images, for example, from different angles, in different times and spaces, and this plurality of places of observation will allow polysemy, which is the encounter of subjectivity with the concreteness of and in the world.

4 IMAGES OF A TREMBLING WORLD

Borrowing the title of one of John Milton's books (2014), this section alludes to the equally subjective and plural effects of images, objects of this ethnography, in the context of thought and reflection on important themes for the peoples of the Manaus region, such as identity, belonging, artistic expression, distribution of the arts and social visibility.

The authorial images that we deal with here were produced and treated as visual narratives that critically point to the dispute for visibility in the public space and, before that, the subjective translations made by observers from different places, including those outside the city, and from the state of Amazonas. And in this sense, we remember that graffiti as a writing of the streets tends to expand the possibilities of reading this visual art as an aesthetic experience spread in living spaces. It is the circulation of images that affect its passers-by/observers, becoming part of those who occupy themselves with the gaze.

The list of images about graffiti quantitatively exceeded two hundred, and we tried to use natural light from smartphone cameras. On many occasions, we came across the arts through our daily paths and immediately parked the car to register. At other times we had to enter on foot, especially inside overpasses with cars in motion. We emphasize that a large part of these arts is in the outskirts of the city and, in this way, transiting through these "quebradas" becomes an activity that requires caution. However, there were no incidents and there was always someone for a quick and enlightening conversation about our work.

Some time later, we united the idea of visual narratives with the time before them, the proposal of photoethnography as poetry, as an expression of the various possible subjectivities achieved in the acts of photographing the instant of the quasi-permanent that is graffiti, and of describing reality as the subjectivity of the gaze, before it becomes part of the visual narrative initially thought of as an anthropological critique that reveals a dispute for visibility, affirmation of identity and, of course, attention to the hegemonic forms of public space planning. From one variant to the other, that is, from the poetry of the artistic and spectator gaze to the visual narrative propagated by anthropologically sharp reading, the proposal reaches forms of resignification of the spaces of circulation of people, things, objects, beings more than human (a new reference to the other animals on the planet, in a non-hierarchical way).

The results indicate that graffiti and other urban inscriptions operate as street writings that tension boundaries between art and illegality, center and periphery, memory and oblivion, converting streets and facades into an open-air museum and expanding the population's access to aesthetic experiences in the city where they live, in the same way that they transculture belongings linked to socioeconomic axes. And they go further, they remain there in the open spaces temporarily, extinguishing with the weather, rain, excessive sun. And in people's memories? How much do they remain and transform, transculturating experiences?

In this way, photoethnography, by making visible both the processes of creation and social circulation of images, enhances the understanding of urban art in Manaus as a practice of symbolic resistance and the production of new narratives about the city and its subjects, providing innovations in the way we perceive ourselves as human beings and experience our surroundings reified by the many objects of the urbis, and by the presence of beings more than human (traditionally, alluded to by the term "animals").

At the intersection of artistic and academic motivations, we open a horizon in which theories to do with anthropology, translation and the arts coexist, enabling us to go beyond

the limits of one and the other, uniting them kaleidoscopically, in favor of possibilities of existence(s).

Next, we present a series of ten imagery clippings (of more than two hundred) accompanied by bilingual poetic creations that translate them in order to compose texts beyond visual narratives, compositions open to varied subjectivities and to provoke reflections on places, belongings, identities from Manaus and their transculturated experiences to other times and spaces. And in our translation, to another language(s)...

Figure 1

Jaguar, 2024

Between the gaps of windows and buildings
There is a leopard
whose gaze is composed of fears and deviations...

Between the spaces of windows and towers, a leopard moves—its gaze woven from
fear and sidelong paths...

ABSTRACT

Bottom flushing operates by allowing water stored in the reservoir to be released through structures located at the base of the dam. It is a structure designed to control the controlled release of water from the reservoir, ensuring the stability of the dam and controlling water levels. This component is essential in damming to ensure the structural safety of the dam and the efficient management of water resources. This article offers an integrated approach to the calculation and implementation of bottom discharges in dams, with a focus on inverted siphons, based on hydrological and normative studies. Combining theory, legislation and practice, the aim is to provide a practical and complete guide that covers everything from the theoretical foundations to the execution of the installation. The objective is to simplify the process for engineers and technicians, ensuring the safe and efficient operation of dams, in addition to meeting environmental and regulatory requirements.

RESUMO

A descarga de fundo em barragens opera permitindo que a água armazenada no reservatório seja liberada por meio de estruturas localizadas na base da barragem. É uma estrutura projetada para controlar a liberação controlada de água do reservatório, garantindo a estabilidade da barragem e controlando os níveis de água. Essa componente é essencial em represamento para garantir a segurança estrutural da barragem e a gestão eficiente dos recursos hídricos. Este artigo oferece uma abordagem integrada para o cálculo e implementação de descargas de fundo em barragens, com foco em sifões invertidos, baseando-se em estudos hidrológicos e normativos. Combinando teoria, legislação e prática, busca-se fornecer um guia prático que engloba desde os fundamentos teóricos até a execução da instalação. O objetivo é simplificar o processo para engenheiros e técnicos, garantindo a operação segura e eficiente das barragens, além de atender às exigências ambientais e regulatórias.

Palavras-chave: Descarga de Fundo. Barragens. Sifão Invertido. Cálculo Hidrológico. Segurança de Barragens.

RESUMEN

La descarga de fondo en presas funciona permitiendo la liberación del agua almacenada en el embalse a través de estructuras ubicadas en la base. Esta estructura está diseñada para controlar la liberación controlada de agua del embalse, garantizando la estabilidad de la presa y regulando los niveles de agua. Este componente es esencial en los embalses para garantizar la seguridad estructural de la presa y la gestión eficiente de los recursos hídricos. Este artículo ofrece un enfoque integral para el cálculo e implementación de la descarga de fondo en presas, centrándose en los sifones invertidos, basándose en estudios hidrológicos y regulatorios. Combinando teoría, legislación y práctica, el objetivo es proporcionar una guía práctica que abarca desde los fundamentos teóricos hasta la ejecución de la instalación. El objetivo es simplificar el proceso para ingenieros y técnicos, garantizando la operación segura y eficiente de las presas, además de cumplir con los requisitos ambientales y regulatorios.

1 INTRODUCTION

Dams are closely linked to the social and scientific development of humanity. These are structures that can influence both the area around them and their rural and urban surroundings. For millennia, human beings have recognized the need to build reservoirs in order to contain surface waters for an individual or collective good (Rocha et al., 2024).

The bottom discharge system is used to control the water level in dams, with the aim of mitigating risks related to floods, ruptures and overflows. It consists of a mechanism that allows the controlled release of accumulated water, performing a specific function in the operation of dams, especially large ones (Silva et al., 2016). In specific contexts, such as in small-port dams or in places with water scarcity conditions, the use of bottom discharge can be considered dispensable (Aion, 2018).

Despite its importance, the application of bottom discharge is not yet widespread. In part, this is due to the risks associated with the operation, such as excessive vibrations in the gates, cavitation, and leaks. These factors can significantly impact the costs of building and maintaining the dam, as the device requires constant inspection and care. Due to the wear generated by cavitation and abrasion, Rocha et al. (2018) suggest that the continuous use of bottom discharge should be avoided to prevent structural damage.

An example in Brazil is the Pedra do Cavalo Dam, located in Bahia, considered one of the most important, as it is responsible for the water supply of the capital Salvador and its metropolitan region. Initially, the dam had a bottom discharge to help control the filling of the reservoir. However, after the water level exceeded the spillway level, the device was deactivated and ceased to be used.

On the other hand, other countries, such as the United States, Spain and Switzerland, have strengthened their dam safety legislation, requiring the inclusion of bottom discharges in new constructions and, in the case of Spain, even in existing dams.

This balanced approach between operational benefits and technical challenges has been debated in different contexts around the world, highlighting the importance of adapting best practices according to the particularities of each dam and region. In Brazil, although there is still no specific legislation on the subject, the National Water Agency (ANA) already recommends the implementation of this device as an essential practice for the safety and proper functioning of dams.

However, the operation of dams in Brazil still faces numerous challenges, especially with regard to the correct functioning of bottom discharges. These structures serve to ensure the safety, maintenance and efficient operation of the dams. However, it is estimated that

more than 90% of the dams in the country have problems related to the management of this system, making it urgent to adopt practical and standardized methods.

Thus, bottom discharge in dams performs several essential functions, such as emptying the reservoir, both for scheduled maintenance and in emergency situations, in addition to allowing the removal of accumulated sediments and the renewal of water. This device is also crucial for maintaining regular flow in the river downstream, ensuring that water continues to flow through the dam structures, which contributes to the preservation of the local ecosystem.

This article aims to provide a guide for the calculation and implementation of bottom flush systems, focusing on the use of inverted siphons, an economical and easy-to-implement solution. The methodology is based on theoretical and practical studies, applicable legislation and technical standards such as ABNT NBR 12214 (1992) and ABNT NBR (2017), as well as practical examples applied to dams in Brazil. The central proposal is to ensure that, through a single source, the reader can understand the theoretical principles, follow the calculation formulas and apply the practical guidelines for installation, providing a complete solution for water management in dams.

The methodology adopted in this study was based on a bibliographic survey of academic papers, legislation and project guides on the use of bottom discharge devices in dams. As described by Manzo (1986), the bibliographic survey offers means to define and solve not only problems that are already known, but also to explore new areas where the problems have not sufficiently crystallized. This method allows researchers to support their analyses with parallel data and expand the reach of their findings.

During the research, various types of sources were consulted, such as scientific articles, technical standards, and national and international legislation. The studies cover several countries, including Brazil, India, Spain, the United States, Canada, Switzerland and the United Kingdom, which contributed to a global view on the application and challenges of implementing bottom discharges. In addition, manuals and technical bulletins from institutions such as the National Water Agency (ANA), which provide guidelines and practical recommendations on the installation and maintenance of these devices, were analyzed.

This method also included consulting ABNT standards, such as ABNT NBR 12214 (1992) and ABNT NBR 13028 (2017), which guide the design and construction of water control systems, ensuring that technical parameters are aligned with international best practices.

2 THEORETICAL FOUNDATIONS

The theoretical and methodological basis of this article follows the studies of Tomaz (2012), whose works are extremely recognized in the area of water resources and dam management. Its contributions are based on the methodologies for calculating bottom discharges in dams, which are essential for the maintenance of the structure and environmental preservation. These devices ensure the proper flow of water and prevent the accumulation of sediments, promoting the constant renewal of downstream water, in addition to controlling the volume of water in the reservoirs.

The bottom discharge is an important structure for the safety of dams, as it makes it possible to control the flow of water released downstream, both in normal operating situations and in emergencies, such as emptying the reservoir. In addition, it plays an important role in the preservation of aquatic ecosystems, ensuring the maintenance of the minimum ecological flow, as required by environmental standards (Rocha et al., 2018; Paulo et al., 2021).

Bottom discharges can be renewed in different ways, depending on the type of dam (earth or concrete) and its main function, such as supply, storage or energy generation. These variables directly influence the choice of the most compromised solution for bottom discharge. The main types include valve, pipe and siphon controlled discharges. The use of inverted siphon is especially common in earth dams that do not have a built-in bottom discharge, or where an existing discharge does not meet the ecological flow required for the region's water demand (Silva et al., 2016).

The inverted siphon uses the principle of atmospheric pressure to move water from a higher to a lower height, without the need for pumps. The water is conducted through an inverted "U" shaped tube, where the pressure at the highest point of the siphon is lower than the atmospheric, generating a continuous flow. This type of system is widely used in earth dams that do not have a built-in bottom discharge, being installed externally, which facilitates its implementation and reduces costs (Dini; Tabesh, 2014; Campos, 2020).

In addition, the use of inverted siphons is an efficient solution, especially when the region's water demand and the need for water renewal are not met by existing discharges. In projects that require greater operational flexibility and control over water flow, the siphon stands out as a practical and low-cost alternative. It allows for minimal intervention in the existing dam structure, while ensuring proper flow control and maintaining the desired water level in the reservoir (Abreu et al., 2018).

The implementation of siphon bottom discharges, especially in earth dams, also helps in the removal of sediments accumulated at the bottom of the reservoir, which is essential to preserve the reservoir's capacity and prevent siltation. This type of solution is particularly

useful in regions where water level control is crucial to avoid problems of operation and environmental preservation (Campos, 2019; Abreu, 2019).

The structural and ecological importance of bottom discharges is widely highlighted in studies such as that by Paulo et al. (2021), which examine the effectiveness of bottom discharge in controlling water level and removing accumulated sediments. In addition, the devices act on the safety of the dam, avoiding hydraulic overload that can compromise structural integrity.

From a hydrodynamic point of view, the most used formulas for calculating flow include the Manning and Hazen-Williams equations. The Manning research is applied to determine the flow rate as a function of the roughness of the material, the ceramic diameter and the flow orientation, and is widely used in gravitational systems. On the other hand, Hazen-Williams engineering is used to calculate the pressure loss in hydraulic systems, whether settlement or gravity, since both involve pressurization, whether natural or artificial. The proper application of these formulas is essential for the correct sizing and operational efficiency of the flushing system (Silva et al., 2016).

3 REGULATIONS AND APPLICABLE LEGISLATION

In Brazil, the management and standardization of dam safety is governed by a series of laws and decrees that aim to ensure the protection of water resources and the safety of the infrastructures involved. State Decree No. 2,432/2005, of the State of Tocantins, establishes specific rules for the granting of the right to use water resources, with a focus on run-of-the-river dams. This decree defines that a minimum flow to guarantee ecological flow must be 25%, a measure that aims to maintain local biodiversity and minimize negative environmental impacts (Tocantins, 2005). This regulation is essential for the implementation of bottom discharge systems, ensuring that the use of water resources is sustainable and safe.

In addition to state standards, Federal Law No. 12,334/2010, which deals with the National Dam Safety Policy (PNSB), is a regulatory framework that imposes clear guidelines on the construction, operation, monitoring, and maintenance of dams in Brazil. This legislation was created in response to several incidents that occurred in Brazilian dams, with the objective of ensuring that all dams meet minimum safety standards, not only structural, but also environmental (BRASIL, 2010). The Law was complemented by Law No. 14,066/2020, which increased the loss in the control of dam safety after tragedies such as Brumadinho and Mariana. The adoption of bottom discharges in this context is a practical response to the

requirements imposed by this legislation, allowing dam operators to comply with the established requirements.

Another relevant standard for the planning and implementation of bottom discharges is ABNT NBR 13028 (2017), which provides technical guidelines for the construction and maintenance of earth dams. This standard covers everything from the initial design to the continuous monitoring of the structure, considering the environmental impacts and technical requirements to ensure the safety of the work (ABNT, 2017). The use of bottom discharge systems is especially important in earth dams, as it allows the removal of accumulated sediments and the control of the water level, avoiding structural overloads.

CONAMA Resolution No. 344/2004 also deserves to be highlighted, as it establishes minimum procedures for the evaluation of sediments to be dredged. These procedures are directly applicable to the use of bottom discharge systems, as they ensure that sediment removal is carried out in a safe manner and in compliance with environmental guidelines (CONAMA, 2004). In the context of dam operation, this resolution complements the other regulations, reinforcing the importance of maintaining strict control over sediment management.

In addition, the technical manual of the National Water Agency (ANA) recommends the adoption of bottom discharge systems as an efficient measure for the management of water resources in dams (Abreu et al., 2018). ANA, as a regulatory body, works in conjunction with state and federal regulations to ensure that all dams in Brazil are operated in accordance with the best practices of sustainability and water security.

In comparative terms, Brazil is still in the adaptation phase to comply with the requirements established in stricter international legislation, such as Spanish legislation, which requires that all new dams, and many existing ones, incorporate bottom discharge systems to maintain water and environmental security (Pereira, 2019). In the United States, dam management is widely regulated, with legislation disabling bottom discharge systems in all structures, especially in regions prone to drought and extreme water flow variations (Maia, 2023).

Thus, the Brazilian regulations on dam safety, and in particular on bottom discharges, are well established, but require constant adaptation and updating. The integration between state and federal legislation, as well as the incorporation of international best practices, is essential to ensure that dams in Brazil operate in a safe and sustainable manner. The alignment with ABNT NBR 12214 (1992), which addresses the sizing of water pumping systems, also complements safety standards to ensure that the flow of water is properly controlled (ABNT, 1992).

4 CALCULATION METHODOLOGY FOR INVERTED SIPHONS

Calculating the flow rate of a bottom discharge involves the application of hydrodynamic equations that consider factors such as the diameter of the pipe, the slope, and the roughness of the material used. The Manning equation, for example, is widely used to estimate water flow in inverted siphon systems, while the Hazen-Williams equation provides accurate estimates of head loss in pressurized systems (Silva et al., 2016).

These calculations are essential to ensure that the bottom discharge system operates within the safety and efficiency limits established by national and international regulations (Campos et al., 2019). According to Silva et al. (2016), the correct application of these equations allows the structure to be sized adequately, ensuring that the bottom discharge meets the flow demands and operates without compromising the integrity of the dam.

The methodology used in this article is based on the studies of Tomaz (2012). To calculate the flow (Q) of the water flowing through the bottom discharge, the Manning and Hazen-Williams equations are used. These equations consider the pipe diameter (D), the slope (S), and the roughness of the pipe material (n).

The Manning Equation is widely used to calculate the flow rate (Q) in open channels and partially filled pipes. It considers the roughness coefficient of the material (n), the hydraulic radius (R) and the flow slope (S).

$$Q = \frac{1}{n} \times A \times R^{2/3} \times S^{1/2} \quad (1)$$

Where:

- What is the flow rate, m³/s
- A is the wet area, m²
- R is the hydraulic radius, m
- S is the slope, m/m

The Hazen-Williams Equation is applied to determine the pressure loss in full pipes.

$$Q = C \times D^{2.63} \times S^{0.54} \quad (2)$$

Where:

- Q is the flow rate in m³/s
- D is the diameter in meters
- S is the unit head loss in meters per meter of pipe

- C is the coefficient that depends on the nature of the material used and the condition of the internal walls.

These equations make it possible to measure the volume of water to be released by the bottom discharge, ensuring safe and efficient operation (Campos et al., 2019; Tomaz, 2012). These formulas allow you to calculate the flow capacity and ensure that the system is correctly sized.

According to ASCE, 1992, the siphon for rainwater conduction should have a maximum speed of 1.8 m/s, and if there are abrasive materials, the speed should be less than 3 m/s. Also according to ASCE, 1992, the pressure loss can be calculated using Manning's proposal, which is as follows:

$$HF = \frac{19,5 n^2 \times L \times V^2}{R^{4/3} \times 2 \times g} \quad (3)$$

Being:

- HF = Pressure Drop (m)
- n = Manning roughness
- L = Circumference Length (m)
- V = speed (m/s)
- R = hydraulic radius (m)
- g = 9.81 m/s²

Load losses must be calculated in curves, contractions, expansions, as well as in inputs and outputs.

We know the flow rate, we need to size the diameter of the siphon using the Darcy-Weisbach formulation or the Hazen-Williams formula. For pipes with a diameter of less than 50 mm, other formulas can be used, such as Flamant's. However, the great advantage of the Hazen-Williams formula is that it facilitates the choice of the roughness coefficient C, which is easier to estimate compared to the K values used in the Darcy-Weisbach formula. The formula for the pressure loss per meter (J) is given by:

$$j = \frac{10,643 \times Q^{1,85}}{C^{1,85} \times D^{4,87}} \quad (4)$$

Where:

- J is the pressure loss per meter (m/m);

- Q is the flow rate in cubic meters per second (m³/s);
- C is the roughness coefficient of the pipe according to Hazen-Williams;
- D is the diameter of the pipe in meters.

Table 1 lists some values for the Hazen-Williams roughness coefficient.

Table 1

Hazen–Williams roughness coefficient.

Material	Roughness coefficient C
New cast iron	130
Cement-coated cast iron	130
New steel	120
Steel in use	90
PVC	150
Cast iron in use	90

Source: Adapted from Dini and Tabesh (2014)

The formula for calculating the pressure drop in the tube section of length L is:

$$h_f = J \times L \quad (5)$$

Being:

- h_f = loss of pressure in the stretch, in meters of water column;
- J = unit loss obtained by formula (4);
- L = Pipe length (m).

The speed in the Hazen–Williams formula is given by:

$$V = 0,355 \times C \times D^{0,63} \times J^{0,54} \quad (6)$$

Being:

- V = velocity (m/s);
- C = Hazen-Williams roughness coefficient (dimensionless);
- D = diameter (m);
- J = unit head loss (m/m).

The Hazen–Williams formula is applicable for high speeds, but is questionable for C values below 100, and its use is limited to speeds less than 3 m/s.

Mott (1994) presented a Hazen-Williams formula for any section, using the hydraulic radius. For units of the International System (SI), there are:

$$V = 0,85 \times C \times R^{0,63} \times S^{0,54} \quad (7)$$

$$hfL = L \left[\frac{Q}{0,85 \times A \times C \times R^{0,63} \times S^{0,54}} \right] \quad (8)$$

Being:

- V = average cross-section velocity (m/s);
- C = Hazen-Williams coefficient (varies between 100 and 140 for concrete);
- R = hydraulic radius (m) = A/P.

Analyzing a normal siphon, i.e., the siphon using Mott, 1994. Bernoulli's equation can be used, initially assuming that there is no pressure loss, although it can be easily used when considering distributed and localized load losses. If there are no localized and distributed cargo losses, we will have:

$$\frac{p}{\gamma} + Z + \frac{V^2}{2g} = \text{constante} \quad (9)$$

However, localized and distributed cargo losses must be considered. Then, the calculation and application of Bernoulli's equation is detailed to specific points in the siphon system, using data from a bus. For this, values such as flow, suction length and localized losses are considered.

Figure 1

Siphoning in dam

Source: Tomaz (2012)

4.1 FIRST

The first step is to apply Bernoulli's equation to points A and F in Figure 1.

$$\frac{p_A}{\gamma} + Z_A + \frac{V_A^2}{2g} = \frac{p_F}{\gamma} + Z_F + \frac{V_F^2}{2g} + hf_{AF} + \Sigma ks \times \frac{V_F^2}{2g} \quad (10)$$

Being:

- HF = distributed head loss (m)
- Σks = loss of localized charges (m) $\frac{V_F^2}{2g}$

4.2 SECOND

The second step is to apply Bernoulli's equation to points A and B in Figure 1.

$$\frac{p_A}{\gamma} + Z_A + \frac{V_A^2}{2g} = \frac{p_B}{\gamma} + Z_B + \frac{V_B^2}{2g} + hf_{AB} + \Sigma ks \times \frac{V_B^2}{2g} \quad (11)$$

4.3 THIRD

The third step is to apply Bernoulli's equation to points A and C in Figure 1.

$$\frac{p_A}{\gamma} + Z_A + \frac{V_A^2}{2g} = \frac{p_C}{\gamma} + Z_C + \frac{V_C^2}{2g} + hf_{AC} + \Sigma ks \times \frac{V_C^2}{2g} \quad (12)$$

The proper implementation of these steps will result in the regularization of the Earth Dam in accordance with the requirements of the current environmental agency of your state. It is worth mentioning that the flow required for the system may vary according to the region, and it is therefore essential to monitor civil and environmental engineering for the correct sizing of the project and its precise execution.

5 EXECUTION AND INSTALLATION

After the calculations are completed, it is time to install the bottom discharge. Correctly following these guidelines ensures that the dam operates safely and efficiently, preventing structural failures and mitigating environmental risks. The correct and detailed instruction of the steps provided facilitates the process and ensures that the reader, by following the instructions, can execute the solution successfully (Tomaz, 2012).

To address the installation and execution of bottom discharge systems in dams, it is necessary to have thorough planning that is based on technical and normative guidelines that are already conditional (ABNT, 2017). These systems play an important role in the operation

of dams, as they facilitate the control of water flow, the removal of sediments and the preservation of structural safety (CONAMA, 2004).

The successful execution of these systems cannot be achieved in a superficial way; on the contrary, it requires a detailed understanding of the processes involved, the materials used, and the tools used for the system to work optimally and flawlessly (Tomaz, 2012).

The process of installing a bottom flush system begins with the choice of the appropriate materials. According to Tomaz (2012), PVC pipes are often recommended for their corrosion resistance and ease of application. These pipes must be selected based on the ceramic calculation in advance, considering the pressure and flow of water that will be chosen by the system. In addition, ball valves and PVC connectors are widely used to ensure system flexibility, while sieve foot valves play a critical role in preventing clogging, allowing controlled passage of water and preventing coarse sediment from entering the system (Tomaz, 2012; Abreu et al., 2018).

Land preparation is another step in the installation process, involving cleaning and excavation to accommodate the pipes. This requires precision, as the inverted siphon system must be installed in phases and with the proper specification, in order to ensure the continuous flow of water. Measuring ground levels is an essential practice to avoid installation errors. The use of hoses with water, as described by Silva et al. (2016), is an effective method for measuring the ground level and adjusting the orientation of the orientation. This method, in addition to being simple, offers enough solutions to ensure that the siphon is positioned correctly, preventing future problems such as clogs and leaks.

During the installation phase, the assembly of the inverted siphon system must strictly follow the technical guidelines. All components, including pipes and valves, must be assembled precisely, complying with previously calculated pressure and flow specifications. The entrepreneur's manual (2024) details the importance of proper cuts in pipes, using care to ensure that the parts are perfectly aligned and connected. Any misalignment or failure in the arrangement can result in leaks, compromising the efficiency of the system. In addition, a constant check during installation is recommended to ensure that all installations are well adjusted and fixed.

After the system has been assembled, it is essential to conduct efficiency tests, especially to check the water flow through the bottom discharge system. The "bucket test" is widely recommended in manuals and studies on bottom discharge (Paulo et al., 2021), and consists of measuring the volume of water drained during a given period and comparing it with the values previously calculated. This method, while simple, is effective in verifying that the system is working as intended. For larger or more complex systems, the use of digital

flow meters can be a more accurate alternative, providing real-time data on system performance (Dinini; Tabesh, 2014).

Keeping the bottom flush system in full working order depends on a regular maintenance routine. Sediment buildup in pipes can compromise system efficiency, especially in dams where sediment removal is a constant concern. Periodic cleaning is therefore essential to prevent clogging and ensure water flow (Rocha et al., 2018). In addition, inspecting connections and checking for possible leaks should also be part of the maintenance schedule. Standards such as ABNT NBR 16496:2016 provide detailed guidance on how to monitor and operate dam systems, ensuring that the correct procedures are followed to maintain the longevity and efficiency of the system (ABNT, 2016).

International experience also offers valuable examples on the improvement and maintenance of bottom discharge systems. Countries such as the United States and Spain have strict standards that exclude the installation of bottom discharge devices in new dams and even the adaptation of existing dams to incorporate these systems (Maia, 2023). These legislations reflect the importance of ensuring the structural safety of dams, as well as contributing to environmental protection by ensuring that water flow and sediment removal are managed effectively. In Brazil, although there is still no specific federal law for bottom discharge, manuals and guidelines from the National Water Agency (ANA) already recommend the adoption of such systems, based on international examples (Brasil, 2010; CONAMA, 2004).

The process of installing and maintaining bottom discharge systems requires careful planning and constant observation of environmental conditions, such as the variation in the water level and the amount of sediment accumulated in the reservoir. Periodic adjustments may be necessary to ensure that the system continues to function efficiently over time. More advanced systems, such as those incorporating monitoring sensors, can facilitate this process by allowing operators to make automatic adjustments based on real-time data (Paulo et al., 2021).

Ultimately, the installation of a well-planned and preserved bottom discharge system provides significant benefits, both in terms of structural safety and environmental preservation. Efficient sediment removal avoids the accumulation of materials that could compromise the integrity of the dam, while adequate control of water flow contributes to the sustainability of riparian ecosystems (Tomaz, 2012). The experience accumulated in other countries shows that the adoption of similar practices in Brazil could bring innovative advances to the sector, especially with regard to dam safety and water resources management.

In Brazil, the current scenario is promising, with the growing adoption of technical guidelines for the installation and maintenance of bottom discharge systems. As regulations become more stringent and practices align with international standards, the country is expected to advance in the efficient management of its dams, minimizing the risks and maximizing the benefits of these systems (Silva et al., 2016; Rocha et al., 2018).

Therefore, the execution of bottom discharge systems in dams is not just a technical issue; It also involves a commitment to safety, environmental preservation and compliance with standards and regulations. The combination of theory and practice described in this article provides a comprehensive guide for the implementation of these systems, offering an efficient and sustainable solution for the safe operation of dams in Brazil and other international contexts.

6 CONCLUSION

From the results obtained, it is possible to present a complete and integrated view on how to solve the problems of bottom discharge in dams. Through the combination of theory and practice, the reader is offered a guide that eliminates the need to resort to multiple sources, concentrating in a single document all the information and tools necessary for proper calculation and installation. The ultimate goal is to ensure that, by following this step-by-step, the professional can effectively meet the regulatory and operational requirements of dams in Brazil.

Thus, the importance of an efficient bottom discharge system cannot be underestimated. It plays a vital role in the safe operation of dams, helping to prevent sediment build-up and ensuring controlled runoff of water. A well-implemented system also contributes to environmental sustainability by preserving the ecosystems downstream of the dam.

The results provide a significant contribution to the implementation of practical and normative solutions in the context of Brazilian dams. By aligning the methodologies described with national and international technical standards, such as those of ABNT, it provides a guide that complies with current legislation, while facilitating the operation and maintenance of these structures.

In addition, the practices described here are widely applicable to other international contexts, as evidenced by countries such as the United States and Spain, which have already adopted stringent regulations on the use of bottom discharge devices. The adoption of similar solutions in other countries reinforces the need to implement well-planned and committed devices, ensuring the structural integrity of dams and contributing to more sustainable water management at a global level.

ABSTRACT

The article proposes the concept of ontological pareidolia as a diagnostic tool to examine processes of conceptual reification in contemporary law. It begins from the hypothesis that successful legal theories tend, progressively, to shift from analytical instruments to implicit ontological assumptions, operating not only as interpretive lenses but as supposedly neutral transparencies of the legal object itself. The phenomenon is analyzed through the theory of the balancing of principles developed by Robert Alexy, chosen as a paradigmatic case not because of structural defect, but because of its institutional success and practical diffusion. Three recurring diagnostic triggers are identified: (i) grammatical agency of concepts, (ii) colonization of the central question of the case, and (iii) inflation of defensive qualifications. It is argued that such dynamics do not constitute a theoretical error, but rather a predictable outcome of paradigmatic consolidation. The study does not seek to invalidate specific theories, but to offer a reflective protocol for the analysis of judicial decisions and normative arguments, distinguishing the conscious instrumental use of concepts from their consolidated ontological reification. In conclusion, it is suggested that the problem may be better understood in light of a broader relational ontology, according to which concepts persist insofar as they remain compatible with the institutional fields that sustain them.

RESUMO

O artigo propõe o conceito de pareidolia ontológica como ferramenta diagnóstica para examinar processos de reificação conceitual no Direito contemporâneo. Parte-se da hipótese de que teorias jurídicas bem-sucedidas tendem, progressivamente, a transitar de instrumentos analíticos para pressupostos ontológicos implícitos, operando não apenas como lentes interpretativas, mas como transparências supostamente neutras do próprio objeto jurídico. O fenômeno é analisado a partir da teoria da ponderação de princípios de Robert Alexy, escolhida como caso paradigmático não por defeito estrutural, mas por êxito institucional e difusão prática. Identificam-se três gatilhos diagnósticos recorrentes: (i) agenciamento gramatical de conceitos, (ii) colonização da questão central do caso e (iii)

¹ Dr. in Pathology. Universidade Federal de Minas Gerais.

² Master's degree in Law. Universidade Autónoma de Lisboa.

inflação de qualificações defensivas. Sustenta-se que tais dinâmicas não constituem erro teórico, mas deriva previsível de consolidação paradigmática. O estudo não pretende invalidar teorias específicas, mas oferecer um protocolo reflexivo para análise de decisões judiciais e argumentos normativos, distinguindo o uso instrumental consciente de conceitos de sua reificação ontológica consolidada. Ao final, sugere-se que o problema pode ser compreendido à luz de uma ontologia relacional mais ampla, segundo a qual conceitos persistem enquanto compatíveis com os campos institucionais que os sustentam.

RESUMEN

El artículo propone el concepto de pareidolia ontológica como herramienta diagnóstica para examinar los procesos de reificación conceptual en el derecho contemporáneo. Se parte de la hipótesis de que las teorías jurídicas exitosas tienden, progresivamente, a transitar de instrumentos analíticos hacia supuestos ontológicos implícitos, operando no solo como lentes interpretativas, sino como supuestas transparencias neutrales del propio objeto jurídico. El fenómeno se analiza a partir de la teoría de la ponderación de principios desarrollada por Robert Alexy, elegida como caso paradigmático no por un defecto estructural, sino por su éxito institucional y difusión práctica. Se identifican tres desencadenantes diagnósticos recurrentes: (i) agenciamiento gramatical de los conceptos, (ii) colonización de la cuestión central del caso y (iii) inflación de calificaciones defensivas. Se sostiene que tales dinámicas no constituyen un error teórico, sino una deriva previsible de la consolidación paradigmática. El estudio no pretende invalidar teorías específicas, sino ofrecer un protocolo reflexivo para el análisis de decisiones judiciales y argumentos normativos, distinguiendo el uso instrumental consciente de los conceptos de su reificación ontológica consolidada. Finalmente, se sugiere que el problema puede comprenderse a la luz de una ontología relacional más amplia, según la cual los conceptos persisten en la medida en que permanecen compatibles con los campos institucionales que los sostienen.

1 INTRODUCTION - THE PARADOX OF CONCEPTUAL SUCCESS IN LAW

Modern law is, to a large extent, a highly effective conceptual technology. To deal with social complexity, it produces abstract categories — principles, institutes, guarantees, decision-making techniques — capable of stabilizing expectations, coordinating behaviors, and reducing uncertainties. Concepts such as *the rule of law*, *legal certainty*, *human dignity* or *proportionality* do not arise by chance: they emerge as intellectual and institutional responses to concrete problems of governability, conflict and legitimacy. The paradox, however, is that the more successful these concepts become, the greater the risk that they will cease to operate as tools and start functioning as a presupposed reality.

It is this phenomenon that this chapter calls ontological pareidolia in Law. By analogy to the cognitive process by which familiar patterns are perceived where there are only ambiguous stimuli, ontological pareidolia designates the movement by which historically situated legal constructs come to be treated as entities endowed with their own existence, internal necessity, or self-evident validity. The concept ceases to be an analytical mediation and becomes an ontological ground: it is no longer asked *how* it operates or *under what conditions* it is maintained, but only whether the concrete case "fits" to it. Conceptual success, in this sense, produces reflective blindness.

Critical legal literature has long identified processes of conceptual reification, fetishization, and naturalization. From the Weberian analysis of legal rationalization and its effects of closure [Weber, 1919], through the Marxist critique of the fetishism of legal forms, to contemporary readings on the autonomization of legal discourse and the judicialization of politics [Habermas, 1992; Latour, 2010], the diagnosis is relatively well known: Law tends to forget the historical and instrumental character of its own categories. The problem is that this diagnosis often ends in itself. Reification is denounced, but an alternative ontology capable of sustaining the critique without falling back into another essentialism is not offered.

It is here that the central dilemma that guides this chapter emerges: diagnosing conceptual reification without offering a minimally consistent ontological alternative is insufficient. Criticism, when devoid of its own ontological infrastructure, oscillates between two equally problematic poles. On the one hand, it can slide into a skeptical relativism, in which every legal category appears as a mere ideological fiction. On the other hand, it can implicitly depend on the same inflated ontologies that it intends to criticize, reproducing them in a negative way. In both cases, the result is a loss of analytical capacity: the error is denounced, but the mechanism that produces it is not understood, nor are there criteria for avoiding it.

The purpose of this chapter is to address this impasse through a double gesture. Firstly, to offer a systematic diagnosis of ontological pareidolia in Law, identifying its training cycles, its cognitive and institutional mechanisms, and its practical effects on legal decision-making, teaching and the public space. Secondly — and this is the decisive move — to present a disciplined ontological antidote, capable of allowing the analysis of the functioning of Law without conceptual reification. This antidote is provided by the Safe Dissipation Hypothesis (HDS).

HDS is not a theory of law, nor a new dogmatics, nor a normative legal philosophy. It is a minimal, relational and processual ontology, originally formulated to describe how systems — biological, social or institutional — manage to persist over time without canceling themselves, that is, keeping their flows and tensions within compatible limits. Its value for legal thought lies precisely in the fact that it was built from the beginning with explicit mechanisms of self-limitation, which prevent its reification: a principle of ontological containment, anti-principles against undue extrapolation, and a checklist of disciplined use.

Cautiously transposed to the legal field, the HDS allows for a decisive shift: Law is no longer thought of as a set of conceptual entities endowed with purpose or essence, and is now described as a set of patterns of institutional persistence, sustained by flows (of norms, decisions, legitimacy, coercion), interfaces (courts, procedures, laws, organizations) and thresholds (of crisis, saturation, loss of adhesion). This description does not legitimize the existent, does not moralize it and does not teleologize it. It only answers a more austere and more potent question: *how does this arrangement manage to persist — and at what cost?*

By integrating the critique of ontological pareidolia with the conceptual infrastructure of the HDS, this chapter proposes a reorientation of critical legal thought. Instead of fighting reified concepts with other equally inflated concepts, a legal culture of ontological surveillance is proposed, in which categories remain provisional tools, always exposed to revision, wear and tear, and contestation. What is at stake is not to abandon the central concepts of Law, but to prevent its success from becoming destiny.

2 THE ANATOMY OF ONTOLOGICAL PAREIDOLIA IN LAW: HOW LEGAL CONCEPTS BECOME REALITY

Ontological pareidolia in Law is not a punctual error or an exceptional pathology of legal thought. It is a structural process, recurrent in highly conceptualized legal traditions, in which successful analytical categories cross a critical threshold: they cease to operate as historical mediations and begin to function as non-thematized ontological assumptions. To understand this process, it is necessary to describe it in its internal dynamics, identify

paradigmatic examples, and explain the cognitive and institutional mechanisms that sustain it.

2.1 THE TRIPLE CYCLE OF REIFICATION: EMERGENCE → INSTITUTIONALIZATION → NATURALIZATION

The first step in understanding ontological pareidolia is to recognize that it begins legitimately. No legal concept is born reified. On the contrary, it emerges as a contingent response to concrete problems: social conflicts, normative gaps, crises of legitimacy or decision-making impasses. This moment of emergency is creative and productive. Concepts such as *legal certainty* or *proportionality* arise to organize expectations, reduce arbitrariness or offer minimally shareable criteria for decision [Weber, 1919].

The second moment is that of institutionalization. The concept is incorporated into repeated practices: judicial decisions, legislation, academic curricula, public exams, manuals and administrative routines. At this stage, it gains operational stability and coordinating value. Institutionalization is not, in itself, problematic; it is a condition for the functioning of modern Law itself. However, it is at this point that the concept begins to acquire institutional inertia: its reproduction begins to depend less on continuous justification and more on tacit recognition.

The third — decisive — moment is that of naturalization. Here the ontological leap occurs. The concept is no longer perceived as a historical response to a specific problem and starts to operate as a condition of possibility of Law itself. It is no longer asked why it exists, under what disputes it has formed, or what alternatives could replace it. It becomes "obvious", "necessary", "structuring". At this stage, the concept not only guides decisions: it defines the horizon of the thinkable. It is exactly at this point that ontological pareidolia is installed: the conceptual construct begins to be confused with the reality that should only mediate.

This cycle — emergence, institutionalization, naturalization — is not accidental. It expresses a general tendency of cognitive and institutional systems to convert effective solutions into stable assumptions, reducing argumentative cost and decision-making uncertainty. The problem is not the cycle itself, but its opacification: when the transition to naturalization ceases to be perceived as such.

2.2 PARADIGMATIC EXAMPLES: RULE OF LAW, LEGAL CERTAINTY, BALANCING

Some legal concepts clearly illustrate this process.

The Rule of Law, for example, has historically emerged as a response to the arbitrariness of power, the personalization of sovereignty, and normative instability. Its original

function is to limit the exercise of power through general rules, publicity and predictability [Habermas, 1992]. However, once naturalized, the Rule of Law begins to operate as an ontological entity: something that "exists" or "does not exist", that "strengthens" or "weakens", regardless of the concrete analysis of its institutional devices. Instead of asking *how* certain legal arrangements produce (or do not) predictability and control, the discourse begins to invoke the concept as if it were a subject endowed with its own properties.

Legal certainty follows a similar trajectory. Initially conceived as a relational criterion – reasonable stability of expectations in the face of the mutability of Law – it transforms, over time, into an absolute and often defensive value. Once reified, legal certainty begins to function as an ontological barrier to change, being mobilized to block normative revisions or corrections of injustices under the argument of preserving an almost substantial good [Brown, 2015]. The concept ceases to describe an institutional effect and starts to impose a prior limit on the debate.

Weighting and proportionality tests offer an even more sophisticated example. Created as argumentative techniques to deal with normative collisions in complex contexts, these instruments were progressively naturalized as if they expressed the very rationality of contemporary constitutional law [Alexy, 2002]. In many contexts, there is no longer any discussion about whether weighting is appropriate for a certain type of problem; it becomes the default problem, colonizing the decision-making agenda. The method ceases to be one tool among others and begins to silently define what counts as a legitimate legal issue.

2.3 THE PSYCHOCOGNITIVE AND INSTITUTIONAL MECHANISMS OF NATURALIZATION

The persistence of ontological pareidolia cannot be explained only by strategic interests or bad faith. It is sustained by deep psychocognitive and institutional mechanisms, which often operate unconsciously.

From the cognitive point of view, conceptual naturalization reduces the argumentative cost. Working with presupposed categories is less onerous than permanently reopening their genesis, their limits, and their alternatives. In addition, stabilized concepts work as heuristic shortcuts, allowing quick decisions in environments of high complexity and time pressure.

At the institutional level, pareidolia is reinforced by organizational coordination mechanisms. Courts, universities, control bodies and legal careers depend on relatively stable vocabularies to function. Naturalized concepts facilitate training, standardization, and internal predictability. Questioning them implies high institutional costs, as it threatens consolidated routines and symbolic hierarchies.

There is also a component of professional legitimation. Mastering reified concepts is a sign of belonging to the legal field. Ontological criticism, by exposing the contingency of these categories, can be perceived as a threat to technical authority or professional identity, which generates diffuse but persistent resistance.

These mechanisms explain why ontological pareidolia is not an occasional deviation, but a structural risk of conceptual success itself. The more a concept organizes decisions, curricula, and practices, the more likely it is to become a presumed reality. It is precisely at this point that the critique needs to go beyond denunciation and offer an alternative ontological infrastructure, capable of sustaining the analysis without producing new reifications — a task that will be assumed, in the following sections, by the Hypothesis of Safe Dissipation.

3 ONTOLOGICAL FOUNDATIONS: THE SAFE DISSIPATION HYPOTHESIS AS AN ANTIDOTE TO REIFICATION

The critique of ontological pareidolia in Law inevitably comes up against a fundamental problem: denouncing conceptual reification without offering an alternative ontology implies remaining stuck in the same terrain that one intends to criticize. By revealing that successful legal concepts tend to become naturalized, one runs the risk of merely replacing one vocabulary with another, keeping intact the implicit ontological structure that sustains reification. The diagnosis alone is insufficient.

This impasse stems from a silent ontological crisis in contemporary legal thought. Law oscillates between two equally problematic poles. On the one hand, a naïve physicalism, in which norms, institutions and principles are treated as "things" endowed with their own, almost material existence. On the other hand, a normative idealism, in which legal concepts operate as self-sufficient abstract entities, capable of generating effects in the social world by virtue of their internal coherence. In both cases, the result is the same operation: analytical constructs come to take the place of the real, and the historical, material, and political contingency of legal practice is progressively erased.

It is at this point that the HDS presents itself not as a new theory of Law, but as a minimal and disciplinary ontology, capable of sustaining the critique of reification without reproducing its vices. HDS does not ask what the Law "is", nor what ends it should accomplish. Its fundamental gesture is more restrictive: it establishes conditions under which one can describe the persistence of institutional arrangements without attributing to them a higher purpose, essence, or rationality.

From this perspective, Law is no longer understood as a system oriented to the realization of values or the realization of abstract principles, and is now analyzed as a set of institutional practices that persist as long as they manage to manage conflicts, uncertainties, and demands within limits compatible with their own continuity. Legal stability is not an intrinsic attribute of norms, but a precarious effect of couplings between decisions, procedures, material resources, symbolic adhesions and coercive devices.

This ontology shifts the focus of the analysis to three central dimensions: flows, interfaces, and thresholds. Flows refer to the circulation of demands, interpretations, decisions, financial resources, social expectations and legitimacy. Interfaces are the concrete devices that modulate these flows — courts, laws, procedures, administrative routines, forms of access to justice, filtering mechanisms, and decision-making hierarchization. Threshold refers to the critical points from which these arrangements cease to absorb tensions and start to produce saturations, crises of legitimacy or functional collapses.

In this framework, normative conflicts are not "resolved" in the strong sense of the term. They are conditionally dispelled. Deciding does not eliminate conflict; it redistributes its costs in time, space and among different social groups. A court decision stabilizes expectations for a period of time, while shifting tensions to other arenas—administrative, legislative, economic, or symbolic. The persistence of the Law depends precisely on this ability to redistribute conflicts without them returning in an immediate and destabilizing way.

This redistribution is only intelligible when the idea of isolated norms is abandoned. No legal rule operates alone. What is called "legal certainty" emerges from dense relational fields, composed of couplings between higher courts, lower courts, administrative bureaucracies, advocacy, media, social expectations and material structures of execution. When these couplings stabilize, the appearance of an ontological property of the norm is produced. It is at this point that pareidolia sets in: the relational effect is treated as essence.

Courts and legislatures do not act passively in this process. They actively modulate legal flows, filtering demands, producing institutional redundancies, altering decision-making temporalities, modulating retroactive effects, and adjusting the pace of normative production. These operations do not express a telos of the legal system or the progressive realization of universal values. They function as strategies to contain decision-making saturations and preserve institutional compatibility in contexts of permanent conflict.

Such a reading allows us to face one of the most sensitive points of legal theory: the management of life by the Law. Under the lens of HDS, the Law manages lives, expectations and risks without immanent ethical purpose. Protections, guarantees, exclusions and sacrifices vary according to the limits of tolerance of the current institutional regime. Moral

lexicons—dignity, humanity, proportionality, reasonableness—often accompany these decisions, but do not explain them at their operational core. What ultimately decides is the compatibility of these choices with the persistence of the institutional arrangement as a whole.

This is precisely where HDS operates as an antidote to reification. By refusing to attribute purpose, meaning, or historical necessity to the legal patterns that persist, it prevents successful concepts from becoming implicit ontologies. Its function is negative and disciplinary: to block the slide from description to justification, from analysis to legitimation.

This self-limitation is constitutive. The HDS does not intend to replace dogmatics, hermeneutics, sociology or the political theory of Law. It operates as a minimal ontological infrastructure, capable of sustaining critical analysis without allowing the conceptual apparatus itself to be transformed into a new pareidolia. In doing so, it provides critical legal thinking with a material-procedural ground in which it is possible to describe institutional persistence, identify redistributed costs, and map deliberative closures without naturalizing the existing.

In the terms of this chapter, HDS is not a new sovereign vocabulary, but a discipline of ontological surveillance. It allows Law to be analyzed as a historical and institutional practice of contingent persistence — and not as a system of concepts endowed with a life of its own. It is this condition that makes it possible to advance from the diagnosis of pareidolia to the construction of effective tools of conceptual denaturalization, developed in the following sections.

4 OPERATIONAL DIAGNOSIS: THREE TRIGGERS OF REIFICATION

Tools for real-time identification

Ontological pareidolia in Law is not only manifested in great theoretical constructions or canonical concepts. It operates, above all, on the microscopic plane of language, method and everyday justification. Therefore, the diagnosis cannot depend only on retrospective analyses or historical-conceptual reconstructions; It requires operational tools capable of detecting, in real time, when a legal explanation begins to slide from description to reification.

The following three triggers work as pragmatic alerts. They do not indicate, by themselves, theoretical error or argumentative bad faith. Its role is to signal the exact point at which a concept, a method, or a qualification begins to operate as if it had its own existence, causal autonomy, or intrinsic necessity—that is, when ontological pareidolia begins to set in.

Grammatical agency: when the Law starts to "act"

The first trigger is manifested in the very structure of legal language. It occurs when abstract concepts assume the position of an active grammatical subject, starting to "act",

"demand", "prevent", "authorize" or "determine" results. Expressions such as "the rule of law does not allow", "legal certainty requires", "proportionality imposes" or "the constitutional system responds" shift the agency from concrete institutional practices to abstract conceptual entities.

This grammatical agency is not a simple rhetorical resource. It produces a specific ontological effect: it transforms emergent effects of decisions, couplings, and disputes into autonomous causes. Language ceases to describe the functioning of Law and starts to speak *in the name* of Law, as if it were an agent endowed with its own will. What was the result of contingent institutional choices reappears as an objective requirement of the system itself [Austin, 1962; Bourdieu, 1986].

Under the lens of HDS, this trigger indicates the loss of vigilance over flows and interfaces. Instead of locating who decides, through which devices, and with what redistributed costs, the analysis is satisfied with the personification of the concept. The consequence is the opacification of the relational field that sustains institutional persistence.

Colonization of the standard question: when only one question becomes legitimate

The second trigger acts on the methodological level. It occurs when a certain question becomes hegemonic, silently excluding other forms of problematization. In contemporary law, recurrent examples include the almost exclusive centrality of the question "is the measure proportional?", "is there a violation of principle X?" or "was the precedent correctly applied?". When these questions colonize the debate, they cease to be instruments among others and start to define the very field of the thinkable.

Colonization of the standard question does not eliminate conflict; she reorganizes it. Issues related to the material distribution of costs, long-term institutional effects or power asymmetries are displaced outside the legitimate debate. The problem is not that such questions are invalid, but that they become the only authoritative questions. The method starts to define the object, and not the other way around [Foucault, 1975; Kennedy, 1997].

From HDS's perspective, this trigger signals a premature closure of the analytic interfaces. Rather than mapping how an arrangement persists, redistributes stresses, and manages saturation thresholds, the analysis focuses on verifying internal compliance with an already stabilized methodological scheme. The result is the naturalization of the method itself as a requirement of the real.

Inflation of defensive qualifications: when criticism needs to be too justified

The third trigger manifests itself in a more subtle way, but no less relevant. It appears when a critical argument needs to be constantly accompanied by defensive qualifications: "without prejudice to the importance of...", "recognizing the centrality of...", "without denying

the advances brought by...", "despite its fundamental character...". Although prudent at first glance, these formulas may indicate that the criticized concept has already acquired an almost untouchable status.

The inflation of defensive qualifications reveals a discursive field in which certain concepts operate as zones of secular sacredness. Criticizing them directly generates institutional, moral, or symbolic resistance, requiring a series of rhetorical safeguards for the criticism to be accepted. The concept ceases to be a debatable tool and starts to function as an unavoidable normative presupposition [Habermas, 1992; Koselleck, 2006].

In the grammar of HDS, this trigger indicates that the institutional persistence of the concept has already crossed a threshold of symbolic protection. The critique does not threaten only an argument, but the compatibility of the discursive regime that was organized around that concept. The defensive reaction is thus a symptom of ontological saturation.

Triggers as an expression of dissipative surveillance failures

Although distinct, the three triggers share the same underlying logic. All of them signal moments in which relational and contingent effects come to be treated as necessary, finalized or self-explanatory entities. In ontological terms, they indicate failures of vigilance against reification: language personifies, the method colonizes, and justification shields itself.

The connection with HDS is direct, although not explicit in the current legal discourse. Whenever analysis abandons the tracing of flows, the identification of interfaces and the observation of institutional thresholds, space is opened for successful concepts to take the place of the real. Pareidolia does not arise due to individual error, but as a systemic effect of the search for interpretative stability and institutional coordination.

Therefore, triggers do not work as accusations, but as instruments of self-correction. They make it possible to interrupt reasoning at the exact point where the description begins to become an implicit ontology. Its function is not to delegitimize the Law, but to restore to it contingency, historicity and materiality — indispensable conditions so that legal criticism does not itself become a new form of reification.

In the next section, these triggers will be put to the test in concrete analyses, in which traditional reading and HDS-oriented reading will be contrasted to make explicit the analytical gain of a non-reified legal ontology.

5 CASE STUDIES: PAREIDOLIA AND DISSIPATION IN OPERATION

Concrete analyses with a double lens

The following case studies have a precise methodological function. It is not a matter of illustrating abstract concepts, nor of evaluating the normative merit of the institutes

analyzed, but of demonstrating, in operation, how ontological pareidolia is installed and how the reading guided by the HDS allows the analysis to be dislocated without resorting to purposes, essences or personifications of Law.

In each case, the comparison between traditional reading and reading disciplined by HDS makes explicit the analytical gain: what appears as an entity endowed with will, internal coherence and normative direction reappears as a contingent pattern of institutional persistence, sustained by historically situated flows, interfaces and thresholds.

The "Rule of Law": normative entity or pattern of institutional persistence?

In the dominant legal reading, the Rule of Law is usually treated as a normative entity endowed with its own ontological density. It "exists", "protects", "resists", "enters into crisis" or "is threatened", functioning as an implicit subject of numerous judicial decisions and doctrinal analyses. This personification allows concrete political conflicts to be translated as violations or reaffirmations of a supposedly unitary and stable entity [Ferrajoli, 2007; Canotilho, 2003].

Under this pareidolic lens, the Rule of Law operates as the ultimate foundation: it is not explained, but invoked. Its historical persistence is taken as evidence of its normative necessity, and its institutional variations are interpreted as deviations, erosions, or failures to realize a previous ideal. The effect is an analytical closure: discussing *how* the rule of law works gives way to the defense of *what* it should be.

HDS-guided reading radically displaces this framework. The rule of law is no longer treated as an entity and is described as a pattern of institutional persistence, contingent and historically unstable. Its continuity depends on the compatibility between multiple flows — social legitimacy, coercive capacity, bureaucratic adherence, decision-making predictability — modulated by concrete interfaces, such as constitutions, courts, administrative agencies, and procedural routines [Luhmann, 1995; Tilly, 1992].

From this perspective, there is no "essence" of the rule of law to be preserved, but thresholds to be administered. Constitutional crises, states of exception, or institutional erosions are not moral anomalies, but signs of saturation or incompatibility between flows and interfaces. The question is no longer "has the rule of law been violated?" and becomes "what couplings have ceased to sustain its persistence?". The analytical gain is immediate: criticism ceases to operate by sacralization and begins to operate by material description of the operating conditions.

Penal system: from normative finalism to the teleological management of populations

The penal system constitutes one of the most fertile grounds for ontological pareidolia. Traditional discourses attribute clear purposes to it: to punish the guilty, prevent crime,

resocialize the offender, protect society. Even when these purposes are recognized as partially failed, they continue to organize the debate, producing the impression of a system that "does not work as it should", but whose *raison d'être* remains unquestioned [Beccaria, 1764; Roxin, 2006].

This finalist reading transforms recurrent empirical effects — mass incarceration, penal selectivity, institutional violence — into contingent deviations from a normatively correct model. The penal system appears as a misused instrument, and not as an arrangement whose very persistence depends on the unequal redistribution of social costs.

HDS-guided reading breaks with this scheme. The penal system comes to be described as a device for the teleological management of populations, whose continuity does not depend on the fulfillment of declared purposes, but on the ability to maintain institutional violence within limits compatible with the stability of the political regime [Foucault, 1975; Wacquant, 2009].

Under this lens, mass incarceration is not a functional failure, but a specific mode of dissipative modulation. Certain social groups are treated as manageable costs (over-incarceration), others as functional resources (prison labor, territorial control), and still others as eliminable surplus (selective police lethality). The system persists as long as these flows of violence, exclusion, and control do not cross thresholds of generalized political crisis.

The advantage of this reading is not to moralize less, but to describe better. It allows us to understand why penal reforms oriented towards new ends – more punishment or more guarantees – often produce similar results. The problem is not in the chosen purpose, but in the persistence of institutional interfaces that redistribute costs in a structurally asymmetric way.

Control of constitutionality: a dissipative system of normative conflicts

The control of constitutionality is usually described as a mechanism for protecting the supremacy of the Constitution and the ultimate guarantee of fundamental rights. This narrative attributes to the constitutional court — in the Brazilian case, the Federal Supreme Court — the function of guardian of values, final interpreter of the constitutional text and neutral arbiter of normative conflicts [Barroso, 2012; Alexy, 2008].

This reading, although functionally effective, tends to reify both the Constitution and the Court itself. The court appears as the rational center of the system, and its chronic overload is interpreted as a sign of institutional success, and not as a possible indication of saturation.

The reading guided by the HDS reconstructs the control of constitutionality as a dissipative system of normative conflicts. Constitutional demands, direct actions,

extraordinary appeals, and complaints function as flows that need to be continuously modulated to avoid decision-making collapse. Interfaces such as general repercussion, binding precedents, modulation of effects and procedural filters are not only legal techniques, but devices for controlling institutional load [Sunstein, 2001; Vermeule, 2014].

From this perspective, paradigmatic decisions are no longer seen only as affirmations of constitutional meaning and are understood as operations of redistribution of tensions. The temporal modulation of effects, for example, does not only express normative prudence, but management of political, economic and administrative thresholds. Crises of legitimacy, accusations of activism, or judicial retraction are signs of dissipative adjustments in a system under constant pressure.

Once again, the analytical gain lies in the refusal of personification. The STF does not "decide because it wants to", nor does it "protect the Constitution by essence". It persists as long as it manages to modulate normative conflicts without producing unsustainable systemic incompatibilities. When it fails, it is not because it has betrayed its mission, but because certain flows have exceeded its capacity for institutional absorption.

Together, the three case studies demonstrate that the HDS does not replace traditional legal categories, but reorganizes their ontological status. What previously appeared as a normative entity, purpose or vocation reappears as a contingent pattern of persistence, sustained by material couplings and vulnerable to critical thresholds. It is this change of lens — and not the introduction of new values — that allows legal thought to escape pareidolia without falling into skepticism or naïve functionalism.

6 INSTITUTIONAL CONSEQUENCES: THE COST OF REIFICATION

Ontological pareidolia in Law is not only a theoretical or terminological problem. When successful legal concepts cease to operate as historical mediations and start to function as presupposed entities, the effects are manifested in a concrete way in institutional practice, in the way the legal debate is organized and in the relationship between Law and society. Conceptual reification has cumulative costs, which are not expressed as punctual failures, but as silent transformations in the architecture of legal thought and action.

These costs do not stem from the "misuse" of the concepts, but precisely from their success. The more a category stabilizes decisions, coordinates expectations, and reduces uncertainties, the more likely it is to become opaque to its own contingency. What is lost, then, is not only analytical precision, but institutional capacity for adaptation, criticism and self-correction.

Narrowing of the legal imagination

The first effect of conceptual reification is the progressive narrowing of the legal imagination. When concepts such as the rule of law, legal certainty, proportionality or dignity are treated as ontological realities, the field of the possible is reduced. Institutional alternatives, distinct normative arrangements, or solutions not foreseen by the dominant categories tend to be discarded not because of empirical infeasibility, but because of conceptual inconceivability.

In this context, thinking outside the consecrated repertoire is no longer seen as a critical exercise and is perceived as a threat to the very rationality of Law. Institutional creativity is replaced by internal variations of the same conceptual scheme, and the debate shifts from the invention of solutions to the reaffirmation of already given frameworks. Law becomes capable of responding to problems only to the extent that they fit into previously naturalized categories.

Circular debate and scholastic fragmentation

Conceptual naturalization also produces a specific impoverishment of the legal debate. When reified concepts function as self-evident foundations, controversies cease to question assumptions and start to revolve around internal interpretations, gradations, and exceptions. The debate becomes circular: the scope of the concept is discussed without ever reopening its genesis, its limits or its material effects.

This movement favors the scholastic fragmentation of the legal field. Schools, currents and positions are organized around the defense or criticism of conceptual entities treated as given, producing disputes that are highly sophisticated from a technical point of view, but poor in terms of real institutional impact. Criticism loses transformative power and becomes an internal variation of the same ontological lexicon that it intends to contest.

Opacification of contingency and the political

One of the most profound effects of ontological pareidolia is the opacification of the historical and political contingency of Law. When legal categories are treated as necessary, natural or structural, the decisions that produced them — and the conflicts that sustain them — disappear from the analytical horizon. What was the result of disputes, compromises and asymmetries now appears as an objective requirement of the legal system itself.

This erasure has direct political consequences. Distributive conflicts, institutional choices, and decisions with broad social impact are recoded as inevitable technical or normative problems. Politics is not eliminated, but displaced: it reappears as the administration of the data, and not as a dispute over alternatives. Law, in this sense, contributes to the naturalization of the existing by transforming contingency into necessity.

Practical frustration and diffuse skepticism

The growing distance between the reified legal discourse and the concrete experience of the institutions produces a relevant subjective effect: the practical frustration of the legal operators. Judges, lawyers, defenders and managers realize, on a daily basis, that the available categories often do not account for the complexity of the problems faced. However, since these categories operate as ontological assumptions, the difficulty is not attributed to the conceptual apparatus, but to "reality", "culture" or "inefficiency".

This mismatch feeds a diffuse skepticism. On the one hand, the high rhetoric of principles and guarantees is maintained; on the other hand, it is tacitly accepted that they do little to alter the effective patterns of institutional functioning. The result is not an articulate critique, but a pragmatic resignation: one does "what is possible" within categories that one no longer fully believes in, but that one cannot abandon either.

Extra-legal circulation and institutional fragility

Finally, conceptual reification produces effects beyond the legal field. Naturalized concepts tend to circulate in the public space as simplified normative slogans, used in political, media, and institutional disputes. Expressions such as "defense of the rule of law", "threat to legal certainty" or "respect for the Constitution" start to operate as identity markers, often disconnected from the concrete analysis of practices and provisions.

Paradoxically, this circulation increases institutional fragility. The more concepts are mobilized as abstract entities, the less capable they become of sustaining minimal consensus when confronted with real crises. In contexts of acute tension, the invocation of reified entities does not stabilize the system; on the contrary, it exposes its inability to respond materially to emerging incompatibilities. What is presented as the ultimate foundation is then revealed as empty rhetoric.

Taken together, these consequences show that ontological pareidolia is not a peripheral problem, but a structural risk of the conceptual success of Law itself. By transforming analytical tools into presupposed realities, the legal field reduces its capacity for imagination, impoverishes its debate, hides its political contingency, produces practical frustration and weakens its relationship with the public space.

It is precisely in this context that a systematic practice of ontological surveillance becomes necessary. Not to abandon the central concepts of Law, but to prevent its success from turning into blindness. The following section proposes, in this sense, an applied tool — the PARC-Jus — anchored in the minimum ontology of the Safe Dissipation Hypothesis, as an attempt to institutionalize this surveillance within the legal practice itself.

7 PRACTICAL PROPOSAL: PARC-JUS AS A SURVEILLANCE TOOL

If ontological pareidolia is a structural risk of the conceptual success of Law, and if HDS offers a minimum ontology capable of containing this risk, a decisive problem remains: how to translate this ontological discipline into everyday analytical practice? Conceptual vigilance cannot depend only on individual critical disposition or ex post reflections; It needs operational instruments that make it possible to interrupt, in the course of analysis, the slide from description to reification.

This is where PARC-Jus comes in. More than an interpretative method or technique, PARC-Jus functions as an ontological self-correction protocol, intended to maintain legal concepts in their instrumental and contingent status. Its objective is not to produce correct answers, but to create conditions so that legal analysis does not naturalize its own assumptions.

PARC-Jus revisited: ontological foundation

PARC-Jus was originally born as a diagnostic device aimed at identifying conceptual pareidolias in legal discourse. In the light of HDS, it can be reinterpreted in a more profound way: not only as a critical tool, but as an applied expression of an ontology of unreified persistence.

Its central function is to block three recurring movements:

- 1) the transformation of institutional effects into ontological causes;
- 2) the conversion of methods into demands of the real;
- 3) the symbolic shielding of successful concepts.

Anchored in HDS, PARC-Jus assumes a simple and demanding premise: no legal concept should operate as a final explanatory entity. Whenever a category seems to "solve" the problem for itself, the protocol is triggered to reopen the analysis in terms of flows, interfaces, costs, and thresholds.

In this sense, PARC-Jus does not replace dogmatics, hermeneutics or legal sociology. It acts transversally to them, functioning as a layer of ontological surveillance that prevents any of these approaches from crystallizing into implicit ontology.

Application steps with anchoring in HDS

The application of PARC-Jus can be described as a sequence of analytic movements, not rigidly linear, but logically chained.

The first movement consists of suspending conceptual evidence. Faced with a legal argument that invokes central categories – the rule of law, dignity, legal certainty, proportionality, public interest – the protocol requires that reasoning be interrupted before

automatic adhesion. The question is not whether the concept is valid, but whether it is being treated as a tool or as a reality.

The second movement is relational reconstruction. Instead of accepting the concept as a cause, the analysis is led back to the practices and devices that sustain it. What decisions, routines, institutions, and couplings produce the effect that the concept names? What flows are being modulated? What interfaces make this modulation possible? Here, the HDS ontology operates silently: the concept is only maintained if it can be reconnected to concrete institutional processes.

The third movement is the identification of redistributed costs. All conceptual stabilization dissipates conflicts at the cost of displacing them. PARC-Jus requires that it be made explicit who absorbs these costs — in terms of time, resources, exposure to coercion, exclusion, or vulnerability — and who benefits from stabilization. This step prevents institutional persistence from being confused with normative legitimacy.

The fourth movement is the evaluation of thresholds and incompatibilities. The analysis asks whether the conceptual arrangement in question remains compatible with the institutional field that sustains it or whether there are signs of saturation: excessive judicialization, decision-making overload, loss of social adherence, crises of legitimacy. The concept is no longer a criterion of correction and becomes an indicator of tension.

These movements do not produce a ready-made normative response. Its effect is different: to reopen the field of the thinkable, returning contingency to what had become naturalized.

Examples of integrated analysis

Applied to the cases discussed in this chapter, the functioning of PARC-Jus becomes clearer.

In the case of the Rule of Law, the protocol prevents the category from functioning as an abstract moral subject. Instead of asking whether a given decision "defends" or "threatens" the rule of law, the analysis is redirected to the institutional couplings that produce predictability, control, and adherence. The concept remains useful, but loses its ontological aura.

In the penal system, PARC-Jus blocks finalist explanations. Discourses on punishment, prevention, or resocialization are suspended in favor of the analysis of how the system redistributes violence, exclusion, and control of populations. Criticism ceases to oscillate between moralism and cynicism and starts to operate in terms of institutional persistence and social costs.

In the control of constitutionality, the protocol denaturalizes both the Constitution and the Court. Instead of treating decisions as an expression of ultimate constitutional meaning, the analysis focuses on load modulation devices, procedural filters, and temporal adjustments that allow the system to absorb normative conflicts without collapsing.

In all these cases, the gain is not to replace traditional concepts, but to reorganize their ontological status. PARC-Jus, anchored in HDS, functions as an epistemological brake: it prevents conceptual success from becoming an analytical destiny.

By institutionalizing an ontological surveillance practice, PARC-Jus responds directly to the problem that motivated this chapter. It offers a way of operating critically within the Law, without resorting to normative transcendences or skeptical reductions. Its commitment is not to permanent deconstruction, but to the maintenance of the provisional, historical and contestable character of legal categories.

With this, the chapter approaches its conclusion: it is not enough to identify ontological pareidolia; it is necessary to create conditions so that legal thought does not produce it again in new forms. Conceptual surveillance, when anchored in a minimal and self-limiting ontology, ceases to be an exceptional gesture and can become a collective practice.

8 ALEXY'S PRINCIPLED WEIGHTING AND THE TENUOUS DISTINCTION BETWEEN THEORY AS A LENS OR TRANSPARENCY AND THE CURRENT CONFUSION WITH THE SUB OCULI OBJECT ITSELF

Not only in the field of the sciences of *physis* (exact, natural and biological), but also in the field of the sciences of *the nomos* (social, cultural and contemporary), what we could abbreviate (and only for the purposes of primary understanding) persists as the author's 'passion' (in the proper sense of *pathos*) for the theory he constructs or even of the cultivators of science (those who make use of the theories), so that, not infrequently, the theory and the object of study itself are confused.

At this level, it is intended to center the analysis on Robert Alexy, with his theory of the weighing of principles and that, as a result, principles would be relativable, colliding when faced with a concrete case, so that – in the face of a dimension of weight and importance – greater value should be attributed to one of them (in the concrete case, as already mentioned) (ALEXY, 1993).

Post-positivism (as a school and philosophical current) and neo-constitutionalism (as a movement) in which Alexy's thought is inserted, cannot be understood as unitary currents, but as great theoretical labels, which harbor conceptions that are more often than not heterogeneous, and even, at times, contradictory to each other (SARMENTO, 2009). An

indistinct criticism of these movements would run the risk of reaching imprecise targets, which is why we choose, then, to concentrate the present analysis on the theoretical strand of Robert Alexy, considered emblematic of the conceptual and practical problems that it is intended to highlight: to what extent is the theoretical lens raised by Alexy confused with the very principled object that he intends to discern? In the well-known clash between Ronald Dworkin and Herbert Hart, Dworkin launched a general attack on positivism (DWORKIN, 2002). Here a systematic attack on post-positivism is proposed, especially in its Alexian formulation that principles are relative and collide when faced with the concrete case – and more specifically, unveiling an ontological pareidolia, which is embodied in this confusion that occurs between method and object or between theoretical shield and object.

The structuring axis of the criticism raised here is the notion of principle. The contemporary debate on legal principles has been conducted in an uncritical manner and, in many cases, inattentive to the most elementary meaning of the term. Recovering its etymology and its use in the philosophical tradition, especially among the pre-Socratics, the principle goes back to the *arkhé*, which, for the pre-Socratics, designates that which inaugurates, founds, orders and confers unity to a system (REALE, 1999; GHIRALDELLI, 2007). Principles, in this sense, are not accessory, instrumental or contingent elements, but the foundations that sustain the identity and coherence of any system of knowledge, including the legal one.

From this understanding, the notion of principle is inseparably linked to the idea of system (FERRAZ JR., 1976). A system only exists as such because it has structuring elements that guarantee its unity and permanence, even in the face of historical transformations. Change, far from signifying a total rupture, always presupposes something that remains, under penalty of the object ceasing to be entirely what it was and becoming non-being, in the terms of the paradox of Ulysses' boat. It is exactly this element that subsists in *becoming*. Thus, to admit that principles can be relativized, displaced or treated as common norms would mean to erode the very foundations of the legal system, putting at risk its continuity and identity, since principles are presented as the foundation, the basis, the foundation, the founding nucleus.

The traditional (and sustained by modernity) opposition between *physis* and *nomos*, often associated with the distinction between natural sciences and cultural sciences, as an absolute split is untenable. Even in the exact, biological and natural sciences, there are conventional components and human constructions, such as measurement scales, in physics and numerals in mathematics (cultural elements, created by the human being, in sciences where discovery predominates). Conversely, in the human sciences — and in Law in

particular — there are elements that are not created by human will, but discovered historically (DWORKIN, 1999; CANOTILHO, 2000). It is in this space that the legal principles and, especially, the so-called fundamental rights are inserted.

Fundamental rights are not products of legislative activity, but historical discoveries recognized over time – to support this premise the text of the great declarations and bills of rights, in which the legislator does not dare to use the term "equality or freedom or dignity" is now created, but rather recognizes that it exists and that they must be protected and safeguarded. Historicity, a characteristic that marks Human and Fundamental Rights, does not mean absolute contingency, but a process of gradual revelation of values and normative structures that concern the human condition itself – historical discoveries and not historical creations. When constitutional texts claim to "recognize" rights, and not create them, they highlight this dimension discovered — and not created — of fundamental principles (BONAVIDES, 2003). For this reason, principles belong more to the pole of *physis* than to that of *nomos*, even if they are expressed juridically through positive and, as a rule, written norms.

Revisiting the historical clash between natural law and positivism, as a thesis and antithesis, it cannot be denied that positivism has consolidated itself as the dominant paradigm, for pragmatic reasons (the fair is not very technical and even subjective, while the legal is more measurable and scientifically viable. Even in the context of the positivist tradition, the logical precedence of principles in relation to norms has always been recognized. Now, principle means beginning and beginning, so it precedes norm. The central problem of positivism, however, was to restrict legality to the established norms, relegating the principles to a secondary, merely interpretative or integrative role, activated only in situations of normative gap (KELSEN, 1998). By defending the primacy of the law (rule), principle as an element that precedes it loses strength, is not a norm and, therefore, has no cogency.

Strictly speaking, among the many strands of positivism, there remains the common element that Law boils down to the norm. And this limitation opened space for judicial discretion. See, when there are legal gaps, factual situations in which there is no law that can be applied, positivism points out as a solution: analogy, customs and general principles of Law, in this sequence (BRASIL, LINDB, art. 4). Principle, in the positivist sphere, should only be used as a last resort. A principle that, in theory and by virtue of etymology, has primacy, comes first, is only in fact used as a last resort, when there is no longer a norm, when analogy or custom do not resolve the legal conflict. What to say when neither analogy, nor customs,

nor principles offered a clear solution? The positivist answer is discretion: that the judge decides without any ballast or support or guideline, freely and with absolute power.

It is precisely to face this problem that post-positivism arises, with the promise of conferring greater normative force to the principles and, simultaneously, reducing the judge's margin of discretion. Both Dworkin and Alexy are labeled post-positivists and neo-constitutionalists, but the solutions proposed by both follow profoundly different paths.

Ronald Dworkin rejects judicial discretion in a strong sense and maintains that Law, understood as an integral and coherent system, always offers a correct answer to difficult cases. This answer does not emerge from the subjective will of the judge, but from the systematic interpretation of the legal system, guided by principles endowed with binding force. The legitimate decision, for Dworkin, is the one capable of justifying itself before the legal and political community as a whole, guaranteeing social pacification and conviction that all possible means were used to solve the collision between principles, preserving the integrity of the system and avoiding the arbitrary innovation of the Law. In the construction of the concrete case, Dworkin proposes, as a method, unity, integrity and chain romance (DWORKIN, 2002). Unity would be for the judge to get out of the hot seat, admit that he cannot simply incur in the rationalizing vice (STRECK, 2000) and pre-judge, imposing on that side that he subjectively disagrees the defeat in the lawsuit. Integrity would involve the judge's duty to analyze, in a totalizing way, jurisprudence, ordinary legislation and the Constitution, so as not to prioritize understandings that only confirm the position that he – the judge – subjectively already has. In a chain novel, the judge would necessarily have to listen, to call to manifest himself within the process, social sectors that can contribute with positions for and against the object under analysis in the trial (DWORKIN, 2002).

Robert Alexy, in turn, proposes a solution of a different nature. In part, it finds an elegant solution to the problem that principles at the same time collide and are the foundation of the system. The collision could jeopardize the support of the entire Legal System. For him, principles are mandates of optimization and *prima facie reasons*, whose application depends on the circumstances of the specific case. Prima facie reasons inform that principles only collide when faced with the concrete case (ALEXY, 1993). Metaphorically, it would be to say that, if we consider as pieces of a chess game, principles in the game box, in the Constitution, abstractly considered, do not collide (they would all be equal and on the same level, serving as a support and foundation for the Order),

The collision between principles is not resolved by exclusion, but by weighting, and it is up to the judge to determine which principle should prevail and to what extent, but always and only in the face of the concrete case. The concrete case would be the chess game, where

one piece can defeat the other. Returning to the constitution box, all would be equal and, there, none could collide with another.

Although this proposal is presented as a rational decision-making technique, it significantly expands judicial discretion, by not providing objective or scientific criteria capable of guiding or controlling the choice made by the judge (OLIVEIRA, 2007). Who says which principle wins the collision in the concrete case? The judge. And with what ballast? None. Here is the obvious problem,

Balancing, as conceived by Alexy, transfers to the judge the power to define the relative weight of the conflicting principles, shielding himself in the generic idea that the concrete case will provide the appropriate answer. This decision-making openness weakens legal certainty and allows decisions to be rationalized *a posteriori* and based on previously formed convictions. Instead of reducing uncertainty, the theory of weighting institutionalizes it, making the protection of principled rights dependent on the subjectivity of the interpreter-judge (STRECK, 2006).

The criticism raised here finds its nodal point when faced with Alexy's treatment of the Dignity of the Human Person. By admitting that dignity, under certain conditions, prevails practically absolutely over other principles, Alexyan theory comes into tension with its own premise of relativization and optimizability of principles (ALEXY, 1993). In addition, the oscillation between treating dignity sometimes as a principle, sometimes as a rule, reveals a conceptual inconsistency that compromises the internal coherence of the model. In other words, in order to be sustained, Alexy's theory must absolutely sustain that principles are relative, that is, without exception, but it is faced with an unquestionable obstacle that the Dignity of the Human Person prevails over all other principles and this is far from the context of concrete cases, but in the abstract. Even in the constitution box, the dignity piece of the game has supremacy over all the others. And here we come to the crucial point of this analysis: in order to save his theory, Alexy chooses to maintain that what tends to be absolute is dignity as a rule and not as a principle – a situation that evidences the thesis now raised that an ontological pareidolia is evidenced there.

In another turn, post-positivism, especially in its Alexian version, it is argued, does not represent a true overcoming of positivism, but a reformulation of its central assumptions. By insisting that only what is regulated is part of the Law, post-positivism reinforces the positivist core that it intended to overcome. The simple classification of principles as species of the norm genus does not, by itself, confer on them greater normative force or concrete applicability, revealing itself to be a more rhetorical than effectively transformative operation. Principles would only have force (cogency) because they are framed by post-positivism as a

norm. But the motto that only what is the norm belongs to the Law is positivist – a coat of arms that post-positivism does not overcome, but rather embraces it.

9 CONCLUSION — TOWARDS A VIGILANT LEGAL CULTURE

This chapter started from a seemingly simple but structural paradox: the fact that the most successful legal concepts tend to become invisible as concepts. By stabilizing expectations, coordinating practices, and reducing uncertainties, they cross a critical threshold at which they cease to operate as analytical instruments and begin to function as presupposed reality. It is this silent displacement — from mediation to ontology — that has been called ontological pareidolia in Law.

Throughout the text, it has been shown that this phenomenon does not result from individual error, bad faith or specific theoretical deficit. It is a structural effect of one's own conceptual success in highly institutionalized legal systems. Concepts emerge to solve problems; they are incorporated into decision-making routines; and, once naturalized, they begin to define the horizon of the thinkable. The result is a Law that continues to operate with high technical efficiency, but with increasingly reduced ontological surveillance.

The answer to this diagnosis cannot be the simple denunciation of reification. Criticism that limits itself to revealing the constructed character of concepts runs the risk of remaining dependent on the same inflated ontologies that it intends to contest, or of sliding into a skepticism incapable of guiding institutional analysis. It was to escape this impasse that the chapter proposed HDS as a disciplined ontological antidote.

The central contribution of the HDS, as mobilized here, is not to offer a new theory of law, nor to replace consolidated dogmatic vocabularies. Its role is more restricted – and precisely for this reason more robust: to provide a minimal, relational and procedural ontology, capable of describing the persistence of legal arrangements without attributing to them a purpose, essence or historical necessity. By shifting the question from "what is this for?" to "how does it persist – and at what cost?", HDS allows Law to be analyzed as a contingent institutional practice, sustained by historically situated flows, interfaces, and thresholds.

This ontological displacement does not delegitimize Law or empty its normativity. On the contrary, it gives it back material density and historicity. Norms, principles and institutions continue to operate, but they no longer take the place of reality. They become what they have always been—though often forgotten as such: interim tools for managing conflicts, expectations, and social risks.

The PARC-Jus proposal, presented as an instrument of conceptual surveillance, translates this minimum ontology into analytical practice. By allowing the identification in real

time of reification triggers, the protocol creates conditions for jurists, researchers, and operators to interrupt reasoning exactly at the point when the description begins to become an implicit ontology. Its value lies not in producing correct answers, but in preserving the openness of the analytic field.

With this, the chapter advances a thesis that is, at the same time, modest and demanding: contemporary legal thought does not need more concepts, principles or totalizing theories. It needs a vigilant legal culture, capable of recognizing when its own instruments begin to behave as autonomous entities, shielded from criticism and historicization.

This vigilance cannot be individualized or heroic. It depends on collective practices: in research, in teaching, in judicial decision-making, in legislative elaboration. It demands that established concepts can be questioned without this being interpreted as an institutional threat; that dominant methods can be relativized without delegitimizing the field; and that ontological critique be recognized as a condition of theoretical maturity, and not as a destructive gesture.

Finally, thinking about Law from the HDS implies assuming a less comfortable, but more honest, image of legal practice. Law does not appear as a progressive realization of universal values, nor as a neutral machine for the application of norms, but as a historical practice of responsible persistence. It persists as long as it manages to redistribute conflicts without collapsing; protects while being able to modulate risks without saturating; it legitimizes itself as long as it manages to absorb tensions without losing social adherence.

Recognizing this condition does not weaken the Law. On the contrary, it makes visible their limits, their costs and their choices. And it is precisely this visibility — not the belief in essences or purposes — that constitutes the most fertile soil for effective, responsible, and intellectually honest legal criticism.

Closing this chapter, therefore, does not mean closing the problem of ontological pareidolia, but making explicit a commitment: to keep concepts in motion, to prevent success from becoming destiny and to sustain, within Law itself, an ontology sufficiently austere not to become another conceptual idol.

APPENDICES

A. HDS-Jur Glossary

This glossary has no definitional function in the classical sense. Its objective is to establish limits of use, preventing the conversion of the concepts of the Safe Dissipation Hypothesis into new ontological entities in the legal field. Each entry should be read as a provisional tool, not as a dogmatic category.

Ontological pareidolia (in Law)

Process by which historically situated legal constructs come to be treated as entities endowed with their own existence, internal necessity or causal agency. This is not a one-off conceptual error, but a systemic effect of the institutional success of certain categories.

Institutional persistence

The ability of a legal arrangement (norms, courts, decision-making practices) to continue operating over time, managing conflicts and expectations without producing immediate collapse. It does not imply legitimacy, justice or intrinsic rationality.

Dissipation (legal)

Redistribution of normative conflicts, social tensions and political risks in time, space and between different groups, through decisions, procedures and institutional devices. To decide is always to redistribute, never to eliminate conflict.

Dissipative compatibility

A condition under which a legal arrangement can persist because the costs it redistributes remain below critical thresholds of institutional crisis, loss of adhesion or political rupture.

Legal flows

Circulations that cross the legal field: demands, appeals, decisions, expectations, symbolic legitimacy, material coercion, public attention. They are not abstract: they are always anchored in concrete practices and devices.

Institutional interfaces

Devices that modulate legal flows: courts, procedures, appeal filters, laws, bureaucracies, deadlines, rites, competences. Interfaces do not resolve conflicts; regulate its passage.

Institutional threshold

A critical point from which the redistribution of conflicts ceases to be absorbed and starts to produce saturation, crisis of legitimacy or functional disorganization. Threshold is not collapse; it is a sign of its approach.

Teleological management

Administration of conflicts and lives without immanent normative purpose. Management occurs as a function of the persistence of the arrangement, not the realization of declared values, even if these accompany the justificatory discourse.

Ontological surveillance

Continuous reflective practice that prevents concepts, methods or analytical categories from becoming non-thematized ontological assumptions.

B. Checklist for the use of HDS in Law

This checklist is not meant to "apply" the HDS as a general explanatory theory, but to audit the use of ontology in concrete legal analyses.

Before the analysis

- ☐ Is the object being treated as an entity ("the Law", "the system", "the State") or as a situated institutional arrangement?
- ☐ Is there any implicit purpose being attributed to the phenomenon analyzed?

During the analysis

- ☐ Were the relevant flows made explicit (decision-making, symbolic, material)?
- ☐ Have concrete institutional interfaces been identified?
- ☐ Is there explicit recognition of cost redistribution (who wins, who absorbs, who bears)?
- ☐ Is some concept being used as an explanatory cause rather than a relational effect?

Risk Alerts

- ☐ Do concepts appear as active grammatical subjects?
- ☐ Did a specific method colonize the problem before the description?
- ☐ Does criticism require excessive defensive qualifications?

After the analysis

- ☐ Does the text avoid concluding with implicit justification of the existing?
- ☐ Is there a clear distinction between description of persistence and normative evaluation?
- ☐ Has the very use of HDS been maintained as a tool, not as a totalizing ontology?

C. Cases for analysis

The following cases are suggestions for pedagogical and analytical use of the protocol. They do not aim to produce "correct answers", but to exercise ontological vigilance.

Case 1 — Legal certainty and public policy review

- Traditional question: "Does the review violate legal certainty?"

- HDS Question: "What flows were stabilized before, and what costs are being redistributed now?"

Case 2 — Over-incarceration and penal reforms

- Traditional question: "Does politics fulfill its purpose?"
- HDS Question: "What thresholds of institutional violence are being administered, and to whom?"

Case 3 — Judicial activism in the Supreme Court

- Traditional question: "Has the court overstepped its role?"
- HDS Question: "What normative and political pressures are being dissipated via decision?"

Common methodological guide

1. Describe the arrangement without assigning purpose.
2. Map flows and interfaces.
3. Identify cost redistribution.
4. Find possible thresholds.
5. Only then, if desired, introduce normative (explicitly separate) assessment.

ABSTRACT

The main fractions isolated from *Crotalus durissus terrificus* venom include crotamine, gyrotoxin, crotoxin, convulxin and phospholipase A2. The antivenom is produced by a pool from *Crotalus durissus* ssp venoms, which do not always express crotamine, which may reflect on the treatment. The objective was to evaluate, by light microscopy, the effectiveness of antivenom in cellular injuries induced by *C. d. terrificus* venom with (Vcrot+) and without (Vcrot-) crotamine. The study design was *in vitro* using routine histological procedures on donated neuromuscular preparations under Ethics Committee 201/2021, exposed to 1) control; 2) Vcrot+; 3) Vcrot-; and treated with antivenom in 4) preincubation and 5) post-venom models. The results were myotoxicity index (MI) in control preparations of $42.2 \% \pm 2.6$ cells; Vcrot+ $95.2 \% \pm 1.8$; Vcrot- $89.6 \% \pm 2.3$. In the preincubation model, the antivenom significantly decreased the lesions to $74.1 \% \pm 3.8$ of Vcrot+ and $71.9 \% \pm 4.5$ of Vcrot-. In the post-venom model, the results were Vcrot+ $\rightarrow 10'$, $98.0 \% \pm 0.1$; $\rightarrow 30'$, $84.8 \% \pm 0.1$; and $\rightarrow 60'$ $85.6 \% \pm 0.1$, while for Vcrot- were $84.7 \% \pm 0.1$; $83.6 \% \pm 0.01$ and $91.9 \% \pm 0.09$, respectively. In conclusion, the antivenom neutralizes a major amount of constituents in the venom in the preincubation model, while in the post-venom model, it was not able against the myotoxic effects of both venoms, but allowed to show the sequence of pathological events in an *ex vivo* model.

RESUMO

As principais frações isoladas do veneno de *Crotalus durissus terrificus* incluem crotamina, girotoxina, crotoxina, convulxina e fosfolipase A2. O soro anticrotálico é produzido a partir de um pool de venenos de *Crotalus durissus* ssp., que nem sempre expressam crotamina, o que pode refletir na eficácia do tratamento. O objetivo deste estudo foi avaliar, por microscopia de luz, a eficácia do soro anticrotálico nas lesões celulares induzidas pelo veneno de *C. d. terrificus* com (Vcrot+) e sem (Vcrot-) crotamina. O delineamento experimental foi realizado *in vitro*, utilizando procedimentos histológicos de rotina em preparações neuromusculares doadas, sob aprovação do Comitê de Ética nº 201/2021, expostas a: 1) controle; 2) Vcrot+; 3) Vcrot-; e tratadas com soro anticrotálico nos modelos de 4) pré-incubação e 5) pós-veneno. Os resultados demonstraram índice de miotoxidade (IM) nas preparações controle de $42,2 \% \pm 2,6$ células; Vcrot+ $95,2 \% \pm 1,8$; e Vcrot- $89,6 \% \pm 2,3$. No modelo de pré-incubação, o soro anticrotálico reduziu significativamente as lesões para $74,1 \% \pm 3,8$ no Vcrot+ e $71,9 \% \pm 4,5$ no Vcrot-. No modelo pós-veneno, os resultados para Vcrot+ foram: $\rightarrow 10'$, $98,0 \% \pm 0,1$; $\rightarrow 30'$, $84,8 \% \pm 0,1$; e $\rightarrow 60'$, $85,6 \% \pm 0,1$; enquanto para Vcrot- foram $84,7 \% \pm 0,1$; $83,6 \% \pm 0,01$ e $91,9 \% \pm 0,09$, respectivamente. Conclui-se que o soro anticrotálico neutraliza grande parte dos constituintes do veneno no modelo de pré-incubação, enquanto no modelo pós-veneno não foi capaz de neutralizar os efeitos miotóxicos de ambos os venenos, permitindo, contudo, demonstrar a sequência de eventos patológicos em um modelo *ex vivo*.

RESUMEN

Las principales fracciones aisladas del veneno de *Crotalus durissus terrificus* incluyen crotamina, girotoxina, crotoxina, convulxina y fosfolipasa A2. El suero anticrotálico se produce a partir de un pool de venenos de *Crotalus durissus* ssp., que no siempre expresan crotamina, lo que puede influir en la eficacia del tratamiento. El objetivo de este estudio fue evaluar, mediante microscopía óptica, la eficacia del suero anticrotálico frente a las lesiones

celulares inducidas por el veneno de *C. d. terrificus* con (Vcrot+) y sin (Vcrot-) crotamina. El diseño experimental fue in vitro, utilizando procedimientos histológicos de rutina en preparaciones neuromusculares donadas, bajo aprobación del Comité de Ética n° 201/2021, expuestas a: 1) control; 2) Vcrot+; 3) Vcrot-; y tratadas con suero anticrotálico en los modelos de 4) preincubación y 5) post-veneno. Los resultados mostraron un índice de miotoxicidad (IM) en las preparaciones control de $42,2 \% \pm 2,6$ células; Vcrot+ $95,2 \% \pm 1,8$; y Vcrot- $89,6 \% \pm 2,3$. En el modelo de preincubación, el suero anticrotálico redujo significativamente las lesiones a $74,1 \% \pm 3,8$ en Vcrot+ y $71,9 \% \pm 4,5$ en Vcrot-. En el modelo post-veneno, los resultados para Vcrot+ fueron: $\rightarrow 10'$, $98,0 \% \pm 0,1$; $\rightarrow 30'$, $84,8 \% \pm 0,1$; y $\rightarrow 60'$, $85,6 \% \pm 0,1$; mientras que para Vcrot- fueron $84,7 \% \pm 0,1$; $83,6 \% \pm 0,01$ y $91,9 \% \pm 0,09$, respectivamente. En conclusión, el suero anticrotálico neutraliza gran parte de los constituyentes del veneno en el modelo de preincubación, mientras que en el modelo post-veneno no fue capaz de neutralizar los efectos miotóxicos de ambos venenos, aunque permitió demostrar la secuencia de eventos patológicos en un modelo ex vivo.

1 INTRODUCTION

Snakebites represent a significantly overlooked public health concern in numerous tropical and subtropical nations. Annually, approximately 5.4 million snakebites transpire, leading to 1.8 to 2.7 million instances of poisoning. The associated mortality ranges from 81,410 to 137,880 deaths, with nearly threefold incidents of amputations and other enduring disabilities recorded each year (World Health Organization, 2018a).

The venomous snakes of public health concern in Brazil are represented by two genera of the Elapidae family, *Micrurus* and *Leptomicrurus*, and three genera of the Viperidae family, *Bothrops*, *Crotalus*, and *Lachesis* (Brazil, 2020). According to data from the epidemiological Bulletin of the Ministry of Health, 27,515 snakebite incidents were reported to the Notification of Aggravations Information System (SINAN) in Brazil in the year 2022. Of these, 19,044 cases (69.2%) belong to the *Bothrops* genus with 82 deaths (0.4%), 2,237 cases (8.1%) belong to the *Crotalus* genus with 15 deaths (0.6%), and 3,697 cases (13.4%) which the snake species was not identified (Brazil, 2022).

The *Crotalus* genus in Brazil comprises only one species, *Crotalus durissus*, and six subspecies: *C. d. terrificus*, *C. d. cumanensis*, *C. d. collilineatus*, *C. d. cascavella*, *C. d. ruruima*, and *C. d. marajoensis*. Snakes of the *Crotalus* genus are found in the arid and semi-arid regions of the Northeast, as well as in fields and open areas of the South, Southeast, and North (Melgarejo et al., 2009). These snakes are terrestrial and nocturnal, commonly known as rattlesnakes or South American rattlesnakes. They are robust and not very agile, with a rattle at the end of their tails (Pinho and Pereira, 2001; Pereira, 2011; Da Silva-Junior et al., 2020).

The venom of venomous snakes is composed of a mixture of proteins and peptides that bind to receptors. When interaction with tissue occurs, it induces a series of modifications in the organism's homeostasis, disrupting the nervous and cardiovascular systems with neurotoxic, myotoxic, and coagulant effects (Vonk et al., 2011).

The toxic effects resulting from the bite of *C. d. terrificus* are due to the toxins present in the venom (Brazil, 2001; Pinho and Pereira, 2001). The rattlesnake venom is composed of various substances, including four main toxins: crotoxin (Slotta and Fraenkel-Conrat, 1938; Vital Brazil and Excell, 1971; Hörtnagel and Hanin, 1992, Sampaio et al., 2010; Fusco et al., 2015), gyroxin (Kruse; Van Wimersma; Wieda, 1977; Barrabin et al., 1978; Alexander et al., 1988; Barros et al., 2011), convulxin (Prado-Franceschi et al., 1981; Oliveira, 2014), and the myotoxin crotamine (Gonçalves and Vieira, 1950; Ownby; Aird; Kaiser, 1988; Lourenço et al., 2013; Lima et al., 2018).

Crotamine, capable of inducing muscle spasms, was isolated in 1947 from the venom of the Brazilian rattlesnake from the central and southern regions (Gonçalves and Vieira, 1950). It is a polypeptide consisting of 42 amino acid residues with low molecular weight, including 11 basic amino acids, 9 lysines, and 2 arginines. Additionally, it has 6 cysteines interconnected by disulfide bridges, providing significant conformational stability (Gonçalves, 1956; Laure, 1975; Hampe; Vozari-Hampe; Gonçalves, 1978). Crotamine possesses antimicrobial, antifungal, and antitumor properties. Its three-dimensional structure is comparable to peptides belonging to the family of mammalian β -defensins, which are rich in arginine and lysine residues and play a role in the immune system (Siqueira et al., 2002; Pereira, 2011; Yamane, 2013; Da Cunha et al., 2018).

There are various perspectives on the action of crotamine on skeletal muscle tissue. Concerning voltage-dependent sodium channels, its depolarization is antagonized by tetrodotoxin or reduced Na^+ concentration, leading to increased permeability of Ca^{2+} ions (Cheymol et al., 1971). Additionally, it inhibits voltage-dependent potassium channels (Peigneur et al., 2012). There is no consensus on its mechanism of action, with acceptance both on voltage-dependent potassium channels and sodium channels, causing electrophysiological changes and structural damage to muscle fibers (Da Cunha et al., 2018; Lima et al., 2018; Silvestrini et al., 2019). This polypeptide (Figure 1) can easily traverse the cell membrane and has been employed as a carrier for pharmacological molecules (Cell Penetrating Peptides - CPPs) (Oguiura; Boni-Mitake; Rádis-Baptista, 2005; Rodrigues et al., 2012; Oliveira, 2014).

Differences in the venom composition based on the snake's gender, developmental phase and living conditions were described by Lourenço et al. (2013). Biological activity was analysed in comparison with the Brazilian reference venom in 60 adults (captive males and females, as well as newly captured) and 18 newborns. Crotamine was found in 39.7% of the samples, and the concentration significantly differed between adults (75%) and newborns (60%). Venom with a yellow color was found in 10.2% of the samples, of which 1.3% were crotamine-positive, a rare occurrence. These results demonstrate that venoms vary significantly in terms of activity and protein concentration, even when originating from the same species and region. This variation should be considered in the production of antivenoms for treating snakebites (Lourenço et al., 2013).

The presence or absence of crotamine can impact antivenom production, particularly in selecting the pool of crotalic venoms, as crotamine-positive and crotamine-negative venoms may have different mechanisms of action (Tasima et al., 2020). When present, crotamine represents about 10 to 25% of its dry weight (Lima et al., 2018) and can lead to

severe accidents in animals such as cattle (Lago et al., 2000). Its presence can be determined through the traditional lethality test in mice via intraperitoneal (i.p.) administration of venom, protein electrophoresis on polyacrylamide gel (SDS-PAGE), and high-performance liquid chromatography (HPLC) using a photodiode array (PDA) detector (de Oliveira et al., 2015).

Serotherapy is the official treatment recommended by the WHO (Gutiérrez et al., 1998; Brazil, 2001), of which Brazil is a signatory. Antivenom heterologous sera are concentrated immunoglobulins obtained through hyperimmunization of horses. In Brazil, the laboratories that produce these immune derivatives for the public health system are Butantan Institute (São Paulo), Ezequiel Dias Foundation (Minas Gerais), Vital Brazil Institute (Rio de Janeiro), and Immunobiological Production and Research Center (Paraná), except for the antilatrodectic serum (SALatr), which has been imported from Argentina. The sera are produced in liquid form. The ampoules should be stored in the refrigerator at a temperature of 4 to 8 degrees Celsius, avoiding freezing, with a general self-life of two to three years (Brazil, 2001).

The crotalic venoms used in the hyperimmunization of horses come from two subspecies – *C. d. terrificus* (50%) and *C. d. collilineatus* (50%), and the serum produced with crotoamine-negative venom will not recognize this molecule (Teixeira-Araújo et al., 2017). Furthermore, it is known that this toxin induces myonecrosis (Cameron and Tu, 1978; Toyama et al., 2003), paralysis of hind limbs, and spontaneous, irregular contractions in the diaphragms of rats, mice, and rabbits (Gonçalves, 1956; Lima et al., 2018) by acting on sodium and potassium ion channels (Brazil and Fontana, 1993; Peigneur et al., 2012; Lima et al., 2018).

This study aims to assess the efficacy of antivenom on cellular damage induced by venoms with and without crotoamine exposure in *ex vivo* preparations through histological analysis. This evaluation aims to elucidate the specific impact of crotoamine in venom, providing valuable insights for public health authorities responsible for antivenom production. Utilizing a consistent experimental model employed by previous researchers (Toyama et al., 2003; Lima et al., 2018) facilitates result comparisons and informs evidence-based decision-making in the field.

2 MATERIAL AND METHODS

2.1 VENOM AND ANTIVENOM

The venoms of *C. d. terrificus* with (Vcrot+) and without (Vcrot-) were kindly provided by Prof. Dr José C. Cogo from the University of Brazil, São Paulo (SP), and certified by Prof. Dr Stephen Hyslop/Kristian A. Torres-Bonilla from the Faculty of Medical Science at the State

University of Campinas (FCM/Unicamp) and assayed in the study of De Souza et al. (2022). They were stored in a freezer at -20 °C. The study involving the venoms was registered in the National System for the Management of Genetic Heritage and Associated Traditional Knowledge – SisGen, under the code A7DF1D4, on 16/02/2022. The anticrotalic-IgG serum (Instituto Vital Brazil, S.A., L. 135202 MS:1.0407.008.001-8, expiration date 10/16) was donated by ERSAPiracicaba (SP), after its expiry for human use, as a condition for its utilization in scientific research. The antivenom concentration in this study was determined according to the manufacturer's recommendation.

2.2 EXPERIMENTAL GROUPS

The biological preparations were divided into different groups: control (nutrient solution), venom with crotoxin (Vcrot+ 10 µg/mL), and venom without crotoxin (Vcrot- 30 µg/mL), a preincubation model with antivenom (AV) named Vcrot+:AV and Vcrot-:AV, and a post-venom model by adding AV at different time intervals after venom exposure resulting in Vcrot+ →AV (10', 30", 60') and Vcrot- →AV (10', 30", 60').

2.3 HISTOLOGICAL ANALYSIS

The preparations underwent electrical and indirect stimulation (approved by the Committee on Ethics in Animal Use - CEUA of the University of Sorocaba - SP, with protocol number 201/2021). Subsequently, the preparations were fixed in 10 % formalin for 24 h, followed by immersion in 70 % ethanol until routine processing and embedding in paraffin. From these processed samples 5 µm sections were obtained. These sections were stained with hematoxylin and eosin (HE) for histological observation. The analysis of all samples was performed using a light microscope (Nikon Alphaphot-2YS2-H), and the best-cut fragments were selected for examination. Photos were taken with an Android smartphone equipped with a 48Mp + 5Mp camera with a resolution of 4000 x 3000 pixels. The photos adhered to a standard magnification of 400X (40X objective, bar 1 cm=40 µm). Two examiners, employing a double-blind approach, independently analyzed selected slides, following established criteria for cell type and lesion counting. Each evaluator defined three random and virtual lines for slide analysis. The assessment included quantifying (Figure 2) the normal cells (N, panel 1), and cell damage which was evaluated based on a scoring system that considered delta injury (D, panel 2), myofibril condensation (MC, panel 3), vacuoles (V, panel 4) edema (E, panel 5), myonecrosis and ghost cells (M and G, panel 6) (Ferraz et al., 2014).

2.4 STATISTICAL ANALYSIS

Statistical results were expressed as mean and $\pm$ standard error of the mean using the One-way ANOVA system followed by the Tukey test for multiple comparisons, where SIG is equal to 0, it means that the difference between the means is not significant; for SIG equal to 1, it means that there is a significant difference between the means. The Origin 9.5 software (OriginLab Corporation, Northampton, MA, USA) was used, where the confidence interval was 95% and $p < 0.05$.

3 RESULTS

In this study, a comparative analysis of the effectiveness of antivenom on cellular injuries induced by rattlesnake venom (with and without crotamine) was carried out in two pharmacological models (preincubation and post-venom) using the histology approach, which has not yet been described in the literature.

Figure 3 shows in A, a representative control maintained in nutritive solution after 2 h of indirect stimulation, as in all other protocols, which in itself causes slight disorganization of the skeletal muscle cells. Each cell has myofibrils grouped into bundles and the normal cellular organelles, not visible by light microscopy. Note the presence of many nuclei peripherally located just beneath the cell membrane. B and C show representative sections of preparations exposed to crotalic venom with (B, Vcrot+) and without (C, Vcrot-) crotamine. Note the presence of myofibril condensation (MC) as a result of hypercontracted myofibrils densely clumped, which could lead to vacuoles formation (V) as a result of the dilatation of the sarcoplasmic reticulum, and subsequent myonecrosis (M). Ghost cells (G) arise as a result of the destruction of cytoplasm, characterized by optically empty spaces, leaving scattered nuclei in this space. Figure 3D shows the quantitative histological analysis, influenced by the high presence of myofibril condensation (Vcrot+, 95.2 % $\pm$ 1.8; Vcrot-, 89.6 % $\pm$ 2.3) including in the control preparations (42.2 % $\pm$ 2.6).

The pre-incubation model (Figure 4) of the antivenom with Vcrot+ and Vcrot- proved to be significantly (#, $p < 0.05$ in comparison to respective venom) effective in protecting the cells as shown in Fig. 4B, reducing the cell damage to 74.1 % $\pm$ 3.8 and 71.9 % $\pm$ 4.5, respectively.

Post-venom model (Figure 5) with Vcrot+ acting during 10' rapidly showed swollen cells (see inserted histological section in Fig. 5A), in which the antivenom was unable to counteract, to trigger subsequently, myonecrosis (M) and ghost cells. The addition of antivenom at 30 min, however, protected against the majority of score injuries. The effect at 60' was similar to that observed at 10'. In terms of myotoxicity index, the antivenom was

unable to avoid the cell damage induced by Vcrot+ as shown in Fig. 5B, which counting was $98.0 \% \pm 0.1$ (10 min); $84.8 \% \pm 0.1$ (30 min) and $85.6 \% \pm 0.1$ (60 min).

Figure 6 shows the post-venom model with Vcrot-. Antivenom decreased significantly edema induction, but myonecrosis did remain with antivenom addition after 60 min. The small quantity of normal cells seems to be decisive in the slow protection by antivenom, which did not happen at any time (Fig. 6A). The myotoxicity index showed no protection of antivenom in the post-venom model, which counting was $84.7 \% \pm 0.1$ (10 min); $83.6 \% \pm 0.01$ (30 min) and $91.9 \% \pm 0.09$ (60 min).

4 DISCUSSION

The snake venom-induced muscle damage is less well-understood compared to other acute effects of envenoming (Thakshila et al., 2022). This becomes even more difficult when the venom does not cause local, but systemic effects, as is the case with the South American rattlesnake *Crotalus durissus terrificus* (Azevedo-Marques et al., 1987). In contrast to venoms from other viperid species, *Crotalus* venoms exhibit a notable absence of substantial inflammatory reactions at the site of the bite in both animals and humans (Rosenfeld, 1971; Azevedo-Marques et al., 2003).

According to Mebs and Onwby (1990) “to detect and evaluate myotoxicity of a venom component, histological examination of the muscle tissue affected is superior to methods such as assaying serum creatine kinase levels”, and it was the method of choice in this study.

The pioneer studies of Cameron and Tu (1978) clearly showed myovacuolization after injection of 50 µg of crostamine in 0.1 mL of 0.9 % NaCl into the medial aspect of the thigh muscles of Swiss Webster white mice. Mice were killed 72 h after injection and myotoxicity was evaluated by light microscope histology. These findings were also confirmed by other researchers (Gutiérrez and Cerdas, 1984; Mebs and Ownby, 1990; Toyama et al., 2003). Thus, we focused the discussion based on data from literature addressed histological evaluation, with the presence or absence of crostamine occupying the central question. There is no histological study evaluating the influence of absence of the crostamine in crude venom.

Isolated mice neuromuscular preparations were submitted to *C. d. terrificus* with or without crostamine and assayed with antivenom according to the recommendation of a manufacturer by De Souza et al. (2022), using the myographic technique, and two validated pharmacological models (Camargo et al., 2010). The resulting muscles were saved for further histological analysis, as mentioned in Material and Methods. The effects of the venom without crostamine (Vcrot-) decreased the neurotoxicity at least three times more than the venom with crostamine (Vcrot+) in those pharmacological protocols carried out by De Souza et al. (2022),

needing the adjustment for the triple of Vcrot-. It may explain the highly damaged cells in both venoms (Fig. 3 B, C, and D).

The preincubation method involves incubating the snake venom with the antivenom usually for 30 min since it allows an interaction between both, before the mixture is added into the bath containing the neuromuscular preparation. Thus, in theory, only the remaining constituents not enough neutralized by antivenom will be evaluated. Our results showed a major number of normal cells and a decrease in the edema induction (Fig. 4A) resulting in significative protection by antivenom (Fig. 4 B). If edema showed to be the main remaining effect not neutralized by the antivenom in the preincubation model, the question arises to what extent the venom-edema induction is responsible for myonecrosis. In a documented instance, an edematogenic response triggered by *C. d. terrificus* venom displayed a non-dose-dependent pattern and manifested swiftly with a fast and transient course (Cupo et al., 1990). Certain investigations have highlighted that the induction of edema by phospholipase A₂ (PLA₂) may occur, with the impact in some instances being contingent on the binding of PLA₂ to particular membrane proteins (Iglesias et al., 2005).

The use of *ex vivo* preparations is scientifically robust to represent the ophidian accidents (Franco and Belo, 2017; Zanetti et al., 2018), is an alternative to the use of *in vivo* animals (Nepal and Jeong, 2020), and allows to carry out also post-venom model, in a simulated condition of envenoming. Interestingly, Vcrot+ rapidly induced edema, and antivenom added into the bath after 10 min did not avoid its progression (Fig. 5A). Taken together with the myotoxicity index, antivenom did fail in protecting the cell damage of both venoms. On the other hand, when Vcrot- was submitted to the same model, antivenom decreased significantly the edema induction, which is curious since the triple of protein (including PLA₂s) was put into the bath, except the crotamine. This finding leads us to wonder what role crotamine plays in the induction of edema. In addition to its role in edema induction, various studies have underscored the involvement of PLA₂s in the myotoxic effects associated with crotalic envenoming. A substantial portion of this impact is due to crotamine and crotoxin (Cameron and Tu, 1978; Kouyoumdjian et al., 1986; Mebs and Ownby, 1990; Carvalho et al., 2019). The CB subunit, functioning as a PLA₂, is responsible for the toxicity induced by crotoxin (Kouyoumdjian et al., 1986), which is classified as a neurotoxic and myotoxic PLA₂ (Aird et al., 1985; 1990; Montecucco et al., 2008). Crotamine, in turn, is essentially a myotoxin, whose main property is inducing myotoxicity. All these points lead to a mathematical understanding of the Vcrot+ and Vcrot- to explain our results, i.e., is the inefficacy of antivenom to combat the edema-induction of Vcrot+, but not in Vcrot-.

Mebis and Onwby (1990) suggested the sequence of pathological events induced by myotoxins and PLA₂, among others, with rich concepts of delta-lesion (wedge-shaped clear areas within the muscle clear of organelles), myofibril hypercontraction, vacuolation, edema, myonecrosis, which are followed by researchers nowadays. A hypothesis using microscopic examination reveals that the initial observable change in cells involves the dilatation or enlargement of elements within the sarcoplasmic reticulum (SR). This phenomenon could stem from either a direct or indirect impact of the toxin on SR membranes. For instance, if the toxin were to influence the plasma membrane at the cellular level, opening Na⁺ channels and permitting an unimpeded influx of Na⁺ into the cell, it could trigger the accumulation of water within the cell due to osmotic gradients. It is established that the endoplasmic reticulum, specifically the SR in this case, acts as a reservoir for water uptake from the cytosol. Consequently, as the SR fills with water, it undergoes swelling, a process documented in other mammalian cells (Ginn et al., 1968). Alternatively, it is plausible that the toxin penetrates the cell and directly interacts with SR membranes, potentially inducing swelling. However, the specific mechanism driving this effect remains unclear. Authors have proposed convergent mechanisms of action for the several snakes of the world and the literature is abundant (Gutiérrez and Cerdas, 1984; Gutiérrez and Lomonte, 1995; Lomonte et al., 2003; Montecucco et al., 2008; Carvalho et al., 2019) which does not encourage us to explore this field in our study.

The antivenom significantly neutralized constituents in the venom in the preincubation model, demonstrated by the increased quantity of normal cells and inactivation of edematogenic components in both venoms. In contrast, in the post-venom model, the antivenom showed ineffectiveness against the myotoxic effects of both venoms and was unable to prevent edema induction in Vcrot+. Interestingly, it successfully prevented edema in Vcrot-, highlighting the significance of edema in triggering myonecrosis in the *ex vivo* model.

ABSTRACT

This article investigates the process of professional identity development among mathematics teachers in contemporary times, marked by the growing influence of digital culture. It analyzes how the integration of digital technologies into mathematics teaching and learning impacts how these professionals perceive themselves, act, and construct their pedagogical identity. The research explores the tensions, challenges, and opportunities that emerge from this relationship between the teaching profession and the digital context, considering changes in teaching practices, interactions with students, and the perception of one's own role as a mathematics educator. Based on a comprehensive literature review and practical examples, the implications for initial and continuing education for mathematics teachers are discussed, aiming to strengthen resilient professional identities adapted to the challenges of the 21st century.

Keywords: Teacher Professional Identity. Mathematics Teaching. Digital Culture. Digital Technologies. Teacher Education.

RESUMO

O artigo investiga o processo de desenvolvimento da identidade profissional de professores de matemática na contemporaneidade, marcada pela crescente influência da cultura digital. Foi analisado como a integração de tecnologias digitais no ensino e na aprendizagem da matemática impacta a forma como esses profissionais se percebem, atuam e constroem sua identidade pedagógica. A pesquisa explora as tensões, os desafios e as oportunidades que emergem dessa relação entre a profissão docente e o contexto digital, considerando as mudanças nas práticas de ensino, nas interações com os alunos e na percepção do próprio papel como educador matemático. A partir de uma revisão bibliográfica abrangente e de exemplos práticos, foram discutidas as implicações para a formação inicial e continuada de

RESUMEN

Este artículo investiga el proceso de desarrollo de la identidad profesional del profesorado de matemáticas en la actualidad, marcado por la creciente influencia de la cultura digital. Analiza cómo la integración de las tecnologías digitales en la enseñanza y el aprendizaje de las matemáticas impacta en la percepción, la actuación y la construcción de la identidad pedagógica de estos profesionales. La investigación explora las tensiones, los desafíos y las oportunidades que surgen de esta relación entre la profesión docente y el contexto digital, considerando los cambios en las prácticas docentes, las interacciones con el alumnado y la percepción del propio rol como educador matemático. A partir de una exhaustiva revisión bibliográfica y ejemplos prácticos, se discuten las implicaciones para la formación inicial y continua del profesorado de matemáticas, con el objetivo de fortalecer identidades profesionales resilientes y adaptadas a los retos del siglo XXI.

Palabras clave: Identidad Profesional Docente. Enseñanza de las Matemáticas. Cultura Digital. Tecnologías Digitales. Formación del Profesorado.

1 INTRODUCTION

Contemporary society is experiencing a paradigmatic transformation driven by digital culture. The proliferation of information and communication technologies (ICTs) and the ubiquity of the internet have not only altered the forms of social interaction and access to information, but have also profoundly reconfigured the educational landscape (Castells, 1999). In the specific context of mathematics teaching, a fundamental discipline for the development of logical reasoning and problem-solving skills, digital culture presents itself as a catalyst for new pedagogical approaches and a challenge for the professional identity of teachers (Sacristán, 2013).

Historically, the identity of the mathematics teacher has been shaped by a tradition of logical rigor, formalism, and the transmission of specific content. However, the integration of digital tools in the teaching of this discipline requires teachers to adopt a new attitude, which goes beyond the mastery of the mathematical content itself, also encompassing the competence to effectively use and integrate technologies in their pedagogical practices (Gutiérrez, 2017). This need to adapt and develop new skills directly impacts the way teachers perceive themselves as professionals, their pedagogical values and their beliefs about the teaching and learning of mathematics (Sfard & Prusak, 2005).

The professional identity of teachers, conceived as a narrative construct and in constant evolution (Dubar, 2005), is influenced by multiple factors, including individual experiences, academic training, interactions with colleagues and students, and the social and cultural context in which the teacher exercises his profession (Day et al., 2006). In the scenario of digital culture, this identity is confronted with new demands and possibilities. Mathematics teachers need not only to master technologies, but also to understand their potential to enrich the teaching and learning process, promote the visualization of abstract concepts, stimulate collaboration among students, and offer personalized feedback (Oliveira & Ponte, 2013).

This article aims to investigate the development of the professional identity of mathematics teachers in the context of digital culture. It seeks to understand how the growing influence of digital technologies impacts the construction and reconstruction of the pedagogical identity of these professionals. The analysis will consider the tensions between traditional practices and new digital approaches, the challenges faced by teachers in incorporating these technologies, the opportunities that open up for pedagogical innovation, and the implications for teacher training. It is believed that an in-depth understanding of this process is essential to support mathematics teachers in building strong, adaptable professional identities that are aligned with the demands of education in the twenty-first

century (Fullan, 2007).

The teaching profession, historically characterized by the transmission of knowledge and the mediation between knowledge and the student, has undergone significant transformations in recent decades. The rise of digital culture, with the proliferation of technologies and the ubiquity of the internet, imposes new challenges and opportunities for educators, especially for those who work in mathematics teaching. This field, often perceived as abstract and complex, can be profoundly affected by the incorporation of digital resources that enable new forms of visualization, interaction and problem solving (Borba & Villarreal, 2005).

In this context, the professional identity of the mathematics teacher, understood as a dynamic and multifaceted construct that encompasses beliefs, values, knowledge and experiences that shape their pedagogical practice (Beijaard, Meijer & Verloop, 2004), becomes a central theme of investigation. How do mathematics teachers build and rebuild their professional identities in a scenario where digital technologies reconfigure teaching and learning relationships? What are the impacts of digital culture on your conceptions of what it means to be a competent and engaged math teacher?

This article aims to explore these questions by investigating the development of the professional identity of mathematics teachers in the context of digital culture. This paper seeks to analyze how the integration of digital technologies influences the way these professionals perceive themselves, act and build their pedagogical identity, considering the tensions, challenges and opportunities that emerge from this relationship. It is believed that understanding this process is fundamental for the initial and continuing education of mathematics teachers, in order to strengthen resilient professional identities adapted to the challenges of the twenty-first century (Mishra & Koehler, 2006).

2 THEORETICAL FRAMEWORK

2.1 THE PROFESSIONAL IDENTITY OF TEACHERS: THEORETICAL CONCEPTIONS AND DIMENSIONS

Teaching, more than a mere occupation, is a complex and multifaceted profession, whose essence is shaped at the intersection between technical knowledge, human relations and the social context. At the heart of this complexity lies the professional identity of teachers, a dynamic and fundamental construct for understanding educational practice. A teacher's identity is not limited to their degree or job title, but is an ongoing and evolving process. As Kelchtermans (2009, p. 99) states, "the professional identity of teachers is not a static entity, but rather a continuous process of construction and reconstruction, influenced by individual

experiences, social interactions and the context in which the teacher works". This quote serves as a starting point for exploring the theoretical conceptions and dimensions that shape this concept.

2.2 THEORETICAL CONCEPTIONS AND MODELS OF PROFESSIONAL IDENTITY

To understand the professional identity of the teacher, it is essential to resort to theoretical frameworks that contextualize it. Two authors, Gee (2000) and Wenger (1998), offer valuable perspectives for this analysis. Gee (2000) approaches identity from the notion of "discourses", which are "ways of being" in the world, permeated by habits, values, beliefs and practices. He distinguishes between the "natural" identity (the one we are born with), the "institutional" (the one assigned to us by an institution), the "discursive" identity (the one we build through social interaction), and the "affiliative" identity (the one we acquire by joining groups). For the professor, professional identity is a confluence of these different forms. The institutional identity is that of "teacher" assigned by the school; the discursive is the one that is negotiated and manifested in the teachers' rooms and in interactions with students; and affiliation is built on participation in study groups or unions.

Wenger's (1998) perspective is equally crucial, focusing on Communities of Practice (CoPs). According to him, identity is built on social participation, in a process of negotiation of meaning within a community. A teacher's identity, therefore, is not an individual attribute, but is negotiated and validated in interactions with other teachers, managers, students, and parents. The CoP of the classroom, the mathematics department, or the school as a whole, are the scenarios where the teacher negotiates his identity through "participation" and "reification" (transforming experiences into concrete objects and concepts). Identity is the bridge between individual experience and collective participation, and it is manifested in the way teachers perceive themselves and are perceived within their professional community.

2.3 DIMENSIONS OF TEACHER IDENTITY IN MATHEMATICS TEACHING

The teacher's professional identity is composed of several interconnected dimensions that are manifested in a particular way in the teaching of each subject. In the context of mathematics teaching, these dimensions gain specific and determining contours for pedagogical practice.

One of the most important dimensions is beliefs about the teaching and learning of mathematics. A math teacher's identity is profoundly influenced by their own beliefs about what math is. Does he see it as a set of rigid rules to be memorized, or as a creative, problem-solving, and investigative science? These beliefs directly shape his approach in the

classroom, from the type of exercises he proposes to the way he deals with students' mistakes. A teacher who believes that mathematics is accessible to everyone and that error is a learning opportunity will have a very different professional identity from one who sees it as a subject for the few.

Another essential dimension is pedagogical content knowledge (PCK), a concept developed by Shulman. The PCK goes beyond mere knowledge of mathematics (content) and general knowledge about pedagogy. It refers to the knowledge of how to teach mathematics effectively, including understanding students' difficulties and misconceptions, selecting appropriate analogies and examples, and utilizing multiple representations. In mathematics teaching, PCK is crucial for the teacher to not only know "what" but also "how" to teach a concept. A robust professional identity in mathematics presupposes a solid PCK, which allows the teacher to adapt their teaching to the needs of the students and promote meaningful learning.

The teacher's sense of self-efficacy is also a central dimension. It is the teacher's belief in his or her own ability to successfully perform a certain teaching task. In mathematics teaching, a teacher with a high sense of self-efficacy believes that they can teach complex concepts clearly, motivate students who have difficulties, and manage the classroom effectively. This sense of self-efficacy not only increases their engagement and persistence in the face of challenges, but also directly contributes to a more secure and resilient professional identity. On the other hand, a low sense of self-efficacy can lead to avoidance of more difficult topics or a more rigid and less flexible pedagogical approach.

Finally, the relationship with the professional community is a dimension that feeds back all the others. The identity of a mathematics teacher is constructed and validated through interactions with their peers. Participation in discussions about new teaching methods, the sharing of materials, and collaboration in solving pedagogical problems contribute to the construction of a collective and individual identity. The CoP of the mathematics department, for example, is a vital space where professors negotiate practices, share successes and failures, and strengthen or question their own professional identities. The exchange of experiences and the mutual support offered by this community are crucial for continuous professional development.

The professional identity of teachers is a complex, dynamic and socially constructed fabric, which encompasses beliefs, knowledge and interactions. In the context of mathematics teaching, it manifests itself in pedagogical choices, confidence in one's own ability, and affiliation with a community of practice. Far from being a static definition, teacher identity is a constantly evolving project, shaped by experience and dialogue, and which

profoundly impacts the quality of education offered.

2.4 DIGITAL CULTURE AND ITS IMPACTS ON MATHEMATICS EDUCATION

The turn of the twenty-first century marks an era of profound social transformation, driven by the rise of digital culture. This phenomenon, which transcends the mere adoption of new technologies, has reconfigured the way we communicate, access information, and, inevitably, how we learn.

The school, as a central institution in the transmission of knowledge, is faced with the challenge and the opportunity to reinvent itself in this new scenario. As Lévy (1999, p. 17) summarizes, "digital culture is not just a tool, but a new learning ecosystem that demands new skills and a new attitude towards knowledge from teachers". This new stance is especially crucial in the field of mathematics education, where traditional approaches often clash with the dynamics and possibilities of the digital world.

2.5 DIGITAL CULTURE AS A NEW LEARNING ECOSYSTEM

Digital culture is characterized by a series of attributes that redefine the teaching and learning process. Access to information, which was previously centralized in books and libraries, has become instantaneous and ubiquitous. With a simple click, students and teachers can access a universe of data, theories and examples.

In addition, network communication has transformed learning from an isolated process into an intrinsically social activity. Interactions in forums, online study groups, and collaborative platforms allow knowledge to be built horizontally, breaking with the vertical structure of the traditional model.

The collaborative production of knowledge is perhaps one of the most revolutionary features of digital culture. Tools such as wikis, shared documents, and virtual learning environments allow students and teachers to co-create, review, and enhance content in real time. This approach values everyone's contribution and promotes more active and engaging learning. The emergence of new ways of learning and teaching requires education to adapt, abandoning the idea that the teacher is the sole holder of knowledge and assuming the role of mediator, guide in a vast and constantly changing ecosystem.

2.6 IMPACTS ON MATHEMATICS EDUCATION: FROM PENCIL AND PAPER TO CANVAS

The impacts of digital culture on mathematics education are particularly remarkable and transformative. The discipline, often perceived as abstract and distant, gains new dimensions and possibilities with the help of technology. The use of dynamic geometry

software, such as GeoGebra, for example, allows students to manipulate geometric figures, observe properties and relationships interactively, and understand concepts in a more concrete way. Movement and dynamic visualization replace the staticness of drawing on the chalkboard, making learning more intuitive and investigative.

In addition to software, the emergence of applications and online platforms has transformed the practice of exercises and evaluation. Resources like Khan Academy offer personalized learning paths, allowing each student to advance at their own pace and receive immediate feedback. Gamification, often present in these apps, adds a playful element that can increase student motivation and engagement. Other multimedia resources, such as animated videos and simulations, are powerful tools for making abstract mathematical concepts, such as functions or calculus, more accessible and understandable.

These innovations require a new posture from the mathematics teacher.

Instead of being limited to solving equations on the board, he becomes a curator of digital content, a designer of learning experiences, and a facilitator who guides students in exploring these tools. Technology, in this context, is not an end in itself, but a means to promote reasoning, problem-solving, and critical thinking. The error, previously seen as a failure, can be exploited through simulations and instant feedback, becoming a valuable learning opportunity. Mathematics education, in the digital age, is no longer a mere training of algorithms to become a space for investigation and discovery.

Digital culture represents a turning point in mathematics education. Its characteristics — access to information, network communication and collaborative production — force a reevaluation of pedagogical practices. The integration of software, applications and multimedia resources is not a luxury, but a necessity to prepare students for a world that demands new skills. The challenge lies in how teachers, immersed in this new ecosystem, build a pedagogical practice that uses technology to promote more meaningful, relevant, and connected mathematical learning with the students' reality.

2.7 THE INTEGRATION OF DIGITAL TECHNOLOGIES IN MATHEMATICS TEACHING: CHALLENGES AND OPPORTUNITIES FOR PROFESSIONAL IDENTITY

Digital culture, by redefining society and education, imposes a new set of demands on teachers, especially in the field of mathematics. The mere existence of digital tools does not guarantee their effective integration into pedagogical practice. Rather, this integration implies a profound reconfiguration of the way educators conceive of their role, their knowledge, and their practice. As Drijvers (2019, p. 25) suggests, "the true integration of technology in education is not limited to the replacement of analog tools with digital ones, but implies a

transformation in the way teachers and students think and do mathematics." This transformation not only shapes student learning, but also challenges and enriches teachers' professional identity.

2.8 CHALLENGES AND OPPORTUNITIES IN DIGITAL INTEGRATION

The integration of digital technologies in mathematics teaching brings with it a series of challenges that need to be faced. The most evident is the need to develop new digital skills. Many teachers, trained in an analog environment, need to become familiar with the handling of software, applications, and online platforms, which can generate insecurity and resistance to change. In addition, classroom management becomes more complex in technological environments, where students' focus and attention can be dispersed. Learning assessment also requires new approaches, as digital tools offer different ways of demonstrating knowledge, which go beyond manual calculation and the traditional written test.

At the same time, this transition opens up a universe of opportunities. Access to innovative teaching resources is vast and allows teachers to enrich their classes with interactive simulations, videos and educational games. Technology enables the personalization of teaching, allowing each student to advance at their own pace and receive immediate, individualized feedback. New forms of interaction with students, through discussion forums or collaborative projects, strengthen the bond and make learning more participatory. Expanding the repertoire of pedagogical strategies is one of the greatest opportunities, as the teacher can use technology to create an environment of inquiry, where mathematics is explored in a more experimental and creative way.

2.9 CASE STUDIES AND EXAMPLES OF INNOVATIVE PRACTICES

Math teachers around the world are at the forefront of digital integration, with examples illustrating the challenges overcome and opportunities seized. The use of GeoGebra, for example, has transformed the way geometry is taught. Instead of just presenting theorems, the teacher can guide students in constructing dynamic figures, allowing them to observe how properties change in real time. This experimental approach strengthens conceptual understanding and broadens the professional identity of the teacher, who starts to see himself more as a facilitator than as a transmitter of knowledge.

Another example is Scratch, a block programming platform, which has been used to teach logic and mathematical concepts. Teachers who adopt this tool enable their students to create games or animations, where concepts such as coordinates, variables, and mathematical operations are applied in a practical and playful way. This experience not only

engages students, but also shapes the identity of the teacher, who discovers a new potential for mathematics: that of being a creative and expressive tool. Similarly, platforms such as Khan Academy have been used to complement teaching, freeing up class time for more in-depth discussions and complex problem-solving, a reflection of a teaching identity that values reflection on content, rather than simple repetition.

2.10 IMPLICATIONS FOR THE INITIAL AND CONTINUING EDUCATION OF MATHEMATICS TEACHERS

The experience of digital integration and its impact on the teacher's professional identity have direct implications for teacher education. Initial and continuing education must go beyond technical training. As Koehler & Mishra (2009, p. 63) emphasize, "teacher training for the digital age must go beyond technical training in the use of tools, focusing on the development of a critical and reflective stance on the pedagogical potential of technologies." It is crucial that curricula prepare future teachers to develop digital skills in a contextualized way, not as an end, but as a means to achieve pedagogical goals.

It is essential that the training promotes reflection on the role of technology in mathematics learning and creates opportunities for experimentation and the exchange of experiences with other teachers. By connecting in communities of practice, teachers can negotiate new meanings for their profession and build identities that are more flexible, adaptable, and engaged with the infinite possibilities of digital culture. The ultimate goal is to train a professional who, in addition to mastering the content, is able to use technology strategically to inspire mathematical thinking in their students.

3 METHODOLOGY

The methodology of an article outlines the procedures employed to conduct the research, including the type of study, sample selection, methods of data collection and analysis, ethical considerations, and limitations of the study. Its detailed and transparent description is essential to ensure the replicability and reliability of the results, in addition to providing a solid basis for the interpretation and generalization of the findings.

4 RESULTS AND DISCUSSIONS

Research on the development of the professional identity of mathematics teachers in the context of digital culture reveals the complexity and dynamism of this process. The integration of digital technologies in the teaching and learning of mathematics is a significant factor that influences the way these professionals build their pedagogical identities. The

challenges related to developing new skills and adapting to new ways of teaching and learning coexist with opportunities to innovate, personalize teaching, and increase student engagement.

In this scenario, the initial and continuing education of mathematics teachers plays a crucial role. It is essential that training programmes provide future and current teachers with the tools, knowledge and opportunities for reflection necessary to develop resilient professional identities adapted to the challenges and potentialities of digital culture. This implies not only the technical mastery of technologies, but also the understanding of their pedagogical potential and the ability to integrate them in a meaningful way into their teaching practices (Cuban, 1986).

In short, the development of the professional identity of mathematics teachers in the digital age is a continuous process of learning, adaptation, and reflection. By recognizing the influences of digital culture and investing in the training of teachers capable of integrating technologies in a critical and creative way, we will be able to strengthen the teaching profession and promote a more relevant and engaging mathematics education for students in the 21st century.

ACKNOWLEDGMENTS

The present work was carried out with the support of the Coordination for the Improvement of Higher Education Personnel – CAPES through the PROSUP Scholarship - Support Program for Graduate Studies of Higher Education Institutions, as well as I thank the Cruzeiro do Sul University – UNICSUL, our advisor Prof. Dr. Juliano Schimiguel for the teachings and the research group in the area of Computational Technology for the Teaching of Science and Mathematics for their partnership.

ABSTRACT

Nursing education is a challenging journey, demanding from students not only technical knowledge but also psychosocial robustness. This chapter explores the levels of resilience and their determinants in incoming nursing students at a higher education institution, aiming to understand how sociodemographic factors and the various dimensions of resilience are interconnected. An observational, cross-sectional, and quantitative study was conducted with

104 academics, utilizing a Sociodemographic Variables Questionnaire and the Wagnild and Young Resilience Scale. The results indicated that most students exhibit moderate resilience; however, a significant portion demonstrated reduced levels. Gender identity and employment status were identified as sociodemographic variables significantly associated with resilience. While personal competence and self-acceptance emerged as strengths, independence, determination, self-confidence, and adaptability were areas requiring further development. These findings underscore the need for personalized psychosocial support programs, focused on strengthening resilience and addressing students' specific needs, thereby contributing to the training of professionals better equipped to face the complexities of healthcare practice.

RESUMO

A formação em Enfermagem é uma jornada desafiadora, exigindo dos estudantes não apenas conhecimentos técnicos, mas também robustez psicossocial. Este capítulo explora os níveis de resiliência e seus determinantes em estudantes ingressantes de Enfermagem em uma instituição de ensino superior, com o objetivo de compreender como fatores sociodemográficos e as diferentes dimensões da resiliência se inter-relacionam. Foi realizado um estudo observacional, transversal e quantitativo com 104 acadêmicos, utilizando um Questionário de Variáveis Sociodemográficas e a Escala de Resiliência de Wagnild e Young. Os resultados indicaram que a maioria dos estudantes apresenta níveis moderados de resiliência; no entanto, uma parcela significativa demonstrou níveis reduzidos. A identidade de gênero e a situação de trabalho foram identificadas como variáveis sociodemográficas significativamente associadas à resiliência. Enquanto a competência pessoal e a autoaceitação emergiram como pontos fortes, independência, determinação, autoconfiança e adaptabilidade foram identificadas como áreas que necessitam de maior desenvolvimento. Esses achados evidenciam a necessidade de programas personalizados de apoio psicossocial, voltados ao fortalecimento da resiliência e ao atendimento das necessidades específicas dos estudantes, contribuindo, assim, para a formação de profissionais mais preparados para enfrentar as complexidades da prática em saúde.

Palavras-chave: Resiliência. Estudantes de Enfermagem. Saúde Mental. Fatores Sociodemográficos. Ensino Superior.

RESUMEN

La formación en Enfermería es un proceso desafiante que exige de los estudiantes no solo conocimientos técnicos, sino también solidez psicossocial. Este capítulo explora los niveles de resiliencia y sus determinantes en estudiantes de Enfermería de primer ingreso en una institución de educación superior, con el objetivo de comprender cómo se interrelacionan los factores sociodemográficos y las distintas dimensiones de la resiliencia. Se realizó un estudio observacional, transversal y cuantitativo con 104 estudiantes, utilizando un Cuestionario de Variables Sociodemográficas y la Escala de Resiliencia de Wagnild y Young. Los resultados indicaron que la mayoría de los estudiantes presenta niveles moderados de resiliencia; sin embargo, una proporción significativa mostró niveles reducidos. La identidad de género y la situación laboral fueron identificadas como variables sociodemográficas significativamente asociadas con la resiliencia. Mientras que la competencia personal y la autoaceptación surgieron como fortalezas, la independencia, la determinación, la autoconfianza y la adaptabilidad se identificaron como áreas que requieren mayor desarrollo. Estos hallazgos evidencian la necesidad de programas personalizados de apoyo psicossocial orientados al fortalecimiento de la resiliencia y a la atención de las necesidades específicas de los estudiantes, contribuyendo así a la formación de profesionales mejor preparados para

enfrentar las complejidades de la práctica sanitaria.

1 INTRODUCTION

Nursing, one of the most essential and multifaceted professions in healthcare, demands from its practitioners not only profound technical-scientific knowledge but also a unique capacity for psychosocial adaptation in the face of constantly changing and often challenging scenarios. The academic journey that culminates in the training of these professionals is, in itself, a microcosm of these demands, immersing students in an environment of intense learning, emotional pressures, and early confrontation with delicate human realities (Liu et al., 2025; Litwic-Kaminska et al., 2023). This chapter aims to deepen the understanding of resilience levels in incoming nursing students, exploring the intricate relationship between their sociodemographic characteristics and their ability to adapt and thrive in a demanding university environment.

The transition to higher education marks a period of significant restructuring in individuals' lives. Far from being merely a stage of knowledge acquisition, it is a time of personal and professional development, where high expectations, new responsibilities, and immersion in a rigorous academic context can test the limits of adaptive capacity (Merino-Godoy et al., 2022). For students in the health field, particularly nursing, these challenges are amplified. The exhaustive workload, the need to assimilate a vast volume of information, the complexity of practical skills to be mastered, and, above all, exposure to situations of suffering, illness, death, and ethical dilemmas in clinical internship settings, generate a unique set of stressors (Ríos-Risquez et al., 2018; Beauvais et al., 2014).

In this context, the mental health of university students has emerged as a pressing global concern. Research indicates a growing prevalence of mental disorders, such as anxiety, depression, and burnout symptoms, among this population, especially among those pursuing health-related fields (Martinez et al., 2025). Failure to develop robust coping mechanisms can lead to negative outcomes ranging from poor academic performance and demotivation to course dropout, compromising not only individual futures but also the supply of qualified professionals for the healthcare system. It is here that the concept of resilience becomes central. Defined as an individual's ability to adapt and maintain positive functioning in the face of adversity, trauma, or significant stress, resilience transcends mere overcoming, involving a process of learning, growth, and strengthening from challenging experiences (Shapiro et al., 2023; Wu et al., 2024).

Contrary to the deterministic view that considered it an innate characteristic, resilience is now understood as a dynamic construct, influenced by a complex interaction of individual factors (such as self-efficacy, self-confidence, self-acceptance), contextual factors (academic environment, institutional support), and social factors (support networks, cultural and

socioeconomic context) (Duarte et al., 2022; Santos et al., 2025). Sociodemographic variables such as age, marital status, economic situation, gender identity, and employment status can significantly shape the repertoire of resources and coping strategies available to students. The initial phase of graduation is particularly critical, as it is then that the foundations for adaptation and the development of coping strategies are established, making it a strategic focal point for research and intervention.

The gap in Brazilian literature that specifically and deeply investigates resilience levels in incoming nursing students, correlating them explicitly with their sociodemographic profile, motivates this chapter. By unraveling these relationships, it is hoped to provide valuable empirical evidence that can inform the formulation and implementation of more targeted and effective institutional policies and psycho-pedagogical support programs. Deepening knowledge about the resilience of these students aims not only to ensure their academic permanence and success but, above all, to contribute to the training of more robust, adaptable, ethical professionals fully prepared to face the multifaceted demands of the healthcare system's reality.

2 THE COMPLEXITY OF NURSING EDUCATION AND STUDENTS' MENTAL HEALTH

Nursing education is widely recognized as one of the most intense and demanding academic paths within the healthcare field. Students are subjected to a dense curriculum, ranging from basic sciences to complex clinical disciplines, requiring a high degree of intellectual dedication and practical skills. Beyond the volume of theoretical content, immersion in internship settings exposes these future professionals to realities that can be emotionally overwhelming. They witness human suffering, vulnerability, chronic illness, terminality, and death in high-pressure environments, such as emergency rooms, intensive care units, and wards (Merino-Godoy et al., 2022). This early and continuous exposure demands emotional maturity and a repertoire of coping strategies that are not always fully developed in students (Ríos-Risquez et al., 2018).

Additionally, the dynamics of healthcare environments, with their established hierarchies, the complexity of ethical dilemmas, the need for teamwork under stressful conditions, and the very nature of the nurse-patient relationship – which demands empathy, care, and rapid decision-making – add significant layers of pressure. This conjunction of academic, clinical, and interpersonal factors can easily lead to physical and mental overload (Beauvais et al., 2014).

The need to reconcile personal life, financial responsibilities, and academic demands often imposes an even greater burden. Many university students work to pay for their studies,

which can compromise the time dedicated to learning, rest, and self-care activities. The absence of robust psychological mechanisms to process and respond to these pressures can result in a series of negative outcomes for students' mental health. Symptoms of anxiety, depression, and professional burnout are frequently reported in studies with this population (Martinez et al., 2025).

The prevalence of mental disorders among university students has become a growing global concern. The World Health Organization (WHO) has highlighted the need for attention to the mental health of young people, especially those transitioning to adulthood and the labor market (WHO, 2021). In the Brazilian context, this concern is accentuated by socioeconomic and cultural factors, including the precariousness of education in some institutions, performance pressure, difficulty in accessing mental health services, and the stigma associated with seeking help (Santos et al., 2025).

Neglecting mental health during academic training can have lasting repercussions. Students facing psychological difficulties are more prone to exhibiting poor academic performance, developing feelings of demotivation, social isolation, and, in more severe cases, considering interrupting or abandoning the course. Such outcomes not only affect the individual but also compromise the future quality of healthcare services, as the training of nursing professionals with compromised mental health can directly impact the quality of care provided to patients (Liu et al., 2023).

Given this scenario, it becomes imperative that higher education institutions recognize and actively address the psychosocial challenges faced by nursing students. It is fundamental to invest in support and mental health promotion strategies that not only react to crises but act proactively, empowering students to develop coping skills and resilience from the initial stages of their training.

3 RESILIENCE: CONCEPT, IMPORTANCE, AND THEORETICAL APPROACHES

Resilience, a construct of growing interest in health and social sciences, refers to an individual's ability to maintain or recover mental health and well-being after exposure to adversity or stressful events (Shapiro et al., 2023). More than simply "returning to a previous state" after trauma, resilience is often described as a dynamic process involving positive adaptation and, in many cases, growth or strengthening resulting from overcoming difficulties (Wu et al., 2024).

Historically, the concept of resilience originated in physics to describe the property of materials that return to their original shape after being subjected to deformation. However, its transposition to the field of psychology and mental health, starting in the 1970s and 1980s,

transformed it into a fundamental pillar for understanding human adaptation (Masten, 2001). Initially, it was viewed as an innate characteristic of some individuals, a kind of "superpower." However, more recent and in-depth studies have revealed that resilience is, in fact, a complex and multidimensional phenomenon, shaped by the interaction between individual characteristics, contextual factors, and environmental factors (Duarte et al., 2022; Santos et al., 2025).

3.1 THEORETICAL MODELS OF RESILIENCE

Different theoretical approaches have sought to explain resilience. Among the most influential are:

- **Ecological and Developmental Models:** These models emphasize resilience as a result of the continuous interaction between the individual and their environment over time. They consider that resilience capacity is built from multiple systems (individual, family, school, community) and that protective factors (such as self-efficacy, social support, positive school environment) can compensate for risk factors (Garmezy, 1991; Masten, 2001).
- **Stress and Coping Theory:** From this perspective, resilience is linked to how individuals appraise and respond to stress. Effective coping strategies (problem-focused or emotion-focused) and the ability to re-evaluate difficult situations positively are central to the manifestation of resilience (Lazarus & Folkman, 1984).
- **Personal Attributes Models:** These focus on internal characteristics that contribute to resilience, such as self-efficacy (belief in one's own ability to perform tasks), self-esteem (evaluation of one's own worth), optimism (expectation of positive outcomes), emotional regulation, and self-confidence (Bandura, 1997; Block & Block, 1980). The Wagnild and Young Resilience Scale, used in this study, aligns with this perspective, unfolding resilience into domains such as personal competence, self-acceptance, independence, determination, self-confidence, and adaptability (Wagnild & Young, 1993).

3.2 THE IMPORTANCE OF RESILIENCE IN NURSING EDUCATION

For nursing students, resilience is not just a desirable characteristic but a fundamental protective competence. The profession demands constant emotional engagement, critical decision-making, and the ability to act under pressure. Resilience empowers the future nurse to:

- **Navigate Academic Stressors:** Cope with the intensity of the curriculum, rigorous evaluations, and time demands, maintaining focus and motivation.
- **Face Clinical Challenges:** Process experiences of suffering, trauma, and loss, maintaining empathy and professionalism without being consumed by emotional exhaustion.
- **Develop Self-Care Skills:** Recognize and manage one's own stress, preventing burnout and promoting well-being throughout their career.
- **Adapt to Change:** The healthcare environment is dynamic, with new technologies, protocols, and challenges constantly emerging. Resilience allows the professional to adjust and continue learning and growing.
- **Maintain Quality of Care:** Resilient nurses are better able to provide compassionate, safe, and effective care, even in adverse situations.

In summary, resilience acts as a protective factor that allows nursing students not only to survive but to thrive in a challenging environment. Recognizing that resilience can be learned and strengthened implies that educational institutions have a crucial role in developing programs and environments that cultivate this essential capacity.

4 METHODS FOR INVESTIGATING RESILIENCE IN NURSING STUDENTS

Investigating resilience and its associated factors in nursing students requires a rigorous methodological design that allows for capturing the phenomenon's complexity. This chapter is based on a carefully planned study, aiming to generate reliable data on the sociodemographic profile and resilience levels of these academics.

4.1 STUDY DESIGN AND SETTING

The study adopted an observational, descriptive, cross-sectional, and quantitative design. The choice of a quantitative approach was motivated by the need to measure specific variables, such as resilience levels and sociodemographic characteristics, to allow for the application of statistical analyses that identify patterns, associations, and, when possible, predictive relationships objectively. As an observational study, it refrained from any intervention, limiting itself to recording existing characteristics and perceptions at the time of data collection. The cross-sectional nature implied that data collection was performed at a single point in time, offering a snapshot of the variables under study during that specific period, which is efficient for identifying prevalences and associations. The descriptive aspect allowed for a detailed characterization of the sample, while the analytical aspect sought to explore the relationships between resilience and sociodemographic characteristics.

The research setting was the University Center of Santa Fé do Sul (UNIFUNEC), a private higher education institution located in the interior of São Paulo state, Brazil. The choice of UNIFUNEC as the study locus was strategic, allowing a focus on a specific population of incoming nursing students, facilitating the logistics of data collection, and offering a homogeneous context for analysis.

4.2 PARTICIPANTS AND ELIGIBILITY CRITERIA

The target population for this study comprised all students regularly enrolled in the first semester of the Nursing course at UNIFUNEC in the academic year 2025. The focus on incoming students was crucial, as it represents a period of intense adaptation and new academic challenges, where resilience may be more observable and its foundations more susceptible to intervention.

The sample selection was non-probabilistic, by convenience. This means that participants were recruited based on their accessibility and voluntary expression of interest in participating in the study, rather than by a random selection method. To ensure the homogeneity and relevance of the sample to the research objectives, the following criteria were established:

- **Inclusion:** Students with active enrollment in the first semester of the Nursing course in 2025, aged 18 years or older, and who formally consented to participate by signing the Free and Informed Consent Form (FICF).
- **Exclusion:** Participants who did not fully complete the data collection instruments or who exhibited inconsistencies or response patterns indicating a lack of comprehension or seriousness in completing the questionnaires.

After applying these criteria, the final sample consisted of 104 participants. This number, although representative for an initial analysis in a single institution, should be considered when discussing generalizability.

4.3 DATA COLLECTION INSTRUMENTS

Data collection was carried out using a structured, self-administered electronic form, hosted on the Google Forms platform. This form integrated the Free and Informed Consent Form (FICF) and two specific instruments:

- **Sociodemographic Variables Questionnaire (SVQ):** Developed specifically for this study, the SVQ aimed to broadly characterize the participants' profile. It consisted of a series of multiple-choice questions and open fields, covering:

- **Personal and Identification Data:** Biological sex, gender identity, and sexual orientation.
- **Demographic and Socioeconomic Data:** Age (age groups), marital status, number of children, personal or family income, and religious affiliation.
- **Previous Educational History:** Information about Elementary and High School (type of school, course modality, time elapsed since completion) and higher education experience (if they have already attended, completed, reasons for interruption).
- **Employment and Financial Situation Related to Study:** Current employment status (working in the course area, working in a different area, not working), primary source of funds to pay for studies, and type of course admission. This questionnaire was fundamental for contextualizing resilience levels within the students' life realities.
- **Wagnild and Young Resilience Scale (RS-25):** For measuring resilience levels, this instrument, originally proposed in 1993 (Wagnild & Young, 1993), was used. The RS-25 is widely recognized and has been translated and validated for the Brazilian Portuguese context by Pesce et al. (2005), ensuring its psychometric and cultural suitability. It consists of 25 positively worded items that seek to capture various facets of resilience. Participants responded to each item on a 7-point Likert scale (1 = "Strongly Disagree" to 7 = "Strongly Agree"). The total score on the scale ranges from 25 to 175 points, with higher scores indicating greater resilience. Conceptually, the RS-25 is organized into three main domains:
 - **Domain 1: Personal Competence and Self-Acceptance:** Assesses self-efficacy, self-acceptance, and perception of strengths.
 - **Domain 2: Independence and Determination:** Reflects autonomy, persistence, and self-sufficiency.
 - **Domain 3: Self-Confidence and Adaptability:** Measures confidence in dealing with challenges and flexibility to new demands. Total scores were categorized into resilience levels (reduced, moderate, and high) based on standardized criteria in the literature.

4.4 ETHICAL PROCEDURES AND DATA COLLECTION

The study was conducted in strict compliance with ethical principles for research involving human beings, as per Resolution No. 466/2012 of the National Health Council. Approval was obtained from the Research Ethics Committee of UNIFUNEC before the start of any procedures.

Students were invited to participate in the research at the beginning of classes, in a face-to-face setting. Researchers provided detailed explanations about the study's objectives, the voluntary nature of participation, and the guarantee of anonymity and confidentiality. Participation was voluntary, and the Free and Informed Consent Form (FICF) was signed electronically by each participant before completion. Instruments were applied individually, in an environment that ensured privacy. Researchers were available for specific questions, without influencing responses.

4.5 STATISTICAL ANALYSIS

Data were exported from Google Forms to electronic spreadsheets and subjected to thorough cleaning. Processing and statistical analyses were conducted using Jamovi software (version 2.5) and Python (Jupyter Notebook environment). Analyses included:

- **Descriptive Statistics:** Absolute (n) and relative (%) frequencies for categorical variables; mean, median, standard deviation, minimum, and maximum for numerical variables.
- **Normality Verification:** Shapiro-Wilk and Kolmogorov-Smirnov tests to guide the choice of inferential tests (parametric or non-parametric).
- **Inferential Statistical Tests and Modeling:**
 - Chi-square test (χ^2) and Fisher's Exact Test: For association between categorical sociodemographic variables and resilience categories.
 - Analysis of Variance (ANOVA): To compare means of the scores of the three resilience domains among different resilience levels (reduced, moderate, high).
 - Spearman's Correlation (ρ): To assess the strength and direction of monotonic association between scores of each domain and the total resilience score.
 - Multiple Linear Regression: To identify sociodemographic variables and scale domains as predictors of the total resilience score (continuous dependent variable).
 - Multinomial Logistic Regression: To model the probability of a student belonging to each resilience category (reduced, moderate, high), with evaluation of precision, recall, and F1-Score.

All statistical analyses were performed with a significance level of 5% ($p < 0.05$), indicating that a p-value below this threshold was considered statistically significant. Results were presented in tables and figures, accompanied by detailed interpretations.

5 RESULTS: AN OVERVIEW OF RESILIENCE AND ITS DETERMINANTS IN NURSING STUDENTS

The analysis of collected data allowed for a detailed profile of incoming nursing students and an investigation into the nuances of their resilience. This section presents the main findings of the study, organized to contextualize the sociodemographic profile, the distribution of resilience levels, and the significant associations found.

5.1 SOCIODEMOGRAPHIC PROFILE OF NURSING STUDENTS

The study sample comprised 104 incoming nursing students from UNIFUNEC in 2025. Sociodemographic characterization is fundamental, as participants' backgrounds can influence their coping abilities and resilience.

Table 1

Percentages referring to the sample characterization variables of nursing students. Santa Fé do Sul, 2025.

Characterization Variables	n	%
Biological Sex		
Male	11	10.58
Female	93	88.46
Gender Identity		
Man	11	10.58
Woman	93	88.46
Age		
20 or < 20 years	62	59.62
Between 21 and 30 years	20	19.23
Between 31 and 40 years	16	15.38
> 40 years	6	5.77
Marital Status		
Single	60	57.62
Married	29	27.88
Stable Relationship	11	10.58
Divorced	4	3.85
Number of Children		
0 children	75	72.12
1 Child	9	8.65
More than 1 child	20	19.23
Personal or Family Income		
≤ 1,000.00	12	11.54
1,001.00 to 3,000.00	55	52.88
≥ 3,000.00	37	35.58
Religion		
No Religion	13	12.50
Afro-Brazilian	1	0.96
Catholic	33	31.73
Evangelical	51	49.04
Spiritualist	2	1.92
Others	4	3.85

Table 1 provides a detailed view of the sociodemographic profile. A female predominance (88.46%) and younger age (59.62% up to 20 years old) are notable, reflecting the traditional demographics of nursing and the tendency for direct entry from high school. Most students are single (57.62%) and without children (72.12%), but the presence of married/in stable relationships and with children indicates a diversity of responsibilities. Family income is concentrated between R\$ 1,001.00 and R\$ 3,000.00 (52.88%), suggesting financial pressures that may influence the need to work.

Previous educational background was also analyzed:

Table 2

Percentages referring to the student data characterization variables of nursing students. Santa Fé do Sul, 2025

Characterization Variables	n	%
Elementary School (EF)		
All or mostly in public school	91	87.50
All or mostly in private school	13	12.50
Course Type (EF)		
Regular - 1st to 8th grade	86	82.69
Supplementary	18	17.31
High School (EM)		
All or mostly in public school	89	85.58
All or mostly in private school	15	14.42
Course Type (EM)		
Regular - 1st to 3rd grade	81	77.88
Technical	14	13.46
Supplementary	9	8.65
How many years ago did you finish high school?		
Last year	5	4.81
1 to 5 years ago	55	52.58
6 to 10 years ago	17	16.35
More than 10 years ago	27	25.96
Have you attended another higher education course?		
No	22	21.15
Yes	82	78.85
Did you complete the course?		
Not applicable	65	62.50
No	11	10.58
Yes	28	26.92
What type of institution was the course in?		
Not applicable	73	70.19
Public	5	4.81
Private	26	25.00

Table 2 indicates that the majority of students attended basic education in public schools (87.50% in Elementary School and 85.58% in High School), suggesting a diverse socioeconomic profile. A notable finding is that 78.85% have previously attended another higher education course, with many not having completed it (10.58%), which may indicate

resilience in the pursuit of education, but also experience with interruptions due to financial issues or disidentification.

Parents' schooling is also a relevant indicator of cultural capital and family expectations:

Table 3

Percentages referring to parents' schooling variables of nursing students. Santa Fé do Sul, 2025

Variables	n	%
Father		
Incomplete elementary education	36	34.60
Complete elementary education	4	3.80
Incomplete high school	5	4.80
Complete high school	28	26.90
Incomplete higher education	1	1.00
Complete higher education	17	16.30
Don't know	11	10.60
Others	2	1.90
Mother		
Incomplete elementary education	30	28.80
Complete elementary education	6	5.80
Incomplete high school	7	6.70
Complete high school	34	32.70
Incomplete higher education	0	0.00
Complete higher education	24	23.11
Don't know	3	2.20
Others	2	1.40

In Table 3, it is observed that mothers' schooling is, on average, slightly higher than fathers', with a greater concentration of complete high school and a considerable proportion with higher education. This data may reflect social and educational trends from previous generations and can influence family support and academic expectations.

Finally, employment status and how studies are funded reveal the challenges faced by students:

Table 4

Percentages referring to resource sources and type of course admission variables of nursing students. Santa Fé do Sul, 2025

Variables	n	%
Employment status		
Work in course-related area	38	36.50
Work in non-course-related area	53	51.00
Do not work	13	12.50
Main source of funds for studies		
Own resources	53	51.00
Family resources	35	33.70
Will apply for an institutional scholarship	16	15.40
Type of course admission		

First call	90	86.50
Second Call	10	9.60
Other	4	3.80

Table 4 highlights that more than half of the students (51.00%) work in an area different from nursing, which imposes a dual burden and can add significant stress. Dependence on own resources (51.00%) reinforces the need to reconcile work and study. The vast majority (86.50%) were admitted via the first call, indicating dedication and preparation.

5.2 GENERAL LEVELS OF RESILIENCE

The assessment of resilience levels using the Wagnild and Young Resilience Scale provided an overview of students' adaptive capacity:

Table 5

Descriptive analysis of absolute and relative frequencies of participants classified according to resilience levels. UNIFUNEC, 2025

Resilience Category	Frequency (n)	Percentage (%)
Reduced	26	25.0
Moderate	53	50.9
High	25	24.1

Table 5 reveals that most students (50.9%) have moderate levels of resilience. However, a significant portion (25.0%) demonstrated reduced resilience, which signals a group more vulnerable to developing psychosocial difficulties. Approximately a quarter of the sample (24.1%) exhibited high resilience, indicating a strong capacity for adaptation and overcoming challenges. The overall mean resilience score was 129.3 (standard deviation of 26.6), with a median of 132 points, corroborating the predominance of moderate resilience in the sample.

Figure 1

Distribution of Classifications According to Resilience Level. Santa Fé do Sul, 2025.

Figure 1 visually illustrates the percentage distribution of resilience categories, reinforcing the predominance of moderate resilience and the expressive presence of reduced and high resilience groups.

5.3 DETAILED ANALYSIS OF RESILIENCE DOMAINS

The Wagnild and Young Resilience Scale disaggregates resilience into three domains, whose mean scores provide insights into the strengths and areas that may require development in students.

Table 6

Descriptive analysis of scores for the three domains of the Wagnild and Young Resilience Scale. Santa Fé do Sul, 2025

Domain	Mean	Median	Standard Deviation	Minimum / Maximum
Domain 1 (Personal Competence and Self-Acceptance)	77.17	79.00	15.54	15.0 / 105.0
Domain 2 (Independence and Determination)	22.09	23.00	5.05	4.0 / 28.0
Domain 3 (Self-Confidence and Adaptability)	30.06	31.00	7.45	6.0 / 42.0

Table 6 shows that Domain 1 (Personal Competence and Self-Acceptance) presented the highest mean score (77.17), suggesting that students, in general, possess a robust perception of their capabilities and a healthy level of self-acceptance. On the other hand, Domain 2 (Independence and Determination) and Domain 3 (Self-Confidence and Adaptability) presented comparatively lower mean scores (22.09 and 30.06, respectively).

This indicates that, although students feel competent, they may have more difficulty exercising their independence, maintaining determination in the face of complex obstacles, and feeling less self-confident to adapt to new and demanding situations in the university environment and clinical practice.

Figure 2

Boxplot Distribution of Domain 1 by Resilience Level. Santa Fé do Sul, 2025.

Figure 3

Boxplot Distribution of Domain 2 by Resilience Level. Santa Fé do Sul, 2025

Figure 4

Boxplot Distribution of Domain 3 by Resilience Level. Santa Fé do Sul, 2025

Figures 2, 3, and 4, which illustrate the distribution of each domain by resilience level, corroborate the significant differentiation of the domains among the resilience groups (as demonstrated by ANOVA in Table 7), showing that students with high resilience tend to have higher scores in all domains, especially in Domain 1.

5.4 SOCIODEMOGRAPHIC FACTORS ASSOCIATED WITH RESILIENCE

Chi-square association analyses were crucial to identify which sociodemographic variables are significantly related to students' resilience levels.

Table 7

Association between Sociodemographic Variables and Resilience Level (Chi-square). Santa Fé do Sul, 2025

Variable	p-value	Significant (p < 0.05)
Biological sex	0.125	No
Gender identity	0.0419	Yes
Age	0.1235	No
Marital status	0.9037	No
Children	0.1027	No
Income	0.812	No
Religion	0.0835	No
Work	0.027	Yes
Source of Resources	0.1666	No
Form of Admission	0.7167	No

As per Table 7, Gender Identity ($p = 0.0419$) and Employment Status ($p = 0.027$) were the only sociodemographic variables that showed a statistically significant association with resilience levels. This finding suggests that how an individual identifies in relation to gender

and their employment condition (whether they work in the area, outside the area, or do not work) can influence their resilience capacity. In contrast, other variables such as biological sex, age, marital status, number of children, income, religion, source of resources, and form of admission showed no significant association in this sample.

Figure 5

Resilience Level by Gender Identity. Santa Fé do Sul, 2025

Figure 5 illustrates the distribution of resilience levels by gender identity. For the "Woman" identity, there is a predominance of moderate resilience, with smaller proportions of reduced and high resilience. For the "Man" identity, although the sample is smaller, the distribution appears more balanced across levels, corroborating the statistical association.

Figure 6

Resilience Level by Employment Status. Santa Fé do Sul, 2025

Figure 6, which represents the distribution of resilience levels by employment status, shows that students who "Work in the area" have a relatively balanced distribution, while those who "Work in a different area" show a significant concentration in moderate resilience. Curiously, those who "Do not work" are distributed between high and moderate resilience, with no cases of reduced resilience, which may indicate that having time to dedicate exclusively to studies can be a protective factor.

5.5 PREDICTIVE MODELS OF RESILIENCE

To deepen the understanding of resilience determinants, analyses of variance (ANOVA), correlation, and regression were performed.

Table 8

ANOVA Results between Domains and Resilience Levels. Santa Fé do Sul, 2025

Domain	F Statistic	p-value	Significant (p < 0.05)
Domain 1	84.1	< 0.001	Yes
Domain 2	55534	< 0.001	Yes
Domain 3	68542	< 0.001	Yes

Table 8, with the ANOVA results, shows that all three domains of the Resilience Scale presented p-values < 0.001, indicating that there are statistically significant differences in the mean scores of each domain among the groups of students classified with reduced, moderate, and high resilience. This confirms the discriminatory capacity of the scale and suggests that resilience is a coherent construct where different psychological aspects manifest together.

Spearman's correlations (Table 9) revealed strong interrelationships between the domains and the total resilience score:

Table 9

Spearman's Correlation between Domains and Total Score. Santa Fé do Sul, 2025

Domain	Correlation Coefficient (ρ)	p-value
Domain 1	0.92	< 0.001
Domain 2	0.79	< 0.001
Domain 3	0.83	< 0.001

Domain 1 exhibited the strongest correlation ($\rho = 0.92$), followed by Domain 3 ($\rho = 0.83$) and Domain 2 ($\rho = 0.79$), all with $p < 0.001$. These highly significant correlations indicate that the higher the score in each domain, the higher the total resilience score, reinforcing the internal consistency of the scale.

Figure 7: Scatter Plot: Domain 1 vs. Total Score. Santa Fé do Sul, 2025.

Figure 8: Scatter Plot: Domain 2 vs. Total Score. Santa Fé do Sul, 2025.

Figure 9: Scatter Plot: Domain 3 vs. Total Score. Santa Fé do Sul, 2025.

Figures 7, 8, and 9 visually illustrate these strong positive correlations, with points distributed in an upward trend and close to the trend lines, confirming that the increase in domain scores is directly related to the increase in the total resilience score.

Regression models further deepened the predictive analysis. Multiple linear regression (Table 10) identified significant predictors for the total resilience score:

Table 10

Results of the Multiple Linear Regression Model. Santa Fé do Sul, 2025

Variable	Coefficient	p-value	Significant ($p < 0.05$)
Constant	1341381	< 0.001	Yes
Gender identity	109782	0.1519	No
Works in the area	-11062	0.0319	Yes
Works outside the area	70304	0.3761	No
Does not work	-1091381	< 0.001	Yes

In the multiple linear regression, the variables "Works in the area" ($p = 0.0319$) and "Does not work" ($p < 0.001$) were statistically significant as predictors of the total resilience score. Interestingly, "Gender Identity," although significant in bivariate analyses, lost significance in this multivariate model, suggesting that its impact may be mediated by other variables or that its isolated contribution is not as strong in a context of multiple predictors. It is important to note that the domains of the resilience scale, as discussed in the body of the

dissertation, were even stronger predictors of the total score, with a high adjusted R^2 , indicating that these domains explain a large part of resilience variability.

Multinomial logistic regression (Table 11) evaluated the model's performance in predicting resilience categories:

Table 11

Model Performance by Resilience Category. Santa Fé do Sul, 2025

Category	Precision	Recall	F1-Score	Sample (support)
High	1.00	0.17	0.29	6
Moderate	0.68	1.00	0.81	13
Reduced	0.00	0.00	0.00	2

Table 11 demonstrates that the multinomial logistic regression model performed best in predicting the "Moderate" category (Recall of 1.00; F1-Score of 0.81). For the "High" and "Reduced" categories, performance was more limited, especially for "Reduced" (F1-Score of 0.00), which can be attributed to the small number of participants in these categories in the test sample. However, a deeper analysis (not detailed in the table, but addressed in the dissertation) indicated that Domain 1 (Personal Competence and Self-Acceptance) and Domain 3 (Self-Confidence and Adaptability) were significant predictors for moderate and high resilience categories.

6 DISCUSSION: IMPLICATIONS FOR NURSING EDUCATION AND HEALTH

The results presented offer a multifaceted view of resilience levels and their determinants in incoming nursing students, revealing crucial internal challenges and resources for the training of these future professionals. The predominance of moderate resilience in the sample, while a common finding in university populations, requires careful analysis, especially in the face of the significant proportion of students with reduced resilience. This scenario not only aligns with contemporary discussions on mental health in higher education but also drives the need for proactive strategies to strengthen the adaptive capacity of these academics.

6.1 RESILIENCE IN CONTEXT: CHALLENGES AND OPPORTUNITIES

The finding that approximately half of the students exhibit moderate resilience reflects an intermediate capacity to cope with the adversities intrinsic to the nursing educational path. Such a resilience level may be sufficient to deal with daily stressors but may be insufficient in the face of more intense or prolonged crises, such as those experienced in clinical internships or during periods of great academic pressure (Merino-Godoy et al., 2022). The

group with reduced resilience, in turn, represents a particularly vulnerable segment that demands priority institutional attention. These students are at higher risk of developing mental disorders, experiencing accentuated adaptation difficulties, and, in extreme cases, dropping out of the course (Ríos-Risquez et al., 2018; Martinez et al., 2025). Early identification and implementation of customized psycho-pedagogical support are imperative to strengthen their coping strategies and promote a more protective academic environment.

Understanding resilience as a dynamic construct capable of development (Masten, 2001) opens a window of opportunity for educational institutions. Instead of simply identifying "resilient" or "non-resilient" individuals, the focus should be on developing programs that cultivate and strengthen this capacity in all students, with special attention to the most vulnerable.

6.2 THE ROLE OF GENDER IDENTITY AND EMPLOYMENT STATUS

One of the most relevant findings of the study was the statistically significant association between resilience levels and gender identity, as well as employment status. Although biological sex did not prove significant, gender identity emerged as a crucial factor. This is particularly pertinent in the current context, where gender diversity is increasingly recognized but still confronted with social challenges (Stubin et al., 2024). Students who identify outside traditional gender norms or who experience gender minority status may face additional stressors, such as microaggressions, veiled discrimination, invisibility, or social and institutional isolation (Berdida et al., 2023; Naz et al., 2024). Such experiences can deeply impact self-perception, sense of belonging, and consequently, resilience. The results of this study, therefore, reinforce the critical need for higher education institutions to cultivate inclusive and equitable environments, offering specific support and resources that recognize and address the particularities experienced by students of all gender identities, promoting a sense of psychological safety indispensable for the development of resilience (Karabey, 2023).

Concurrently, employment status proved to be a significant predictor of resilience levels. The majority of students who work do so in areas distinct from nursing, which imposes a considerable burden. Reconciling the demands of a job, often not aligned with academic goals, with the intense demands of a health science degree course, creates a dual journey that drains physical and mental resources (Gerdes & Schuessler, 2024; Labrague et al., 2025). Although work can provide financial independence and valuable life experience (Li et al., 2025), the pressure to balance multiple roles can compromise time dedicated to studies,

rest, and participation in social and self-care activities, all crucial elements for maintaining mental health and resilience (Ghimire, 2025).

In-depth analysis indicated that certain categories of work, or the absence thereof, act as predictors of resilience scores. Those who do not work, for example, showed no cases of reduced resilience in the test sample of the logistic regression model, suggesting that having time to dedicate entirely to studies can be a protective factor. These findings underscore the importance of institutional policies considering the reality of working students, offering academic flexibility, scholarships, and mentoring programs that mitigate the negative impacts of this dual responsibility.

It is noteworthy that other commonly investigated sociodemographic variables, such as age, marital status, number of children, family income, and religious affiliation, did not demonstrate, in this study, a statistically significant direct association with resilience. Although these factors may exert influences in other contexts or mediate other relationships (e.g., income may influence the ability to reduce workload and, indirectly, increase resilience), the results obtained here suggest that, for this specific sample, gender identity and employment status emerge as the sociodemographic vectors with the greatest direct impact on the resilience capacity of academics. This distinction is fundamental for directing the formulation of support interventions and policies more effectively.

6.3 STRENGTHS AND WEAKNESSES OF RESILIENCE COMPONENTS

Delving into the internal structure of resilience, the analysis of the Wagnild & Young Resilience Scale domains revealed distinct patterns. Domain 1, "Personal Competence and Self-Acceptance," presented the highest mean scores. This is a very positive finding, indicating that students, in general, arrive at higher education with a robust perception of their own capabilities and a healthy level of self-acceptance. Self-efficacy and a positive self-image are recognized as pillars of mental health and protective factors against stress, empowering individuals to face new learning and challenges with greater confidence (Li et al., 2025; Berdida et al., 2023). This strength can be capitalized on by institutions, building upon this solid foundation of self-confidence.

On the other hand, Domain 2, "Independence and Determination," and Domain 3, "Self-Confidence and Adaptability," presented comparatively lower mean scores. These domains, which encompass autonomy, persistence in the face of obstacles, and flexibility in demanding new situations, suggest areas of greater vulnerability or that require greater development among students. Nursing education, with its practical nature and constant need to operate in dynamic and highly complex environments, demands high levels of

independence in decision-making and adaptability to unpredictable scenarios (Gil-Hernández et al., 2025; Ghimire, 2025). Weakness in these aspects can hinder proactivity, intrinsic motivation, and the ability to adjust to the constant changes in the clinical and academic environment, potentially leading to higher levels of stress and lower professional satisfaction.

The inferential analyses corroborated the validity and internal consistency of the Resilience Scale. Analysis of Variance (ANOVA) demonstrated that all three domains significantly differentiate groups of students with reduced, moderate, and high resilience, suggesting that resilience is a coherent construct. Spearman's correlations revealed strong and significant associations between each domain and the total resilience score, confirming that different aspects of resilience operate in conjunction. Interventions directed at any of these domains can, therefore, have a positive and comprehensive impact on students' overall resilience.

Linear and multinomial logistic regression analyses deepened the understanding of resilience predictors. Multiple linear regression showed that the scale's domains are significant predictors of the total resilience score, explaining a considerable proportion of its variability. Multinomial logistic regression, focused on predicting resilience categories (reduced, moderate, high), pointed to Domain 1 (Personal Competence and Self-Acceptance) and Domain 3 (Self-Confidence and Adaptability) as the main predictors for moderate and high resilience categories. This finding is of great practical value, as it guides the formulation of intervention strategies: programs focused on strengthening self-efficacy, self-confidence, and adaptability may be the most effective in raising resilience levels among students.

6.4 IMPLICATIONS FOR INSTITUTIONAL POLICIES AND INTERVENTIONS

In a broader perspective, the results of this study reinforce the importance of a holistic approach to the well-being of nursing students. Resilience, understood not only as an individual characteristic but as a competence capable of development, must be actively cultivated by educational institutions (Kunzler et al., 2020; Moura et al., 2024).

Higher education institutions have a central role in creating environments that promote resilience, through various fronts:

- **Specialized Psycho-pedagogical Support Programs:** Given the existence of a group with reduced resilience and the specific vulnerabilities identified, it is fundamental to offer accessible, free psychological counseling services with professionals specialized in the demands of the health field. Early screening of at-risk students can enable preventive interventions.

- **Socio-emotional Skills Workshops:** The focus should be on strengthening the domains of "Independence and Determination" and "Self-Confidence and Adaptability." This can be done through workshops on stress and anxiety management, mindfulness techniques, assertive communication training, problem-solving strategies, and the development of autonomy in simulated clinical decision-making.
- **Inclusive and Equitable Environments:** The significance of gender identity as a factor associated with resilience points to the urgent need for policies of inclusion and respect for diversity. This involves everything from training professors and staff to deal with gender issues to creating support groups and promoting an academic culture free of prejudice, where everyone feels safe and belongs (Fricke et al., 2023).
- **Support for Working Students:** Recognizing the dual burden of many academics, institutions should consider flexible schedules, scholarship programs, and mentorship to assist in time and stress management. Dialogue with employers can be facilitated, seeking conciliations between work and study demands.
- **Integration of Resilience into the Curriculum:** Resilience skills should not be treated as "extras" but as transversal competencies in nursing education. This can be achieved by including discussions on mental health, self-care, and coping strategies in relevant disciplines, and by promoting pedagogical experiences that stimulate autonomy and adaptability.
- **Academic Culture of Well-being:** A culture that values well-being as much as cognitive performance is essential. This includes everything from promoting extracurricular activities that encourage leisure and relaxation to creating open communication channels so students feel comfortable expressing their difficulties.

The training of resilient nurses not only benefits the individual mental health of future professionals but also strengthens the quality of professional practice, empowering them to face the complexities, pressures, and rapid changes inherent in healthcare with greater competence, ethics, and humanity (Gil-Hernández et al., 2025). Investment in resilience is, therefore, an investment in the quality of public health.

7 FINAL CONSIDERATIONS

This chapter, based on robust research with incoming nursing students, had as its central purpose to unveil resilience levels and how these intertwine with students' sociodemographic characteristics. The findings underscore the complexity of the nursing

educational journey and the imperative need for holistic approaches to promoting well-being and adaptive capacity.

It was found that the majority of students enter the course with a moderate level of resilience, which represents a promising foundation, but one that needs constant nurturing. The existence of a significant group with reduced resilience raises an alert for the urgency of personalized interventions. The research demonstrated that sociodemographic factors such as gender identity and employment status exert a significant influence on resilience, revealing the importance of considering the multiple realities and life experiences of students in the design of support strategies.

Regarding the components of resilience, "Personal Competence and Self-Acceptance" stands out as a notable strength in these academics. However, "Independence and Determination" and "Self-Confidence and Adaptability" were identified as areas requiring greater attention and development. These insights are crucial, as they direct efforts towards intervention programs that can strengthen the most vulnerable facets of resilience, empowering students to navigate academic and clinical challenges more effectively.

In summary, investing in strengthening the resilience of nursing students is not merely a measure of individual support but a fundamental strategy to ensure the training of competent, ethical, and psychologically prepared professionals for the demands of one of the most vital professions in healthcare. Higher education institutions, by implementing evidence-based policies and programs that promote resilience, not only guarantee the success and permanence of their students but also contribute significantly to the quality of healthcare and to the well-being of society as a whole. This chapter hopes to serve as a catalyst for future research and concrete actions that transform the challenges of nursing education into opportunities for growth and strengthening.

ABSTRACT

According to the Logistics Bulletin released by the National Civil Aviation Agency (ANAC), air transport accounted for almost 70% of interstate travel on regular routes in 2019. In the Planned Behavior Theory (PBT) model, behavioral intention is directly influenced by three components: attitudes, subjective norms, and perceived behavioral control (Ajzen, 1991). Although PBT has been used in many studies related to transportation (Hsiao; Yang, 2010; Jing et al., 2014), it has limited application in passenger research in the LCC (low-cost carrier) market. Therefore, this research aimed to expand the theory of planned behavior focusing on Brazilian low-cost airlines. The results showed that PBT, when applied to understanding Brazilian low-cost airlines, has the following explanatory variables: risk, quality, and frequency.

Keywords: Brazilian Tourists. Brazilian Airlines. Theory of Planned Behavior.

RESUMO

Segundo o Boletim de Logística divulgado pela Agência Nacional de Aviação Civil (ANAC) o transporte aéreo foi responsável por quase 70% dos embarques para viagens interestaduais em linhas regulares em 2019. No modelo TCP (Teoria do Comportamento Planejado), a intenção comportamental é diretamente influenciada por três componentes: atitudes, normas subjetivas e controle comportamental percebido (Ajzen, 1991). Embora a TCP tenha sido usada em muitos estudos relacionados ao transporte (Hsiao; Yang, 2010; Jing et al., 2014), ele tem aplicação limitada na pesquisa de passageiros do LCC (mercado de empresas aéreas de baixo custo, ou Low Cost Carriers). Nesse ínterim, essa pesquisa teve por objetivo expandir a teoria do comportamento planejado com foco nas companhias aéreas brasileiras de baixo custo. Teve como resultados encontrados que TCP quando aplicada a compreensão das companhias aéreas brasileiras de baixo custo tem como variáveis de explicação: risco, qualidade e frequência.

RESUMEN

Según el Boletín de Logística publicado por la Agencia Nacional de Aviación Civil (ANAC), el transporte aéreo representó casi el 70% de los viajes interestatales en rutas regulares en 2019. En el modelo de la Teoría del Comportamiento Planificado (TCP), la intención de comportamiento se ve directamente influenciada por tres componentes: actitudes, normas subjetivas y control conductual percibido (Ajzen, 1991). Si bien la TCP se ha utilizado en numerosos estudios relacionados con el transporte (Hsiao; Yang, 2010; Jing et al., 2014), su aplicación en la investigación de pasajeros en el mercado de aerolíneas de bajo costo (LCC) es limitada. Por lo tanto, esta investigación tuvo como objetivo ampliar la teoría del comportamiento planificado, centrándose en las aerolíneas brasileñas de bajo costo. Los resultados mostraron que la TCP, aplicada a la comprensión de las aerolíneas brasileñas de bajo costo, presenta las siguientes variables explicativas: riesgo, calidad y frecuencia.

Palabras clave: Turistas Brasileños. Aerolíneas Brasileñas. Teoría del Comportamiento Planificado.

1 INTRODUCTION

According to the Logistics Bulletin released by the National Civil Aviation Agency (ANAC), air transport was responsible for almost 70% of shipments for interstate travel on regular lines in 2019. The airline sector is fundamental to tourism activities and, therefore, it is said to catalyze, that is, it induces part of other activities involved in tourism. (ANAC, 2023).

According to the Brazilian Association of Airlines (ABEAR), the airline sector was responsible for 25.6% of the gross value added of tourism in 2019 and 27.1% of the taxes paid related to tourism activity. Overall, the activities of the airline sector catalyzed 53.2 billion reais in value added via induction of tourism-related activities and R\$ 16.5 billion in taxes paid for such activities.

Azul Linhas Aéreas Brasileiras, for example, is a national aviation company, headquartered in São Paulo. Created in 2008, the company began its activities focused on regional routes from the airport of Viracopos (SP).

In a short time, Azul conquered a large number of passengers. Thus, it expanded its operations in the national territory and started to offer selected international routes, such as Argentina, the United States, Portugal and Uruguay.

In 2014, Azul incorporated *Trip* Linhas Aéreas and became the third largest company in number of passengers. As of June 2022, its fleet had more than 140 aircraft, with national models from Embraer and international models from *Airbus and Avions de Transport Régional* (ATR) (Genial Investimentos, 2023).

Azul's IPO took place in 2017, in an initial public offering (IPO) that raised around R\$ 643 million. At the time, preferred shares were issued under the AZUL4 ticket and these are shares that guarantee preference in receiving dividends. (Genial Investimentos, 2023). Another company that operates with air transport is Gol Linhas Aereas Inteligentes S.A. Created in 2001 in Rio de Janeiro, it is among the largest aviation companies in Brazil. As of June 2022, the company had more than 120 aircraft and carried out different national and international routes. (Genial Investimentos, 2023).

Gol also operates with logistics, through GAC Inc., in addition to owning two financial services companies (GOL *Finance* and GOL *Finance Cayman*). Throughout its history, the company has acquired Varig and Webjet, as well as entered into alliances with Delta and *Air France* — KLM. (Genial Investimentos, 2023).

Taking into account that tourism stimulates economic and social development by generating employment in addition to moving different sectors of the economy, this study is justified by the investigation of how low-cost air travel stimulates tourism. In the meantime, the research problem raised is: Does the Theory of Planned Behavior (TCP) explain the

choice of air transport by Brazilian tourists? Aiming to expand the theory of planned behavior with a focus on Brazilian low-cost airlines.

2 THEORETICAL FRAMEWORK

In recent decades, there has been a considerable increase in academic terms regarding the enrichment of the theoretical and methodological field of Tourism. However, aiming at a greater unfolding of the object itself, a relevant item may not be mentioned frequently, namely: the history of Tourism and Travel. (Cisne & Gastal, 2010).

In this sense, Rodrigues (2000) states that the tourism industry has presented unusual results in developing countries, since it not only contributes to the creation of jobs, the increase in income, but also contributes to reducing regional differences and improving the quality of life of less developed regions, due to the execution of infrastructure works, such as transportation, sanitation, energy etc.

Although there is no single definition for tourism, the United Nations World Tourism Organization, in its recommendations for tourism statistics, defines it as "the activities that people carry out during their travels and stay in places other than those in which they live, for a period of time less than one consecutive year, for leisure purposes, business and others" (Campos, 2007).

Currently, tourism encompasses the correlation of different sectors of economic activity, with the objective of promoting cultural, religious, leisure or business travel. For this, it is necessary to provide transportation, accommodation, recreation, food and other related services to meet the needs of domestic and international travelers, from arrival to departure from a city, state or country (Colantuono, 2015).

In summary, tourism encompasses all the activities that people carry out during their trips and stays in places other than their usual surroundings, for a consecutive period of less than one year, for leisure, business or other purposes (UNWTO, 2001).

The degree of market concentration in the operations of *charter* airlines (those that charter aircraft to perform flights that are not part of their scheduled network) varies between countries and even between locations within a country, but appears to be highly concentrated in key markets. By the end of the 1980s, for example, the five major *charter* airlines held a combined market share, in terms of miles carried per passenger, of more than 80% in Spain and approximately 70% in the United Kingdom (Bote Gómez & Sinclair, 1991).

The dominance of major *charter* airlines is being challenged, however, by the emergence of low-cost airlines, whose pricing strategies represent a significant shift in the

behavior of the airline industry (Piga & Filippi, 2002) and by increased price-based competition among major airlines (Milman, 1997; French, 1998).

In the era of globalization, air travel has evolved from a luxury reserved only for the wealthy to the primary mode of transportation for most people traveling the world, whether for business or pleasure. This is evidenced not only by the substantial increase in the number of people choosing to travel by air in recent years, but also by the fact that the number of people traveling by air is expected to increase from nearly 2 billion in 2021 to 2.6 billion in 2026 and to 8.2 billion in 2037. (Thongkruer & Wanarat, 2023).

As is evident in the first quarter of 2022, the total number of domestic air passengers was 9.74 million, increasing by 23.4 percent or 1.85 million, compared to the previous quarter in 2021, in which the total number of domestic passengers totaled 7.89 million. . (Thongkruer & Wanarat, 2023).

In view of this, the market for low-cost airlines, or *Low Cost Carriers* (LCC), as they are universally known, had its beginning with the change in *Southwest Airlines'* business model, when there was the deregulation of air transport in the United States of America (USA), in 1978. (Hiney, et al., 2025).

A review of the literature reveals important gaps in the research of LCC passengers (Low Cost *Carriers* market). First, the existing literature focuses mainly on intermodal choices between FSCs (*Full Service Carrier*), that is, companies that still embed many services in their business strategies, and LCCs, which have their business strategies focused on low cost and consequently for not providing extra services, leaving aside the study of passengers' behavioral intentions. (Hiney, et al., 2025).

While these studies identified important factors, such as price and service, for passengers to choose LCCs (low-cost *carriers*) over other modes of transportation, they did not provide an in-depth analysis of how these factors influenced passengers' motivation to use LCCs. (Hiney, et al., 2025). In view of this, the application of the Theory of Planned Behavior (TCP) aims to understand the criteria that lead to the choice of air transport by the Brazilian tourist.

The theory of planned behavior – TCP – is one of the most important theoretical frameworks for predicting human behaviors (Ajzen, 2002). In the TCP (Theory of Planned Behavior) model, behavioral intention is directly influenced by three components: attitudes, subjective norms, and perceived behavioral control (Ajzen, 1991).

While the three components can provide useful predictions of intention and behavior, the model is open to the inclusion of additional predictors if they can be shown to capture a significant proportion of the variation in intention or behavior after the theory's current

variables have been considered (Ajzen, 1991). The flexibility and openness of the model make TCP (Theory of Planned Behavior) a useful conceptual framework for examining intentions and behaviors in various domains, including air transport. Although TCP (Theory of Planned Behavior) has been used in many transport-related studies (Hsiao & Yang, 2010; Jing et al., 2014), it has limited application in the search for LCC (*Low Cost Carriers*) passengers.

The Theory of Planned Behavior (TCP) (Ajze, 1991,2002) is a parsimonious model for explaining human behavior, which is widely applied in a variety of fields, including healthcare, marketing, education, etc. The core idea behind TCP is that a person's actual behavior is immediately determined by behavioral intention, which is a three-construct function, that is, attitude, subjective norm and perceived behavioral control.

Specifically speaking, behavioral intention is a measure of the strength of an individual's willingness to perform a certain behavior (Ajzen 1991). By definition, attitude is a reflection of a person's evaluative reaction to the performance of a certain behavior, for example, happy or sad, favorable or unfavorable, useless or useful. The more positive attitude individuals have, the stronger their intention to conduct a particular behavior (Beck & Ajzen 1991).

The subjective norm (SN) refers to the "perceived social pressure to perform or not to perform the behavior" (Ajzen 1991), which is related to the perception of the expectations of important others. It has been proven that the subjective norm positively affects behavioral intention (Castanier et al. 2013; Wang et al. 2016).

Regarding perceived behavioral control (PBC), it was added to the initial theory of rational action (Ajzen & Fishbein 1980; Fishbein & Ajzen 1975), and reflects the extent to which a person perceives constraints and their capacities on target behavior.

Simply put, it is defined as the degree of ease or difficulty in performing the behavior as being perceived by an individual (Ajzen 1991). Taking the choice of mode of transport as an example, individuals are more intentional to travel by a certain mode if they have some positive evaluations of it, perceive a greater degree of social pressure to use it, and are sure that they have the necessary skill. In addition, when perceived behavioral control coincides with actual behavioral control, it also exerts a direct influence on behavior (Ajzen 1991).

Although TCP (Theory of Planned Behavior) has been used in many studies related to transportation (Hsiao & Yang, 2010; Jing et al., 2014), it has limited application in LCC passenger research. The existing literature on passenger behavior in the context of LCC is primarily focused on intermodal choice between LCCs and FSCs using choice models (Ong & Tan, 2010; Chang & Sun, 2012; Jung & Yoo, 2014) and in the perception of LCCs based

on service-related models, especially the SERVQUAL model that measures five dimensions of quality of service, including tangible, responsiveness, reliability, assurance, and empathy (Ariffin et al., 2010; Kim & Lee, 2011; Lerrthaitrakul & Panjakajornsak, 2014).

In China, Chiou & Chen (2010) examined the relationships between service factors, satisfaction, airline image, and behavioral intentions in passengers' choice of LCCs and FSCs. The results indicated that the perception of service was most important to FSC passengers, while the value of service had the greatest effect on intentions among LCC passengers (Chiou & Chen, 2010). Passenger attitudes and behaviors received limited attention in the survey on LCC passengers. Only one study by Buaphiban & Truong (2017) developed a TCP (Theory of Planned Behavior) model to examine passenger purchase intentions and actual LCC ticket purchases in Thailand. The study focused exclusively on the components of TCP (Theory of Planned Behavior), and the authors reported that passenger attitudes and subjective norms had a positive impact on purchase intentions, while intention and perceived behavioral control significantly influenced purchase behaviors. The Theory of Planned Behavior is one of the most important theoretical frameworks for predicting human behaviors (Ajzen, 2002).

While these studies identified important factors, such as price and service, for passengers to choose LCCs over other modes of transportation, they did not provide an in-depth analysis of how these factors influenced passengers' motivation to use LCCs. Second, there is a significant gap in understanding the motivation of LCC passengers in China, A country with a large population base, rapid economic development, and a huge market potential for low-cost travel. The study by Chiou & Chen (2010) focused primarily on service-related factors, which does not provide a complete picture of the underlying reasons for passengers to use LCCs. The effect of other factors, such as attitude and behavioral factors on the use of LCCs, has not yet been examined.

In addition, it is not known how context-specific factors, especially cultural factors, may influence passengers' decisions when using LCCs in China. Finally, although the TCP (Theory of Planned Behavior) study by Buaphiban & Truong (2017) provides insight into the influence of attitude and behavior on LCC passenger intent, the findings were derived from the mature LCC market in Thailand, which is very different from China, where the LCC market is at an early stage of development. Clearly, a new research model should be developed focusing on the behavioral intentions of Chinese passengers and including relevant factors to gain deeper insights into the intention to use LCCs in China.

According to the theory, three latent constructs explain intention, namely attitude toward behavior, subjective norm, and perceived behavioral control. Attitude is a person's

positive or negative evaluation of behavior and reflects beliefs about the likely outcomes of behavior (behavioral beliefs); subjective norm is the perception of social pressure to engage or not engage in the behavior, based on the perceived expectations of important referents (normative beliefs), such as the person's partner, parents, friends, or colleagues; and perceived behavioral control refers to the perceived ability to perform the behavior, taking into account beliefs about potentially facilitating or interfering factors, such as lack of financial resources, cooperation from others, and business experience (control beliefs). The three explanatory constructs of intention (attitude, subjective norm, and perceived behavioral control) are not necessarily independent. They are correlated due to common external causes and interactions between attitude, subjective norm, and perceived behavioral control are possible. TCP (Theory of Planned Behavior) assumes that intention has a strong causal influence on behavior (Fishbein & Ajzen, 1975). In view of this, the hypotheses for this research arise:

H1: The price is positively related to the intention of passengers to use Brazilian airlines. The ticket price of LCCs (*Low Cost Carriers*), which are typically 40–60% lower than their full-service competitors (O'Connell & Williams, 2005; Lawton, 2002), is often the main reason for passengers to choose LCCs over FSCs (Full Service Carrier, i.e., companies that still embed many services in their business strategies) (Chang and Sun, 2012; Sai et al., 2012; Jung & Yoo, 2014; Ong & Tan, 2010). Ong & Tan (2010) investigated determining factors in the choice between full-service Malaysia Airlines and low-cost AirAsia and found that fares are significant in the choice of airline.

In a similar study, Sai et al. (2012) indicated that LCC passengers in Malaysia placed great emphasis on low price, which reconfirmed the perception that price is the most important reason for choosing LCCs. The dominant effect of price; however, has been questioned in recent years due to changing market conditions (Kim & Lee, 2011). These passengers are likely to be price-sensitive and, as such, are potential customers for low-cost travel (Fu et al., 2015). Therefore, it is necessary to examine the effect of price on the intentions of Brazilian passengers.

The quality of service is often less important to LCC passengers compared to FSC passengers. In traditional LCC markets (*Low Cost Carriers*), passengers consider service elements such as in-flight service and punctuality to be insignificant in their choices between LCCs and FSCs (Mikulić & Prebežac, 2011). In emerging markets LCC; however, there seems to be market space for LCCs to offer low rates and high quality of service (Kim & Lee, 2011; Yeung et al., 2012).

Although these LCCs (low-cost *carriers*) still emphasize low costs and low fares, they

achieve cost reduction by improving efficiency in their operations, rather than reducing services (Saha & Theingi, 2009). Studies have shown that passengers of LCCs (*Low Cost Carriers*) are not only concerned with low prices, but also with services (Yang et al., 2012). The literature also shows that the quality of service can influence both consumer satisfaction (Ariffin et al., 2010; Kim & Lee, 2011) and behavioral intentions in relation to LCCs (Lerrthaitrakul & Panjakajornsak, 2014). The proposed model thus examines the quality of service of LCCs (*Low Cost Carriers* market), which is indicated by: H2: The quality of service is positively related to passengers' intentions to use Brazilian airlines.

Risk aversion in this context refers to the degree to which members of a society feel uncomfortable or uncertain in their consumption choices (Hofstede, 1984), for this study it is relevant because the decision to choose a mode of transport often contains uncertainties and risks related to the characteristics of the means of transport. Brazilian culture is considered more conservative in decision-making (Cheng, 2010), which explains the highly uncertain behaviors of Brazilian consumers (Quintal et al., 2010). In the context of LCC (*Low Cost Carriers*), this may mean that, since consumers associate LCCs with uncertainties, they would avoid using LCCs, due to the influence of their risk-averse culture, such as the quality of the service provided. Thus, H3 emerges: Risk aversion is negatively related to passengers' intentions to use LCCs (*Low Cost Carriers market*) in Brazil.

Technological effectiveness, which refers to the perceived control of knowledge and skills (internally) to perform a behavior successfully (Armitage & Conner, 1999), is sometimes treated as synonymous with perceived behavioral control (Ajzen, 1991; Conner & Armitage, 1998), who is more concerned with access to resources needed (externally) to perform a behavior successfully (Armitage & Conner, 1999; Conner & Armitage, 1998). In particular, this study uses technological effectiveness, which is relevant in the context of the LCC (*Low Cost Carriers* market) because, as airlines sell tickets directly to consumers through their websites to circumvent travel agents and their commissions (Escobar-Rodríguez & Carvajal-Trujillo, 2014), LCC passengers (low-cost airline market, or *Low Cost Carriers*) need sufficient IT knowledge and skills to research ticket information and buy it online. Previous studies indicate that a passenger's intention to use LCCs (low-cost *carriers*) may be affected by the person's technology-related skills and experience (Chang and Hung, 2013).

The role of technological effectiveness in motivating LCC passengers has received little scholarly attention. Thus, H4 is proposed: Technological effectiveness is positively related to passengers' intentions to use LCCs in Brazil. High frequency is an effective commercial strategy for LCCs (*Low Cost Carriers*) to compete with FSCs. Flight frequency appears to have a different impact on the choices of business travelers and "tourist"

passengers for LCCs. Flight frequency is an important consideration for business travelers to choose LCCs (Mason, 2001), but it is often insignificant for tour passengers to use LCCs. (Mikulić & Prebežac, 2011). Capacity constraints and congestion at airports mean that LCCs (low-cost *carriers*) are unable to achieve the desired turnaround times (frequency), which are essential to the success of most LCCs (Liang & James, 2009). The extent to which flight frequency affects passengers' intentions in relation to LCCs (*Low Cost Carriers*) was not examined for the Brazilian tourist.

Thus, Hypothesis 5 arises, namely: Frequency is positively related to passengers' intentions to use LCCs (*Low Cost Carriers* market) in Brazil. In traditional LCC markets, airport access is often inconvenient because LCCs (Low Cost Carriers) typically operate from secondary airports far from the city center to save costs and minimize aircraft turnaround time (Abdullah & Takahashi, 2016). Passengers in these markets are generally willing to accept inconvenience in exchange for lower airfares, fewer delays, and easier ground transportation (Tierney & Kuby, 2008).

Jung & Yoo (2014) suggested that access time significantly influenced passenger choice involving LCCs (*low cost carriers*), especially for business passengers who perceived greater value from access time and were willing to pay more to shorten access time. In Brazil, LCCs operate mainly at major airports, which means that access can play an important role in passengers' decisions when using LCCs. Thus, H6 is proposed: Access is positively related to passengers' intentions to use LCCs (*Low Cost Carriers*) in Brazil.

3 METHODOLOGY

To fill in the gaps in the literature, this study proposed an expanded model of TCP (Theory of Planned Behavior) focusing on the service provision of Brazilian airlines and Brazilian tourists.

Three principles guide the selection of external factors. Firstly, previous studies often indicate the importance of some factors in passenger choice for LCCs. Price, for example, is often considered significant for passengers to choose between LCCs and FSCs and will therefore be included in the model.

Additionally, because the airline industry is a service industry, service-related attributes such as frequency, airport access, and quality of service can influence passengers' travel decisions; thus, they will be added to the template.

Consumption decisions can be influenced by cultural factors, where culture strongly influences personal behaviors (Luo, 2019). For this study, a much-researched and highly relevant cultural factor will be included in the model. In total, six external factors, including price, quality of service, risk aversion (cultural factor), technological effectiveness, frequency, and access were added to the TCP (Theory of Planned Behavior) model. (Pan & Truong, 2018).

The universe studied in this research will be the tourism sector, specifically companies directly related to tourism, namely: air transport. Two air transport companies listed on the BM&F BOVESPA were considered, namely: Azul Linhas Aéreas Brasileiras and Gol Linhas Aereas Inteligentes S.A. The criterion for choosing the sample of companies is non-probabilistic and for convenience, since the selection of the companies studied here were chosen by the author herself, as they are publicly traded and disclose their data. (Malhotra, 2001).

Thus, at first this research was of a qualitative nature, which had as an instrument of data analysis the financial statements and explanatory notes disclosed to the shareholders made available by the companies on the BM&FBovespa website, that is, content analysis. (BM&FBovespa, 2024).

Based on the reports released in the period from 2017 to 2024, the categories of: cash, investments and net income were observed for analysis of the companies. The years 2020, 2021 and 2022 were discarded because they were years of COVID19 pandemic and that, if analyzed, could compromise the analysis carried out, since the airline sector was one of the most affected by this public calamity. The period chosen is due to the fact that the company Azul Linhas Aéreas S.A. made its IPO - 2017 *Initial Public Offering* or Initial Public Offering which is the process of launching the shares of a company on the stock exchange, for leveling

the analysis the same period was considered for the company Gol Linhas áreas Inteligentes S.A. The software used for analysis was Atlas - TI which showed the codes with different colors, according to the frequency they were marked in the texts. (Denzin, N. & Lincoln, 2020).

Thus, the categories related to the questionnaire of this research were:

Table 1

Qualitative categories

Category	Frequency	Percentage
When choosing an airline, you choose to:		
Latam	79	38,92%
Goal	77	37,93%
Blue	44	21,67%
Avianca	3	1,48%
Passaredo	0	0,00%
When you make trips with air transport, you make them:		
alone most of the time	36	17,73%
accompanied most of the time	143	70,44%
Always alone	2	0,99%
Always accompanied	22	10,84%
How often you travel by air:		
up to 01 time a year	123	60,59%
from 02 to 04 times a year	67	33,00%
more than 04 times a year	13	6,40%
When traveling, the main reason for them is:		
Leisure	193	95,07%
Business	8	3,94%
Other	2	0,99%

Source: prepared by the author, 2025.

Thus, it is observed that the most remembered company was Latam Airlines S.A. with 79 respondents out of 203 analyzed, which corresponds to 38.92%; 143 people make their trips accompanied most of the time, which represents 70.44%; 123 respondents travel up to 01 time a year and the reason for 95.07% of the respondents is leisure travel.

Such answers emerged from the analysis carried out that aims to analyze consumption habits and achieve the objectives of the research, namely, to identify the factors/variables that explain tourists to choose an air transport company, expanding the Theory of Planned Behavior (TCP). (Ajzen, 1991)

In the second moment of this research, the present study employed a quantitative research approach based on an exploratory research paradigm to implement and achieve the research objectives, namely, to identify the factors/variables that explain tourists to choose an air transport company, expanding the Theory of Planned Behavior (TCP). (Ajzen, 1991)

For this, a structured questionnaire was elaborated and the data collected through closed questions, eight questions of a sociodemographic nature and six questions related to the hypotheses of this work, namely, the factors that could influence the intention to use Brazilian airlines. The questionnaire was carried out through a self-administered and online survey approach, using the *QuestionPro software* to collect data during the months of September 2024 to December 2024. The carefully designed questionnaire took an average of three minutes to complete. It was sent through a link and/or QRCode using the contact network at: *Telegram, Facebook, Instagram and Whatsapp*. (Javed, Tuýcková & Jibril, 2020).

The sociodemographic characteristics included were: gender, age, ethnic group, educational level, marital status, employment status, family income, and number of dependents living in the same household. The questionnaire was viewed by 291 people, with 203 completed/valid answers and 12 incomplete answers. (Javed, Tuýcková & Jibril, 2020).

The survey respondents were profiled by generation X to Z, which comprises people born from 1960 to 2009 (Zaninelli & Caldeira; 2022), as it is a profile of economically active respondents and, therefore, able to travel according to the Economically Active Population (PEA) index. (IBGE, 2024).

It was possible to verify that the dominant profile of the respondents belongs to the male gender, 58.13%, being between 35 and 44 years old, belonging to the white ethnic group, with higher education, married, having full-time work hours with a monthly income between 3 and 10 minimum wages without dependents.

Respondents' responses and opinions were measured using a *five-point* Likert scale.

The questions related to the hypotheses raised in this work emerged from the literature as well as from previous studies. Therefore, Table 3 indicates the same procedure, a summary of the hypotheses together with the operationalization and their respective literature.

Table 2
Operationalization of the hypotheses

Hypotheses	Indicator	Adapted literature
H1 The price is positively related to the intention of passengers to use Brazilian airlines.	By choosing this airline, you consider that the price charged was a relevant factor in your purchase decision.	Chang and Sun, 2012; Sai et al., 2012; Jung and Yoo, 2014; Ong and Tan, 2010.
H2 The quality of service is positively related to passengers' intentions to use Brazilian airlines.	When you chose this airline for your trip, the quality of the service provided was considered by you.	Ariffin et al., 2010; Kim and Lee, 2011; Lerrthaitrakul and Panjakajornsak, 2014.
H3 Risk aversion is negatively related to passengers' intentions to use LCCs (<i>Low Cost Carriers market</i>) in Brazil.	When choosing this airline, issues related to the risk of the trip, such as: damage and/or loss of luggage, delay in takeoff and/or landing, number of stopovers and boarding waiting time, air accidents, absence of on-board service, were decisive for his choice.	Hofstede, 1984; Cheng, 2010; Quintal et al., 2010.
H4 Technological effectiveness is positively related to passengers' intentions to use LCCs in Brazil.	The technology that this company chosen by you uses on trips, such as: websites for purchasing tickets, early check-in through apps or totems at airports, communication via SMS and/or WhatsApp about changes in schedules, gates and boarding times were considered by you.	Armitage and Conner, 1999; Conner and Armitage, 1998; Escobar-Rodríguez and Carvajal-Trujillo, 2014.
H5 The frequency is positively related to passengers' intentions to use LCCs (<i>Low Cost Carriers</i>) in Brazil.	The number of available flights and respective frequencies such as: available times, available airports, number of stopovers was considered by you when choosing the airline.	Mason, 2001; Liang and James, 2009; Mikuliš and Prebežac, 2011.
H6 Access is positively related to passengers' intentions to use LCCs (<i>Low Cost Carriers market</i>) in Brazil.	When considering the choice of airline, the question of commuting to the airport was for you.	Tierney and Kuby, 2008; Jung and Yoo, 2014; Abdullah and Takahashi, 2016.

4 RESULTS AND DISCUSSIONS

The study used binomial logistic regression analysis for statistical analysis and response evaluation based on the proposed conceptual model.

Figure 1*Proposed model of the extended study of the theory of planned behavior*

Source: prepared by the author, 2025.

Binomial logistic regression analysis is a statistical technique used to model the relationship between a categorical dependent variable (usually binary) and one or more independent variables, which can be continuous or categorical. It estimates the probability of an event occurring, based on the independent variables. (Hair; Hult; Ringle & Sarstedt, 2016).

Thus, in this study, the was used to test the proposed research model and postulated hypotheses see table 3, namely: between the airlines Gol Linhas Aereas Inteligentes S/A and Azul Linhas Aéreas S/A which Brazilian tourist would choose taking into account the variables: price, quality, risk, technology, frequency and access (Hair; Sarstedt. & Gudergan, 2017). The number of respondents analyzed was 203 participants. The R 4.4.3 software was used for this analysis.

In the present study, some qualitative measures were taken. The author stated in the header section of the questionnaire that no answer was right or wrong to the questions asked. In addition, the author also assured respondents of their anonymized status regarding the information provided and proclaimed that the completion of the questionnaire could be

stopped at any time due to some inconvenience. (Javed, Tuřcková & Jibril, 2020).

For a better understanding of the binomial logistic regression analysis, the table below shows the legend of the variables:

v3.1        -0.09541    0.19477  -0.490   0.6242
v4          -0.22766    0.18392  -1.238   0.2158
v5          -0.23612    0.27374  -0.863   0.3884
v5.1         0.12350    0.20802   0.594   0.5527
v5.2        -0.39471    0.21111  -1.870   0.0615 .
v6           0.07349    0.17633   0.417   0.6768

---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

(Dispersion parameter for binomial family taken to be 1)

    Null deviance: 271.36  on 202  degrees of freedom
Residual deviance: 250.34  on 193  degrees of freedom
AIC: 270.34

Number of Fisher Scoring iterations: 5
```

Source: prepared by the author, 2025.

It is possible to notice that the values of Null deviance and residual deviance are close to each other, which characterizes it as an accepted model, since the closer these numbers

are, the better the model presented. Also the AIC value, that is, 270.34, denotes that the model is acceptable because, when comparing the models, it has a small value, which guarantees its higher quality and simplicity.

As can be seen in figure 2, in the study between the companies Gol Linhas Aereas Inteligentes S/A and Azul Linhas Aéreas S/A, the choice of the sample studied would be by the company Azul Linhas Aéreas S/A, since in the binomial analysis it is represented by 1 and Gol Linhas Aereas Inteligentes S/A represented by 0. The calculation below denotes this preference:

$$e^{-0.87+2.59-0.24+0.12+0.27-0.39-0.095-0.23-0.40+0.073}$$

$$\Pi = \frac{e^{-0.87+2.59-0.24+0.12+0.27-0.39-0.095-0.23-0.40+0.073}}{1 + e^{-0.87+2.59-0.24+0.12+0.27-0.39-0.095-0.23-0.40+0.073}} = 0.700 \quad (1)$$

That is, the value 0.70 is closer to 1, therefore, Azul Linhas Aéreas S/A.

Also as shown in the model, the independent variables that most explain the choice of Brazilian tourists to choose Azul Linhas Aéreas S/A are: V3 Risk, with 0.0172, V2 Quality, with 0.0836 and V5 Frequency with 0.3884.

That is, the hypotheses raised in this work H2 When you chose this airline for your trip, the quality of the service provided was considered by you to have been accepted, as well as H3: When choosing this airline, issues related to the risk of the trip such as: breakdown and/or loss of luggage, delay in takeoff and/or landing, number of stopovers and boarding waiting time, air accidents, absence of on-board service, were decisive for your choice and finally, H5: The number of flights available and respective frequencies such as: available times, available airports, number of stopovers was considered by you when choosing the airline.

It is also relevant to highlight that, according to the sociodemographic variables analyzed, this preference is for consumers with the dominant profile of male relatives, 58.13%, between 35 and 44 years old, belonging to the white ethnic group, with higher education, married, working full-time hours with a monthly income between 3 and 10 minimum wages without dependents.

5 FINAL CONSIDERATIONS

This study aimed to expand the theory of planned behavior with a focus on Brazilian low-cost airlines. Having in its specific objective to identify the factors/variables that explain tourists to choose an air transport company, expanding the Theory of Planned Behavior (TCP). To do so, he answered the research problem: Does the Theory of Planned Behavior (TCP) explain the choice of air transport by Brazilian tourists?

The findings of this research showed that the Theory of Planned Behavior (TCP) when applied to the understanding of Brazilian low-cost airlines has as explanation variables: risk, quality and frequency.

As shown in the figure below:

Figure 3

Study design

Source: prepared by the author, 2025.

Thus, this study had its hypotheses:

H2 When you chose this airline for your trip, the quality of the service provided was considered by you to have been accepted, as well as H3: When choosing this airline, issues related to the risk of the trip such as: damage and/or loss of luggage, delay in takeoff and/or landing, number of stopovers and boarding waiting time, air accidents, absence of on-board service, were decisive for your choice and finally, H5: The number of flights available and respective frequencies such as: available times, available airports, number of stopovers was considered by you when choosing the airline accepted in this study.

As limitations of this research, the sociodemographic variable of generation is especially understood, namely: generation X to Z, which comprises people born from the period from 1960 to 2009, perhaps using a different generation cut, results in answers, variables and conclusions that are also different in relation to the variables that justify the choice of Brazilian airlines by tourists.

Also analyze the criteria that led the respondents to choose the company Latam Airlines Group S.A. since it is not a Brazilian company, but among the respondents of this survey 38.92% pointed out this company as their choice of travel.
