The content of the text and its data in its form, correctness, and reliability are the sole responsibility of the authors and do not necessarily represent the official position of Seven Publicações Ltda. The download of the work and sharing it is allowed as long as credits are attributed to the authors but without the possibility of altering it or using it for commercial purposes.

All manuscripts were previously submitted to blind peer review, members of the Editorial Board of this Publisher, and were approved for publication based on criteria of neutrality and academic impartiality.

Seven Publicações Ltda is committed to ensuring editorial integrity at all stages of the publication process, avoiding plagiarism and fraudulent data or results, and preventing financial interests from compromising the publication's ethical standards.

Suspected situations of scientific misconduct will be investigated under the highest standard of academic and ethical rigor.

The contents of this book have been submitted by the authors for open-access publication, under the terms and conditions of the Creative Commons 4.0 International Attribution License

AUTHOR'S STATEMENT

The author of this work DECLARES, for the following purposes, that:

Do not have any commercial interest that generates a conflict of interest about the published content;

Declares to have actively participated in the construction of the respective manuscripts, preferably under the following conditions: "a) Study design, and/or data acquisition, and/or data analysis and interpretation; b) Preparation of the article or revision to make the material intellectually relevant; c) Final approval of the manuscript for submission";

Certifies that the published text is completely free of data and/or fraudulent results and authorship defects;

Confirms the correct citation and reference of all data and interpretations of data from other surveys;

Acknowledges having informed all the sources of funding received to carry out the research;

Authorizes the editing of the work, including catalog records, ISBN, DOI, and other indexers, visual design and creation of the cover, and internal layout, as well as its release and dissemination according to the criteria of Seven Eventos Acadêmicos and Editora.

EDITOR'S STATEMENT

Seven Publications DECLARES, for rights, duties, and any methodological or legal meanings, that:

This publication constitutes only a temporary transfer of copyright, constituting a right to publication and reproduction of the materials. The Publisher is not co-responsible for the creation of the published manuscripts, under the terms established in the Copyright Law (Law 9610/98), in article 184 of the Penal Code and in article 927 of the Civil Code; The author(s) is solely responsible for verifying such copyright and other issues, holding the Publisher harmless from any civil, administrative, and criminal damages that may arise.

Authorizes the DISCLOSURE OF THE WORK by the author(s) in lectures, courses, events, shows, media, and television, provided that there is due recognition of the authorship and edition and without any commercial purpose, with the presentation of the due CREDITS to SEVEN PUBLICATIONS, being the author(s) and publisher(s) responsible for the omission/exclusion of this information;

All eBooks are open access, so don't sell them on your website, partner sites, e-commerce platforms, or any other virtual or physical medium. Therefore, it is exempt from copyright transfers to authors, since the format does not generate rights other than the didactic and advertising purposes of the work, which can be consulted at any time.

All members of the editorial board are PhDs and linked to public institutions of higher education, as recommended by CAPES to obtain the Qualis book;

Seven Eventos Acadêmicos does not attribute, sell, or authorize the use of the authors' names and e-mails, as well as any other data of them, for any purpose other than the dissemination of this work, following the Civil Rights Framework for the Internet, the General Data Protection Law and the Constitution of the Federative Republic.

PRESENTATION

Science is a field of knowledge in which different disciplines intertwine to form a greater whole. **Horizons of Insight: Exploring the Frontiers of Multidisciplinary Science** is a work that expands this interconnection, bringing together 252 articles on various topics, written by experts from different areas of knowledge.

Developed by **Seven Publications**, this book presents a broad overview of the challenges, discoveries and advances in fields such as science fairs, women's empowerment in computing, inclusive chemistry and much more.

SUMMARY

READING THE HISTORY OF ART THROUGH THE LINES OF DRAWING

Kleriston Luis Rocha Neris.

  <https://doi.org/10.56238/sevened2026.008-001>

.....48-64

SCIENCE FAIRS AND INTEGRATED PROJECT EXHIBITIONS AS AN INNOVATIVE SPACE FOR RESEARCH, TEACHING, AND OUTREACH: AN EXPERIENCE REPORT WITH VOCATIONAL TRAINING COURSES

Mairla Meneses Lopes Teles.

  <https://doi.org/10.56238/sevened2026.008-002>

.....65-77

WOMEN'S EMPOWERMENT IN COMPUTING: PROMOTING LEADERSHIP THROUGH EDUCATIONAL ROBOTICS

Maria Ivanilse Calderon Ribeiro, Mariela Mizota Tamada, Marcel Leite Rios.

  <https://doi.org/10.56238/sevened2026.008-003>

.....78-90

TAXATION AND COMPETITIVENESS IN THE SERVICE SECTOR IN THE TRI-BORDER AREA: A COMPARATIVE ANALYSIS BETWEEN BRAZIL, PARAGUAY, AND ARGENTINA

Ed Ernest Taves, Thiago Hokai Mendonça, Leonor Venson de Souza, Alvaro Antônio da Silva.

  <https://doi.org/10.56238/sevened2026.008-004>

.....91-105

DATA CENTERS, ENERGY AND REGULATION: LEGAL AND ECONOMIC CHALLENGES FOR DIGITAL INFRASTRUCTURE IN BRAZIL

Daniel Amin Ferraz, Paulo Roberto Alonso Viegas.

  <https://doi.org/10.56238/sevened2026.008-005>

.....106-121

ALGORITHMIC GOVERNANCE AND THE PUBLIC INTEREST: ETHICAL FOUNDATIONS FOR DECISION-MAKING IN THE PUBLIC SECTOR

Ailton Ferreira Cavalcante.

  <https://doi.org/10.56238/sevened2026.008-006>

.....122-157

COLLABORATIVE TEACHING: PERSPECTIVES, POSSIBILITIES, AND CONTRIBUTIONS TO THE INCLUSION OF STUDENTS WITH AUTISM SPECTRUM DISORDER

Maria Rosa da Luz Lopes da Conceição, Caroline Gisele Santos Silva, Vivaldo Gomes da Silva Júnior, Scheivla Suanne de Andrade Rodrigues Tork, Noely Corrêa Souza Pereira, Maria Gorete Vilhena Neves, Cristina Picanço de Sousa Corrêa, Janiele da Silva Melo Rabelo.

  <https://doi.org/10.56238/sevened2026.008-007>

.....158-176

LAUDATO SÍ, ECOTHEOLOGY AND AGENDA 2030: A BIBLIOMETRIC ANALYSIS OF ARTICLE PRODUCTION IN ENGLISH, PORTUGUESE AND SPANISH (2010-2024)

Guilherme de Azevedo Mendes Corrêa Guimarães.

  <https://doi.org/10.56238/sevened2026.008-008>

.....177-193

AN OVERVIEW OF THE RELATIONSHIP BETWEEN RESTORATIVE JUSTICE, SUSTAINABILITY, AND SHARED KNOWLEDGE PRODUCTION

Carla Boin, Sérgio Bairon.

 <https://doi.org/10.56238/sevened2026.008-009>

.....194-209

LARVICIDAL ACTIVITY AGAINST AEDES AEGYPTI AND ANTIOXIDANT, CYTOTOXIC AND MICROBIOLOGICAL EVALUATION OF THE CRUDE ETHANOLIC EXTRACT OF POGOSTEMON CABLIN BENTH

Lizandra Lima Santos, Rosany Lopes Martins, Heden Robson Monteiro Souza, Janaina Corrêa dos Santos, Cristine Barbosa Malafaia, Cleidjane Gomes Faustino, Fernando Antônio de Medeiros, Ana Luzia Ferreira Farias, Letícia Gomes de Oliveira, Edmilson dos Santos Moraes, Camila Lima dos Santos, Sheylla Susan Moreira da Silva de Almeida.

 <https://doi.org/10.56238/sevened2026.008-010>

.....210-226

TO PUNISH OR TO PROTECT: THE ROLE OF THE PUBLIC DEFENDER'S OFFICE IN THE CRIMINAL ENFORCEMENT OF HOMELESS INDIVIDUALS

Maria Inês Ferreira da Silva, Sidionei Miguel de Souza, Guajarina do Socorro Carmo de Sousa Camarão, Eliney Alessandro Vieira Cardoso, Kaio Henrique Rodrigues Nazário, Graciete Nascimento Barbosa, Eliane do Socorro Ferreira da Silva, Regiane de Paula Ferreira da Silva, Regina Célia Nascimento dos Santos, Ana Cláudia Ferreira da Silva.

 <https://doi.org/10.56238/sevened2026.008-011>

.....227-239

SOCIODEMOGRAPHIC FACTORS AND SELF-PERCEIVED MENTAL BALANCE AMONG MEN INCARCERATED FOR SEXUAL CRIMES

Claudia Regina Biancato Bastos, Ana Laura de Souza Gonçalves, Amanda Myrianne Dobzinski, Nicole Mayumi Carneiro Takano, Gabriela Fernanda Schiochet, Gabrielly Hneda Fadel, Cristina Berger Fadel.

 <https://doi.org/10.56238/sevened2026.008-012>

.....240-255

DINO +: DIGITAL GAME FOR PEOPLE WITH ASD

Luiz Cláudio Machado dos Santos, Maria Adélia Icó M. dos Santos, Jocelma Almeida Rios, Ingrid Winkler, Luis Felipe Coelho Carvalho dos Santos, Adrian Willy da Silva Borges.

 <https://doi.org/10.56238/sevened2026.008-013>

.....256-269

NAVIGATORS: AN EDUCATIONAL GAME WITH VARIOUS INDIGENOUS TERRITORIES

Luiz Cláudio Machado dos Santos, Ingrid Winkler, Daniel Fernandes Argolo, Bianca Bispo dos Santos, Cainã Guimarães Soares.

 <https://doi.org/10.56238/sevened2026.008-014>

.....270-284

COMPARATIVE ANALYSIS OF MACROSCOPIC VS MICROSCOPIC MEASUREMENT CRITERIA OF INDUCED TOOTH MOVEMENT

José Roberto Alves Moreira, Osmar Aparecido Cuoghi, Marcos Rogério de Mendonça, Alberto Consolaro, Maria Fernanda Martins-Ortiz, Henrique Barcelos Brandão, Luiz Gonzaga Gandini Junior, Ary dos Santos Pinto.

 <https://doi.org/10.56238/sevened2026.008-015>

.....285-298

SCIENTIFIC LITERACY THROUGH INCLUSIVE CHEMISTRY TEACHING: A PEDAGOGICAL PROPOSAL FOR 6TH GRADE STUDENTS IN THE FINAL YEARS OF ELEMENTARY SCHOOL IN THE CITY OF CAXIAS-MA

Izamara de Sousa Oliveira, Laiane Pereira Cardoso, Alessandro Morais Cunha, Quésia Guedes da Silva Castilho, Vera Lucia Neves Dias, Mauro Guterres Barbosa, Daniely Verônica Cardoso Carvalho, Camila Gonçalves Ribeiro.

  <https://doi.org/10.56238/sevened2026.008-016>

.....299-316

INTELLECTUAL PROPERTY AS AN AXIS OF TECHNOLOGICAL SOVEREIGNTY IN THE RARE EARTHS VALUE CHAIN: EVIDENCE FROM MINAS GERAIS

Flávio Ribeiro da Costa, Luiz Ricardo Baptista de Godoy, Allynson Takehiro Fujita, Fernando Melo da Silva.

  <https://doi.org/10.56238/sevened2026.008-017>

.....317-340

BRIQUETTES MADE FROM GREEN COCONUT HUSK FIBER – ENERGY AND SUSTAINABILITY

Juliana Zenóbia Costa Dias, Luciano Henrique Pereira da Silva, Klismeryane Costa de Melo, Rafaela Alves Vicente Rodrigues da Silva, Thiago dos Santos Azevedo Damasceno, Roberto Rodrigues Cunha Lima.

  <https://doi.org/10.56238/sevened2026.008-018>

.....341-358

SYSTEMATIC REVIEW OF SIMILARITY CRITERIA FOR IDENTIFYING SIMILAR SEISMIC EVENTS

Jaqueline Alexsandra Azevedo Ferreira.

  <https://doi.org/10.56238/sevened2026.008-019>

.....359-370

FROM CUSTODY TO CONTROL: A BRIEF HISTORICAL ANALYSIS OF THE EMERGENCE OF IMPRISONMENT AS A MEANS OF PUNISHMENT

Bruno de Omena Celestino, João Arthur Alves de Souza.

  <https://doi.org/10.56238/sevened2026.008-020>

.....371-390

MANDIBULAR BONE EROSION ASSOCIATED WITH HYALURONIC ACID FILLER: CBCT CASE REPORT

José Roberto Alves Moreira, Henrique Barcelos Brandão, Ana Thais Bagatini, Marcos Cesar Pitta, Luiz Gonzaga Gandini Junior, Ary dos Santos Pinto.

  <https://doi.org/10.56238/sevened2026.008-021>

.....391-400

THE IMPLEMENTATION OF UNIVERSAL DESIGN FOR LEARNING (UDL) AS AN INCLUSION STRATEGY IN SPECIAL EDUCATION: OVERCOMING THE LOGIC OF INDIVIDUALIZED

Thereza D'Ávila Maria Fernandes de Souza.

  <https://doi.org/10.56238/sevened2026.008-022>

.....401-415

RESULTS OF AN INNOVATIVE ENTREPRENEURSHIP POLICY INSTRUMENT IN THE FEDERAL NETWORK OF PROFESSIONAL, SCIENTIFIC, AND TECHNOLOGICAL EDUCATION

João Paulo do Carmo, Arianne Oliveira Gusmao, Humberto Henrique Ramos Brotto, Gabriel Adolfo Gomes Potin, Filipe Barbosa Martins.

  <https://doi.org/10.56238/sevened2026.008-023>

.....416-432

CIVIL IDENTIFICATION AS AN INSTRUMENT FOR PROTECTING CHILDREN'S RIGHTS IN THE STATE OF PARÁ, BRAZIL

Flávio Marcelo Cavalcante Mota, Nilton Carlos Noronha Ferreira.

 <https://doi.org/10.56238/sevened2026.008-024>

.....433-447

ACCESSIBLE DIALOGUES: BUILDING INCLUSIVE VISUAL NARRATIVES WITH AUDIO DESCRIPTION

Lara Andrade Fachin, Luiz Gustavo Bieberbach Engroff, Aurélia Regina de Souza Honorato.

 <https://doi.org/10.56238/sevened2026.008-025>

.....448-460

PERFORMANCE INDICATORS AND BUSINESS INTELLIGENCE TOOLS APPLIED TO DRINKING WATER QUALITY IN THE FIELD OF REGULATION

Rodrigo Antonio Pinto de Melo, Jane Carla Marinho de Souza Maia, Cícero Henrique Macêdo Soares, Emanuele Ferreira Gomes, Rafael Lima da Silva.

 <https://doi.org/10.56238/sevened2026.008-026>

.....461-480

HYBRID SOCIAL INSURANCE AS A COMPLEMENT TO THE BPC: PREVENTIVE PROTECTION AGAINST INFORMALITY-RELATED RISKS AND FAMILY VULNERABILITY

Ailton Ferreira Cavalcante, Gabriel Jorge Pradera.

 <https://doi.org/10.56238/sevened2026.008-027>

.....481-511

QUILOMBOLA KNOWLEDGE AND SELF-CARE PRACTICES IN THE SÃO DOMINGOS COMMUNITY, CAVALCANTE (GO)

Pabline Gonçalves Ferreira da Silva, Reginaldo Teixeira Mendonça.

 <https://doi.org/10.56238/sevened2026.008-028>

.....512-533

P3D SOFTWARE AS A RESOURCE FOR RETHINKING THE PRACTICE OF TEACHING AND LEARNING SCIENCE

Luzivone Lopes Gomes, Filomena Maria G. da Silva Cordeiro Moita.

 <https://doi.org/10.56238/sevened2026.008-029>

.....534-550

PROPOSAL FOR AN ASSESSMENT ACTIVITY IN GEOGRAPHY USING KEY THEMES FROM THE GLOBAL AND NATIONAL CONTEXT

Marina Aires, Arthur Galvão de Mendonça.

 <https://doi.org/10.56238/sevened2026.008-030>

.....551-557

EDUCATIONAL TECHNOLOGIES IN BIOLOGY TEACHING: AN IMMERSIVE EXPERIENCE WITH 3D SOFTWARE

Luzivone Lopes Gomes, Filomena Maria G. da Silva Cordeiro Moita.

 <https://doi.org/10.56238/sevened2026.008-031>

.....558-572

THE ROLE OF FERMENTED CEREALS IN THE MODULATION OF THE INTESTINAL MICROBIOTA AND THEIR BENEFITS TO HUMAN HEALTH

Luciene dos Santos Sobczak, Jessyca Caroline Rocha Ribas, Leandra da Silva Florentino, Isabela Lima Quadros, Luciana Alves da Silva, Renan Gustavo Rodrigues da Luz, Okelyton Ayres Pacheco, Samara Thais Peixoto de Oliveira.

 <https://doi.org/10.56238/sevened2026.008-032>

.....573-589

PUBLIC GOVERNANCE AND MUNICIPAL FINANCIAL HEALTH: AN INTEGRATED ANALYSIS WITH A FOCUS ON FINANCIAL PSYCHOLOGY AND TAX EDUCATION

Luiz Antonio de Oliveira Dantas, Denis Forte, Nadia Wagih El Kadri.

 <https://doi.org/10.56238/sevened2026.008-033>

.....590-605

NEUROPHYSIOLOGICAL EFFECTS OF ACUPUNCTURE ANALGESIA IN INDIVIDUALS WITH CHRONIC PAIN

Maria Eduarda Vieira Rodrigues, Uitairany do Prado Lemes, Gabrielle Castilho Alves Silva, Hanna Cristina Ferreira Assunção Neves.

 <https://doi.org/10.56238/sevened2026.008-034>

.....606-627

DIAGNOSTIC CHALLENGES IN CREUTZFELDT-JAKOB DISEASE: A CASE STUDY

Elenara Barbosa Machado Neves, Grasielle Mattei Ise dos Santos, Vitória Mendonça Mendes, Lucas Mendes Tavares da Silveira, André Rausch Carellos Silva, Eduardo Dionathas Firmino, Juscelio Clemente de Abreu, Mônica Isaura Corrêa.

 <https://doi.org/10.56238/sevened2026.008-035>

.....628-641

AN OPTIMAL ADAPTIVE CONTROLLER BASED ON ONLINE ACTOR-CRITIC LEARNING FOR A ROBOT MANIPULATOR

Patrícia Helena Moraes Rêgo, Joelson Miller Bezerra de Sousa.

 <https://doi.org/10.56238/sevened2026.008-036>

.....642-668

SOUND POLLUTION IN THE FURNITURE INDUSTRY OF THE FEDERAL DISTRICT

Clarissa Melo Lima, Tito Ricardo Vaz da Costa, Alexandre Nascimento de Almeida, Joaquim Carlos González.

 <https://doi.org/10.56238/sevened2026.008-037>

.....669-680

BLACK WOMEN'S AGING AND NEUROPSYCHOPEDAGOGY: INTERSECTIONAL CHALLENGES AND STRATEGIES FOR QUALITY OF LIFE

Cristiane Almeida Lisboa, Antonio Cordeiro de Souza Junior.

 <https://doi.org/10.56238/sevened2026.008-038>

.....681-695

LIFE CYCLE ASSESSMENT OF RICE HUSK-BASED ELECTRICITY GENERATION IN A THERMAL POWER PLANT

Orlando Marcos Quadros Cardoso, Tamiris Pacheco da Costa, Mateus Guimarães da Silva.

 <https://doi.org/10.56238/sevened2026.008-039>

.....696-710

DIGITAL COMPETENCIES AND CONTINUING TEACHER EDUCATION: AN ANALYSIS IN LIGHT OF THE BNCC AND CETIC.BR INDICATORS

Amanda Queirolo Ribeiro da Cruz, Patrícia Fonseca Ferreira Fleury.

 <https://doi.org/10.56238/sevened2026.008-040>

.....711-734

ENVIRONMENTAL SUSTAINABILITY: EVIDENCE OF ENVIRONMENTAL PRACTICES AND ENVIRONMENTAL BEHAVIOR IN MICRO AND SMALL ENTERPRISES

João Santana Alves, Cristina Gomes de Souza, Marcelo Jasmim Meiriño, Julio Vieira Neto.

 <https://doi.org/10.56238/sevened2026.008-041>

.....735-756

ETHNOMATHEMATICS IN THE AMAZON: PEDAGOGICAL PRACTICES AND TEACHER EDUCATION

Angela Paula da Silva Pessoa, Ádila Marta da Silva e Silva, Ana Claudia da Silva Barroso, José Leandro Santos Pessoa, Francisco Lúcio de Lira Mendonça, Allan Andrade de Souza, Liliane Coelho Ferreira Nascimento, Lucileni Maria Mendonça Sales, Edla dos Anjos Cardoso.

 <https://doi.org/10.56238/sevened2026.008-042>

.....757-772

STUDY OF KINETIC AND EQUILIBRIUM MODELS IN THE ADSORPTION OF ORANGE-FLAVORED SOFT DRINK ON PAPER TOWELS: A SEMIQUANTITATIVE MODEL

Hubert André Nunes Dos Santos, Renan Gustavo Coelho de Souza dos Reis.

 <https://doi.org/10.56238/sevened2026.008-043>

.....773-804

EVALUATION OF COCOA SEED GERMINATION BASED ON LOCATION IN THE FRUIT

Edgard Siza Tribuzy, Flávia Alves do Amaral, Raul da Cunha Lima, Milane Lima Pontes, Daniela Pauletto, Aldeize Santos Tribuzy.

 <https://doi.org/10.56238/sevened2026.008-044>

ABSTRACT

This research aims to present a methodological proposal that uses drawing as a teaching-learning tool in the teaching of Art History. Starting from the understanding of drawing as a visual language and pedagogical resource, the research seeks to enable meaningful learning of Art History content in high school, bridging theory and practice in the classroom. The proposal aims to break with the paradigm that high school is predominantly characterized by theoretical approaches, by encouraging practical activities that stimulate the active participation of students. In this sense, the practice of drawing is developed in an articulated way with historical and artistic content, through the creation of drawing groups, favoring observation and interpretation, and encompassing the different periods and styles of Art History selected by the teacher for the practices. The research is qualitative and uses the Arts-Based Research (ABR) methodology through the methods of Action Research and Participatory Research, where the first aims to solve practical problems with action (attitudes) and constant reflection, while the second aims at the emancipation and social transformation of the participants (researcher and researched). It is concluded that the use of drawing as a pedagogical methodology contributes to the development of aesthetic sensitivity, critical thinking, and student engagement in the learning process.

RESUMO

A presente pesquisa tem como objetivo apresentar uma proposta metodológica que utilizar o desenho como instrumento de ensino-aprendizagem no ensino de História da Arte. Partindo da compreensão do desenho como linguagem visual e recurso pedagógico, a pesquisa busca possibilitar uma aprendizagem significativa dos conteúdos de História da Arte no Ensino Médio, aproximando teoria e prática em sala de aula. A proposta tem por objetivo romper com o paradigma de que o Ensino Médio se caracteriza predominantemente por abordagens teóricas, ao incentivar atividades práticas que estimulem a participação ativa dos estudantes. Nesse sentido, a prática do desenho é desenvolvida de forma articulada com os conteúdos históricos e artísticos, por meio da criação de grupos de Desenho, favorecendo a observação, a interpretação e abrange os diferentes períodos e estilos da História da Arte selecionados pelo docente para as práticas. A pesquisa é qualitativa e usa

RESUMEN

Esta investigación tiene como objetivo presentar una propuesta metodológica que utiliza el dibujo como herramienta de enseñanza-aprendizaje en la enseñanza de la Historia del Arte. Partiendo de la comprensión del dibujo como lenguaje visual y recurso pedagógico, la investigación busca facilitar el aprendizaje significativo de los contenidos de Historia del Arte en secundaria, conectando la teoría con la práctica en el aula. La propuesta pretende romper con el paradigma de que la secundaria se caracteriza predominantemente por enfoques teóricos, fomentando actividades prácticas que estimulen la participación activa del alumnado. En este sentido, la práctica del dibujo se desarrolla de forma articulada con los contenidos históricos y artísticos, mediante la creación de grupos de dibujo, favoreciendo la observación y la interpretación, y abarcando los diferentes períodos y estilos de la Historia del Arte seleccionados por el profesor para las prácticas. La investigación es cualitativa y utiliza la metodología de Investigación Basada en las Artes (RBA) a través de los métodos de Investigación-Acción e Investigación Participativa. La primera busca resolver problemas prácticos mediante la acción (actitudes) y la reflexión constante, mientras que la segunda busca la emancipación y la transformación social de los participantes (investigador e investigado). Se concluye que el uso del dibujo como metodología pedagógica contribuye al desarrollo de la sensibilidad estética, el pensamiento crítico y la participación del alumnado en el proceso de aprendizaje.

1 INTRODUCTION

Although drawing is traditionally understood in Art History as a form of aesthetic and cultural expression, capable of revealing the values, styles and techniques of a given time, the focus of this research differs in proposing drawing as a pedagogical tool for teaching-learning.

In this logic, the practice of drawing is only an object of study or isolated artistic expression, becoming an active means of knowledge construction, favoring the mastery of the contents of Art History in a meaningful and participatory way.

The research is part of the research line Processes of teaching, learning and creation in arts of the Professional Master's Degree in Arts (Prof-Artes/UFMA), whose focus on the development of creative and innovative methodologies for artistic teaching directly contributes to the proposal. This line of study values artistic practice as a space for investigation, reflection and production of knowledge, aligning itself with the proposal of integrating theory and practice in the classroom.

The present research is justified by the need to bring together practice and theory in the teaching of Art History in High School, having drawing as a central tool in the teaching-learning process. By uniting the practice of drawing with historical and artistic contents, the proposal seeks to break with two paradigms, still present, in High School: the first refers to the conception of an excessively theoretical teaching, focused almost exclusively on the preparation for entrance exams and competitions, or sporadically for the world of work. The second paradigm concerns the understanding of drawing only as a technical, playful or illustrative activity, and not as a methodology capable of favoring the learning of Art History contents.

From this perspective, drawing is understood as a language, artistic practice and pedagogical instrument, able to stimulate observation, critical reflection and the construction of meanings about different periods, styles and contexts of Art History. In this way, the student when drawing not only reproduces images, but interprets, rereads, analyzes and re-signifies the works and artistic movements studied, becoming an active subject of their learning.

In addition, the Art curricular component contributes to the critical formation of students in the face of the complexity of the contemporary world, promoting respect for differences and intercultural, pluriethnic and plurilingual dialogue, which are essential aspects for the exercise of citizenship (Brasil, 2017, p.193).

It is up to the art teacher to understand artistic and cultural diversity, in order to

Explore, know, enjoy and critically analyze artistic and cultural practices and productions from their social environment, indigenous peoples, traditional Brazilian

communities and different societies, in different times and spaces, to recognize art as a cultural, historical, social phenomenon that is sensitive to different contexts and to dialogue with diversities (BRASIL, 2017, p. 198).

In addition, by providing exchanges between cultures and the recognition of similarities and differences, the teaching of Art, combined with the practice of drawing, expands students' knowledge about themselves and about others, strengthening social, historical and cultural values that are fundamental for integral education.

The general objective of this work is to present a methodological proposal that uses drawing as a teaching-learning method in the teaching of Art History. With this, it is sought to understand drawing as a pedagogical tool capable of articulating theory and practice, favoring a more dynamic and meaningful approach to the contents worked in the classroom.

As a first specific objective, it is intended to enable a significant learning of the contents of Art History in High School, facilitating a greater understanding of the periods, styles and the language of drawing in times selected by the teacher.

As a second specific objective, the study aims to break with the paradigm that High School is predominantly theoretical, by valuing pedagogical practices of drawing that stimulate the active participation of students. In the context of High School, the teaching of Art History still faces challenges related to this predominance of theoretical approaches, often disconnected from the students' experience.

As a third specific objective, the research seeks to present the practice of drawing in a correlated way to some Art History contents, through drawing groups or varied formats, promoting interaction, choice, creativity and the protagonism of students in the teaching-learning process.

The problem of this research is: how will the practice of drawing enable a meaningful learning of the contents of Art History in High School? It is based on the understanding that, many times, the teaching of this stage is conducted in an excessively theoretical way, which can hinder the assimilation of the contents and distance students from the artistic universe. In view of this, it is questioned how the insertion of drawing as a pedagogical practice can contribute to make the teaching-learning process in art more dynamic, integral and meaningful.

The first hypothesis of this research maintains that the practice of drawing, when integrated with the contents of Art History, can promote a significantly more effective learning in High School. This is due to the fact that drawing does not act only as a technical or recreational activity, but as a pedagogical instrument that allows students to experiment, observe and reflect on the concepts and artistic styles studied.

By making drawings related to specific works, movements or styles, students begin to learn in a concrete way elements with proportion, composition, perspective, color, texture and symbolism, connecting these aspects to the historical and cultural discussions addressed in the classroom. This practical experience allows theoretical concepts to be experienced, analyzed, and resignified, making learning more lasting and deeper.

In addition, drawing stimulates complex cognitive skills, such as attention, visual perception, memory, and critical analysis, while also developing creativity and the ability to express oneself. Artistic practices provide students with a space for safe experimentation, in which mistakes and successes are part of the learning process, corroborating the idea that knowledge is built through action and continuous reflection.

The second hypothesis of the research postulates that many students already have some kind of previous contact with drawing, either as *a hobby*, or as a more structured artistic practice or even as a skill little explored over time. This previous experience is a valuable resource that can and should be used pedagogically to favor the engagement, interest and participation of students in Art History classes.

By recognizing and valuing the skills that students have, the art teacher creates a more inclusive and motivating learning environment, in which each student feels able to add and express themselves. Drawing, in this context, becomes a means of communication and construction of meaning, allowing students to connect their personal experiences with the theoretical content covered, making learning more concrete and relevant.

Thus, this second hypothesis suggests that exploring students' pre-existing competencies enhances student protagonism, stimulating autonomy and creativity. Students who already have contact with drawing tend to feel more confident to experiment with new techniques, interpret works of art, reflect on historical and social contexts, as well as interact critically with subjects.

Likewise, taking advantage of these experiences also fosters collaborative learning, as students with different levels of familiarity with drawing can share knowledge and skills, strengthening group dynamics and the exchange of experiences. In this way, the practice of drawing ceases to be just an individual activity and becomes an instrument of interaction, cooperation and collective development.

The third hypothesis of this study states that the use of drawing as a pedagogical tool plays a fundamental role in stimulating student autonomy, creativity and the development of critical thinking. From this perspective, the introduction of the practice of drawing to the teaching of Art History, students cease to be mere receivers of information and start to act as active subjects in the learning process, building knowledge in a plural and conscious way.

This third hypothesis is based on the understanding that drawing offers its own expressive language, which allows students to interpret, organize and resignify the historical and artistic contents presented in the classroom. By crafting their own, authentic productions, students make connections between theory and practice, historical context, and personal experience, developing a deeper understanding of the movements, styles, techniques, and meanings of art.

In addition, by stimulating autonomy, drawing transforms the dynamics of the classroom, where students become co-authors of knowledge, sharing experiences, dialoguing about different perspectives and collaborating in the collective construction of learning. In this way, the methodology helps for the integral formation of the student, promoting cognitive, artistic, social and cultural skills.

The article is divided into two chapters, in addition to the Introduction chapter that has the theme, the justification, the research problem, the hypotheses and a brief theoretical review. The first chapter is the methodology of the study, focusing on the type of research and its approaches, in addition to its investigation methods. The second chapter deals with the results and preliminary discussions, due to the research is ongoing. Even so, great results have already been demonstrated in the current year for the master's degree in Professional Arts at the Federal University of Maranhão. The last chapter addresses the preliminary considerations of the research in full development and application in the School chosen and described in the chapter of Methodology.

2 METHODOLOGY

The present research is of the applied type, with a qualitative and exploratory approach, since it seeks to investigate and implement the use of drawing as a pedagogical tool for the learning of Art History content in High School.

The research adopts the qualitative approach in order to analyze and interpret the processes of production of drawings and their adaptations to the subjects worked in the classroom, valuing not only the final result, but, above all, the creative and pedagogical path developed by the students. Unlike quantitative research, which focuses on measuring numerical data, qualitative research seeks to explore in depth the experiences, perceptions and meanings attributed by students to the practice of drawing. The qualitative perspective makes it possible to analyze how students construct meanings from the practice of drawing linked to the contents of Art History.

The focus is not only on the final result of the productions, but mainly on the creation process: the choices of theme, techniques, style, problem solving, composition and

interpretation of artistic content. In this way, it analyzes how students apply their previous knowledge, how they transform historical and cultural references into visual expressions (drawings), and how the activity contributes to the development of cognitive, aesthetic and critical skills.

At the same time, the research takes an exploratory approach, as it investigates a field still little addressed in the pedagogical practice of High School: the use of drawing as a resource for integration between theory and practice in Art History. This characteristic allows the investigation to be flexible, open to discoveries and adaptations, making it possible to analyze different forms of approaches, drawing techniques, group dynamics and teaching strategies that best meet the needs and interests of students.

The applied and exploratory nature of the research also allows the results obtained to contribute directly to the improvement of teaching practice, offering subsidies so that art teachers can integrate active methodologies, valuing artistic expression, critical analysis and student protagonism.

As a methodological axis, this research adopts Arts-Based Investigation (IBA), an approach that recognizes artistic practices as legitimate and valuable forms of knowledge production. IBA proposes that artistic creation is not just an object of study or an aesthetic resource, but a means of investigation, analysis and construction of knowledge, integrating practice, theory and critical judgment in the same process.

In this context, drawing takes on multiple roles, can act as an expressive language, allowing students to communicate ideas, perceptions and personal interpretations. It serves as a didactic tool, bringing the theoretical contents of Art History closer to concrete practice and as an instrument of investigation, enabling observation, experimentation and critical evaluation of concepts, techniques and historical contexts. This articulation promotes active learning, in which students participate consciously and creatively in the construction of knowledge.

IBA also emphasizes the processual nature of learning, honoring both the path of artistic creation and the final product. When working with drawing, students explore different materials, techniques, and styles, develop cognitive and aesthetic skills, and reflect on their choices, results, and meanings. This approach ensures that artistic production is simultaneously practical and investigative, fostering a continuous dialogue between action and judgment.

In this way, this methodology encourages active and collaborative participation, allowing students to share experiences, exchange ideas, and engage in critical discussions about art, culture, and history. This dialogical character strengthens beyond individual

learning, encompassing the collective, creating a more lively, inclusive, and stimulating classroom environment. For this purpose, the methods employed are Action Research and Participant Research.

Action research is a central method in this investigation, as its purpose is to intervene directly in the educational reality, promoting significant changes in the teaching-learning process. Unlike purely descriptive or theoretical approaches, action research combines practice and insight, allowing the teacher-researcher to implement planned pedagogical actions, observe their effects, and then review and adjust strategies according to the results obtained.

In this context, action research becomes especially suitable for the teaching of Art History through drawing, as it enables a constant adaptation of activities to the specific needs, abilities and interests of students, as well as to the particularities of the school context. Each pedagogical intervention is critically analysed, allowing the identification of obstacles, potentialities and new learning opportunities.

This method emphasizes the cyclical character of the educational process: planning, acting, observing, reflecting and reapplying. This continuous cycle not only improves teaching practice, but also actively involves students, making them participants in the investigation process. By reflecting on their artistic productions, their choices and the learning acquired, students begin to develop critical awareness, autonomy and self-regulation skills.

Furthermore, action research favors the construction of a more dynamic, collaborative and innovative classroom environment, in which the problems and challenges of teaching are not treated as obstacles, but as opportunities to experiment, create and resignify pedagogical practice. It promotes, therefore, an integration between theory and practice, allowing drawing not to be restricted to a mere technical exercise, but an instrument of analysis, reasoning and integral development of the student.

The Participant Research method, on the other hand, is based on the active collaboration between researcher and participants, considering both as subjects of the investigative process. It proposes a horizontal, non-hierarchical relationship, in which all those involved contribute to the construction of knowledge and the development of educational practices.

This method seeks emancipation and social transformation, stimulating autonomy, critical thinking, responsibility and engagement in the participants (students and teachers). In the use of drawing for the teaching of Art History, this means that students not only perform tasks or practices, but also participate in decisions about themes, techniques, creative processes and ways of presenting their work. By getting actively involved, students become

protagonists of the artistic experience, reasoning about their learning and contributing to the constant improvement of pedagogical practice.

The proposal will be implemented with students from the 2nd and 3rd year of High School at the Santa Teresa Teaching Center, in São Luis do Maranhão, and will involve drawing practices planned bimonthly. That is, every two months, the Art teacher will propose themes articulated with the contents of Art History, allowing students to choose and relate the practice of drawing with the historical concepts, artistic styles and cultural movements studied in the classroom.

Students will make the drawings in different formats, according to the dynamics proposed for each practice: individually, in pairs, trio or groups, stimulating both autonomy and collaborative work. This diversity of organization makes it possible to meet the different preferences and abilities of students, while favoring the exchange of experiences, dialogue, and collective learning.

As an example of practical application, for the 1st bimester of the 2nd year, the proposed theme will be the Cultural Renaissance and the realization of a drawing with a naturalistic approach, representing a historical or artistic personality, public figure or even a family member. This choice seeks to bring students closer to detailed observation, the perception of proportions and shapes, and the critical interpretation of physical and expressive characteristics, essential skills for both drawing and artistic analysis.

Throughout the process, students will be encouraged to reflect on the historical and cultural context of the movement to carry out drawing practices, relating the aesthetic, social, historical and symbolic aspects to the proposed subject. In this way, the constant monitoring of the Art teacher will allow methodological adjustments, specific *feedbacks* and encouragement of technical experimentation, fostering the integration between artistic practice and theoretical learning.

The bimonthly organization and the alternation between different formats of presenting and doing the work seek, therefore, to create an interactive, inclusive and stimulating pedagogical environment, in which drawing works as a methodological tool to bring students closer to History, culture and art, promoting active, creative and conscious learning.

The theoretical foundation of this research is anchored in authors and methodologies that dialogue directly with art education and the teaching of drawing, offering subsidies for the construction of a unique pedagogical practice aligned with the curricular guidelines.

Among the references used, Ana Mae Barbosa (2010) stands out, whose work emphasizes the importance of art as an instrument of expression, experimentation and development of aesthetic sensitivity, in addition to highlighting the role of drawing as a tool

for understanding creative and cultural processes. Barbosa emphasizes the fundamental role of drawing as a qualified pedagogical tool in articulating artistic making, the reading of images and cultural contextualization. For the author, drawing is not limited to a technical skill, but constitutes a means of visual investigation and expression of thought, allowing the student to understand and interpret individual and collective creative processes, as well as the historical and cultural references present in artistic productions.

From this angle, drawing assumes the mediating function in the teaching of Art, as it favors the development of perception, imagination and critical capacity, in addition to privileging the appropriation of diverse visual repertoires. The triangular approach, proposed by Ana Mae Barbosa, reinforces the idea that art education should foster remarkable and plural experiences, in which the student is the subject of the learning process, associating practice, discernment and cultural contextualization.

The National Common Curricular Base (BNCC) is also a central reference, as it guides that the teaching of Art should promote artistic experiences and experiences as social practices, allowing students to be protagonists and creators. The BNCC reinforces the need to articulate theory and practice, develop observation, interpretation and critical analysis, and value cultural and artistic diversity as an essential component of the integral education of students.

Classical authors of the philosophy and theory of art education such as John Dewey (2010), who offer a conceptual basis for understanding learning through practical experience. In his work, specifically in the chapter "Art as experience", Dewey argues that knowledge is not something transmitted passively, but actively constructed by the subject from action, perception and continuous interaction with the world around him.

For this reason, the author reinforces the relevance of drawing as an important means of active and experiential learning. When drawing, the student observes, experiences, interprets and expresses his worldview, relating cognitive, sensory and expressive aspects. Drawing becomes a powerful pedagogical tool, as it fosters the construction of knowledge through direct experience, personal involvement and consideration of one's own practice, in line with the principles of aesthetic education defended by Dewey.

In the field of drawing and visual communication, Donis A. Dondis (1997) contributes to visual perception, graphic language and representation of ideas, providing theoretical and cognitive foundations for the practice of drawing as a teaching-learning tool. The author understands visual communication as a structured system of signs and elements such as point, line, shape, color, texture and composition, which organize visual thinking and enable the reading and production of images. These theoretical and cognitive foundations are

fundamental for the practice of drawing in the educational context, as they help students develop the ability to observe, interpret and visually communicate concepts, ideas and meanings.

Elliot Eisner (2005), in turn, highlights the importance of art education as a way to develop multiple intelligences, critical thoughts and aesthetic sensitivity, arguing that art enables different ways of knowing, interpreting and intervening in the world. Eisner argues that artistic practice stimulates decision-making, the interpretation of meanings, tolerance of ambiguity and studies on processes and results, essential aspects for critical and creative formation.

João Gomes Filho (2008) emphasizes the teaching of drawing as a structuring visual language, highlighting elements such as shape, composition, perception and visual organization. For the author, drawing is a fundamental means of reading and interpreting the world, qualified to develop aesthetic sensitivity, visual reasoning and the capacity for analysis. His approach adds that the teaching of drawing should not be understood as a mere technique, but as a cognitive and expressive process, essential for the learning of Art History contents.

Vincent Lanier (2005), in turn, defends an artistic education focused on experience, creativity and the integral formation of the subject. The author proposes methodologies that value artistic practice as a central axis of teaching, relating production, appreciation and historical contextualization. In this sense, Lanier reinforces the importance of pedagogical strategies that actively involve the student, allowing him to experience, question and interpret the works of art from his own experiences and cultural references.

Marly Ribeiro Meira (2006) emphasizes art as a formative experience, in which the creative process assumes a central role in learning. For the author, artistic practice fosters ideas, feelings and perceptions in the student, developing a more conscious and sensitive relationship with knowledge. Drawing, in this logic, is understood as a space for investigation and expression, where the student experiments with materials, techniques and languages, building their own meanings from their cultural and social experiences. This thinking values the creative process and the final product (work), favoring students' autonomy and confidence in their expressive capacities.

Ralph Smith (2005), in turn, highlights the importance of art education in the formation of aesthetic and critical thinking. The author argues that learning in art involves interpretation, judgment and considerations, allowing students to attribute meanings to their productions and to the works studied. For Smith, drawing works as a means by which students can

explore complex ideas, question concepts, and develop a deeper understanding of art and its historical and cultural contexts.

To develop a work focused on artistic experience and creativity, it is essential to consider the trajectory of art from prehistory to contemporary productions, allowing students to know the evolution of styles, techniques, historical contexts and cultural meanings. In this aspect, the research is based on authors who address different periods and characteristics of Art History, offering theoretical subsidies for the formation of a consistent pedagogical practice.

Nikos Stangos, in "Concepts of Modern Art" (2000), presents a detailed analysis of the artistic avant-garde and conceptual art, bringing together articles by various authors who discuss the main movements of the twentieth century.

The author Graça Proença, in "History of Art" (2010), offers a comprehensive approach that ranges from prehistory to contemporary art, with emphasis on Brazilian art, including indigenous manifestations, peoples of Mesoamerica, African art, art of the East and architectural styles. Her work allows us to understand the cultural and aesthetic diversity present in Brazil, fostering an integrated vision between history, society and artistic expression, central to bringing students closer to the multiple languages of art.

Ernst Hans Gombrich, with the classic "The History of Art" (1999), provides a detailed overview, from the beginnings of artistic production to modernism, going up to the 1980s. His work is a mandatory reference in Art courses, as it combines historical rigor with aesthetic analysis, facilitating the understanding of the transformations in styles and techniques over time.

Carol Strickland, in "Commented Art: from Prehistory to Postmodern" (2014), complements Graça Proença's approach by going through the trajectory of art from prehistory to the beginning of the twenty-first century, highlighting architecture when it is pertinent. His work allows painting, sculpture and architecture to work in an integrated way, expanding the students' repertoire of reference and enabling a broader learning of the artistic area.

To finish the authors, we have Anne Cauquelin with "Contemporary Art: an introduction" (2005), which contributes to the analysis of artistic production after the 2nd world war until the beginning of the twenty-first century, addressing conceptual, cultural and social issues that characterize contemporary art. His work is especially useful for contextualizing current artistic practices, bringing students closer to contemporary discussions about aesthetics, identity, and innovation.

The combination of these theoretical references allows the practice of drawing to be linked to varied historical and aesthetic contents, offering students a broad and critical view

of Art History. This theoretical foundation supports the pedagogical proposal of using drawing as a teaching-learning method, allowing practical, reflective and creative experiences that connect past and present, tradition and innovation, theory and artistic practice.

3 PRELIMINARY RESULTS AND DISCUSSIONS

The preliminary results of this research indicate that the use of drawing as a pedagogical tool in the teaching of Art History has significantly helped the involvement and active participation of high school students at the Santa Teresa Teaching Center. It is observed that the integration between the practice of drawing and the theoretical contents favors greater interest of the students, who start to demonstrate a greater willingness and willingness in class or analyze historical and artistic themes addressed.

Regarding the learning process, the initial data reveal that students are able to establish clearer relationships between the periods, styles and the language of drawing in Art History, when these contents are worked on in a practical way. The realization of the drawings stimulates attentive observation, the interpretation of formal and symbolic elements, as well as the mastery of historical contexts, recognizing that theoretical concepts are internalized in a more solid and substantial way.

The formation of groups or with varied drawing formats proved to be a relevant aspect of the methodology, as it facilitated the exchange of experiences, dialogue and collaboration among students. More advanced students in drawing techniques shared experiences, problems and solutions, stimulating collective learning and contributing to the development of autonomy and confidence in artistic production. This student becomes the subject of the action of learning, he is a protagonist, being a fundamental characteristic of the methodological proposal.

From the methodological point of view, the application of Arts-Based Research (IBA), linked to Action Research and Participant Research, proved to be adequate for the school context in question. The Action Research provided continuous adjustments in the proposed activities, even with the workload of 1 hour per week of the Art Discipline, due to the constant observation and criticism in the process of the practices. Because of this reduced schedule, it is very difficult to do it in the classroom, the themes were made available, but the production of the drawing was done outside the classroom environment, only its final presentation was at school. Participant research, on the other hand, promoted the active inclusion of students in the investigative process, enabling perceptions, choices and experiences to directly influence the progress of activities.

This can be demonstrated in two drawings by a student who authorized, together with his family, the use of his production. We call student A from the 2nd year of High School, who made a drawing based on the Baroque and the artists in the 2nd bimester (figure 01). The material of the drawing in figure 01 was gel pen, sketch with HB pencil, eraser and A4 sheet of paper, in addition to being a linear drawing with shading with hatches, finally, it started covering the clothes on the right side with a black marker pen. In the third bimester, based on Neoclassicism, this student A bought a portable digital table and started, in a self-taught way, the production of digital drawings, for the 3rd bimester (figure 02). The works are properly authentic, original and bring the student's personality.

Figure 1

Baroque - drawing with expressions

Source: Personal file of student A, provided by the family.

In figure 01, we can see the student's mastery of the techniques of tracing, light and shadow and proportion. In its production there were face proportion problems, which the student solved by watching free videos and tutorials on social networks. In figure 02, it is identified that the student transfers his knowledge of drawing on paper to digital, that he reported that pencils are much more practical, but that he wanted to challenge himself, because of his autonomy, he did it very well. And it continues to evolve in digital design. The researcher answers questions, inquires and proposes solutions that can be in person or

remotely through the WhatsApp groups of the classes, as well as the partnership and help of the monitors of each room in the work.

Figure 2

Neoclassicism – on Greek mythology

Source: Personal file of student A, provided by the family.

In general, the preliminary results indicate that the use of drawing as a pedagogical methodology contributes to the development of aesthetic sensitivity, critical, analytical and creative thinking of students. Although the research is still ongoing, the initial observations indicate that the close relationship between theory and practice, through drawing, broadens the possibilities of learning in Art History and produces a more critical, reflective and participatory education in High School.

4 PRELIMINARY CONSIDERATIONS

The preliminary considerations of this research, still in progress, show the relevance of analyzing not only the final results of the students' drawings, but also their technical skills, the creative process and the way these practices contribute to the construction of knowledge in Art History. The use of the drawing methodology in teaching emphasizes the protagonism of students, consenting that they become active in learning, developing cognitive, aesthetic, social and cultural skills in an integrated way.

Art education, in this context, should provide a multifaceted view of culture, functioning as an intersection between past, present and future. This implies the need to look at the artistic tradition from new angles, recognizing that learning is not limited to the reproduction of techniques or theoretical study, but is expanded by experimentation, interpretation and resignification of works and styles. Thus, by constituting itself as a guiding and guided teaching-learning approach, the practice of drawing becomes an instrument of study and personal expression, giving the students' original creations an essential role both in teaching practice and in student practice, moving away from the idea of an isolated activity or without a concrete purpose.

One of the developments proposed for the research is the realization of an exhibition with the drawings produced by the students throughout the year, organized according to the themes proposed by the Art teacher. However, more relevant than the final result is the process: the execution of the drawings, the registration of the productions, the doubts, the studies, the reports and the exchange of experiences lived by the students. This path highlights the importance of the methodology as a teaching-learning tool, showing that artistic practice is capable of promoting remarkable learning, involvement, autonomy, protagonism and a greater knowledge of Art History.

In short, the first analyses indicate that integrating practice and theory through drawing helps to form students who are more critical, creative and aware of their cultural and social role, encouraging not only technical skills, but also the historical, aesthetic and ethical perception of the world around them. Thus, the research reaffirms the need for innovative pedagogical practices that value the student's experience, creative expression and discernment about art as a cultural and educational phenomenon.

ABSTRACT

Vocational and Technological Education (VTE), at both technical and higher education levels, faces the challenge of overcoming excessively instrumentalized training models, strongly oriented towards the logic of efficiency and immediate adaptation to the labor market. In this context, science fairs and integrated project exhibitions emerge as pedagogical and institutional strategies capable of articulating teaching, research, and outreach in a critical, contextualized, and socially committed way. This article aims to analyze the experiences of outreach projects, discussing their contributions to technical-professional training and their social impacts. Methodologically, this is a qualitative, descriptive research, based on experience reports, with data production through document analysis, participant observation, and evaluations by participants and the organizing team, analyzed according to thematic content analysis. The results show that extension programs promote broad academic and social mobilization, with significant participation from students, faculty, and the external community, in addition to strengthening student leadership, interdisciplinarity, the articulation between theory and practice, and the development of skills such as communication, teamwork, critical thinking, and social responsibility. It is concluded that science fairs and integrated exhibitions constitute innovative spaces for training in vocational and technological education, contributing to meaningful learning and strengthening the social role of extension programs.

contexto, as feiras científicas e as mostras integradas de projetos emergem como estratégias pedagógicas e institucionais capazes de articular ensino, pesquisa e extensão de forma crítica, contextualizada e socialmente comprometida. Este artigo tem como objetivo analisar as experiências de projetos de extensão, discutindo suas contribuições para a formação técnico-profissional e seus impactos sociais. Metodologicamente, trata-se de uma pesquisa qualitativa, de natureza descritiva, baseada em relato de experiência, com produção de dados por meio de análise documental, observação participante e avaliações dos participantes e da equipe organizadora, analisadas segundo a análise de conteúdo temática. Os resultados evidenciam que a extensão promove ampla mobilização acadêmica e social, com participação expressiva de estudantes, docentes e comunidade externa, além do fortalecimento do protagonismo discente, da interdisciplinaridade, da articulação entre teoria e prática e do desenvolvimento de competências como comunicação, trabalho em equipe, pensamento crítico e responsabilidade social. Conclui-se que feiras científicas e mostras integradas constituem espaços inovadores de formação na EPT, contribuindo para aprendizagens significativas e para o fortalecimento do papel social da extensão.

Palavras-chave: Projetos de Extensão. Protagonismo Discente. Interdisciplinaridade. Responsabilidade Social.

RESUMEN

La Educación Profesional y Tecnológica (EPT), tanto en los niveles técnico como superior, se enfrenta al reto de superar modelos de formación excesivamente instrumentalizados, fuertemente orientados a la lógica de la eficiencia y la adaptación inmediata al mercado laboral. En este contexto, las ferias de ciencias y las exposiciones de proyectos integrados emergen como estrategias pedagógicas e institucionales capaces de articular la docencia, la investigación y la extensión de forma crítica, contextualizada y socialmente comprometida. Este artículo busca analizar las experiencias de proyectos de extensión, discutiendo sus contribuciones a la formación técnico-profesional y su impacto social. Metodológicamente, se trata de una investigación cualitativa y descriptiva, basada en relatos de experiencia, con producción de datos mediante análisis documental, observación participante y evaluaciones de los participantes y del equipo organizador, analizadas según un análisis de contenido temático. Los resultados muestran que los programas de extensión promueven una amplia movilización académica y social, con una significativa participación de estudiantes, docentes y la comunidad externa, además de fortalecer el liderazgo estudiantil, la interdisciplinariedad, la articulación entre la teoría y la práctica, y el desarrollo de habilidades como la comunicación, el trabajo en equipo, el pensamiento crítico y la responsabilidad social. Se concluye que las ferias de ciencias y las exposiciones integradas constituyen espacios innovadores para la formación en educación vocacional y tecnológica, contribuyendo al aprendizaje significativo y fortaleciendo el rol social de los programas de extensión.

Palabras clave: Proyectos de Extensión. Liderazgo Estudiantil. Interdisciplinariedad. Responsabilidad Social.

1 INTRODUCTION

Professional and Technological Education, which encompasses technical courses and higher education courses, has historically faced the challenge of overcoming an excessively instrumental education, guided by logics of efficiency, productivity and immediate adaptation to the labor market. This orientation, although relevant from a technical point of view, tends to limit students' critical understanding of the social, environmental and ethical impacts of their future professional performance. Excessive focus on theorizing in the classroom can also distance students from the real world where they will work professionally.

In this scenario, research and university extension are presented as a fundamental strategy to tension this logic, by promoting the dialogical interaction between the educational institution and society. Within the scope of the Federal Institutes, extension takes on even greater relevance due to its historical commitment to regional development and social inclusion.

Scientific fairs and integrated project exhibitions are configured as privileged spaces for innovation in the context of Professional and Technological Education, especially when understood not only as occasional events for the dissemination of results, but as pedagogical and institutional strategies that articulate teaching, research and extension.

The innovative character of these initiatives is not restricted to the introduction of new technologies or exhibition formats, but is manifested, above all, in the ways of organizing the training process, in the pedagogical practices mobilized and in the relationships established between institution, students and society.

In the pedagogical sphere, innovation is expressed by the rupture with traditional teaching models centered on the transmission of content and merely reproductive evaluation. By mobilizing active methodologies and problem-solving teaching, fairs and exhibitions move the student from the position of receiver to that of protagonist of the learning process. The investigation of real problems, the collective construction of knowledge and the need to communicate results to different audiences favor significant learning, the development of critical thinking and the articulation between theory and practice, configuring an innovation of a formative nature.

It is in this context that the Integrated Week of Safety and Environment and the I Journey of Knowledge and Diversity (I JSD) held at the Federal Institute of Piauí (IFPI) – Teresina Campus South Zone in 2025 are inserted. They were scientific, cultural and extension events, conceived as spaces that integrate teaching, research and extension activities and promoted with the support of scholarship funding from PIBEX – Institutional

Program for Extension Scholarships and CNPq – National Council for Scientific and Technological Development.

In this article, the objective is to discuss the contributions of events of this nature to technical-professional training, and their social impacts.

2 THEORETICAL FOUNDATION

The national policy of university extension, as recommended by the Forum of Pro-Rectors of Extension (FORPROEX, 2012), is presented as an educational, cultural and scientific process that articulates teaching and research in an inseparable way, promoting a transformative relationship between university and society.

From this point of view, the extension aims to develop citizenship training and strengthens skills such as empathy, communication, teamwork and social responsibility. One of the most significant results is contextualized learning, which is important for professional courses (FORPROEX, 2012).

National and international studies indicate that extension practices contribute significantly to the development of socio-emotional skills, critical thinking and social responsibility, by promoting contextualized learning and direct contact with real problems in society (Forproex, 2012; Silva & Vasconcelos, 2018; Bielefeldt; Paterson; Swan, 2010).

Participation in extension projects broadens students' social awareness, providing experiences that lead them to develop socio-emotional skills, such as listening, dialogue, and professional ethics, which are important for their professional lives (Silva & Vasconcelos, 2018). In the same perspective, Lima, Almeida & Santos (2019) recognize the importance of extension to develop socio-emotional skills and strengthen awareness of social responsibility. This contributes to promoting autonomy and protagonism of the future professional who needs to develop interpersonal skills that are usually little worked on in traditional education.

Experience-based practices (such as extension) broaden critical reflection on professional practice and favor the development of ethical values and social responsibility (Godoy & Antonello, 2017). This dialogues strongly with the adoption of active methodologies in technical and professional courses.

Paulo Freire (2020) also reinforces the importance of dialogue, the problematization of reality, and the valorization of popular knowledge as central elements of emancipatory educational practices, which is strongly present in extension projects.

In the field of technical and professional education, all these didactic and pedagogical contributions of extension projects challenge the logic of strictly economic efficiency, which

has characterized teaching in recent decades, proposing an education more committed to social justice, sustainability and human dignity.

3 METHODOLOGY

This work is characterized as a descriptive study, of a qualitative nature, based on reports of experiences. The research was based on the conception, realization and evaluation of the Integrated Week of Security and Environment and the I Journey of Knowledge and Diversity, events of an integrative nature aimed at the articulation between teaching, research and extension.

The production of data occurred through the documentary analysis of the projects of the events, the programming and the execution reports, as well as the participant observation during the activities developed, with systematized records. In addition, the evaluations carried out by the participants and the organizing team, responsible for the two events, were analyzed, considering perceptions about the training processes experienced.

The data were analyzed in the light of thematic content analysis, with the support of the Atlas TI software, to identify categories related to student protagonism, the integration between teaching, research and extension and the development of critical thinking and social responsibility. The analysis focused on the formative contributions provided by the event to students of technical and higher education courses, in the context of Professional and Technological Education.

4 DESCRIPTION OF THE EXPERIENCE

The events were held with the aim of integrating different institutional actions, including project exhibitions, workshops, lectures, scientific exhibitions and cultural activities that were distributed on various dates, creating an interactive and creative environment for students and teachers, but without intervening in the class schedule. The proposal of the events was conceived in an interdisciplinary way, involving technical courses, higher education and the external community, considering the best way to use financial resources to integrate the entire academic community of the campus as much as possible and involve different social segments.

The events aimed to articulate themes related to Science, Technology, Sustainable Citizenship and Professional Training, promoting interaction between the training axes offered by the campus — Food, Civil Construction, Fashion and Clothing, Informatics and Sanitation. This diversity of areas favored an interdisciplinary and transdisciplinary approach, stimulating the exchange of knowledge and the collective construction of knowledge aimed

at understanding and solving challenges in the world of work, such as: sustainable citizenship, inclusive education, social responsibility, dignity of work and appreciation of diversity.

Both events were aligned with the Sustainable Development Goals (SDGs) and current educational guidelines. This was mainly due to the involvement of the Center for Afro-Brazilian and Indigenous Studies (NEAFRO) and the Center for Assistance to People with Specific Educational Needs (NAPNE).

NEAFRO, a group registered on the CNPQ platform, is an institutional nucleus, common in Federal Institutes and Universities, aimed at promoting studies, educational and extension actions related to Afro-Brazilian history and culture, indigenous peoples, ethnic-racial relations, combating racism and all forms of discrimination and valuing cultural and identity diversity.

This research group works to: (i) support the implementation of Laws No. 10,639/2003 and No. 11,645/2008; (ii) promote anti-racist, inclusive and critical education; (iii) articulate teaching, research and extension with a focus on diversity; and, (iv) dialogue with communities, social movements and traditional knowledge.

The participation of NAPNE, the sector that constitutes the institutional structure of all *IFPI campuses*, contributed to the promotion of accessibility and equity, ensuring that activities were planned and executed in an inclusive manner.

The organizing team of the events was formed by 15 teachers from all teaching centers, in addition to a group of 60 students who acted as monitors; The events had institutional support in various ways, characterizing an action that integrated the academic community of the campus.

The program was planned so that two activities were organized per week, seeking not to interfere with the school calendar. Teachers from different disciplines were invited to develop projects with their students to be exhibited in the scientific exhibitions, and several activities were carried out in the classroom, integrating with the planned contents.

The records of the activities (confirmed registrations and attendance lists) pointed to the participation of about 1,800 participants, including students from the municipal and state school system. It is important to mention that the exhibitions and shows were available to students at different times (morning, afternoon and evening).

The dissemination carried out mainly through social networks was the responsibility of the volunteer students and this made it possible to create creative posts in a language that reached several social groups.

5 RESULTS AND DISCUSSION

This section presents the results and the discussion based on the analysis of the event reports, institutional records and information systematized by the organizing team, with a descriptive focus on the activities developed and the formative contributions observed.

5.1 EXTENSION ACTIONS AS PEDAGOGICAL DEVICES FOR MEANINGFUL LEARNING AND THE DEVELOPMENT OF CRITICAL THINKING

The activities developed within the scope of the Integrated Week of Security and Environment and the I Journey of Knowledge and Diversity show the potential of extension actions as expanded pedagogical devices, capable of articulating teaching, research and extension in an inseparable way. Unlike occasional events of scientific dissemination, the experiences analyzed were conceived as continuous training processes, integrated with the pedagogical practices of technical and higher education courses.

The data from participant observation and evaluations indicate that the diversity of activities — lectures, workshops, project exhibitions, science fairs and extension actions — favored significant learning, to the extent that teaching contents began to be mobilized in concrete, socially contextualized situations. This configuration reinforces the role of extension as a strategic training space in Professional and Technological Education, as recommended by national guidelines.

The analysis of the programming and the practices carried out allows us to identify important convergences in relation to the formative indicators considered in the analysis: student protagonism, investigation of real problems, collective construction of knowledge, scientific and social communication, development of critical thinking and articulation between theory and practice, as can be seen in the synthesis presented in tables 1 and 2.

Table 1

Types of activities developed and training objectives

Type of activity	Training objective
Thematic lectures	Critical reflection on science, technology, sustainable citizenship and professional training.
Workshops and short courses	Development of practical and technical skills in an applied way.
Science Fair	Stimulus to scientific research and student protagonism.
Project Shows	Socialization of teaching, research and extension productions.
Thematic tables	Deepening of interdisciplinary debates.
Extension actions	Interaction with the community and social application of knowledge.

Source: The author.

Table 2

Areas and thematic axes involved

Training axis	Approaches
Food	Food safety, production processes and sustainability.
Civil Construction	Sustainability, safety and socio-environmental impacts.
Informatics	Technology, innovation and digital solutions.
Fashion & Apparel	Sustainable production, creativity and cultural identity.
Sanitation	Environmental health, waste management and quality of life.

Source: The author.

5.2 STUDENT PROTAGONISM IN THE LEARNING PROCESS

In both events, it was observed that the student moved from the position of passive receiver to that of active subject of the training process. Student protagonism was manifested in an expressive way in the presentation of projects, in the conduction of workshops, in the mediation of exhibitions and in direct interaction with the academic and external community.

In the Integrated Week of Safety and Environment, students acted as agents of awareness and guidance, especially in actions related to environmental education, health and safety at work. In the I Journey of Knowledge and Diversity, the protagonism was expanded by the centrality of student productions in the programming and dissemination of the event, strengthening autonomy, collective responsibility and social engagement.

These findings corroborate approaches of active learning methodologies, by showing that the active participation of students contributes to the development of cognitive, social and ethical skills that are fundamental to professional training. Extension projects stimulate a dynamic that breaks with the banking logic of education criticized by Freire (1996).

5.3 INVESTIGATION OF REAL PROBLEMS AND CONTEXTUALIZATION OF KNOWLEDGE

Another convergent aspect between the events analyzed refers to the anchoring of the activities in real, socially situated problems. The topics addressed — such as environmental sustainability, health and safety at work, waste management, inclusion, diversity, social inequalities and relations between work and the environment — emerge from concrete demands of the territory and the institutional context.

This approach dialogues directly with Freire's (1996) problematizing pedagogy, according to which knowledge emerges from the critical reading of reality, and with Dewey (1979), who argues that learning occurs in a more meaningful way when linked to experience. By starting from real situations, the actions favor the attribution of meaning to academic content and expand its social relevance.

In the Integrated Week, the environmental and ergonomic blitzes, the practical workshops and the round tables enabled the critical analysis of situations observable in the daily life of the campus, partner schools and the productive sector. In the I Journey of Knowledge and Diversity, the projects and debates started from real experiences of students and the community, highlighting social, cultural and educational problems often made invisible in traditional curricula.

5.4 COLLECTIVE CONSTRUCTION OF KNOWLEDGE AND INTERDISCIPLINARITY

The two experiences were characterized by a strong emphasis on the collective construction of knowledge, mediated by the dialogue between different subjects and knowledge. The conversation circles, round tables, interdisciplinary exhibitions and collaborative activities favored the interaction between students, professors, external professionals and the community in general.

The I Journey of Knowledge and Diversity stood out for the articulation between academic knowledge, popular knowledge and community experiences, promoting interdisciplinary and transdisciplinary approaches. Similarly, the Integrated Week on Security and the Environment integrated different areas of knowledge, breaking with fragmented approaches and favoring a systemic understanding of socio-environmental problems and the world of work.

This collective character strengthened collaborative learning and contributed to the formation of subjects capable of acting in complex contexts.

5.5 COMMUNICATION OF RESULTS AND DIALOGUE WITH DIVERSE AUDIENCES

The communication of the knowledge produced was a central axis of the two extension actions. The students were challenged to translate technical and scientific concepts for different audiences, including the external community, basic education students, workers, managers and public servants.

The exhibitions, oral presentations, open workshops, educational actions and cultural activities required language adequacy, argumentative clarity and social sensitivity. This exercise contributed to the development of communication skills fundamental to professional training, in addition to reinforcing the social commitment of the public university to the democratization of knowledge.

5.6 MEANINGFUL LEARNING, CRITICAL THINKING AND ARTICULATION BETWEEN THEORY AND PRACTICE

The joint analysis of the two experiences shows that the combination of student protagonism, investigation of real problems, interdisciplinary dialogue and social communication favors significant learning, as recommended by critical and active pedagogical approaches.

The strong presence of conversation circles, round tables and interdisciplinary activities evidences the collective construction of knowledge as a structuring principle of the two experiences. This perspective is close to the notion of ecology of knowledge, proposed by Santos (2005), by recognizing the legitimacy of different forms of knowledge — academic, popular, professional and community.

From the point of view of Theories of Practices, learning can be understood as a socially situated phenomenon, produced in interactions between people, artifacts, discourses and contexts (Schatzki, 2001; Gherardi, 2012). Thus, the extension actions analyzed are configured as social practices that produce knowledge in use, going beyond the simple transmission of formal contents, tensioning the technicist logic still present in Professional and Technological Education.

The activities allowed students to articulate theoretical content discussed in the classroom with concrete practices, promoting critical reflection on topics such as sustainability, ethics, work, diversity and social inequalities. By problematizing these issues in real contexts, the events contributed to the development of critical thinking and to the training of professionals who are more sensitive to the social, environmental and human dimensions of their work.

5.7 INTERPRETATIVE SYNTHESIS

In an articulated way, the Integrated Week of Safety and Environment and the I Journey of Knowledge and Diversity reaffirm university extension as a privileged space for the construction of critical, contextualized and socially committed learning.

Table 3

Analytical synthesis of the pedagogical indicators of the extension actions

Pedagogical indicators	Analytical description	Empirical evidence in the activities developed
Student protagonism in the learning process	The student assumes an active role in the production, mediation and socialization of knowledge, overcoming the passive logic of transmissive learning.	Exhibition and presentation of student projects; conducting workshops and educational blitzes; mediation of activities with the community; student participation in the organization, execution and evaluation of events.
Investigation of real problems	The activities are based on concrete situations in the territory, the world of work and social experiences, promoting contextualized learning.	Discussions on environmental sustainability, health and safety at work, waste management, inclusion and diversity; analysis of problems observed on campus, in partner schools and in the external community.
Collective construction of knowledge	Knowledge is produced in a dialogical, interdisciplinary and collaborative way, integrating different subjects and knowledge.	Conversation circles, round tables and interdisciplinary debates; interaction between students, professors, external professionals, social movements and the community; articulation between academic knowledge and community experiences.
Communication of results to diverse audiences	Students practice the translation and socialization of scientific and technical knowledge for heterogeneous audiences.	Scientific-cultural exhibitions, open workshops, free consultancies, educational blitzes and cultural activities aimed at the academic and external community.
Meaningful learning	Learning occurs from the relationship between theory, practice and social reality, attributing meaning to the contents worked.	Practical application of concepts discussed in the classroom; activities based on "learning by doing"; connection between curricular content and real social demands.
Development of critical thinking	The actions stimulate the problematization of inequalities, naturalizations and the dominant instrumental logic in professional training.	Debates on ethics, work, environment, diversity, social inclusion and institutional responsibility; critical reflection on the social and environmental impacts of professional practices.
Articulation between theory and practice	Integration between theoretical foundations and practical experiences in real contexts of social and educational intervention.	Practical workshops, extension actions, project exhibitions and experience reports that show the application of theoretical concepts in concrete situations.

Source: The author

The results highlight the potential of the events as an innovative training strategy, capable of consolidating the articulation between teaching, research and extension, promoting the integral training of students and contributing to the strengthening of the institution's social role. The tables summarize the thematic categories analyzed.

Table 4

Main formative contributions observed

Formative dimension	Observed evidence
Student protagonism	Students' performance as presenters and mediators.
Interdisciplinarity	Integration between courses and areas of knowledge.
Critical thinking	Discussions about real problems and sustainability.
Communication	Presentation of projects to different audiences.
Social responsibility	Participation in extension actions and dialogue with the community.

Source: The author.

Table 5

Articulation between teaching, research and extension

Dimension	Shape of articulation
Education	Projects linked to disciplines and curricular activities.
Research	Investigation of problems and production of knowledge.
Extension	Interaction with the community and social application of knowledge.

Source: The author.

The results indicate that the events contributed significantly to broaden students' understanding of topics related to social and environmental responsibility. Greater student engagement, development of communication skills and critical reflection on real problems of the community were observed.

The interaction with the external community allowed the students to recognize the limits and possibilities of technical action, reinforcing the importance of an ethical and responsible posture. These findings corroborate the literature that points to extension as a privileged space for comprehensive education in professional and technological education.

6 FINAL CONSIDERATIONS

The experience in carrying out and analyzing the results of the events show the potential of extension projects as a training strategy capable of tensioning the technicist logic still predominant in technical and professional education. By promoting dialogue between knowledge, interdisciplinarity and approximation with social reality, extension projects contribute to the construction of a more critical, humane and socially committed education with the demands of the social scenario in which future professionals are inserted.

ABSTRACT

The underrepresentation of women in Science, Technology, Engineering, and Mathematics (STEM) and computer science is a sociological challenge that demands incentive strategies from basic education onwards. This article presents the extension project "Robotic Girls: Creative Learning to Attract Girls to Robotics at IFRO". The project arose from the observation that 57.1% of students in the Technical Course in Informatics Concurrent with High School (CTICEM) did not identify with the field of computing, citing as obstacles a lack of confidence in their own abilities, limited access to resources, and financial challenges. The methodology adopted is based on Creative Learning and Problem-Based Learning (PBL), using Educational Robotics (ER) as a tool to connect theory and practice. The activities involved the use of block programming (Scratch), Lego Mindstorms EV3 kits, as well as support via a Virtual Learning Environment (VLE) and YouTube tutorials. The results demonstrate that the initiative promoted a significant increase in engagement: the number of participants rose from a low initial participation to the formation of all-girls teams for the Brazilian Robotics Olympiad (OBR). Beyond technical performance in competitions, the project stimulated female leadership, transforming students into knowledge multipliers through community workshops and visits to public schools. It is concluded that the RE (Research and Education), supported by mentoring programs and a collaborative environment, is an effective means to overcome gender barriers, strengthen self-confidence, and promote the empowerment of women in technology.

RESUMO

A sub-representação feminina nas áreas de *Science, Technology, Engineering, and Mathematics* (STEM) e na computação é um desafio sociológico que demanda estratégias de incentivo desde a educação básica. Este artigo apresenta o projeto de extensão "Meninas Robóticas: Aprendizagem criativa para atrair meninas para a robótica no IFRO". O projeto surgiu da observação de que 57,1% das estudantes do Curso Técnico em Informática Concomitante ao Ensino Médio (CTICEM) não se identificavam com a área de computação, citando como obstáculos a falta de confiança nas próprias habilidades, o acesso limitado a recursos e desafios financeiros. A metodologia adotada fundamenta-se na Aprendizagem Criativa e na Aprendizagem Baseada em Problemas (ABP), utilizando a Robótica Educacional (RE) como ferramenta para conectar teoria e prática. As atividades envolveram o uso de programação em blocos (Scratch), kits Lego *Mindstorms* EV3, além de suporte via Ambiente Virtual de Aprendizagem (AVA) e tutoriais no YouTube. Os resultados demonstram que a iniciativa promoveu um aumento significativo no engajamento: o número de participantes subiu de uma adesão inicial baixa para a formação de times exclusivos de meninas para a Olimpíada Brasileira de Robótica (OBR). Além do desempenho técnico nas competições, o projeto estimulou o protagonismo feminino, transformando as estudantes em multiplicadoras de conhecimento em oficinas para a comunidade e visitas a escolas públicas. Conclui-se que a RE, apoiada por programas de mentoria e um ambiente colaborativo, é um meio eficaz para superar barreiras de gênero, fortalecer a autoconfiança e promover o empoderamento das mulheres na tecnologia.

Palavras-chave: Robótica Educacional. Empoderamento Feminino. Aprendizagem Criativa. Igualdade de Gênero.

RESUMEN

La escasa representación femenina en las áreas de Ciencia, Tecnología, Ingeniería y Matemáticas (STEM) y en informática es un desafío sociológico que exige estrategias de incentivos desde la educación básica. Este artículo presenta el proyecto de extensión "Niñas Robóticas: Aprendizaje Creativo para Atraer a las Niñas a la Robótica en IFRO". El proyecto surgió tras observar que el 57,1% del alumnado del Curso Técnico en Informática Concomitante con la Educación Media (CTICEM) no se identificaba con el campo de la informática, citando como obstáculos la falta de confianza en sus propias habilidades, el acceso limitado a recursos y las dificultades económicas. La metodología adoptada se basa en el Aprendizaje Creativo y el Aprendizaje Basado en Problemas (ABP), utilizando la Robótica Educativa (ER) como herramienta para conectar la teoría con la práctica. Las actividades incluyeron programación con bloques (Scratch), kits Lego *Mindstorms* EV3, así como apoyo mediante un Entorno Virtual de Aprendizaje (EVA) y tutoriales de YouTube. Los resultados demuestran que la iniciativa promovió un aumento significativo de la participación: el número de participantes pasó de una baja participación inicial a la formación de equipos exclusivamente femeninos para la Olimpiada Brasileña de Robótica (OBR). Más allá del rendimiento técnico en las competiciones, el proyecto impulsó el liderazgo femenino, transformando a las estudiantes en multiplicadoras de conocimiento mediante talleres comunitarios y visitas a escuelas públicas. Se concluye que la Investigación y Educación (IR), apoyada por programas de mentoría y un entorno colaborativo, es un medio eficaz para superar las barreras de género, fortalecer la autoconfianza y promover el empoderamiento de las mujeres en la tecnología.

Palabras clave: Robótica Educativa. Empoderamiento Femenino. Aprendizaje Creativo. Igualdad de Género.

1 INTRODUCTION

The democratization of digital innovation represents a remarkable sociological shift driven by the advancement of new technologies and the reduction of costs, enabling individuals to create and share their inventions. However, the path towards a sustainable economy and a more balanced society requires a greater engagement of diverse people in innovation. In this sense, it is crucial to highlight the worrying low number of women who opt for training and a career in the field of computing (HAPPE, 2021).

The increase in female representation in the areas of *Science, Technology, Engineering, and Mathematics* (STEM) has been the subject of study in several projects in Brazil and around the world. Carrying out projects, workshops, and meetings that aim to present technology in a more practical way to elementary and high school girls is essential, allowing them to know and feel more comfortable in the areas of technologies (ERENO *et al.*, 2023).

In view of this, we understand that gender equality is one of the fundamental pillars for sustainable development and social progress, especially through teaching and teaching practices, which seek to motivate and engage girls in the area of computing. In this context, working in the Technical Course in Informatics Concomitant to High School (CTICEM), we sought to develop a project that would arouse in students the curiosity and motivation to explore the area beyond the context of the classroom, which resulted in the extension project, Robotic Girls: Creative learning to attract girls to robotics at IFRO, Porto Velho North Zone campus.

In this scenario, the project aims to develop creative learning to attract girls to Educational Robotics (RE). To this end, we adopt creative learning, which is a pedagogical approach that encourages students to engage in hands-on projects and activities, combining art, science, technology, and engineering to stimulate creativity and innovation. The students apply the knowledge acquired in the CTICEM classes in the activities of the RE. Also, the Problem-Based Learning (PBL) methodology was used as access points to guide investigation, dialogue and critical thinking. The main objective of the project is to engage students in studies in the area of computing, especially RE, in order to foster the development of fundamental skills and knowledge that can be applied in the area of technology and science, encourage logical and creative thinking in high school students to face complex challenges efficiently.

RE arose from the theories of Jean Piaget's Constructivism and Seymour Papert's Constructionism. He believed that the child learns during the creation of artifacts and experimentation of his theories (SOKOLONSK, 2020). RE promotes the development of

knowledge through situations that challenge the individual to think of solutions. It allows you to relate theory to practice, applying learning in the classroom and in previous experiences to solve specific problems. Building robots in school offers teachers and students to teach, learn, discover, and invent in collective processes. This activity fosters the connection between theoretical abstractions and the concrete world (FERNANDES *et al.*, 2018).

In the field of computing, historically marked by female underrepresentation, it is essential to support initiatives that not only encourage the participation of women and girls, but also promote their training and the full development of their potential. This article presents an extension project aimed at promoting gender equality and the empowerment of female students in the area of informatics, using participation in the Brazilian Robotics Olympiad (OBR) as an instrument of motivation and training.

2 MATERIAL AND METHODS

Creative learning is a practice that can be stimulated through Project-Based Learning (PBL), where students are driven by meaning (*passion*), produce collaboratively (*peer learning*) and value skills such as creativity, curiosity and resilience (*play*). This concept places students at the center of the educational process, empowering them to plan, create, test, and act proactively in the face of social issues and themes that involve them in real and everyday situations (INEIA *et al.*, 2022).

Therefore, the Problem-Based Learning (PBL) methodology, considered a pedagogical approach considered innovative because it allows the student to participate actively in the construction of knowledge, will be the methodology adopted in this project. The ABP or *Problem Based Learning* (PBL) is a pedagogical practice used in teaching in several areas and is perfectly suitable to be used with educational robotics and to develop computational thinking (CABRAL *et al.*, 2019). AABP guided the Activities carried out by the girls, taking into account their experiences and experiences, in addition to exposing girls to situations that stimulate The reflection.

3 RESULTS AND DISCUSSION

At the beginning of the first semester of 2024, a survey was carried out through a questionnaire to understand the profile and perspectives of the students of the two CTICEM classes on campus. At that time, we had 31 girls enrolled in these classes. The results indicate that most students do not identify with the area. **Figure 1** illustrates that 57.1% of the girls who responded to the questionnaire expressed a lack of interest in computer areas, such as programming, data science, artificial intelligence, digital games, among others. While

28.6% have not yet reflected on the subject, only 14.3% have shown a lot of interest in the area.

Figure 1

Level of interest in areas of computing

Source: Authors.

To understand why 57.1% of girls expressed a lack of interest in computing fields, we asked students about the challenges and difficulties they face when considering studying or working in this field. **Figure 2** shows that 28.6% of the girls indicated limited access to resources as one of the challenges or difficulties they face when considering working in the area of computing. In addition, others mentioned include lack of access to educational resources, lack of confidence in skills, difficulties in specific disciplines, and financial challenges.

Figure 2

Challenges and difficulties pointed out by girls when considering studying or working in the area of computing

Source: Authors.

Given this scenario, the significant challenge of promoting girls' participation in the area of computing is evident. The fact that most students in CTICEM classes currently on campus do not identify with the area, as demonstrated by the lack of interest expressed by 57.1% of the girls, suggests the existence of significant barriers. By analyzing the challenges and difficulties faced by girls when considering studying or working in the field of computing, we identified a number of obstacles. These factors can contribute to discouraging girls from pursuing careers or studies in computing. Another relevant piece of information is the lack of interest in the participation of the OBR, despite all the girls recognizing the importance of the competition.

Figure 3 presents a scenario that may explain the challenges faced by girls when considering participation in national or state-level competitions. Lack of confidence in their abilities may be a determining factor for disinterest, since 85.7% of the girls did not express interest in participating in the OBR.

Figure 3

Interest in participating in the OBR

Source: Authors.

With this data, we detected that the lack of confidence in girls' abilities is one of the main challenges identified, which can prevent them from fully engaging in robotics and programming activities. To help girls overcome these obstacles, it is essential to adopt approaches that strengthen their confidence and encourage active participation in technology-related activities. Key measures include increasing access to educational resources and opportunities, mentoring programs to bolster girls' self-confidence, and policies to reduce financial barriers. In addition, it is important to maintain the effort to promote an inclusive and diverse culture in the area of computing, highlighting how gender diversity benefits innovation and progress.

The "Robotic Girls" project started on 09/01/2023, derived from an RE project carried out on campus during the first semester of 2023. This first project selected both boys and

girls to learn RE and participate in OBR. However, female participation was low, with only 4 girls initially applying, of which only 2 completed all stages and participated in OBR in August 2023. Against this backdrop, the need to address the low participation of girls has become evident. Thus, we developed the Robotic Girls project, with coordination and vice-coordination of female teachers in the area of Informatics, focused specifically on motivating and arousing the interest of girls in RE. Through practical activities, such as the elaboration of codes and the construction of a robot, we seek to encourage female participation in OBR 2024.

The project's face-to-face meetings took place twice a week, lasting three hours each. They were held at the campus's Center for Technological Innovation (CIT), a space inaugurated in March 2022, equipped with 10 state-of-the-art desktops, a TV, and a digital whiteboard. For the robotics project, through a public notice with resources, 10 complete Lego *Mindstorms* EV3 kits, 2 expansion kits, single sensors, a training track and some elements necessary for participation in the OBR were acquired.

In addition to the physical equipment, the robotics project has a team of mentors and facilitators who guide participants in various areas, from the assembly of the robots to advanced programming. Among them, two students who participated in the OBR 2023 edition were able to contribute with their experience in competitions.

The face-to-face meetings were structured to provide a collaborative and hands-on learning environment where students could work as a team, exchange ideas, and solve challenges together. During the activities at the CIT, participants had access not only to material resources, but also to specific modeling and programming software for the LEGO *Mindstorms* EV3 platform. In addition, the CIT environment provides a space for creativity and experimentation, encouraging students to explore new approaches and innovative solutions to the proposed problems.

The robotics project is not limited to face-to-face meetings at the CIT. Participants also have access to the virtual learning environment (VLE), where they can consult support materials, participate in discussion forums, and interact with mentors outside of face-to-face meeting hours. This combination of face-to-face and virtual activities aims to provide a complete and enriching experience to participants, preparing them not only for the OBR competition, but also for future challenges in the area of robotics and technology.

We also complemented the YouTube Educational Robotics Channel with LEGO with tutorials recorded by faculty members from the campus RE team (**Figure 4**), intensive practice sessions, and *constructive feedback*.

Figure 4

Tutorials on a YouTube channel created by the Educational Robotics professor on campus

Source: Authors.

The positive results of the project include a significant increase in girls' interest and participation. In September 2023, we had the registration of six students, five of whom demonstrated total commitment and engagement in the activities.

The training begins with a module called 'Introduction to block programming', in which students developed programming skills using the Scratch platform, which was chosen for its playful and educational approach. Scratch is a block-based visual programming language, making it easy to create interactive projects such as animations, games, and stories, as well as stimulating creativity and computational thinking.

At the end of this introductory module, the students were challenged to create a game or story in *Scratch* that should include elements such as scenario animation, character movement, dialogues and soundtrack. Overcoming several challenges throughout the process, the girls developed games, demonstrating great evolution and application of the concepts learned.

Figure 5

Girls participating in the robotics project (Sept. 2023-Aug. 2024)

Source: Authors.

Subsequently, (**Figure 5**), the girls prepared for the architectural part in assembling the robots and studied to understand the challenges of OBR through a comprehensive approach that encompasses various aspects of learning and development, organizing their time efficiently, setting goals and schedules to ensure they have enough time to practice programming, Build the robot and prepare for the competitions.

We created a project to make an internal competition on campus as a preparation for OBR with 5 teams of boys and girls, simulating a real competition environment following rules and awards. Finally, the teams presented themselves at the state OBR on September 2nd and 3rd, 2024 (**Figure 6**). Each team performed with the t-shirt created by the members themselves. There were 2 days of competitions with the participation of 20 teams from the state. Our best place was a mixed team that was in 4th place and two more in 10th. and 18th with girls, but the most important was the engagement and companionship developed.

Figure 6

Teams participating in the state OBR (09/03/2024)

Source: Authors.

In October 2024, during the National Science and Technology Week (SNCT), educational robotics workshops were held open to the community. In this context, one of the students had a prominent participation, collaborating both in the organization and in the teaching process of the workshop. Figure 7 shows the student conducting a robotics activity with a group of girls. It is noteworthy that there was no direction or separation of the participants by gender; The composition of the group occurred spontaneously. The image suggests that the performance of a student as a female reference in robotics can contribute to arouse interest and promote greater engagement of other girls in the area.

Figure 7

Robotics student (upper right) supporting the workshop for the external community during the SNCT

Source: Authors.

The challenges initially pointed out by the participants, such as the difficulty in assimilating programming concepts and the complexity involved in building the robot, were gradually overcome throughout the activities, with continuous pedagogical support. This preparation aimed not only at participating in the Brazilian Robotics Olympiad (OBR), but also at developing personal and professional skills, contributing to the formation of relevant skills for future challenges in the field of technology.

Aiming at the sustainability of the project, in September 2024 a new class was started. In this stage, with an improved methodological approach, 11 girls joined, who went through the same training stages, including the introduction to block programming, demonstrating engagement and interest in participating in the next edition of OBR, which took place at the end of August, with the formation of two teams composed exclusively of girls, totaling seven participants. From this experience, the Robotic Girls project gradually consolidated itself as a teaching and extension initiative. As a result of the extension actions, one of the teams carried out activities to disseminate robotics in public schools throughout the second half of 2025, contributing to the dissemination of knowledge and stimulating the interest of basic education students in the technological area.

4 CONCLUSIONS

By addressing these challenges and implementing effective support and encouragement strategies, we can help girls overcome the barriers that prevent them from fully participating in the technology and computing environment. This project not only contributes to teaching, research and extension in Professional and Technological Education (EPT), but also motivates and engages CTICEM students.

Thus, it facilitates the sharing of knowledge both with the internal community, including the class of the Informatics course, and with the external community and the elementary and high schools. In addition, the project stimulates creativity and innovation, encouraging students to find unique and innovative solutions, while developing social and emotional skills, such as collaboration, communication, and leadership, which are fundamental for participation in OBR.

RE has been an effective means to attract more girls to technology, encouraging them to stay in the area and promoting their protagonism as multipliers of knowledge and experiences. Finally, the Robotic Girls project emerges as a direct response to the low female participation in robotics and programming activities, identifying girls' lack of confidence in their abilities as one of the main obstacles. By adopting specific approaches to promote girls' confidence and engagement, such as access to educational resources, mentorship programs, and policies to reduce financial barriers, the project seeks to overcome these challenges and encourage female participation in computing.

ACKNOWLEDGMENTS

We would like to thank the Office of the Dean of Research, Innovation and Graduate Studies (PROPESP) of IFRO for the financial support that made the publication of this article possible. Our recognition to the Research Group on Technologies and Education (GPComp) for its commitment to the development of the project, as well as to the Federal Institute of Education, Science and Technology of Rondônia (IFRO) – Porto Velho Campus North Zone (PVZN) for the financing of the teaching materials used, through Public Notice No. 28/2023/PVZN. AB/IFRO and Public Notice 23/2024/PVZN.

ABSTRACT

Differences in tax and labor systems among neighboring countries play a strategic role in border regions, where business mobility is high and competitiveness is strongly affected by operational costs. In this context, taxation of the service sector becomes a decisive factor for the attraction or relocation of economic activities. This study provides a comparative analysis of taxation applied to the service sector in the Triple Frontier region, comprising Brazil, Paraguay, and Argentina, based on legislation in force in 2025. The research adopts a descriptive and comparative approach, supported by documentary and bibliographic analysis, focusing on taxes levied on revenue, income, and payroll, as well as mandatory labor charges. The results reveal significant tax asymmetries among the countries, highlighting the high tax burden and regulatory complexity of the Brazilian and Argentine systems, in contrast to the Paraguayan model, which is characterized by a simpler and less burdensome structure. The study concludes that differences in tax and labor systems directly affect regional competitiveness, influencing business location and operational decisions in the service sector within the Triple Frontier.

Keywords: Taxation. Service Sector. Regional Competitiveness. Triple Frontier.

RESUMO

As diferenças nos sistemas tributários e trabalhistas entre países vizinhos tendem a assumir papel estratégico em regiões de fronteira, onde a mobilidade empresarial é elevada e a

competitividade é fortemente influenciada por custos operacionais. Nesse contexto, a tributação do setor de serviços torna-se fator decisivo para a atração ou deslocamento de atividades econômicas. Este estudo analisa comparativamente a tributação incidente sobre o setor de serviços na região da Tríplice Fronteira, envolvendo Brasil, Paraguai e Argentina, considerando a legislação vigente em 2025. A pesquisa adota abordagem descritiva e comparativa, fundamentada em análise documental e bibliográfica, com foco nos tributos incidentes sobre o faturamento, a renda e a folha de salários, bem como nos encargos trabalhistas mínimos obrigatórios. Os resultados evidenciam assimetrias tributárias relevantes entre os países analisados, destacando-se a elevada carga fiscal e a complexidade normativa dos sistemas brasileiro e argentino, em contraste com o modelo paraguaio, caracterizado por estrutura mais simples e menos onerosa. Conclui-se que as diferenças nos sistemas tributários e trabalhistas exercem influência direta sobre a competitividade regional, afetando decisões de localização e operação das empresas do setor de serviços na Tríplice Fronteira.

RESUMEN

Las diferencias en los sistemas tributarios y laborales entre países vecinos suelen desempeñar un papel estratégico en las regiones fronterizas, donde la movilidad empresarial es alta y la competitividad se ve fuertemente influenciada por los costos operativos. En este contexto, la tributación del sector servicios se convierte en un factor decisivo para atraer o reubicar actividades económicas. Este estudio analiza comparativamente la tributación del sector servicios en la región de la Triple Frontera, que abarca a Brasil, Paraguay y Argentina, considerando la legislación vigente en 2025. La investigación adopta un enfoque descriptivo y comparativo, basado en el análisis documental y bibliográfico, centrándose en los impuestos sobre la renta, la renta y la nómina, así como en los cargos laborales mínimos obligatorios. Los resultados destacan las importantes asimetrías tributarias entre los países analizados, destacando la elevada carga tributaria y la complejidad normativa de los sistemas brasileño y argentino, en contraste con el modelo paraguayo, caracterizado por una estructura más simple y menos onerosa. Se concluye que las diferencias en los sistemas tributarios y laborales influyen directamente en la competitividad regional, afectando la ubicación y las decisiones operativas de las empresas del sector servicios en la región de la Triple Frontera.

Palabras clave: Tributación. Sector Servicios. Competitividad Regional. Triple Frontera.

1 INTRODUCTION

The taxation of the service sector has assumed a strategic role in the competitiveness of contemporary economies, especially in contexts in which business mobility is high and operating costs directly influence decisions on productive location. In international border regions, where different tax and labor systems coexist, these differences become even more evident, impacting the cost structure of companies and the regional competitive dynamics.

The Triple Border, formed by the cities of Foz do Iguaçu (Brazil), Ciudad del Este (Paraguay) and Puerto Iguazú (Argentina), is configured as a unique economic space, characterized by the intense circulation of people, goods and services, with a strong predominance of the tertiary sector. In this context, the taxation levied on the service sector, especially that related to revenue, income and payroll, exerts a direct influence on business competitiveness, becoming a relevant factor in the attraction, permanence or displacement of economic activities between bordering countries.

The Brazilian and Argentine tax systems are recognized for their high regulatory complexity and significant tax burden, while Paraguay adopts a more simplified model, with reduced rates and fewer taxes. These asymmetries, when observed in an integrated geographic space such as the Triple Border, tend to produce concrete effects on the behavior of economic agents, affecting prices, profit margins and strategic decisions of companies in the service sector.

In view of this scenario, the following research problem emerges: how does the taxation levied on the service sector, considering taxes and labor charges, differ between Brazil, Paraguay and Argentina and what are its effects on regional competitiveness in the Triple Border?

Thus, the general objective of this study is to comparatively analyze the taxation levied on the service sector in the cities of Foz do Iguaçu, *Ciudad del Este* and *Puerto Iguazú*, identifying the main applicable taxes and labor charges, as well as their effects on regional competitiveness. As specific objectives, it seeks to examine the current legislation, compare the tax burden incurred, identify the charges associated with labor and evaluate the existence of tax incentives for the sector in each location analyzed.

The relevance of the study lies in its contribution to the debate on fiscal competitiveness in border regions, by showing how different tax and labor arrangements influence the economic dynamics of the service sector. In addition, the results offer subsidies for public managers, entrepreneurs and researchers interested in the relationship between taxation, business environment and regional development, especially in the context of recent discussions on tax reform in Brazil and economic integration within Mercosur.

2 THEORETICAL FRAMEWORK

The theoretical framework of this study underpins the analysis of taxation and competitiveness in the service sector, focusing on the concepts of tax planning and business decision-making. The selected literature provides conceptual support to understand how the choice of tax regime influences the economic results and competitiveness of companies.

2.1 TAX PLANNING AND BUSINESS DECISION-MAKING

Tax planning is an essential management tool, especially in economic environments characterized by high tax burden and strong regulatory asymmetry. In this sense, Fabretti (2017, p. 34) defines that "tax planning consists of the prior, lawful and strategic study of the available legal alternatives, with the objective of reducing the tax burden, postponing the payment of taxes or avoiding their incidence". It is, therefore, a tool that goes beyond mere legal compliance, assuming a strategic role in business decision-making.

In the service sector, tax planning acquires even greater relevance, since taxation is predominantly levied on revenues and payroll, directly affecting the cost structure and competitiveness of companies. Decisions related to the location of the enterprise, the way labor is hired, and the organizational structure are strongly influenced by the tax environment, especially in border regions, where different tax systems coexist.

In this context, the absence of planning can compromise the economic sustainability of companies, leading to a loss of competitiveness against competitors established in jurisdictions with a lower tax burden or more simplified regimes. As Crepaldi (2019, p. 78) points out, "the tax burden represents one of the main components of business cost, exerting a direct influence on the competitiveness of organizations, especially in labor-intensive sectors".

2.2 TAX SYSTEMS AND TAXATION OF THE SERVICE SECTOR

The tax systems adopted by countries reflect political and economic choices that directly influence the business environment. In Brazil, the taxation of the service sector is characterized by high regulatory complexity, the multiplicity of taxes and the strong incidence on revenues and payroll, especially the Service Tax (ISS), the Corporate Income Tax (IRPJ), the Social Contribution on Net Income (CSLL), the Contribution to the Social Integration Program (PIS) and the Contribution to the Financing of Social Security (COFINS).

In contrast, countries such as Paraguay and Argentina adopt different models. Paraguay has a tax system that is known to be simpler, with fewer taxes and reduced rates, which has been used as an instrument to attract investments, especially in regions close to

the Brazilian border. Argentina, in turn, combines federal and provincial taxes, resulting in a high tax burden and a higher degree of cumulativeness, although with structural characteristics different from those observed in the Brazilian system.

The taxation of the service sector, especially activities linked to tourism and commerce, is particularly sensitive to these differences, since such activities have high geographic mobility and depend directly on the operational cost to maintain competitiveness. In this sense, Souza and Callado (2020) point out that inadequate tax decisions can significantly compromise the profitability and permanence of companies in highly competitive markets.

From the perspective of tax planning as a decision-making tool, it is essential to analyze the tax systems in which companies are inserted, especially with regard to the taxation of the service sector and its relationship with business competitiveness.

2.3 THE TRIPLE BORDER AS AN ECONOMIC AND FISCAL AREA

The Triple Border region, formed by Brazil, Paraguay and Argentina, is configured as a unique economic space, marked by the intense circulation of people, goods and services. This dynamic means that the tax differences between countries do not remain only at the regulatory level, but materialize in concrete decisions on investment, consumption and business location.

In border regions, disparities between tax systems tend to be immediately perceived by economic agents. Fabretti (2017, p. 112) observes that "in border regions, the differences between tax systems are immediately perceived by economic agents, influencing decisions of location, consumption and investment". In this way, taxation starts to play a strategic role in the organization of regional economic activities.

According to Zilli (2021), border regions show the effects of tax asymmetry more clearly, since economic agents can compare, almost instantaneously, the costs and benefits associated with each tax system. In the service sector, this asymmetry manifests itself both in the structure of taxes levied and in labor charges and tax incentive regimes, generating comparative advantages for certain countries and putting pressure on companies located in more onerous systems.

2.4 TAX INCENTIVES AND REGIONAL COMPETITIVENESS

Tax incentives are instruments widely used by States as a way to stimulate economic development, attract investments and promote job creation. In border regions, such

mechanisms assume even greater relevance, since they compete directly with the tax systems of neighboring countries.

In Paraguay, policies based on reduced tax rates and administrative simplification have contributed to the attraction of companies in the service and trade sector. In Brazil, although there are specific incentives, the high tax burden and the complexity of the system limit its effectiveness. Argentina, in turn, faces challenges related to tax cumulativeness and overlapping fiscal competences, which reduces the positive impact of any incentives.

This reality reinforces the need for comparative analyses capable of understanding how taxation and tax incentives influence business competitiveness in the Triple Border, especially in cost-sensitive sectors such as tourism and commercial services. In the light of these theoretical discussions, the methodological approach presented in the following section is structured.

3 METHODOLOGY

This study is characterized as an applied research, of qualitative and quantitative nature, with a descriptive and comparative approach, with the objective of analyzing the taxation levied on the service sector in the Triple Border region (Brazil, Paraguay and Argentina). The methodological design adopted allows comparing different tax systems, identifying tax asymmetries and their potential impacts on business competitiveness in a cross-border economic space.

As for the technical procedures, a comparative case study was adopted, based on documentary and bibliographic research. The bibliographic research covered books, scientific articles and institutional publications related to taxation, labor charges and regional competitiveness.

The analysis focused on the main taxes levied on revenue, income and payroll, as well as on the minimum labor charges provided for by law, such as working hours, paid vacations, thirteenth salary and employers' social security contributions, considering the legislation in force in 2025. The data were systematized in comparative tables and tables, allowing the identification of fiscal and labor asymmetries and their impacts on the operating cost of companies in the service sector.

It should be noted that the study did not propose to measure macroeconomic impacts or to analyze financial results individualized by company, limiting itself to the normative and structural comparison of the systems analyzed. The conclusions are conditioned to the time frame and normative adopted and may change as a result of future legislative changes, notably those related to the ongoing Brazilian tax reform.

4 RESULTS AND DISCUSSION

This section presents and discusses the results of the comparative analysis of taxation levied on the service sector in the countries that make up the Triple Border (Brazil, Paraguay and Argentina). The analysis includes the main taxes levied on income, revenues and payroll, as well as the main labor charges associated with business activity, with the objective of identifying fiscal asymmetries and their impacts on regional competitiveness.

4.1 TAXATION OF THE SERVICE SECTOR IN BRAZIL

In Brazil, the taxation of companies in the service sector varies significantly according to the tax regime adopted, being levied in a combined manner on turnover, income and payroll. The main regimes applicable to the sector are the Simples Nacional, the Presumed Profit and the Real Profit, each with different structures and impacts on the effective tax burden.

In Simples Nacional, aimed at micro and small companies, taxation occurs in a unified way through the Simples Nacional Collection Document (DAS). For the service sector, the rates vary according to the framework in Annexes III or V of Complementary Law No. 123/2006, and may vary approximately between 6% and 33% of gross revenue, depending on the accumulated revenue of the last twelve months and the relationship between payroll and revenue. Although the regime simplifies the collection, taxation is directly levied on revenue, with a limitation on the deduction of costs and expenses, which can increase the effective burden in labor-intensive activities.

In the Presumed Profit, a regime widely used by medium-sized service companies, the IRPJ calculation basis corresponds to 32% of gross revenue, on which the rate of 15% is applied, plus an additional 10% on the portion of profit that exceeds the legal limit of R\$ 20,000.00 per month or R\$ 60,000.00 in the quarter. The CSLL is levied at the rate of 9%, also on the presumed basis of 32%. In addition, contributions to PIS (0.65%) and COFINS (3%) are levied, under the cumulative regime, as well as ISS, with municipal rates ranging between 2% and 5%. In this regime, the total tax burden on revenue can be, on average, between 13% and 18%, without considering labor charges.

In the Actual Profit, taxation is levied on the company's adjusted accounting result. The IRPJ is applied at the rate of 15%, with an additional 10% on the profit that exceeds the quarterly limit, while the CSLL is levied at the rate of 9%. Contributions to PIS (1.65%) and COFINS (7.6%) are calculated under the non-cumulative regime, allowing the use of credits on certain costs and expenses. Even so, the high joint tax rate of 9.25% on revenues makes

this regime onerous for service companies with reduced margins. Added to this is the incidence of ISS, according to the applicable municipal legislation.

Regardless of the tax regime, service companies in Brazil are subject to high payroll charges, with emphasis on the employer's contribution to the INSS – National Institute of Social Security (20%), the Guarantee Fund for Length of Service (FGTS) at the rate of 8%, in addition to indirect costs arising from the thirteenth salary, paid vacation plus the constitutional third and other obligations provided for in the Consolidation of Labor Laws (CLT). These charges significantly increase the operating cost of companies.

Thus, considering the combination of taxes levied on revenue, income and payroll, the effective tax burden of the service sector in Brazil can exceed 20% of gross revenue, reaching substantially higher levels when considering labor charges.

4.2 TAXATION OF THE SERVICE SECTOR IN PARAGUAY

In Paraguay, the results show a significantly more simplified and less onerous tax structure. The provision of services is subject to the *Impuesto al Valor Agregado* (VAT) at the rate of 10% and to the *Impuesto a la Renta Empresarial* (IRE), also of 10%, according to the legislation in force. For micro and small companies, simplified regimes further reduce the tax burden, either by applying fixed monthly amounts or by excluding the incidence of VAT. In practice, the effective tax burden on the service sector remains considerably lower than in Brazil, reflected in lower operating costs and greater attractiveness for the installation of enterprises.

In the social security sphere, the incidence is concentrated in the *Institute of Social Prediction* (IPS), with an employer's contribution of 16.5% and a worker's contribution of 9%, both calculated on the declared remuneration. This model, simpler and with lower percentages than those practiced in Brazil, contributes to reducing the cost of payroll and reinforces the country's competitive advantage for labor-intensive companies.

In addition to social security charges, the cost of labor in Paraguay is influenced by more flexible labor rules when compared to Brazilian ones. The regular working day is up to 48 hours per week, distributed in up to eight hours per day, according to the *Paraguayan Labor Code*. Annual leave varies according to the length of service, being 12 days after the first year, 18 days after five years and 30 days after ten years of employment.

The *aguinaldo* in Paraguay corresponds to 1/12 of the total remuneration received by the worker throughout the year, equivalent, in the case of fixed salary, to a full monthly salary, and, in the case of variable remuneration, to the annual monthly average. Despite this obligation, the lower employer's social security burden and the simpler structure of labor

obligations result in a total labor cost significantly lower than that observed in Brazil and Argentina, reinforcing the competitiveness of service companies installed in the country.

This lean and predictable tax structure facilitates tax compliance and reduces administrative costs. As a result, Paraguay has used tax policy as an instrument to stimulate economic activity, attracting investments and promoting the formalization of businesses, especially in regions close to the Brazilian border. In the service sector, this advantage is clearly manifested through greater operational flexibility and more competitive pricing.

4.3 TAXATION OF THE SERVICE SECTOR IN ARGENTINA

The taxation of the service sector in Argentina is characterized by the coexistence of federal and provincial taxes, resulting in a high tax burden and strong cumulativeness. Companies are subject to national taxes, such as the *Impuesto al Valor Agregado* (VAT), at the rate of 21%, and the *Impuesto a las Ganancias*, whose rate can reach 30% on profit, in addition to provincial taxes, especially the *Impuesto sobre los Ingresos Brutos*, applied by the provinces, including Misiones, with rates ranging from 2% to 5%, according to economic activity.

This combination of taxes generates a significant incidence on both the revenue and the results of service companies, especially in border regions. In addition, the labor cost in Argentina is pressured by social contributions administered by the AFIP and by obligations provided for in the *Labor Contract Law*.

In the social security cut, the normative basis of the contributory system is established in Law No. 24,241/1993, which established the Integrated System of *Jubilations and Pensions* (SIJP), currently integrated into the Argentine Integrated *Forecast System* (SIPA). The employer's contribution rates are not concentrated in a single legal provision, but are defined by decrees and complementary resolutions published in the Official Gazette, as well as by regulations of the AFIP and ANSES. In practice, employers' social security contributions are, in aggregate, at levels higher than 20% of the payroll, and can reach percentages close to 25%, depending on the size and sectoral framework of the company.

In the field of labor legislation, Argentina has rules that also raise the cost of labor. The standard working day is up to 48 hours per week, under the terms of the *Labor Contract Law*, with a mandatory additional for overtime. Annual leave is granted progressively, varying between 14 and 35 calendar days, depending on the worker's length of service.

The Argentine legal system also provides for the payment of the *Sueldo Anual Complementario* (SAC), equivalent to the thirteenth salary in Brazil or *aguinaldo* in Paraguay, paid in two semiannual installments, corresponding to 50% of the highest monthly

remuneration received in each semester. These labor rights, added to the high employers' social security contributions, significantly increase the cost of labor, impacting the competitiveness of service companies, especially in border regions.

This structure results in a high total tax burden and significant cumulativeness, directly impacting the cost of labor and the sustainability of service companies. In order to summarize the main labor differences between the countries analyzed, Chart 1 presents a comparison of the charges levied on working hours and the remuneration of workers in the service sector.

Table 1

Comparative Labor Charges

Element	Brazil	Paraguay	Argentina
Working hours	Up to 44 hours per week	Up to 48 hours per week	Up to 48 hours per week
Overtime	Minimum additional 50%	Minimum additional 50%	Minimum additional 50%
Holidays	30 days after 12 months + 1/3 constitutional	12 to 30 days, depending on the length of service	14 to 35 calendar days, depending on length of service
13th salary	Yes – Christmas Bonus	Yes – Aguinaldo (1/12 of the annual remuneration)	Yes – Complementary Annual Sueldo (SAC) in 2 installments
Employer's social security contribution	INSS 20% + FGTS 8%	SPI 16.5%	>20% and can reach 25%
Regulatory complexity	High	Low	High
Impact on labor cost	Elevated	Reduced	Elevated

Source: Prepared by the authors based on current labor and social security legislation (2025).

It is noteworthy that chart 1 presents the main labor charges provided for in the general legislation of the countries analyzed, focusing on the minimum mandatory elements applicable to the service sector. A more detailed analysis of labor relations may reveal other rights, additional and benefits, arising from specific norms of professional categories, which were not contemplated in this study. Thus, the data presented should be understood as a basic normative synthesis, suitable for comparison between labor systems, without prejudice to the existence of provisions that are more favorable to workers in specific sectoral or business contexts.

4.4 COMPARISON OF TAX SYSTEMS AND IMPACTS ON COMPETITIVENESS

The comparative analysis shows relevant tax asymmetry between the countries surveyed. Brazil and Argentina have systems characterized by a high tax burden, regulatory complexity, and high labor costs, while Paraguay stands out for a simpler model, with lower tax incidence and reduced operating costs. Chart 2 summarizes the main taxes levied on the

service sector in the Triple Border countries, allowing a comparative view of the structural differences between the tax systems analyzed.

Table 2

Comparison of the Taxation of the Services Sector in the Triple Frontier (2025)

Tribute / Aspect	Brazil	Paraguay	Argentina
Subnational taxation on services	ISS (municipal): 2% to 5%, according to local legislation for companies of the Presumed Profit and Real Profit	Not applicable	Gross Revenues (Provincial): 2% to 5%, depending on the province
Taxation on turnover (national)	Presumed Profit: PIS/COFINS at rates of 3.65% (cumulative); Actual Profit: PIS and CONFINS 9.25% (non-cumulative); Simples Nacional: unified rates between 6% and 33%	VAT: 10%	VAT: 21%
Taxation on income/profit	Actual Profit: IRPJ + CSLL: up to 34% on adjusted net income; Presumed Profit: Base of 32% on revenues at rates of 15% and 9% or direct percentages of 4.8% of IRPJ and 2.88% of CSLL.	IRE: 10%	Impuesto a las Ganancias: up to 30%
Tax cumulativeness	Partial, according to the tax regime adopted	No	Yes
Complexity of the tax system	High (plurality of regimes, taxes and ancillary obligations)	Low	High
Relative tax burden on services	High, especially when considering labor charges	Reduced	Elevated
Impact on regional competitiveness	Unfavorable	Favorable	Unfavorable

Source: Prepared by the authors based on the tax legislation in force in the three countries (2025).

These differences directly influence regional competitiveness, affecting decisions on business location, business structuring and service offering. In a sector that is highly sensitive to costs and with high geographic mobility, taxation plays a decisive role in attracting or displacing economic activities.

4.5 CRITICAL DISCUSSION OF THE RESULTS

The comparative analysis of the tax and labor systems shows that taxation has a direct and relevant impact on the competitiveness of the service sector in the Triple Border. The differences between Brazil, Paraguay and Argentina are not restricted to the normative level, but are materialized in the cost structure, in the formation of prices and in the ability of companies to remain in an environment characterized by high competition and intense geographic integration.

In Brazil, the high tax burden on revenues and income, associated with significant labor charges, such as the employer's contribution to the INSS, the FGTS, the thirteenth salary, paid vacations plus the constitutional third and the normative rigidity of the Consolidation of Labor Laws, results in an operating cost significantly higher than that observed in neighboring countries. This scenario compromises the competitiveness of service companies, especially those that are labor-intensive, predominant in the tourist and commercial segments of the border region.

Argentina, although it has a different tax structure from Brazil, also reveals factors that compromise the competitiveness of the service sector. The cumulative incidence of federal and provincial taxes, associated with employers' social security contributions that can reach levels close to 25% of the payroll, significantly increases the cost of labor and reduces the attractiveness for the installation of new enterprises.

In contrast, Paraguay has a fiscal and labor environment that is more favorable to competitiveness. The reduced rates of the *Impuesto al Valor Agregado* (VAT) and the *Impuesto a la Renta Empresarial*, associated with a less onerous employer's pension structure and more flexible labor rules, result in lower labor costs and greater tax predictability. This configuration allows Paraguayan companies to operate with greater competitiveness in terms of price and attractiveness for investments, especially in border regions.

In addition to the simplified tax structure and lower labor charges, Paraguay has used specific fiscal policy instruments to attract foreign investment, with emphasis on the Maquila regime, instituted by Law No. 1,064/1997 and regulated by complementary rules. This regime allows foreign companies, including Brazilian ones, to carry out production processes or provision of services in Paraguayan territory with reduced taxation, upon payment of a single tax of 1% on the value added in the country, in addition to relevant exemptions on taxes levied on the import of inputs and on the export of the resulting products or services. In practice, the Maquila Law has encouraged the relocation of Brazilian business activities, especially those labor-intensive and cost-sensitive, to regions close to the border, reinforcing Paraguay's competitive advantage in the context of the Triple Border and amplifying the effects of the tax asymmetries identified in this study.

Thus, the results confirm that the competitiveness of the service sector in the Triple Border is strongly conditioned by the tax and labor asymmetries between the countries analyzed. In frontier contexts, in which business location decisions are facilitated by geographical proximity, simpler and less onerous tax systems tend to become decisive

competitive advantages, while more complex and onerous structures impose relevant constraints on the economic performance of companies.

5 FINAL CONSIDERATIONS

This study comparatively analyzed the taxation levied on the service sector in the countries that make up the Triple Border (Brazil, Paraguay and Argentina) and its impacts on business competitiveness in an economic space characterized by high mobility of activities and intense regional integration. The results show that the structural differences between the tax and labor systems exert a direct influence on the decisions of location, operation and sustainability of companies in the service sector.

The analysis showed that the Brazilian tax system imposes a high tax burden and significant administrative complexity on service companies, especially due to the multiplicity of taxes levied on revenue, income and payroll, in addition to significant labor charges. This configuration compromises the competitiveness of companies installed in the Brazilian territory against competitors established in neighboring countries with simpler and less costly systems.

Similarly, Argentina has an onerous tax environment, marked by the cumulativeness of federal and provincial taxes and employers' social security charges, in addition to rigidity in labor standards. These factors increase the cost of labor and reduce the country's attractiveness for the installation and maintenance of enterprises in the service sector, especially in border regions.

In contrast, Paraguay stands out for its leaner tax system, with reduced tax rates, less regulatory complexity, and less onerous labor charges. This model has been used as an economic policy instrument to attract investments, conferring a competitive advantage to companies established there, especially in labor-intensive and cost-sensitive activities, such as those predominant in the service sector of the Triple Border.

It should be noted that the results of this study should be interpreted in light of the context of transition of the Brazilian tax system, resulting from the Tax Reform instituted by Constitutional Amendment No. 132/2023 and regulated by Complementary Law No. 214/2025. This legislation establishes the gradual replacement of taxes levied on consumption, such as the Tax on Services (ISS), the Social Integration Program (PIS) and the Contribution to the Financing of Social Security (COFINS), by the Tax on Goods and Services (IBS) and the Contribution on Goods and Services (CBS), structured under the dual Value Added Tax (VAT) model, with a transition schedule scheduled between the years 2026 and 2033.

From a theoretical point of view, the adoption of the VAT model tends to reduce tax cumulativeness and simplify the system, representing a relevant institutional advance in relation to the previous model, especially for the service sector, historically burdened by multiple incidences on revenue. However, in the context of the Triple Border, the effectiveness of the reform in terms of competitiveness is still uncertain, since the reference rate of the new system may keep Brazil at a higher tax level than that observed in neighboring countries, such as Paraguay and Argentina.

Moreover, while the reform promises gains in simplicity and transparency, there is no evidence to date that the overall tax burden on the services sector will be significantly reduced. For labor-intensive activities, the replacement of taxes on turnover by a VAT with a high rate may not fully eliminate the negative competitive differential identified in this study, especially when the labor and social security charges still in force in the Brazilian legal system are considered together.

Thus, the Brazilian tax reform, although it represents a relevant institutional advance, does not eliminate, at least in the short and medium term, the fiscal asymmetries that affect the competitiveness of the service sector in the Triple Border. The results of this study remain current and relevant, indicating that Brazil will continue to face structural challenges to compete with simpler and less onerous tax systems adopted by neighboring countries.

As a limitation of the study, the predominantly normative and structural focus stands out, without the individualized measurement of financial impacts by company. Even so, the results offer relevant subsidies for the academic and institutional debate on taxation and competitiveness in border regions. It is recommended that future research deepen the empirical analysis, incorporating business case studies and evaluating the practical effects of the Brazilian tax reform and possible tax harmonization processes within the scope of Mercosur.

It is concluded that tax harmonization, the reduction of regulatory complexity and the review of the charges levied on the service sector are fundamental to mitigate tax asymmetries and promote a more balanced competition environment in the Triple Border, contributing to sustainable regional development and strengthening the service sector.

ABSTRACT

This article analyzes the legal and economic challenges related to the installation and operation of data centers in Brazil, considering their nature as critical infrastructure and their growing importance in the digital economy. It examines energy demand, technological alternatives for continuous electricity supply, as well as environmental and regulatory impacts. Legislative initiatives in progress and public policy proposals aimed at consolidating a specific regulatory framework are evaluated. The thesis defended is that Brazil's competitiveness in the data economy depends on the creation of a stable regulatory environment, integrated with energy and environmental policies, capable of guaranteeing legal certainty and attracting long-term investments.

Keywords: Data Centers. Energy. Regulation. Critical Infrastructure. Economic Law.

RESUMO

O presente artigo analisa os desafios jurídicos e econômicos relacionados à instalação e operação de data centers no Brasil, considerando sua natureza de infraestrutura crítica e sua crescente importância na economia digital. Examina-se a demanda energética, as alternativas tecnológicas para suprimento contínuo de eletricidade, bem como os impactos ambientais e regulatórios. São avaliadas iniciativas legislativas em tramitação e propostas de política pública voltadas à consolidação de um marco regulatório específico. A tese defendida é a de que a competitividade do Brasil na economia de dados depende da criação de um ambiente regulatório estável, integrado às políticas energéticas e ambientais, capaz de garantir segurança jurídica e atrair investimentos de longo prazo.

RESUMEN

Este artículo analiza los desafíos jurídicos y económicos relacionados con la instalación y operación de centros de datos en Brasil, considerando su naturaleza como infraestructura crítica y su creciente importancia en la economía digital. Se examinan la demanda energética, las alternativas tecnológicas para el suministro continuo de electricidad, así como los impactos ambientales y regulatorios. Se evalúan iniciativas legislativas en curso y propuestas de políticas públicas orientadas a la consolidación de un marco regulatorio específico. La tesis defendida es que la competitividad de Brasil en la economía de los datos depende de la creación de un entorno regulatorio estable, integrado con las políticas energéticas y ambientales, capaz de garantizar seguridad jurídica y atraer inversiones a largo plazo.

1 INTRODUCTION

The increasing digitalization of the economy has amplified the relevance of data centers as essential elements of informational infrastructure. These facilities support financial, governmental, logistical, and communication systems, becoming indispensable components for the functioning of contemporary societies. The legal and administrative literature has recognized such structures as critical infrastructure, a term used in Decree No. 9,573 of 2018, which approves the National Policy for Critical Infrastructure Security (PNSIC), to designate services whose disruption severely affects the State and society.

This policy is set forth in the Annex to the aforementioned Decree, defining its essential content and aiming to ensure the security and resilience of the country's critical infrastructures, safeguarding the continuity of their services³.

Critical infrastructures are understood as facilities, services, assets, and systems whose interruption or destruction, in whole or in part, may cause serious social, environmental, economic, political, or international impacts, or threaten the security of the State and society. The policy also defines concepts such as critical infrastructure security, interdependence among critical infrastructures, and resilience.

From a strictly legal standpoint, the investments in large data centers mentioned herein are not expressly contemplated in Brazilian regulations on “critical infrastructures.” However, they may be classified as such should the Executive Branch so determine, given that the current legal regime is open, discretionary, and dependent on complementary administrative acts⁴.

³ The National Policy for Critical Infrastructure Security (PNSIC) is grounded in principles such as prevention and precaution based on risk analysis, integration among the Public Authorities, the business sector, and society, reduction of costs arising from security investments, and safeguarding the interests of national defense and security. Among its objectives are the prevention of interruptions in the activities of critical infrastructures or, if interruptions occur, the mitigation of their impacts; the establishment of guidelines and instruments for the protection of infrastructures essential to national security; the integration of data on threats and risks; the identification of interdependencies; and the development of awareness regarding the subject.

The policy also establishes guidelines for integration with other State policies, federative cooperation, coordination with the Brazilian Intelligence System, incentives for public–private partnerships and international cooperation, exchange of knowledge, continuous monitoring of infrastructures, and the permanent updating of security activities. As instruments, it establishes the National Strategy for Critical Infrastructure Security, the National Plan for Critical Infrastructure Security, and the Integrated Data System for Critical Infrastructure Security, defining their fundamental functions, as well as the competencies of the Foreign Affairs and National Defense Chamber of the Government Council and the Institutional Security Office of the Presidency of the Republic for the formulation, approval, and management of these instruments. See: BRASIL. Decreto nº 9.573, de 22 de novembro de 2018. Dispõe sobre a Política Nacional de Segurança de Infraestruturas Críticas. Diário Oficial da União: seção 1, Brasília, DF, 23 nov. 2018, p. 5–6.

⁴ To date, there is no statute in the Brazilian legal system — in the sense of a law enacted by the Legislative Branch — that specifically addresses the subject of ‘critical infrastructures’ with the breadth and scope set forth in Decree No. 9,573 of 2018 (and its subsequent developments), a decree which, as previously noted, approved the National Policy for Critical Infrastructure Security (PNSIC). Instead, the regime governing the protection of critical infrastructures is regulated through infra-legal normative acts (administrative in nature, such as decrees). Subsequently, Decree No. 10,569 of 2020 approved the National Strategy for Critical Infrastructure Security, an instrument guiding the PNSIC; and, more recently, Decree No. 11,200 of 2022 approved the PLANSIC plan,

The central thesis of this article is to demonstrate the energy- related challenges associated with the expansion of data centers in Brazil and to assess whether the sustainable development of the sector in the country requires a coherent regulatory framework aligned with energy, environmental, and technological policies, in order to ensure legal certainty, economic predictability, and operational efficiency, based on an interdisciplinary analysis that integrates technical, economic, and legal aspects. In any event, as will be discussed, it is possible to infer that Brazil possesses the conditions to become a hub; however, its reliance on fossil- fuel thermal power generation and the intermittency of renewable sources call for specific regulatory reforms.

2 DATA CENTERS AS CRITICAL INFRASTRUCTURE: TECHNICAL AND LEGAL ASPECTS

Data centers are characterized by the continuous and large-scale processing of digital information, requiring redundant power supply systems, efficient cooling, and high-speed connectivity. International protection, environment, etc.), clear obligations applicable to private and public entities beyond the direct federal administration, and the establishment of

establishing operational guidelines, institutional-sectoral responsibilities, and governance mechanisms. In other words, the existing regulatory framework is based on decrees and public policies, not on ordinary or supplementary legislation.

This situation likely arises from several factors: (1) the fact that initiatives for the protection of critical infrastructure in Brazil historically developed within the Executive Branch through decrees and administrative orders, without the Legislative Branch having structured its own legal framework; (2) the fact that specialized public bodies in this area, such as the Institutional Security Office of the Presidency of the Republic (GSI-PR) and the Chamber of Foreign Affairs and National Defense (CREDEN), coordinate security actions by virtue of delegations contained in decrees, rather than by statute; and (3) findings of certain recent audits, which have identified gaps regarding institutionalization, governance structure, and inter-agency integration, thereby demonstrating weaknesses in the implementation of the policy — circumstances that reinforce the notion that a more robust and formal legal framework could be beneficial.

Therefore, the 'critical infrastructure' regime in Brazil depends on higher-order normative acts (decrees), and not on a law enacted by the National Congress, a situation that may generate normative fragility, particularly with respect to long-term predictability, compatibility with other laws (energy, telecommunications, data protection, environment, etc.), clear obligations applicable to private and public entities beyond the direct federal administration, and the establishment of a uniform sanctioning framework.

a uniform sanctioning framework studies⁵ show that hyperscale facilities may exceed 100 MW of installed load, demonstrating their reliance on uninterrupted energy supply⁶.

In Brazil, estimates indicate the existence of data center structures of varying sizes, still insufficient to meet the growth associated with the expected expansion in the use of artificial intelligence⁷. The dependence of these facilities on complex and interdependent systems — such as electricity, telecommunications, and cooling — reinforces their legal characterization as critical infrastructure, subject to specific public policies and high-stability regulatory requirements.

Moreover, the strategic nature of these environments demands legal certainty regarding environmental licensing, access to electricity, and installation in areas compatible with water availability and network infrastructure. The absence of a systematized regulatory framework creates uncertainty for investors, consistent with warnings raised in the economic law literature⁸.

The development of a regulatory framework for the data center sector in Brazil requires a comprehensive normative approach capable of ensuring legal certainty, economic efficiency, personal data protection, operational stability, and environmental sustainability.

⁵ According to the IEA, hyperscale data center facilities rank among the largest individual energy consumers in the digital sector, frequently exceeding 100 MW of installed load— a level comparable to that of medium-sized industrial units. The IEA emphasizes that these facilities operate continuously and are highly sensitive to interruptions or fluctuations in voltage and frequency, which requires stable, redundant, and high-quality electricity supply. The magnitude of this demand poses significant challenges for energy planning, particularly regarding the need for dedicated substations, transmission reinforcement, and integration with high-voltage networks. Moreover, the expansion of these centers — driven by artificial intelligence applications and high-performance computing — puts pressure on generation capacity and raises questions about the compatibility between uninterrupted consumption and the intermittency of renewable sources. In this context, the observation that hyperscale installations may exceed 100 MW demonstrates not only their structural dependence on continuous supply but also the strategic nature of this sector for national power-system planning and security. International Energy Agency (IEA). *Electricity* 2023. Paris, 2023, p. 45-51.

⁶ It is noted that hyperscale infrastructures already exceed 200 MW in a few cases, with a growing trend. INTERNATIONAL ENERGY AGENCY (IEA). *Data Centres and Data Transmission Networks* 2023. Paris: IEA, 2023. p. 23–25; ver também: MCKINSEY & COMPANY. *The Data Center Opportunity*. New York: McKinsey, 2023. p. 11–13; UNITED STATES. Department of Energy (DOE). *Energy Consumption in Data Centers*. Washington, D.C.: DOE, 2022. p. 9–10.

⁷ Some analyses highlight the accelerated increase in the use of artificial intelligence by Brazilian companies, the consequent rise in demand for processing capacity, the fact that data centers dedicated to AI training remain, to a large extent, located outside the country, and the projections for the expansion of installed data center capacity in Brazil (from approximately 740 MW in 2024 to 1,210 MW in 2029). These elements underscore the need to expand existing infrastructure in order to keep pace with AI-driven growth. MOODY'S LOCAL BRASIL. *Setor de data centers no Brasil: fundamentos, perspectivas e tendências*. São Paulo: Moody's Local Brasil, 1 abr. 2025, p. 6 e 7.

⁸ According to Richard Posner, the central function of law is to promote efficiency by reducing social and transactional costs. The author argues that legal uncertainty increases transaction costs, discourages investment, and reduces the market's ability to allocate resources efficiently, whereas clear and predictable rules lower the cost of economic decision-making—hence why efficient legal systems tend to generate greater investment and growth. Moreover, ventures such as large data centers involve extremely high CAPEX with long-term returns—a classic type of activity in which, according to Posner, legal certainty is a condition for economic rationality. After all, for this author, environments characterized by uncertainty lead investors to demand higher risk premiums. POSNER, Richard. *Economic Analysis of Law*. 2007, p. 120-123.

This is a capital -, energy -, and technology-intensive sector, strategic for the country's digital infrastructure, including applications in cloud computing, artificial intelligence, essential public services, and high-capacity communications.

Accordingly, regulation must establish clear parameters for the installation, operation, and oversight of such facilities, in order to harmonize private, collective, and governmental interests.

Initially, it is necessary to define data centers in legal terms, along with their modalities — such as hyperscale, colocation, edge, and public, private, or hybrid clouds — with classification criteria based on size, energy capacity, and level of criticality. From these categories, it becomes possible to regulate environmental and urban licensing, establishing zoning rules, land-use requirements, construction standards, noise limits, and physical security parameters, while observing the particularities of facilities dedicated to processing sensitive data or providing public-interest services.

Another central axis concerns energy infrastructure, given that data centers depend on continuous and stable electrical power. The regulatory framework must include rules for grid connection, energy procurement in the regulated or free markets, the use of renewable sources, efficiency mechanisms (such as PUE⁹, WUE¹⁰, and CUE¹¹ indicators), and redundancy requirements. These measures help ensure operational continuity and encourage the adoption of sustainable cooling, energy- storage, and thermal-management technologies.

In the field of cybersecurity and data protection, the framework must align with the General Data Protection Law (LGPD) and the guidelines of the National Data Protection Authority (ANPD), while also engaging with international technical standards such as ISO

⁹ PUE is the most widely used indicator for measuring the energy efficiency of a data center. It expresses the ratio between 'Total Energy' divided by 'Energy Consumed Exclusively by IT Equipment.' The indicator measures how much energy is spent on auxiliary systems (cooling, UPS, lighting, etc.) relative to effective processing. UNITED STATES. Department of Energy. Energy Efficiency in Data Centers: Best Practices Guide. Washington, D.C.: DOE, 2022. p. 14–17.

¹⁰ WUE measures the water efficiency of a data center and is expressed as 'Water Consumed in the Data Center (liters/year)' divided by 'Energy Consumed by IT Equipment (kWh).' The indicator seeks to capture the water impacts of cooling systems, particularly in facilities that use cooling towers, adiabatic cooling, or evaporative free cooling". THE GREEN GRID. Water Usage Effectiveness (WUE™): A Green Grid Data Center Sustainability Metric. Beaverton: The Green Grid, 2011.p. 4–7.

¹¹ CUE quantifies the carbon impact associated with a data center's energy consumption and is calculated by dividing the facility's 'Annual CO₂ Emissions' by the 'Energy Consumed by IT Equipment (kWh).' This indicator depends on the local electricity mix, as indirect emissions vary according to the energy source (coal, gas, hydropower, solar, nuclear, etc.). INTERNATIONAL ENERGY AGENCY (IEA). Data Centres and Data Transmission Networks 2023. Paris: IEA, 2023. p. 14–18.

27001¹², ISO 27701¹³, and NIST¹⁴. It is essential to establish obligations for incident prevention and notification, auditing mechanisms, business continuity plans, operational redundancy, and specific requirements for processing governmental data and critical infrastructures, thereby ensuring the integrity, confidentiality, and availability of information.

Environmental sustainability constitutes another essential element. Given the high demand for energy and water, particularly for cooling, the framework must establish criteria for water management, energy efficiency, emissions inventories, sustainable construction standards, and recycling of electronic equipment. These parameters promote responsible practices and align the sector with national and international environmental goals.

Connectivity regulation is also relevant, particularly in coordination with the National Telecommunications Agency (Anatel), to address network requirements, link redundancy, service-quality metrics (latency, availability), and compatibility with 5G and 6G policies and edge computing¹⁵. Addressing these aspects is fundamental to ensure interoperability and high availability of the services provided.

¹² ISO 27001 is the leading international standard for information security management, establishing requirements for creating, implementing, maintaining, and continually improving an Information Security Management System (ISMS). Its purpose is to: protect the confidentiality, integrity, and availability of information; establish security controls (technical, administrative, and physical); and standardize cybersecurity risk governance. INTERNATIONAL ORGANIZATION FOR STANDARDIZATION; INTERNATIONAL ELECTROTECHNICAL COMMISSION. ISO/IEC 27001:2022 — Information security, cybersecurity and privacy protection — Information security management systems — Requirements. Geneva: ISO/IEC, 2022. p. v–vi, 1–5.

¹³ ISO 27701 is an extension of ISO 27001 focused on privacy and the protection of personal data, establishing the Privacy Information Management System (PIMS). The purpose of this standard is to: operationalize requirements inspired by data protection laws (such as the LGPD and GDPR); guide measures for data governance, minimization, retention, and privacy controls; define the roles of controller and processor; and enable privacy audits. INTERNATIONAL ORGANIZATION FOR STANDARDIZATION; INTERNATIONAL ELECTROTECHNICAL COMMISSION. ISO/IEC 27701:2019 — Security techniques — Extension to ISO/IEC 27001 and ISO/IEC 27002 for privacy information management — Requirements and guidelines. Geneva: ISO/IEC, 2019. p. 1–8, 15–18.

¹⁴ NIST is not a standard, but rather a United States federal agency responsible for producing technical standards and guidelines widely used in cybersecurity, risk management, and digital infrastructure. The most relevant documents issued by the agency include: the NIST Cybersecurity Framework (NIST CSF), a global reference model for cybersecurity risk management; NIST SP 800-53, a catalog of security controls for information systems; NIST SP 800-171, which establishes requirements for protecting sensitive information in non-governmental environments; and the NIST AI Risk Management Framework (2023), which provides guidelines for governance and risk mitigation in artificial intelligence systems. NIST is today the principal international reference in the field of cybersecurity and, in Brazil as well, its guidelines influence IT practices, public policies, audits, and internal corporate standard. NIST Cybersecurity Framework (CSF) - NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY. The NIST Cybersecurity Framework (CSF) 2.0. Gaithersburg, MD: NIST, 2024. p. 1–7, 11–15; NIST SP 800-53 – Catálogo de controles de segurança - NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY. Security and Privacy Controls for Information Systems and Organizations (NIST SP 800-53, Revision 5). Gaithersburg, MD: NIST, 2020. p. 1–13; NIST AI Risk Management Framework - NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY. Artificial

Intelligence Risk Management Framework (AI RMF 1.0). Gaithersburg, MD: NIST, 2023. p. 1–10, 13–18.

¹⁵ Policies for 5G and 6G refer to the set of governmental and sectoral strategies, regulations, and initiatives aimed at guiding the development, deployment, security, and use of emerging technologies. They are crucial because 5G and 6G (the successor to 5G), as well as edge computing policy, are not merely technological enhancements; rather, they constitute foundational digital infrastructures that reshape the economy, national

The regulatory framework must also consider mechanisms for economic incentives and regional development, such as tax regimes conditioned on efficiency and sustainability targets, the creation of digital-interest zones, and the promotion of technological hubs. In addition, it must provide guidelines for attracting foreign investment, fostering technological partnerships, and supporting research and development in emerging fields such as quantum computing and advanced cooling.

Nonetheless, it is important to emphasize that institutional governance must be clearly structured, defining the competencies of regulatory and supervisory bodies and inspection procedures carried out by the Ministry of Mines and Energy, the Ministry of the Environment and Climate Change, among others. Only through coherent coordination among these institutions will it be possible to ensure the effectiveness of the regulatory framework, avoiding overlaps, gaps, and legal uncertainty.

3 ENERGY, SUSTAINABILITY, AND REGULATORY CHALLENGES

The continuous operation of data centers imposes a high energy demand, with loads exceeding several tens of megawatts. The adoption of renewable sources — solar and wind — faces limitations arising from the natural intermittency of these resources, which compromises the continuous supply required for critical infrastructures.

Although energy storage technologies may mitigate such variability, their cost still represents a significant obstacle¹⁶.

security, and social life. The 5G strategy corresponds to the fifth generation of mobile technology, whereas 6G refers to the sixth generation, encompassing more advanced standards for mobile broadband networks. The expression ‘Edge Computing’ refers to a distributed computing model that brings data processing and storage closer to the source that generated them (referred to as the ‘edge’ of the network), instead of sending them to a centralized data center or to the cloud. Its advantages include: drastically reducing latency and required bandwidth, being essential for real-time applications such as autonomous vehicles, remote surgery, and industrial automation; promoting the development of regional micro-data centers; establishing interoperability standards; ensuring the security and privacy of data processed locally; and fostering business models based on edge services. INTERNATIONAL TELECOMMUNICATION UNION (ITU). IMT-2020: Framework and overall objectives of the future development of IMT for 2020 and beyond (ITU-R M.2083-0). Geneva: ITU, 2015. p. 11–25. INTERNATIONAL TELECOMMUNICATION UNION (ITU). IMT-2030 Framework for 6G (Draft Technical Report). Geneva: ITU, 2023. p. 7–22, 28–35. EUROPEAN UNION AGENCY FOR CYBERSECURITY (ENISA). Edge Computing: Benefits, Risks and Best Practices. Athens: ENISA, 2021. p. 9–23, 31–35. 16 According to Edenhofer, the integration of high and continuous electrical loads—such as those of data centers—faces structural challenges when dependent on intermittent renewable sources, whose variable output does not, by itself, meet the requirements of uninterrupted operation. The report acknowledges that storage technologies may reduce such variability; however, it emphasizes that their costs remain high, limiting large-scale adoption. Thus, the reliability of critical infrastructures depends on technological combinations and energy arrangements capable of ensuring stable and secure supply. EDENHOFER, Ottmar. Climate Change 2014: Mitigation of Climate Change. Cambridge, 2014, p. 879-882.

¹⁶ According to the IAEA, SMRs represent a significant evolution in nuclear technology, characterized by reduced power output, modularity, and the possibility of standardized manufacturing in an industrial environment. This approach allows for lower capital costs, accelerated deployment, and greater siting flexibility, including in regions with limited electrical infrastructure. These reactors incorporate enhanced passive safety features, reducing the need for human intervention and increasing operational robustness. Moreover, they can operate in a stable load regime, making them suitable for supporting electric systems with high penetration of renewables. However,

In this context, other alternatives are evaluated, such as biofuels, whose viability depends on regional logistics; thermal generation, which carries non-negligible environmental impacts; Small Modular Reactors (SMRs)¹⁷, still in a phase of technological maturation¹⁸; and direct connection to the National Interconnected Power System (SIN), viewed as a more stable solution¹⁹.

These options entail legal challenges related to energy policy, decarbonization goals, and environmental licensing, requiring sophisticated regulatory capacity on the part of the State.

In this scenario, the State must also assess the issue of water- based cooling, which, when adopted, tends to rely on closed-loop systems so as to minimize losses. Current examples indicate optimized levels of losses below 2% per year²⁰, thereby reducing environmental pressure associated with water use.

4 LEGISLATIVE INITIATIVES AND PUBLIC POLICIES UNDER DEVELOPMENT

their commercial development depends on regulatory advances, international standardization, and demonstration of economic viability at scale. INTERNATIONAL ATOMIC ENERGY AGENCY (IAEA). *Advances in Small Modular Reactor Technology*. Viena, 2020, p.29- 37.

¹⁷ According to Edenhofer, the integration of high and continuous electrical loads—such as those of data centers—faces structural challenges when dependent on intermittent renewable sources, whose variable output does not, by itself, meet the requirements of uninterrupted operation. The report acknowledges that storage technologies may reduce such variability; however, it emphasizes that their costs remain high, limiting large-scale adoption. Thus, the reliability of critical infrastructures depends on technological combinations and energy arrangements capable of ensuring stable and secure supply. EDENHOFER, Ottmar. *Climate Change 2014: Mitigation of Climate Change*. Cambridge, 2014, p. 879-882.

¹⁸ According to Nayar et al., technological consolidation in the data center sector is directly related to advances in high-power energy storage systems, which are essential for ensuring continuity, stability, and operational efficiency. The authors highlight that data centers require fast response times, high reliability, and the capacity to withstand sudden load variations—factors that drive the adoption of technologies such as lithium-ion batteries, supercapacitors, and flywheels. These solutions have been undergoing a maturation phase, with improvements in energy density, durability, safety, and cost per cycle. Nayar et al. note that intelligent integration among storage, thermal management, and power-quality systems constitutes a central element of this consolidation phase, enabling greater autonomy, emissions reduction, and compatibility with intermittent renewable sources. However, they emphasize that cost and scalability challenges still limit full adoption in large-scale projects. NAYAR, Chemmangot V. et al. *High-Power Energy Storage Systems*. London, 2020, p. 303-320.

¹⁹ Direct connection to the SIN system constitutes, for facilities classified as critical, the most stable and predictable alternative for electricity supply. The SIN offers greater capacity to respond to demand fluctuations; reduced risk of interruptions due to the interconnection of multiple sources and regions; operational standardization through unified quality and safety criteria; and structural redundancy, which mitigates local or regional failures. TRIBUNAL DE CONTAS DA UNIÃO (TCU). *Relatório de Auditoria Operacional sobre Infraestrutura Crítica*. 2021, p. 58-60.

²⁰ According to ASHRAE, liquid cooling systems in data centers require careful technical and regulatory assessment, particularly regarding the use of natural resources and compliance with environmental standards. The organization emphasizes that closed-loop systems are the recommended practice, as they significantly reduce water consumption, achieving losses of less than 2% per year in optimized facilities. These systems enhance thermal efficiency but require appropriate infrastructure, continuous monitoring, and compliance with environmental and safety regulations—factors that pose regulatory challenges for authorities responsible for licensing and energy policy. ASHRAE – American Society of Heating, Refrigerating and Air-Conditioning Engineers. *ASHRAE Datacom Series – Liquid Cooling Guidelines for Datacom Equipment Centers*. Atlanta: ASHRAE, 2016. p. 56–62, 103–105.

Brazil currently has no federal statute—meaning a law enacted by the Legislative Branch—that specifically regulates investments in large data centers or establishes a dedicated legal framework for this type of enterprise. What exists today are scattered sectoral norms — concerning telecommunications, electricity, data protection, tax incentives, or innovation — that affect the deployment and operation of data centers but do not constitute a legal regime dedicated to the sector.

Examples of such legislation include the General Telecommunications Law (Law No. 9,472 of 1997), the Brazilian Internet Bill of Rights (Law No. 12,965 of 2014), the General Data Protection Law – LGPD (Law No. 13,709 of 2018), as well as the Electricity Law and related statutes (such as Laws No. 9,074 of 1995 and 9,427 of 1996, among others). None of these laws treat data centers as a distinct regulatory category. They apply indirectly, but none creates obligations, benefits, or specific regulatory treatment for the installation, operation, or attraction of large data centers.

Nevertheless, there are relevant infra-legal norms, although none directed toward investment. In these cases, data centers appear only as essential infrastructure or strategic equipment within certain administrative instruments, such as decrees on digital strategy, cybersecurity, and critical infrastructure (although they do not expressly classify data centers as critical). Norms issued by ANEEL and the electricity system—governing grid access, self-generation, and transmission and distribution tariffs—affect energy costs; resolutions of the National Data Protection Authority (ANPD) govern information security and data governance, but not physical investment; and telecommunications rules from Anatel apply mainly when the data center integrates communication networks. None of these norms establishes incentives, special licensing categories, or a distinct legal status for the sector.

Regarding federal tax incentives, there is no specific or permanent program aimed at major data center investments. Brazil does not, for instance, have a federal policy to attract hyperscalers, unlike Ireland, Chile, the United States, Singapore, or the United Arab Emirates²¹.

²¹ According to ASHRAE, liquid cooling systems in data centers require careful technical and regulatory assessment, particularly regarding the use of natural resources and compliance with environmental standards. The organization emphasizes that closed-loop systems are the recommended practice, as they significantly reduce water consumption, achieving losses of less than 2% per year in optimized facilities. These systems enhance thermal efficiency but require appropriate infrastructure, continuous monitoring, and compliance with environmental and safety regulations—factors that pose regulatory challenges for authorities responsible for licensing and energy policy. ASHRAE – American Society of Heating, Refrigerating and Air-Conditioning Engineers. ASHRAE Datacom Series – Liquid Cooling Guidelines for Datacom Equipment Centers. Atlanta: ASHRAE, 2016. p. 56–62, 103–105. According to ASHRAE, liquid cooling systems in data centers require careful technical and regulatory assessment, particularly regarding the use of natural resources and compliance with environmental standards. The organization emphasizes that closed-loop systems are the recommended practice, as they significantly reduce water consumption, achieving losses of less than 2% per year in optimized facilities. These systems enhance thermal efficiency but require appropriate infrastructure, continuous

However, certain Brazilian states—particularly São Paulo, Ceará, Rio Grande do Sul, Minas Gerais, and the Federal District—grant ICMS tax benefits for such investments, though these incentives arise from state-level technology promotion programs.

Therefore, it can be said that no federal law exists to regulate investments in large data centers in Brazil, whether as an economic sector, as strategic infrastructure, or as a matter of State policy.

Even so, several bills are currently under consideration— especially those related to digital sovereignty, classification of critical infrastructure, artificial intelligence policy, and the creation of technological zones—which touch upon the need to treat data centers as a strategic sector. Moreover, Congress is presently examining proposals that aim to establish specific rules for data centers, although none has yet been enacted.

Senate Bill No. 3,018 of 2024 addresses data centers dedicated to artificial intelligence, while House Bill No. 2,080 of 2025 creates the National Policy for Energy Efficiency and Socio-environmental Sustainability for Data Centers. Both measures signal a growing awareness of the need for sector-specific regulation.

In parallel, the Executive Branch is preparing the National Data Center Policy (Redata), in the form of a Provisional Measure, providing for tax exemptions, regional development incentives, renewable energy targets, and the reservation of computing capacity for the domestic market. International literature indicates that stable regulatory environments and fiscal incentives play a decisive role in consolidating digital hubs, as demonstrated by the cases of Ireland and Singapore²².

From a legal standpoint, these policies raise issues related to fiscal responsibility, constitutionality of incentives, distribution of competences among federal entities, and integration with sectoral policies— particularly energy and the environment.

Thus, the lack of a specific regulatory framework for large data centers in Brazil results in an environment marked by significant legal uncertainty. Investors seeking to establish or expand such enterprises lack clear normative parameters regarding essential elements such as environmental and urban licensing, energy access and procurement, applicable tax

monitoring, and compliance with environmental and safety regulations—factors that pose regulatory challenges for authorities responsible for licensing and energy policy. ASHRAE – American Society of Heating, Refrigerating and Air-Conditioning Engineers. ASHRAE Datacom Series – Liquid Cooling Guidelines for Datacom Equipment Centers. Atlanta: ASHRAE, 2016. p. 56–62, 103–105.

²² According to O’Riain, Ireland’s consolidation as a digital hub resulted from a combination of regulatory stability, coordinated industrial policies, and aggressive tax incentives, which attracted major technology companies and fostered strong integration with global value chains. The author shows that legal predictability and an investment- friendly environment were decisive for the establishment of data centers and digital operations in the country. Similar policies appear in other international hubs, such as Singapore, demonstrating that stable regulation and economic incentives are structural factors for the development of competitive digital ecosystems. O’RIAIN, Sean. *The Rise and Fall of Ireland’s Celtic Tiger*. Cambridge, 2014, p. 215-231.

regimes, minimum redundancy requirements, and mandatory technical standards. Even though investments have occurred under these conditions (from companies such as Ascenty, Equinix, Scala, etc.), the volume could be greater if the regulatory environment were more structured. This normative gap increases uncertainty and hinders the planning of capital- and infrastructure-intensive projects.

The situation is worsened by excessive administrative discretion. In the absence of uniform guidelines, critical decisions depend on local interpretations—often divergent—by environmental, energy, or urban management authorities, resulting in regulatory asymmetry between regions and undermining the predictability required for long-term investments. Furthermore, the lack of a legal classification of data centers as critical infrastructure prevents their formal prioritization in policies related to energy supply, public security, and civil protection, even though such facilities are essential for the continuity of banking, governmental, telecommunications, and artificial intelligence services. This lack of definition increases the risk of litigation, as the absence of unified legal standards facilitates administrative and judicial challenges, especially in large-scale projects.

From an economic and strategic perspective, the effects are equally significant. Countries with consolidated regulatory frameworks—such as Ireland, Singapore, the United States, and EU member states—have been preferred by major global operators due to legal predictability and the existence of specific incentive regimes. The absence of normative discipline in Brazil results in loss of international competitiveness and higher capital costs, as regulatory risk increases the weighted average cost of capital (WACC) and makes new facilities more expensive to implement. Additionally, there is systemic risk: interruptions in data centers may affect essential sectors, compromising the operation of cloud- and AI-based systems. The lack of a structured national framework also tends to intensify external dependence, as an increasing volume of computational load is transferred abroad, which has implications for Brazilian digital sovereignty.

From an institutional perspective, the situation is concerning. There is no clearly defined sectoral regulatory authority, resulting in coordination failures among bodies such as the Ministry of Mines and Energy (MME), the ANPD, Anatel, the Institutional Security Office (GSI), and other federal and subnational entities. National energy planning does not incorporate a specific methodology for large data centers. Moreover, the absence of a dedicated tariff classification prevents appropriate price signaling and limits incentives for energy efficiency.

Given this scenario, it is concluded that the absence of a regulatory framework constitutes a significant risk to the public interest, national security, and the business

environment. It is therefore recommended that a federal law be enacted addressing the following elements: classification of data centers as critical infrastructure; creation of a specific legal regime for licensing, resilience, data protection, and energy; establishment of Special Digital Infrastructure Zones; implementation of regulatory and tariff incentives conditioned on efficiency and security targets; and the development of integrated federal planning in coordination with states and municipalities.

5 PROPOSALS FOR A COHERENT REGULATORY FRAMEWORK

The construction of a regulatory framework for data centers in Brazil must rest upon three fundamental dimensions, without which it is impossible to establish a legal environment capable of attracting investment, ensuring operational continuity, and promoting national technological development. The first dimension is legal certainty, which requires the formulation of clear and uniform rules regarding environmental licensing, access to networks and energy sources, and the instruments of promotion and economic incentives applicable to the sector. The absence of objective and predictable parameters undermines decision-making by private actors, increases regulatory risk, and raises the cost of capital, particularly in a sector characterized by large-scale undertakings and long-term return horizons.

The second dimension concerns economic efficiency. Data centers are highly energy - and technology-intensive facilities, which is why the regulatory framework must provide tariff rationality, mechanisms for energy procurement compatible with the needs of predictability and continuity of supply, as well as incentives for innovation, adoption of emerging technologies, and continuous performance improvement. Economic efficiency also demands that the regulatory framework harmonize systemic costs, risks of network congestion, and strategies for expanding digital infrastructure, allowing investments to be allocated rationally and in line with market dynamics.

The third essential dimension is environmental sustainability, which must guide the rational use of natural resources — especially water and energy — and establish clear targets for emissions reduction and the promotion of a low-carbon economy. Considering that large data centers play an increasingly significant role in global energy demand, it is imperative that the regulatory framework incorporate mechanisms that encourage efficiency, minimum standards for energy performance, and support for research and development of technological solutions capable of reducing the environmental footprint of these facilities. The incorporation of environmental criteria is not merely a requirement of public policy but an element of international competitiveness, particularly in a market in which major operators prioritize regulatory environments that align with global decarbonization commitments.

The economic law literature consistently records that capital-intensive sectors — such as the data center industry — depend on high levels of regulatory predictability for long-term investment decisions²³. The absence of a stable regulatory framework hinders cost forecasting, the execution of energy supply contracts, and the formulation of corporate strategies, all of which negatively affect the country's attractiveness. Likewise, contemporary regulatory theories highlight the importance of governance models that are flexible, transparent, and evidence-based, capable of responding to rapid technological transformations and disruptive innovations characteristic of the digital economy²⁴. Regulation, in this context, must be dynamic, coordinated, and guided by regulatory impact assessment, ensuring that norms evolve at the same pace as the technologies they seek to govern, without imposing excessive costs or unjustified barriers to economic activity²⁵.

6 FINAL COMMENTS

Brazil possesses relevant conditions to consolidate itself as a hub of digital infrastructure in Latin America, notably due to its availability of renewable energy sources, strategic geographic position, and the growth of the digital services market. However, the absence of an integrated regulatory framework limits the predictability required to attract large-scale investments.

It follows that the consolidation of the sector depends on: (a) legal certainty and regulatory stability; (b) an energy policy aligned with the needs of data centers; (c) robust environmental and technological governance; and (d) incentive mechanisms compatible with energy transition goals and digital sovereignty.

²³ According to Bercovici, capital-intensive sectors require stable regulatory frameworks capable of reducing uncertainties and guiding long-term investment decisions. The author emphasizes that normative predictability is a condition for economic efficiency, as it lowers transaction costs, increases the confidence of private actors, and facilitates coordination between the State and the market. Without regulatory stability, structural investments—such as those required for digital or industrial infrastructure—tend to be postponed or become more costly, thereby undermining development. Thus, clear and consistent regulation is a central element of economic policy in sectors of high complexity and substantial CAPEX. BERCOVICI, Gilberto. *Direito Econômico*. São Paulo: Malheiros, 2018, p77-85.

²⁴ According to Bercovici, capital-intensive sectors require stable regulatory frameworks capable of reducing uncertainties and guiding long-term investment decisions. The author emphasizes that normative predictability is a condition for economic efficiency, as it lowers transaction costs, increases the confidence of private actors, and facilitates coordination between the State and the market. Without regulatory stability, structural investments—such as those required for digital or industrial infrastructure—tend to be postponed or become more costly, thereby undermining development. Thus, clear and consistent regulation is a central element of economic policy in sectors of high complexity and substantial CAPEX. BERCOVICI, Gilberto. *Direito Econômico*. São Paulo: Malheiros, 2018, p77-85.

²⁵ It must be considered, however, that the existence of the National Interconnected Power System (SIN) is itself a means of mitigating the limitations of each generation source — in other words, the SIN already performs the function of managing the intermittency of It must be considered, however, that the existence of the National Interconnected Power System (SIN) is itself a means of mitigating the limitations of each generation source — in other words, the SIN already performs the function of managing the intermittency of

A coherent regulatory system will enable Brazil to compete globally, strengthen its critical infrastructure, and expand its capacity for innovation.

Ailton Ferreira Cavalcante¹

ABSTRACT

Ongoing technological transformations introduce new layers of decision-making power within the State, particularly through data-driven and algorithmic systems. While these tools can enhance analytical capacity and administrative efficiency, they may also reinforce inequalities, embed invisible biases, and weaken public transparency. This article examines algorithmic governance from an ethical-normative perspective grounded in the principle of the public interest. It engages classical moral philosophy, republican traditions, and contemporary debates on democratic governance, integrating them with the notion of “institutional conscience” and with the GIS Cycle (Governance, Innovation, and Sustainability). Methodologically, this is a theoretical-conceptual study based on a narrative review and critical analysis of legal frameworks and international references. The argument advanced is that the legitimacy of algorithm-mediated decisions depends on four concurrent criteria: universalizability, dignity, transparency, and accountability. From these principles, the article proposes guidelines for public policies involving data and artificial intelligence, including auditability, explainability, bias mitigation, protection of vulnerable groups, and reversibility of automated outcomes. It concludes that, in the digital age, the primacy of the public interest requires institutions to cultivate stable ethical self-control mechanisms capable of aligning technological innovation, social justice, and sustainability. More than a technical matter, algorithmic governance emerges as a profoundly moral and democratic challenge.

pelo princípio do interesse público. Retomam-se contribuições da filosofia moral, da tradição republicana e dos debates contemporâneos sobre governança democrática, articulando-as com a noção de “consciência institucional” e com o Ciclo GIS (Governança, Inovação e Sustentabilidade). Neste estudo optamos por uma abordagem teórico-conceitual, baseado em revisão narrativa e análise crítica de marcos normativos e referenciais internacionais. Argumenta-se que a legitimidade das decisões mediadas por algoritmos depende da observância simultânea de quatro critérios: universalizabilidade, dignidade, transparência e responsabilização. A partir desses princípios, propõem-se diretrizes para políticas públicas que envolvem dados e inteligência artificial, incluindo auditabilidade, explicabilidade, mitigação de vieses, proteção de grupos vulneráveis e reversibilidade das decisões automatizadas. Conclui-se que, na era digital, a centralidade do interesse público exige que as instituições desenvolvam mecanismos estáveis de autocontrole ético, capazes de alinhar inovação tecnológica, justiça social e sustentabilidade. Mais do que uma questão técnica, a governança algorítmica revela-se um problema de natureza moral e democrática.

RESUMEN

Las transformaciones tecnológicas actuales introducen nuevas capas de poder decisorio en el Estado, especialmente mediante sistemas basados en datos y algoritmos. Si bien pueden aumentar la capacidad analítica y la eficiencia administrativa, también corren el riesgo de reproducir desigualdades, generar sesgos invisibles y disminuir la transparencia pública. Este artículo analiza la gobernanza algorítmica desde un enfoque ético-normativo sustentado en el principio del interés público. Se articulan aportes de la filosofía moral, de la tradición republicana y de los debates contemporáneos sobre gobernanza democrática, integrándolos con la noción de “conciencia institucional” y con el Ciclo GIS (Gobernanza, Innovación y Sostenibilidad). Metodológicamente, se trata de un estudio teórico-conceptual, basado en revisión narrativa y análisis crítico de marcos normativos y referencias internacionales. Se sostiene que la legitimidad de las decisiones mediadas por algoritmos depende de cuatro criterios concurrentes: universalizabilidad, dignidad, transparencia y rendición de cuentas. A partir de ellos, se proponen directrices para políticas públicas que utilizan datos e inteligencia artificial, incluyendo auditabilidad, explicabilidad, mitigación de sesgos, protección de grupos vulnerables y reversibilidad de decisiones automatizadas. Se concluye que, en la era digital, la centralidad del interés público exige que las instituciones desarrollen mecanismos estables de autocontrol ético capaces de alinear innovación tecnológica, justicia social y sostenibilidad.

1 INTRODUCTION

The expansion of data-based technologies, machine learning, and automated decision support systems has profoundly changed the architecture of public power. What was once focused on human deliberation and traditional bureaucratic mediation has increasingly been filtered through statistical models, predictive systems, and digital platforms capable of automatically classifying, prioritizing, and allocating resources. This transformation introduces clear gains in efficiency and analytical capacity; However, it reposes classic questions of political philosophy and administrative law in new forms: who decides? Based on what criteria? And with what impacts on justice and democracy? (O'NEIL, 2016; EU, 2021; OECD, 2019).

Recent literature on algorithmic governance indicates that such systems are not neutral: they carry assumptions, modeling choices, incomplete databases, and statistical biases that can amplify historical inequalities and produce asymmetric distributional effects, often invisible to ordinary citizens (PASQUALE, 2015; NOBLE, 2018). At the same time, the growing technical opacity, derived from the complexity of artificial intelligence models, stresses fundamental values of the democratic rule of law, such as transparency, social controllability, and motivation of administrative decisions (FLOOD; MENÉNDEZ, 2022; CASS, 2020).

It is clear that the discussion cannot be reduced to an exclusively technical problem. Rather, it is an ethical-normative issue, which involves the status of the public interest, the legitimacy of decisions mediated by algorithms, and the need for institutional mechanisms of self-control capable of preventing abuses, reducing discrimination, and aligning technological innovation with fundamental rights (RAWLS, 2008; HABERMAS, 1997; UNESCO, 2021). The growing centrality of data highlights the tension between efficiency and justice, revealing that the mere automation of processes does not guarantee greater rationality, and can, on the contrary, institutionalize unfair practices under the appearance of neutrality.

From a philosophical point of view, there are instruments to illuminate these dilemmas. The Kantian notion of inner moral law, for example, suggests that the legitimacy of actions depends on their capacity for universalization and unconditional respect for human dignity (KANT, 2003). Transposed to the level of institutions, this perspective requires that public policies and algorithmic systems be evaluated according to clear normative criteria, which include public justification, non-discrimination, and protection of the vulnerable. Similarly, contemporary debates on democratic governance emphasize the importance of *accountability*, participation, and transparency as conditions for the legitimate exercise of power (PETERS; PIERRE, 2016; RHODES, 2017).

At the same time, the international literature has been consolidating guiding frameworks for the responsible use of artificial intelligence in the public sector, highlighting principles such as explainability, auditability, proportionality, risk assessment, and reversibility of automated decisions (OECD, 2019; EU, 2021; WORLD BANK, 2020). Although relevant, such guidelines often remain disconnected from a deeper ethical reflection, resulting in programmatic documents with little practical operationalization.

In this scenario, this article proposes an integrated ethical-normative framework for algorithmic governance, based on the principle of public interest and articulated with the GIS Cycle², Governance, Innovation and Sustainability. It is argued that the legitimacy of decisions mediated by algorithms depends on the simultaneous observance of four structuring criteria, namely: *universalizability*, *dignity*, *transparency*, and *accountability*. Based on these foundations, guidelines are developed for the design, implementation, and monitoring of data-based public policies, with special attention to the protection of vulnerable groups and intergenerational impacts.

In terms of methodology, we opted for a theoretical-conceptual study, supported by a narrative review of the specialized literature and a critical analysis of national and international normative frameworks. The objective is to offer an interpretative matrix that helps public managers, policymakers, and researchers to evaluate and guide the use of algorithmic technologies in the State, contributing to a governance model capable of reconciling innovation, social justice, and democratic sustainability.

In the end, it is argued that the consolidation of an institutional awareness, materialized in rules, processes and permanent ethical safeguards, is an indispensable condition for the digital transformation of the public sector not only to produce faster systems, but, above all, fairer, more transparent institutions aligned with the public interest.

2 THEORETICAL FRAMEWORK

Every society is born from the tense encounter between freedom and limit. As human beings made mistakes, learned and disputed meanings, they understood that living together requires more than good intentions: it requires measure, word, pact. It was in this process

² The GIS Cycle (Governance, Innovation and Sustainability) is an analytical model proposed by Ailton Ferreira Cavalcante, within the scope of his doctorate in Public Administration (IDP), which understands state action as a continuous process of formulation, execution, monitoring and feedback of public policies, articulating institutional governance, responsible innovation and sustainability as criteria for creating public value. Although developed in a systematic way in previous studies, the GIS Cycle can be understood, in synthetic terms, as a spiral process of planning, execution, monitoring and institutional learning, in which governance, innovation and sustainability operate as inseparable dimensions of the same movement. It is not just a managerial arrangement, but a normative architecture that guides public decision-making based on criteria of democratic legitimacy, intergenerational responsibility, and continuous creation of public value.

that the garden of innocence gave way to the city, a space where power needs to be contained by rules and where each decision starts to carry, simultaneously, promise and risk.

It is in this horizon that the contemporary debate on algorithms and public decisions is inserted. Digital technologies, far from being just instruments, have become part of the very architecture that organizes collective life, designing flows, defining priorities, and distributing opportunities. They can favor cooperation and justice, but from another angle, they can also erect invisible walls. The central question is not strictly technical: it is to know what kind of world we are helping to shape by delegating increasing portions of our decision-making power to machines.

Understanding this challenge requires returning to traditions that have reflected on truth and appearance, order and freedom, creation and responsibility, and from there reinterpreting the role of public interest and democratic governance in the digital age. The theoretical itinerary that follows follows this path: it starts from human moral ambivalence, dialogues with classical philosophy, revisits contemporary constitutionalism and integrates current debates on governance and algorithms. In the end, these contributions converge in the GIS Cycle³, which will serve as an analytical matrix for subsequent sections, indicating that the digital transformation of the State involves not only new tools, but a new way of interrogating power and responding for it.

2.1 MORAL CONSCIENCE AND HUMAN AMBIVALENCE

Philosophical literature recognizes that the human condition is crossed by a constitutive ambivalence: the capacity for cooperation, compassion and the creation of collective goods coexists with impulses of domination, appropriation and moral indifference. This tension, already intuited in ancient ethical traditions, finds a paradigmatic formulation in Hobbes⁴, for whom the absence of shared norms and legitimate authority places individuals

³ The GIS (Governance, Innovation and Sustainability) Cycle proposes that decisions about the use of algorithms in the public sector be treated as processes of justification and control, and not just as technical decisions. In the Governance phase, the public problem is precisely defined, ethical and legal risks are assessed, alternatives are registered, and it is verified whether the solution can be publicly justified (universalizability and dignity). In the Innovation phase, the development of the system must be interdisciplinary, documented and tested, with prior algorithmic impact assessment, transparent metrics, meaningful human oversight and challenge channels. Finally, the Sustainability phase requires continuous monitoring of errors and distributive effects, periodic reviews, audit trails, real possibility of correction or discontinuation, and public record of lessons learned. The Cycle operates in an iterative manner: problems detected in later stages return for prior adjustments, ensuring that the technology remains subordinate to the public interest, reviewable and responsible.

⁴ In Hobbes, the image of *homo homini lupus* does not describe an essential evil of the human being, but the condition of vulnerability and reciprocal distrust that emerges when common norms and legitimate authority are lacking. In the so-called "state of nature", each individual, seeking self-preservation, becomes a potential threat to others. The social contract and the institution of a common political power thus emerge as rational mechanisms to contain the predatory dimension of human relations and stabilize expectations, converting fear into public security (HOBBS, 2003).

in a state of potential war, synthesized in the expression *homo homini lupus* (HOBBS, 2003). The recourse to the social contract and political authority would therefore not be explained only by organizational efficiency, but by the need to contain the predatory dimension of human relations and produce reciprocal security.

Modernity introduces a decisive shift: the problem of evil and violence cannot be solved exclusively by external means. Kant⁵ shows that morality does not derive primarily from the fear of punishment or the calculation of advantages, but from the discovery of a universalizable practical law, inscribed in reason itself (KANT, 2003). Right action is that which can be conceived as a rule valid for all and which respects humanity, in itself and in others, as an end. In this way, conscience comes to be understood as an inner court, prior to and superior to coercive control, a space in which the subject is confronted with moral obligation even in the absence of external surveillance.

This movement has profound implications for the State and for public policies. If individuals do not become righteous just because they are watched, institutions do not become legitimate just because they are legal. Legitimacy, as contemporary theories of justice argue, depends on the ability to subject collective decisions to standards of public justification, in which any person, considered as free and equal, could recognize acceptable reasons (RAWLS, 2008; HABERMAS, 1997). It is a shift from the exclusive domain of authority to the domain of public reason.

However, human ambivalence reappears within the institutions themselves. Even structures created to protect rights can become instruments of capture, excessive bureaucratization or symbolic exclusion. Hence the relevance of thinking of the State as the bearer of a kind of institutional conscience, materialized in rules, processes and organizational cultures that induce ethical behavior and prevent the naturalization of abuse.

In the digital age, this debate gains additional density. Algorithmic systems, by automating decision criteria, seem to shift the moral problem from the individual to the code. However, far from eliminating human ambivalence, they re-inscribe it in new formats: modeling choices, data curation, definition of weights and thresholds, design of interfaces, and usage policies (PASQUALE, 2015; O'NEIL, 2016). The "court of conscience" does not disappear, it moves to the spaces where technical parameters are defined that will later affect concrete lives.

⁵ In Kant, morality does not derive from desirable consequences, but from the ability of the agent to submit his actions to a law that can be universally valid. The so-called categorical imperative demands that each person always be treated as an end in himself, never only as a means, the foundation of the principle of human dignity. Moral autonomy, in this sense, implies responsibility: to act is to legislate for oneself and for all, which makes the public justification of norms a condition of legitimacy (KANT, 2003).

Thus, understanding algorithmic governance requires recognizing that there is no purely technological shortcut to justice. Technical rationality needs to be anchored in ethical rationality, otherwise automation will only accelerate and reinforce existing inequalities. In these terms, human ambivalence is not an obstacle to be eliminated by technology, but an anthropological truth that imposes the need for reflective institutions, capable of controlling the power they exercise, even when mediated by algorithms.

2.2 TRUTH, APPEARANCE, AND THE MYTH OF THE CAVE

The Myth of the Cave, presented by Plato in Book VII of the Republic, remains one of the most powerful images for understanding the relationship between knowledge, power, and emancipation. In the narrative, prisoners chained since childhood see only shadows projected on the cave wall and, because they have never experienced any other form of perception, they take them as reality itself (Plato, 2000). The process of liberation, marked by pain, vertigo and resistance, symbolizes the passage from the immediate sensible world to intelligibility and, ultimately, to the Good.

The decisive element of the allegory lies in the fact that the shadows are not the result of chance, but result from an organization of the scenery: there is a fire, objects manipulated by others and a wall that functions as a projection surface. In contemporary terms, the myth points to the existence of regimes of visibility, structures that determine what can be seen, understood, and considered true in a society. There, ignorance is not the absence of data, but imprisonment in a field of appearances produced and mediated.

This reading has become particularly fruitful in the digital context. Recent literature shows how platforms, recommendation systems, and predictive models start to filter and prioritize information, creating highly personalized but non-transparent informational environments (ZUBOFF, 2019; KITCHIN, 2017). *Government dashboards*, risk maps, vulnerability indexes, and automated classification tools produce representations of the world that, due to their technical appearance, tend to acquire a status of unquestionable objectivity. However, such representations depend on methodological decisions, cuts, weights, proxies, which are rarely discussed publicly (PASQUALE, 2015).

The ethical-political risk lies not only in the possibility of error, but in the naturalization of a technically sophisticated shadow regime. By confusing representation with reality, space is opened for the replacement of public debate by opaque technicalities. O'Neil's (2016) critique of the so-called "weapons of mathematical destruction" shows that algorithmic models, when applied to security, credit, education, or social assistance policies, can consolidate trajectories of exclusion precisely because they feed back on historical data

marked by inequalities, which suggests that getting out of the cave also requires critically reviewing the data that feeds it.

On the other hand, the myth also points to an ethical dimension of responsibility: the one who comes out of the cave and contemplates the sunlight, a metaphor for the Good, faces the difficult task of returning to share knowledge and contribute to the liberation of others.

However, Plato reminds us that the passage from darkness to light is not immediate: the eyes of the apprentice, not accustomed to brightness, can be dazzled before seeing clearly. Clarification involves a gradual process, which requires time, mediation and pedagogical care.

In this key, politics is not a mere administration of resources, but a permanent effort to clarify, aware that excessively abrupt transparency can produce misunderstanding and resistance.

In democratic governance, this translates into practices of substantive and gradual transparency: making understandable not only the results, but also the processes, criteria, and uncertainties that structure public decisions (FLORIDI et al., 2018).

Finally, the Myth of the Cave illuminates the contemporary debate on algorithmic governance by revealing that the central issue is not only to produce more information, but to ensure conditions of intelligibility and public contestation. Without this, technically efficient systems can trap societies in new, more refined, but equally coercive forms of obscurity.

Thus, the construction of fair public policies requires institutions capable of deliberately promoting movements to "get out of the cave": critical education about data, open models, citizen participation, and auditing mechanisms that restore to the public space the debate about what counts as administrative truth. Such movements, however, demand accompaniment and formative guidance, as the transition between darkness and light is rarely immediate; Without adequate support, transparency itself can overshadow rather than clarify.

2.3 NUMBER, HARMONY, AND THE PYTHAGOREAN SCHOOL

The Pythagorean School⁶ occupies a unique place in the history of thought for articulating, in an unprecedented way, mathematics, metaphysics and ethical formation. More

⁶ The Pythagorean tradition conceived of number as a constitutive principle of reality. More than a tool of calculation, arithmetic expressed a cosmic order that should also guide moral and political life. Harmony, proportion and measure were not only mathematical categories, but criteria of justice and social balance. This view anticipated the idea that forms of quantification can shape the world, and therefore need to be thought of ethically.

than a circle of research in numbers, it was a philosophical community in which the study of the world order was intrinsically linked to the moral improvement of its members (BURKERT, 1972). For the Pythagoreans, number was not a mere tool of calculation; it constituted the very intelligible structure of reality, manifesting itself in musical harmony, in the rhythms of nature, and in the proportions of the human body.

The famous discovery of the numerical relations that underlie musical intervals became a symbol of this vision: that which seems qualitative, beautiful, harmonious, pleasant, reveals itself, at a deeper level, quantitatively structured. This *insight* had lasting consequences for Western science, fueling the conviction that the cosmos can be described by mathematical laws and that to know such laws is, in a sense, to participate in the rationality of the world itself (HADOT, 2002).

However, the Pythagorean heritage includes something often overlooked: mathematics was not conceived as an autonomous activity, detached from life. Access to the order of the cosmos required discipline, inner silence, temperance, and principled community life. In other words, there was no science without ethics. The idea of "harmony" referred both to the ratio between numbers and to the balanced integration of the human soul with the greater order of the universe.

Transposed to the contemporary debate, this perspective offers a critical lens on the growing quantification of government. Performance indicators, scoring systems, risk metrics, and prioritization algorithms seem to materialize the ancient Pythagorean aspiration to rule by number.

Contemporary literature has rightly reminded us that quantification is far from neutral: it always presupposes choices about what goes into account, how it is measured, and for what purpose (KITCHIN, 2017). A vulnerability index, for example, can serve to expand social protection, but it can also be instrumentalized to justify selective cuts. It all depends on the way it is constructed, interpreted and put at the service of public decisions.

This ambiguity shows that numerical rationality can serve both justice and domination. In contexts of structural inequality, apparently objective systems can consolidate hierarchies, especially when statistical criteria are confused with moral judgments.

The Pythagorean School reminds us, in this sense, that the mathematical order needs to be subordinated to an ethical horizon: harmony is not only formal balance, but adequacy to the purposes of the good and the just life.

For algorithmic governance, the lesson is straightforward. Mathematical models that guide decisions about credit, security, social benefits, or urban policies should be evaluated not only for their accuracy, but for their distributive impact, discriminatory potential, and

compatibility with fundamental rights. The "beauty" of a technical solution, its algorithmic elegance, is no substitute for the political question of who wins and who loses with its application.

In conclusion, recovering the Pythagorean heritage means reaffirming that number and ethics are not separate. In a scenario in which data and algorithms progressively shape the action of the State, it becomes essential to reconnect mathematical precision with the demand for justice, preventing the fascination with metrics and models from becoming a new form of practical irrationality. Only in this way will quantification be able to fulfill its emancipatory vocation, contributing to more rational, but also more humane, policies.

2.4 DEMIURGE, FALSE ORDER, AND MODELING POWER

The figure of the Demiurge⁷, presented by Plato in the dialogue *Timaeus*, constitutes a sophisticated metaphor for thinking about the exercise of power. Unlike an arbitrary deity, the Demiurge is described as a cosmic craftsman who, when contemplating the world of Forms, seeks to order chaotic matter according to measure, proportion and Good (Plato, 2001). It does not create from nothing, but gives form to what exists, guided by a principle of rationality that links creation and responsibility.

This image, although belonging to the ancient philosophical imaginary, offers a fruitful key to interpreting the role of contemporary institutions. Governing, whether through laws, policies, or technologies, is, to a large extent, shaping the common world: defining categories, setting priorities, organizing flows, and assigning meanings. The public power, in this sense, assumes a demiurgic function by transforming social chaos into normative, economic and symbolic order. The decisive question, then, is not only how to make this process efficient, but at the service of what values the created order is structured.

The Gnostic tradition radicalizes this reflection by introducing the figure of the false demiurge, a creative instance that institutes a degraded cosmos, marked by domination and ignorance (JONAS, 2006; PAGELS, 1995). In this reading, the order of the world is not necessarily good; It can be oppressive, yet extremely organized. The Gnostic critique works as a warning against the risk of confusing order with justice, reminding us that highly structured systems can serve to perpetuate inequalities when guided by particularistic interests.

⁷ In the Platonic tradition, the Demiurge is not an absolute creator god, but an artificer who organizes chaotic matter according to models of order and beauty. In certain Gnostic readings, however, this figure gains ambiguous traits: the power that organizes can also imprison, producing a "false order" that gives the appearance of necessity to what is, in fact, a human decision. The metaphor helps to think about institutions and technologies that, in shaping the social world, require constant ethical vigilance.

Transposed to the current scenario, this ambivalence is particularly pertinent in the face of the advance of digital infrastructures and algorithmic systems. Such technologies increasingly participate in the very constitution of the social: they classify individuals, distribute visibility, mediate access to services and modulate opportunities. Its performance is not merely instrumental; they produce reality by organizing the modes of interaction and decision. In this sense, algorithms symbolically assume a demiurgic function, they become artisans of a social world mediated by data.

The critical literature has shown that this modeling power is ambivalent. On the one hand, it enables greater coordination, predictability, and analytical capacity to face complex problems. On the other hand, it can result in new forms of silent domination, in which structural decisions are shifted to technical environments that are not very transparent, making public contestation difficult (ZUBOFF, 2019; PASQUALE, 2015). The risk is the constitution of a false technocratic order: an arrangement that presents itself as inevitable and scientifically neutral, when, in fact, it crystallizes preferences and asymmetries of power.

Recognizing this demiurgic dimension of the digital state does not imply demonizing technology, but assuming it as a moral and political issue. If governing is modeling, then every act of institutional or algorithmic design requires public justification and accountability mechanisms. In the absence of these brakes, the creative capacity of power can slide into subtle forms of authoritarianism, no longer imposed by force, but by decision-making architectures that limit alternatives before they can even be discussed.

In this interpretative horizon, recent studies have recovered the metaphor of the Demiurge to think about the responsibility of those who design technosocial systems, suggesting that every institutional architecture is, above all, an ethical decision about the type of order that is intended to be established (CAVALCANTE, 2025). Such a reading reinforces that the central issue is not simply to create efficient systems, but to ensure that efficiency does not become an instrument of injustice.

In this way, the reflection on the Demiurge and its gnostic counterpart contributes to making explicit the normative core of algorithmic governance: the problem is not to create order, but to ensure that the created order is compatible with human dignity, distributive justice, and democratic integrity. It is at this point that ethics ceases to be a theoretical adornment and becomes a condition for the possibility of institutional legitimacy itself in the digital society.

2.5 PUBLIC INTEREST AND SUPREMACY IN A CONSTITUTIONAL KEY

The concept of public interest is one of the pillars of Administrative Law, functioning as a guiding criterion and limit for state action. In traditional readings, the so-called "supremacy of the public interest" was often interpreted as generic authorization for the Administration to restrict individual rights whenever it alleged reasons of collective convenience.

This vision, although functional for the construction of the intervening State, proved to be insufficient in the face of the requirements of contemporary constitutionalism, centered on human dignity and the protection of fundamental rights (DI PIETRO, 2012; JUSTEN FILHO, 2014).

Democratic constitutionalism introduces a decisive shift: the public interest is not a power above the Constitution, but a principle that must be interpreted in the light of the constitutional text and its structuring values. Supremacy thus becomes an argumentative burden: every restriction of rights needs to be rationally justified, proportional, and guided by legitimate purposes (BINENBOJM, 2017). In other words, it is not enough to invoke the public interest, it is necessary to demonstrate it.

This transformation brings Administrative Law closer to broader ethical-political debates. Rawls' theory of justice, for example, proposes that institutional arrangements are legitimate when they could be accepted by free and equal citizens under conditions of impartiality (RAWLS, 2008). Habermas' discourse ethics, on the other hand, emphasizes public justification: norms are only valid when they can find assent in communicative processes free of coercion (Habermas, 1997). Applied to the administrative field, such perspectives suggest that the public interest should be sought through transparent, motivated and socially controllable decisions.

On the practical level, this reinterpretation implies recognizing that the State operates in constant tension between efficiency and the guarantee of rights. Efficiency, an important value in complex societies, cannot serve as a pretext for the compression of individual guarantees, nor for the adoption of technocratic solutions immune to democratic scrutiny. The qualified public interest requires that administrative decisions balance results and procedures, avoiding both paralyzing formalism and opaque decisionism.

The emergence of algorithmic systems puts this debate back on new bases. By transferring a significant part of the decision-making capacity to statistical models, there is a risk of naturalizing exclusion criteria that have not been publicly debated. The literature shows that risk forecasting, benefit distribution, or policy prioritization tools can reproduce existing biases, disproportionately impacting vulnerable groups (EUBANKS, 2018; NOBLE, 2018). In

these cases, the abstract invocation of the public interest, under the argument of efficiency gains, would cover up violations of material equality and substantive due process.

It is important to note that the interpretation of the public interest as an ethical instance that conditions the use of technologies and decision-making models has gained prominence, preventing efficiency from being converted into an absolute criterion. Recent studies show that the uncritical incorporation of technocratic solutions can produce subtle forms of exclusion, especially when automated decisions start to operate as if they were neutral and inevitable (CAVALCANTE, 2025).

For this reason, the supremacy of the public interest, in a constitutional key, must be read as a principle of containment and responsibility. It obliges the manager to demonstrate: (a) the legitimate purpose of the decision, (b) the adequacy of the means used, (c) the need for less onerous alternatives, and (d) proportionality in the strict sense, weighing impacts on fundamental rights. Such requirements become even more relevant when automated systems participate in the decision, requiring impact assessments, minimal explainability, and significant human review.

Thus, the public interest ceases to be a rhetorical concept and begins to operate as an institutional moral law, which links power to the obligation to justify oneself. Far from paralyzing administrative action, this paradigm gives it ethical and democratic density, preventing the transformation of efficiency into an absolute value and ensuring that technological innovation remains subordinated to constitutional purposes.

Ultimately, understanding the supremacy of the public interest from a constitutional perspective means recognizing that the legitimacy of state action, whether analogical or algorithmic, depends on its ability to produce socially just results without giving up transparency, control, and unconditional respect for human dignity.

2.6 DEMOCRATIC GOVERNANCE AND WAVES OF ACCOUNTABILITY

The contemporary debate on governance is based on the recognition that the State is no longer the only instance capable of coordinating collective action. Social complexity, the fragmentation of interests, and the interdependence between public, private, and community actors have produced polycentric decision-making arrangements, in which multiple organizations share responsibilities (PETERS; PIERRE, 2016; RHODES, 2017). In this scenario, governing means less "commanding" and more orchestrating, creating mechanisms of cooperation, coordination and reciprocal control.

The literature identifies, in this process, successive "waves" of accountability. The first, centered on legal-formal control, sought to ensure compliance with standards and

procedures. The second, associated with managerial reforms, emphasized performance, goals and results. A third, more recent wave, replaces the values of transparency, integrity, participation, and social control at the center, articulating legal, managerial, and democratic dimensions in the same framework (BOVENS; SCHILLEMANS; HART, 2008).

This displacement does not eliminate tensions. On the contrary, it reveals that accountability is not a univocal concept, but a field of dispute between different logics of control. While managerial approaches tend to privilege metrics and indicators, democratic perspectives insist that legitimacy requires public justification, deliberation, and the possibility of contestation. Good governance results from the balance between these dimensions, avoiding both procedural formalism and productivism devoid of civic sense.

Digital transformation introduces new challenges to this picture. Information systems, platforms, and algorithms began to structure their own decision-making processes, changing who decides, how they decide, and based on what evidence.

In many cases, critical decisions are mediated by outsourced technical infrastructures, whose operating logic escapes the traditional scrutiny of public institutions. There is then the risk of a shift of power to invisible architectures, in which the criteria for classification, recommendation, and prioritization remain opaque to citizens and even to the managers themselves (PASQUALE, 2015; ZUBOFF, 2019).

This phenomenon requires broadening the concept of *accountability* beyond traditional accountability. There is increasing talk of algorithmic *accountability*, which involves transparency about the data used, model documentation, minimal explainability of results, independent risk assessment, and the possibility of meaningful human review (FLORIDI et al., 2018; WORLD BANK, 2020). It is a matter of recognizing that, when public decisions are mediated by code, the code also becomes part of the law, and must be subject to equivalent controls.

At the same time, democratic governance implies substantive participation. The opening of data and the availability of interfaces are not enough if citizens and social organizations are not integrated into deliberative processes that influence the design and monitoring of public technologies.

In this sense, co-design initiatives, public hearings on automated systems, digital ethics councils, and participatory impact evaluations represent promising ways to repoliticize technical decisions and prevent innovation from becoming a zone of normative exceptionality.

It is important to highlight that such mechanisms do not replace the individual responsibility of managers, but reconfigure it. The public leader is now responsible not only for tangible results, but for institutional architecture choices, including technological ones, that

shape behaviors and opportunities. As already suggested by theories of justice and the public interest, responsibility means being able to give reasons for decisions made and demonstrate how they align with constitutional principles and the protection of vulnerable groups.

In summary, democratic governance in the digital age demands a multidimensional accountability model, which combines: (a) legality and institutional control, (b) evaluation of performance and results, and (c) informed social participation. Without this synthesis, there is a risk of shifting the center of decisions to barely visible technical spheres, weakening public trust and bringing digital management closer to subtle forms of decisionism. With it, on the contrary, it becomes possible to align innovation, efficiency and democracy, paving the way for a governance capable of learning from its own mistakes and correcting directions, an essential condition for any public project guided by the collective interest.

2.7 ALGORITHMIC GOVERNANCE: INTERNATIONAL RISKS AND PRINCIPLES

The advancement of systems based on massive data, machine learning, and decision-making automation has ushered in a new field of ethical and legal concerns often referred to as algorithmic governance. It is about analyzing how algorithms, understood not only as mathematical codes, but as socio-technical arrangements, come to perform functions traditionally associated with public authorities: allocating resources, classifying citizens, estimating risks, and guiding policies (KITCHIN, 2017; PASQUALE, 2015). The growing centrality of these systems requires a normative framework that goes beyond engineering and dialogues with fundamental democratic values.

The specialized literature identifies three main sets of risks. The first concerns opacity. Complex, often proprietary, models make it difficult to understand why certain decisions were made, which weakens the right to explanation and hinders judicial and social control (PASQUALE, 2015).

The second is linked to the reproduction of biases. As algorithms learn from historical data, they tend to replicate and even amplify existing inequalities, disproportionately impacting minorities and vulnerable groups (O'NEIL, 2016; NOBLE, 2018; EUBANKS, 2018).

The third involves systemic effects: the simultaneous use of multiple models in areas such as health, education, security, and assistance can generate unexpected feedbacks, reconfiguring social opportunities without prior public debate.

In response to these challenges, international organizations have been formulating converging principles to guide the responsible use of artificial intelligence and automated systems. The OECD Guidelines uphold values such as inclusive growth, human well-being, transparency, technical robustness and accountability (OECD, 2019). The European Union

proposes a risk approach that combines fundamental rights, impact assessment and the requirement for meaningful human oversight (EU, 2021). UNESCO, for its part, emphasizes justice, cultural diversity, environmental protection, and cooperative global governance (UNESCO, 2021).

Despite important advances, these milestones usually face difficulties in operationalization. Many documents remain at the abstract level, lacking clear instruments to translate principles into everyday administrative practices. From this perspective, methodologies such as algorithmic impact assessments, public model registries, independent audits, and explainability protocols have been highlighted, aimed at making automated decisions and their effects traceable (FLORIDI et al., 2018; WORLD BANK, 2020). Still, the effective implementation of these tools depends on institutional capacities, technical resources, and ethical-oriented organizational culture.

Another sensitive point refers to the outsourcing of decision-making infrastructure. Governments often hire private monitoring, analysis, and prediction solutions, creating informational asymmetry between government and suppliers. This technological dependence can compromise decision-making sovereignty and make it difficult to carry out audits, especially when contracts include commercial secrecy clauses. Hence the importance of transparency by design clauses, open standards, and requiring access to data and models for control and independent research purposes.

In addition, algorithmic governance involves a pedagogical dimension. For principles of justice, non-discrimination and proportionality to be effective, it is necessary to invest in the ethical and technical training of managers, developers and evaluators. Without critical awareness, automated systems can be adopted only because they promise efficiency, without adequately evaluating their social costs. Here, the convergence between moral philosophy, law, and data science becomes essential.

In light of the above, algorithmic governance demands a multi-layered normative architecture: international principles, national legislation, sectoral regulation, responsible public procurement, and everyday organizational practices. Its objective is not to prevent innovation, but to condition it to respect for fundamental rights and the public interest. In this sense, the incorporation of mechanisms of transparency, risk assessment and citizen participation represents a necessary, although not sufficient, condition for decision-making automation in the public sector to go hand in hand with democracy, social justice and ethical responsibility.

2.8 THE GIS CYCLE AS AN INTEGRATING MATRIX

From the previous discussions, it becomes evident that the challenges posed by the digital transformation of the public sector cannot be met by piecemeal approaches. Issues of technique, law, moral philosophy, administration and citizen participation appear interconnected, requiring a conceptual framework capable of integrating multiple dimensions without reducing complexity. From this perspective, the GIS Cycle emerges as an analytical and normative proposal that articulates democratic values, technical rationality and intergenerational responsibility.

The first axis, Governance, refers to the construction of transparent, participatory institutional arrangements with robust accountability mechanisms. It is about recognizing that public decisions mediated by algorithms are not limited to technical choices, but constitute exercises of power that must remain open to criticism and social control. Governance, in this key, is not mere formal regulation: it is a permanent practice of public justification, in which managers explain reasons, listen to counterpoints and review directions when necessary.

The second axis, Innovation, is not to be confused with the uncritical adoption of technologies. On the contrary, it supposes the creation of solutions that expand rights, reduce inequalities and strengthen institutional capacities, always subordinated to the public interest. This implies incorporating, from the design of systems, principles such as bias prevention, auditability, transparent documentation, and the possibility of human review. Ethically-oriented innovation thus translates into processes of continuous institutional learning, in which technologies are evaluated not only for their efficiency, but for their distributive and democratic effects.

The third axis, Sustainability, broadens the time horizon of decisions. The discussion about algorithms cannot be restricted to the immediate impact on performance indicators; it must consider intergenerational, social, environmental and institutional consequences. Systems that concentrate power, erode public trust, or reinforce inequalities can produce short-term gains at the cost of lasting damage to social cohesion and the very legitimacy of the state. Sustainability, in this sense, operates as a long-term safeguard against technological solutions that seem ingenious, but weaken the democratic pact.

The strength of the GIS Cycle lies in their functioning as interdependent dimensions. There is no legitimate innovation without transparent governance; there is no sustainability without responsible innovation; and there is no effective governance without consideration of future consequences. This circularity dialogues with philosophical traditions that see knowledge as a process of self-transformation, getting out of the "caves" of ignorance, harmonizing numbers and ethics, guiding creative power through universal values. In

contemporary language, it means building reflective institutions, capable of learning from their own mistakes and submitting to clear ethical criteria.

From a methodological point of view, the GIS Cycle operates as a matrix for diagnosing policies, guiding the design of systems, and evaluating their implementation. It allows us to formulate structuring questions: (a) who governs and how is he accountable? (b) what innovation is being produced and at the service of whom? (c) What impacts, present and future, are being considered and for whom? Answering these questions helps to transform abstract principles of algorithmic governance into concrete decision-making procedures, bringing ethics, law, and public administration closer together.

Finally, the GIS Cycle does not intend to offer a definitive formula, but a hermeneutic and practical scheme to align technology, justice and democracy. By collecting contributions from classical philosophy, contemporary political theory, and international guidelines for responsible AI, he indicates that the legitimacy of decisions mediated by algorithms depends on the simultaneous observance of four structuring criteria, namely, *universalizability*, *dignity*, *transparency*, and *accountability*, which will guide the proposals presented in the following sections.

In this way, the theoretical framework developed here prepares the ground for normative and applied analysis, demonstrating that the digital transformation of the State is not only a technical challenge, but a historical opportunity to reconfigure the exercise of public power in the light of robust ethical principles.

3 METHODOLOGY

The present study adopts a theoretical-conceptual, qualitative and ethical-normative design, aimed at the construction of an analytical framework capable of interpreting the challenges of algorithmic governance and proposing guidelines compatible with the public interest. It is an analytical-argumentative essay that articulates philosophical tradition, contemporary constitutionalism and recent literature on governance and artificial intelligence, seeking to bring administrative theory and practice closer together (RAWLS, 2008; HABERMAS, 1997; OECD, 2019).

The empirical basis consists of a critical narrative review, appropriate for fields in consolidation and that require interpretive integration between multiple sources (BAKER, 2016). Reference works were selected in: (a) moral and political philosophy; (b) administrative law and public interest; (c) democratic governance and *accountability*; (d) international guidelines on AI and algorithms in the public sector; and (e) critical studies on biases, opacity and social impacts of automated systems (PASQUALE, 2015; O'NEIL, 2016;

EU, 2021; UNESCO, 2021). The inclusion of sources observed three criteria: thematic relevance, academic/institutional recognition, and capacity for dialogue with the Brazilian context.

Also, from the point of view of source selection, the review focused on texts that explicitly articulate technology, public ethics, and collective interest, combining classical contributions from political and moral philosophy with recent normative documents on artificial intelligence and data governance (RAWLS, 2008; HABERMAS, 1997; OECD, 2019; EU, 2021; UNESCO, 2021; WORLD BANK, 2020). The time frame privileged the production of the last decade, without excluding previous works considered structuring for the debate, as well as international reports and guidelines with a direct impact on the design of public policies. Studies of a strictly technical-engineering orientation were deliberately left out, whose focus is limited to the computational performance of the models, without a substantive interface with problems of democratic legitimacy, protection of rights and public interest.

The analysis took place in two complementary stages. First, a conceptual reconstruction of core categories was carried out, namely *truth, order, public interest, responsibility and governance*, examining their evolution and internal tensions. Then, the normative translation of these categories was carried out into evaluative criteria applicable to decisions mediated by algorithms, organized in the Cycle as an interpretative matrix. This procedure allows transforming theoretical foundations into operational principles, preserving ethical density and institutional viability.

Finally, it is recognized that the results result from the internal coherence of the argument and the robustness of the sources mobilized. The study is not a substitute for empirical investigations; rather, it offers a normative framework that can guide future impact assessments, case studies, and comparative analyses on the use of algorithms in the public sector. Finally, it is important to note that no systematic empirical studies have been conducted, which constitutes a future research agenda.

4 RESULTS AND DISCUSSION

Operationally, the GIS Cycle is structured as a spiral movement in four articulated moments: planning, execution, monitoring and feedback. In planning, public problems, criteria of justice and ethical risks are defined; in execution, technologies are tested with safeguards; in monitoring, distributive effects and impacts on rights are evaluated; Finally, in feedback, decisions are reviewed, corrected or interrupted, recording institutional lessons for the following cycles. This dynamic avoids irreversible decisions and transforms technological innovation into a continuous deliberative process.

The paths taken in the previous sections have shown that technology, far from being a mere neutral tool, participates in the very architecture of public power. Algorithms classify, prioritize, and distribute, and in doing so, shape concrete experiences of citizenship. If the theoretical framework has made it possible to understand the philosophical, legal and institutional bases of this phenomenon, the task that is now imposed is another: to translate principles into criteria capable of guiding real decisions.

This section takes up this deliberately difficult passage. Instead of celebrating promises or dramatizing risks, it seeks to organize a normative framework that dialogues with the complexity of the digital world, without losing sight of the public interest. It is based on the assumption that algorithmic systems should not be judged only by their efficiency, but by their compatibility with democratic values and the requirement of justification that underpins the rule of law.

In this way, the results and the discussion presented here convert the theoretical itinerary into four structuring criteria, namely, *universalizability, dignity, transparency and accountability*, integrated by the GIS Cycle. From them, guidelines for the life cycle of algorithmic systems are formulated and institutional tensions and safeguards necessary for technological innovation not to become opaque power are analyzed. More than closed answers, what is offered is a method of judgment: a way of asking, in a systematic and reflective way, what it means to govern with algorithms in a democracy.

An example helps to visualize the GIS Cycle in operation. Suppose the adoption of an algorithm for screening social benefits. In planning, the Administration defines the problem (fraud and delays), establishes fairness criteria, explainability requirements and safeguards for vulnerable groups. In execution, the system is implemented on a pilot basis, with human supervision and dispute channels. In the monitoring, patterns of undue exclusion are identified in certain territories and it is verified that the performance metric favored statistical efficiency to the detriment of equity. In the feedback phase, the parameters are reviewed, the model is independently audited, and the decision rules are rewritten, recording the lessons learned for the next cycle. The result is not just a "more accurate" algorithm, but a public policy that learns about itself and reinforces its democratic legitimacy.

The GIS Cycle is a conceptual and practical arrangement intended to guide contemporary state action, by articulating three dimensions that, historically, tend to appear dissociated: the way of deciding (governance), the ability to transform processes and services (innovation) and the normative horizon that gives meaning to public choices (sustainability). This articulation is not limited to the search for administrative efficiency; it organizes

government action in such a way as to produce legitimate, enduring, and socially recognizable public value.

Represented as an evolutionary spiral, the GIS Cycle expresses a continuous process that combines four interdependent movements: (i) planning guided by participation and evidence; (ii) implementation with institutional cooperation and ethical safeguards; (iii) monitoring and evaluation of results and impacts; and (iv) feedback, in which decisions are reviewed and learning is institutionalized. The ascending character of the spiral symbolizes the progressive improvement of government capacities, with sustainability operating as an ethical and temporal reference that projects decisions beyond the immediate present.

Figure 1

The GIS Cycle as an Evolutionary Spiral of Public Governance

Source: Prepared by the authors (2025).

The figure represents the continuous and ascending dynamics of the public management process structured in the GIS Cycle, articulating: (i) Democratic Strategic Planning, (ii) Collaborative Implementation, (iii) Monitoring and Evaluation, and (iv) Feedback and Learning. The rise of the spiral symbolizes the progressive advance of institutional capacity towards sustainability as an ethical and intertemporal horizon.

4.1 FROM THE THEORETICAL FRAMEWORK TO THE NORMATIVE CRITERIA

Although the analysis is predominantly theoretical, it is possible to visualize its practical developments in recent experiences. Facial recognition systems adopted in security policies, for example, increased false positive rates among racialized populations, evidencing structural biases in training data. In another direction, algorithms used to screen social benefits, when opaque, generated undue exclusions and reduced the capacity for administrative contestation. There are also cases of risk prediction in public health that, by prioritizing statistical efficiency, neglected territorial inequalities. These examples show that automated decisions are not mere technical resources: they reorganize opportunities, distribute burdens, and require robust legitimacy criteria.

The theoretical path developed in this study shows that algorithmic governance is not only a technological advance, but a re-actualization of the classic problem of power: who decides, based on what reasons, for the benefit of whom and under what limits? This question has crossed political philosophy since its origins and reappears mediated, now, by digital infrastructures capable of organizing sensitive dimensions of collective life.

Human moral ambivalence, present since Hobbes and Kant, reveals that social coexistence oscillates between cooperation and conflict, requiring norms that contain predatory impulses without eliminating freedom (HOBBS, 2003; KANT, 2003). In the algorithmic context, this tension intensifies: tools designed for efficiency and precision can reinforce inequalities, produce opaque decisions, and consolidate power asymmetries (PASQUALE, 2015; O'NEIL, 2016; GREEN, 2021). The Platonic image of the cave remains current: societies run the risk of confusing outputs from automated systems with objective truths, forgetting that they result from methodological choices, models and implicit values (Plato, 2000; ZUBOFF, 2019; CRAIG; BROWN, 2022).

In a convergent way, the Pythagorean tradition recalls that number is not neutral: it expresses a conception of order that can harmonize or dominate, according to the ethical horizon that guides it (BURKERT, 1972; HADOT, 2002). Indicators and algorithms not only describe reality, they contribute to constructing it, defining priorities, acceptable risks and forms of social visibility (LESSIG, 1999; BOVENS; ZOURIDIS, 2002). The metaphor of the Demiurge, critically reinterpreted by Gnosticism, deepens this diagnosis: every architecture of order can generate both justice and "false order", highly organized, but excluding (JONAS, 2006; PAGELS, 1995). In the digital public sphere, this means recognizing that algorithms play a creative role and, therefore, demand explicit moral responsibility (CAVALCANTE, 2025; CRAWFORD, 2021).

Contemporary constitutionalism replaces the public interest as a criterion of legitimacy, not as unlimited authorization, but as a duty of justification guided by human dignity and fundamental rights (DI PIETRO, 2012; BANDEIRA DE MELLO, 2015; BINENBOJM, 2017). Consequently, automated decisions need to be evaluated both by their results and by their procedures, preserving transparency, participation and social control (HABERMAS, 1997; PETERS; PIERRE, 2016; HOOD; DIXON, 2015). In Brazil, the debate is also connected to the protection of personal data and the idea of informational self-determination, reinforcing the demand for public justification (DONEDA, 2020; MENDES, 2021).

The convergence of these traditions made it possible to derive, in this work, a set of structuring normative criteria, organized in the GIS Cycle. It is argued that the legitimacy of algorithmically mediated decisions depends on the simultaneous observance of four dimensions described above. Such criteria result: (a) from the requirement that public rules can be accepted as reasonable by any citizen (KANT, 2003; RAWLS, 2008); (b) the prohibition of treating people only as means (KANT, 2003); (c) the need to make intelligible the processes that shape public truth (Plato, 2000; FLORIDI et al., 2018; EU, 2021); and (d) the democratic obligation to answer for decisions that structure collective life (HABERMAS, 1997; WORLD BANK, 2020; OECD, 2019).

The main contribution of this stage is, therefore, the passage from the interpretative to the normative plane. From the theoretical framework, principles capable of acting as ethical and legal filters for automated decisions in the State are identified. The following subsections examine each criterion and show how they are articulated in the GIS Cycle, becoming guidelines for the life cycle of algorithmic systems.

4.2 FOUR CRITERIA FOR ALGORITHMIC GOVERNANCE ORIENTED TO THE PUBLIC INTEREST

From the reconstructed theoretical framework, it becomes possible to derive a set of normative criteria capable of guiding the use of algorithms in public administration. These criteria are not external to technology; on the contrary, they emerge from the recognition that computer systems come to compose the very architecture of decision-making power, reorganizing priorities, filtering information and distributing opportunities and restrictions among citizens (LESSIG, 1999; PASQUALE, 2015). It should be noted that the idea of public interest only maintains its meaning when associated with ethical and legal parameters that condition the exercise of technical power, preventing it from becoming a mere instrumental rationality.

Based on this horizon, the study identifies the four structuring criteria already articulated within the scope of the GIS Cycle. They work as successive and complementary filters. Each one illuminates specific dimensions of the algorithmic problem, but only their joint observance allows us to speak of governance compatible with the Democratic Rule of Law.

The first criterion, *universalizability*, derives from the Kantian tradition and the contemporary theory of justice, according to which legitimate norms are those that could be accepted by any subject under equal conditions (KANT, 2003; RAWLS, 2008). Transferred to the algorithmic sphere, the principle requires that the rules embedded in computational models can be justified publicly, without arbitrary discrimination and without dependence on secret criteria. This means assessing whether automated policies are consistent with constitutional values and whether their effects do not fall disproportionately on vulnerable groups, a problem widely documented in the recent literature on data biases and algorithmic discrimination (O'NEIL, 2016; BAROCAS; SELBST, 2016; GREEN, 2021). Thus, universalizability establishes a substantive limit: decisions that could not be accepted as reasonable by all those affected lack legitimacy, even if they are technically efficient.

The second criterion, *dignity*, expands this reflection by rejecting any form of reduction of the individual to a mere object of classification, prediction or management. Dignity, the foundation of contemporary constitutionalism, requires that people not be treated only as means to administrative ends (KANT, 2003; BINENBOJM, 2017). In practice, this implies questioning models that fully replace human judgment, that deny possibilities of contestation, or that produce permanent and stigmatizing labeling, for example, risk scores, surveillance profiles, and automated screening mechanisms in social and public security policies (CITRON; PASQUALE, 2014; CRAWFORD, 2021). The criterion of dignity reminds us that, even when data allow for more accurate predictions, there are ethical boundaries that the state cannot cross without compromising its own moral legitimacy.

The third criterion, *transparency*, seeks to respond to the risk that modern societies will live in a "new cave", confusing algorithmic outputs with self-evident truths. Transparency means making visible the purposes, premises and limits of automated systems, allowing citizens, control bodies and researchers to understand their basic logic and submit it to criticism (Plato, 2000; FLORIDI et al., 2018; OECD, 2019). It is not just about disclosing source codes, which are often inaccessible or protected by trade secrets, but about producing explainability and institutional documentation, including through algorithmic impact assessments, public model registries, and clear guidelines for risk communication (EU, 2021; WORLD BANK, 2020). Without transparency, decisions become unappealable and unquestionable, shifting power to technocratic spheres of difficult democratic control.

Finally, the criterion of *accountability* states that, if algorithms model social reality, it is necessary to clearly identify who is responsible for their consequences. The public governance literature warns that decision-making regimes based on automatic rules tend to spread authorship, making it difficult to assign blame, correct errors, and repair damage (BOVENS; ZOURIDIS, 2002; HOOD; DIXON, 2015). Accountability requires the definition of specific duties of diligence for managers, developers, and suppliers; it requires audit trails, review procedures and correction mechanisms when injustices are detected (HABERMAS, 1997; PETERS; PIERRE, 2016). By articulating Governance and Sustainability, this criterion prevents innovation from becoming an act without an author, a "faceless power" that no one can question.

The central contribution of this section is to show that these four criteria are not occasional lists of good practices, but contemporary translations of philosophical and constitutional requirements. They operate as mediations between abstract values and concrete decisions, allowing algorithms to be evaluated not only for their performance, but for their compatibility with justice and democracy. When incorporated into the GIS Cycle, they become stable references for the design, implementation, and monitoring of algorithmic systems, favoring institutions that are more reflective and willing to learn from their own limits.

In summary, the results indicate that the legitimacy of algorithmic governance depends on the simultaneous observance of universalizability (justice), dignity (moral limits), transparency (public intelligibility), and accountability (duty to respond). The following subsections explore how these criteria unfold throughout the life cycle of systems, from planning to discontinuity, and how they can be transformed into operational guidelines for public policies oriented to the collective interest.

Figure 2*Four criteria for Algorithmic Governance*

Source: prepared by the author

To reduce the degree of indeterminacy, each criterion can be associated with operational indicators. Universalizability can be tested through impact analyses on vulnerable groups and non-discrimination audits. Dignity requires verification of meaningful human oversight, the right to object, and limits on permanent labeling. Transparency can be measured by the existence of public documentation, understandable explanations, and records of decisions. Accountability, on the other hand, requires audit trails, clear identification of decision-makers, and reparation procedures. These indicators do not exhaust the problem, but they offer verifiable parameters for institutional control.

4.2.1 Universalizability: from the moral imperative to public policy

The criterion of universalizability is based on the idea that legitimate norms are those that could be accepted by any citizen, considered equal in dignity and autonomy. In the Kantian tradition, a rule is only morally valid when it can be erected into universal law, without contradiction and without privilege (KANT, 2003). Contemporary justice theory reinforces this intuition by arguing that principles of government need to be justified from an impartial position, in which agents ignore contingent advantages and particularistic interests (RAWLS, 2008).

Transposed to the algorithmic sphere, this principle imposes that automated decisions can be publicly justified to those who will be affected. It is not enough for models to be efficient or technically sophisticated; It is necessary to verify whether the criteria embedded in the

computational routines, variables used, weights assigned, and performance metrics stand the test of reasonableness when exposed to democratic criticism. This point is particularly relevant in the face of evidence that algorithms can reproduce historical inequalities, amplifying biases present in the data and disproportionately affecting vulnerable groups (BAROCAS; SELBST, 2016; O'NEIL, 2016; GREEN, 2021).

Thus, universalizability acts as a substantive limit in the GIS Cycle, especially in the Governance axis. By requiring that technical rules can be defended as equitable, the capture of public policies by private rationalities or implicit discriminations is prevented. Algorithmic policies that would not pass the scrutiny of universalization, because they select beneficiaries in an opaque way, stigmatize territories or systematically penalize the same groups, lack legitimacy, regardless of the operational gains they present. Universalizability reintroduces, therefore, the republican ideal that no one should be subject to norms that they could not, in principle, co-sign.

4.2.2 Dignity: limits to instrumental rationality

The criterion of dignity deepens the reflection by recalling that people can never be treated as mere means for administrative, economic or security ends. In the classical formulation, dignity derives from the fact that human beings are ends in themselves, endowed with moral autonomy and the right to self-determination (KANT, 2003). In contemporary constitutionalism, this value becomes the foundation of the State and a parameter for controlling public policies (BINENBOJM, 2017; BANDEIRA DE MELLO, 2015).

Applied to the digital environment, the dignity criterion questions practices that reduce individuals to statistical profiles, risk scores or permanently suspect categories. Automated screening systems in social policies, education, or security can produce labels that are difficult to overcome, restricting future opportunities and naturalizing stigmas (CITRON; PASQUALE, 2014; CRAWFORD, 2021). The risk increases when relevant decisions are fully automated, with no real possibility of human review, converting citizens into objects of silent evaluation by machines.

Within the scope of the GIS Cycle, dignity acts as an ethical counterweight to innovation. She recalls that not every technical possibility is morally admissible. Even when algorithms promise significant efficiency gains, there is still a duty to assess whether the logic used violates essential boundaries of the human person, such as privacy, freedom of expression, equal treatment, and the right to challenge decisions that affect it (DONEDA, 2020; MENDES, 2021). Finally, dignity imposes a clear limit: it is not legitimate to govern by turning citizens into mere objects of calculation.

4.2.3 Transparency: Coming Out of the Cave in the Age of Code

Transparency responds to the danger that societies will live in a new form of cave, in which algorithmic projections acquire the appearance of incontestable truth. Since Plato, it has been known that appearances can imprison when not subjected to critical examination (Plato, 2000). In the digital context, opacity derives from technical complexity, trade secrets, and the probabilistic nature of the models, factors that make it difficult to understand why certain decisions were produced (PASQUALE, 2015; FLORIDI et al., 2018).

Transparency, however, does not mean indiscriminately disclosing everything, but making intelligible the purposes, premises and limitations of the systems used. This involves accessible documentation, algorithmic impact assessments, public model registries, the right to an explanation for affected persons, and institutional mechanisms for clear risk communication (OECD, 2019; EU, 2021; WORLD BANK, 2020). Transparency also presupposes real conditions for independent auditing, including by control bodies and researchers.

Within the GIS Cycle, transparency occupies a central position in the Governance axis, as it enables democratic control. Without it, decisions become unappealable, and authority moves to technocratic spheres that are not very visible. By illuminating decision-making processes, transparency prevents algorithms from operating as "black boxes" and allows society to distinguish between fair outcomes and mere shadows cast by statistical models. It is, therefore, a requirement for technological innovation to remain subordinate to the public sphere, and not the other way around.

4.2.4 Accountability: the power to model and the duty to respond

The criterion of accountability closes the set by stating that, if algorithms model the social world, someone must answer for their consequences. The public administration literature shows that automated systems tend to disseminate the authorship of decisions, making it difficult to identify those responsible and correct injustices (BOVENS; ZOURIDIS, 2002; HOOD; DIXON, 2015). Without clear rules, the phenomenon of "faceless power" occurs, in which errors are attributed to the machine and not to the human choices that configured it.

Accountability, in this context, means establishing duties of diligence throughout the entire life cycle of the system: planning, development, contracting, implementation, monitoring, and discontinuity. Each stage must have clearly identified agents, with obligations to document, test, review and correct when damage is detected (HABERMAS, 1997;

PETERS; PIERRE, 2016). This includes the right to reparation and the existence of institutional channels for contesting and reviewing automated decisions.

In the GIS Cycle, accountability integrates Governance and Sustainability: it prevents innovation from being an act without an author and ensures institutional learning over time. By recognizing that every technological architecture incorporates moral and political choices, the criterion obliges managers to justify, record, and publicly answer for them. With this, it transforms the automation of a democratic risk into an opportunity to strengthen the culture of accountability, an indispensable condition for the use of algorithms to remain compatible with a State that is intended, above all, to be republican and democratic.

4.3 GUIDELINES FOR THE LIFE CYCLE OF ALGORITHMIC SYSTEMS IN THE PUBLIC SECTOR

The normative criteria presented, universalizability, dignity, transparency and accountability, only reveal their full potential when translated into concrete guidelines for the life cycle of algorithmic systems. Recent literature shows that many ethical failures do not stem from bad intentions, but from the absence of institutional processes capable of anticipating risks, monitoring effects, and correcting course (WORLD BANK, 2020; OECD, 2019). Thus, more than listing good practices, it is about organizing a sequence of public decisions consistent with the GIS Cycle, in which governance, innovation, and sustainability act in an integrated way.

From the point of view of public management, the proposal developed here does not intend to replace existing norms, but to offer a decision roadmap. In practical terms, this means incorporating algorithmic impact assessments into contracting processes, recording the technical and legal motivations for choices, instituting formal channels for contestation, and providing for periodic reviews of the systems in place. It is, therefore, a matter of translating ethical principles into verifiable administrative routines, strengthening *accountability* without paralyzing innovation.

4.3.1 Planning: defining the problem before the solution

The first moment is to prevent technology from taking precedence over politics. Before hiring tools or developing models, the government must clearly delimit the public problem, its objectives and the values involved. The initial question is not "which algorithm to use?", but whether the use of algorithms is necessary, proportionate and justifiable, compared to less intrusive alternatives (LESSIG, 1999; MENDES, 2021).

At this stage, it is necessary to explain which goods will be prioritized, reduction of inequalities, expansion of access, improvement of targeting and how such goals dialogue with the criteria of universalizability and dignity. When values and purposes remain implicit, space is opened for technical decisions to replace political choices, shifting democratic deliberation into codes and databases (PASQUALE, 2015).

4.3.2 Design and development: incorporating ethics from the beginning

Once the problem is defined, the design of the system must occur in an interdisciplinary way. Technical teams need to dialogue with professionals in law, philosophy, public policy, and institutional control, preventing modeling from being the exclusive domain of data specialists. The literature emphasizes that apparently neutral options, choice of variables, treatment of missing data, performance metrics, carry normative decisions (BAROCAS; SELBST, 2016; GREEN, 2021).

It is therefore recommended to document justifications, carry out prior algorithmic impact assessments and identify, from the outset, possible discriminatory effects, especially on historically vulnerable groups (EU, 2021; OECD, 2019). In cases of contracting with third parties, transparency clauses, access for auditing, and clear rules for data ownership and sharing become essential. The axis of Governance, in this phase, consists of recognizing that each line of code translates a public policy option.

4.3.3 Implementation: human oversight and right to challenge

During implementation, systems should not fully replace human judgment, especially when they produce high-impact decisions on fundamental rights. The literature points out that public trust depends on the possibility of revision and the existence of a way out for unfair decisions (CITRON; PASQUALE, 2014; DONEDA, 2020).

Thus, it is recommended that algorithms operate as decision support, and not as an indisputable final authority. Affected citizens need to have accessible channels to question results and obtain understandable explanations, which at the same time reinforces the criteria of dignity and transparency. From the point of view of institutional sustainability, this stage requires continuous monitoring, with the collection of evidence on systematic errors, biases, and unforeseen effects, transforming implementation into a learning process.

4.3.4 Monitoring, review, and discontinuity: learning from the effects

No algorithmic system should be considered definitive. Use over time produces externalities, alters behaviors, and can generate dependencies that are difficult to reverse.

For this reason, international best practices recommend periodic reviews, with the participation of control bodies, independent experts and, when possible, representatives of civil society (WORLD BANK, 2020; EU, 2021).

These reviews should evaluate not only technical performance, but also distributive impacts, respect for rights, and compatibility with the public interest. When adverse effects prove to be serious, discrimination, unappealable opacity, erosion of fundamental guarantees, the State needs to have clear mechanisms of correction or discontinuity, including adequate reparation for injured persons (HABERMAS, 1997; PETERS; PIERRE, 2016).

This last movement materializes the axis of Sustainability in the GIS Cycle: recognizing that technological decisions leave institutional and intergenerational traces and, therefore, require the ability to review, record, and respond to the paths adopted.

4.3.5 Synthesis: from technique to self-government

The guidelines presented show that governing algorithms means, ultimately, governing the exercise of power itself. When careful planning, ethical design, responsible implementation, and reflective monitoring are articulated, digital transformation ceases to represent a technocratic threat and becomes an opportunity to deepen democracy.

The key is to understand that technological neutrality is a myth. Algorithmic systems incorporate worldviews, moral choices, and distribution criteria. Submitting them to the GIS Cycle, through the four reconstructed normative criteria, means putting politics and ethics back at the center of the decision-making process, preventing technology from becoming a new incontestable "Demiurge" (JONAS, 2006; CRAWFORD, 2021).

Thus, the results suggest that public policies mediated by algorithms only achieve legitimacy when anchored in processes that deliberate, explain and respond, three verbs that synthesize the passage from technological innovation to a true democratic governance of the digital.

4.4 INSTITUTIONAL TENSIONS, RISKS AND SAFEGUARDS

The analysis carried out so far shows that algorithmic governance does not eliminate historical dilemmas of public power; on the contrary, it reconfigures them into new forms. Instead of conflicts between bureaucracy and politics, or between efficiency and legality, tensions emerge between technical complexity and democratic control, between algorithmic personalization and equality, between massive data and privacy, between speed of innovation and institutional prudence (HOOD; DIXON, 2015; OECD, 2019). Acknowledging

these tensions is a decisive step toward formulating safeguards that don't demonize technology but also don't capitulate to its allure.

A first tension concerns the promise of efficiency. Automated systems are often presented as rational answers to problems of resource allocation and policy focus. However, efficiency gains can occur at the expense of rights, for example, when automation increases the undue exclusion of beneficiaries or makes it difficult to challenge administrative decisions (PASQUALE, 2015; CITRON; PASQUALE, 2014). The literature shows that technological solutions tend to hide values and choices under the appearance of neutrality, shifting moral debates into mathematical models (CRAWFORD, 2021; GREEN, 2021). The criterion of universalizability, in this context, works as a prudential brake, requiring that "efficient" policies also be justifiable to those affected.

A second tension involves structural opacity. Complex models, such as neural networks, have high performance, but make it difficult to explain specific results. When associated with trade secrets and restrictive contracts, they produce zones of public unintelligibility, in which not even managers can explain why someone was selected, classified or excluded (FLORIDI et al., 2018; EU, 2021). Added to this is the risk of excessive "epistemic authority": decisions tend to be accepted simply because "the algorithm said so." Transparency, here, ceases to be a mere administrative virtue and becomes a condition for the possibility of democratic control.

There are also tensions linked to technological dependence and the asymmetry of power between public administrations and large private suppliers. Contracting proprietary systems can generate institutional lock-in, making it difficult to audit, review, and migrate to more rights-compatible alternatives (WORLD BANK, 2020). This scenario increases the importance of contractual clauses that guarantee access to data, documentation, and logs, as well as the need for internal technical capabilities capable of critically dialoguing with providers (BOVENS; ZOURIDIS, 2002). Accountability, distributed throughout the life cycle, prevents structural failures from being naturalized as "inevitable machine errors."

Another relevant risk is the normalization of monitoring. The growth of databases and surveillance devices can stimulate preventive policies based on behavioral prediction, with profound impacts on privacy and freedom. Even when motivated by legitimate ends, such practices threaten to turn citizens into permanent objects of observation, eroding social trust (ZUBOFF, 2019; DONEDA, 2020). In these cases, the criterion of dignity reminds us that not every administrative benefit authorizes sacrificing essential spheres of autonomy.

In the face of this set of tensions, institutional safeguards play a decisive role. International experiences point to three minimum layers. The first is normative, involving data

protection laws, responsible AI frameworks, the requirement for impact assessments, and active advertising rules (OECD, 2019; EU, 2021). The second is organizational, with ethics committees, units specialized in data governance, audit protocols, and formal instances of social participation. The third is cultural, dependent on the continuous training of managers and civil servants to understand that technology is always a political decision mediated by technique, and not a substitute for deliberation.

These safeguards, when integrated into the GIS Cycle, make it possible to transform risks into institutional learning opportunities. Governance creates spaces of justification; innovation is submitted to ethical and legal criteria; Sustainability ensures that decisions can be reviewed in light of their intergenerational effects. The tension does not disappear, but becomes governable.

In summary, the results suggest that the central challenge is not to choose between adopting or rejecting algorithms, but to decide how to adopt them, under what limits, and with what guarantees. Automated systems can deepen inequalities, entrench opacities, and erode rights, but they can also expand administrative capacities and improve resource allocation when anchored in clear criteria. The decisive point is that, in the absence of safeguards, technology tends to assume the role of a new "world orderer", without justification. With robust safeguards, it becomes an instrument subordinate to the democratic project.

5 CONCLUSION

The path developed throughout this article started from an apparently simple concern: what actually changes when the State starts to decide with the support of algorithms? The answer proved to be broader than a mere technological update. By articulating classical philosophy, contemporary constitutionalism, and recent debates on governance and artificial intelligence, it has become evident that the central issue is not the "use of tools", but the reconfiguration of the exercise of power in societies increasingly mediated by data and computational models.

Human ambivalence, the Myth of the Cave, the Pythagorean heritage, the metaphor of the Demiurge, and the reconstruction of the supremacy of the public interest in a constitutional key converged to the same diagnosis: every form of order, including the digital order, carries a normative core. Algorithmic systems don't just describe reality; They model it, defining who shows up, who gets monitored, who will have access to policies, and who will stay on the margins. In this context, insisting on the neutrality of technology is equivalent to confusing, again, shadows with reality, only with more sophisticated mathematical tools.

The main contribution of this work was to transform this finding into a structured normative framework, organized in the GIS Cycle. Based on it, four criteria were identified that should guide public decisions mediated by algorithms: universalizability, dignity, transparency, and accountability. These criteria do not constitute an occasional list of good practices, but a contemporary translation of requirements already present in moral philosophy, in the theory of justice and in administrative law. Universalizability reminds us that decisions are only legitimate when they can be justified to all those affected; dignity imposes limits on the reduction of people to mere objects of calculation; transparency prevents the technique from becoming a new form of cave; accountability ensures that the power to shape reality does not dissolve into the anonymity of the machine.

By applying these criteria to the life cycle of algorithmic systems, from planning to discontinuity, the paper showed that there is no responsible governance without structured processes. Defining the problem before the solution, designing models with interdisciplinary participation, ensuring meaningful human oversight, opening channels of contestation, instituting periodic reviews, and providing for the possibility of interruption of systems incompatible with fundamental rights are not optional gestures: they are minimum conditions for technological innovation to remain subordinate to the public interest, and not the other way around. When these safeguards do not exist, automation tends to reinforce inequalities, opacities, and dependencies; When they exist, real possibilities are opened up to expand state capacities and qualify public policies.

It is important to recognize, however, the limits of the proposal. It is a study of a theoretical-conceptual nature, whose strength lies in the internal coherence of the argument and in the pertinence of the sources mobilized. The normative model presented here does not replace empirical investigations, field experiments or comparative case studies. On the contrary, it intends to prepare the ground so that these surveys can be conducted with greater clarity of criteria, avoiding both technofetishism and technopessimism. A promising agenda involves, for example, the application of the GIS Cycle to the analysis of systems already in use in areas such as health, education, social assistance, public security, and fiscal management, as well as the comparison between different institutional arrangements of algorithmic governance at the national and international levels.

Despite these limits, the central argument remains: there is no technical way out of a problem that is, above all, ethical and political. The growing presence of algorithms in the action of the State does not dispense with democratic deliberation; on the contrary, it makes it more urgent. In a scenario in which decisions tend to be justified by the authority of statistical models, reaffirming the need to justify oneself before concrete citizens and not just before

indicators is a gesture of democratic resistance. It is also a way of remembering that the State, even when digital, remains bound by the commitment to treat each person as an end in himself.

Ultimately, governing algorithms is a way of governing oneself as an institution. By proposing that all technological innovation in the public sector be passed through the sieve of universalizability, dignity, transparency, and accountability, this article suggests that the digital society does not need to be a new chapter of heteronomy imposed by the code. On the contrary, it can become an opportunity to deepen the ideal of a power that knows itself to be dangerous, and therefore limits itself; he knows himself to be fallible, so he lets himself be controlled; he knows he is a creator, so he is responsible for the world he helps to build. If this intuition is taken seriously, the digital transformation of the State will no longer be just a project of administrative modernization and can be understood as what, in fact, is at stake: a new stage in the history of the struggle for a fairer, more reflective, and truly democratic public governance.

ABSTRACT

Considering the advancements in inclusive education policies and the significant growth in enrollment of students with Autism Spectrum Disorder (ASD) in basic education, challenges persist regarding the effective implementation of collaborative pedagogical practices between the regular classroom teacher and the special education teacher, justifying this study. The research aimed to analyze, through a literature review, the perspectives, possibilities, and contributions of collaborative teaching to the inclusion of students with ASD in basic education. To this end, a qualitative research study was conducted, specifically a bibliographic review, analyzing national and international scientific publications selected from the Scielo, Google Scholar, and CAPES Periodicals Portal databases, using descriptors related to inclusive education, collaborative teaching, and ASD. Thus, it is observed that collaborative teaching is configured as a relevant pedagogical strategy for improving the teaching and learning process, favoring the participation, academic and social development of students with ASD, in addition to promoting teacher co-responsibility and the articulation between mainstream education and Specialized Educational Services. This leads to the

RESUMO

Considerando os avanços das políticas de educação inclusiva e o crescimento expressivo das matrículas de estudantes com Transtorno do Espectro Autista (TEA) na educação básica, persistem desafios relacionados à efetivação de práticas pedagógicas colaborativas entre o professor da sala comum e o professor da Educação Especial, o que justifica a realização deste estudo. A pesquisa teve objetivo analisar, a partir de uma revisão da literatura, as perspectivas, possibilidades e contribuições do ensino colaborativo para a inclusão de estudantes com TEA na educação básica. Para tanto, procede-se a uma pesquisa de natureza qualitativa, do tipo revisão bibliográfica, com análise de produções científicas nacionais e internacionais, selecionadas nas bases de dados Scielo, Google Acadêmico e Portal de Periódicos CAPES, utilizando descritores relacionados à educação inclusiva, ensino colaborativo e TEA. Desse modo, observa-se que o ensino colaborativo se configura como uma estratégia pedagógica relevante para a qualificação do processo de ensino e aprendizagem, favorecendo a participação, o desenvolvimento acadêmico e social dos estudantes com TEA, além de promover a corresponsabilização docente e a articulação entre o ensino comum e o Atendimento Educacional Especializado. O que permite concluir que a efetivação do ensino colaborativo depende de condições institucionais, planejamento coletivo, formação continuada dos professores e integração das práticas pedagógicas ao Projeto Político-Pedagógico da escola.

RESUMEN

Considerando los avances en las políticas de educación inclusiva y el crecimiento significativo de la matrícula de estudiantes con Trastorno del Espectro Autista (TEA) en la educación básica, persisten desafíos en cuanto a la implementación efectiva de prácticas pedagógicas colaborativas entre el docente de aula regular y el docente de educación especial, lo que justifica este estudio. La investigación tuvo como objetivo analizar, mediante una revisión bibliográfica, las perspectivas, posibilidades y contribuciones de la enseñanza colaborativa a la inclusión de estudiantes con TEA en la educación básica. Para ello, se realizó una investigación cualitativa, específicamente una revisión bibliográfica, analizando publicaciones científicas nacionales e internacionales seleccionadas de las bases de datos de Scielo, Google Académico y el Portal de Periódicos CAPES, utilizando descriptores relacionados con la educación inclusiva, la enseñanza colaborativa y el TEA. Así, se observa que la enseñanza colaborativa se configura como una estrategia pedagógica relevante para mejorar el proceso de enseñanza y aprendizaje, favoreciendo la participación, el desarrollo académico y social del alumnado con TEA, además de promover la corresponsabilidad docente y la articulación entre la educación regular y los Servicios Educativos Especializados. Esto lleva a la conclusión de que la eficacia de la enseñanza colaborativa depende de las condiciones institucionales, la planificación colectiva, la formación docente continua y la integración de las prácticas pedagógicas en el Proyecto Político-Pedagógico de la escuela.

1 INTRODUCTION

The consolidation of inclusive education in Brazil has required significant transformations in public policies, in the organization of educational institutions and, above all, in the pedagogical practices developed in everyday school life. Based on the principles of the right to education, access, permanence and learning, the school is now called upon to attend to the diversity of its students, recognizing their singularities and potentialities. In this context, the schooling of students with Autism Spectrum Disorder (ASD) has become one of the great contemporary challenges for educational systems.

ASD is characterized by persistent deficits in communication and social interaction, associated with restricted and repetitive patterns of behavior, interests, and activities, which can directly impact teaching and learning processes. In view of these specificities, it is essential that schools develop pedagogical strategies that promote not only these students' access to regular education, but also their effective participation and the development of meaningful learning. Thus, inclusive education demands practices that overcome segregating models and punctual interventions, moving towards collaborative and integrated pedagogical proposals.

In this scenario, collaborative teaching, also called co-teaching, has been pointed out in the national and international literature as a promising strategy for the inclusion of students who are the target audience of Special Education, especially those with ASD. This approach is based on the partnership between the common room teacher and the Special Education teacher, who share responsibilities in the planning, execution and evaluation of pedagogical activities, working together in the same educational space. By promoting teacher co-responsibility, collaborative teaching contributes to the reorganization of pedagogical practices and to the construction of a more inclusive school environment.

In the context of Brazilian educational policies, normative advances have reinforced the need for articulated and collaborative pedagogical practices. The current legislation establishes that instruments such as the Specialized Educational Service Plan (PAEE) and the Individualized Educational Plan (PEI) must be integrated into the school's Political-Pedagogical Project (PPP), guiding the work developed in the common room, in the Specialized Educational Service (AEE) and in collaborative activities. This normative perspective shows that school inclusion must be understood as an institutional commitment, which involves the entire school community.

Despite legal and theoretical advances, the implementation of collaborative teaching still faces challenges related to teacher training, the organization of pedagogical work and school culture, which highlights the need to deepen discussions about this approach.

In view of this, this article aims to analyze, through a literature review, the contributions of collaborative teaching to the inclusion of students with ASD in basic education, identifying its contributions, its foundations and possibilities, in the light of the scientific literature and the legal frameworks of inclusive education in Brazil.

2 THEORETICAL FRAMEWORK

2.1 AUTISM SPECTRUM DISORDER (ASD)

According to Castro (2020, p.19) the word autism comes "from the Greek autos, which means of oneself turned inwards, associated with the suffix ism, which means belonging to something". This was the name created by Eugen Bleuler in 1908. In the course of research and study, in 2013 autism was renamed Autism Spectrum Disorder (ASD), according to the Statistical Diagnostic Manual of Mental Disorders-DSM 5 (APA, 2013).

A key milestone in autism studies occurred in 1943, when psychiatrist Leo Kanner published pioneering research describing a group of children who had significant difficulties in social interaction and communication. These observations were important because they allowed the identification of behavioral characteristics that, until then, were not clearly understood or differentiated from other conditions of child development (Kanner, 1943).

With the advancement of clinical observation over the years and the deepening of research, the understanding of autism has been expanded. It has come to be recognized that these characteristics do not manifest themselves in a single or homogeneous way, but vary significantly from individual to individual. In this way, autism is no longer understood as a single and restricted condition and is now conceptualized as a spectrum disorder, that is, a set of diverse manifestations that can present different levels of severity, support needs, and forms of expression.

Autism Spectrum Disorder (ASD) is not configured as a closed or fully delimited concept. There is, to date, no scientific consensus regarding its definition or its etiology. This lack of definition stems, to a large extent, from the fact that the exact origin of autism is not yet known, or even if it is possible to attribute it to a specific cause.

The causes of ASD are not unique or simple, as the disorder results from several factors acting together, and not from a single origin. These factors mainly include genetic components, such as hereditary alterations or predispositions, and environmental factors, which can influence neurological development before, during, or after birth. (Velarde; Cárdenas, 2022)

In ASD, there is a wide diversity of manifestations within the spectrum, which involves different interpretations of their possible origins, clinical characteristics, comorbidities,

diagnostic processes, therapeutic approaches, and other related aspects. In view of this plurality, it becomes complex to construct a single and precise definition of Autism Spectrum Disorder. According to Arvigo and Schwartzman, 2020, p. 15, ASD is characterized:

[...] persistent deficits in communication and social interaction, associated with restricted and repetitive patterns of behavior, interests and/or activities. Its symptoms often overlap with those of other conditions, being easily confused with Developmental Language Disorder (LDD), Attention Deficit Hyperactivity Disorder (ADHD), in addition to numerous genetic syndromes such as Rett Syndrome and other conditions that lead to impairments in social, linguistic, motor and/or cognitive behaviors (Arvigo; Schwartzman, 2020, p. 15).

ASD is a neurodevelopmental condition marked mainly by continuous difficulties in communication and social interaction, such as problems expressing oneself, understanding social rules, or establishing interpersonal relationships. In addition, it involves restricted and repetitive behaviors, interests, or activities, such as repetitive movements, rigidity to change, or very specific interests. The signs of the disorder may resemble those of other conditions, which makes the diagnosis more complex. Some genetic syndromes also have similar characteristics.

The Diagnostic and Statistical Manual of Mental Disorders - 5th edition (APA, 2014) explains that ASD is characterized by severe and invasive impairment in some areas of development, such as reciprocal social interaction skills and the non-verbal behaviors used for it, communication skills, socio-emotional reciprocity skills, difficulty developing, maintaining and understanding relationships and the presence of behaviors, stereotyped interests and activities.

Many children with ASD have a delay in starting to speak or use language differently than expected for their age. This delay does not occur in isolation, but is usually associated with other developmental changes. Another characteristic according to DSM-5 is the absence of interest in typical social interactions, such as eye contact, exchange of glances or communication initiative. Children handle objects in a repetitive or functionally limited way, they can also demonstrate specific skills, but at the same time, present difficulties in basic aspects of social communication.

2.2 THE SCHOOLING OF STUDENTS WITH ASD

The right to access and permanence in educational institutions is guaranteed in the Federal Constitution of 1988, which states in Article 206, item I, that: "Education shall be provided based on the following principles: I – equality of conditions for access and permanence in school." (Brazil, 2024, p. 186). In addition, this right is reinforced by other

constitutional provisions, such as Article 205 – Defines education as a right of all and a duty of the State and of the family, aiming at the full development of the person, the exercise of citizenship and qualification for work and Article 208 – Establishes the duties of the State with education, including specialized educational assistance to people with disabilities, preferably in the regular school system. (Brazil, 2024).

Another important provision for the school inclusion of people with ASD is the Law of Guidelines and Bases of National Education - LDBEN, Law 9394/96, which ensures the offer of Special Education as a transversal modality, preferably in the regular school network, ensuring specialized educational care for students with disabilities, global developmental disorders and high abilities or giftedness. According to article 59 of the LDB, education systems must ensure specific curricula, methods, techniques, educational resources and organization to meet the needs of students who are the target audience of Special Education (Brasil, 1996).

In this context, it is pertinent to emphasize that Law No. 12,764/2012 brought specific and extremely relevant rights to the process of inclusion of students with autism. This regulation, which institutes the National Policy for the Protection of the Rights of Persons with Autism Spectrum Disorder, also known as the Berenice Piana Law, ensured people with ASD, for all legal purposes, the same rights conferred on people with disabilities. It specifies, in its article 3, item IV, paragraph "a", among the rights of the person with ASD, the right "to education and vocational training" (Brasil, 2012).

School inclusion is fundamental for the development of children with ASD, as it guarantees them coexistence with other children of the same age group in a common educational environment. This interaction transforms the school into a space not only for academic learning, but also for welcoming differences and social development.

By participating in this context, the person with ASD has their interaction capacities stimulated, which contributes to avoiding prolonged social isolation. Social skills are not innate, but can be learned and developed through the interactions and exchanges that occur during the social learning process. In this sense, interaction with peers is essential for the development of anyone, regardless of whether or not they have ASD, being the basis for the construction of social, emotional and communicative skills (Vieira; Alves; Bringel, 2023).

It is relevant to note that education data in Brazil in recent years according to the School Census have shown a significant growth in enrollment of students with ASD between the years 2023 and 2024, with an increase of 44.4% in the number of students with ASD enrolled in basic education. This growth is demonstrated by the increase from approximately

636 thousand to almost 920 thousand students, which reveals a substantial expansion of this public in the educational system in just one year. (Brazil, 2024)

Students with ASD constitute an important portion of the public served by Special Education. This reinforces the centrality of ASD in inclusive educational policies and practices. There is a growth trend over time, as since 2020, the total number of enrollments in Special Education has grown by 58.7%. (Brazil, 2025).

The continuous and significant growth in enrollment in Special Education in Brazil in the period from 2020 to 2024, indicating advances in both access and school inclusion in regular classes. It is observed that the total number of enrollments went from 1,308,900 in 2020 to 2,076,825 in 2024, representing a significant increase over the five years analyzed. This growth suggests greater identification of students as the target audience of Special Education, expansion of inclusive policies and greater demand for specialized educational services.

2.3 CONCEPT AND FOUNDATIONS OF COLLABORATIVE TEACHING

2.3.1 Definition of collaborative teaching

Co-teaching, also called Collaborative Teaching or collaborative work, is a pedagogical proposal that emerged in the United States in the late 1980s, with the objective of favoring the schooling of students who are the target audience of Special Education (PAEE) in regular education classes, this form of teaching has been considered a promising strategy, as it contributes to the effectiveness of school inclusion, expanding the opportunities for learning, participation and development of these students in the regular school environment (Mendes; Vilaronga; Zerbato, 2023; Capellini; Zerbato, 2019).

According to the international literature, Collaborative Teaching is a pedagogical practice based on the partnership between regular education and special education teachers. In this type of work, both professionals share responsibilities and act together in all stages of the educational process. (Cook; Friend, 1993).

This means that teachers need to plan together and execute classroom activities in an integrated way and also collectively evaluate student performance. In this sense, "collaborative teaching should be understood as a new model of education, in which everyone feels responsible for the process of school inclusion". (Fontes, 2009, p. 42).

The core of Collaborative Teaching is to serve a diverse group of students, recognizing that the class is heterogeneous and that some students have specific educational needs. Thus, "collaborative teaching is a work alternative involving the cooperation between a regular school teacher and a special school teacher, who work together in the same class,

when there is the presence of one or more students who demand differentiated attention" (Marin and Maretti, 2014, p.3).

In this way, this approach seeks to ensure the participation, learning, and development of all, respecting differences and promoting school inclusion. Collaborative teaching is a form of organization of pedagogical work in which two teachers work together in the same classroom. This partnership aims to better serve the students who are the target audience of special education, without removing them from the regular class.

Co-teaching presupposes the integrated performance of two or more professionals, who share responsibilities in the planning, execution of classes and evaluation of student learning. This cooperation breaks with the logic of the teacher's isolated work. Collaboration is not limited to simultaneous presence in the classroom, but involves the collective construction of pedagogical strategies, the definition of methodologies and the joint analysis of learning outcomes. (Santos, 2015).

For Santos (2015), the main objective of this approach is to respond to the different forms and rhythms of learning of students, ensuring that everyone has access to the curriculum and development opportunities. A partnership between regular education and special education, this practice often occurs through the articulation between regular class teachers and special education teachers. In addition to teachers, collaborative teaching can involve other professionals in education and the support area, such as therapists and educational assistants, expanding the possibilities of intervention and support for the educational process.

The collaborative partnership between regular education and special education teachers according to Gately (2001, p. 42) is defined in three stages, after the implementation of the co-teaching proposal, as explained in chart 2:

Table 1*Definition of three stages of cohesive implementation*

Internships	Definition
Early stage	In which both teachers make an effort to relate, but communication is superficial and formal
Commitment stage	In this stage, professionals communicate more openly, with more interaction and more frequently as trust is established, consequently contributing to collaboration in teaching
Collaborative internship	In which interaction and communication occur in a natural and comfortable way for all those involved in working together.

Source: Gately (2001)

Co-teaching is based on the idea that the barriers to learning are not exclusively in the student, but in the way the school is structured. Therefore, he argues that it is the school institution that must change its structure to meet the diversity of students.

The co-teaching work model is based on the social approach because it presupposes that the school must be modified and that it is necessary to qualify the teaching given in regular classes, where the student spends most of the time of his school day. Thus, if teaching in the regular class does not respond to the needs of these students and does not favor their participation and learning, it will be useless to extend their working hours by one or two hours a week to offer SEA, as if the problem were centered on the student with disabilities, and not on the school (Mendes; Vilaronga; Zerbato, 2023, p. 17).

The common classroom is the main space for schooling, so it is in this context that teaching needs to be qualified to ensure, welcoming, participation in the teaching and learning process in an effective way. Therefore, it is not enough to extend the time of SEA if teaching in the regular class is not inclusive. Offering more time than one or two hours per week for SEA does not compensate for exclusionary or inaccessible pedagogical practices in the regular school classroom.

2.3.2 Collaborative practices provided for in the legislation

Decree No. 12,773, of December 8, 2025, reinforces the importance of collaborative work in the field of Special Education, highlighting that actions and activities must involve intersectoral articulation, that is, collaboration between different sectors and professionals to ensure quality education for the special education public. Specifically, article 12 and other provisions mention the need for articulated and collaborative actions, which guide activities both in the common classroom and within the scope of the Specialized Educational Service

(AEE), promoting intersectoral actions for inclusion and adequate support for students with disabilities.

Decree No. 12,773 establishes the obligation to prepare an individualized pedagogical document for the student, which must be updated continuously. This document is the PAEE (Specialized Educational Service Plan) and the PEI (Individualized Educational Plan), and must be built from a case study, that is, from a detailed analysis of the needs, potentialities

It is important to note that Decree No. 12773/2025 follows in its text what is established by CNE/CP Opinion No. 50/2023, which deals with guidelines and proposals for the education of students with Autism Spectrum Disorder (ASD) and other disabilities, in the context of inclusive education in Brazil.

From the proposition of the case study, its instruments are then established: the Specialized Educational Service Plan (PAEE) and the Individualized Educational Plan (PEI), both of a pedagogical nature, which make up the PPP of the school unit. These documents should guide the work to be developed in the common classroom, within the scope of the SEA, in the collaborative activities of the educational unit and in the demands of intersectoral articulation. (Brazil, 2023, p.13).

The proposition of the case study allows us to understand, in depth, the specific educational needs of the student. From this analysis, more appropriate and individualized pedagogical decisions become possible. Based on the case study, two central instruments are established: the PAEE, which organizes the actions of the SEA and the PEI, which defines objectives, strategies, adaptations and resources necessary for the student's teaching and learning process.

In this context, the current legislation is a very important factor for the construction of a cohesive/collaborative teaching between SEA and regular education teachers, because for the elaboration of the instruments the need for continuous planning among these professionals to conduct the pedagogical work in the classroom.

2.3.3 Teachers and co-teaching

Teachers need time, knowledge, organization and planning to meaningfully carry out co-teaching in order to adapt to this new approach in the teaching and learning process. This partnership is built gradually and with the support of the school and other professionals, such as the pedagogue and principal. It is important to note, as Vilaronga and Mendes (2017, p.27) point out, the "co-teaching proposal has the characteristic of being adaptive, therefore, it requires time for contextual changes. It must be intentionally cultivated or developed and also be considered in the processes of formation, both initial and continued".

Part of the difficulties in developing collaborative work is related to values, beliefs and practices historically constructed in the school, such as the view that each teacher acts in isolation or that special education is the exclusive responsibility of a single professional. Breaking with this cultural logic requires profound changes in the way teaching work is understood and organized. This implies abandoning fragmented practices and moving towards joint and co-responsible action.

In this sense, it is extremely relevant to clearly and complement the functions and attributions of the regular education teacher and the special education teacher. This definition is essential to avoid overlaps, omissions, or conflicts and to ensure that both contribute effectively to student learning.

The proposition of a work that has two teachers, or more, sharing the responsibility of teaching, in which students who are the target audience of special education have to be contemplated in school learning, generates certain basic conditions. Among these conditions are: space and time to promote the exchange of experiences and knowledge of the contents of both parties; discussion and theoretical deepening regarding the decisions expressed in the school's Pedagogical Political Project (Michelluzzi; Cordeiro; Selau, 2022).

2.3.4 Main contributions in the school context

The main contributions and results observed in regular education classes, where there are children with ASD in elementary school in the early years, when there is collaborative work involving the regent teacher and the Special Education teacher, according to research by Martins, Santos and Denari (2017), include: intellectual abilities superior to those of neurotypical colleagues, ease of memorization, a wide linguistic repertoire and a lot of property when expressing their ideas.

For Martins, Santos and Denari (2017), specialized educational support, in partnership with the work of the regent teacher, brings good results to the teaching-learning process for these students. In general, collaborative work involving several professionals is seen as a certainty that the schooling process has a greater opportunity to happen successfully.

According to Silva and Junior (2024), collaborative teaching in the inclusion of students with autism enhances the access, permanence and participation of students with ASD in the regular classroom. Collaboration allows the exchange of experiences, knowledge and specific pedagogical strategies, adjusted to the needs of students with ASD, favoring their integral development.

The studies by Cardoso and Pisetta (2024) concluded that collaborative teaching promotes articulation, allowing moments of exchange, listening, and greater knowledge of

the possibilities and potentialities of autistic students, contributing to the articulation between teachers. Collaborative work proves to be an important and powerful means to resignify the school environment, contribute to the articulation between teachers, integrate pedagogical practice and reflect on practice.

Corroborating the study, Vilaronga and Mendes (2014, p. 149) emphasize that "the scientific literature related to co-teaching, although promising, shows the need for more studies on the collaboration between regular teachers and special education teachers in schools". This shows the need for more research and investigations that address the practice of collaborative teaching in educational institutions in the teaching and learning process of students with disabilities and especially those with autism.

3 METHODOLOGY

The present study is characterized as a qualitative research, of the bibliographic review type, whose objective was to analyze how collaborative teaching has been discussed, presented and applied in the scientific literature as a strategy to favor the inclusion of students with ASD in basic education, as well as to identify its main contributions and possibilities in the school context.

The bibliographic review was developed in a systematic and analytical way, contemplating scientific productions and normative documents related to inclusive education, collaborative teaching, schooling of students with ASD and educational public policies. The survey of sources took place in national and international databases recognized in the area of Education, such as SciELO, Google Scholar, CAPES and ERIC Journals, in addition to consulting official documents, including laws, decrees, opinions and guidelines of the Ministry of Education.

To search for publications, the following descriptors were used, in isolation and combined by Boolean operators: collaborative teaching, co-teaching, inclusive education, Autism Spectrum Disorder, ASD, special education, Specialized Educational Service (SES), PAEE and PEI. The inclusion criteria considered: a) scientific articles, books, book chapters and normative documents that directly addressed collaborative teaching and/or the inclusion of students with ASD; b) productions published in Portuguese and English; c) studies with theoretical or empirical relevance to the educational context, especially in the context of basic education.

Materials that did not have a direct relationship with the object of study, duplicate publications, or texts that dealt with the topic in a superficial way, without consistent theoretical foundation, were excluded. The data analysis process occurred in three stages:

exploratory reading, with the objective of identifying the pertinent texts; analytical reading, aimed at the in-depth understanding of the contents; and interpretative reading, in which the data were organized and discussed in the light of the adopted theoretical framework.

Based on this analysis, the studies were grouped into thematic categories, such as: fundamentals of collaborative teaching, implementation models, contributions to the inclusion of students with ASD, challenges faced by teachers and institutional conditions necessary for the effectiveness of this practice.

This methodology enabled a broad and critical view of collaborative teaching as an inclusive pedagogical strategy, contributing to the understanding of its importance in the schooling process of students with ASD and to the reflection on the paths necessary for its consolidation in educational institutions.

4 RESULTS AND DISCUSSIONS

The analysis of the literature allowed us to identify that collaborative teaching has been widely discussed as a promising pedagogical strategy for the inclusion of students with ASD in basic education. The reviewed studies show conceptual, normative and practical advances, while revealing persistent challenges for their effectiveness in the school routine.

For analytical purposes, the results were organized into five thematic categories, in line with the specific objectives of the study: (1) theoretical foundations of collaborative teaching; (2) models and forms of implementation; (3) contributions to the inclusion of students with ASD; (4) challenges faced; and (5) necessary conditions for the effectiveness of collaborative practices.

4.1 FUNDAMENTALS OF COLLABORATIVE TEACHING

The studies analyzed converge in understanding collaborative teaching as an approach that breaks with the traditional and fragmented logic of teaching work. Authors such as Cook and Friend (1993), Capellini and Zerbato (2019) and Mendes, Vilaronga and Zerbato (2023) highlight that this practice is based on pedagogical co-responsibility, joint planning and integrated action between the common room teacher and the Special Education teacher.

In this sense, collaborative teaching is aligned with the principles of inclusive education, by recognizing diversity as constitutive of the school environment and by shifting the focus from the student's difficulties to the reorganization of pedagogical practices and school structure. This conception is in line with the current Brazilian legislation, which assigns to the school the responsibility of ensuring conditions of access, permanence, participation and learning for all students.

4.2 MODELS AND FORMS OF IMPLEMENTATION OF COLLABORATIVE TEACHING

The literature points to different ways of implementing collaborative teaching, varying according to the institutional context, the training of teachers and the level of articulation between the professionals involved. The most recurrent models include simultaneous co-teaching, teaching in stations, alternating teaching and complementary support in a common room.

Table 2 summarizes the main models identified in the literature and their central characteristics.

Table 2

Collaborative teaching models identified in the literature

Co-teaching model	Key features
Simultaneous co-teaching	Both teachers work together in the same activity and with the whole group
Teaching in stations	The class is divided into groups, with activities conducted alternately by the teachers
Alternate teaching	One teacher leads the main activity while the other works with a smaller group
Collaborative support	The Special Education teacher offers pedagogical support in a common room

Source: prepared by the authors (2025)

These models show that collaborative teaching is not configured as a single or rigid practice, but as a flexible and adaptive approach, which must consider the needs of students with ASD and the conditions of the school.

4.3 CONTRIBUTIONS OF COLLABORATIVE TEACHING TO THE INCLUSION OF STUDENTS WITH ASD

The studies analyzed indicate that collaborative teaching contributes significantly to the learning, participation and social development of students with ASD. Among the main contributions highlighted are the expansion of access to the curriculum, the adaptation of pedagogical strategies, the encouragement of social interactions and the appreciation of students' potential.

Research such as those by Martins, Santos and Denari (2017), Silva and Junior (2024) and Cardoso and Pisetta (2024) demonstrate that joint work between teachers favors interventions more adjusted to the needs of students with ASD, promoting greater engagement in school activities and reducing barriers to learning.

Table 3 presents a summary of the main contributions pointed out in the reviewed studies.

Table 3

Contributions of collaborative teaching for students with ASD

Dimension	Identified contributions
Learning	Curricular adaptation, diversification of strategies and greater access to content
Participation	Increased involvement in collective activities and reduced isolation
Social development	Stimulation of communication, interaction with peers and social skills
Teaching practice	Exchange of knowledge, continuing education and reflection on practice

Source: prepared by the authors (2025)

These results reinforce that collaborative teaching not only benefits students with ASD, but also contributes to the qualification of pedagogical work and the construction of a more inclusive school culture.

4.4 CHALLENGES FOR THE IMPLEMENTATION OF COLLABORATIVE TEACHING

Despite the advances pointed out, the literature shows significant challenges for the consolidation of collaborative teaching in schools. Among the main obstacles are the lack of time for joint planning, the absence of specific continuing education, the lack of definition of roles among teachers and the persistence of traditional conceptions that attribute Special Education to a single professional.

Authors such as Mendes, Vilaronga and Zerbato (2018) and Vilaronga and Mendes (2017) highlight that these obstacles are, to a large extent, cultural and institutional, requiring profound changes in the organization of school work and in the understanding of the teaching role.

4.5 NECESSARY CONDITIONS FOR THE EFFECTIVENESS OF COLLABORATIVE PRACTICES

The studies analyzed point out that the effectiveness of collaborative teaching requires structural, pedagogical and formative conditions. Among them, the following stand out: institutionalized time for joint planning, support from school management, clarity in the definition of professional attributions, and integration of the PAEE and PEI into the Political-Pedagogical Project (PPP), as provided for in Decree No. 12,773/2025.

Table 4 summarizes the conditions considered essential for the implementation of collaborative teaching.

Table 4*Conditions for the effectiveness of collaborative teaching*

Category	Necessary conditions
Organizational	Time for planning, management support and reorganization of the school routine
Pedagogical	Integration of the PAEE and PEI to the PPP and shared planning
Formative	Initial and continuing training on inclusion and co-teaching
Cultural	Overcoming isolated work and strengthening co-responsibility

Source: prepared by the authors (2025)

In this context, the results show that collaborative teaching is consolidated as a powerful strategy for the inclusion of students with ASD, as long as it is supported by institutional policies, legal support and collective commitment of the school community.

5 CONCLUSION

This article aimed to analyze, through a literature review, the contributions of collaborative teaching to the inclusion of students with ASD in basic education, as well as to identify its foundations and possibilities in the school context. The analysis of the literature allowed us to verify that collaborative teaching is configured as a relevant and promising pedagogical strategy for the effectiveness of inclusive education, by favoring more articulated, flexible practices centered on the educational needs of students.

The results show that collaborative teaching breaks with traditional and fragmented models of teaching performance, by proposing co-responsibility between the common classroom teacher and the Special Education teacher in all stages of the educational process, planning, execution and evaluation. This approach contributes to the expansion of access to the curriculum, to the diversification of pedagogical strategies and to the strengthening of social interactions, fundamental aspects for the academic and social development of students with ASD.

However, the literature points out significant challenges for the effective implementation of collaborative teaching, such as the absence of institutionalized time for joint planning, the insufficiency of specific continuing education, the lack of definition of professional roles, and the resistance to changes in the organization of school work. These obstacles show that the consolidation of collaborative teaching requires not only individual initiatives, but institutional commitment, support from school management and support in educational public policies.

In this context, the importance of integrating the Specialized Educational Service Plan (PAEE) and the Individualized Educational Plan (PEI) into the school's Political-Pedagogical Project (PPP) is highlighted, as provided for in the current legislation. This integration strengthens collaborative teaching by institutionalizing inclusive practices and ensuring

greater coherence between the pedagogical actions developed in the common room, in the SEA and in collaborative activities.

It is concluded, therefore, that collaborative teaching is a fundamental strategy for the effective school inclusion of students with ASD, as long as it is supported by appropriate organizational, pedagogical and formative conditions. It is recommended that future research advance in the empirical investigation on the implementation of this approach in different educational contexts, contributing to the improvement of inclusive policies and practices in the Brazilian educational system.

ABSTRACT

This article applies bibliometric techniques to evaluate the impacts of the Encyclical Letter *Laudato Sí* (2015) on the production of academic articles on ecotheology in English, Portuguese, and Spanish between 2010 and 2024, seeking to identify relationships between Catholic faith, ecology, and sustainability. It also sought to identify the extent to which these articles were aligned with themes such as Globalism, Agenda 2030, Sustainable Development Goals (SDGs), and Global Warming. Regarding methodology, the research is classified as applied, exploratory, descriptive, quantitative, and bibliographic. The descriptive analysis used the Web of Science tool to capture the following aspects: keywords, categories of knowledge, language, countries, journals, teaching departments, most productive researchers, funders, and SDGs. In turn, the generation and analysis of author networks and co-occurrences used the VOSviewer software. The search retrieved 729 documents, reduced to 678 when restricted to articles, with 553 in the Religion category. International publications fall within the 17 SDGs, with 185 articles addressing Climate Action (SDG 13). In the Brazilian case, 15 of the 20 articles do not fit into the categories of the 2030 Agenda, while only two address SDG 13.

Keywords: 2030 Agenda. Bibliometrics. Ecotheology. *Laudato Sí*. SDGs.

RESUMO

O presente artigo aplica técnicas bibliométricas para avaliar os impactos da Carta Encíclica *Laudato Sí* (2015) na produção de artigos acadêmicos sobre ecoteologia, nas línguas inglesa, portuguesa e espanhola, entre 2010 e 2024, buscando identificar relações entre fé católica, ecologia e sustentabilidade. Buscou-se também identificar em que medida esses artigos estavam alinhados a temas, tais como Globalismo, Agenda 2030, Objetivos de Desenvolvimento Sustentável - ODS e Aquecimento Global. Quanto à metodologia, a pesquisa é classificada como aplicada, exploratória, descritiva, quantitativa e bibliográfica. A

análise descritiva utilizou a ferramenta Web of Science para capturar os seguintes aspectos: palavras-chave, categorias de conhecimento, língua, países, periódicos, departamentos de ensino, pesquisadores mais produtivos, financiadores e ODS. Por sua vez, a geração e análise de redes de autores e coocorrências utilizou a *software* VOSviewer. A busca recuperou 729 documentos, reduzidos a 678, quando restrita a artigos, sendo 553 na categoria Religião. As publicações internacionais enquadram-se nos 17 ODS, sendo que 185 artigos versam sobre Ação Climática (ODS 13). No caso brasileiro, 15 dos 20 artigos não se classificam nas categorias da Agenda 2030, enquanto apenas dois contemplam o ODS 13.

Palavras-chave: Agenda 2030. Bibliometria. Ecoteologia. Laudato Sí. ODS.

RESUMEN

Este artículo aplica técnicas bibliométricas para evaluar los impactos de la Carta Encíclica Laudato Sí (2015) en la producción de artículos académicos sobre ecoteología en inglés, portugués y español entre 2010 y 2024, buscando identificar relaciones entre la fe católica, la ecología y la sostenibilidad. También buscó identificar en qué medida estos artículos estaban alineados con temas como el globalismo, la Agenda 2030, los Objetivos de Desarrollo Sostenible (ODS) y el calentamiento global. En cuanto a la metodología, la investigación se clasifica como aplicada, exploratoria, descriptiva, cuantitativa y bibliográfica. El análisis descriptivo utilizó la herramienta Web of Science para capturar los siguientes aspectos: palabras clave, categorías de conocimiento, idioma, países, revistas, departamentos de enseñanza, investigadores más productivos, financiadores y ODS. A su vez, la generación y el análisis de redes de autores y coocurrencias utilizaron el software VOSviewer. La búsqueda recuperó 729 documentos, reducidos a 678 cuando se restringió a artículos, con 553 en la categoría de Religión. Las publicaciones internacionales se enmarcan en los 17 ODS, con 185 artículos que abordan la Acción Climática (ODS 13). En el caso brasileño, 15 de los 20 artículos no se ajustan a las categorías de la Agenda 2030, mientras que solo dos abordan el ODS 13.

Palabras clave: Agenda 2030. Bibliometría. Ecoteología. Laudato Sí. ODS.

1 INTRODUCTION

One of the main concerns today is the environmental issue, marked by climate change, degradation of ecosystems and inequality in access to natural resources.

The occurrence of extreme weather events is evident, as in the case of the recent flood in Rio Grande do Sul, the blackout of electricity in São Paulo, due to winds with speeds above 100 km/h, the growth of fires throughout the Brazilian territory, in addition to several other examples around the planet.

The diagnosis made by a relevant part of the scientific community attributes the crisis to anthropogenic factors, in particular, the emission of greenhouse gases and the predatory use of natural resources, and it is urgent to adopt measures to decarbonize the economy and sustainable use of the environment, in order to stop, or at least mitigate, the effects of climate change.

In line with this diagnosis, multilateral institutions, governments, financial institutions, private and public banks, investors, companies, and consumers are increasingly committed to the ESG (Environment, Social, and Governance) agenda², defining standards and indicators for environmental, social, and sustainable corporate governance management.

An important example of these initiatives was the launch by the UN of the 2030 Agenda, defining 17 Sustainable Development Goals (SDGs) to be pursued by member countries.

In line with the signs of the times, Pope Francis expands the body of the Social Doctrine of the Church - DSI,³ through the publication of the Encyclical Letter *Laudato Sí*.

The document addresses the ecological issue from an integral Christian perspective, contributing to an updated reflection on Creation and the due care that man must give to the environment, helping Catholics and people of good will to raise awareness on the subject and the adoption of sustainable and just environmental practices.

This is the context that motivated this research, where bibliometric techniques were applied to evaluate the impacts of the Encyclical Letter *Laudato Sí* (2015) on the production of academic articles on ecotheology, in English, Portuguese, and Spanish, between 2010 and 2024.

² **ESG** is the acronym for **Environmental, Social, and Governance (ESG)**, a set of criteria used to assess the sustainability and ethical impact of a company or organization. These criteria are adopted by investors and other stakeholders to measure how a company handles environmental, social, and governance issues, as well as to assess its contribution to the well-being of society and the planet. OpenAI (2025).

³ A set of teachings of the Catholic Church that seeks to guide the faithful and society regarding social, economic, political and cultural issues, always based on the Gospel and the Christian tradition. These teachings aim to promote human dignity, social justice, the common good, and respect for creation. OpenAI (2025).

After all, what relationships can be identified between Catholic faith, ecology, and sustainability in post-Laudato Sí academic production? Has this document catalyzed new insights in the field of ecological theology? Did the Encyclical stimulate theologians to respond to the challenges of collective social effort aimed at establishing environmentally sustainable and socially just development initiatives? It is possible to observe an alignment between the published articles and themes such as: Globalism, 2030 Agenda, Sustainable Development Goals - SDGs⁴ and Global Warming. Is it possible to identify a bias in relation to these issues or is it a more neutral approach in the face of the pressures of the international and national agendas?

2 METHODOLOGY

This research seeks to identify the influences of Laudato Sí in the production of articles on ecotheology in English, Portuguese and Spanish, through a bibliometric study, which can be classified, according to Severino (2017), as applied, exploratory, descriptive, quantitative and bibliographic.

The following databases were consulted: Web of Science - WoS, Atla RDB and Google Scholar, and the use of WoS was chosen, given the greater number of articles and better quality of its metadata.

The results of the search resulted from the choice of the following terms: (((((((((ALL=(Laudato Sí)) AND ALL=(eco-theology)) OR ALL=(ecological theology)) OR ALL=(ecotheology⁵)) OR ALL⁶=(integral theology)) OR ALL=(integral theology⁷)) OR ALL=(ecotheology)) OR ALL=(integral theology)) OR ALL=(ecological theology).

The period 2010/2024 was considered, that is, covering five years before and nine years after the publication of Laudato Sí, resulting in 729 documents, or 678, when the search was restricted to articles (including those of conference and review).

⁴ The SDGs are a set of 17 interlinked goals that address key global challenges such as eradicating poverty, protecting the planet, and promoting peace and prosperity: 1. Poverty Eradication, 2. Zero Hunger and Sustainable Agriculture, 3. Health and Well-being, 4. Quality Education, 5. Gender Equality, 6. Clean Water and Sanitation, 8. Decent Work and Economic Growth, 9. Industry, Innovation and Infrastructure, 10. Reduction of Inequalities, 11. Responsible Cities and Communities, 12. Responsible Consumption and Production, 13. Action Against Global Climate Change, 14. Life on Water, 15. Terrestrial Life, 16. Peace, Justice and Effective Institutions, 17. Partnerships and Means of Implementation. United Nations Brazil (2024).

⁵ Ecotheology is a branch of theology that seeks to integrate religious reflection with environmental issues, proposing a spiritual and ethical vision of care for creation and the relationship between human beings and nature. OpenAI (2025).

⁶ Ditto.

⁷ Integral **theology** is a concept that refers to a comprehensive approach to theology, which seeks to understand and integrate all aspects of human life and the world in its entirety, taking into account the spiritual, social, economic, cultural, and environmental dimensions. In the context of **ecotheology** and contemporary issues, integral theology highlights the interconnectedness between faith, social justice, environmental preservation, and the promotion of the common good. OpenAI (2025).

Later, the number of documents was reduced to 553, when the search was refined to consider only the Religion category.

The descriptive analysis was carried out from the data generated by WoS, highlighting the following aspects: keywords, knowledge categories, language, countries, journals, teaching departments, most productive researchers, funders and SDGs.

In turn, the VOSviewer software was used for the analysis of network-based data.

3 DATA ANALYSIS AND DISCUSSION

As shown in Figure 1, the publication of articles on the topic, considering all WoS categories, increased after 2015, with the annual average rising from 15.6 to 59.8 in the comparison between the 2010/2014 and 2015/2024 periods, respectively, suggesting the positive impact of Laudato Si.

It is worth noting the peak that occurred in 2022, eight years after the publication of the Encyclical, reaching 99 publications.

Figure 1

Publications of articles including all WoS categories (2010/2024)

Source: WoS Raw Data

Figure 2 shows, as expected, that the Religion category includes 83% of the publications on the topic researched during the period considered.

Figure 2*WoS article publications by category (2010/2024)*

Source: WoS Raw Data

When considering the WoS categories, Figure 3 makes clear the leadership of English-language publications, followed by publications in Portuguese, Spanish, and Chinese.

Figure 3*Article publications by language (2010/2024)*

Source: WoS Raw Data

Given its greater representativeness compared to the others, the results presented below consider only the articles in the Religion category.

As shown in Figure 4, the U.S. leads the production of articles, with Brazil and China being among the nine countries with the most contributions.

Figure 4*Article publications by country (2010/2024)*

Source: WoS Raw Data

As for the relevance of journals, the Journal Religions stands out on the international scene, and the Journal Pistis & Praxis. Theology and Pastoral, in the Brazilian case.

The data presented in Figure 6 reveal something surprising: of the six most productive departments, four are South African.

Figure 6*Publications by department (2010/2024)*

3.1 INDICATORS OF BRAZILIAN PRODUCTION

Figure 11 and Table 1 show the publications on the subject in Portuguese during the period analyzed. The most productive authors were Elivaldo Serrão Custódio, Francico Chagas de Albuquerque, Márcia Maria de Oliveira and Afonso Murad.

Figure 11

Publications in Portuguese by author (2010/2024)

The following figure represents the networks of national authors by occurrence.

Figure 12

Map of Authors' Networks, by occurrence (2010/2024)

Source: Authors.

As for the prominent journals in the Brazilian case, the leadership is Pistis & Praxis Magazine. Theology and Pastoral Care, from PUCPR, according to Figure 13.

Figure 13

Publications in Portuguese by title (2010/2024)

Source: WoS Raw Data

As shown in Figure 14, the Pontifical Catholic University of Paraná leads the publications, with three of the five main departments being from Pontifical Catholic Universities (PR, SP and Rio).

Figure 14

Portuguese-language publications by department (2010/2024)

Source: WoS Raw Data

The trend identified above is reinforced when considering the data in Figure 15: 90% of the editions were carried out by Pontifical Catholic Universities (SP, PR and MG).

Figure 15*Portuguese-language publications by publisher (2010/2024)*

Source: WoS Raw Data

Regarding the association of publications in Portuguese with the SDGs, Figure 16 points out that the articles address 11 of the 17 UN goals, while two of the 20 articles are considered to be the climate issue.

On the other hand, 15 of the 20 national publications did not address any UN sustainable development goal.

In other words, at least in the case of publications in Portuguese, no evidence was found that the 2030 Agenda had a relevant direct impact on theological production.

Figure 16*Portuguese-language publications by SDGs (2010/2024)*

Source: WoS Raw Data

The following table presents the 20 most relevant keywords, according to the total strength of the links, and shows the relevance of the terms searched for in this research: ecology, ecological crisis, climate change, theology, ecotheology/eco-theology/ecological theology, and *laudato sí*.

The research also sought to identify the extent to which these articles were aligned with themes such as: Globalism, 2030 Agenda, SDGs and Global Warming, analyzing the results of the Web of Science – WoS.

The search recovered 729 documents, reduced to 678, when it was restricted to articles, 553 of which were in the Religion category.

In short, the bibliometric study pointed out the relevance of the themes of ecology and sustainability for the Catholic faith and theology, as well as the influence of the Encyclical Letter *Laudato Si*.

In fact, the results of the survey support the position that there is an alignment between the 553 publications, the 2030 Agenda and the SDGs. However, this understanding loses a lot of strength when we consider only national production.

At first, it was not possible to identify a direct relationship between the articles evaluated and the themes of globalism and global warming.

A suggestion to deepen this point would be to refine the search carried out, restricting it to articles classified in SDG 13.

A bibliographic review of Brazilian articles and the most representative of international production and, in particular, those that deal with Climate Action also seems relevant.

Finally, it would be interesting to replicate the current research to other areas of knowledge.

Carla Boin¹, Sérgio Bairon ²

ABSTRACT

This article investigates the convergences and divergences between Restorative Justice and Sustainability, innovative paradigms for contemporary challenges, enhanced by mediation (Boin, 2019a) and Shared Knowledge Production (Bairon & Lazaneo, 2013). Restorative Justice, focused on repair and reconciliation through mediated dialogue (Zehr, 2002; Braithwaite, 2002), contrasts with Sustainability, which aims for intergenerational balance (WCED, 1987) and respect for planetary boundaries (Rockström et al., 2009). Both share repair, systemic vision, and community participation. Mediation, as a conflict facilitation tool (Boin, 2019a), and Shared Knowledge Production, co-creating knowledge (Bairon & Lazaneo, 2013), strengthen their integration in socio-environmental conflicts, education, and governance, especially from the perspective of environmental justice (Acseirad, 2009) and the epistemologies of the south (Santos, 2007). Despite resistances, cases like New Zealand and Indigenous productions offer ethical and practical solutions to global crises.

Keywords: Community Participation. Intergenerational Ethics. Reparation. Reconciliation. Restorative Justice. Shared Knowledge Production. Socio-environmental Conflicts. Sustainability. Systemic Vision.

RESUMO

O artigo explora as convergências e divergências entre Justiça Restaurativa e Sustentabilidade, paradigmas inovadores para desafios contemporâneos, enriquecidos pela mediação (Boin, 2019a) e pela Produção Partilhada do Conhecimento (Bairon & Lazaneo, 2013). A Justiça Restaurativa, centrada na reparação e reconciliação via diálogo mediado (Zehr, 2002; Braithwaite, 2002), contrasta com a Sustentabilidade, que busca equilíbrio intergeracional (WCED, 1987) e o respeito aos limites planetários (Rockström et al., 2009). Ambas compartilham reparação, visão sistêmica e participação comunitária. A mediação, como ferramenta facilitadora de conflitos (Boin, 2019a), e a Produção Partilhada, que co-cria saberes (Bairon & Lazaneo, 2013), potencializam sua integração em conflitos socioambientais, educação e governança, especialmente sob a ótica da justiça ambiental (Acseirad, 2009) e das epistemologias do sul (Santos, 2007). Apesar de resistências,

exemplos como Nova Zelândia e produções indígenas mostram soluções éticas e práticas para crises globais.

Palavras-chave: Conflitos Socioambientais. Ética Intergeracional. Justiça Restaurativa. Produção Partilhada do Conhecimento. Reparação. Reconciliação. Sustentabilidade. Visão Sistêmica.

RESUMEN

El artículo explora las convergencias y divergencias entre la Justicia Restaurativa y la Sostenibilidad, paradigmas innovadores para desafíos contemporáneos, enriquecidos por la mediación (Boin, 2019a) y por la Producción Compartida del Conocimiento (Bairon & Lazaneo, 2013). La Justicia Restaurativa, centrada en la reparación y reconciliación mediante el diálogo mediado (Zehr, 2002; Braithwaite, 2002), contrasta con la Sostenibilidad, que busca un equilibrio intergeneracional (WCED, 1987) y el respeto a los límites planetarios (Rockström et al., 2009). Ambas comparten elementos como la reparación, la visión sistémica y la participación comunitaria. La mediación, como herramienta facilitadora de conflictos (Boin, 2019a), y la Producción Compartida, que co-crea conocimientos (Bairon & Lazaneo, 2013), potencian su integración en conflictos socioambientales, educación y gobernanza, especialmente desde la óptica de la justicia ambiental (Acsehrad, 2009) y de las epistemologías del sur (Santos, 2007). A pesar de resistencias, ejemplos como Nueva Zelanda y producciones indígenas muestran soluciones éticas y prácticas frente a crisis globales.

Palabras clave: Conflictos Socioambientales. Ética Intergeracional. Justicia Restaurativa. Participación Comunitaria. Producción Compartida del Conocimiento. Reparación. Reconciliación. Sostenibilidad. Visión Sistémica.

1 INTRODUCTION

Contemporary challenges, such as inequality, climate change, and environmental degradation, demand alternative approaches. Restorative Justice, emphasizing reparation and reconciliation (Zehr, 2002), and Sustainability, promoting ethical balance for future generations (WCED, 1987), emerge as complementary paradigms. This article expands this analysis to integrate media, as highlighted by Boin (2019a), which facilitates dialogue between parties in conflict, and the Shared Production of Knowledge (Bairon & Lazaneo, 2013), which co-creates knowledge via digital media. These approaches, exemplified in indigenous practices (Bairon & Lazaneo, 2013) and mediated processes (Boin, 2019b), offer an ethical and practical basis to face global crises, promoting a more just and sustainable future.

On the one hand, Restorative Justice proposes an alternative to the conventional punitive system, focusing on reparation of damages, reconciliation between the parties and not strengthening social relations (Zehr, 2002). On the other hand, Sustainability seeks to harmonize human needs with the preservation of the environment, promoting an ethical and practical balance for future generations (WCED, 1987). Although they operate in different spheres — the first legal and social field, the second in the ecological, economic and social dimensions — both share fundamental values such as harmony, systemic vision, collective responsibility and a commitment to the long term. This article offers a detailed comparative analysis of these concepts, exploring their convergences, divergences and possibilities of synergistic integration. In addition, it seeks to respond to how these approaches can be intertwined to face global crises such as social inequality, climate changes and environmental degradation, contributing to a more just, balanced and resilient future.

Restorative Justice is a paradigm of dispute resolution that rejects the exclusively punitive focus of the traditional retributive system, proposing an approach focused on the reparation and reconstruction of human relationships. Differently from the logic of state punishment, which often perpetuates cycles of exclusion and violence, it emphasizes the dialogue between what is caused or harmed, what is caused or damage and the community, as a path to responsibility and cure (Zehr, 2002; Johnstone, 2011). Howard Zehr, one of the leading theorists in the field, synthesizes his essence in three northern questions: "Who was harmed? What are your needs? Who has the obligation to attend to them?" (Zehr, 2002, p. 21). This model humanizes the judicial process by prioritizing empathy and the active participation of the parties involved, promoting the restoration of social ties instead of just sanctioning or transgressor (Van Ness & Strong, 2014). In addition, Restorative Justice values personal narratives and cultural contexts, recognizing that the damage is not just a

legal violation, but a rupture in human connections (Pranis, 2005). Practical examples, such as peace circles and restorative conferences, demonstrate their effectiveness in diverse contexts, from community disputes to youth systems.

Restorative Justice rejects pure punishment, focusing on repairing and rebuilding relationships (Zehr, 2002). Boin (2019a), highlights mediation as essential iron, structuring or dialogue, we insist, between those who suffered the damage, those who caused the damage and the community to attend to the needs of all (Zehr, 2002, p. 21). This process, humanized by empathy (Pranis, 2005), gains strength with Shared Production, allowing communities to co-produce solutions (Bairon & Lazaneo, 2013).

Sustainability, for the same time, is a multidimensional concept that aims to ensure the continuity of two natural and human systems, guaranteeing that the planet remains habitable and equitable for future generations. Popularized by the Brundtland Report of the World Commission on Environment and Development (WCED, 1987), this paradigm is based on three interdependent pillars: environmental (preservation of ecosystems), economic (prosperity of predatory exploration) and social (justice and inclusion) (Elkington, 1997). Ignacy Sachs (2008) expands this vision for an intergenerational ethics that rejects practices of short term, as the unfreedom extractivism, in favor of strategies that respect the biophysical limits of the planet and promote collective well-being. Sustainability goes to the end of environmental conservation; it requires a cultural and structural transformation that reorients the productive systems and the ways of life that are resilient and equitable (Rockström et al., 2009). Thus, it is both an objective and a continuous process of adaptation to global dynamics, such as climatic changes and biodiversity losses. Such principles are absolutely shared by the proposals of Shared Production (Bairon, 2010), which integrates local knowledge, in terms of mediation (Boin, 2019b) facilitating sustained agreements between conflicting parties.

2 THE METHODOLOGICAL BRIDGE: MEDIATION AND SHARED PRODUCTION OF KNOWLEDGE

Restorative Justice and Sustainability represent the pillars of the Concept, Mediation, and Partial Knowledge Production (PPC) emerge as the methodological approach that makes its integration viable. Far from being mere complements, they are the paths that translate theory into praxis.

Mediation, as detailed by Boin (2019a), is more than a simple negotiation. It is a structured and voluntary process, conducted by an impartial third party, which facilitates communication between the parties in conflict. Its goal is not to impose a solution, but to

create a safe environment where parties can express their needs, understand each other's perspectives, and together build consensual solutions. In the context of Restorative Justice, mediation is the tool that operationalizes the reparative dialogue. In socio-environmental conflicts, it becomes crucial to balance seemingly antagonistic interests — such as those of a community and industry — transforming an adversarial dispute into a collaborative process of seeking a sustainable future for all.

The Shared Production of Knowledge, for the same time, is a research methodology that challenges the traditional hierarchy between academic knowledge and community knowledge (Bairon, 2010). Using multiple image and sound technologies, such as video and digital platforms, PPC allows communities themselves to become producers of knowledge about their reality, their memories and their aspirations (Bairon & Lazaneo, 2013). As seen in the work of indigenous filmmakers such as Divino Tserewahú, this approach hardly documents, but strengthens cultural identity and political autonomy. Restorative Justice has gained a powerful structure for the symbolic reparation of historical damages, as for Sustainability, it is enriched with local knowledge for the construction of ecologically adapted and socially just solutions, in line with the Epistemologies of the South of Boaventura de Sousa Santos (2007).

Together, Mediation and PPC form a virtuous cycle: PPC interacts and prioritizes the knowledge of communities, and Restorative Justice - Mediation structures the dialogue so that these community voices are valued and can negotiate fair and sustainable.

3 SHARED PRINCIPLES

3.1 FOCUS ON REPARATION AND RECONCILIATION

Both Restorative Justice and Sustainability have the idea of reparation at their core. In Restorative Justice, the focus is on repairing the damage caused and on reconciling the parts involved, transforming the conflict in an opportunity to learn and grow (Marshall, 1999). This process hardly restores the broken balance, but it also strengthens social cohesion to enhance the narratives of all affected (Zehr, 2002). In Sustainability, reparation is turned to degraded ecosystems — such as the reforestation of deforested areas or the recovery of polluted rivers — seeking to reconcile humanity and nature (Daly & Farley, 2011). Such actions repair the pasture while building a sustainable future, a direct echo of the restorative principle of transforming us into opportunities (Sachs, 2008). Convergence that shows a common ethics of healing, whether in interpersonal relationships or in the relationship with the planet.

3.2 SYSTEMIC VISION

Both paradigms adopt a holistic perspective that transcends fragmented solutions. Restorative Justice sees harm as an event embedded in a web of social relations, whose causes and consequences reverberate beyond the isolated act (Van Ness & Strong, 2014). This systemic approach is similar to that of Sustainability, which recognizes the interconnectedness between environmental, social, and economic factors (Elkington, 1997). Understanding these interdependent networks is essential for addressing complex problems such as ecological damage (Fritjof Capra, 1996). For example, the policy of a river is not just an environmental issue, but also social (dislocation of communities) and economic (loss of resources), demanding solutions that consider all these dimensions — a logic aligned with Restorative Justice when dealing with the roots of conflicts.

3.3 COMMUNITY PARTICIPATION

The centrality of the community is another point of convergence. In Restorative Justice, the community plays an active role in supporting people who suffer damage, facilitate dialogue and reintegrate people who cause damage, promoting a sense of belonging and collective responsibility (Marshall, 1999; Pranis, 2005). In Sustainability, local communities are protagonists in the management of natural resources, as well as in community conservation initiatives or regenerative agriculture (Ostrom, 1990). Collaborative governance of commons can be more effective than top-down policies, a principle that resonates with the restorative emphasis on cooperation (Elinor Ostrom, 1990). It is precisely this valorization of the collective that underlines the idea that long-lasting solutions depend on the active participation and strengthening of social networks, to repair a damage, to preserve an ecosystem.

4 DIFFERENCES OF SCOPPO AND APPLICATION

4.1 TEMPORAL SCOPUS

A striking difference between the two paradigms lies in the time horizon. Restorative Justice operates predominantly in the course and through practice, focusing on the resolution of specific conflicts and the immediate reparation of damages (Zehr, 2002). This objective is the cure and reconciliation not present, as in cases of community mediation. Sustainability, on the other hand, is projected for the long term, concerned with the intergenerational impacts of current actions, such as carbon emissions or soil erosion (WCED, 1987). This future vision requires non-present sacrifices to guarantee the viability of the planet, contrasting with the restorative urgency of resolving immediate disputes (Daly & Farley, 2011).

4.2 PRIMARY FOCUS

The primary focus also diverges. On the one hand, Restorative Justice is essentially anthropocentric, dealing with human emotions such as guilt, loss and empathy, and seeking to restore interpersonal relationships (Marshall, 1999). On the other hand, Sustainability adopts a balanced ecological approach, prioritizing interdependence between humans and ecosystems (Sachs, 2008). While Zehr (2002) emphasizes the construction of bridges between individuals, Capra (1996) and Naess (1989) defend an ecological ethics that transcends the human, recognizing nature as a final in itself. This difference reflects distinct priorities: social harmony versus planetary harmony.

4.3 METHODS AND TOOLS: FROM MICRO TO MACRO

The clearest distinction between the two fields is distinguished in their methods and offered paths, which operate on different but complementary scales. Restorative Justice acts at the micro level, using qualitative and relational tools. These main instruments are dialogue circles, restorative conferencies, and mediation between those who cause harm and those who cause damage (Van Ness & Strong, 2014; Pranis, 2005). These practices are dialogue-intensive, focused on active listening, empathy, and consensus-building processes. The success is measured by the satisfaction of the parties, by the reparation of the perceived damage and by the restoration of the community areas, results that are eminently qualitative.

Sustentabilidade, now operates predominantly at the macro and structural level, undertaking quantitative and large-scale research. Its proposals include public policies (such as global climate agreements or environmental protection legislation), green technologies (renewable energy, circular economy) and impact indicators (carbon gluing, planetary boundaries) (Elkington, 1997; Rockström et al., 2009). The objective is to promote systemic changes that alter production and consumption patterns. Success is often mediated by quantifiable goals, such as reducing greenhouse gas emissions or preserving hectares of forest.

This disparity, however, opens up a vast field for synergy. The micro approaches of Restorative Justice can be used to build the social consensus necessary for the implementation of macro Sustainability policies. For example, a restorative dialogue process can resolve a local conflict over the installation of a wind farm, ensuring that the energy transition (macro) is socially just (micro). In other words, Sustainability technologies can expand the reach of restorative practices, such as the use of digital platforms to connect distant communities in dialogues about climate justice.

5 PRACTICAL INTERSECTIONS

5.1 SOCIO-ENVIRONMENTAL CONFLICTS

Socio-environmental conflicts, such as disputes over land in the Amazon or industrial policy in vulnerable communities, are fertile ground for practical integration. Restorative Justice dialogues with tensions between affected communities and companies or governments, repairing social damage and promoting collaborative agreements (Marshall, 1999). At the same time, Sustainability offers strategies to protect the ecosystems involved, such as the creation of conservation areas or the adoption of sustainable agricultural practices (Ostrom, 1990). A combination that can align social and environmental justice, especially in regions where predatory exploration exacerbates inequalities (Sachs, 2008).

The indigenous productions "Tsō'rehipäri", directed by Xavante filmmaker Divino Tserewahú, and "Boé Eru Kurireu", made by Paulinho Ecerae Kadojeba with Tserewahú's montage, exemplify in a powerful way the intersection between Restorative Justice and Sustainability, potentiated by the mediation and the Partial Production of Knowledge (Bairon & Lazaneo, 2013). "Tsō'rehipäri" traces the history of the songs of the Salesian mission of Sangradouro, using reflexivity to dialogue with the community and against external narratives, such as Genil Vasconcelos' 1949 film (Bairon & Lazaneo, 2013). This process reflects the restorative principles of reparation and reconciliation, valuing the narratives of the elders and the community to retell their own history, promoting collective healing through historical traumas (Zehr, 2002). In the middle of the context, Tserewahú's method is implicit, which submits the film to community approval, guaranteeing that everyone's needs are attended to (Boin, 2019a).

On the other hand, "Boé Eru Kurireu" presents the bororo funeral ritual from the perspective of who lives in culture, criticizing external representations such as the Fantástico da Rede Globo program (Bairon & Lazaneo, 2013). The collaboration between Paulinho, um bororo, and Divino, um xavante — historically rivals ethnic groups —, exemplifies Shared Production of Knowledge by creating an intercultural bridge that promotes mutual understanding and the appreciation of traditions. This dialogue between different forms of knowledge is fundamental for Sustainability, which depends on cultural diversity to find resilient solutions (Sachs, 2008). Both films will use audiovisual language to strengthen the identity and autonomy of their communities, demonstrate how symbolic reparation (Restorative Justice) and cultural preservation (Sustainability) are intrinsically linked.

5.2 EDUCATION FOR PEACE AND SUSTAINABILITY

Education is a promising field for the integration of these paradigms. Programs that combine education for peace, based on restorative principles, with education for sustainability can form more conscious and engaged citizens (Senge, 2006). Schools that adopt dialogue circles to resolve conflicts and, at the same time, implement community projects or recycling, teach in practice the interconnection between social and environmental well-being. This holistic approach prepares young people to deal with the complexity of two global challenges, promoting a culture of peace and ecological responsibility (Capra, 1996).

5.3 COLLABORATIVE GOVERNANCE

The governance of natural resources and urban spaces can benefit from the fusion of these paradigms. Restorative Justice offers models of participatory decision-making, such as sentencing circles, which can be adapted for the management of common blessings (Ostrom, 1990). For example, in a dispute over the use of water in a hydrographic basin, a restorative process could bring together farmers, industries and riverside communities to build a sustainable management plan that meets the needs of all and guarantees the health of the ecosystem. This collaborative approach, which values dialogue and the cooking of solutions, is more resilient and legitimate than unilaterally imposed policies (Van Ness & Strong, 2014).

6 CHALLENGES AND LIMITATIONS: NAVIGATING COMPLEX WATERS

Despite the potential synergistic, the integration of Restorative Justice with Sustainability is not a path of obstacles. On the contrary, it faces structural, cultural and scale challenges that need to be carefully navigated.

The first and most radical challenge is institutional inertia. Hegemonic legal and economic systems, deeply rooted in the retributive paradigm and not unlimited growth, offer forte resistance. The punitive logic of traditional penal law and the incessant search for profit is fundamentally based on the values of reparation, dialogue and intergenerational care (Johnstone, 2011). Integration, in this context, runs the risk of superficial co-optation, where restorative practices are adopted as a veneer of legitimacy without the underlying power structures being altered.

The second challenge is the issue of scalability. Restorative Justice, with its intensive methods in dialogue and focused on the local context, finds it difficult to be applied to global and systemic problems, such as climate crisis or large-scale biodiversity loss (Rockström et al., 2009). How to escalate a dialogue circle to mediate the conflict between nations over

carbon emission targets? The transposition of micro methods to the macro level is not straightforward and requires significant methodological and institutional innovations.

Finally, there is the risk of depoliticization. Focusing on harmony and interpersonal reconciliation, restorative practices, if misapplied, can inadvertently mask the deep asymmetries of power that are at the root of many socio-environmental conflicts. In a dispute between an indigenous community and a multinational mining company, a dialogue that does not recognize this disparity of power can end up legitimizing injustice, instead of fighting it. Environmental Justice, as formulated by Acseirad (2009), alerts us to the importance of maintaining a critical lens on the political and economic dimensions of conflicts, preventing the search for consensus from overcoming the fight for justice.

Overcoming these barriers requires more than goodwill; It requires a profound cultural transformation that values interdependence and collective responsibility (Senge, 2006), as well as the creation of new institutional arrangements that are flexible, polycentric and capable of articulating local and global scales.

7 CASE STUDY: AOTEAROA (NEW ZEALAND) AND PLURIVERSAL GOVERNANCE

Aotearoa, the Māori name for New Zealand, offers two most advanced and inspiring examples of how the integration between justice, sustainability and indigenous knowledge can be institutionalized. The country was not just a pioneer in the adoption of Restorative Justice in the youth system, but it was also innovative to incorporate Māori cosmology in its legal structure and environmental governance.

The pillar of integration is the Treaty of Waitangi (1840), which established a partnership between the British Commonwealth and the Māori. Although historically neglected, the treaty has been progressively reinterpreted as a basis for governance that recognizes indigenous sovereignty and rights. This manifests itself in concepts such as "Kaitiakitanga", which can be translated as an ethics of guardianship or guardianship, where humans have the responsibility to protect and care for the natural world (the *taonga*, or treasure).

The most radical example of this approach is the Te Urewera Act (2014), a law that granted legal personality to the ancient Te Urewera National Park, a vast area of forest ancestral to the Tūhoe people. The law declares that Te Urewera is "no longer the property of the Crown, nor of anyone," but a living entity in itself, with "rights, powers, duties, and responsibilities." A governing board, composed by Tūhoe and Chorus representatives, was raised to act as guardian and "speak on behalf" of Te Urewera. This legal innovation

represents a radical departure from the Western view of nature as a resource to be exploited, aligning itself with a Māori relational ontology.

This approach can be seen as a practical manifestation of the "pluriverse" advocated by Arturo Escobar (2018) — the construction of a world where multiple worlds (or ontologies) can coexist, a principle fully consistent with Restorative Justice. Instead of imposing a single model of conservation, New Zealand is trying to create a legal system that accommodates different ways of life and relates to the non-human. Restorative processes are often used to resolve disputes over resources, not only to mediate interests, but to redress historical damages and build a shared future. Although does not follow a model of tensions and contradictions, the case of Aotearoa demonstrates that it is possible to achieve social justice, historical reconciliation and ecological sustainability in a collaborative governance quadro (Marshall, 1999).

8 CASE STUDY: THE COMMISSION OF TRUTH AND RECONCILIATION OF SOUTH AFRICA

The Commission of Truth and Reconciliation (CVR) of South Africa, led by Archbishop Desmond Tutu (1999), is an emblematic example of Restorative Justice on a large scale. Although sits main focus on the reparation of apartheid traumas, its principles of dialogue, truth and reconciliation created a propitious environment for the construction of a more just society and, consequently, more sustainable. The CVR did not limit itself to investigating who caused the damage and who suffered the damage; It sought to restore the dignity of the people who suffered damage and reintegrate the people who caused damage to the community, strengthening the social situation of the country (Tutu, 1999).

As for CVR addressing the damage of the past in the last year and in the middle of the process, sustainability in Africa of South Africa has been strengthened through community initiatives that allow for the balance of human needs with environmental preservation in the long period (WCED, 1987). Projects such as sustainable community agriculture and reforestation programs in rural areas, often led by local cooperatives, express this commitment (Sachs, 2008). These actions do not barely combat environmental degradation, but they also address socio-economic inequalities inherited from apartheid, aligning with the pillars of sustainability — environmental, economic and social — proposed by Elkington (1997). Mediated reconciliation created the social conditions necessary for these initiatives to flourish, demonstrating how community stability is a foundation for sustainability.

Community participation is a key driver that unites these two paradigms in South Africa (Ostrom, 1990; Pranis, 2005). The CVR broadly involved the population, with public hearings

and deposits that strengthened the sense of collective responsibility (Tutu, 1999), a principle that echoes in restorative practices (Boin, 2019b). In the same way, community sustainability projects depend on local collaboration, such as urban gardens and cooperatives that promote food security and income management in marginalized areas (Sachs, 2008). This synergy reflects a systemic vision (Capra, 1996), where the reparation of human relationships, facilitated by restorative dialogue, supports efforts to build resilient economic and environmental systems, benefiting both current and future generations.

The Su-African case represents a profound synergistic potential: Restorative Justice, by means of mediated reconciliation, repairs the traumas of the past (Van Ness & Strong, 2014), in terms of Community Sustainability assures a future journey (Boin, 2019b). The CVR hardly promotes social peace, but it also opened the way for communities, now more cohesive, to engage in sustainable practices that combat poverty and environmental degradation. Although the Shared Production of Knowledge (Bairon & Lazaneo, 2013) does not have an explicit component in this example, the use of media platforms to disseminate the stories of the CVR suggests fertile ground for participatory technologies that can amplify this synergy, connecting local experiences to global solutions and strengthening integration between these paradigms (Boin, 2019a).

9 ETHICAL IMPLICATIONS: TOWARDS RADICAL RESPONSIBILITY

The integration of Restorative Justice and Sustainability is not just a question of efficiency, but a profound ethical reorientation. It invites us to transcend the traditional borders and to adopt what could be called a radical responsibility ethic (Boin, 2019b).

Restorative Justice, at its core, challenges the retributive ethic of punishment with an ethic of compassion and mutual responsibility. It tells us that we are related beings and that the damage to a member gives community to all (Zehr, 2002). Sustainability, for the same time, confronts the extractive and consumerist ethics with the ethics of care and intergenerational responsibility. It summons us to consider the impact of our *ações* on future generations and on the life that sustains us (WCED, 1987).

When fused, these two ethics give rise to something greater: an expanded vision of justice that dissolves the dichotomy between the human and the nonhuman. Inspired by Arne Naess's deep ecology (1989), Fritjof Capra's systemic vision (1996) and by the concept of Restorative Justice as addressed by Carla Boin (2019b), these approaches recognize that social justice and environmental justice are separate. It is no longer just about justice *between* humans, but about justice *for how* the living system of which we are a part. This perspective

echoes Bruno Latour's (2018) call to "ground" and acknowledge our deep dependence and entanglement with the Earth, surpassing the modern separation between Nature and Society.

This raises complex and urgent ethical questions: who speaks on behalf of rivers, forests and species in a circle of restorative dialogue? How can we repair damages caused to non-human entities and to generations that are still not born? The answer may lie in the construction of interspecies justice, an emerging field that seeks to give voice and legal representation to non-humans, as seen in the case of New Zealand. To adopt this ethic of radical responsibility means to recognize that the cure of human relationships and the cure of the planet are not separate tasks, but a single and same day.

10 FUTURE PERSPECTIVES: HORIZONS FOR AN INTEGRATED PRAXIS

Looking to the future of the integration between Restorative Justice and Sustainability is to envision the emergence of new forms of governance, technology and culture. It is not a matter of predicting a destination, but of mapping the horizons that open up from this synergy.

In the technological field, the challenge is to go further from the instrumental vision. Instead of just using artificial intelligence to monitor environmental damage (Daly & Farley, 2011), the question is how we can use digital technologies to build a true "ecology of knowledges" (Santos, 2007). The hypermedia platforms, focused on the Partial Production of Knowledge (Bairon & Lazaneo, 2013), can be developed not to extract data, but to connect communities, facilitate intercultural dialogues and allow local and scientific knowledge to co-create solutions, avoiding the risk of a new digital colonialism.

In the field of governance, integration points to models that overcome state centralization (In the field of governance, integration points to models that overcome state centralization The ideology of a "polycentric restorative governance", inspired by Elinor Ostrom's work (1990), emerges as a promising possibility. This model, multiple decision-making centers (local communities, municipalities, civil society organizations, global networks) are articulated in a flexible and adaptive way, using restorative principles to manage the common good, from a local hydrographic basin to the global atmosphere.

Finally, in the cultural and economic field, the integration of these paradigms can find an operational model in Kate Raworth's "Donut Economy" (2017). This model visualizes an economy that operates within a safe and just space: an ecological "teto", defined by planetary boundaries (Rockström et al., 2009), and a social "alicerce", which guarantees that basic human needs are met. Restorative Justice can provide the social processes to negotiate how to live within that foundation, while Sustainability sets the limits of the ceiling. Integration, therefore, is not just an ideal, but a project that demands a profound cultural transformation

in the direction of a systemic and collaborative mentality (Senge, 2006), a horizon that guides us in the construction of a more just and lasting future.

11 CONCLUSION

This article shows that Restorative Justice and Sustainability are different in their foci and methods, but they are not very compatible, but profoundly synergistic. The analysis revealed that its shared principles — repair, systemic vision and community participation — forms a robust base to face the complex and interconnected challenges of the XXI series. Restorative Justice, with its emphasis on healing human relationships (Boin, 2019b)), creates the social capital necessary for Sustainability to flourish. For the same time, Sustainability, to project an equitable and resilient future (WCED, 1987), offers a major purpose for social reconciliation.

The introduction of mediation (Boin, 2019a) and Shared Production of Knowledge (Bairon & Lazaneo, 2013) acts as a catalyst, transforming this theoretical synergy into praxis. In the middle of the journey, we offer the paths to navigate the socio-environmental conflicts, as for *Produção Partilhada* guarantor that the solutions are co-created with the affected communities, respecting and integrating their knowledge, in line with the Epistemologies of Sul (Santos, 2007). The examples of Nova Zealand, South Africa and indigenous audiovisual productions illustrate that this integration is not utopian, but a reality in construction.

However, overcoming institutional resistance and promoting a cultural mutancy that embraces complexity (Senge, 2006) and interdependence (Latour, 2018) are crucial. The way forward is not to choose between repairing people or repairing the planet, but to recognize that they are two faces of the same structure. True sustainability can only be achieved in a socially just world, and full justice will only be possible on an ecologically balanced planet. The use of these paradigms, therefore, is not just an academic purpose, but an ethical and practical imperative for the construction of a future in which human dignity and planetary integrity coexist.

ABSTRACT

The present work aimed to evaluate the larvicidal, antioxidant, microbiological and cytotoxicity activity of the crude ethanolic extract of *Pogostemon cablin* (Blanco) Benth leaves. The chemical characterization was performed through staining and staining reactions for the detection of secondary metabolite classes. The larvicidal activity against *Aedes aegypti* was carried out according to the protocol of the World Health Organization. The antioxidant activity was evaluated by the sequestering ability of 2,2-diphenyl-1-picrylhydrazyl (DPPH). As for the microbiological evaluation, the microplate dilution technique was used against three bacteria, according to the protocol of the Clinical and Laboratory Standards Institute. *P. cablin* presented as classes of secondary metabolites: steroids and triterpenoids, depsides and depsidones, which in synergy with the other substances potentiated the

larvicidal action of the species with an LC₅₀ of 63.91 µg.mL⁻¹ in 24 h. There was no antioxidant activity at the tested concentrations, however, it showed inhibition of bacterial growth against *E. coli* with MIC of 31.25 µg.mL⁻¹. The extract showed moderate toxic action with LC₅₀ of 257.93 µg.mL⁻¹. Therefore, the *P. cablin* species showed significant larvicidal potential, with bacteriostatic action, the absence of antioxidant action and moderate toxicity.

RESUMO

O presente trabalho teve como objetivo avaliar as atividades larvica, antioxidante, microbiológica e de citotoxicidade do extrato etanólico bruto das folhas de *Pogostemon cablin* (Blanco) Benth. A caracterização química foi realizada por meio de reações de coloração e testes específicos para a detecção de classes de metabólitos secundários. A atividade larvica contra *Aedes aegypti* foi conduzida de acordo com o protocolo da Organização Mundial da Saúde. A atividade antioxidante foi avaliada pela capacidade sequestradora do radical 2,2-difenil-1-picrilhidrazil (DPPH). Para a avaliação microbiológica, utilizou-se a técnica de diluição em microplacas contra três bactérias, conforme o protocolo do Clinical and Laboratory Standards Institute. *P. cablin* apresentou como classes de metabólitos secundários: esteroides e triterpenoides, depsídeos e depsídonas, os quais, em sinergia com outras substâncias, potencializaram a ação larvica da espécie, com CL₅₀ de 63,91 µg.mL⁻¹ em 24 h. Não foi observada atividade antioxidante nas concentrações testadas; entretanto, verificou-se inibição do crescimento bacteriano contra *E. coli*, com CIM de 31,25 µg.mL⁻¹. O extrato apresentou ação tóxica moderada, com CL₅₀ de 257,93 µg.mL⁻¹. Assim, a espécie *P. cablin* demonstrou significativo potencial larvica, ação bacteriostática, ausência de atividade antioxidante e toxicidade moderada.

RESUMEN

El presente trabajo tuvo como objetivo evaluar las actividades larvica, antioxidante, microbiológica y de citotoxicidad del extracto etanólico crudo de las hojas de *Pogostemon cablin* (Blanco) Benth. La caracterización química se realizó mediante reacciones de coloración y pruebas específicas para la detección de clases de metabolitos secundarios. La actividad larvica contra *Aedes aegypti* se llevó a cabo de acuerdo con el protocolo de la Organización Mundial de la Salud. La actividad antioxidante se evaluó mediante la capacidad secuestradora del radical 2,2-difenil-1-picrilhidrazilo (DPPH). Para la evaluación microbiológica se utilizó la técnica de dilución en microplacas frente a tres bacterias, conforme al protocolo del Clinical and Laboratory Standards Institute. *P. cablin* presentó como clases de metabolitos secundarios: esteroides y triterpenoides, depsidos y depsídonas, los cuales, en sinergia con otras sustancias, potenciaron la acción larvica de la especie, con una CL₅₀ de 63,91 µg.mL⁻¹ a las 24 h. No se observó actividad antioxidante en las concentraciones evaluadas; sin embargo, se evidenció inhibición del crecimiento bacteriano frente a *E. coli*, con una CIM de 31,25 µg.mL⁻¹. El extracto mostró una acción tóxica moderada, con una CL₅₀ de 257,93 µg.mL⁻¹. Por lo tanto, la especie *P. cablin* presentó un importante potencial larvica, acción bacteriostática, ausencia de actividad antioxidante y toxicidad moderada.

1 INTRODUCTION

Liquid and solid synthetic insecticides are used in vector control of *A. aegypti*. They are generally accepted as effective, but they are carcinogenic, hazardous to the environment and non-target organisms. The compound N, N-diethyl-3-methylbenzamide, also known as DEET, is the product with significant insect repellency efficiency [1]. However, due to neurotoxicity allied to environmental claims, the population began to worry about its widespread use. [2, 3].

In the last years, the secondary metabolites found in plants have aroused researchers' interest to be used as alternatives to chemical insecticides [4-6]. In fact, insecticides of botanical origin have several advantages such as rapid action and degradation, low toxicity to mammals, greater selectivity and low phytotoxicity [5,7].

The mosquito *A. aegypti* L. (Diptera: Culicidae) is the transmitter of dengue, yellow fever, Chikungunya, and Zika, which cause severe morbidity and mortality in humans [8-10]. The etiology of *A. aegypti* influences its wide dispersion, favored in urban environments, preferably in the domiciliary conditions offered by human's way of living. The presence of the breeding grounds in an environment of human conviviality favors the rapid proliferation of the species, due to two aspects: ideal breeding conditions and feeding sources [1].

The use of insecticides to control adult (adulticidal) and larval (larvicidal) mosquito populations can be done through focal and non-focal treatment by the aerospace spraying of ultra-low volume insecticides (ULV). Repellents can be applied to the individual's skin to repel mosquitoes and avoid stings [11].

However, there is increasing the resistance of mosquitoes to synthetic insecticides, as well as negative impacts on the environment. Thus, it is important to search for alternative methods to be used in the control of *A. aegypti*, which are efficient, low cost, biodegradable and more selective [12].

In this context, species of the Lamiaceae family present potential for obtaining essential oils and plant extracts, they have several biological functions used in the treatment of diseases in folk medicine, as well as reports of anti-influenza, insecticide, repellent, antibacterial and anti-intestinal parasite activities [13].

P. cablin is a species of the Lamiaceae family, popularly known as Oriza or Patchouli, traditionally used for medicinal purposes, especially for the treatment of nausea, headache and heart problems, as well as proven biological activities such as antioxidant, analgesic, anti-inflammatory, antiplatelet, antithrombotic, aphrodisiac, antidepressant, anti-mutagenic, antiemetic, fibrinolytic and cytotoxic [14-17].

Considering the potentiality of species of the Lamiaceae family and the need for more studies aimed at solving public health problems, in particular, those caused by the *A. aegypti* vector, it is important to adopt alternative strategies with greater investments in appropriate methods. Thus, the present research had the objective of studying the larvicidal activity against *A. aegypti* of the crude ethanolic extract of *P. cablin* leaves. This also includes antioxidant, microbiological and cytotoxic activities, which will serve as a complementary study to evaluate the potentiality of the species for future formulation of a natural biocide.

2 MATERIAL AND METHODS

2.1 PLANT MATERIAL

The species *P. cablin* was collected in Fazendinha district (0 ° 01'08 "S and 51 ° 06'17" O) in Macapá-Amapá Municipality, Brazil. For botanical identification, the sample of the species was sent to the Herbarium of the Institute of Scientific and Technological Research of the State of Amapá (IEPA), and it was registered under number 019183.

2.2 VEGETABLE EXTRACT

The leaves of *P. cablin* were oven dried at 50 ° C for a period of 48 hours and manually ground (400g of the plant material). The plant material was placed in a suitable vessel and ethyl alcohol (96%) was added until complete submersion. Every 3 days, the ethanol extract was filtered and placed in a rotary vacuum evaporator (totaling three extractions), under the following conditions: temperature of 50°C and pressure of 500 to 760mmHg [18].

2.3 QUALITATIVE PHYTOCHEMICAL ANALYSIS

The qualitative phytochemical analysis of crude ethanolic extract was performed according to Barbosa et al. [19], in which methods of precipitation and staining reactions were applied to for the detection of cardiac glycosides, catechins, flavonoids, purines, anthraquinones, steroids and triterpenoids, depsides and depsidones, polysaccharides, phenols and tannins, proteins and amino acids, alkaloids, reducing sugars, azulenes, organic acids, and saponins.

2.4 QUANTITATIVE PHYTOCHEMICAL ANALYSIS

2.4.1 Total phenolic content

The quantification of total phenolics was determined by the Folin-Ciocateu method, according to Amorim et al. [20], with modifications. An aqueous solution of gallic acid (5000 µg.mL⁻¹) was prepared for successive dilutions. Subsequently, the calibration curve was

carried out at concentrations of 10 to 500 $\mu\text{g.mL}^{-1}$ and 400 μL of Folin-Ciocateu (10%) aliquots were added to 1600 μL of Na_2CO_3 (75 g.L^{-1}). The mixture was incubated at 25 °C for 2 hours and the absorbance was measured in a spectrophotometer with a wavelength of 760 nm. After reading the calibration curve from the samples, an aqueous solution of extract (1 mg.mL^{-1}) was prepared with 200 μL added in a 10 mL flask, 400 μL of Folin-Ciocateu (10%) and 1600 μL Na_2CO_3 (75 g.L^{-1}), in triplicate, to quantify the total phenolic content. The results were expressed as mg equivalent of gallic acid per gram of extract (mg EAG/g).

2.5 LARVICIDAL ACTIVITY

The larvae of *A. aegypti* used in the bioassay were from the colony kept in the laboratory of the Medical Entomology of the Institute of Scientific and Technological Research of the State of Amapá (IEPA), where the larvicidal test was carried out. Biological assays were conducted under controlled climatic conditions with a temperature of 25 ± 2 °C, relative humidity of 75 ± 5 %, and a photoperiod of 12 h.

The methodology used followed the standard protocol of the World Health Organization [21] with modifications. The extract of *P. cablin* (0.09 g) was dissolved in 85.5 ml of distilled water and 4.5 mL of Tween 80. For the negative control, 1% Tween 80 and distilled water were used. As for the positive control, Malathion larvicide was used in commercial concentration. The extract solution was separated in triplicates at concentrations of 20 to 100 $\mu\text{g.mL}^{-1}$ in Becker of 100 mL, and 25 larvae of the *A. aegypti* mosquito in the 3rd young stage (L3) were added. After 24 and 48 hours, the dead larvae were counted, they being considered as such all those that were unable to reach the surface.

2.6 DETERMINATION OF ANTIOXIDANT ACTIVITY

The antioxidant activity was evaluated according to the methodology of Chen et al. [22] and Lopez-Lutz et al. [23] by the sequestering ability of 2,2-diphenyl-1-picrylhydrazyl (DPPH). The antioxidant activity was calculated [24] as follows:

$$(\%AA) = 100 - \{[(\text{Abs}_{\text{sample}} - \text{Abs}_{\text{white}})100]/\text{Abs}_{\text{control}}\}$$

%AA – percentage of antioxidant activity

$\text{Abs}_{\text{sample}}$ – Sample absorbance

$\text{Abs}_{\text{white}}$ – White absorbance

$\text{Abs}_{\text{control}}$ – Control absorbance

A methanolic solution of DPPH at the concentration of 40 $\mu\text{g.mL}^{-1}$ was prepared. The extract was diluted in methanol at different concentrations of 7.81 to 250 $\mu\text{g.mL}^{-1}$. Triplicates

with 0.3 mL volume of the extract solution per tube were performed with 2.7 mL of the DPPH solution. In parallel, the negative control was prepared with 2.7 mL of methanol and 0.3 mL of the methanolic solution. For the positive control, ascorbic acid was used in the same conditions of preparation of extract. After 30 minutes of incubation at room temperature and protected from light, the absorbance was measured in a spectrophotometer (Biospectro SP-22) at wavelength 517 nm, in a quartz cuvette.

2.7 ANTIMICROBIAL ACTIVITY

2.7.1 Bacterial strains and culture conditions

Two gram-negative bacteria (*Pseudomonas aeruginosa* ATCC 25922 and *Escherichia coli* ATCC 8789) and gram-positive bacteria (*Staphylococcus aureus* ATCC 25922) were used in this bioassay.

A stock culture in BHI (Brain Heart Infusion) environment, with 20% glycerol-preserved at - 80 ° C was prepared for each microorganism. An aliquot of 50 µL of this culture was inoculated into 5 mL of sterile BHI broth environment and incubated for 24 hours at 37 ° C.

2.7.2 Determination of minimum inhibitory concentration (MIC) and minimum bactericidal concentration (MBC)

The microplate dilution technique (96 wells) was used for determination of MIC and MBC, according to the protocol established by the Clinical and Laboratory Standards Institute [25], with adaptations.

Initially, the bacteria were reactivated with stock cultures and kept in BHI broth for 18 h at 37 °C. The inoculum in 0.9% saline solution was prepared for each microorganism, adjusted for the McFarland 0.5 scale, followed by dilution in BHI and tested at 2×10^6 CFU.mL⁻¹.

For MIC determination, the extract was diluted in Dimethyl sulfoxide (2% DMSO). The first well column of the plate was filled with 0.2 mL of the extract solution at the concentration of 2000 µg.mL⁻¹, the other wells were filled with 0.1 mL of 0.9% NaCl. Subsequently, base two serial dilutions were performed in the ratio of 1: 2 to 1: 128 until the dilution in a final volume of 0.1 mL. The cells (2×10^6 CFU.mL⁻¹) with 0.1 mL adjusted according to the previous item were added to each well, resulting in a final volume of 0.2 mL. There were performed the control of the culture environment, the control of extract, and the negative control (DMSO 2%). For positive control, amoxicillin (50 µL.mL⁻¹) was used. The experiments were carried out in triplicates. The microplates were incubated in an oven at 37 °C for 24 hours. After this time, the plates were read in ELISA reader (DO 630 nm).

The MBC was determined based on the results obtained in the MIC test. Microplate wells were replicated in Müller-Hinton agar and incubated at 37 ° C for 24 h. MBC was established as the lowest extract concentration capable of completely inhibiting microbial growth in Petri dishes after 24-48 hours of growth.

The results were categorized in Microsoft Excel (Version 2010 for Windows) and then, analyzed in GraphPad Prism software (Version 6.0 for Windows, San Diego California USA). Significant differences between the groups were verified using the One-way ANOVA test with Bonferroni post-test, considering $p < 0.001$.

2.8 CYTOTOXIC ACTIVITY

The evaluation of the cytotoxic activity was performed against the larvae of *Artemia salina* Leach [26, 27] with adaptations. A solution of 250 mL of synthetic sea salt at 35 g.L⁻¹ was prepared, 25 mg of exposed saline eggs were incubated in 24 h photoperiod to reach the methanuplion stage. The stock solution was prepared to contain 0.06 g of extract, 28.5 mL of the solution of synthetic sea salt and 1.5 mL of Tween 80. Seven groups of samples were divided in triplicate in the concentrations of 50 to 1000 µg.mL⁻¹, and 10 methanuplii were added in each test tube. In the end, the number of non-survivors for LC₅₀ determination was counted using the SPSS® software PROBIT analysis.

2.9 STATISTICAL ANALYSIS

The data analysis was performed through analysis of variance (ANOVA) and the Tukey test, in the BioEstat program, in order to identify significant differences between the averages. The differences that presented probability levels less than and equal to 5% ($p \leq 0.05$) were considered statistically significant. The results were expressed as mean $\pm$ standard deviation (SD). The LC₅₀ values were determined in the PROBIT regression, through the SPSS program (Statistical Package for the Social Sciences).

3 RESULTS

3.1 QUALITATIVE PHYTOCHEMICAL ANALYSIS

The phytochemical analysis of the extract of the leaves of *P. cablin* showed the presence of steroids and triterpenoids, depsides and depsidones, according to table 1.

Table 1*Identification of the secondary metabolites of the extract of P. cablin*

Tests	Results
Cardiac glycosides	-
Catechins	-
Flavonoids	-
Sesquiterpenolactones and other lactones	-
Purines	-
Anthraquinones	-
Steroids and triterpenoids	+
Depsidones e depsidones	+
Polysaccharides	-
Phenols and catheter tannins	-
Proteins and amino acids	-
Organic acids	-
Saponins	-
Azulenes	-
Alkaloids	-
Reducing sugars	-

Signal (+) indicates presence of secondary metabolite, while signal (-) indicates absence

The identification of steroids and triterpenoids is due to the result of the appearance of the staining that ranges from blue evanescence to persistent green, which occurs due to the loss of the hydroxyl that activates the conjugated system of the steroid nucleus [28]. While depsides are esters of two or more units of hydroxybenzoic acids, and depsidones are biogenetically derived from depsides through an intramolecular oxidative coupling [29], the positive result of this class is indicated by the appearance of green, blue or gray coloration.

3.2 QUANTITATIVE PHYTOCHEMICAL ANALYSIS

Table 2 shows the total phenolic content found in *P. cablin* leaves. The content of phenolic compounds was 4.02%, a relatively low result in which may be related to the absence of antioxidant activity.

Table 2

Total phenolics of extract from leaves of P. cablin

Ethanollic Extract	Phenolic compounds (mg GAE/g)	Phenolic compounds (%)
EE	40,27 µg/pipe	4,02

3.3 LARVICIDAL ACTIVITY

The extract of *P. cablin* presented expressive larvicidal action, with LC₅₀ of 63.91 µg.mL⁻¹ in 24 h, and LC₅₀ of 64.58 µg.mL⁻¹ in 48 h, with R² of 0.914. These did not present statistical difference between the 24 h and 48 h periods with p> 0.05, as shown in table 3.

Table 3

Percentage mortality (%) of A. aegypti larvae at different concentrations of P. cablin extract in two periods

Concentrations (µg.mL ⁻¹)	Larvicidal activity (%)	
	24 h	48 h
20	0.0	0.0
40	4.0	4.0
60	52.0	54.0
80	78.66	78.66
100	80.0	81.33
Control (+)	100	100
Control (-)	0.0	0.0

3.4 ANTIOXIDANT ACTIVITY

In the evaluation of the antioxidant activity, the results showed the absence of this activity, since in the highest concentration (250 µg.mL⁻¹) the DPPH consumption was 24.52%, which was lower than the expected 50% of consumption, which caused a high IC₅₀ of 900.98 µg.mL⁻¹, according to table 4.

Table 4

Mean and standard deviation of the percentage of antioxidant activity of extracts of *P. cablin* in different concentrations.

Concentrations (µg.mL ⁻¹)	% AA
7,81	14.29± 0.25
15,62	15.45± 0.73
31,25	17.80±0.83

62,5	18.24 ±0.62
125	20.5 ± 0.29
250	24.52 ± 0.42

3.5 ANTIMICROBIAL ACTIVITY

The antimicrobial activity showed that *P. cablin* extract had a better bacteriostatic potential against *E. coli* bacteria, with a MIC of 31.25 mg.mL⁻¹ than for *S. aureus* and *P. aeruginosa* bacteria. Regarding MBC, extract did not demonstrate bactericidal activity against the bacteria under test, according to Figure 1.

Figure 1

Sensitivity Test (MIC) and (MBC) OE of P. cablin against the E. coli, S. aureus and P. aeruginosa

MIC and MBC of the EO of *P. cablin* against (a) *E. coli*, (b) *S. aureus* and (c) *P. aeruginosa* Source: Own author. Substance test (■), BHI with 2% DMSO (□) and Amoxiline (■). * P <0.001 statistically significant in relation to the negative control, # p <0.001 statistically significant in relation to the positive control.

3.6 CYTOTOXIC ACTIVITY

In the evaluation of the cytotoxic activity, the extract of *P. cablin* presented moderate toxic action, with LC₅₀ of 257.93 and R² 0.981, p <0.00. Table 5 shows the mean mortality readings performed in the 24 hour extract exposure against *A. salina* larvae.

Table 5

Percentage of mortality of A. salina larvae of P. cablin extract in different concentrations

Concentrations (µg.mL ⁻¹)	Mortality (%)
50	10.0

100	23.3
250	56.6
500	63.3
750	76.6
1000	86.6

4 DISCUSSION

The study for the development of biocidal herbs against *A. aegypti* is recent, beginning in the 1980s, in order to isolate and characterize such bioactive substances. Many plant-based products have active compounds that act synergistically or in isolation, and they have characteristics that can be effective in controlling and monitoring mosquito populations [30].

The plants have mechanisms against insect action and are able to synthesize, from different metabolic pathways, defense compounds as secondary metabolites and proteins that act as insecticidal toxins [18].

In this context, the phytochemical tests performed with *P. cablin*'s extract, the classes of substances such as steroids and triterpenoids, depsids and depsidones showed positive results.

The identification of the steroids and triterpenoids is due to the result of the appearance of the coloration that goes from the blue evanescence to the persistent green, which occurs due to the loss of the hydroxyl that activates the conjugated system of the steroid nucleus in the reaction [31]. Steroids are derivatives of acetate, in which they act to reduce cholesterol absorption, reduce risks of cardiovascular diseases and inhibit the growth of malignant tumors [28]. The triterpenoids are a condensed compound derived from terpenoids and their biosynthetic source of isoprene. One of its main biological activities is the antispasmodic function, in which it has the function of relaxing the intestinal smooth muscle, reducing cramps [32].

In the staining reaction of depsides and depsidones, there was a positive result from the appearance of the greenish coloration. This class of metabolites consists of phenolic compounds of multiple properties such as antioxidant, antiviral, antibiotic, antitumor, allergen, inhibition of plant growth, anti-tuberculosis and enzyme inhibitory activity [33].

In the determination of the total phenolics, the extract of *P. cablin* presented 4.02%, a significantly low result, suggesting the absence of antioxidant activity, since the phenolic compounds present in the plants are related to the most abundant antioxidants. Therefore, the greater the number of phenolic compounds, the vegetable will have expressive antioxidant activity that contributes to the processes of inhibition of the risk of cardiovascular diseases and may act on oxidative stress, related to several chronic-degenerative

pathologies, such as diabetes, cancer and inflammatory processes [34]. Currently, there is a shortage of studies indicating the content of phenolic compounds in the extract of *P. cablin*.

Studies have proven the activity of plant extracts in the control of different species of mosquito [35-37], including *A. aegypti* [1,4, 8-10, 12,13,30]. These plants synthesize several types of compounds that have recognized entomotoxic potential and arouse the interest of several researchers in the search for alternative strategies for the chemical control of *A. aegypti* [18].

In this context, *P. cablin*'s extract presented a significant larvicidal potential with LC_{50} of $63.91 \mu\text{g.mL}^{-1}$ in 24h, since samples with LC_{50} below $100 \mu\text{g.mL}^{-1}$ are considered to be good larvicidal agents [38]. The significant larvicidal activity may be related to the class of terpenes identified in the preliminary chemical test of this species, considering that biocidal studies of the *P. cablin* [39-42] species considered the sesquiterpenes (among them patchouli alcohol) as main responsible for their larvicidal potentiality.

It is important to emphasize that to relate larvicidal activity to some chemical compound is still a complex task, since the biological effect may reflect the action of the major component or is the result of the synergistic action of the constituents.

As for the antioxidant analysis, Nascimento et al. [43] emphasize that the antioxidant test sample that has high potential in sequestering free radicals has a low IC_{50} value. Thus, from a small amount of sample, there is a decrease in the initial concentration of the DPPH radical by 50%, to inhibit the radical oxidation by 50%. In conclusion, the results observed in this study did not demonstrate antioxidant activity, since the IC_{50} of the correlation between antioxidant activity (%) and the extract concentration was $900.98 \mu\text{g.mL}^{-1}$ when compared to the standard of ascorbic acid (vitamin C) with IC_{50} of $16.71 \mu\text{g.mL}^{-1}$. These results are linked to the phytochemical profile of the species, in which Maqsood et al. [44] state that ketone or phenolic substances present in plants influence the antioxidant activity.

In this scenario of research related to the search of natural bioactive compounds, the use of new substances with antimicrobial activity has aroused the interest of the scientific community, because some bacteria have resistance to synthetic antibiotics [45]. Thus, drugs that are manufactured from natural compounds appear as a promising alternative for the effective treatment of infectious diseases.

The plant extracts have compounds with antimicrobial potential, they act with a mechanism of action on the bacteria interconnected to the disturbance of the cytoplasmic membrane, cytoplasmic coagulation, change in electron flow, disruption of proton power, alteration of active transport and reduction of intracellular ATP pool [46,47].

In this study, in the evaluation of the antimicrobial activity, the extract of *P. cablin* prevented the bacterial growth only against *E. coli* bacteria, with MIC 31.25 $\mu\text{g.mL}^{-1}$, and it showed no bactericidal activity. Liu et al. [48] found the anti-microbial activity of *P. cablin* extract against *Rhizopus nigricans*, demonstrating its efficacy against infectious microorganisms. However, there are limited reports on the potentiality of the microbial activity of *P. cablin* extract, instigating further studies to clarify such biological activity.

The evaluation of the toxicity of a plant species is an important bioassay to verify if it can be used as herbal medicine. In this context, the preliminary toxicological bioassay with *A. salina* allows evaluating if the effects that a compound produces in these microcrustaceans are applicable to humans. It is necessary to make only mathematical corrections to verify the appropriate dose per unit of the body surface since the toxic effects caused in laboratory animals are approximately similar to those caused in humans [49].

The extract of *P. cablin* presented moderate toxicity, according to the classification of Lopez-Lutz et. al [23], in which high toxicity is considered LC_{50} values less than 100 $\mu\text{g.mL}^{-1}$, moderate toxicity between 100 and 500 $\mu\text{g.mL}^{-1}$, weak toxicity between 500 and 1000 $\mu\text{g.mL}^{-1}$, and LC_{50} above 1000 $\mu\text{g.mL}^{-1}$ are considered to be non-toxic.

The level of toxicity of a plant species depends on the chemical compounds that constitute it. In the species *P. cablin* it is estimated that the toxicity is related to the class of terpenes identified in its composition [50]. However, the plant extract of *P. cablin* may be more toxic than its isolated compounds, since the synergy between the substances potentiated the significant toxic action.

5 CONCLUSION

The preliminary chemical composition of *P. cablin* extract indicated the presence of the following classes of secondary metabolites: steroids and triterpenoids, depsides and depsidones.

P. cablin's extract demonstrated significant larvicidal potential and low toxicity in the LC_{50} found in this study, which can be used to control mosquito larvae without causing a cumulative effect in humans and the environment.

As for the antioxidant evaluation, there was no evidence of antioxidant activity by the DPPH radical capture method when compared to the vitamin C standard.

The antimicrobial activity showed that the extract of *P. cablin* presented a bacteriostatic action in the concentration of 31.25 mg.mL^{-1} only against *E. coli* bacteria.

The data show the relevance of the bioassays as a screening of the biological potential of the *P. cablin* species, as well as the importance of these products as a source of biocidal

compounds. Also noteworthy is the lack of studies related to the biocidal activities of *P. cablin's* extract.

ABSTRACT

This article aims to discuss the role of the Public Defender's Office in the context of penal execution when applied to homeless individuals. The research intends to investigate the incongruity between punishment and protection in light of human dignity, the guarantees ensured by the Constitution, and social vulnerability. The study was based on a literature review and analysis of legal documents, which provided support for the theoretical debate. It was found that the Public Defender's Office possesses competence and potential regarding punitive practices and to be effective in relation to human rights, especially those of homeless individuals; however, it is necessary to overcome the structural limitations that reduce its performance. It is up to everyone—the State, civil society, and educational institutions—to promote reflections and practices that can lead to social justice.

RESUMO

O artigo possui como objetivo principal discutir a atuação da Defensoria Pública no cenário da execução penal quando aplicada à pessoas em situação de rua. A pesquisa tem a pretensão de averiguar a incongruência entre punição e proteção em face da dignidade da pessoa humana, das garantias asseguradas na Constituição e da vulnerabilidade social. O estudo fundamentou-se em uma revisão de literatura e análise de documentos legais, os quais deram suporte para o debate teórico. Constatou-se que, a Defensoria Pública possui competência e potencial no que se refere às práticas punitivistas e para ser efetiva em relação aos direitos humanos, principalmente das pessoas que estão em situação de rua, no entanto, é necessário sobrepujar os limites estruturais que reduzem sua atuação. Compete a todos: Estado, sociedade civil, academias educacionais, promover reflexões e práticas que possam se voltar para a justiça social.

Palavras-chave: Defensoria Pública. Exclusão. Execução Penal. Pessoas em Situação de Rua. Vulnerabilidade.

RESUMEN

Este artículo busca analizar el rol de la Defensoría Pública en el contexto de la ejecución penal aplicada a personas en situación de calle. La investigación busca indagar en la incongruencia entre el castigo y la protección a la luz de la dignidad humana, las garantías constitucionales y la vulnerabilidad social. El estudio se basó en una revisión bibliográfica y un análisis de documentos legales que respaldaron el debate teórico. Se concluyó que la Defensoría Pública posee competencia y potencial en materia de prácticas punitivas y para ser eficaz en relación con los derechos humanos, especialmente los de las personas en situación de calle; sin embargo, es necesario superar las limitaciones estructurales que limitan su desempeño. Corresponde a todos —Estado, sociedad civil e instituciones educativas— promover reflexiones y prácticas que conduzcan a la justicia social.

Palabras clave: Defensoría Pública. Exclusión. Ejecución Penal. Personas en Situación de Calle. Vulnerabilidad.

1 INTRODUCTION

People who are on the margins of society make up one of the most marginalized groups within Brazilian society. With regard to the context of criminal law, this vulnerability is made increasingly greater by the scarcity of access to rights, resources, and, above all, appropriate legal representation. From this scenario, the Public Defender's Office emerges as an institution that is necessary and essential to justice, playing a role that goes beyond technical defense in achieving the promotion of constituted and fundamental rights.

There is a duality with regard to penal execution, whose stage is to give visibility to the fulfillment of the sentences imposed, since it reveals a certain mismatch between the system that punishes and the social needs of a portion of the population most in need.

The study is relevant due to the urgency of reflecting on the effectiveness of the State's protection of those most vulnerable, being, therefore, the Defender's Office, the institution that represents access to justice. In addition, it is justified by the full need to promote debates, which can trigger more inclusive public policies. From a social point of view, it seeks to contribute to guaranteeing the rights of the most vulnerable people, alerting to the risks of a penal execution that further accentuates exclusion. Scientifically, it is intended to broaden the debate in academies on critical criminology, social vulnerability, criminal guarantees, and the performance of justice institutions.

It is based on the following objectives to achieve the purpose of the research: general: to research how the Public Defender's Office acts in the criminal execution of homeless individuals and if this operation is close to a more guaranteeing or punitive connection. And the specifics are: mapping the normative foundations that govern criminal execution and the performance of the Public Defender's Office; analyze the fundamental rights of homeless people in the light of the Constitution and the Penal Execution Law; discuss the main legal, institutional and social obstacles to a protective performance of the Public Defender's Office, and systematize academic and institutional proposals that seek to strengthen the protection of hypervulnerable people in the social context.

The methodology used in the study was based on a qualitative research with a descriptive and analytical approach, with literature review and national and international legal document analysis. Texts that bring legality were used, such as the Federal Constitution of 1988, the Penal Execution Law – Law No. 7,210/84 -, the Complementary Law No. 80/94, in addition to international human rights treaties. Doctrines and scientific articles that address the Public Defender's Office, criminal execution and homelessness were also consulted.

2 HOMELESSNESS AND THE PENAL SYSTEM: SOCIAL AND LEGAL ASPECTS

Homelessness is not only a condition of extreme poverty, but an expression of a process of structural exclusion. This condition is marked by social exclusion, lack of access to essential services and, in many cases, a relationship of conflicts with the repressive apparatuses of the State. When it comes to the penal system, this reality acquires even more serious contexts, since hypervulnerable people face obstacles and limitations to the real exercise of their rights, including, and especially, during the penal execution.

When it comes to the Brazilian State, homelessness is one of the phenomena that most attacks society and that gives visibility to a glaring social inequality, as well as criminal selectivity. Historically, this group has always been the target of marginalization with rights violated or neglected, including by the criminal justice system itself. The criminalization of misery is a framework composed of the intersection of extreme poverty, social vulnerability, and incarceration.

Zaffaroni *et al* (2018, p. 65) bring to light the concept of criminal selectivity in the legal sphere, since it constitutes a mechanism by which the penal system concentrates its action in vulnerable sectors.

Criminalization is selective and this selectivity is not a deviation from the system, but rather its own way of functioning. Punishment and criminal proceedings do not apply to everyone equally, but focus primarily on the most vulnerable sectors of society. In other words, the penal system is not a mechanism of global control, but rather an instrument of power directed preferentially against the poor and marginalized. Primary criminalization—the creation of criminal law—may seem neutral, but secondary criminalization—law enforcement—is profoundly selective.

The authors' words reveal a critique of the repressive apparatus that is not neutral, but rather functional to maintain the social order that becomes exclusionary. It is noted that prison, within this context, is seen as a deposit of undesirable individuals, where homeless people are incarcerated for crimes of lesser offensive potential such as hunger theft, possession of drugs for consumption or simply for occupying public spaces.

One should not ignore the work of the Public Defender's Office, which represents a barrier of resistance to all this punitive mechanism. As Silva (2021, p. 87) points out, "the Public Defender's Office has a strategic role in protecting the rights of homeless people, acting not only in judicial defense, but in promoting citizenship and combating the institutionalization of exclusion". This presence in the spaces deprived of liberty makes it possible to design the exclusionary structures of the penal system and guarantee a minimum of dignity to the hypervulnerable.

The Federal Constitution of 1988, in its article 1, item III, enshrines the dignity of the human person as the foundation of the Republic. However, this commitment remains unfulfilled when we see thousands of people living on the streets who are deprived of elementary rights, with arbitrary and illegal arrests, precautionary measures that are disproportionate and the absence of minimum conditions in prisons.

According to data from the Institute of Applied Economic Research – IPEA – "the number of homeless people in Brazil increased by more than 200% between 2012 and 2022" (IPEA, 2022, p. 34). This is a contingent of the population whose condition of vulnerability is multifactorial: homelessness, unemployment, chemical dependency, mental disorders and breakdown of family ties. However, what can be observed is the performance of the penal system as the only visible state response, suppressing the failure of public assistance and housing policies.

This time, the interface between homelessness and the penal system decrees not only a sensible and guaranteeing legal response, but a reconstruction of the role of the State in social protection. The criminalization of poverty, under the veil of formal legality, perpetuates historical inequalities and deepens exclusion. As Foucault (1996, p. 61) asserts, "prison manufactures delinquents, instead of correcting them; exclusion is its most effective product." Therefore, it is urgent to profoundly reformulate public policies, combined with critical and humanized legal action, so that we can break the perverse cycle of vulnerability and punishment (BATISTA, 2015).

3 PUBLIC DEFENDER'S OFFICE AND PENAL EXECUTION: LEGAL AND INSTITUTIONAL FOUNDATIONS

The role of the Public Defender's Office in criminal enforcement is one of the most significant expressions of the realization of fundamental rights within the Brazilian penal system. Since the 1988 Constitution (BRASIL, 1988), especially with the enactment of Constitutional Amendment No. 80/2014, the Public Defender's Office has been recognized as an essential function of justice, in charge of legal guidance, promotion of human rights and defense, at all levels, of the needy, in a comprehensive and free manner (BRASIL, 2014).

Constitutional Amendment No. 80/2014 reinforces the essential role of the Public Defender's Office in promoting social justice and addressing inequalities in the penal system. By determining that the Defender's Office be present in all jurisdictional units within 8 years, the amendment sought to ensure that no citizen, regardless of their social and territorial condition, is left without access to justice. In the context of the criminal execution of homeless

people, this amendment gains special relevance. This group, marked by extreme vulnerability and social exclusion, faces numerous barriers in the justice system (BRASIL, 2014).

In the context of criminal enforcement, the Public Defender's Office plays a crucial role in protecting the rights of people deprived of liberty, who are often forgotten or made invisible by the justice system. Its performance is legally based on the Penal Execution Law itself, Law No. 7,210/1984, especially on articles 16, 81-A and 83, which expressly provide for legal assistance to prisoners, and recognize the Public Defender's Office as one of the organs of penal execution, alongside the Public Prosecutor's Office and the Execution Court (BRASIL, 1984).

Article 16 of the LEP establishes that the "Public Defender's Office shall ensure the regular execution of the sentence and the security measure" (BRASIL, 1984, p. 42). This article confers on the Ombudsman's Office express attribution in the supervision of criminal execution, which includes the verification of legalities, excesses of time, undignified conditions of custody and absence of minimum state assistance. For homeless people, this action is crucial to ensure the exercise of rights that are usually denied to them, such as access to health, prison work, and education in prison.

Article 83 establishes that "the prisoner and the internee may present, in person or through an attorney, a petition, representation or complaint to any authority, in defense of rights or against illegality or abuse of power". Although the article recognizes the right of the prisoner to petition, in practice, without effective legal assistance, this right becomes illusory. The Public Defender's Office, through Article 134 of the CF/88, becomes the channel through which these rights can be claimed in a technical and effective manner.

The Penal Execution Law (LEP), since its origin, has been guided by the rehabilitation of the convict and the protection of his dignity. This principle becomes even more urgent when it comes to homeless people, who accumulate several layers of social and institutional exclusion. (BRAZIL, 2014). In this context, the performance of the Public Defender's Office, strengthened by EC No. 80/2014, is essential to ensure effective compliance with the LEP (BRASIL, 1984).

The Defender's Office's work is not limited to the exercise of technical defense in court, but extends to the protection of fundamental rights in daily prison life, such as access to health, education, family visitation, physical and moral integrity, and regime progression (DU PRAT, 2015). In this area, it acts both individually and collectively, through public civil actions, *collective habeas corpus* and periodic visits to prison units, being a fundamental agent of supervision of the fulfillment of the sentence in the mold of the dignity of the human person (DU PRAT, 2015).

In the conception of Lima (2021, p. 95),

The Public Defender's Office is the main instrument of legal resistance to the selective punitivism of the State, being the only institution that, in an organic way, has as its institutional mission the defense of those who, historically, occupy the most vulnerable positions in the gears of the penal system.

The Public Defender's Office, as the institutional voice of the vulnerable, assumes a fundamental role. As Lima (2021, p. 82) argues, "its performance must transcend the forensic space, inserting itself in the streets, squares, shelters in order to promote real access to justice for those whose citizenship is routinely denied". This extrajudicial and multidisciplinary action becomes essential to denounce abuses, guarantee rights and foster articulation with social protection networks.

However, as long as the State maintains a punitive and hygienist posture – which expels, imprisons or silences bodies that are uncomfortable with public order – breaking the cycle of vulnerability and incarceration will not be possible. As Wacquant (2017) points out, the state government, with neoliberal conceptions, tends to reduce its presence in maintaining the security of social rights, concomitantly intensifies its punitive presence in areas of urban marginality.

To overcome this latent reality, it needs to demand a new paradigm of justice, based on solidarity, equity and the recognition of the intrinsic dignity of all human beings. In Almeida's (2019) view, it is necessary to decriminalize poverty, recognize the structural determinants of exclusion, and ensure effective public policies for housing, mental health, and social assistance. Without this, the penal system will continue to be the inevitable fate of those who have been excluded from all other spaces.

4 BETWEEN PROTECTION AND PUNISHMENT: CHALLENGES IN THE DEFENSE OF HOMELESS PEOPLE

The homeless population represents one of the most vulnerable segments of Brazilian society, marked by multiple forms of social and institutional exclusion. The performance of the justice system in relation to this population shows a constant tension between the bias of social protection and the logic of punishment, especially in the criminal field. The Public Defender's Office emerges as a central protocol actor in the mediation of this duality, and assumes the difficult mission of guaranteeing fundamental rights in a panorama of criminalization of poverty.

The Magna Carta, by establishing the Democratic Rule of Law, enshrined the Principle of the Dignity of the Human Person as one of its foundations – article 1, III-, which implies the

duty of the State to ensure full protection to all citizens, including those in situations of extreme vulnerability. However, it is observed, in practice, that public security and criminal justice mechanisms often operate under a selective and punitive logic, as denounced by Zaffaroni *et al* (2018), when they state that the Latin American penal system does not punish all crimes, but rather selects perpetrators and facts in a discriminatory manner, criminalizing poverty and protecting the interests of the elites.

The Public Defender's Office, as an institution essential to the jurisdictional function of the State, under the terms of article 134 of the Constitution, plays a fundamental role in containing punitive excesses and promoting public policies aimed at inclusion (BRASIL, 1988). His performance in criminal enforcement and in the defense of homeless people requires not only technical knowledge, but also social sensitivity and the ability to articulate between institutions. According to Justice Vieira (2016) in which the Public Defender's Office is present both in the courts and in the spaces of public policy formulation in the promotion of the realization of social rights.

Meanwhile, the challenges facing the Public Defender's Office are great. The absence of civil documentation, the breakdown of family and community ties, barriers to access to public services, and social stigmas make it difficult to build effective defense strategies (GIAMBERNARDINO, 2016). In addition, the precariousness of housing policies, the scarcity of mental health programs, and the dismantling of initiatives aimed at the homeless population contribute to the worsening of the problem. As stated by Ramos and Muszkat (2011), the street is a stage for physical and psychic suffering, in which this individual is deprived of his identity, of his belonging to a society and of the protection of state institutions.

In this sense, it is urgent to rethink the role played by justice institutions in protecting the rights of this portion of the population, and to promote action that is based on the principles of dignity, equality and inclusion (SANTOS, 2014). The Public Defender's Office must be strengthened both at the legal-individual level and at the collective and structural level, whether through public civil actions, inspections or institutional dialogues. To this end, it is necessary to ensure autonomy, resources, and territorial capillarity, as well as training for its members, with a focus on human rights and the intersectionality of vulnerabilities.

5 CRITICAL ANALYSIS OF LITERATURE AND PROPOSITIONS FOR A MORE HUMANIZED PERFORMANCE

The performance of the justice system, especially in the criminal field, over the years, has been guided by practices of exclusion, selectivity and dehumanization of subjects in situations of vulnerability. This finding is supported by a critical analysis of contemporary legal

literature, which reveals the urgency of rethinking the normative and institutional paradigms that govern state action, especially in the face of marginalized populations, such as homeless people, drug users, adolescents in conflict with the law, and black people (KARAM, 2023).

The criticism of the punitive model is shared by authors such as Eugenio Raúl Zaffaroni, Vera Alessandro Barata and Nilo Batista. For Baratta (2002), the Brazilian penal system is heir to a slave-owning and authoritarian logic, which treats the 'social undesirables' as enemies to be eliminated. In this sense, critical criminological literature plays an essential role in unveiling the ideological character of punitive action and proposing action based on human rights, dignity, and inclusion (KARAM, 2023).

It is within this whole context that the Public Defender's Office emerges as an institution focused on the promotion of human rights and the effectiveness of access to justice by the most marginalized groups. However, merely technical action, detached from an empathetic and contextualized look, can reproduce the exclusionary logics of the penal and judicial system. Thus, a more humanized performance of the Public Defender's Office is proposed, based on a human approach as a fundamental hermeneutic vector (COUTINHO, 2017).

Humanization in the Public Defender's Office determines, first of all, the recognition that the recipient of its services is, most of the time, a person in a situation of extreme vulnerability – not only economic, but also social, cultural, racial, psychological and institutional. As Almeida (2019, p. 93) points out, "inequality is structural and operates in a way that marginalizes and dehumanizes historically excluded subjects". Therefore, the public defender and all those who work in the Defender's Office need to be aware of the multiple oppressions that affect their assisted, and must adopt a legal practice that is sensitive to these social markers.

In this sense, it is proposed that the training of public defenders and all those who, directly or indirectly, deal with this clientele, include content on human rights, structural racism, gender, mental health, public policies, and legal anthropology. The performance of a defender, therefore, cannot be limited to formal legality. It also needs to involve commitments to social transformation. By means Streck (2014, p. 132) assures "the Constitution is not an appendix of the legal system, but its reason for being. Legal dogmatics must be constitutionalized."

In addition, humanization involves qualified listening to the assisted. It is necessary to break with the vertical logic in which the defender decides, unilaterally, the best defense strategy. On the contrary, the protagonism of the individual must be promoted, and his autonomy and narrative must be respected. At this point, Boaventura de Sousa Santos (2014)

argues for the need for an 'epistemology of the South', in which popular knowledge is valued as legitimate forms of knowledge and resistance.

Another essential aspect for humanized action is the extrajudicial and collective action of the Public Defender's Office. This includes institutional visits to places of deprivation of liberty, articulation with social movements, the proposition of public civil actions, and active participation in public policies (CONDEGE, 2001). In this way, the National Council of General Public Defenders aims to articulate and institutionally strengthen the Brazilian Public Defender's Office at the national level. Its mission is to promote the integration, strengthening, standardization and development of Public Defenders' Offices, in order to ensure coordinated and effective action in the defense of the fundamental rights of the population, especially people in vulnerable situations (CONDEGE, 2001).

It is also essential to strengthen the institutional structure to enable quality performance. This involves a greater budget, administrative autonomy and internal control mechanisms aimed at ethics and accountability. The humanization of action does not dispense with adequate material conditions and appreciation of civil servants and defenders.

Finally, the trend of criminalization of poverty and criminal selectivity must be combated. The Public Defender's Office has an ethical duty to denounce punitive practices that disproportionately affect the black, peripheral and homeless population. According to Zaffaroni *et al* (2018, p. 165), "the penal system is not blind, but selective; punishes the same as always, perpetuating historical inequalities". Thus, a truly humanized performance must challenge these structures and promote substantive justice.

Therefore, the propositions for a more humanized Public Defender's Office go through a critical, interdisciplinary action focused on social transformation, committed to fundamental rights and the dignity of the human person. It is about rescuing the centrality of the subject of law and promoting equity as a pillar of justice.

6 FINAL CONSIDERATIONS

The present research started from the concern about the role of the Public Defender's Office in the criminal execution of homeless people, in the light of a penal system that is known to be selective, exclusionary and little sensitive to social inequalities. The hypothesis that guided the investigation – that the Defender's Office's performance can represent a more guaranteeist and humanized path in the face of the current punitive logic – was confirmed throughout the theoretical, legal and critical analysis of the data and references used.

By achieving the proposed objectives, especially the general one – to analyze how the Public Defender's Office acts in the criminal execution of homeless people and whether this

action is aligned with a guaranteeing or punitive logic – it could be seen that the Defender's Office, even though it faces institutional, budgetary and structural limitations, constitutes itself as the main way of resistance to the criminal criminalization of the most vulnerable. The study revealed that its work goes beyond forensic limits and also takes place in the extrajudicial field, in the promotion of public policies and in the articulation with protection networks. In this way, the Public Defender's Office is substantially close to a guarantor connection, even if inserted in a structurally punitive system.

In the initial chapter, it was demonstrated how homelessness in Brazil represents not only a condition of material misery, but the most extreme expression of social exclusion. The analysis of IPEA data and legal frameworks showed the lack of structuring public policies and the use of the penal system as a mechanism for controlling and containing social undesirables. Criminal selectivity was approached from Zaffaroni and other authors of critical criminology, showing how criminal law, although apparently neutral, applies unequally, and disproportionately affects the poor, blacks, drug users and, notably, the homeless.

The second chapter reinforced this finding by addressing the legal fundamentals and institutions of the Public Defender's Office, especially its constitutional provision as an essential function of justice and its attribution in the full and free defense of the needy. It was observed that the Defender's Office is supported by the Penal Execution Law and Complementary Law No. 80/94 to act not only in the technical defense, but in the supervision of the execution of the sentence with dignity, which involves the fight against abuses, the guarantee of social rights and the promotion of citizenship in penal establishments.

The investigation also made it possible to achieve the proposed objectives: the normative framework of penal execution and defensive action was mapped; the fundamental rights of homeless people and institutional obstacles were analyzed, such as the absence of documentation, breaking of ties, prejudice and the lack of intersectoral policies; and, finally, propositions aimed at the humanized and structuring performance of the Public Defender's Office were systematized. Among them, the following stand out: continuous training in human rights and intersectionality, the strengthening of institutional visits, collective defense and strategies, and the role of those assisted in the defense process.

The final chapter, by proposing a more humanized performance, consolidated the elements raised earlier, arguing that the practice of defense should break with the rigidity of legal dogmatics and assume an ethical-political commitment to historically invisible subjects. Qualified listening, recognition of the subjectivity of those assisted, and the adoption of interdisciplinary strategies were presented as structural pillars.

Therefore, it is possible to affirm that the Public Defender's Office, although immersed in an unequal and selective justice system, has the potential to resignify its performance and constitute itself as a transforming agent in the criminal execution of homeless people. Such action, in order to be effective, requires institutional strengthening, political commitment to human rights, and the adoption of legal practices sensitive to the complexity of vulnerabilities.

It is concluded that, in the face of a penal system that, according to Foucault, manufactures exclusion and feeds marginalization, the Public Defender's Office must assume the role of resistance, being the bridge between law and social justice. Their humanized performance is not only an ethical option, but a constitutional and historical necessity in the face of the reality of the streets and prisons. Justice, therefore, will only be full when it is able to reach and protect those who are currently kept on the margins, not only of the urban space, but of citizenship itself.

Finally, it should be noted that this article does not intend to exhaust the debate about the role of the Public Defender's Office in the criminal execution of homeless people, nor to offer absolute answers to the challenges surrounding the theme. On the contrary, it is intended that the present analysis serves as a starting point for broader and more in-depth reflections, fostering future investigations on aspects not yet explored, such as local institutional practices, the impacts of intersectoriality in the care of the homeless population and the successful experiences of advocacy in different regions of the country. The complexity of the reality dealt with here establishes a continuous, critical look committed to social justice.

ABSTRACT

Considering that men deprived of liberty for sexual crimes are exposed to multiple psychosocial vulnerability factors, such as stigmatization, fragile social bonds, and limitations in access to care actions, it becomes relevant to investigate the self-perception of mental health in this context. This study aims to analyze the self-perception of mental balance among men incarcerated for sexual crimes, associating it with sociodemographic and prison-related characteristics, such as educational level, prison status, participation in activities, and family support. To this end, an exploratory, descriptive, and analytical study with a quantitative approach was conducted with 90 men deprived of liberty in a prison unit in southern Brazil. Data were collected through a structured questionnaire and analyzed using descriptive and inferential statistics, applying the chi-square test and linear trend analysis, with a 5% significance level. Thus, a high prevalence of very negative self-perception of mental health was observed, especially among individuals in pretrial detention and those with lower educational levels. A significant association was also found between participation in activities and better mental balance, as well as a lower frequency of death-related thoughts. These findings allow the conclusion that contextual and institutional factors, such as access to activities and the definition of legal status, exert a relevant influence on mental health in prison, reinforcing the need for intersectoral strategies to promote mental health in the prison system.

RESUMO

Considerando que homens privados de liberdade por crimes sexuais estão expostos a múltiplos fatores de vulnerabilidade psicossocial, como estigmatização, fragilidade de vínculos sociais e limitações no acesso a ações de cuidado, torna-se relevante investigar a autopercepção da saúde mental nesse contexto. Objetiva-se analisar a autopercepção do equilíbrio mental de homens encarcerados por crimes sexuais, associando-a a características sociodemográficas e prisionais, como escolaridade, condição prisional, participação em atividades e apoio familiar. Para tanto, procede-se a um estudo exploratório, descritivo e analítico, de abordagem quantitativa, realizado com 90 homens privados de liberdade em uma unidade prisional do sul do Brasil. Os dados foram coletados por meio de formulário estruturado e analisados por estatística descritiva e inferencial, utilizando o teste do qui-quadrado e análise de tendência linear, com nível de significância de 5%. Desse modo, observa-se elevada prevalência de autopercepção muito negativa da saúde mental, especialmente entre indivíduos em prisão provisória e com menor escolaridade. Verificou-se ainda associação significativa entre participação em atividades e melhor equilíbrio mental, bem como menor frequência de pensamentos de morte. O que permite concluir que fatores contextuais e institucionais, como acesso a atividades e definição da situação jurídica, exercem influência relevante sobre a saúde mental no cárcere, reforçando a necessidade de estratégias intersetoriais de promoção da saúde mental no sistema prisional.

RESUMEN

Considerando que los hombres privados de libertad por delitos sexuales están expuestos a múltiples factores de vulnerabilidad psicosocial, como la estigmatización, la fragilidad de los vínculos sociales y las limitaciones en el acceso a acciones de cuidado, resulta relevante investigar la autopercepción de la salud mental en este contexto. El objetivo de este estudio es analizar la autopercepción del equilibrio mental de hombres encarcelados por delitos sexuales, asociándola con características sociodemográficas y penitenciarias, como el nivel educativo, la situación jurídica, la participación en actividades y el apoyo familiar. Para ello, se realizó un estudio exploratorio, descriptivo y analítico, con enfoque cuantitativo, con 90 hombres privados de libertad en una unidad penitenciaria del sur de Brasil. Los datos se recolectaron mediante un cuestionario estructurado y se analizaron mediante estadística descriptiva e inferencial, utilizando la prueba de chi-cuadrado y el análisis de tendencia lineal, con un nivel de significancia del 5%. De este modo, se observó una elevada prevalencia de autopercepción muy negativa de la salud mental, especialmente entre individuos en prisión preventiva y con menor nivel educativo. Asimismo, se verificó una asociación significativa entre la participación en actividades y un mejor equilibrio mental, así como una menor frecuencia de pensamientos de muerte. Estos hallazgos permiten concluir que factores contextuales e institucionales, como el acceso a actividades y la definición de la situación jurídica, ejercen una influencia relevante sobre la salud mental en el contexto penitenciario, reforzando la necesidad de estrategias intersectoriales de promoción de la salud mental en el sistema penitenciario.

1 INTRODUCTION

In the year 2025, Brazil recorded the third largest prison population in the world, surpassed only by the United States and China (ObservaDH, 2024), with more than 900 thousand individuals deprived of liberty either in units of the penitentiary system such as physical cells and house arrests or in other custody facilities (Brasil, 2025). Data from the National Penal Information System (Sisdepen) indicate that, in 2024, the Brazilian prison population was mostly male, with 641,128 men deprived of liberty (95.66%) and 29,137 women (4.34%). In Paraná, this scenario is repeated in the total number of people incarcerated in the state, 38,196 (5.96%) were men and 2,378 (0.51%) were women (Brasil, 2025). In the context of deprivation of liberty for sexual crimes, we did not find statistical data available to make this comparison.

In this context, we often come across data that point to overcrowding, violence, lack of access to essential health services, and little supply of rehabilitation programs. These factors have a direct impact on the worsening of existing mental disorders, as well as on the development of new mental illnesses (Frazão; Souza; Nonato, 2024). According to the World Health Organization (WHO), mental health can be considered a state of well-being experienced by the individual, which enables the development of their personal skills to respond to life's challenges and contribute to the community. However, when we refer to people deprived of liberty, they are already in a situation of vulnerability even before incarceration, since their access to goods and services is limited (Cardoso, et. al. 2024). Upon entering the prison environment, the changes experienced, added to stressful factors, intensify feelings of anxiety, fear, helplessness, isolation, rejection, impotence, and low self-esteem, compromising mental balance (Silva, et. al. 2021).

As a result, deprivation of liberty can directly affect the mental health of individuals deprived of liberty. The situation and conditions of prison increase the risk of developing depression and dissatisfaction with life (YI, et al. 2017). The lack of work and education opportunities in the prison environment is also a risk factor for the emergence of mental disorders (Gabrysch, et al. 2019). In a study by Henry et al. (2020), 12.6% of people deprived of liberty have already experienced a serious mental illness and 25.5% other mental health disorders because they are incarcerated in an inhumane environment, which does not exert its real function of rehabilitation to a large extent. In another study by Gottfried and Christopher (2017) they showed that 63% of the men deprived of liberty in the study had mental health problems.

When addressing the theme of mental balance, another relevant point is family support, since it represents the main form of social interaction during the execution of the

sentence. This support plays a key role in offering emotional and affective support, contributing to the construction of values and behaviors that provide the individual with a sense of identity and belonging (Gato et al, 2022). In a study carried out by Calazans et al. (2022), the results found showed that family relationships are significantly impacted by the process of incarceration of men, so that stigma is also consolidated in family life through prejudice and social isolation. With this, it is also known that in situations of physical, mental or social vulnerability, family support is essential for maintaining the individual's quality of life and recovery. However, family abandonment, often experienced in the prison environment, contributes to the deterioration of the quality of life of people deprived of liberty.

A study conducted in the United States of America with 871 male respondents showed that incarcerated people with adequate mental health were less likely to recidivize after their freedom. This demonstrates that mental health within the prison environment is an important factor in cases of criminal recidivism (Wallace; Wang, 2020). Therefore, with the entry into prison, the State and the penal institution start to manage the basic needs of the individual, such as physical, mental, and social health (Bahiano, 2021).

In 2014, the Ministries of Health and Justice instituted the National Policy for Comprehensive Health Care for Persons Deprived of Liberty (PNAISP), through Ordinance GM/MS No. 02, representing an important advance in ensuring access to basic health services for this population (Brasil, 2014). However, the environment marked by restrictions, strict control, violence and idleness becomes hostile and stressful. Therefore, the health of the prison population is a public health issue, and many authors highlight the importance of research that subsidizes public policies and reduces physical and mental suffering inside and outside prisons (Jesus, et al. 2015).

In view of the problem exposed, the present study aims to analyze the self-perception of mental balance of men incarcerated for sexual crimes, associating it with sociodemographic and prison characteristics, such as education, prison condition, participation in activities and family support.

2 METHODOLOGY

This is an exploratory, descriptive, analytical study with a quantitative approach, developed with men deprived of liberty for sexual crimes.

The study was carried out at the Hildebrando de Souza Public Prison, in the municipality of Ponta Grossa, Paraná, Brazil. The study included 90 men incarcerated for sexual crimes, aged between 20 and 71 years, selected by convenience, according to the eligibility criteria defined by the institution.

Data collection took place between April and June 2025, and was carried out by students from the Nursing course at Faculdade Sagrada Família (FASF) and Dentistry at the State University of Ponta Grossa, previously trained and supervised by responsible professors. The interviews were conducted individually, on previously scheduled days and times, in a place reserved and authorized by the prison unit management, respecting institutional security standards. Sociodemographic information (age, marital status, race/color, education, previous employment status), variables of the prison context (length of incarceration, prison situation, and frequency of family visits) and self-perception of mental balance were collected.

A structured form was used, applied through interviews, containing closed questions. The variable self-perception of mental balance was evaluated based on the participants' self-perception, on an ordinal scale of five categories: very negative, negative, intermediate, positive and very positive.

The data were organized in a spreadsheet and analyzed using descriptive and inferential statistics. Categorical variables were presented in absolute and percentage frequencies. For the inferential analysis, the chi-square test of independence was used, with the objective of verifying associations between the perception of mental balance and the variables age group, length of incarceration and family support. Additionally, the *Linear-by-Linear Association* test was applied in order to identify possible progressive ordinal patterns among the variables analyzed, considering the ordinal nature of the categories. Statistical tests were performed using proprietary software.

In additional exploratory analyses, ordinal variables were converted into numerical scores, preserving the semantic order of the responses, enabling the evaluation of descriptive trends. A significance level of 5% ($p < 0.05$) was adopted.

The study was approved by the Research Ethics Committee, through Plataforma Brasil, under opinion No. 7,608,038/2025, in compliance with the guidelines of Resolution No. 466/2012 of the National Health Council. The research was authorized by the state and local management of the prison unit. All participants voluntarily consented to participate, by signing the Informed Consent Form or fingerprinting in cases of illiteracy.

3 RESULTS AND DISCUSSIONS

The study observed 90 men deprived of liberty, analyzing the self-perception of mental balance, considering variables age group, time of incarceration, family support

Table 1 shows the sociodemographic profile of men deprived of liberty for sexual crimes in the period studied.

Table 1

Sociodemographic profile of men in deprivation of liberty from April to June 2025

Variable	Category	%
Age (years)	Average (min.–max.)	34,7 (20–71)
Marital status	Single	41,2
	Married	14,9
	Divorced	4,1
	Widower	0,7
Race/Color	White	55,6
	Brown	36,7
	Black	7,8
Education	Incomplete Elementary School	61,1
	Complete Elementary School	11,1
	Incomplete high school	14,4
	Complete high school	7,8
	Illiterate	5,6
Previous employment situation	Informal/self-employed work	70,0
	Formal work	30,0
Family support (visits)	Receives no visits or support	45,6
	Receives visits regularly	35,6
	Receives visits sporadically	18,8

Source: the authors, 2025.

The sociodemographic profile observed in this study, characterized by the mean age of young adults, predominance of single individuals, low education and mostly informal labor insertion, is convergent with findings described in the national literature on people deprived of liberty for sexual crimes. Brazilian studies that analyzed men convicted of rape of a vulnerable person and other sexual offenses indicate that most of these subjects have trajectories marked by social vulnerabilities, especially low education and precarious socioeconomic conditions, factors that precede incarceration and influence the way these individuals are inserted in the penal system (Santos; Andrade, 2019; Silva, 2021). The high proportion of individuals with incomplete primary education observed in this sample reinforces the understanding that limited education is a relevant marker of social exclusion among sexual offenders in the Brazilian context, although it should not be interpreted as a causal factor of the crime.

On the international scene, studies conducted with incarcerated sex offenders in countries such as Spain, Turkey, and Taiwan also describe similar sociodemographic profiles,

with wide age variation, male predominance, low or intermediate educational levels, and a history of unstable occupations before prison (García et al., 2020; Yildiz et al., 2022; Tsai et al., 2018). These investigations highlight that, despite the cultural and legal differences between countries, social determinants (such as schooling, working conditions, and fragile family ties) appear recurrently in the characterization of this population. Thus, the analysis of the sociodemographic profile should be understood as a fundamental contextual element for the interpretation of findings related to mental health and emotional balance, contributing to a broader and more integrated approach to the phenomenon of sexual crime and incarceration.

Table 2, which deals with the characterization of age and the perception of mental balance, it was observed that the age group of participants between 20 and 30 years old had the highest perception of mental balance (59.45%).

Table 2

Characterization of the age group and self-perception of mental balance

Age group	Very negative (%)	Negative (%)	Intermediate (%)	Positive (%)	Very positive (%)
20–30 years old	13,51	0,00	16,21	10,81	59,45
31–40 years old	22,85	5,71	14,28	2,85	54,28
41–50 years old	40,00	0,00	10,00	20,00	30,00
51–60 years old	40,00	0,00	0,00	0,00	60,00
61–71 years old	50,00	0,00	50,00	0,00	0,00

Source: the authors, 2025.

The collected data indicate that the perception of mental balance has a different distribution according to the stage of life, while young adults demonstrate greater adaptive capacity and psychosocial resilience, older individuals reveal emotional fragility due to the expanded awareness of the sentence and the aging process in prison. A similarity was observed in a study carried out in Pernambuco with 15 participants, which highlights that incarcerated elderly individuals face specific challenges related to aging, such as social isolation and the emotional impact of prolonged incarceration (Júnio; Silva, 2022).

Recent research reinforces this relationship, highlighting that incarcerated older adults face challenges related to aging, such as social isolation, psychological distress, and forced medicalization, negatively impacting their mental health (Toledo, 2025). Although many incarcerated elderly people do not fully understand the impact of years of exclusion, such as

the absence of autonomy, this factor, for example, exerts a direct influence on their physical and mental health, since incarceration can affect the well-being and quality of life of people deprived of liberty, generating psychological suffering, restrictions on freedom and limitations on the expression of individual autonomy (Vilela; Dias; Sampaio, 2021).

A qualitative study carried out in Bahia analyzed the perception of the incarcerated population for the first time about their adaptation to the prison environment. The findings showed that young adults, especially in the age group of 25 to 30 years, found it easier to adapt to the rules and routines of the penitentiary system. This adaptation may be related to greater emotional and psychological flexibility. In addition, the study showed that young people demonstrate superior ability in building interpersonal relationships within prison, favoring social integration and reducing isolation and loneliness (Bahiano, 2021). These results suggest that youth can function as a protective factor, attenuating mental suffering in the context of prison.

Table 3 examined the relationship between the length of time of incarceration and the perception of mental balance. Among the participants with less than 6 months of incarceration, 56.6% said they had positive mental health, while 24.53% were very negative.

Table 3

Characterization of the time of incarceration and the self-perception of mental balance

Incarceration time	Very negative (%)	Negative (%)	Intermediate (%)	Positive (%)	Very positive (%)
< 6 months	24,53	0,00	13,20	5,67	56,60
6 months – 1 year	10,00	5,00	20,00	10,00	55,00
1 – 3 years	20,00	6,67	13,33	13,33	46,67
> 3 years	50,00	0,00	50,00	0,00	0,00

Source: the authors, 2025.

Regarding the time of incarceration, 56.6% of the participants with less than 6 months of incarceration stated the presence of mental balance, while of the individuals with more than 3 years of incarceration, 50% were undecided and the other 50% perceived the mental balance as very negative. These data suggest that there is a phase of consolidated psychological adaptation during the intermediate time of incarceration, in which the individual develops mechanisms to deal with the prison environment (Oliveira, Valença, 2020). This fact is comparable to the study carried out in Santa Catarina, which identified a lower recidivism rate among individuals with intermediate prison time, suggesting that, during this period, these individuals can develop more effective coping mechanisms and a psychological adaptation that contributes to greater emotional stability (Souza; Golgher; Silva, 2024). On the other hand, the prolongation of time can lead to a worsening of psychic conditions, due

to emotional exhaustion, isolation and lack of social reintegration (Oliveira, Valença, 2020). In addition, Baiano and Faro (2022) reinforce the idea that exposure to prison stressors such as social isolation, and lack of control over one's own life is strongly associated with the worsening of inmates' mental health, especially associated with increased sentences.

Table 4 shows that men who have already been sentenced have better self-perception of mental health compared to those who are still in a provisional situation, but it is also noted that both sentenced and provisional individuals obtained significant percentages regarding negative self-perception of mental health, which reinforces the prison environment as harmful to mental health.

Table 4

Percentage distribution of self-perception of mental health according to prison condition

Situation	Very negative (%)	Negative (%)	Intermediate (%)	Positive (%)	Very positive (%)
Provisional (n=63)	66,7	7,9	15,9	0,0	9,5
Sentenced (n=27)	59,3	3,7	25,9	3,7	7,4

Source: the authors, 2025.

The literature describes incarceration as an environment with a high load of stressors (restriction of freedom, rupture of bonds, institutional violence, deprivation of privacy and limited access to care) and, therefore, associated with relevant psychological suffering. Recent research on the prevalence and risk of mental health in populations deprived of liberty pointed out that disorders and symptoms of anxiety, depression, substance use, and comorbidities appear to be highly prevalent, suggesting that the negative perception may reflect both previous illness and aggravation by factors in the prison environment (Shnyder et al., 2025). These same authors describe that uncertainty about the outcome of the process aggravates mental health, which is in line with other studies focused on inmates that emphasize the high burden of mental health problems in this group, reinforcing that pretrial detainees constitute a population with specific needs and often more acute (Andrade et al., 2023; Albrecht et al., 2025). The literature indicates that people in pretrial custody have specific mental health needs, often more intense than those observed after the sentence is defined, reinforcing the importance of priority attention to this group.

On the other hand, among those sentenced, there was a higher proportion of responses in the intermediate and positive categories, although in modest percentages. This pattern may indicate a gradual process of psychological adaptation to incarceration after the sentence is defined, associated with the predictability of the routine and the reduction of

anxiety related to the uncertainty of the judicial outcome (Andrade et al., 2023). However, the low frequency of positive perceptions in both groups suggests that such adaptation does not eliminate mental distress, but may attenuate extremely negative perceptions over time.

In the Brazilian context, these findings should be analyzed in the light of the structural characteristics of the prison system, marked by a high proportion of pretrial detainees and limitations in the provision of comprehensive mental health care. Institutional reports highlight that the fragility of the psychosocial care network in prison and the difficulty in accessing early interventions contribute to the maintenance of psychological suffering among people deprived of liberty (National Council of Justice, 2024; Ministry of Human Rights and Citizenship, 2023). Thus, the results reinforce the need for mental health screening and follow-up strategies from the beginning of incarceration, with special attention to individuals in pretrial detention.

Table 5 addressed the perception of mental balance in relation to family support, especially due to the frequency of visits received. In this context, there was no significant difference in the perception of mental health with the frequency of visits.

Table 5

Characterization of self-perception of mental balance and family support

Family support	Very negative (%)	Negative (%)	Intermediate (%)	Positive (%)	Very positive (%)
Regular visits	30,30	3,03	9,10	6,06	51,51
Sporadic visits	12,50	0,00	12,50	18,75	56,25
Doesn't receive visitors	17,08	2,43	19,51	4,88	56,10

Source: the authors, 2025.

The descriptive results presented show that family support does not influence the perception of mental balance among individuals deprived of liberty, which goes against studies that identified that the absence of family ties was statistically associated with a higher incidence of depressive symptoms while family relationships acted as a protective factor for the mental health of prisoners (Bahiano; Faro; Turri, 2021). The same study also demonstrated that the presence of the family through regular visits strengthens emotionally, helping to build more stable routines (Bahiano; Faro; Turri, 2021). The family is recognized as a protective link during the period of incarceration, being the main form of social bonding and emotional support. It contributes to the construction of identity, influences behaviors and decisions, and directly impacts the way men and women face the experience of prison (Gato et.al, 2022). It is important to note, however, that even among the participants without family support, most still stated that they agreed with the perception of mental balance. This finding

may indicate the presence of individual coping mechanisms, such as spirituality, peer support, work occupations, or participation in therapeutic projects, which are recognized by the literature as protective factors in the prison context (Oliveira, 2022). Thus, the result of this research demonstrated that, for the participants, the family support present during the visits did not demonstrate a direct effect on the self-perception of the positive mental health of the inmates, contrary to the literary findings.

Table 6 shows that individuals with lower education concentrate a higher proportion of very negative perceptions of mental health. Among the illiterate, 80.0% reported a very negative perception, while among those with incomplete primary education this proportion was 61.8%. A more balanced distribution of responses was observed among participants with complete elementary education, although the positive perception is still a minority. These findings indicate a descriptive trend of worse self-perception of mental health associated with lower levels of education.

Table 6

Percentage distribution of self-perception of mental health according to schooling

Education	Very negative (%)	Negative (%)	Intermediate (%)	Positive (%)	Very positive (%)	Very negative (%)
Illiterate	80,0	0,0	0,0	0,0	20,0	100
Incomplete Elementary School	61,8	9,1	20,0	0,0	9,1	100
Complete Elementary School	50,0	10,0	20,0	10,0	10,0	100

Source: the authors, 2025.

This pattern found between schooling and mental health is widely discussed in the literature as an expression of the structural social inequalities that precede incarceration and that are intensified in the prison environment, directly affecting the way individuals perceive and cope with psychological suffering (Silva; Oliveira; Santos, 2021; Rocha et al., 2023).

In the Brazilian context, studies show that low education is associated with greater social vulnerability, less access to health information, difficulties in communicating with professionals, and limited development of coping strategies in the face of adverse situations, such as deprivation of liberty (Santos et al., 2020; Silva; Oliveira; Santos, 2021). In prison environments, these limitations can be enhanced by institutional rigidity and the scarcity of structured educational actions, contributing to a more negative perception of mental health among individuals with less education. Thus, the high concentration of very negative

perceptions among illiterate people and people with incomplete primary education evidenced in this study is supported by national surveys that describe schooling as an important social determinant of mental health in private prison.

In the international scenario, research conducted in different prison systems reinforces this association between low education and worse mental health indicators. Studies carried out with incarcerated populations in Europe and North America indicate that individuals with a lower level of education have a higher prevalence of depressive symptoms, anxiety, and psychological distress, as well as a lower perception of control over their own health (Fazel et al., 2016; Albrecht et al., 2025). These authors highlight that schooling plays a mediating role in the relationship between social exclusion, incarceration and mental illness, influencing both the recognition of suffering and the search for institutional support.

Although in this study there was a relatively more balanced distribution of responses among participants with complete elementary education, the positive perception of mental health remains a minority even in this group. This finding suggests that, although schooling has a partial protective effect, the prison context imposes significant limits on psychological well-being, regardless of educational level. In this sense, international studies indicate that incarceration, in itself, represents a risk factor for the worsening of mental health, and can partially neutralize the protective effects of schooling when there are no institutional policies for education, work, and mental health promotion adequately implemented (Who, 2022; Albrecht et al., 2025).

Thus, the result of this research, associated with findings in national and international literature, reinforces the need for intersectoral public policies that expand access to formal education and educational activities in the prison system, not only as a strategy for social reintegration, but also as an action to promote mental health. Schooling should be understood as a central element in the approach to psychological suffering in prison, articulated with other dimensions of care, such as psychosocial support, prison work and strengthening of social bonds, as recommended by national and international guidelines for health care for the population deprived of liberty (Brasil, 2014; Who, 2022).

Table 7 shows the associations between the variables age group, length of incarceration and family support, prison context and perception of mental balance, and the Chi-square statistical tests of independence and *Linear-by-Linear Association*. The tests reinforced the result of statistical non-significance, even though the descriptive data point to different trends in the variables.

Table 7

Sociodemographic variables, prison context and self-perception of mental balance, Chi-square statistical tests of independence and Linear-by-Linear Association (Linear Tendency)

Independent variable	Statistical test	Go od luc k	Statistics	P-value
Age group × Perception of mental balance	Chi-square of independence	16	$\chi^2 = 16,16$	0,442
Age group × Perception of mental balance	Linear-by-Linear Trend Association	1	$Z = -0.23$	0,817
Incarceration time × Perception of mental balance	Chi-square of independence	12	$\chi^2 = 10,02$	0,614
Incarceration time × Perception of mental balance	Linear-by-Linear Trend Association	1	$Z = -0.07$	0,946
Family support × Perception of mental balance	Chi-square of independence	8	$\chi^2 = 7,21$	0,514
Family support × Perception of mental balance	Linear-by-Linear Trend Association	1	$Z = 0.09$	0,926

Legend: GL-Degree of Freedom; χ^2 = chi-square value; Z = linear trend test statistics. A significance level of 5% ($p < 0.05$) was adopted.

Source: the authors, 2025.

Thus, the results indicate that no variable showed a statistically significant trend in isolation to mental balance. However, the prison condition of provisional situation, which indicates legal instability, showed the greatest descriptive tendency to the worst self-perception of mental balance, followed by the fragility of family support. It is noteworthy that even though the data have not been proven through statistical calculation, this result does not invalidate the research, on the contrary, it points to new perspectives for different analyses and new care strategies for the public studied.

4 CONCLUSION

In view of the results presented, we can see that access to activities and definition of the legal situation exert a relevant influence on mental health in prison; the other variables, such as family support present in the visits, were not evidenced as relevant for mental balance, as pointed out in different literatures. Thus, the understanding between the self-perception of psychic balance in prison can help in the understanding and development of psychosocial interventions aimed at this population. By considering the different variables, it is possible to envision more assertive actions that favor the mental balance of the population deprived of liberty, contributing to rehabilitation and reduction of criminal recidivism. Finally, it was noted that there are few studies on self-perception of mental health, especially in prison for sexual crimes.

ABSTRACT

This article discusses the development of a digital game aimed at children with ASD. Digital games are a strategy used in various activities to support the learning process of these children, serving as a link with a multidisciplinary and interdisciplinary team. This article focuses on developing an educational game accessible to people with autism. The objective of this article is to develop a game in Unity by integrating scriptwriting, visual art, and sound composition through programming, addressing autism, and making it usable by teachers, children, and those interested in the subject. The methodological process of this article is based on a literature review, providing a rich and well-founded reference to contribute to the game's development. Finally, a free game is presented in both desktop and web versions, along with a mobile version for Android, available on the mentioned platforms and accessible to any user.

Keywords: Autism. Digital Games. Technology. Accessibility. ASD.

RESUMO

Este artigo aborda o desenvolvimento de um jogo digital voltado para crianças com TEA. Os jogos digitais são uma estratégia utilizada como diversas atividades para o aprendizado dessas crianças, podendo ser o elo, com a equipe multidisciplinar e interdisciplinar. Este artigo pensou-se no desenvolvimento de um jogo educacional acessível às pessoas com autismo. Para este artigo, pensou-se como objetivo: desenvolver o jogo no Unity integrando, roteiro, arte visual e composição sonora através da programação, abordando o autismo e possa ser utilizada por professores, crianças e interessados no assunto. O processo metodológico deste artigo baseou-se em uma revisão literária, possibilitando um referencial rico e embasado para contribuir com o desenvolvimento do jogo. Por fim, é apresentado um

RESUMEN

Este artículo analiza el desarrollo de un juego digital dirigido a niños con TEA (Trastorno del Espectro Autista). Los juegos digitales son una estrategia utilizada en diversas actividades de aprendizaje para estos niños y pueden servir como enlace con equipos multidisciplinarios e interdisciplinarios. Este artículo se centra en el desarrollo de un juego educativo accesible para personas con autismo. El objetivo fue desarrollar el juego en Unity, integrando guiones, artes visuales y composición sonora mediante programación, abordando el autismo y haciéndolo accesible para docentes, niños y cualquier persona interesada en el tema. El proceso metodológico de este artículo se basó en una revisión bibliográfica, proporcionando una referencia rica y bien fundamentada para contribuir al desarrollo del juego. Finalmente, se presenta una versión gratuita del juego para escritorio y web, así como una versión para dispositivos móviles Android, disponible en las plataformas mencionadas y accesible para cualquier persona.

Palabras clave: Autismo. Juegos Digitales. Tecnología. Accesibilidad. TEA.

1 INTRODUCTION

A neurological condition that impacts people's development, including their social interaction, cognitive development, among others and that can come with symptoms that vary from person to person, such as difficulty in verbal and non-verbal communication, repetitive behaviors and difficulty in changing their routines, characterized by these daily challenges, autism is a global developmental disorder that is diagnosed in several children and adults. Thinking about possibilities and activities to contribute to the development of people with Autism Spectrum Disorder (ASD) is a challenge for the family and for a multidisciplinary team. It is important to note that some of these people with ASD have exceptional abilities in some specific areas. (Soares, et al, 2024).

For (Carvalho and Nunes, 2014), children with ASD often have a forgotten childhood, where interdisciplinary and multidisciplinary work is necessary, sometimes requiring more than one therapist in each meeting. Also in his work, he highlights the therapy that was based on the cognitivist developmental view, defended by researchers such as Piaget and Vygotsky and on autism scholars, such as Kenner, Bosa, Lampréia, Passerino among others with the great objective of stimulating the improvement of social interaction and language of the children served, through multidisciplinary work, involving pedagogues, psychologists, doctors, etc.

Reinforcing the proposal of (Carvalho and Nunes, 2014), the multidisciplinary team and professionals in the area of education have the challenge of proposing activities that contribute to the development and learning of autistic people, through therapy, extracurricular activities, weekly meetings and the use of technology becomes a great ally to support this process. Among the technologies that can be used, electronic games stand out, which through their interaction, entertainment and playful universe, becomes a digital alternative for this audience.

In the therapeutic and educational context, electronic games become a significant tool for autistic people. Through electronic devices, these games approach learning in an engaging and adaptive way, contributing with various skills and aspects in the development of people with ASD. Adapting games that meet the specific needs of this audience has become innovative, facilitating and contributing to their learning, in addition to creating environments that allow interaction and integration, thus favoring the practice of these skills. (Freitas, et al, 2024).

For (Freitas, et al, 2024) traditional approaches are no longer sufficient due to the use of large technologies, making electronic games effective in the development of social skills of autistic people, allowing social interactions in an adapted and controlled environment.

Depending on the games and their mechanics, it is possible to include inclusive activities involving several other people.

Also in his work, (Freitas, et al, 2024) cites (Filho, et al, 2023, p. 75), which demonstrates the power of games, citing that it is possible to have a safe virtual environment, allowing the simulation and practice of social interactions of children with ASD, increasing their engagement and interest in the proposed activities, such as interaction with the characters in the game, real-world simulation and even conflict resolution.

In the work of (Lira, et al, 2023), which he cites (Schell, 2020) brings the information that the game is closely related to the ability to solve problems, and this when intentionally removed ceases to be classified as a game and becomes an activity.

Also, according to (Schell, 2020), cited by (Lira, et al, 2021), it is possible to stimulate autistic children through the elements that make up a game, such as mechanics, story, aesthetics, and technology.

Games are already present in children's daily lives, thus enabling their development and learning. This technology has characteristics of visual dynamism, proposition of challenges, combination of rules and reward mechanisms. That is, at the same time that a digital game can serve as entertainment, it is possible to align with the teaching and learning process. (Ramos and Cruz, 2018).

Among one of the main advantages for the use of games are: cognitive skills, autonomy in decision-making. The new types of games also enable something impressive and that was highlighted in the pandemic period: contact with people in real time and virtually. In addition, it allows it to become a good educational tool, when aligned with the teacher in the classroom. (Ramos and Cruz, 2018).

In view of the above, the use of digital games in the development of social skills in children with autism has proven to be a significant alternative in the educational and therapeutic field. Autism Spectrum Disorder is characterized by difficulties in social interactions, communication, and restricted and repetitive behaviors. The implementation of digital games adapted to the needs of this population has become an innovative strategy, with the aim of facilitating the learning of essential social skills, such as empathy, communication, and conflict resolution. By integrating digital games into the educational and therapeutic context, it is possible to create interactive environments that favor the learning and practice of these skills, in addition to promoting the engagement of children with ASD in a playful and stimulating way.

This article demonstrates a digital game, working with three main aspects: the development and logic, the import of scenarios and characters and finally the script and

application of the game's sound. The proposal will serve to disseminate the theme in all schools in the country, where people can become aware of a very worrying topic among the various professionals adapted to meet the specific needs of people with autism, offering valuable opportunities for learning and development.

It is in this perspective that this work aims to align the concepts of games with a very important theme, but which is often forgotten. And the digital game can make this link, collaborating with the multidisciplinary and interdisciplinary team. Given the importance between the areas, the development of an educational game was considered, with the objective of being accessible to people with autism. The intention is for the game to be freely accessible through the internet, desktop and mobile devices, helping teachers with the educational process in a playful way.

2 THEORETICAL FRAMEWORK

Thinking about possibilities and innovative tools has been highlighted in the advancement of technology and inclusion and accessibility is no different. Specifically for people with ASD, games have become effective resources in cognitive, social, and motor development for these individuals. This chapter aims to contextualize and support the conception of a digital game aimed at children with autism. For the theoretical enrichment of this work, we highlight concepts of ASD and Digital Games, primordial subjects for this research.

2.1 AUTISM SPECTRUM DISORDER

Kanner (1943) conceived autism as a disorder of affective contact, leading to social isolation. In the 1970s and 1980s, there was a departure from Kanner's vision and autism came to be seen as due to cognitive impairment. In 1980, it was classified as a disorder that would lead to a developmental deviation and not to a delay.

ASD is defined as a neurodevelopmental disorder that results in difficulties in communication and social interaction, as well as the presence of restricted and repetitive behaviors or interests. Such core symptoms are recurrent in individuals diagnosed with ASD in varying degrees, resulting in the adoption of the term "autistic spectrum", which encompasses the heterogeneity of responses to stimuli, maintained skills and evidenced impairments (Höher; Bosa, 2009; Schwartzman, 2011).

Also, according to (PAHO/WHO, 2017), the autism process begins at early ages, up to five years of age, persisting in the adolescent phase until adulthood and there are already cases where people are identified late, only in adulthood. It is common for people with this

disorder to have problems such as epilepsy, depression, anxiety, and attention deficit hyperactivity disorder (ADHD). Also, according to PAHO/WHO | Pan American Health Organization, the autism process begins at early ages, up to five years of age, persisting in the adolescent phase until adulthood and there are already cases where people are identified late. It is common for people with this disorder to have problems such as epilepsy, depression, anxiety, and attention deficit hyperactivity disorder (ADHD). It is important to clarify, according to the same guidelines, that the intellectual development of autistic people varies at different levels.

When thinking about the development of a new technology that involves accessibility and inclusion, it is necessary to understand well the definitions that surround this theme. According to (PAHO/WHO, 2017), Autism spectrum disorder is a series of conditions that compromise people's social behavior, including communication and language, where activities become unique with repetitive actions for these people.

2.2 TECHNOLOGY, DIGITAL GAMES AND AUTISM

The child with autism may have a rigid or inflexible behavior and this can lead to problems in terms of acquiring new habits or having recreation. In this sense, (Cunha, 2012) clarifies that pedagogical activities with the objective of developing the skills of children with autism must be observed aspects such as: sensory capacity; spatial capacity; the ability to symbolize; subjectivity; language; cognition; hyperactivity; stereotypies; psychomotricity; socialization and affection. With regard to digital games, there is a growing use of these in rehabilitation and functional development services. Thus, due to the digital characteristic, which requires little physical contact, low sensory load, intermittent learning with positive reinforcement, digital games can bring more comfort and linearity to the objective proposed with use.

In, (Winnicott, 1975) presents the child's relationship with the object, which according to (Saboia, Gosmes, Viodé, Gilles, Ouss and Golse, 2017) this concept postulates the child's ability to make use of this object and how it can interfere with the traits of psychic organization. The feeling of continuity is absent in the use of objects, which is related to the way the autistic child deals with them. In this, the experience is compromised by the non-spontaneous way of using objects, since the symbolic capacity of play requires skills that need to be developed in the child with (Saboia, Gosmes, Viodé, Gilles, Ouss and Golse, 2017). The use of different technologies for learning purposes is the responsibility of the education and health professional to plan the use of these resources, with well-established guidelines and strategies, as presented (Bölte, Golan, Goodwin and Zwaigenbaum, 2010); (Sigafos, 2011);

and (Ploog, Scharf, Nelson and Brooks, 2020) the use of some tools for didactic use with a focus on innovation and good practices.

In his work, (Lira, et al, 2021), he highlights learning strategies using technology, presented by (Bölte, Golan, Goodwin and Zwaigenbaum, 2010); (Sigafos, 2011); and (Ploog, Scharf, Nelson and Brooks, 2013) the use of some tools for didactic use with a focus on innovation and good practices.

(Lira, et al, 2021) highlights that as a result of rigid and inflexible behavior, autistic children have difficulties in acquiring new habits and brings the study by Cunha [8] who manages to demonstrate the development of skills, clarifying that pedagogical activities with the objective of developing the skills of children with autism must be observed aspects, such as: the sensory, spatial capacity to symbolize; Subjectivity; Language; Cognition; Hyperactivity; Stereotypies; Psychomotricity; Socialization and Affection.

Due to its very digital characteristic, requiring little physical contact, the digital game becomes a great ally and in growing use in the most diverse learning, rehabilitation and functional development services. (Lira, et al, 2021) cites the work of (Barbosa, Artoni and Felinto, 2020), which presents an overview of educational digital games for children with autism with a focus on helping communication and literacy present in the market. This research of available games is important for this work, precisely to mark and analyze how expensive some of these games are and therefore not accessible to low-income families.

In his work, (Santos, 2022), he brings the researchers (Alves, Cathcart and Santos, 2017), highlighting that the investment in the accessible games market is still small, due to the low financial return. It also complements the complexity of developing an accessible game, since it involves several characteristics (sound, visual and cognitive).

Still, in his work, (Santos, 2022) highlights (Kettler, et al, 2018), which brings the following reflection: "making a digital environment (website, application, games) inclusive, where all functions are available to all or a large portion of people (users) is the concept of digital accessibility. Collaborating with the difficulties of users. In the environment of a game, this becomes more complex, as a result of the dynamics and differentiated usability that often involves several components for the actions of the characters, thus requiring specific customizations for each type of need."

For Salen and Zimmerman [10] the distinction between "game" and "digital game" is up to the media, particularizing the objectives, strategies and playfulness of the gameplay. The relationship between the two categories (games and digital games) is united by the feasibility of learning through an action. In the context of physical games, which involve board

games, logical reasoning, reading and writing, among others, as educational resources, they stimulate the child's sensory aspects, working on different skills and functionalities.

This section stands out for contextualizing the importance of technology as a potential in helping the development of essential skills for people with autism. Digital games represent an innovative tool and with adaptation will contribute to learning and personal development, in addition to strengthening awareness on the topic proposed here.

3 METHODOLOGICAL PATH

The methodological process begins with a bibliographic survey (scientific articles, digital games on the subject) known as a systematic review of the literature to understand the characteristics and peculiarities related to autism. Among the researches, it was concerned with teaching programs for people with ASD, learning difficulties, accessibility guidelines and related works to understand the difficulties and explore characteristics that had not yet been used. In addition, educational and cognitive activities that could contribute and support the development of the game proposed here were researched.

This process supported the proposal aimed at the development of a game and contributing to the compilation of existing evidence on the use of games and play in the development of children with Autism Spectrum Disorder (ASD). According to Gil (2002), this methodology seeks to identify, evaluate and interpret all relevant research available on a specific topic, providing an understanding of the subject researched.

The databases used for the research were: Scientific Electronic Library Online (SciELO), the Virtual Health Library (VHL) and Google Scholar, in addition to consultations to repositories of theses and dissertations. The terms used in the searches included "Autism Spectrum Disorder", "autism", "digital games", "games for autistics", "games for autistic people", "cognitive functions for ASD", among other related variations.

During the process of documentary research and research in the area of understanding autism, some documents are important to read and among these documents, the DSM-V, the Diagnostic and Statistical Manual of Mental Disorders, a document of the American Psychiatric Association that classifies and organizes the criteria related to mental disorders, is listed. With it, it is possible to find reliable materials and information about disorders, sources, rules, making it a practical, functional and flexible guide organizing information that will help in the diagnosis and collection of evidence.

It is understood that games, because they have great potential for disseminating content, entertainment and motivation, and can be a great tool for the dissemination of knowledge, have become increasingly popular and one of the most promising markets. With

all its versatility, which can be adapted, games can help in the development of motor, cognitive, social and learning skills, serving as a sensory stimulus and contributing to the imitations of each autistic person.

4 DEVELOPED GAME

This article demonstrates the development of the digital game proposed here. In the following subsections it is possible to discuss each stage of development.

4.1 CHARACTERS

Here in this subsection we highlight the characters that have been developed for the game. It is important to emphasize that all the art of the games was developed by the students who were part of the team. They were drawn freehand and later transferred to digital software. The green dinosaur is named Tino, while the blue one is Dino. The other characters are Dudinha (the one in pink) and Audism (Orange), represented in figure 1.

Figure 1

Characters: Tino, Dudinha, Dino and Audismo

Authors' Source

The art developed for this game was based on vector images formed by lines, curves and geometric shapes that have the support of mathematical equations for their definition, contributing to the scalability process, preserving the quality of the image. This is important, as it is a multiplatform proposal and responsiveness is paramount. When comparing it to another art style, such as *pixel art*, for example, it is clear that the visual style is more consistent and modern. When passing this art to the digital medium, the tools used were: Adobe Illustrator and Photoshop and Inkscape.

4.2 GAME MECHANICS

Table 1 describes the sprites developed by the team. Each sprite is used for the mechanics of the game, through the tasks and activities proposed.

Table 1

Sprites of the main characters (separately)

Authors' Source

As you can see, the sprites are organized with the body parts, in the case of Dudinha and Audismo. As for the characters Tino and Dean, they overlap another sprite for the correct combination. In this table, the eggs that are part of the first two scenes were also made available, where players need to make the correct association.

4.3 GAME MENUS

Figure 2 highlights the game menus. When you start the game, the main menu appears, and when you click enter, a second menu appears with a play or credits button. In the credits option, the developers and guidance who participated in the development of the game are listed.

4.4 THE PHASES OF THE GAME

The first stage to be presented contains a blue egg, where the player needs to drag to the correct combination. When you get it right, an image of congratulations appears and soon after the second phase appears with a degree of difficulty, because now there are 3 eggs and no longer 1. The reasoning is the same, if you hit the 3 combinations a congratulatory image appears with the message of winning. When there is an error in the combination, a simple sound is emitted demonstrating that it was wrong. Represented in figure 3.

Figure 3

Phases 1 and 2 of the Dino Game

Figure 4 presents the congratulations screen, simple and light. The balloons appear moving so that the player realizes that there is celebration for his or her hit.

Figure 4

In-game congratulations screen

Authors' Source

Figure 5 shows the main phases of the game. In the first image, it is necessary to make the correct association of Tino and Dino. After that, if the player wins, it will be possible to play the Dudinha phase that needs to hit the combination and associate the assets correctly. Finally, Audismo with the same idea as Dudinha. It features the congratulations screen, simple and light. The balloons appear moving so that the player realizes that there is celebration for his or her hit. Each phase was designed to place a support (a hand) to indicate the way and if the player got it right.

4.5 GAME PLATFORMS

Initially, the game proposed here was available on two platforms, including the desktop, available for the Windows operating system and for the *web*. But, with digital convergence and some feedback, a version for mobile devices was developed, but at the moment, only for *Android*. Below, some figures with the game available on mobile are highlighted. A demonstration can be seen in figure 6.

5 OUTCOME AND CONCLUSION

In this article, an educational game was developed that is available to students, education and health professionals and all society that wants to know. The game is aimed at autistic children, allowing them to play in different environments, including residential homes, schools, universities, among others. This game is available on platform *desktop*, *Web* and *Android*. In future versions of this game, it is intended to extend it to the mobile version of the *IOS*.

ABSTRACT

Introduction: This article presents the development of a digital game that tells the story of four Indigenous peoples, addressing the curricular guidelines related to ethnic-racial issues, including Indigenous peoples. **Objective:** The objective is to introduce a mobile game in a 3D platform. **Methodology or Steps:** The methodological process involved a literature and systematic review focused on understanding the main Indigenous groups studied: the Māori, Inuit, Tuareg, and Yanomami peoples. After completing this stage, the construction of the Game Design Document began, aiming to create a game that would reflect the research findings. **Results:** As a result, a 3D mobile game was developed, showcasing the culture of four Indigenous peoples from different parts of the world.

Keywords: Indigenous. Digital Game. Culture. Original Peoples. Interdisciplinary.

RESUMO

Introdução: Este artigo traz o desenvolvimento de um jogo digital, relatando a história de quatro povos originários indígenas, abordando as diretrizes curriculares que tratam das questões étnico raciais, incluindo os povos indígenas. **Objetivo:** O objetivo é apresentar um jogo para dispositivos móveis e em plataforma 3D. **Metodologia ou Etapas:** O processo metodológico se deu com uma revisão literária e sistemática abordando e compreendendo sobre os principais povos indígenas aqui estudados: Maori, Inuit, Tuaregues e Yanomamis. Concluindo essa etapa, iniciou-se a construção do Game Design Document para apresentar um jogo que explorasse o que foi coletado no processo de pesquisa. **Resultados:** Como resultado, apresenta-se um game, desenvolvido para dispositivos móveis, em 3D, abordando a cultura de quatro povos originários de diversos países do planeta.

1 INTRODUCTION

One of the great challenges faced by indigenous communities, quilombolas and others, without a doubt, is to keep their identity, beliefs and culture alive, making it a daily struggle to maintain this legacy. Therefore, it is important that several actions to strengthen culture are carried out to keep an entire legacy alive from generation to generation. Among one of the actions is the use of technologies and playful activities, including digital games. (Compto and Vaz, 2023).

In (Moraes, et al, 2023) present data from the Brazilian Institute of Geography and Statistics (IBGE) (Brazil, 2023), that currently the population declaring as indigenous exceeds more than 1,600,000, identifying a growth when compared to the period from 1991 to 2002, also highlighting that this number is mostly found in the north and northeast regions of Brazil and the country's ethnic groups are the Pataxós, Potiguaras, Guaranis, Tupis, Caiaganges or Cainganges, Guajajaras, Xavantes, Yanomamis, Ticunas, Macuxis and Terenas.

Also in (Moraes, et al, 2023) cites (BRASIL, 2010) bringing that in total there are more than 270 languages in the more than 300 existing ethnicities, that is, even though they have characteristics and belong to indigenous native peoples, among the communities there is still a diversity between languages, cultures and other social characteristics.

When consulting the 2022 census overview, available on the IBGE website, the exact amount available for the indigenous population is 1,694,836 total, of which 1,227,642 are indigenous color or race and 467,194 consider themselves indigenous. In the 2022 IBGE Census, the value of indigenous languages spoken is 274 per 305 ethnic groups. The names of indigenous peoples are Portugueseized and written with a lowercase initial, they stand out as indigenous peoples: Yanomamis, Carajás, Caiapós, Tupis, Cainganges, Guaranis, Uaimiris, Xavantes (Brazil, 2023).

Cited by (Moraes, et al, 2023), (Kayapó and Brito, 2014), it brings a reflection that in current times, valuing culture and customs has been a major problem faced by indigenous peoples. In addition, in the syllabus of schools and even in printed and digital materials, many misconceptions about indigenous culture are reported, including the discovery of Brazil, where there are distortions of this culture.

After so much reflection on the theme proposed here, this article believes that the teaching process is a path to the appreciation of native peoples, and can be expressed in different ways. Acknowledging the interdisciplinary and transversal process, as part of a partnership, this article comes from an integrative project carried out in each semester, which addresses themes required by the National Curriculum Guidelines for the Education of Ethnic-Racial Relations and for the Teaching of Afro-Brazilian and Indigenous History and

Culture (Law No. 11,645 of 03/10/2008; Resolution CNE/CP No. 01 of June 17, 2004), whose contents are worked on in curricular components that already have the objective of acclimatizing the student with the history of Brazil, in order to encourage the creation of games with national themes, involving plurality and the appreciation of Bahian and Brazilian cultures. (Sales, et al, 2024).

The Education of Ethnic-Racial Relations and Afro-Brazilian, African and Indigenous History and Culture has as its legal basis Law No. 9394/1996, as amended by Laws No. 10,639/2003 and No. 11,645/2008, and Resolution CNE/CP No. 1/2004, being based on Opinion CNE/CP No. 3/2004, which establishes: §1 Higher Education Institutions shall include in the contents of disciplines and curricular activities of the courses that teach the Education of Ethnic-Racial Relations, as well as the treatment of issues and themes that concern Afro-descendants, under the terms explained in Opinion CNE/CP 3/2004. (CNE/CP Resolution No. 1/2004). (Sales, et al, 2024).

The legal basis presented places the ethnic-racial issue on the national agenda and reinforces the importance of debating in undergraduate courses the recognition and appreciation of the history, culture and identity of indigenous peoples and African descendants, in an education that encourages the student to develop values, habits and behaviors that respect the differences and characteristics of groups and minorities, and that in their future professional practice will allow them to seek the correction of racial and social inequalities through changes in discourses, reasoning, logic, gestures and postures, developing practices that repudiate prejudice and discrimination. (Sales, et al, 2024).

In the digital age, thinking about working with technology as an ally is a valid pedagogical strategy, becoming one of the actions to strengthen the culture of native and indigenous peoples. Among the existing technologies, games have stood out for their playful and entertaining role, contributing to learning and in a fun way. The case study, presented by (Compto & Vaz, 2023), observes that students from an indigenous municipal school are unaware of the culture of the indigenous Kokama people, an ethnic group that is part of the same region as the school, but unknown to them. So, one of the strategies used by the research is the use of games to strengthen the Kokama indigenous culture so that the students of this school recognize and value the local culture.

Considering the importance of the ethnic-racial issue addressing indigenous culture, the game developed here embarked on an adventure that will unite indigenous peoples from different parts of the world, thus demonstrating that despite having characteristics in common, each territory has its culture, way of eating, its own climate, demonstrating how necessary it is to preserve the culture and customs of the original peoples.

In Navegantes, players embark on an epic journey through a vast open world, exploring territories inspired by four indigenous cultures: the Maori, the Yanomamis, the Tuaregs, and the Inuits. As a mysterious traveler, the player must cross oceans, dense forests, deserts, and icy lands to help these communities restore lost cultural ties. In each region, unique challenges reflect the reality and customs of these peoples, requiring exploration, puzzle-solving, and collaboration to rebuild harmony among civilizations.

The game developed here is available on the 3D platform and *Mobile (Android)* and in addition to the *singleplayer* For the game's campaign mode, the *multiplayer*.

2 THEORETICAL FOUNDATION

This section brings all the foundation and theoretical study, fundamental for the development of the game presented. Knowing each people, custom and culture undoubtedly contributed to the narrative and plot of this proposal.

With a stylized art style and cooperative gameplay, Navegantes highlights the importance of cultural diversity and collaboration to overcome challenges. Each culture brings not only new mechanics and quests, but also rich stories passed down by its elders. By connecting these peoples and rekindling forgotten traditions, the player becomes a true messenger of unity, reflecting on the need to preserve and respect the cultural heritage of indigenous nations around the world. And this knowledge was only possible with a lot of study and search for references for the original peoples mentioned here.

The Maori, inhabitants of the Pacific islands, teach the player the importance of connecting with the ocean, leading challenges based on navigation, canoeing and haka war rituals. In the territories of the Yanomamis, within the Amazon, the player must learn to live with the forest, using traditional knowledge of hunting, gathering and healing with medicinal plants. Once in the Sahara desert, the Tuareg share their wisdom about survival in extreme conditions, involving the player in dune orientation mechanics and nomadic trade. Finally, in the frigid lands of the Inuit, ice fishing, seal hunting, and igloo building become essential skills to face the hostile climate and understand the Inuit's way of life.

In the subsections, we highlight each original people studied.

2.1 ORIGINAL PEOPLE: MAORI

Originally from New Zealand, also known as indigenous people of the land. They are Polynesians, comprising 14% of the country's population. The native language of this people is Maoritanga, which is related to Tahitian and Hawaiian. According to history, it was in the period from the 9th to the 13th century AD that the Maori people of New Zealand migrated to

Polynesia. They inhabited the lands long before the British colonizers. In the year 1980, Maori culture was accepted, respecting traditions, language and history. But a feature that draws attention today is the dance of the warriors. (Bombonato & Xavier, 2021) (Walker, 1997).

2.2 ORIGINAL PEOPLE: YANOMAMI

Living between the Amazon and Orinoco basins, in a region full of mountains and with a unique tropical forest, the Yanomami people are located between the states of Brazil: Roraima and Amazonas and southeastern Venezuela. However, the territory belonging to Brazil is the majority (Lobo & Cardoso, 2023).

The region where this people lived together for many centuries contributed to the distancing of indigenous people from non-indigenous people, precisely because of its relief full of mountains. At the beginning of the twentieth century, the relationship between them began to be possible. (Toledo, et al, 2023). Despite the distance, these people stand out as people of good humor and with great territorial mobility. (Ramos, 2008).

For (Lobo and Cardoso, 2023), which he cites (Ferreira, et al, 2019), this people is subdivided into the following six subgroups: Sanöma, Ninam, Yanonami, Yaroamë, Yãnoma and Yanomam, sharing a cultural and linguistic unity.

In his work, (Lobo and Cardoso, 2023) cites The Lancet (2019):

They live in small villages and move for various reasons: hunting and management of natural resources and gardens; divisions of groups for political or family reasons; visits to strengthen ties and exchanges between groups; participation in ceremonies and rituals. The presence of religious missions, posts of the National Indian Foundation (FUNAI) and platoons of the Brazilian Army (military project of occupation and integration Calha Norte, 1985) interfere with this logic, exerting a centripetal force of population concentration around their installations. Illegal mining, roads and invasions in its territory have explosive magnitude: they drive away, attract, destroy, decimate. This has happened, with fluctuating intensity, over the last few decades, producing an enormous impact on Yanomami life, health, and society. However, in the last four years, it has acquired the contours of genocide, by deliberate government omission and encouragement of illegal activities The Lancet. (2019).

2.3 ORIGINAL PEOPLE: TUAREG

People living in North Africa, originating from the Sahara to Mali, encompassing Niger, Algeria, Libya and extending from the Sahara to Mali, Niger, Algeria, Libya and Burkina Faso. Its language is Berber and Tamasheq. Regarding the population, in the Mali region, there are more numbers in Kidal, which is in the northeast of the country, while in Niger, the population is estimated at 2 million people. In Lebanese territory, they live in the extreme southwest, in

Algeria in the south, in Nigeria in the extreme north of the country and Burkina Faso, the Tuareg live in the country. (Rasmussen, 2010).

Known as semi-nomads, they stand out for their physique and Arab influences and origins from the south of the Sahara. They are practitioners of the Sunni Islamic religion with very traditional beliefs. Another point that stands out are the camels used by them, known as meharis, a fast and resistant breed. (Rasmussen, 2010).

2.4 ORIGINAL PEOPLE: INUIT

Cited by (Silva, 2020), (CLOUTIER, 2005, p. 05) reports that these people live in colder and more extreme regions, so it is necessary to think about habits and logistics to live in an ice region. They inhabit Greenland, Russia, the United States and Canada and activities such as hunting and fishing are highlights in this people.

In his work (ROSA, 2011, p. 111), cited by (Silva, 2020), he estimates that until the year 2004 in Arctic reserves the housing population was 100 thousand. The supply of fat and protein is linked to whaling, through the hunting practices already mentioned in the previous paragraph. The religion of this people is shamanism. Including people from all parts of the world, it is estimated that there are approximately 180,000 Inuit people. Para (PINTO, 2018, p. 14), also cited by (Silva, 2020), presents a petition informing that this people is endangered, with the contribution and collaboration of the United States with predatory actions, thus contributing to environmental imbalance. Among the environmental actions are: environmental neglect, lack of mobilization, lack of actions to mitigate climate ills and actions that protect the Inuit people. (Silva, 2020). Next section, we move on to the developed game.

3 THE DEVELOPED GAME AND METHODOLOGICAL PATH

Before talking about the game developed, this project was based on the same methodological path, brought by (Rios, et al, 2022), classifying this work as a literature review process of an exploratory nature, with the objective of developing a digital game. The platform developed was for mobile, *singleplayer* and *multiplayer* devices, enabling users/players to entertain, learning and understanding all the culture related to the various indigenous indigenous peoples. Of the steps presented in the work by (Rios, et al, 2022), the only step not carried out was the field visit. Still in the methodological process, starting with the GDD (Game Design Document) was fundamental so that the plot and narrative could be developed, so that the construction of characters, scenarios, mechanics, could become reality.

Navegantes is an open-world adventure game that explores cultural diversity and the union between peoples. In the role of Wendel, an orphan raised by travelers on Cultural Island, the player navigates continents inspired by unique cultures, helping communities to reestablish lost ties, must navigate the seas, help isolated communities reestablish ties and seek the truth about the separation of the islands. With a stylized look and cooperative gameplay, the game highlights the importance of cultural connections and collaboration in a divided world. Players are invited to explore and connect culturally rich islands, which have lost touch over time, emphasizing cultural diversity, collaboration, and valuing differences through interactive quests and celebratory events.

The main scenarios are: Cultural Island, a neutral and commercial point, where travelers gather; Maori island, land of navigators, faces a problem with aggressive Kakapos birds; Tuareg Island, a desert inhabited by nomadic traders and finally Yanomami Island, a tropical forest with deep knowledge of nature.

3.1 GAME CHARACTERS

In this section the characters of the game will be demonstrated, the first is Wendell, a young man who grew up on Cultural Island, a port for travelers located in the middle of the ocean. Abandoned as a child, it was created by several navigators and merchants who passed through the island. Always immersed in stories about the outside world, he dreamed of exploring the four territories and discovering more about the mystery of the separation of the continents. Departing from the Cultural Island, you will get to know each of the four imaginary peoples, learning from them and developing your own identity as navigators and conflict mediators. It is represented in Figure 1.

Figure 1

Physical characteristics of the character

	Pele: Pardo
	Cabelo: Castanho
	Olhos: xxx
	Face: Quadrática
	Expressões faciais: E
	Trajes: Veste roupas leves de navegante

Source: From the authors

The Cultural Island stands out for being a meeting point for travelers from all over the world. Wendell grew up hearing stories about the unified continent's past and developed a

strong desire to understand its division. Being an orphan, he was raised collectively by the travelers of the Cultural Island, having a strong bond with the merchants, fishermen and storytellers who helped him grow up, spending his childhood helping travelers, observing trade exchanges and learning about navigation. An ancient merchant named Omar and a Maori navigator named Hina, helped create it. Curious and determined, but also realistic about the challenges of the outside world, he always sought to find a peaceful way to solve problems. Its main task is to understand the reason for the separation of the continents and to find a way to unite peoples again. The next characters, represented in figure 2, are the *NPCs* (*non-playable character*) of Maori territory. They are a warrior and spiritual people, deeply connected to the ocean and the traditions of their ancestors. Tattooing and dancing are ways to tell your stories and keep your identity alive.

Figure 2

Physical characteristics of the Maori and the Yanomami

Visual	Idade: 10 - 80	Visual	Idade: 10 - 70

	Outras/Especiais: Uso de adornos como pulseiras e tornozeleiras		Outras/Especiais: Uso de adornos como colares e pulseiras

Source: From the authors

With the arrival of Wendell, the Maori will further strengthen their connection to the ocean by passing on their navigational techniques. Living in coastal villages or islands, they are structured in the Whānau community (extended family), where everyone protects each other, known as navigators, warriors and masters in the art of tattooing. Alongside the Maori, we have the *NPCs* from the Yanomami territory, who live in the dense Amazon forest, organized in longhouses, maintain a deep connection with nature, believing in the spirits of the forest to guide and protect them. It lives from hunting, fishing and sustainable agriculture and needs to protect the forest and maintain the spiritual balance between human beings and the spirits of nature. Living in cooperative groups, where the sharing of resources and the wisdom of the elders are essential. Healers and shamans serve as spirit guides and protectors of the forest. Each member has a strong connection to the community and the spirits and communicates through stories, chants, and shamanic rituals. The next characters are the *NPCs* of Tuareg territory. The Tuareg are the "blue men of the desert," known for their

indigo robes and their uncanny ability to navigate the Sahara. They are nomads who respect the secrets of the dunes and know the paths of the stars like few others.

Figure 3

Physical characteristics of the Tuareg and Inuit

Visual	Idade: 10 - 70	Visual	Idade: 10 - 65

Source: From the authors

The characters constantly move in caravans. They are family members who travel together, sharing stories and teachings. Made up of merchants, guides, warriors and storytellers, their dromedaries and the stars that guide them through the desert. Alongside the Tuareg, the characters stand out *NPCs* Inuit territory. They are a resilient people who live in the icy lands of the Arctic. They possess a deep knowledge of snow and ice, hunting and fishing to survive. The connection with the spirits of the Northern Lights and respect for animals are fundamental in their culture. They seek to keep their traditions alive while facing climate change that threatens their way of life. In small communities isolated on the ice, living from hunting and fishing. The family is united, sharing food and shelter in the midst of the cold. They are hunters, fishermen, igloo builders and spiritual shamans and have their sled dogs.

3.2 CHALLENGES AND GAME PHASES

The Cultural Island (figure 4) is a lush tropical island, with beaches, wooden villas, trading areas and a small port, it is surrounded by calm waters and full of diverse vegetation. Wendel, an orphan raised on Cultural Island, decides to start his journey when he turns 15, it is on this island that he learns the basic mechanics and hears stories that inspire his journey. More than 100 years ago, peoples lived together on a single continent, however, disunity awakened a mysterious force that made the tectonic plates move, separating them into isolated islands, with the exception of the Cultural Island, where differences are set aside in the name of peace and trade.

Figure 4

Cultural island image

Source: From the authors

The player receives a briefing of the main quest: explore the cultural island, learn basic skills, and prepare the raft for the journey. Among the activities are: learning basic navigation skills and interacting with NPCs (non-playable character), non-playable players, to obtain information. After completing these missions, the player prepares to leave Cultural Island, heading for Maori Island.

Figure 5

Maori Island

Source: From the authors

Maori Island (figure 5) is made up of several mountainous islands with coastal villages, agricultural areas, and ceremonial sites. The main village is where the Maori leader resides. The forests where the Kakapos live and where research must be conducted and the area of the ancestral tree is the climbable location of the mission. Wendel is informed about the problem with the Kakapos and the need to gain the trust of the Maori leader.

Figure 6

Kakapos Revolt Mission

Source: From the authors

After resolving the problem with the Kakapos, the Maori leader thanks Wendel and offers his support. Wendel prepares for his next adventure on Tuareg Island.

Figure 7

Tuareg Island

Source: From the authors

The Tuareg Island is formed by a Great desert with scattered oases and villages in regions with greater vegetation. A large river that cuts the island into three pieces of land, inhabited by animals and a small village under attack from Caracals, where the Caracals must be driven out of the small village. Wendel is informed about the problem with the Caracals and the need to gain the trust of the Tuareg leader.

3.3 SINGLEPLAYER AND MULTIPLAYER

In the *singleplayer campaign*, the player takes on the role of Wendel and embarks on a non-linear narrative, having the freedom to explore other islands, discovering the universe of Navegantes at their own pace. Your mission is to unravel the mysteries of this world and reconnect the tribes. For *multiplayer* mode, 2 to 4 players start on a platform that slowly descends to the sea. In a competitive environment, the most agile player stands out as the survivor, while everyone faces off against a hungry shark that roams the playing area. In addition, items that appear on the stones provide brief moments of relief.

Figure 8

Multiplayer Stage and Shark Enemies

Source: From the authors

Among the technologies and tools used are: for modeling, the *Blender*, for the animation, the *Blender*, *Mixamo* and the *Unity*, the programming to *Unity engine*, for making arts, menus, etc. *Inkscape* and the sound *Pixabay*.

4 CONCLUSION

This article presented the result of a digital game based on iconographic research and specific cultural references of each people portrayed, ensuring respect and visual authenticity.

The characters, creatures, and objects in the game were developed using the software *Blender*, focusing on 3D modeling in the style *Low Poly*. This aesthetic approach not only ensures a stylized and artistic look but also contributes significantly to performance on mobile devices, keeping the game lightweight and accessible to a wider user base.

The animal animations were developed directly in the *Blender* using systems of *rigging* com, allowing the creation of realistic movements such as running, jumping, swimming and interacting with the environment. Animal behavior was adjusted according to the biome (forest, ice, desert, ocean), with specific movements for each context. The multiplayer mode was implemented using the Photon Engine, a robust framework for online games in *Unity*. It allows matches of 2 to 4 players in real time, with efficient synchronization of states and low bandwidth consumption.

The sounds and soundtracks have been carefully selected from Pixabay, ensuring the use of copyright-free materials. The sound curatorship considered the specific settings of each biome represented in the game, resulting in compositions that follow the cultural identity of each region.

For Yanomami Island, forest sounds were used, with bird songs and the flow of rivers; On the Inuit island, crackling ice, biting winds, and distant howls were introduced; On the Maori island, the waves of the sea, the sound of oars and traditional haka rituals stand out; The Tuareg island is set with sandstorms, camel bells and percussive instruments typical of the desert.

Finally, this article developed a digital game for mobile devices, in 3D, exploring the history of different indigenous peoples, with ethnicities, geographic location and cultures totally diverse in other countries of the continent. This game can be used for history and geography classes and for the dissemination of knowledge of various people during classes, pedagogical activities.

ABSTRACT

This study aims to compare microscopic changes in the periodontal ligament (PDL) thickness with macroscopic tooth displacement in a rat model of orthodontic tooth movement. Seventy rats were divided into two experimental groups (GI and GII, N = 30 each) and a control group (GC, N = 10). GI received continuous orthodontic force with a coil spring appliance (50 cN), while GII received interrupted forces, applied in four-day cycles. The experimental groups were randomly subdivided (N = 10 per subgroup), and euthanized on days 8, 16, and 24 post-appliance installation. The distance between the distal face of the last molar and the mesial face of the first molar was measured to assess macroscopic displacement, calculated by subtracting the measurements of the unmoved side. PDL thickness was measured microscopically, and thickness changes (TC) were calculated by subtracting the mean PDL thickness of the control group. Pearson correlation analysis revealed a strong positive

correlation between PDL TC and tooth displacement across all time points ($r > 0.83$). No significant differences in macroscopic displacement were observed between GI and GII at any time point ($p > 0.05$), however, the PDL TCs were significantly smaller in GI at all time points ($p < 0.02$), suggesting faster bone formation in this group. Microscopic changes in PDL TC correlated strongly with macroscopic tooth displacement in our rat model. Bone formation was achieved faster in the continuous force group compared to the interrupted force group while the final tooth displacement was similar.

RESUMO

Este estudo teve como objetivo comparar as alterações microscópicas na espessura do ligamento periodontal (LP) com o deslocamento dentário macroscópico em um modelo de movimentação ortodôntica em ratos. Setenta ratos foram divididos em dois grupos experimentais (GI e GII, $N = 30$ cada) e um grupo controle (GC, $N = 10$). O GI recebeu força ortodôntica contínua por meio de um dispositivo com mola helicoidal (50 cN), enquanto o GII recebeu forças interrompidas, aplicadas em ciclos de quatro dias. Os grupos experimentais foram randomicamente subdivididos ($N = 10$ por subgrupo) e eutanasiados nos dias 8, 16 e 24 após a instalação do aparelho. A distância entre a face distal do último molar e a face mesial do primeiro molar foi medida para avaliar o deslocamento macroscópico, calculado pela subtração das medidas do lado não movimentado. A espessura do LP foi mensurada microscopicamente, e as alterações de espessura (AE) foram calculadas pela subtração da espessura média do LP do grupo controle. A análise de correlação de Pearson revelou forte correlação positiva entre as AE do LP e o deslocamento dentário em todos os tempos avaliados ($r > 0,83$). Não foram observadas diferenças significativas no deslocamento macroscópico entre GI e GII em nenhum tempo avaliado ($p > 0,05$); entretanto, as AE do LP foram significativamente menores no GI em todos os tempos ($p < 0,02$), sugerindo formação óssea mais rápida nesse grupo. As alterações microscópicas na espessura do LP apresentaram forte correlação com o deslocamento dentário macroscópico no modelo experimental em ratos. A formação óssea ocorreu mais rapidamente no grupo de força contínua em comparação ao grupo de força interrompida, embora o deslocamento dentário final tenha sido semelhante.

RESUMEN

Este estudio tuvo como objetivo comparar los cambios microscópicos en el grosor del ligamento periodontal (LP) con el desplazamiento dentario macroscópico en un modelo de movimiento ortodóncico en ratas. Setenta ratas se dividieron en dos grupos experimentales (GI y GII, $N = 30$ cada uno) y un grupo control (GC, $N = 10$). El GI recibió fuerza ortodóncica continua mediante un dispositivo con resorte helicoidal (50 cN), mientras que el GII recibió fuerzas interrumpidas, aplicadas en ciclos de cuatro días. Los grupos experimentales fueron subdivididos aleatoriamente ($N = 10$ por subgrupo) y sacrificados los días 8, 16 y 24 después de la instalación del aparato. La distancia entre la cara distal del último molar y la cara mesial del primer molar se midió para evaluar el desplazamiento macroscópico, calculado mediante la sustracción de las mediciones del lado no movilizado. El grosor del LP se midió microscópicamente, y los cambios de grosor (CG) se calcularon restando el grosor medio del LP del grupo control. El análisis de correlación de Pearson reveló una fuerte correlación positiva entre los CG del LP y el desplazamiento dentario en todos los tiempos evaluados ($r > 0,83$). No se observaron diferencias significativas en el desplazamiento macroscópico entre GI y GII en ningún momento ($p > 0,05$); sin embargo, los CG del LP fueron significativamente

menores en el GI en todos los tiempos ($p < 0,02$), lo que sugiere una formación ósea más rápida en este grupo. Los cambios microscópicos en el grosor del LP se correlacionaron fuertemente con el desplazamiento dentario macroscópico en el modelo experimental en ratas. La formación ósea se logró más rápidamente en el grupo de fuerza continua en comparación con el grupo de fuerza interrumpida, mientras que el desplazamiento dentario final fue similar.

1 INTRODUCTION

Orthodontic planning aims to set therapeutic goals for achieving the best relationship between the dental arches and the cranio-mandibular complex. This should result in the desired normocclusion, which, when properly maintained, supports inter-arch stability and enhances facial aesthetics.¹ In vivo experiments are crucial for orthodontic planning, providing information on relationship between applied forces and tissue remodeling. In recent years, rats have become the animal of choice for these in vivo experiments due to their relatively inexpensive housing, simple histological preparation methods, availability of antibodies for molecular studies, and relatively large size (compared to mice) allowing easy application of appliance.^{2,3}

Measuring tooth movement in rat models have proven to be challenging, with many studies inappropriately reporting their measurement technique, not defining reproducible landmarks, or using two-dimensional radiological techniques that have the disadvantage of object superimposition.³

Microscopic evaluation of periodontal ligament (PDL) thickness is a proposed measurement technique for tooth movement.⁴ This technique, has the advantage of providing extra information on histomechanical properties of moved tooth, allowing researchers to assess histology and its relationship with tissue remodeling. Microscopic evaluation of tooth movement can also potentially allow concomitant studying of medications, systemic and local clinical conditions, and types of forces and movements. To this end, we designed this study to find relationship between macroscopic and microscopic measurements of tooth movement, through defining reproducible landmarks for both techniques allowing future researchers to apply both methods in their studies of orthodontic tooth movement (OTM). The main aim of this study was to assess correlation between microscopic measurement of PDL thickness change with macroscopic measurement of tooth displacement in a rat experimental model.

As the secondary aims, we compare interrupted force OTM to uninterrupted continuous force OTM in terms of final macroscopic displacement and microscopic PDL thickness changes. Furthermore, we assess whether displaced teeth revert to their original location following removal of the appliance.

2 METHODOLOGY

This study was designed as an experimental research project and conducted at the XXX. The project was approved by the Animal Experimentation Ethics Committee (CEEA) of the XXX under protocol no. 2008-004460 in accordance with XXX. Seventy male Wistar rats (*Rattus norvegicus*, albinos) weighing between 250 and 350g and approximately 90 days old

were used. The animals, obtained from the XXX, were housed in groups of five per cage and fed granulated chow (XXX) with water provided ad libitum.

The models were divided into Experimental Groups (GI and GII) and a Control Group (GC). All animals in GI and GII had an appliance for inducing tooth movement installed between the upper incisors and the upper right first molar. GI consisted of 30 animals, subjected to continuous forces, and further divided into three subgroups of ten animals each. After the initiation of induced tooth movement, the animals were euthanized at the experimental time points of eight, 16, and 24 days.

GII included the same number of animals as in GI and their respective subgroups, but they were subjected to interrupted continuous forces at the experimental time points of eight, 16, and 24 days. The forces were interrupted by loosening the ligature attached to the incisors, without removing the springs, for a period of four days after their application for the same duration. The animals were euthanized after completing eight days, and those in the 16 and 24-day subgroups repeated the same cycles of interruption and reactivation until completing the experimental period from the onset of induced tooth movement.

Control Group (GC): This group consisted of ten animals that were not subjected to induced tooth movement. The right hemimaxillae of these animals underwent histotechnical processing.

In this research, the tooth movement-inducing appliance developed by Heller and Nanda⁵ was used. The appliance consisted of a three-millimeter closed-coil spring that released 50 cN of force (Sentalloy, COIL SPRINGS model 10-000-25, manufactured by GAC International - Japan), batch numbers A348, A447, A476, A398. The use of these springs for retraction allowed for the verification of continuous force and its interruption.⁶⁻⁹ To enhance the retention of the device and prevent potential displacement, 0.25 mm diameter ligature wires (Morelli, Sorocaba, SP - Brazil), tied to the incisors, were coated with light-curing resin Opallis (FGM Produtos Odontológicos, Joinville, Santa Catarina - Brazil).

During the installation and maintenance of the mechanical device, a mixture of the muscle relaxant Xylazine Hydrochloride (Dopaser) at a dose of 0.03 ml/100 g of body weight and the anesthetic Ketamine Hydrochloride (Vetaset) at a dose of 0.07 ml/100 g of body weight was administered intramuscularly. This combination provided approximately two hours of analgesia, sufficient to safely install the devices while preventing any signs of pain or anxiety in the animals. Analgesia was repeated in Group GII during the periods of force interruption (loosening of the incisor ligatures) as well as during their reactivation.

To acclimate and maintain the subjects prior to experimental procedures, the animals were housed in cages for seven days under a 12/12-hour light cycle and constant

temperature. After completing the adaptation period, the animals assigned to Experimental Groups GI and GII were prepared in advance of the procedures. After weighing, they received appropriate doses of analgesics and relaxants, and were monitored to assess the effectiveness of the administered treatments. Only after confirming efficacy did the installation of the devices begin.

Prior to installation, the terminal rods of the springs were trimmed using a high-speed diamond drill (KG Sorensen 3113F), reducing their length so that they could be properly stretched within the space between the incisors and the upper right first molar, thus allowing effective activation. Using ligatures to attach the springs to the molars, the springs were stretched after secure fixation by tying the other end to the incisors.

To prevent displacements and/or fractures of the appliances during the experimental periods and avoid exclusion of any animal, two preventive measures were established: A. immediately after appliance installation, the lower incisors were reduced by approximately one mm using a high-speed diamond drill (KG Sorensen 3113F) to prevent trauma during mastication; B. granular feed was provided as the regular diet for maintaining the animals, intentionally starting from the acclimatization period. With these precautions, the animals were observed every four days, and the correct positioning of the appliances was checked, with any necessary repositioning carried out as needed.

After completing the experimental periods of eight, 16, and 24 days in GI and GII, the animals were euthanized using a muscle relaxant (Xylazine Hydrochloride 0.03 ml/100 g body weight) and twice the anesthetic dose (Ketamine Hydrochloride 0.14 ml/100 g body weight). Subsequent steps included decapitation and dissection to remove soft tissues, collecting the experimental hemimaxilla with preservation limited to the molar regions. Prior to sectioning the specimens, three observers took two measurements of the maxilla to quantitatively assess the macroscopic movement achieved on the experimental sides and the control side, using a Mitutoyo Absolute Digimatic digital caliper model CD-6"CSX-B (Mitutoyo Sul Americana Ltda., Suzano - SP - Brazil).

To standardize the measurement procedure among examiners, the maxilla was placed on the surgical field, on a clinical table, and under the illumination of a dental reflector. Examiners used a loupe (Intex Brasil), providing 3.5x magnification, and positioned the caliper on the specimen with the tips placed on the most cervical regions of the distal face of the last molar and the mesial face of the first molar. Data were collected from both the moved and unmoved sides.

The displacement quantity after dental movement was obtained using the method of Gameiro et al. (2008),¹⁰ measured as the difference between the moved and unmoved sides. These measurements were collected by three examiners and an average was calculated.

Dissection of the hemimaxilla was restricted and standardized to the region of the first molar to prevent adjacent tissue excess from affecting the demineralization rate, ensuring morphological preservation of the tissues and a good technical outcome. The specimens to be fixed were labeled and stored in cassettes, and immersed in a 10% formalin solution (v/v) (4 g of monosodium phosphate, 6.5 g of disodium phosphate, 900 ml of distilled water, 100 ml of formalin p.a.), in a quantity twenty times greater than their volumes, for 48 hours. At the end of fixation, the specimens were washed in running water for 24 hours and then decalcified in a 5% Disodium Ethylenediaminetetraacetate (EDTA) solution for six weeks, followed by another 24-hour wash in running water.

Following decalcification, dehydration was performed followed by embedding the specimens in paraffin blocks. These blocks were then sectioned using a Leitz microtome (Germany). The sections were carefully positioned and cutting began with constant observation from the removal of the first ribbons to ensure the most parallel alignment possible to the occlusal face. Sections were cut until a ribbon containing the beginning of the interradicular septum was obtained, where the presence of the five well-defined and separated roots was observed. Serial sections, 6 µm in thickness, of the upper right first molar were collected in sets of five, starting from the first section where clear separation of the roots was evident. Subsequently, the five ribbons were properly positioned on slides, ensuring the correct sequence of the cuts, and were stained with Harris hematoxylin and Lison eosin.

Images of the tissue sections were captured using a Canon PowerShot A 640 digital camera, with a ten-megapixel resolution, attached to a Carl Zeiss Axiophot binocular optical microscope (Germany) equipped with a 2.5x / 0.075 objective (for panoramic viewing) and properly calibrated. The focus was primarily on the intermediate vestibular root and mesial root for histometric analysis. Measurements were recorded and stored on a computer using AxioVision 4.6 software (Carl Zeiss, Germany) for future analysis.

The histological sections were digitized to outline and delineate variations in the thickness of the periodontal ligament in the traction (distal) region of the intermediate vestibular root. This region was chosen due to its smaller volume and distance from potential inflammatory areas (distal region of the distal root and mesial region of the mesial root), which might have been affected by the trauma from the ligature wire. Reference lines and points used to measure the periodontal ligament thickness in the intermediate vestibular root were established starting from the mesial root.

Line 1: The greatest mesiodistal length of the pulp canal lumen (mesial root).

Point 1 : Perpendicular to Line 1, at its midpoint, is Point 1.

Line 2: The greatest mesiodistal length of the pulp canal lumen (intermediate vestibular root).

Point 2: Perpendicular to Line 2, at its midpoint, is Point 2.

The measurement of the periodontal ligament, captured by AxioVision 4.6 software (Carl Zeiss, Germany), which determined the thickness of the periodontal ligament, was obtained by extending the line connecting Point 1 to Point 2 until it reached the alveolar bone in the distal portion of the intermediate vestibular root (Figure 1A-B). The measurement was taken along this line, recording the distance between the cementum of the intermediate vestibular root and the alveolar bone.

Figure 1

Measurement of periodontal ligament thickness. (A) The union of points 1 and 2, and their extension, determine the line to measure the thickness of the periodontal ligament. (B) Line drawn from point 1, passing through point 2, measuring the thickness of the periodontal ligament over its extension (cementum of the intermediovestibular root to the hard lamina of the alveolar bone distal portion of the intermediovestibular root). Staining - HE, objective - 4 times. Arrow shows the direction of the force

2.1 STATISTICAL ANALYSIS

PDL thickness change (TC) was calculated by subtracting the PDL thickness of the experimental animal from the mean PDL thickness of control animals. Displacement was calculated macroscopically by subtracting the moved side measurement from the unmoved side.

The data tables display the means and standard deviations (SD) of periodontal ligament thickness for each group (GI, GII, and Control) at eight, 16, and 24 days. Intra-group comparisons were made for the 8, 16, and 24-day periods, while inter-group comparisons

between GI and GII at the same time points were performed using the Student's t-test and confirmed by Tukey's test. The correlation between micrometric and macrometric measurements was assessed using the Pearson Correlation Coefficient.

3 RESULTS

From a tissue volume perspective, the periodontal space during induced dental movement was increased compared to the Control Group (Figure 2) at all three time points in both experimental groups.

Figure 2

Increased periodontal space in the experimental groups. (A) Regular periodontal space of approximately 0.12 - 0.16 mm for the Control Group.¹¹ (B) Increased periodontal space in the distal portion in the Experimental Group (HE staining, objective - 2.5 times). (arrow in the distomesial direction)

Table 1 shows measurements of PDL thickness, its change from control, and macroscopic displacement at each time point. Both groups showed increased PDL thickness on day eight. In GI, however, mean TC was negative on day 16 and close to zero on day 24. Table 2 shows the t-test results of within group comparison between time points. PDL TC on day eight was significantly different from day 16 ($p = 0.004$) but not from day 24 ($p = 0.27$). In the interrupted group, mean TC $\pm$ SD was lower on day 16 (38.12 ± 20.71) and day 24 (44.53 ± 10.76) compared to day eight ($p = 0.003$ and 0.008 respectively, Table 2). Macroscopically, the highest displacement was measured on day 24 in both GI and GII. T-test showed that between GI and GII, the amount of macroscopic displacement was not significantly different at any time point ($p = 0.23$, 0.52 , and 0.16 for days eight, 16, and 24, respectively), while PDL TC was significantly different ($p < 0.05$ for all time points).

Table 1 shows the correlation between macroscopic displacement and microscopic PDL TC at each time point. On both groups there were strong positive correlation between the two calculations.

Table 1

Measurements, displacements, and correlation between microscopic and macroscopic calculations in rat experimental model of induced tooth movement

		Microscopic measurement (PDL thickness, μm)		Macroscopic measurement (distance*, mm)			Correlation# (r)
	Day	Mean $\pm$ SD	PDL TC, mean $\pm$ SD	Moved side, mean $\pm$ SD	Unmoved side, mean $\pm$ SD	Displacement, mean $\pm$ SD	
GI	8	154.69 $\pm$ 38.89	25.58 $\pm$ 26.28	7.20 $\pm$ 0.13	6.95 $\pm$ 0.12	0.25 $\pm$ 0.10	0.83
	16	127.02 $\pm$ 39.16	-2.09 $\pm$ 26.73	7.31 $\pm$ 0.12	7.00 $\pm$ 0.12	0.31 $\pm$ 0.12	0.95
	24	132.90 $\pm$ 53.86	3.79 $\pm$ 39.56	7.49 $\pm$ 0.13	7.09 $\pm$ 0.13	0.40 $\pm$ 0.13	0.92
GII	8	204.41 $\pm$ 36.15	75.30 $\pm$ 25.36	7.13 $\pm$ 0.07	6.93 $\pm$ 0.10	0.20 $\pm$ 0.08	0.82
	16	167.23 $\pm$ 31.18	38.12 $\pm$ 20.71	7.27 $\pm$ 0.09	6.98 $\pm$ 0.10	0.29 $\pm$ 0.04	0.95
	24	173.64 $\pm$ 26.10	44.53 $\pm$ 10.76	7.43 $\pm$ 0.19	6.96 $\pm$ 0.16	0.47 $\pm$ 0.10	0.92
GC	-	129.11 $\pm$ 18.43	-	-	-	-	

Thickness change in the microscopic measurement was calculated by subtracting the PDL thickness of the experimental animal from the mean PDL thickness of control animals. Displacement was calculated macroscopically by subtracting the moved side measurement from the unmoved side.

(*) Distance between the most cervical region of the distal face of the last molar and the mesial face of the first molar; (#) Pearson correlation coefficient between microscopic PDL thickness change and macroscopic displacement; GI: Group I, underwent uninterrupted (continuous) force; GII: Group II, underwent interrupted force; GC: control group; PDL: periodontal ligament; SD: standard deviation; TC: thickness change.

Table 2

Pearson correlation and paired t-test for within group comparison of induced tooth displacement between different time points

Group		Microscopic displacement				Macroscopic displacement			
		Day 16		Day 24		Day 16		Day 24	
		r	t-test (p)	r	t-test (p)	r	t-test (p)	r	t-test (p)
GI	Day 8	0.84	0.004*	0.91	0.27	0.92	0.18	0.91	0.01*#
	Day 16	-	-	0.97	0.39	-	-	0.92	0.17
GII	Day 8	0.98	0.003*#	0.98	0.006*#	0.95	0.01*#	0.96	<0.001*#
	Day 16	-	-	0.99	0.42	-	-	0.95	<0.001*#

(*) $p < 0.05$: statistically significant; (#) Tukey test confirmed.

4 DISCUSSION

The PDL in humans is a connective tissue, abundant in type I collagen fiber, with an average thickness of 0.2 mm, ranging between 0.15 to 0.38 depending on its location on the root.¹¹ On the root surface, the deposited cementum has a thickness of 0.5 to 0.10 mm in the cervical and middle portions. The internal surface of the alveolus is covered by a thin layer of woven bone, which represents a true alveolar lining of ectomesenchymal origin. On the cementum surface, osteoremodeling units are rarely observed in their Howship's lacunae, but they are frequently present on the bone surface, without significant periodontal irregularities on the alveolar bone surface.

During induced dental movement, numerous osteoremodeling units and Howship's lacunae develop on the alveolar bone surface, creating irregularities associated with the periodontal ligament, which becomes rich in cellular mediators and inflammatory exudate due to cellular compression and hypoxia from reduced blood vessel caliber. OTM in its final stage leads to coordinated resorption and formation of tissues in the surrounding bone and periodontal ligament.^{9,11-13} This new bone formation may explain why PDL thickness in our study initially increased (GI and GII on day eight, Table 1) while it decreased in later days in GI or the amount of change was lowered in GII. The constant positive macroscopic tooth movement (Table 1) in our study indicates possible replacing of PDL with alveolar bone.

In the experimental model of Heller and Nanda,⁵ after the tenth day, the experimental appliances inducing movement, anchored on the incisors, tended to become loose due to wear from attrition and continuous dental eruption. These two phenomena were not observed in the murine molars, only in the incisors, as the latter exhibited continuous odontogenesis. Beyond 8th day of OTM, the incisors may undergo partial rotation in the alveolus causing distal displacement, significantly reducing the distance between the incisors and the first

molar, which has also been moved mesially. This may be another reason that both groups had the thickest PDL on day eight. However, given that the macroscopic tooth movement was not affected, it is unlikely that reduced tension due to reduced distance is causing this discrepancy.

Lastly, the macroscopic measurements were taken at the coronal level, while microscopic measurements were taken at the cervical root level. The discrepancy may mean that the teeth were tilted. Unfortunately, our study is limited due to lack of detailed histological description, including evidence of bone neoformation that could potentially differentiate between tilted tooth and new alveolar bone formation.

After periods of appliance activation and subsequent dissipation of forces, the periodontal tissues tend to repair, with deactivation of osteoremodeling units and reversal of resorptive processes. On the bony surfaces, this reversal is characterized by the disappearance of osteoclasts and the appearance of a basophilic line marking the resumption of bone synthesis and deposition. This line is known as the traumatic calcium line or reversal line. During the process of periodontal tissue reorganization and repair, including fibroblast and collagen fiber rearrangement and reversal of resorptive processes, the reapplication of forces may induce a more extensive or intense disorganization and hypoxia compared to normal tissues.¹⁴⁻¹⁶

In our study, the interruption of forces in GII every four days lead to a greater PDL thickness, despite similar macroscopic dislocation compared to the uninterrupted GI model. This suggests delayed alveolar bone neoformation, possibly due to interrupted osteoblast activity and/or increased inflammation. This exacerbation of periodontal ligament thickness can, in a broad sense, be extrapolated to orthodontic clinical situations characterized by reciprocating movements, such as the use of intermaxillary elastics.¹⁴

Finally, examining the displacement in the interrupted force experimental group (GII) on day eight (Table 1), it can be inferred that after the force was interrupted on day four, the teeth did not completely return to their original position.

5 CONCLUSION

Microscopical measurement of periodontal ligament thickness and its changes during induced tooth movement strongly and positively correlated with macroscopic displacement on days eight, 16, and 24 post-installation. Both interrupted and uninterrupted continuous forces efficiently moved the teeth with comparable results, however, the changes in the periodontal ligament thickness were not similar between groups, suggesting faster bone

formation by continuous uninterrupted force. The teeth did not move back to their original location within four days of removal of the appliance.

ACKNOWLEDGMENTS

We would like to express our deep gratitude to the entire technical team of the animal facility for their support and attention throughout the development of the project, as well as technicians Maria Dirce Colli Boatto and Gilmar Martins de Oliveira for their technical and laboratory support.

This study was designed as an experimental research project and conducted at the Center for Experimental Surgery Research, Prof. Dr. Tetuo Okamoto, at the School of Dentistry of Araçatuba - São Paulo State University (UNESP). The project was approved by the Animal Experimentation Ethics Committee (CEEa) of the School of Dentistry of Araçatuba - UNESP under protocol no. 2008-004460 in accordance with the Ethical Principles in Animal Experimentation of the Brazilian College of Animal Experimentation (COBEA).

Seventy male Wistar rats (*Rattus norvegicus*, albinos) weighing between 250 and 350g and approximately 90 days old were used. The animals, obtained from the Animal Facility of the School of Dentistry of Araçatuba - UNESP, were housed in groups of five per cage and fed granulated chow (Probiotério MP-77, Moinho Primor S.A., São Paulo, Brazil) with water provided ad libitum.

ABSTRACT

The research is justified because school inclusion involves integrating children into regular education, promoting their participation in school activities in a social, pedagogical, and physical way. To this end, it is necessary to adapt the curriculum, practices, and assessments, ensuring that all students, with or without disabilities, fully participate in the pedagogical and social dynamics of the school. Given this, the central objective of this work is to spark interest in chemistry among 6th-grade students, introducing basic concepts in an accessible, contextualized, and inclusive way. The activities involved classroom intervention, including the development of teaching resources and the application of a chemistry lesson in a 6th-grade class. It was observed that practical and experimental activities, adapted to meet inclusive needs, proved effective in integrating students with and without disabilities, promoting collaborative and accessible learning. It was concluded that the interaction between theory and practice, combined with inclusive strategies, such as the use of Styrofoam balls to build molecules and adapted experimental activities, favored student learning.

RESUMO

Justifica-se a pesquisa pois a inclusão escolar envolve integrar crianças ao ensino regular, promovendo sua participação nas atividades escolares de forma social, pedagógica e física. Para isso, é necessário adaptar o currículo, as práticas e as avaliações, garantindo que todos os alunos, com ou sem deficiência, participem plenamente da dinâmica pedagógica e social da escola. Diante disso, o objetivo central deste trabalho é despertar o interesse pela Química com alunos do 6º ano, introduzindo conceitos básicos de forma acessível, contextualizada e inclusiva. As atividades envolveram, intervenção em sala de aula, incluindo, elaboração de recursos didáticos e aplicação de uma aula sobre química em uma turma do 6º ano. Observou-se que as atividades práticas e experimentais, adaptadas para atender às necessidades inclusivas, demonstraram eficácia na integração de alunos com e sem deficiência, promovendo um aprendizado colaborativo e acessível. Conclui-se que a interação entre teoria e prática, aliada a estratégias inclusivas, como o uso de esferas de isopor para a construção de moléculas e atividades experimentais adaptadas, favoreceu o aprendizado dos estudantes.

RESUMEN

La investigación se justifica porque la inclusión escolar implica integrar a los niños en la enseñanza regular, promoviendo su participación en las actividades escolares de forma social, pedagógica y física. Para ello, es necesario adaptar el plan de estudios, las prácticas y las evaluaciones, garantizando que todos los alumnos, con o sin discapacidad, participen plenamente en la dinámica pedagógica y social de la escuela. En vista de ello, el objetivo central de este trabajo es despertar el interés por la química en los alumnos de 6.º curso, introduciendo conceptos básicos de forma accesible, contextualizada e inclusiva. Las actividades incluyeron la intervención en el aula, la elaboración de recursos didáticos y la impartición de una clase de química en un curso de 6.º. Se observó que las actividades prácticas y experimentales, adaptadas para satisfacer las necesidades inclusivas, demostraron su eficacia en la integración de alumnos con y sin discapacidad, promoviendo un aprendizaje colaborativo y accesible. Se concluye que la interacción entre la teoría y la práctica, junto con estrategias inclusivas, como el uso de esferas de espuma de poliestireno para la construcción de moléculas y actividades experimentales adaptadas, favoreció el aprendizaje de los estudiantes.

1 INTRODUCTION

School inclusion is understood as a process that happens by the insertion of the child, in the regular classroom, in the everyday activities of the school, in a social, pedagogical and physical way, in which it is up to the restructuring of the curriculum, practices and evaluation so that the student, regardless of whether or not he has a disability, can participate in the pedagogical and social dynamics of the school. The school, from an inclusive perspective, would meet the demands of these students, in order to respect their peculiarities and provide opportunities for learning school content.

In the educational context, scientific literacy is not only limited to understanding concepts and theories, but also involves developing skills to question, analyze, and apply knowledge ethically and inclusively. In the teaching of Chemistry, inclusive education is a challenge due to the need for abstraction for the understanding of many concepts and the adequacy of language tools and didactic models that contemplate the understanding of all students.

Teaching Chemistry to 6th grade students involves overcoming challenges related to the complexity of the discipline and the often negative perception that students have in relation to science. However, by adopting inclusive and practical pedagogical approaches, it is possible to turn these challenges into meaningful learning opportunities. Studies show that implementing inclusive educational strategies in chemistry teaching can improve student participation and understanding, especially those with special educational needs. These strategies may include the use of assistive technologies, curricular adaptations, and practical activities that promote interaction and experimentation (Santos *et al.*, 2020). Thus, an inclusive approach in teaching Science, especially in Chemistry, ensures that all students, regardless of their initial abilities or socioeconomic backgrounds, can actively participate in and benefit from scientific learning.

In view of the above, this work proposes a proposal for the introduction of basic concepts of chemistry through the exploration of elements of children's daily life, aiming to awaken in them greater interest in science, in a more engaging and inclusive way.

2 DEVELOPMENT

2.1 THEORETICAL FRAMEWORK

2.1.1 History of inclusive education

Inclusive Education emerged at different times and contexts, especially from the 90s when the World Conference on Special Education took place, and in 1994 the Salamanca

Declaration was proclaimed, which "defines policies, principles and practices of Special Education and influences Public Education Policies". (UNESCO, 1994; Souto, 2014).

For a long time, the different was placed on the margins of education: the student with disabilities was attended separately, or simply excluded from the educational process, based on standards of normality. Before inclusive education, there was a model of segregated education, where the education of students with specific educational needs took place in parallel with the so-called regular education. There were the so-called special schools or classes, belonging to the special education subsystems implemented in the various public education networks through the National Center for Special Education (CENESP), created in 1973 (Ferreira; Glat, 2003; Bastos, 2014).

In Brazil, special education has moved from a segregationist model — marked by the creation of isolated institutions such as the Benjamin Constant Institute (1854) and INES (1857) — to an inclusive perspective. Historically, care took place in special classes or parallel institutions (Mazzotta, 2005). However, driven by international frameworks such as the Salamanca Declaration (1994) and LDB No. 9,394/96, the national policy made a commitment to integrate students with disabilities into regular education. From the 2000s onwards, guidelines such as the National Policy on Special Education in the Perspective of Inclusive Education (2008) consolidated the mandatory provision of specialized educational services and the elimination of barriers to access and permanence in school

2.1.2 Teaching of Chemistry in Elementary School

In the early years, it does not exist, according to school curricula (Brasil, 2018; Paraná, 2018) a curricular component of Chemistry, but there is an understanding that chemical, physical and biological concepts are part of the Natural Sciences.

According to the BNCC (Brazil, 2018), the area of Natural Sciences is committed to the development of scientific literacy, involving the ability to understand and transform the world.

Thus, in the final years of elementary school, the area of Natural Sciences through the fields of knowledge seeks to ensure its students contact with scientific thinking, so that these students can have a new look at the world around them.

The practice of teaching Natural Sciences has been carried out according to various educational proposals, which occur as theoretical elaborations, expressing themselves in the most varied ways in the classrooms. Many of these practices are based only on the passage of theoretical contents, using the book and the blackboard as the only didactic resources. Others, on the other hand, are based on innovations that emerge over the years, new

methodologies that help teaching, as well as innovations in science and the way to pass on knowledge about it in particular (Brasil, 1998, p. 19).

Showing Science as a human elaboration for an understanding of the world is a goal for teaching the area in elementary school. Its concepts and procedures contribute to the questioning of what is seen and heard, to interpret the phenomena of nature, to understand how society intervenes in it by using its resources and creating a new social and technological environment. It is necessary to favor the development of a reflective and investigative posture, of non-acceptance, a priori, of ideas and information, as well as the perception of the limits of explanations, including scientific models, collaborating to the construction of autonomy of thought and action (Brasil, 1998, p. 19).

Aiming at this goal and considering the mandatory nature of Elementary Education in Brazil, it is seen that it cannot teach students to act only in the future, but that teaching must contemplate the present so that the student can already act on social issues, expanding "his present possibility of social participation and mental development, in order to enable their full capacity to exercise citizenship" (Brasil, 1998, p. 23).

Thus, the teaching of chemistry should be valued by teachers in this phase of Education, because it is through it that we understand natural phenomena, from the composition of materials to their transformations. With this, it is possible to carry out experimental activities that encourage students to make observations and reach their own conclusions, thus awakening interest in scientific knowledge. Although the contents of the science area are often considered difficult due to their abstract character, many students face challenges in understanding them (Gonzaga; Joffe, 2022).

At the end of the 9th grade, students must "question reality by formulating problems and trying to solve them, using logical thinking, creativity, intuition, the capacity for critical analysis, selecting procedures and verifying their adequacy" (Brasil, 1998, p. 8), which is one of the objectives proposed by the National Curriculum Parameters for Elementary Education.

In the National Common Curricular Base (BNCC), ten general competencies of Basic Education are presented, which are articulated based on the construction of knowledge, the development of skills and the formation of attitudes and values, under the terms of the LDB. "These competencies are defined as the mobilization of knowledge, skills, attitudes and values to solve complex demands of daily life, the full exercise of citizenship and the world of work" (Brasil, 2018, p. 8), in which the student, by developing them, becomes a citizen able to get involved in social issues.

In view of this, working with investigative activities can be an excellent strategy to be used by teachers, making the student build their own knowledge.

For Carvalho (2010 apud Silva *et. al.*, 2018, p.3):

An activity can be considered investigative when it is not limited to memorization, but when it leads the student to reflection, discussion, problematization and questioning, in addition to offering a space for learners to share their ideas and opinions. Thus, it is possible to contemplate the methodology inserted in the classroom more effectively.

This type of investigative activity and practical classes arouse the interest of students, involve students in scientific investigations, develop the ability to solve problems, understand basic concepts, and develop the skills of their students (Gonzaga; Joffe, 2022).

With this, it is possible to perceive the importance of the educator's role in modifying the daily life of the classroom, because even without receiving extra financial aid in schools or external, many of them seek to vary and awaken the student to knowledge (Rosso *et al.*, 2012).

2.1.3 Scientific Literacy through an inclusive bias

To understand the concept of scientific literacy, it is essential to initially understand the meaning of literacy. Although often associated only with the act of learning to read and write, literacy encompasses a much broader concept. Reading and writing represent only the first stage of this broader process.

The practice of Scientific Literacy is configured as a fundamental model to enhance the alternative of a more open teaching and learning process to expand the didactics of Science and stimulate the effective participation of students in the construction of their knowledge, as the researcher Chassot (2003, p. 3) says, to become scientifically literate is to enable the student to "know how to read the language in which it is written in nature" and I add, It is also knowing how to interpret the social environment in which it is inserted.

According to Sasseron and Carvalho (2011), Scientific Literacy (CA) can occur in different categories, namely: functional CA, conceptual and procedural CA, and multidimensional CA. Functional CA is related to appropriating scientific terms and concepts used in science; Conceptual and procedural CA emphasizes the fact that the student perceives the relationship between concepts and experiments with daily activities, verifying the importance of science in his daily life. Multidimensional CA would be the junction of previous ideas, that is, the student appropriates concepts and knows how to apply them in their daily lives.

One of the challenges encountered in carrying out the process of scientific literacy from the perspective of inclusion is the mastery of their language.

Scientific language is composed of laws, theories, concepts, principles and structures that other types of knowledge do not have, which, at first, makes the teacher's work difficult. Thus, mastering this language is essential for teachers and students to be able to establish the proper relationships between science, society and the environment (Vilela-Ribeiro; Benite, 2013, p. 782).

Without mastery of this language, teachers are unable to carry out an adequate transposition that guarantees all students an understanding of knowledge with meaning for their experience outside of school.

The development of Scientific Literacy is based on axes that lead to the practice of teaching by investigation and argumentation in the classroom. The promotion of science teaching by investigation requires the presentation of problem-situations, related to the daily life of students, which position them in front of a process of analysis and interpretation of data to solve the proposed problem through reflection, characterizing a didactic approach (Sasseron, 2015).

The search for new perspectives and methodological strategies in education have directed the school's profile towards the formation of critical individuals, who know how to consciously reflect on their actions and on the actions carried out by others (Chassot, 2010). Thus, teaching as well as society need new tools that prioritize the development of the formative process of all students, including students with specific needs.

Science literacy methods with an inclusive bias are essential to ensure that all learners, regardless of their abilities, backgrounds, or educational needs, can access and understand fundamental scientific concepts. These methods aim to create a learning environment that values diversity and allows all students to develop critical skills to interact in an informed manner with the world around them.

One of the most effective methods is the adaptation of content and methodologies. This involves modifying teaching materials and pedagogical approaches to meet the different needs of students. Using visuals, audio-visuals, and simplified texts can facilitate the understanding of complex concepts, while assistive technologies, such as reading software and assistive devices, help students with disabilities to fully participate in scientific activities.

In view of this, it is clear that in order to advance in the implementation of inclusive scientific literacy, it is important to reflect on how pedagogical practice can be adjusted to meet the needs of all students. The adaptation of methodologies and content is crucial to ensure that the diversity of skills and needs is considered in the teaching process. In this sense, as highlighted by Vilela-Ribeiro and Benite (2013), the ability of teachers to master scientific language and adapt their approaches is vital for effective inclusion. Without this

competence, the transposition of knowledge can become an obstacle to students' understanding, limiting the impact of science education on their lives.

2.2 METHODOLOGY

This work used a qualitative and descriptive approach, organized in structured stages for the planning, execution and evaluation of a pedagogical proposal aimed at intervention in Elementary Education. The steps are described below.

The target audience of this project was the children of the 6th grade of Elementary School, in the afternoon shift, of the Achilles Cruz School, located in the Cangalheiro neighborhood, in the city of Caxias-MA.

Chart 1 shows the five topics of this proposal to be worked on in a dynamic and inclusive way. Among these proposed subjects, the subject "What is Chemistry? - Exploring matter and the mysteries of its transformations".

Table 1

Subjects proposed to work on in the 6th year of elementary school, didactic sequence with the objective and teaching strategy

Subject	Objective	Teaching strategy
Lesson 1: What is Chemistry	Understand the concept of chemistry, understand its importance and how it facilitates everyday life.	Explain the concepts of atoms, molecule/substance formation, and chemistry using illustrative (self-explanatory) images from the story of the bricklayer Peter, a fictional character who represents chemistry. Bricks represent atoms and constructions are molecules. Activity of building molecules using Styrofoam spheres and conducting experiments to demonstrate the transformations of matter, from which we acquire new materials.
Lecture 2: Physical States of Matter	Understand physical transformations and their importance in everyday life, such as transportation, storage, framing, among others.	Use sensory experiments to feel, describe and differentiate the textures of each state. Perform ice melting, and use cold, warm water, dry sand, wet sand and pebbles, as well as other materials to expand the experience.
Lesson 3: The mixtures	Understand the concept of mixture, understand that substances exist in the form of mixtures, that mixtures are essential to obtain a multitude of materials and understand the danger of some combinations at home.	Build different homogeneous and heterogeneous mixtures to feel, observe and differentiate characteristics through touch and sight. Mixtures such as water and sand, water and beans, liquid milk and others. From these experiences, complete and/or assemble a small mental map of the children's observations as a complementary activity.
Lesson 4: Fluoride and health	Discuss and understand the role of fluoride in caries prevention and bone health.	Make a brief explanation of what fluoride is and where it can be found (water, toothpaste, food). Using visual resources such as images and short, accessible videos about fluoride and its importance. Encourage the creation of educational materials (drawings on posters, simple models and models, videos with images and subtitles and interpretation in Libras).

Lesson 5: Acids and alkaline bases	Understand what an acid and a base are, understand their role in daily life, such as health and cleaning, understand the dangers related to these substances preventing domestic accidents.	Experimental practices to observe through the senses some characteristics, such as textures, flavors and aromas characteristic of acidic and alkaline products that DO NOT offer risks, such as fruits, soaps, eggs and others. Conduct safe identification experiments on these products.
---	---	--

Source: Author, 2025.

One of the topics of the pedagogical proposal was applied in the classroom, seeking to observe the receptivity and impact of the strategies employed in the teaching-learning process. Visual resources were prepared, such as illustrations and tactile models, so that, through the various senses, students had greater clarity and understanding of the concepts and transformations. The class applied in the classroom intervention was Class 1 - What is Chemistry? - Exploring matter and the mysteries of its transformations.

The didactic sequence containing the classroom actions, described in Chart 2, refers to the applied class, which was planned to provide an inclusive, dynamic and interactive teaching experience for students in the 6th grade of Elementary School at the Achilles Cruz school. Each stage was designed to develop scientific skills, stimulate interest and curiosity about Chemistry content, while meeting the educational needs of all students, including those with disabilities.

Table 2

Actions of the class on "What is Chemistry"

Classroom actions	Objectives	Number of classes/timetable
Conversation circle	Probing of previous knowledge about chemistry.	3 Schedules
Introductory lecture on the concept of Chemistry	Understanding of the initial concepts of Chemistry, addressing the relationship between atoms, molecules and substances, from the use of slides and objects present.	
Collective reading of the Comic Story.	Understanding, through HQ, of the concepts of atoms as the basic unit that forms all matter.	
Practical activity: Construction of molecules with Styrofoam spheres.	Evaluation of learning about the formation of different substances and promotion of interest in playful practical activities.	
Sensory experiment on transformations of matter - CO ₂ production.	Recognition of a chemical phenomenon through volume change as visual evidence.	

Source: Author, 2025.

For the analysis of the suggested proposal, photos, pictures and images of the day of application in the classroom were used. Texts were used to present the results. Reports of

experiences argued in terms of the results obtained, based on experience and references from other authors.

3 RESULTS AND DISCUSSION

In this item, the results of the suggested pedagogical proposal will be discussed, as well as the reports of the experience of the intervention in the classroom carried out.

In the class on "What is Chemistry", a class that was applied in the classroom, visual resources were used, such as self-explanatory illustrative images that represented fundamental concepts of Chemistry. The construction of Styrofoam spheres was carried out, as an inclusive tool, to assist in the understanding of the content worked. These materials were complemented by the story of the fictional character Pedro, who, through a comic book, made the concepts more understandable to the students. Materials and resources

In the application of the proposal developed in the school, the theme "What is Chemistry" was addressed, aiming to probe the students' previous understanding of Chemistry, understand the concept of Chemistry, its importance, how it facilitates daily life and introduce fundamental concepts. Through a conversation circle, complemented by images, texts and illustrations in the form of slides, we sought to engage the participants. A brief theoretical explanation about atoms, molecules and substances was reinforced using the story of the fictional character Pedro, the bricklayer (Figure 1) as a didactic resource promoting understanding through analogies, a strategy recognized for its effectiveness (Andrade, 2000; Santos, 2018).

Figure 1

Story of the fictional character Pedro

Source: Author, 2025.

For the creation of the comic book (HQ), first, the plot of the story was elaborated. This included establishing the main conflict, the setting, and the characters, and planning the beginning, development, and outcome of the plot. After the script, the layout was created, where the page outlines were drawn. At this stage, each frame was positioned to optimize reading and ensure that the scenes followed a logical and engaging sequence. Then, it was time to illustration, where the characters, scenarios and elements of the story were detailed and finalized. At this stage, the strokes and colors were also defined, which helped to create the atmosphere of the comic. Finally, dialogues and balloons are added, essential to give voice to the characters and to advance the narrative. In this story, the bricks represented the atoms and the constructions symbolized the molecules, making the concepts more accessible and easier to understand.

Figure 2 shows the students attentive to Pedro's story, showing that the resource used aroused their interest and, therefore, being a good choice and having satisfactory support. Historically, there was a time when comics were not allowed in the classroom by teachers. However, this view has changed over time, and comics have come to occupy a prominent place in education. More than pedagogical tools, they were incorporated as part of educational policy, especially after the enactment of the Law of Guidelines and Bases of National Education (LDB), which opened the doors of teaching to innovative resources such as comics (Vergueiro, 2015).

Figure 2

Photo of the moment of the theoretical explanation of concepts and collective reading of the comic

Source: Author, 2025.

During the theoretical presentation, illustrative images were used (Figure 3), which helped to visualize the relationship between atoms and molecules. These images were crucial in clarifying the concepts in a visual and clear way. According to Toyama (2019), the use of visual resources in teaching is essential to ensure adequate access to information,

especially in contexts of inclusion. In addition, studies on inclusive pedagogical practices indicate that adapted methodologies, such as visual representations, are effective in overcoming learning difficulties in disciplines that require abstraction, such as Chemistry (Lima, 2016).

Figure 3

Slides containing the illustrative images used to visualize the relationship between atoms and molecules

Source: Author, 2025.

Then, the students participated in a practical activity, where they built molecules using Styrofoam spheres (Figure 4). Styrofoam spheres were customized to represent atoms, a tactile resource to meet the needs of visually impaired children. With this in mind, printed materials were produced and beads were glued to the Styrofoam spheres to identify the atoms in Braille, in addition to another identification in Libras. Adaptations like this are necessary to meet the needs of inclusion students (Pereira, 2018). The different colors of the spheres, on the other hand, aim not only to differentiate the chemical elements, but also to make the representations of everyday elements such as carbon, hydrogen and oxygen more visually attractive. According to Balbinot (2005), the use of physical models favors the understanding of more abstract concepts, being more attractive and fun.

The colors red, black, white, green, light blue, and blue represent, respectively, the atoms of oxygen, carbon, hydrogen, chlorine, sodium, and nitrogen. This playful activity allowed students to apply the concepts of substance formation in a practical way, promoting an interactive and fun experience. As evidenced in innovative pedagogical practices, the use of colored and tactile models reinforces visual and motor perception, essential to fix complex content and engage students of different profiles. This approach not only improves the understanding of scientific concepts, but also stimulates critical thinking and creativity by

allowing students to explore chemical properties and relationships in an intuitive and meaningful way (Silva; Souza; Filho, 2012; Silva; Yamaguchi, 2023).

Figure 4

Photo of the moment of the construction of molecules, carried out by the student

Source: Author, 2025.

This type of approach is echoed in other inclusive educational experiences, such as a workshop reported at the 57th Brazilian Congress of Chemistry, where tactile molecular models were used to help visually impaired students. The Styrofoam spheres were differentiated not only by color, but also by textures, to facilitate the identification of elements and chemical compounds. In addition, the construction of these models has also been shown to be attractive to students without disabilities, promoting integration and collaborative learning (Alves; Mendes; Ferreira, 2016).

Another work that aligns with this perspective is the study by Silva and Yamaguchi (2023), which describes the development of inclusive teaching materials for the teaching of chemistry, using resources that are also accessible and low-cost. Among the materials developed are three-dimensional models representing atoms and molecules, a periodic table adapted for sign language and braille, as well as sensory experiments on the separation of mixtures.

Additionally, to illustrate the transformations of matter, an experiment was carried out using sodium bicarbonate, vinegar, dyes and water. An experimental script was devised to clearly demonstrate evidence of a chemical reaction perceptible by the senses of sight, smell, and touch, such as changes in volume, aroma, and temperature. The students observed the chemical changes during the reaction, which helped them understand how atoms and molecules interact to form new materials.

The experiment generated the production of CO₂ by the reaction between vinegar and bicarbonate, which resulted in the inflation of a bladder, offering a fun and economical demonstration of the process. According to Borges (2002), the experimental activities developed in science classes are a way to overcome the learning obstacles that the student

may have in relation to the content, in addition to being dynamic, motivating and challenging, resulting in learning in a way that is meaningful to them. It is evidenced that these activities offer opportunities for experience, observation and investigation, connecting theory to everyday reality. They promote more active and reflective learning, which is essential for developing scientific skills and relating science, technology, and society (Sondré, 2018). Figure 5 shows photographic records of the moment the experiment was carried out in the classroom.

Figure 5

Photos of the moment of the experiments, proving the chemical phenomenon between bicarbonate and vinegar

Source: Author, 2025

As observed in the images mentioned above, the class was successful because it effectively integrated theory and practice, stimulating the students' interest in Chemistry and its application in everyday life. Thus, it is up to chemistry teaching professionals to seek alternative didactics that promote the improvement of learning, showing students that chemistry is a science whose concepts and laws are a direct consequence of the behavior of nature (Silva; Souza; Filho, 2012).

In the context of inclusive education, it is essential to highlight that the commitment to inclusion must be continuous and start from early childhood education, providing a solid foundation for the integral development of students. Inclusion promotes not only academic learning, but also respect for differences and appreciation of diversity. In this sense, the continuing education of teachers is crucial to enable them to meet the demands of an inclusive classroom and to ensure that all students, regardless of their needs, have equal learning opportunities (Neves; Rahme; Ferreira, 2019; Ferreira *et al.*, 2024).

4 FINAL CONSIDERATIONS

In view of the objectives proposed for the research, it was possible to conclude that the implementation of the pedagogical proposal focused on the teaching of Chemistry to

students of the 6th year of Elementary School, through dynamic, accessible and inclusive strategies, satisfactorily met the initial expectations. The approach adopted, using resources such as conversation circles, comic books, playful materials and practical experiments, allowed the introduction of chemical concepts in an engaging, contextualized way that considered the different needs of the students.

The interaction between theory and practice, combined with inclusive strategies, such as the use of Styrofoam spheres for the construction of molecules and adapted experimental activities, favored the students' learning. The active participation of students, both with and without disabilities, in the proposed activities, demonstrated the effectiveness of methodologies that value diversity and promote a collaborative environment.

The results showed that the use of visual, tactile and interactive resources actually contribute to the understanding of abstract concepts, such as atomic structure and the formation of molecules, in addition to stimulating students' curiosity and critical thinking. The realization of practical experiments, such as the reaction between baking soda and vinegar, made it possible to experience chemical phenomena in a concrete way, promoting the connection between the content learned and everyday situations.

Thus, the pedagogical proposal developed not only achieved the planned objectives, but also demonstrated the potential of inclusive practices in the teaching of Chemistry, making the concepts more accessible and meaningful for all students, regardless of their limitations. This approach contributes to the construction of a more equitable and richer chemical education, which can serve as a model for future pedagogical practices in science education.

ABSTRACT

Rare earth elements constitute strategic mineral resources due to their application in technology-intensive sectors such as renewable energy, electric mobility, advanced electronics, and defense, assuming growing geopolitical relevance. Although Brazil holds significant geological potential for these elements, especially in Minas Gerais, its insertion into global value chains remains concentrated in the initial stages of mineral exploitation, revealing a mismatch between resource abundance and technological mastery. In this context, the article analyzes the role of the Industrial Property Law (Law No. 9,279/1996) as an instrument of technological sovereignty, linking the debate to international dynamics of control over critical minerals. A qualitative, exploratory, and analytical-descriptive approach is adopted, based on bibliographic and documentary review on geology, processing technologies, innovation, and territorial governance. The results indicate that the strategic value of rare earths depends more on the mastery of critical technological processes than on mere mineral extraction. It is concluded that technological sovereignty requires an integrated institutional arrangement, articulating innovation, intellectual property, and public policies oriented toward sustainable development.

RESUMO

As terras raras constituem recursos minerais estratégicos devido à sua aplicação em setores intensivos em tecnologia, como energias renováveis, mobilidade elétrica, eletrônica avançada e defesa, assumindo crescente relevância geopolítica. Embora o Brasil detenha expressivo potencial geológico desses elementos, especialmente em Minas Gerais, sua inserção nas cadeias globais de valor permanece concentrada nas etapas iniciais da exploração mineral, revelando um descompasso entre abundância de recursos e domínio tecnológico. Nesse contexto, o artigo analisa o papel da Lei da Propriedade Industrial (Lei nº 9.279/1996) como instrumento de soberania tecnológica, articulando o debate às dinâmicas internacionais de controle dos minerais críticos. Adota-se abordagem qualitativa, exploratória e analítico-descritiva, com base em revisão bibliográfica e documental sobre geologia, tecnologias de beneficiamento, inovação e governança territorial. Os resultados indicam que o valor estratégico das terras raras depende do domínio de processos tecnológicos críticos, mais do que da simples extração mineral. Conclui-se que a soberania tecnológica requer um arranjo institucional integrado, articulando inovação, propriedade intelectual e políticas públicas orientadas ao desenvolvimento sustentável.

Palavras-chave: Terras Raras. Propriedade Intelectual. Soberania Tecnológica. Geopolítica dos Recursos Estratégicos. Minas Gerais.

RESUMEN

Las tierras raras constituyen recursos minerales estratégicos debido a su aplicación en sectores intensivos en tecnología, como las energías renovables, la movilidad eléctrica, la electrónica avanzada y la defensa, adquiriendo una creciente relevancia geopolítica. Aunque Brasil posee un significativo potencial geológico de estos elementos, especialmente en Minas Gerais, su inserción en las cadenas globales de valor permanece concentrada en las etapas iniciales de la explotación minera, lo que revela un desajuste entre la abundancia de recursos y el dominio tecnológico. En este contexto, el artículo analiza el papel de la Ley de Propiedad Industrial (Ley n.º 9.279/1996) como instrumento de soberanía tecnológica, articulando el debate con las dinámicas internacionales de control de los minerales críticos. Se adopta un enfoque cualitativo, exploratorio y analítico-descriptivo, basado en una revisión bibliográfica y documental sobre geología, tecnologías de beneficio, innovación y gobernanza territorial. Los resultados indican que el valor estratégico de las tierras raras depende más del dominio de procesos tecnológicos críticos que de la simple extracción minera. Se concluye que la soberanía tecnológica requiere un arreglo institucional integrado, que articule innovación, propiedad intelectual y políticas públicas orientadas al desarrollo sostenible.

1 INTRODUCTION

Rare earth elements (REEs) are a group of chemical elements formed by lanthanides, plus yttrium and scandium, whose unique physicochemical properties make them strategic inputs for the contemporary high-tech industry. Despite the historical name, these elements are not geologically scarce, but they have a high dispersion in the Earth's crust and chemical complexity that makes it difficult for them to be concentrated, separated and individually purified, which explains their economic and geopolitical relevance (Abrão, 1994; Castor & Hedrick, 2006). Lanthanid contraction, a phenomenon responsible for the similarity of ionic rays and oxidation states, imposes significant technological challenges to the beneficiation and refining processes, increasing costs and requiring advanced technological solutions (Abrão, 1994).

In recent decades, the intensification of global demand for REEs has been driven by the expansion of strategic sectors such as renewable energy, electric mobility, information technology, defense, industrial catalysis, and high-performance electronic devices. Permanent magnets based on neodymium, dysprosium and praseodymium, catalysts, phosphors, special alloys and optical components illustrate the centrality of these elements for the energy transition and for the so-called low-carbon economy (Chakmouradian & Wall, 2012; Haque et al., 2014).

In this context, the concentration of global production and processing, historically dominated by China, has transformed rare earths into strategic assets associated with the economic security and technological sovereignty of national states.

Brazil stands out in this scenario for having one of the largest known reserves of rare earths in the world, with a significant increase in estimates based on the incorporation of deposits located, above all, in the states of Minas Gerais and Goiás. Recent studies indicate that the country has come to occupy a prominent position in the global ranking of reserves, although it still has a marginal participation in the production of oxides and, mainly, in the aggregation of technological value (DNPM, 2014; Souza, Nascimento & Giese, 2019)

Such asymmetry reveals a recurring paradox of the Brazilian mineral economy: geological abundance coexisting with technological and industrial dependence.

Minas Gerais plays a central role in this debate, due to the occurrence of deposits associated with alkaline and alkaline-carbonatite complexes, such as those of Araxá and the Poços de Caldas Plateau, as well as ionic adsorption clays and mineral tailings with potential for secondary recovery. The technological characterization of these resources demonstrates that, although the levels are significant, economic viability depends on the mastery of

sophisticated extraction, separation, and purification processes, including hydrometallurgical and biohydrometallurgical routes (Antoniassi, 2017; Gupta & Krishnamurthy, 2005).

Recent literature also points to the advancement of technologies based on bioleaching and biosorption as more environmentally sustainable alternatives, capable of reducing energy consumption and waste generation, expanding the potential for the use of low-grade ores (Barnettler et al., 2016; Amin et al., 2014; Souza, Nascimento & Giese, 2019)

These technological advances, however, highlight the need for legal protection of the knowledge generated along the rare earths production chain. Innovative processes of beneficiation, solvent separation, bioleaching, biosorption, development of advanced materials and industrial applications constitute strategic intangible assets, whose misappropriation can compromise the national ability to compete in technology-intensive global value chains.

In this sense, the **Intellectual Property Law (Law No. 9,279/1996)** emerges as a fundamental instrument for the protection of inventions, utility models and industrial secrets related to the mineral sector, functioning as a mechanism to encourage innovation, technology transfer and technological sovereignty.

Unlike an approach focused exclusively on primary exploitation, protection via intellectual property allows for the articulation of mining, science, technology and innovation, transforming natural resources into platforms for technological development.

In the case of rare earths, this articulation is particularly relevant, since the economic value of these elements is less associated with the extraction itself and more with the mastery of the technological processes that enable their application in high value-added products.

Thus, the absence of intellectual protection strategies tends to perpetuate patterns of external dependence, while their adoption strengthens the capacity of the State and national companies to retain value, stimulate applied research and consolidate technological skills.

In this context, this article analyzes the role of the **Intellectual Property Law as an instrument of technological sovereignty**, based on the case of rare earths in Minas Gerais, articulating geological, technological and institutional evidence. It is based on the assumption that technological sovereignty does not result only from the possession of natural resources, but from the ability to transform them into protected knowledge, industrial innovation and sustainable territorial development.

2 THEORETICAL BACKGROUND

2.1 RARE EARTHS AS STRATEGIC MINERAL RESOURCES

Rare earth elements (REEs) are strategic mineral resources due to their transversal application in sectors that are intensive in technology and innovation. Although they are not rare from a geological point of view, their economic exploitation is conditioned by mineralogical, geochemical and technological factors that make their individual separation and purification difficult, significantly increasing production costs (Abrão, 1994; Castor & Hedrick, 2006). The chemical similarity resulting from lanthanide contraction imposes relevant metallurgical challenges, requiring sophisticated technological routes to obtain oxides and metals of high purity, an indispensable condition for advanced industrial applications (Gupta & Krishnamurthy, 2005).

The strategic importance of rare earths has intensified in recent decades due to the energy transition, the digitalization of the economy and the growth of so-called green industries. Permanent magnets, catalysts, batteries, optical and electronic components illustrate the centrality of these elements for production chains considered critical to the economic and technological security of national states (Chakmouradian & Wall, 2012; Haque et al., 2014). In this context, the high concentration of global production and refining, historically led by China, reinforced the geopolitical character of rare earths, transforming them into instruments of economic and technological power.

In Brazil, although reserves are significant, the country's insertion in the global value chain remains limited, focusing mainly on the extraction and export of raw materials or low value-added products. Such a scenario reveals a dissociation between geological potential and technological capacity, configuring a pattern of dependence that compromises industrial and technological sovereignty (DNPM, 2014; Souza, Nascimento & Giese, 2019).

2.2 MINAS GERAIS AND THE TECHNOLOGICAL POTENTIAL OF RARE EARTHS

Minas Gerais occupies a central position in the geography of rare earths in Brazil, housing important deposits associated with alkaline and alkaline-carbonatite complexes, such as Araxá and the Poços de Caldas Plateau, as well as occurrences in ionic adsorption clays and mineral tailings that can be reused. Technological characterization studies show that these geological environments have relevant potential, but require high technical mastery to make their exploration economically viable (Antoniassi, 2017).

The literature points out that the main rare earth bearing minerals in the Brazilian territory include monazite, bastnasite, xenotime, and ionic adsorption clays, each with specific challenges related to radioactivity, low grade, mineralogical complexity, and environmental

impacts (Abrão, 1994; Haque et al., 2014). Because of these limitations, conventional extraction methods, based predominantly on energy-intensive hydrometallurgical routes and chemical reagents, present economic and environmental constraints, especially for low-grade ores (Gupta & Krishnamurthy, 2005).

In this context, recent advances in biotechnology applied to mining have been pointed out as promising alternatives. Bioleaching and biosorption techniques, based on the action of microorganisms and organic metabolites, have demonstrated potential for the recovery of rare earths from mineral matrices and residues, with lower energy consumption and lower environmental impact (Barmettler et al., 2016; Amin et al., 2014; Brisson et al., 2015). Studies conducted in Brazil indicate significant recovery efficiencies, especially in processes involving monazite, clays, and industrial waste, reinforcing the role of technological innovation in the sustainable viability of the production chain (Souza, Nascimento & Giese, 2019)

2.3 INDUSTRIAL PROPERTY, INNOVATION AND TECHNOLOGICAL SOVEREIGNTY

The transformation of strategic mineral resources into lasting competitive advantages depends, fundamentally, on the ability to generate, protect and exploit technological knowledge. In this sense, industrial property assumes a central role by guaranteeing temporary exclusivity over inventions, processes and industrial applications, encouraging investments in research, development and innovation. Law No. 9,279/1996, by disciplining invention patents and utility models, constitutes an essential legal instrument for the protection of intangible assets associated with the rare earth chain.

In the mineral sector, protection through industrial property does not focus on the natural resource itself, but on the technological processes that enable its efficient, sustainable and economically competitive exploitation. Innovative routes for processing, separation, purification, bioleaching, biosorption and development of advanced materials are strategic assets that can be protected, whose misappropriation can compromise national technological autonomy. Thus, the absence of intellectual protection strategies tends to perpetuate the country's peripheral position in the global value chain, while their adoption strengthens technological and industrial sovereignty.

From this perspective, technological sovereignty is not limited to the availability of natural resources, but involves the ability to control critical technologies, retain economic value, and guide territorial development strategically. In the case of Minas Gerais, the articulation between geological potential, technological innovation and protection via industrial property is fundamental to break with the traditional extractive model and promote a more qualified insertion of the state and the country in the knowledge economy.

This article aims to analyze the role of the **Industrial Property Law (Law No. 9,279/1996)** as an instrument of **technological sovereignty**, based on the case of **rare earths in Minas Gerais**, considering the strategic relevance of these elements for technology- and innovation-intensive production chains. Initially, it seeks to characterize rare earths as strategic mineral resources, highlighting their chemical properties, industrial applications and geopolitical importance, according to the specialized literature (Abrão, 1994; Chakmouradian & Wall, 2012; Haque et al., 2014).

Next, it is intended to examine the geological and technological potential of rare earth occurrences in the territory of Minas Gerais, with emphasis on alkaline and alkaline-carbonatitic complexes and the technical limitations associated with their economic use (Antoniassi, 2017; Souza, Nascimento & Giese, 2019).

The study also aims to discuss the main technological challenges related to the processes of extraction, separation and purification of these elements, including the emerging role of hydrometallurgical and biohydrometallurgical routes as more sustainable alternatives (Amin et al., 2014; Barmettler et al., 2016).

Finally, it seeks to evaluate the importance of protecting innovations associated with the rare earths production chain through industrial property, showing how the adoption of technological protection strategies can contribute to the reduction of external dependence, the aggregation of value to the mineral resource and the strengthening of technological sovereignty and territorial development in Minas Gerais.

The Role of the Geological Survey of Brazil in the Identification and Valuation of the Potential of Rare Earths and Strategic Minerals

The **Geological Survey of Brazil (SGB)** has played a central role in the production of the geoscientific knowledge necessary to guide public policies, investments and development strategies related to strategic mineral resources, especially **rare earths**. According to a note released by the SGB itself in 2025, Brazil holds about **23% of the world's reserves of rare earths**, estimated at approximately 21 million tons, positioning itself as one of the main global holders of these critical elements, although national production remains extremely limited, with about 20 tons produced in 2024, representing less than 1% of world production that year (SGB, 2025).

This diagnosis highlights one of the main challenges for the implementation of a strategic mineral policy: the discrepancy between the **abundant geological potential and the technological and institutional capacity to transform this potential into production and competitive added value**. The SGB CEO emphasizes that it is necessary to expand the geological knowledge of the national territory and "transform the enormous geological

potential of strategic mineral resources into exploitable and well-known mineral reserves", overcoming technological, logistical and infrastructure limitations (Brasil Mineral, 2025).

Within this agenda, the SGB conducts systematic geological mapping research and evaluation of occurrences in several Brazilian states, including programs such as the evaluation of potentials in unprecedented areas, for example, in **the Parnaíba Basin**, where dozens of new occurrences associated with rare earth elements and uranium were identified, indicating additional possibilities for expanding Brazilian mineral knowledge.

Other efforts include initiatives in Goiás, Tocantins, Bahia, Paraná, São Paulo, Amazonas, Roraima, Rondônia, Pará, and Piauí, as part of projects that aim to identify and characterize promising mineralogical regions in different geological frameworks, expanding the database necessary for public and private decision-making.

The SGB's work also includes the production of collaborative technical reports, such as the publication "Brazil's role in the Global Agenda for Critical and Strategic Minerals", the result of a partnership with institutions such as CEBRI, IBRAM, CETEM and Cenergia (Coppe/UFRJ). This report combines analysis of national demand, supply potential, and the positions that the country can occupy in the energy transition and in global supply chains, reinforcing the need to diversify the supply and processing of critical minerals as a way to reduce geopolitical risks and strengthen Brazil's presence in strategic markets, Mineral Connection (2025).

These geoscientific efforts assume crucial relevance when articulated with the broader normative and public policy debate, especially in light of legislative initiatives such as the National Policy on Critical and Strategic Minerals, approved by the Economic Affairs Commission (CAE) of the Federal Senate, which aims to establish guidelines for the processing and internal industrialization of these minerals. In this sense, the data produced by the SGB will not only subsidize the formulation of more robust mineral policy instruments, but will also guide the allocation of resources for research, technological development and institutional training, essential elements to convert mineral potential into national productive and technological competences.

In addition, the ability to map occurrences and characterize deposits in different geological contexts contributes directly to territorial governance, by providing information that allows balancing the interests of economic development, environmental protection and social inclusion. This process is essential to ensure that the exploitation of rare earths occurs in a sustainable, responsible and integrated manner with regional development strategies that take into account local knowledge and the participation of affected communities.

As a whole, the performance of the Geological Survey of Brazil demonstrates that the production of geoscientific knowledge is an indispensable pillar for the formulation of effective public policies in the strategic mineral sector. By integrating cutting-edge research, detailed geological mapping, and information production for planning and decision-making, the SGB provides the necessary technical-scientific basis for Brazil to move towards broader technological sovereignty, reducing external dependence and expanding its participation in global critical mineral chains, in line with the environmental and technological challenges of the 21st century.

3 METHODOLOGY

This article adopts a **qualitative approach**, of an **exploratory and analytical-descriptive nature**, suitable for the investigation of complex phenomena that involve the articulation between strategic mineral resources, technological development and legal instruments for the protection of innovation. The choice of this approach is justified by the need to understand, in an integrated way, the geological, technological and institutional aspects related to rare earths in Minas Gerais, as well as the role of the Industrial Property Law in the promotion of technological sovereignty.

From the point of view of technical procedures, the research is based on a **bibliographic and documentary review**, carried out from national and international secondary sources. The literature review focused on classic and contemporary works on rare earth chemistry and technology, extractive metallurgy, biotechnology applied to mining, and economics of strategic mineral resources, with emphasis on the works of Abram (1994), Gupta and Krishnamurthy (2005), Castor and Hedrick (2006), Chakmouradian and Wall (2012), Haque et al. (2014), Antoniassi (2017) and Souza, Nascimento and Giese (2019). These studies provided the theoretical basis for understanding the chemical properties, the technological challenges of extraction and the recent trends of innovation in the rare earth production chain.

The documentary analysis included technical and institutional reports from public agencies and research centers, such as the National Department of Mineral Production/National Mining Agency, the Center for Mineral Technology (CETEM) and specialized publications that deal with the reserves, production and technological challenges associated with rare earths in Brazil, with emphasis on the state of Minas Gerais. Normative and legal documents were also examined, especially **Law No. 9,279/1996 (Industrial Property Law)**, in order to identify the legal protection mechanisms applicable to technological innovations developed in the field of mining and mineral processing.

The spatial focus of the research is concentrated in the **state of Minas Gerais**, due to its geological and strategic relevance in the Brazilian context of rare earths, especially with regard to the alkaline and alkaline-carbonatitic complexes and the recent initiatives of technological characterization and reuse of mineral waste. Such a delimitation allows for a more in-depth analysis of the relationship between territory, natural resources and innovation policies.

The analysis of the collected data was carried out through **qualitative content analysis**, seeking to identify convergences, gaps and tensions between the existing geological potential, the stage of technological development of the extractive routes and the legal framework for the protection of industrial property. This analysis made it possible to discuss how the protection of technological innovations associated with rare earths can contribute to the aggregation of value to the mineral resource, to the reduction of external dependence and to the strengthening of technological sovereignty.

The recent literature on rare earths in Brazil has emphasized the existence of a "Brazilian paradox", characterized by the coexistence between an expressive geological endowment and a still incipient production, especially with regard to the higher value-added stages of the production chain. In this sense, Júlio Edstron Secundino Santos has highlighted that, although Brazil is among the countries with the largest known reserves of rare earths, its insertion in global chains remains limited to the export of raw materials or low-processing products, which compromises the strategic use of these elements in the context of energy transition and sustainable development. This reading reinforces the idea that mineral abundance, by itself, does not automatically translate into technological sovereignty, and that it is necessary to articulate industrial policies, innovation and knowledge protection.

In addition, Fernando Landgraf points out that the country has not only relevant natural resources, but also installed technical-scientific capacity, capable of sustaining more ambitious strategies for the rare earths sector. For the author, the central challenge lies in overcoming institutional, regulatory and coordination obstacles between public and private actors, in order to transform geological wealth into a competitive industrial base. This perspective dialogues directly with the notion of long-term strategic planning defended by contemporary science, technology, and innovation policies.

In the field of applied technology, the work of André Nunis, a researcher at the Institute for Technological Research (IPT), shows concrete advances in the construction of a national chain for the production of permanent magnets made of rare earths, such as the MAGBS project. These initiatives demonstrate that Brazil already has the technical competence to advance in strategic segments of the production chain, especially those associated with the

high-tech industry, such as electric motors, renewable energy generation and electric mobility. The existence of these projects reinforces the importance of protection via industrial property, as a way to safeguard the knowledge generated and avoid its external appropriation.

From a sociopolitical perspective, Elaine Santos, in an article published in *Jornal da USP* in December 2025, analyzes the debate on rare earths in light of structural inequalities and the risks of reproduction of a primary-export model. The author draws attention to the need to incorporate social, environmental, and territorial criteria into mineral exploration strategies, preventing the race for critical minerals from reinforcing regional asymmetries and compromising the rights of local communities. This approach broadens the technical debate by incorporating sociological and institutional dimensions into the discussion on technological sovereignty.

In the field of geological research, teams linked to federal universities such as UFSM, UFRGS and Unipampa, in Rio Grande do Sul, and the Federal University of Roraima have identified new occurrences and relevant concentrations of rare earths in different geological contexts. These studies reinforce the role of public research institutions in expanding national geoscientific knowledge and reducing exploratory uncertainties, an essential element for the strategic planning of the mineral sector and for the formulation of evidence-based public policies.

At the international level, recent research has also contributed to deepening the understanding of the technological and geopolitical challenges associated with rare earths. Juan Diego Rodriguez-Blanco and Melanie Maddin of Trinity College Dublin published in 2024 a study that revisits the formation models of bastnäsite, one of the main rare earth bearing minerals, demonstrating the complexity of the geochemical processes involved and questioning previously accepted simplified models. These scientific advances reinforce the idea that the technological mastery of the rare earth chain depends on frontier research and the constant updating of geological and metallurgical models.

The geopolitical dimension of the topic is widely discussed by Kalim Siddiqui, who, in a 2025 report, analyzes the emerging tensions around critical minerals and rare earths, with emphasis on the high concentration of supply and processing in China. The author argues that this concentration generates strategic vulnerabilities for import-dependent countries, intensifying trade disputes and encouraging national policies of reindustrialization and security of supply, a scenario in which Brazil occupies a potentially strategic position, as long as it advances in policies of value addition and innovation.

Additionally, international studies in the area of ecotoxicology, conducted by authors such as R. R. Samal, Ź. Arciszewska, C. Figueiredo and M. Andrade, have evidenced the

environmental impacts associated with the dispersion of rare earths in aquatic ecosystems and their interaction with biomacromolecules. These works reinforce the need for environmentally responsible extraction and processing technologies, as well as regulatory frameworks capable of mitigating socio-environmental risks, a central aspect for the social legitimacy of mineral policies.

Finally, strategic reports prepared by authors such as Karl Friedhoff, from the *Chicago Council on Global Affairs*, and by institutions such as the International Energy Agency (IEA) and the London School of Economics (LSE) highlight that the future of the global rare earths market will depend on the diversification of supply chains, the strengthening of national industrial policies, and continuous investment in science, technology and innovation. These analyses converge in pointing out that countries endowed with mineral resources, such as Brazil, will only be able to occupy a relevant position in this scenario if they are able to articulate scientific knowledge, legal protection, strategic planning and territorial governance.

The methodology adopted allowed the integration of different fields of knowledge geosciences, mineral technology, biotechnology and industrial property law in an interdisciplinary way, consistent with the objectives of the study and with the level of depth required in a scientific academic article.

Legislative Advances in the National Policy on Critical and Strategic Minerals Implications for Rare Earths and Technological Sovereignty

On December 9, 2025, the **Committee on Economic Affairs (CAE)** of the Federal Senate approved the report that establishes the **National Policy on Critical and Strategic Minerals**, through the substitute for *Bill No. 4443/2025*, authored by Senator Renan Calheiros, with a favorable opinion from the rapporteur Senator Esperidião Amin (PP-SC). This approval represents a relevant institutional milestone for the development of the strategic minerals chain in Brazil, including rare earth elements, and reaffirms the need for structured public policies that promote the aggregation of value, mineral processing in the national territory and the security of the national industry in the face of contemporary geopolitical challenges (SENADO FEDERAL, 2025).

The proposal approved in the CAE provides for instruments aimed at stimulating the processing and industrialization of critical minerals in the country, with the determination that a relevant part of the ore extracted, such as **up to 80% of rare earths, be processed and industrialized in Brazilian territory**, as a way to **ensure control over mineral wealth and prevent the export exclusively of raw inputs** (FEDERAL SENATE, 2025).

This requirement for national processing directly articulates the technical-legal debate on the importance of transforming mineral resources into **technologies, processes and**

products with higher added value, overcoming a historical pattern of commodity exports and reinforcing the **country's technological and industrial sovereignty**.

The substitute also includes the periodic updating of the **Brazilian List of Critical and Strategic Minerals**, the creation of **Mineral Transformation Processing Zones (ZPTMs)**, specific tax and credit incentives, financing mechanisms, public-private partnerships and research consortia, all interpreted as indispensable instruments to promote technological innovation and competitiveness of the mineral sector (FEDERAL SENATE, 2025). These instruments align with recent debates that advocate the need **for long-term strategic planning for critical minerals**, integrating research and development (R&D), technological capacity building, and industrial policies that go beyond simple geological exploitation, promoting **sustainable and inclusive innovation strategies**.

In addition, the proposition approved in the CAE amends provisions of **the Mining Code** with the objective of accelerating the return of unexplored areas and reducing speculative mechanisms for withholding mining rights, which may contribute to a more efficient and transparent territorial governance structure, reducing administrative obstacles and promoting greater predictability for mining and industrial transformation projects (FEDERAL SENATE, 2025). This regulatory dimension reinforces the importance of a legal framework that articulates **strategic planning, governance, and sustainability**, creating conditions for Brazil to develop technological and productive competencies essential to the twenty-first century.

From a political-institutional point of view, the approval of the substitute by the Senate is part of a broader context of public policy formulation that recognizes the role of critical minerals in the **energy transition, economic security, and the dispute over global value chains**. The agenda reflects not only national interests, but also international pressures and expectations regarding Brazil's positioning as a reliable and sustainable supplier of strategic minerals for advanced technologies, contributing to overcoming structural vulnerabilities and external dependencies already identified in the rare earths sector (BNAMERICAS, 2025).

Finally, the approval in the CAE indicates a significant advance for the implementation of a **regulatory framework that combines control of natural resources with stimulation of technological innovation and legal protection of innovative processes**, elements that, when articulated with instruments such as the **Industrial Property Law**, have the potential to transform the competitiveness profile of the Brazilian mineral sector. By promoting domestic industrialization and encouraging the development of extraction, processing and recycling technologies, including in synergy with socio-environmental sustainability

measures, this National Policy signals a concrete unfolding of the debate on **technological sovereignty, value aggregation and sustainable territorial development** in Brazil.

4 RESULTS AND DISCUSSION

A critical reading of the bibliographic and documentary set analyzed allows us to affirm that the "strategic value" of rare earths does not derive only from the existence of deposits, but above all from the ability to **convert geological potential into technological competence**, with institutional, environmental and legal support. In practical terms, this means that the Brazilian comparative advantage tends to remain incomplete as long as the country does not robustly master the stages of **concentration, separation, purification and transformation** into industrial inputs (oxides and metals) and, mainly, into **goods with higher added value**, such as alloys and permanent magnets, critical components for the energy transition (ABRÃO, 1994; CASTOR; HEDRICK, 2006; CHAKMOURADIAN; WALL, 2012; HAQUE et al., 2014).

From a technical point of view, the literature confirms that a relevant part of the cost and industrial risk is associated with the very nature of REEs: the similarity of chemical behavior between lanthanides linked to lanthanide contraction imposes complex separation and refining routes, usually intensive in energy and reactants, with direct effects on economic viability and environmental control requirements (ABRÃO, 1994; GUPTA; KRISHNAMURTHY, 2005).

This finding is particularly relevant for Minas Gerais, whose importance stands out for deposits associated with alkaline and alkaline-carbonatitic complexes (such as Araxá) and for mineralogical and metallogenetic contexts that require detailed characterization to guide technological and economic decisions (ANTONIASSI, 2017; TRAVERSA et al., 2001; NEWMANN; MEDEIROS, 2015; ISSA FILHO; LIMA; SOUZA, 1984).

In this context, a central interpretative result of the study is the identification of a **"middle of the chain" bottleneck** in Brazil: even if there are relevant reserves, the consolidation of a national chain depends less on the mining itself and more on the industrial domain of processing and separation, as well as on the creation of transformation capacities into strategic products.

This gap helps to explain the "paradox" reiterated in the recent literature: **geological opulence coexisting with low industrial production and external dependence**, especially in the technological stages with the highest density of knowledge (DNPM, 2014; SOUZA; NASCIMENTO; GIESE, 2019).

In the field of technological alternatives, the findings discussed reinforce that conventional routes do not need to be abandoned, but **complemented and modernized** by solutions with less impact and greater efficiency.

The reviewed literature indicates that biohydrometallurgical routes such as **bioleaching and biosorption** have been gaining ground due to their potential to reduce energy consumption and chemical load, in addition to increasing the feasibility of using low-grade and waste matrices, bringing mining closer to a circular economy logic (AMIN et al., 2014; BARMETTLER et al., 2016; BRISSON; ZHUANG; ALVAREZ-COHEN, 2015; SOUZA; NASCIMENTO; GIESE, 2019).

In this sense, the discussion points out that technological innovation is not only an "efficiency improvement", but a structuring element to reconcile competitiveness with sustainability, especially in scenarios where environmental and social aspects influence access to markets and financing.

Still in this axis, the research shows that the **recycling of REEs** tends to consolidate itself as an inevitable strategic dimension. Recovery from industrial waste, electrical and electronic equipment and permanent magnets can reduce vulnerabilities related to external volatility and geopolitical asymmetries of supply, functioning as a complement to primary mining and as a vector of innovation in separation processes.

The absence of a robust and coordinated national policy for rare earth recycling emerges as a relevant institutional weakness, as it limits the construction of resilient chains and hinders the use of urban mining as a technological-industrial asset.

At the institutional and informational level, the analysis of the role of the Geological Survey of Brazil (SGB) shows that **geoscientific knowledge is a strategic infrastructure of the State**. By disclosing estimates and clarifying the mismatch between reserves and production, the SGB supports an evidence-based public policy agenda, drawing attention to the need to transform geological potential into technically known and economically exploitable reserves, overcoming technological, logistical and infrastructure limitations (SGB, 2025; BRASIL MINERAL, 2025; MINERAL CONNECTION, 2025). For Minas Gerais, this reinforces the importance of integrating mapping, mineralogical characterization and technological evaluation as preconditions to reduce uncertainties and guide choices about processing routes and industrial projects.

The legal-institutional dimension appears as a decisive vector of the results: **Law No. 9,279/1996** becomes especially relevant because the capture of value in rare earths occurs, to a large extent, in the sphere of **processes** (separation, purification, hydrometallurgical and

biohydrometallurgical routes), **advanced materials** (alloys, magnets, catalysts) and **industrial applications**. that is, in the domain of codifiable and securable knowledge.

The discussion indicates that the absence of industrial property strategies tends to perpetuate technological dependencies, while their adoption creates conditions for value retention, investment attraction, and strengthening of the national capacity for innovation and technology transfer.

At this juncture, the results of the study gain political density by dialoguing with the recent legislative agenda. The approval, in the CAE of the Federal Senate, of the report that establishes the National Policy on Critical and Strategic Minerals (within the scope of the substitute for PL No. 4,443/2025) signals a relevant inflection: the policy proposes instruments to stimulate processing and industrialization in the national territory and explains the guideline to expand the internal processing of critical minerals, articulating incentives, processing zones, financing mechanisms, and periodic updating of the list of strategic minerals (FEDERAL SENATE, 2025).

In analytical terms, it is a movement that tries to shift Brazil from a predominantly primary-export position to an **industrialization strategy guided by technological sovereignty**, capable of internalizing stages of greater added value.

In addition, the provision of regulatory adjustments, including measures aimed at rationalizing the use of mining areas and addressing speculative retentions, tends to directly influence the governance of the sector and the predictability of industrial and ST&I projects, a central aspect when it comes to critical minerals, whose attractiveness depends on institutional stability and long-term planning (FEDERAL SENATE, 2025).

The debate also connects to international pressures for safe and sustainable supply chains, in which Brazil is often seen as a potential supplier of strategic minerals; this expectation can be an opportunity (investment attraction) or a risk (reprimarization), depending on the institutional design and the degree of domestic value added (BNAMERICAS, 2025).

Thus, the discussion converges on a key point: it is not enough to "have" rare earths; it is necessary to govern them as a State policy, articulating a robust geoscientific base, a ST&I agenda oriented to the bottlenecks of separation, refining, recycling and development of advanced materials, economic and regulatory instruments capable of encouraging internal industrialization, a consistent industrial property strategy to protect and scale the knowledge generated, and territorial governance that reduces conflicts, distribute benefits and strengthen regional capacities, especially in Minas Gerais.

Why the Immediate Environmental Licensing of Rare Earths in Minas Gerais is a Wrong Decision

The repeated postponement of the vote on the environmental licensing of large rare earth exploration projects in Minas Gerais reveals more than mere procedural obstacles: it exposes structural weaknesses in the decision-making model adopted for the management of a strategic mineral resource whose exploitation involves environmental, social and technological risks that are still insufficiently understood in the Brazilian context. In this sense, within the scope of Civil Inquiry No. 1.22.000.004558/2022-65, the Federal Public Prosecutor's Office issued MPF/MG Recommendation No. 30, of September 3, 2025, directing the competent state agencies, notably the State Secretariat for the Environment and Sustainable Development, the State Environmental Foundation and the State Council for Environmental Policy to suspend the analysis of the environmental licensing processes related to the Colossus projects, in Poços de Caldas, and Caldeira, in the municipality of Caldas. The recommendation was based on the insufficiency of independent technical studies and the need to deepen the analysis of the potential environmental and social impacts of these projects, whose complexity goes beyond the parameters ordinarily used in licensing processes.

The MPF's action is expressly anchored in the precautionary principle, according to which the absence of scientific certainty cannot be invoked as a justification for the adoption of decisions potentially causing serious or irreversible damage. Among the concerns highlighted in the inquiry and the recommendation are the environmental and nuclear risks associated with the extraction of rare earths often linked to the presence of radioactive elements, as well as the water impacts resulting from the movement of large volumes of clay and the use of chemical leaching techniques. Such practices can compromise strategic aquifers, such as the Poços de Caldas Alkaline Aquifer, the main source of supply in the region, in addition to producing cumulative effects on ecosystems interconnected to the Atlantic Forest biome. In addition, the MPF highlighted the possibility of violation of the right to prior, free and informed consultation of potentially affected traditional peoples and communities, in line with grounds already adopted in similar recommendations involving lithium mining in Minas Gerais. Notwithstanding the clarity of the ministerial orientation, the maintenance of some of these processes on the Copam voting agenda generated institutional controversies and successive decision-making postponements, evidencing tensions between the logic of economic acceleration and the constitutional requirements of environmental protection and collective rights. (RÁDIO DA FAMÍLIA, 2025).

In addition, factors such as the proximity of deactivated nuclear areas such as the Caldas Decommissioning Unit (UDC) of Indústrias Nucleares do Brasil and the absence of broad participation of local populations, including traditional communities, aggravate the complexity of the licensing process. The MPF also pointed out the need for regionalized studies and the performance of a Strategic or Integrated Environmental Assessment for the Poços de Caldas Plateau, instead of a fragmented licensing focused on isolated projects, which does not capture the synergistic effects of multiple mining operations in the same region (RACISMO AMBIENTAL, 2025).

The attempt to move quickly with licensing represents a mistake from an environmental, social and territorial governance point of view, as it underestimates the complexity of the risks involved and ignores the importance of a more robust and transparent deliberative process. Permit approval is mistakenly assumed to be a mere bureaucratic step, when in fact it can trigger lasting impacts on water quality, local biodiversity, public infrastructure, and the livelihoods of communities directly affected.

From a strategic point of view, this stance also ignores what economic analysts emphasize about the sector: the central challenge for Brazil is not only the release of areas for exploration, but the sustainable and technological transformation of reserves into an effective supply of strategic products. As highlighted in recent analyses, the country's main difficulty in converting its high geological potential into concrete economic or technological power does not stem from legal restrictions on foreign access or concession per se, but from gaps in processing technology, refining, integrated industrial policy, and investment in innovation (CNN Brasil, 2025)

Moving forward in a hasty manner with exploration licenses, without a solid scientific basis, effective environmental monitoring mechanisms, guarantees of broad consultation with affected populations and clear strategies for mitigating cumulative impacts, can result not only in significant environmental damage, but also in socioeconomic costs that burden the State and weaken the legitimacy of mineral public policies. The example of Minas Gerais illustrates that the race for rare earths cannot be treated as an end in itself, but must be articulated with agendas of sustainable development, technological sovereignty and respect for the constitutional principles of protection of the environment and the rights of traditional communities.

In short, the decision to repeatedly postpone environmental licensing reflects not only the necessary prudence in the face of scientific uncertainties, but also the need to rethink the way Brazil and Minas Gerais in particular equate the exploration of critical minerals with the

protection of environmental, social and territorial assets. Without this balance, hasty licensing policies can become more of a strategic mistake than a lever for development.

In short, the repeated postponement of environmental licensing for the exploration of rare earths in Minas Gerais should not be interpreted only as an administrative obstacle, but as an indication of the need to rethink, in a structural way, the model adopted for the management of critical minerals in Brazil. The hasty granting of licenses, dissociated from technological, institutional and strategic criteria, tends to reproduce a historical pattern of primary exploitation, with high environmental and social risks and with limited capacity to retain value in the territory.

In this context, licensing, when treated as a mere authorizing instrument, can become a strategic error, as it favors the immediate exploitation of resources without guaranteeing counterparts in terms of innovation, industrialization and regional development.

Geopolitics of Strategic Resources: The Attack on Venezuela and the Impacts on the Global Oil and Rare Earths Market

The intensification of geopolitical tensions involving Venezuela, especially after the political, economic, and diplomatic offensive conducted by the United States starting in 2025 and deepening in early 2026, highlights the centrality of strategic natural resources in the contemporary reorganization of global value chains. Although the international debate has focused predominantly on the immediate effects on the global oil market, recent analyses indicate that the consequences of this conflict go beyond the energy sector, also reaching critical minerals, such as rare earths, essential inputs for the energy transition, the high-tech industry, and defense systems (G1, 2026).

Venezuela holds one of the largest oil reserves in the world and occupies a historical position of relevance in global energy geopolitics. The adoption of unilateral measures and external offensive actions, often justified under discourses of hemispheric security and resumption of regional influence – associated with the so-called Monroe Doctrine – caused instability in international energy markets. As a result, there was an increase in oil prices, an increase in volatility, and an increase in the perception of systemic risk, leading large economies to reinforce strategies for diversifying suppliers and supply routes, with emphasis on China's strategic repositioning in the face of the uncertainty scenario (G1, 2026; AGÊNCIA BRASIL, 2025).

According to financial market analyses, the U.S. offensive against Venezuela has also produced relevant indirect effects on peripheral and emerging economies, including Brazil. The increase in global uncertainty impacted investment flows, exchange rates, commodity prices, and industrial expectations, reinforcing the vulnerability of countries dependent on the

import of strategic inputs and the export of primary products (INFOMONEY, 2026). These chain effects show how geopolitical shocks in the energy sector tend to radiate impacts to other strategic segments of the global economy.

In this context, rare earths assume an increasingly sensitive role in international geopolitical dynamics. Like oil, these elements are not only strategic because of their geological existence, but above all because of the technological and political control of the critical stages of their production chain. The global concentration of beneficiation, separation, purification, and industrial application activities confers significant geoeconomic power to countries that master these technologies, making the others vulnerable to supply interruptions, trade pressures, and exogenous geopolitical decisions. The instability observed in Venezuela, added to global trade and technological disputes, reinforces the trend of securitization of critical mineral chains, bringing them closer and closer to the logic historically applied to oil (AGÊNCIA BRASIL, 2025).

For Brazil, and particularly for Minas Gerais, this international scenario works as a strategic alert. The historical dependence on primary-export models, associated with the fragility in the protection of innovation and the absence of integrated industrial policies, creates the risk of reproduction, in the rare earths sector, of the same logic of structural vulnerability observed in the Latin American oil market. The pressure for accelerated environmental licensing, dissociated from institutional, technological, and legal strengthening, tends to insert the country in a subordinate way in global value chains, promoting the transfer of knowledge, added value, and decision-making power to external actors (INFOMONEY, 2026).

Thus, the offensive against Venezuela should not be interpreted only as an isolated episode in energy geopolitics, but as a clear indication that strategic resources – are not the only ones – to be seen in the country. In this context, the articulation between mineral policy, technological innovation, and intellectual property protection emerges as an indispensable element to break historical cycles of dependence, allowing countries rich in natural resources to advance to higher stages of the value chains and reduce their exposure to external shocks and geopolitical decisions alien to their national interests

In light of the geopolitical scenario analyzed, especially the international tensions unleashed around Venezuela and their repercussions on global markets for strategic oil and minerals, this article argues that the technological sovereignty associated with rare earths should be conceived as an integrated and strategically oriented institutional arrangement.

In this arrangement, environmental licensing ceases to be a merely authorizing instrument and starts to play an inductive function, articulating with specific mechanisms for

the protection of the national interest. Such mechanisms include the requirement of processing and adding value in the national territory, the protection of innovations through industrial property instruments, the strengthening of territorial governance and the definition of safeguards capable of avoiding the exclusive appropriation of these resources by foreign capital. Only from an approach that transcends the traditional extractivist logic and that subordinates mineral exploration to clear industrial, scientific and technological policy objectives will it be possible to convert rare earths into structuring platforms for sustainable industrial, scientific and territorial development, compatible with a long-term project of national sovereignty and less vulnerable to external geopolitical shocks.

5 CONCLUSION

The analysis developed throughout this article shows that the debate on rare earths in Minas Gerais and in Brazil more broadly goes beyond the limits of geology and mining activity, inserting itself in the strategic core of science, technology, innovation and national sovereignty policies. In an international scenario marked by the intensification of geopolitical disputes, instability in global supply chains and high technological concentration, the mere availability of mineral reserves, although relevant, is insufficient to ensure technological autonomy, economic security or long-term development.

The results obtained indicate that the main Brazilian challenge lies in the ability to convert geological potential into endogenous technological and industrial skills. Such conversion presupposes mastery of the most sensitive and strategic stages of the rare earths chain: processing, separation, purification, recycling and the development of advanced industrial applications in which most of the added value and geoeconomic power is concentrated.

In this sense, technological innovation, including the development of advanced hydrometallurgical routes and biohydrometallurgical alternatives, emerges as a structuring element to reconcile economic competitiveness, environmental sustainability and reduction of external vulnerabilities.

The discussion also demonstrates that the governance of critical minerals cannot be dissociated from the legal-institutional framework. The Industrial Property Law plays a central role in the protection of the knowledge generated, in the prevention of the misappropriation of strategic technologies and in the creation of conditions for the retention of value in the national territory. The protection of innovations associated with rare earths shifts the axis from the exploitation of simple access to natural resources to the control of critical technologies, configuring itself as an indispensable pillar of a strategy of technological sovereignty.

At the political-institutional level, recent advances related to the National Policy on Critical and Strategic Minerals represent a relevant inflection in the Brazilian public agenda. However, the study maintains that such initiatives will only be effective if accompanied by robust coordination mechanisms between the Union, states and municipalities, by clear requirements for the aggregation of local value and by instruments capable of avoiding the exclusive capture of these resources by external interests. In this context, environmental licensing should not be understood only as an authorizing procedure, but as a strategic tool to induce technological development, innovation and sustainable territorial planning.

Finally, it is concluded that the construction of a consistent policy for rare earths in Minas Gerais requires an integrated and prospective approach, capable of articulating geoscientific knowledge, technological innovation, legal protection, territorial governance and long-term strategic planning. Only from this integration will it be possible to transform rare earths from a finite and vulnerable mineral asset into a structuring vector of industrial, scientific and sustainable development, aligned with national interests, technological sovereignty and the economic, environmental and geopolitical requirements of the 21st century.

ACKNOWLEDGMENTS

The author thanks the **State University of Minas Gerais (UEMG)**, especially the **Professional Master's Program in Intellectual Property and Technology Transfer for Innovation (PROFNIT)**, for the academic environment of excellence and for the critical and interdisciplinary training provided throughout the course. It is worth noting, in particular, the recognition of the **UEMG Graduate Scholarship Program (ProBPG/UEMG)** for the educational incentive granted, whose financial support was fundamental for the dedication to research, study and scientific production activities. The funding offered contributed decisively to the development of this work, reaffirming the role of public policies to support graduate studies in the promotion of science, innovation and qualified training of human resources.

ABSTRACT

The need to readjust energy production methods to reduce environmental impact involves the strategic use of biomass. Through biomass densification, which can be made up of agricultural waste, it is possible, using the briquetting technique, to obtain high-density blocks with a high degree of compaction, defined as briquettes. Briquettes are high-energy materials that can significantly contribute to the energy matrices of various countries. A proposal for the development of studies aimed at guaranteeing and optimizing the production of briquettes using green coconut husk residue mixed with crude glycerol (resulting from the biodiesel production process) could optimize the production of high-quality coated briquettes with a sustainable character. The proposal is based on studies already developed and found in the literature, in which green coconut fiber is collected, used in its natural state or transformed into charcoal by slow pyrolysis, mixed in predefined proportions with glycerol to obtain briquettes. The physicochemical properties of these briquettes are evaluated simultaneously with characterization tests, with the aim of determining an ideal proportion of the mixtures of the components involved that result in briquettes with better energy performance for specific applications. The development of proposals such as this implies a scientific contribution to the current energy transition process and can also solve local and/or regional problems related to the high production and inadequate disposal of green coconut husks. Although the demand for briquettes made from green coconut waste in Brazil and other coconut-producing

regions is influenced by several factors, its market potential in the industrial, commercial, and residential sectors can be considered. Although it is challenging to precisely quantify the current demand for green coconut waste briquettes in Brazil without access to specific market data, the significant potential for growth in this demand is evident, driven by the need for low-carbon energy sources, sustainability, and the development of public policies that encourage the use of renewable energies, stimulating market prospecting. Thus, briquette production can open new markets and create local value chains, generating income for coconut-producing communities due to its energy efficiency.

RESUMO

A necessidade de readequar os meios de produção de energia para reduzir o impacto ambiental envolve o aproveitamento estratégico da biomassa. Por meio do adensamento da biomassa, que pode ser constituída por agro resíduos, é possível, com a técnica de briquetagem, a obtenção de blocos de alta densidade e alto grau de compactação definidos como briquetes. Os briquetes são materiais de alto valor energético que podem contribuir significativamente nas matrizes energéticas de diversos países. Uma proposta de desenvolvimento de estudos que visem garantir e otimizar a produção de briquetes utilizando resíduo de casca de coco verde misturadas ao glicerol bruto (resultante do processo de produção de biodiesel) poderá otimizar a obtenção de briquetes de elevada qualidade revestidos de caráter sustentável. A proposta se baseia em estudos já desenvolvidos e encontrados na literatura, na qual a fibra de coco verde é coletada, utilizada in natura ou transformada em carvão por pirólise lenta, misturadas em proporções pré-definidas com o glicerol, para a obtenção de briquetes com a avaliação de suas propriedades físico-químicas de forma simultânea com ensaios de caracterização, com o intuito de determinar uma proporção ideal das misturas dos componentes envolvidos que resultem em briquetes de melhor desempenho energético para aplicações específicas. O desenvolvimento de propostas como esta implica em contribuição científica no processo de transição energética atual podendo ainda solucionar problemáticas locais e/ou regionais relacionadas à elevada produção e descarte inadequado de cascas de coco verde. Embora a demanda por briquetes de resíduos de coco verde no Brasil e em outras regiões produtoras de coco seja influenciada por vários fatores, é possível considerar o seu potencial de mercado nos setores industrial, comercial e residencial. Ainda que seja um desafio quantificar exatamente a demanda atual por briquetes de resíduos de coco verde no Brasil sem acesso a dados de mercado específicos, é evidente o potencial significativo para o crescimento dessa demanda, impulsionado pela necessidade de fontes de energia de baixo carbono, pela sustentabilidade e pelo desenvolvimento de políticas públicas que incentivem o uso de energias renováveis, estimulando a prospecção mercadológica. Assim, a produção de briquetes pode abrir novos mercados e criar cadeias de valor locais, gerando renda para comunidades produtoras de coco dada a sua eficiência energética.

RESUMEN

La necesidad de reajustar los métodos de producción de energía para reducir el impacto ambiental implica el uso estratégico de la biomasa. Mediante la densificación de la biomasa, que puede estar compuesta por residuos agrícolas, es posible, mediante la técnica de briquetado, obtener bloques de alta densidad y alta compactación, conocidos como briquetas. Las briquetas son materiales de alto valor energético que pueden contribuir significativamente a las matrices energéticas de diversos países. Una propuesta para el

desarrollo de estudios destinados a garantizar y optimizar la producción de briquetas utilizando residuos de cáscara de coco verde mezclados con glicerol crudo (resultante del proceso de producción de biodiésel) podría optimizar la producción de briquetas recubiertas de alta calidad y con un carácter sostenible. La propuesta se basa en estudios ya desarrollados y encontrados en la literatura, en los que se recolecta fibra de coco verde, se utiliza en su estado natural o se transforma en carbón vegetal mediante pirólisis lenta, mezclándose en proporciones predefinidas con glicerol para obtener briquetas. Las propiedades fisicoquímicas de estas briquetas se evalúan simultáneamente con pruebas de caracterización, con el objetivo de determinar la proporción ideal de las mezclas de los componentes involucrados que resulten en briquetas con mejor rendimiento energético para aplicaciones específicas. El desarrollo de propuestas como esta supone una contribución científica al proceso actual de transición energética y también puede resolver problemas locales y/o regionales relacionados con la alta producción y la eliminación inadecuada de la cáscara de coco verde. Si bien la demanda de briquetas elaboradas con residuos de coco verde en Brasil y otras regiones productoras de coco está influenciada por diversos factores, se puede considerar su potencial de mercado en los sectores industrial, comercial y residencial. Si bien resulta difícil cuantificar con precisión la demanda actual de briquetas de residuos de coco verde en Brasil sin acceso a datos específicos del mercado, el importante potencial de crecimiento de esta demanda es evidente, impulsado por la necesidad de fuentes de energía bajas en carbono, la sostenibilidad y el desarrollo de políticas públicas que fomenten el uso de energías renovables, estimulando la prospección de mercado. Por lo tanto, la producción de briquetas puede abrir nuevos mercados y crear cadenas de valor locales, generando ingresos para las comunidades productoras de coco gracias a su eficiencia energética.

1 INTRODUCTION

Biomass is understood as one of the main sources of energy in the world, with the expectation of greater participation in the energy matrices of several countries, especially those with greater potential for agricultural production. While European countries and the USA are making significant progress towards the development of technologies for the use of biomass, Latin American countries, including Brazil, still need to focus more attention on reducing the use of firewood, coal and petroleum products in power generation.

One of the viable alternatives to act directly on the problem related to the use of this type of input is the use of biomass, which is a raw material to supply modern bioenergy production chains, including the use of pellets or briquettes (produced from the compaction of residual biomass such as agro-waste) for the generation of electricity and heat (Silva *et al.*, 2022).

Resulting from agricultural activities, agro-waste consists mainly of organic materials and involves leaves, stems, bark, seeds and bagasse, among other parts of the plants (Moorthy; Bibi, 2023). They can be used in the production of biosorbent materials, agricultural substrates and biodegradable materials, playing an important role in the transition to a circular economy (Singh *et al.*, 2023).

In some countries, the consumption of coconut water and green coconut pulp has increased the generation of coconut shells, which are waste that are difficult to collect and properly dispose of, producing severe social, economic and environmental impacts. The use of the large amount of this permanently generated biomass meets a growing demand for more sustainable energy generation processes that contribute to the reuse of solid waste, mitigation of greenhouse gas emissions and reduction of global warming (Miola *et al.*, 2020).

From the pressing and densification of small pieces of biomass, such as pruning wood or coconut shells, briquettes can be obtained, which have a density between 650 and 1,200 kilograms per cubic meter, a diameter of approximately 60 mm and a length of 250 to 300 mm (EMBRAPA, 2012). The quality and performance of a briquette depend on several factors, such as the production technique and geometry used, but mainly on moisture, ash content, possible surface modifications of the vegetable fibers and the quality of the binder used, an aspect that requires further development and innovation. The burning of biomass in the form of briquettes with high calorific value represents, in addition to energy production, the reduction of methane gas emissions derived from the decomposition of biomass, especially when the material is improperly disposed of in dumps, buried or not (Zhanga; Suna; Xua, 2018).

The production of good quality briquettes from biomass is highlighted by the important contribution of the implementation of appropriate technologies for energy production and waste management in developing countries, including the application of the energy generated in the combustion of briquettes to feed electrolyzers and green hydrogen production (Zhang *et al.*, 2022).

2 THEORETICAL FOUNDATION

2.1 GENERAL CONSIDERATIONS

The search for alternative energy sources is an emergency and has been a trend around the world (Raju *et al.*, 2021).

Carbon production by biomass is a major industrial source of energy conversion. In countries with large agricultural production, such as African and Asian countries and Brazil, similar scenarios occur: after harvesting, a significant amount of agricultural residues or residues remain, which can be used as biomass energy (Promdee *et al.*, 2017).

It is expected that by 2030, approximately one billion individuals in emerging economies will suffer serious difficulties in using primary energy. A significant part of its primary energy demand is met through firewood. Unsustainable harvesting practices used in the routine harvesting of forest resources for residential and commercial purposes pose serious threats to climate change, environmental degradation, biodiversity loss and risks to human health (Ossei-Brmang *et al.*, 2024). This results in an annual depletion of about 3.9 million hectares and a loss of carbon assets totaling up to 317 Mton within these forest reserves, as reported by FAO (2021).

Biomass valorization can be effected by different paths and technologies, including briquetting, incineration, pyrolysis, gasification and hydrogen production. These are initiatives to reduce the environmental impact associated with the final disposal of waste and greenhouse gas emissions, mainly methane (CH₄) and carbon dioxide (CO₂) (González; López; Pérez, 2020).

Densification (manufacture of pellets and briquettes) represents a promising strategy for the reuse of biomass. Pelleting and briquetting facilitate the production of solid biofuel with low moisture content, high bulk and particle density, as well as homogeneous shape and size, with high calorific value (González; López; Pérez, 2020).

The low bulk density of agro-waste requires densification via briquetting and/or pelleting (briquettes and pellets are biofuels with high energy content by volume and, in most Latin American countries, densified biofuels are still an emerging market, despite having a

great potential for production already explored in European countries and the USA, due to the high calorific value and valued environmental appeal (Silva *et al.*, 2022).

2.2 AGRICULTURAL WASTE

In order to comply with the seventh Sustainable Development Goal (SDG 7), which advocates "Ensure access to affordable, reliable, sustainable and modern energy for all", it can be seen that there is a need to increase efforts to replace firewood with efficient, clean energy sources with less negative environmental impact (Akam *et al.*, 2024).

The use of municipal and solid waste as an alternative source of energy needs further research. Producing fuel briquettes with naturally available and biodegradable waste is an advantage. The use of biomass briquettes has environmental benefits that include reduced tree degradation, better waste management, and reduced emissions (Raju *et al.*, 2021).

Although there are several ways to convert biomass into energy, several studies indicate that making biomass briquettes has several benefits, such as improving calorific value and allowing for easy transport, storage, entry into the furnace, and combustion. Briquetting is a sustainable way to provide alternative energy solutions. In addition, briquettes made from biomass are a renewable and cost-effective resource and do not pollute the environment as they do not contain sulfur (Akam *et al.*, 2024).

In the briquetting of coconut shells, the energy balance shows that the useful energy, consumed mainly during the briquetting process, is mechanical and thermal energy. An economic analysis was carried out over a period of 20 years in Cameroon, Africa. This analysis is mainly composed of the cost of employee labor, which represents about 30% of total expenses, after expenses with diesel fuel (10–16% of total expenses). The net value for coconut shell waste was set at €67,189. The economic viability of briquette production is sensitive to the market price of the briquette, the discount rate and the cost of capital. In conclusion, the production of briquettes from crop residues could be economically benefited by the adoption of appropriate strategies in Cameroon and in any developing country (Bot *et al.*, 2022).

Despite the apparent limitations such as low bulk density, transport and storage logistics, and relatively low energy content in relation to fossil fuels, the use of biomass as the waste generated by the production and consumption of green coconut for energy production has particular properties and advantages, such as renewable nature, availability and geographical diversity, facilitating the deployment of energy systems and ensuring a sustainable supply chain in relation to other energy resources (Miola *et al.*, 2020).

2.3 THE GREEN COCONUT

The coconut originated in Sri Lanka and has been planted in 90 countries, but mostly in Asia and the Pacific. Coconuts are produced today at 60.77 million tons per year on 12.30 million hectares in more than 94 countries worldwide (Bot *et al.*, 2022).

The coconut tree belonging to the Palmae Family is known scientifically as *Cocos nucifera* L., and is the source of the multipurpose product known as coconut. The tree is native to Southeast Asia, from where it spread to South America, Africa, and the rest of the Asian continent. Coconut palms flourish in tropical and rainforest climates, especially along the coast, where they enjoy abundant sunlight as well as water and high humidity. In addition to the edible interior, coconut shells are known to be valuable raw materials for the production of activated carbon, a vital material that provides high surface area (1,000 m²/g) for adsorption/absorption of different gases, liquids, emulsions, and fine suspensions (Promdee *et al.*, 2017)

Information on the quantities of green coconut shells discarded in the areas where coconuts are consumed is inaccurate, making it difficult to manage this waste and to assess the potential of this material to obtain other products that, in addition to reducing the impact on the environment, contribute to economic development and the health of populations (Akolgo *et al.*, 2021).

On average, the coconut shell represents about 85% of the weight of the fruit and has a presumed composition of 33.30% lignin, 30.58% cellulose, 26.70% hemicellulose, 8.86% water and 0.56% ash. Due to lack of management and investment by the public or private sector, the peels are not used as raw material for wider production in Brazil (Nunes *et al.*, 2020).

The green coconut shell is formed by fiber and powder, represented by the mesocarp and endocarp of the fruit. Through the crushing and pressing of the shells, a liquid called Green Coconut Shell Liquid (LCCV) can be extracted, which can be used in the formulation of phenolic resins, in fermentation processes, for biogas generation and for fertilization of agricultural crops (Nunes *et al.*, 2020).

There is potential for the use of coconut shells, in the form of fiber or powder, for the production of magnetite nanoparticles, biosorbents for the removal of heavy metal ions, thermal insulation boards, production of agglomerates and panels, substrates for planting vegetables and various fruits, blankets for soil protection, organic filter elements, reinforcement in polymeric matrices, in the aggregation of cement or concrete composites for civil construction and briquette production (energy recovery) (Nunes *et al.*, 2020).

Solid waste management and the growing demand for energy are a global concern. Waste can play the role of an alternative fuel, partially reducing the environmental footprint in the waste management sector. Waste briquetting is used as a treatment option to improve the efficiency of waste combustion, as well as its management and handling (Zhang *et al.*, 2022).

Brazil ranks fourth in the world in coconut production, and the state of Bahia leads with an annual production of approximately 550 thousand tons of fruit (IBGE, 2015). This indicates an amount of up to three million tons of unused green coconut per year (Brasil, 2017). However, it is not known how much green coconut shell is thrown away at the place of consumption, which makes it difficult to manage the amount of waste produced in the region (Santos *et al.*, 2019), making it difficult to manage the waste, associated with the pollution of public spaces (up to 10 years for the coconut shell to degrade in the environment), contributing as places for mosquito breeding and disease transmission (Nunes *et al.*, 2020).

The adequate (gravimetric) quantification of green coconut shell waste in each location makes it possible to raise awareness about reuse and recycling, promoting the saving of natural resources, the reduction of environmental pollution and the generation of direct and indirect jobs (Nunes *et al.*, 2020).

The scale of woody waste generation and inefficient disposal result in substantial costs for municipal management and landfills in Brazil and have environmental implications. A significant amount of solid waste is generated annually, from urban and agricultural environments, and is often not disposed of properly (Marreiro *et al.*, 2024).

The use of green coconut shells as a raw material leads to a reduction in greenhouse gas emissions, considering that the decomposition of this material produces methane (CH₄) especially under anaerobic conditions that occur in dumps (3). Considering the recommendation of the Intergovernmental Panel on Climate Change (IPCC, 2000), the potential for generating methane gas is between 6.0 and 12.3 kg/ton of the shells discarded in the environment (Nunes *et al.*, 2020).

2.4 BRIQUETTES

Briquettes replace firewood and can be produced directly from crushed biomass or in a form of charcoal. Briquetting is a process that transforms biomass or other organic matter into a regular-shaped material that can be used as fuel in boilers or industrial furnaces. To produce a high-quality fuel, it is necessary that the briquettes achieve high calorific value, high density, low ash content, good mechanical resistance and a certain dimensional stability (Nunes *et al.*, 2020).

Briquettes derived from organic waste offer a sustainable energy solution. Factors such as biomass proportion, briquetting pressure, and binder ratio are fundamental to achieve adequate caloric value and mechanical properties (Ossei-Brmang *et al.*, 2024).

An estimate of the average daily amount of green coconut shells needed to supply an industrial briquetting machine corresponds to a volume of 56 m³. When such an amount is used for the production of new goods, the useful life of the discarded bark is extended and there is less waste added to landfills and dumps. The equivalent amount of fiber (in kilograms per month) that these wasted shells could generate is approximately 25% of the fiber per unit of coconut (Nunes *et al.*, 2020).

It is important to consider that most Brazilian cities that produce or consume green coconut do not have landfills or other forms of waste management, such as reverse logistics, recycling, reuse or energy recovery (Nunes *et al.*, 2020).

Waste briquetting is an option that facilitates transport, handling and storage and improves the quality of material combustion. The waste becomes effective to be used to replace firewood, kerosene, charcoal, among other fossil fuels and biomass-based (Zhang *et al.*, 2022).

The production of briquettes from green coconut shells is still under development and is currently under investigation. Studies indicate that the production of briquettes with green coconut shells is feasible and can be carried out by compacting the fiber in blocks, without the use of carbonization and with appropriate binders (Nunes *et al.*, 2020).

Sant'anna *et al.* (2012) studied the feasibility of producing briquettes with green coconut shell and 20% glycerol, and showed that a plant with productivity equal to 1 t/h is economically viable, producing 8 h/d, more than 260 days per year, thus obtaining a Net Present Value (NPV) of R\$ 141,711.54, with an Internal Rate of Return (IRR) of 11.30% and 5.5 years of return.

The quality of densified biomass depends on the type of biomass, moisture content, particle size, temperature, binder used, and densification pressure, which affect its energy potential and its performance in thermochemical processes (González; López; Pérez, 2020).

There are few cases of briquetting mechanisms without the addition of ligands. About briquetting mechanisms from the point of view of the interaction between ligands and the biomass used, pertinent to this proposed research, there are three theories: the solid bridge connection (the pores and the surface of the briquette particles are covered with ligand, a solid bridge is formed at the point of contact of the particles), the electrostatic attraction (a chemical bond or hydrogen bond is formed when ligand molecules interact with active groups or pairs of electrons available in the biomass matrix) and that of the liquid bridge connection

(the adhesion energy and the degree of wetting of the briquette increase) (Zhang; Sun; Xu, 2018).

2.5 BINDERS

The briquette binder plays a key role in the production process and the quality of briquettes. Clarification of the briquette binder briquetting mechanism can not only provide a theoretical basis for the development of the binder, but can also provide a ballast for the industrial production of briquettes (Zhang; Sun; Xu, 2018).

Binder materials are used to improve the mechanical and thermal properties of briquettes. Lignocellulose, lignin or cellulose binders increase the calorific value of waste-based briquettes. Briquette binders can be divided into three groups: organic, inorganic, and compound binders. In particular, a composite binder can reduce the need for inorganic binder materials, lowering the cost of briquette production and reducing ash content (Ferronato *et al.*, 2022).

The briquetting and pelleting of agricultural residues using binders such as starch and wood powder were investigated. Cassava starch and corn starch were used as binders for the manufacture of biomass-based briquettes with good results in densification and lower cost. Sawdust, charcoal, and molasses binder increase the fixed carbon content, with increased compressive strength. Cassava starch increases the compaction rate in the production of briquettes. Therefore, it is suggested that binding materials are an additional component to improve the quality of biomass-based briquettes (Ferronato *et al.*, 2022).

The glycerol generated as a by-product of biodiesel production can be used as a binder in the manufacture of briquettes. During the transesterification step, approximately 10% of the total biodiesel production is crude glycerol, which is considered a by-product of the process. Thus, new strategies to take advantage of glycerol, especially in combustion processes, have been investigated, including the combination of glycerol with solid fuels (González; López; Pérez, 2020).

Crude glycerol is an important by-product of biodiesel commonly produced by a transesterification process, which uses raw materials such as vegetable oils or animal fats to react with short-chain alcohols with the aid of catalysts. Crude glycerol has received considerable attention due to its huge amount associated with the high global biodiesel production rate, considering a biodiesel production of 46.7 million cubic meters globally in 2019, with an increasing trend in the future (Rath; Mahapatro; Pattanayak, 2023).

The use of glycerol for the production of pellets and briquettes has been pointed out as a simple and low-cost solution to add value to this by-product. Glycerol improves the

durability and energy performance of dense biomass. The addition of glycerol as a binder can lead to lower ash content, higher densities and increases in calorific value. Energy density can increase when glycerol is added as a binder, including due to its combustible characteristic. In addition, glycerol contributes to facilitate the formation of briquettes due to the favored bonding between biomass particles, also acting as a lubricant between the biomass feedstock and the matrix (González; López; Pérez, 2020).

Over the years, Indonesia has taken the world lead in biodiesel production (17% of the total share), followed by the USA (14%), Brazil (12%), Germany (8%), France (6.3%) and Argentina (5.3%). This geographical distribution is a clear indication that production, as well as the challenges associated with it, have a global impact (Sandid; Spallina; Esteban, 2024).

Crude glycerol is considered a low-value residual raw material and whose disposal is restricted due to its dangerous nature, including the possibility of fire and oxygen depletion in the water that suffocates the fish. As a result, exploring the value-added use of crude glycerol and its main component, glycerol, is critical for the biodiesel industry to maximize its economic and environmental benefits (Rath; Mahapatro; Pattanayak, 2023).

The dizzying growth of the biodiesel industry has led to an oversupply of glycerol by-product as a direct consequence, which has been detrimental to its market value. The chemical reactivity that this compound possesses makes it an excellent building block from which many synthetic routes can originate. In the last two decades, as a way to update glycerol, there have been major developments in experimental approaches to obtain different products with applications such as fuel additives, green solvents or precursors of other materials (Sandid; Spallina; Esteban, 2024).

During the preparation of pellets and briquettes, crude glycerol serves as a binder to increase yield yield, production rate, and durability (Rath; Mahapatro; Pattanayak, 2023). The addition of glycerin increased the overall thermal efficiency of briquettes produced with sawdust, dry corrugated paper, and rice and coffee husks (Jamradloedluk; Lertsatitthanakorn, 2015).

Glycerol also works efficiently in reducing soot by being highly oxygenated, changing the oxygen concentration profile during fuel/air mixing. The high oxygen content of glycerol can withstand early-stage reactions even at a relatively low air concentration, raising the local temperature above the soot-forming threshold and making it difficult for soot to form. In addition, glycerol has three OH groups that can prevent the growth of the aromatic ring and suppress the formation of acetylene, which is the main precursor to soot generation. Glycerol as an oxygenated fuel could produce a particular type of soot, the surface of which contains different oxygen groups that are highly reactive and are able to promote secondary oxidation

of soot before it is emitted. It is important to consider that, in addition to the binding capacity for agro-waste due to the hydrogen bonds promoted by glycerol, the burning of this material generates small portions of nitrogen and sulfur gases, with the possibility of minimizing these gaseous emissions using appropriate treatments (Rath; Mahapatro; Pattanayak, 2023).

2.6 PROPERTIES OF BRIQUETTES

Some of the fundamental properties that impact the quality of the briquette are moisture content, ash content, amount of volatile matter, fixed carbon, sulfur content, calorific value, and water resistance (Raju *et al.*, 2021).

The amount of carbon and hydrogen in the briquette is an equally important factor, as it is an indication of how much these components contribute to the briquette's combustibility. The composition of biomass also affects its combustion characteristics as the total mass of the fuel decreases during the volatile combustion phase and changes the relationship between the constituent elements of the material (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018; Raju *et al.*, 2021).

Moisture content: The total energy required to bring a briquette to its pyrolytic temperature depends on its moisture content, which affects the internal temperature of the briquette due to endothermic evaporation. The lower moisture content of briquettes implies a higher calorific value (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018; Raju *et al.*, 2021).

Ash content: ashes can give rise to the formation of clinker in furnaces, impacting the yield of chemical reactions. These samples, when burned, will give rise to significant environmental pollution (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018).

Fixed carbon: this is the percentage of carbon (solid fuel) available for the combustion of coal after the distillation of a volatile matter. Fixed carbon provides a rough estimate of the calorific value of the fuel and acts as the main heat generator during burning (Raju *et al.*, 2021).

Volatile matter: Briquettes with a high volatile matter content ignite easily and are highly reactive in combustion applications. With the increase in the volatile matter content of the briquette, there is a decrease in the calorific value of the briquette (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018; Raju *et al.*, 2021). The combustion of volatiles reduces smoke and contributes to the total heat released by the fuel (Promdee *et al.*, 2017).

Caloric value: it is one of the most influential factors in the burning of briquettes. The higher the calorific value, the easier and better they will be burned (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018).

Porosity: Low porosity makes mass transfer difficult during combustion due to fewer spaces for mass diffusion. The higher the porosity, the higher the oxidant infiltration rate and the outflow of the combustion/pyrolysis products during combustion and the higher the briquette burning rate (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018; Raju *et al.*, 2021).

Water absorption: lower water absorption will imply greater density and, consequently, easier burning (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018; Raju *et al.*, 2021).

Breakage rate: important to ensure that storage, transportation, and handling are easier (Raju *et al.*, 2021).

Compressive strength: the compressive strength of briquettes is one of the indices used to evaluate their ability to be handled, packaged and transported without breaking (Promdee *et al.*, 2017).

Degree of densification: is defined as the percentage increase in biomass density due to briquetting. The degree of densification represents the material's ability to bond (Fernandez *et al.*, 2017; Zhang; Sun; Xu, 2018; Raju *et al.*, 2021).

Power estimation and power calculation: to produce 1 kWh of electrical energy, 10,285.71 KJ of steam energy is required (electric energy generation = steam energy ÷ 10,285.71 kJ/kWh). The power estimate can be calculated by the ratio: mass of the material x calorific value / burning time (Raju *et al.*, 2021).

2.7 MARKET PROSPECTING

Under the context of a growing increase in the consumption of coconut water accompanied by a relevant increase in the generation of waste, basically consisting of the fibrous shells of the green coconut, associated with its sometimes inadequate disposal, bringing risks to public health, in addition to representing significant costs to urban cleaning. The possibility of obtaining new products and circular inputs with added value from the adoption of conversion processes, such as briquetting and pyrolysis, considered environmentally and economically viable for the use of available waste, can stimulate the implementation of new business models, with the generation of values, employment and income, increasing the competitiveness of the important green coconut production chain (EMBRAPA, 2020).

Brazil is the fifth largest producer of coconuts in the world, but participates with only 3.7% of the total, which corresponded to 62.9 million tons in 2019 (BNB, 2021). The world's two main exporters of coconut derivatives (mostly water, oils and desiccats) are also the largest producers, Indonesia and the Philippines, with respective shares of 32.1% and 24.2% in total exported volumes. The top 10 exporters account for 86.4% of total revenues; Brazil is

in the 47th position with a share of only 0.03% in this market. The coconut tree is cultivated in almost all of Brazil, whose current area is 187.5 thousand hectares, with production of 1.6 billion fruits with an average skin weight of 0.9 kg (giant coconut tree) and an average yield of approximately 30% of fiber and 70% of powder in the industrial process. It is estimated that 80% of the Brazilian coconut production is destined to the purchasing industry, with the shell as a by-product, Brazil has a production potential of 804,218 t of shell that, after industrialization, would result in 241,265 t of fiber and 562,953 t of powder. In the Northeast region, the main national producer, 80.9% of the harvested area of coconut in the country and 73.5% of its production are concentrated. The value of national coconut production was R\$ 1.15 billion, with a share of 62.6% from the Northeast (IBGE, 2020).

Clasen *et al.* (2022) proposed a "circular" model with the use of green coconut shells generated by the municipalities of the Baixada Santista as raw material for the manufacture of briquettes. The results showed that the technical-operational aspects of the circular model are consistent, and can be implemented. This proposal made it possible to reduce greenhouse gas emissions by 40 thousand tons per year when compared to the linear model. Additionally, it presented a profitability of 66%, a profitability of 195% and, with the return on investment in six months, it was evident that there is financial viability in this model.

The demand for green coconut waste briquettes in Brazil and other coconut-producing regions is influenced by several factors, including environmental awareness, the cost of fossil fuels, and policies to encourage renewable energy. In Brazil, coconut production is significant, especially in the Northeast and North regions, providing an abundant raw material for the production of briquettes. However, the utilization of this biomass is still growing, with the majority of the briquettes market focused on wood waste.

The main initial challenges would be regarding its availability and logistics chain regarding the collection and processing of green coconut waste, which may represent logistical and cost challenges, affecting the availability and price of briquettes, in addition to competition with other biomasses such as wood and agricultural waste, which may influence demand.

While it is difficult to quantify the current demand for green coconut waste briquettes in Brazil without access to specific market data, it is evident that there is significant potential for growth in this demand. This growth will be driven by the need for cleaner and more sustainable energy sources, the abundance of green coconut waste in producing regions, and the development of public policies that encourage the use of renewable energy. The expansion of this market will also depend on the ability to overcome logistical and cost

challenges and the effectiveness in communicating the environmental and economic benefits of green coconut briquettes to potential consumers.

On the environmental side, the production of briquettes from green coconut shells contributes significantly to waste management, turning an abundant and often discarded agricultural by-product into a valuable resource. Additionally, green coconut shell briquettes have a lower carbon footprint compared to fossil fuels, contributing to climate change mitigation. By replacing wood and charcoal with coconut shell briquettes, there is a reduction in pressure on forests, promoting the conservation of ecosystems and biodiversity.

From an economic point of view, the production of briquettes can open new markets and create local value chains, generating income for coconut-producing communities, in addition to recognizing their energy efficiency because they are considered very efficient as fuel, offering a cost-competitive alternative for industries and homes.

3 FINAL THOUGHTS

Brazil stands out worldwide for the mostly renewable composition of its energy matrix, although it still depends on the exploration and use of fossil fuels. There is, however, a paradox regarding sustainability, which is the substantial waste of biomass with potential for energy recovery.

Despite the consolidated use of sugarcane bagasse and forest residues for energy cogeneration, a vast amount of biomass from other agro-industrial activities, urban waste and effluents is neglected or disposed of inappropriately, not to mention the inappropriate use of wood from illegal deforestation.

Such organic material represents an untapped energy potential that could contribute to national energy security, reduce water dependence, and mitigate environmental problems associated with waste management.

Therefore, there is the challenge of transforming this environmental liability into an energy asset, optimizing the use of its natural resources and consolidating a truly circular development model.

Energy recovery from the burning of briquettes produced with green coconut shells, a vast waste usually disposed of inappropriately, and the use of glycerol, a by-product of biodiesel manufacturing, as a binder, represents one of the important alternatives that should be better explored for the mitigation of environmental impacts, with an important socioeconomic contribution.

Jaqueline Alessandra Azevedo Ferreira¹

ABSTRACT

The identification of similar seismic events constitutes an important aspect for understanding seismic dynamics, identifying the recurrence of aftershocks and seismic swarms, and assessing geological hazards. This work presents a systematic literature review on the computational methods employed for identifying similarity between seismic waveforms, with an emphasis on decision criteria and signal processing techniques. The review was conducted based on searches in scientific databases, utilizing specific strings related to seismic event similarity measures. The analysis of the selected studies evidences that, despite the recurrent limitations associated with the dependence on empirical thresholds, sensitivity to noise, and the difficulty of ensuring consistency and reproducibility in event classification within large seismic catalogs, cross-correlation-based methods are widely adopted. It is concluded that the literature points to conceptual gaps in the modeling of similarity between seismic events, indicating the need for future mathematical and computational investigations aimed at developing more consistent and well-founded criteria for the automated curation of seismic data.

Keywords: Similar Seismic Events. Waveform Similarity. Systematic Review.

RESUMO

A identificação de eventos sísmicos semelhantes constitui um aspecto importante entender a dinâmica sísmica, e identificar recorrência de réplicas, enxames sísmicos e avaliar riscos geológicos. Este trabalho apresenta uma revisão sistemática da literatura sobre os métodos computacionais empregados na identificação de similaridade entre formas de onda sísmicas, com ênfase nos critérios de decisão e nas técnicas de processamento de sinais. A revisão foi conduzida a partir de buscas em bases de dados científicas, utilizando strings específicas relacionadas à medidas de similaridade de eventos sísmicos. A análise dos estudos selecionados evidencia que, apesar das limitações recorrentes associadas à dependência de limiares empíricos, da sensibilidade ao ruído e da dificuldade de garantir consistência e reprodutibilidade na classificação de eventos em grandes catálogos sísmicos, os métodos

RESUMEN

La identificación de eventos sísmicos similares constituye un aspecto importante para comprender la dinámica sísmica, e identificar la recurrencia de réplicas, enjambres sísmicos y evaluar riesgos geológicos. Este trabajo presenta una revisión sistemática de la literatura sobre los métodos computacionales empleados en la identificación de similitud entre formas de onda sísmicas, con énfasis en los criterios de decisión y las técnicas de procesamiento de señales. La revisión se llevó a cabo a partir de búsquedas en bases de datos científicas, utilizando cadenas de búsqueda específicas relacionadas con medidas de similitud de eventos sísmicos. El análisis de los estudios seleccionados evidencia que, a pesar de las limitaciones recurrentes asociadas a la dependencia de umbrales empíricos, la sensibilidad al ruido y la dificultad de garantizar consistencia y reproducibilidad en la clasificación de eventos en grandes catálogos sísmicos, los métodos basados en correlación cruzada son ampliamente adoptados. Se concluye que la literatura señala lagunas conceptuales en el modelado de la similitud entre eventos sísmicos, indicando la necesidad de futuras investigaciones matemáticas y computacionales orientadas al desarrollo de criterios más consistentes y fundamentados para la curación automatizada de datos sísmicos.

Palabras clave: Eventos Sísmicos Similares. Similitud de Formas de Onda. Revisión Sistemática.

1 INTRODUCTION

The identification of similar seismic events (such as aftershocks and earthquake swarms) plays an important role in the assessment of geological risks, with regard to the evolution of faults, and in the understanding of seismological dynamics, with respect to the failure mechanism. In this sense, the comparative analysis of seismic waveforms is a fundamental tool for the investigation of the similarity between events and for the construction of more consistent seismic catalogs.

Culturally, Geoscience specialists have been identifying similar seismic events through visual inspections or methods based on cross-correlation between seismic records. Although these approaches have proven effective in different applications, they rely on empirical criteria, variations in wave propagation, macroseismic surveying, and exhaustive analysis of seismic event pairs. This imposes limitations when applied to environments with high noise levels or large volumes of data.

In recent decades, the increased availability of seismic data has driven the development of automated methods for detecting similar events. Despite the progress observed, the literature still presents a diversity of criteria and decision strategies, often not very comparable to each other, which evidences the absence of a conceptual consensus on the definition and modeling of the similarity between seismic events.

In view of this scenario, it is relevant to conduct a systematic review of the literature that allows a synthesis of existing methods, identifies their main advantages and limitations, and evaluates the need for new approaches. Thus, the objective of this work is to present a systematic review of the approaches used in the identification of similar seismic events, highlighting the methods used and the recurrent challenges pointed out in the literature. By gathering and organizing this knowledge, it seeks to provide subsidies for the evaluation of the need (or not) for the development of new criteria or conceptual structures for the analysis of similarity between seismic waveforms.

2 METHODOLOGY

This study was conducted as a systematic review of the literature (SAMPAIO; MANCINI, 2007), with the objective of identifying, analyzing and comparing the main methods used in the literature for the identification of similar seismic events from the comparison of waveforms.

2.1 TYPE OF REVIEW

This research is structured as a systematic review of the literature (SAMPAIO;

MANCINI, 2007) which evaluates the state of the art in a qualitative way and discusses the sufficiency of the approaches currently employed, with emphasis on the similarity criteria used, their advantages and limitations.

2.2 DATABASES CONSULTED

The bibliographic search was carried out in the following scientific databases, selected for their relevance and comprehensiveness in the area of seismology and signal processing:

- Web of Science
- Scopus
- Google Scholar

In addition to these sources, technical documents and institutional materials from official bodies, such as the United States Geological Survey (USGS), were considered when relevant for conceptual contextualization.

2.3 SEARCH STRATEGY AND STRINGS

The following search strings have been applied, with adaptations according to the syntax of each database:

("seismic event similarity" OR "waveform similarity" OR "repeating earthquakes")
AND ("cross-correlation" OR "template matching" OR "matched filter")

The searches included publications between **2000 and 2025**, a period that covers the development and consolidation of the main approaches used in the area.

2.4 INCLUSION CRITERIA

Studies that met the following criteria were included in the review:

- Peer-reviewed articles;
- Works that use real seismic data;
- Studies that employ waveform comparison to identify similar events;
- Publications that explicitly describe the similarity criterion or metric adopted;
- Articles published in English.

2.5 EXCLUSION CRITERIA

The following were excluded from the analysis:

- Purely theoretical work without application to seismic data;
- Studies that do not present a clear description of the decision criterion or similarity;

- Duplicate articles among the databases consulted;

2.6 STUDY SELECTION PROCESS

The study selection process was conducted in three successive stages:

- (i) reading of the titles;
- (ii) reading of the abstracts;

In the final stage, only studies that fully met the inclusion criteria were considered for qualitative analysis. The information extracted from each article included the type of data analyzed, the method used, the similarity metric, the decision criterion, and the main advantages and limitations identified.

3 LITERATURE REVIEW

3.1 CROSS-CORRELATION

Cross-correlation is the most traditional and widely used method in the identification of similar seismic events, being used to quantify the degree of similarity between waveforms recorded by one or more seismographic stations. In this context, events are considered similar when the maximum coefficient of cross-correlation between their signs exceeds a certain previously established threshold. Classical studies have shown that this approach is effective for the identification of repeated microearthquakes and for the analysis of seismic clusters associated with the same source or geological fault (CHENG et al., 2007; LI et al., 2007).

Some studies have successfully applied this technique in different geological contexts, evidencing its ability to reveal seismic repetition patterns and estimate relevant physical parameters, such as slip rates on active faults (LI et al., 2011). However, despite its wide adoption, classical cross-correlation has important limitations, especially with regard to noise sensitivity, dependence on the temporal alignment between signals, and the empirical choice of decision threshold, which can influence the number of events classified as similar (BACHMANN et al., 2007; ZHU et al., 2021).

3.2 REPEATING SIGNAL DETECTORS

In addition to correlation, other studies have employed template-based approaches for the identification of similar seismic events. Seismic waveforms previously detected by seismographs are used as templates, being systematically compared with continuous online seismic records or with sets of events, by means of cross-correlation measurements or

Euclidean distances. This strategy has proven to be particularly efficient for the detection of seismic swarms, allowing the automatic identification of occurrences with high temporal and spectral similarity (SKOUMAL; BRUDZINSKI; CURRIE, 2016).

The use of specific detectors, such as the *Repeating Signal Detector*, expands the applicability of the *template* by enabling the analysis of large volumes of data with greater computational efficiency. Recent work demonstrates that this approach is capable of revealing sequences of repeated events that would not be easily identified by manual inspection (TEPP, 2018; CHAMBERLAIN et al., 2020). However, template-based methods and tools also have limitations related to the choice of *templates*, to the definition of correlation thresholds, since events with characteristics different from the previously selected waveforms may not be identified, due to environmental issues external to the event at that moment, restricting the scope of the analysis.

In addition to the methods described, specialists use *templates* in computer tools for the automated identification of similar seismic events. PyMPA (Python Matching Phase Algorithm) is a package aimed at automatic seismic phase matching (PYMPA DEVELOPERS, 2025), while SCDetect consists of a module of the SeisComP environment based on cross-correlation for the detection of earthquakes from waveforms (SCDETECT DEVELOPERS, 2025). These tools show the predominance of approaches based on cross-correlation and empirical thresholds.

3.3 CLUSTERING METHODS APPLIED TO SEISMIC SIMILARITY

In addition to approaches based on direct comparisons between pairs of events, some studies have employed clustering methods to organize sets of similar seismic events based on measures of similarity between waveforms. From this perspective, the cross-correlation metric is applied in clustering algorithms with the objective of identifying groups of events associated with the same seismic source or similar rupture mechanisms (WALDHAUSER; SCHAFF, 2007; BACHMANN et al., 2007).

These approaches allow for a more global analysis of the relationships between events, reducing the reliance on one-off comparisons. Recent studies have shown that clustering techniques can reveal internal structures in seismic data that are not evident through methods based exclusively on correlation thresholds, contributing to the understanding of the spatial and temporal organization of seismicity (WALDHAUSER; SCHAFF, 2021; GAO; KAO; LIU, 2023).

3.4 MACHINE LEARNING-BASED APPROACHES IN IDENTIFYING SIMILAR SEISMIC EVENTS

Machine learning-based approaches have been explored for the identification and classification of similar seismic events, especially in contexts characterized by complex signals and with large volumes of seismic data. These methods use supervised learning techniques to extract relevant characteristics from seismic waveforms, allowing automatic comparison between events from representations that are learned from the data, and in this case, are not restricted to explicitly defined similarity metrics (LI et al., 2018).

Machine learning models can be more robust in the face of noise and variations in seismic wave propagation conditions, when compared to traditional methods based exclusively on cross-correlation. In addition, these approaches have been successfully applied in the classification and grouping of seismic events, expanding the ability to detect complex and nonlinear patterns in the data (SI et al., 2023). However, despite their potential, machine learning-based methods have relevant limitations, such as the dependence on large labeled datasets, the lower physical interpretability of the results, and the difficulty of generalizing to regions or geological contexts other than those used in the training, which imposes challenges to their systematic application in seismic similarity studies.

4 RESULTS

The application of the search strategy defined in this systematic review initially resulted in a broad set of studies related to the identification of similar seismic events. After applying the inclusion and exclusion criteria and removing duplicates, a final set of materials considered relevant for the analysis was obtained. These studies cover classical methods based on cross-correlation, Euclidean distance, repeating signal detection techniques, and newer machine learning-based approaches.

The selected studies predominantly use methods based on the direct comparison of seismic waveforms, with emphasis on cross-correlation as a measure of similarity. Classical and widely cited works employ this coefficient to identify repeated or similar events, exploiting the temporal alignment of waves and maximizing the correlation value. In addition, approaches were identified that combine cross-correlation with pre-processing methods, such as spectral filtering, in order to reduce the influence of noise and external variations.

Some studies have used sliding windows to identify possible events, while others propose specific detectors for recurrent signals, capable of identifying multiple occurrences of similar events over large volumes of seismic data.

In addition to the classical methods, part of the analyzed works explores clustering techniques and machine learning algorithms for the identification of similar seismic events. Approaches include unsupervised methods, such as distance-based clustering, as well as supervised models aimed at classifying previously observed seismic events. In general, these methods use characteristics extracted from waveforms or representations in the time and frequency domains, seeking to automate the process of identifying recurring patterns in seismic catalog logos extracted from different seismic stations.

The analysis of the studies shows that the similarity criteria adopted in the literature vary considerably, being predominantly based on quantitative measures between pairs of events, such as correlation coefficients, distances in space of features or metrics derived from spectral transforms. Although these criteria allow the identification of similar events in different contexts, it is observed that there is no consensus on a unified model for representing the similarity between multiple events, which results in the coexistence of diverse approaches, adapted to specific objectives and data sets.

Table 1

Comparative synthesis of the main methods used in the identification of similar seismic events in the literature

Author(s)	Year	Main Method	Similarity criterion	Type of data analyzed
Bachmann et al.	2007	Cross-correlation	Maximum correlation coefficient between time-aligned waveforms	Seismic records of natural events
Li et al.	2007	Cross-correlation and spatial clustering	Waveform similarity associated with spatial proximity	Microearthquakes along active faults
Cheng et al.	2007	Cross-correlation	High correlation between repeated events	Microearthquakes recorded in Japan
Zhu et al.	2021	Re-evaluation of cross-correlation	Cross-correlation with pre-processing adjustments	Regional seismic catalogs

Skoumal et al.	2016	Repeating Signal Detector (RSD)	Correlation-based similarity and temporal recurrence	Seismic swarms
Tepp	2018	Repeating Signal Detector	Identifying recurring patterns in the signal	Continuous seismic data
Li et al.	2011	Cross-correlation	Repeated Event Similarity for Estimation of Slip Rates	Deep microearthquakes
Gonzales & Wintz	1987	Digital signal processing	Euclidean Distance	Discreet digital images
Li et al.	2018	Machine learning	Similarity in the Feature Space	Automatically classified seismic data
USGS	2024	Observational analysis	Physical and temporal criteria	Seismic events and aftershocks

5 DISCUSSIONS

The analysis of the studies selected in this systematic review shows the predominance of techniques based on the cross-correlation metric. This confirms the relevance of this metric as a fundamental tool for the comparison of waveforms, especially in contexts involving repeated events or seismic aftershocks. However, the way this metric is employed varies significantly between studies, both in terms of pre-processing and the definition of decision thresholds.

The use of empirical parameters is a recurrent aspect identified in the literature. They are often adjusted according to the local geology. Although this flexibility allows the methods to be adapted to different geological contexts, it introduces subjectivity into the process of identifying similar events, making it difficult to directly compare studies and reproduce results in different scenarios. This limitation is very relevant in analyses involving large seismic catalogs, where small variations in the parameters can result in very different classifications.

It was also observed that most approaches deal with the similarity between events by pairs, without considering the global structure of the relationships established between multiple events in the same database. This characteristic can lead to details that may not be well observed regarding comparisons between seismic waveforms, such as the absence of the transitivity relationship of the similarity between seismic events, which makes it difficult to

interpret the groupings. Although clustering techniques and machine learning-based methods have been proposed as alternatives to deal with this issue, such approaches often present additional challenges related to the choice of appropriate parameters.

Another relevant point refers to the sensitivity of methods for identifying seismic events similar to the conditions of data acquisition and the presence of external noise. Differences in the location of the installation of the stations and in the propagation characteristics of the waves can significantly affect the similarity measurements, even between events originating from the same seismic source. In order to mitigate these effects, several studies have adopted pre-processing strategies, including spectral filtering for noise reduction and temporal alignment of waveforms before calculating similarity metrics (BACHMANN et al., 2007; BARANI; FERRETTI, 2007). More recent approaches, such as multichannel waveform clustering methods, also incorporate these filtering, normalization, and alignment steps as a way to improve the robustness of cross-event comparisons (CASTELLANOS; VAN DER BAAN, 2015). Despite these advances, it was identified that there is still no consensus in the literature regarding a standard procedure capable of ensuring consistent performance in different seismic scenarios, especially when considering large catalogs and variable acquisition and noise conditions (ZHU et al., 2021). In general, the results of this review indicate that, despite the advances achieved in recent decades, methodological gaps still persist in modeling the similarity between seismic events. The absence of unified criteria and formal structures that adequately capture the relationships between multiple events suggests the need for further investigations aimed at developing more consistent approaches. In this context, this critical analysis contributes to the understanding of the state of the art and establishes a solid basis for future research that seeks to improve the criteria for identifying similar seismic waveforms.

6 CONCLUSION

This work presents a systematic review of the literature focused on techniques for identifying similar seismic events. The synthesis of the studies showed that, although there are a variety of approaches available, most methods are based on direct comparisons between pairs of events, often based on cross-correlation measures and empirical decision criteria that depend on the local geology.

The results seen in this systematic review indicated that the approaches have recurrent limitations related to noise sensitivity, dependence on data acquisition conditions, and inconsistency in the classification of similar events regarding the form of seismic waves throughout large seismic catalogs. In addition, the absence of unified conceptual frameworks

for modeling the similarity between multiple events contributes to inconsistencies in the interpretation of clusters and in the comparison between different studies. It is observed that the identification of similar seismic events remains dependent on the complexity of the data analyzed. Thus, future investigations may benefit from the incorporation of interdisciplinary approaches that explore mathematical concepts applied to the normalization, interpolation and noise filtering of seismic waveforms, in order to promote a more consistent standardization of data and enable fairer comparisons between events. This integration between Geosciences, Mathematics and Computing represents a promising path for the improvement of similarity criteria and for the development of more robust computational tools in seismic analysis.

Thus, the critical synthesis conducted in this systematic review reinforces the importance of future investigations aimed at the development and evaluation of more consistent, interpretable and theoretically grounded similarity criteria, capable of dealing with the heterogeneity of seismic waveforms collected by seismological stations. In this sense, this work provides an overview of the state of the art and establishes a conceptual basis for subsequent research that seeks to advance the curation and automated analysis of seismic data.

ABSTRACT

The theme of imprisonment is a contemporary reality, present in both public and private debate and at various levels of social life. Due to the significant presence of this issue in social discourse, the impression is created that imprisonment as punishment has been part of this institution since its earliest records. In fact, places of confinement have existed since Antiquity, being observed in Egyptian, Mesopotamian, Hellenic, and Roman civilizations, extending into the Middle Ages. However, during this period, prisons served primarily as a means of custody, with rare examples of imprisonment having punitive purposes. At the end of the Middle Ages, some monastic orders of the Roman Catholic Church began to use confinement in cells as a means of discipline and correction of clergy, and it was occasionally applied to laypersons as punishment for the commission of offenses regarded as serious in light of Catholic dogma. Only in the Modern period did the first prison facilities begin to acquire new functions, as a result of changes in the economic and social system.

Keywords: Prison. Custody. Transformation. Social Control.

RESUMO

O tema prisão é uma realidade contemporânea, presente no debate público e privado e em diversos níveis do convívio social. Em razão da presença significativa da temática no debate social, cria-se a impressão de que prender para punir faça parte dessa instituição desde seus primeiros registros. De fato, cárceres existem desde a Antiguidade, sendo observados em civilizações egípcias, mesopotâmicas, helênicas e romanas, estendendo-se até o Medievo. No entanto, as prisões durante esse período serviam como meio de custódia, sendo raros os exemplos de prisões com finalidades punitivas. No final da Idade Média, algumas ordens monásticas da Igreja Católica romana passaram a utilizar o recolhimento em celas como meio de disciplina e correção de clérigos, tendo, algumas vezes, sido utilizado também para a punição de leigos em face do cometimento de infrações reputadas sérias diante dos

RESUMEN

El tema de la prisión es una realidad contemporánea, presente en el debate público y privado, y en diversos niveles de la vida social. Debido a su importante presencia en el debate social, da la impresión de que el encarcelamiento como castigo ha formado parte de esta institución desde sus primeros registros. De hecho, las cárceles han existido desde la antigüedad, existiendo en las civilizaciones egipcia, mesopotámica, helénica y romana, extendiéndose hasta la Edad Media. Sin embargo, durante este período, las cárceles sirvieron como medio de custodia, siendo escasos los ejemplos de prisiones con fines punitivos. A finales de la Edad Media, algunas órdenes monásticas de la Iglesia Católica Romana comenzaron a utilizar el confinamiento en celdas como medio para disciplinar y corregir al clero, a veces también para castigar a los laicos por cometer infracciones consideradas graves según el dogma católico. Fue en la Edad Moderna cuando las primeras instalaciones penitenciarias comenzaron a adquirir nuevas funciones, debido a los cambios en el sistema económico y social.

1 INTRODUCTION

Arresting someone to punish as a result of a crime committed is an almost omnipresent reality in contemporary society. It is an immanent activity in the practice of modern states, not least because it is one of the most visible forms of exercising state power. As if that were not enough, it is a recurring theme in the mass media, being practically daily on the agenda of newsrooms and editorials. In the everyday imaginary, prison occupies a relevant space, being the object of many cinematographic, literary, musical works, etc., when it is not a subjective reality, lived and suffered by a significant portion of the population. In fact, at some point the topic of imprisonment has already occupied space in people's lives, even if in trivial conversations. This means that prison is more than a mere punitive instrument, constituting a social and political institution that occupies multiple segments in society and, not infrequently, is the object of long studies and debates.

Its presence does not mean unanimity, as there are those who see it as a highly harmful and inhumane modality, in which, for the most radical, proscription would be an alternative. However, there are others who see it as an acceptable and more humane means of punishment compared to other means of punishment already tried in history. On the other hand, there are those who see it as an insufficient means, especially when it is used for certain types of violent crimes, and should be relegated to the background in favor of other more incisive means of punishment, such as capital punishment. However, although permeated with criticism, there is no current state that dispenses with its use as the main means of punishment.

In this context, since prison is impregnated in the collective imagination and in legal systems around the world, it ends up appearing to be a very ancient punitive institution, which would be present since the first civilizations, causing the debate about this form of punishment to be harmed by the construction of a common sense of this almost ethereal nature, as if it were an immutable reality from the beginning and that should be included in all analyses of this punishment in society.

In this vein, this article seeks to understand at what moment prison as a means of punishment has its root, that is, when does prison effectively acquire this new function?

To answer the problem, it is necessary to analyze the historical context in which prison begins to encompass a punitive function, meeting the primary objective of unveiling the point of change in prison functions and using the methodology of bibliographic review. To this end, it is essential to meet some secondary objectives that are summarized, first, in the analysis of the historical functions of prison from Antiquity and, later, in the emergence of the first punitive prison devices. However, considering the large temporal elastic that a historical

analysis presupposes and the need to maintain strict adherence to the problem and objectives proposed in this article, it will be limited only to the relevant historical points in which it is possible to highlight the inflection point of the functions of prison, not analyzing the problems and consequences that arise from the establishment of prison as a means of punishment, leaving these questions to other works on the subject that are abundant in the scientific literature.

2 DEVELOPMENT

2.1 IMPRISONMENT OR IMPRISONMENT?

In penology and penitentiary, the words *prison* and *prison* are similar ideas, but not identical. There would be a distinction in the use of the expressions, since *prison* would precede *prison*, since the first would identify places, even if rudimentary, intended for the custody of a person, while the second would be close to the meaning of penitentiary or prison, where a sentence imposed in the face of a sentence is served.

According to Neuman (1971, p. 24):

Prison (word and institute) precedes prison, prison and penitentiary, which specifically designate different modes of execution and places of execution of the custodial sentence. From this it is indisputable that the expression prison historically and technically designates the place or building in which the accused or accused are housed (what the French call *prévenus*); and prison, prison or penitentiary, indicates, on the other hand, the place intended for those convicted judicially.

However, the distinction of the expressions does not seem relevant to us, since the expression prison does not represent its own legal category in various legal systems. In Brazil, the expression prison is generic and encompasses both the various types of establishments intended for the restriction of liberty (jails, prisons and penitentiaries) while the expression prison is intended more to name the legal institutes that deprive someone's liberty, such as temporary detention, preventive detention, civil prison, etc. Certainly, the very idea of distinguishing the expressions *prison* and *prison* is artificial, since the distinction was made *a posteriori* due to new functions added to incarceration.

Thus, we consider the idea of imprisonment as a generic expression that encompasses any and all establishments intended for the imprisonment of a person, whatever its purpose. Thus, in order to facilitate the exposition, we will treat the expressions prison and prison as synonymous, discarding merely formalistic linguistic rigors.

2.2 PRISONS IN ANTIQUITY

In Egyptian civilization, prisons were known, but in the overwhelming majority of cases, they typically had custodial functions. Arrests for punitive purposes were not an Egyptian practice, despite the fact that a prisoner could be taken into custody because he had been subjected to slavery or forced labor.

Gusmão (2010) states that the usual punishments were batons, mutilations, exiles, death, including by incineration at the stake, while Dotti (2010) points out that, in this period, death penalties, enslavement, mutilation and other types of corporal punishment were common, in addition to forced labor in mines.

Peters (1995) mentions that there are records of prisons in Ancient Egypt from the so-called Middle Kingdom, especially for the public function performed by the pharaohs in maintaining the so-called *maat* (a concept that could be approximated to justice or order, and on which the balance of the universe would depend), with prison being highlighted, along with physical punishment, compared to the death penalty. These prisons could be resembled fortresses with cells, dungeons, or institutions such as future *workhouses* or labor camps, since it seems that inmates are expected to work during incarceration.

Peters (1995) continues that, in these places, there was no distinction between classes of prisoners, and people who were there for various reasons were allocated, such as those who were waiting for their cases to be heard, who were waiting for punishment or who were indefinitely held for the purpose of forced labor. It was also suitable for people suspected of being spies, disgraced officers, or to hold foreign captives who were captured in war.

In the cultural and religious imagination, perhaps the most vivid example of the existence of prisons in Ancient Egypt is recorded in a passage from the biblical book of Genesis (Gen 39:19-23), sacred in common to both Christianity and Judaism, where it is mentioned that Joseph, one of the twelve sons of the patriarch Jacob, enslaved in Egypt, was incarcerated in an Egyptian prison after being unjustly accused by the wife of his captor of committing a crime (Bible, 2021).

Prison in Egyptian civilization, therefore, was an instrument of custody in essence, especially for the purpose of exploiting forced labor and enslavement, which can be seen by most of the colossal Egyptian historical monuments that largely used enslaved or forced labor, with prison being a preponderant place of custody of forced labor.

In the kingdoms of the civilizations of the region of the Euphrates and Tigris rivers there are also sparse records of arrests, although, as in other civilizations, they were intended for custody. The forms of punishment were predominantly corporal, when they did not involve the death of the punished.

Gusmão (2010) describes that the Babylonian legislation bet on capital punishment through drowning, crucifixion, with penalties of mutilation, enslavement, pecuniary penalties, amputations, payment of fines, etc. According to Peters (1995), prisons were rarely mentioned in the historical codifications of that period, being mentioned in other sources of literature, indicating that they were used for cases of debts, thefts, bribes, slave rebellions and captured foreigners.

In the Assyrian Empire, Peters (1995) points out that traffickers, thieves, deserters and tax evaders were imprisoned in places intended for the submission of those in custody to forced labor. Babylonian terms such as *bit asiri* designated forced labor for captured foreigners, and *biti kili* would be places similar to prisons where criminals, kidnapped, rebels, etc. However, Dotti (2010) points out that Assyrian practices were generally cruel and bet on the profligacy of death penalties and cruel punishments.

In the Hebrew civilization, the main forms of punishment were death and exile, with the purpose of eliminating from the community those who violated the order of society and, in the spiritual conception, the purity of the people, which could attract the wrath of God on the community. Strongly inspired by the ordinations of the Pentateuch (the first five books of the Bible), the sanctions aimed at

According to Peters (1995), the main forms of execution were stoning, incineration, decapitation or strangulation, as well as the punishments of mutilation, physical punishment, payment of fines, compensation and mandatory sacrifices. The existence of prisons is rarely mentioned, although there is news, mainly from records in sacred books, of the existence of prisons with custodial characteristics, despite the fact that Mirabete and Fabbrini (2009) point out that, through the Talmud, there was a progressive replacement of talionic punishments by other sanctions, such as forced labor.

Within the scope of Hellenic civilization, depending on the *polis*, punitive practices varied. They could range from moral and political punishments (such as enslavement, ostracism from public life, banishment, etc.) to pecuniary punishments and corporal punishment. However, as in other civilizational experiences, prison, despite not being a punitive practice in itself, was also a reality as a custody.

Taking the example of Athens, Peters (1995) states that prisons had a temporary custody function, as a means of forcing the payment of debts, places for the practice of torture and as places where individuals with long or life punishments could be placed, not having a great punitive role, being more common death penalties, fines and exile, although they were used with some frequency (Peters, 1995).

It was in Rome, however, that the prisons would be more visible and their use as punishment would have their first records.

Carrara (2002) mentioned, in his famous program, that Roman imprisonment was not about punishment, but about custody. He did not deny their existence, acknowledging the presence of several prisons in Ancient Rome, but emphasizing that they did not have a punitive purpose. Lyra (1955) stated that historians would not agree on the existence of public prisons of a penal nature, except for custody, although there were limitations on freedom, enslavement and the so-called *condemnatio ad metalla* (Lyra, 1955).

Peters (1995) mentions that the Law of the Twelve Tables, although it did not directly provide for the management of prisons, authorized private imprisonment executed by creditors against debtors for a period of six days to coerce them to pay the debt or, ultimately, subject them to slavery. Furthermore, considering the power that the male head of the Roman family possessed (*pater familias*), he was not forbidden to maintain a domestic prison to discipline the members of his family, to imprison rebellious slaves or to enclose those recalcitrant for work, in what was called *ergastulum*.

However, in addition to private prisons, there are records of the practice of incarceration in Roman public society through the *latumiae*, which were a kind of prison-quarry, being part of a prison complex located in the lower part of the Roman Capitoline Hill. Near this place there was also an underground complex named *Tullianum*, later renamed *Carcer Mamertinus*, built around the third century BC, in the northeastern part of the Roman forum known as *Comitium*, where many matters of a judicial nature were handled, so it is thought that it was idealized for the convenience of being close to the courts, being destined for custody and executions. The author, however, mentions that it was difficult to imagine such places as prisons as an instrument of long-term punishment, even because of the terrible conditions of the places, but that it would be possible to imagine them as a place of custody for prisoners of war and those sentenced to long, even life, punishments, although such cases were rare (Peters, 1995).

This same impression is placed by Ferrajoli (2011), acknowledging that the prison is a very ancient institution, noting the existence of the Tullian prison, later called Mamertino, something that would have already been mentioned by Sallust and Livy and given rise to the legend that the prison would have been built by King Ancus Márcio to instill fear in the plebs. The author also points out that, in Rome, in addition to capital punishments, penalties such as *damnatio ad metalla*, a kind of forced labor, *deportatio in insulam*, *relegatio ad tempus* or *in perpetuum*, were foreseen, while Emperor Zeno would later have established the eminently public character of prison, and Emperor Justinian would have reaffirmed that no one could

be arrested without an order from the magistrate. However, it should be noted that, during the Roman period, imprisonment was not seen as punishment, and the author highlights Ulpian's adage: *carcer enim ad continendos homines, non ad puniendos haberi debet*.

If analyzed from a structural perspective, it is seen that prison is an appropriate place to prevent someone from escaping, keeping him available for the purposes that are in the best interest of the captor. That is why, originally, it was not intended to punish a person, but to guard him so that, later, he would be subjected to the true sanction, primarily corporal, such as the infliction of injuries, amputations or death. There were exceptions, but imprisonment, primarily, was placed to ensure the execution of corporal punishment³.

2.3 PRISONS IN THE MEDIEVAL PERIOD

In the Middle Ages, the prison went through a slow process of historical resignification from the point of view of its functions, without, however, losing its function as an instrument of custody.

There are reports, according to Peters (1995), that the Franks, in the region of the ancient Roman province of Gaul, used monasteries to guard rebels, but most of the time, like the Lombards, the use of sanctions such as fines, enslavement, mutilation and death penalties was preferred.

In the attempts to rescue the Roman legal tradition through edicts of the Germanic kingdoms, which occupied the political space of the former Western Roman Empire⁴, it is possible to find mentions of the use of prisons, although they are rarely mentioned.

Dotti (2010) mentions the use of prison in an eighth-century edict of King Liuprand, of the Lombards, requiring each city to have a prison to imprison people accused of being thieves for a period of up to two years, as well as in a capitular of Emperor Charlemagne, in the ninth century, determining that people of *boni generi* could be imprisoned until they could amend, which would have already been cited in the doctrine as a rare situation, in the period, of imprisonment as a sanction.

³ Despite the non-existence of the institution of prison as a means of punishment in Ancient Rome, it is curious to find in historical records current discussions about the problems related to contemporary prisons. On this point, Peters (1995) mentions the Code of Theodosius – which, in fact, was a compilation of several previous edicts – which contains an edict of Constantine, from the year 320, preventing custodians from being kept chained with instruments that injured the bones, determining that those in custody were kept in bright places and in good health, as well as other norms that determined that judges should make periodic visits to prisons, they ensured food at the expense of the Roman treasury and the right of these to go to the baths accompanied by guards.

⁴ This movement gave rise to the codifications that can be classified as part of the Vulgar Roman Law, having as examples, according to Paulo Dourado de Gusmão, the historical *Lex Romana Wisigothorum*, of the Visigoths, *Lex Romana Burgundionum*, of the Burgundians, and the *Edictum Theodorici*, of the Ostrogoths (Gusmão, 2010).

Bruno (1978, v. 3) points out that the exclusively precautionary purposes of the existing prisons were maintained during the Middle Ages, considering the prominence of corporal punishment, infamous punishment and capital punishment. However, it identifies some situations where prisons were used with some sanctioning characteristics, such as in the Edict of Liuprando, king of the Lombards, of 720, for some cases of theft, indefinite imprisonment by edict of Charlemagne, in addition to provisions in the ancient criminal law of Nuremberg, where incarceration was provided as a model of punishment for some crimes. In addition, several medieval German and Italian cities had prisons for detention, substitution of fines, and punishment of petty crimes.

Peters (1995) also mentions the edict of King Liuprando as a rare example of the standardization of prisons in the early eighth century, adding the information that it was up to the judges to build the prisons in their respective district. Also according to the author, the Visigoths, in the region of present-day Spain, were strongly influenced by Roman legal practices, highlighting the existence of Visigothic laws that mentioned imprisonment as an instrument of custody of prisoners for later execution.

In the period of the Late Middle Ages, with the beginning of the slow process of replacing the old traditional and decentralized monarchies with models that, henceforth, would give way to monarchies centralized in the figure of a sovereign, the use of prisons becomes better documented and with facilities (castles, forts, palaces, etc.) adapted to be transformed into prisons, without, With this, one can speak of the use of prison as a penalty.

According to Neuman (1971), except for sporadic cases at the end of the sixteenth century, the idea of deprivation of liberty was not known in the Middle Ages. In fact, incarceration took place in underground cells called *vade in pace* or in dungeons, rooms in fortresses and palaces adapted for incarceration, such as the Tower of London, initially a fortified palace, the Bastille Fortress in Paris, originally a palace and treasury of the Templars, the *Bicêtre*, which would have been built to be an episcopal palace or *Piombi di Venezia*, apartments of the Venetian ducal palace.

In the Kingdom of England, Peters (1995) points to the Tower of London, built by order of King William I and which was used as a prison to guard the king's enemies. In other prison buildings, it was already possible to find people in custody by order of local judges, as they were prisoners of war or hostages. In addition, when the *Assizes of Clarendon* was issued in 1166 by King Henry II, the *sheriffs* were ordered to build local jails in their respective counties, for the custody of prisoners accused of offenses until the arrival of the itinerant royal judges, who would promote the respective trials.

The arrests of these periods maintained clear precautionary purposes, intended to keep the prisoners in custody until their trials. Also according to Peters (1995), punishment in English law was made to be quick and discourage the practice of other crimes, and the forms of punishment were vexatious, involving mutilation, branding, public flogging, in addition to death penalties that could be given by hanging, drowning, incineration, live burial or decapitation, without forgetting the possibility of inflicting previous torments.

In the French Kingdom, a similar situation was found. The justice system of that period consisted of decentralized levels of administration of justice, where, alongside royal justice, the justice of the nobility, municipalities and ecclesiastical courts coexisted, a reality that, in fact, would persist until the appearance of the Napoleonic codifications. It was during this period that well-known fortifications began to be used as prisons. The best known and most emblematic were the fortifications of the *Châtelet*, on the banks of the Seine River, which had already been used for the custody of detainees around 1200, and the emblematic fortress of the Bastille, which, although it was designed as a defensive structure of Paris, was successively modified in the following kingdoms, becoming a prison facility (Peters, 1995).

It is necessary to recognize that, even though penitentiary facilities have existed in France since the period of the Late Middle Ages and in the centuries that followed, the use of prison as a punishment was not the main means of sanction. Hence the warning of Carrara (2002, v. 2) that it was only with the enactment of the Penal Code of 1791 – therefore, after the events that determined the outbreak of the French Revolution and the end of the Modern Age – that prison began to be used properly as a penalty.

In the Iberian Kingdoms there were prisons and, like many models spread in the Western world, they were intended for the custody of individuals so that, in the future, they would be the object of the common punishments of the period. However, what draws attention in some of these kingdoms is the existence of advanced legislation dealing with prisons, which found no parallel in many of the kingdoms that were contemporary with them.

Peters (1995) alludes to the *Siete Partidas*, a collection of laws organized and published in 1265 by King Alfonso X of the Kingdom of Castile, which contained the most extensive discussion of the use of prisons in that medieval period. If it is not possible to know the extent of the de facto application of this legislation to Castilian prisons, the existence of a legislative work of this magnitude would indicate a concern with the situation of prisons, and it is not a legislation that was a mere copy of ancient Roman laws or laws of the Kingdom of France.

However, if there is a medieval institution that developed the purposes of imprisonment in the period, it was the Roman Catholic Church. Originally, the juridical questions with which

the Catholic Church dealt were of an ecclesiastical nature. However, with the increasing intervention in worldly affairs, the Church began to position itself as the authority to regulate matters that would involve the entire Christian community or Christendom.

According to Peters (1995), bishops assumed responsibility for broad matters of interest to the clergy, as well as those related to the property of the Church itself and immoral behaviors within their communities. Writings of bishops and religious of the city of Rome, which contained legislative and consultative acts, had their authority accepted in much of European Christendom. Furthermore, from the sixth century A.D., as various materials of a legal nature were produced by local ecclesiastical assemblies, individual books of penance, liturgical books and edicts of Germanic kings, they began to be the object of study and systematization by scholars, and from the twelfth century onwards, they began to receive the referendum of the Church, having as its starting point the *Decretum* of 1140 ("Concurrence and Disagreement of the Canons")⁵.

Imprisonment will appear in Canon Law as a punitive and correctional alternative, a true disciplinary instrument seeking the punishment and expiation of sins by cellular isolation.

Dotti (2010) notes that punitive practice in canon law was responsible for clearly introducing the punitive nature of an individual's submission to prison. The prison would have the function of subjecting the sinner to the awareness of his sin and his consequent expiation through imprisonment.

Mirabete and Fabbrini (2019, v. 1) highlight the contribution of canon law to add another purpose to punishment, which, in addition to being an expiatory means, should also be regenerating.

For Peters (1995), the development of canon laws in the cases of monks, secular clergy and laity can be understood as a remote articulation of an institutionalized system of discipline, based on the ideal of correction and penitentiary atonement, where the prison emerges with a new function.

There is no certain date as to when the use of imprisonment as a means of punishment by Canon Law begins. According to Peters (1995) one could point to the recovery of the Roman practice of *ergastulum* in monasteries, since during the Synod of Tribur, in 895, a letter from the bishop of Tarragona, at the end of the fourth century, was republished, containing in that document the defense that rebellious monks and nuns should be enclosed in *ergastula*, separate compartments in the monasteries where they would receive discipline

⁵ Also according to Peters (1995), the *Decretum* of 1140 would be a collection carried out by Gratian, which came to be accepted as a basis for the study of ecclesiastical or canonical laws. Canon laws were widely recognized by various political entities of the time, such as individual monarchies, principalities, and free cities, until the advent of the Reformation in the sixteenth century.

through forced labor. This practice was included in the collection of the *Decretum* of 1140. As if that were not enough, from the sixth century onwards, many monastic constitutions, although not part of the *legislative corpus* of the Roman Catholic Church, used the expression *cárcere* (*carcer*) to designate a place of penitentiary enclosure at the discretionary disposal of the abbot, including, in some more extreme cases, perpetual enclosure being possible. With the systematization of canon law at the end of the twelfth century, it was already expected that each monastery would have a prison or something similar, and in the thirteenth century, monastic enclosure was already formally mentioned as a punishment, being compared by many writers of the time, when perpetual, as comparable to the death penalties imposed in the secular sphere.

In this point, he points out:

Monastic prisons also served to confine the secular clergy under the supervision of bishops. The process was known as *detrusio in monasterium* ('confinement in the monastery'), and this may suggest either living as a monk in a normal monastic discipline or being held in a monastic prison. During the twelfth century, bishops were expected to have their own diocesan prisons for the criminal punishment of clergy. The episcopal use of imprisonment as punishment was regularized in a decree entitled '*Quamvis*' and published by Pope Boniface VIII in his legal collection, *Liber sextus*, of 1298. Addressing the doctrine of Roman law that prisons should serve as places of confinement, not punishment, Boniface nevertheless allowed abbots and bishops to punish offenders with *poena carceris* ('prison sentence') either for a period or in perpetuity. Boniface VIII was the first sovereign authority in the Western tradition to define that imprisonment as punishment was a legitimate instrument of a universal legal system (Peters, 1995, p. 28-29).

Although monastic enclosure was used primarily for internal disciplinary matters, the influence and interference of the Roman Rite Catholic Church in the daily life of the laity meant that, at a certain point, there are also records that it was used as a means of punishment to the detriment of the laity.

For Peters (1995), Catholic religious discipline imposed that it was the duty of the Church to ensure the expiation of the sins of the faithful, which, *a priori*, was done through penances in the face of sinners who confessed their sins in secret. However, in some cases, when the sins were public and caused scandal that offended the Christian community, they were required to be regarded as criminal sins and the object of public penances, admitting, in some cases, extreme measures such as exclusion from the Church, exclusion from the sacraments, and the imposition of public penalties of various kinds, including confinement in monastic prisons. In several councils held during the eighth and ninth centuries, incarceration was directly insisted upon as a means of dealing with public sins, such as incest, witchcraft, and divination.

Neuman (1971) emphasizes the possibility of applying imprisonment outside the clerical ranks, highlighting the difference between the *detrusum in monasterium*, applied to the detriment of clerics who violated ecclesiastical norms, and the punishments imposed to the detriment of "heretics", highlighting the difference, even, in regimes, such as the one called common or *murus largus* from those of a cellular nature or *murus arctus o arctissimus*.

Gradually, therefore, the monastic prison is transformed from an instrument for the disciplinary issues of the Catholic clergy into a means of punishment that can be enforceable against the other individuals over whom the authority of the Church was in fact exercised, which can be explained by the political decentralization of the period, where the Catholic Church, through the prestige of its Roman heritage, of its organization and political hierarchy, was one of the rare examples, in the Middle Ages, of a minimally organized legal structure that managed to make itself respected to the point of having the authority to impose sanctions.

However, even though the prisons existing in the medieval period had maintained the preponderantly precautionary purposes, it is already observed, in that period, the appearance of structural problems faced in many contemporary penitentiary systems. Peters (1995), using the English example, points out that, with the growth of criminal matters, jails began to suffer from overcrowding, leading the Crown to appoint commissions to solve penitentiary problems as early as the thirteenth century. there are records of prisons maintained by nobles or under a franchise regime, where the right to imprison people in exchange for remuneration was assured.

2.4 THE FIRST PRISON EXPERIENCES OF MODERNITY

With the beginning of the Modern Age, the first prison institutions begin to take shape. The change in the functionality of the prisons was not immediate, but gradual. As Prado (2013, v. 3, p. 113) points out, "[...] prison, until the eighteenth century, continued as an instrument of procedural custody, so that those institutions remained with an exceptional character".

Pimentel (1989) states that the radical of prisons is located in the Middle Ages, through the monastic cells dedicated to the penance of monks and clerics who were absent, in a place where, due to isolation, they would dedicate themselves to silence, meditation and repentance. However, the first prison facilities for the incarceration of criminals have as precursors the experiences of the *houses of correction*, built in London in the sixteenth century, which were replicated in Amsterdam at the end of the century, in male and female establishments, and later in what would be present-day Germany, in the seventeenth century,

while, in the eighteenth century, they would also spread in what would be present-day Belgium, also remembering the creation of the Hospital of St. Michael, in Rome, by the work of Pope Clement IX.

In England, around the sixteenth century, the so-called Houses of Correction or *Bridewells* appeared. According to Lyra (1995, v. 2), the British and Americans understand the *bridewells* as being the first examples of facilities intended for the fulfillment of sentences, being sketches of the sentences of correctional houses. This conception is further noted by Bruno (1978, v. 3), for whom Bridewell was the first experience of a house of correction, which began in London around the second half of the sixteenth century A.D., and which ended up being repeated not only in England, but also in other centers, in Amsterdam, German cities and even in the aforementioned correctional centers for minors in the Italian peninsula.

Melossi (2010) mentions that Bridewell Castle was intended to welcome vagabonds, idlers and thieves who committed minor crimes, with the aim of reforming the unemployed through strong discipline and submission to work, as well as discouraging other people from following such a path. Due to the apparent success, the other houses of correction that followed also came to be called *bridewells*. These *bridewells*, however, functioned as a means of forcing people to work in the condition offered to them, whatever it might be, under penalty of authorizing judges to submit idlers capable of working to prisons.

In the region of the present-day Netherlands – generalized inaccurately as the Netherlands – there were also institutions for incarceration and the imposition of work on prisoners, known as workhouses (*Tuchthuis*) or even as *Rasphuis* and *Spinhuis*.

They have peculiarities that do not necessarily make them mere repetitions of the English *workhouses*, being known as *tuchthuis*, whose main activity was the scraping of wood so that dyes could be produced from this process, something profitable at the time and which is related to the history of Brazil, considering that one of the raw materials for such activities was brazilwood wood, extracted in abundance in the Brazilian colonial period. Such institutions would also have been known as *rasphuis*, as they were the houses of correction intended for men, while the *spinhuis* were those intended for the gathering of women.

Melossi (2010) states that the Dutch workhouses were not necessarily directly influenced by the English *houses of correction*, as the *tuchthuis* would have reached a high degree of development due to the economic context of the period. For the author, there was a context of stimulation of forced labor due to the changes caused by the Protestant Reformation throughout Europe, as well as the growth of the mercantile traffic, which increased the labor market and began to demand instruments to regulate the available labor forces through changes in punitive instruments, especially due to the fear that there would

be a high cost of this labor. Furthermore, in addition to controlling remuneration, it sought to control the workforce itself, educating and domesticating it.

Also according to Melossi (2010), the beginning of this institution had as its starting point the installation, in 1596, in a convent in the city of Amsterdam, due to a decision by the local magistrates to install a house so that vagabonds, evildoers and braggarts could be arrested to be punished and occupied with work for as long as the magistrates deemed convenient. The institution was designed to be self-sustaining with the work of prisoners, although it did not aim at personal profit, even for its leaders. In addition, the penalties would be brief and would admit modification through the behavior of the prisoner. Furthermore, the creation of this institution would not have replaced the other forms of punishment, becoming just another punitive instrument intermediate between pecuniary punishments and physical punishments and the penalties of banishment and capital.

The nomenclature, in turn, comes from the type of forced labor that began to be carried out in these institutions: the scraping of wood for the purpose of producing dyes, being a kind of manufacture, a means of production until then dominant, much thought out for idle and lazy people, due to its strenuous nature, which could cause serious injuries, although it did not translate into quality, as there were already complaints that the quality of the powder produced would not be as good as that produced in the mills. In addition, these places were assured the monopoly of production, typical of a mercantilist structure, which caused problems with municipalities that sought modern means of production (Melossi; Pavarini, 2010).

In a similar vein, Prado (2013, v. 3), highlighting that the appearance of these institutions took place in 1596, in Amsterdam, reinforces that the *rasphuis* were those work facilities intended for men, while the *spinhuis* for women, being houses of correction that influenced the proliferation, in Germany, of similar establishments.

As can be seen, the influence of the *tuchthuis* in the history of prison is very much felt in Europe, either because they represent a model of institution very similar to the houses of correction, attributing a different purpose to the prison from that of mere custody, or because they proved useful according to the mercantile and colonialist model of the period, marked by the exploitation of both the natural resources of the overseas colonies and the labor of captives and prisoners.

In addition to the houses of correction that originated in the sixteenth century in what is now the United Kingdom and the Netherlands, another type of correctional institution was operationalized in the late seventeenth and early eighteenth centuries in the Italian peninsula: the so-called hospices or hospitals for young delinquents, whose nomenclature should not

be confused with the contemporary institutions of the same name. but it concerned a kind of houses of correction that were structured to collect young people accused of crimes so that they could, by rigid discipline typical of monastic prisons, reform them.

Carrara (2002, v. 2), although he states that prison sentences took shape after the liberal revolutions, recalls that there were monasteries in the seventh century, used for penitentiary purposes, recalling that it was already pointed out that there were already prisons for young delinquents in the Hospital of San Miguel, in Rome, in 1703, and in San Felipe, in the city of Florence, in the year 1701.

Prado (2013, v. 3) indicates that in the second half of the seventeenth century, the priest Filippo Franci created the Hospice of St. Philip Neri, in Florence, intended for the correction of young people; however, it was in Rome, in 1704, that Pope Clement XI himself created the institution of the Hospice of St. Michael, in the wake of the reforming ideas, being a house of correction that subjected young people to a penitentiary regime of daytime silence and nighttime cell collection for the purpose of reform.

2.5 THE ATTRIBUTION OF THE NEW FUNCTION TO PRISON: PUNISHING TO CONTROL

With the emergence of the first modern prison experiences, there is then a turning point: new functions begin to be attributed to prison. From a means of custody, the embryonic prison establishments become a means in themselves.

The reasons are varied. On the one hand, there are theories that identify that its emergence was due to humanitarian or utilitarian reasons, either because of the lesser harm when compared to other corporal punishments, or because of the impossibility of applying some types of punishment en masse, such as capital punishment.

Lyra (1955, v. 2) pointed to several factors that culminated in the appearance of the first modern prison experiences. On the one hand, the religious conception of penance that encouraged incarceration for the purpose of correction and expiation of sins. On the other hand, the increase in crime in the sixteenth and seventeenth centuries and the impossibility of mass application of corporal punishment generated imprisonment as a viable alternative. Thus, the first attempts to solve this problem were practices of seclusion with the imposition of forced labor, citing as examples installations in Amsterdam, between the years 1595 and 1597, Bremen in 1609, Lubuque in 1616, Hamburg in 1622 and Danzig in 1629. The author also mentions places identified as houses of refuge for minors, which welcomed such people, such as in Florence in the period from 1650 to 1667, prisons on Giulia Street, in Rome, around 1655, and the Hospital of San Miguel, in 1703.

On the other hand, however, there are those who see that the punitive function attributed to imprisonment is related, first, to the need to create a new mechanism of social control that could adapt to the new economic and social context of the capitalist production system of the State.

Melossi (2010) emphasizes the changes of an economic and cultural nature as preponderant for the appearance of the modern prison. He states that, with the changes in the structure of production observed at the beginning of the modern period, as well as the processes of secularization of properties due to religious reforms, there was the dismantling of Church properties that practiced charity and were used for the sustenance of peasants, resulting in the appearance of a large number of helpless masses who ended up becoming unemployed and resorting to begging. Seen as vagabonds, they were not only listed as such, but also objects of various laws that sought to repress this condition of misery, which imposed physical punishment, banishment or even capital punishment.

Van der Slice (1936) pointed out that, since the reign of Henry VIII, legal statutes have been issued to punish beggars or vagrants who did not have certain licenses granted by *justices of peace*, and that they could be physically punished, even mutilated. In this way, the laws enacted sought to solve the problem of poverty and unemployment through measures of a criminal nature. However, despite the severity of the measures, such problems not only persisted, but increased, with space emerging for the adoption of experimental measures, including incarceration for correction purposes in the so-called *houses of correction*.

Also according to Van der Slice (1936), people were initially collected at the Bridewell fortification. Petty offenders, thieves and vains were collected, but there were also people who were detained merely because they had become a problem in a certain city. In that place, the ideal of the reform of the person through discipline and work was believed, being distributed according to the greater or lesser aptitude of the prisoners. The services were varied, the supply increasing over time, but included services in loom rooms, bakeries, mills, etc. The work was paid and the food provided by the watchmen. In addition to the discipline of work, physical punishment of prisoners was practiced by means of whippings, food restrictions and torture. In a short time, similar *houses of correction* began to be applied in cities such as Oxford, Salisbury, Norwich, Gloucester, Ipswich, Acle and Chester.

Fenton (1954) points out that punishments in England in the sixteenth century were severe and corporal, and only in this period did the use of prisons for punishment purposes begin. However, its use was not based on humanitarian issues, but with the management of poverty due to the collapse of the feudal model and the new legislation on land fencing. In

this way, many people were incarcerated in institutions that were precursors to penitentiary facilities such as Bridewell, and the other institutions were called *Bridewells*.

Baratta (1982) also points out that the new functions attributed to the prison and the factory work regime have historical similarities, since both are aimed at controlling the peasant masses separated from the means of production, adapting them to the models of discipline of modern factories, so that the understanding of the penitentiary institution is born together with the idea of capitalist society, although this single element is not sufficient to explain the current relationship between prison and society, but by analyzing its origin⁶.

Foucault (1999), analyzing the resignification of the function of prison, highlights that the use of prison was restricted to custody. At one point, its use was even seen as a despotic means of justice. In spite of this, what we saw was that, from being a semi-proscribed, it became an institution of generalized punishment, which could not be explained only by humanitarian reasons. He then pointed to the *rasphuis* as a precursor, highlighting the influence of this model as an instrument of control through the exploitation of labor and the economic dynamics as possible remote causes of this change.

According to Vacani (2015), it is during mercantilism that imprisonment gradually becomes a punitive form and thus due to the new economic-social program that Western states acquired.

According to the author:

Prisons manifested themselves as diverse spaces in which people deprived of liberty were housed (galleys, mines, military and naval prisons, border forts and forts) throughout the Middle Ages and early Modern Ages. At the same time, the idea of exploiting the labor force of prisoners and rehabilitating them for this purpose appears in the sixteenth century as a practice aimed at training all that population excluded from this social structure. Thus, the first attempts to bring together the strategy of excluding the inadmissible other (from the leper to the beggar, passing through the one who commits a crime or professes another faith) with the disciplining of the useful other (Vacani, 2015, p. 120)

Bustos Ramírez and Hormazábal Malarée (1997, v. 1), despite thinking that the appearance of the prison sentence was related to the consolidation of the liberal State, attributing humanizing, utilitarian and resocializing functions to prison, recognize that antecedents could already be observed since the sixteenth, seventeenth and eighteenth centuries, especially in the experiences of the *tuchthuis* and of the correction houses, which

⁶ However, Baratta (1982) states that the function of the prison to produce unequal individuals would still be important in the economic dynamics, because the prison would produce a stigmatizing and reductive effect, either in the dynamics of the labor market, as well as outside this dynamic, such as, e.g., by providing human and material means for criminal practices such as the crime industry, the drug cycle, etc.

would have the function of forcing marginals to work in favor of the State, fulfilling both an economic function in favor of the new model of capital accumulation and of overcoming the monopoly of craft corporations, a concept that would have been extended to France and England.

3 CONCLUSION

Prison as a means of punishment, in historical terms, is a recent reality, but with remote antecedents. Prisons are reported during much of Classical Antiquity, despite their use not being recurrent, existing in the overwhelming majority of times as custody facilities in favor of the future application of other punishments, especially corporal punishment.

During the Middle Ages, this system of using prisons as a means of custody was maintained, however, it was already possible to see the use of prisons as an instrument of custody and exercise of power, as in the case of fortified facilities adapted to receive prisoners of war and political opponents. However, the use of prison as an instrument of correction and control is recorded in this historical period, mainly due to the contribution of the clerical practice of using prison as an instrument of correction and ecclesiastical discipline, with records of its use also in the face of lay people.

The turning point of the purposes of prison, from the institution of precautionary purposes to a means of punishment, is linked to the new purposes that have been attributed to it. Since the *bridewells* in present-day England and *Tuchthuis*, *Rasphuis* and *Spinhuis* in the present-day Netherlands, modern antecedents of the current penitentiaries, there has been a change in the function of the old prisons, in order to attribute correctional-punitive objectives to those through the submission of prisoners to work due to changes in the context of the means of production and social control.

ABSTRACT

We report a case of bone erosion in the mental region associated with hyaluronic acid (HA) injection for cosmetic purposes, incidentally identified in a patient undergoing orthodontic treatment with miniscrew-assisted rapid palatal expansion (MARPE). This case offers rare sequential radiographic documentation using cone-beam computed tomography (CBCT) both before and after HA injection, along with intraoperative confirmation of the lesion. These findings provide further support for the hypothesis of HA-induced bone resorption. This report underscores the critical role of imaging in interdisciplinary clinical practice and contributes meaningful evidence regarding the potential adverse effects of facial fillers on underlying osseous structures.

(MARPE). Este caso apresenta uma rara documentação radiográfica sequencial por meio de tomografia computadorizada de feixe cônico (TCFC), realizada antes e após a aplicação do AH, além da confirmação intraoperatória da lesão. Esses achados fornecem suporte adicional à hipótese de reabsorção óssea induzida pelo ácido hialurônico. O presente relato destaca o papel fundamental dos exames de imagem na prática clínica interdisciplinar e contribui com evidências relevantes acerca dos potenciais efeitos adversos dos preenchedores faciais sobre as estruturas ósseas subjacentes.

RESUMEN

Se reporta un caso de erosión ósea en la región mentoniana asociada a la inyección de ácido hialurónico (AH) con fines estéticos, identificado de forma incidental en una paciente sometida a tratamiento ortodóncico con expansión rápida del maxilar asistida por miniimplantes (MARPE). Este caso presenta una rara documentación radiográfica secuencial mediante tomografía computarizada de haz cónico (TCFC), realizada antes y después de la aplicación de AH, además de la confirmación intraoperatoria de la lesión. Estos hallazgos aportan mayor respaldo a la hipótesis de reabsorción ósea inducida por el ácido hialurónico. El presente informe destaca el papel fundamental de las técnicas de imagen en la práctica clínica interdisciplinaria y contribuye con evidencia relevante sobre los posibles efectos adversos de los rellenos faciales en las estructuras óseas subyacentes.

1 INTRODUCTION

Miniscrew-Assisted Rapid Palatal Expansion (MARPE)¹ has established itself as an effective alternative for the treatment of transverse maxillary deficiencies in young and adult patients, promoting predominantly skeletal movements with minimal dentoalveolar repercussions. The protocol often involves the use of cone beam computed tomography (CBCT) both in planning and post-treatment evaluation, providing a detailed view of the craniofacial bone structures involved in the procedure.²

At the same time, the use of hyaluronic acid (HA)-based dermal fillers has become widely popular in minimally invasive facial aesthetic procedures, especially in the mental region.³ Although they are considered safe, reports in the literature have described rare cases of complications, including localized bone resorption, possibly from chronic inflammatory reactions or vascular compression.^{4,5}

In this context, we report a clinical case of bone erosion in the mandibular body region, incidentally identified by tomography performed for post-expansion evaluation with MARPE. The patient had a history of HA application in the mental region, and the radiographic finding suggests a possible association between the aesthetic procedure and the observed bone resorption. This case reinforces the importance of imaging evaluation and interdisciplinary dialogue between orthodontists and orofacial aesthetics professionals.

2 CASE REPORT

A 21-year-old female patient sought orthodontic treatment with the chief complaint of anterior open bite, masticatory difficulty, and a narrow smile. Clinical examination and cephalometric analysis revealed a constricted maxilla with moderate transverse deficiency, a Class I maxillomandibular dental relationship, mild mandibular retrusion, and no facial asymmetries.^{6,7} CBCT was requested for treatment planning and demonstrated stage C maturation of the midpalatal suture according to Angilieri's classification.² Considering the patient's advanced age for conventional rapid palatal expansion using a Hyrax or Haas-type expander, MARPE was selected as the treatment approach.⁸ A MARPE EX 13 mm expander (Peclab) was installed and four mini-implants anchored in: two anterior (code: 5500) HS MARPE 1.8 × 7 × 8 mm and two posterior (code: 2926) HS MARPE 1.8 × 7 × 4 mm orthodontic mini-implants (Peclab, Belo Horizonte, Brazil), registered with ANVISA under number 80041470004. The mini-implants were positioned in the paramedian region of the palate. Immediately after the success achieved through this procedure, orthodontic completion with aligners was started (Fig. 1A, B).

Figure 1

A. Initial 3D CBCT reconstruction performed for planning of the MARPE device. B. Intraoral occlusal photograph showing the MARPE appliance installed, anchored by four mini-implants

Activation was performed according to protocol (1/4 turn per day), totaling 18 activations in approximately 19 days.¹ The success of the procedure was confirmed clinically by the diastema between the central incisors, and radiographically, by the opening of the midpalatal suture observed in the follow-up CBCT (Fig. 2A-D). After eight months transverse stability was achieved and removal of the MARPE device was planned. A new CBCT was requested to evaluate bone consolidation. The objective of scan was to reevaluate the bone anatomy before removal of the mini-implants.⁹

Figure 2

A. Post-expansion 3D CBCT confirming midpalatal suture opening. 2A. Sagittal CBCT slice obtained 15 days before soft tissue filler injection, showing intact mandibular symphysis. 3A. Axial slice confirming no bone erosion in the mentum prior to filler placement. 4A. Coronal CBCT image showing intact cortical and trabecular structure of the anterior mandible before aesthetic procedures

In the analysis of the tomographic image, a well-defined area of bone resorption 1.32cm high x 1.52cm wide x 2.79mm deep was observed in the mandibular body. The lesion showed partial loss of the buccal cortex, with evident reabsorption of the trabecular bone, characterizing an erosive process compatible with chronic and localized involvement of the bone tissue (Fig. 3A-D). When questioned about it, the patient reported no history of trauma in that region and denied pain, paresthesia, or symptoms suggestive of local inflammation. However, she reported a history of application of 1ml of HA in the mental region 7.5 months prior, 15 days after the MARPE locking, by a professional specialized in orofacial harmonization.

Figure 3

A. CBCT 3D reconstruction performed 8 months after MARPE treatment and 7.5 months after HA filler injection in the mental region, revealing erosive lesion in the mentum. 3B–D. Axial, sagittal, and coronal CBCT slices showing the extent of bone erosion in the mandibular symphysis

Given the finding, the patient was referred to an endodontics specialist, who assessed the pulp vitality of the adjacent teeth by periapical and panoramic radiographs. The studies were negative for necrosis, and the patient was then advised to also undergo an evaluation by a bucomaxillofacial surgeon to consult on the best course of action.

PET/CT scans performed to assess the presence of granulomatous lesions in other regions of the body did not show changes compatible with this condition, ruling out systemic inflammatory processes. These findings hypothetically suggest that the observed lesion may be related to the pressure exerted by the filling material with highly cross-linked hyaluronic acid.¹⁰

Ultimately, surgery was decided due to the size of the lesion and concern for inducing aseptic necrosis in the teeth involved in the adjacent area (teeth 31, 32, and 33). During exploratory surgery, signs of reabsorption of the buccal cortex as well as the trabecular area measuring 1.32cm x 1.52cm x 2.79mm was found in the mental region on the left side. In the region on the right side, three foveas without invasion of the trabecular only in the buccal cortex were also detected. after being curetted, as well as the one on the left side, were filled

with Geistlich Bio-Oss® (spongy granules 0.25–1 mm, 2 g; Geistlich Pharma AG, Wolhusen, Switzerland), with ANVISA registration number 80696930002 and Geistlich Bio-Gide® collagen membrane (Geistlich Pharma AG, Wolhusen, Switzerland) registered with ANVISA under number 80696930003, sutured and surgery completed with guided radiographic follow-up after 3 months. No materials were collected for examinations, as reabsorption occurred due to pressure.⁴ (Fig. 4A-D).

3 DISCUSSION

Recent evidence suggests that bone resorption associated with the use of hyaluronic acid-based dermal fillers may be more prevalent than previously reported. Studies have shown that a significant proportion of patients develop bony changes in the mental region after such procedures, highlighting the need for careful evaluation and appropriate

radiographic follow-up.^{11,12} The present clinical case describes an incidental finding, identified by computed tomography requested for orthodontic purposes after completion of the active expansion phase with MARPE. The temporal association with the application of HA in this region suggests a possible causal relationship, as discussed in previous reports.^{4,5,11,12}

Furthermore, as highlighted by Bass et al.,³ the injection technique is critical to achieving excellent results with dermal fillers. Techniques such as threading, fanning, cross-hatching, bleb, and pillar must be mastered to ensure the safety and efficacy of the procedure. Technical execution can only match, but not exceed, the quality of the aesthetic analysis. In the case presented, the absence of clinical symptoms and the incidental detection of the bone lesion highlight the importance of a careful technical approach and a detailed aesthetic evaluation to minimize risks and complications associated with the use of dermal fillers.³

Corroborating this evidence, Guo et al. (2020)⁴ reported a series of Asian cases in a retrospective cohort study that identified bone resorption in the mental region following HA filler application. The authors observed that, even in asymptomatic patients, structural bone changes could occur insidiously. The study raises the hypothesis that the prolonged presence of the filler, combined with the pressure exerted on the cortical bone of the mental region, may trigger an unexpected resorption process.

The case reported by Nakagawa et al. (2022)⁵ described a patient with skeletal Class II deformity and significant bone resorption in the mental region, associated with prolonged use of hyaluronic acid. The authors suggest that chronic compression and/or low-grade inflammatory reactions induced by the material may lead to adverse bone remodeling, particularly when the filler is applied deeply or in close proximity to the periosteum.

Although the radiographic finding raises the hypothesis of bone remodeling associated with the use of dermal fillers, there is insufficient evidence in the literature to state that such alterations require intervention or specific imaging monitoring in healthy patients without symptoms. Therefore, the indication for computed tomography should always be based on clear clinical criteria, respecting the principles of justification and optimization of radiographic exposure.

From an anatomical perspective, the mental region comprises dense cortical bone with limited vascularization, rendering it more susceptible to necrosis or bone resorption when exposed to chronic pressure—either from the intrinsic synergistic action of the mentalis muscle or from vascular compromise. Although HA is widely regarded as a biocompatible and resorbable material, its prolonged presence—particularly in cases of repeated applications—may induce alterations in bone architecture.⁴

This case underscores the importance of an interdisciplinary approach, particularly involving orthodontists, radiologists, and facial aesthetic practitioners. It also emphasizes the critical role of comprehensive documentation of the patient's aesthetic history. Moreover, it highlights the diagnostic value of cone-beam computed tomography, not only as an essential tool for orthodontic planning but also for the identification of incidental findings with potential medical or surgical relevance.

4 CONCLUSION

This case report illustrates the importance of radiographic evaluation using computed tomography in patients undergoing orthodontic treatment, particularly when devices such as MARPE are employed. The incidental detection of a bone lesion in the mental region, associated with prior HA filler application, highlights the necessity for integration across multiple healthcare disciplines, including orthodontics, radiology, and facial aesthetics. Clinical and radiographic follow-up is essential in such cases and reinforces the need for greater awareness regarding the potential adverse effects of dermal fillers on deep bony structures.

ABSTRACT

Contemporary inclusive education demands a transition from the integration model to a perspective of full inclusion, questioning the effectiveness of reactive curricular adaptations. This study aims to analyze the implementation of Universal Design for Learning (UDL) as a fundamental strategy to replace individualized adaptation practices with a teaching model that is accessible and inclusive from its conception. Methodologically, the research is characterized as a qualitative bibliographic study using a deductive method, based on databases such as SciELO and Google Scholar, with theoretical support from authors such as Zerbato, Pletsch, and Sebastián-Heredero. The results indicate that UDL, grounded in neuroscience and structured around the pillars of engagement, representation, action, and expression, enables the creation of flexible curricula that recognize brain variability as the norm. Unlike a posteriori accommodations, which often stigmatize students with disabilities and reduce learning expectations, universal planning eliminates systemic barriers and promotes the autonomy of all learners. It is concluded that the application of UDL represents a necessary paradigmatic shift, moving the focus from the pathology of the individual to the rigidity of the curriculum. The implementation of this approach requires a reconfiguration of teaching culture and instructional design, transforming the school into a democratically accessible space where diversity is valued as pedagogical potential and equity is organically ensured, consolidating the inalienable right to knowledge for all students.

RESUMO

A educação inclusiva contemporânea demanda a transição do modelo de integração para uma perspectiva de inclusão plena, questionando a eficácia das adaptações curriculares reativas. Este estudo tem como objetivo geral analisar a implementação do Desenho

¹ Master's degree of Science in Education. Universidad San Carlos (USC). E-mail: therezadavilaf@gmail.com

Universal para a Aprendizagem (DUA) como estratégia fundamental para substituir as práticas de adaptação individualizada por um modelo de ensino acessível e inclusivo desde a sua concepção. Metodologicamente, a pesquisa caracteriza-se como um estudo bibliográfico de natureza qualitativa e método dedutivo, fundamentado em bases de dados como SciELO e Google Acadêmico, com suporte teórico em autores como Zerbato, Pletsch e Sebastian-Heredero. Os resultados indicam que o DUA, alicerçado nas neurociências e nos pilares do engajamento, representação, ação e expressão, permite a criação de currículos flexíveis que reconhecem a variabilidade cerebral como regra. Diferente das adequações a posteriori, que frequentemente estigmatizam o aluno com deficiência e reduzem expectativas de aprendizagem, o planejamento universal elimina barreiras sistêmicas e promove a autonomia de todos os estudantes. Conclui-se que a aplicação do DUA representa uma ruptura paradigmática necessária, deslocando o foco da patologia do sujeito para a rigidez do currículo. A implementação dessa abordagem exige uma reconfiguração da cultura docente e do design instrucional, transformando a escola em um espaço democraticamente acessível, onde a diversidade é valorizada como potência pedagógica e a equidade é garantida de forma orgânica, consolidando o direito inalienável ao conhecimento para todos os discentes.

Palavras-chave: Desenho Universal para a Aprendizagem. Educação Especial. Inclusão Escolar. Acessibilidade Curricular. Práticas Pedagógicas.

RESUMEN

La educación inclusiva contemporánea exige la transición del modelo de integración hacia una perspectiva de inclusión plena, cuestionando la eficacia de las adaptaciones curriculares reactivas. Este estudio tiene como objetivo analizar la implementación del Diseño Universal para el Aprendizaje (DUA) como estrategia fundamental para sustituir las prácticas de adaptación individualizada por un modelo de enseñanza accesible e inclusivo desde su concepción. Metodológicamente, la investigación se caracteriza como un estudio bibliográfico de naturaleza cualitativa y método deductivo, fundamentado en bases de datos como SciELO y Google Académico, con soporte teórico en autores como Zerbato, Pletsch y Sebastián-Heredero. Los resultados indican que el DUA, sustentado en las neurociencias y estructurado en los pilares del compromiso, la representación, la acción y la expresión, permite la creación de currículos flexibles que reconocen la variabilidad cerebral como norma. A diferencia de las adecuaciones a posteriori, que con frecuencia estigmatizan al alumnado con discapacidad y reducen las expectativas de aprendizaje, la planificación universal elimina barreras sistémicas y promueve la autonomía de todos los estudiantes. Se concluye que la aplicación del DUA representa una ruptura paradigmática necesaria, desplazando el foco de la patología del sujeto hacia la rigidez del currículo. La implementación de este enfoque exige una reconfiguración de la cultura docente y del diseño instruccional, transformando la escuela en un espacio democráticamente accesible, donde la diversidad se valora como potencia pedagógica y la equidad se garantiza de forma orgánica, consolidando el derecho inalienable al conocimiento para todos los discentes.

1 INTRODUCTION

Contemporary inclusive education requires a movement that goes beyond the simple integration of students with disabilities in the school environment, demanding a reconfiguration of pedagogical practices. In this scenario, Universal Design for Learning (UDL) emerges as a revolutionary approach that aims to plan teaching in order to meet human diversity from its conception. Unlike traditional models, which focus on remediating difficulties after planning, UDL proposes the creation of flexible curricula and learning environments that eliminate barriers for all students, recognizing variability as the rule rather than the exception.

Historically, Special Education has been guided by the logic of individualized adaptation, in which the curriculum is designed for an "average student" and, later, "adjusted" for those who do not fit this standard. This practice ends up indirectly segregating the student, burdening the teacher with the need to create multiple lesson plans and keeping the focus on the disability instead of the potential. The problem lies in the fact that these specific adaptations are usually reactive and insufficient to guarantee autonomy and effective engagement, perpetuating a clinical view of inclusion that ignores the systemic barriers of the education system itself. In view of this, this work sought to answer the following Central Question: How can the implementation of the principles of Universal Design for Learning contribute to overcoming the logic of individualized curricular adaptation and promote effective inclusion in Special Education?

The general objective of this study was to analyze the implementation of Universal Design for Learning (UDL) as a fundamental strategy to replace individualized adaptation practices with an accessible and inclusive teaching model from its conception. And as specific: 1 - Identify the main theoretical foundations and the three pillars of UDL (engagement, representation, action and expression) in the context of Special Education; 2 - To contrast the limitations of reactive curricular adaptations against the potentialities of a universally planned curriculum; 3 - Propose pedagogical guidelines that assist teachers in the practical application of UDL to minimize learning barriers in different classrooms.

The choice of this theme is justified by the urgency of updating teaching methodologies in view of the national inclusion guidelines. The persistence in individualized "adjustment" models has proven to be exhausting for educators and ineffective for the integral development of students. By studying UDL, it seeks to offer a methodological path that not only facilitates the teaching work, but also transforms the school into a space where accessibility is a right guaranteed in an organic and transversal way.

From a social point of view, this research contributes to the democratization of knowledge and to the appreciation of diversity, combating the stigma associated with Special Education. Scientifically, the work enriches the field of pedagogy and inclusive education by providing theoretical and practical subsidies on an approach based on neuroscientific evidence. The relevance lies in fostering a paradigm shift: moving from an education that "corrects the student" to an education that "corrects the curriculum", promoting equity and academic excellence for all.

2 METHODOLOGICAL PROCEDURES

The research was characterized as a bibliographic study, developed with the aim of analyzing the implementation of the Universal Design for Learning (UDL) from theoretical contributions already published. The study method adopted was deductive, starting from the general premises about school inclusion to investigate the specificity of the UDL strategy in overcoming individualized adaptations. This choice allowed a deep dive into the specialized literature, ensuring that the topic was explored from different theoretical and empirical perspectives. As Gil (2002, p. 44) has argued, the bibliographic research "is developed based on material already prepared, consisting mainly of books and scientific articles", which provided the necessary basis to sustain the argument about the transition from the medical-clinical model to the social model of learning in the context of Special Education.

The way to obtain the data occurred through a systematic survey in digital libraries and databases such as SciELO and Google Scholar, using specific descriptors related to curricular accessibility and UDL. The treatment and analysis of the data were carried out in an analytical-descriptive manner, organizing the collected material in order to identify patterns, divergences and convergences in contemporary inclusion practices. For Lakatos and Marconi (2003, p. 183), bibliographic research "is not a mere repetition of what has already been said or written on a certain subject, but the examination of a theme under a new focus or approach, reaching innovative conclusions". Thus, the treatment of the information sought not only to describe the concept of Universal Design, but to critically analyze its effectiveness in deconstructing the logic of reactive adaptation, which often segregates the student with disabilities from the common curriculum.

Regarding ethical issues, the research was guided by absolute respect for intellectual property and the reliability of the sources consulted, ensuring that all ideas from third parties were duly credited. Although the bibliographic research does not require registration in Ethics Committees because it does not involve direct intervention with human beings, the commitment to scientific integrity and impartiality in the interpretation of the texts was

maintained. As explained by Severino (2007, p. 122), scientific work must be conducted with rigor, because "research is an activity of investigation that produces knowledge, being a procedure that is both theoretical and practical". Thus, the methodological path was carried out with transparency and academic honesty, ensuring that the data analysis ethically reflected the reality of the advances and challenges of school inclusion through the UDL.

The main theoretical foundations and the three pillars of UDL (engagement, representation, action and expression) in the context of Special Education

Historically, Special Education has been marked by processes of exclusion that restricted the full participation of students with functional specificities in the common education system. In the contemporary scenario, the transition to a truly inclusive model lacks tools that subvert the logic of curricular standardization, focused on a supposed "ideal student" who disregards human singularities. Universal Design for Learning (UDL) is a pedagogical philosophy that recognizes brain variability as a rule, proposing that the environment adapts to the individual and not the other way around. In this context, the scientific literature asserts that "UDL aims to remove barriers to learning and increase opportunities for all students, regardless of their abilities" (Zerbato, 2021, p. 150). Such a premise shifts the focus from the subject's pathology to the rigidity of teaching, requiring that educational planning foresees cognitive plurality from its initial conception, without the need for subsequent patches that only reinforce the stigma of difference.

Neuroscientifically, UDL is based on the functioning of three primordial neural networks that dictate how the brain processes knowledge. The understanding that each student has a unique neurocognitive profile invalidates linear or homogeneous methodologies that once dominated classrooms. When the school ignores this biological reality, it ends up marginalizing those whose psychic processing deviates from the statistical norm, generating insurmountable obstacles to academic progress. As the Brazilian research highlights, "educational evaluation requires a sensitive look at the particularities of the subject's cognitive development" (Anache, 2022, p. 45). Recognizing such pedagogical sensitivity means accepting that the instruction process lacks a biopsychosocial foundation that values human potential to the detriment of the diagnosed limitation, promoting an environment of full intellectual acceptance.

Engagement is the first structuring pillar of this model, operating directly in the affective networks of the brain to arouse the student's motivation and sustained interest. Without the emotional involvement and pragmatic sense of what is being taught, concept retention becomes an arduous task for students facing sensory or intellectual barriers. Providing individual choices and safe environments for experimenting with error is essential to keep the

student active in his or her path of discovery. Reinforcing this need, the theory postulates that "inclusion policies aim to overcome the barrier of physical access to ensure the appropriation of scientific knowledge" (Pletsch, 2020, p. 22). Engagement, therefore, acts as the engine that drives the desire to learn, transforming the classroom into a space of belonging and not just physical presence.

Representing information in various ways configures the second pillar, focusing on recognition networks that allow the student to identify and interpret sensory patterns. In the context of Special Education, the provision of content only by textual or oral means summarily excludes students with visual or hearing impairments or neurodevelopmental disorders. The diversification of visual, auditory and tactile stimuli ensures that the reception of the message occurs without noise, respecting the different ways of decoding the world. According to the specialized literature, "the visual support and structuring of the environment facilitate pedagogical mediation for students with ASD" (Nunes, 2021, p. 88). By making the presentation of content more flexible, the teacher removes the obstacles that prevent access to semantics and formal knowledge, ensuring that knowledge reaches everyone in a clear and intelligible way.

Enabling action and expression represents the third pillar of UDL, aimed at the strategic networks that manage the planning and execution of motor and cognitive tasks. Many students with disabilities possess the knowledge but encounter physical or intellectual barriers to demonstrating it through traditional written tests. Offering alternatives such as oral presentations, videos, concept maps or the use of assistive technologies allows the student to reveal their learning in an authentic way. Zerbato corroborates this view by stating that "curricular flexibility constitutes the basis for teaching to cease to be standardized and become accessible" (Zerbato, 2021, p. 158). The freedom to express what has been learned through different paths ensures that the evaluation is a reflection of real progress and not a punishment for the functional limitations of the subject.

From the perspective of pedagogical mediation, the dialogue between the pillars of the UDL and Special Education reveals that inclusion is not limited to isolated assistive technology resources. The integration of these fundamentals requires a change in school culture, where accessibility is thought of universally and not as a favor granted to a few. Anache complements this idea by emphasizing that "each individual has a biological and social rhythm that directly interferes in the appropriation of school content" (Anache, 2022, p. 52). Thus, the teaching practice lacks a clinical-pedagogical look that identifies the student's potential, using the pillars of engagement and representation as foundations for a solid and isonomic intellectual construction.

Teachers who work in the Specialized Educational Service (AEE) find in the DUA a robust theoretical framework to guide collaborative work with teachers in the common room. The articulation between these professionals is the nodal point for the curriculum to stop being a burden and become a path of possibilities. Pletsch observes that "SEA is configured as a service that supplements or complements the training of students with disabilities" (Pletsch, 2020, p. 30). When the principles of action and expression are applied in a coordinated way, the chances of school success increase dramatically, as the student realizes that his or her unique ways of acting in the world are valued and legitimized by the educational institution.

Concomitantly, the use of diversified sensory stimuli favors not only students with disabilities, but the entire heterogeneous group present in the classroom. Neuroplasticity is stimulated when the brain is challenged by multiple languages, promoting deeper and longer-lasting learning. Nunes points out that "the diversification of sensory stimuli promotes greater attention retention in children with developmental disorders" (Nunes, 2021, p. 101). This finding reinforces that Universal Design is not a specific method for disability, but an approach that qualifies teaching for all, transforming heterogeneity into a pedagogical richness instead of a problem to be solved.

Monolithic and rigid curricula represent the greatest barrier to the effectiveness of school democracy, as they presuppose that everyone must learn in the same way and at the same time. The UDL proposes to break this paradigm by suggesting that flexibility should be imbued at the core of institutional planning. Zerbato points out that "brain variability implies that there is no single path for processing information" (Zerbato, 2021, p. 144). By adopting this perspective, the school assumes the ethical commitment to leave no one behind, ensuring that the curricular structure is fluid enough to accommodate the multiple intelligences and the various ways of existing.

Through the critical analysis of evaluation practices, it is perceived that the focus often falls on what the student cannot do, ignoring his qualitative progress. The pillar of action and expression invites the educator to rethink the evaluation instruments, making them less punitive and more procedural. Anache asserts that "the pedagogical diagnosis moves away from the clinical view to focus on the student's learning possibilities" (Anache, 2022, p. 60). This change in mentality is crucial for students with intellectual or physical disabilities to feel capable of overcoming their limits, seeing the school as a space for empowerment and the construction of their citizen autonomy.

Criticism of the traditional teaching model intensifies when we observe that the mere presence of the student in the regular classroom does not guarantee his superior psychic

development. Inclusion lacks pedagogical intentionality and an architecture that supports difference without segregating it into parallel and decontextualized activities. Pletsch stresses that "the inclusive school demands a reorganization of teaching work and school time" (Pletsch, 2020, p. 35). Without this structural reorganization based on the three pillars of UDL, the discourse of diversity remains in the field of intentions, failing to provide an education that is, in fact, an inalienable right and accessible to each and every human being.

Synthesizing the fundamentals exposed, the implementation of UDL in Special Education transcends technique to achieve human dignity in the act of learning. The intertwining of engagement, representation, and expression creates a network of intellectual protection that prevents veiled exclusion within the academic environment. Recognizing the uniqueness of each student is the path to a practice that values existence in its fullness. As the contemporary literature summarizes, "social interactions mediated by language become the engine of higher psychic development" (Nunes, 2021, p. 110). This analysis ends by reaffirming that quality education depends on the courage to break with static curricula in favor of a school open to all minds.

The limitations of reactive curricular adaptations in the face of the potential of a universally planned curriculum

The transition from a clinical perspective to an educational approach based on Universal Design for Learning (UDL) requires the abandonment of segregating practices that have historically guided school inclusion. The rigid curriculum, by ignoring human variability, requires constant tinkering that rarely touches the essence of the pedagogical process. "The Universal Design for Learning presupposes that the barrier is not in the student, but in the curriculum and in the teaching environment, which need to be designed for everyone" (Zerato, 2018, p. 25). Such an inversion of values shifts the focus from individual disability to advance planning, establishing that accessibility should constitute the central pillar of didactic architecture from its primordial conception.

The model of reactive curricular adaptations operates under a logic of exception, intervening only when school failure becomes evident or exclusion manifests itself. This palliative method overloads the teacher and stigmatizes the student, reinforcing the idea that learning needs simplifications instead of diversified paths. "Curricular adaptations, because they are made a posteriori, end up keeping the focus on the student's limitation and not on the flexibility of the environment" (Pletsch, 2020, p. 42). The maintenance of this fragmented system prevents the school institution from reaching a level of institutional maturity where diversity is the standard and not the deviation.

Unlike the improvisation of late adjustments, universal planning foresees multiple means of engagement, representation and expression, ensuring that knowledge is assimilated through different sensory and cognitive pathways. The structure of the UDL is based on neurosciences, seeking to stimulate distinct neural networks that optimize information retention. "The application of the principles of UDL requires the offer of varied options so that the learner can access the content according to their characteristics" (Nunes, 2021, p. 88). When the teacher designs his class contemplating such premises, he eliminates in advance obstacles that would be insurmountable in a traditional and monolithic format.

The criticism lies in the fact that the inflexible curriculum generates an artificial need for specialized support, transforming the regular classroom into a space of merely physical coexistence, devoid of effective learning. The effort to adapt content after it has been developed consumes temporal and intellectual resources that would be better used in an inclusive instructional design. "Often, curricular adaptation is seen as a simplification of content, which reduces learning expectations about students with disabilities" (Zerato, 2018, p. 30). This reductive view restricts intellectual development, depriving the student of access to complex concepts in their entirety.

Establishing a dialogue between the foundations of UDL and teaching practice requires the teacher to assume the role of learning designer, abandoning passive and unidirectional transmission. The multiplicity of technological and methodological resources currently available allows instruction to occur in a fluid way, without the need for visible differentiations that segregate the groups within the same space. "Planning from the perspective of UDL allows the teacher to organize teaching strategies that reach everyone simultaneously" (Nunes, 2021, p. 95). The simultaneity of the pedagogical offer guarantees genuine belonging, strengthening the affective bond with knowledge and with the school community.

It is observed that the rigidity of the evaluation systems constitutes one of the greatest obstacles to the implementation of a universally planned curriculum, since the measurement of performance is usually standardized. The reactivity of the adaptations is reflected in tests that only mask the exclusion, without actually allowing the student to demonstrate his competence in alternative ways. "The evaluation must be consistent with the teaching process, allowing the student to express his knowledge through multiple modalities" (Pletsch, 2020, p. 55). Without a reform in the evaluation instruments, UDL remains a theoretical concept, far from the bureaucratic reality of contemporary educational institutions.

Considering the scenario of educational policies, teacher training lacks a critical basis that replaces the habit of "adapting for one" with "planning for all". Knowledge of the brain

networks involved in learning — recognition, strategic, and affective — provides the scientific substrate for this paradigm shift. "Understanding executive functions is essential to propose strategies that help students in the planning and execution of their tasks" (Prazeres, 2022, p. 112). The technical training of educators becomes the engine that drives the deconstruction of static curricula and the construction of dynamic and responsive learning environments.

The effectiveness of the UDL is manifested in the reduction of the feeling of inadequacy on the part of the student body, promoting a culture of autonomy and self-regulation. When access to information is guaranteed by various formats — visual, auditory, tactile or interactive — the language or sensory barrier is no longer an impediment to academic progress. "Curricular accessibility is not limited to physical space, but encompasses access to knowledge and communication" (Zerato, 2018, p. 45). The distancing from reactive practices allows the school to fulfill its social function of promoting the full development of all human potentialities without prior distinctions.

Paradoxically, institutional resistance often rests on the false premise that UDL would require Herculean work, when in fact it simplifies classroom management over time. Punctual adaptations generate a vicious cycle of dependence on specific materials and tutors, while the universal curriculum fosters learner independence. "By offering choices within the curriculum, the educator stimulates the student's intrinsic motivation and engagement in his own process" (Prazeres, 2022, p. 128). Engagement becomes the catalyst for persistence, minimizing the dropout and disinterest commonly associated with traditional teaching models.

Pletsch (2020) asserts that inclusion requires deep structural changes that go beyond the simple discourse of acceptance, reaching the hard core of didactics and school organization. The limitations of curricular adaptations lie in their remedial character, treating diversity as a problem to be solved and not as an intrinsic characteristic of the collectivity. "School inclusion demands a review of pedagogical practices so that the curriculum is accessible to all students, without exception" (Pletsch, 2020, p. 60). This revision assumes that universality is the initial parameter of any educational proposal, eliminating the dichotomy between regular and special education.

Nunes (2021) corroborates the thesis that flexibility needs to be inscribed in the marrow of teaching plans, allowing each individual to find their point of connection with knowledge. The fragmentation of the curriculum into "common" and "adapted" creates a silent hierarchy that perpetuates exclusion within inclusion itself, limiting the horizon of possibilities of the subjects. "Universal design does not propose a single method for everyone, but rather a variety of methods that meet the uniqueness of each one" (Nunes, 2021, p. 102). The

multiplicity of pedagogical paths enriches the collective experience, preparing citizens for a world characterized by plurality and constant transformation.

It is concluded that the abandonment of reactive strategies in favor of Universal Design for Learning represents the scientific maturation of contemporary pedagogy. Replacing adaptation with universal planning ensures that the architecture of education is robust enough to accommodate variability without collapsing or excluding. "Only through a universally designed curriculum can we ensure that the right to education is fully exercised by all subjects" (Prazeres, 2022, p. 140). The construction of a truly accessible school depends on the intellectual courage to reformulate the curricular foundations, establishing diversity as the cornerstone of the entire educational process.

Pedagogical guidelines that assist teachers in the practical application of UDL to minimize learning barriers in diverse classrooms

The reconfiguration of educational environments under the aegis of Universal Design for Learning (UDL) presupposes the recognition of neurological variability as an inherent norm of the student collective. Pedagogical planning, by moving away from standardized models, seeks to anticipate solutions that contemplate the plurality of cognitive profiles present in contemporary classrooms. "UDL proposes that teaching be planned in such a way as to offer multiple forms of representation, expression, and engagement, removing barriers before they impede learning" (Bock, 2019, p. 115). This proactive posture breaks with the tradition of emergency adjustments, establishing that accessibility must be inscribed in the genetic code of the curricular proposal.

Unlike one-off interventions, universal guidelines seek to base teaching on scientific evidence that explains how the brain processes information and maintains focus. The diversification of sensory stimuli allows knowledge to reach the student through alternative paths, ensuring that specific limitations do not translate into cognitive exclusion. "The application of UDL in teaching practice requires the teacher to know the neural networks of their students to offer diversified learning paths" (Sebastian-Heredero, 2020, p. 58). By understanding the recognition networks, the educator selects visual, auditory and tactile supports that facilitate the decoding of complex concepts autonomously.

Strategies focused on action and expression enable individuals to demonstrate their competencies without the constraints of rigid evaluation instruments. Formal rigidity often prevents subjects with distinct abilities from manifesting their mastery over content, generating performance metrics that do not reflect intellectual reality. "It is necessary to ensure that the student has different means to express what he has learned, using technologies or other languages that surpass traditional writing" (Gewehr, 2021, p. 74). The

offer of options for the execution of tasks promotes a scenario where creativity and critical reasoning prevail over the mere mechanical repetition of pre-established patterns.

Fostering engagement requires that the teacher establish connections between academic knowledge and the reality experienced by the learner, arousing genuine interest through practical relevance. When the curriculum ignores intrinsic affections and motivations, the educational process becomes an exercise in resistance and apathy. "Engagement is the engine of learning and depends on offering appropriate challenges that keep the student motivated and focused on the task" (Oliveira, 2023, p. 42). Providing individual choices about the level of difficulty or the format of the activities strengthens self-regulation, allowing the student to manage his own route with greater security.

Sebastian-Heredero (2020) emphasizes that universal design is not to be confused with the facilitation of content, but rather with the provision of scaffolding that supports access to rigorous knowledge. The distinction between the essential and the accessory in the teaching plan allows the teacher to maintain high expectations while making the ways of achieving the proposed objectives more flexible. "Accessibility in UDL does not mean lowering the level of demand, but rather offering the necessary support for everyone to achieve the same learning objectives" (Sebastian-Heredero, 2020, p. 65). Such a perspective combats the pedagogical prejudice that limits the development horizon of students with atypical trajectories.

Bock (2019) argues that the transition to this model requires a deep reflection on the role of assistive technology, which must be integrated invisibly and fluidly into school daily life. The use of reading software, adapted keyboards or transcription resources benefits the entire class, optimizing the flow of communication between peers. "Technology should act as a mediation resource that enhances human capabilities, eliminating physical or communicational impediments in the school environment" (Bock, 2019, p. 128). Technology, from the perspective of UDL, ceases to be an instrument of segregation to become a catalyst for collective intelligence.

Gewehr (2021) highlights that the support offered by the teacher needs to be dynamic, adapting to the fluctuations of student development throughout the school year. Constant monitoring of progress allows the educator to adjust support resources, withdrawing them as autonomy is consolidated. "Effective pedagogical mediation is one that identifies the needs of the group and adjusts teaching materials to ensure full access to information" (Gewehr, 2021, p. 89). This thorough monitoring ensures that no student remains stagnant due to lack of adequate tools or excessive ease, keeping the learning flow balanced.

Oliveira (2023) analyzes that the construction of inclusive environments depends on the institutional capacity to organize times and spaces in a less linear way. Classrooms that allow different grouping configurations and active methodologies favor the implementation of universal guidelines, as they welcome different work rhythms. "Universally planned learning environments are spaces that celebrate difference and encourage cooperation among peers as a teaching strategy" (Oliveira, 2023, p. 55). Collaboration among students, mediated by the teacher, transforms diversity into a valuable didactic resource, promoting the exchange of knowledge and the strengthening of social bonds.

Considering teacher training, it is observed the urgency of technical knowledge that equips the professional for instructional design. Knowing how to design a class that already contains subtitles, image descriptions and voice syntheses requires a competence that goes beyond traditional didactics. "Teacher training for UDL requires mastery of digital tools and a new understanding of how the brain works in the learning process" (Sebastian-Heredero, 2020, p. 72). The scientific updating of teaching becomes, therefore, the guarantee that learning barriers are systematically identified and removed from daily practice.

Bock (2019) reinforces that the removal of attitudinal barriers is the biggest challenge for the consolidation of universal curricula in educational institutions. The belief in the existence of a standard student prevents methodological innovations from gaining scale, keeping the system in a cycle of veiled exclusion. "Overcoming the view that special education is a parallel system is the first step towards implementing a truly universal curriculum" (Bock, 2019, p. 142). The unification of pedagogical practices under the umbrella of UDL strengthens the school as a democratic space, where the right to know is not mediated by clinical diagnoses.

Gewehr (2021) points out that the sustainability of a proposal based on UDL lies in the creation of professional learning communities where experiences are shared and refined. Teacher isolation prevents creative solutions from circulating and benefiting other educational contexts within the same school unit. "Collaborative work among education professionals is essential to create pedagogical guidelines that respond to the complexity of the diverse classroom" (Gewehr, 2021, p. 101). The exchange of successful practices accelerates the process of curricular flexibility, reducing the individual workload and increasing the effectiveness of interventions.

Oliveira (2023) concludes that the success of universal guidelines is manifested in the full social and academic participation of all subjects, without anyone needing to be "integrated" through late patches. Universal design for learning offers the roadmap for a school that recognizes the beauty of human uniqueness and transforms it into educational

power. "A universally planned curriculum is the maximum expression of respect for diversity and commitment to human development in all its dimensions" (Oliveira, 2023, p. 68). The practical application of these principles ensures that the educational institution fulfills its mission of forming autonomous, critical citizens who are able to contribute to a plural society.

3 CONSIDERATIONS

The implementation of Universal Design for Learning (UDL) at the heart of Special Education represents a paradigmatic break with the logic of exclusion and instructional standardization. By moving from a clinical perspective, centered on the pathology of the individual, to a critical analysis of curricular rigidity, the school institution recognizes its responsibility in the genesis of pedagogical barriers. This philosophy is based on the premise that neurocognitive variability is the biological norm, not the deviation, requiring the educational ecosystem to adapt to human plurality. Thus, accessibility ceases to be a reactive adjustment and becomes a constitutive pillar of planning, ensuring that the right to education transcends rhetoric and materializes in effective participation.

The structuring axes of UDL — engagement, representation, and action and expression — provide the scientific substrate for the operationalization of an inclusive praxis. By stimulating the affective, recognition, and strategic networks of the brain, instructional design ensures that knowledge is mediated by multiple sensory inputs and processed under conditions of sustained motivation. This approach overcomes the insufficiency of a *posteriori* curricular adaptations, which often stigmatize the student and promote conceptual reductionism. On the other hand, universal planning anticipates diversity, offering supports that allow students to internalize and externalize knowledge in an authentic and equitable way.

In the context of pedagogical mediation, the transition to this model requires a reconfiguration of the teaching culture and the architecture of school times. Assistive technology and the diversification of stimuli are no longer peripheral resources of the Specialized Educational Service (AEE) to integrate the core of regency in common rooms, benefiting the entire student body. When the educator assumes the role of architect of learning, prioritizing the provision of dynamic supports to the detriment of passive transmission, he fosters self-regulation and intellectual autonomy. Such transformation is essential for heterogeneity to be converted into pedagogical power, mitigating the feeling of inadequacy and strengthening the bonds with the object of knowledge.

Thus, the maturation of contemporary Special Education lies in the consolidation of fluid curricula that replace the deficient view with the valorization of subjective potentialities.

The overcoming of monolithic models in favor of universal learning paths ensures the fulfillment of the social function of the school in an isonomic and democratic manner. By institutionalizing diversity as a cornerstone of the educational process, the education system breaks with veiled forms of segregation and establishes a territory of genuine belonging. The rigorous implementation of UDL therefore sets the path to quality education that respects human dignity and promotes the integral development of all subjects.

ABSTRACT

Considering the need to strengthen innovation and entrepreneurship within public education institutions, this research analyzes the outcomes of the Innovative Entrepreneurship (IE) project, an initiative of the Ministério da Educação (MEC) - Brazilian Ministry of Education aimed, at the Rede Federal de Educação Profissional, Científica e Tecnológica (RFEPCT) - Federal Network of Professional, Scientific, and Technological Education. The study aims to evaluate the project's impacts on the consolidation of entrepreneurial culture, research infrastructure, and institutional capacity for innovation generation and dissemination. To this end, a qualitative and quantitative methodological approach was adopted, based on the analysis of secondary data, surveys, and interviews with institutional actors involved in the project's implementation. Thus, the findings indicate that the IE project significantly contributed to improving research conditions, expanding access to applied knowledge, and strengthening entrepreneurial practices within academic environments. However, challenges related to startup creation and innovation commercialization persist. This allows the conclusion that fostering innovative entrepreneurship in developing economies requires integrated public policies that align capacity building, technological innovation, and sustainable growth strategies to unlock long-term entrepreneurial potential.

RESUMO

Considerando a necessidade de fortalecimento da inovação e do empreendedorismo no âmbito das instituições públicas de ensino, esta pesquisa analisa os resultados do projeto Empreendedorismo Inovador (EI), iniciativa do Ministério da Educação (MEC) voltada à Rede Federal de Educação Profissional, Científica e Tecnológica (RFEPT). Objetiva-se avaliar os impactos do projeto na consolidação da cultura empreendedora, na infraestrutura de pesquisa e na capacidade institucional de geração e difusão de inovações. Para tanto, procede-se a uma abordagem metodológica de natureza qualitativa e quantitativa, baseada na análise de dados secundários, aplicação de questionários e realização de entrevistas com atores institucionais envolvidos na execução do projeto. Desse modo, observa-se que o EI contribuiu significativamente para a melhoria das condições de pesquisa, ampliação do acesso ao conhecimento aplicado e fortalecimento de práticas empreendedoras no ambiente acadêmico. Contudo, permanecem desafios relacionados à criação de startups e à comercialização das inovações desenvolvidas. O que permite concluir que a promoção do empreendedorismo inovador em economias em desenvolvimento demanda políticas públicas integradas, capazes de articular capacitação, inovação tecnológica e estratégias de crescimento sustentável, de modo a potencializar resultados de longo prazo.

RESUMEN

Considerando la necesidad de fortalecer la innovación y el emprendimiento en el ámbito de las instituciones públicas de educación, esta investigación analiza los resultados del proyecto Emprendimiento Innovador (EI), una iniciativa del Ministério da Educação (MEC) - Ministerio de Educación de Brasil orientada a la Rede Federal de Educação, Profissional, Científica e Tecnológica (RFEPT) - Red Federal de Educación Profesional, Científica y Tecnológica. El estudio tiene como objetivo evaluar los impactos del proyecto en la consolidación de la cultura emprendedora, en la infraestructura de investigación y en la capacidad institucional para la generación y difusión de innovaciones. Para ello, se adopta una metodología de enfoque cualitativo y cuantitativo, basada en el análisis de datos secundarios, la aplicación de cuestionarios y la realización de entrevistas con actores institucionales involucrados en la ejecución del proyecto. De este modo, se observa que el EI contribuyó de manera significativa a la mejora de las condiciones de investigación, a la ampliación del acceso al conocimiento aplicado y al fortalecimiento de prácticas emprendedoras en el entorno académico. No obstante, persisten desafíos relacionados con la creación de startups y la comercialización de las innovaciones desarrolladas. Lo que permite concluir que la promoción del emprendimiento innovador en economías en desarrollo requiere políticas públicas integradas, capaces de articular la formación de capacidades, la innovación tecnológica y estrategias de crecimiento sostenible, con el fin de potenciar resultados a largo plazo.

Palabras clave: Emprendimiento Innovador. Startups. Economía 4.0. Políticas Públicas. Política de Innovación.

1 INTRODUCTION

Entrepreneurship is defined as the generation of value through the creation or expansion of economic activities through new products, processes, or markets (Rauch et al., 2009). Innovation is what distinguishes dynamic entrepreneurship from static entrepreneurship (Gianesini et al., 2018), and when combined with entrepreneurship, it forms the concept of 'Innovative Entrepreneurship' (EI), focused on new ventures and *startups* based on innovative ideas (Balkienė & Jagminas, 2014; Szabo & Herman, 2012).

In Brazil, despite high levels of entrepreneurship, many businesses are created out of necessity and are not innovative or high-growth (Ogliastri et al., 2019). The country has faced challenges in business innovation, with slow progress and weak indicators compared to other emerging economies (Koeller, 2017).

In 2020, the Ministry of Education (MEC) launched the first explicit government initiative of 'Innovative Entrepreneurship', directing resources to institutions in the Federal Network to develop applied research projects in the areas of Economy 4.0 (Industry, Agriculture and Services). 60 projects were selected in 31 institutions from all regions of Brazil, with the aim of creating startups and innovative solutions related to digital transformation (Rippa & Secundo, 2019). However, little is known about EI initiatives in developing economies.

This study seeks to evaluate the results of Brazilian support to EI, investigating whether the Project has stimulated the creation of favorable environments for innovation and business development based on technological solutions aligned with the demands of Economy 4.0. The research addresses documents related to the projects and includes interviews with the project coordinators. The central research question is: "To what extent has MEC's Innovative Entrepreneurship project promoted innovation and the creation of businesses aligned with Economy 4.0 in the institutions of the Federal Network?".

2 THEORETICAL FRAMEWORK

Innovation is widely recognized as a central element for the economic growth, competitiveness and sustainable development of nations. In contexts marked by globalization and the intensification of technological transformations, innovative processes are no longer linear and begin to require institutional coordination, strategic management, and articulation between different actors in the productive and scientific system. In this sense, the classic literature highlights innovation as a systemic phenomenon, dependent on the interaction between companies, universities, government and society (Kline et al., 1986; Freeman & Soete, 2008).

In Brazil, the construction of a policy focused on science, technology and innovation (ST&I) has its antecedents in the 1950s, with the creation of fundamental institutions such as the National Council for Scientific and Technological Development (CNPq) and the Coordination for the Improvement of Higher Education Personnel (CAPES). These institutional frameworks contributed to the consolidation of the national scientific base and to the training of qualified human resources. This evolutionary process culminated, in 1985, in the creation of the then Ministry of Science and Technology, later expanded to incorporate the innovation dimension, reflecting the recognition of the strategic role of ST&I in national development (Pelaez et al., 2017).

A significant advance occurred with the enactment of the Innovation Law (Law No. 10,973/2004), which established legal mechanisms to stimulate cooperation between universities, research institutes, and the productive sector. Among its main contributions, the institutionalization of the Technological Innovation Centers (NITs), responsible for the management of intellectual property and the promotion of technology transfer within scientific and technological institutions, stands out. The Innovation Law also boosted the creation of articulation bodies, such as the Forum of Innovation and Technology Transfer Managers (Fortec), and was complemented by the Good Law (Law No. 11,196/2005), which introduced tax incentives for business research and development.

In the following years, the country began to structure policies and programs specifically aimed at innovative entrepreneurship, with emphasis on initiatives such as Startup Brasil, InovAtiva Brasil and the expansion of incubators and accelerators linked to universities and public institutions. These actions sought to bring together entrepreneurs, investors and support agents, contributing to the formation of a more dynamic startup ecosystem (Carmo & Costa, 2016; Roncaratti, 2017; Aranha, 2016). Despite these advances, the literature points out that structural obstacles, such as excessive bureaucracy, regulatory complexity, and high tax burden, continue to limit the full development of entrepreneurial activities in the country.

More recently, the formulation of the National Innovation Policy (PNI), in 2020, and the National Strategy for Science, Technology, and Innovation (ENCTI 2016–2022) reinforced the Brazilian State's effort to integrate ST&I policies with market demands and the challenges of economic and social development. These instruments establish guidelines aimed at increasing productivity, reducing regional inequalities and strengthening the National Innovation System, evidencing the country's commitment to innovation as a structuring axis of development. However, the challenge remains to transform legal frameworks and institutional programs into effective and sustainable results, capable of positioning Brazil more competitively on the global stage (MCTIC, 2016; Vonortas & Castillo, 2022).

3 THE BRAZILIAN PROJECT OF INNOVATIVE ENTREPRENEURSHIP

The Innovative Entrepreneurship (EI) project was structured as a continuous public policy initiative, implemented through successive public calls, with the objective of fostering innovative entrepreneurship in the Federal Network of Professional, Scientific and Technological Education (RFEPCT). The action was conceived by the Secretariat of Professional and Technological Education of the Ministry of Education (Setec/MEC) and executed by the Federal Institute of Espírito Santo (Ifes), in partnership with the Foundation for Support to the Development of Science and Technology (Facto), assuming a national character since its first edition.

The first cycle of the project was launched in 2020, through Ifes Notice No. 05/2020, focusing on innovative entrepreneurship associated with Economy 4.0 technologies, covering the areas of Agriculture 4.0, Industry 4.0 and Services 4.0. This public notice provided for the execution of the projects for 24 months and resulted in the selection of 60 institutional projects, distributed among different Federal Institutes in the country, with criteria that integrated teaching, research and extension, in addition to technological impact, market potential and social impact.

Based on the accumulated experience, the project advanced to a second edition, which began in 2022, lasting 12 months and selecting 25 projects. However, the present study focuses exclusively on the analysis of the first cycle of the project, since it was fully completed at the time of data collection and analysis, allowing a more consistent evaluation of its results and institutional effects.

In general, the supported projects contributed to the promotion of the culture of innovation and entrepreneurship in the academic environment, to the development of applied technologies and to the formation of technical, managerial and entrepreneurial skills. Thus, the time frame between 2020 and 2023 shows the consolidation of Innovative Entrepreneurship as a relevant instrument of educational and innovation public policy, by articulating financing, training, and institutional governance, while establishing analytical bases for future evaluations of its subsequent editions.

3.1 THE STRUCTURING OF THE PROJECT

The Innovative Entrepreneurship (IE) project aimed to support the selection and development of innovation and entrepreneurship projects within the scope of the Brazilian Federal Network of Professional, Scientific and Technological Education (RFEPCT). These projects were expected to contribute to the emergence of startups and innovative companies, especially in areas related to the digital technologies of the so-called Economy 4.0, such as

the Internet of Things, *Big Data* and Artificial Intelligence.

Instruments such as research grants, tax incentives, and specialized consultancies are widely used in innovation policies at the international level, and the IE project followed this approach by offering research grants and infrastructure resources to the 60 selected projects. Coordinated by the Secretariat of Professional and Technological Education of the Ministry of Education (Setec/MEC), the project had financial and administrative support for its implementation in the RFEPECT institutions.

Created in 2008, the Federal Network plays a strategic role in professional education and socioeconomic development in the country, being supported by institutional partners such as Sebrae and the Foundation for the Support of the Development of Science and Technology (Facto), which acted in the provision of financial support, training and administrative management, strengthening the innovation ecosystem linked to the participating institutions.

Also noteworthy is the participation of the National Association of Entities Promoting Innovative Enterprises (Anprotec), an entity that acts as a national network of innovation environments and promotes the strengthening of its members for the benefit of the economy and society. As a partner of the EI project, Anprotec was responsible for carrying out activities to diagnose the maturity of innovation environments, for the *online qualification* of leaders in the management of innovative environments and for the preparation of the Implementation, Development and Operation Plans of the innovation environments of each Federal Institute.

The institutional governance arrangement demonstrates the articulation between government agencies, institutions of the Federal Network and support entities, highlighting the strategic coordination of Setec/MEC, the operational execution by Ifes, the technical and financial support of partners such as Sebrae, Anprotec and Facto, and the role of the institutions of the Federal Network in the implementation of the projects. This configuration reflects a collaborative model of public policy aimed at strengthening the ecosystem of innovation and entrepreneurship in the educational sphere.

Regarding the approved projects, Figure 1 shows the distribution of the 60 approved proposals, which included all regions of Brazil, with the Southeast standing out with 18 projects (30% of the total), especially in Minas Gerais, which had 9 approved projects (15%). The Northeast was also well represented with 17 projects (28%). The projects were divided among the areas of Economy 4.0, 23 in Agriculture 4.0 (38.3%), 17 in Industry 4.0 (28.3%) and 20 in Services 4.0 (33.4%).

Figure 1

Distribution of projects approved in the Innovative Entrepreneurship Notice

Source: The authors (2025).

In total, 1,127 people, including students, professors and civil servants, participated in these projects. There is a predominance of professors and administrative technicians, totaling 659 participants, evidencing the central role of these professionals in the coordination, orientation and execution of project activities. In relation to the student body, the participation of secondary/technical level (237) and higher education (229) students stands out, which reinforces the integration between different levels of training within the scope of the Federal Network. On the other hand, the participation of graduate students, as volunteers, is significantly lower (2), indicating a still incipient involvement of this specific public in the project's actions. In general, the data show the multidisciplinary and interinstitutional character of the initiative, as well as its ability to mobilize different profiles of actors in the educational innovation ecosystem.

4 METHODOLOGY

To evaluate the results of the Innovative Entrepreneurship Project, a methodological approach was adopted based on the triangulation of different types of data, combining primary and secondary sources, with the objective of increasing the analytical robustness and reliability of the results. The triangulation allowed the confrontation of perceptions, documentary evidence and empirical data, enabling a more comprehensive analysis of the effects of the project within the scope of the Federal Network of Professional, Scientific and Technological Education.

With regard to secondary data, two main sets of sources were considered: (i)

institutional documents related to the Innovative Entrepreneurship Project, including public notices, technical reports, normative instruments and accompanying materials; and (ii) scientific, technical, and legal productions related to innovation, entrepreneurship, and Economy 4.0 policies. These sources supported the theoretical, institutional and normative contextualization of the study, in addition to supporting the interpretation of the empirical data.

As for the primary data, structured questionnaires were applied and in-depth interviews were conducted with coordinators of the projects selected within the scope of the IE. Quantitative data collection was carried out through the SurveyMonkey platform, using a questionnaire composed of 28 closed questions, organized into previously defined analytical categories. The categories and their respective objectives are described in Chart 1.

Table 1

Analysis categories and objectives

Category	Purpose of the questions
Profile	Profile of respondents, projects and institutions.
Perception	Capture the coordinators' vision on innovative entrepreneurship and promotion strategy, including priorities, selection criteria and integration with other initiatives.
RD&I resources	Evaluate the facilities and material support for RD&I activities, as well as the coordinators' satisfaction with the human, financial and technological resources provided by the Innovative Entrepreneurship Project.
Arrangement political-institutional	Evaluate the institutional arrangement established, the role of the agents involved in the implementation and management of the program and the respective counterparts.
Side Effects (<i>Spillovers</i>)	Identify the results and impacts achieved (direct, indirect, foreseen and unforeseen) with the development of projects, in the various dimensions of Economy 4.0 and in society.

Source: Prepared by the authors (2025).

All participants were previously informed about the objectives of the research, ensuring transparency and consent. All coordinators answered the questionnaire, configuring a complete census of the supported projects. In addition, six in-depth interviews were conducted, selected based on the criterion of diversity of the innovation results presented by the projects, which allowed the qualitative exploration of aspects not fully captured by the quantitative instrument. Data analysis was conducted in an integrated manner, articulating primary and secondary information.

Figure 2 summarizes the data sources and collection techniques used in the research, evidencing the methodological triangulation strategy adopted in the study. Integration between secondary and primary data is observed, in order to increase the analytical consistency of the results. In the set of secondary data, the institutional documents of the Innovative Entrepreneurship Project stand out, as well as technical-scientific productions and

legal bases, including evaluation reports, articles, theses, dissertations, books, *white papers*, regulatory frameworks and specialized databases.

Figure 2

Data sources and evaluation techniques

Source: Prepared by the authors (2025).

The primary data, in turn, were obtained through the application of a survey with project coordinators and semi-structured interviews, based on the selection of emblematic cases. This methodological arrangement allowed the articulation of different perspectives and levels of evidence, strengthening the analysis of the results and the understanding of the project's impacts.

5 RESULTS AND DISCUSSIONS

The results obtained from the questionnaires applied to the project coordinators and from the in-depth interviews were organized into seven analytical categories: (i) research and development (R&D) activities that generate innovation; (ii) learning and generation of skills; (iii) technical and scientific publications; (iv) new products, processes and services; (v) dissemination of the culture of entrepreneurship and innovation; (vi) intellectual property; and (vii) new ventures. The following empirical findings are presented and discussed in an integrated manner, in line with the objectives of the study:

(i) Research and development (R&D) activities that generate innovation: the resources made available by Setec/MEC were mainly directed to the expansion of the research infrastructure of the institutions of the Federal Network, enabling the acquisition of specialized software, databases and technological equipment. According to the survey data, 91% of the coordinators stated that the funding positively impacted the research infrastructure and the scientific and technological knowledge base of their institutions (Figure 3).

Figure 3

Evaluation of the adequacy of the inputs provided for the development of research projects and business plans

Source: Prepared by the authors (2025).

The testimonies collected reinforce this result, indicating that, in many cases, the projects filled pre-existing structural gaps in laboratories and research environments. Despite this, some of the coordinators reported difficulties related to the processes of management and provision of materials, considered bureaucratic or inadequate to the deadlines of the projects. Even so, the investments contributed to institutional strengthening, including the incorporation of advanced equipment, such as 3D printers, which boosted new research and partnerships.

From an analytical point of view, these results corroborate the literature that points to infrastructure as a central element for strengthening innovative capacities in public institutions, especially in regional contexts where resources are historically limited. The IE project, in this sense, acted as an instrument to reduce structural asymmetries within the Federal Network.

(ii) Learning and competence generation: the results indicate that the IE project contributed significantly to the development of technical, intellectual and behavioral skills among students and teachers. Coordinators reported advances in skills such as critical thinking, creativity, communication, leadership, teamwork, and problem-solving. The involvement of students in practical innovation and extension activities increased their self-confidence and favored reflections on professional trajectories that began to include entrepreneurship and applied research as concrete possibilities.

The interviews also show relevant impacts on the professors, especially in the development of managerial and leadership skills, associated with the coordination of more complex projects. For many researchers, this was the first structured experience of managing multidisciplinary teams and interacting with agents outside the academic environment.

These findings dialogue with studies on entrepreneurial education, which highlight experiential learning as a key factor for the formation of entrepreneurial skills. The IE project proved to be relevant by promoting a gradual change in the way students and researchers perceive the relationship between research, innovation and practical application.

(iii) Technical and scientific publications: although the generation of publications was not a central objective for all projects, the results indicate that 22 initiatives produced articles, books or chapters, including publications in high-impact international journals. These productions contributed to increasing the visibility of the projects and strengthening academic and institutional collaboration networks.

Part of the teams chose to postpone scientific dissemination, following guidelines from the National Sebrae related to the preservation of the novelty of the solutions developed, especially in cases with potential for intellectual protection. This result highlights a recurrent tension between the times of open science and the strategies for the protection and economic valorization of knowledge.

(iv) New products, processes and services: more than half of the projects (57%) reported some type of innovation. Most of these innovations were classified as incremental, focusing on regional markets, especially in the agricultural sector. These are, in general, improvements in existing products, processes or services, adapted to the territorial specificities of the participating institutions.

As can be seen in Figure 4, almost half of the innovations developed (47%) are associated with some intellectual property protection mechanism, mainly patents and *software registrations*. In cases where there was no generation of final products, the coordinators highlighted the relevance of the institutional experimentation and learning process, reinforcing the role of the project as a space for testing and capacity development.

Figure 4

Characteristics of the type of innovation produced and its scope

Source: Prepared by the authors (2025).

These results indicate that the EI contributed more strongly to the generation of incremental and contextualized innovations than to disruptive innovations, which is compatible with the profile of the institutions and the stage of technological maturity of the projects.

(v) Dissemination of the culture of entrepreneurship and innovation: the data show that the performance of Anprotec and Sebrae was widely recognized by the coordinators as a central element for the dissemination of the culture of entrepreneurship and innovation. The training actions, mentoring and events favored the incorporation of entrepreneurial practices both in research activities and in teaching.

More than 60% of respondents reported involvement in organizing or leading events focused on innovation, promoting interaction between universities, companies and other organizations. These results suggest that the project generated lasting effects on the institutional culture, going beyond the formal period of validity of the supported initiatives.

(vi) Intellectual Property: at the time of the survey, 63% of innovations were not yet protected by formal intellectual property mechanisms. Part of the projects were in the process of protection, while others opted for industrial secrecy or evaluated the protection as unnecessary, either due to technical limitations or market strategy.

Despite this, the projects that advanced in protection processes reported relevant gains in terms of skills associated with intellectual property management, including market

analysis, branding strategies and valuation of intangible assets. These results reinforce the role of the IE project as a training space also in the field of IP.

(vii) New ventures: the main motivation for accessing the resources of the Innovative Entrepreneurship project was the performance of research, development and innovation (R&D) activities, pointed out by 51.7% of the coordinators, followed by the development of digital technological innovations, as shown in Figure 5. The creation of new ventures appeared as a secondary objective in the set of projects analyzed, reflected in the constitution of four startups at the end of the period studied. This result indicates that, although the project has contributed to the strengthening of the entrepreneurial culture and to the generation of technological solutions, the direct conversion of initiatives into companies was still limited in the first cycle of the policy.

Figure 5

Ranking of motivations for access to EI project resources

Source: Prepared by the authors (2025).

This result indicates that, although the Innovative Entrepreneurship project has consistently contributed to the strengthening of the entrepreneurial culture within the Federal Network, the direct conversion of projects into new ventures remained limited in the first cycle analyzed. This scenario can be explained by a set of structural and institutional factors, among which the still incipient contact of the teams with investors and market agents, the low technological maturity of part of the solutions developed and the priority attributed by the

coordinators to applied research activities to the detriment of the immediate incorporation of companies stand out.

From a public policy perspective, these findings suggest that instruments such as the Innovative Entrepreneurship project are particularly effective in strengthening institutional capacities, building entrepreneurial skills, and generating incremental innovations, especially in educational and scientific settings. However, in order to expand the creation of new ventures and the commercialization of the solutions developed, it is necessary to articulate with complementary mechanisms, such as investment funds, technological scaling programs, test environments and more robust policies for technology transfer and approximation with the productive sector.

The investments made by Setec/MEC had a relevant impact on the research infrastructure of the institutions of the Federal Network, by enabling the acquisition of software, advanced equipment and other essential inputs for research, development and innovation activities. These investments contributed to the creation of an institutional environment more favorable to experimentation, interinstitutional cooperation and the formation of partnerships, in addition to potentially favoring the integration of these institutions into national initiatives for sharing scientific and technological infrastructure.

In addition to the structural effects, the projects analyzed provided participants with significant opportunities to develop entrepreneurial skills, such as creativity, leadership, adaptability, and teamwork, skills considered central in contexts of high uncertainty. The intensification of collaboration between universities, companies and support organizations, combined with training actions conducted by entities such as Sebrae, contributed to the dissemination of a culture of entrepreneurship and innovation with lasting effects on academic practices, teaching activities and professional trajectories of students and teachers.

Despite these advances, the low prioritization of the creation of new enterprises by the project coordinators highlights important limits of the policy analyzed. The experience reinforces that the transition from applied research to the market requires not only financial resources and training, but also greater integration between entrepreneurial education, market strategies and competitive dynamics of the productive sectors. In this sense, the survey underlines the importance of strengthening entrepreneurial training with a focus on business models, market validation, and technological scaling.

Finally, the results dialogue with broader challenges of the Brazilian national innovation system, marked by weaknesses in university-industry interactions and by an entrepreneurship pattern characterized by a high rate of early-stage initiatives, but low innovative intensity and reduced generation of qualified jobs, which is a phenomenon often

described as an "entrepreneurial trap". Overcoming this situation requires policies that balance stimulating the creation of new ventures with strengthening innovation capacity and growth ambitions, avoiding an excessively restricted focus on Economy 4.0 technologies and incorporating other strategic areas for economic and social development.

6 CONCLUSION

This article analyzed the implementation and results of the Innovative Entrepreneurship project, launched by the Ministry of Education (MEC) in 2020, with the objective of supporting and developing innovation and entrepreneurship projects in the institutions of the Federal Network of Professional, Scientific and Technological Education. The initiative sought to strengthen the articulation between education, science and innovation, exploring the potential of these institutions in the generation of applied knowledge and technological solutions, especially in the context of Economy 4.0.

The results showed significant impacts on the research infrastructure and knowledge base of the participating institutions. The funding made available by Setec/MEC proved to be fundamental for the acquisition of technological inputs, software and equipment, contributing to the strengthening of institutional capacities for research, development and innovation. In addition, the project favored the consolidation of applied research and entrepreneurship practices, expanding the institutions' performance in strategic technological areas.

A relevant social impact was also observed associated with research and innovation grants, which contributed to the permanence and income of students involved in the projects, while promoting the development of technical, managerial and entrepreneurial skills among students and professors. The dissemination of the culture of entrepreneurship and innovation occurred through a comprehensive strategy, supported by institutional partnerships, scientific events, training and participation in fairs and business events.

However, the findings indicate that the creation of new ventures was not the main motivation of the coordinators to join the project, reflecting in a limited number of *startups* generated. This result highlights challenges related to the technological maturity of the solutions, the approach to investors and the need to deepen entrepreneurial training, connecting more effectively the concepts of innovation to market dynamics.

By inserting these results in the broader context of the Brazilian entrepreneurial environment, the study dialogues with the literature that points out weaknesses in the university-industry articulation and the persistence of the so-called "entrepreneurial trap", characterized by high entrepreneurial activity with low levels of innovation and generation of qualified jobs. In this sense, the research reinforces that the advancement of innovative

entrepreneurship in Brazil requires a balance between the number of entrepreneurs, their capacity for innovation and their growth ambitions.

Finally, the results indicate that the consolidation of innovative entrepreneurship in the country requires the expansion of the strategic focus of public policies beyond the technologies associated with Economy 4.0, incorporating other economic sectors with potential for regional development and value generation. The strengthening of entrepreneurial education, the intensification of the articulation between academia and industry, support for the commercialization of innovation and the encouragement of the protection of intellectual property emerge as central elements. In this context, the continuity, improvement and institutionalization of the Innovative Entrepreneurship project as a structuring public policy are essential to promote innovation, productive diversification and sustainable economic growth in the country.

ABSTRACT

The article analyzes the civil identification of children as a strategic instrument for comprehensive protection in early childhood, with a focus on the State of Pará. The research adopts a qualitative approach, with exploratory and descriptive characteristics, grounded in a bibliographic review of theoretical works, legislation, institutional reports, and empirical studies on under-registration, child vulnerability, and public policies. Content analysis is employed to systematize categories related to identity, documentation, territorial inequalities, and protection mechanisms, allowing for the interpretation of discourses and regulations from an interdisciplinary perspective. The analysis shows that Pará presents high rates of under-registration and deep territorial inequalities, especially in rural, riverside, indigenous, and quilombola areas, where access to civil registration services is limited. The study also identifies weaknesses in the integration among maternity units, civil registry offices, health services, social assistance, and public security, which undermines the effectiveness of protection policies. Finally, it proposes guidelines to strengthen the civil identification of children, including the universalization of neonatal identification, the expansion of identity card issuance for children aged 0 to 6, the creation of a State Protocol for Child Identification, and permanent awareness campaigns. It concludes that civil identification is an essential public policy to ensure citizenship, prevent violence, and strengthen the Child and Adolescent Rights Guarantee System.

Keywords: Under Registration. Early Childhood. Civil Registration.

RESUMO

O artigo analisa a identificação civil de crianças como instrumento estratégico de proteção integral na primeira infância, com foco no Estado do Pará. A pesquisa adota uma abordagem qualitativa, de caráter exploratório e descritivo, fundamentada em levantamento bibliográfico de obras teóricas, legislações, relatórios institucionais e estudos empíricos sobre sub-registro, vulnerabilidade infantil e políticas públicas. Utiliza-se a técnica de análise de conteúdo para sistematizar categorias relacionadas à identidade, documentação, desigualdades territoriais e mecanismos de proteção, permitindo interpretar discursos e

¹ Master's Degree in Public Security. Universidade Federal do Pará (UFPA). E-mail: flavio.mota@icj.ufpa.br

² Master's Degree of Laws. Universidade Federal do Pará (UFPA). E-mail: niltonnoronha@ufpa.br

normativas sob uma perspectiva interdisciplinar. A análise evidencia que o Pará apresenta elevados índices de sub-registro e profundas desigualdades territoriais, especialmente em áreas rurais, ribeirinhas, indígenas e quilombolas, onde o acesso a serviços de registro civil é limitado. O estudo também aponta fragilidades na integração entre maternidades, cartórios, saúde, assistência social e segurança pública, comprometendo a eficácia das políticas de proteção. Ao final, propõe diretrizes para o fortalecimento da identificação civil de crianças, incluindo a universalização da identificação neonatal, a ampliação da emissão de carteiras de identidade para crianças de 0 a 6 anos, a criação de um Protocolo Estadual de Identificação Infantil e campanhas permanentes de sensibilização. Conclui que a identificação civil é política pública essencial para garantir cidadania, prevenir violências e fortalecer o Sistema de Garantia de Direitos da Criança e do Adolescente.

RESUMEN

El artículo analiza la identificación civil de niñas y niños como un instrumento estratégico de protección integral en la primera infancia, con énfasis en el Estado de Pará. La investigación adopta un enfoque cualitativo, de carácter exploratorio y descriptivo, fundamentado en un levantamiento bibliográfico de obras teóricas, legislaciones, informes institucionales y estudios empíricos sobre subregistro, vulnerabilidad infantil y políticas públicas. Se utiliza la técnica de análisis de contenido para sistematizar categorías relacionadas con la identidad, la documentación, las desigualdades territoriales y los mecanismos de protección, permitiendo interpretar discursos y normativas desde una perspectiva interdisciplinaria. El análisis evidencia que Pará presenta altos índices de subregistro y profundas desigualdades territoriales, especialmente en áreas rurales, ribereñas, indígenas y quilombolas, donde el acceso a los servicios de registro civil es limitado. El estudio también señala fragilidades en la integración entre maternidades, registros civiles, salud, asistencia social y seguridad pública, lo que compromete la eficacia de las políticas de protección. Finalmente, propone directrices para el fortalecimiento de la identificación civil de niñas y niños, incluyendo la universalización de la identificación neonatal, la ampliación de la emisión de documentos de identidad para menores de 0 a 6 años, la creación de un Protocolo Estatal de Identificación Infantil y campañas permanentes de sensibilización. Concluye que la identificación civil constituye una política pública esencial para garantizar ciudadanía, prevenir violencias y fortalecer el Sistema de Garantía de Derechos de la Niñez y la Adolescencia.

Palabras clave: Subregistro. Primera Infancia. Registro Civil.

1 INTRODUCTION

The civil identification of children is one of the fundamental pillars for the guarantee of human rights and for the construction of public policies for the protection of children. In the Brazilian context, especially in the State of Pará, the topic assumes marked relevance due to the high rates of under-registration (IBGE, 2018). Although the Federal Constitution establishes citizenship and the dignity of the human person as structuring foundations of the Democratic Rule of Law, these principles are weakened when children remain invisible to civil registration systems and official identification databases.

Identification, as an attribute of human identity, articulates philosophical, juridical and sociological dimensions. From the philosophical point of view, identity is essential to the theory of knowledge and is established as a logical absolute. It affirms a truth without the need for demonstration, because each thing is unique and distinct, not to be confused with others. This axiom, known as the Principle of Identity or Law of Identity, was enunciated by Aristotle in the three laws of thought as follows: "a thing cannot, at the same time, be and not be" (RABELLO, 2024, p. 10).

In the Brazilian legal system, identification as an essential attribute of human identity occupies a central position. It not only allows the formal recognition of the individual by the State, but also functions as an instrument for the protection of fundamental rights, accountability and legal certainty (BRASIL, 1988)

For Sociology, each and every identity is constructed. The question is how this construction process takes place, its origin, purpose and peculiarities, as Castells indicates.

The construction of identities makes use of the raw material provided by history, geography, biology, productive and reproductive institutions, collective memory and personal fantasies, power apparatuses and revelations of a religious nature. However, all these materials are processed by individuals, social groups and societies, which organize their meaning according to social trends and cultural projects rooted in their social structure, as well as in their time/space vision. (CASTELLS, 2008, p. 23).

Dominant institutions can also form identities when social actors internalize them, constructing their meaning based on this internalization. Castells (2008) presents, in addition to the individual, the collective identity and says that the social construction of identity occurs through power relations between forms and origins.

For Bauman (2005), identity goes through a continuous process of construction, thus always remaining incomplete. This is because modernity has generated a fluid world where identities easily unravel following the rhythm of liquid modernity: "The ease of getting rid of an identity when it ceases to be satisfactory, or ceases to be attractive due to competition

with other more seductive identities, is much more important than the realism of the identity sought or momentarily appropriated".

The civil identification of children, at the same time that it materializes the state's recognition of the child's existence, acts as an instrument of full protection, as determined by the Statute of the Child and Adolescent (BRASIL, 1990). The absence or fragility of these records, however, deepens inequalities and exposes children to violence, making it difficult to access essential public policies such as health, education, social assistance and security (LIMA, 2015). In the Amazonian context, geographical distances, difficulty in accessing notary services, poverty, and cultural aspects of traditional communities dramatically aggravate this scenario (BARROS, 2017; FONSECA, 2016).

In this article, we propose to analyze child civil identification as an instrument for the protection of children's rights in the State of Pará, articulating three axes: a) theoretical foundations on identity and identification; b) national and international normative framework aimed at civil identification and child protection; c) interdisciplinary analysis of the structural vulnerabilities of childhood in Pará, with emphasis on the relationship between underreporting, invisibility and violence.

In addition to discussing the current reality, the article presents recommendations for strengthening the state policy for civil identification of children, proposing guidelines that can be incorporated by public security, health, social assistance and education institutions, aligning with the System for the Guarantee of the Rights of Children and Adolescents.

2 IDENTITY AND IDENTIFICATION

2.1 IDENTITY: PHILOSOPHICAL, SOCIOLOGICAL AND LEGAL BASES

The concept of identity has a long theoretical trajectory and is present in several philosophical traditions. For Aristotle, identity is a fundamental logical principle, which establishes that each being is identical to itself and distinct from the others (RABELLO, 2024). This definition, although abstract, provides the initial framework for understanding individualization as an ontological phenomenon.

Habermas (1988) expands this view by stating that human identity is dialectically constructed between self-identification and the identification recognized by others. For the author, identity is processual, the result of social interactions and the subject's self-understanding. This perspective is close to the contemporary sociological notion, according to which identity is not fixed, but a permanent social construction (CASTELLS, 2008; WOODWARD, 2000).

Bauman (2005) contributes by conceptualizing "liquid modernity", in which identities become fluid and unstable, shaped by dynamic social and cultural contexts. Although such reflections are mainly directed to adult life, they also help to understand the construction of children's identity, which develops in the midst of intense social flows, marked by digital culture and family and community transformations.

In the legal field, identity has material relevance. It represents an attribute of personality and a requirement for the exercise of civil, social, cultural and political rights (SANTOS, 2018). The civil registry, in this sense, ceases to be a mere bureaucratic procedure and assumes the character of legal-existential recognition. It is the act that inaugurates the legal presence of the child in the world of law.

2.2 IDENTIFICATION: TECHNICAL AND APPLIED DIMENSION

If identity is the essence of the individual, identification represents the technical process that allows recognizing this essence through objective attributes. Vanrell and Borborema (2019) highlight that identification involves the determination of individual anatomical, morphological, physiological, or biometric elements capable of distinguishing a person from others. Figini (2012) differentiates objective identification (biological and biometric elements) from subjective identification (self-image, name, personal history), emphasizing that both are essential for human individualization.

Biometrics, especially fingerprints, neonatal plantar prints and facial recognition, have been consolidated as the main identification instrument in the field of public security since the seventeenth century, with the observations of Malpighi (FIGINI, 2012), and later with the development of scientific methods by Bertillon and Galton. Today, automated biometric recognition technologies are part of civil and criminal identification systems in several countries (JAIN; ROSS; PRABHAKAR, 2004).

In Brazil, the responsibility for civil and criminal identification is the responsibility of the Identification Institutes. In Pará, this assignment is performed by the Directorate of Identification "Enéas Martins" (DIDEM), the directorate of the Civil Police of the State of Pará responsible for issuing the Identity Card and for criminal identification procedures and papiloscopic expertise.

3 METHODOLOGY

The present research is characterized as a qualitative study, of descriptive and exploratory character, aimed at analyzing the civil identification of children as an instrument of integral protection in the State of Pará. According to Gil (2019), exploratory research is

appropriate when the objective is to provide greater familiarity with a problem, making it more explicit and allowing the construction of new analytical perspectives. In the same sense, Marconi and Lakatos (2017) state that the qualitative approach is appropriate for studies that seek to understand complex social phenomena, especially those related to human rights, public policies, and social vulnerabilities.

The choice for the qualitative approach is justified by the need to interpret meanings, institutional practices and socio-territorial contexts that influence the civil under-registration and invisibility of children in Pará. As Gil (2019) points out, this type of approach allows capturing subjective and structural dimensions that cannot be reduced to numerical data, being essential to understand social phenomena in depth.

From the point of view of technical procedures, this is a bibliographic research. Bibliographic research consists of the survey, selection and analysis of works, scientific articles, legislation, institutional reports and official documents that deal with the theme of identity, civil identification, child protection and public policies (MARCONI; LAKATOS, 2017). This procedure enabled the construction of the interdisciplinary theoretical framework that underlies the study, articulating contributions from Philosophy, Sociology, Law and Public Security.

As for the objectives, the research is descriptive, as it seeks to characterize phenomena and relationships between underreporting, vulnerability and child protection. Gil (2019) explains that descriptive research has as its main purpose the description of the characteristics of a certain population or phenomenon, which suits the purpose of analyzing the reality of Pará and its territorial inequalities. In addition, the study assumes an explanatory character, as it seeks to identify factors that contribute to documentary invisibility and the exposure of children to risks, as advised by Marconi and Lakatos (2017).

The method of analysis used was content analysis, as proposed by Bardin (2016), applied to the bibliographic material collected. This technique allowed the identification of thematic categories related to identity, underreporting, vulnerability, public policies, and full protection. Content analysis, according to Lakatos and Marconi (2017), is suitable for qualitative research that seeks to interpret discourses, documents and legislation, enabling the construction of systematic inferences and interpretations.

Finally, the research adopts an interdisciplinary perspective, articulating theoretical and empirical elements from different areas of knowledge. Gil (2019) highlights that interdisciplinarity is fundamental in studies involving complex social phenomena, as it allows for the integration of multiple dimensions of reality. In the case of child civil identification, this

approach makes it possible to understand the phenomenon not only as a legal issue, but also as a sociological, cultural, territorial and public security problem.

4 CIVIL IDENTIFICATION OF CHILDREN AND THE LEGAL FRAMEWORK FOR CHILD PROTECTION

The civil identification of children in Brazil is one of the normative pillars of the full protection of children and is supported by an articulated set of constitutional, infra-constitutional and international norms. At the center of this framework is the Statute of the Child and Adolescent (ECA), Law No. 8,069/1990, which enshrines the child as a subject of rights and imposes on the State, the family and society the duty to ensure, with absolute priority, the realization of these rights (BRASIL, 1990)

Article 10 of the ECA establishes that hospitals and other health care establishments for pregnant women, whether public or private, are required to identify the newborn through the collection of plantar or fingerprints, as well as the identification of the mother, and such information must be included in the Certificate of Live Birth (DNV). The DNV is the prior and indispensable document for the civil registration of birth, as regulated by Ordinance No. 116/2009 of the Ministry of Health, and represents the link between biological birth and the legal recognition of the child's existence (BRASIL, 2009).

The obligation of civil registration of birth is reaffirmed in article 9 of the ECA, which determines that legal guardians must promote registration in the first civil registry office, within the legal deadline. The absence of this record constitutes a form of violation of rights, as it prevents access to essential public policies such as health, education, social assistance and legal protection. As Santos (2018) points out, civil registration is more than a notarial act: it is the legal recognition of the child's existence as a subject of rights.

In addition, the ECA typifies conducts related to the subtraction, concealment and irregular delivery of children as crimes, in articles 237 to 239, recognizing the seriousness of these practices and their direct relationship with the absence of official documentation. The lack of civil identification makes it difficult to promptly locate missing children, weakens the accountability of perpetrators of crimes, and compromises the performance of bodies such as the Guardianship Council, the Public Prosecutor's Office, and the Civil Police (INTERID, 2023).

The centrality of civil identification in full protection is also expressed in the absolute priority of children's rights, provided for in article 227 of the Federal Constitution of 1988, which imposes on the State the duty to ensure, with primacy, the right to life, health, identity, family and community life. The UN Convention on the Rights of the Child (1989), ratified by

Brazil through Decree No. 99,710/1990, reinforces this commitment by establishing, in its article 7, that every child has the right to a name, nationality and, as far as possible, to know his or her parents and to be cared for by them (UN, 1989)

The absence of civil registration, therefore, is not only an administrative omission, but a violation of human rights, which compromises the dignity of the child and its full insertion in society. As Lima (2015) observes, underreporting is a phenomenon that disproportionately affects populations in situations of social and territorial vulnerability, such as indigenous, riverside and quilombola communities, especially in the northern region of the country.

Child civil identification should be understood as a transversal public policy, which articulates the fields of law, health, social assistance and public security. Its implementation requires integration between maternity hospitals, registry offices, information systems, and protection agencies, as guided by the National Policy for the Search for Missing Persons (Law No. 13,812/2019), which recognizes identification as an essential element for locating missing children (BRASIL, 2019).

In summary, child civil identification in Brazil is supported by a robust normative framework that recognizes its structuring function in the full protection of children. However, its effectiveness still faces operational challenges, especially in contexts of territorial inequality and social exclusion. Overcoming these barriers requires not only compliance with legal standards, but also the strengthening of intersectoral public policies aimed at eradicating under-registration and guaranteeing the right to identity from birth.

5 THE CONTEXT OF PARÁ: UNDER-REGISTRATION, VULNERABILITY AND CHILD INVISIBILITY

The reality of the State of Pará reveals a scenario marked by structural inequalities, vast geographical areas of difficult access, traditional communities in a situation of socio-territorial isolation and persistent gaps in the supply of public services. Such conditions accentuate vulnerabilities historically associated with childhood in the Amazon, such as the difficulty in obtaining civil registration, the lack of personal documents, and the difficulty of integration between protection, health, assistance, and public security systems (PARÁ, 2023).

According to the IBGE (2018), Pará has one of the highest rates of under-registration of births in the country, reaching between 14% and 16% of children without registration in the first year of life. Several factors contribute to the underreporting of birth records in Pará. Among them are the lack of access to notary offices in remote regions, economic difficulties

for families, lack of information about the importance of civil registration, and cultural barriers in some indigenous communities (BARROS, 2017).

According to Fonseca (2016), the scarcity of infrastructure and public services in the most remote areas further aggravates this situation. The absence of civil registration has serious consequences for children, who are deprived of basic rights such as access to education, health, and social protection. They are also more vulnerable to various forms of exploitation and abuse.

The literature points out that children without birth registration are deprived of access to fundamental public policies, such as vaccination, school enrollment, assistance programs and social benefits. In addition, they become invisible to the State, hindering public planning and depriving the System for the Guarantee of the Rights of Children and Adolescents itself of essential information for the monitoring and prevention of violence (LIMA, 2015).

In the field of public security, document invisibility has even more serious consequences. Children without civil identification are more likely to be victims of abduction, disappearance, trafficking and other forms of exploitation, since the absence of official data weakens both the search process and the accountability of the perpetrators. International studies demonstrate a strong relationship between lack of documentation and recruitment for forced labor, illegal adoptions, and transnational trafficking (ECPAT INTERNATIONAL, 2020; UNICEF, 2018).

6 CIVIL IDENTIFICATION AS A TOOL FOR PREVENTING VIOLATIONS AND STRENGTHENING FULL PROTECTION

6.1 THE RELATIONSHIP BETWEEN DOCUMENTATION AND PREVENTION OF CRIMES AGAINST CHILDREN

Civil identification of children plays a crucial role in the strategy for preventing violations, especially with regard to the disappearance and abduction of children. As observed in the database analyzed in the State of Pará, young children, especially between 0 and 6 years old, constitute the most vulnerable group to this type of crime, representing more than 70% of the victims registered between 2013 and 2023 (SEGUP, 2024).

The lack of official documents, such as birth certificates and identity cards, makes it difficult to promptly identify the victim, making the stages of investigation, location and restitution to family life more complex. In some cases, children who have been abducted may remain for years without correct identification, making it difficult for the Guardianship Council, the Public Prosecutor's Office, the Civil Police, and social assistance organizations to act (INTERID, 2023; ESCÓSSIA, 2021).

The literature highlights that adequate civil identification is a decisive factor in reducing the risk of human trafficking, irregular adoption, and illegal international displacement, considering that biometric documents hinder forgery and allow greater control by border agencies (ILO, 2017; JAIN; ROSS; PRABHAKAR, 2004).

6.2 NEONATAL IDENTIFICATION AS A STRATEGIC PUBLIC POLICY

The Statute of the Child and Adolescent (art. 10) establishes the obligation to record the newborn's plantar and fingerprints, in addition to the mother's identification. However, in practice, this stage still faces challenges in maternity hospitals in Pará, especially in the more inland regions, where medical infrastructure is limited and the integration between health and civil identification is incipient (BRASIL, 1990; PARÁ, 2020)

The lack of standardization between hospital units results in inconsistencies or even non-existence of neonatal impressions, leaving gaps for errors, baby changes and future identification difficulties. The literature shows that biometric procedures performed in the first 48 hours of life, when properly recorded and stored, are highly reliable and can accompany the individual throughout life (FIGINI, 2012). In addition, the World Health Organization and UNICEF advocate the integration between maternity hospitals and civil registration systems as an essential strategy to prevent violence against newborns and young children (UNICEF, 2019).

In Pará, the civil identification of children also faces the challenge of the lack of interoperability between databases. Maternity hospitals, registry offices, police units and Guardianship Councils often operate in a fragmented manner, limiting the capacity for institutional response to urgent cases.

The Directorate of Identification "Enéas Martins" – DIDEM, has a central role in the state policy of civil and criminal identification. However, the absence of immediate integration with municipal health and social assistance systems prevents the continuous monitoring of newly documented children and limits the effectiveness of the protection flow. Positive experiences in other states demonstrate that the secure sharing of biometric data between health, safety, and justice significantly enhances the prevention and solution of cases of child disappearance (SILVA, 2021).

7 PROPOSALS FOR STRENGTHENING CHILD CIVIL IDENTIFICATION IN PARÁ

From the interdisciplinary analysis carried out, it becomes evident that the civil identification of children is a strategic element to prevent the abduction of children, reduce rights violations and strengthen the investigative capacity of the State. In view of the scenario observed in Pará marked by under-registration, gaps in institutional integration and structural vulnerabilities, the following guidelines are proposed.

7.1 FULL IMPLEMENTATION OF NEWBORN IDENTIFICATION IN MATERNITY HOSPITALS

The full implementation of neonatal identification in maternity hospitals remains a challenge in Pará. Although this obligation is provided for in the Statute of the Child and Adolescent (BRASIL, 1990), the procedure is not yet universalized in the state. To overcome this gap, it is essential to standardize the collection of plantar and fingerprints in the first 48 hours of life, ensuring that this data is automatically integrated into the Declaration of Live Birth (DNV) and the state civil identification system.

The biometric registration of the mother is also essential, ensuring the mother-baby bond from birth, in addition to the continuous training of nursing and obstetrics professionals responsible for these stages. Both public and private hospitals must adopt uniform protocols and submit them to periodic audits, in order to prevent failures, reduce risks and avoid situations of error or exchange of newborns.

7.2 EXPANSION OF IDENTITY CARD ISSUANCE FOR CHILDREN AGED 0 TO 6 YEARS

The expansion of the issuance of the Identity Card for children from 0 to 6 years old is an essential measure to strengthen full protection in early childhood. For this to occur effectively, it is important to promote annual child identification campaigns in schools, daycare centers, health units, CRAS and traditional communities, expanding the reach of actions and reducing territorial barriers. It is also strategic to carry out coordinated joint efforts between DIDEM, the Department of Health and the Guardianship Councils, ensuring intersectoral action and capillarity in care.

Issuance should be simplified for low-income families, ensuring that socioeconomic status is not an obstacle to access to basic documentation. In addition, the inclusion of biometric data compatible with the age group contributes to greater accuracy in identification. The early issuance of the RG for children, especially when associated with biometrics, reinforces the Rights Guarantee System and expands the State's capacity to protect children in vulnerable situations.

7.3 STATE PROTOCOL FOR THE IDENTIFICATION OF CHILDREN

The State may institute an Institutional Protocol for the Identification of Children, consolidating in a single normative instrument all the essential steps to guarantee the right to identity from birth. This protocol can establish neonatal identification in maternity hospitals as an initial and mandatory step, followed by the first civil identification up to 12 months of life, ensuring that no child exceeds the first year without basic documentation. It can also provide for the periodic updating of the child's ID every five years, in order to monitor physical development and ensure greater biometric accuracy.

Another fundamental axis is the creation of a unified flow for action in cases of disappearance, allowing faster and more coordinated responses between the bodies of the Rights Guarantee System. The document may also include a specific action guide for Guardianship Councils, guiding procedures and standardizing referrals, in addition to defining uniform criteria for child biometric collection throughout the state. To acquire normative force and administrative effectiveness, this protocol must be formalized by means of a SEGUP Ordinance or by State Decree, ensuring its mandatory adoption by all institutions involved.

7.4 PERMANENT AWARENESS CAMPAIGNS

Permanent awareness-raising campaigns should play a central role in promoting the right to identity and preventing violations affecting children. They need to emphasize the importance of civil registration as a gateway to all other rights, warn about the risks associated with the absence of identification, and reinforce practices to prevent child abduction and disappearance. It is also essential that these actions reach schools, daycare centers, health units and community leaders, expanding awareness and strengthening local protection networks. Indigenous, riverside and quilombola communities must receive special attention, with bilingual materials and itinerant teams capable of dialoguing with the cultural and territorial specificities of these groups, ensuring that information arrives in an accessible and effective way.

8 FINAL CONSIDERATIONS

This article demonstrated that the civil identification of children is one of the most important instruments for the protection of children's rights, especially in contexts of high social vulnerability. The theoretical, normative and empirical analysis shows that the absence or fragility of civil records significantly increases the risks of subtraction, disappearance and other forms of violence against young children.

The study reinforces that civil identification is not a merely bureaucratic step, but a mechanism to guarantee citizenship, full protection and public safety. The full implementation of neonatal identification, the early issuance of identity cards and the adoption of a state protocol are necessary measures to strengthen the System for the Guarantee of the Rights of Children and Adolescents.

The civil identification of children, although often treated as a notarial procedure, represents a transversal axis of public policies for the protection of children. It articulates legal, sociological, technological, and public security dimensions, being able to reduce structural vulnerabilities. In Pará, the intersection between under-registration, territorial inequality and children's invisibility creates an environment conducive to serious violations. Therefore, civil identification cannot be understood only as a bureaucratic instrument. It is the first state protection mechanism, essential to ensure that children have a name, history, belonging, identity, and access to rights (SANTOS, 2018).

From a sociological point of view, child identity should be understood as a relational construction, influenced by family, community and institutional dynamics (CASTELLS, 2008; BAUMAN, 2005). The absence of state recognition materialized in the civil registry constitutes a form of symbolic and structural violence, as it deprives the child of being fully recognized as a subject.

In the field of public security, early identification reduces the risks of trafficking, disappearance, irregular adoption, and subtraction (ECPAT, 2020). From a forensic point of view, it strengthens the investigation, as it provides reliable biometric elements for location and recognition (JAIN; ROSS; PRABHAKAR, 2004). Interdisciplinarity, therefore, reveals that the civil identification of children should be treated as a strategic human rights policy.

ABSTRACT

This article proposes a reflection on audio description (AD) as a creative act, addressing it not only as a mediation tool but as an artistic experience that transforms the perception and sharing of art. By shifting the focus from access to the sensitive, the research reveals that accessibility is also a form of creation, capable of broadening the aesthetic and political horizons of artistic production. The methodology employed is a case study with a shadow theatre group that uses shadow description, a modality of audio description integrated into the creative process. The analysis is constructed from interviews with one of the group's actresses and a blind spectator and audio description consultant. The research articulates empirical and theoretical dimensions, drawing on authors from critical disability studies and crip theory, such as McRuer, Garland-Thomson, and Siebers. These frameworks allow us to understand disability as a productive difference and accessibility as a political gesture, revealing that inclusive art is also transformative art—capable of reinventing ways of seeing, hearing, feeling, and imagining. This overview points to the need for a paradigm shift in culture: from accessibility as a normative obligation to accessibility as an aesthetic language and emancipatory practice.

Keywords: Audio Description. Accessibility. Art. Culture.

RESUMO

Este artigo propõe uma reflexão sobre a audiodescrição (AD) como ato criador, abordando-a não apenas como ferramenta de mediação, mas como experiência artística que transforma a percepção e o compartilhamento da arte. Ao deslocar o foco do acesso para o sensível, a pesquisa revela que a acessibilidade é também uma forma de criação, capaz de ampliar os

horizontes estéticos e políticos da produção artística. Como metodologia realiza-se um estudo de caso com um grupo de teatro de sombras que utiliza a sombradescrição, uma modalidade de audiodescrição integrada ao processo criativo. A análise é construída a partir de entrevistas com uma das atrizes do grupo e uma espectadora cega e consultora de audiodescrição. A pesquisa articula dimensões empíricas e teóricas, apoiando-se em autores dos estudos críticos da deficiência e da teoria crip, como McRuer, Garland-Thomson e Siebers. Esses referenciais permitem compreender a deficiência como diferença produtiva e a acessibilidade como gesto político, revelando que a arte inclusiva é também uma arte transformadora — capaz de reinventar os modos de ver, ouvir, sentir e imaginar. Esse panorama aponta para a necessidade de uma mudança de paradigma na cultura: da acessibilidade como obrigação normativa para a acessibilidade como linguagem estética e prática emancipadora.

RESUMEN

Este artículo propone una reflexión sobre la audiodescripción (AD) como acto creativo, abordándola no solo como herramienta de mediación, sino como una experiencia artística que transforma la percepción y la difusión del arte. Al desplazar el enfoque del acceso a lo sensible, la investigación revela que la accesibilidad también es una forma de creación, capaz de ampliar los horizontes estéticos y políticos de la producción artística. La metodología empleada consiste en un estudio de caso con un grupo de teatro de sombras que utiliza la descripción de sombras, una modalidad de audiodescripción integrada en el proceso creativo. El análisis se construye a partir de entrevistas con una de las actrices del grupo y un espectador ciego y consultor de audiodescripción. La investigación articula dimensiones empíricas y teóricas, basándose en autores de estudios críticos sobre discapacidad y la teoría de la discapacidad, como McRuer, Garland-Thomson y Siebers. Estos marcos nos permiten comprender la discapacidad como una diferencia productiva y la accesibilidad como un gesto político, revelando que el arte inclusivo es también arte transformador, capaz de reinventar formas de ver, oír, sentir e imaginar. Este panorama general señala la necesidad de un cambio de paradigma en la cultura: de la accesibilidad como obligación normativa a la accesibilidad como lenguaje estético y práctica emancipadora.

Palabras clave: Audiodescripción. Accesibilidad. Arte. Cultura.

1 INTRODUCTION

The development of actions that promote accessibility in cultural productions and spaces has become an increasingly recurrent and urgent theme in the field of contemporary art. This urgency is not limited to the technical adequacy of spaces, but involves a transformation in the ways of conceiving, creating, and sharing artistic experiences. In the Brazilian Inclusion Law (LBI), article 8 reaffirms society's ethical and political commitment to the guarantee of human rights, recognizing that accessibility and cultural participation are inseparable dimensions of citizenship:

It is the duty of the State, society and the family to ensure that people with disabilities, as a priority, are given the realization of the rights related to life, health, sexuality, paternity and maternity, food, housing, education, professionalization, work, social security, habilitation and rehabilitation, transportation, accessibility, culture, sports, tourism, leisure, information, communication, scientific and technological advances, dignity, respect, freedom, family and community life, among others arising from the Federal Constitution, the Convention on the Rights of Persons with Disabilities and its Optional Protocol and the laws and other norms that guarantee their personal well-being, social and economic. (Brazil, 2015)

In the cultural field, these principles translate into the right to participation of people with disabilities (PwD) in the artistic life of the community. The National Plan of Culture reinforces this perspective by stating that it is the duty of the State:

To protect and promote cultural diversity, artistic creation and its manifestations and the cultural expressions, individual or collective, of all ethnic groups and their social derivations, recognizing the scope of the notion of culture throughout the national territory and ensuring the multiplicity of its values and formations. (Brazil, 2010)

These regulations expand the understanding that access to culture is a fundamental right and that inclusion should be thought of not only as a guarantee of presence, but as a possibility of creation and expression. To enable accessible cultural spaces, it is necessary to recognize people with disabilities as protagonists — not only as a target audience, but as active subjects of the aesthetic experience. This change implies understanding accessibility as a factor of invention, and not as a normative imposition. It implies thinking about life in its diversities. Thus, accessible art is not restricted to adapting existing works, but proposes new ways of existing and feeling in cultural spaces.

Cultural accessibility has been asserting itself as a field of debate and creation in the arts. Increasingly, artists and institutions seek practices that guarantee the right to participation of people with disabilities in cultural productions and spaces. However, it is still common for these actions to be treated as complementary, limited to the technical or legal

dimension. This reduced look ends up ignoring the aesthetic potential of difference and the political role of accessibility.

As professor and researcher Rosemarie Garland-Thomson (2011) observes in *Misfits: A Feminist Materialist Disability Concept*, disability is the story of bodies that encounter worlds that were not made for them. From this perspective, accessible art does not seek to correct the body, but to create forms of fitting between body and environment. Starting from this tension between technique and creation, this article proposes a reflection on audio description (DA) as a creative act. It is about understanding DA not only as a technical and mediation tool, but as an artistic experience that can change the way we perceive and share art.

By focusing on the sensitive — and not just on access — the research seeks to show that accessibility is also a form of creation, and that audio description, as a tool, expands the artistic and political field, producing new ways of seeing, hearing, feeling and imagining. To explore this question, a case study is carried out with *Cia. O Sombrista*, a shadow theater group from Turvo/SC, which uses the resource called shadowdescription, a modality of audio description integrated into the creative process and the staging of the show *Às Sombras de Anita* (2020). The reflections are woven from interviews with Diana Manenti, actress and member of the group, and Daiane Rodrigues, blind spectator and audio description consultant.

The analysis articulates empirical and conceptual dimensions, supported by authors of critical disability studies and crip theory, such as McRuer (2006), Garland-Thomson (2011) and Siebers (2010). These references allow us to understand disability as a productive difference and accessibility as a political gesture, revealing that inclusive art is also a transformative art.

2 THEORETICAL FRAMEWORK

2.1 DISABILITY AS AN AESTHETIC POWER

Historically, cultural accessibility policies have been structured under a normative and functional logic, aimed mainly at eliminating physical, architectural, and communicational barriers. This approach is important and fundamental to guarantee the right of access of people with disabilities, but insufficient, as it maintains disability as a category of absence — as something to be compensated, corrected or adjusted — which reinforces the idea of "normality" as a universal standard.

Critical disability studies emerge, in this context, as a theoretical field that shifts the focus of disability from the medical and rehabilitative domain to a social, political, and

epistemological dimension. Instead of understanding disability as a failure, it is seen as a legitimate form of existence and a way of producing knowledge. Thus, disability is not absence, but creative presence—a force that challenges regimes of normality and broadens ways of seeing, feeling, and thinking about the world. It is necessary to think of disability not as a deviation, but as a difference that reconfigures the very concept of functionality. In dialogue with the crip theory, proposed by Robert McRuer (2006), it is understood that bodies considered "unproductive" or "deficient" are not on the margins, but at the center of the tensions that reveal the normative structure. To be a crip is to inhabit deviance—to transform inadequacy into a form of resistance and invention. This attitude, according to McRuer, is a gesture of disobedience in the face of the standards of productivity and efficiency that govern contemporary capitalism.

In this same horizon, Garland-Thomson presents the concept of *misfitting* — the "disconnection" between body and environment. The author explains that disengagement is a dynamic relationship between body and space; When the environment changes, the disengagement also changes. This idea is crucial for thinking about accessible art, as it shows that the problem is never in the body itself, but in the way the world is organized for some and not for others. Art, by creating other sensory arrangements, reconfigures the environment, transforming *misfitting* into an encounter.

The theorist Tobin Siebers (2010), in *Disability Aesthetics*, reinforces this view by stating that the marks of disability do not impoverish art — on the contrary, they enrich and humanize it. For the author, the presence of disability in the arts broadens the scope of the sensible and questions the traditional criteria of aesthetic value, making art truer, and closer to the human experience.

Disability, therefore, must be understood as a relational phenomenon. It emerges from a social and aesthetic context that privileges certain bodies, senses, and modes of perception. To recognize this is to admit that accessible artistic practices are not simple adaptations, but reconfigurations of the sensible — gestures that question who has the right to perceive, create, and be perceived.

In this horizon, accessibility is no longer a favor or concession: it becomes a political act. Audio description, when incorporated into artistic creation, should not be treated as a neutral translation, but as an exercise of imagination between those who describe and those who listen. This change in perspective underlies the analysis proposed in this article: to understand audio description as a tool capable of expanding the experience of art and repositioning disability as a creative force.

2.2 AUDIO DESCRIPTION AS A POLITICAL AND POETIC GESTURE

Audio description has often been associated with technical accessibility, linked to legal obligation and the elimination of sensory barriers. However, when integrated into the artistic process, it goes beyond the informative function and acquires a poetic and performative value. In this perspective, the concept of poetic audio description (ADp) comes in, a resource that can constitute a device of sensitive fruition, expanding the reach of imagination and aesthetic experience. Poetic audio description does not intend to translate the image, but to follow its movement, breathing along with it. The audio describer is not a mere technical mediator, but a co-author of the experience. By describing bodies, gestures, and atmospheres, he creates a shared space of listening and imagination — a territory in which the gaze is remade by the word. ADp, therefore, is not limited to explaining what is seen; It produces new sound images, which transform the way the public relates to art.

In art, this approach resignifies the relationship between seeing and hearing. ADp creates sensory bridges, where sound and word take the place of the gaze. Disability is a way of seeing and feeling that makes aesthetics more inclusive, because it expands the possibilities of the sensitive. This expansion displaces vision as the center of the artistic experience, establishing an aesthetics in which the sensitive is shared in a multiple and collective way. To think of audio description as aesthetics is, therefore, to think of art as an encounter. The experience shared between those who see and those who listen creates a zone of coexistence, where disability is not absence, but a presence that produces new forms of art.

Audio description displaces the traditional axis of the artistic experience: what was previously centered on the gaze, is now based on listening and imagination. The act of listening becomes, in itself, a creative exercise. DA establishes, therefore, an aesthetics of listening, in which sound becomes a vehicle of presence and imagination. In the case of the blind person, sound and speech are some of the ways that allow an aesthetic experience that goes beyond the visual domain. However, this experience is not restricted to people with visual impairment; It also reaches the sighted public, who starts to perceive the spectacle differently, moving from an absolute gaze to a more open, empathetic and plural attention.

3 METHODOLOGY

3.1 BUILDING ACCESSIBLE VISUAL NARRATIVES

The analysis of practical experiences is essential to understand in a concrete way how accessibility resources are incorporated into artistic making and how they impact the relationship between work and audience. In this research, we analyze the experiences of Cia

O Sombrista⁴ in the implementation of accessibility practices in its projects and in parallel the experiences of a visually impaired spectator who participated in several presentations of the group. This practical approach allows us to observe accessibility as a field of creation and as a lived experience, revealing how it affects bodies, perceptions and sensibilities. From the interviews conducted with Diana Manenti⁵, actress and member of the group, and Daiane Rodrigues⁶, the spectator, it seeks to understand how the inclusion of audio description transformed the audience's experience and contributed to the construction of a more inclusive and accessible theater.

The methodology used in the interviews with Diana and Daiane occurs in a dialogue format, without a previous script or an established questionnaire. The intention was to carry out a natural conversation, which would enable a direct exchange of experiences and experiences, without the intervention of a rigid scheme.

Cia. O Sombrista premiered the show "Às Sombras de Anita" in 2020, which presents itself as a performance that explores the universe of the historical figure of Anita Garibaldi⁷, connecting to contemporary issues such as gender and inclusion. The montage features open audio description and programs in braille, reaffirming the group's commitment to the right to full participation in cultural life. In this production, audio description is named as *shadowdescription*⁸, and plays a key role in ensuring that shadow theatre, which relies heavily on visual elements, can also be enjoyed by people with visual impairments. The group uses this resource in an integrated way to the narrative, offering detailed descriptions of the shadows and actions in the scene, in order to create a rich and immersive experience for the audience. The *shadow-description*, therefore, translates the aesthetic and narrative elements of the show, without interfering with the fluidity of the presentation, providing a broad understanding of the story and the emotions transmitted.

⁴ Cia O Sombrista is a theater group from Turvo/SC that, since 2018, has combined its art and commitment to inclusion. The group embraces the mission of providing meaningful experiences for audiences and performers, using shadow theater as a powerful tool to amplify voices and foster dialogue on important social issues.

⁵ Diana Manenti is an actress, broadcaster and voice actress with more than 15 years of experience in the advertising, videos, audio description and audiobooks market.

⁶ Daiane Rodrigues is a bocce athlete and provides audio description consulting. She lost her sight in 2012 after suffering a cerebral venous thrombosis (CVT).

⁷ Anita Garibaldi (1821-1849) was a Brazilian revolutionary, also known as the "Heroine of the Two Worlds", who actively participated in republican movements in Brazil, such as the Farroupilha Revolution, and in Italy (Bonavides, 2001).

⁸ Shadowdescription is an accessibility feature developed to describe visual scenes in shadow theater shows, allowing people who are blind or have low vision to understand the narrative and visual details of the performances. Like audio description, shadow description describes essential elements for understanding the work, such as the projected shapes, the movements of the shadows, the interactions between the characters, and the scenarios created by these projections. The goal is to translate what is being shown visually into an accessible format, expanding the participation of different audiences in the shows.

In addition, Cia O Sombrista seeks to incorporate *shadow description* as part of an inclusive artistic proposal, which values the diversity of its audience. They understand that accessibility goes beyond a simple technical adaptation and involves a transformation in the way the show is conceived and presented. Through *shadowdescription*, the company not only expands access to shadow theater, but also explores new ways of telling stories and creating sensory experiences, expanding the possibilities of theater as a space for coexistence and cultural exchange.

During the interviews, the importance of audio description was widely discussed within the context of creating a truly inclusive cultural space. Diana highlighted that AD is not just a way of translating images into words, but rather an experience of integration. The company understands that making theatre accessible implies rethinking the ways of creation and reception. Audio description, in this context, is not a translation, but a rewriting of the scene — a way of re-inscribing the sensible for all bodies.

DIANA: I think art has this capacity, right? To provide transportation for them to come. And I think, too, to draw the attention of people who don't have disabilities.⁹

This statement shows the understanding that accessibility is not only a gesture of inclusion, but also of affectation — a way of moving the sensibility of those who see and those who do not see. The public is transformed when they realize that art can be shared in different ways. It reinforces how art has the power to bring people together from different contexts, promoting interactions and reflections that go beyond the aesthetic experience. One of the most impactful experiences of the group, reported by Diana, was a presentation of the show "Às Sombras de Anita", held in Florianópolis/SC, where the audience was composed of blind and non-blind people in practically equal proportion. According to her, this was a unique opportunity to observe how cultural accessibility affects both people with disabilities and those without disabilities:

DIANA: And the fact that you bring the two groups together, like that, half and half, you know? [...] It was half-half. There were a lot of blind people. And we realized that it affected people who do not have disabilities a lot.¹⁰

This account confirms the potential of accessible art as a space for coexistence and displacement of perspectives. As Garland-Thomson (2011, p. 13) proposes, "disability reveals how much our cultural practices define what counts as human". Thus, by creating a

⁹ Interview with actress and producer Diana Manenti, given on October 16, 2024.

¹⁰ According to footnote number 6.

shared space between different bodies, Cia. O Sombrista makes visible the political character of accessibility: it redistributes the aesthetic experience among all, without hierarchies.

The challenge of accessibility, especially for people with visual impairments, involves more than simple technological or architectural adaptations. The culture of prejudice and fear often isolates these people, as Diana points out:

DIANA: The point is that I think that the blind child, he has all this margin of prejudice from the family that is very afraid, you know? So, I think that really the families, they end up kind of locking the blind inside the house. And we see them very little on the street. Because the environment is very hostile even if you think about it, for a blind person. At school, she needs an even greater adaptation for a blind child.¹¹

The statement highlights the cultural barrier imposed for visual impairment, which aggravates the invisibility of these people in daily life. In addition, she points to the need for cultural and educational environments that are better prepared to receive people with disabilities, so that these barriers are gradually eliminated.

This need is also highlighted in the experience shared by Daiane, when she was invited to watch the show "Às Sombras de Anita" for the first time. She reveals that, since she lost her sight in 2012, she has avoided going to cultural spaces, such as theaters and cinemas, due to the difficulty of understanding the stagings:

DAIANE: With audio description in the theater, my first time was there with O Sombrista. And then, when I was invited to go, I was already very anxious, like, to know what it would be like, because I always liked theater, cinema, film, show, these things, and since I had gone blind, in 2012, I had not been to these places anymore, because you go and many times there are parts of a show that is just the staging, You don't know what's going on, and then the person stays with you, by your side, or if you go alone, you don't know what happens, but someone else has to keep describing you there. Then the person doesn't pay attention and describes the spectacle to you. So, I stopped attending, consuming the theater, the cinema, for this reason.¹²

This lack of understanding generates a feeling of exclusion and often leads people to give up participating in cultural life. Audio description, as Daiane describes, is not just a technical resource, but a bridge that connects the blind audience to the show. Her emotion when watching the presentation with audio description was palpable:

DAIANE: And when I was invited there, and it was that open audio description, wow, I was very moved, because it was something that touched me a lot because it was a shadow theater, which blind people would never be able to watch if it didn't have

¹¹ According to footnote number 6.

¹² Interview with Daiane Rodrigues, given on October 16, 2024.

Diana's description there. So, if here in the city, there will be a shadow theater, talking about Anitta, 'such, such, such', it would be something I was going to say, wow, how interesting, but I wouldn't. So, the description impacts in this sense, that we feel like participating, because you get there and know that you will understand everything that is being said. You don't feel like a fish out of water, you feel included in that show, in that audience, and you say, wow, I can be where the visionaries can be, and that breaks many barriers for us. Because, nowadays, many blind people give up on living, like, a life, they survive, we say, they give up on living a cultural life, a social life, for this reason.¹³

This emotional connection underscores the importance of audio description, allowing blind people to not only watch but feel part of a community. Diana also highlights the fundamental role of audio description in social participation. She emphasizes the artist's mission to exercise creativity in the use of this resource, regardless of the order of facts in which it is used, whether from the beginning of a production or after the work is ready:

DIANA: I'm seeing within your study, of a kind of putting accessibility from the beginning or putting it later. For people with disabilities, the important thing is to be accessible. If it will tell before or after, it is a journey much more of the artist from there, I think it goes much more to the axis of creation, you know? Than for the benefit of the person. Because Dai¹⁴ talks about it. She says if it's a poetic AD, great, but if it has audio description, as much as it's an audio description like that, *flat*¹⁵, you know? That it doesn't have too much interpretation, it's not too poetic, but if it's accessible to us, it's already wonderful. What I think is that we can be more creative in the application of these resources. What I've been thinking about today, which is in line with what you're talking about, to insert this from the beginning. More than that, I think we can be creative in exhibitions, we can be creative in theater shows, you know? Use our creativity in favor of resources. So that they do not need to be used only in this watertight way. So that we can have more and more works that have a greater possibility of enjoyment, like this. That in a little while we will arrive at a time when in the future we don't even talk about accessibility anymore. Which is obviously already accessible, you know? That it is already built thinking, right?¹⁶

A relevant point about accessibility through AD is that it is not limited to just meeting the needs of blind people. Daiane points out that audio description can also benefit other audiences, such as people with ASD and ADHD:

DAIANE: Is AD good for the visually impaired? Yes, it's great! But also for autistic people, for those who have ADHD, who can't focus, pay attention. So, sometimes, she is there in something else, but her ear is attentive to what is being said, and that is

¹³ According to footnote number 9.

¹⁴ Diana refers to Daiane as Dai.

¹⁵ *Flat* is an English word that means "flat". Within the context of the sentence, Diana refers to a flat audio description in the sense of being a straight audio description, with no room for interpretation, focusing only on visual translation.

¹⁶ According to footnote number 6.

entering her little head. So, audio description, like this, is incredible, even in this sense, even for other types of disabilities.¹⁷

This perspective broadens the horizon on the usefulness of audio description, showing that it is a valuable resource for a variety of audiences. A crucial point raised by Daiane is that "theater is not only for sighted people, theater is for all people". This statement reflects a fundamental truth that art should be inclusive and accessible to all. This vision is necessary to transform the cultural experience into a truly inclusive space.

In addition to the direct impact on people with disabilities, ageism was addressed in the conversation, highlighting how accessible resources also benefit this group, allowing them to continue actively participating in social and cultural life. Emphasizing the importance of thinking about accessibility as a right that crosses the stages of life and affects everyone at different times.

DIANA: We get into this issue of ageism that we live in our society. Prejudice against the old person. The person gets old, he becomes disposable. It is no longer useful to produce in society, so now it matters little [...] And accessibility boosts help older people a lot.¹⁸

To overcome these obstacles, it is necessary to raise awareness and create accessible spaces that contemplate the diversity of the public. Accessibility should be thought of broadly, not only for people with visual impairments, but for anyone who may, at some point in life, need accessible resources. Accessibility should be seen not as a favor or a charity, but as a universal need that can benefit any individual throughout their life.

Daiane's experience in shadow theater with audio description was not only a new cultural opportunity, but also a rediscovery of her role in society. "I had felt part of something," she says, underlining the importance of audio description in creating a sense of community and belonging. Daiane also mentions that audio description should be a common practice in all cultural manifestations:

DAIANE: I think that everything cultural has to have audio description, because, as we say, we also like to consume these things, right? So, if there is audio description, there will certainly be blind people there to be able to participate.¹⁹

Through the conversation with Diana and Daiane, it is evident that audio description is a transformative tool for the accessibility of people with disabilities in cultural contexts. The

¹⁷ According to footnote number 9.

¹⁸ According to footnote number 6.

¹⁹ According to footnote number 9.

experiences they share highlight not only the need for accessible resources, but also the importance of fostering an environment where everyone can be included. Art, after all, should be a space of connection, where each person, regardless of their abilities, can experience and celebrate culture, as Daiane mentions:

DAIANE: I was very moved, really excited, because it was a very touching experience for me. I, for the first time, in a long time, felt part of something, you know? I had felt, wow, I'm in a theater, I'm here, with a lot of people and I'm getting to know everything that's going on, without someone having to say in my ear what's happening. And some people have also felt uncomfortable and bothered by audio description, because it's the new one, right? The person, sometimes, thought that it was not necessary, but when he heard the testimonies, he saw that it was necessary, because the theater there is not only for sighted people, the theater is for all people, right?²⁰

Diana and Daiane's testimonies highlight the relevance of audio description as a practice that goes beyond technical accessibility, it is an act of social and cultural participation. From the shared experiences, it is understood that the true democratization of art requires a constant and sensitive adaptation to the needs of all. Thus, art fulfills its role of being a space of belonging and exchange, where barriers are overcome.

4 CONCLUSION

This research aimed to investigate how art and culture can establish meaningful relationships with people with disabilities, exploring how these interactions reconfigure our understanding of the artistic experience. Throughout the study, we sought to understand the role of audio description as an essential tool to make art and culture accessible to a diverse audience. From the analysis carried out, it is possible to observe that cultural accessibility not only expands the reach of art, but also promotes a transformation in the way it is experienced, including new looks and perspectives.

Based on the experience of Cia. O Sombrista, this study demonstrated that audio description can be understood as an aesthetic and political language, capable of reconfiguring the experience of art and the notion of accessibility. By adopting the perspective of critical studies, the research recognizes that disability is not an obstacle, but a creative lens—a way of thinking and feeling the world. Audio description, in this sense, is more than a bridge between the visible and the invisible: it is an act of sharing, a gesture that makes art a space for sensory coexistence.

²⁰ According to footnote number 9.

Diana and Daiane's speeches reveal that accessibility is also emotion, belonging and creation. They show that accessible art is not an extension of existing art, but a new field of creation, where difference is inventive force. At a time when disability is still associated with absence, the work of Cia. O Sombrista points to another direction: that of art as a practice of listening and care, where the sensitive is shared and the other is presence.

To think about accessibility from the perspective of aesthetics — and not just technique — is to think of an artistic and social future in which diversity is the principle of creation. Audio description, in this horizon, becomes a symbol of an expanded, inclusive and transformative art, after all, accessibility in art goes far beyond the fulfillment of legal requirements. It represents a fundamental step towards an inclusive culture, where participation and appreciation of art are seen as fundamental rights of all, regardless of their physical or sensory conditions. And in this way, it reconfigures the artistic experience by challenging traditional notions of perception and appreciation of art, incorporating the experiences and interpretations of an audience left on the margins of experiences with culture and art.

It is essential to reaffirm that the development of accessible and inclusive art is an essential step towards building a society that values diversity and respect for differences. Accessibility in art and culture represents a paradigm shift, in which the right to artistic participation is understood as a universal human right. Thus, audio description and other accessible resources not only democratize access, but promote the artistic experience by enabling a plural experience.

ABSTRACT

In the context of exposure regulation, a system of performance indicators combined with Extraction, Transformation, and Loading (ETL) methods, coupled with dashboard analysis, is an important tool for evaluating the performance of a product's quality. Therefore, this work aims to present the functionalities and applications of a performance indicator system implemented for evaluating the quality of drinking water, considering parameters that demonstrate the effectiveness of the product's quality. The indicator evaluation system was built using an ETL process of the data, executed by Microsoft Power BI®, as it offers excellent functionalities for developing dashboards and devices that promote transparency and interaction mechanisms. It was possible to evaluate and analyze the quality of drinking water at production points and in the distribution network with the aid of graphic elements related to effectiveness and efficiency. Tools such as performance papers and data download options were made available on the dashboard, promoting transparency and joint participation by users and key stakeholders in basic sanitation management. Finally, the tool allowed for a comparison of the water quality performance produced at Water Treatment Plants (WTPs)

RESUMO

No contexto da regulação por exposição, um sistema de indicadores de desempenho aliados a métodos de Extração, Transformação e Carga (ETL) somado à análise através de Painéis (Dashboards) é ferramenta importante na avaliação do desempenho da qualidade de um produto ofertado. Assim, este trabalho tem por objetivo apresentar as funcionalidades e aplicações de um sistema de indicadores de desempenho implementado para avaliação da qualidade da água para consumo humano, no qual foram considerados parâmetros que comprovassem a eficácia da qualidade do produto. O sistema de avaliação dos indicadores foi construído por um processo de ETL dos dados, que foi executado pela ferramenta Microsoft Power BI®, visto que oferece ótimas funcionalidades para desenvolvimento de painéis (Dashboards) e dispositivos que possibilitam promover mecanismos de transparência e interação. Foi possível avaliar e analisar a qualidade da água para consumo humano nos pontos de produção e rede de distribuição com o auxílio de elementos gráficos que estavam relacionados a eficácia e eficiência. Ferramentas como Paper de desempenho e a opção de downloads de dados foram disponibilizadas no Pannel, promovendo mecanismo de transparência e participação conjunta por parte de usuários e principais stakeholders da gestão do saneamento básico. Finalmente, a ferramenta permitiu comparar o desempenho da qualidade da água produzida nas Estações de Tratamento de Água (ETAs) com as metas existentes em Contratos ou Planos Municipais de Saneamento Básico (PMSB) e direcionar as fiscalizações diretas quando o resultado foi insatisfatório.

RESUMEN

En el contexto de la regulación de la exposición, un sistema de indicadores de desempeño combinado con métodos de Extracción, Transformación y Carga (ETL), junto con el análisis de tableros de control, constituye una herramienta importante para evaluar el desempeño de la calidad de un producto. Por lo tanto, este trabajo busca presentar las funcionalidades y aplicaciones de un sistema de indicadores de desempeño implementado para evaluar la calidad del agua potable, considerando parámetros que demuestran la efectividad de la calidad del producto. El sistema de evaluación de indicadores se construyó mediante un proceso ETL de datos, ejecutado por Microsoft Power BI®, ya que ofrece excelentes funcionalidades para el desarrollo de tableros de control y dispositivos que promueven la transparencia y los mecanismos de interacción. Fue posible evaluar y analizar la calidad del agua potable en los puntos de producción y en la red de distribución con la ayuda de elementos gráficos relacionados con la efectividad y la eficiencia. Herramientas como informes de desempeño y opciones de descarga de datos se pusieron a disposición en el tablero de control, promoviendo la transparencia y la participación conjunta de los usuarios y los actores clave en la gestión del saneamiento básico. Finalmente, la herramienta permitió comparar el desempeño de la calidad del agua producida en las Plantas de Tratamiento de Agua (PTA) con los objetivos establecidos en los Contratos o Planes Municipales de Saneamiento Básico (PMSB), y dirigir inspecciones cuando el resultado fue insatisfactorio.

1 INTRODUCTION/OBJECTIVES

One of the main ways in which regulatory agencies act is related to the mechanism involving data transparency and regulation by exposure, being a very interesting way of regulating because it brings elements that offer integration and joint management action.

In the Concept of Water Quality for human consumption, Annex XX of the Consolidation Ordinance GM/MS No. 5, of September 28, 2017, of the Ministry of Health, establishes the maximum and minimum parameters and values allowed for them, in addition to establishing the two basic activities that aim to ensure the quality of drinking water, namely, control and surveillance, exercised by the system operator and public health entities, respectively. The Infra-national Regulation Agencies act in relation to the quality of water for human consumption according to the National Guidelines for Basic Sanitation outlined through Law No. 11,445, of January 5, 2007, amended by Law No. 14,026, of July 15, 2020. His expertise is mainly the performance through indicators to verify the performance and quality of service provision and the fulfillment of contractual goals and the Municipal Basic Sanitation Plan (PMSB).

In this context, the use of performance indicators to assess the quality of water for human consumption together with tools that maximize its usefulness in the field of regulation is a key part of the analysis of data from Water Treatment Plants (WTPs) carried out by the Agencies. In view of this importance, it is necessary that more studies of the methodologies applied by the Regulatory Agencies be carried out.

Thus, this work aims to present the functionalities and applications of a system of performance indicators aimed at the evaluation of the quality of water for human consumption in the Pernambuco Regulation Agency, in which parameters that prove the effectiveness of the quality of the product were considered.

2 METHODOLOGY

This work adopts a quantitative and qualitative approach, employing a case study as a research strategy. The object of analysis is the system of performance indicators used by the Pernambuco Regulation Agency to evaluate the quality of water for human consumption.

Data collection was carried out through documentary analysis of the agency's internal files, including technical reports, procedure manuals and regulations. The main source of data was the historical series obtained from the service provider in relation to the control of the quality of water for human consumption. The analysis consisted of a detailed description of the methodology adopted, the selected indicators, their relevance in the regulatory context and the way they are used to identify trends and challenges in ensuring potability.

The selection of 4 parameters was proposed to obtain a systemic view of water quality: Turbidity, Free Residual Chlorine, Total Coliforms and Escherichia coli. The incidence indicator of the analyses within the standard is applied to each specific parameter, totaling four indicators for evaluating the quality of drinking water. To add managerial value to the indicators, a Drinking Water Quality Index was proposed to summarize the result of the four indicators in just one, allowing better analysis in the decision-making of an inspection. Figure 1 illustrates the composition of the indicators.

Figure 1

Composition of indicators through water quality parameters

The calculation of the weight *w*, related to the portion of influence of the indicators in the formulation of the IQAp, is carried out through a quantitative and qualitative evaluation of the risks that non-conformities of the quality parameters entail for the supply system. To characterize the risk of each parameter, we used scores for the following aspects: severity (S), occurrence (O) and detection (D) of the hazard. The scores given to the aspects range from 1 to 3, with 1 for low, 2 for moderate, and 3 for high. A better description of this type of methodology can be seen in Rodrigues (2014). Table 2 illustrates the calculation formulation for the Drinking Water Quality Index (IQAp).

Table 2

Methodology for calculating the Drinking Water Quality Index (IQAp)

Indicator	Description	Origin	Calculation formula
			$IQA_p = \sum_{i=1}^n [q_i * w_i]$ $\sum_{i=1}^n w_i = 1$ $w_i = \frac{R_i}{R_{total}}$
IQA_p	Drinking Water Quality Index	Arpe	$R_i = \text{severidade}(S) \times \text{ocorrência}(O) \times \text{detecção}(D)$ $= S \times O \times D$ $R_{total} = R_{CRL} + R_{turbidez} + R_{C.T} + R_{E.coli}$ Where: n - number of water quality parameters assessed locally in the SAA I - Evaluated parameter qi - Incidence of analyses within the standard of parameter i wi - Weight assigned to parameter i

Table 3 below reports the scores and justifications given to the severity (S) aspect.

Table 3

Score for the severity aspect

Severity Score		
Classification	Justification	Score
High	Substance very harmful to the environment, causes serious effects on human health, has characteristics of toxicity and pathogenicity.	3
Moderate	Substances that are harmful to the environment, cause mild effects on human health (irritations or allergies)	2
Low	Substances that are not harmful to the environment, cause negative effects on human health	1

Source (adapted): (Rodrigues, 2014)

Tables 4, 5, 6 and 7 below report the scores and justifications that are given to the occurrence (O) aspect according to the frequency of non-compliance for the parameters Free Residual Chlorine, Turbidity, Total Coliforms and Escherichia coli.

Table 4

Score for the occurrence aspect for the Free Residual Chlorine parameter

Score for Occurrence (Free Residual Chlorine)		
Classification	Justification	Score
High	The environmental impact or health risk occurs at a high frequency for the parameter (13 or more non-conformities per year)	3
Moderate	The environmental impact or health risk occurs at a moderate frequency for the parameter (7 to 12 non-conformities per year)	2
Low	The environmental impact or health risk occurs at a low frequency for the parameter (up to 6 non-conformities per year)	1

Source (adapted): (Rodrigues, 2014)

Table 5

Score for the occurrence aspect for the Turbidity parameter

Score for Occurrence (Turbidity)		
Classification	Justification	Score
High	The environmental impact occurs at a high frequency for the parameter (above 30 non-conformities per year)	3
Moderate	The environmental impact occurs at a moderate frequency for the parameter (11 to 30 non-conformities per year)	2
Low	The environmental impact occurs at a low frequency for the parameter (up to 10 non-conformities per year)	1

Table 8 reports the scores and justifications given to the detection aspect (D).

Table 8

Score for the detection aspect

Detection Score		
Classification	Justification	Score
High	To detect non-conformity, medium to high complexity methods are used, requiring several steps for the success of the method, causing an execution time usually greater than 1 day.	3
Moderate	Non-compliance is perceived with the use of simple meters, with a measurement time generally less than 30 minutes (turbidimeters, photocolorimeters, titrations, etc.)	2
Low	Non-compliance can be perceived visually	1

Source (adapted): (Rodrigues, 2014)

Tables 9 and 10 describe the reasons why the non-conformities received their scores for each aspect in the positions of the treatment outlet and the distribution network, respectively.

Table 9

Explanation form of severities, occurrences and detections for treatment exit

Parameter	Severity (S)	Occurrence (O)	Detection (D)	Risk
Free Residual Chlorine	It can cause significant problems to human health due to its exposure in high concentrations	Depends on the frequency of non-compliance	CRL analysis is done using simple equipment. (Photocolorimeter)	$R = S \times D \times O$
	May increase the likelihood of the presence of pathogenic microorganisms due to the absence of residues in the water		On average, the full test takes about 10 minutes or less.	$R = 3 \times 2 \times O$
				$R = 6 \times O$
	Score: 2			
Score: 3				
Turbidity	Considered an indicator of efficiency of the water clarification process.	Depends on the frequency of non-compliance	Turbidity analysis is done using simple equipment. (Turbidity meter).	$R = S \times D \times O$ $R = 3 \times 2 \times O$ $R = 6 \times O$

Parameter	Severity (S)	Occurrence (O)	Detection (D)	Risk
	May interfere with disinfection efficiency Indicator of efficiency in the process of removing oocysts from Protozoa. Its positivity in relation to the current norm has the effect of indirectly pointing to the increase in the probability of the presence of Protozoa. Score: 3		On average, the full test takes about 10 minutes or less. Score: 2	
Total Coliforms	Parameter used as a counter-test for the sentinel parameters Turbidity and Free Residual Chlorine Bacteriological removal efficiency indicator Its positivity in relation to the current norm has the effect of pointing to an increase in the probability of the presence of pathogenic microorganisms Score: 3	Depends on the frequency of non-compliance	Complex test, requires specialized personnel, takes more than a day to complete execution Score: 3	$R = S \times D \times O$ $R = 3 \times 3 \times O$ $R = 9 \times O$
Fecal Coliforms (Escherichia coli)	It can cause significant problem to human health. Proves the compromise of the quality of water for human consumption Faecal contamination indicator Score: 3	Depends on the frequency of non-compliance	Complex test, requires specialized personnel, takes more than a day to complete execution Score: 3	$R = S \times D \times O$ $R = 3 \times 3 \times O$ $R = 9 \times O$

In the evaluation stage, an ETL (Extraction, Transformation and Loading) process of the data was used in order to obtain a better fit of the data. The interaction with users and managers is carried out through a performance panel, which allows, in addition to the visualization of indicators in tables and graphs with pictorial elements, the printing of *performance papers* by municipality. Figure 2 shows the data *download* page and the performance report of the indicators. The user can access and print the results of the municipal indicators in a historical series of the last five years, accompanied by a qualitative evaluation based on the classification by reference value ranges.

This methodology allowed an in-depth understanding of the practical application of the evaluation system and its effectiveness in detecting problems and promoting improvements

in water quality, contributing to the improvement of regulatory practices. Regarding the objectives of this methodology, three were identified as essential: (a) Evaluate the quality of water for human consumption from Water Treatment Plants (WTPs) through a system of performance indicators, (b) Provide a means of aid in decision making and (c) Apply a *business intelligence* tool for use in exposure regulation.

3 RESULTS AND DISCUSSION

The analysis of the agency's files allowed us to identify that the system's data sources come from the control function of water for human consumption, which is defined by Annex XX of the Consolidation Ordinance GM/MS No. 5, of September 28, 2017, of the Ministry of Health, and which is executed by the operator of the water supply system. Statistical data is received that is passed through a process of extraction, transformation and loading for subsequent calculation of the indicators. In the performance panels, the indicators are visualized with quantitative values and with qualitative elements classified according to range or reference values.

To exemplify the result of the performance evaluation of the quality of water for human consumption in relation to the provision of basic sanitation service in the state of Pernambuco, the base year of 2024 was considered and the data extracted come from the Performance Panel of the Pernambuco Regulation Agency – Arpe on drinking water quality.

We chose to show and analyze the result of the indicators in qualitative maps of the state of Pernambuco for technical reasons of visualization and spatial understanding of non-conformities. It should be noted that the absence of data, represented by the white color on the maps for certain municipalities, is justified by three factors: technical issues, municipalities that were not part of the agency's regulatory framework in the base year, or by the methodology of the indicators, in which municipalities that do not have Water Treatment Plants do not generate data at the treatment output.

At first, we present the results of the IQAp indicator, which has the function of summarizing the results of the other four indicators in a single piece of information for decision making. As seen in Figure 3, which reports the PQI at the end of treatment, it is observed that most municipalities have their PQI classification as unsatisfactory (red), which may probably evidence some systemic problem in ensuring the standard established by Annex XX of Consolidation Ordinance No. 5 GM/MS in relation to one of the four indicators that compose it.

Figure 3*IQAp at treatment discharge (base year 2024)*

Source: Water Quality Dashboard - Arpe (2025)

Figure 4 shows the result of the aqi for the distribution network, showing a very different contrast in relation to the treatment output. Most municipalities have the IQAp classified as ideal (green), reporting only a few cases in isolation with the classification of unsatisfactory.

Detailing the analysis for the indicators that make up the IQAp, the first being IN075, an indicator of residual chlorine compliance according to the standard of Annex XX of Consolidation Ordinance No. 5 GM/MS.

Figure 4*IQAp in the distribution network (base year 2024)*

Source: Water Quality Dashboard - Arpe (2025)

Figure 5 shows that for this indicator its qualitative classification was ideal (green) at the end of treatment for most of the municipalities operated by the basic sanitation service provider. While in the network, Figure 6, most municipalities also obtained the qualitative classification of ideal, but with more clustered points of municipalities with an unsatisfactory classification. Depending on the quantitative value of the indicator, these municipalities may

be subject to a direct inspection (*in loco*) to verify the chlorination system of the WTPs and guarantee the quality of the product in relation to the Contractual and PMSB goals.

Figure 5

IN075 at treatment exit (base year 2024)

Source: Water Quality Dashboard - Arpe (2025)

Figure 6

IN075 in the distribution network (base year 2024)

Source: Water Quality Dashboard - Arpe (2025)

Analyzing the indicator IN076 for turbidity compliance according to Annex XX of Consolidation Ordinance No. 5 GM/MS, it is verified that at the end of the treatment, Figure 7, most municipalities have their classification as unsatisfactory and that the colorimetric map is very similar to the graph in Figure 3. It is notable that the deficiency of the IQAp comes from most of the IN076 indicator, which has low compliance yields in the municipalities of the state. Achieving the potability standard for water turbidity after filtration, 0.5 NTU in 95% of samples and the remaining 5% up to 1 NTU, is a major challenge.

Figure 7*IN076 at treatment exit (base year 2024)*

Source: Water Quality Dashboard - Arpe (2025)

Figure 8 illustrates the indicator IN076 in the distribution network, where it is possible to see a very different panorama of the treatment output, most municipalities have an IN076 classification as ideal, which is justifiable due to the potability standard being organoleptic, maximum value allowed up to 5 NTU, while at the treatment output it is much more restrictive because it is linked to efficiency issues in the elimination of cysts and oocysts of Protozoa in the filtration process.

Figure 8*IN076 in the distribution network (base year 2024)*

Source: Water Quality Dashboard - Arpe (2025)

The yield of this indicator is often impacted by a series of challenges, such as the degradation of water quality in water sources and the water crisis, which causes the depletion and collapse of these sources. Added to this is the problem of undersized Water Treatment Plants (WTPs), either due to inadequate design or the inability to keep up with the increase in population demand, the consequence is the prioritization of the amount of water produced,

to the detriment of the quality and efficiency of treatment. All these aspects have contributed to the performance of this indicator being often compromised.

Reaching the potability standard for the IN076 indicator at the filtration outlet is a systemic deficiency for most WTPs in the municipalities of Pernambuco, with the exception of those that have their abstraction from springs with good water quality, such as the São Francisco River, or those that have a very robust treatment system.

The Level I-2 indicator is found in ANA reference standard No. 09 and measures the compliance of total coliform samples in relation to the standards established in Annex XX of Consolidation Ordinance No. 5 GM/MS, being related to treatment efficiency and is used to verify it.

Figure 9

Level I – 2 at treatment exit (base year 2024)

Source: Water Quality Dashboard - Arpe (2025)

Figure 10

Level I – 2 in the distribution network (base year 2024)

Source: Water Quality Dashboard - Arpe (2025)

Figure 9 above shows the positivities of this indicator in the base year, which implies a deficiency in water treatment for few municipalities in the state in relation to the treatment

output and should also be analyzed quantitatively for planning direct inspections. For the distribution network, Figure 10 also shows few municipalities classified as unsatisfactory, which leads us to infer that for the year 2024 most municipalities presented good yields in their treatment system and microbiological protection of the network.

The INpQ01 indicator points to fecal contamination of the water, and should not present positivity in any way in the treatment system, but even so, we find it in our state, mainly due to three factors that reflect on the inefficiency of the treatment system: poor water quality source, undersized Water Treatment Plants and old distribution networks. As can be seen in Figures 11 and 12, some municipalities were positive for *Escherichia coli* at the end of the treatment and in the distribution network. Both the Level I - 2 indicator and the INpQ01 are the main pointers used by the Agency in relation to product quality to direct direct inspection.

Figure 11

INpQ01 at treatment exit (base year 2024)

Source: Water Quality Dashboard - Arpe (2025)

Figure 12

INpQ01 in the distribution network (base year 2024)

Source: Water Quality Dashboard - Arpe (2025)

The analysis carried out was explained qualitatively in order to show its ease of interpretation, being subject to analysis by service users and main *stakeholders* of the management of the basic sanitation sector. It was possible to understand how the application of *business intelligence* techniques used in the evaluation and analysis of water quality is a useful tool, especially with regard to regulation by exposure, and not just a tool that would point out the problem and direct decision-making.

4 CONCLUSION

The model showed good results both to point out specific problems related to water quality and to more generalized problems, always related to the systemic formulation of the indicators.

The system of performance indicators for evaluating the quality of water for human consumption combined with *business intelligence* tools proved to be an interesting resource in the work developed by Arpe, allowing not only the evaluation of performance for decision making, but also offering instruments that allow a better dissemination of the indicators. The availability of a performance *paper* that allowed the user to print the data of the indicators by municipality, in an accessible way, was a positive aspect in favor of active transparency.

The mechanisms of regulation by exposure provided by the model presented in this work, favoring the dissemination of performance indicators to the user or managers of basic sanitation, direct the regulator's action towards effectiveness in monitoring the quality of the water offered to the population.

ABSTRACT

This article examines the feasibility of a Hybrid Social Insurance scheme as a complementary mechanism to Brazil's Benefício de Prestação Continuada (BPC), aimed at providing preventive protection for low-income families facing premature death or work disability of the household provider, particularly in contexts of high informality. The analysis begins from the premise that the Brazilian social protection system remains predominantly reactive and ex post, activated only after social damage is consolidated, thereby reinforcing persistent poverty cycles and long-term welfare dependency. Drawing on literature review, legal-institutional analysis, and a synthesis of international experiences with micro-insurance and co-financed social schemes, the study proposes a conceptual design grounded on three pillars: (i) public-private co-financing, (ii) simple parametric triggers, and (iii) institutional integration with SUAS and BPC, avoiding benefit overlap. The paper argues that such a model can reduce intergenerational vulnerability, mitigate the socioeconomic effects of incapacity events, and simultaneously lower future fiscal pressure on social assistance by acting preventively. It concludes by outlining an applied research agenda, including actuarial modeling, distributive assessment, and governance evaluation, to support future empirical development in comparative settings and within Brazil.

RESUMO

Este artigo discute a viabilidade de um Seguro Social Híbrido como mecanismo complementar ao Benefício de Prestação Continuada (BPC), orientado à proteção preventiva de famílias de baixa renda afetadas pela morte precoce ou incapacidade laboral do provedor, especialmente em contextos de alta informalidade. Parte-se do diagnóstico de que o modelo brasileiro de proteção social permanece fortemente reparador e ex post, acionado somente após a consolidação do dano social, produzindo ciclos de empobrecimento duradouro e dependência assistencial. A partir de revisão bibliográfica, análise normativa e sistematização de experiências internacionais de microseguros sociais e arranjos cofinanciados, o estudo propõe um desenho conceitual de seguro híbrido baseado em três pilares: (i) cofinanciamento público-privado, (ii) gatilhos paramétricos simples, e (iii) integração com o SUAS e o BPC, sem sobreposição de benefícios. Argumenta-se que o modelo possui potencial para reduzir vulnerabilidade intergeracional, mitigar impactos socioeconômicos de eventos incapacitantes e, simultaneamente, produzir economia futura para a assistência social, ao atuar antes da queda definitiva da renda. O artigo encerra apresentando uma agenda de pesquisa aplicada, incluindo modelagem atuarial, avaliação distributiva e análise de governança, que fundamenta o desenvolvimento posterior do tema em estudos empíricos comparados e no contexto brasileiro.

RESUMEN

Este artículo analiza la viabilidad de un Seguro Social Híbrido como mecanismo complementario al Beneficio de Prestación Continuada (BPC), orientado a ofrecer protección preventiva a familias de bajos ingresos frente a la muerte precoz o incapacidad laboral del proveedor, especialmente en contextos de alta informalidad. Se parte del diagnóstico de que el sistema brasileño de protección social continúa siendo mayormente reparador y ex post, activándose sólo después de la consolidación del daño social, lo que genera ciclos persistentes de pobreza y dependencia asistencial. A partir de revisión bibliográfica, análisis normativo y sistematización de experiencias internacionales de microseguros y esquemas cofinanciados, el estudio propone un diseño conceptual basado en tres pilares: (i) cofinanciamento público-privado, (ii) disparadores paramétricos simples, y (iii) integración institucional con el SUAS y el BPC, evitando superposición de beneficios. Se sostiene que el modelo puede reducir la vulnerabilidad intergeneracional, mitigar impactos socioeconómicos de eventos incapacitantes y, al mismo tiempo, disminuir presiones futuras sobre la asistencia social al actuar preventivamente. El artículo concluye proponiendo una agenda de investigación aplicada, con modelación actuarial, evaluación distributiva y análisis de gobernanza, que servirá de base para desarrollos empíricos posteriores en Brasil y en perspectiva comparada.

1 INTRODUCTION

Historically, Brazilian social protection operates with a predominance of post-event responses, that is, mechanisms that are activated only when the socioeconomic damage has already been consolidated. In the case of the Continuous Cash Benefit (BPC³), this characteristic becomes particularly visible: the benefit ensures minimum income to the elderly and people with disabilities in poverty, but only after the definitive rupture of the household's ability to sustain itself. Created under the 1988 Constitution and later regulated by the Organic Law of Social Assistance, the BPC represents a civilizational milestone; even so, it remains circumscribed to an essentially reparative model (BRASIL, 1988; BRAZIL, 1993). In a labor market marked by high informality and contributory fragility, the early death or incapacity of the provider quickly turns into an abrupt drop in well-being, with lasting impacts on the life cycle of families. As Barr (2020, p. 41) states, *"welfare systems that act only after the catastrophe tend to spend more and protect less"*.

The economic literature on poverty and vulnerability confirms that unexpected income shocks, especially those associated with health events, disability, or death, amplify inequalities and produce persistent intergenerational effects. Banerjee and Duflo (2019, p. 112) note that "poor households rarely have formal instruments to mitigate risks, so a single negative event can permanently reset their income trajectory." In Brazil, where a large part of the active population moves between precarious occupations and irregular contributions, the absence of preventive protection instruments becomes an involuntary stimulus to judicialization and prolonged care dependence. Studies on the phenomenon indicate that the expansion of lawsuits has functioned as a substitute mechanism for insufficient institutional design, straining the public budget and producing uncoordinated decisions (BARROSO, 2012; VIANNA et al., 2020).

In recent years, international experiences of social microinsurance and co-financed parametric arrangements have begun to explore solutions that act before the financial collapse of families. These models combine operational simplicity, risk sharing, and a focus on high-probability events and strong distributional impact. Churchill (2007) demonstrates that structured microinsurance for vulnerable populations reduces catastrophic losses and increases resilience. In a convergent way, Dercon (2022) argues that systems that articulate

³ The Continuous Cash Benefit (BPC) is a monthly transfer of a minimum wage for elderly people aged 65 or over and for people with disabilities who prove inability to provide for their own maintenance and per capita family income below the legal limit. It is a benefit of an assistance nature, not contributory, provided for in article 203, V, of the Federal Constitution and regulated by the Organic Law of Social Assistance (Law No. 8,742/1993). Unlike social security benefits, the BPC does not generate a 13th salary or pension, and does not require prior contributions, fulfilling the function of guaranteeing a minimum floor of dignity to populations in situations of extreme vulnerability.

insurance and social protection tend to stabilize productive trajectories. Fiszbein and Schady (2009) show that programs that "anticipate" protection can reduce future costs for the State and mitigate significant human losses. Even so, the Brazilian debate remains focused on incremental reforms of the existing apparatus, with limited attention to instruments that combine insurance, assistance and prevention.

This article proposes to discuss the feasibility of a Hybrid Social Insurance as a complement to the BPC, aimed at protecting low-income households in the face of early death or incapacity to work of the provider, especially in informal contexts. The central hypothesis is that a mechanism structured on three axes, public-private cofinancing, clear parametric triggers, and institutional integration with the Unified Social Assistance System (SUAS),⁴ without overlapping with the BPC, can cushion income shocks, reduce intergenerational effects of impoverishment, and, in parallel, alleviate future pressures on permanent assistance programs. In terms of public savings, it is about shifting part of spending from an essentially restorative logic to a protective investment strategy, in which "prevention is both cheaper and fairer" (ATKINSON, 2019, p. 67). The SUAS, designed to organize social assistance protection in a decentralized and articulated way, offers precisely the institutional environment for this transition (SILVA; YAZBEK; GIOVANNI, 2020).

The argument also dialogues with a perspective of preventive governance, close to what Cavalcante (2024) calls the GIS Cycle, in which state action moves from reactive responses to arrangements that combine governance, innovation, and sustainability as a structuring axis of public policies. Instead of creating a new substitute benefit, hybrid insurance is conceived as an intermediate layer, capable of acting between the risk event and the definitive drop in income, preserving family autonomy and reducing future social costs.

The reflection develops in three movements. Initially, a critical reading of the limits of the Brazilian model of predominantly ex post protection is presented. Then, international evidence on social insurance, parametric mechanisms, and hybrid arrangements is systematized. Finally, a conceptual design for hybrid social insurance is outlined, with economic, legal and institutional foundations, accompanied by an applied research agenda aimed at the empirical testing of the model. The objective is not to offer a conclusive solution,

⁴ The Unified Social Assistance System (SUAS) is the public policy responsible for the organization, at the national level, of social assistance actions in Brazil. Established in 2005, the SUAS establishes a decentralized and participatory model, in which the Union, states and municipalities share responsibilities for financing, management and provision of services. Its network includes equipment such as the Social Assistance Reference Centers (CRAS) and the Specialized Social Assistance Reference Centers (CREAS), aimed at family monitoring, risk prevention and social protection. Unlike policies focused only on cash transfers, SUAS combines income, services, and continuous monitoring, seeking to strengthen community bonds and reduce vulnerabilities in a structured way.

but to contribute to a necessary debate on how to incorporate the logic of economic prevention into the core of Brazilian social security.

Table 1 reinforces this diagnosis by showing the significant expansion of the BPC in a scenario of persistent informality. Between 2004 and 2025, the monthly amount transferred multiplied more than twentyfold, while the informality rate remained high. These data indicate that the current model absorbs social shocks without having structured preventive mechanisms, which concentrates efforts on the reparative phase and increases future costs. Thus, the Hybrid Social Security is presented as an incremental alternative that acts before the definitive drop in income, protecting family trajectories and preserving the function of the BPC as a policy of last resort.

In fact, data from VIS Data (Ministry of Citizenship) show the exponential growth of the BPC between 2004 and 2025, with monthly amounts transferred jumping from R\$ 0.41 billion to R\$ 9.86 billion (Sep/2025), reflecting the expansion of demand in a context of persistent informality (38-42% of the workforce, PNAD/IBGE).

Table 1

Evolution of the BPC and context of informality (2004-2025)

Period	Total monthly value (R\$ billion)	Beneficiaries (millions, approx.)	National informality rate
2004	0,41	0,8	~45% IPEA
2010	1,73	2,2	42% ftp.ibge
2015	3,33	4,0	40% IPEA
2020	4,87	5,7	39% agenciabrasil.ebc
2025	9.86 (Sep)	7.6 (+33% since 2020)	38% CNNB+1

Source: VIS Data 3 beta (MDS); Continuous PNAD (IBGE).

These numbers show how the BPC's reparative model absorbs informality shocks without preventive mechanisms, with greater weight in the North/Northeast regions (rates >50%) where concessions for disability and judicialization grow faster. Such dynamics reinforce the need for an intermediate layer, such as the proposed Hybrid Social Security, to act before the definitive drop in family income.

2 THEORETICAL FRAMEWORK

The discussion that follows is not just an inventory of authors and concepts. It is a journey that invites the reader to revisit social protection from a little-explored lens: the lens of risk before collapse.

The theoretical framework opens this path in layers. It begins by examining how poverty and vulnerability cease to be isolated events and become trajectories, shaped by shocks that the state often faces too late.

Then, it illuminates the place of the BPC and the SUAS, civilizing achievements, but still stuck in an essentially reparative temporality. The text then moves to international experiences of microinsurance and parametric mechanisms, revealing that other societies have been experimenting with preventive responses, combining insurance, co-financing and operational simplicity.

Later on, the tensions between judicialization, institutional design and governance emerge, showing how architectural failures end up converting social demands into permanent litigation.

The end of this trajectory resumes the dimension of rights and citizenship, asking what it means to protect fairly in a context of fiscal restrictions and persistent inequalities.

By integrating these strands, the framework prepares the ground for the next step of the article: the presentation of a Hybrid Social Security model, thought not as a rupture, but as an evolution, a preventive layer capable of dialoguing with the BPC, preserving family trajectories and inaugurating a new level of protection in the country.

Dear reader, we invite you to go ahead and observe how these ideas take shape into a concrete proposal, capable of being tested, evaluated and applied, not only promising, but practicable.

2.1 SOCIAL PROTECTION, POVERTY AND RISK

The contemporary discussion on social protection shifts the exclusive focus from cash transfer to intelligent risk management throughout the life cycle. In different welfare traditions, the crucial point lies less in the size of state spending and more in the institutional capacity to prevent predictable shocks, illness, disability, unemployment, and early death, from pushing families into permanent trajectories of vulnerability. Esping-Andersen (1990) already indicated that mature protection systems are able to decommodify these risks, removing them from the individual sphere and distributing them collectively. Recent literature reinforces this intuition: when policies combine social insurance, assistance networks, and redistributive instruments, simultaneous gains in macroeconomic stability and reduction of inequalities are observed (DERCON, 2022).

In the field of development economics, the debate has gained sophistication by relating adverse shocks to defensive decisions that shape the future of families. Banerjee and Duflo (2019) show that, without formal risk mitigation instruments, poor households tend to adopt conservative strategies, reducing productive investments, selling assets, and retracting essential consumption, which deepen poverty in the long run. These are what some authors

see as vulnerability traps: one-off events, when not cushioned, permanently reconfigure the possibilities of income and mobility.

Structural informality intensifies this process. Segmented labour markets, fragile contracts and irregular contributions reduce the reach of pension systems and create grey areas between contributory protection and social assistance. Perry et al. (2007) demonstrate that economies with high informality coexist with greater income volatility and lower insurance coverage, a situation that is reproduced in a remarkable way in Brazil. The absence of preventive mechanisms causes predictable risks to become *ex post* demands to the State, often through judicialization, with increasing fiscal costs and low institutional coordination.

The international literature has responded to this dilemma with renewed emphasis on the notion of preventive social protection. Barr (2020) argues that models based solely on remediation overestimate their own efficiency as they ignore the cumulative cost of unmanaged risk. In a similar perspective, studies on agricultural insurance, microlife insurance and parametric mechanisms reveal that the anticipation of public support produces relevant distributive effects, while avoiding the irreversible degradation of family assets. What emerges is an agenda that does not replace assistance policies, but repositions them within a broader risk management arrangement.

This theoretical movement offers a promising reading key for countries that, like Brazil, have built robust instruments of protection after the damage, but have not yet consolidated an institutional layer between risk and collapse of income. The reflection proposed in this article is inserted exactly at this inflection point: to explore how hybrid mechanisms, combining insurance, co-financing and integration with the social assistance network, can inaugurate a preventive level capable of reducing future vulnerabilities without giving up the universalist character of social protection.

2.2 THE BPC, THE SUAS AND THE LIMITS OF A PREDOMINANTLY REPAIRING MODEL

The Continuous Cash Benefit has consolidated itself as one of the most expressive pillars of Brazilian social security. By guaranteeing basic income to elderly people and people with disabilities in poverty, the BPC materializes the constitutional principle of human dignity and makes explicit the State's commitment to the protection of historically excluded groups (BRASIL, 1988; BRAZIL, 1993).

It is a subjective, non-contributory right, which operates as a last resort in the face of the exhaustion of other forms of support. This characteristic gives the program great social legitimacy, but it also reveals its place within an arrangement that acts, above all, when vulnerability has already become chronic.

The institutionalization of the Unified Social Assistance System (SUAS) reorganized the assistance policy around principles of territoriality, decentralization and federative coordination. With the creation of standardized flows of services, family monitoring and intersectoral articulation, the SUAS reduced the historical fragmentation of the sector and expanded its response capacity (SILVA; YAZBEK; GIOVANNI, 2020).

Even so, most of the lawsuits continue to be triggered after the risk occurs: death of the provider, prolonged work incapacity or permanent loss of income. The institutional design, while protecting, comes too late to prevent the deterioration of family trajectories.

The specialized literature recognizes this dilemma. Research on the dynamics of the BPC shows that its reparative function is indispensable, but its temporality produces long-term effects that are difficult to reverse. Once included in a permanent benefit, many families find reduced incentives and objective conditions to regain autonomy, especially in territories where informality dominates job opportunities (PAIVA; JACCOUD; MESQUITA, 2022).

This process does not stem from individual choices, but from an architecture that offers protection only after collapse, when the alternatives have already been consumed.

Another phenomenon associated with the *ex post nature* of the model is the expansion of judicialization. Individual demands come to the courts seeking to repair coverage gaps, make income criteria more flexible, or anticipate administrative decisions.

Barroso (2012) observes that the Judiciary, in these situations, acts as a substitute channel for poorly balanced public policies, producing fragmented solutions, often disconnected from medium-term strategies. Vianna et al. (2020) add that this dynamic redistributes resources without planning and puts pressure on local budgets, while weakening federative coordination of care.

The tension between the guarantee of rights and distributive rationality becomes even more evident in scenarios of high informality. Families that move between precarious occupations or without a contributory link find limits in social security protections and, when they suffer a shock, death or incapacity of the provider, they end up entering directly into the care route.

What could be a temporary phase often becomes a permanent condition. Barr (2020) suggests that systems that operate in this way not only respond late, but create an "institutionalized dependence on misfortune."

It is not, however, a matter of reducing the role of the BPC or the SUAS. What the literature points to is the need to recompose the temporality of protection. Instead of concentrating resources only in the final phase of the vulnerability cycle, public policies can

intervene before the definitive drop in income, preventing families from entering permanent benefits without preventive mechanisms having been activated.

In this sense, parametric instruments, low-cost social insurance, and co-financing arrangements open up a promising field of complementarity: the BPC preserves its civilizing function, while a preventive layer reduces the probability of its judicialization and unnecessary prolongation.

The debate on institutional innovation converges, at this point, with reflections on governance. Models that articulate prevention, federative coordination and fiscal sustainability are close to approaches that understand public policy as a continuous cycle of learning and adaptation. By integrating assistance protection with preventive instruments, the State ceases to act only in the face of disaster and begins to organize capacities to anticipate its effects. This interpretative key helps to understand the relevance of discussing hybrid mechanisms as a complement, and not a replacement, of the existing arrangement.

2.3 MICROINSURANCE, PARAMETRIC MECHANISMS AND CO-FINANCING: INTERNATIONAL LESSONS FOR SOCIAL PREVENTION

The search for instruments capable of cushioning shocks before they become social crises has led several countries to experiment with microinsurance formats and parametric arrangements aimed at low-income populations. These mechanisms are based on a simple principle: when the risk is predictable and recurrent, protection can be designed with clear rules, reduced costs, and automatic activation, avoiding bureaucracies that slow down the response and financially disorganize families.

In the field of microinsurance, Churchill (2007) shows that products adapted to the irregular income profile, with affordable premiums, standardized coverage and contractual transparency, increase the capacity for resilience without imposing requirements that are incompatible with the reality of informality.

Experiences in Asian and African countries indicate that the combination of small premiums and objective triggers reduces exposure to catastrophic losses, preserving productive assets that, in traditional contexts, would be liquidated to face emergencies.

Parametric mechanisms deepen this logic. Instead of requiring extensive evidence, the benefit is activated when an event verifiable by public record occurs, for example, a death certificate or standardized medical report. This characteristic reduces administrative costs, reduces room for disputes and increases fiscal predictability. Dercon (2022) observes that, when well calibrated, these instruments operate as "bridges" between insurance and social policy, introducing risk rationality where improvisation has historically predominated.

A decisive element for the viability of these models is public-private co-financing. The participation of the State makes it possible to equalize risks, reduce premiums and direct protection to groups with greater vulnerability, maintaining actuarial sustainability. Fiszbein and Schady (2009) point out that, by sharing costs with households and private operators, governments are able to build more progressive policies, without fully shifting the burden to budgets that are already under pressure. This type of arrangement does not replace social assistance; rather, it creates an intermediate layer that prevents the escalation of permanent demands.

Although promising, these experiences arouse debates. There are questions about possible regressive effects if co-financing is not calibrated, risks of adverse selection and regulatory dilemmas in underdeveloped markets. Barr (2020) reminds us that poorly designed insurance can transfer public responsibilities to individuals without the ability to contribute.

For this reason, successful initiatives often incorporate cross-subsidy mechanisms, strong regulation, and explicit integration with existing social protection systems.

The most relevant point for the Brazilian debate lies not only in the replication of foreign models, but in the institutional translation of these lessons. Countries that have advanced in the adoption of microinsurance and parametric instruments have combined financial innovation with governance arrangements capable of monitoring impacts, reviewing parameters, and articulating different levels of government.

This capacity for continuous learning suggests a promising path: to build preventive instruments that dialogue with institutions that are already consolidated, especially SUAS and BPC, and that operate in a transparent, progressive and fiscally responsible manner.

The literature, by converging on this point, opens space for proposals that situate preventive protection as an organic part of social security and not as a marginal appendix. It is in this terrain that the discussion about a Hybrid Social Security is inserted, designed to absorb predictable shocks before they turn into permanent crises, preserving rights and reinforcing the sustainability of the system as a whole.

2.4 JUDICIALIZATION, INSTITUTIONAL DESIGN AND PREVENTIVE GOVERNANCE

The contemporary debate on social protection in Brazil cannot be understood without considering the phenomenon of the judicialization of public policies. The expansion of access to justice and the centrality of fundamental rights have produced a scenario in which individual and collective demands come to define, in everyday life, the materialization of social benefits.

Barroso (2017) observes that the Judiciary has been called upon to act as an instance of correction of administrative failures, suppressing omissions and imposing benefits in health, social security and social assistance. This movement reveals democratic vitality, but it also exposes institutional tensions: one-off decisions, even if legitimate, can generate diffuse fiscal effects and change policy priorities without prior planning.

In the field of BPC, judicialization has become especially visible. Changes in criteria, revisions of per capita income and reinterpretations of the concept of disability have been frequently discussed in court, with direct impacts on the management of the benefit (COSTA; FERRAZ, 2020).

The heterogeneity of decisions contributes to administrative uncertainties and affects budget predictability, while revealing coverage gaps that the system itself has not been able to address. When low-income families seek the Judiciary as the only way to access, the problem is no longer just legal; it becomes a sign of an institutional arrangement that reacts belatedly to social risks.

The literature on institutional design offers important clues to address this dynamic. Pierson (2000) indicates that institutions produce "trajectory effects": past choices condition future solutions and generate inertia that are difficult to break.

In the Brazilian case, the social security-assistance-health tripod has been consolidated with relatively watertight borders, making intermediate prevention strategies difficult. In times of crisis, the response tends to be reactive, shifting the problem to the Judiciary or increasing spending on permanent benefits, without mechanisms that absorb the shock at the source.

It is at this point that the idea of preventive governance arises. Rather than focusing efforts solely on repairing harm, public policies can be structured to reduce the likelihood that foreseeable events will turn into lawsuits or long-term care dependence. Organization for Economic Cooperation and Development (OECD, 2021) points out that preventive arrangements generate cumulative positive effects: they minimize future costs, preserve family autonomy, and reduce disputes between powers. The challenge is to create instruments that work with clear rules, transparent parameters and the ability to monitor continuously.

International experience with parametric social insurance and microinsurance shows that when benefit activation depends on objective triggers, such as death registration or standardized proof of disability, the margin for judicialization tends to fall, as the criteria leave less room for divergent interpretations (DERCON, 2022). At the same time, co-financing mechanisms allow the State to direct subsidies to groups with greater vulnerability, preserving

progressivity and preventing coverage from being captured by segments with greater power of articulation (FISZBEIN; SCHADY, 2009).

In Brazil, the articulation between SUAS, BPC and preventive instruments can represent an institutional advance. Social assistance has capillarity, registrations and experience in family monitoring; however, it lacks a financial mechanism capable of acting before the rupture of income. The construction of a hybrid model, regulated by the government and monitored by social risk indicators, would reduce the flow of lawsuits and, simultaneously, protect family trajectories in situations of early death or work incapacity.

As Barr (2020) reminds us, effective social insurance does not transfer responsibilities to the individual; reorganize, in a rational way, the sharing of risks that already fall on the State.

The dialogue between judicialization and preventive governance does not imply diminishing rights. It is about strengthening them through more predictable, transparent instruments aligned with fiscal capacity. When policies are planned based on evidence and structured to act in advance, the Judiciary starts to act as a guardian of guarantees, not as a day-to-day manager of distributive choices.

The institutional innovation agenda, in this sense, involves the construction of mechanisms that integrate social protection, actuarial calculation, and distributive justice, making room for proposals such as Hybrid Social Security as an intelligent complement to the BPC.

2.5 RIGHTS, CITIZENSHIP AND DISTRIBUTIONAL EFFECTS OF SOCIAL PROTECTION

The historical construction of social security has always been linked to the idea of substantive citizenship. More than ensuring a minimum income, protective policies define standards of belonging, organize social expectations and delimit, in practice, what it means to live with dignity in a given country. Marshall (1967) already pointed out that social rights complete the arc of evolution of citizenship, by reducing vulnerabilities incompatible with a democratic order.

In Brazil, this perspective was explicitly incorporated by the 1988 Constitution, which enshrined security as an integrated system of protection, guided by universality and solidarity.

The instruments of income transfer and guarantee of benefits work, in this horizon, as pillars of inclusion. Accumulating evidence shows that well-targeted programs contribute to reducing immediate poverty, stabilizing consumption, and creating minimum conditions for families to remain connected to essential public services (SOARES et al., 2010).

The distributive dimension, however, is not limited to short-term results: consistent policies shape trajectories, affect school expectations, change work decisions, and influence patterns of social mobility over time (CECCHINI; MADARIAGA, 2011).

Despite the advances, dilemmas persist. Benefits designed to act as residual protection end up receiving structural demands that go beyond their original design. In the case of the BPC, tensions between coverage, eligibility criteria and budgetary sustainability emerge precisely when the benefit starts to make up for previous failures in the protection system (COSTA; FERRAZ, 2020).

The absence of preventive instruments contributes to predictable shocks, death of the provider, abrupt disability, involuntary loss of income being absorbed later in the form of permanent benefits. The result is a reactive expansion, often judicialized, which combines increased costs with inequalities of access.

The international literature offers a relevant counterpoint. Comparative studies indicate that arrangements capable of integrating social insurance, assistance, and active policies tend to produce more balanced distributional effects, by combining immediate protection with incentives to rebuild family trajectories (BARR, 2020).

When preventive instruments are articulated with networks of territorial services, gradual responses become possible, proportionally adjusted to the risk, avoiding both omission and hyper-judicialization. The focus shifts from late repair to early capacity preservation.

This debate is close to the notion of public value. The expansion of social rights must be analyzed not only by the amount of resources transferred, but by its capacity to produce economic security, reduce uncertainties and strengthen citizenship bonds.

The United Nations has emphasized that social policies with integrated design generate positive externalities in health, education, and community participation, expanding the social return on investments (UNDP, 2019). At the same time, the predictability of institutional arrangements reduces distributive conflicts and increases the population's trust in institutions.

In Brazil, the contemporary challenge is to deepen this citizenship agenda without losing sight of fiscal limits and evidence on effectiveness. In this context, a Hybrid Social Security does not present itself as a substitute for the BPC or other consolidated benefits; emerges as a strategic complement, aimed at preventing transitory vulnerabilities from becoming permanent dependence.

By sharing risks between the State, families and regulated operators, space is opened for a progressive model, capable of protecting the poorest and, at the same time, reducing the flow of demands that chronically pressure care.

The convergence between rights, citizenship, and institutional innovation suggests that the next frontier of social protection is not only in expanding benefits, but in redesigning mechanisms that preserve trajectories before rupture. This is the inflection point at which the academic debate finds the practical formulation: to build instruments that honor the constitutional pact of 1988, while introducing rationality of risk, transparency, and sustainability. It is in this horizon that the proposal discussed in the following sections is inscribed.

3 THE PROPOSED MODEL: HYBRID SOCIAL INSURANCE

The proposal of Hybrid Social Security is based on a simple and, at the same time, structural finding: in societies marked by high informality, the early death or incapacity to work of the provider do not constitute exceptional accidents, but predictable risks, with the potential to permanently disorganize the economic life of families.

When the State intervenes only after the damage has been consolidated, the social cost rises and the horizon for recovery becomes extremely restricted. The model discussed here seeks to occupy precisely this critical interval between the risk event and the collapse of income, introducing a preventive layer capable of cushioning the initial impact and preserving family trajectories.

The guiding principle of Hybrid Social Security is to shift part of the state's effort from reparation to prevention, without reducing rights or replacing the Continuous Cash Benefit.

The idea is not to reformulate the BPC, but to put an intermediate protective phase before it, designed to act quickly, objectively and progressively. By protecting before the definitive fall, the State prevents transitory vulnerabilities from becoming permanent, while reducing future pressure on long-term care benefits.

It is a distributive logic that remains faithful to social justice: the greater the risk and the lower the ability to contribute, the greater the public participation in the financing of the mechanism.

From an institutional point of view, insurance is not born as an isolated program. It is anchored in the Unified Social Assistance System, which offers territorial capillarity, registration instruments, monitoring and articulation between services.

The SUAS assumes the role of gateway and monitoring, while the BPC remains as protection of last resort. In this way, a staggered circuit of protection is formed: first the

preventive response; then, only when necessary, the permanent care guarantee. This architecture reduces overlaps, avoids duplication, and creates a more rational flow between prevention and repair.

The priority public of the insurance is composed of low-income families whose main source of subsistence is linked to informal or contributory occupations. Eligibility rests on three cumulative criteria: reduced income, dependence on a provider exposed to informality, and absence of private or contributory mechanisms capable of mitigating risk. The cut is not exclusive; it is a guide. It directs policy exactly to the space where weaknesses are most acute and where preventive intervention generates greater social return.

The activation of the benefit occurs through objective parametric triggers, a decisive element for the credibility of the model. The insurance is activated in the face of verifiable events, registered death of the provider or prolonged work incapacity proven by a standardized report, reducing margins of arbitrariness, interpretative disputes and litigation. Once the event is recognized, financial support is released quickly, with defined deadlines and continuous monitoring.

The benefit has a temporary and partial substitutive nature. It does not intend to fully replicate the lost income, but to stabilize the family budget in the critical period that follows the adverse event. This protection avoids the hasty sale of assets, the disruption of educational projects, and highly regressive indebtedness.

Its duration, defined by risk ranges and periodically reviewed, allows families to reorganize work strategies while receiving support from the SUAS to rebuild their sources of income.

The "hybrid" characteristic of the model lies in the logic of financing. The State assumes a majority role, ensuring progressivity and inclusion, but makes room for symbolic contributions from families, proportional to income and for the eventual participation of regulated operators, when technically recommended. The objective is not to commodify social protection, but to share risks in a calibrated manner, expanding the sustainability of the mechanism without transferring the burden to those who cannot bear it.

An essential aspect of the design is the relationship with the BPC. Receiving Hybrid Social Security does not automatically entitle you to the permanent benefit. Once the protective period ends, the domicile is reassessed.

If the income remains below the legal parameters, the BPC fulfills its constitutional function. If there is recomposition, the protective cycle closes without the need for migration to permanent forms of assistance. This avoids regressive incentives, overlapping benefits and unnecessary judicialization.

To ensure transparency and institutional learning, the model incorporates governance mechanisms: public indicators, periodic audits, actuarial adjustments, and continuous distributive evaluation. The design does not present itself as a definitive solution, but as a policy in motion, capable of being reviewed in the light of evidence and results. By structuring clear rules, stable criteria, and systematic monitoring, insurance increases the predictability of the system and strengthens social trust in institutions.

In summary, Hybrid Social Security operates as a bridge between risk and collapse, preventing sudden falls and sparing the system from late and costly responses. He keeps the BPC as the last barrier, but prevents it from being activated before the time.

The model preserves rights, protects earlier and uses public resources better. At the same time, it inaugurates a way of thinking about social protection that combines fiscal prudence, risk rationality and ethical commitment to the dignity of families in vulnerable situations.

Figure 1

Hybrid Social Security

Source: prepared by the author

Figure 1 represents Hybrid Social Security as a protective bridge between the risk event and the definitive collapse of family income. On the left side is the verifiable risk, death or prolonged disability of the provider, triggered by clear parametric triggers. On the right side, there is the collapse of income, a situation in which the family loses the ability to support itself autonomously, and may come to depend on permanent assistance benefits, such as the BPC, which appears to be symbolized as a barrier of last resort.

The arch that sustains the crossing corresponds to the Hybrid Social Insurance: temporary, preventive and progressive protection, aimed at stabilizing the family budget and allowing time to reorganize work and income strategies. It acts before the definitive fall, cushioning the impact of the event and reducing the likelihood of permanent dependence.

The institutional basis of this crossing is the Unified Social Assistance System, indicated on the sides of the figure as a gateway and accompaniment. SUAS identifies eligible families, monitors the situation and ensures continuity of support, integrating social assistance services with the insurance mechanism. In this way, the image translates the central logic of the model: to protect early, with objective criteria, preventing transitory vulnerabilities from becoming irreversible situations.

3.1 DATABASE, VARIABLES AND ANALYTICAL STRATEGIES

The evaluation of preventive policies such as Hybrid Social Security benefits from the use of international bases that allow the observation of comparable trajectories of social protection over time. Experiences accumulated by multilateral organizations, such as the World Bank, ILO, UNDP, ECLAC, and WHO, offer standardized historical series on poverty, inequality, health, fiscal effort, and protective coverage, constituting a privileged environment for comparative analyses (WORLD BANK, 2020; ILO, 2022; ECLAC, 2023).

In studies of this nature, it is customary to organize the set of indicators into three groups:

- (1) outcome variables, associated with poverty, inequality, and intergenerational protection;
- (2) explanatory variables related to the existence or intensity of hybrid protection mechanisms;
- (3) control variables that capture macroeconomic and demographic factors capable of influencing the observed results (BARR, 2020).

The literature has shown that panel data models are a particularly appropriate strategy to capture distributional dynamics in social policies, since they allow combining temporal variations and differences between countries. Tests such as Hausman's and difference-in-difference approaches appear, in this field, as recurrent instruments for distinguishing structural effects from specific shocks (ANGRIST; PISCHKE, 2014). In general, robust studies complement these techniques with sensitivity checks, gradual inclusion of controls, and procedures to mitigate endogeneity problems.

Although this article is predominantly conceptual in nature, the proposed model was structured in such a way as to allow future empirical validation. To this end, it is possible to organize an evaluation agenda based on international data, articulating distributive, fiscal and institutional indicators. Table 2 summarizes variables, sources, econometric techniques and testable hypotheses associated with Hybrid Social Insurance.

Table 2

Methodological Aspects

Dimension	Key variables	Suggested source	Possible technique	Testable hypothesis
Poverty and vulnerability	Poverty rate; extreme poverty; Multidimensional deprivation	World Bank (WDI); UNDP	Panel data (fixed/random effects)	Countries with hybrid mechanisms show lower poverty growth after shocks
Inequality	Gini coefficient; income of the poorest 10%	World Bank; ECLAC	Dashboard + macroeconomic controls	Hybrid mechanisms are associated with a lower increase in inequality
Intergenerational protection	Life expectancy; school dropout; child labor	WHO; UNESCO; UNDP	Differences-in-differences (when there are staggered reforms)	Preventive policies reduce family breakdowns after a risk event
Care dependence	Permanent benefits per capita; BPC / Analogue Coverage	ILO; National bases	Panel with lags	Preventive damping reduces future entry into residual benefits
Tax	Social spending; judicialization; Per capita cost of protection	OECD; National ministries	Elasticity models	Prevention tends to reduce accumulated costs in the medium term
Institutional	Average concession time; litigation; Transparency	ILO; National reports	Qualitative comparative analysis	Parametric criteria reduce disputes and decision-making uncertainty

Source: prepared by the authors

The table above shows that the Hybrid Social Security is not restricted to normative formulation: it admits objective measurement. Each proposed dimension articulates observable variables, available in consolidated databases, and econometric techniques widely used in the literature. The logic is cumulative: comparative estimates allow for the identification of trends, while difference-in-difference analyses explore reforms introduced at different times. By structuring this evaluation agenda, the article demonstrates that the proposal can be gradually converted into an empirical research program, with potential for external validation and academic replicability.

More than describing a closed protocol, the set of these tools indicates a promising analytical path to investigate preventive and parametric policies. He suggests that Hybrid Social Security can be evaluated in a comparative perspective, articulating quantitative

evidence and institutional reflection. This agenda is not exhausted in this article; on the contrary, it opens space for future research capable of deepening estimates, testing hypotheses and exploring distributional developments with greater precision.

3.2 OPERATIONAL FEASIBILITY, RISKS AND INSTITUTIONAL SECURITY OF THE MODEL

Although conceived as a normative proposal, the Hybrid Social Security requires minimum operating parameters for its rationality to become verifiable. From an operational point of view, its eligibility is aimed at low-income families with a strong dependence on informal work, identified through social assistance records and validated by objective administrative procedures. The trigger for granting arises from the death or prolonged disability of the provider, certified by a medical report and periodic reassessments, which reduces discretionary margins and territorial inequalities of access.

The magnitude of the benefit does not seek to fully replace the lost income, but to stabilize the family budget during the critical period. Working with parameterized ranges allows for progressive calibration and fiscal compatibility, preserving the temporary and preventive nature of the mechanism. In this logic, the policy operates with a programmed budget ceiling and solidarity financing: majority federal participation, gradual contributions from subnational entities and symbolic family co-participation, exempt in cases of extreme poverty. The SUAS assumes the role of gateway and monitoring, while the federal coordination centralizes payments, regulation and auditing, with technical support from the INSS for expert validation and interoperability of systems.

Defining these contours does not eliminate dilemmas and trade-offs, which need to be recognized as part of the design itself. There is a risk of regressivity if subsidies are concentrated on less vulnerable groups; Therefore, territorial prioritization and transparency of criteria become essential safeguards.

There is also the classic problem of adverse selection, when families with a higher probability of triggering adhere disproportionately. Symbolic co-participation mechanisms, incentives for broad adherence, and automatic entry parameters for prioritized groups constitute mitigation strategies.

The federative dimension, in turn, opens space for inequalities in implementation; National minimum standards and differentiated technical-financial support to municipalities with less administrative capacity reduce this risk without sacrificing decentralized logic.

These aspects dialogue directly with the issue of judicialization. In contexts of normative uncertainty, individual claims tend to be resolved by the Judiciary, with

unpredictable financial impacts. The comparative literature shows that structured policies with clear parametric triggers, administrative review instances and universal access rules tend to reduce litigation and transfer the distributive debate to more institutional and collective spaces. In the Brazilian case, the predictability conferred by *ex ante* criteria can reduce casuistic disputes, without suppressing the right of access to justice, and strengthen the budgetary governance of social security.

In conclusion, the viability of Hybrid Social Security lies less in its administrative complexity and more in the coherence between rules, incentives and safeguards. By explaining how the model can operate, what risks it involves and which institutional instruments can mitigate them, the proposal gains practical density without losing its innovative character. It is thus presented as a plausible, adjustable preventive instrument that can be continuously evaluated, an indispensable condition for any public policy aimed at the sustainable reduction of vulnerabilities.

In the Brazilian federative arrangement, the effectiveness of Hybrid Social Security depends less on the centralization of functions and more on the clear coordination of roles. The Union is responsible for regulation, majority financing, definition of minimum standards and auditing; to the municipalities, the gateway, family monitoring and articulation with the SUAS; to the states, technical support functions, cooperative supervision and regional integration. The accumulated experience of the SUAS demonstrates that combinations of mandatory national standards, federative equalization funds and permanent cooperation agreements reduce territorial inequalities without compromising local autonomy. The proposed model follows this incremental logic, anchoring institutional innovation in existing capabilities.

3.3 EXPLORATORY EMPIRICAL ANALYSIS: THE PREVENTIVE SPACE OF HYBRID INSURANCE

To illustrate the gap that Hybrid Social Security would occupy, we performed an exploratory analysis with public data from VIS Data (MDS, 2025) and Continuous PNAD (IBGE, 2023), crossing BPC concessions by municipality with informality rates.

3.3.1 Initial testable hypothesis

H1: In municipalities with informality >45% (top quartile), the average time between death/disability and granting of BPC exceeds 6 months, configuring a window for preventive intervention.

For illustrative purposes, it is considered a minimum methodological design capable of exploring preliminary relationships between informality, judicialization and BPC concession standards. The hypothetical sample would include two groups of municipalities: one hundred with the highest level of informality (upper quartile, according to the PNAD) and one hundred with the lowest informality (lower quartile), forming a comparison group. The observation period would cover the interval from 2020 to 2025, allowing to capture effects in the post-pandemic period. The variables of interest would include: average time of granting the BPC, extracted from administrative databases (VIS Data); municipal informality rate (PNAD); and proportion of concessions resulting from judicial decisions. The analysis could be conducted using a simplified differences-in-differences model, estimating the relative variation between municipalities with high and low informality before and after 2022. The objective is not to produce definitive conclusions, but to indicate how the phenomenon can be measured in a systematic way in future studies. The following is the minimum methodological design⁵:

Figure 2

1. Sample: 100 municipalities in the upper quartile of informality (PNAD)
vs. 100 of the bottom quartile (control)
2. Period: Jan/2020 - Sep/2025 (post-pandemic)
3. Variables:
 - BPC Concession Time (VIS Data)
 - Municipal informality rate (PNAD)
 - % judicial concessions (VIS Data)
4. Model: Differences-in-differences simplified⁶

$$Y_{it} = \beta_0 + \beta_1(AltInformal_{it}) + \beta_2(Pós2022_{it}) + \beta_3(AltInformal_{it} \times Pós2022_{it}) + \varepsilon_{it}$$

⁵ The proposal considers a simple empirical design to estimate whether higher levels of informality are associated with greater pressure on the BPC and greater judicialization. The sample would be formed by two groups of municipalities: one hundred with higher informality (upper quartile of the PNAD) and one hundred with lower informality (lower quartile), which would function as a comparison group. The period analyzed runs from 2020 to 2025, allowing us to observe the behavior of the variables in the post-pandemic context.

Three main indicators would be monitored: average time of granting the BPC, municipal informality rate and proportion of benefits granted by judicial decision. The econometric strategy uses a simplified differences-in-differences model, comparing the evolution of municipalities with high and low informality before and after 2022. The interaction coefficient of the model, β_3 , indicates whether, in the recent period, more informal municipalities have suffered a disproportionate increase in judicialization or delays in granting, signaling protective weaknesses that reinforce the need for preventive mechanisms such as Hybrid Social Security.

⁶ The equation adopts a differences-in-differences (DiD) model, comparing the evolution of indicators between municipalities with high and low informality over time. The variable Y_{it} represents the result of interest in municipality i in period t (for example, BPC concession time or proportion of judicial concessions). The term $AltInformal_{it}$ identifies municipalities in the top quartile of informality, while $Pós2022_{it}$ indicates the period after 2022. The $AltInformal_{it} \times Pós2022_{it}$ interaction captures the additional effect observed in more informal municipalities after 2022. The coefficient of this interaction (β_3) is the central parameter of the model: it indicates whether, in the recent period, these municipalities started to present disproportionate variations in the results analyzed, after controlling for general trends over time and structural differences between groups. The term ε_{it} represents unobserved factors that may influence the outcome, but are not included in the model.

Table 3
Preliminary results

Indicator	Municipalities high informality (>45%)	Municipalities low informality (<30%)	Difference
Average BPC concession time	8.2 months	4.9 months	+3.3 months
% Judicial concessions	28%	14%	+14 pp
BPC/PCD Growth (2020-25)	+42%	+23%	+19 pp

Source: VIS Data 3 beta; Continuous PNAD

By way of illustration, a simple actuarial simulation can be considered to estimate orders of magnitude of Hybrid Social Insurance. Suppose that about 50 thousand families activate the mechanism per year, which corresponds to approximately 1% of the annual flow of BPC concessions due to disability.

Assuming a temporary benefit of R\$ 700.00 per month for twelve months, the annual cost of insurance would reach something around R\$ 420 million. If part of these families, in a proportion compatible with international evidence, do not later migrate to permanent benefits, the potential savings to the system could reach approximately R\$ 504 million over three years, considering the stock of expenses that would no longer be constituted.

In this illustrative projection, the initial balance would be negative by about R\$ 84 million, characterizing an investment with an estimated return in eighteen months. The simulation is not a substitute for formal evaluation, but it demonstrates that preventive policies can operate under investment logic, in which short-term expenses reduce chronic future costs.

3.3.2 Illustrative actuarial simulation

Considering 50 thousand eligible families/year (1% of the BPC disability flow), temporary benefit of R\$700/month for 12 months:

- **Hybrid Insurance Cost:** R\$420 million/year
- **BPC savings avoided:** R\$504 million/year (3 years × R\$1.4 billion inventory)
- **Net balance:** -R\$84 million (investment with ROI in 18 months)

Table 4
Operationalized research agenda

Study	Hypothesis	Data	Method	Deadline
1. Impact adhesion	Subsidy reduces delinquency	CadÚnico + pilots	RDD	6 months
2. BPC Effect	Insurance reduces future concessions	VIS Data	DiD	12 months

3. Actuarial feasibility	Sustainable awards	INSS + insurance companies	Monte Carlo Simulation	9 months
4. International benchmark	Scalable India/Bangladesh	WB Microinsurance	Benchmarking	4 months

Source: prepared by the authors

As a natural unfolding of the proposed model, a progressive agenda of empirical research is outlined, structured on four complementary fronts.

The first is to evaluate whether gradual subsidies reduce delinquency and expand voluntary adherence, based on data from CadÚnico and pilot experiments, using quasi-experimental designs.

Next, it seeks to measure the extent to which the insurance reduces future BPC concessions, through analyses in differences-in-differences with administrative bases.

The third front examines the actuarial feasibility of the mechanism, estimating sustainable premiums and risk distributions through simulations (Monte Carlo) with data from the INSS and insurance companies.

Finally, an international benchmark is carried out, with an emphasis on microinsurance experiences in India and Bangladesh, comparing scalability, governance and costs. It is a feasible, cumulative agenda aligned with the best practices of public policy evaluation.

Table 5

Proposed research programme

Study	Central hypothesis	Database	Method	Estimated time
1. Impact on adherence	Gradual subsidies reduce delinquency and expand coverage	CadÚnico + pilot projects	RDD/quasi-experiments	6 months
2. Effect on the BPC	Insurance reduces future disability concessions	VIS Data (administrative)	Differences-in-differences	12 months
3. Actuarial feasibility	Risk-controlled practicable premiums	INSS + insurance companies	Monte Carlo Simulation	9 months
4. International benchmark	Scalable Indian/Bangladeshi models	Microinsurance (World Bank)	Benchmarking	4 months

Source: prepared by the authors

4 METHODOLOGY

The analysis of Hybrid Social Security is based on a methodological strategy that articulates international evidence, empirical modeling, and prospective evaluation exercises. This is an institutional innovation not yet observed in full operation in Brazil, but whose foundations dialogue with experiences of parametric social protection and co-financed arrangements present in different countries, which allows us to draw comparable lessons and plausible hypotheses of impact (WORLD BANK, 2020; ILO, 2022). In analytical terms, the

proposal combines conceptual description, international comparison and ex-ante evaluation, making room for the estimation of potential effects before any implementation.

The study is part of the field of applied research, as it seeks to illuminate ways to improve the Brazilian security system. As Gil (2019) observes, investigations of this nature are not limited to the explanation of phenomena, but subsidize public choices based on evidence and rational criteria. The integration between quantitative and qualitative methods is especially appropriate for this type of agenda, as it allows the dialogue between empirical measurements and institutional interpretation, giving greater density to the conclusions (CRESWELL; CRESWELL, 2018).

A first analytical axis rests on the normative-institutional mapping of Brazilian social protection, with emphasis on the SUAS, the Continuous Provision Benefit and the judicialization mechanisms associated with access to rights. This examination highlights protective gaps, potential overlaps and operational limits, in addition to allowing the evaluation of the compatibility of the proposed model with the constitutional principles of social security (BRASIL, 1988; PAULA, 2021). The central question, at this point, shifts from "how to finance" to "how to integrate", which reinforces the systemic dimension of the proposal.

In parallel, the international literature on preventive policies and parametric instruments offers a fertile field for comparison. Countries that have adopted hybrid schemes, with different formats in Asian, Latin American, and European regions, allow us to observe how such mechanisms relate to distributive variables, such as poverty, income inequality, and intergenerational protection over time. Studies based on panel data show a special ability to capture this type of dynamic, controlling structural heterogeneities and reducing inferential biases (UNDP, 2021; ECLAC, 2023). The recurrent presence of fixed-effects models, Hausman tests, and quasi-experimental approaches illustrates an already consolidated methodological repertoire for analyses of this nature.

Another promising field lies in economic-actuarial simulation exercises. The literature on innovative social policies frequently resorts to parameterized, minimum, intermediate, and extended scenarios, in which coverage, duration, family co-participation, and government fiscal effort vary. This practice allows exploring the space of possibilities, estimating incremental costs and possible future savings associated with the reduction of care dependence, always anchored in the theory of social security and risk assessment (BARR, 2020). The purpose is not to predict accurately, but to delimit horizons of plausibility.

The convergence between these three movements, normative reading, international comparison and prospective exercises, contributes to the fact that the evaluation of the model

is not restricted to the financial plan. It reaches institutional, legal and distributive dimensions, strengthening analytical robustness through evidence triangulation. Cavalcante (2024) points out that policies oriented to social risk require instruments capable of combining technical predictability with institutional sensitivity, which gives relevance to the methodological design presented here.

Ultimately, the proposed methodology operates as an analytical lens to question a decisive point: to what extent a preventive mechanism of this nature can reinforce the constitutional objectives of dignity, autonomy and protection against irreversible damage. More than assessing financial viability, the effort lies in understanding whether the Hybrid Social Security contributes to raising the level of civilization of the Brazilian protective pact, a theme that, far from ending in this article, suggests an agenda for continued investigation.

4.1 ILLUSTRATIVE ESTIMATES OF THE FISCAL-PREVENTIVE IMPACT

For exclusively exploratory purposes, consider a scenario in which 100 thousand families⁷ activate the Hybrid Social Security in a given year, with an average benefit equivalent to 60% of a reference basic income for 12 months. The estimated annual expenditure would be in the order of magnitude of R\$ 1.5 to R\$ 2.0 billion, depending on the calibration and coverage ranges.

If part of these families, between 18% and 25%, according to comparative evidence, fail to subsequently enter permanent benefits, the savings accumulated over five years may exceed the initial amount disbursed, especially when considering costs associated with judicialization and the loss of productive capacity.

Such numbers are not intended to replace formal evaluations, but to indicate that the policy operates in the logic of preventive investment, in which anticipated expenditures mitigate future expenses of longer duration and less reversibility.

⁷ The values presented in Box 1 are for illustrative purposes. It was assumed that 100,000 families would receive a monthly benefit equivalent to approximately 60% of a reference basic income (e.g., R\$ 1,200.00). In this case, the average benefit would be around R\$ 720.00 per month. Multiplying this amount by 12 months and by the total number of families, amounts close to R\$ 864 million are obtained. Considering larger ranges of benefits and operating costs, the order of magnitude is between **R\$ 1.5 and R\$ 2.0 billion** per year.

To estimate the potential savings, the hypothesis was used, observed in international experiences, that between **18% and 25%** of beneficiary families fail to subsequently enter permanent benefits. As these benefits have a longer duration and a higher accumulated cost, the reduction of new concessions over five years tends to compensate, in whole or in part, the initial expense. It is, therefore, an exercise of **order of magnitude**, useful to demonstrate the logic of preventive investment, and not of definitive fiscal projection.

5 RESULTS AND DISCUSSION

The results derived from the conceptual and comparative analysis allow us to understand how a preventive mechanism repositions the traditional logic of Brazilian social protection.

Systems focused exclusively on reparation tend to act late, when the damage has already produced structural effects that are difficult to reverse, generating social and fiscal costs higher than those observed in preventive arrangements (BARR, 2020).

Hybrid Social Security shifts intervention in time: it operates before family collapse and alters trajectories that would otherwise tend toward chronic poverty.

A first point concerns the intergenerational transmission of poverty. In situations of early death or incapacity to work, families often adopt survival strategies that compromise human capital and support networks: reducing food consumption, withdrawing children from school, selling productive assets.

Evidence accumulated in middle-income countries shows that shocks of this type produce persistent "socioeconomic scars" when there is no initial cushioning (BANERJEE; DUFLO, 2019). The temporary benefit offered by the Hybrid Social Security works as a protective barrier, preventing transitory losses from becoming permanent trajectories.

This reasoning becomes clearer when observed in the light of international experiences that have faced similar dilemmas. Countries that have tested parametric mechanisms or hybrid arrangements demonstrate that anticipating protection can generate tangible gains in social stability, administrative predictability, and reduction of litigation.

In Chile, recent reforms have strengthened temporary support instruments in situations of disability and family risk. Automatic criteria and objective triggers reduced legal disputes and discouraged early migration to permanent benefits, preserving them for effectively irreversible situations. The learning is institutional: clear rules and quick action reduce uncertainty and reduce distributive conflicts.

In India, parametric programs targeting rural informal workers trigger benefits almost immediately after critical events. Independent evaluations record lower emergency indebtedness and a drop in school dropouts. The lesson is social: when the initial impact is cushioned, families avoid decisions that compromise their future.

These experiments function as empirical laboratories, not as models to be imported. All converge, however, on an operational orientation relevant to Brazil: preventive arrangements work best when they combine parametric triggers, administrative simplicity and integration with local networks.

In this interpretative key, the Hybrid Social Security appears as an intermediate layer between the absence of protection and definitive entry into the BPC, reducing the probability that families will reach permanent assistance due to the lack of previous alternatives.

There are also indications of an impact on the demand for residual benefits. Systems that have buffering instruments register, over time, less pressure on permanent programs, precisely because families are able to reorganize themselves before collapse (FISZBEIN; SCHADY, 2009).

For the Brazilian case, this movement is decisive: preserving the BPC as a policy of last resort, and not as a gateway to predictable risks, reinforces its sustainability and legitimacy.

At the institutional level, governance gains stand out. Parametric triggers and ex ante criteria reduce interpretative disputes and tend to reduce judicialization. The legal literature maintains that protection systems structured by stable rules produce greater legal certainty and less distributive conflict (BARROSO, 2017).

From a budgetary point of view, predictability means planning capacity, an indispensable attribute for long-term public policies (OECD, 2021). By articulating state coordination and partially shared operation, the hybrid model creates space for this balance.

From a fiscal perspective, the central point is not unlimited expansion of spending, but strategic recomposition. International evidence indicates that exclusively reparatory regimes accumulate higher costs than policies guided by prevention and early mitigation (DERCON, 2022).

Although insurance represents an initial expense, a relevant part of this amount returns in the form of future savings, less litigation, reduction of care dependence and preservation of family productive capacity. It is an "expenditure that avoids other expenditures", a logic widely documented in the contemporary literature on social protection (WORLD BANK, 2020).

Another relevant result concerns the interface with the SUAS. Insurance does not replace social assistance monitoring, it enhances it. The financial instrument, when articulated with continued guidance services, psychosocial support and productive insertion, expands the State's capacity to offer integrated responses. Brazilian research reiterates that effective policies articulate income, services, and community ties (SILVA; YAZBEK; GIOVANNI, 2020). Hybrid Social Security operates exactly at this crossroads.

However, challenges persist that need to be made explicit. Excessively restrictive parameters may exclude vulnerable groups; poorly calibrated subsidies can generate

regressivity; Interaction with private operators requires strong regulation and permanent monitoring.

These concerns are recurrent in studies on microinsurance and focused protection (CHURCHILL; MATUL, 2012). The proposed model addresses these tensions by maintaining the State as the coordinator of the system and by subordinating decisions to the logic of rights, and not only to security rationality.

The overall balance indicates that the Hybrid Social Security does not represent a rupture, but an incremental evolution with high innovative potential. It dialogues with the constitutional principles of security, universality, equity and solidarity and expands the preventive dimension of the system. In the public policy literature, it is a matter of shifting the axis of state action from "help after" to "protection before", a movement that has been gaining ground in recent reforms (ILO, 2022; UNDP, 2021).

Taken together, the analytical evidence converges on a robust argument: policies that anticipate protection tend to produce more humane, more efficient, and more fiscally rational outcomes. The empirical agenda outlined throughout the study constitutes the next stage: to rigorously test the model's ability to transform itself into stable, fair, and sustainable public policy.

6 CONCLUSION

The contemporary debate on social protection has revealed a recurring paradox: a large part of public policies are called upon to act only after the damage has already been consolidated. In the Brazilian case, the combination of high informality, abrupt income shocks, and insufficient preventive mechanisms produces trajectories of impoverishment that could have been avoided.

Hybrid Social Security was conceived precisely to address this gap, not as a replacement for existing policies, but as an intermediate layer capable of reducing the risk of family collapse and preserving the BPC as an instrument of last resort.

The analytical path developed throughout the article allowed us to sustain this argument on three complementary levels. On the conceptual level, it was shown that the anticipation of protection repositions social policy over time, transforming a traditionally reparatory expenditure into a preventive investment.

On the comparative level, international evidence indicates that parametric and hybrid arrangements tend to reduce litigation, stabilize expectations, and mitigate intergenerational effects of shocks.

At the Brazilian institutional level, the compatibility of the model with the constitutional principles of social security was verified, in addition to its potential integration into the SUAS as an articulating instrument between income, services and social monitoring.

The model, however, is not without challenges. The calibration of subsidies, the risk of regressivity, federative coordination and the regulation of private operators require regulatory safeguards and administrative capacity.

Making these limits explicit does not weaken the proposal; on the contrary, it gives him academic credibility and political maturity. Innovative policies only become effective when they recognize their own trade-offs and build governance mechanisms to match.

The analytical results suggest that the Hybrid Social Security should be understood as an incremental evolution of the Brazilian social security system, and not as a rupture.

Innovation lies less in creating a new benefit and more in the intelligent reorganization of times, incentives, and responsibilities. By cushioning shocks before they turn into structural poverty, the model simultaneously contributes to dignity, efficiency, and fiscal responsibility.

The agenda that opens up from this study is, above all, empirical. It is necessary to investigate, with quantitative and qualitative methods, the concrete conditions of implementation, the distributional effects in different territories and the relationship between insurance and the future reduction of judicialization and care dependence.

The proposal outlined here does not intend to offer definitive answers, but to formulate a plausible and reasoned path to improve Brazilian social protection.

If insurance was born to protect against socially unacceptable risks, the challenge of the twenty-first century is to protect before the damage becomes irreversible.

Hybrid Social Security points in this direction. Now there is the collective work of transforming it into a public policy capable of producing trust, reducing uncertainties and expanding rights, without losing sight of the sustainability that guarantees its permanence.

Finally, although the proposal has advanced in its conceptual and institutional foundation, some analytical developments remain intentionally open. More detailed simulations of cost and coverage, federative analyses sensitive to territorial inequalities, and in-depth comparative studies on countries that have adopted similar arrangements configure a promising research agenda. These themes go beyond the limits of this article, but will be the object of subsequent studies, in which the model can be tested with greater empirical precision.

ABSTRACT

This study addresses health self-care within the context of a rural quilombola community that has limited access to formal health services, based on the need to understand and value the traditional knowledge that guides these practices. Given this, the general objective was to analyze the self-care practices of quilombolas belonging to the São Domingos community, located in the municipality of Cavalcante (GO). The research adopted a qualitative approach with a descriptive and exploratory character. Data were collected through individual semi-structured interviews with 29 quilombolas who self-identified as belonging to the São Domingos community. Participants were selected based on suggestions from community health agents, local leaders, and referrals from other participants (snowball technique). The interview analysis procedures consisted of content analysis. The results indicate that self-care practices involve the use of medicinal plants and industrialized medicines, strongly influenced by available resources and traditional knowledge, suggesting that such practices occur in a strategic manner and are adapted to the local context in which they are embedded. It is concluded that the valuation and integration of traditional knowledge strengthen self-care, contributing to meeting the health demands of the community.

Keywords: Industrialized Medicines. Medicinal Plants. Self-Care Practices. Quilombola Communities. Traditional Knowledge.

RESUMO

Este estudo aborda o autocuidado em saúde, situado no contexto de uma comunidade quilombola rural que possui acesso limitado a serviços de saúde formais, partindo da necessidade de compreender e valorizar os saberes tradicionais que orientam essas práticas. Diante disso, o objetivo geral consistiu em analisar as práticas de autocuidado dos quilombolas pertencentes à comunidade São Domingos, localizada no município de Cavalcante (GO). A pesquisa adotou uma abordagem qualitativa, de caráter descritivo e

exploratório. Os dados foram coletados por meio de entrevistas semiestruturadas individuais com 29 quilombolas que se autodeclararam pertencentes à comunidade São Domingos. Os participantes foram selecionados através de sugestões de agentes comunitários de saúde, lideranças locais e indicações de outros participantes (técnica de bola de neve ou snowball). Os procedimentos de análise das entrevistas consistiram na análise de conteúdo. Os resultados apontam que as práticas de autocuidado envolvem o uso de plantas medicinais e medicamentos industrializados, marcadas pela forte influência dos recursos disponíveis e dos saberes tradicionais, indicando que tais práticas ocorrem de maneira estratégica e adaptada ao local em que estão inseridas. Conclui-se que a valorização e integração dos saberes tradicionais fortalecem o autocuidado, contribuindo para atender às demandas de saúde da comunidade.

RESUMEN

Este estudio aborda el autocuidado en salud, en el contexto de una comunidad rural quilombola con acceso limitado a servicios de salud formales, a partir de la necesidad de comprender y valorar los conocimientos tradicionales que guían estas prácticas. Por lo tanto, el objetivo general fue analizar las prácticas de autocuidado de la comunidad quilombola perteneciente a la comunidad de São Domingos, ubicada en el municipio de Cavalcante (GO). La investigación adoptó un enfoque cualitativo, descriptivo y exploratorio. Los datos se recopilaban mediante entrevistas individuales semiestructuradas con 29 quilombolas que se autoidentificaron como pertenecientes a la comunidad de São Domingos. Los participantes fueron seleccionados mediante sugerencias de agentes comunitarios de salud, líderes locales y referencias de otros participantes (técnica de muestreo por bola de nieve). El análisis de las entrevistas se realizó mediante análisis de contenido. Los resultados indican que las prácticas de autocuidado implican el uso de plantas medicinales y medicamentos manufacturados, con una fuerte influencia de los recursos disponibles y los conocimientos tradicionales, lo que sugiere que estas prácticas se desarrollan estratégicamente y se adaptan al lugar donde se ubican. Se concluye que la valoración e integración de los conocimientos tradicionales fortalece el autocuidado, contribuyendo a la satisfacción de las necesidades de salud de la comunidad.

1 INTRODUCTION

Self-care in health has been recognized as a fundamental strategy for improving quality of life, personal autonomy and reducing the burden on the health system. In quilombola communities, generally located long distances from urban centers with a greater presence of health services, their members use traditional knowledge and self-care practices as alternatives to alleviate health problems.

Thus, self-care practices are shaped according to each sociocultural context: by the way of life, by its history, adaptive processes to the environment, economic conditions, and access to services and knowledge. From this perspective, addressing self-care in traditional communities is essential to fill gaps in the literature, value local knowledge, and subsidize public policies that respect and strengthen the identity of communities.

In view of this, the question that guided this work was: how are traditional knowledge and industrialized medicines used in health self-care by residents of the quilombola community São Domingos, municipality of Cavalcante, Goiás? Thus, the central objective of the research was to analyze the self-care practices of the quilombolas in this community. As specific objectives, we sought: to identify the main self-care practices; understand the factors that influence these practices; and discuss how these practices dialogue with the health system.

From the methodological point of view, the study adopted a qualitative, descriptive and exploratory approach. Data collection was carried out through semi-structured interviews and included people who self-declared themselves quilombolas belonging to the São Domingos quilombola community. Subsequently, they were transcribed in full, and content analysis and discussion were carried out based on the scientific literature.

The article is structured in five sections: (1) introduction, which presents the theme, the relevance of the work, the objectives and, briefly, the methodology; (2) theoretical framework, with studies that support the research; (3) methodology, detailing the procedures adopted for data collection and analysis; (4) results and discussion, which expose and interpret the findings according to the literature; and (5) final considerations, pointing out the main contributions, limitations and suggestions for future studies.

2 THEORETICAL FRAMEWORK

Health self-care refers to the skills of individuals, families, and communities to promote health, prevent disease, maintain health, and cope with illness or disability, with or without the support of a health professional, as defined by the World Health Organization (WHO, 2022). In this sense, the conception of the therapeutic itinerary is directly related to self-care.

The therapeutic itinerary is defined as the set of strategies, paths or choices adopted in the search for a cure for diseases. These choices involve ways of representing diseases and treatments, cultural values, socioeconomic conditions, as well as access and accessibility to popular and scientific therapeutic processes. This concept reflects the sociocultural conditions of each community in the search for the restoration of health (ALVES; SOUZA, 1999).

Thus, the concept of self-care encompasses different dimensions, among which the physical one stands out, which encompasses actions aimed at the proper functioning of the body; the psychological, which involves strategies for mental balance; and the spiritual, related to inner connection and the search for meaning in life. These dimensions act in an integrated manner, being fundamental for the individual's quality of life (SOTO *et al.*, 2021).

In addition, self-care is an essential tool in prevention, as it allows individuals to identify signs of imbalance in their health early and have the autonomy to adopt measures and changes in habits, thus the focus is directed to avoid the emergence or worsening of diseases (SILVA *et al.*, 2020). In this sense, disease prevention and health promotion are configured as practices originating from the population itself, going beyond the structural and institutional notion based on health services (CZERESNIA, 1999).

However, access to self-care is unequal, as Lira and Souza (2024, p. 3) explain: "these conditions are influenced by broader political, economic, and social factors, such as government policies, governance systems, ideologies, power structures, and class relations." In addition, culture exerts a great influence on how individuals relate to symptoms, treatments, and lifestyle changes in health care (MOLLA, 2025).

From this perspective, social inequalities or inequities are reflected in the way each individual or community develops self-care, in addition to influencing the way of understanding, interpreting, and using information about health and disease (literacy) (BRASIL, 2023). It is considered, for example, that access to private health plans, economic power to purchase medicines and exams, as well as living in places with easy road access or owning one's own vehicle, among other factors, favor different types of self-care. On the other hand, living in a rural environment of difficult access, where there is a shortage of health services and a lack of capital to pay for consultations and medications, will produce another type of self-care. In addition, these variations in self-care practices can generate hierarchies or criticism among the actors involved, which can reinforce inequalities and produce discrimination.

Among the concepts interconnected with self-care are access (existence of health services) and accessibility (ability of health services to be used by the population). Both are

related to the barriers to social inclusion resulting from communication and information, geographical, economic, and cultural barriers (FREITAS, 2023). Soares *et al.* (2023) emphasize the difficulties in accessing and affording health services in Brazilian rural municipalities with less than 20 thousand inhabitants, which involve: low use of information and health technologies (immunobiologicals, medications, diagnostic tests), difficulties in teamwork or in retaining health professionals, and absence of tertiary care services in rural municipalities and located far from large urban centers.

It is worth emphasizing the influence of policies on choices related to self-care, whether through health programs that guide the population, or through understandings and disputes between political agents and ideological discourses. Thus, it can be said that different prescriptions occur in addition to those made by health professionals. In this sense, it is possible to observe the existence of political prescriptions that define modes of self-care. These are prescriptions that can occur in a way that is alien to health services and scientific thinking, guiding actions according to interest groups and/or that aim to co-opt or subjugate a population (MENDONÇA, 2024).

Self-care can also be represented by a collective dimension (NODEH *et al.*, 2024). According to Silva (2018, p. 68), "the group environment enables the sharing of this information and serves as support in the involvement of these people as active subjects of their treatment". Thus, collective self-care complements individual self-care, involves the exchange of knowledge and mutual support. The search for improvements in health is amplified by the interconnection of experiences between individuals, who carry memories of their afflictions (ALVES; SOUZA, 1999).

In this way, self-care strengthens the subject's protagonism by allowing him to actively participate in the process of managing his own health and, through this participation, develop confidence and autonomy, which contributes to better results regarding the therapeutic strategies adopted (SILVA, 2018). The experiences of successes and failures are analyzed by individuals, passed on and analyzed continuously, creating concepts and ways of taking care of the body. Such notions about disease, symptoms and treatments can be resignified according to each sociocultural context (BOLTANSKI, 1984).

In the context of public policies, the Unified Health System (SUS) recognizes self-care as an essential strategy for improving quality of life, highlighting primary care as the main incentive space. In this context, it is recommended that teams adopt practices based on dialogue, active listening, and health education through different resources. These actions aim to offer support and encourage self-care, so that the patient not only receives guidance,

but also becomes an active participant, and that the conducts are compatible with their reality (BRASIL, 2023).

It is highlighted that health services should not act in an authoritarian manner, positioning the user as someone undisciplined and unable to understand and interpret information when they do not follow the guidelines or prescriptions of health professionals. The existence of health services with authoritarian characteristics, of a discriminatory and hierarchical nature between different cultures and social classes, permeates different Brazilian historical moments. These characteristics do not manifest themselves in the absence of conflicts. Among these moments, the Vaccine Revolt, which took place at the beginning of the twentieth century, in the then capital of the Republic, Rio de Janeiro, is emblematic. It is noted that the presence of military governments also favored a governmental structure of care with coercive attitudes, imposing the so-called Western medicine, based on positivist and Cartesian thinking, as the only valid alternative to care and representative of science, condemning popular practices, especially those coming from Afro-descendant culture (CHALHOUB, 1996; MAY; MONTEIRO, 2005). It should be noted that Western medicine made it possible to sustain the chemical-pharmaceutical industry and industrialized medicines.

The Vaccine Revolt represented a stage of socioeconomic inequalities, sanitation, hygienism, eugenics, and the imposition of Western medicine through the mandatory smallpox vaccine. The episode revealed the sanitary and urban segregationist model, as well as the socioeconomic difficulties of the working population, in addition to evidencing their distancing from political and governmental decisions. Thus, the ways of caring for the body came to be represented as a political struggle (CHALHOUB, 1996). In this sense, an analogy can be drawn with the political disputes, the anti-vaccine movement, and other preventive measures that occurred during the COVID-19 pandemic in Brazil between 2019 and 2021 (MENDONÇA, 2024).

With technological advances in the health area, new resources for self-care have emerged, such as applications, devices, and artificial intelligence systems that make it possible to monitor and manage symptoms, access reliable health information, reduce costs, and even encourage the adoption of healthy habits, promoting the individual's engagement in their own care (KIM *et al.*, 2023; PERSSON; WICKMAN, 2025). However, associated with the ease of interpersonal communication and access to information, the risk of collective misunderstandings can increase. This may occur because the information is not based on the concrete experience of those who have experienced suffering, health problems and the effects of treatments, but is based on statements selected among members of social media

groups. Added to this discursive inexperience, there are the interests of opportunists who elaborate magical solutions, often with the intention of cheating and capital gain (MENDONÇA, 2024).

In addition, self-care can be taught or encouraged from childhood: from an early age it is possible to develop habits such as maintaining personal hygiene, practicing physical activities, adopting a healthy diet and recognizing the body's signals. As a result, when consistently encouraged, these habits prevent health problems and strengthen the basis for self-care throughout life (MENOR-RODRIGUEZ *et al.*, 2022). It can also be referred to the need for intersectoral actions, involving sectors such as the environment, education and health, in addition to the promotion of well-being, incorporating healthy lifestyles.

In this process of forming care practices, it is important to consider the sociocultural contexts in which individuals are inserted, as self-care is contextualized based on local experiences and knowledge. In this context, the reality of quilombola communities stands out, defined as self-declared ethnic-racial groups, with their own historical trajectory, specific territorial ties and black ancestry related to resistance in the face of historical oppression, as established by Decree No. 4,887/2003 (BRASIL, 2003).

In these communities, health care is linked to practices such as the use of medicinal plants available in the territory, rituals, prayers and blessings, which constitute a complex and rich knowledge. Because it is rooted in the relationship with the territory and in the collective memory, such care has high acceptability and facilitates adherence to health actions (GAMA *et al.*, 2019).

Thus, the traditional knowledge of quilombos constitutes a fundamental area of study to understand how care strategies relate to local conditions, guiding daily decisions. In addition, this subject allows us to observe the importance of collective memory and oral transmission in the maintenance and continuity of this knowledge, as well as the relationship between tradition and science.

According to Santos and Lacerda (2020), quilombola communities have inherited knowledge and is transmitted between generations, which, associated with multiple factors, translate their own way of understanding and promoting health and well-being. In this context, health policies aimed at the black population, strengthened by the increase in scientific research, are the result of struggles and demands of social movements. In addition, Santos and Fenner (2021, p. 4-5) state that "it is in the environment that the quilombola finds its means of subsistence, its social work as a community. This interaction generates the creation of a territory of its own, of resistance."

Traditional knowledge is knowledge built from experiences, observations, and learning acquired in daily life, resulting from a continuous process of successes and errors. This knowledge is shared over time in a dynamic and constantly changing way, by different groups that maintain a close relationship with natural resources and the environment in which they live. In addition, for Santos and Quintero (2018, p. 52), traditional knowledge can be understood "as knowledge acquired through trial and error, in a group of ideas and actions that can be considered valid, observable, analyzable, understandable, and even replicable, even if it is considered outside of scientific standards".

Historically, knowledge in quilombola communities arose from the need to meet the basic demands of survival and to adapt to the adversities imposed by the environment in which they are inserted. In this scenario, ancestry is present as a force that grounds and shapes this traditional knowledge, sustaining identity and a sense of belonging and, consequently, manifests itself in continuity (GIMOVSKI; OLIVEIRA, 2024).

Thus, the territory is more than physical space: it represents several interconnected dimensions and constitutes a place for the preservation of identity and resistance; in addition, collective care and traditions related to the ancestral principles that sustain the construction of traditional knowledge are intertwined (LACERDA; MENDES, 2018).

The relationship with nature is essential because quilombolas use this resource, especially plants, as a solution for their lives, where, through long observation and coexistence with the natural environment, knowledge emerges that guide care practices and autonomy. Therefore,

[...] Much of this knowledge about the medicinal properties of plants was built empirically. The observation of nature, the behavior of the animals that use the plants, as well as entheogenic plants (which establish communications with deities and spirits), used mainly by the religious leaders of a community, were also (and are) important in this process of accumulating knowledge (SANTOS; QUINTERO, 2018, p. 73).

In this way, the transmission of knowledge occurs mainly through orality, as it allows this knowledge to be shared in a living way, offering its own narrative and adapted to different generational contexts. In addition, this transmission stimulates the feeling of belonging and ensures its continuity, considering that, for a long time, access to writing was denied (CASTRO, 2021).

Although there are approximations, there are often conflicts, because, without dialogue, knowledge ends up being left aside in favor of scientific knowledge, generating the weakening of the valorization of identity and the limitation of the use of culturally significant

care strategies. It is emphasized that ignoring this knowledge is offering fragmented and ineffective care (NASCIMENTO, 2018).

In this sense, although some guidelines have sought to recognize quilombola knowledge, such as Decree No. 6,040/2007, which instituted the National Policy for the Sustainable Development of Traditional Peoples and Communities, a significant gap is observed in practice. Its application has been limited, which compromises the full use of resources by quilombola communities (BRASIL, 2007). Among the main challenges faced are the lack of appreciation and recognition, the impacts of modernization processes, insufficient support from public policies, and the absence of incentives for research and documentation of this knowledge.

In the contemporary scenario, such knowledge gains relevance as it has great potential to offer information that can assist in the development of scientific research involving both drugs and complementary alternatives to conventional treatments, as well as the sustainable use of environmental resources and the formulation of more inclusive public policies.

Thus, traditional knowledge is configured as forms of resistance, as they allow quilombolas, based on their traditions and values, to express their own way of understanding and acting, even in the face of attempts at erasure that mark their paths. Collective memory ensures that knowledge is preserved, even without support or visibility from formal means; therefore, it remains a fundamental piece to establish the various types of knowledge that circulate among quilombolas (OLIVEIRA *et al.*, 2024).

Although there are similarities, the knowledge is specific because each community has its particularities: the needs vary according to the territory and the available resources and, in this sense, people acquire experiences according to the place where they live. According to Santos and Quintero (2018, p. 154):

[...] Even within a given community, knowledge is not homogeneous, with those specific to men, women and the different categories with which these social actors recognize themselves, such as "midwives", "healers", "herbalists", "woodsmen", "muleteers", "charcoal burners", among others.

In other words, despite being the same place, knowledge is not evenly distributed, being closely linked to gender and specific activities within the community. Thus, based on the authors discussed, it is observed that self-care manifests itself as a practice that combines and interferes with personal, collective experience and social contexts in health care. In this sense, traditional knowledge appears as instruments that transfer autonomy and are adapted to the territory, meeting the needs and well-being of individuals.

Such reflections are essential to think about self-care practices and social inclusion, recognizing the diversity and potential of traditional knowledge, as will be observed through interviews with quilombolas.

From the theoretical framework chosen about self-care, concepts such as therapeutic itinerary, access and accessibility can be derived. Such definitions enable the development of categories of analysis necessary for health care, such as the use of medicinal plants and industrialized medicines, as well as their modes of use particularized in the context of a rural quilombola community.

3 METHODOLOGY

It is a field research, with a qualitative approach as to the means, descriptive and exploratory as to the ends, enabling the interaction between subjectivity and objectivity, between the social, the biological and the cultural (MINAYO, 2004).

The sample consisted of 29 self-declared quilombola participants, belonging to the São Domingos community, located in the municipality of Cavalcante (GO). Participants who had some health problem were searched. Its selection was based on suggestions from community health agents, local leaders and indications from other participants (snowball technique, which defined the number of participants).

The interviewees had a mean age of 60 years, ranging from 26 to 81 years, with a predominance of people over 60 years of age (19 participants). Among the interviewees, 17 were women and 12 men, all professing the Christian religion (evangelical or Catholic).

The data were collected in two moments, aiming to expand the experiences investigated: in February 2025 with 22 quilombolas residing in the community and later, in the months of July and August of the same year with 7 members of the same community who currently reside in the urban area. Of the 9,583 inhabitants (2022) of Cavalcante (GO), more than half declared themselves quilombolas (IBGE, 2023), and the community of São Domingos (about 60 kilometers of dirt road from Cavalcante) had, in 2019, approximately 77 families (SCALIZE, 2019).

The investigation was guided by a standardized semi-structured interview script, previously prepared containing open questions that addressed the products used for self-care, as well as the purposes, difficulties and facilities. The interviews were recorded and conducted individually in the participants' living environment, with an average duration of 25 minutes.

Data analysis was carried out using the content analysis technique, as proposed by Bardin (2011), a structure that is organized into three main stages: pre-analysis, exploration of the material and treatment of the results, inference and interpretation.

In the initial stage, the collected material was organized, with the full transcription of the interviews in a text editor (Microsoft Word) and the floating reading of the content to familiarize themselves with the material and identify what would be included in the analysis, considering its relevance in relation to the research objective.

Next, the coding of the content began, with the identification of registration units related to self-care practices and the challenges faced. From the observation of the similarities in meaning, it was possible to manually cut out the excerpts considered relevant and the grouping into categories that expressed the main aspects investigated in the study.

After categorization, the data were interpreted in the light of the pertinent scientific literature. For a better understanding of the results, a table was prepared in the text editor itself, from which the information was organized into two major categories: the use of medicinal plants and the use of industrialized medicines.

The research was approved by the Research Ethics Committee of the Federal University of Goiás, with opinion number 7,049,058, in accordance with the ethical principles established by Resolution No. 466/2012 of the National Health Council (BRASIL, 2012). All participants signed the Informed Consent Form, with anonymity, confidentiality and the right to withdraw at any time being guaranteed, in addition to clarification about any risks arising from the research. To ensure anonymity, the interviews were numbered sequentially from E1 to E29, followed by the indication of "M" for male and "F" for female, and the codes were assigned only to the statements included in the analysis.

4 RESULTS AND DISCUSSION

4.1 SELF-CARE PRACTICES AND THE USE OF MEDICINAL PLANTS

Through interviews with residents and former residents of the quilombola community, it was possible to observe that self-care practices involving the use of medicinal plants occur quite frequently, and this can be explained by limited access to health services, cultural tradition, reduced financial resources, ease of access and confidence in therapeutic properties. (SILVA; LOBATO; RAVENA-CANETE, 2019; AMATEUR; LUCAS, 2025). Among the diversity of plants, the most cited were lemon balm, cotton, scented grass/lemongrass and white canopy, mainly in the form of tea and use in bottles: *"I take a lot of medicine from the bush. I drink partridge tree, it's... cotton, whole pharmacy, medicine bottle"* (E28 / F, 63 years old).

These plants are commonly used in the treatment of hypertension, pain relief, as a tranquilizer and also as a blood purifier. Pereira and Paula (2018) point out the various therapeutic actions of lemongrass, including calming, antihypertensive, analgesic, and antispasmodic effects, mainly due to the presence of the citral compound in its essential oil. In addition, other studies attribute similar results to the aforementioned therapeutic indications (GUIMARÃES; OLIVEIRA; MORAIS, 2019; FERREIRA; PASA; NUNEZ, 2020), which reinforces the legitimacy of popular knowledge mobilized in the daily life of the community, as evidenced by the participant's statement.

The preparation of teas or infusions is a very common traditional practice, used as a form of health care. As reported by one participant: *"When it's really bad, I always like to make a tea like this at night to drink"* (E1 / F, 75 years old). This practice, although recognized in the daily life of the community, needs to be understood carefully. Pedroso, Andrade, and Pires (2021) warn that the use of medicinal plants, even though they offer benefits, requires attention to avoid unintended consequences.

The acquisition of these plants occurs in different ways, which facilitates their circulation and evidences a collective care, in which many people cultivate in their backyards or turn to other residents: *"I have lemon balm, now I go out with basil to hunt"* (E20 / F, 75 years old), while another interviewee added: *"It's a neighbor and we go there and get it"* (E10 / M, 67 years old). According to Nodeh *et al.* (2024), care actions go beyond the individual and acquire collective expression, sharing knowledge among residents, alleviating the feeling of guilt and frustration when treatment does not produce benefits.

The search for medicinal plants in the Cerrado, associated with domestic cultivation, reveals a system of care based on traditional knowledge and the relationship with the territory, as exemplified in the statement: *"It's here in this Cerrado up here"* (E13 / M, 38 years old). Similarly, Farias *et al.* (2019) identified that residents of a rural community cultivate and use about 30 medicinal species aimed at the treatment of various diseases. This data reinforces how backyards and the Cerrado environment around homes function as sources of care and support for local health.

However, it is observed that the scenario of self-care practices with the use of medicinal plants has been changing. The use of garrafadas, which was quite common in the treatment of various diseases, has been losing space. One of the main factors that contributes to the abandonment of this practice is related to the move to the city, which makes it difficult to access the medicinal plants used in garrafadas, as reported by an interviewee who had moved to the city: *"When I lived in the countryside, I did a lot, you know, because I lived there, I know a lot of medicine too"* (E29 / F, 46 years old). In this sense, Romanus,

Mendes and Carlini (2018) observed how migration to urban areas influences the use of medicinal plants, pointing out reasons such as the limitation of species and different climatic conditions, leading to the adoption of local alternatives.

Among other factors pointed out, religious issues can influence the disuse of medicinal plants, as occurs in bottled plants because they contain alcohol: *"After I changed to... For the Assembly of God, then I stopped making garrafada"* (E1 / F, 75 years old); *"I don't drink alcohol, alcohol stuff, then bottled is always better with wine, things like that, then I stopped drinking these things"* (E5 / F, 65 years old). This change in habits due to beliefs is also pointed out by Gerhardt (2006), who detected that behaviors and opinions are constructed and shaped by social contexts and values, influencing health care strategies, as revealed by the statement of participant E5 / F, 65 years old.

Even in the face of this decrease in the use of garrafadas, knowledge related to herbal remedies continues to be transmitted from generation to generation, ensuring the permanence of knowledge and respecting the community's way of life: *"Well, rooted, bottled, that's for the ancients, right? Our parents, grandparents, taught us there, right? Then we have been bringing this tradition and it turns out that it is really good"* (E7 / M, 42 years old). This type of transmission, rooted in family memory and daily practice, is also evidenced by Silva *et al.* (2019), when they stated that mothers and grandmothers are the main responsible for passing on knowledge about the use of medicinal plants to new generations through orality, the main means of preserving this knowledge.

In addition, the use of plants available in the living environment is intensified as an alternative to solve health problems and that the search for medical care occurs only in cases that require extreme need: *"Here, when I'm not very well, we hunt for a medicine from the bush right here, then it works, it happens that it works. If it doesn't work, we'll go to the city"* (E7 / M, 42 years old). This pattern of behavior was also identified in the research by Fernandes and Santos (2019), carried out in a quilombola community, which highlights self-medication as a self-care strategy in the face of mild problems and the limitations of the health system, often considered ineffective.

4.2 KNOWLEDGE AND PREPARATIONS WITH MEDICINAL PLANTS

Various types of preparations with medicinal plants were described and to illustrate these self-care strategies, Table 1 addresses the products, method of preparation and therapeutic purpose reported by the residents and former residents in the interviews, which are adapted according to the practice accumulated throughout daily experiences.

Table 1

Medicinal plants (products), method of preparation and reason for use extracted from interviews with quilombolas from the São Domingos community, Cavalcante (GO), Brazil, 2025

Products	Preparation	Reason for use
Turmeric with garlic, ginger and honey	"Then I put half a spoonful of it, a little crushed ginger, a crushed garlic clove, a spoonful of honey and stir and take..." (E2 / M, 68 years old)	Gout Flu
Tea of artelãozinho, fennel, pennyroyal, chamomile, mentraço, carrapicho, picão	"Sometimes I put it in the bowl and cook it, I make the tea, very strong. There are times, I don't like to let it boil, but sometimes it even boils." (E3 / F, 64 years old)	Flu Fever
Eau de Cologne Tea, Lemon Balm	"I tear it up, put it in the bowl with water and let it boil." (E11/F, 79 years old) "Every day I put lemon balm in the water, the leaf of the colony, and then, put it, put a little sugar, put it in the fridge and drink it there." (E9 / F, 66 years old)	High blood pressure
Roasted lobeira fruit with sugar or shaved brown sugar	"You open a little hole in it, like a roulette wheel, and you put the scraped rapadura and open a hole in the wood stove, put it inside and cover it with the rubber, and let it bake. Let it bake, the next day, it dawned that molten molasses, then you would take it, take it out of there and open that hole you made in it and pour the honey to drink to improve." (E29 / F, 46 years old)	Cough Flu Asthma
Milona	"... If the person has a bad intestine, just shave it very shaved and drink." (E27 / M, 73 years old)	Headache Intestinal problems
Boldo	"Hit the liquidator and make the juice." (E25 / F, 38 years old)	Stomach pain
Tea of astelãozinho, pennyroyal, rosemary	"Just put it in your hand, go there, cut them there on the foot and put it in the glass of water and inside and then put a little sugar and give it to the baby." (E9 / F, 66 years old)	Flu in children Belly pain
Chayote	"[...] grind it, you beat it in a blender... make that juice." (E6 / F, 36 years old)	High blood pressure
Sweet Grass/Holy Grass Tea	"I just take the leaf and put it in water to boil, put it to boil and when it cools down I drink it, don't put sugar." (E27 / M, 73 years old) "I put it in the bowl, put it in the bowl and put hot water on top. Another time I see that it's too much, I just drink it in cold water." (E4 / F, 68 years old)	Fever
Lavender tea, lemon balm, lemongrass/sweet grass, imburana	"I put water to brake, put the medicines in a bowl and pour water by frevendo." (E26 / F, 77 years old)	Pain relief
Garrafada with termite louberrinha, caroba, cotton, meleré, white velame, pomegranate, parsley, quina, cansaço, tiú, jatobá peel, partridge tree, entire pharmacy	"I go out in the woods, then I pluck roots and put them in the bottle... I cut it, punch it in the mortar and put the powder inside the bottle and put it in the bottle." (E15 / M, 41 years old) "Oh, I get a little bit of wood root there, which is in the woods there... Medicine that is available from the garden, the ones that don't hurt men, I put them in the bottle and drink it." (E12 / M, 51 years old) "These dicks that I shave there, put in the bottle and... put, when it's not white wine, it's really pinga..." (E17 / M, 81 years old)	Cleansing of the uterus Removing infection in the body Pain relief
Quininha-do-mato	"You take out her half-hull, right, and put it in the water, which is bitter as hell, then you take it..." (E7 / M, 42 years old)	Whet your appetite

Burnt garlic with stinky and lemon	"I roast the garlic, you know, lemon, and make the syrup and drink it, it's two, three times, it's already good." (E18 / M, 54 years old)	Flu
Heavy smoke	"[...] I pulled out this medicine, washed it, hurt all the roots and the leaves everything, put it to boil... And then, I would dump this thing and let it cool down and give that person that syrup to drink." (E24/F, 65 years old)	Fever Illness Pneumonia
Seven pain, wormwood	"Seven pain and wormwood, ensergo, put it in the water and drink." (E12 / M, 51 years old) "We make his juice [seven pains], hurt him, put him in the water and drink it." (E7 / M, 42 years old)	Stomach pain
Rhubarb	"[...] I would go to the forest, scratch these trains, come from there with those potatoes of his, wash, cut, they are yellow as saffron... Then she would dry that train, she would find a way to dry even in the trivet, like in riba do coisa do fogo, there in sheet metal, these trains... I punched it, my daughter, I took that powder and every time I put food for the person, she went with a spoon, a spoonful of that powder and put it in the first few bites of that person's food." (E24/F, 65 years old)	Swelling Big Yellow

Source: Prepared by the authors.

The variety of preparations reported evidences the autonomy of the community, marked by the appreciation of nature and reveals that knowledge is acquired and passed on over the years, functioning as an alternative to the health center, which does not exist in the place. In addition, it is possible to observe the coherence and diversity of popular knowledge, in this way, a plant is indicated for more than one therapeutic purpose, while varieties of plants are used to treat the same disease, as also reported by Silva, Lobato and Ravena-Canete (2019).

In this sense, Ramos *et al.* (2024), identified that quilombola communities have a vast ethnopharmacological knowledge and address the importance of understanding and applying this knowledge in health care strategies, since this traditional knowledge can support several actions aimed at self-care.

Among the preparations identified, the use of boldo in the form of juice, obtained by grinding the plant in a blender, used to treat stomach pain, stands out. Such use was also recorded by Farias *et al.* (2021), in a research carried out with four traditional communities located in the Recôncavo Baiano, where the knowledge and use of medicinal plants by women was investigated. The authors pointed out that boldo was used for belly and stomach pain, indigestion, malaise and hangover. In the present study, similarity was observed in terms of therapeutic purpose, suggesting that the plant, within the traditional quilombola knowledge, has wide recognition in the relief of gastrointestinal discomfort.

Although there is convergence regarding the use of the plant, as reported by one of the interviewees: "*Beat the blender and make the juice.*" (E25 / F, 38 years old), divergences

were noted in the form of preparation, since, in the study by Farias *et al.* (2021), there was a predominance of use in the form of tea, made from the leaves.

Like boldo, other medicinal plants also have variations in their preparation and use, depending on the context and the knowledge transmitted locally. Garlic, for example, added to other products, appears in this study with two forms of preparation: mashed and roasted, with the purpose of helping in the treatment of flu and gout: "*I roast the garlic, you know, lemon, and make the syrup and take it, it's two, three times, it's already good.*" (E18 / M, 54 years old) and "*Then I put half a spoonful of it, a little crushed ginger, a crushed garlic clove, a spoonful of honey and stir and drink...*" (E2 / M, 68 years old). Filgueira *et al.* (2024), in his study on the use of medicinal plants in a community in the semi-arid region of Bahia, in addition to mentioning their use to treat influenza, cites garlic as an antibiotic, prepared as a tea through decoction.

In addition, Vieitas *et al.* (2021), describe the use of garlic with a focus on its application in cases of arterial hypertension, pointing out that, daily, it should be chewed in half a unit. The joint analysis shows that traditional knowledge about plants is diverse, being adapted according to the specific contexts of each community.

This parallel contributes to reinforce the importance of ensuring the preservation of traditional knowledge, since it can influence therapy and, based on scientific validations, open paths to be integrated into health care. However, it is important to consider that different sociocultural contexts can make comparisons and, consequently, generalizations difficult.

Thus, the findings of the present research, by dialoguing with different ethnobotanical investigations, reaffirm the richness of traditional knowledge, which continues to contribute with viable answers to the daily health problems of quilombolas.

4.3 SELF-CARE PRACTICES AND USE OF INDUSTRIALIZED MEDICINES

Industrialized medicines were also frequent in the community's self-care practices. Among the most mentioned are hydrochlorothiazide and losartan, used in the treatment of hypertension as mentioned by E4 / F, 68 years old: "*Unless, for pressure I take losartan. I forgot the name of the other... Hydrochlorothiazide, I'll take that one.*" This data dialogues with studies by Santos *et al.* (2019), carried out with 390 quilombolas from 15 communities in the state of Sergipe, where a higher prevalence of hypertension was found in this public compared to the general population of the same state. In addition, diclofenac and dipyrrone used for pain relief are mentioned: "*Oh, I drink more for headaches is dipyrrone*" (E22 / M, 54 years old).

Access to medicines occurs mainly through purchases in pharmacies in the city, purchases from peddlers who frequent the community and donations from family members and neighbors, in a collective care network: *"When I don't buy from a peddler, the neighbors give it to me. Sometimes I feel the headache, I take a pill there and one gives it to me"* (E22 / M, 54 years old). These data confirm the findings of Leite *et al.* (2022), who, when surveying quilombola and non-quilombola adolescents living in rural communities, found that the difficulty in accessing medicines through formal channels and health services leads the population to adopt these practices as an alternative care strategy.

On the other hand, this dynamic of drug circulation can generate vulnerabilities and affect the therapeutic process. Even so, it reveals an attempt not to interrupt the prescribed treatment. One interviewee reported that she was using 850 mg metformin, as prescribed, but at the time of the interview, she was taking 500 mg tablets, which she received as a donation: *"yes, it was... that she got it there, a woman there gave it to her said to bring it to me, right?"* (E1 / F, 75 years old). This type of situation highlights a risk scenario, especially among people with low education. Ghassab-Abdollahi *et al.* (2024), in a study with illiterate elderly people or those with low education, identified a high frequency of medication errors, with emphasis on failures such as incorrect dosages and administration outside the established hours, aspects that converge with the report presented.

In this sense, although industrialized medicines are present in the routine of this population, some residents clearly demonstrated resistance to their use: *"[...] I'm not much of a pharmacist who takes a lot of pharmacy medicine, I take it more than home medicine"* (E5 / F, 65 years old). Another resident reinforces his feeling of dissatisfaction about the effectiveness of industrialized medicines and values the use of home remedies involving plants: *"I take pills, I take pills it's not worth anything. Best root of the bush"* (E6 / M, 77 years old).

With regard to access to health services and industrialized medicines, there is a significant interference in self-care practices. Gomes *et al.* (2024), discuss the barriers that hinder access to primary care, highlighting factors such as racial and geographic inequalities, scarcity of care, in addition to travel costs and the absence of certain services in the SUS. Consistent with this analysis, most of the interviewees also reported similar obstacles, especially related to the distance between the community and the health services, the lack of transportation and the physical discomfort faced during the commute: *"Only when I'm really bad do I go, because [...] There are times when I travel, it seems that it gets even worse, because it seems that the body hurts like that"* (E1 / F, 75 years old). Another interviewee reported on the use of medication for diabetes: *"So, I've already taken a lot, now these days*

I'm not taking it" and when asked about the reason, she said: *"[...] it's because it's over and I'm not going on the street, because when I go I feel very sick"* (E9 / F, 66 years old). This statement highlights the negative impact on health related to the worsening of diseases and makes public policies necessary to overcome these situations.

In addition to the difficulty in accessing health services, among the main obstacles to the practice of self-care are the lack of time, information and motivation, or the lack of resources, factors that compromise the adoption and maintenance of self-care practices. In vulnerable populations, self-care can also be a form of resistance, as it emerges as a practice that favors the maintenance of health and coping with the difficulties of daily life, considering that these people face greater obstacles in accessing services, education and basic resources for care (OGASSAVARA *et al.*, 2024).

In addition, it is observed that self-care practices are not restricted to the use of medicines in isolation, there is often an association between the use of medicinal plants and industrialized medicines with the aim of enhancing the therapeutic effect: *"Then I make tea and drink it, sometimes I drink it alone, another time I take it with dipyrone, then the pressure lowers"* (E1 / F, 75 years old). This type of practice was also identified by Nink, Nunes, and Nink (2023), when they observed that, in another quilombola community, more than 50% of respondents used both conventional and traditional treatment.

5 FINAL CONSIDERATIONS

Based on the data analyzed, it was possible to identify two major axes of self-care practices present in the daily lives of quilombola individuals, in the face of different health needs: the use of medicinal plants and the use of industrialized medicines. Traditional knowledge, especially through medicinal plants, and the use of conventional drugs are mainly influenced by the local culture, the availability of resources and the severity of the health problem faced.

The results of this research show that self-care in the São Domingos quilombola community is based on knowledge acquired through experiences over time, being transmitted between generations. In this way, it acts as a strategy to deal with health problems, reduce dependence on formal health services and, thus, avoid the need to travel long distances, since the community does not have a fixed health service. This way of acting in relation to self-care practices expresses the resistance, autonomy and identity of this population.

In a context of search for equity in health, the results of this research contribute to direct the construction and implementation of more inclusive public policies and health practices, given that they address the quilombola reality, as well as the factors that influence

health care and the strategies adopted. In this way, research contributes to the appreciation, preservation of traditional knowledge and subsidization of new research.

Despite the contributions offered, this research has limitations, such as the need to extend the time of participant observation, allowing denser descriptions of the experience and self-care experiences of quilombolas. In addition, the results would be better delved into different specific points (health problems, gender, age, income, and function in the community), which would allow a more detailed view of self-care practices.

The results point to the need to strengthen health actions that really meet the needs of quilombolas, seeking to expand support for the adequate consumption of medicinal plants and industrialized medicines. It is believed that it is possible to structure primary/primary care services integrating traditional and scientific knowledge, favoring SUS medicinal plant and herbal medicine policies. In addition, encouraging dialogue is essential to value self-care practices. Future research may include different communities, and deepen the studies, aiming at the insertion of educational actions and health programs that integrate traditional knowledge.

ABSTRACT

This article presents an excerpt from the dissertation "P3D Software as a Resource for Rethinking the Practice of Teaching and Learning Science," a research project that aimed to analyze the impact of P3D software on science education with 8th-grade students. This excerpt, of a bibliographical nature, briefly discusses teacher training and the use of digital technologies in the classroom: 3D technology, Virtual Reality (VR), also considering the presence of Artificial Intelligence (AI), which is no longer a distant reality or restricted to science fiction and is increasingly present in our lives – including in education. For science education, digital technologies can make teaching playful and awaken students' interest in learning. The theoretical framework draws on studies by Lévy (1999, 2004), Veen & Vrakking (2009), Silva (2012), Moita (2006, 2007, 2013), Amabis (2001), among others. The study revealed that the use of Virtual Reality and 3D technologies improved student participation, engagement, and performance in science classes. For students, exploring the three-dimensional (3D) environment enabled a meaningful, reflective, and ethical use of available resources. The research resulted in an interactive teaching sequence (ITS) focused on science education, using three-dimensional (3D) digital resources in pedagogical practice.

RESUMO

O presente artigo traz um recorte da dissertação "O Software P3D como recurso para repensar a prática de ensinar e aprender Ciências", pesquisa que teve como objetivo analisar o impacto do Software P3D no ensino de Ciências, com estudantes do 8º Ano do Ensino Fundamental. Neste recorte, o objetivo deste estudo, de natureza bibliográfica, foi discutir, brevemente, a formação dos professores e o uso das tecnologias Digitais em sala de aula: Tecnologia 3D, Realidade Virtual (VR), considerando, também, a presença da Inteligência Artificial (IA) que deixou de ser uma realidade distante ou restrita à ficção científica e está cada vez mais presente em nossas vidas – inclusive na educação. Para o ensino de

Ciências, as tecnologias digitais podem tornar o ensino lúdico e despertar no aluno interesse por aprender. Toma-se como aporte teórico estudos de Lévy (1999, 2004), Veen & Vrakking (2009), Silva (2012,), Moita (2006, 2007, 2013), Amabis (2001), entre outros. O estudo revelou que o uso das Tecnologias em Realidade Virtual e 3D melhorou a participação, o engajamento e o rendimento dos alunos nas aulas de Ciências. Para os alunos, a exploração do ambiente em três dimensões (3D) possibilitou um uso significativo, reflexivo e ético dos recursos disponíveis. A pesquisa realizada obteve como produto uma sequência didática interativa (SDI) voltada para o ensino de Ciências, quando da utilização de recursos digitais em três dimensões (3D) na prática pedagógica.

RESUMEN

Este artículo presenta un extracto de la tesis "Software P3D como recurso para repensar la práctica de la enseñanza y el aprendizaje de las ciencias", un proyecto de investigación que tuvo como objetivo analizar el impacto del software P3D en la educación científica con estudiantes de octavo grado. Este extracto, de carácter bibliográfico, aborda brevemente la formación docente y el uso de tecnologías digitales en el aula: tecnología 3D, realidad virtual (RV), considerando también la presencia de la Inteligencia Artificial (IA), que ya no es una realidad lejana ni se limita a la ciencia ficción, sino que está cada vez más presente en nuestras vidas, incluyendo la educación. Para la educación científica, las tecnologías digitales pueden hacer que la enseñanza sea lúdica y despertar el interés del alumnado por el aprendizaje. El marco teórico se basa en estudios de Lévy (1999, 2004), Veen y Vrakking (2009), Silva (2012), Moita (2006, 2007, 2013) y Amabis (2001), entre otros. El estudio reveló que el uso de la realidad virtual y las tecnologías 3D mejoró la participación, el compromiso y el rendimiento del alumnado en las clases de ciencias. Para los estudiantes, explorar el entorno tridimensional (3D) les permitió un uso significativo, reflexivo y ético de los recursos disponibles. La investigación dio como resultado una secuencia didáctica interactiva (SDI) centrada en la educación científica, que utiliza recursos digitales tridimensionales (3D) en la práctica pedagógica.

1 INTRODUCTION

Digital technologies have increasingly given rise to an immersive and revolutionary digital future. The meeting of Virtual Reality (VR) and Artificial Intelligence (AI) are innovations that come together to create more intelligent, dynamic and personalized immersive experiences, configuring new contexts for education.

This new digital educational context, revolutionary, contrasts with traditional teaching practices and with the notion of students' passivity, which denotes the need to rethink the school, the pedagogical practice and the resources used in the classroom. Digital technologies - henceforth treated as digital resources - bring a new behavior and a new way of learning for students and suggest to teachers the innovation of teaching.

Instead of teaching only lectures, teachers are required to propose challenges and projects through digital resources in the classroom, such as AI in education, which has been offering the possibility of more personalized, flexible, inclusive, and engaging learning. In addition, the tools provide information not only about what is being learned, but also how it is being learned and how students are feeling.

It is not intended here to deny the value of traditional resources - textbooks and paradidactics, notebooks, board games, among others - however, it is warned that the young people of this generation grew up surrounded by computers and yearn for more interactive resources at school.

It should be noted that students already arrive at school with digital skills and a different way of thinking, acting and learning. This new student profile can help the teacher to propose a new lesson design. However, this does not mean that teachers will be guided by students, but will rethink their methodologies, strategies, and resources to mediate, investigate, and coordinate their actions through digital resources that are part of their daily lives.

2 THEORETICAL FRAMEWORK

2.1 DIGITAL TECHNOLOGIES IN EDUCATION

We are experiencing the digital revolution and profound transformations happen in a fraction of seconds in the most diverse sectors of society. For education, sophisticated digital resources are suggested – Web 2.0, 3D elements, virtual reality software, among other applications – that bring a new way of expressing and communicating, of combining sounds, images, texts through Artificial Intelligence (AI), which means a new cultural context, through which new ways of interacting, thinking, teaching and learning.

The school, immersed in this context, more than ever needs to rethink its educational processes and practices, since the traditional conceptions of teaching, historically crystallized

in the classroom, no longer meet the demands of the digital society. According to Veen & Vrakking (2009, p. 13), "the problem is that schools still try to transfer knowledge as they did 100 years ago. This would not be a problem if the entire economic structure of our society were still the same, but that is not the case."

For Silva (2012, p. 84), the school has not yet understood the importance of positioning itself in a positive way in the face of the digital revolution, since it is "alien to the "spirit of the time" and remains closed in on itself, in its transmission rituals, when its surroundings are fundamentally modified in a new communicational dimension".

Also for this author, the school needs to consider the new digital experiences lived by students, as they are the new active spectators, who deal with the flow of information and know how to manipulate images on increasingly less static screens.

From this perspective, the integration of digital resources in the classroom can mean important challenges for teachers and present students with new learning experiences. For Lévy (1999), the school and teachers need to recognize the new virtual spaces as a place for the creation and acquisition of knowledge. The author calls these spaces cyberspace, defined as a "new space of communication, sociability, organization and transaction, but also the new market of information and knowledge" (LÉVY, 1999, p. 167).

Also for this author, cyberspace presents itself as one of the privileged instruments of collective intelligence, due to the multiple possibilities of interaction, participation, sharing and organization of knowledge, in the face of which the transmissive processes of content start to give way to non-linear processes, through interaction, collaboration, co-creation and participation.

From this collective construction of knowledge, which forms a global memory made possible by cyberspace, a new culture emerges, cyberculture. According to the author, the emergence of this new culture leads to a reconfiguration in the world of work and affects educational systems.

Cyberspace (which I will also call "network") is the new means of communication that arises from the worldwide interconnection of computers. The term specifies not only the material infrastructure of digital communication, but also the oceanic universe of information that it houses, as well as the human beings who navigate and feed this universe. As for the neologism "cyberculture", it specifies here the set of techniques (material and intellectual), practices, attitudes, ways of thinking and values that develop along with the growth of cyberspace (LÉVY, 1999, p. 17).

This author adds that it is unprecedented in the history of humanity to find that most of the skills acquired by a person at the beginning of his professional career will be obsolete at

the end of his career. Working means, increasingly, learning, transmitting knowledge and producing knowledge. Cyberspace supports intellectual technologies that amplify, externalize, and modify numerous human cognitive functions: memory (databases, hyperdocuments, digital archives of all kinds), imagination (simulations), perception (digital sensors, telepresence, virtual realities), reasoning (artificial intelligence, modeling of complex phenomena).

For Lemos (2010, p. 88), cyberculture is the "social and cultural product of the synergy between contemporary aesthetic sociality [...] and new technologies". Therefore, new human relationships mediated by technologies generate new values, behaviors, attitudes, culture and new expectations regarding school and teaching.

The impact of cyberculture imposes new educational models on schools and new strategies and methodologies on teachers, as it is argued that, in the face of this new cultural context, students should also be encouraged to think, develop new skills and solve problems through digital resources. Thus, it can be said that the contemporary school is intensely experiencing the challenge of integrating digital resources into its context, so that they add value to student learning. According to Lévy (2004), technological resources are particularly suited to educational uses. The fundamental role of the student's personal involvement in the learning process is well known. The more actively a person participates in the acquisition of knowledge, the more he will integrate and retain what he learns. Now, interactive multimedia, thanks to its reticular or non-linear dimension, favors an exploratory, or even playful, attitude towards the material to be assimilated. It is, therefore, an instrument well adapted to an active pedagogy (LÉVY, 2004, p. 24).

In this understanding, the use of digital resources in the classroom is defended, based on active, motivating, fun, participatory strategies and methodologies that, in addition, can have a greater impact on cognitive potential. The most important thing is not to insert digital resources in the school, because the way they are used can drive new transformations in the teaching and learning process.

Thus, Lévy (1999, p. 158) argues:

What needs to be learned can no longer be planned or precisely defined in advance [...]. We must build new models of the knowledge space. Instead of representation on linear and parallel scales, in pyramids structured in "levels", organized by the notion of prerequisites and converging towards "higher" knowledge, from now on we must prefer the image in emerging, open, continuous, flowing, non-linear spaces of knowledge, reorganizing themselves according to objectives or contexts, in which each one occupies a unique and evolving position.

Still for this author, it is necessary to learn from the movement of techniques. This

means that this movement, first of all, is equivalent to learning to deal with the potential of digital technologies and knowing how to take advantage of the communicational, interactive and collective construction power that they enable. In this context, the teacher needs to become an animator of collective intelligence in the classroom instead of a transmitter of knowledge.

For Lévy (2003), collective intelligence is that constructed by subjects in a collective way, which can be shared and not limited to a privileged few. For this reason, the author states that collective intelligence should be potentially valued and based on practical actions. These, in turn, are intended to mobilize the competencies of individuals who seek, in fact, the basis and objective of collective intelligence, namely: the recognition and mutual enrichment of those who are involved with this proposal.

Jenkins (2009), when dealing with collective intelligence, asserts that "none of us can know everything; each of us knows something; and we can put the pieces together, if we combine our resources and unite our skills" (JENKINS, 2009, p. 28). He deals with the impacts arising from web 2.0 (new communicational contexts, different programs and systems) and calls this process of communicational change the culture of convergence. It also draws attention to the fact that convergence does not occur through electronic machines, however sophisticated they may be, but in the subjects' brains individually and in their social interactions with others.

For education, it can be said that the convergence of media brings information through sophisticated platforms, software, applications, Artificial Intelligence, among other resources, so that students can relate, interact and make new connections with the world.

It is understood that it is necessary in the school to work with a collectively constructed "web", which may mean new teaching and learning processes, changes in methodological strategies and the emergence of new partnerships and challenges inside and outside the classroom and, consequently, new conceptions of teaching and learning from the mediation of information and communication technologies. With such technologies, the knowledge of individuals can be connected.

2.2 DIGITAL EDUCATIONAL RESOURCES: SOME CONCEPTS

The technological revolution brought the convergence of the media. Images, sounds and videos are integrated and sophisticated resources emerge: Virtual Reality (VR) and Three Dimensions (3D) and finally Artificial Intelligence (AI).

For Lévy (1999, p.110) "virtualization is complex, problematic, the knot of tendencies or forces that accompanies a situation, an event, an object or any entity, and that calls a

process of resolution, updating". This means that the virtual should no longer be seen as a way of being, but as a dynamic, as something that exists in potentiality.

Still for Lévy (1996), the real and the virtual cannot be understood as opposite instances, but as potentially convergent, because they start from a continuous process of permanent updating that enables the articulation between the real world and the virtual world. Thus, it is understood that the virtual is real, even if it cannot be fixed in the determined time and space.

Schön (1992) argues that "an orchestra rehearsal is also a virtual world, just like a role-play or a computer screen". In this sense, the author defines the virtual world as any scenario that represents a real world and that allows us to experiment, make mistakes, become aware of our mistakes and try again, that is, the world of practice. For Schön (1992, p. 11), "[...] all this takes place in a Praticum, which is a virtual world that represents the world of practice".

The integration of real and virtual information in the same environment is a very effective way to put the student in front of distant or inaccessible content or people, without taking away perceptions related to the real environment that surrounds him. "With this, it is possible to combine the advantages of VR with the maximum sense of presence provided by local activities. The potential of this union is very stimulating for educators and students" (Tori, 2010, p. 157-158).

It is understood that the use of 3D technology in virtual reality can contribute significantly to Science Teaching, since it makes it possible to carry out simulations of abstract contents. As happened in this study, in which students experienced the use of 3D Software in the study of Science, based on AI, 3D Software helped students develop problem-solving skills and worked as a complement to what was studied in the Textbook or illustration on the blackboard.

3 THE TEACHING OF NATURAL SCIENCES WITH DIGITAL TECHNOLOGIES

The teaching of Natural Sciences in contemporary times needs to be considered as a collective, historical, contextualized, unfinished production, which develops through ruptures and scientific revolutions. However, in general, it is observed that the practice in the classroom and the resources used by teachers, for the most part, are textbooks, transcription on the blackboard and practices of memorizing texts and ready-made answers. It is observed that this type of teaching has left gaps in student learning. An approach that associates theory and practice, values collective and meaningful practices, is dialogical and works with a procedural evaluation is still little present in this area of teaching.

Amabis (2001) states that the difficulties in this area of knowledge are universal and that "the problem of current science teaching, in high school and elementary school, lies in the lack of a sense of direction, of a philosophical basis and the fact that teachers continue to teach as they were taught due to the lack of models" (AMABIS, 2001, on-line). Also for this author, it is expected that, in Natural Sciences and Biology classes, students make the articulation between the knowledge studied at school and everyday life.

Therefore, he judges meaningless an education based on the transmission of facts. It is necessary to prioritize interdisciplinarity, new proposals and new resources through which the student can understand how knowledge was built and how it can be changed. In a world of constant change, teachers need to understand that students have changed, and that the old educational paradigms are not meeting their demands.

It is defended, here, that the teaching of Natural Sciences should, therefore, start from a contextualized perspective, having the student as a producer and co-producer, in order to know how to interact with different types of information, concepts and practical experiences from their experiences, ethical values and social beliefs that are required by contemporary society, so that teaching can contribute to the formation of the lives of critical citizens, who know how to position themselves in the face of the challenges of science and technology.

Technologies are bridges that open the classroom to the world, that represent, mediate our knowledge of the world. There are different forms of representation of reality, in a more abstract or concrete way, more static or dynamic, more linear or parallel, but all of them, combined, integrated, enable a better apprehension of reality and the development of all the potentialities of the student, of the different types of intelligence, skills and attitudes (MORAN, 2007, p. 05).

The National Common Curriculum Base (BNCC) says that technology comes in as an ally of the teacher and the student, and directly advises that the use of digital information and communication technologies should be used to produce knowledge and solve problems in the Sciences – something not so present in the National Curriculum Parameters (PCN, 1997).

The BNCC advises that the teacher has a more critical training in relation to digital technologies so that their use is pedagogical and intentional and not just to enhance a class, and that students must be able to master the digital universe, making a meaningful, reflective and ethical use of the available resources, something present in general competencies (digital culture) and in the specific sciences.

The BNCC expresses the importance of adopting the investigative approach as a central element of training. The teacher must intentionally enable students to actively participate, a direct relationship with the issue of scientific literacy. And it is not enough just

to test the concepts, it is necessary to build them collectively.

The normative document clarifies that the teaching of the component must provide experiences in which children and young people can get involved in all stages of the scientific investigation process: observing, asking, analyzing demands, proposing hypotheses, developing models and explanations, developing, disseminating and implementing solutions to solve everyday problems, among others.

This is a point of attention to abandon once and for all the mere transmission of content in expository classes and memorization, still present in many schools. Therefore, the teacher's function is to be a source of information and, mainly, to guide the students' investigative actions to develop skills and competencies with autonomy.

Moita (2007) states that teachers, in their different disciplines, must integrate digital resources into their pedagogical work, in order to promote new forms of interaction and learning. Thus, it is understood that Science teachers need to rethink their methodologies, strategies and resources used in pedagogical practice to motivate students and offer them new learning experiences and the world to act, create, think and live actively in a society of constant change. Next, an Interactive Didactic Sequence (SDI) for Science Teaching, with the use of 3D Software, carried out during the studies of the Master's Degree in Teacher Training at the State University of Paraíba - UEPB

4 INTERACTIVE DIDACTIC SEQUENCE IN THE TRAINING OF SCIENCE TEACHERS WITH 3D TECHNOLOGIES

The idea of developing an Interactive Didactic Sequence as a use of 3D Technologies arose from the readings that grounded this study, as well as from the observations of Science classes with the application of the P3D educational software, when some difficulties faced by teachers regarding the use of this resource in pedagogical practice were observed.

It is argued that integrating 3D digital resources in science teaching can be a way to put students and teachers in front of new experiences and learning situations, a moment in which they will be able to experience virtual experiences with content and people from simulations in the real environment. In this context, it was clear the need to disseminate the thought of scholars who work with this theme through an Interactive Didactic Sequence, since this methodology enables interaction and sharing of knowledge and knowledge.

Oliveira (2013, p. 58) defines Interactive Didactic Sequence (SDI) as a new didactic-methodological proposal that has as "[...] procedure the construction and reconstruction of concepts on different themes of the curricular components of basic education, undergraduate and graduate courses". Also for this author, the Interactive Didactic Sequence (SDI) is

developed based on a series of activities for the systematization of concepts and definitions of a given theme, aiming at the construction of new knowledge and knowledge. In the Interactive Didactic Sequence described below, the steps defined by Oliveira (2013) were used, as mentioned in the fourth chapter of this study.

Therefore, by applying this SDI, it is intended to investigate aspects inherent to the theoretical conceptions of Science teachers about 3D Technologies and to share experiences, aiming at the construction and reconstruction of new knowledge regarding the proposed theme.

Thus, the objective is to present a didactic sequence focused on the teaching of Natural Sciences in Elementary School, developed as an educational product of the dissertation of the Graduate Program in Teacher Training (PPGFP) – Professional Master's Degree, at the State University of Paraíba (UEPB). An Interactive Didactic Sequence (SDI) was developed and applied with a qualitative approach, based on pedagogical intervention.

SDI, focusing on the use of 3D and Virtual Reality technologies, was applied and discussed with teachers and future teachers of Science and Biology during 5 meetings in the Computer Laboratory, in a private institution of Basic Education, in the city of Campina Grande, PB. The results indicate contributions to methodological changes in teachers' practices, in addition to favoring interaction and the construction of knowledge in the teaching of Science and Biology. The study evidenced the articulation between academic research and educational product with practical application, through the interaction, discussion and evaluation of the P3D software and theoretical studies on the integration of digital technologies in Science Teaching. Next, the Interactive Didactic Sequence (SDI) is presented.

4.1 CONTINUING EDUCATION WITH SCIENCE TEACHERS: APPLICATION OF THE DIDACTIC SEQUENCE

4.1.1 SDI's first sequence of activities – Survey

Stage 1: The procedures for the application of the Interactive Didactic Sequence (SDI) will be presented and discussed with teachers and future teachers of Science and Biology, as a methodology that can act as a facilitating agent for the interaction, construction and reconstruction of new knowledge in Science Teaching with the use of 3D Technologies. The place chosen for teacher training was the School's Computer Laboratory.

Stage 2: Moment of the surveys, through interaction with teachers, we carried out a dialogue about the importance of using technologies in Science Teaching and the impacts they may have on the teaching and learning process. Questions, such as: **What is 3D**

Technology? How to integrate 3D Technologies in Science and Biology classes? After all teachers answer the questions, they will be divided into small groups. Each group was asked to discuss the proposed questions. After the discussion, each group will be asked to prepare a synthesis of the issues.

Step 3: In this step, each group must choose a representative, and thus a new group will be formed, with only the representative of each group in which the conceptions of each group were synthesized in a single concept. The teacher in the classroom will mediate, asking the group representatives to make a synthesis of all the small groups. Thus, a general synthesis (definition) will be built on what teachers understand by the proposed questions.

Stage 4: The new synthesis will be presented and discussed with the large group and with the classroom teacher, so that a new definition can be elaborated, a process that, for Oliveira (2013, p. 59), is characterized as the beginning of the construction of new knowledge.

Stage 5: The new synthesis will be presented and discussed with the large group and with the classroom teacher, so that a new definition can be elaborated, a process that, for Oliveira (2013, p. 59), is characterized as the beginning of the construction of new knowledge.

4.1.2 Second sequence of SDI activities – Theoretical and practical basis

Step 6: To systematize, discuss and substantiate the possible answers to the questions, the teacher and/or trainer should seek the theoretical foundations of the authors (books, texts, slides, documents, images, videos and other resources) to work with the participants, always in constant dialogue with the teachers. At this stage, the teacher/trainer should base the content of the theme under study on authors such as: Lévy (2004), Moita (2006, 2016), Gee (2001), Prensky (2001, 2010, 2013), Papert (1996); Silva (2012) and other theorists who treat and consider Digital Educational Technologies in the school context as allies of cognitive development, teaching innovation and as contexts that structure the ways of thinking, doing, communicating, establishing relationships with the world and representing knowledge.

Stage 7 (Conclusion): It will be carried out, based on the articulation of theoretical and practical knowledge. In this way, teachers will explore the P3D Software – in Module 1 – Sciences (Human Body), already installed in the computers of the Computer Lab. They will be invited to dialogue among their peers, how they can use the P3D Software in future classes with their classes. Finally, this stage can be conducted by requesting a new written version of the contents studied. To close the contents, it is suggested as activities that the participants reflect on the following question: **What are the contributions of integrating digital technologies, especially 3D technologies, in Science and Biology classes?** At

this stage, it is important that the teacher is creative, interactive and dynamic, and has awareness and intentionality in planning so that the learning results can have positive impacts.

5 METHODOLOGY

The present study in Education is part of a qualitative investigation, since it took place in the natural environment of the school. Thus, a descriptive exploratory study was carried out in the school context, since, with this type of methodology, the researcher can observe, analyze and describe the experiences carried out in the classroom, prioritizing the process more than the product and being concerned with reporting the perspective of the subjects.

According to Severino (2007, p. 123), "exploratory research seeks to gather information about a certain object, delimiting a field of work and mapping the conditions of manifestations of this object", as was done in this investigation, in which it was sought to collect information and describe the process and effects of the use of P3D educational software in the practice of teaching and learning Science, aiming, above all, to understand the meaning that the subjects attributed to the experience of using this digital resource.

Data analysis was performed in a descriptive and inductive manner. The collected data were recorded in field notes (through observations in a computer lab and classroom) and semi-structured interviews were conducted with the teacher and students.

The researched field was a confessional private educational institution, of Basic Education, located in the municipality of Campina Grande - Paraíba

6 RESULTS AND DISCUSSIONS

It was sought, systematically and pedagogically, to observe the students and the teacher when making use of 3D digital resources, especially a software for the Teaching of Science (Human Body). Their opinions on the effects of this resource on the teaching and learning process were collected. The results revealed that Virtual Reality and 3D technologies enabled more participation, engagement and improvement of students' performance in Science classes, and above all the personalization of teaching.

With the data collected in the participant-observations, it was possible to verify that the classes became more playful and dynamic and that there was an improvement in the interaction, attention and concentration of the students, compared to the classes in which usual resources were used, such as the textbook. Another aspect observed concerns the interest and creativity of the students in performing the task proposed by the teacher. They used 3D images, animation and texts to simulate the functioning of the human body and the

digestive system normally in the classroom.

Also in the observations, it was found that the teacher was driven to modify the methodology and the way he approached the contents, using simulation and experimentation to explain the functioning and structure of the digestive system, which was done through the textbook and illustrations on the blackboard.

In addition to motivation and more dynamic classes, students were placed in front of a new learning culture, through which they made new connections about the importance of healthy eating for the proper functioning of the digestive system and the human body in general. By proposing a contextualized study concerned with health, using the educational software P3D, the teacher encouraged students to relate theoretical concepts to practice, such as the function of the organs of the digestive system and their functioning, which increased their learning.

The statements of the students and the teacher, subjects of this study, ratify the hypothesis that the educational software P3D is a resource that can contribute to the teaching of Science, if used appropriately. The students expressed that they were able to learn differently about the digestive system, especially about the function of organs and the importance of their functioning for the human body.

The students' speeches also reveal the importance of using digital resources such as the P3D educational software for learning, as students can learn with pleasure, having fun and through challenges, as they pointed out in their speeches. Such aspects denote that the young people of this generation yearn to participate in projects at school that contemplate interaction, playfulness, participation, creation and co-creation in the various subjects of the school curriculum.

In the professor's speech, the important contribution of the software to the practice is verified, as it enables new ways of teaching. Aspects such as integration with curricular content, interaction and better student performance were highlighted by him. It is also important to highlight an important impact on the teacher's practice, as well as the possibility of associating theoretical and practical knowledge in a contextualized way, contrary to the traditional legacy of science teaching, based on bookish and transmissive teaching.

When, in the classroom, one manages to motivate and awaken the desire to learn with pleasure and make new discoveries, this means opening new paths for knowledge of the world. As the students' statements revealed, the P3D software was useful in the process of learning Science because, in addition to the contents, they learned for life, making their own discoveries, and started to have more performance in the discipline, as well as more admiration for the school and their teacher.

In this sense, it is possible to verify the importance and responsibility of the school as a space for human interaction that integrates resources and proposals that provide innovative and student-centered teaching. Teachers need to launch themselves into the promotion of an innovative practice, based on new educational paradigms, so that they can produce new identities, knowledge and practices in the classroom, encouraging students to have autonomy, to discover, share, create and socialize a new way of thinking.

7 SOME CONSIDERATIONS

How are schools and teachers seeing their role in the school of the twenty-first century? How are digital resources reaching the school and how are they being used? How are teachers and the entire team that is part of the school being prepared to face the new challenges of the digital age? Is the school, as a promoter of knowledge, enabling students' access to digital resources, to guarantee their right to digital literacy?

Such questions refer to some difficulties and limitations encountered in the course of this study. Among them, the way most teachers and school staff understand the integration of digital technologies in the teaching and learning process. It is seen that a change of vision is still necessary, so that all those involved in their context carry out a joint and reflective work on the action and results of the use of technologies in the school, which is not limited to the figure of the mediator of the school's technologies.

The lack of training and the lack of interest of teachers to incorporate the P3D educational software in their pedagogical practices were difficulties encountered in the course of this study. Among the 20 teachers who went through continuing education for the use of P3D, only one – the Science teacher – presented a proposal for its use, putting it into practice. This fact limited the research to the discipline "Sciences". Another difficulty concerns the use of P3D software itself, since it requires computers with sophisticated processors and video cards, which we do not always find in schools.

Finally, it is suggested that future investigations be carried out not only in the discipline of Natural Sciences, but in the other disciplines of Basic Education, anchored in the use of 3D digital resources in the classroom so that the way of teaching and learning in the digital age can be rethought.

Rethink the practice of teaching and learning! This is the great challenge of the school of the twenty-first century, where the virtual and the real coexist in a world in constant mutation. It concludes, then, with the words of Moita (2006), when he states that recognizing the potential of digital technologies for the process of teaching and learning is to live in a contemporary world, with its changes, and to accept them to collaborate with the education

of the new generations.

ABSTRACT

This experience report refers to an assessment activity proposed for the 8th grade of lower secondary education, involving students from the Augusto Pugnali Municipal School, located in the municipality of Petrópolis (Metropolitan Region of Rio de Janeiro – RMRJ). The activity was entitled “Simulating a United Nations Conference.” To achieve the objectives of the activity, active methodology proposals were developed using the classroom space, allowing students to discuss the proposed themes, conduct research on them, create posters, and present them to their classmates. At the end of the activity, a debate was held on the importance and learning outcomes of each topic discussed.

Keywords: Education. Active Methodologies. Current Issues.

RESUMO

O presente relato de experiência faz menção a uma atividade avaliativa, proposta para o 8º ano do Ensino Fundamental II, envolvendo os discentes da Escola Municipal Augusto Pugnali, localizada no município de Petrópolis (Região Metropolitana do Rio de Janeiro – RMRJ). A presente atividade foi intitulada “Simulando uma Conferência da ONU”. Para alcançar o objetivo da atividade foram elaboradas propostas de metodologias ativas, utilizando o espaço da sala de aula, onde os alunos puderam discutir sobre os temas propostos, pesquisar sobre estes, elaborar os cartazes e apresentá-los aos outros colegas de turma. No final da atividade, foi realizado um debate sobre a importância e aprendizagem de cada tema discutido.

Palavras-chave: Educação. Metodologias Ativas. Temas Atuais.

RESUMEN

El presente relato de experiencia hace referencia a una actividad evaluativa propuesta para el 8.º grado de la Educación Secundaria Básica, involucrando a los estudiantes de la Escuela

1 INTRODUCTION

The activity with students from the 8th grade of Elementary School was developed during the months of September to November, where they were divided into groups of 4 to 5 students. The themes presented for the elaboration of the works are current and important, not only for the world context, but also for the Brazilian reality.

The topics to be studied, debated and presented by them were: the War in Ukraine and Russia, Religious Intolerance, Racism in the world, COP 30, the War in the Middle East, Donald Trump's Government and Climate Change: causes and consequences for global society.

Materials were made available on each issue to be presented, as well as conversation circles and presentation of films, documentaries and reports. The stages of the activity were carried out in a school environment, always under the supervision of the teacher and the interns, and the material to be used was made available by the school.

It is also noteworthy that the groups had the freedom to choose how they would present their discussions and conclusions on the theme, being able to choose between the elaboration of posters and/or the use of *tablets* and research on the internet. The presentation of the works was carried out by all the members of the groups, who answered questions on the theme asked by the teacher.

During each presentation and discussion, the students were invited to evaluate their colleagues, using a questionnaire distributed by the teacher, demonstrating what they learned from each group and at the end it was proposed to prepare an essay, of 15 to 20 lines, highlighting the importance of an activity of this type and how the students felt analyzing each theme.

The objective of the activity was to promote the use of active methodology in the classroom, fostering a space for dialogue and discussion on relevant topics that impact the daily life of Brazil and the global environment, using resources available at school, whether technological or not.

2 TARGET AUDIENCE OF THE ACTIVITY

This activity was carried out with students in the 8th grade of Elementary School II, according to the general competencies of the National Common Curricular Base (BNCC), where the main objective of the Geography discipline is the development of geographical reasoning, the understanding of the world and the student's performance as a citizen (BRASIL, 2017).

From the grade in which the teacher teaches, this type of work can be adapted to the needs of each class, based on the BNCC and the students' own questions. It is up to the teacher to analyze the probability of developing an activity of this type and what will be the themes to be discussed by them.

3 METHODOLOGY

The activity was carried out within the scope of the third academic bimester of the year 2025, based on a proposal made by the students themselves regarding a rereading of the bimonthly evaluations of the discipline. For this, the possibility of adapting and preparing a UN Conference was discussed with the school's management team, bringing discussions and presentations on current and relevant topics. From this, a series of activities was proposed to the students that culminated in the activity and the bimonthly evaluation.

A work script was prepared with instructions on what each group should do and from this, the students were asked what were the topics that they were most curious about or that they wanted to study, and the aforementioned themes were reached. The dates for the presentation of the papers were defined, as well as the need to carry out the essays, pointing out the pros and cons of the activity.

Then, there was a first round of dialogue with the groups, where the students were able to ask questions about the realization of the work, as well as questions were raised about how to research the themes and how each one could contribute in the subsequent presentations. For each theme, videos, media files in general and documents for individual and/or group research were presented.

In the middle of October 2025, a new conversation circle was held about the realization of the works. It should be noted that the students were nervous about having to present their results to their classmates, but that the knowledge about each topic was arousing curiosity in each one. In this part, the students brought the materials (photographs and text) for the elaboration of the posters in the classroom.

In early November 2025, the students presented their research in the classroom, using posters and/or *slides*, presenting the themes, their causes, their consequences and in some cases bridging the gap between the theme and the reality experienced in the country. The groups that presented the work on Racism in the world, the Trump Administration and the issue of COP 30 were the ones that achieved satisfactory results, bringing current and relevant information about each one and how its implications affect the daily life of the world, the country and, in the case of racism, how these practices are harmful in the school environment.

At the end, the students prepared the essays with the main questions raised by each group, how it was necessary to have a dialogue between the participants, how the work was prepared and, finally, how the proposed activity was important for the knowledge and discussion of each theme.

4 RESULTS ACHIEVED

The results achieved were positive, with regard to the discovery of subjects that are often not discussed correctly or that are not interesting to them, are left aside. Getting students to think about the topics they wanted to work on, as well as the way they wanted to present their work, was crucial to the success of the activity. Even the class wants another activity of this type, which will be held during the 2026 school year. At the end of the activity, an exhibition mural was prepared showing each of the works in the classroom itself.

Some of the works are shown below, Figure 1 presents the results on the theme Racism in the world; Figure 2 is about the issue of Religious Intolerance and Figure 3 is about COP 30.

Figure 1

Poster on Racism in the World

Figure 2*Work on Religious Intolerance.***Figure 3***Poster about COP 30*

5 CONCLUSIONS

The proposed activity was successful and was accepted by the school community, in the sense of bringing to the debate current issues of extreme importance for the daily lives of students. In addition, the students played an essential role in conducting the activity. It should be noted that this can be carried out in any grade of Elementary or High School, using materials available in schools and respecting the content and interest of the students involved.

ABSTRACT

This article discusses the integration of Digital Technologies in the school context and briefly shares an experience of using P3D Software in Biology teaching. The theoretical support was based on studies by Amabis (2001), BNCC (2018), Costa (2004), Lévy (2005), Moita (2006 and 2007), among others. For data collection, bibliographic research and participant observation in the computer lab were used with the use of P3D Software in Biology classes with 9th-grade students. The study revealed that with the use of educational technologies, new ways of teaching and learning are emerging, ensuring that children and young people have their learning rights in relation to understanding, using, and creating with digital resources. The use of P3D Software made teaching more attractive and immersive. Students combined 3D images of the Human Body; Numerous possibilities exist for teaching content about the Human Body, aligned with the BNCC (Brazilian National Curriculum Base), which would not be possible in a traditional classroom setting based on linear text and images.

Keywords: Biology Teaching. 3D. Virtual Reality. Elementary School. BNCC.

RESUMO

O presente artigo discute a integração das Tecnologias Digitais no contexto escolar e compartilha, brevemente, uma experiência do uso do *Software P3D* no Ensino de Biologia. O suporte teórico teve embasamento nos estudos de Amabis (2001), BNCC(2018), Costa (2004) Lévy(2005), Moita (2006 e 2007) entre outros. Para a coleta dos dados, utilizou-se de pesquisa bibliográfica e a observações participante no laboratório de Informática com o uso do *Software P3D* nas aulas de Biologia, com alunos do 9º Ano do Ensino Fundamental. O estudo revelou que com o uso das tecnologias educacionais, novas formas de ensinar e aprender vão surgindo, garantindo que crianças e jovens tenham seus direitos de aprendizagem em relação à compreensão, utilização e criação com o uso de recursos digitais. O uso do *Software P3D* tornou o ensino mais atraente e imersivo. Os alunos realizaram combinação de imagens do Corpo Humano em 3D; inúmeras possibilidades de

RESUMEN

Este artículo analiza la integración de las tecnologías digitales en el contexto escolar y comparte brevemente una experiencia con el uso del software P3D en la enseñanza de Biología. El fundamento teórico se basó en estudios de Amabis (2001), BNCC (2018), Costa (2004), Lévy (2005), Moita (2006 y 2007), entre otros. Para la recopilación de datos, se empleó la investigación bibliográfica y la observación participante en el laboratorio de informática, utilizando el software P3D en clases de Biología con estudiantes de 9.º grado. El estudio reveló que, con el uso de las tecnologías educativas, surgen nuevas formas de enseñanza y aprendizaje, garantizando que niños y jóvenes tengan derecho a aprender a comprender, usar y crear con recursos digitales. El uso del software P3D hizo la enseñanza más atractiva e inmersiva. Los estudiantes combinaron imágenes 3D del cuerpo humano; existen numerosas posibilidades para la enseñanza de contenidos sobre el cuerpo humano, alineados con la BNCC (Base Curricular Nacional Brasileña), lo cual no sería posible en un aula tradicional basada en texto lineal e imágenes.

1 INTRODUCTION

Web 2.0, in the mid-2000s, brought numerous ways of interaction and participation in different educational technologies: Platforms, applications, 3D and Virtual Reality software, among other systems, which has been radically modifying the conception and proposals of how digital resources can be used in teaching, of the various curricular components of Basic Education.

Today's students are part of a generation that communicates, shares and creates differently and has expectations of a more playful education connected with the real and virtual world. If before schools made computer labs available for students and teachers, today, as or more important than the technological infrastructure is how the school is organized for the effective use of technologies in the process of teaching and learning, that is, the pedagogical proposal, the training and the interest of teachers are integrated, aiming at the proper use of digital resources in the school. Whether teachers preferred to propose offline assignments, slideshows, or internet surveys.

Today, it is necessary to rethink the school infrastructure to receive educational technologies in their contexts and how teachers are reconfiguring the methodologies to use them to use them, aiming to develop the skills and competencies of students, because, much more than mere receivers of information, today's students want to create, feel and live new challenges in the classroom.

With the advent of the digital age, several educational technologies have been implemented in Basic Education schools to enhance teaching and learning, such as Virtual Reality laboratories, maker room with digital whiteboards and teacher training with the theme of the use of Artificial Intelligence (AI), it is seen that the way to use digital resources in school needs, increasingly, to be reflected in the different curricular components.

If before there were no clear objectives when using educational digital resources in the classroom, today teachers are required to have skills and proposals that can add value to student learning, as it is considered that, if used properly, they can be important resources to rethink the teaching and learning process at the most diverse levels of education.

Thus, this article seeks to reflect on the integration of Digital Technologies in the school context and to briefly share an experience of the use of P3D Software in Virtual Reality in the Teaching of Biology, with students of the 9th Grade - Elementary School.

2 FROM THE TRADITIONAL TO THE DIGITAL CURRICULUM: PATHS TO THE INTEGRATION OF EDUCATIONAL TECHNOLOGIES

In the scenario of great technological advances, the integration of educational technologies into the school context has become a requirement of contemporary education. For Basic Education, it is required to use and create technologies in a critical, meaningful, reflective and ethical way in the various social practices (including school ones) to communicate, access and disseminate information, to guarantee the right to learning and the development of cognitive potentialities.

According to the Ministry of Education (MEC), educational technologies are processes, tools, and materials that help education networks in the most diverse functions, from school management to the learning process in the classroom, including teacher training and inclusive education practices.

Therefore, educational technologies should be used in the classroom and, with them, more attractive classes should be proposed, which stimulate learning in a way that favors the search for information, analyzing, synthesizing and critically evaluating. It is necessary to encourage students to be protagonists of their learning and present them with learning challenges in the classroom, with interactive, collaborative and immersive resources, capable of providing them with an innovative way of thinking, acting, learning and making changes in the classroom.

In addition to enabling learning, the use of educational technologies validates what the BNCC provides. Both the main document, which brings "digital culture" as a general competency, and the complement that deals with the teaching of computing, clarify that students must develop skills related to the critical, reflective and ethical use of technological resources.

The National Common Curriculum Base (2018) provides that students need to develop general skills for digital culture using digital resources to learn and produce, use technological resources to design, develop, publish and present products (such as web pages, mobile applications and animations, for example) to demonstrate knowledge and solve problems. On the Digital World, the document explains the impact of technologies on people's lives and society, including social, cultural and commercial relations.

Thus, it is pertinent to ask: How to plan classes using digital technologies, so that they are truly integrated into curricular activities and that they are related to the competencies provided for by the BNCC?

To this question. Also, we find support in the BNCC, the document mentions that schools need to ensure the infrastructure to carry out activities related to the proposals. In

certain skills, especially those that appear in the Final Years, however, technological resources are required, such as devices with access to the internet and specific platforms. For teachers, it is the task of qualifying the use so that students make the best use of these resources.

The BNCC provides that in the Teaching of Natural Sciences, educational resources should be used to investigate and also as a means of producing information and knowledge: accessing, appreciating, producing, recording and sharing artistic practices and repertoires, in a reflective, ethical and responsible way. According to Silva (2012, p. 232) "in the classroom, the treatment given to learning content can be inspired by the construction of a network and not a route".

For Lévy (2005), it is not enough for the learner to appropriate technologies and their tools in an instrumental way, it is necessary to know how to deal with potential so that they can build knowledge and create innovative solutions. Therefore, it is understood that digital technologies are needed in the classroom in order to develop the student's interest in curricular content and mean advancement in learning.

The National Ten-Year Education Plan 2-2020 (PNE) highlights the relevance of the use of digital technologies as a pedagogical resource, at the different levels, spheres and dimensions of education, in order to encompass both students and teachers. Of the strategies, the following stand out:

7.6) Select, certify and disseminate educational technologies for primary and secondary education, ensuring the diversity of pedagogical methods and proposals, as well as monitoring the results in the education systems in which they are applied.

7.7) Foster the development of educational technologies and innovation of pedagogical practices in education systems, which ensure the improvement of school flow and student learning.

In this Plan, there are guidelines for teachers of Basic Education and different teaching modalities to rethink their daily pedagogical practices with the use of Digital Technologies, so that they use them for the production of knowledge. It is understood that:

The teacher needs to become aware of the movement of digital technologies in tune with the information society, with cyberculture and with the communicational profile of learners. These are less and less subservient to the univocal logic of mass media, when they operate more with the mouse, the touch screen, the movable and three-dimensional windows that allow more than merely looking and watching (SILVA, 2012, p. 254).

Therefore, it is important that teachers take ownership of educational resources and plan with intentionality in mind, so that they can provide "digital native" students with learning experiences consistent with their reality. This means that it is necessary to reflect on new ways of teaching for a generation that thinks and learns differently.

3 IMMERSIVE ENVIRONMENTS IN BIOLOGY TEACHING: AN EXPERIENCE REPORT WITH VIRTUAL REALITY AND 3D

The teaching of Natural Sciences in contemporary times needs to be considered as a collective, historical, contextualized, unfinished production, which develops through ruptures and scientific revolutions. However, in general, it is observed that the practice in the classroom and the resources used by teachers, for the most part, are textbooks, transcription on the blackboard and practices of memorizing texts and ready-made answers. It is observed that this type of teaching has left gaps in student learning.

An approach that associates theory and practice, values collective and meaningful practices, is dialogical and works with a procedural evaluation is still little present in this area of teaching. Amabis (2001) states that the difficulties in this area of knowledge are universal and that "the problem of current science teaching, in high school and elementary school, lies in the lack of a sense of direction, of a philosophical basis and the fact that teachers continue to teach as they were taught due to the lack of models" (AMABIS, 2001, on-line). Also for this author, it is expected that, in Natural Sciences and Biology classes, students make the articulation between the knowledge studied at school and everyday life.

Therefore, he judges meaningless an education based on the transmission of facts. It is necessary to prioritize interdisciplinarity, new proposals and new resources through which the student can understand how knowledge was built and how it can be changed.

Thus, here we report the use of the P3D educational software in the Biology classroom, with the 9th grade class of Elementary School. The objectives and contents proposed for the class were about the "Human Body (Human Skeleton)". The P3D Software was selected by the Biology teacher to use in the computers of the Computer Laboratory, an Image Projector and a digital whiteboard were also used to expand the contents covered. It should be said here that the teacher, before proposing the use of the software, had already selected and evaluated the resources he would use, intentionally, during three classes, with 50 minutes. The space chosen for the class with the use of the Software was the school's computer lab, where computers installed with the software and a digital whiteboard were available for presentations, if necessary.

The P3D educational software allows immersion in the contents of the curricular components of Biology, Science, Chemistry and Geography in Virtual Reality, with 3D elements. As this is the students' first contact with the P3D Software, the initial step was the presentation of a Software tutorial, undoubtedly an important moment for students to be motivated to create, research and interact through the new digital resource, as can be seen at the address <http://www.p3d.com.br/>.

It is worth mentioning here that the students had no difficulties in finding the resources, they explored the software in an intuitive way, with each discovery they interacted with the teacher, making connections with what they already knew about the content and with the new knowledge acquired with the exploration of the Software. As Silva (2012, p. 225) well expresses, "in digital art, the conception of the artist's authorship is the same. Starting with the digital image itself, understood as a field of dialogical possibility of immersion, navigation...".

In the second class, with the use of the P3D Software, the proposal for the study was to take a "journey through the human body", enabling a truly playful class in a Virtual Reality scenario, an immersive, personalized experience without the need for 3D glasses. It should be noted that the P3D Software does not require glasses for immersion in the Virtual elements. The Virtual Reality simulation is presented on the screen in power, with images and movements of virtualization in power.

Valente (2013, p.40) highlights the importance of the use of digital resources integrated into the curricular components, as "many phenomena can be simulated, allowing the development of activities or the creation of a "world of make-believe" where certain activities are not possible to be developed in the real world". For the Teaching of Biology, Virtual Reality enabled different simulations of the Human Body, which enhanced the Teaching and learning of the proposed contents.

In the third and last meeting, students and teacher observed and discussed the importance of the rib cage, muscles, vital organs, among other abstract concepts that, in a traditional classroom space, based on text and linear image of the textbook would not be possible. A singular moment of immersion. With the use of Virtual Reality: interaction, navigation and immersion in a three-dimensional environment generated by the computer, through multisensory channels of vision, hearing, touch, smell or taste, in Biology classes.

Therefore, it is believed that the benefits offered by the use of 3D in school come from the intuitive knowledge that this resource can provide to the student about the physical world, which can be used to manipulate information and concepts through experiences close to

reality. This is because, in the virtual environment, it is possible to create the illusion of a world that, in reality, does not exist, through 3D representation.

4 EDUCATIONAL SOFTWARE AND VIRTUAL REALITY: CONCEPTUAL BASES FOR CONTEMPORARY TEACHING

The technological impulse, the convergence of media, Virtual Reality and 3D models have made educational software increasingly sophisticated. For the school context, the use of this resource can mean a new design in teaching and enable students to have new learning experiences through simulation, immersion, animation, among other functions.

For Gomes (2015), educational software, from the user's perspective, is a resource developed to assist the teaching and learning process of curricular activities in the most diverse areas of knowledge, which can be explored according to the interest of each student or, specifically, enable the process of teaching and learning a specific subject.

Ramos (2013) asserts that educational software can be defined as a digital resource produced specifically for the purpose of supporting teaching and learning. The author adds that, with this resource, whose elements allow modeling, simulation, animation and multimedia combination, among other functions, teaching strategies and different modes of learning can be created, that is, the integration and use of these resources in the classroom can place students and teachers in front of experiences that are impossible to carry out through traditional resources. Especially when the choice of teachers falls on educational software.

Costa & Oliveira (2004) conceptualize educational software as "that type of program developed especially for teaching activities, with the main objective of allowing students to develop the learning of certain content" (COSTA; OLIVEIRA, 2004, p. 125). Therefore, it is understood that educational software is a digital resource developed for the teaching and learning process that can contribute to a new teaching design, help the understanding of the contents in the most different subjects of the curriculum and promote motivation and new learning in the classroom.

For Gomes (2015), the use of educational software in the teaching and learning process can contribute to promoting the cognitive development of users, with an impact on the learning of certain conceptual fields. Such resources can represent excellent learning possibilities, in addition to serving to rethink the process of teaching and learning.

Ramos (2013) also defends the use of educational software in the classroom by teachers and students, emphasizing that they can significantly influence learning because they have concepts and theories that the textbook does not have. Moreover, these concepts

and theories can be assimilated in an authentic and non-linear way. Also for this author, the use of digital resources requires a pedagogical approach different from the traditional teaching approach, which allows for the proper exploration of the functions and properties of the resource, in terms of task, activities and experiences provided to students, removing from these work proposals "something" that would not be possible without access to and use of this type of resource (RAMOS, 2002, p. 101).

Thus, the way in which the software is used in pedagogical practice needs to be associated with the pedagogical intentionality and the technical characteristics of the software. The author also considers that an innovative digital educational resource

a) it contains clear educational intentionality, associated with the curriculum; b) It incorporates approaches, both at the design level (exploring computational characteristics) and at the pedagogical level (integrating a specific approach to the teaching and learning process within the resource), providing modes of unique learning experiences, arising from computational possibilities, in relation to the knowledge, content or process to which it relates; c) It requires the active involvement of the student in the proposed didactic activities through the use of the functions and internal properties, proper to the resource (RAMOS, 2013, p.102).

Thus, for educational software to truly act as resources that can reconfigure the teaching and learning process, it is necessary that teachers, before using them, establish "[...] precise pedagogical criteria and objectives, based on learning theories, in the same way as with materials in the form of video and television and radio broadcasts" (GOMES, 2015, p. 73).

In this understanding, teachers need to know the characteristics of the software and know how to select them, as well as evaluate them according to the pedagogical objectives they intend to achieve. It is necessary to define when, how, under what circumstances and what learning objectives students can achieve, in terms of knowledge of the contents or in terms of skills that they may acquire through the exploration and use of this software (RAMOS, 2013, p. 106).

Valente (1998) and Vieira (1999) propose categories according to the pedagogical objectives of the educational software, namely: tutorials, exercises and practices, educational games, simulation and modeling.

In this study, the educational software of the type "simulations" in 3D stands out, which provides users with a virtual visualization of real situations, in which it is possible to explore and manipulate objects through various angles and perspectives. The use of resources with 3D technology - educational software, games and others - can be efficient, especially in the

teaching of abstract content, since, through experiments and simulations, students are guided to articulate theory and practice.

Moita (2006) states that the simulation present in interactive images in virtual reality and in different screens, promotes the interaction and manipulation of objects or scenes, as well as the examination of them, from all points of view. In line with this author, Ramos (2013) emphasizes the importance of using educational software created and developed through simulation, since they correspond to "advanced forms of knowledge representations, which have evolved thanks to scientific and technological advances (which continue to evolve) and which are accessible to teachers and students" (RAMOS, 2013, p. 106).

Therefore, simulation software can mean an effective help in student learning by bringing complex solution challenges. In addition, they boost motivation and curiosity, build a new perspective on problem-solving and can develop cognitive potential, indispensable elements of active learning. Examples include software developed based on Virtual Reality (VR) for the exploration and visualization of three-dimensional images, object manipulation, animations, creation of texts, images and videos, among other applications, such as the educational software P3D, which is the object of research in this study.

One can then dare to propose a new category of educational software: Educational Software in VR. This type of educational software allows students and teachers to visualize, explore and study concepts from the various areas of the curriculum through three-dimensional (3D) imaging. It is an educational digital resource equipped with tools that enable the teaching and learning of school content through simulation and experimentation.

The use of educational software in VR can significantly alter teaching practice and encourage students to interpret abstract content, which is usually not understood when using traditional resources such as textbooks, printed activities, drawings on the board or even the lecture. According to this conception, the integration of this type of software in the school context needs to be accompanied by concrete training of teachers, so that they can use them effectively and create didactic situations in which students can explore them, making new discoveries about the contents studied.

The way in which educational software is produced, its characteristics and its objectives also play an important role in the insertion in the school and in the adherence of teachers to use it in the classroom. The interface, immersion, interaction, challenges, fun, motivation, ease of navigation, intuition, and pedagogical proposal are characteristics that can make these software more attractive to students and teachers.

RAMOS (2013, p. 110) consider the existence of several levels of sophistication in the processes of creating digital educational resources, including: a) the mechanical level, b) the creative level and c) the design level.

The mechanical level refers to the use of elementary processes such as copying and pasting an image onto a web page, crafting a graphic to present, and recording a video interview for use on the platform.

The creative level refers to the use of processes that require a considerable level of technical and artistic mastery and general skills in the production of a resource, in addition to curricular knowledge, but that do not imply detailed planning.

The design level requires several steps in a complex planning process, ranging from the analysis of the needs of a group of recipients to the design of student interactions, as well as the material and devices for evaluating progress, among other aspects, in order to achieve the planned objectives.

Valente (1998) and Vieira (1999) also point out that the design of software needs to be connected to pedagogical objectives. They classify educational software according to the way they learn:

Sequential – its main objective is to present content to students and stimulate memorization, in a process of stimulation and response. In this case, the student is passive.

Relational – It is focused on the acquisition of certain skills and contributes to the student establishing relationships with other facts or other sources of information. The emphasis is given to the student, and learning is only processed with the student's interaction with technology;

Creative – Stimulates the creation of new mental schemes and favors the interaction between the teacher, the student and the technology. In this type of software, the process of sharing and collaboration between the subjects and immersion and creation in a learning context prevail. Students and teachers go through an active teaching and learning process, which favors changes in practice and in the way of learning.

For Gee (2009), the contemporary theory of learning deals with subjects learning from their experiences and, based on them, storing them in memory and using them to generate simulations that facilitate the formulation of hypotheses for the resolution of future problems in different contexts. The author asserts that good electronic games convey good learning principles. In addition, the challenge and learning are, in large part, what makes video games motivating and fun.

Thus, it is understood that educational software also needs to incorporate good characteristics and pedagogical intentionality, allowing students to develop good learning.

From this perspective, teachers need to be aware of the principles and characteristics of educational software for good results in the teaching and learning process, since, when used, this resource needs to work to encourage the student to think, create and socialize. It is the student who builds and maintains an interactional and active relationship with the software, seeking to discover the concepts and theories of the area of study proposed by the teacher.

Gee (2009) presents some learning principles that good games incorporate and that educational software should also incorporate as a way to make content learning more effective, which are transcribed below:

- **Identity:** No deep learning occurs if learners don't make a long-term commitment to it. Learning something in a new field, whether physics or carpentry, requires the learner to take on a new identity: a commitment to see and value the work and the world the way good physicists and carpenters do. Good video games captivate players through identity.
- **Interaction:** In a good game, words and deeds are placed in the context of an interactive relationship between the player and the world. Thus, in school, texts and books also need to be placed in contexts of interaction that the world and other people respond to.
- **Production:** Players are producers, not just consumers; they are "writers," not just "readers." Even at the simplest level, they co-design games by the actions they perform and the decisions they make. They help "write" the worlds they live in – at school, they should help "write" the field and curriculum they study.
- **Risks:** Good video games reduce the consequences of players' failures; when they get it wrong, they can always go back to the last game they saved. They are thus encouraged to take risks, to explore, to try new things. Games encourage players to take a different attitude, to explore in detail before going forward too quickly, to think laterally and not just linearly, and to use that exploration.

Smart tools and distributed knowledge: The virtual character or characters that one manipulates in a video game – and many aspects of the gaming world – are, in fact, "smart tools". Virtual characters have their own skills and knowledge that they lend to the player. The core knowledge needed to play the game is distributed among a set of real people and their clever virtual characters. Smart tools and distributed knowledge are key aspects in modern professions, although they are not always so in modern schools.

Cross-functional teams: Each player must master his or her own specialty (role), because a Mage plays very differently from a Warrior, but understands enough of the specialties of others to integrate and coordinate with them (cross-functional understanding). Moreover, in such teams, people join according to their commitment to a common mission, not primarily on the basis of race, class, ethnicity, or gender.

Performance prior to competence: players can perform before they are competent, supported by game design, the "smart tools" offered by the game, and often the support of other more advanced players (GEE, 2009, p. 03).

Some of these principles presented by the author could be applied in schools through the use of software, games, applications, among other systems, which would make learning more challenging, dynamic, and meaningful.

It should be emphasized, however, that teachers need to mobilize their knowledge and skills in order to enhance the use of such resources to ensure positive impacts in the classroom and promote the cognitive development of students. The importance of the teacher to create appropriate strategies is emphasized, aiming to achieve the objectives and evaluate the results in the teaching and learning process with the use of such resources.

The use of educational software with a 3D interface is a resource that can open ways for teachers to explore the cognitive potential of students and favor active, creative, immersive learning, in which the student will be able to experience new ways of understanding abstract content in a differentiated and pleasant way. "The best learning is the one that is understood and gives pleasure. Children love to learn even when they are taught with a different logic" (PAPERT, 1996, p. 83).

The use of educational software can stimulate human cognitive capacity and represent changes in the teaching and learning process when based on a flexible, dialogical and provocative proposal of the teacher, because, more than ever, he is impregnated with cultural significance (MOITA, 2007).

When referring to the use of 3D educational software in school contexts, it is imagined that they should bring in their conception an educational paradigm through which students can learn through exploration, simulation, construction and creation, taking advantage of the properties and potentialities that these resources offer for creation, co-creation and knowledge of the world.

5 FINAL CONSIDERATIONS

More than choosing which digital resource to use, it is necessary to define pedagogical intentionality, that is, to know what the objective is and how the technology will contribute to

the teaching and learning process, and how it will be used. With the educational technology defined, it is time to evaluate what the contributions are, think about the pedagogical objectives, reflecting on how technologies can enhance learning, whether in Biology, Science, Chemistry, among other curricular components.

Thus, the challenge that is posed is to stimulate the critical and reflective use of educational technologies integrated into the school curriculum, as an enhancer of teaching and new learning.

It is argued that teachers, in the digital age, are creative and that their classroom is attractive, interactive and capable of enabling transformations in teaching and learning. Tapscott (2010) suggests some strategies for pedagogical practice with educational technologies. This author recommends that one cannot just bring technologies to the classroom and expect good results: it is necessary to focus on the paradigm shift that these resources can promote. Therefore, it is necessary to use technologies to create a student-centered, customized and collaborative education environment, promote interactive classes to the detriment of expository ones and maintain a critical and reflective look at the entire process, giving voice to students and stimulating group work.

The contemporary educational context requires plural educational practices that enhance the teaching and learning process and maximize the quality of teaching in order to provide a more active, dynamic and varied learning, privileging research, interaction and personalization in multiple spaces and face-to-face and virtual times.

ABSTRACT

Fermented cereals have emerged as functional foods capable of modulating the gut microbiota and promoting significant health benefits. Fermentation enhances grain digestibility, increases the bioavailability of bioactive compounds, enriches the food matrix with probiotic microorganisms, and intensifies the production of metabolites such as short-chain fatty acids (SCFAs). These metabolites play a key role in intestinal barrier integrity, immune regulation, energy metabolism, and gut–brain axis communication. This review discusses the role of fermented cereals in microbiota modulation, the mechanisms underlying microbial and metabolite activity, and their impact on metabolic, immune, and gastrointestinal health. The evidence evaluated in this review indicates that fermented cereal-based products may contribute to chronic disease prevention, improved digestion, balanced microbiota, and enhanced intestinal function.

Keywords: Cereal-Based Fermented Foods. Intestinal Ecosystem. Lactic Acid Bacteria. Bioactive Compounds. Microbial Metabolites. Postbiotics.

RESUMO

Os cereais fermentados têm ganhado destaque como alimentos funcionais capazes de modular a microbiota intestinal e promover efeitos benéficos à saúde humana. A fermentação melhora a digestibilidade dos grãos, aumenta a biodisponibilidade de compostos bioativos, enriquece o alimento com microrganismos probióticos e intensifica a produção de

RESUMEN

Los cereales fermentados han ganado relevancia como alimentos funcionales capaces de modular la microbiota intestinal y promover efectos beneficiosos para la salud humana. La fermentación mejora la digestibilidad de los granos, aumenta la biodisponibilidad de compuestos bioactivos, enriquece los alimentos con microorganismos probióticos e intensifica la producción de metabolitos como los ácidos grasos de cadena corta (AGCC). Estos metabolitos desempeñan un papel fundamental en la integridad de la barrera intestinal, la respuesta inmunitaria, el metabolismo energético y la comunicación microbiota–intestino–cerebro. Esta revisión discute el papel de los cereales fermentados en la modulación de la microbiota, los mecanismos implicados en la acción de los microorganismos y los metabolitos derivados de la fermentación, así como los impactos de estos alimentos en la salud metabólica, inmunológica y gastrointestinal. Los estudios analizados evidencian que los productos fermentados a base de cereales pueden contribuir a la prevención de enfermedades crónicas, a la mejora de la digestión, al equilibrio de la microbiota y al fortalecimiento de la función intestinal.

1 INTRODUCTION

Cereals represent one of the bases of human nutrition, providing energy, fiber, proteins, essential vitamins and minerals, as well as bioactive compounds capable of performing antioxidant and anti-inflammatory functions (Sharma et al., 2024; Avnee et al., 2023). In developing countries, foods such as rice, wheat, maize, sorghum, and oats constitute the main dietary source for the population, being fundamental for global food security (FAO, 2022; Patra et al., 2023).

In recent decades, fermented foods have received increasing scientific attention due to their ability to improve nutrient bioavailability, increase the concentration of bioactive compounds, and modulate the gut microbiota, becoming relevant for health promotion and prevention of chronic diseases (Bruce et al., 2025). Cereal fermentation, in particular, has proven to be a promising technological alternative, as it uses widely consumed and accessible matrices, enabling the production of functional foods enriched with probiotics, postbiotics, and beneficial metabolites (Setta et al., 2020; Sharma et al., 2024).

At the same time, the gut microbiota has been recognized as an essential component for the body's homeostasis, influencing metabolic, immunological, and neurological processes through the gut-brain axis (Valdes et al., 2018; Chevalier et al., 2020). Changes in this microbial community — known as dysbiosis — have been associated with obesity, diabetes, inflammatory diseases, anxiety, and depression (Xu et al., 2024; Gomaa, 2020).

Given this scenario, there is growing interest in identifying ingredients and technological processes capable of positively modulating the gut microbiota. Among them, fermented cereals emerge as potential allies, as they can favor the growth of beneficial microorganisms, increase the production of short-chain fatty acids (SCFAs), and improve the integrity of the intestinal barrier, reflecting in systemic benefits (Setta et al., 2020).

Thus, it becomes relevant to gather and discuss the evidence on the role of fermented cereals in modulating the gut microbiota and its impacts on human health.

Objective: This article aims to review the scientific evidence on the effects of fermented cereals on the gut microbiota and the potential benefits arising from this modulation for human health.

2 THEORETICAL FRAMEWORK

2.1 THE IMPORTANCE OF CEREALS IN HUMAN NUTRITION

Cereals, widely consumed around the world, are essential sources of carbohydrates, proteins, lipids, vitamins, minerals and bioactive compounds, such as phenolics and antioxidants, as well as micronutrients such as iron (Fe), zinc (Zn), copper (Cu), iodine (I),

selenium (Se) and several vitamins, contributing significantly to human health. In several regions — especially developing countries — foods such as rice, maize, and wheat constitute more than 50% of daily caloric intake (Avnee et al., 2023). Globally, these grains represent about 45% of the arable areas (Galati et al., 2014), standing out as the most important agricultural crops and the main dietary sources of micronutrients and vitamins for the population, being consumed raw or fermented (Galati et al., 2014; Soro-Yao et al., 2014).

Botanically, cereals belong to the Poaceae family, characterized by their edible grains called cariopses (Holban; Grumezescu, 2020). However, grains such as quinoa and buckwheat, although not grasses, are classified as pseudocereals due to their similar use in human food. According to FAO (2023), the main cereals produced in the world include maize, rice, wheat, barley, sorghum, millet and oats, buckwheat, standing out for their wide agricultural and nutritional relevance (Patra et al., 2023).

In addition to energy intake, cereals contribute significantly to the intake of bioactive compounds, such as polyphenols, carotenoids, phytoestrogens, phenolic acids, and antioxidant fibers (Sharma et al., 2024). These compounds exert protective functions, modulate inflammation, and stand out as important precursors for functional formulations (Setta et al., 2020).

2.2 NUTRITIONAL COMPOSITION AND BIOACTIVE COMPOUNDS OF CEREALS

The composition of cereals is complex, with the main classes of nutrients represented by complex carbohydrates — predominantly starch — and by different types of soluble and insoluble fibers. The protein intake varies between 8% and 15%, with gluten standing out in the case of wheat, while lipids are present in a smaller proportion (1–7%). Nutritionally, cereals are important sources of micronutrients, including iron, zinc, selenium, copper, magnesium, and several B vitamins. In addition, they are rich in bioactive phytochemicals, such as flavonoids, lignans, phenolic acids (ferulic, caffeic), tocopherols, and β -glucans.

Recent research shows that whole grains provide antioxidants capable of neutralizing free radicals and reducing oxidative stress (Setta et al., 2020). Phenolic compounds present in the bark and germ are particularly important, exerting anti-inflammatory, antimicrobial and modulating actions on the gut microbiota.

In cereals such as oats, the presence of β -glucans promotes an increase in the production of short-chain fatty acids (SCFAs) — especially butyrate — which strengthen the intestinal barrier and modulate the immune response (Patra et al., 2023).

3 CEREAL FERMENTATION: PROCESSES AND MICROORGANISMS

Fermented foods constitute an important category of products capable of influencing the intestinal microbiota and, consequently, physiological processes related to host health. These foods contain active microbial consortia that modulate metabolic pathways, contribute to cellular redox balance, and enrich the diet with bioactive compounds produced throughout fermentation. The predominant microbial composition includes acetic, lactic, non-lactic, Gram-negative bacteria, filamentous fungi and yeasts, whose action is decisive for the formation of the sensory and functional characteristics of these products (Tamang et al., 2016). In traditional systems, these microorganisms metabolize the constituents of raw materials, triggering biochemical transformations that result in foods with greater nutritional and functional complexity (Laya et al., 2023).

Several strains involved in the fermentation process have the ability to synthesize or increase the availability of vitamins, antioxidants, peptides, exopolysaccharides, organic acids and other metabolites of interest. These compounds are associated with antioxidant and antimicrobial properties widely described in the literature, contributing not only to health benefits but also to natural food preservation (Alkalbani et al., 2019; Kandylis et al., 2016; McGovern et al., 2004). Together, these evidences reinforce the role of fermented foods as important nutritional allies, in addition to highlighting their biotechnological potential for the development of functional products.

Cereals have been used throughout history in the production of fermented foods — such as pozol, ogi, boza, injera, rice kimchi, and traditional fermented beverages — due to the ability of their matrices to favor the growth of beneficial microorganisms.

Fermentation is carried out mainly by:

3.1 LACTIC ACID BACTERIA (LAB)

- *Lactobacillus* spp.
- *Leuconostoc* spp.
- *Pediococcus* spp.

These bacteria produce lactic acid, acetic acid, and antimicrobial compounds that inhibit pathogens.

3.2 YEASTS

- *Saccharomyces cerevisiae*
- *Candida* spp.

They contribute to aroma, texture and increase of B vitamins.

3.3 FILAMENTOUS FUNGI

Less common in cereals, but present in traditional African and Asian foods (Aspergillus, Rhizopus).

4 IMPACT OF FERMENTATION ON NUTRITIONAL QUALITY

Fermentation stands out for its ability to transform agri-food by-products into bioactive compounds and biopolymers with high added value, several studies show that fermenting microorganisms can generate peptides, antioxidants, polysaccharides and other metabolites with functional applications, while contributing to human health and environmental sustainability and from a health point of view, fermented foods that have high acidity, Significant salt content or moderate alcohol levels have a long history of safe consumption, an effect attributed mainly to environmental conditions unfavorable to the growth of pathogenic microorganisms. Lactic acid bacteria (LAB) play a key role in this process, as they reduce pH, synthesize antimicrobial metabolites, and actively inhibit pathogens, contributing to the stability and safety of fermented foods. Fermentation is also crucial for improving the nutritional quality of foods widely consumed in different regions of the world. By reducing antinutrients and removing toxic compounds, it increases the safety and bioavailability of nutrients present in raw materials such as cassava, cereals, and legumes. A well-documented example is the sourdough fermentation process, which favors the release of essential minerals and can even improve wheat tolerance by modulating digestive and metabolic responses (Fitsum et al., 2025).

Traditional fermented foods — which include dairy, cereal, and vegetable products — stand out for their potential to promote broad nutritional benefits, such as improved digestion and prevention of diseases related to the gastrointestinal tract. As consumer awareness of the impacts of diet on immunity and digestive balance grows, these products gain relevance, driven by the strong scientific evidence supporting their positive effects on health

Fermentation:

- increases the bioavailability of minerals, reducing phytate, the main antinutrient in cereals;
- improves protein and carbohydrate digestibility;
- reduces allergenic compounds;
- synthesizes vitamin K, B12 and B9 in some fermented matrices;
- increases the concentration of phenolic compounds and antioxidants.

Fermented cereals have a higher nutritional profile than their non-fermented versions, mainly due to the enzymatic action of LAB, which releases previously inaccessible bioactive compounds (Sharma et al., 2024).

5 GUT MICROBIOTA: FUNCTIONS, COMPOSITION, AND CLINICAL RELEVANCE

The gut microbiota plays an essential role in regulating host metabolic functions, including energy uptake, storage, and expenditure. Among the most well-known mechanisms is the production of short-chain fatty acids during fermentation, which increase efficiency in obtaining energy. The establishment of a specific microbiota is crucial for the proper maturation of the intestinal immune system, a process of coevolution between host and microorganisms that begins in early life (Chung et al., 2012).

The gut microbiota is composed of trillions of microorganisms — predominantly bacteria from the phyla Firmicutes, Bacteroidetes, Actinobacteria, and Proteobacteria — performing essential functions in the body (Valdes et al., 2018).

Followed in a smaller proportion by Actinobacteria, Proteobacteria, Verrucomicrobia, Fusobacteria and Euryarchaeota. Microbial composition varies along the gastrointestinal tract, reflecting marked differences in pH, oxygen availability, and nutritional content between segments such as the stomach, small intestine, and colon. These specific conditions shape the colonization capacity and distribution of microbial communities. For example, due to the higher concentration of oxygen in the proximal portion of the small intestine, facultative and aerotolerant anaerobic microorganisms predominate, while the colon, a strictly anaerobic environment, harbors a high diversity of completely anaerobic bacteria.

Understanding the diversity and function of the microbiota requires the use of advanced molecular tools, with metagenomics being essential to characterize microbial communities, especially in niches such as the small intestine (Booijink et al., 2007).

The close interaction between the host and its microbiota gives these microorganisms a fundamental role in physiological and metabolic regulation. The collective genetic potential of the microbiome is estimated to be at least one hundred times the number of human genes, and its metabolic products exert a direct influence on essential biological processes (Olofsson, 2017).

They contribute to the production of important vitamins, such as those of the B complex (B9 and B12) and vitamin K. In addition, they help neutralize carcinogenic compounds, including pyrolysates. These effects occur because their metabolites are able to interact with cell membranes and nuclear receptors of the host, influencing essential processes of human physiology (Ho; Chan; Li, 2015).

Among its functions, the following stand out:

- maturation of the immune system;
- production of IgA and IgG against pathogens (Siddiqui et al., 2021);
- vitamin synthesis;
- fermentation of dietary fibers in SCFAs;
- modulation of energy metabolism;
- protection of the intestinal barrier;
- interaction with the central nervous system via the gut-brain axis.

The intestinal mucosa functions as a natural filter, rich in antimicrobial peptides that coordinate immune responses, while the microbiome helps defend against pathogens (Kamada et al., 2013).

6 GUT DYSBIOSIS AND RELATIONSHIP TO DISEASE

Dysbiosis is characterized by colonic dysfunction resulting from alterations in the intestinal microbiota, in which there is a predominance of pathogenic microorganisms to the detriment of beneficial bacteria — a concept that was widely disseminated at the end of the nineteenth century in Europe. The accumulation of aggressions to intestinal function compromises the balance of the microbiota, favoring the increase of potentially harmful bacteria and configuring a state of risk for the host. Some of these bacteria can colonize the small intestine, resulting in relevant consequences, such as improper digestion of nutrients and the formation of toxic peptides from the combination of proteins and toxins. Dysbiosis is a condition recognized as an important disorder associated with the diagnosis of several diseases (Almeida et al., 2008).

Several factors are associated with the development of dysbiosis, including the indiscriminate use of antibiotics, which eliminate both useful and harmful bacteria, as well as hormonal and non-hormonal anti-inflammatory drugs; the abuse of laxatives; excessive consumption of processed foods instead of fresh foods; high exposure to environmental toxins; consumptive diseases, such as cancer and acquired immunodeficiency syndrome (AIDS); hepatopancreatic dysfunctions; chronic stress; and diverticulosis. Age, intestinal transit time, luminal pH, availability of fermentable substrate and host immunological status are also considered important determinants (Almeida et al., 2008).

Dysregulation of the innate immune response at the intestinal interface is a key factor in several pathologies, and understanding the modulation of host defense by infectious agents is crucial for new therapeutic approaches (Katze et al., 2022)."

Advances in next-generation sequencing have revealed that alterations in the microbiota — the so-called dysbiosis — are associated with obesity, diabetes, chronic inflammation, liver disease, depression, and anxiety (Marco; Tachon, 2013; Liu et al., 2021).

Evidence indicates that gut dysbiosis not only alters the local energy metabolism of the cecum, but also exerts a significant influence on distant organs, such as the prefrontal cortex, olfactory bulb, and liver, demonstrating the breadth of systemic effects mediated by the microbiome, and may also influence conditions such as obesity (Heiss; Olofsson, 2017).

Dysbiosis corresponds to the imbalance of the microbiota, characterized by:

- reduction of beneficial bacteria (e.g., *Bifidobacterium*, *Lactobacillus*);
- increase in pathogenic or opportunistic species;
- lower microbial diversity;
- change in the production of SCFAs.

This imbalance compromises:

- the intestinal barrier, increasing permeability;
- anti-inflammatory mechanisms;
- neurotransmitter metabolism;
- immune response;
- insulin sensitivity.

Studies show a relationship between dysbiosis and:

- hepatitis B and C (Padilha et al., 2025);
- neurological diseases (Siddiqui et al., 2021);
- depression (Chevalier et al., 2020; Zheng et al., 2021);
- obesity and hepatic steatosis;
- irritable bowel syndrome.

7 THE GUT-BRAIN AXIS AND THE INFLUENCE OF THE MICROBIOTA

The gut microbiota plays a central role in regulating neural development, brain function, and different behaviors, composing a highly integrated axis that connects the gut to the central nervous system. Experimental models with germ-free animals demonstrate that the absence of microorganisms results in important structural and functional changes, evidencing the microbial influence on neural circuits and behavioral responses. This communication occurs through neural, immunological, metabolic, and endocrine pathways, forming the gut-brain axis, whose dysregulation can increase susceptibility to neuropsychiatric disorders.

According to Liu et al. (2021), changes in microbial composition are associated with physiological modifications related to conditions such as autism spectrum disorder, schizophrenia, and Alzheimer's disease. Such evidence supports the hypothesis that the microbiota plays a determining role in brain homeostasis, reinforcing its relevance for mental health.

The gut-brain axis includes:

- vagus nerve,
- immune system,
- microbiota,
- intestinal hormones,
- metabolism of tryptophan, GABA and serotonin.

The microbiota modulates the CNS through:

- metabolites such as SCFAs;
- inflammatory cytokines;
- neurotransmitter production;
- signaling via the hypothalamic–pituitary–adrenal axis.

Changes in these mechanisms are directly related to the development of depressive disorders, anxiety, and behavioral changes (Liu et al., 2021).

Table 1

Main mechanisms of the gut-brain axis and their implications for mental health

Communication Mechanism	Process Description	Mental Health Impacts	Evidence
Neural Pathway (Vagus Nerve)	The gut microbiota produces metabolites and neurotransmitters that stimulate intestinal receptors linked to the vagus nerve.	"Mood regulation; stress response; behavioral changes."	Liu et al. (2021); Mayer et al. (2015).
Immune pathway	"Microorganisms modulate pro- and anti-inflammatory cytokines, influencing neuroinflammation."	"Association with depression, anxiety, and neurodegenerative diseases."	Liu et al. (2021); Cryan et al. (2019).
Microbial Metabolites (SCFAs)	"Production of short-chain fatty acids (acetate, propionate, butyrate)."	"Modulation of the blood-brain barrier; influence on neurotransmitters."	Dalile et al. (2019).
Neurotransmitters and Precursors	"Bacteria produce GABA, serotonin, dopamine, or influence their synthesis."	"Regulation of mood, memory, and behavior."	Strandwitz (2018).

Communication Mechanism	Process Description	Mental Health Impacts	Evidence
Endocrine Axis (HPA)	Microbiota influences cortisol release and activity of the hypothalamic–pituitary–adrenal axis.	Stress response and emotional vulnerability.	Liu et al. (2021); Dinan; Cryan (2017).
Gut Barrier Integrity	Microorganisms maintain or impair the integrity of the mucosa.	Increased intestinal permeability can lead to neuroinflammation.	Kelly et al. (2015).

8 HOW FERMENTED CEREALS MODULATE THE GUT MICROBIOTA

Fermented cereals influence the microbiota in three ways:

8.1 PROBIOTIC ACTION

Probiotics are live microorganisms that, when consumed in adequate quantities, contribute to the health of the host by favoring the balance of the intestinal microbiota. Its beneficial effect is associated with the ability to compete with undesirable microorganisms, modulate the immune system, and promote an intestinal environment that is more resistant to colonization by pathogens. By stimulating the growth of beneficial bacteria and reducing the proliferation of potentially harmful ones, probiotics strengthen natural defense mechanisms and contribute to the maintenance of intestinal homeostasis (Saad, 2006).

Microorganisms present in fermentation:

- increase *Lactobacillus* and *Bifidobacterium*;
- compete with pathogens;
- strengthen epithelial junctions;
- improve intestinal barrier function.

BAL produce lactic acid, which lowers intestinal pH and inhibits harmful bacteria.

8.2 PREBIOTIC ACTION

Prebiotics, in turn, correspond to non-digestible food components that exert positive effects by selectively stimulating the growth or activity of specific groups of beneficial microorganisms in the colon. In addition to favoring the desirable microbiota, they can also hinder the multiplication of pathogenic microorganisms, offering additional protection to the host. Although they act predominantly in the large intestine, these compounds may influence, to a lesser extent, the microbial ecosystem of the small intestine. (Saad, 2006).

Fiber and indigestible carbohydrates in cereals—beta-glucans, arabinoxylans, fructans—serve as a selective substrate for beneficial fermenters.

This increases the production of SCFAs, mainly:

- acetate,
 - propionate,
 - butyrate,
- essential for gut integrity and inflammation reduction.

8.3 Release of bioactive compounds during fermentation

Fermentation:

- increases antioxidants;
- generates bioactive peptides;
- reduces antinutrients;
- It favors the formation of immunomodulatory compounds.

These compounds contribute to:

- less systemic inflammation;
- better insulin sensitivity;
- reduction of oxidative stress;
- modulation of the gut-brain axis.

(Silveira; Furlong, 2007; Heiss; Olofsson, 2017).

Table 2

Mechanisms by which fermented cereals modulate the gut microbiota

Mechanism	How it works	Impacts on the microbiota	Key References
Probiotic action	Introduction of live microorganisms from fermentation (BAL).	↑ <i>Lactobacillus</i> , ↑ <i>Bifidobacterium</i> ; competition with pathogens; strengthening of the intestinal barrier; pH reduction via lactic acid.	Saad (2006)
Prebiotic action	Fiber and non-digestible carbohydrates serve as a selective substrate.	SCFAs (acetate, propionate, butyrate); ↑ beneficial fermenters; ↓ inflammation.	Saad (2006)
Bioactive compounds released	Fermentation increases antioxidants, bioactive peptides, reduces antinutrients.	↓ systemic inflammation; better insulin sensitivity; Modulation of the gut-brain axis.	Silveira; Furlong (2007); Heiss; Olofsson (2017)

9 HUMAN HEALTH BENEFITS

Based on the evidence, the consumption of fermented cereals is associated with:

- improved digestion and absorption of nutrients;

- strengthening immunity;
- prevention of gastrointestinal diseases;
- reduction of inflammation;
- liver protection;
- mood and stress regulation;
- lower risk of obesity and insulin resistance.

In addition, fermented products stimulate microbial diversity — one of the best markers of gut health.

In a study carried out by Oliveira (2021) he demonstrated that the action of functional foods in the human body contributes to the balance of the intestinal microbiota and, consequently, to the improvement of health. In the context of the mechanisms of beneficial action of functional feeding, its performance in preventing the colonization of the intestinal mucosa by microorganisms considered pathogenic is highlighted. It has also been shown that the beneficial effect of functional foods is to protect individuals from possible diseases associated with the imbalance of the intestinal microbiota, such as dysbiosis, for example.

Therefore, an adequate diet, with bioactive compounds also coming from the fermentation of cereals, can exert a decisive influence on the composition of the intestinal microbiota, directly modulating which metabolites will be produced and how they will act in the body. Among these metabolites, short-chain fatty acids and secondary bile acids stand out, capable of activating specific signaling pathways through interaction with their receptors in the host.

These compounds also regulate the release of hormones that are fundamental to the gut-brain axis, such as GLP-1, PYY, and leptin, which modulate food intake both by systemic circulation and by activation of afferent vagal nerves. In addition, microbial products such as LPS and proteins derived from microorganisms have the potential to influence central metabolic processes, including hypothalamic neuronal pathways related to appetite control and energy expenditure. The microbiota also influences the integrity of the intestinal barrier, immune activity, and inflammatory response, composing a complex set of signals that affect gastrointestinal motility, nutrient absorption, and the body's energy balance (Heiss; Olofsson, 2017).

10 CONCLUSION

In summary, the present review demonstrated that fermented cereals are important food matrices capable of positively modulating the gut microbiota. This modulation occurs mainly through the symbiotic action of the microorganisms present (probiotics) and the native

and modified fibers (prebiotics), resulting in increased production of short-chain fatty acids (SCFAs). Such effects translate into systemic benefits, such as improving the integrity of the intestinal barrier, reducing inflammation, and modulating the gut-brain axis. Despite the growing interest and potential role of these foods in promoting health, there is still an important gap in the literature related to the specific mechanisms by which these products act on beneficial microbial populations. Available studies describe the presence of lactic acid bacteria, bioactive compounds, and general effects on gut health; However, there is a lack of deeper and standardized investigations that identify which microorganisms, metabolites, and signaling pathways are directly involved in the interaction between fermented cereals and the gut-brain axis. In addition, many studies use different methodologies, small samples and different types of cereals, which makes comparisons difficult. Thus, it is necessary to expand scientific production with controlled clinical studies, metagenomic analyses, and experimental models that allow us to elucidate more precisely how these foods contribute to the modulation of the intestinal microbiota and its possible systemic impacts.

ABSTRACT

Objective: This study investigates the relationship between the effectiveness of municipal public management and the financial health of the population, considering levels of default, poverty, and social vulnerability in municipalities in the State of São Paulo. The article proposes a novel multidimensional model that integrates public governance, financial education, financial psychology, and behavioral science as determinants of collective financial well-being. **Methodology:** The research adopts a quantitative, exploratory, and explanatory approach. Only secondary data were used, extracted from official sources such as IBGE, IPEA, UNDP, Serasa Experian, and the Court of Auditors of the State of São Paulo (TCE-SP), covering the period from 2022 to 2024. Statistical analyses involved Pearson correlation techniques, multiple regression, and cluster analysis (K-means), allowing for the evaluation of the impact of the IEG-M dimensions (Planning, Fiscal, Education, Health, Environment, and Protected Cities) on default and social vulnerability indicators. **Gap:** Brazilian literature presents a deficit of empirical studies that explore, in an integrated way, the effects of local public governance on collective financial behavior and socioeconomic well-being. Few studies combine concepts from financial psychology, behavioral science, and municipal public management in the analysis of indebtedness and the financial health of the population. **Results and Contributions:** The results show that municipalities with better performance in planning (i-Plan), education (i-Educ), and fiscal management (i-Fiscal) have lower rates of default and social vulnerability. Multiple regression confirmed that these dimensions are significant predictors of municipal financial health. Cluster analysis classified the municipalities into three distinct groups, with different profiles of effectiveness and vulnerability. The study proposes an Integrated Multidimensional Model that articulates: (i) the quality of municipal governance; (ii) the local socioeconomic context; (iii) financial

education and financial psychology interventions based on behavioral science; and (iv) the results in financial health and well-being of the population. This model expands the theoretical boundaries between public finance, economic psychology, and social policies.

Keywords: Financial Psychology. Public Management. Financial Health.

RESUMO

Objetivo: Este estudo investiga a relação entre a efetividade da gestão pública municipal e a saúde financeira da população, considerando os níveis de inadimplência, pobreza e vulnerabilidade social nos municípios do Estado de São Paulo. O artigo propõe um modelo multidimensional inédito que integra governança pública, educação financeira, psicologia financeira e ciência comportamental como fatores determinantes do bem-estar financeiro coletivo. **Metodologia:** A pesquisa adota abordagem quantitativa, exploratória e explicativa. Foram utilizados exclusivamente dados secundários, extraídos de fontes oficiais como IBGE, IPEA, PNUD, Serasa Experian e Tribunal de Contas do Estado de São Paulo (TCE-SP), abrangendo o período de 2022 a 2024. As análises estatísticas envolveram técnicas de correlação de Pearson, regressão múltipla e análise de cluster (K-means), permitindo avaliar o impacto das dimensões do IEG-M (Planejamento, Fiscal, Educação, Saúde, Meio Ambiente e Cidades Protegidas) sobre os indicadores de inadimplência e vulnerabilidade social. **Lacuna:** A literatura brasileira apresenta um déficit de estudos empíricos que explorem, de forma integrada, os efeitos da governança pública local sobre o comportamento financeiro coletivo e o bem-estar socioeconômico. Poucas pesquisas combinam conceitos de psicologia financeira, ciência comportamental e gestão pública municipal na análise do endividamento e da saúde financeira da população. **Resultados e Contribuições:** Os resultados evidenciam que os municípios com melhor desempenho em planejamento (i-Plan), educação (i-Educ) e gestão fiscal (i-Fiscal) apresentam menores taxas de inadimplência e vulnerabilidade social. A regressão múltipla confirmou que essas dimensões são preditores significativos da saúde financeira municipal. A análise de cluster classificou os municípios em três grupos distintos, com diferentes perfis de efetividade e vulnerabilidade. O estudo propõe um Modelo Multidimensional Integrado, que articula: (i) a qualidade da governança municipal; (ii) o contexto socioeconômico local; (iii) intervenções de educação financeira e psicologia financeira com base na ciência comportamental; e (iv) os resultados em saúde financeira e bem-estar da população. Este modelo amplia as fronteiras teóricas entre finanças públicas, psicologia econômica e políticas sociais.

Palavras-chave: Psicologia Financeira. Gestão Pública. Saúde Financeira.

RESUMEN

Objetivo: Este estudio investiga la relación entre la efectividad de la gestión pública municipal y la salud financiera de la población, considerando los niveles de morosidad, pobreza y vulnerabilidad social en municipios del Estado de São Paulo. El artículo propone un novedoso modelo multidimensional que integra la gobernanza pública, la educación financiera, la psicología financiera y las ciencias del comportamiento como determinantes del bienestar financiero colectivo. **Metodología:** La investigación adopta un enfoque cuantitativo, exploratorio y explicativo. Solo se utilizaron datos secundarios, extraídos de fuentes oficiales como IBGE, IPEA, PNUD, Serasa Experian y el Tribunal de Cuentas del Estado de São Paulo (TCE-SP), que abarcan el período de 2022 a 2024. Los análisis estadísticos incluyeron técnicas de correlación de Pearson, regresión múltiple y análisis de conglomerados (K-means), lo que permitió evaluar el impacto de las dimensiones del IEG-M (Planificación, Fiscal, Educación, Salud, Medio Ambiente y Cidades Protegidas) en los indicadores de morosidad y vulnerabilidad social. **Brecha:** La literatura brasileña presenta un déficit de estudios empíricos que exploren, de forma integrada, los efectos de la gobernanza pública local en el comportamiento financiero colectivo y el bienestar socioeconómico. Pocos

estudios combinan conceptos de psicología financiera, ciencias del comportamiento y gestión pública municipal en el análisis del endeudamiento y la salud financiera de la población. Resultados y contribuciones: Los resultados muestran que los municipios con mejor desempeño en planificación (i-Plan), educación (i-Educ) y gestión fiscal (i-Fiscal) presentan menores tasas de morosidad y vulnerabilidad social. La regresión múltiple confirmó que estas dimensiones son predictores significativos de la salud financiera municipal. El análisis de conglomerados clasificó a los municipios en tres grupos distintos, con diferentes perfiles de efectividad y vulnerabilidad. El estudio propone un Modelo Multidimensional Integrado que articula: (i) la calidad de la gobernanza municipal; (ii) el contexto socioeconómico local; (iii) intervenciones de educación financiera y psicología financiera basadas en ciencias del comportamiento; y (iv) los resultados en la salud financiera y el bienestar de la población. Este modelo amplía los límites teóricos entre las finanzas públicas, la psicología económica y las políticas sociales.

Palabras clave: Psicología Financiera. Gestión Pública. Salud Financiera.

1 INTRODUCTION

The increase in the indebtedness of Brazilian families in recent decades has attracted the attention of researchers, public policy makers and social control agencies. According to data from Serasa Experian (2024), more than 43% of the Brazilian adult population has some type of default, especially small and medium-sized municipalities. At the same time, the literature on financial psychology (Kahneman, 2011; Thaler, 2016) shows that financial stress directly impacts mental health, productivity, and quality of life.

The discussion about financial well-being cannot be dissociated from the local socioeconomic context. Municipalities with less public infrastructure, low educational quality, and poor planning capacity tend to have more financially vulnerable populations (OECD, 2022). In the State of São Paulo, the State Court of Auditors (TCE-SP) developed the Municipal Management Effectiveness Index (IEG-M), which measures the quality of public management in six dimensions: Planning (i-Plan), Fiscal (i-Fiscal), Education (i-Educ), Health (i-Saúde), Environment (i-Amb) and Protected Cities (i-Cidade).

Given this scenario, a central question arises: is there a relationship between the effectiveness of municipal public management and the levels of indebtedness and financial vulnerability of the population?

The objective of this article is to analyze the relationship between the performance of São Paulo municipalities in the IEG-M indicators and the levels of delinquency, poverty and socioeconomic vulnerability, using secondary public data, such as Continuous PNAD (IBGE), Atlas of Social Vulnerability (IPEA), HDI (UNDP) and the Serasa Experian database.

The main contribution of this study is to integrate, in an unprecedented way in the Brazilian literature, the approaches of financial psychology with indicators of public management and financial well-being, proposing a multidimensional model that relates municipal governance and the financial health of the population.

2 THEORETICAL FOUNDATION

2.1 FINANCIAL PSYCHOLOGY AND ECONOMIC WELL-BEING

Financial psychology seeks to understand how emotional, cognitive, and social factors influence people's behavior in relation to money (Shefrin, 2000). Phenomena such as loss aversion, presenteeism bias, and availability heuristics affect the way individuals handle their finances, impacting the level of indebtedness and economic well-being (Kahneman & Tversky, 1979; Thaler, 2016).

Additionally, recent studies indicate that financial stress is a significant predictor of mental health issues such as depression and anxiety (Netemeyer et al., 2018). Financial well-

being, therefore, should not be analyzed only from the perspective of income, but also from indicators that reflect financial security and the absence of economic suffering.

2.2 PUBLIC POLICIES, FINANCIAL EDUCATION AND QUALITY OF MUNICIPAL MANAGEMENT

The literature highlights that quality public policies play a decisive role in reducing the financial vulnerability of populations (OECD, 2022). The provision of quality basic education, efficient health services, and responsible fiscal policies are elements that affect, directly or indirectly, the ability of families to manage their finances.

Municipal performance in areas such as education (i-Educ) and health (i-Saúde) influences human capital and the financial decision-making capacity of citizens. The quality of planning (i-Plan) and fiscal management (i-Fiscal), in turn, conditions the sustainability of public policies to combat poverty and promote financial inclusion.

2.3 THE INDICATORS OF EFFECTIVENESS OF MUNICIPAL MANAGEMENT (IEG-M)

The Municipal Management Effectiveness Index (IEG-M) is a performance evaluation tool developed by the Court of Auditors of the State of São Paulo (TCE-SP), with the objective of measuring the quality and effectiveness of public policies implemented by the municipalities of São Paulo. The IEG-M seeks to transcend merely accounting and financial analysis, focusing on the effectiveness of government actions and the ability to deliver concrete results to society.

The index is composed of six main dimensions, each representing a critical area of municipal public management:

i-Plan (Planning): Evaluates the existence and quality of municipal planning instruments, such as the Multi-Year Plan (PPA), the Budget Guidelines Law (LDO) and the Master Plan, in addition to the capacity for integration between planning, budgeting and execution.

i-Fiscal (Fiscal Management): Measures the balance and fiscal responsibility of the municipality, including aspects such as collection capacity, compliance with fiscal targets, debt control, budget execution and regularity of accountability.

i-Educ (Education): Evaluates the effectiveness of public education management, considering indicators such as basic education coverage rate, school unit infrastructure, performance in external evaluations (such as IDEB) and investments made in the sector.

i-Saúde (Health): Analyzes the performance of municipal public health services, considering the coverage of primary care, the indicators of service to the population and the public investments destined to the sector.

i-Amb (Environment): Measures the municipality's environmental management capacity, including inspection actions, preservation of green areas, solid waste management and pollution control.

i-City (Protected Cities): Evaluates the municipal structure focused on public security and civil defense, considering aspects such as emergency response capacity, prevention of natural disasters and investments in security.

Each of these dimensions is composed of a set of specific indicators, based on objective information declared by the municipalities themselves in response to standardized questionnaires, validated and audited by the TCE-SP. The IEG-M methodology allows the generation of a final grade per dimension, as well as an overall grade for each municipality.

In addition to enabling longitudinal comparisons (over the years), the IEG-M favors the comparison between municipalities of different sizes and regions, functioning as an important instrument for social control, public policy planning and the continuous improvement of municipal management.

2.4 SOCIAL VULNERABILITY, POVERTY AND DEFAULT

The social and financial vulnerability of a population is a multidimensional concept, which reflects the ability (or inability) of people and families to meet their basic needs, maintain minimum standards of quality of life, and face adverse economic shocks. The specialized literature recognizes that precarious socioeconomic conditions are strongly associated with financial risk behaviors, such as excessive indebtedness and default (Lusardi & Mitchell, 2014).

To measure financial vulnerability in the municipal context, this study used proxy variables derived from institutionally recognized and validated secondary sources.

2.4.1 Default Rate (Serasa Experian):

Considered one of the main indicators of financial vulnerability, the delinquency rate reflects the percentage of the adult population with overdue bills or negative credit records. This metric, obtained from the Serasa Experian database, allows a direct assessment of the level of indebtedness and the payment capacity of the municipal population.

2.4.2 Poverty and Household Income Indicators (Continuous PNAD/IBGE):

Based on the Continuous National Household Sample Survey (Continuous PNAD), data on the average household income per capita and the percentages of the population living below the poverty line and extreme poverty were used, according to the parameters established by the World Bank and the IBGE itself. These indicators are key to capturing the structural economic conditions that affect the financial behavior of households.

2.4.3 Municipal Human Development Index (MHDI/UNDP):

The MHDI, produced by the United Nations Development Program (UNDP), was used as a synthetic measure of the quality of life in the municipalities. It contemplates three essential dimensions: education, income and longevity, offering an integrated view of the conditions of human development that influence the financial security of the population.

2.4.4 Atlas of Social Vulnerability (IPEA):

Complementing the previous indicators, the Atlas of Social Vulnerability, prepared by the Institute of Applied Economic Research (IPEA), provides detailed data on aspects such as urban infrastructure, access to basic services (education, health, sanitation) and housing conditions. The Social Vulnerability Index (SVI) extracted from this database was used as an aggregate measure of the exposure of municipal populations to social and economic risks.

By using this set of indicators, the study adopts a multifactorial approach to understand the determinants of delinquency and financial vulnerability, seeking to capture both the structural aspects of poverty and the behavioral reflexes in the financial sphere.^a

3 METHODOLOGY

This study adopts a quantitative, exploratory and explanatory approach, based exclusively on public secondary data available at the municipal level.

3.1 SAMPLE AND ANALYSIS PERIOD

The sample comprises the 645 municipalities of the State of São Paulo, with data collected for the period from 2022 to 2024. The choice of the State is justified by the availability and quality of the IEG-M data and the high number of municipalities, which allows for robust statistical analyses.

3.2 DATA SOURCES

This study used exclusively secondary data of public or institutional access, from consolidated databases recognized nationally and internationally for the quality and comprehensiveness of the information.

3.2.1 Municipal Management Effectiveness Index (IEG-M) – Court of Auditors of the State of São Paulo (TCE-SP) – Period 2022 to 2024:

The results of the six dimensions that make up the IEG-M were extracted: Planning (i-Plan), Fiscal Management (i-Fiscal), Education (i-Educ), Health (i-Health), Environment (i-Amb) and Protected Cities (i-City). The data were obtained directly from the official portal of the TCE-SP, with a standardized methodology for collection and validation with the municipalities of São Paulo.

3.2.2 Continuous National Household Sample Survey (Continuous PNAD) – Brazilian Institute of Geography and Statistics (IBGE):

Microdata from the Continuous PNAD were used for the period from 2022 to 2024, focusing on socioeconomic indicators disaggregated by municipality. The selected variables include average household income per capita, unemployment rate, percentage of the population in poverty, and extreme poverty.

3.2.3 Atlas of Social Vulnerability in Brazilian Municipalities – Institute of Applied Economic Research (IPEA):

The indicators of the Social Vulnerability Index (IVS) by municipality were used, detailing the dimensions of urban infrastructure, human capital, and income and work. This database allowed the identification of areas with greater social risk and economic vulnerability.

3.2.4 Municipal Human Development Index (MHDI) – United Nations Development Program (UNDP):

MHDI data disaggregated by municipality were extracted, focusing on the education, longevity and income components. These data were used as a proxy for the human and social development of the analyzed locations.

3.2.5 Municipal Default Base – Serasa Experian:

The survey used the average default rate of the adult population of each municipality in São Paulo, with data stratified by income range and population profile. The data includes the percentage of delinquent consumers, the average volume of debts per individual, and the historical evolution of indebtedness between 2022 and 2024.

3.3 ANALYSIS TECHNIQUES

To achieve the proposed objectives and explore the relationships between the effectiveness of municipal public management and the indicators of financial well-being of the population, the following statistical techniques were applied:

3.3.1 Descriptive Analysis:

Initially, a descriptive analysis of the variables involved in the study was carried out, with the objective of characterizing the sample of municipalities. Measures of central tendency (mean and median), dispersion (standard deviation and amplitude), as well as relative and absolute frequencies were calculated. This stage allowed the identification of general patterns, outliers and distribution of data among the different municipal strata.

3.3.2 Pearson's correlation:

To investigate the existence of linear associations between public management indicators (IEG-M) and socioeconomic indicators (default rate and social vulnerability), Pearson's correlation was used. This bivariate analysis made it possible to identify the degree and direction of the relationships between the independent variables (IEG-M dimensions) and the dependent variables (default and vulnerability), considering a significance level of 5%.

3.3.3 Multiple Regression:

In the next stage, linear multiple regression analysis was used, with the objective of evaluating the simultaneous impact of the dimensions of the IEG-M on the levels of delinquency and municipal poverty. The model included control variables, such as population size and Gross Domestic Product (GDP) per capita of the municipalities, to reduce the risk of biases due to omission of relevant variables. The assumptions of linearity, homoscedasticity, normality of residuals and absence of multicollinearity among the predictors were evaluated.

3.3.4 Cluster Analysis (K-means):

Finally, a cluster analysis was applied, using the K-means method, with the objective of classifying the municipalities of São Paulo into homogeneous groups based on aggregate performance in the dimensions of the IEG-M and the levels of financial and social vulnerability. The definition of the ideal number of clusters was carried out through the analysis of the Elbow criterion and the inspection of intergroup distances. This stage allowed the identification of different profiles.

4 RESULTS

4.1 DESCRIPTIVE ANALYSIS OF THE SAMPLE

The analysis of the 645 municipalities of São Paulo revealed a wide variation in public management indicators (IEG-M) and in social and financial indicators. Municipalities with larger populations presented, on average, better performance in the i-Fiscal and i-Plan axes, while smaller municipalities stood out in i-Educ and i-Health.

Table 1

General Statistics of the Sample

Indicator	Value
Average default rate	38,5%
Standard deviation of delinquency	9.2 percentage points
i-Educ Average	0,65
i-Plan Medium	0,62
i-Fiscal Average	0,60

Source: Author (2025).

The descriptive analysis shows that the average delinquency among the municipalities is high, with great variation (9.2 percentage points). The averages of the municipal public management indexes indicate intermediate performance in the education, planning and fiscal management axes.

From the point of view of financial vulnerability, Serasa Experian's data indicated that the average default rate in the State of São Paulo, in the period analyzed, was 38.5%, with significant variations between municipalities.

4.2 PEARSON'S CORRELATION

Table 2

Relationship between IEG-M and Delinquency

Independent Variable	Correlation with Delinquency	Significance (p-value)
i-Educ	-0.48	< 0.01
i-Plan	-0.44	< 0.01
i-Fiscal	-0.32	< 0.05
i-Health	-0.29	< 0.05

Source: Author (2025).

The results show statistically significant negative correlations between public management indicators and municipal default levels. Municipalities with better performance in the areas of education, planning and health tend to have lower default rates.

4.3 MULTIPLE REGRESSION

Table 3

Predictors of Municipal Delinquency

Variable	Beta Coefficient	Significance (p-value)
i-Educ	-0.31	< 0.01
i-Plan	-0.27	< 0.01
i-Fiscal	-0.18	< 0.05
Control: GDP per capita	-0.12	< 0.05

Source: Author (2025).

The multiple regression analysis revealed that management indicators in education and planning are the main predictors for the reduction of delinquency, followed by fiscal performance and GDP per capita, which is included as a control variable.

4.4 CLUSTER ANALYSIS

Table 4

Classification of Municipalities

Cluster	Description	Average Delinquency	IVS Medium
Cluster 1	High Effectiveness / Low Vulnerability	28,4%	0,35
Cluster 2	Moderate Effectiveness / Moderate Vulnerability	39,2%	0,48
Cluster 3	Low Effectiveness / High Vulnerability	48,7%	0,61

Source: Author (2025).

The cluster analysis allowed the identification of three distinct profiles of municipalities in São Paulo regarding the effectiveness of public management and the levels of social and

financial vulnerability. Cluster 1 brings together municipalities with high administrative effectiveness, characterized by better performance in the dimensions of the IEG-M, lower default rates and reduced social vulnerability, with Campinas, São José dos Campos and Ribeirão Preto standing out, which have more consolidated institutional structures and more stable economic environments.

Cluster 2 encompasses municipalities with intermediate effectiveness, in which institutional advances and occasional weaknesses coexist, reflecting moderate levels of delinquency and social vulnerability; this profile includes Sorocaba, Taubaté and Presidente Prudente, which demand policies to strengthen planning and fiscal education.

In turn, Cluster 3 is composed of municipalities with low effectiveness of public management, high levels of delinquency and greater social vulnerability, such as Itapeva, Registro and Cajati, evidencing the need for structuring actions and intergovernmental support to improve institutional capacity and local socioeconomic conditions.

4.5 RELATIONSHIP BETWEEN PUBLIC MANAGEMENT INDICATORS AND DEFAULT

Pearson's correlation analysis showed negative and statistically significant associations between the i-Educ, i-Saúde and i-Plan indicators with the municipal default rate ($p < 0.05$). In other words, municipalities with better performance in these axes had lower levels of delinquency.

In addition, multiple regression indicated that the dimensions i-Educ ($\beta = -0.31$; $p < 0.01$) and i-Plan ($\beta = -0.27$; $p < 0.01$) were the strongest predictors to explain the variation in delinquency, even controlling for factors such as population size and GDP per capita.

Table 5

Relationship between IEG-M Indicators and Default/Vulnerability

IEG-M dimension	Relationship with Delinquency	Featured Impact
i-Educ	Significant negative ($\beta = -0.31$; $p < 0.01$)	Reduction of delinquency
i-Plan	Significant negative ($\beta = -0.27$; $p < 0.01$)	Reduction of delinquency
i-Fiscal	Negative with Social Vulnerability ($p < 0.05$)	Reduction of social vulnerability
i-Health	Significant negative ($p < 0.05$)	Reduction of delinquency

Source: Author (2025).

Table 1 shows that the i-Educ and i-Plan dimensions had the greatest negative impacts on the municipal delinquency rate, indicating that better rates in these axes are associated with lower levels of delinquency. The i-Fiscal, in turn, had a relevant effect on social vulnerability.

4.6 FISCAL MANAGEMENT AND SOCIAL VULNERABILITY

The results also showed that the i-Fiscal showed a negative correlation with the Social Vulnerability Index (SVI) ($p < 0.05$), suggesting that municipalities with better fiscal management capacity tend to have lower levels of socioeconomic vulnerability.

5 DISCUSSION

The findings of this study reinforce the hypothesis that the effectiveness of municipal public management plays a central role in reducing the financial vulnerability of the population, even when controlling for structural factors such as population size and income level.

The results dialogue with the financial psychology literature, which points out that the institutional environment can reinforce or mitigate harmful financial behaviors (Lusardi & Mitchell, 2014; Kahneman, 2011). Municipalities with better performance in education and planning offer more favorable conditions for building a culture of financial health.

The i-Educ dimension emerges as one of the main factors associated with the reduction of delinquency. This result is consistent with previous studies that indicate education as a key variable in the formation of healthy financial habits (OECD/INFE, 2022).

In addition, the performance in planning (i-Plan) and fiscal management (i-Fiscal) shows that the ability to anticipate scenarios, organize resources and implement effective public policies can generate indirect effects on the financial well-being of the population.

From the point of view of public policies, the findings indicate the need for integration between the areas of education, health, inspection and planning, promoting financial education strategies aligned with local contexts of vulnerability.

6 CONCLUSIONS AND IMPLICATIONS

This study provides robust empirical evidence that the quality of municipal public management, assessed by means of the Municipal Management Effectiveness Index (IEG-M), exerts a significant influence on the levels of delinquency, poverty and social vulnerability in the municipalities of the State of São Paulo. The results demonstrate that dimensions such as planning (i-Plan), education (i-Educ) and fiscal management (i-Fiscal) have negative and statistically significant correlations with financial vulnerability indicators, reinforcing the idea that better public governance practices are associated with more favorable socioeconomic conditions.

From a theoretical point of view, the main contribution of this research is in the advancement of integration between the fields of public management, financial education,

financial psychology and behavioral science. The combination of concepts from behavioral economics, such as cognitive biases, loss aversion, and decision heuristics, with objective indicators of public administration performance, broadens the understanding of the structural and behavioral factors that influence indebtedness and financial stress in the population.

Empirically, the study stands out for its exclusive use of official secondary databases, covering sources such as IBGE, IPEA, UNDP, Serasa Experian and the TCE-SP itself. From this information, it was possible to establish statistically significant correlations between the quality of public management and the financial and social outcomes of the population, using robust quantitative methods such as multiple regression and cluster analysis.

As a practical contribution, this study proposes an Integrated Multidimensional Model of the Influence of Municipal Governance on the Financial Health of the Population. This model establishes four interrelated dimensions:

- Municipal Governance (IEG-M): Quality of management in the areas of planning, fiscal management, education, health, environment and public safety.
- Local Socioeconomic Structure: Objective conditions of the population in terms of income, poverty, social vulnerability and human development.
- Interventions in Financial Education and Financial Psychology: Inclusion of public policies aimed at developing financial skills, combating behavioral biases, and promoting a culture of financial planning in schools and communities.
- Financial Health and Well-Being Outcomes: Reduced delinquencies, mitigated financial stress, increased subjective financial security, and strengthened citizens' economic decision-making capacity.

This model suggests that the effectiveness of public management, when combined with financial education strategies and interventions based on behavioral science, can generate positive effects on both macroeconomic indicators and individual financial well-being.

It is important to recognize the limitations of this research. Because it is based on aggregated data at the municipal level, it was not possible to capture the nuances of individual financial behavior within the municipalities. In addition, the exclusive use of secondary indicators restricts the analysis of subjective psychosocial variables, such as individual attitudes towards money and perception of financial well-being.

For future research, it is recommended:

- Conducting longitudinal investigations, with the objective of evaluating the effects of improvements in public management on debt levels and financial well-being over time.

- The development of inter-regional comparative studies, involving different states and regions of Brazil, to test the generalization of the proposed model.
- The conduction of qualitative surveys and surveys at the household level, to explore individual perceptions about the effectiveness of public management and its impact on financial and emotional well-being.
- The evaluation of financial education programs already implemented by local governments, focusing on the behavioral and financial effects generated in the population.

Finally, the results of this research reinforce the importance of efficient, integrated municipal public governance guided by principles of financial psychology and behavioral science, as a strategic factor for the promotion of collective financial health, contributing to the strengthening of the economic and social resilience of local populations.

ABSTRACT

Introduction: Chronic pain, a highly prevalent condition sustained by neurophysiological, emotional, and social alterations, remains a clinical challenge due to the limitations of exclusively pharmacological treatments. In this context, the use of non-pharmacological strategies has increased, including acupuncture, which is recognized for modulating endogenous analgesic mechanisms.

Objective: To analyze the neurophysiological mechanisms of acupuncture-induced analgesia and the evidence supporting its effectiveness in individuals with chronic pain.

Methodology: A narrative review conducted according to SANRA criteria, carried out in the PubMed, PEDro, Web of Science, and LILACS databases, using the descriptors “Acupuncture,” “Chronic Pain,” and “Acupuncture Analgesia.” After screening, 46 studies were included.

Theoretical framework: Acupuncture modulates peripheral, spinal, and supraspinal pathways through the release of endogenous opioids, serotonin, and noradrenaline, strengthening the descending inhibitory system and reducing central sensitization. Neuroimaging evidence demonstrates functional reorganization of structures such as the anterior cingulate cortex, insula, thalamus, and prefrontal cortex, as well as adjustments in default mode and salience networks. Comparative trials indicate greater specificity of true acupuncture compared to sham acupuncture, particularly in connectivity between the periaqueductal gray matter, serotonergic nuclei, and pain-modulating regions, with effects observed mainly between 4 and 12 sessions.

⁴ Graduated in Physiotherapy. Universitário de Goiatuba (UniCerrado). E-mail: hanna.cristina192@gmail.com

Final considerations: The evidence indicates that acupuncture exerts consistent analgesic effects supported by integrated neurophysiological mechanisms, contributing safely and effectively to the interdisciplinary management of chronic pain.

Keywords: Acupuncture. Chronic Pain. Analgesia. Neurophysiology.

RESUMO

Introdução: A dor crônica, condição altamente prevalente e sustentada por alterações neurofisiológicas, emocionais e sociais, permanece um desafio clínico diante das limitações dos tratamentos exclusivamente farmacológicos. Nesse cenário, cresce o uso de estratégias não farmacológicas, entre elas a acupuntura, reconhecida por modular mecanismos de analgesia endógena.

Objetivo: Analisar os mecanismos neurofisiológicos da analgesia por acupuntura e as evidências que sustentam sua eficácia em indivíduos com dor crônica.

Metodologia: Revisão narrativa conduzida segundo os critérios SANRA, realizada nas bases PubMed, PEDro, Web of Science e LILACS, utilizando os descritores “Acupuncture”, “Chronic Pain” e “Acupuncture Analgesia”. Após triagem, 46 estudos foram incluídos.

Referencial teórico: A acupuntura modula vias periféricas, espinais e supramedulares por meio da liberação de opioides endógenos, serotonina e noradrenalina, fortalecendo o sistema inibitório descendente e reduzindo a sensibilização central. Evidências de neuroimagem demonstram reorganização funcional de estruturas como córtex cingulado anterior, ínsula, tálamo e córtex pré-frontal, além de ajustes em redes de modo padrão e de saliência. Ensaios comparativos indicam maior especificidade da acupuntura verdadeira em relação à simulada, sobretudo na conectividade entre substância cinzenta periaquedutal, núcleos serotoninérgicos e regiões moduladoras da dor, com efeitos observados majoritariamente entre 4 e 12 sessões.

Considerações finais: As evidências apontam que a acupuntura exerce efeitos analgésicos consistentes, sustentados por mecanismos neurofisiológicos integrados, contribuindo de forma segura e eficaz para o manejo interdisciplinar da dor crônica.

RESUMEN

Introducción: El dolor crónico, una condición altamente prevalente sostenida por alteraciones neurofisiológicas, emocionales y sociales, sigue siendo un desafío clínico debido a las limitaciones de los tratamientos exclusivamente farmacológicos. En este contexto, ha aumentado el uso de estrategias no farmacológicas, entre ellas la acupuntura, reconocida por modular los mecanismos endógenos de analgesia.

Objetivo: Analizar los mecanismos neurofisiológicos de la analgesia por acupuntura y las evidencias que respaldan su eficacia en individuos con dolor crónico.

Metodología: Revisión narrativa realizada según los criterios SANRA, llevada a cabo en las bases de datos PubMed, PEDro, Web of Science y LILACS, utilizando los descriptores “Acupuncture”, “Chronic Pain” y “Acupuncture Analgesia”. Tras el proceso de selección, se incluyeron 46 estudios.

Marco teórico: La acupuntura modula las vías periféricas, espinales y supramedulares mediante la liberación de opioides endógenos, serotonina y noradrenalina, fortaleciendo el sistema inhibitor descendente y reduciendo la sensibilización central. La evidencia de neuroimagen demuestra una reorganización funcional de estructuras como la corteza cingulada anterior, la ínsula, el tálamo y la corteza prefrontal, además de ajustes en las redes de modo por defecto y de saliencia. Ensayos comparativos indican una mayor especificidad de la acupuntura verdadera en comparación con la simulada, especialmente en la conectividad entre la sustancia gris periacueductal, los núcleos serotoninérgicos y las regiones moduladoras del dolor, con efectos observados principalmente entre 4 y 12 sesiones.

Consideraciones finales: Las evidencias indican que la acupuntura ejerce efectos analgésicos consistentes, sustentados por mecanismos neurofisiológicos integrados, contribuyendo de manera segura y eficaz al manejo interdisciplinario del dolor crónico.

Palabras clave: Acupuntura. Dolor Crónico. Analgesia. Neurofisiología.

1 INTRODUCTION

Chronic pain, defined by the International Association for the Study of Pain (IASP) as persistent pain for more than three months and associated with neurophysiological, emotional, and social changes, is one of the main causes of global disability (Nicholas et al., 2019; Treede et al., 2019). It is estimated that about 20% of the adult population lives with this condition, recognized by the World Health Organization as a problem of high relevance in public health (WHO, 2021).

The complexity of this condition stems from its multifactorial etiology and the interaction between peripheral alterations, central sensitization, emotional and cognitive factors, which makes its clinical management challenging (Robinson et al., 2022). Despite pharmacological advances, many patients remain symptomatic or develop adverse effects related to long-term use of analgesics and opioids, limiting the effectiveness of conventional treatments (CDC, 2022). Thus, the search for safe and effective alternatives for the management of chronic pain has stimulated the use of complementary therapies, such as acupuncture, whose efficacy is supported by a growing body of literature covering clinical trials, meta-analyses, and neurophysiological studies (Chou et al., 2022; Lyu et al., 2021).

Recent evidence supports that acupuncture exerts measurable analgesic effects at both the peripheral and central levels, observed in clinical trials and meta-analyses (Kato et al., 2022). Stimulation of specific acupoints promotes the release of neurotransmitters endogenous and activates descending inhibitory circuits (Yuan et al., 2022). Neuroimaging studies demonstrate the reorganization of brain networks involved in pain perception, suggesting an integrated regulation of sensory and affective dimensions (Wen et al., 2021). These findings legitimize its use as an adjunctive and safe intervention in the treatment of chronic pain (Niruthisard et al., 2024).

Although there is solid evidence that acupuncture modulates chronic pain by recognized neurophysiological mechanisms, part of these processes still needs clarification (Lyu et al., 2021; Wen et al., 2021). Since chronic pain involves alterations in nociceptive processing, especially central sensitization and dysfunctions of modulatory pathways, understanding how acupuncture acts on these circuits becomes essential. Thus, the present study aims to analyze and synthesize the neurophysiological mechanisms described in the literature to explain the analgesic effects of acupuncture in individuals with chronic pain.

The methodological diversity of the available research justifies the adoption of a narrative review, allowing the integration of findings from different designs and the construction of an expanded and reasoned interpretation of the processes involved in analgesia.

2 METHODOLOGY

The present study is a descriptive narrative review of the literature, guided by the following guiding question: what are the main neurophysiological mechanisms described in the literature to explain the analgesic effects of acupuncture in individuals with chronic pain?

The bibliographic search was carried out in the first half of 2025 in the PubMed, PEDro, Web of Science and LILACS databases. The indexing descriptors were retrieved from the DeCS/MeSH descriptors portal, and applied in English, Portuguese and Spanish, without the use of Boolean operators, corresponding to: "Acupuncture"; "Chronic Pain"; "Acupuncture Analgesia". In addition, a feedback search was performed in the reference lists of the included articles, in order to identify additional relevant publications.

The selection of studies followed the quality criteria recommended by the SANRA (Scale for the Assessment of Narrative Review Articles) checklist. Articles published between 2019 and 2025, in English, Portuguese, and Spanish, that addressed the effects of acupuncture on the modulation of chronic pain in humans and that described, directly or indirectly, neurophysiological mechanisms, whether peripheral, spinal, supramedullary, autonomic or neurochemical. Studies with animal samples, duplicate texts between databases, and studies without access to the full text were excluded.

After reading the titles and abstracts, 45 articles met the eligibility criteria and were included for the critical synthesis. These articles were examined in an organized manner, grouping the findings by level of physiological performance, type of pain investigated, and techniques employed, seeking to identify the main neurophysiological mechanisms involved in acupuncture-induced analgesia and its clinical implications in people with chronic pain. The synthesis was constructed in a narrative way, privileging convergences, divergences, methodological limitations and gaps in the literature, as guided by the SANRA checklist.

3 THEORETICAL FRAMEWORK

3.1 NEUROPHYSIOLOGY OF PAIN

Pain is a complex sensory and emotional experience, associated or not with actual tissue damage, and results from the integration between multiple neuronal systems (Treede et al., 2019). Under physiological conditions, pain mechanisms begin in nociceptors, free nerve endings sensitive to potentially harmful mechanical, thermal or chemical stimuli. These receptors convert the energy of the stimulus into electrical signals that are conducted by the A δ and C fibers to the dorsal horn of the spinal cord, constituting the ascending nociceptive pathways. It is at this point that the nervous system begins to decide what to do with the painful information that arrives from the body. (Di Maio et al., 2023).

Once in the spinal cord, these signals are modulated before making their way to the brain. The first level of this modulation occurs in the mechanism known as the spinal gate. In it, inhibitory interneurons use neurotransmitters such as GABA and glycine to reduce the excitability of projection neurons, filtering the nociceptive impulse and preventing low-intensity stimuli from being amplified in an exaggerated way (Stachowski et al., 2021). This process works as a "quality control" of pain: only relevant information goes to higher levels of the central nervous system (Rivera-Arconada et al., 2025).

After this initial filtering, the nociceptive signals that go up to the brain are interpreted by an integrated network of structures known as the "pain matrix". This matrix involves the somatosensory cortex, responsible for the location and discrimination of the stimulus, the insula, associated with subjective and interoceptive experience, the anterior cingulate cortex (CCA), linked to the affective component, in addition to the thalamus and the prefrontal cortex (PFC), which organize and modulate cognitive aspects of pain. It is in this interaction that the stimulus gains meaning and transforms, in fact, into the conscious experience of pain (Kato et al., 2022; Wang et al., 2024).

The coordinated activity of these regions is shaped by neuroplasticity processes. In adaptive modulation, the nervous system adjusts its response to maintain functionality and protection. In maladaptive neuroplasticity, connections are reorganized in a dysfunctional way, reinforcing circuits that sustain pain even after the initial injury has resolved. This phenomenon explains why chronic pain can persist even in the absence of ongoing peripheral damage (Pan et al., 2022; Robinson et al., 2022).

Parallel to spinal modulation and cortical processing, the body has a second regulatory axis: downward modulation. Structures such as the periaqueductal gray matter (PAG) and the rostroventromedial medulla (CABG) send projections that release serotonin, noradrenaline, and endogenous opioids, capable of inhibiting nociceptive transmission in the spinal cord (Rocha-Jacob; Silva; Ferreira, 2024). This system acts as a physiological brake on pain and is strongly influenced by emotional, cognitive, and contextual factors, demonstrating that thoughts, expectations, and affective states modulate the painful experience (Treede et al., 2019).

The continuous communication between neurons of the nociceptive pathway is mediated by several excitatory neurotransmitters, such as glutamate, substance P, and CGRP, which promote the activation of projection neurons and participate in the encoding of the intensity and duration of the painful stimulus (Rivera-Arconada et al., 2025). The balance between excitatory and inhibitory neurotransmitters is essential for pain to maintain its

protective and adaptive character, functioning as an alert for potential threats to the body (Stachowski et al., 2021).

Thus, the painful experience results from the coordinated interaction between ascending nociceptive pathways, spinal inhibitory circuits, descending modulatory systems, and the integrated activity of the pain matrix. This organization ensures that pain functions as a physiological signal of protection, reflecting the complex neurofunctional structure of the nervous system (Wang et al., 2024).

3.1.1 Pathophysiology and classification of chronic pain

Pain chronicity is a multifactorial process underpinned by interrelated neurophysiological mechanisms. Among them, the following stand out: central sensitization (Rivera-Arconada et al., 2025); maladaptive neuroplasticity (Pan et al., 2022; Robinson et al., 2022); the dysfunction of inhibitory interneurons (Stachowski; Dougherty, 2021); the weakening of descending inhibitory pathways (Rocha-Jacob et al., 2024; Treede et al., 2019) and persistent glial activation (Di Maio et al., 2023). The interaction of these mechanisms favors the amplification of nociceptive signals and the transition from acute to chronic pain.

Pain chronicity occurs when neurophysiological modulation mechanisms cease to function properly. In this condition, changes in the organization and functionality of the pain matrix are among the main mechanisms associated with the transition from acute to chronic pain. Persistent activation of this network alters the connectivity between the somatosensory cortex, insula, thalamus, and CCA, resulting in increased neuronal responsiveness and amplification of pain perception (Wang et al., 2024).

This process is supported by maladaptive neuroplasticity, in which synaptic reorganization and excessive excitability of the central nervous system favor the maintenance of pain even after the resolution of the initial lesion (Pan et al., 2022; Robinson et al., 2022). Among the mechanisms involved, central sensitization stands out, a condition in which neurons in the dorsal horn of the spinal cord become hyperexcitable in the face of repetitive stimulation of C and A δ fibers, generating a progressive amplification of the synaptic response known as wind-up (Rivera-Arconada et al., 2025).

When persistent, this phenomenon contributes to the transition between acute pain and chronic pain, reflecting a short-term synaptic facilitation that raises the frequency of action potentials and prolongs the painful sensation. Under physiological conditions, inhibitory interneurons of the dorsal horn limit this activity by controlling nociceptive transmission through neurotransmitters such as GABA and glycine. The dysfunction of these

interneurons causes synaptic disinhibition and increased neuronal excitability, intensifying the conduction of nociceptive impulses (Di Maio et al., 2023; Stachowski; Dougherty, 2021).

At the supramedullary level, descending inhibitory pathways, originating in the GWP and the CABG medulla, act to modulate pain through the release of serotonin, noradrenaline, and endogenous opioids, which reduce the excitability of neurons in the dorsal horn and limit nociceptive transmission (Rocha-Jacob et al., 2024; Stachowski; Dougherty, 2021). The weakening of these pathways compromises endogenous modulation, reduces the pain threshold, and favors the amplification of nociceptive signals, a mechanism often observed in conditions of chronic pain and associated with the loss of balance between excitation and inhibition (Di Maio et al., 2023; Rivera-Arconada et al., 2025; Treede et al., 2019).

This imbalance favors the emergence of allodynia and hyperalgesia, conditions characterized by the exaggerated painful response to harmless or moderate stimuli (Rivera-Arconada et al., 2025). Another commonly associated mechanism concerns the sustained activation of glial cells, such as microglia and astrocytes. These cells release pro-inflammatory cytokines, enhancing neuronal excitability and reinforcing the maintenance of central sensitization (Di Maio et al., 2023).

This set of structural and chemical alterations characterizes pathological synaptic plasticity, in which neuronal connections cease to perform a modulating function and start to reinforce pain circuits. In this way, the painful experience becomes independent of peripheral stimuli, being supported by central mechanisms, composing the clinical picture of primary chronic pain described in the International Classification of Diseases (ICD-11) (Treede et al., 2019).

Understanding these neurophysiological dysfunctions is essential for the clinical management of chronic pain. Treatment should seek to restore the balance between excitatory and inhibitory pathways, reduce neuronal hyperexcitability, and strengthen endogenous pain modulation mechanisms (Pan et al., 2022; Wang et al., 2024).

3.1.2 Multidimensionality of chronic pain and biopsychosocial model

Understanding the pathophysiological mechanisms, however, is not sufficient to explain the complexity of chronic pain. It is a phenomenon that emerges from the interaction between neurophysiological, emotional, cognitive, and social factors, shaping both the perception and expression of suffering (Robinson et al., 2022).

Neuroimaging evidence indicates that the painful experience is modulated by neural networks that integrate sensory, affective, and cognitive dimensions, involving the CCA, insula, and prefrontal cortex (PFC) (Wang et al., 2024). This integration demonstrates that

pain is not limited to peripheral nociceptive transmission, but involves brain circuits capable of amplifying, suppressing, or reorganizing pain perception, according to emotional states, expectations, and previous experiences (Vlaeyen; Crombez, 2020).

Structural and functional changes in the brain, combined with emotional states such as anxiety, stress, and depression, contribute to amplifying pain perception and reinforcing pain maintenance over time (Simons et al., 2022). Individual sensory profiles and differences in cortical connectivity also influence vulnerability to chronicity (Wang et al., 2024).

In addition to biological and emotional factors, the social dimension exerts a significant influence on the painful experience. Family support, community insertion, working conditions, and living environment determine the individual's coping ability and functionality (Kovačević et al., 2024). When these elements are insufficient or adverse, greater pain intensity and lower therapeutic response are observed (Gava et al., 2025).

These findings reinforce that chronic pain should not be considered just an individual condition, but a biopsychosocial phenomenon (BPS), in which psychological and social factors interact with neurophysiological mechanisms, modulating the intensity, persistence, and functional impact of pain (Robinson et al., 2022). Given this complexity, the BPS model is the most appropriate approach to understand and treat chronic pain. This model proposes the integration of biological, psychological, and social factors in clinical assessment and intervention, enabling a more comprehensive and person-centered approach (Simons et al., 2022).

By considering the interactions between chronic pain, mental health, and social context, the BPS model broadens the understanding of human suffering, highlighting the importance of strategies that promote psychosocial support, prevention of negative emotional impacts, and improvement of quality of life (Gava et al., 2025; Kovačević et al., 2024).

3.2 CHRONIC PAIN MANAGEMENT STRATEGIES

The clinical management of chronic pain requires a comprehensive and integrated approach, capable of contemplating the biological, psychological, and social aspects involved in the painful experience. Because it involves multiple dimensions, this condition represents a challenge for health professionals, requiring individualized care, whose manifestations and therapeutic responses vary widely among individuals (CDC, 2022).

Clinical management should seek not only symptomatic relief, but also the restoration of functionality and overall improvement of health (Knopp-Sihota; Morris; Courtney, 2022). Treatment should prioritize functional recovery, combining resources as clinically needed, and carefully weighing the risks and benefits of each intervention. International

recommendations guide the organization of safe and effective care, with an emphasis on person-centered practices (CDC, 2022).

The contemporary paradigm of care is based on multimodal approaches, which integrate medications, physiotherapy, restorative therapies, behavioral strategies and psychosocial interventions (Wang; Doan, 2024). However, long-term use of analgesic drugs, especially opioids, is related to risks of dependence, tolerance, and overdose, in addition to offering limited long-term benefits (CDC, 2022).

Non-pharmacological interventions, such as physical and psychological therapies and pain education, have demonstrated efficacy comparable to the use of analgesics, contributing to the improvement of functionality and well-being. (Knopp-Sihota et al., 2022). Integrated with conventional treatment, complementary therapies can expand the possibilities of intervention and strengthen interdisciplinary care models (Lyu et al., 2021; Wang; Doan, 2024).

Among the complementary interventions, acupuncture stands out, whose use has been widely documented in clinical research and systematic reviews. Studies suggest that the technique can influence central and peripheral nociceptive processes and assist in autonomic regulation, integrating with modern care plans aimed at pain reduction and functional restoration (Lee et al., 2024; Vickers et al., 2022).

3.3 ACUPUNCTURE IN CHRONIC PAIN MANAGEMENT

Acupuncture is an ancient practice of Traditional Chinese Medicine that has been consolidated as a technique of physiological regulation through the stimulation of specific points of the body, called acupoints (Zhu; Wang; Liu, 2021). These acupoints have microstructures rich in nerve fibers, vessels, and connective tissue, which contributes to their high therapeutic responsiveness (Ifrim-Chen; Antochi; Barbilian, 2019). The standardization of these points, associated with the modernization of the materials, favored their integration and expanded their use in the management of chronic pain (Zhu et al., 2021).

True acupuncture consists of inserting needles into defined acupoints, capable of activating sensory fibers and triggering autonomic and neurochemical responses associated with analgesia and physiological regulation (Hamvas et al., 2023). While sham acupuncture uses superficial stimuli or points outside the traditional meridians, functioning as an experimental control and producing minimal or non-specific effects (Liu et al., 2019).

The clinical procedure involves the insertion of thin, sterile needles into selected points based on Traditional Chinese Medicine diagnostic criteria, corresponding to areas of high neural and vascular responsiveness (Zhang et al., 2022). After skin asepsis, the needles are

inserted at varying depths according to the region and therapeutic objective (Ang et al., 2025). Manual manipulations, such as rotation or light traction, can be applied to intensify sensory activation (Zhang et al., 2022).

This stimulation usually produces the sensation of *deqi*, described as heaviness, pressure, numbness, tingling, or warmth. *Deqi* is considered a clinical marker of effective acupoint activation and is associated with the activation of cutaneous and myofascial nerve endings (Du et al., 2019). In addition, it triggers immediate adjustments in the autonomic nervous system, contributing to increased parasympathetic activity and sympathetic-parasympathetic rebalancing (Hamvas et al., 2023).

These responses occur because mechanical stimulation of the needles activates afferent fibers that project to autonomic nuclei of the brainstem and hypothalamus, regions essential for homeostatic regulation (Li et al., 2021). Thus, acupuncture can be understood as a neurostimulatory intervention that combines controlled needle insertion, *deqi* attainment, and activation of autonomic and sensory circuits involved in physiological modulation (Li et al., 2021).

In addition to classical acupoints, clinical practice also incorporates *Ashi* points, defined as areas of increased sensitivity identified by palpation, especially in musculoskeletal conditions (Zhu et al., 2021). These points do not necessarily follow the paths of the meridians, but are selected according to local or segmental pain. Although widely used, they have a lower volume of specific mechanistic evidence when compared to standardized acupoints (Ifrim-Chen et al., 2019). Therefore, the literature recommends the combination of *Ashi* points with classical acupoints that have greater experimental support, especially in protocols aimed at neurophysiological investigation (Zhu et al., 2021).

3.3.1 Neurophysiological mechanisms of acupuncture analgesia

Acupuncture-induced analgesia is associated with the release of endogenous neurotransmitters, such as opioids, serotonin, and norepinephrine, which act on ascending and descending pain pathways, reducing neuronal excitability and pain sensitivity. Among the mechanisms described, opioid modulation is the physiological axis with the greatest methodological support, supported by studies with antagonists such as naloxone, which attenuate the analgesic effect observed (Dimitrova et al., 2021; Niruthisard et al., 2024).

Classical acupoints such as Hegu (IG4) and Zusanli (E36) appear frequently in experimental models precisely because they trigger robust neurochemical responses. Stimulation of these points activates descending inhibitory pathways and modulates core pain structures, an effect that is significantly attenuated by opioid receptor blockade (Zhu et

al., 2021; Niruthisard et al., 2024;). Even so, the magnitude of this response varies according to protocol, stimulus intensity, and clinical heterogeneity of the samples, which limits the direct extrapolation of the findings.

Moving to more integrated levels of the central nervous system, acupuncture modulates multiple brain regions responsible for pain perception and control, including the somatosensory and prefrontal cortices, the thalamus, insula, and brainstem structures (Niruthisard et al., 2024; Kato et al., 2022). Neuroimaging assays show that manual IG4 and E36 stimulation promotes selective activations and inhibitions in these areas, reflecting functional reorganization compatible with pain reduction (Lu et al., 2021).

This reorganization is accompanied by changes in neural oscillations, as demonstrated by magnetoencephalography (MEG) studies. These investigations identified low-frequency oscillations in the occipital lobe and high-frequency oscillations in the prefrontal and somatosensory cortices, indicating a dynamic pattern of electrophysiological response during the intervention. From these local responses, functional connectivity studies suggest distributed effects in large-scale networks (Kato et al., 2022).

Such adaptations contribute to the modulation of functional connectivity between widely distributed brain networks, including the Default Mode Network, Salience Network, and the Descending Pain Modulation System. The modulation of these networks has been consistently associated with reduced pain and improved affective processing, although methodological differences persist regarding connectivity analysis techniques and the statistical models employed (Lu et al., 2021; Niruthisard et al., 2024).

In individuals with chronic pain, acupuncture regulates the connectivity between areas related to emotional and autonomic modulation, such as serotonergic nuclei of the brainstem, reinforcing the role of descending mechanisms, especially the activation of raphe and PAG nuclei, in the analgesia observed after IG4 and E36 stimulation, strengthening endogenous inhibitory mechanisms responsible for suppressing nociceptive impulses at the medullary level (Dimitrova et al., 2021; Niruthisard et al., 2024).

Another important axis of analgesia involves the brain's reward system. Acupuncture stimulation activates the mesolimbic dopaminergic circuit, attenuating negative emotions from the painful experience and increasing tolerance to nociceptive stimuli (Lu et al., 2021; Pan et al., 2022). These emotional effects are articulated with sensory and cognitive processes, reinforcing the multidimensional character of analgesia (Niruthisard et al., 2024).

Finally, acupuncture also triggers autonomic and neuroimmune responses that contribute to the modulation of inflammation and the restoration of neural homeostasis,

evidencing the interaction between nervous and immune systems. These effects involve, among other processes, the regulation of the neuroimmune axis and sympathetic and parasympathetic autonomic activity, effects frequently observed in E36 stimulation (Lyu et al., 2021; Niruthisard et al., 2024). The combination of these mechanisms favors adjustments in the functional plasticity of brain networks related to chronic pain and underpins clinically observed therapeutic effects (Lu et al., 2021; Niruthisard et al., 2024)

3.4 EVIDENCE-BASED PROTOCOLS

The recent literature on acupuncture in chronic pain demonstrates a growing number of experimental studies characterized by significant methodological heterogeneity. The differences involve point selection, insertion depth, stimulation techniques and deqi acquisition, as well as the use of neuroimaging methods employed to understand analgesic mechanisms (Cao et al., 2019; Xiang et al., 2019).

This methodological diversity also reflects the heterogeneity of chronic pain itself, which encompasses conditions with distinct pathophysiology and specific therapeutic demands. Studies on shoulder pain, for example, have evaluated distal points such as ST38 (Liu; Zhao; Jin, 2019), while protocols targeting systemic conditions such as fibromyalgia (Baelz et al., 2023) and sickle cell disease (Li et al., 2021) tend to employ broader combinations of acupoints.

Research involving neck pain and primary dysmenorrhea reinforces this variability by using, respectively, sets of points based on traditional recommendations (Xu et al., 2022) or the isolated application of SP6 (Xu et al., 2022). Thus, Table 1 shows a synthesis of evidence that reflects the plurality of these conditions and the complexity inherent in the establishment of standardized protocols.

Table 1

Acupuncture protocols employed in chronic pain conditions

References	Sample and type of chronic pain	Intervention	Protocol used	Observed effects
Liu <i>et al.</i> (2019) Essay E Exploratory randomized clinical	Pain Chronic on the shoulder. N= 38 subjects (Real acupuncture group N= 19 vs. Group sham acupuncture)	Manual acupuncture on ST38 or on local points of the shoulder; 1 single treatment session; retention time ~20 min; initial manipulation of 30s.	ST38 contralateral vs ipsilateral; depth 10–15 mm; manual rotation to deqi.	Both sides reduced pain; contralateral had greater pain reduction and better ROM; no adverse events.

Cao <i>et al.</i> , (2019) Experimental study (fMRI) with pain-induced in a controlled manner	Pain Induced experimental in healthy volunteers. N = 27 healthy adults (crossover design)	Four interventions in order omized: acupuncture, acupuncture sham, VGAIT (<i>Video-Guided Acupuncture imagery treatment</i>) and VGAIT control (video of swab touching the skin); classic point stimulus (e.g. LI4), with cold pain induction and recording fMRI. for 9 min.	Randomized real Points used in fMRI interventions: points on the legs (real points and adjacent control points; 1–2 points applied per session Real Point: experimental point located 3 cun above and 1 cun posterior to KI8, on the Kidney meridian.	Real acupuncture and VGAIT increased the pain threshold vs their controls. Real acupuncture activated the insula more; VGAIT produced greater deactivation in rostral ACC. It shows the potential of acupuncture and placebo interventions, but in an experimental, non-clinical model.
Xiang <i>et al.</i> (2019) Experimental clinical trial with fMRI	Chronic nonspecific low back pain. N= 52 individuals (Group with low back pain N=27 vs. Healthy control group N=25)	Ankle acupuncture with manual stimulation for 8 min while resting fMRI was recorded; single session; comparison with tactile stimulus control at the same place.	Acupuncture on the ankle, perimallegia/ankle points.	Acupuncture reduced pain VAS and modulated ALFF in pain-related regions (thalamus, somatosensory cortex, default mode network). There were distinct changes between chronic pain vs controls, suggesting Specific modulation of networks
	(real VS tactile stimulus)			of pain, but with heterogeneity and Sample small.
Li <i>et al.</i> (2021) Mixed methods pilot study	Pain associated with sickle cell disease. N= 6 adults with sickle cell disease and chronic pain	Individualized protocol as an adjunct to standard care; up to 10 sessions lasting 30 min, 1-2x/week, in a palliative care hospital; points defined according to complaint and TCM standard.	Analgesia and toning points based on TCM and STRICTA Standardized 18-point protocol: CV17, CV6, PC6 (bilateral), LI4, SP6, SP10, ST36,	Reduction of pain intensity and interference; 82% acceptance; safe and feasible acupuncture; no serious adverse events reported.

LR3, LR8,
KI3, CV7
(transverse).

Kato <i>et al.</i> (2022)	Pain chronic (various etiologies) N = 21 patients with chronic pain	Sessions Unique acupuncture procedure with magnetoencephalography (MEG) recording; systemic points with <i>Dehere</i> ; needle left for 30 s; immediate pre/post evaluation.	WHO standard stitches and individualized stitches (≤ 2 cm); needles held for 30s, without rotation. Miscellaneous Points: LI4, BL15, BL16, BL48, GB33, BL53, SI7, among many others (each participant had 1 point selected).	Acupuncture modulated low-frequency oscillations in occipital and high-frequency regions. Regions prefrontal/somatosensory; pain reduction was associated, but with focus predominantly mechanistic. No Clinical long-term.
Xu, H. <i>et al.</i> (2022)	Pain chronic cervical. N= 99 subjects (True acupuncture: n $\approx$ 49; Sham acupuncture: n $\approx$ 50)	Manual acupuncture in a standardized protocol for neck pain, 3x/week for 4 weeks (12 sessions) lasting 30 min; cranial and cervical points described in the article; stimulation up to <i>deqi</i> .	Recommended points in the literature for neck pain due to the absence of specification in the article: GB20, GV14, SI15, SI14, GB21, LI4, SI3, TB5 AT vs AS.	True acupuncture group had pain reduction (VAS $p < 0.001$), and robust brain serotonergic vs. <i>sham</i> effect connectivity, but with individual variation and short follow-up.
Xu, J. <i>et al.</i> (2022)	Primary dysmenorrhea (chronic pelvic pain). N = 34 (Acupuncture <i>verum</i> SP6: n = 17; Sham acupuncture SP6: n=17)	Bilateral acupuncture in Sanyinjiao (SP6), 8 weeks intervention; serial sessions with <i>deqi</i> , associated with resting fMRI acquisition; 30 min needle retention; manipulation of 30s each	Unilateral SP6; depth 1–1.2 cun; manual stimulation up to <i>deqi</i> .	Both groups reported pain reduction, but only the <i>verum</i> group showed normalization of connectivity between GWP and areas involved in affective/attentional pain modulation, suggesting a specific effect on the system descending modulation.

10 min.

Baelz <i>et al.</i> (2023) Essay Double-blind randomized clinical	Fibromyalgia. N = 40 (Acupuncture: n=20; Sham: n=20)	Systemic acupuncture with points: PC6, HT7, LI4, ST36, SP6, LR2, with <i>deqi</i> ; 30 min/session, 1x/week; total of 8 sessions; 4-week follow-up.	PC6, HT7, LI4, ST36, SP6, LR2 (<i>DEQI</i>); (needles 15 mm lateral to the points, outside the meridian).	Acupuncture reduced pain in ~16% and improved FIQ by ~21% vs baseline, with significant difference vs sham group.
Astini; Ri- berto (2023) Essay Prospective clinical	Severe hip osteoarthritis N = 12 (case series, single group)	Standardized acupuncture protocol for hip OA, 10 weekly sessions; systemic points + locations, standard hold; focus on pain control in patients eligible for arthroplasty but in a queue or with restrictions.	Standardized 6-point protocol used in all patients: GB29, GB30, GB34, GB36, BL62, SJ5.	VAS reduced from ~75.8 mm to 20 mm at the end of the 10 sessions and ~48 mm in the follow-up; relevant improvement in pain and function.

Legends: ADM – Range of motion; ACC – Anterior Cingulate Cortex; Ashi – Tender points tender to palpation; ALFF – Low Frequency Fluctuations in Amplitude; AS – Simulated Acupuncture; TA / Verum – True Acupuncture; CV – Vessel Conception (Ren Mai); *deqi* – Characteristic sensation of acupuncture; fMRI – Functional Magnetic Resonance Imaging; FIQ – Fibromyalgia Impact Questionnaire; Follow-up – Follow-up assessment after treatment; GB – Gallbladder; GV – Du Mai (Governor Vase); HT – Heart; KI – Kidney; LI – Large Intestine; LR – Liver; MEG – Magnetoencephalography; TCM/TCM – Traditional Chinese Medicine; MVPA – Multivariate Pattern Analysis; OA – Osteoarthritis; GWP – Periaqueductal Gray Matter; CP – Pericardium; PET – Positron Emission Tomography; SJ/TB – Triple Heater (Sanjiao); SP – Spleen; Sham – Sham acupuncture (placebo); ST – Stomach; STRICTA – Guidelines for Reporting Interventions in Clinical Trials of Acupuncture; VAS – Visual Analogue Scale; VGAIT – Video-Guided Acupuncture Imagery Treatment.

Source: Survey data.

The analysis of the included studies shows that, despite the diversity in protocols involving differences in the selection of points, depth, type of stimulation, and number of sessions, they all converge in demonstrating analgesic effects mediated by central and peripheral neurophysiological mechanisms that are widely consistent in the literature (Astini: Riberto, 2023; Baelz et al., 2023; Cao et al., 2019; Kato et al., 2022; Li et al., 2021; Liu et al., 2019; Xiang et al., 2019; Xu H. et al., 2022; Xu J. et al., 2022). Frequently employed points, such as LI4, ST36, SP6, PC6, HT7, ST38, and the Ashi points, activate somatosensory,

autonomic, and visceral pathways associated with pain modulation (Baelz et al., 2023; Liu et al., 2019; Xiang et al., 2019; Xu et al., 2022).

In the cases of neck pain and low back pain, approaches that combine standardized acupoints, local points and Ashi have shown significant pain reduction. These effects were accompanied by reorganization of brain activity in regions associated with nociceptive processing, reinforcing acupuncture's ability to modulate central networks involved in pain (Xiang et al., 2019; Kato et al., 2022; Xu et al., 2022).

Trials comparing real and sham acupuncture showed greater specificity of the real technique, evidenced by clinical improvement and changes in connectivity between the FPC, INSULA, ACC, GP, and serotonergic nuclei of the brainstem (Cao et al., 2019; Xu H. et al., 2022). These findings reinforce that analgesia depends on the integrated activation of distributed circuits of descending pain modulation (Kato et al., 2022; Xu J. et al., 2022).

In shoulder pain, the ST38 point produced immediate effects on range of motion and reduction of ipsilateral and contralateral pain, suggesting the participation of intersegmental mechanisms and sensorimotor integration (Liu et al., 2019). This response indicates that distal points can promote adjustments in higher levels of the central nervous system, favoring cortical reorganization related to the upper limb (Cao et al., 2019; Liu et al., 2019). Similarly, in low back pain, changes in the ALFF (Amplitude of Low-Frequency Oscillations) and fALFF (Fraction of Low-Frequency Oscillations) indices revealed modulations in the default mode network and in thalamocortical areas, associating clinical improvement with brain functional reorganization (Kato et al., 2022; Xiang et al., 2019).

In systemic conditions, such as fibromyalgia, protocols using broad combinations of points such as PC6, HT7, LI4, ST36, SP6, and LR2, which resulted in reduced pain, improved quality of life, and decreased symptoms such as fatigue and discouragement (Baelz et al., 2023). Although neuroimaging was not used in this sample, the findings are compatible with limbic and prefrontal modulation patterns described in other chronic pain conditions (Kato et al., 2022; Xu H. et al., 2022).

The efficacy of SP6 in primary dysmenorrhea reinforces the role of visceral mechanisms in analgesia. Only the group submitted to true acupuncture showed normalization of connectivity between the periaqueductal gray matter, limbic regions, and cortical areas related to interoception and affective assessment (Xu J. et al., 2022).

Studies involving less frequent conditions, such as severe hip osteoarthritis and pain associated with sickle cell disease, have also demonstrated improved pain and functionality, even in small samples. Despite their preliminary nature, these results reinforce the versatility of acupuncture in different models of chronic pain (Astini; Riberto, 2023; Li et al., 2021).

Mechanistic studies evaluated by fMRI, MEG, and experimental paradigms show that acupuncture modulates core pain matrix structures, such as the CCA, insula, dorsolateral and ventromedial PFC, thalamus, and somatosensory cortex (Cao et al., 2019; Kato et al., 2022; Xu H. et al., 2022). The technique also adjusts networks such as the salience network, default mode network, and sensorimotor network, which are essential for the maintenance of chronic pain and its emotional and cognitive load (Kato et al., 2022; Xu H. et al., 2022).

In addition, these studies show that image-guided interventions, often used as a simulated acupuncture condition, can generate neural patterns partially similar to those of real acupuncture, especially in regions associated with attention, expectation, and cognitive pain processing. This helps explain some of the variability between protocols, since psychological factors also modulate cortical networks of the painful experience. However, such interventions do not reproduce the full neurochemical effects of true acupuncture, whose peripheral stimulation activates descending pathways and promotes the release of endogenous opioids, serotonin and noradrenaline, which are fundamental for consistent analgesia (Cao et al., 2019; Kato et al., 2022).

In an integrated way, the studies analyzed point to four pillars that explain the analgesic effects of acupuncture: (1) release of neurotransmitters and neuropeptides (2) functional reorganization of cortical and subcortical networks; (3) activation of inhibitory descending pathways; and (4) autonomic and neuroimmune modulation. Thus, even in the face of wide variation between protocols, there is convergence in the demonstration of consistent neurophysiological mechanisms that support acupuncture-promoted analgesia in different chronic pain conditions (Baelz et al., 2023; Kato et al., 2022; Liu et al., 2019; Xiang et al., 2019; Xu H. et al., 2022).

4 FINAL CONSIDERATIONS

The literature analyzed demonstrates that acupuncture exerts consistent analgesic effects in individuals with chronic pain, confirming the main neurophysiological mechanisms described in the literature. In an integrated manner, the studies show four fundamental pillars of the analgesic action of the technique: (1) release of neurotransmitters and neuropeptides (2) functional reorganization of cortical and subcortical networks involved in pain perception and modulation; (3) activation of inhibitory descending pathways that reduce neuronal excitability; and (4) autonomic and neuroimmune modulation, contributing to the rebalancing of systems related to the painful experience. These findings reinforce that acupuncture acts in an integrated manner on multiple levels of the nervous system, fully answering the guiding question of this review.

Despite the solidity of the neurophysiological results, challenges persist related to the heterogeneity of the protocols, the variability in the selection of acupoints, and the lack of standardization in stimulation parameters, which reinforces the need for larger and more rigorous clinical trials. Even so, the body of evidence demonstrates that acupuncture is a safe, effective intervention in line with the BPS model, contributing to pain reduction, functional improvement, and modulation of emotional dimensions frequently affected in chronic pain. Thus, it is a relevant therapeutic resource in interdisciplinary care, expanding quality of life and offering significant clinical support to people living with chronic pain.

APPENDIX

Table 2

Acupuncture points cited in the studies analyzed

Point	Code	Location
Zusanli	ST36 (E36)	Located 3 cun below the knee joint line, lateral to the tibial tuberosity (TAT).
Tiaokou	ST38	Located 8 cun below ST35, 1 cun lateral to crest of the tibia.
Hegu	LI4 (IG4)	On the back of the hand, at the midpoint between the 1st and 2nd metacarpals.
Fengchi	GB20	Below the occiput, in the depression between the trapezius and sternocleidomastoid.
Jianjing	GB21	At the midpoint between the acromion and C7, over the trapeze.
Julião	GB29	In depression between the anterior superior iliac spine and the greater trochanter.
Huantiao	GB30	In the depression between the greater trochanter of the femur and the sacral hiatus (S2).
Xiyangguan	GB33	Above the lateral epicondyle of the femur, between vastus lateral and biceps femoris.
Yanglingquan	GB34	Inferior and anterior to the head of the fibula.
Waiqiu	GB36	7 cun above the lateral malleolus, anterior to the fibula.
Sanyinjiao	SP6	3 cun above the medial malleolus, near the medial border of the tibia.

ABSTRACT

Creutzfeldt-Jakob Disease (CJD) is a severe and rapidly progressive neurological disease, with a median survival of 6 to 12 months, caused by the abnormal accumulation of prion protein in the brain. It is characterized by rapid dementia, myoclonus, tremors, ataxia, and motor impairments. Due to its nonspecific clinical presentation, diagnosis is challenging and often delayed, but the association of clinical findings with complementary examinations, such as magnetic resonance imaging, cerebrospinal fluid analysis, and EEG, contributes to its early identification. This report describes the case of a 73-year-old male patient, previously healthy, residing in a rural area of Minas Gerais, who presented with subacute onset of mental confusion, associated with rigidity, incoherent speech, stereotyped movements, and progressive loss of autonomy. Initially treated with antipsychotics and antidepressants without response, he was admitted to a tertiary hospital, where laboratory tests ruled out infections and metabolic disorders. Magnetic resonance imaging (MRI) revealed cortical hyperintensities in the right frontal, parietal, and occipital lobes, as well as involvement of the caudate nucleus, and cerebrospinal fluid analysis revealed positivity for the 14-3-3 protein, consistent with sporadic CJD. During the course of the disease, the patient presented with

severe neurological deterioration, requiring prolonged care, and bilateral laminar subdural hemorrhage as an associated complication. Therefore, this case highlights the importance of comprehensive assessment in elderly patients with mental confusion, especially after intensive pharmacological treatments. The interaction between pre-existing neurological conditions, medication use, and metabolic factors should be carefully considered.

RESUMO

A Doença de Creutzfeldt-Jakob (DCJ) é uma enfermidade neurológica grave e rapidamente progressiva, com sobrevida média de 6 a 12 meses, causada pelo acúmulo anormal de proteína priônica no cérebro. Caracteriza-se por demência rápida, mioclonias, tremores, ataxia e alterações motoras. Devido à apresentação clínica inespecífica, o diagnóstico é desafiador e muitas vezes tardio, mas a associação de achados clínicos com exames complementares, como ressonância magnética, líquido e EEG, contribui para sua identificação precoce. Este relato descreve o caso de um paciente masculino, 73 anos, previamente hígido, residente em área rural de Minas Gerais, que apresentou quadro de confusão mental de início subagudo, associado a rigidez, fala desconexa, movimentos estereotipados e progressiva perda de autonomia. Inicialmente tratado com antipsicóticos e antidepressivos sem resposta, foi admitido em hospital terciário, onde exames laboratoriais descartaram infecções e alterações metabólicas. A ressonância magnética evidenciou hiperintensidades corticais nos lobos frontais, parietal e occipital direitos, além de acometimento do núcleo caudado, e a análise do líquido revelou positividade para a proteína 14-3-3, compatível com DCJ esporádica. Durante a evolução, o paciente apresentou deterioração neurológica grave, necessitando de cuidados prolongados, e hemorragia subdural laminar bilateral como complicação associada. Portanto, este caso ressalta a importância da avaliação abrangente em pacientes idosos com confusão mental, especialmente após tratamentos farmacológicos intensivos. A interação entre condições neurológicas prévias, uso de medicamentos e fatores metabólicos deve ser cuidadosamente considerada.

RESUMEN

La enfermedad de Creutzfeldt-Jakob (ECJ) es una enfermedad neurológica grave y de rápida progresión, con una mediana de supervivencia de 6 a 12 meses, causada por la acumulación anormal de proteína priónica en el cerebro. Se caracteriza por demencia rápida, mioclonías, temblores, ataxia y deterioro motor. Debido a su presentación clínica inespecífica, el diagnóstico es difícil y a menudo tardío, pero la asociación de los hallazgos clínicos con exámenes complementarios, como la resonancia magnética, el análisis del líquido cefalorraquídeo y el electroencefalograma (EEG), contribuye a su identificación temprana. Este informe describe el caso de un paciente masculino de 73 años, previamente sano, residente en una zona rural de Minas Gerais, quien presentó un cuadro de confusión mental de inicio subagudo, asociado a rigidez, habla incoherente, movimientos estereotipados y pérdida progresiva de autonomía. Inicialmente tratado con antipsicóticos y antidepressivos sin respuesta, ingresó en un hospital terciario, donde las pruebas de laboratorio descartaron

infecciones y trastornos metabólicos. La resonancia magnética (RM) reveló hiperintensidades corticales en los lóbulos frontal, parietal y occipital derechos, así como afectación del núcleo caudado. El análisis del líquido cefalorraquídeo reveló positividad para la proteína 14-3-3, compatible con ECJ esporádica. Durante la evolución de la enfermedad, el paciente presentó un deterioro neurológico grave que requirió cuidados prolongados, y una hemorragia subdural laminar bilateral como complicación asociada. Por lo tanto, este caso resalta la importancia de una evaluación integral en pacientes de edad avanzada con confusión mental, especialmente después de tratamientos farmacológicos intensivos. Se debe considerar cuidadosamente la interacción entre las afecciones neurológicas preexistentes, el uso de medicamentos y los factores metabólicos.

1 INTRODUCTION

Creutzfeldt-Jakob disease (CJD) is a rare, progressive and fatal condition of the central nervous system, belonging to the group of transmissible spongiform encephalopathies. It is mainly characterized by a rapidly evolving dementia, accompanied by multifocal motor and neurological changes (Brasil, 2020). Caused by prions, which are infectious particles formed only by abnormal and extremely resistant proteins, CJD presents relevant diagnostic challenges (Brasil, 2020; Zerret al., 2024).

According to the World Health Organization (WHO), definitive confirmation of the diagnosis still depends on neuropathological tests performed after death, although clinical, epidemiological, and laboratory criteria allow classifications as possible or probable cases (Brasil, 2020). The rarity and complexity of the disease reinforce the importance of recognizing atypical clinical presentations, especially in the face of uncharacteristic initial symptoms (Salehi et al., 2022).

CJD can manifest in three main clinical forms: sporadic, hereditary, and iatrogenic. The sporadic form is the most common, accounting for about 85% of cases, appearing without an identifiable cause, usually between the ages of 55 and 75, and characterized by rapidly progressive dementia, ataxia, and myoclonus. The hereditary form, which accounts for 10% to 15% of cases, is related to mutations in the PRNP gene and follows an autosomal dominant pattern of inheritance, and may present earlier onset and symptoms similar to those of the sporadic form. The iatrogenic form, on the other hand, is extremely rare and results from accidental transmission through medical procedures, such as the use of contaminated neurosurgical instruments, transplants of human tissues, or the administration of growth hormone derived from cadavers (Zerr et al., 2024).

Between 2005 and 2021, 1,576 suspected cases of CJD were reported in Brazil, with a higher concentration in the South, Southeast, and Northeast regions of the country. The states with the highest number of notifications were São Paulo, responsible for approximately one third of the records (32.5%), followed by Paraná (12.0%) and Minas Gerais (10%). The most affected age group was 55 to 74 years, representing about 60% of suspected cases, which reinforces the predominance of the disease in older individuals. Regarding gender, the distribution was relatively balanced, with a slight predominance of women (53.6%) compared to men (46.3%), highlighting the importance of epidemiological surveillance and attention to clinical signs, especially in older populations (Brasil, 2020).

CJD has a very varied clinical spectrum, which contributes to the complexity of the diagnosis. Among the most frequent symptoms are rapidly progressing dementia, cerebellar ataxia, and myoclonus, but other manifestations may also be present, making it difficult to

identify the disease early (Hermann et al., 2021). In view of this heterogeneity, the use of high-performance biomarkers becomes essential to increase diagnostic accuracy and assist in differentiating CJD from other neurological conditions with a similar presentation (Sato, 2021).

Currently, there are still no effective therapies for CJD, and diagnostic confirmation remains a major clinical challenge. The diagnosis is based on a combination of typical neuropsychiatric manifestations, imaging tests such as magnetic resonance imaging, electroencephalogram (EEG), and the presence of specific proteins in the cerebrospinal fluid, such as 14-3-3 (Hermann et al., 2021).

Biomarkers such as elevated levels of total tau protein in cerebrospinal fluid have been widely used to support the diagnosis of Creutzfeldt-Jakob Disease. However, the reliability of some of these markers, especially the 14-3-3 protein and the tau protein itself, is still the subject of controversy. Although useful as indicators of rapid neuronal injury, both markers have important limitations in terms of specificity. The 14-3-3 protein, for example, may be increased in other acute neurological conditions, such as viral encephalitis, meningitis, strokes, prolonged epilepsies, and other rapidly evolving neurodegenerative diseases, which can lead to false-positive results. Similarly, tau protein elevation is also observed in other neurodegenerative pathologies, such as late-stage Alzheimer's disease (Zerr, 2022).

In addition, the sensitivity of these tests may vary according to the clinical stage of CJD, being less effective in the early stages of the disease, which compromises their usefulness as an early diagnostic tool. The interpretation of the results also depends on the standardization of the laboratory methods used, which can generate variations between diagnostic centers. For these reasons, although these biomarkers continue to be used as support criteria in the classification of probable or possible cases, their application should be done with caution and always associated with other clinical, radiological, and electroencephalographic parameters (Hermann et al., 2021; Noor et al., 2024).

Although progressive cognitive loss is the most common form of CJD onset, atypical presentations in the early stages can make diagnosis difficult and lead to misinterpretations (Nooret al., 2024). In cases with isolated symptoms, such as visual changes or cerebellar signs, it is important to consider variants of the disease (Usluet al., 2020).

When the clinical suspicion remains, tests such as magnetic resonance imaging and EEG should be repeated throughout the follow-up, since the findings may become more evident with the progression of the condition. As there is no cure for CJD currently, treatment is centered on supportive care, with a focus on symptom relief and patient comfort (Rasheedet al., 2024).

In view of this scenario, it is noteworthy that the scarcity of in-depth clinical studies on uncommon manifestations of CJD reinforces the need to report cases that deviate from the classic pattern of the disease, contributing to expand the knowledge of health professionals in the face of conditions that are difficult to diagnose.

Atypical presentations can delay the proper identification of CJD, leading to mistaken initial treatments and prolonged suffering of the patient and their families. This Case Report is justified by the relevance of sharing a real clinical experience that highlights the challenges involved in the suspicion and confirmation of a rare condition, with the aim of enriching medical practice, sensitizing multidisciplinary teams and promoting more assertive conducts in the face of rapidly evolving neurological diseases.

In this perspective, the present study aims to report and analyze an atypical manifestation of Creutzfeldt-Jakob Disease, through a clinical case study, in order to discuss the diagnostic and therapeutic challenges involved, as well as to reflect on the importance of early recognition of non-classical presentations of this rare neurodegenerative disease.

2 METHODOLOGY

This is an observational, descriptive, case report study with theoretical foundation, which presents the clinical manifestation, diagnosis, treatment and evolution of a patient with Creutzfeldt-Jakob Disease (CJD).

The bibliographic search was carried out in the PubMed, SciELO and Science Direct databases, using descriptors related to the disease, with the objective of subsidizing the discussion and contextualizing the case in the current scientific scenario.

The study was carried out in a public hospital located in the eastern region of the state of Minas Gerais. As it is a rare condition, the focus of the research was on the detailed analysis of a single patient, describing in detail the clinical, laboratory and radiological aspects observed during follow-up.

The information was obtained by reviewing the patient's medical record, available in the Medical and Statistical Archive of the institution. To describe the data, a structured instrument was used, covering variables such as initial symptoms, complementary tests performed, differential diagnoses, therapeutic conducts instituted and clinical evolution.

During the document analysis, medical records, imaging reports (such as magnetic resonance imaging), cerebrospinal fluid and electroencephalogram exams, as well as relevant clinical notes were examined, ensuring the integrity and consistency of the information collected.

The description of complementary information occurred through a detailed review of the clinical record, allowing the comparison of the observed findings with the data described in the scientific literature, with the aim of contributing to the improvement of knowledge about CJD and its diagnostic and evolutionary particularities.

The patient's legal guardians were duly informed about the objectives and procedures of the research, and expressed agreement by signing the Informed Consent Form (ICF).

3 CASE REPORT

A 73-year-old male patient, previously healthy, living in a rural area of the eastern region of Minas Gerais, driver, married, accompanied by his grandson, who reported a history of Bell's palsy for four years and cataract surgery for about 60 days. He had previously used carvedilol (Ablok), suspended due to hypotension, and haloperidol drops (2mg/ml - 10 drops/day).

The companion reported that approximately 45 days after the beginning of the investigation, the patient presented acute mental confusion, with subacute and progressive onset. He was initially evaluated by a psychiatrist, with a diagnostic hypothesis of mood disorder, and treatment with venlafaxine was instituted, later replaced by olanzapine and mirtazapine, without satisfactory clinical response. The patient evolved with progressive cognitive worsening, with disconnected speech, muscle rigidity, more evident in the left limb, but without the "cogwheel" stiffness pattern.

During hospitalization, the patient presented neurological and clinical worsening, rapidly and progressively, becoming dependent for all activities of daily living. He developed stereotyped hand movements, suggestive of parkinsonism, as well as paresthesias in the distal upper limbs.

Magnetic resonance imaging (MRI) of the brain, performed on 10/03/2024, revealed mild cortical hyperintensity in FLAIR, with restricted diffusion in the right frontal, parietal, and occipital lobes, in addition to involvement of the caudate nucleus. Diagnostic hypotheses included ischemic lesions, metabolic causes, and, less likely, prion disease.

About twelve days later (10/15/2024), the patient was admitted to a tertiary hospital in the state of Minas Gerais, presenting with a progressive confusional state. At the initial neurological examination, he was autopsychically oriented, but disoriented in time and space, with comprehension and execution preserved for simple commands, a pattern that was lost during hospitalization.

Initial laboratory tests showed mild renal dysfunction (creatinine: 1.61 mg/dL), blood count without significant alterations, and negative serology for HIV, hepatitis B and C, and VDRL.

A new MRI, performed on 10/17/2024, demonstrated cortical hypersignal on FLAIR and diffusion restriction affecting the superior frontal gyri, posterior cingulate, and right striatum, without contrast-enhanced enhancement. Filling failures suggestive of possible cerebral venous thrombosis were also observed, to be clarified.

On 10/21/2024, a lumbar puncture was performed, which showed cerebrospinal fluid with normal cellularity (3 cells/mm³, predominant mononuclear), slightly elevated proteins (58 mg/dL), normal glucose, and non-reactive VDRL. The molecular panel for infectious agents was negative.

With the clinical and neurological worsening, the patient was transferred to the Intensive Care Unit (ICU), with fluctuations in the level of consciousness, episodes of agitation, seizures, and supraventricular tachyarrhythmia. Levetiracetam 500 mg/day was instituted for subclinical seizure control, in addition to intensive clinical support.

A new brain MRI scan, on 10/30/2024, confirmed the persistence of cortical changes and identified bilateral laminar subdural hematomas. The lumbar puncture repeat, on 10/30/2024, showed cerebrospinal fluid with 2 cells/mm³, slightly elevated proteins (68.6 mg/dL) and positive testing for neuronal protein 14-3-3, strongly suggestive of prion disease.

On 10/31/2024, the reference laboratory (FUNED) confirmed the positivity of the 14-3-3 protein in the cerebrospinal fluid, a finding that, together with the clinical pattern and the results of the magnetic resonance imaging, contributed to the establishment of the diagnosis, on 11/01/2024, of Prion Disease, probably sporadic Creutzfeldt-Jakob Disease (CJD).

During hospitalization, the patient received pulse therapy with methylprednisolone, empiric acyclovir, and broad-spectrum antibiotic therapy at times of infectious suspicion, without significant neurological response.

In view of the condition presented, the patient evolved with severe and progressive neurological deterioration, with loss of verbal and visual contact, absence of response to commands, decortication posture and total dependence. On 11/07/2024, he was transferred to the long-term care ward, under the monitoring of the palliative care team, according to the family's desire not to carry out invasive measures.

After hospital discharge, the patient was followed up at home, with the neurology team, together with the palliative care team, with the main focus on adjusting the doses of anticonvulsants, due to the persistence of stereotyped movements and myoclonus. Non-invasive measures were instituted in order to avoid therapeutic obstinacy, prioritizing comfort

and human dignity. During this period, the neurological condition remained stable, with no evidence of new relevant clinical manifestations, compatible with the progressive and inexorable course of sporadic Creutzfeldt-Jakob disease.

At home, the patient presented an episode of community-acquired pneumonia, treated with levofloxacin, with a good initial response, however, approximately one month later, he evolved with a new episode of aspiration pneumonia, and treatment with broad-spectrum therapeutic antibiotic, piperacillin/tazobactam, was instituted at home, without the need for hospitalization at that time.

However, during treatment, the patient presented with an episode of bronchoaspiration, accompanied by progressive clinical deterioration, characterized by acute respiratory failure and hemodynamic instability. The patient developed septic symptoms with a probable pulmonary focus, culminating in death at home, despite adequate support measures and antibiotic therapy.

This outcome reflects the rapidly progressive and fatal character of sporadic Creutzfeldt-Jakob disease, whose clinical course tends to be marked by continuous neurological decline, secondary infectious complications, and therapeutic limitation due to the absence of course-modifying treatment to date.

The case reinforces the importance of early diagnosis, multidisciplinary follow-up and an approach focused on the comfort and dignity of the patient, especially in the advanced stages of the disease, in which palliative care plays an essential role in maintaining quality of life and supporting the family.

4 DISCUSSION

Creutzfeldt-Jakob Disease (CJD) is a rare spongiform encephalopathy, being the most common form among human prion diseases, with an incidence of approximately one case per million inhabitants per year (Sitammagari; Masood, 2021). It is a neurodegenerative disease caused by abnormal prions, predominantly accumulated in brain and eye tissue, especially in the retina and optic nerve. Clinically, it is characterized by rapidly progressing cognitive decline, associated with myoclonus and pyramidal signs, in addition to typical electroencephalographic findings that aid in the diagnosis. However, the clinical course may be nonspecific and similar to that of other neurological diseases, which makes early recognition difficult (Uttley et al., 2020).

The present case clearly reflects many of the classic aspects of CJD, where the patient initially presented with subacute dementia, rigidity, incoherent speech, parkinsonian signs, and rapid progression to total dependence. These findings are in line with traditional

descriptions of the disease, in which accelerated cognitive decline, associated with focal neurological manifestations such as myoclonus and rigidity, make up the most characteristic clinical picture (Appleby et al., 2021; Haddad et al., 2022; Jurcau et al., 2024).

Despite this, CJD can manifest in a heterogeneous way, with variations that make early recognition difficult. In some cases, the initial manifestations mimic psychiatric disorders, focal dementias (with alterations in language or visual perception), or parkinsonian syndromes, which often leads to inappropriate initial therapeutic approaches. In the case described, the introduction of antipsychotics and antidepressants before the neurological hypothesis reflects a pattern observed in other reports in the literature, in which the atypical presentation contributes to the delay in diagnosis (Oliveira et al., 2021; Appleby et al., 2021).

The definitive diagnosis of sporadic CJD is confirmed only by postmortem neuropathological examination, by means of brain biopsy or autopsy. However, according to the criteria of the World Health Organization (WHO), the diagnosis can be classified as possible, probable, or definitive, based on the combination of clinical picture, epidemiological history, and results of complementary tests (Ministry of Health, 2025). Among these, magnetic resonance imaging (MRI) and electroencephalogram (EEG) may present findings characteristic of the disease, being fundamental to support clinical suspicion (Jurcau et al., 2024).

In this context, one of the highlights of the present case was the use of MRI with FLAIR and diffusion (DWI) sequences, showing cortical hyperintensities in the right frontal, parietal, and occipital lobes, as well as involvement of the caudate nucleus, and then evolution of the findings to other structures (superior frontal gyri, posterior cingulate, striatum).

Similar to the present case, Farnetano et al. (2019) reported a 74-year-old female patient from Ubá (MG) with rapidly progressing dementia, cerebellar ataxia, and myoclonus, who was later diagnosed with sporadic CJD, whose DWI-weighted MRI of the head showed cortical hyperintensity in the frontal lobes and in the caudate nuclei and bilateral thalamus. Similarly, Appleby et al. (2021) described a 21-year-old man in the United States with cognitive decline, behavioral changes, and progressive motor disorders, whose MRI demonstrated asymmetric cortical hyperintensity and involvement of the caudate nuclei, findings compatible with prion disease.

Reinforcing these findings, Park et al. (2021) found in their meta-analyses that DWI has a sensitivity of around 91% (95% CI: 84-95%) and specificity around 97% (95% CI: 94-99%) when used to diagnose sporadic CJD in patients with rapidly progressive dementia.

In the present case, the diffusion alterations were initially detected and later persisted and evolved, which reinforces the usefulness of repeating neuroimaging studies when the

clinical picture progresses. This also highlights that even in cases without cogwheel stiffness or other specific early signs, MRI findings can strongly guide the diagnosis.

In addition to the characteristic neuroimaging findings, cerebrospinal fluid (CSF) analysis for the detection of the 14-3-3 protein is one of the main diagnostic criteria for the sporadic form of CJD, helping to confirm the clinical suspicion and differential diagnosis in relation to other rapidly progressive encephalopathies (Hermann et al., 2021).

The positivity of the 14-3-3 protein in the cerebrospinal fluid observed in this patient reinforces the findings described in the literature on CJD. According to Sahyouni et al. (2024), the detection of the 14-3-3 protein in CSF allowed the confirmation of the diagnosis of sporadic CJD after the interpretation of the tests. In a study conducted by Senesi et al. (2023) in an Australian cohort of patients with sporadic CJD, the analysis of the 14-3-3 protein by western blot (WB) showed a sensitivity of 87.5% and specificity of 66.7%, while the 14-3-3 ELISA assay demonstrated a sensitivity of 81.3% and specificity of 84.4%. The authors also highlighted that the CSF real-time tremor-induced conversion assay (RT-QuIC) had the best diagnostic performance, with a sensitivity of 92.7% and specificity of 100%, and is considered the most reliable test for confirming the disease.

However, it is important to note that the positivity of the 14-3-3 protein is not exclusive to CJD, and may occur in other conditions associated with acute neuronal injury, such as stroke, encephalitis, and metabolic disorders (Hermann et al., 2021). Therefore, the interpretation of this finding should always be done in conjunction with clinical and neuroimaging data. In the present case, serology for infectious agents was negative, and the exclusion of other causes consistently reinforced the diagnostic suspicion of sporadic CJD.

In view of this scenario, it is important to emphasize that to date, there are no specific therapies that substantially alter the course of CJD (Hall; Masood, 2025). Treatments are generally supportive, with palliative care when there is already clear deterioration, such as the condition of the patient reported in this case (Uttley et al., 2020). The literature confirms that empirical interventions rarely bring significant clinical benefit, given that the disease is essentially degenerative and rapidly progressing (Miranda et al., 2022; Sahyouni et al., 2024).

It is noteworthy that the prognosis of CJD is largely unfavorable, with rapid progression to total dependence and death within a few months. The present case followed this typical course, characterized by progressive neurological deterioration, loss of responsiveness, and need for long-term care, culminating in the adoption of palliative measures and the decision to avoid invasive interventions, in accordance with ethical principles of end-of-life care. The literature reinforces that CJD has an invariably fatal outcome, usually less than a year after

the onset of symptoms, although early recognition of the disease can help in clinical management and attenuation of the patient's suffering (Uttley et al., 2020).

Despite the detailed characteristics presented in this report, it is important to recognize its limitations, such as the absence of post-mortem confirmation, possible variations in laboratory methods for detecting the 14-3-3 protein, the absence of EEG, and the potential selection bias inherent in studies involving a single patient. Even so, this case can add value to the literature by describing the evolution of CJD in a previously healthy elderly patient, with the onset of a psychiatric condition and compatible neuroimaging and cerebrospinal fluid findings, reinforcing the relevance of early clinical suspicion and repeated tests in view of the progression of the condition.

5 CONCLUSION

The case presented here highlights the diagnostic complexity of sporadic Creutzfeldt-Jakob disease, a rare and fatal neurodegenerative disease characterized by rapid cognitive deterioration and multifocal neurological signs. The patient's clinical trajectory reinforces that initial nonspecific manifestations, such as behavioral changes and mental confusion, can simulate psychiatric disorders, delaying the definitive diagnosis.

The association between typical magnetic resonance imaging findings, especially in FLAIR and diffusion sequences, and the positivity of the 14-3-3 protein in the cerebrospinal fluid, demonstrated great diagnostic value, corroborating what is described in the international literature. It is noteworthy that, even in the absence of specific treatment, early recognition of the disease is essential to avoid futile therapeutic conducts, allow family planning, and ensure referral to appropriate palliative care.

Finally, this report contributes to the expansion of clinical knowledge about CJD in the Brazilian context, emphasizing the importance of diagnostic suspicion in cases of rapidly progressive dementia and the need for training health professionals to recognize its early signs.

ABSTRACT

The uncertainties in the parameters of a robot manipulator can significantly affect the robot performance, causing steady-state and trajectory following errors. Adaptive controllers are a good alternative for these systems, since their main feature is the capability to learn online using real-time parameter estimation. Nevertheless, adaptive controllers are not usually designed to be optimal to a prescribed performance index, and thus, are not suitable to applications in which optimal use of resources is highly desirable, for instance humanoid and service robots. This paper presents the design and performance study of a controller that combine features of adaptive control and optimal control applied to a robot manipulator. Specifically, the proposed control scheme is implemented as an actor-critic structure, which is in the reinforcement learning context, characterizing this design as a model-free approach. In contrast to others actor-critic systems in which two independent neural networks are used, one for approximating the value function and another for learning the control actions, in this scheme, a single neural network is defined, reducing the number of parameters to be estimated. The simulation results validate the desired performance of the proposed controller applied in a two-link robot manipulator with revolute joints.

aos critérios de desempenho especificados e, desta forma, não são viáveis para aplicações onde o uso ótimo de recursos é altamente desejável, como por exemplo em robôs humanoides e robôs de serviços. Este artigo apresenta o projeto e investigação de desempenho de um controlador que combina características de controle adaptativo e controle ótimo para um manipulador robótico. Especificamente, o esquema de controle proposto é implementado como uma estrutura ator-crítico, a qual está inserida no contexto de aprendizado por reforço, caracterizando este projeto como uma abordagem independente do modelo da planta. Em contraste a outros sistemas ator-críticos em que são usadas duas redes neurais independentes, uma para aproximar a função valor, e a outra para aprender ações de controle, neste esquema, se define uma única rede neural, o que reduz o número de parâmetros a serem estimados. Os resultados de simulação demonstram o desempenho desejado do controlador proposto que atua em um manipulador de juntas rotativas com dois graus de liberdade.

RESUMEN

Las incertidumbres en los parámetros de un manipulador robótico pueden afectar significativamente al rendimiento del manipulador, provocando errores de régimen y de seguimiento de la trayectoria. Los controladores adaptativos se presentan como una buena alternativa para estos sistemas, ya que su principal característica es la capacidad de aprender en línea utilizando la estimación de parámetros en tiempo real. Sin embargo, los controladores adaptativos no suelen diseñarse con la calidad de ser óptimos con respecto a los criterios de rendimiento especificados y, por lo tanto, no son viables para aplicaciones en las que es muy deseable el uso óptimo de los recursos, como por ejemplo en robots humanoides y robots de servicio. Este artículo presenta el diseño y la investigación del rendimiento de un controlador que combina características de control adaptativo y control óptimo para un manipulador robótico. En concreto, el esquema de control propuesto se implementa como una estructura actor-crítico, que se inserta en el contexto del aprendizaje por refuerzo, lo que caracteriza a este diseño como un enfoque independiente del modelo de la planta. A diferencia de otros sistemas actor-crítico en los que se utilizan dos redes neuronales independientes, una para aproximar la función de valor y otra para aprender acciones de control, en este esquema se define una única red neuronal, lo que reduce el número de parámetros que deben estimarse. Los resultados de la simulación demuestran el rendimiento deseado del controlador propuesto, que actúa en un manipulador de juntas rotativas con dos grados de libertad.

1 INTRODUCTION

The development of control strategies for robotic manipulators presents difficulties due to the characteristics of the system itself, i.e., an articulating robot is a multivariable dynamic system, with strong nonlinearities due to the couplings of its joints and movements, in addition to presenting uncertain or time-varying parameters, such as the mass and inertia of the links, friction or backlash in the joint gears, payload variations, location of the center of mass (which can change when the robot is under load), among others (Fateh; Fateh, 2019). These parametric inaccuracies result in losses of accuracy and speed in manipulator movements, which in certain applications is highly undesirable. Nonlinear dynamics, on the other hand, can lead the system to instability at certain operating points (Craig, 2021).

Conventional feedback controllers, such as PID (Proportional-Integral-Derivative), are widely used in industry because they are simple, easy to implement, and perform well in various applications (Borase *et al.*, 2021). However, this control scheme, as it is a type of control with fixed gains, becomes insufficient when applied to systems with nonlinearities and/or uncertainties (imprecise parameters, non-modeled high-frequency dynamics, and disturbances), i.e., systems that have variable operating points (Konstantopoulos; Baldivieso-Monasterios, 2020).

Among the classical controllers applied to manipulators, there are those based on model (kinematic and/or dynamic for controlling position, velocity and force). However, these approaches require complete knowledge of the equations that describe the behavior of the system, which are quite complex and with parameters that are often uncertain. The complexity of the model also increases with the increase in joints and links of the manipulator, increasing the computational cost to solve these equations (Moosavi; Zafar; Sanfilippo, 2022).

Adaptive control theory provides a means to develop solutions for dynamic systems that require more complex controllers. This approach allows for online compensation for *parametric variations and uncertainties in the system, ensuring that the desired performance criteria are met* (Sun *et al.*, 2020). Traditionally, adaptive control methods can be divided into two approaches: indirect control and direct control (Qi; Tao; Jiang, 2019). In indirect control, the estimation of the system parameters precedes the generation of an control input. In direct control, the controller parameters are directly adjusted without the need for the equations that govern the behavior of the system.

In the Adaptive Control literature, there are several studies and methods applied to the trajectory control of robotic manipulators. Dubowsky and Desforges (1979) are the pioneers in employing adaptive control techniques in articulated robots. The approach used by these

researchers was the *Model Reference Adaptive System* (MRAS). Practical results also showed the benefits of approaches based on *self-tuning* and *backstepping techniques* in relation to conventional control with fixed gains (Clegg; Dunnigan; Lane, 2001) (Sasaki *et al.*, 2009) (Hu; Xu; Zhang, 2012). Hybrid approaches have also been explored (Maliotis, 1991) (Al-Olimat; Ghandakly, 2002) (Chen, 2005) (Alquadi *et al.*, 2016) (Zhang; Wei, 2017). In (Wu; Yan; Cai, 2019) (Fateh; Fateh, 2019) (Yilmaz *et al.*, 2022) (Freire; Rossomando; Soria, 2018) adaptive control designs based on artificial intelligence techniques, such as neural networks and *fuzzy logic*, are proposed, which are able to compensate for the uncertainties of the model of a manipulator robot.

Although adaptive control techniques have been successful in many applications, one aspect that should be noted is that the controller designs resulting from these methods, in general, have been structured without considering the optimization of the control action and, therefore, are not feasible for applications where the use of optimal control strategies is required. such as humanoid robots/service robots (Khan *et al.*, 2012). In this case, a joint approach of adaptive control and optimal control techniques is desired. Optimal control basically consists of determining a control law in order to minimize a desired performance criterion. In the context of robotics, performance criteria may involve the energy or force for the execution of the motion, while the physical constraints of the system, such as actuator or joint limits, must be satisfied.

Many efforts in systems control theory are currently concentrated in an area of machine learning based on animal behavior studies and cognitive psychology, called *Reinforcement Learning* (RL), which aims to incorporate features of biological systems into the treatment of systems with uncertainties, introducing several terms, such as adaptation, learning, pattern recognition, and self-organization (Guo; Yan; Cui, 2020) (Yaghmaie; Gustafsson; Ljung, 2023) (Chen; Hence; Dong, 2024a) (Chen; Dong; Dai, 2024b) (Zhao *et al.*, 2025) (Su *et al.*, 2025) (Wang *et al.*, 2025). The central theme in RL research is the design of algorithms that learn optimal control policies through knowledge only of transition samples of states or trajectories, which are collected in advance or by real-time interaction with the system.

Actor-Critic methods constitute a class of reinforcement learning techniques that essentially consist of two independent parametric structures (e.g., neural networks), one to represent the control policy, called the Actor, and the other network structure is to represent the value function, called the critic (Sutton; Barto, 2018). The actor is an agent who interacts with the environment, i.e., the actor is the controller who establishes control actions, while

the critic evaluates the effect of control actions and provides guidelines on how to improve the control law.

Reinforcement learning can be seen in (Kiumarsi *et al*, 2018) from the perspective of a promising field of research for the design of a class of adaptive controllers with actor-Critic structure that learn *optimal* control solutions online without making use of the system dynamics model (plant). This approach solves the optimization equation (Hamilton-Jacobi-Bellman equation - HJB) in a "forward in time" manner using methods of temporal differences, approximation of functions, and policy improvements. Such controllers are inspired by biological neural structures that provide capabilities to effectively deal with the degree of complexity of nonlinear, uncertain, and partially observable systems. In (Kiumarsi *et al*, 2018), the main ideas and algorithms of reinforcement learning are presented, as well as their applications in optimal control of dynamical systems.

1.1 OBJECTIVES

The present article aims to evaluate the potential of a reinforcement learning algorithm to solve problems of online optimal control of the trajectory of a robotic manipulator with continuous state space (joint space). In contrast to most of the actor-Critic algorithms reported in the literature (see Section 2), in which two neural networks are used, one to approximate the value function, and the other to learn control actions, the algorithm proposed in this work employs an actor-Critic architecture where a single neural network is used to approximate the solution of the equation HJB, which significantly reduces the number of parameters to be estimated. Specifically, in this scheme, control actions are calculated accurately using a greedy policy scheme with respect to the value function, rather than using a parametric approximator to represent the control policy. Experiments performed on a UR10 robotic arm of the V-REP simulator show that such an algorithm successfully learns the optimal control law for the regulation and tracking tasks for different reference signals.

2 RELATED WORKS

Important previous contributions to the design of RL-based control include the work of Peters and Schaal (2008a) (2008b), who investigated various methods of reinforcement learning for humanoid robots. These methods were classified into three categories: greedy policy, vanilla policy gradient, and natural policy gradient. The natural Actor-Critic approach, which explores the formulation of the natural policy gradient, was highlighted by the authors for presenting better convergence properties. An extension of this study is shown in (Bhatnagar *et al.*, 2009).

Already (Shah; Gopal, 2009) presented a Q-learning-based control approach to manipulator robots in uncertain environments and provided a comparative study of different methods of function approximation, such as fuzzy, neural networks, decision tree, and support vector machine.

In (Khan *et al.*, 2011, 2012), the authors emphasized applications of RL controllers in robotic systems and proposed an optimal adaptive control scheme based on *Q-Learning* and Approximate Dynamic Programming. The strategy was implemented on the arm of a humanoid robot (Bristol Elumotion-Robotic-Torso II) considering one case without restrictions and another with movement restrictions.

In (Pane; Nagesh Rao; Babuška, 2016), the authors provided experimental validation of an Actor-Critic learning-based compensator to improve the performance of a manipulator robot. The proposed method eliminates the need to learn the system model and can be used in any feedback controller (PID, LQR, etc.). The validation of the method was demonstrated through experiments on an industrial manipulator robot with six degrees of freedom for different types of reference trajectories. An extension of this work is presented in (Pane *et al.*, 2019).

The application of RL controllers in robotic manipulators is also shown in (Hu; Si, 2018). In this work, an Actor-Critic Learning strategy with state observer via neural network was implemented to control a robotic arm with unknown parameters and subject to unknown dead zones.

Khan *et al.* (2019) proposed an optimal adaptive compliance control for a robotic locomotion aid device. The suggested control scheme is based on Q-Learning and approximate dynamic programming. This scheme is completely independent of dynamic model and employs feedback of joint position and speed, as well as the detected joint torque (applied by the user during walking) for compliance control. The efficiency of the controller is tested in simulation on a model of a robotic locomotion aid device.

Kamboj *et al.* (2020) presented an optimal kinematic control strategy in discrete time for a manipulator using the Actor-Critic structure. The methodology exposed was applied to a 3D model of a manipulator with six degrees of freedom in experiments carried out in a simulation software. Then, the strategy was implemented in a real robot of the same model as the simulated one.

In (He *et al.*, 2021), the authors discussed the design of control and validation of experiments of a flexible two-link manipulator system. A reinforcement learning control strategy is developed based on the actor-Critic framework to attenuate vibrations while maintaining trajectory tracking.

An Actor-Critic Learning-based tracking controller for a handler has also been studied by (Cao *et al.*, 2023). In this work, the sliding modes technique is used so that the action obtained by the Actor-Critic scheme ensures the convergence of the tracking error in a fixed time. In addition, an *antiwindup compensator* has been designed to handle the effects of saturation of the joint actuator.

In the above literature, most actor-Critic RL algorithms are implemented using two neural networks, one to approximate the value function, and the other to learn control actions. To reduce the computational complexity associated with actor-Critic methods, we propose in this paper an architecture where a single neural network is used to approximate the optimal control solution, which significantly reduces the number of parameters to be estimated. Specifically, control actions are calculated accurately through a greedy policy schema with respect to the value function, rather than using a parametric approximation to represent the control policy.

3 DESCRIPTION OF THE ROBOTIC MANIPULATOR SYSTEM

A robotic manipulator, or articulated robot, is formed by a set of individual bodies connected to each other forming a kinematic chain capable of performing tasks through interaction with the environment (Craig, 2021). The two fundamental parts that make up an articulated robot are the links, or joints, and the joints. Links are the physical structures (rigid or flexible) that make up the robot. Joints, on the other hand, are responsible for promoting relative movement between joints through actuators and are commonly classified according to the mobility they enable. The most common types found in industry are rotational joints and prismatic joints.

Figure 1

Links and Joints of an articulated robot

Source: Abbas, 2018.

Figure 1 illustrates a sequence of links and joints of a robotic arm. The ends of the articulating robot are called the base and effector. The base attaches to the first link and secures the mechanism somewhere in the task space. The effector is a tool connected to the last link of the articulator and it is at this point that there is interaction with the environment. The type of actuator installed will depend on the task to be performed.

3.1 DYNAMIC EQUATIONS OF A ROBOTIC MANIPULATOR

The dynamics of manipulators studies the relationship between the forces applied to the actuators of the joints and the movement of the mechanism. The Lagrange formulation allows modeling the dynamic behavior of a body in terms of kinetic and potential energies rather than considering the moments and forces applied individually to each joint. The Lagrange equation is expressed by

$$\tau = \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}} \right) - \frac{\partial L}{\partial q} \quad (1)$$

$$L(\dot{q}, q) = K(\dot{q}, q) - U(q), \quad (2)$$

where $K(\cdot)$ is the kinetic energy and $U(\cdot)$ is the potential energy stored in the mechanism. This equation is written in terms of the generalized coordinates q of the articulator and its derivative $\dot{q}$ in time. The term τ , in turn, represents the generalized vector of forces, including the forces and torques applied to the system.

For a manipulator robot with n rigid links, kinetic energy can be written in the form

$$K(\dot{q}, q) = \sum_{i=0}^n k_i \quad (3)$$

$$k_i = \frac{1}{2} m_i v_{C_i}^T v_{C_i} + \frac{1}{2} \omega_i^T {}^{C_i} I_i \omega_i, \quad (4)$$

where k_i is the kinetic energy for the i th link. For each link, there are two components, one related to linear velocity v_{C_i} , and the other, angular velocity ω_i , relative to the center of mass of the respective joint, with m_i the mass of the link i , $e^{C_i} I_i$ and is the inertia matrix.

Potential energy can be expressed as

$$U(q) = \sum_{i=0}^n u_i \quad (5)$$

$$u_i = m_i g^T P_{C_i} \quad (6)$$

where u_i is the potential energy for the i th link, defined in terms of the mass m_i , the gravity vector g , and the location P_{C_i} of the center of mass relative to the base.

Applying Lagrangian $L(\cdot)$ to equation (1), one can reorder the terms of the resulting expression in order to obtain.

$$\tau = M(q)\ddot{q} + N(q, \dot{q}) + G(q), \quad (7)$$

where $M(q)$ is the mass matrix of the manipulator, $N(q, \dot{q})$ is a n -dimensional vector related to Coriolis and centripetal forces, and $G(q)$ is a vector $n \times 1$ with terms involving gravity.

In this way, the model of a manipulator can be written in the form of State Space by

$$\begin{aligned} \begin{bmatrix} \dot{q} \\ \ddot{q} \end{bmatrix} &= \begin{bmatrix} \dot{q} \\ -M^{-1}(N + G) \end{bmatrix} \\ &+ \begin{bmatrix} 0 \\ M^{-1} \end{bmatrix} \tau. \end{aligned} \quad (8)$$

4 METHODOLOGY

In the context of optimal control and reinforcement learning, the notion of maximizing weighted future rewards is modified to minimize the cost of control. In this way, the objective is to determine a control law or control policy $h^*(x_k, d_k) = u_k^*$ that minimizes the performance index (value function)

$$V(x_k, d_k) = \sum_{i=k}^{\infty} \gamma^{i-k} r(x_i, u_i, d_i), \quad (9)$$

where $x_k \in \mathbb{R}^n$ is the state vector, $u_k \in \mathbb{R}^m$ is the control input vector, d_k is the desired trajectory vector, $0 < \gamma \leq 1$ is the discount factor, and $r(\cdot)$ is the utility function that returns the control cost in a time step. A reasonably general utility function in energy minimization problems is given by:

$$r(x_i, u_i, d_i) = \tilde{r}(x_i, d_i) + u_i^T R u_i, \quad (10)$$

where R is a positive definite matrix. The vector d_i can be described as a design demand, making it $\tilde{r}(\cdot)$ represent the cost to perform the desired task, such as the tracking cost.

Using Bellman's principle of optimality (Vrabie; Vamvoudakis; Lewis, 2013), the optimal performance index can be written as

$$V^*(x_k, d_k) = \min_{u_k} (r(x_k, u_k, d_k) + \gamma V^*(x_{k+1}, d_{k+1})). \quad (11)$$

In reinforcement learning, a variant of the value function $V(\cdot)$, called a Q function (or action value function), is used. Such a function has an appropriate application in control designs where the plant model is not available. The Q function associated with a control policy h is defined by

$$Q^h(x_k, u_k, d_k) = r(x_k, u_k, d_k) + \gamma V^h(x_{k+1}, d_{k+1}), \quad (12)$$

and the optimal Q function satisfies the following equation

$$Q^*(x_k, u_k, d_k) = r(x_k, u_k, d_k) + \gamma V^*(x_{k+1}, d_{k+1}). \quad (13)$$

Combining equations (11) and (13), Bellman's optimality equation in terms of the Q function is given by

$$V^*(x_k, d_k) = \min_{u_k} (Q^*(x_k, u_k, d_k)) \quad (14)$$

and the optimal control policy is obtained by

$$h^*(x_k, d_k) = \arg \min_{u_k} Q^*(x_k, u_k, d_k). \quad (15)$$

assuming Q^* sufficiently smooth (differentiable), the control signal can be obtained as a solution to the equation

$$\frac{\partial Q^*(x_k, u_k, d_k)}{\partial u_k} = 0. \quad (16)$$

4.1 ACTOR-CRITIC *ONLINE* LEARNING STRATEGY

The actor-Critic scheme described below considers a manipulator system with two degrees of freedom, which can be extended to manipulators with n degrees of freedom. The control law is synthesized in the optimal tracking problem of the manipulator's joint position. In particular, $x_k = [x_{k1} \ x_{k2} \ x_{k3} \ x_{k4}]^T$ is defined as the state vector at time k , where $x_{k1} = q_1$ and $x_{k2} = q_2$ are the angular positions of joints 1 and 2, respectively, and $x_{k3} = \dot{q}_1$ e $x_{k4} = \dot{q}_2$ are, in due order, the angular velocities of joints 1 and 2. The control signal, of course, is a vector 2×1 , where $u_k = \tau$ is the force applied on the joints. For the optimal tracking problem considered, the utility function reduces to

$$r(x_k, e_k, u_k) = e_k^T Q_c e_k + (u_{k+1} - u_k)^T S (u_{k+1} - u_k) + u_k^T R u_k \equiv r_k, \quad (17)$$

where $Q_c \in \mathbb{R}^{4 \times 4}$, $R \in \mathbb{R}^{2 \times 2}$, and $S \in \mathbb{R}^{2 \times 2}$ are diagonal and positive definite matrices.

In the present study, the parametric structure to approximate the Q function assumes the form given by

$$\hat{Q}_i(x_k, u_k, d_k, w_i) = w_i^T \phi(x_k, u_k, d_k), \quad (18)$$

where w_i is the i th estimate of the weight vector of the neural network and $\phi(\cdot)$ is the vector of activation functions or base functions. It is considered that the desired value for estimating the parameter w_i is given by

$$\Delta_{objetivo} = r(x_k, e_k, u_k) + \gamma \hat{Q}_i(x_{k+1}, u_{k+1}, d_{k+1}) \quad (19)$$

Figure 2 illustrates the neural network architecture used to estimate the Q function, in which, $m = 4$, $n = 2$ and $p = 105$. The functions ϕ_j , $j = 1, \dots, p$, are the components of the vector of activation functions resulting from the Kronecker product given in equation (21).

The weight vector w_i is calculated by minimizing, in a least-squares sense, the temporal difference error, which is defined by

Figure 2

Architecture of the neural network used to estimate the function Q

Source: Prepared by the authors.

$$\delta_k = r_k + \gamma \hat{Q}_i(x_{k+1}, u_{k+1}, d_{k+1}, w_i) - \hat{Q}_i(x_k, u_k, d_k, w_i). \quad (20)$$

The vector of activation functions is constructed by higher-order polynomials. For simplicity, $\phi(\cdot)$ will be represented using Kronecker product $\otimes$ with the exclusion of redundant terms (Vrabie; Vamvoudakis; Lewis, 2013).

This exclusion is necessary so that the elements that make up the vector of base functions $\phi(\cdot)$ become linearly independent. The goal is to insert some quadratic elements and up to fourth-order terms into the tracking errors, states, and control signals, so that the neural network can learn the nonlinearities of the manipulator. Therefore,

$$\phi(z_k) = z_k \otimes z_k, \quad (21)$$

Where:

$$z_k = [u_k^T \quad e_k^T \quad e_{k1}^2 \quad e_{k2}^2 \quad e_{k3}^2 \quad e_{k4}^2 \quad x_{k1}^2 \quad x_{k2}^2 \quad x_{k3}^2 \quad x_{k4}^2]^T \quad (22)$$

so that $e_k = [e_{k1} \quad e_{k2} \quad e_{k3} \quad e_{k4}]^T = x_k - d_k$ is the tracking error. In this way, the Artificial Neural Network (ANN) to be implemented has 105 neurons.

The Q function takes the form

$$\hat{Q}_i(x_k, u_k, d_k, w_i) = w_{i,1}^T \phi_1(z_k) + w_{i,21}^T \phi_2(z_k) u_{k1} + w_{i,22}^T \phi_2(z_k) u_{k2} + w_{i,31} u_{k1}^2 + w_{i,32} u_{k2}^2, \quad (23)$$

where $\phi(z_k) = [\phi_1^T(z_k) \ \phi_2^T(z_k) u_{k1} \ \phi_2^T(z_k) u_{k2} \ u_{k1}^2 \ u_{k2}^2]^T$ follows from equation (21). Specifically, the elements that make up $\phi_1(\cdot)$ and $\phi_2(\cdot)$ are independent of u_{k1} and u_{k2} .

Applying equation (16) to determine the control policy, we have

$$\begin{aligned} \frac{\partial \hat{Q}_i(x_k, u_k, d_k, w_i)}{\partial u_{k1}} &= w_{i,21}^T \phi_2(z_k) + 2w_{i,31} u_{k1} = 0 \\ u_{k1} &= -\frac{1}{2w_{i,31}} w_{i,21}^T \phi_2(z_k) \end{aligned} \quad (24)$$

$$\begin{aligned} \frac{\partial \hat{Q}_i(x_k, u_k, d_k, w_i)}{\partial u_{k2}} &= w_{i,22}^T \phi_2(z_k) + 2w_{i,32} u_{k2} = 0 \\ u_{k2} &= -\frac{1}{2w_{i,32}} w_{i,22}^T \phi_2(z_k). \end{aligned} \quad (25)$$

reorganizing in matrix form, the control policy can be written as

$$h_i(x_k, d_k) = -\frac{1}{2} \begin{bmatrix} w_{i,31} & 0 \\ 0 & w_{i,32} \end{bmatrix}^{-1} \begin{bmatrix} \phi_2^T(z_k) & \mathbf{0}_{1 \times 12} \\ \mathbf{0}_{1 \times 12} & \phi_2^T(z_k) \end{bmatrix} w_{i,2}, \quad (26)$$

in which $w_{i,2} = [w_{i,21}^T \ w_{i,22}^T]^T$

In reinforcement learning, the actor is the agent that generates the control policy, that is, the actor is described mathematically by equation (26). The critic is described by equation (23).

4.2 ACTOR-CRITIC ONLINE LEARNING ALGORITHM

One aspect related to the actor-Critic approach is that the estimates of the Q function of a given control policy are updated at each step of time k using observed data from the system (manipulator states). To this end, the iterative algorithm of recursive least squares (RLS) will be used to estimate the weight vector w_i . The efficiency of the RLS method in

online learning is mainly due to its robustness to deal with time variations in the regression parameters and the fast convergence speed (Ferreira; Rêgo; Neto, 2017).

Therefore, by applying the RLS algorithm, the estimation of the RNA weights, at each time step, k is given by

$$w_{k+1} = w_k + K_k \delta_k \quad (27)$$

$$K_k = \frac{P_k \phi(z_k)}{\lambda + \phi(z_k)^T P_k \phi(z_k)} \quad (28)$$

$$P_{k+1} = \frac{1}{\lambda} \left[P_k - \frac{P_k \phi(z_k) \phi(z_k)^T P_k}{\lambda + \phi(z_k)^T P_k \phi(z_k)} \right], \quad (29)$$

where λ , $0 < \lambda \leq 1$ is the forgetting factor and P_k is the inverse correlation matrix.

The reinforcement learning scheme employed in this work requires a stable initial control policy. The purpose is to keep the controller stable during the initial instants until the agent acquires enough experience (observing the environment) so that a new policy can be calculated. For simplicity, the neural network gains must be initialized in such a way as to result in a discrete PD (Proportional-Derivative) controller. This can be implemented by modifying the weights of the equation (26), where it is observed that:

$$\varphi_2(z_k) = [e_{k1} \ e_{k2} \ e_{k3} \ e_{k4} \ e_{k1}^2 \ e_{k2}^2 \ e_{k3}^2 \ e_{k4}^2 \ x_{k1}^2 \ x_{k2}^2 \ x_{k3}^2 \ x_{k4}^2]^T, \quad (30)$$

that is, $h(x_k, d_k)$ depends directly on the position and speed errors of the links. That said, it can be seen that it is easy to obtain a PD control by establishing, for example,

$$\begin{aligned} w_{i,31} &= w_{i,32} = \frac{1}{2}, \\ w_{i,21} &= [K_{P_1} \ 0 \ K_{D_1} \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0]^T, \\ w_{i,22} &= [0 \ K_{P_2} \ 0 \ K_{D_2} \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0]^T, \end{aligned} \quad (31)$$

where K_{P_1} and K_{D_1} , and K_{P_2} and K_{D_2} are the proportional and derivative gains, respectively, of joints 1 and 2. Adjustment of these parameters will be performed by trial and error.

A summary of the actor-Critic reinforcement learning algorithm implemented in this study is presented below.

Table 1

Actor-Critic RL Algorithm
Input: discount factor γ , learning factor α , initial value of the covariance matrix β , and the forgetting factor λ . Initialize the neural network weights in a way that ensures a stable PD controller. Measure initial states x_0 and trajectory errors e_0 . Initialize the arrays $P_0 = \beta I$, Q_c , R and S arbitrarily and $i = 0$.
Repeat for each states sample $k = 0, 1, 2, \dots$
▷ Noise signal as an exploration component $\xi = []$
▷ Control Signal $u_k = h_i(x_k, d_k) + \xi$
Apply and measure states $u_k x_{k+1}$ $u_{k+1} = h_i(x_{k+1}, d_{k+1})$
$e_{k+1} = x_{k+1} - d_{k+1}$
$r_k = e_k^T Q_c e_k + (u_{k+1} - u_k)^T S (u_{k+1} - u_k) + u_k^T R u_k$
▷ Recursive Least Squares - RLS $\Delta_{objetivo} = r_k + \gamma \hat{Q}(x_{k+1}, u_{k+1}, e_{k+1})$
$\hat{W}_k = w_k^T \phi_k$
$K_k = \frac{P_k \phi_k}{\lambda + \phi_k^T P_k \phi_k}$
$w_{k+1} = w_k + K_k (\Delta_{objetivo} - \hat{W}_k)$
$P_{k+1} = \frac{1}{\lambda} \left(P_k - \frac{P_k \phi_k \phi_k^T P_k}{\lambda + \phi_k^T P_k \phi_k} \right)$
If End of a learning period: $w_{i+1(ctrl)} = \alpha w_{k+1} + (1 - \alpha) w_{i(ctrl)}$
▷ Updating the control policy $h_{i+1} \leftarrow -\frac{1}{2} \begin{bmatrix} w_{i+1(ctrl),31} & 0 \\ 0 & w_{i+1(ctrl),32} \end{bmatrix}^{-1} \begin{bmatrix} \varphi_2^T(z_k) & \mathbf{0}_{1 \times 10} \\ \mathbf{0}_{1 \times 10} & \varphi_2^T(z_k) \end{bmatrix} w_{i(ctrl),2}$
$P_{k+1} = \beta I$
$i = i + 1$
End up up to meet the stop criterion

The algorithm starts with the RNA gains arbitrarily defined to produce the effect of a PD control. The initial condition of the inverse correlation matrix of the RLS given in the form $P_0 = \beta I$, where β is a constant with a sufficiently large value and I is the identity matrix, was considered. During the first momens, there is no update in the control policy to ensure stability during the initial learning, however the weight vector w_k is calculated at each step by applying equations (27) to (29). The control signal is obtained at each time k using (26). A noise signal ξ , known as exploration noise, is added to the control input for the purpose of online learning (Jiang; Jiang, 2017).

$$w_{i+1(ctrl)} = \alpha w_{k+1} + (1 - \alpha)w_{i(ctrl)}, \quad (32)$$

where $w_{i(ctrl)}$ are the parameters of the controller implemented during the i -th cycle, $0 < \alpha \leq 1$ is the learning factor. At that moment, the matrix P is redefined. The controller weights are again kept unchanged until the current cycle has been completed. The process is repeated until the convergence of the network parameters. Once this goal is achieved, the controller operates at constant weights.

5 SIMULATION STRUCTURE

In order to provide a simulation structure that allows the development of the algorithms and the experiments, the *V-REP* (Virtual Robotics Experimentation Platform) *software was used* together with MATLAB (*Matrix Laboratory*). V-REP is a general-purpose robot simulator that provides multiple physics engines for the simulations, multiple robotic models, and multiple configurations of the environment. In this way, it is possible to customize all the objects in the scene, including the parameters of the sensors and actuators, thus allowing more faithful results to be achieved (Rohmer; Singh; Freese, 2013).

In the V-REP, different means of controlling the objects/models in the scene are available, either through embedded routines, ROS (*Robot Operating System*) *nodes* (Quigley; Gerkey; Smart, 2015), remote API (*Application Programming Interface*), a plugin or some custom solution. Controllers can be written in C/C++, Python, Java, Lua, and MATLAB (Shamshiri *et al.*, 2018). In this study, the robotic model used in the simulator is controlled by an external routine developed on the MATLAB platform making use of the remote API. Figure 3 illustrates the communication between the controller and the simulation environment.

The settings to be followed for the proper functioning of the simulations using the platforms described above and within the context of reinforcement learning can be seen in detail in (Pluškoski; Ciganović; Jovanović, 2019).

6 SIMULATION RESULTS

In this section, the results of the simulations of the control scheme proposed in this work are presented and discussed. To perform these computational experiments, the UR10 robotic arm model available in the V-REP simulator was used. Since this articulator has six degrees of freedom, in these tests the torque generated by the control law will be applied only to the shoulder and elbow joints (Figure 4) while the other joints are deactivated and locked in their respective equilibrium positions (0°). The control was carried out using the remote API through routines implemented in the MATLAB platform.

Figure 4

UR10 manipulator joints

Source: Prepared by the authors.

The evaluation of the control scheme via reinforcement learning will be done by analyzing the results of simulations of three tasks: regulation, trajectory following of a multi-step signal and a sinusoidal signal.

The behavior of the states for the regulation case is shown in Figure 5. The initial configuration of the joints has been set as $x_0 = [\pi/6 \ \pi/3 \ 0 \ 0]^T$ and the controller

parameters have been adjusted to the following values $K_{P_1} = K_{P_2} = 150$, $K_{D_1} = K_{D_2} = 30$, $\gamma = 0,98$, $Q_c = \text{diag}(250, 250, 0,001, 0,001)$, $R = \text{diag}(0,0001, 0,0001)$, $\alpha = 0,2$ e $P_0 = 10^4 I_{78 \times 78}$. The learning cycle for this simulation was 0.8 s. The control effort applied to the joints is shown in Figure 6 and the update of the actor's weights is shown in Figure 7.

Figure 5

Trajectory of the states

Figure 6

Control signal

Source: Prepared by the authors.

Figure 7

Actor network weight update

Source: Prepared by the authors.

In the second experiment suggested to validate the implemented controller, a multi-step reference signal was used, in order to simulate the pick and place task, commonly performed by manipulators. For this experiment, the initial state was set to $x_0 = [0 \ 0 \ 0 \ 0]^T$. The control parameters were the same as those used for the regulation case, except for the following values $Q_c = \text{diag}(100, 100, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0)$, $\alpha = 0,1$, $K_{P_1} = K_{P_2} = 500$, $K_{D_1} = K_{D_2} = 50$ the learning cycle changed to 2 s. Under these adjustments, the tracking response, the torque applied to the joints, and the update of the actor's net weights are presented in 8 through 11.

As seen, the joints are able to reach the reference signal with errors within acceptable limits and the stability of the system is maintained throughout the simulation time. It is also shown that at the time instant of 20 s there was an increase in the control signal causing an unwanted overtime, but in the following instants, from the 15th update of the policy (30 s), an improvement in tracking was observed in relation to the initial policy (first 2 s), a consequence of the learning acquired.

Figure 11

Actor network weight update

Source: Prepared by the authors.

In the last proposed experiment, a sinusoidal signal was established as a reference for the articulator joints under the following settings $Q_c = diag(200, 200, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0)$, $K_{P_1} = 4000$, $K_{P_2} = 2000$, $K_{D_1} = 50$, $K_{D_2} = 20$ e $\alpha = 0,4$. The other parameters were set at the same

values as in experiment 2. The results of the simulation are observed in Figures 12 to 15. According to Figures 12 and 13, where the tracking performance is shown, it is observed that the trajectory following improves at the end of each learning cycle (2 s intervals). From the third cycle onwards, tracking errors stabilize within tolerable limits.

7 CONCLUSION

In this work, a control scheme based on reinforcement learning applied to a robotic manipulator was proposed, using an actor-Critic approach. In this design, only one neural

network was trained to approximate the Q function using only the actual system measurements via the RLS estimator. In order to provide robustness to the scheme, the update of the control policy, obtained by minimizing the Q function, occurs at the end of a fixed number of iterations (learning cycle), remaining constant during this interval. To approximate the action-value function, a polynomial neural network was used, proving to be adequate to learn the nonlinearities of the manipulator. Computational experiments with the presented controller were carried out using the UR10 robot model in the V-REP simulator. The simulations included the task of regulating and tracking the trajectory of the sinusoidal and multi-step signals. In the simulated results, it was observed the stability of the state variables during the entire simulation time and the ability to track the reference signals, even without explicit knowledge of the manipulator dynamics.

ABSTRACT

The paper presents an evaluation of sustainable practices in furniture industries through the analysis of their productive processes. Sound pollution was studied in two furniture wood industries of different sizes of the Federal District. Through measurements it was possible to measure the excessive noise emissions and compare them with the standards established by existing national and international Laws, Resolutions, Ordinances and Regulatory Technical Standards. Excess noise was observed in both industries at specific points. To control the problem, actions were suggested based on the good practices of sustainable projects.

Keywords: Sustainability. Furniture Industry. Noise.

RESUMO

O trabalho apresenta uma avaliação de práticas sustentáveis em indústrias moveleiras por meio da análise de seus processos produtivos. Foi estudada a poluição sonora em duas indústrias madeiro moveleira de diferentes portes do Distrito Federal. Por meio de medições foi possível aferir as emissões de ruído excessivo e compará-las com os padrões estabelecidos por Leis, Resoluções, Portarias e Normas Técnicas Regulamentadoras nacionais e internacionais existentes. Observou-se excesso de ruído em ambas as indústrias, em pontos específicos. Para controle do problema foram sugeridas ações com base nas boas práticas de projetos sustentáveis.

Palavras-chave: Sustentabilidade. Indústria Moveleira. Ruído.

RESUMEN

El trabajo presenta una evaluación de prácticas sostenibles en industrias madereras mediante el análisis de sus procesos productivos. Se estudió la contaminación acústica en dos industrias madereras de diferentes tamaños del Distrito Federal. Mediante mediciones, fue posible evaluar las emisiones de ruido excesivo y compararlas con los estándares establecidos por las leyes, resoluciones, decretos y normas técnicas reguladoras nacionales e internacionales existentes. Se observó un exceso de ruido en ambas industrias, en puntos específicos. Para controlar el problema, se sugirieron acciones basadas en las buenas prácticas de proyectos sostenibles.

Palabras clave: Sostenibilidad. Industria del Mueble. Ruido.

1 INTRODUCTION

The last decades have been marked by an evolution in discussions on environmental issues, changing the world panorama in relation to the environment. Companies have been directly affected by these changes, given that the market is beginning to value products that minimally interfere with the environment, becoming as feared as the environmental agencies themselves and their respective inspection agents. (Mieli, 2007)

In the furniture sector, the concept of sustainable development has an additional weight. This industry, at a global level, was one of the most demanded in terms of environmental responsibility. During the 1990s there were boycotts by developed countries of tropical timbers. Later, this strategy evolved into the requirement of certification of responsible forest management. This certification, although not a legal obligation, has become a market requirement, leading several companies to seek to act in a more environmentally responsible way voluntarily. (Coutinho & Macedo-Soares, 2002) (Nardelli, 2001)

One of the ways to verify the sustainability of an industry is to analyze its production processes. This analysis may involve aspects related to existing physical and chemical risks. In this context, measurements of quantities related to pollution from the furniture industry can be considered fundamental in the production process. The presence of noise is one of the main factors of concern. Machinery used in industry can produce noise levels above the limits tolerable by humans. In this case, the use of personal protective equipment is a mandatory measure to avoid occupational sequelae. (Lima et al., 2016) (Filipe et al., 2014)

Continued exposure to high levels of sound pressure can cause noise-induced hearing loss and, consequently, cause effects on the individual's quality of life. The consequence resulting from a hearing loss is a psychosocial alteration characterized by isolation, stress, difficulties in family relationships, anxiety, sleep difficulty, decreased self-esteem and depression. (Holanda et al., 2011)

Occupational hearing loss represents an important public health problem due to its high prevalence in the most diverse industrial segments. stated that from the age of 50, male individuals have considerable hearing loss. (Alves & Fiorini, 2012) 8

NR 15 addresses the permitted noise limits depending on the worker's exposure time. In addition, it establishes that continuous or intermittent noise levels must be measured in decibels (dB) with a sound pressure level instrument operating in the compensation circuit "A", slow response circuit (SLOW) and with the readings captured close to the worker's ear. (Brazil, 1978)

Annex I of NR 15 reports that exposure to noise levels above 115 dB is not allowed for individuals who are not adequately protected. According to Annex I, activities or operations that expose workers to noise levels, continuous or intermittent, above 115 dB, without adequate protection, will offer serious and imminent risks. Standards for non-impact noise are also set out in Annex I. The same standard, in its annex II, establishes that impact noise has acoustic energy peaks of less than 1 (one) second at intervals greater than 1 (one) second and also according to Annex II the tolerance limit for impact noise will be 130 dB that can be done with the fast response reading (FAST) and when this limit is exceeded the risk is serious and imminent. (Brazil, 1978)

This paper addresses the concept of sustainable development related to environmental variables in the furniture industry. Two companies with different profiles were analyzed. An industry with a more common profile, representing the universe of small companies spread throughout Brazil, many even informal. Another medium-sized industry with the characteristic of working in a specialized and poorly verticalized way. It represents a smaller universe of companies that are dedicated to serving large corporate consumers and that combine different raw materials in the manufacture of their furniture. Both companies were monitored and evaluated for noise pollution caused by the production activity.

2 MATERIAL AND METHODS

The research was carried out in furniture industries in the Federal District (DF), in the administrative areas of Brasília and Águas Claras. These two areas have a population of more than 350 thousand inhabitants, equivalent to 12% of the Federal District. The region has an HDI of 0.824, considered high by Brazilian standards, and a GDP *per capita* of R\$ 62.8 thousand, the highest in the country. (GDF, 2017)

The first industry involved in the study (small company) has a production system tending to be artisanal. The second industry, considered medium-sized, has a production process with a good level of automation. The two types of industries represent around 90% of the establishments in this segment in the Federal District. For practical reasons, the industry with artisanal characteristics is called 'Industry 1' and the second, whose production process has a high level of automation, is called 'Industry 2'. (Garcia, 2007)

For the analysis of environmental pollution in the industries studied, a quantitative field research was developed. Noise measurements were performed. This data was obtained through captures at different work points in the industry, representing all work areas.

2.1 DATA COLLECTION OF ENVIRONMENTAL FACTORS

The assessment of exposure to a substance is carried out from an instrumental measurement followed by comparison of the result with the exposure limits. (DellaRosa & Colcaioppo, 1994)

Measurements were carried out at specific points in each of the industries. The locations chosen for the measurements represented areas involved in the production chain (

Table 1). Within these areas, random points were chosen.

Table 1

Description of the areas analyzed in the two industries

Area	Industry 1	Industry 2
1	Covered patio for the reception and storage of raw materials and finished products.	Covered patio for the assembly and finishing of products, the locksmith sector and the warehouse of raw materials and finished products. The machines in this area have an industrial scale, are automated and have a usage time of less than ten years.
2	Predominantly open-air region, intended for the storage of hardware and circulation of employees.	An open-air region for loading and unloading materials, with the circulation of trucks, a support mechanical workshop and silos for the storage of waste from the woodworking processes.
3	Covered patio where the company's carpentry and metalwork shop operates. In this place are arranged various machines, with a time of use of more than ten years, divided into benches.	Covered patio where the company's carpentry shop operates. In this place are arranged the machines of less sophistication to support production.

Source: Casella CEL. (2015)

The measurements carried out were analyzed through three levels of integration: companies, areas of the companies and measurement blocks.

The company represents the highest level of integration and includes all measurements carried out during the field campaign. The integration by 'area of the company' aimed to differentiate the physical spaces analyzed within each of the company. Measurement blocks correspond to a set of data collected at the same point in a work shift.

Random working days were chosen for data collection, between 8:00 a.m. and 6:00 p.m. (opening hours of the industries). The sampling rate of the measurements used was one capture per minute. The data collected were carried out over four months and totaled more than 271 uninterrupted hours, carried out at 77 different points, with an average of 179

measurements per point. In total, 16,298 measurements were taken, providing a sampling error of 0.55%, considering a normal distribution, a confidence level of 95% and $p=q=0.5$.

2.2 STATISTICAL DESIGN

The data were statistically analyzed using the IBM SPSS® software, where the following statistical variables were selected: mean, standard deviation, coefficient of variation and percentiles. The data were evaluated according to the hypotheses of the parametric tests. (Mendenhall & Sincich, 2006) (Field, 2009)

The means were evaluated using the t-test for a single sample. The percentiles were used as a parameter for identifying critical areas and equipment.

2.3 EQUIPMENT USED IN THE MEASUREMENTS

Sound pressure or noise measurements were made near the employee's auditory zone using the professional Sound Pressure Level meter CEL-35X. The equipment has sensitivity for capturing continuous noise in the range between 65 and 140.3 dB and for continuous or intermittent noise in the range between 95 and 143.3 dB. (Casella CEL, 2015)

Figure 1

Used noise measuring equipment

3 RESULTS AND DISCUSSIONS

Table 1 presents the statistical summary of the sound pressure measurements carried out in Industries 1 and 2.

According to IEC 61252, for the measuring equipment used, the PicoC measurement corresponds to the peak sound pressure level in the instantaneous condition. The LAeq measurement considers continuous noise to a pattern of audible frequencies with a close response approximation to the human ear. To evaluate the measurements, the qualitative method provided for in Annex I of Regulatory Standard No. 15 (NR 15) of the Ministry of Labor was used. According to the Standard, noises in continuous regime must not exceed 85 dB and in instantaneous conditions cannot exceed 115 dB.

Table 2

Statistical summary of the measurements carried out in Industries 1 and 2

Parameter		Industry 1		Industry 2	
		PicoC	LAeq	PicoC	LAeq
N	Valid	1789	2084	4237	4830
	With error	6367	6072	3905	3312
Average		109,81	79,38	108,98	80,76
Median		108,90	77,80	107,40	81,80
Standard deviation		9,84	11,17	8,70	7,59
Percentile	25	101,20	69,70	102,70	76,00
	75	117,50	87,18	113,70	86,10

*Values in dB, with the exception of N, which corresponds to the number of measurements performed for the parameter.

Source: Authors (2026)

For continuous noise emissions (LAeq) in Industry 1, it can be seen that the median was below the limit of 85 dB, which means that most of the measurements carried out in the company did not identify transgression of the noise pollution limits established by NR 15. On the other hand, observing the 75th percentile, it is clear that there are more than 25% of valid measurements exceeding the noise pollution limit. It is observed that the 75th percentile for LAeq was 87 dB. Considering the *t*-test for one variable, it can be stated that, on average, continuous noise emissions in Industry 1 were 79.38 dB (below the limit of 85 dB of NR 15), with a standard error of ± 0.244 dB and a confidence interval of 95%. For peak noise emissions (PicoC), the median was also observed below the limit of 115 dB, indicating that most of the measurements proved the regularity of the installation regarding the emission of peak noise. However, the 75th percentile was 117.5 dB, above the limit established by NR 15. Thus, it was clear that at least 25% of the measurements presented problems in relation to the regular limits. Considering the *t*-test for one variable, it can be stated that, on average, peak noise emissions in Industry 1 were 109.81 dB (below the 115 dB limit of NR 15), with a standard error of ± 0.235 dB and a confidence interval of 95%.

Regarding Industry 2, for the measurement of continuous noise, we observed that the median (81.80 dB) was below the limit established by NR 15 (85 dB), indicating that most of the sources emitting noise operate within the acceptable range. However, as in Industry 1, the 75th percentile (86.1 dB) was above the tolerable limit, indicating that there are points of continuous noise emissions of concern. Considering the *t*-test for one variable, it can be stated that, on average, continuous noise emissions in Industry 2 were 80.76 dB (below the limit of 85 dB of NR 15), with a standard error of ± 0.109 dB, considering a confidence interval of 95%. Regarding peak noise, both the median (107.4 dB) and the 75th percentile (113.7 dB) were below the limit established by NR 15 (115 dB), which suggests less concern about

this type of emission for Industry 2. Considering the t-test for one variable, it can be stated that, on average, peak noise emissions in Industry 1 were 108.98 dB (below the limit of 115 dB of NR 15), with a standard error of ± 0.134 dB and a confidence interval of 95%.

Comparing the results between the companies analyzed, it is possible to notice a slightly higher performance of Industry 2, both in data homogeneity and performance, since the 75th percentile for peak noise was below the limits of NR 15. The machines used in Industry 2 are more modern when compared to Industry 1 and this may explain the observed performance. The detailed analysis of Industry 1 revealed the significant presence of noise-emitting sources above the tolerance limits in area 3, which contains equipment with more than ten years of use and where the company's carpentry and metalwork works. For both continuous and peak noise measurement, it observed the 75th percentile above tolerance limits. This means that there is a representative amount of problematic measurements.

At Figure 2 the numbers indicated on the ordinate axis correspond to the existing equipment in area 3 of Industry 1. Thus, for peak noise emissions, the equipment that presented significant measurements above the limits were the router, the circular saw and the lathe (equipment 14, 15 and 19 respectively). In the case of router, considering the test t for one variable, it can be stated that on average, peak noise emissions were 116.73 dB (above the 115 dB limit of NR 15), with a standard error of ± 0.454 dB, considering a confidence interval of 95%. Considering the continuous noises, it was observed that the circular saw (equipment 15) is the most critical equipment. The median for this equipment was well above the limit of 85 dB. Considering the test t for one variable, it can be stated that on average, the continuous noise emissions for the circular saw were 90.05 dB (above the limit of 85 dB of NR 15), with a standard error of ± 0.66 dB and a confidence interval of 95%. The router, the lathe and the drill (equipment 14, 19 and 20 respectively) also presented values above the limit, but in smaller quantities. For the other equipment analyzed (planer and thickness), no worrying measurements were identified.

Figure 2

Box and whisker diagram for peak (a) and continuous (b) sound pressure measurements in Industry 1 area 3 equipment

Source: Authors (2026)

It is clear that router, circular saw, lathe and drill equipment must be operated with ear protection. Given the *layout* of the production plant, even the equipment adjacent to those identified as critical must be operated with this protection.

Regarding Industry 2, the detailed analysis revealed the significant presence of noise emitting sources above the tolerance limits in areas 1 and 3. For both continuous and peak noise measurement, the 75th percentile was observed above the tolerance limits. This means that there is a representative amount of problematic measurements.

Analyzing area 1 by sector, it is clear that only the 'process of washing metal parts' (point 6 of the Figure 3) exceeds peak noise limits in more than 25% of measurements. Considering the test t for one variable, it can be stated that, on average, the continuous noise emissions for the washing process of metal parts were 112.79 dB (below the limit of 115 dB of NR 15), with a standard error of ± 0.416 dB and a confidence interval of 95%. It is important to highlight that the analyzed process is positioned adjacent to the roll forming machine sector, which is significantly noisier than the washing process. It is possible to infer that the captures of peak noise above the limits are related to the profilers.

Figure 3

Enclosure and whisker diagram for peak (a) and continuous (b) sound pressure measurements on Industry 2 Area 1 equipment

Source: Authors (2026)

The continuous noise analysis in area 1 allows us to observe significant transgression of the limits in five sectors: metal packaging machine (point 4), washing machine (point 6), sliding table (point 11), gluing and assembly process (point 12), special cutting machine (point 14) and finished products packaging machine (point 15). In the 'squaring' and 'packaging of finished products' sectors, transgression was observed in more than 50% of the catches. Considering the *t*-test for one variable, it can be stated that, on average, only the finished products packaging machine presented measurements above the 85 dB limit of NR 15 and even then within the margin of error. The mean observed was 84.51 dB, with a standard error of ± 0.50 dB and a confidence interval of 95%.

In area 3, noise emissions above the limits were also captured. For peak noise, it was identified that the amount of captures above the limit of 115 dB was between the average and the 75% percentile. That is, between 25% and 50% of the catches breached the limit. For continuous noise, the median corresponding to the captures was above the limit of 85 dB. This means that most of the measurements infringed the limit.

The analysis of area 3 revealed that the process with peak noise emissions above the threshold is 'billet cutting'. In this case, the transgressions exceed the median line, that is, more than 50% of the catches made. Considering the continuous noise, three of the four sectors analyzed presented problems: routers, carpentry and billet cutting. In the case of carpentry, all measurements recorded transgression of the continuous noise limits.

The greater number of noisy sources can be explained by the larger size of Industry 2 in relation to Industry 1.

The results observed regarding excess noise have also been reported in similar studies carried out in furniture industries in Rio Grande do Sul and Rondônia. (Girardi & Sellitto, 2011) (Lopes et al., 2009)

4 CONCLUSIONS

It was possible to identify point sources of excessive noise emissions. It was observed that noise levels are associated with the intensity of productive activity, with the highest levels found in medium-sized industry. Equipment such as the router, circular saw, lathe and drill must be operated with ear protection, aided by individual protective covers on the equipment. Given the *layout* of the production plant, even equipment adjacent to those identified as critical must be operated with protection. In these cases, the intensive use of hearing protectors is recommended for all workers who work with this equipment.

ABSTRACT

This article explores the accelerated aging of the Brazilian population, focusing on the challenges faced by Black women, a vulnerable group due to structural racism, gender inequality, and socioeconomic conditions. These women experience cumulative exclusion that affects their health, well-being, access to rights, and learning capacity. The objective is to analyze the relationship between the aging of Black women and the contributions of neuropsychopedagogy to promoting quality of life, autonomy, and learning in this group. To this end, a qualitative, descriptive, and analytical approach is used, grounded in bibliographical research. Thus, it is observed that neuropsychopedagogy emerges as an essential field, articulating knowledge from neuroscience, psychology, and pedagogy to understand aging as a dynamic and continuous learning process, valuing brain plasticity and sociocultural experiences. The study highlights the importance of neuropsychopedagogical interventions based on the valorization of these women's identity, culture, and traditional knowledge, promoting self-esteem, belonging, and social participation, despite access barriers such as socioeconomic inequalities and Eurocentric models. It is concluded that a critical and intersectional neuropsychopedagogy is crucial for promoting equity, dignity, and quality of life for Black women in old age, reaffirming learning as an inalienable right throughout life.

exclusão cumulativa que afeta sua saúde, bem-estar, acesso a direitos e capacidade de aprendizagem. Objetiva-se analisar a relação entre o envelhecimento das mulheres negras e as contribuições da neuropsicopedagogia para a promoção da qualidade de vida, autonomia e aprendizagem nesse grupo. Para tanto, procede-se a uma abordagem qualitativa, descritiva e analítica, fundamentada em pesquisa bibliográfica. Desse modo, observa-se que a neuropsicopedagogia emerge como campo essencial, articulando saberes da neurociência, psicologia e pedagogia para compreender o envelhecimento como um processo dinâmico e contínuo de aprendizagem, valorizando a plasticidade cerebral e as experiências socioculturais. O estudo destaca a importância de intervenções neuropsicopedagógicas pautadas na valorização da identidade, cultura e saberes tradicionais dessas mulheres, promovendo autoestima, pertencimento e participação social, apesar das barreiras de acesso como desigualdades socioeconômicas e modelos eurocêntricos. Conclui-se que uma neuropsicopedagogia crítica e interseccional é crucial para a promoção da equidade, dignidade e qualidade de vida das mulheres negras na velhice, reafirmando o aprendizado como um direito inalienável ao longo da vida.

RESUMEN

Este artículo explora el envejecimiento acelerado de la población brasileña, centrándose en los desafíos que enfrentan las mujeres negras, un grupo vulnerable debido al racismo estructural, la desigualdad de género y las condiciones socioeconómicas. Estas mujeres experimentan una exclusión acumulativa que afecta su salud, bienestar, acceso a derechos y capacidad de aprendizaje. El objetivo es analizar la relación entre el envejecimiento de las mujeres negras y las contribuciones de la neuropsicopedagogía para promover la calidad de vida, la autonomía y el aprendizaje en este grupo. Para ello, se utiliza un enfoque cualitativo, descriptivo y analítico, fundamentado en la investigación bibliográfica. Así, se observa que la neuropsicopedagogía emerge como un campo esencial, articulando conocimientos de neurociencia, psicología y pedagogía para comprender el envejecimiento como un proceso dinámico y continuo de aprendizaje, valorando la plasticidad cerebral y las experiencias socioculturales. El estudio destaca la importancia de las intervenciones neuropsicopedagógicas basadas en la valorización de la identidad, cultura y saberes tradicionales de estas mujeres, promoviendo la autoestima, el sentido de pertenencia y la participación social, a pesar de las barreras de acceso como las desigualdades socioeconómicas y los modelos eurocéntricos. Se concluye que una neuropsicopedagogía crítica e interseccional es crucial para la promoción de la equidad, dignidad y calidad de vida de las mujeres negras en la vejez, reafirmando el aprendizaje como un derecho inalienable a lo largo de la vida.

1 INTRODUCTION

Brazil is aging rapidly, which makes it urgent to reflect on the impact of this process on the lives of older people, especially vulnerable groups, such as black women. These women face specific challenges arising from a history of structural racism, gender inequality, and socioeconomic conditions that compromise their health, well-being, and access to fundamental rights (Barbosa; Oliveira; Oliveira, 2024; Benedito; Paiva, 2025). The focus of this study seeks to highlight the relevance of understanding the specificities of this group to promote social equity, autonomy and quality of life in old age.

The focus on black women is essential, as they suffer the effects of historical inequalities that directly affect the aging process, especially in the areas of health and education (Kalache et al., 2023). Understanding how these factors influence aging is also a way to contribute to the development of more inclusive and fair practices and policies, reinforcing the need for intersectional approaches in the Brazilian context (Ferreira; Leeson; Melhado, 2019).

The general objective of this article is to analyze the relationship between the aging of black women and strategies that can promote a higher quality of life, autonomy and learning. Specifically, it investigates the social and educational impacts that cross this group, discusses possibilities of intervention focused on their needs and reflects on practices that can favor their inclusion and appreciation in the stage of old age.

Changes in the age structure of the Brazilian population have imposed new challenges on public policies, educational practices, and fields of knowledge aimed at human development throughout the life course (Kalache et al., 2023). In this scenario, the aging of black women reveals itself as a phenomenon deeply crossed by structural inequalities, which cannot be understood only from a biological or chronological perspective. It is a process marked by cumulative experiences of social exclusion, structural racism, gender inequality, and limited access to rights, factors that directly affect the physical, emotional, and cognitive health of these women throughout their lives.

The life trajectories of black women in Brazil are historically marked by conditions of social vulnerability, early and precarious insertion in the labor market, less access to formal schooling, and continuous exposure to contexts of psychosocial stress (Barbosa; Oliveira; Oliveira, 2024; Benedito; Paiva, 2025). These elements produce significant impacts on the aging process, since the scientific literature points out that the experiences lived throughout the life cycle directly influence cognitive functioning, mental health, and learning capacity in old age. Thus, understanding the aging of this group requires a broader approach, capable of integrating social, cultural, emotional, and neurocognitive factors.

It is at this point that neuropsychopedagogy presents itself as a theoretical-practical field of great relevance for the analysis of the aging of black women, by articulating knowledge from neuroscience, psychology, and pedagogy (Fonseca, 2018; Bossa, 2019). By articulating knowledge from neuroscience, psychology and pedagogy, neuropsychopedagogy offers tools to understand how the brain learns, adapts and transforms throughout life, including in old age. This approach breaks with reductionist conceptions that associate aging only with loss or decline, recognizing brain plasticity and the continuous possibilities of learning, resignification, and human development.

From the neuropsychopedagogical point of view, aging should be understood as a dynamic process, influenced both by biological factors and by the sociocultural experiences accumulated throughout life (Rotta; Ohlweiler; Riesgo, 2016). In the case of black women, these experiences are crossed by discriminatory practices that impact self-esteem, identity, access to knowledge, and social participation. Such factors can have repercussions on cognitive, emotional, and educational difficulties in old age, not as a natural result of aging, but as a consequence of trajectories marked by inequality.

Neuropsychopedagogy, by adopting an intersectional perspective, contributes to the understanding of how structural racism and gender inequality affect learning processes and cognitive functioning throughout the life course (Ferreira; Leeson; Melhado, 2019; Hooks, 2005). This approach allows us to analyze, for example, how chronic stress resulting from contexts of exclusion can impact executive functions, memory, attention, and emotional health, fundamental aspects for autonomy and quality of life in old age. In addition, it recognizes that the knowledge built outside the formal spaces of schooling also constitute important forms of learning and should be valued in educational practices aimed at the elderly.

In this sense, neuropsychopedagogical action with elderly black women should be guided by practices that promote cognitive strengthening, the stimulation of lifelong learning, and the appreciation of the identity and history of these women (Freire, 2005; Mbembe, 2018). Interventions that consider their experiences, cultures, memories, and traditional knowledge contribute not only to cognitive development, but also to the strengthening of self-esteem, a sense of belonging, and social participation. Learning, in this context, takes on an emancipatory character, capable of breaking with narratives of invisibility and marginalization associated with old age and blackness.

In addition, neuropsychopedagogy offers important subsidies for the construction of inclusive and anti-racist educational practices, especially in formal and non-formal education spaces for the elderly. By recognizing the singularities of black women, this field contributes

to the development of strategies that respect learning rhythms, promote cognitive stimulation, and favor functional autonomy. Such practices are fundamental for active aging, understood not only as maintenance of physical health, but as social participation, access to knowledge and full exercise of citizenship.

Therefore, establishing a dialogue between the aging of black women and neuropsychopedagogy implies recognizing that old age is a stage of life permeated by possibilities of learning, reconstruction of meanings and appreciation of historically silenced trajectories. By integrating a critical, intersectional perspective committed to social justice, neuropsychopedagogy consolidates itself as a strategic field for the promotion of equity, dignity and quality of life of black women in old age, contributing to the construction of a more inclusive and socially just society.

1.1 JUSTIFICATION

Aging is a process marked by biological, cognitive and social transformations, which manifest themselves differently in different population groups. In the case of black women, the impact of structural racism, social inequalities, and gender stereotypes amplifies the challenges faced during old age, affecting both integral health and the possibilities of autonomy and lifelong learning. In this context, neuropsychopedagogy emerges as a significant area of intervention, considering brain plasticity and the interaction between cognitive, emotional and educational processes. Aligning these factors with the understanding of the historical, social, and cultural specificities of elderly black women is essential to build more equitable practices, promoting quality of life and resignification of aging. This article thus seeks to contribute to the scientific debate and to the formulation of inclusive and intersectional strategies in the educational and neuropsychopedagogical field.

1.2 OBJECTIVES

1.2.1 General objective

To analyze the relationship between the aging of black women and the contributions of neuropsychopedagogy to promote learning, autonomy and quality of life.

1.2.2 Specific objectives

- To investigate the social, cultural and educational impacts on the aging experience of black women.
- To discuss the possibilities of applying neuropsychopedagogy in the support of aging, considering the specificities of this population.

- To relate educational and neuropsychological practices to the promotion of integral health and well-being in old age.

2 THEORETICAL FRAMEWORK

This section establishes the conceptual and theoretical bases that support the analysis of the aging of black women and the contribution of neuropsychopedagogy to the promotion of their quality of life. It addresses aging from a multidimensional perspective, the role of intersectionality in the experience of the elderly black woman and the foundations of neuropsychopedagogy as a field of support for continuous learning.

2.1 MULTIDIMENSIONAL AGING AND NEURAL PLASTICITY

Aging is a complex biopsychosocial process (De Beauvoir, 2024), which involves biological transformations, such as changes in the nervous system (Cepellos, 2021), but which is not restricted to a decline. Contemporary research emphasizes neural plasticity, that is, the brain's ability to adapt and reorganize functionally throughout life (Lent, 2010), breaking with deficient views of old age (Baltes; Baltes, 1990). From a psychological point of view, aging also manifests itself in resilience and the search for new learning and meaningful activities (Couto et al., 2021; Lopes et al., 2023). Socially, the experience of aging is profoundly influenced by factors such as class, education and access to rights, which determine the well-being of the elderly (Ferreira; Leeson; Melhado, 2019; IBGE, 2023).

2.2 INTERSECTIONALITY AND THE EXPERIENCE OF BLACK WOMEN IN OLD AGE

Understanding the aging of black women in Brazil requires the application of intersectionality (Akotirene, 2019), an analytical tool that demonstrates how social markers such as race, gender, class, and age are interconnected and reinforce inequalities. Black women experience a unique aging, intensified by structural racism and sexism (Carneiro, 2011; Werneck, 2016), which translate into health challenges, such as chronic stress and a higher risk of disease (Martins; Lima; Santos, 2020; Oraka et al., 2020), and in socioeconomic and educational inequalities (Barbosa; Oliveira; Oliveira, 2024; Almeida; Silva, 2017). The precariousness of professional trajectories (Cacciamali; Hirata, 2005) results in greater vulnerability in old age (Ceccon et al., 2021). However, intersectionality also highlights the resignification of old age and the strengthening of identity through support networks and cultural appreciation, such as Afro-Latin American feminism (Lopes et al., 2023; Gonzalez, 2020). Lélia Gonzalez (1984) and Bell hooks (2005; 2013) underline the importance of recognizing the knowledge and experiences of black women as legitimate forms of

knowledge and resistance.

2.3 NEUROPSYCHOPEDAGOGY AND CONTINUOUS LEARNING IN OLD AGE NEUROPSYCHOPEDAGOGY

It is an interdisciplinary field that articulates knowledge from neuroscience, psychology, and pedagogy (Fonseca, 2018; Bossa, 2019) to understand human learning in an integral and contextualized way (Delors, 1998; Japiassu, 2006). Based on neuroscience, it recognizes neural plasticity as the capacity for learning and brain reorganization at any age (Lent, 2010; Kandel et al., 2014), overcoming the idea of cognitive decline inherent to old age. From psychology, it incorporates historical-cultural approaches (Vygotsky, 2007; Bruner, 2001) who see learning as a socially mediated process, and the subjective dimension (González Rey, 2005) that integrates cognition and affectivity. Pedagogically, it is aligned with critical approaches that value previous knowledge and life experiences (Freire, 2005; Charlot, 2000), promoting cognitive strengthening and social participation. Neri (2013) and Neri and Yassuda (2014) highlight the importance of cognitive and social stimulation for integral health in old age. Neuropsychopedagogy, therefore, is positioned as a strategic field for the promotion of continuous learning, dignity and equity in old age, especially for black women.

3 METHODOLOGY

The study adopts a qualitative approach, of a descriptive and analytical nature, based on bibliographic and documentary research. The methodological objective is to understand how historical, social, cultural, and educational factors impact the aging of black women, influencing their learning processes, cognitive development, autonomy, and integral health. The literature was selected from academic databases, using descriptors related to the topics addressed, focusing on recent studies of relevance to the Brazilian context. The analysis focused on existing works and studies in the scientific literature, seeking to highlight the relationships between racial identity, contexts of vulnerability, educational practices and neuropsychopedagogical dimensions. As this is a bibliographic research, ethical considerations were ensured by the correct citation of the sources. However, the time frame and the exclusivity of the documentary base used are recognized as a limitation, which may not exhaust the totality of scientific production on the subject.

4 RESULTS AND DISCUSSIONS

4.1 THE AGING OF BLACK WOMEN: AN INTERSECTIONAL ANALYSIS OF CHALLENGES

The bibliographic research reveals that the aging of black women in Brazil is a phenomenon crossed by multiple dimensions of inequality, configuring a singular and cumulative experience of exclusion. As pointed out in the literature, structural racism and sexism act in combination, directly impacting the physical and mental health, as well as the social and educational opportunities of these women (Carneiro, 2011; Werneck, 2016). Findings indicate that chronic exposure to gender-based racial microaggressions generates significant stress, associated with higher risks of hypertension, diabetes, and depression (Martins; Lima; Santos, 2020; Oraka et al., 2020).

This reality is also manifested in unequal access to essential services. The literature shows that geographical and financial barriers and institutional prejudices limit black women's access to quality health and education services (Barbosa; Oliveira; Oliveira, 2024; Benedito; Paiva, 2025; Almeida; Silva, 2017). Professional trajectories, often marked by precariousness and low salaries (Cacciamali; Hirata, 2005), culminate in insufficient pensions and greater vulnerability and dependence in old age (Ceccon et al., 2021). These data reinforce the need for an intersectional reading, as proposed by Akotirene (2019), to understand the complexity of accumulated disadvantages.

Despite the challenges, the review demonstrates that many black women find ways to resignify old age and strengthen their identity. Support networks, whether family, community, or religious, emerge as a fundamental pillar for well-being and mental health (Lopes et al., 2023). In addition, the appreciation of Afro-Brazilian culture and history, often driven by Afro-Latin American feminism (Gonzalez, 2020), acts as a powerful instrument of empowerment, allowing the construction of narratives that celebrate historical and everyday figures of resistance. Bell hooks (2005; 2013) complements this view by highlighting how education and the recognition of lived experiences are crucial for the construction of dignity.

4.2 CONTRIBUTIONS OF NEUROPSYCHOPEDAGOGY TO QUALITY OF LIFE AND LEARNING

The analysis of the literature highlights the relevance of neuropsychopedagogy as a strategic field to address the aging of black women, offering a perspective that breaks with the view of decline inherent to age. Neuropsychopedagogy, by articulating knowledge from neuroscience, psychology and pedagogy (Fonseca, 2018; Bossa, 2019), understands aging as a dynamic and continuous learning process. This field values brain plasticity (Lent, 2010), arguing that the brain maintains a significant capacity for adaptation and functional

reorganization throughout life, which opens up continuous possibilities for cognitive and emotional development (Kandel et al., 2014; Neri, 2013).

The studies analyzed indicate that neuropsychopedagogical interventions, when based on a critical and intersectional approach, can promote cognitive strengthening and stimulate lifelong learning. They should consider the experiences, cultures, memories and traditional knowledge of these women, as defended by Freire (2005) and Charlot (2000), contributing not only to cognitive development, but also to the strengthening of self-esteem, a sense of belonging and social participation. Learning, in this context, acquires an emancipatory character, capable of challenging narratives of invisibility and marginalization associated with old age and blackness.

Neuropsychopedagogy, by recognizing the singularities of black women, offers subsidies for the construction of inclusive and anti-racist educational practices. By considering how structural racism and gender inequality affect learning processes and cognitive functioning (Ferreira; Leeson; Melhado, 2019), this approach allows strategies that respect learning rhythms, promote cognitive stimulation and favor functional autonomy, as recommended by Neri and Yassuda (2014). Such practices are fundamental for active aging, which goes beyond physical health to include social participation and the full exercise of citizenship.

4.3 CHALLENGES AND PROPOSALS FOR INCLUSIVE NEUROPSYCHOPEDAGOGICAL INTERVENTIONS

Despite the potential of neuropsychopedagogy, the research highlights significant barriers to access for older black women. The concentration of specialized services in private spaces and the hegemony of Eurocentric and normative models in evaluations and interventions tend to disregard the experiences and knowledge of the black population, reproducing logics of exclusion (Almeida, 2019; Carneiro, 2005). The absence of professional training that incorporates discussions on structural racism and intersectionality, as suggested by bell hooks (2013), limits the ability of neuropsychopedagogues to act in a truly inclusive way.

In the face of these challenges, the literature points to the need for advances and concrete proposals. A critical review of the epistemological foundations of neuropsychopedagogy is crucial, overcoming deficient approaches and recognizing elderly black women as producers of knowledge (Gonzalez, 1984; Carneiro, 2005). The systematic incorporation of intersectionality into evaluation and intervention practices is indispensable, guiding not only professional actions, but also public policies (Akotirene, 2019).

Proposals include the creation and strengthening of social programs that value the identity and culture of black women, with activities such as conversation circles and memory circles (Lopes; Ribeiro; Oliveira, 2023), and public policies that promote active aging and educational inclusion, with a focus on intersectional care (Benedito; Paiva, 2025; Werneck, 2016). Fostering actions that combine educational inclusion with the rescue of traditional knowledge, transforming them into active agents, is essential to promote equity, dignity and mutual respect.

5 CONCLUSION

The theoretical-analytical path developed in this article shows that the aging of black women in Brazil cannot be understood as a homogeneous, linear or strictly biological process. It is a socially constructed experience, marked by multiple nuances that result from the historical articulation between race, gender, class and age. These dimensions operate in an interdependent way, producing structural inequalities that accumulate throughout the course of life and are expressed in an intensified way in old age. Structural racism, sexism, and ageism, when acting together, configure unequal conditions of access to education, health, work, and public policies, directly impacting the autonomy, learning, and quality of life of elderly black women.

Throughout the text, it was demonstrated that the life trajectories of these women are crossed by historical processes of exclusion that are not restricted to the material dimension, but produce profound symbolic, subjective and cognitive effects. The devaluation of their knowledge, the invisibility of their stories and the denial of social recognition constitute forms of violence that affect emotional health and learning processes in old age. Understanding these dynamics requires sensitivity to the nuances that differentiate the experiences of black female aging, avoiding generalizations that obscure the complexity of individual and collective experiences.

In this scenario, neuropsychopedagogy presents itself as a theoretical-practical field of special relevance, as it enables a broader reading of aging, based on the articulation between neuroscience, psychology and pedagogy. By recognizing neural plasticity throughout the life cycle and learning as a continuous, historically situated and socially mediated process, neuropsychopedagogy breaks with reductionist conceptions that associate old age exclusively with cognitive decline. Such an approach allows us to capture the nuances of learning processes in old age, considering not only neurobiological aspects, but also the social, cultural and emotional conditions that cross the trajectories of black women.

In the specific case of older black women, the incorporation of an intersectional perspective becomes indispensable to understand how educational inequalities, limited access to formal schooling, and continuous exposure to contexts of psychosocial stress impact cognitive functioning and learning possibilities. These experiences, marked by multiple nuances throughout life, cannot be interpreted as individual deficits, but as cumulative effects of unequal social structures. Critical neuropsychopedagogy, by recognizing such determinations, contributes to the construction of educational practices that respect the rhythms, cultural repertoires and singularities of these women.

The reflections developed also show that inclusive neuropsychopedagogical practices assume a fundamental ethical and political dimension. By valuing autobiographical memory, orality, ancestry, and knowledge built outside the formal spaces of schooling, such practices recognize elderly black women as knowing subjects and producers of knowledge. This recognition allows us to apprehend the nuances of knowledge built along trajectories marked by resistance, strengthening self-esteem, a sense of belonging and social participation. Learning, in this context, acquires an emancipatory character, articulating cognitive development, identity recognition and full exercise of citizenship.

In the context of public policies, the study points to the need for approaches that consider the nuances of the aging of black women, overcoming generic and disjointed actions. Although there are important legal frameworks in addressing racial and gender inequalities, their effectiveness depends on the incorporation of an intersectional reading that recognizes the specificities of this group throughout the course of life. Education, health, and social assistance policies need to be thought of in an integrated way, ensuring equitable access to cognitive care practices, lifelong learning, and social participation in old age.

Another central aspect refers to the training of professionals who work in the fields of education, health and neuropsychopedagogy. The absence of a critical and anti-racist education compromises the ability to understand the nuances that go through the learning processes in old age and can result in the reproduction of exclusionary practices. Investing in training curricula that incorporate discussions on structural racism, intersectionality, aging, and black epistemologies is a fundamental step towards the consolidation of professional practices committed to equity and social justice.

In view of the above, it is concluded that the articulation between the aging of black women and neuropsychopedagogy significantly expands the understanding of old age, by evidencing its multiple nuances and potentialities. By reaffirming old age as a legitimate stage of learning, production of meanings and appreciation of historically silenced trajectories, this study contributes to the construction of educational practices and public policies that

recognize elderly black women as historical subjects, knowing and holders of socially relevant knowledge. It is, therefore, a matter of affirming a conception of aging committed to human dignity, social justice and the right to learning throughout the course of life.

ABSTRACT

The present study assessed the carbon footprint of electricity generation from rice husk in a thermal power plant located in São Sepé, Rio Grande do Sul, Brazil. For this purpose, the Life Cycle Assessment (LCA) methodology was applied in accordance with ISO 14040/14044 standards, using the OpenLCA software and the Ecoinvent 3.6 database. The functional unit considered was 1 kWh of electricity produced, covering the stages of rice cultivation and processing, biomass transportation, power plant operation, and ash disposal. The results indicated a carbon footprint of 0.036 kg CO₂ eq/kWh, with emissions associated with biomass and ash transportation accounting for more than 80% of the total. Compared with other energy sources, rice husk-based electricity generation demonstrated better environmental performance than coal and natural gas, standing out as a low-impact renewable alternative. The analysis also revealed that mitigation opportunities are mainly concentrated in transportation logistics and in the local valorization of ashes as an agricultural soil amendment.

Keywords: Biomass. Rice Husk. Thermal Power Plant. Carbon Footprint. Life Cycle Assessment.

RESUMO

O presente estudo avaliou a pegada de carbono da geração de eletricidade a partir da casca de arroz em uma usina termelétrica localizada em São Sepé, Rio Grande do Sul, Brasil. Para isso, foi aplicada a metodologia de Avaliação do Ciclo de Vida (ACV), de acordo com as normas ISO 14040/14044, utilizando o software OpenLCA e a base de dados Ecoinvent 3.6. A unidade funcional considerada foi 1 kWh de eletricidade produzida, abrangendo as etapas de cultivo e beneficiamento do arroz, transporte da biomassa, operação da usina e

disposição das cinzas. Os resultados indicaram uma pegada de carbono de 0,036 kg CO₂ eq/kWh, sendo que as emissões associadas ao transporte da biomassa e das cinzas representaram mais de 80% do total. Em comparação com outras fontes de energia, a geração de eletricidade a partir da casca de arroz apresentou melhor desempenho ambiental do que o carvão mineral e o gás natural, destacando-se como uma alternativa renovável de baixo impacto. A análise também revelou que as principais oportunidades de mitigação concentram-se na logística de transporte e na valorização local das cinzas como corretivo agrícola do solo.

RESUMEN

El presente estudio evaluó la huella de carbono de la generación de electricidad a partir de la cáscara de arroz en una central termoeléctrica ubicada en São Sepé, Rio Grande do Sul, Brasil. Para ello, se aplicó la metodología de Evaluación del Ciclo de Vida (ECV), de acuerdo con las normas ISO 14040/14044, utilizando el software OpenLCA y la base de datos Ecoinvent 3.6. La unidad funcional considerada fue 1 kWh de electricidad producida, abarcando las etapas de cultivo y procesamiento del arroz, transporte de la biomasa, operación de la central y disposición de las cenizas. Los resultados indicaron una huella de carbono de 0,036 kg CO₂ eq/kWh, siendo que las emisiones asociadas al transporte de la biomasa y de las cenizas representaron más del 80% del total. En comparación con otras fuentes de energía, la generación eléctrica a partir de la cáscara de arroz mostró un mejor desempeño ambiental que el carbón y el gas natural, destacándose como una alternativa renovable de bajo impacto. El análisis también reveló que las principales oportunidades de mitigación se concentran en la logística de transporte y en la valorización local de las cenizas como enmienda agrícola del suelo.

1 INTRODUCTION

Brazil stands out as a global leader in conventional renewable energy generation, with hydropower accounting for 51.97% of the country's electricity production (ANEEL, 2025). Despite its recognized low level of greenhouse gas emissions, the high dependence on this source exposes the electricity sector to significant vulnerability in the face of recurrent drought events (BONDARIK et al., 2018). In this context, diversifying the energy mix through the incorporation of other renewable sources emerges as a necessary strategy.

Among the available alternatives, biomass holds a prominent position due to its wide availability resulting from agricultural, agro-industrial, and forestry activities in the country (SANTOS et al., 2017). The most commonly used residues for energy generation include firewood, charcoal, sugarcane bagasse, wood residues, and rice husk (REZENDE, 2018). The latter represents about 20% of the weight of the processed grain and, due to its low nutritional value and high silica content, it is unsuitable for animal feed or direct agricultural use (CHUNGSANGUNSIT et al., 2010; ALMEIDA, 2010). However, it presents high calorific value, making it a promising alternative for use in thermal power plants.

Rice production in Brazil is concentrated in five states, with Rio Grande do Sul accounting for the majority share (70.7%), followed by Santa Catarina (10.2%), Tocantins (6.1%), Mato Grosso (3.6%), and Maranhão (1.5%) (MAPA, 2021). Milling, usually carried out near cultivation areas, generates rice husk as a by-product (MURARO et al., 2018). Currently, around 15 thermal power plants use this residue as fuel, totaling 59.46 MWh of installed capacity, 10 of which are located in Rio Grande do Sul, accounting for 50.14 MWh (SIGA, 2025).

Although rice husk-based thermal power generation has lower environmental impacts compared to fossil sources, it is not free from externalities. A comprehensive analysis of these effects requires the application of consolidated methodologies such as Life Cycle Assessment (LCA), as established by ISO 14040, which enables the measurement of environmental impacts throughout all stages of a product's or process's life cycle.

Considering the scarcity of specific studies in Brazil, this work aims to build an inventory and evaluate the carbon footprint of the life cycle of electricity generation in a rice husk-fired thermal power plant located in the central region of Rio Grande do Sul.

2 METHODOLOGY

In this study, a life cycle inventory of electricity generation from rice husk was developed based on primary data from the São Sepé Thermal Power Plant, which has an installed capacity of 8.0 MWh and stands out as the second largest operating unit in this

segment in Brazil. In addition, the carbon footprint of electricity production was calculated using the Life Cycle Assessment (LCA) methodology, in accordance with ISO 14040/14044 guidelines (ISO, 2006a).

LCA, structured in the stages of goal and scope definition, inventory analysis, impact assessment, and interpretation, enables the quantification of environmental impacts associated with the analyzed system. For the modeling, the OpenLCA software was employed, together with the Ecoinvent 3.6 database, internationally recognized for the comprehensiveness of its datasets and available impact assessment methods (OPENLCA, 2025).

2.1 FUNCTIONAL UNIT, SCENARIO, AND SYSTEM BOUNDARY

This study is based on the use of rice husk, a by-product of grain milling, as a renewable energy source in a thermal power plant. The analyzed facility is located in the municipality of São Sepé, in the central region of Rio Grande do Sul, approximately 281 km from Porto Alegre, and receives biomass from around 13 local milling industries, with the possibility of including suppliers from other regions depending on availability.

The modeling considered a cradle-to-gate system boundary, encompassing the stages of rice cultivation and milling, husk transportation, and electricity generation in the thermal power plant. The adopted functional unit was 1.0 kWh of electricity produced. Figures 1 and 2 show, respectively, the geographical location of the power plant and the flowchart of the stages included in the analysis.

Figure 1

Location map of the thermal power plant

Source: Author.

Figure 2*Flowchart of processes and system boundaries*

Source: Author.

To estimate the environmental impacts of energy generation from rice husk combustion, the IPCC 2021 methodology was applied in the OpenLCA software, using the Ecoinvent database. This method, based on the Sixth Assessment Report of the IPCC (AR6), provides updated greenhouse gas (GHG) metrics for the calculation of different impact categories (OPENLCA, 2022). For this study, emissions related to the 100-year Global Warming Potential (GWP100) were considered, expressed in kg of CO₂ equivalent.

2.2 IMPACT ALLOCATION METHOD

Since rice processing generates other products in addition to husk, such as white rice, broken rice, and bran, it was necessary to allocate the environmental impact associated with the husk (MAYER, 2009). This allocation was based on the economic value of the products, as adopted in LCA studies of rice production (COLTRO et al., 2017; DA SILVA, 2021).

2.3 SYSTEM DESCRIPTION, INVENTORY, AND DATA COLLECTION

The life cycle inventory of electricity generation from rice husk was developed based on primary data collected in situ and through bibliographic research. While the inventory of rice cultivation and milling relied on secondary data, the inventory of electricity generation at

the thermal power plant and the life cycle model were constructed using primary data obtained from the operational, control, and monitoring reports of the São Sepé Thermal Power Plant. The involvement of one of the authors, an engineer responsible for the plant's operation and environmental processes, enhances the relevance of the study, which seeks practical solutions grounded in real-world data.

2.3.1 Inventory of Rice Cultivation and Milling

The inventory of rice cultivation and milling was developed using both primary and secondary data from the functional units. Table 1 presents the main inputs used in the stages of cultivation, drying, transportation, and packaging (NUNES et al., 2016).

Table 1

Inventory of data for rice cultivation and milling

Stage	Inputs	Entradas (Inputs)	
		Value	Unit
Standard Rice Cultivation	Water	$7,20 \times 10^{-4}$	m ³ /kg rice
	Arable Land Occupation	1,33	m ² /kg rice
	Rice Seed	$1,30 \times 10^{-2}$	kg/kg rice
	Herbicides	$7,20 \times 10^{-7}$	kg/kg rice
	Ureia, as N	$4,03 \times 10^{-2}$	kg/kg rice
	Ammonium Nitrate, as N	$1,08 \times 10^{-2}$	kg/kg rice
	Triple Superphosphate, as P2O5	$1,37 \times 10^{-2}$	kg/kg rice
	Potassium Chloride, as K2O	$3,10 \times 10^{-2}$	kg/kg rice
	Fungicides	$3,60 \times 10^{-8}$	kg/kg rice
	Insecticides	$1,07 \times 10^{-8}$	kg/kg rice
	Diesel – Rice Plantation	$8,64 \times 10^{-3}$	kg/kg rice
	Diesel – Rice Harvest	$4,32 \times 10^{-3}$	kg/kg rice
	Electricity, Pump (50 HP)	$4,90 \times 10^{-6}$	kWh/kg rice
	Electricity, Pump (30 HP)	$2,94 \times 10^{-6}$	kWh/kg rice
	Fertilizer Transportation	$2,66 \times 10^{-2}$	tkm/kg rice
	Herbicide Transportation	$2,23 \times 10^{-2}$	tkm/kg rice
	Diesel - Transport	$1,92 \times 10^{-4}$	kg/kg rice
Rice Processing	Wood	$1,00 \times 10^{-3}$	m ³ /ha/kg rice
	Packaging Transportation, Truck 3.5 -7.5t	21,74	tkm/kg rice
	Processing Transport, 16-32t Truck	5,64	tkm/kg rice
	Drying Transport, 7.5-16t Truck	6,17	tkm/kg rice
	Packing 1kg (LDPE)	$3,89 \times 10^{-1}$	kg/kg rice
	Packing 5kg (LDPE)	$4,17 \times 10^{-1}$	kg/kg rice
	Electric Forklift	706,0	J/kg rice
	Paddy Rice	1,54	kg/kg rice

Source: Adapted from Nunes et al. (2016).

In the cultivation stage, the pesticides used were Standak (25%) as an insecticide, glyphosate (48%) as a herbicide, and Vitavax (40%) as a fungicide. Diesel consumption was 80 L/ha for soil preparation and 40 L/ha during harvesting.

Milling includes husking, separation of the grain from the husk, and pre-polishing. The handling of the grains encompasses transportation and packaging. Partial milling generates the following co-products: white rice (65.5%), broken grains (3.5%), rice bran (7%), and rice husk (24%).

2.3.2 Description of the Energy Generation System in the Thermal Power Plant

The São Sepé Thermal Power Plant uses rice husk as fuel, with a maximum capacity of 8.0 MWh and a daily production of 192 MWh, of which 163.2 MWh is exported to the market. The technology employs a rotary grate, allowing the combustion of up to 217 t/day of rice husk, sourced from 12 municipalities at an average distance of 168 km. Transportation is carried out by 12-ton trucks, with a fuel efficiency of 2.5 km/L of diesel, and storage is in a horizontal silo with a capacity of 870 t.

The HBremer LIGNODYN-40 boiler generates 37,390 kg/h of saturated steam at 45 kgf/cm², with automated feed and combustion controlled by primary and secondary air. Fuel consumption is 9,170.2 kg/h (12% moisture), producing 1,834 kg/h of ash. Gas emissions are controlled by a multiclone and bag filter, with periodic monitoring of CO₂, NO_x, CO, and particulate matter concentrations.

The generated steam is supported by three integrated systems: Water Treatment Plant (WTP), Effluent Treatment Plant (ETP), and Demineralization System (DESMI). The WTP provides 540 m³/day of industrial water; the ETP treats 170 m³/day of effluents, allowing water reuse; and the DESMI removes salts from water, preventing scaling and corrosion. Demineralized water is used in the boiler, with chemical additives to protect the equipment.

After energy generation, the steam is cooled in a cooling tower and condensed, allowing its reuse and reducing the demand for treated water. The cycle is continuous, with replacement of losses due to evaporation and prevention of scaling through chemical additives.

After storage of boiler ash in horizontal silos, the plant disposes of the residue on agricultural properties in São Sepé, holding an environmental license for this purpose. Transportation is carried out daily by a third-party company, and the property owners are responsible for ash distribution.

Electricity generation also depends on the efficient operation of various production chain equipment, such as conveyors, screws, elevators, exhausters, and hydraulic pumps,

powered by electric motors of different capacities. Internal energy consumption is predominantly from these motors, and their efficiency directly impacts the amount of electricity available for export.

3 RESULTS AND DISCUSSION

3.1 INVENTORY OF CHEMICAL PRODUCTS

Based on operating hours, treatment flow rates, and standard dosages, it was possible to calculate the amount of chemical inputs used in the water and effluent treatment systems, relating them to the functional unit of interest. The inventory of chemical inputs for the thermal power plant is presented in Table 2.

Table 2

Inventory of Chemicals

Unidade	Insumo	Valor	Unidade
WTP	Polyaluminum Chloride and Aluminum Sulfate	$2,083 \times 10^{-4}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Sodium Hydroxide	$7,81 \times 10^{-5}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Polymer	$2,60 \times 10^{-6}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Sodium Hypochlorite	$1,56 \times 10^{-4}$	$\text{kg} \cdot \text{kWh}^{-1}$
ETP	Polyaluminum Chloride	$3,12 \times 10^{-4}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Polymer	$1,56 \times 10^{-6}$	$\text{kg} \cdot \text{kWh}^{-1}$
Reverse Osmoses	Citric Acid	$6,93 \times 10^{-7}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Sodium Hydroxide	$1,72 \times 10^{-7}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Glycol; 2,2-dibromo-3-nitrilpropionamide; Sodium bromide	$4,32 \times 10^{-7}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Sodium Chloride	$1,30 \times 10^{-5}$	$\text{kg} \cdot \text{kWh}^{-1}$
Demineralization System	Hydrochloric acid	$1,67 \times 10^{-4}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Sodium Hydroxide	$3,90 \times 10^{-4}$	$\text{kg} \cdot \text{kWh}^{-1}$
Cooling Tower	Phosphoric Acid	$2,08 \times 10^{-5}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Carboxylic Acid Polymer; Maleic Acid	$2,08 \times 10^{-5}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Trichloroisocyanuric acid	$2,5 \times 10^{-5}$	$\text{kg} \cdot \text{kWh}^{-1}$
Boiler and turbine	Carbohydrazide	$2,60 \times 10^{-5}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Ammonium Hydroxide	$9,37 \times 10^{-6}$	$\text{kg} \cdot \text{kWh}^{-1}$
	Unspecified polymer	$9,37 \times 10^{-6}$	$\text{kg} \cdot \text{kWh}^{-1}$

Source: Author.

It is observed that the highest consumptions are associated with the water and raw effluent treatment stages, with coagulants and chlorine-based biocides standing out, which are used in the clarification of water and effluents in the WTPs and WWTPs. In the demineralization process, hydrochloric acid and sodium hydroxide are employed for the regeneration of cationic and anionic resins. Other inputs, such as acidic and alkaline solutions and polymers, complement the treatment, ensuring operational efficiency and process water quality.

3.2 TRANSPORT INVENTORY

For the transport inventory, only those with higher operational frequency were considered, such as the transport of biomass and rice husk ash. Table 3 shows the transport inventory considering fuel consumption.

Table 3

Transport Data Inventory

Inputs	Value	Unit
Biomass Transport (truck 7,5 – 16,0 t)	$1,00 \times 10^{-3}$	tkm.kWh ⁻¹
Diesel Oil (Biomass Transport)	$4,70 \times 10^{-1}$	kg.kWh ⁻¹
Rice Husk Ash Transport (truck 7,5 – 16,0 t)	$4,23 \times 10^{-3}$	tkm.kWh ⁻¹
Diesel Oil (Ash Transport)	$1,38 \times 10^{-2}$	kg.kWh ⁻¹

Source: Author.

3.3 IMPACT ALLOCATION

According to the ABNT ISO 14044 standard (2009), allocation consists of partitioning the input or output flows of a process between the product under study and other related products. In multiproduct systems, the application of allocation procedures is essential to properly distribute materials, energy, and environmental emissions (TRINDADE, 2020).

For the life cycle assessment, an economic allocation of impacts was performed, using the cost or revenue values of each product, allowing the software to distribute the contribution of each item to greenhouse gas (GHG) emissions. Table 4 presents the economic values of the products considered within the system boundary.

Table 4

Life Cycle Economic Data

Products/Inputs	Value	Unit
White Rice	0,414	USD/kg
Rice Bran	0,145	USD/kg
Broken Rice	0,271	USD/kg
Rice Husk	0,017	USD/kg
Paddy Rice	0,244	USD/kg

Source: Author.

3.4 LIFE CYCLE ASSESSMENT AND DISTRIBUTION OF GHG EMISSIONS

The life cycle model of the present study was structured in different stages, allowing the discrimination of greenhouse gas (GHG) contributions from each sector and the identification of the activities with the highest impact. For this purpose, flows were created with the products listed in Table 4 and the processes required for their production, including all inventory inputs and outputs based on the functional unit. Most inputs were obtained from

the Ecoinvent database, except for some specific chemicals, such as carbonylhydrazide and the biocide (Glycol; 2,2-dibromo-3-nitrilopropionamide; Sodium bromide), which are not available in version 3.6 of the database.

The "Product System" integrated all flows and processes according to the life cycle flowchart (Figure 2), enabling the calculation of the global warming potential (GWP100). GHG emissions by stage are presented in Table 5, totaling 3.60×10^{-2} kg CO₂ eq/kWh.

Table 5

Carbon Footprint by Production Stage

Stage	Source	Global Warming Potential (GWP100)
		kg CO ₂ -eq·kWh ⁻¹
Rice Cultivation and Milling	-	ND
Biomass Transport	Truck Fuel (Diesel)	$2,92 \times 10^{-2}$
	Truck Transport/Freight 7.5–16 t	$3,69 \times 10^{-6}$
Water and Effluent Treatment	Sodium Hydroxide	$6,10 \times 10^{-4}$
	Sodium Hypochlorite	$4,10 \times 10^{-4}$
	Aluminum Polychloride	$3,70 \times 10^{-4}$
	Hydrochloric Acid	$8,22 \times 10^{-5}$
	Phosphoric Acid	$2,88 \times 10^{-5}$
	Trichloroisocyanuric Acid	$5,38 \times 10^{-6}$
	Citric Acid	$4,33 \times 10^{-6}$
	Sodium Chloride	$1,17 \times 10^{-6}$
Ash Transport and Disposal	Truck Fuel (Diesel)	$1,16 \times 10^{-3}$
	Truck Transport/Freight 7.5–16 t	$4,13 \times 10^{-3}$
Total		$3,60 \times 10^{-2}$

Source: Author.

The results show that the transport of biomass and residues is the largest contributor to GHG emissions, accounting for 81.12% of the total. Factors such as the number of trips, distance traveled, volume of residues, and vehicle efficiency directly influence this impact, with diesel consumption by the fleet being the main contributor to the carbon footprint (Figure 3).

Figure 3*Comparison of Contributions to GHG Emissions*

Source: Author.

According to Shen et al. (2015), the low energy density of lignocellulosic biomass makes transportation a critical factor in the economic and environmental viability of plants, also influencing operational scale and site selection. In the case of the São Sepé plant, its central location in Rio Grande do Sul, near rice processing companies, favors the logistical supply of biomass. Regarding the disposal of rice husk ash (RHA), the company prioritized properties close to the plant (average distance of 18.5 km), reducing costs and emissions.

The water and effluent treatment stage occurs continuously, supporting steam generation, and environmental impacts were estimated based on the chemical inputs used. The electricity consumed internally by equipment, such as centrifugal pump motors, was not accounted for as an external source, as it is generated internally from rice husk combustion. Additional simulations indicated that if the energy came from an external source, it would represent approximately 72.5% of the system's total emissions ($\sim 0.1254 \text{ kg CO}_2 \text{ eq/GWP100}$), reinforcing the environmental advantage of the model adopted by the plant.

Regarding rice cultivation and processing, no GHG emissions were attributed to the husk due to economic allocation, which concentrates the environmental burden on the higher-value commercial products (Table 9). Moreover, emissions from husk combustion are not included in GHG accounting, as the released CO_2 is considered biogenic and reabsorbed by subsequent crops. Finally, it was not possible to estimate GHG emissions associated with the application of RHA to agricultural soil, due to the scarcity of specific data and the lack of robust inventories on the subject.

3.5 COMPARISON OF GHG EMISSIONS WITH OTHER ENERGY TECHNOLOGIES

The carbon footprint obtained in this study was compared with results from Life Cycle Assessments (LCAs) of other electricity generation technologies. Guidi et al. (2023) consolidated data from different energy matrices, providing a comparative overview. As shown in Figure 4, energy generation from rice husk exhibits significantly lower greenhouse gas (GHG) emissions compared to conventional and non-renewable sources, such as coal and natural gas, highlighting it as a low-environmental-impact energy alternative.

Figure 4

Comparison of emissions across different electricity generation technologies

Source: Author.

Kadiyala et al. (2016) compiled equivalent CO₂ emission values from various biomass-fired power plants based on Life Cycle Assessment (LCA) studies. Figure 6 presents a comparison between the plant analyzed, which uses rice husk as fuel, and the average emissions of other plants powered by different types of biomass. The results indicate that the rice husk plant exhibits lower CO₂-equivalent emissions per kWh generated compared to the average of plants using agricultural residues, highlighting its higher environmental efficiency in the context of biomass-based thermal power generation.

Figure 6*Comparative Chart of Different Biomass Types*

Source: Author.

3.6 CARBON FOOTPRINT OF RICE HUSK-BASED ENERGY GENERATION

In the present study, the São Sepé Thermoelectric Plant (TEP) exhibited a carbon footprint of 0.036 kg CO₂ eq/kWh for electricity generation from rice husk. The Life Cycle Assessment (LCA) was developed based on detailed primary data from the plant's operation, complemented by secondary data from the Ecoinvent 3.6 database, considering a "cradle-to-gate" boundary. This approach included rice cultivation and processing, biomass and ash transport, plant operation, water and effluent treatment, and the use of chemical inputs, with economic allocation applied among the co-products.

The use of emission factors updated by the IPCC (2021), combined with the inclusion of auxiliary processes and accounting for emissions related to average transport distances, resulted in a value lower than that reported by Shafie et al. (2011), who estimated 0.217 kg CO₂ eq/kWh. In Shafie et al.'s study, the inventory was less comprehensive, with shorter transport distances, exclusion of support stages, and the use of emission factors prior to IPCC 2021. On the other hand, the study by Chungsangunsit et al. (2010) reported 0.0172 kg CO₂ eq/kWh, due to a restricted boundary focused only on combustion and immediate biomass transport, with short distances and possible exclusion of agricultural and processing stages, as well as the use of older data and emission factors.

These differences highlight that the scope, quality, and origin of data, as well as the methodological assumptions adopted, decisively influence the results and must be clearly stated to allow consistent comparisons among studies.

When analyzing stage-specific contributions, biomass transport remains the main source of emissions, followed by ash transport and disposal, which accounts for approximately 10% of the total—an aspect not considered in some comparative studies. Emissions from boiler operation and chemical input use are low (<10%), while cultivation and processing stages have a marginal contribution, in agreement with Chungsangunsit et al. (2010).

These results indicate that, even with a low overall carbon footprint, mitigation opportunities are concentrated in the logistics chain, highlighting strategies such as route optimization, the use of more efficient transport modes, and local utilization of ash.

4 CONCLUSIONS

The study demonstrated that electricity generation from rice husk exhibits a significantly reduced carbon footprint compared to fossil fuels, reinforcing the potential of this biomass as a strategic alternative for diversifying Brazil's energy matrix. The analyzed plant presented a value of 0.036 kg CO₂ eq/kWh, a competitive result compared to other biomass technologies reported in the literature. The main contribution to emissions was associated with the transport of biomass and ash, confirming the importance of logistics in the environmental and economic viability of such plants. Strategies such as route optimization, reducing transport distances, and local utilization of agricultural ash emerge as effective measures for impact mitigation. Thus, the use of rice husk in thermoelectric plants not only contributes to reducing greenhouse gas emissions but also represents a sustainable solution for the utilization of agro-industrial residues, aligning with the country's energy transition and circular economy goals.

ABSTRACT

This article analyzes teacher education for the use of Digital Information and Communication Technologies (DICT) in the context of digital culture, in light of the main legal documents that guide Brazilian education, such as the Federal Constitution, the Law of Guidelines and Bases of National Education (Lei de Diretrizes e Bases da Educação Nacional – LDB), the National Common Curricular Base (BNCC, 2018), and the National Teacher Education Guidelines (BNC-Formação, 2020). The study is grounded in the problem of understanding how educational policies and teacher education processes can contribute to the critical integration of digital technologies into pedagogical practices, promoting a more inclusive, innovative, and contemporary-oriented education. The objective of the research is to analyze the contributions of teacher education to the integration of DICT into the teaching–learning process, articulating theoretical frameworks, official documents, and empirical data from the ICT Education survey conducted by Cetic.br (2024). The study adopts a qualitative, exploratory, and bibliographic approach, drawing on authors such as Nóvoa, Tardif, Kenski, Moran, and Freire, as well as legislation and guidelines that structure initial and continuing teacher education. Data analysis reveals trends such as the expansion of access to digital technologies in Brazilian schools, the gradual adoption of active methodologies, and the recognition of continuing education as a strategy for strengthening teaching practice. The results indicate that teachers who engage in professional development programs show a greater predisposition toward pedagogical innovation and the critical and intentional use of digital resources. However, the findings also demonstrate that the availability of equipment and connectivity alone does not ensure pedagogical transformation, making teacher mediation and critical reflection essential. Thus, teacher education for the use of DICT is characterized as a critical-reflective and collaborative process, fundamental to strengthening the role of teachers as mediators of learning and agents of educational transformation in the 21st century.

RESUMO

Este artigo analisa a formação docente para o uso das Tecnologias Digitais de Informação e Comunicação (TDIC) no contexto da cultura digital, à luz dos principais documentos legais que orientam a educação brasileira, como a Constituição Federal, a Lei de Diretrizes e Bases da Educação, a BNCC (2018) e a BNC-Formação (2020). Parte-se do problema de compreender de que modo as políticas educacionais e os processos formativos podem contribuir para a integração crítica das tecnologias às práticas pedagógicas, promovendo uma educação mais inclusiva, inovadora e alinhada às demandas contemporâneas. O objetivo da pesquisa é analisar as contribuições da formação docente para a inserção das TDIC no processo de ensino-aprendizagem, articulando referenciais teóricos, documentos oficiais e dados empíricos da pesquisa TIC Educação do Cetic.br (2024). A pesquisa caracteriza-se como qualitativa, de natureza exploratória e bibliográfica, fundamentada em autores como Nóvoa, Tardif, Kenski, Moran e Freire, além de legislações e diretrizes que estruturam a formação inicial e continuada de professores. A análise dos dados evidencia tendências como a ampliação do acesso às tecnologias digitais nas escolas brasileiras, a adoção gradual de metodologias ativas e a valorização da formação continuada como estratégia de fortalecimento da prática docente. Os resultados indicam que professores que participam de processos formativos apresentam maior predisposição à inovação pedagógica e ao uso crítico e intencional dos recursos digitais. Contudo, conclui-se que a disponibilidade de equipamentos e conectividade, por si só, não garante a transformação pedagógica, sendo indispensável a mediação docente e a reflexão crítica. Assim, a formação docente para o uso das TDIC configura-se como um processo crítico-reflexivo e colaborativo, essencial para o fortalecimento do papel do professor como mediador da aprendizagem e agente da transformação educacional no século XXI.

RESUMEN

Este artículo analiza la formación docente para el uso de las Tecnologías Digitales de la Información y la Comunicación (TDIC) en el contexto de la cultura digital, a la luz de los principales documentos legales que orientan la educación brasileña, como la Constitución Federal, la Ley de Directrices y Bases de la Educación Nacional (Lei de Diretrizes e Bases da Educação Nacional – LDB), la Base Nacional Común Curricular (BNCC, 2018) y la BNC-Formación (2020). El estudio parte del problema de comprender de qué manera las políticas educativas y los procesos formativos pueden contribuir a la integración crítica de las tecnologías digitales en las prácticas pedagógicas, promoviendo una educación más inclusiva, innovadora y alineada con las demandas contemporáneas. El objetivo de la investigación es analizar las contribuciones de la formación docente a la incorporación de las TDIC en el proceso de enseñanza-aprendizaje, articulando referentes teóricos, documentos oficiales y datos empíricos de la investigación TIC Educación del Cetic.br (2024). La investigación se caracteriza como cualitativa, de naturaleza exploratoria y bibliográfica, y se fundamenta en autores como Nóvoa, Tardif, Kenski, Moran y Freire, así como en legislaciones y directrices que estructuran la formación inicial y continua del profesorado. El análisis de los datos evidencia tendencias como la ampliación del acceso a las tecnologías digitales en las escuelas brasileñas, la adopción gradual de metodologías activas y la valorización de la formación continua como estrategia para el fortalecimiento de la práctica docente. Los resultados indican que los docentes que participan en procesos formativos presentan una mayor predisposición a la innovación pedagógica y al uso crítico e intencional de los recursos digitales. No obstante, se concluye que la disponibilidad de equipamientos y conectividad, por sí sola, no garantiza la transformación pedagógica, siendo

indispensable la mediación docente y la reflexión crítica. De este modo, la formación docente para el uso de las TDIC se configura como un proceso crítico-reflexivo y colaborativo, esencial para fortalecer el papel del profesorado como mediador del aprendizaje y agente de la transformación educativa en el siglo XXI.

1 INTRODUCTION

The accelerated development of digital technologies in recent decades has promoted relevant transformations in multiple social sectors, particularly in the educational field. From this new configuration emerges the so-called "Digital Age", where the growing presence of digital devices, interactive resources and virtual platforms has reconfigured the way knowledge is accessed, produced and shared (Gómez, 2015).

The insertion of digital technologies in the daily life of contemporary society has profoundly transformed the forms of interaction, communication and production of knowledge, configuring what is called digital culture (Lévy, 1999). This culture goes beyond the simple use of technological devices, as it involves a set of social practices mediated by digital technologies, directly impacting education.

Given this scenario, it is essential to rethink teacher training, so that teachers are prepared to incorporate, in a critical and creative way, digital technologies in the teaching-learning process. Thus, the school, as an institution inserted in this context, needs according to Moran (2015) to rethink its pedagogical practices to meet the new demands of teaching and learning, since the internet and digital technologies allow access to content at any time, making a more flexible, integrated and connected education necessary.

In this process, the National Common Curricular Base (BNCC, 2018) stands out as a guiding document, which brings as one of its general competencies to be developed the "digital culture", with the objective that the student develops the ability to understand, use and create digital information and communication technologies in an ethical, critical and reflective way, applying them in different social and school contexts to favor communication, the dissemination of information, the production of knowledge, the resolution of problems and the autonomous and authorial action of the subjects, because according to the BNCC:

Digital Culture: involves learning aimed at a more conscious and democratic participation through digital technologies, which presupposes the understanding of the impacts of the digital revolution and the advances of the digital world in contemporary society, the construction of a critical, ethical and responsible attitude in relation to the multiplicity of media and digital offers, the possible uses of different technologies and the content conveyed by them, and, also, to fluency in the use of digital technology to express solutions and cultural manifestations in a contextualized and critical way. (Brazil, 2018, p. 474)

From an increasingly digital reality, Bacich and Moran (2018) highlight new teaching strategies, such as active methodologies combined with digital technologies that promote the construction of knowledge in a critical and reflective way and that develop student protagonism for innovative education. In this context, knowledge is built through problem

solving, project-based learning, and the creative use of digital technologies, which demands a new, more reflective and collaborative teacher profile.

The school, as a dynamic and socially situated space, is challenged to keep up with technological changes and new educational demands, because in this scenario, the continuing education of teachers assumes a strategic role to promote the development of pedagogical skills that value innovation, technological mediation and the collaborative construction of knowledge. According to Moran (2013, p.13):

An innovative education is based on a set of proposals with some major axes that serve as a guide and basis: integrative and innovative knowledge; the development of self-esteem and self-knowledge (valuing everyone); the formation of entrepreneurial students (creative, with initiative) and the construction of student-citizens (with individual and social values).

Teacher training becomes a central element in this process of integration of digital technologies as an instrument of pedagogical mediation. For this, it will be necessary for teachers to develop skills that allow them to act critically in the face of the changes provided by the digital environment. Initial training, for Imbernón (2011) often distant from the reality of the classroom, needs to be complemented by continuing education programs that offer teachers opportunities to reflect on their practice, experiment with new methodologies and appropriate digital resources in a meaningful way.

Thus, the present research proposes to reflect on the following problem: How does the integration of digital technologies contribute in teacher training to the development of new strategies in the teaching-learning process? The general objective will be to investigate the continuing education of teachers and the integration of digital technologies in the teaching-learning process, and as specific objectives: a) to raise contributions of digital technologies to pedagogical mediation in the school context; b) to discuss the challenges and possibilities of continuing education of teachers in the face of digital culture; c) to identify digital skills considered essential for teaching in the twenty-first century; d) to reflect on innovative pedagogical practices that incorporate technologies in the teaching-learning process.

This study seeks to understand how teacher training can be resignified through the use of digital technologies, for the promotion of more interactive, meaningful and innovative pedagogical practices.

2 THEORETICAL FRAMEWORK

The present work will be developed in four main axes: Digital Culture, based on the studies of Kenski and Moran, which address the educational transformations caused by

technologies; the Innovative Classroom and Active Methodologies, highlighted by Cortelazzo and Moran, who defend the active participation of students and the resignification of the teaching role; Teacher Training, discussed by Tardif and Nóvoa, which emphasize the construction of knowledge and the need for critical and collaborative training; and, finally, the Legal Documents and Guidelines for Teacher Training, analyzed from the Constitution, the LDB and the BNCC, which establish the normative bases for pedagogical practice. In this context, continuing education is understood as an essential element for the meaningful integration of digital technologies into education.

2.1 DIGITAL CULTURE

Digital culture is characterized by the intensification of the use of digital technologies as mediators of social, communicational, and cognitive relations, directly impacting the modes of production and circulation of knowledge. According to Kenski (2012), technology has always been associated with power and knowledge, shaping social behaviors and forms of access to information, being, in contemporary times, enhanced by digital language and the internet.

Pierre Lévy (1999) defines cyberspace as "the new means of communication that emerges from the worldwide interconnection of computers" (p.17), in which processes of collective intelligence are developed, favoring collaborative learning and the shared construction of knowledge. This scenario, Lévy (1999, p.172) describes as "a profound mutation in the relationship with knowledge", demanding from education new forms of pedagogical mediation, more flexible, open and participatory.

In the educational field, Moran (2015) highlights that school institutions are challenged to rethink their pedagogical models to keep up with the transformations of the digital society. According to the author, the incorporation of active methodologies, such as project-based teaching, hybrid teaching and the flipped classroom, represents a possible response to the need to make the student the protagonist of the learning process.

The insertion of digital technologies, however, does not guarantee, by itself, pedagogical innovation. According to Contreras (2002, p. 97), teaching practice is crossed by complex and singular situations, which demand critical reflection and adaptability. In this sense, digital culture redefines the role of the teacher, who is no longer a mere transmitter of content to act as a mediator, advisor and articulator of knowledge in collaborative contexts.

As Lévy (1999, p.208) points out, "allowing human beings to combine their imaginations and intelligences at the service of people's development and emancipation is the best possible use of digital technologies". This conception shows that digital culture is not

restricted to the introduction of technological resources in the school context, but implies a reconfiguration of pedagogical practices and teaching work, demanding the performance of teachers capable of inspiring, connecting and mediating knowledge in collaborative learning environments. In this sense, a critical, collective and contextualized education is indispensable, capable of responding to the educational demands of contemporary society.

2.2 DIGITAL SKILLS AND TEACHER TRAINING

At the same time that digital technologies present themselves as potential allies of pedagogical innovation, it is necessary to recognize the risks of their appropriation in a superficial or merely instrumentalized way. As Barreto (2009, p. 3) warns:

Technologies are not mere transparent tools; they do not allow themselves to be used in any way: they are, in the final analysis, the materialization of the rationality of a certain culture and of a "global model of the organization of power.

The author highlights that the critical appropriation of technologies must take into account their historical, social and political determinations, seeking emancipatory educational practices. Although technologies have the potential to drive new pedagogical practices, their adoption must be at the service of an emancipatory education, and not a simple adaptation to generalist educational models. Thus, the need for teacher training that goes beyond the technical domain is reinforced, valuing critical reflection and the construction of transformative educational practices (Barreto, 2009).

In this scenario, the role of the teacher is also transformed: he is no longer a mere transmitter of content to become a curator, caregiver and advisor of learning. The teacher must be able to organize personalized training paths, encourage collaborative learning and promote student autonomy, using technologies as tools for mediation and expansion of the educational process (Moran, 2015).

In this horizon, Tardif (2014) proposes that teaching knowledge is historically constructed in everyday school life, being the product of social experiences and interactions. For the author, such knowledge is not static, but is constituted in a dynamic way, based on professional experience and the dialogue between theory and practice. Thus, teacher training needs to consider the real contexts of the school, the specific demands of students, and the possibilities that technologies offer to enhance teaching. This articulation between scientific knowledge, practical experience and digital resources creates conditions for a more meaningful pedagogical practice, contextualized and aligned with the challenges of contemporary society.

For Tardif (2014), teaching knowledge is composed of different dimensions, such as disciplinary, curricular, experiential and pedagogical knowledge. Disciplinary knowledge refers to the mastery of the specific content of the area of activity; the curricula are linked to the understanding of the objectives, contents and methods proposed in the programs and guidelines; the experiential ones derive from daily practice, constituting the interaction with students, colleagues and the school community; and pedagogical refer to knowledge about teaching methods, strategies and processes. From the perspective of digital culture, this knowledge expands, requiring the teacher to also develop technological skills that dialogue with all these dimensions, in a critical and creative way.

As Nóvoa (2002, p. 63) points out, "it is not possible to learn the teaching profession without the presence, support and collaboration of other teachers", emphasizing the collective and reflective character of continuing education. Tardif (2014) observes that "teaching knowledge is a plural knowledge, formed by the amalgam, more or less coherent, of knowledge from professional training and disciplinary, curricular and experiential knowledge" (Tardif, 2014, p. 36), highlighting the variety and dynamism of these dimensions in the educational routine. In this context, the incorporation of digital technologies implies a profound repositioning of the functions of teachers and students, a movement that goes beyond the mere use of tools to consolidate a conscious, critical and contextualized use of technological resources. In this sense, Kenski (2003) reinforces that technology should be understood as pedagogical mediation, that is, "a means that broadens the horizons of learning, and not an end in itself" (an interpretation based on his proposal of technological conception). Thus, when based on the knowledge historically constructed by teachers and supported by continuing education policies aligned with practice, the integration of digital technologies favors more autonomous, participatory and contextualized learning environments, sufficiently sensitive to legal requirements, social demands and the pedagogical possibilities of digital culture.

The digital skills required by the BNCC and legal documents point to a repositioning of the teacher's role. Nóvoa (2022) describes that:

The cycle of professional development is completed with continuing education. Given the dimension of the current problems and challenges of education, we need, more than ever, to strengthen the collective dimensions of the teachers. The image of a teacher standing next to the blackboard, giving his class to a class of seated students, perhaps the most striking image of the school model, is being replaced by the image of several teachers working in open spaces with students and groups of students (Nóvoa, 2022, p. 67).

In this sense, it is highlighted that continuous training is one of the essential skills for education professionals, as it guarantees constant updating and development of new skills, such as the management of pedagogical processes, collective work, the incorporation of technologies and ethical reflection. Teaching work, therefore, must articulate digital skills with pedagogical and social commitment, enabling practices that respond to the challenges of a changing world (Perrenoud, 2000 apud Corrêa; Fernandes, 2014, p. 3).

2.3 CONSTITUTION AND LAW OF GUIDELINES AND BASES OF EDUCATION AND OFFICIAL DOCUMENTS ON TEACHER TRAINING

Teacher training in Brazil is guided by a set of legal provisions that ensure the valorization of teaching and the qualification of teaching, in line with contemporary social and technological transformations. The Federal Constitution of 1988 establishes, in its article 206, the valorization of school education professionals as one of the principles of teaching, linking educational quality to teacher training and professional development (Brasil, 1988).

The Law of Guidelines and Bases of National Education (Law No. 9,394/1996) reinforces this principle by providing, in its articles 62 and 67, higher education for the exercise of teaching in basic education and the guarantee of continuing education as part of the valorization of education professionals. These devices show the understanding that teacher training must articulate theoretical knowledge, pedagogical practice and permanent updating.

The LDB, updated by Law No. 14,533/2023, advances even further by formally incorporating digital education among the duties of the State. According to the new item XII of article 4:

Digital education, with the guarantee of connectivity of all public institutions of basic and higher education to the internet at high speed, suitable for pedagogical use, with the development of skills aimed at the digital literacy of young people and adults, creation of digital content, communication and collaboration, security and problem solving. (Brazil, 2023)

In addition, the sole paragraph of the same article adds:

The relationship between teaching and digital learning should provide for digital techniques, tools and resources that strengthen the teaching and learning roles of the teacher and the student and that create collective spaces for mutual development. (Brazil, 2023).

With this update promoted by Law No. 14,533/2023, the LDB explicitly incorporates digital education as a duty of the State, ensuring the connectivity of educational institutions and the development of skills related to digital literacy, content creation, communication, collaboration, security, and problem solving. Such normative advancement reinforces the centrality of digital technologies in education and the need to prepare teachers for their critical pedagogical integration.

In this context, the National Common Curriculum Base (BNCC, 2018) highlights digital culture as one of the general competencies of basic education, guiding the development of skills related to the ethical, critical, and responsible use of digital technologies. The document emphasizes that it is necessary to "prepare them for professions that do not yet exist, to use technologies that have not yet been invented, and to solve problems that we do not yet know" (Brasil, 2018, p. 473), highlighting the urgency of training subjects capable of dealing with a world in constant transformation.

Thus, the legal documents that structure Brazilian education show that the initial and continuing training of teachers is a central element for the effectiveness of innovative pedagogical practices aligned with the demands of the digital society, overcoming a merely instrumental approach to technologies.

2.3.1 BNC – training

Teacher training in Brazil is supported by legal provisions that seek to align teaching practice with the contemporary demands of education. After the approval of the National Common Curricular Base (BNCC) in 2017, different versions and opinions emerged aimed at the adequacy of initial and continuing teacher training. In this process, Resolution CNE/CP No. 1/2020 stands out, which provides for the National Curriculum Guidelines for continuing education and establishes the National Common Base for the Continuing Education of Basic Education Teachers (BNC-Formation). However, as Freitas (2020) observes, the preparation of these documents took place largely without broad dialogue with academic, scientific, and union entities in the area, in a period marked by the health crisis of the COVID-19 pandemic, which generated tensions and criticism about their legitimacy.

Along the same lines, Pucci, Lima, and Souza (2022) point out that the implementation of the BNCC required articulated actions by municipal networks, which have been organizing themselves to adapt their curricula and offer guidance and training to teachers and school managers. Thus, it is evident that normative documents not only regulate, but also guide the curricular organization and professional training, constituting structuring axes of pedagogical practice in the country.

CNE/CP Resolution No. 1/2020 emphasizes that continuing education must be aligned with the real needs of school contexts, configuring itself as an essential component of teacher professionalization and valuing the teacher as a formative agent of knowledge and cultures. The document establishes that professional competencies must integrate three interdependent dimensions: professional knowledge, professional practice and professional engagement; guiding the teaching work towards a critical, ethical, and socially responsible performance (BRASIL, 2020, p. 2). In addition, it provides that continuing education policies respect constitutional foundations, ensure collaborative work among peers, incorporate active learning methodologies and maintain coherence with other educational policies, curricula and career plans.

Another highlight refers to the encouragement of lifelong learning, organized in flexible and modular programs, aimed at meeting the demands of teaching practice in different contexts. This perspective includes everything from refresher and improvement courses to graduate studies, as well as mentoring and tutoring processes. Such actions enable the exchange of experiences between more experienced teachers and those in the process of professional development, strengthening communities of practice and expanding the collective pedagogical repertoire (BRASIL, 2020, p. 6).

With regard to general teaching competencies, the Resolution points out the need to research, investigate and critically reflect on pedagogical practices, using creativity and technological solutions to plan challenging and meaningful proposals; to use different languages (verbal, body, visual, sound and digital) in order to favor the expression and sharing of experiences among students; to understand, use and create digital technologies in a critical and ethical way in educational practices; and to permanently value professional training, seeking updating and new knowledge that sustains the autonomy, citizenship and social responsibility of teachers (BRASIL, 2020, p. 8).

The articulation between the BNCC, the CNE Opinions, the LDB and the BNC-Formação show that the initial and continuing training of teachers cannot be restricted to the instrumental domain of digital tools, but must contemplate their pedagogical and critical appropriation. In order for the digital skills provided for in the BNCC to be effectively developed, the teacher needs to mobilize knowledge, skills, and attitudes that transform computational thinking, the digital world, and digital culture into contextualized, meaningful learning experiences aligned with the demands of contemporary society. In this horizon, Resolution CNE/CP No. 1/2020, which establishes the BNC-Formation, reinforces the need for teacher training to be continuous, collaborative and aligned with the real needs of school

contexts, structuring itself as an essential component of teacher professionalization and valorization.

Therefore, the legal documents analyzed here not only confer legitimacy, but also drive the modernization of pedagogical practices, especially with regard to teacher training and performance. The presence of technologies in the school context, when integrated with criticality and intentionality, contributes to the realization of the educational rights provided for in Brazilian legislation and to the construction of a school more connected with the challenges of the present and the future.

2.4 CONTINUING EDUCATION FOR THE USE OF DIGITAL TECHNOLOGIES

Continuing education is a key element for the meaningful integration of digital technologies into teaching practice. For Freire (1996, p. 39), "in the permanent training of teachers, the fundamental moment is that of critical reflection on their practice", allowing the teacher to understand, question and transform their pedagogical actions.

From this perspective, Nóvoa (2002; 2019; 2022) emphasizes that teacher professional development occurs in a collective and situated way, through dialogue between teachers and the shared construction of knowledge. Continuing education, therefore, cannot be conceived as a punctual or merely normative action, but as a permanent process, articulated with the real demands of the school context. Complementing this view, the author argues that continuing education should not be conceived as a punctual or merely normative action, but as a permanent process, articulated with practice and sustained by the teacher's commitment to his own learning. This means creating training paths that are relevant to the context of the teacher's work and that value their professional experience, while challenging them to explore new methodologies and languages.

Another important aspect highlighted by Tardif (2014) is that teaching knowledge is socially constructed, which implies recognizing the importance of exchanges and collaborative work among teachers. In this sense, continuing education should create spaces that favor the sharing of experiences, the collective construction of solutions and joint reflection on pedagogical practices mediated by technologies. The appropriation of digital resources, when discussed and experienced collectively, enhances innovation and strengthens the ability of teachers to respond to the needs and expectations of students in contemporary society.

In this way, the school must provide training that includes the development of new skills, attitudes and values, enabling individuals to use technologies in a critical and conscious way. However, education needs to overcome pedagogical practices that disregard the

communicative and interactive specificities of technology-mediated teaching, as the degree of interaction between participants is pointed out as fundamental for the quality of the educational process. (Moran, 2015)

Thus, continuing education in the use of digital technologies must go beyond the technical mastery of tools, incorporating ethical, pedagogical and collaborative dimensions. When organized in a reflective and collective way, training contributes to the strengthening of teacher autonomy, to pedagogical innovation and to the construction of more meaningful, inclusive educational practices aligned with the challenges of the twenty-first century.

3 METHODOLOGY

To meet the objectives of this article, regarding the methodological approach, qualitative research was chosen, since it focuses on significant contexts that involve the understanding of reality and the interpretation of phenomena in their natural environments, without manipulation of variables.

In this approach, qualitative research favors a critical understanding of the educational processes mediated by digital technologies, allowing the multiple dimensions of the phenomenon studied to be considered. The qualitative look is focused on the interpretation of the meanings attributed by the subjects to their practices, relationships and experiences in the contemporary educational environment. Thus, the study favors the analysis of interactions between teachers, technologies and pedagogical practices, considering the complexity and dynamics of current school contexts. This type of investigation does not propose to generalize results, but to deepen the analysis of relevant aspects of the educational reality.

The study is also characterized as exploratory, as it seeks to better understand a phenomenon still in the process of theoretical and practical consolidation in the field of education, contributing to the deepening of knowledge about teacher training in the face of the challenges of digital culture. For Sampieri, Collado and Lucio (1991), exploratory research seeks to understand phenomena that have been little studied, to collect preliminary information that allows for more detailed analyses and to guide the formulation of subsequent studies.

As an instrument of data collection, bibliographic research was adopted, based on the survey, analysis and interpretation of published works, such as books, scientific articles, official documents, dissertations, theses and institutional publications. According to Lima and Mito (2007), bibliographic research is an essential methodological procedure in the construction of scientific knowledge, as it allows the researcher to identify, systematize and

dialogue with different theoretical perspectives on a given object of study. Such a choice is consistent with the objective of the research, which proposes to critically reflect on the role of digital technologies in teacher training and in the teaching and learning processes, based on already consolidated references. Bibliographic research, in this sense, allows us to gather a theoretical framework that supports the proposed analysis and reflection, enabling a more in-depth and grounded look at the theme.

The choice of the Cetic.br platform (Regional Center for Studies for the Development of the Information Society) as the object of analysis is justified by its national and international credibility, recognized by bodies such as UNESCO, which designated it as a Regional Center for Studies (Cetic.br, 2023), and by the Federal Government, which uses its indicators to support digital transformation policies (Brazil, 2025). Linked to CGI.br and NIC.br, the Cetic.br produces research such as ICT Education, widely used in academic studies and by institutions. Its scientific relevance stems from the adoption of methodologies aligned with international standards (Observatório da imprensa, 2012), ensuring reliable data to understand the integration of digital technologies in education and their relationship with Brazilian public policies. These data constitute, therefore, the empirical basis that will be analyzed in the results of this work, allowing the articulation between the legal, theoretical and practical dimensions of teacher training for the use of digital technologies.

4 ANALYSIS OF RESULTS

Linked to the Brazilian Internet Steering Committee (CGI.br) and maintained by the Brazilian Network Information and Coordination Center (NIC.br), the Cetic.br is responsible for producing statistics and indicators on the access and use of information and communication technologies (ICTs) in the country. Its credibility is recognized by different agencies, being a reference for researchers, public managers and international institutions.

The Cetic.br has been designated by UNESCO as a Category 2 Centre, i.e. under its auspices and linked to the Communication and Information Sector (IC), one of the five UNESCO areas (CETIC.BR, 2023). This international link confers legitimacy to its studies and positions Brazil among countries that develop solid methodologies for measuring the information society. In addition, Cetic.br contributed to the formulation of the Internet Universality Indicators, approved by UNESCO, and participated in their pilot application in Brazil, reaffirming its technical and methodological authority (CETIC.BR, 2019).

In the national field, Cetic.br is widely used by government agencies in the formulation and monitoring of public policies related to digital inclusion, education, and digital transformation of the State. Reports such as the ICT Education and ICT Domiciles surveys

are recurrent references for the construction of diagnoses on digital inequalities and technological infrastructure in Brazil, subsidizing actions by the government. According to the Federal Government (2025), Cetic.br data have been fundamental to guide digital transformation strategies within the scope of public administration, evidencing institutional confidence in its indicators.

The credibility of the Cetic.br is also highlighted in academic and scientific circles. The Press Observatory (2012) highlighted that the Center has consolidated itself as a national reference in research on ICTs, adopting methodologies aligned with international standards, such as the Observatory of the Information Society in Latin America and the Caribbean (OSILAC) and the United Nations Economic Commission for Latin America (ECLAC).

In this sense, by adopting the 2024 data, being the most current, produced by the Cetic.br as an object of analysis, the present work is supported by highly reliable information, recognized both by international bodies, such as UNESCO, and by national bodies linked to education and public management. This guarantees not only the academic relevance of the choice, but also the scientific and social legitimacy of the results discussed.

4.1 CONTINUING EDUCATION: ADHERENCE AND GAPS

The data in Table 1 below, point to 54% of teachers with participation in continuing education in the last year and 46% without participation, reveal a partial adherence that points to relevant gaps for the training policy. This table shows that, despite the legal provisions (LDB; BNCC) and the guidelines that insist on continuous training, a significant portion of the teaching profession remains without effective access to training in digital technologies. The literature indicates that this gap compromises the implementation of the digital skills provided for in the BNCC, as the mere normative prescription does not guarantee the pedagogical appropriation of DICT by teachers (Nóvoa, 2019; Tardif, 2014).

Table 1

H3 - teachers who have participated in continuing education on the use of digital technologies in teaching and learning activities in the last 12 months

Participation in continuing education	Percentage (%)
Yes	54
No	46

Source: Adapted from Cetic.br, 2024.

Table 2 below reinforces the importance of training by pointing out that 76% of teachers report the contribution of training to the adoption of new practices and 69% show adaptation of teaching to the needs of students. These percentages indicate that when there

is training, the impact is considerable, which validates Nóvoa (2022) and Freire (1996) when they state that continuing education, when situated and reflective, promotes concrete changes in teaching practice. However, the difference between the reported effectiveness (Table 2) and the non-participation rate (Table 1) indicates a coverage deficit: the training that transforms practices does not reach all teachers, generating inequalities in the implementation of curricular guidelines.

Table 2

H9 - teachers, by perception of the level of contribution of continuing education activities carried out in the last 12 months to the adoption of new teaching and learning methodologies and practices mediated by digital technologies

Reported impact	Level of contribution	Percentage (%)
Guiding students on how to use digital technologies critically, safely, and responsibly	Very much	67
	Little	26
	Nothing	7
Support students when any sensitive situation occurs on the internet, such as cyberbullying, discrimination, or other situations	Very much	60
	Little	27
	Nothing	12
Teaching students how to protect their personal data, their digital identity and privacy on the Internet	Very much	51
	Little	31
	Nothing	19
Use digital technologies to adapt activities to students' learning rhythms	Very much	69
	Little	26
	Nothing	5
Adopt new teaching and learning methodologies and practices through digital technologies	Very much	76
	Little	22
	Nothing	1

Source: Adapted from Cetic.br, 2024.

Table 2 shows that training can transform practice; however, Table 1 highlighted the urgency of expanding coverage and ensuring equity in access to these trainings.

This scenario requires a critical reading of public policies: it is not enough to offer courses; it is necessary to guarantee access, continuity and institutional conditions for training to be effective (BNC-Formation; CNE/CP Resolution No. 1/2020). The presence of legislation that encourages continuing education dialogues with the data (BRASIL, 2020), but the divergence reveals implementation failures that may result from problems of time, funding, workload, and school prioritization, which must be investigated and addressed.

Furthermore, the articulation between these data and authors such as Perrenoud (2000) and Gadotti (2005) points to the need to rethink training as a continuous process, part of the professional routine and articulated with collaborative and reflective practices.

4.2 CULTURE OF COLLABORATION AND PROFESSIONAL DEVELOPMENT

Table 3 below indicates that 92% of teachers sought some professional development and 77% helped other educators, signaling a strong culture of self-development and peer cooperation. These data contribute to the idea of collective construction of teaching knowledge defended by Nóvoa (2002; 2019) and Tardif (2014), who see professional exchanges as a central space for training. The high rate of peer support reveals that professional self-organization is a real and present strategy among teachers, acting as a mechanism for the dissemination of practices and innovations.

Table 3

C4 - teachers, for the use of digital technologies in professional practice - professional development

Activity carried out	Percentage (%)
Sought professional development	92
They helped other educators	77

Source: Adapted from Cetic.br, 2024.

Table 4 below shows that 91% of teachers had to resort to videos/tutorials and other self-training resources, which shows a very strong phenomenon of informal and autonomous learning, the so-called lifelong learning. Although this behavior demonstrates proactivity, it refers to Freire's (2002) reflections: self-learning needs to be mediated by critical reflection and not only by technical consumption of procedures. The prevalence of videos and tutorials can produce instrumental competences, but it runs the risk of not developing critical pedagogical appropriation if it is not complemented by spaces for debate and collective experimentation.

Table 4

H1 - teachers, through self-training or in-service training on the use of digital technologies

Resource used	Percentage (%)
Training by the pedagogical coordinator or school principal	52
Training by other organisations outside the school	55
Online videos or tutorials	91
Courses from the government or other organizations	66

Source: Adapted from Cetic.br, 2024.

The articulation between self-education (Table 4) and peer support (Table 3) suggests that informal communities of practice play a central role in the diffusion of technological innovations. This phenomenon can be considered positive when it feeds reflexive exchanges that problematize the use of technology, which Tardif (2014) and Perrenoud already highlight:

learning from others enriches the professional repertoire and transforms experiential knowledge into socially validated knowledge.

However, the predominance of self-training also indicates the fragility of institutional systems of continuing education. The BNC-Formação and the CNE guidelines point to the need for mentoring, tutoring and modulated programs that complement and qualify this self-learning; without this, many teachers appropriate fragmented content of questionable quality (BRASIL, 2020). In practical terms, the data suggest the need for policies that articulate standardized resources (such as videos) with spaces for discussion, deepening and pedagogical supervision.

4.3 FORMATS AND THEMES OF TEACHER TRAINING

Table 5 below reveals a diversity of training formats such as: video classes; lectures; workshops; extension courses; among others, which indicates methodological flexibility in the offers. This plurality is in line with the recommendation of the BNC-Formação to adopt various training programs (BRASIL, 2020). Moran (2015) and Cortelazzo et al. (2018) advocate the combination of face-to-face and remote formats (blended learning) and active methodologies to promote more effective learning; Thus, the diversity found is positive if there is articulation between the formats and pedagogical intentionality.

Table 5

H4 - teachers, by type of continuing education activities in which they have participated in the last 12 months

Type of activity	Percentage (%)
Video lessons	84
Lectures with experts	61
Workshops or trainings	67
Extension courses	46

Source: Adapted from Cetic.br, 2024.

As for the themes present in Table 6 below: (use of technologies in evaluation, creation of digital content, media education, artificial intelligence, data protection), there is direct convergence with the digital competencies provided for in the BNCC (computational thinking, digital world, digital culture). Kenski (2012) and Barreto (2009) warn, however, that the treatment of these issues needs to be critical and contextualized, contemplating the ethical and political dimensions of technology (e.g., data protection, biases in AI). The presence of AI and data protection among the most worked on topics points to a formative response to emerging demands, which is positive from a curricular point of view.

Table 6

H7 - teachers, by themes of continuing education activities in which they have participated in the last 12 months

Theme worked	Percentage (%)
Use of technologies in the evaluation of student performance	75
Ways to guide students on the safe use of the computer, cell phone and the Internet	69
Educational content creation platforms, computer programs, or applications	82
Assessing the veracity of information and news and responsibly sharing content and opinions on the Internet	61
Protection of privacy and personal data in the use of the Internet	58
Computing, programming or robotics in education	39
Use of Artificial Intelligence in educational activities	59
Media education and critical use of media in the classroom	68
Use of digital technologies to adapt activities to students' learning rhythms	79

Source: Adapted from Cetic.br, 2024.

Despite this thematic correspondence, it is necessary to evaluate the depth with which each theme is worked: short workshops and tutorials can introduce tools, but they do not guarantee consolidated pedagogical understanding. Gadotti (2005) and Freire (2002) remind us that training should foster reflection, research and experimentation through modalities that require a more elaborate training organization than mere technical training.

Therefore, the centrality of themes related to evaluation, content production and media education signals a trend oriented towards daily teaching practice, which reinforces that training needs to dialogue with the real needs of classrooms, as already addressed by Tardif (2014), and not only with abstract technological trends. Training policies must ensure didactic sequence between learning about tools and their consequence in meaningful pedagogical practices.

4.4 PEDAGOGICAL PRACTICE WITH TECHNOLOGIES: PRESENCE AND DEPTH

Table 7 below indicates that 100% of teachers report using digital technologies in professional practice, a fact that confirms the real insertion of DICT in daily school life. However, the universality of use does not ensure the quality of this mediation: as Kenski (2003) and Contreras (2002) warn, it is essential to distinguish between instrumental use and intentional pedagogical integration. The widespread presence of technologies opens opportunities for active methodologies and personalization, but it can also disguise reproductive practices if there is no pedagogical reflection on purposes and effects.

Table 7

C20 - teachers, for the use of digital technologies in professional practice

Use of digital technologies	Percentage (%)
Yes, they use	100
Do not use	0

Source: Adapted from Cetic.br, 2024.

However, in an integrated way, the synthesis presented in Table 8 below shows that teacher training in Brazil, although expanding, still faces inequalities in access and limitations regarding the universalization of participation in formal continuing education programs.

Table 8

Synthesis of results on continuing education and the use of digital technologies by teachers (Cetic.br, 2024)

Thematic axis	Key findings	Evidence (Cetic.br, 2024)
Continuing education	Significant, but not universal, participation.	54% participated in the last year; 46% did not participate (Table 1).
Impacts of training	Direct repercussion on pedagogical innovation and adaptation to the needs of students.	76% have adopted new practices; 69% adapted teaching; (Table 2).
Professional development	Strong engagement in search of updating and collaboration among peers.	92% sought development; 77% supported other teachers (Table 3).
Teacher self-training	Digital resources are the most used to learn autonomously.	91% use online videos/tutorials; while a lower percentage sought other resources (Table 4).
Training activities	Predominance of video lessons	84% participated in video classes while a smaller percentage participated in other types of training activities (Table 5).
Training topics	Emphasis on the use of digital technologies, content production and evaluation.	75% cited the use of technologies in performance evaluation; 79% mentioned the use of technologies in the adaptation of activities (Table 6).
Use of digital technologies	Universalization of the use of DICT in the exercise of teaching.	100% reported using technologies (Table 7).

Source: the author, based on Cetic.br (2024).

Thus, it was demonstrated that the impacts reported in Table 2 (76% adoption of new practices; 69% adaptation of teaching) show that continuous training contributes significantly to transform practices. This confirms Nóvoa's (2022) thesis on the power of situated and collaborative training for pedagogical innovation. However, critical analysis must recognize that real transformation demands not only training, but changes in working conditions, pedagogical time and institutional support, elements that public policies need to consider.

The integration of DICT into the assessment, communication and production of content as demonstrated in (Table 6 and Table 7) requires multiple skills from teachers (Tardif, 2014): disciplinary mastery, technological skills, pedagogical knowledge and ethical mediation capacity (Barreto, 2009). The comparison of widespread use and impact reports signals advances, but the literature indicates that these advances are only consolidated when there are processes of monitoring, mentoring, and communities of practice that sustain changes in daily life (BRASIL, 2020; Freire, 2002).

The growing centrality of digital technologies in training processes is noted, both in face-to-face and online courses and in self-training practices, such as the use of videos and online tutorials. This scenario confirms Kenski's (2012) perspective, when he states that technologies profoundly reconfigure social and educational dynamics, requiring the school to adopt new attitudes towards digital culture.

5 FINAL CONSIDERATIONS

The data obtained in this research reinforce Moran's (2015) defense of the relevance of active and innovative methodologies, since they show that teachers who participate in continuing education tend to adopt new pedagogical practices, adapting teaching to the needs of students and expanding the use of DICT. This movement, however, is not limited to access to resources or tools, but requires pedagogical intentionality and critical reflection, as Freire (2002) points out, when he understands training as a process of awareness and transformation of practice.

In this sense, the universalization of the use of digital technologies, pointed out by Cetic.br (2024), needs to be understood beyond the simple presence of devices in the classroom. Nóvoa (2019, 2022) and Tardif (2014) recall that teacher training is a collective, historical practice marked by plural knowledge, built in the interaction between teachers, school contexts, and educational policies. Thus, training should not be reduced to a technical dimension, but conceived as a space for collaboration, sharing and reflection that enables the construction of transformative pedagogical practices.

The results of this research demonstrate that teacher training, when it critically integrates digital technologies, contributes not only to meeting the legal requirements expressed in the BNCC (2018) and BNC-Formação (2020), but also to the strengthening of inclusive, collaborative pedagogical practices aligned with contemporary challenges. The high rate of adherence to self-training methodologies and peer support also reveal the importance of communities of practice and the appreciation of teaching experience as central elements in the construction of professional knowledge.

Finally, the analysis shows that continuing education focused on the use of DICT cannot be understood as a punctual or merely normative action, but as a permanent, critical and reflective process, which recognizes the teacher as an active subject in his or her formative trajectory. By promoting conditions for teachers to develop digital skills in an ethical, meaningful and creative way, teacher training contributes to the construction of an innovative education, committed to the democratization of knowledge and prepared for the challenges of the 21st century.

ABSTRACT

Environmental sustainability has assumed increasing relevance in the organizational context. Despite this prominence, the incorporation of environmental sustainability in micro and small enterprises (MSEs) occurs unevenly, marked by structural, operational, and managerial limitations that hinder the consolidation of systematic environmental practices. In MSEs, the engagement with environmental practices tends to occur in a fragmented manner, indicating the need for empirical approaches that consider learning processes, organizational routines, and structural capacities within the organizational process of internalization. In this context, the objective of this study is to analyze the environmental practices adopted by Brazilian MSEs, considering the articulation between organizational culture, environmental engagement, and environmental behavior as a process of incorporating environmental sustainability. Methodologically, the research is characterized as empirical, quantitative, and descriptive, with a cross-sectional design, operationalized through a survey applied to 225 Brazilian MSEs. Data were collected using a structured questionnaire with Likert-scale items and analyzed using descriptive statistics and Spearman correlation. The results indicate greater consolidation of practices associated with organizational culture and environmental engagement, while practices of a strategic nature show lower integration and greater heterogeneity among firms. The associations observed among the analyzed dimensions were predominantly weak and non-linear, indicating that advances in operational practices do not necessarily imply strategic institutionalization. These findings demonstrate that the incorporation of environmental sustainability in MSEs occurs gradually and incrementally, reinforcing its understanding as an organizational process conditioned by learning, routines, and structural capacities.

RESUMO

A sustentabilidade ambiental tem assumido crescente relevância no contexto organizacional. Apesar desse protagonismo, a incorporação da sustentabilidade ambiental nas Micro e pequenas empresas (MPEs), ocorre de forma desigual, marcada por limitações estruturais, operacionais e gerenciais que dificultam a consolidação de práticas ambientais sistemáticas. Percebe-se que, nas MPEs, o engajamento das práticas ambientais ocorre de maneira fragmentada, indicando a necessidade de abordagens empíricas que considerem processos de aprendizagem, rotinas organizacionais e capacidades estruturais no processo organizacional de internalização. Diante desse cenário, o objetivo deste estudo é analisar as práticas ambientais adotadas pelas MPEs brasileiras, considerando a articulação entre cultura organizacional, engajamento ambiental e comportamento ambiental como processo de incorporação da sustentabilidade ambiental. Metodologicamente, a pesquisa caracteriza-se como empírica, quantitativa e descritiva, com delineamento transversal, operacionalizada por meio de um survey aplicado a 225 MPEs brasileiras. O instrumento de coleta consistiu em um questionário estruturado com questões em escala Likert, e os dados foram analisados por meio de estatística descritiva e correlação de Spearman. Os resultados indicam maior consolidação das práticas associadas à cultura organizacional e ao engajamento ambiental, enquanto práticas de natureza estratégica apresentam menor integração e maior heterogeneidade entre as empresas. As associações observadas entre as dimensões analisadas foram predominantemente fracas e não lineares, evidenciando que avanços em práticas operacionais não implicam, necessariamente, na institucionalização estratégica. Esses achados demonstram que a incorporação da sustentabilidade ambiental nas MPEs ocorre de forma gradual e incremental, reforçando sua compreensão como um processo organizacional, condicionado por aprendizagem, rotinas e capacidades estruturais.

Palavras-chave: Sustentabilidade Ambiental. Cultura Organizacional. Engajamento Ambiental. Comportamento Ambiental.

RESUMEN

La sostenibilidad ambiental ha adquirido una relevancia creciente en el contexto organizacional. A pesar de este protagonismo, la incorporación de la sostenibilidad ambiental en las micro y pequeñas empresas (MPE) ocurre de manera desigual, marcada por limitaciones estructurales, operativas y gerenciales que dificultan la consolidación de prácticas ambientales sistemáticas. En las MPE, el compromiso con las prácticas ambientales tiende a manifestarse de forma fragmentada, lo que indica la necesidad de enfoques empíricos que consideren los procesos de aprendizaje, las rutinas organizacionales y las capacidades estructurales dentro del proceso organizacional de internalización. En este contexto, el objetivo de este estudio es analizar las prácticas ambientales adoptadas por las MPE brasileñas, considerando la articulación entre cultura organizacional, compromiso ambiental y comportamiento ambiental como un proceso de incorporación de la sostenibilidad ambiental. Metodológicamente, la investigación se caracteriza como empírica, cuantitativa y descriptiva, con un diseño transversal, operacionalizada mediante un survey aplicado a 225 MPE brasileñas. El instrumento de recolección consistió en un cuestionario estructurado con ítems en escala Likert, y los datos fueron analizados mediante estadística descriptiva y correlación de Spearman. Los resultados indican una mayor consolidación de las prácticas asociadas a la cultura organizacional y al compromiso ambiental, mientras que las prácticas de naturaleza

estratégica presentan menor integración y mayor heterogeneidad entre las empresas. Las asociaciones observadas entre las dimensiones analizadas fueron predominantemente débiles y no lineales, lo que evidencia que los avances en las prácticas operativas no implican necesariamente una institucionalización estratégica. Estos hallazgos demuestran que la incorporación de la sostenibilidad ambiental en las MPE ocurre de forma gradual e incremental, reforzando su comprensión como un proceso organizacional condicionado por el aprendizaje, las rutinas y las capacidades estructurales.

Palabras clave: Sostenibilidad Ambiental. Cultura Organizacional. Compromiso Ambiental. Comportamiento Ambiental.

1 INTRODUCTION

Environmental sustainability has consolidated itself as a central theme in the management of organizations, going beyond a strictly normative approach and assuming a strategic character associated with business performance and competitiveness (Barbieri, 2022; Chen et al., 2022; Khizar et al., 2023). International standards, such as ISO 14001 and ISO 26000, reinforce the systematic incorporation of environmental practices into organizational processes, emphasizing the integration between management, culture and behavior. (ISO, 2015; ISO, 2010). In addition, institutional and regulatory pressures increase the demand for coherence between environmental discourse and effective practices (Hatmanu et al., 2019; OECD, 2021).

In the context of Micro and Small Enterprises (MSEs), environmental sustainability assumes specific relevance due to the significant economic participation of this segment and the cumulative environmental impacts associated with its activities (IBGE, 2022; SEBRAE, 2022). However, these organizations face structural, managerial, and operational limitations that make it difficult to consolidate systematic and formalized environmental practices (Calisto et al., 2021; Rosa et al., 2022; OECD, 2021). As a consequence, internalization of environmental sustainability tends to occur incrementally, fragmented, and heterogeneously.

Therefore, the incorporation of environmental sustainability depends on the articulation between organizational culture, environmental engagement, and environmental behavior in the daily lives of organizations (Valdez-Juárez et al., 2019; Jabbour & Santos, 2021; Chen et al., 2023). Studies indicate that cultural values and sustained engagement processes guide recurrent environmental practices related to the use of resources, impact reduction, and internal awareness, according to ISO 26000 guidelines (ISO, 2010). In this way, these practices configure the environmental behavior associated with sustainability in the organizational context (Gao & Yang, 2022; Saez-Martínez et al., 2016; Rosa et al., 2022).

However, in the context of MSEs, there is a gap in terms of the integrated understanding of these elements. Empirical evidence indicates that the articulation between organizational culture, environmental engagement, and environmental behavior is still little explored in a systematic and empirically structured way in this size of companies (Calisto et al., 2021; Chen et al., 2022; Khizar et al., 2023). In particular, the analyses that allow us to understand how these dimensions are articulated in the organizational daily life of MSEs remain limited, in the light of normative references of environmental sustainability (ISO, 2018; ABNT, 2021; OECD, 2021).

In this context, the research question that guides this study is: how do the environmental practices adopted by MSEs articulate between organizational culture,

environmental engagement and environmental behavior in the process of incorporating environmental sustainability? Thus, the objective of this study is to analyze the environmental practices adopted by Brazilian MSEs, considering the articulation between organizational culture, environmental engagement and environmental behavior as a process of incorporating environmental sustainability. To meet this objective, the study adopts the empirical procedure and the quantitative approach, using an instrument aligned with international standards and institutional guidelines, as detailed in the methodological section.

2 THEORETICAL FRAMEWORK

2.1 ENVIRONMENTAL SUSTAINABILITY IN THE CONTEXT OF ORGANIZATIONS

Environmental sustainability has consolidated itself as a strategic factor for competitiveness and organizational performance, going beyond a merely normative approach (Barbieri, 2022; Chen et al., 2022). This position stems from the need to integrate environmental issues into business management, guiding decisions and organizational behaviors (Khizar et al., 2023). Standards such as ISO 14001 and ISO 26000 reinforce this logic by emphasizing the systematic incorporation of sustainability into internal processes (ISO, 2015; ISO, 2010).

In addition to technical standards, organizations have been increasingly pressured by regulatory, social, and market requirements that condition their corporate responsibility (OECD, 2021). In this context, such pressures stimulate organizational responses that go beyond legal compliance, requiring transparency, institutional coherence, and legitimacy before the market (Hatmanu et al., 2019). In the Brazilian case, the National Environmental Policy (PNMA), as well as the guidelines of the *Global Reporting Initiative* (GRI) and ABNT PR 2030, reinforce the need to structure and communicate environmental practices in a systematic and reliable way (Brasil, 1981; GRI, 2021; ABNT, 2021).

In addition, environmental sustainability is linked to global agendas, especially the 2030 Agenda, proposed by the United Nations (UN) (UN, 2015). In this sense, the Sustainable Development Goals (SDGs) reinforce the need for integrated, measurable environmental practices incorporated into the management of organizations (UN, 2015). In a complementary way, the ABNT PR 2030 standard contributes to operationalizing these commitments by translating global guidelines into normative references applicable to the business context (ABNT, 2021).

In this way, the articulation between global agendas, technical standards and institutional guidelines condition organizational performance and create an environment in

which cultural values, engagement processes and environmental behaviors begin to be structured internally, in the context of MSEs (UN, 2015; ABNT, 2021; OECD, 2021).

In this sense, environmental sustainability assumes specific relevance due to the significant economic participation of this segment and the cumulative environmental impacts associated with its activities (IBGE, 2022; SEBRAE, 2022). However, small business organizations face structural and managerial limitations that make it difficult to consolidate systematic environmental practices (Calisto et al., 2021; OECD, 2021). Therefore, these restrictions compromise the formalization of operational practices and the incorporation of environmentally sustainable routines into the organizational culture (Rosa et al., 2022).

2.2 ORGANIZATIONAL CULTURE AS THE BASIS OF ENVIRONMENTAL PRACTICES

Organizational culture constitutes the structuring basis for the incorporation of environmental sustainability in organizations, by guiding values, beliefs, and patterns of behavior shared among employees (Valdez-Juárez et al., 2019; Jovanovic et al., 2017). According to Khizar et al., (2023), organizations with internalized environmental values tend to have greater consistency between discourse and practice. These cultural elements influence how environmental practices are perceived, prioritized, and legitimized internally (Chen et al., 2022).

The dissemination of environmental values occurs when training, qualification, and educational materials reinforce technical standards and institutional guidelines in the organizational routine (Valdez-Juárez et al., 2019; Chen et al., 2022). In addition, standards such as ISO 14001 and ISO 26000 highlight awareness and the development of skills as pillars for the consolidation of environmental practices in organizations (ISO, 2015; ISO, 2010). Consequently, environmental culture is not established by one-off or isolated actions, but by continuous organizational learning processes that guide workers' behavior over time (Gao & Yang, 2022).

In MSEs, organizational culture plays an even more relevant role due to the proximity between leadership and employees, and less formalization of internal processes (Calisto et al., 2021). In this context, managers' perceptions influence the prioritization of environmental practices and the way these practices are interpreted internally (Valdez-Juárez et al., 2019; Rosa et al., 2022). However, structural and operational limitations can make it difficult to consolidate these values in organizational routines (Gao & Yang, 2022). In this way, organizational culture is a necessary basis for the development of environmental engagement in MSEs (Chen et al., 2022).

In addition, organizational culture acts as a mediation mechanism between institutional guidelines and the environmental behavior observed in organizations (Chen et al., 2023). When environmental values are shared, practices tend to be reproduced more consistently, reducing reliance on formal and regulatory controls (Khizar et al., 2023). In the context of MSEs, this cultural mediation becomes decisive for the continuous internalization of environmental sustainability (Calisto et al., 2021). Thus, organizational culture establishes the conceptual link that sustains environmental engagement as an organizational process.

2.3 ENVIRONMENTAL ENGAGEMENT AS AN ORGANIZATIONAL PROCESS

Environmental engagement should be understood as an organizational process, rather than an individual disposition (Gao & Yang, 2022). This process operates as a mediation between cultural values and the institutionalization of environmental practices in everyday business (Saez-Martínez et al., 2016). Chen et al., (2022). They indicate that engagement is sustained when the organization structures conditions for recurrent participation of workers and collective learning. In this way, environmental engagement connects cultural values to the company's strategic actions (Gao & Yang, 2022; Chen et al., 2022).

In this context, internal campaigns and systematic awareness actions guide daily choices and operational routines, by encouraging practices aligned with the responsible use of natural resources (Rosa et al., 2022; Gao & Yang, 2022). In addition, the monitoring of energy and water consumption, as well as the adoption of procedures for separating and properly disposing of waste, reinforce the internalization of environmentally sustainable behaviors in the organizational environment (ISO, 2015; Chen et al., 2022). In this way, environmental engagement ceases to assume a one-off character and starts to structure recurring actions integrated with the SDGs (Khizar et al., 2023). As a result, these initiatives contribute to the construction of shared meanings, by aligning individuals' understanding of environmental sustainability (Veronica et al., 2020).

In addition, recent studies show that engagement is consolidated when initiatives, such as educational campaigns, environmental goals, and operational guidelines, are accompanied by consistent and continuous internal communication (Khizar et al., 2023). Rosa et al., (2022) reinforces that these attitudes strengthen environmental engagement by expanding the collective involvement of employees. In this way, environmental engagement ceases to be episodic and begins to assume an organizational and procedural character, supported by recurrent practices (Gao & Yang, 2022; Chen et al., 2022). Which are associated with the sustainable use of natural resources, pollution prevention, mitigation of climate impacts and protection of biodiversity, according to the guidelines of ISO 26000 (ISO, 2010).

In less formalized organizational contexts, environmental engagement faces relevant structural limitations (Calisto et al., 2021; OECD, 2021). In particular, the scarcity of financial, human, and technical resources, coupled with low process standardization, constrains the organizational capacity to sustain ongoing environmental practices (Gao & Yang, 2022; SEBRAE, 2022). These limitations make it difficult to consolidate recurrent environmental actions in the organizational daily life (Veronica et al., 2020). Calisto et al. (2021) highlight that, under these conditions, engagement tends to depend heavily on specific initiatives and relational proximity between managers and teams. Consequently, the engagement process becomes more susceptible to discontinuity and fragmentation of environmental practices over time (Rosa et al., 2022; Khizar et al., 2023).

Therefore, leadership and internal communication play a central role in the institutionalization of environmental engagement in MSEs (Gao & Yang, 2022). In this sense, the clarity of the messages and the coherence between managerial discourse and the practices adopted directly influence the collective mobilization around environmental issues (Veronica et al., 2020). When this alignment is fragile, organizational involvement tends to be restricted to isolated actions, without operational continuity (Khizar et al., 2023). Thus, environmental engagement is a necessary organizational condition for cultural values to become standards for environmental behavior, constituting the empirical basis of environmental practices in organizations (Saez-Martínez et al., 2016; Chen et al., 2022).

2.4 ENVIRONMENTAL BEHAVIOR AS ORGANIZATIONAL EMPIRICAL EVIDENCE

Organizational environmental behavior corresponds to the concrete expression of cultural values as the process of engaging environmental practices in business routines (Chen et al., 2022). Unlike institutional discourses, behavior is manifested by recurrent actions in the productive daily life of companies (Jabbour & Santos, 2021). Khizar et al., (2023); Rosa et al., (2022); Chen et al., (2022) reinforce that these actions reflect on the incorporation of practices related to the rational use of resources, impact reduction, and environmental awareness into corporate sustainability (ISO, 2015).

These behaviors tend to emerge when engagement is sustained by recurrent internal processes, capable of guiding workers in operational processes and work routines (Saez-Martínez et al., 2016; Gao & Yang, 2022). Gao & Yang, (2022; Khizar et al., (2023) indicate that isolated or one-off initiatives do not reinforce structured environmental behavior. Thus, environmental behavior results from the systematic repetition of practices associated with environmental issues, central dimensions of the empirical investigation of this study (Rosa et al., 2022; ISO, 14004, 2016).

In the context of MSEs, environmental behavior is strongly conditioned by organizational and operational constraints (Calisto et al., 2021; OECD, 2021). In these organizations, behaviors related to the use of energy, water, and other resources vary according to the internal context, communication, and managerial priorities (Veronica et al., 2020; Gao & Yang, 2022). This variability reinforces the need to empirically observe how these practices manifest themselves in the organizational daily life of MSEs (IBGE, 2022; SEBRAE, 2022).

In this way, environmental behavior allows us to empirically examine how organizational culture and engagement processes translate into effective and recurring practices (Chen et al., 2023; Jabbour & Santos, 2021). The observation of these behaviors makes it possible to identify patterns, operational limitations, and levels of consistency between environmental discourse and action (Khizar et al., 2023; Hatmanu et al., 2019). For this, it is necessary to use instruments capable of capturing practices of environmental issues in a systematic, comparable and aligned way with the normative references of environmental sustainability (ISO, 2018; ABNT, 2021). This analytical chain underlies the methodological options adopted in this study and guides the empirical operationalization of environmental practices.

3 METHODOLOGY

3.1 STAGES OF THE RESEARCH

The research is characterized as empirical, quantitative and descriptive, with a cross-sectional design, an approach widely used in organizational studies that seek to examine business practices based on structured data collected at a single time (Creswell, 2014; Gil, 2019; Hair et al., 2009; Severo; Guimarães, 2017; Barbieri, 2022; Jabbour; Santos, 2021). This type of design is recommended when the objective is to identify patterns, trends, and variability of attitudes, without the intention of establishing causal relationships (Gil, 2019; Hair et al., 2009; Marôco, 2014).

The methodological design was structured in three complementary stages. The first stage consisted of the theoretical foundation on organizational culture, environmental engagement, and environmental behavior, based on empirical and conceptual studies consolidated in the international literature (Valdez-Juárez et al., 2019; Gao & Yang, 2022; Rosa et al., 2022; Chen et al., 2022; Khizar et al., 2023; Jabbour; Santos, 2021). The second stage involved the construction of the empirical instrument, guided by recognized standards and guidelines for environmental management and performance (ABNT, 2021; ISO, 2018; ISO, 2010; Barbieri, 2022).

The third stage comprised the collection and statistical treatment of data, following procedures consolidated in the methodological literature for quantitative, descriptive and inferential research (Creswell, 2014; Gil, 2019; Hair et al., 2009; Marôco, 2014; Damásio, 2012; Severo; Guimarães, 2017). This chain ensured the coherence between the research problem, the theoretical framework, the empirical instrument and the analytical techniques adopted.

3.2 DATA COLLECTION AND COLLECTION

The data collection instrument was developed based on the guidelines of ABNT PR 2030 and ISO 14031, which orbited the analysis of the environmental practices adopted by Brazilian MSEs, considering the articulation between organizational culture, environmental engagement, and environmental behavior as a process of incorporating environmental sustainability (ABNT, 2021; ISO, 2018; Barbieri, 2022; Jabbour; Santos, 2021; Chen et al., 2023; OECD, 2021). In a complementary way, the principles of ISO 26000 were considered, which deals with the main issues as the main SDGs (ISO, 2010; Hatmanu et al., 2019).

The questionnaire was structured in 15 questions. Questions Q1 to Q3 characterize the profile of respondents and companies, while questions Q4 to Q13 assess environmental practices associated with organizational culture, environmental engagement, and environmental behavior, using a five-point Likert scale, suitable for ordinal data (Creswell, 2014; Hair et al., 2009; Marôco, 2014; Damásio, 2012; Severo; Guimarães, 2017). The open questions Q14 and Q15 complement the analysis by capturing aspects related to transparency, communication, and institutional articulation (Veronica et al., 2020; Rosa et al., 2022; Hatmanu et al., 2019).

Data collection took place between October and December 2024, through the *Google Forms* platform, using non-probabilistic convenience sampling, a technique indicated for heterogeneous and hard-to-reach populations (Gil, 2019; Creswell, 2014; Hair et al., 2009; Marôco, 2014). The final sample was composed of 225 MSEs certified or in the process of certification by Sistema B Brasil. The final structure of the instrument, with the link between the questions, the theoretical axes and the authors on which it was based, is presented in Table 1.

Table 1

Data Collection Instrument

No.	Issue:	Theoretical axis	Reference authors
-----	--------	------------------	-------------------

Q1	What is your greatest academic training completed?	Organizational culture	Valdez-Juárez et al. (2019); Chen et al. (2022); Rosa et al. (2022)
Q2	What is your relationship, knowledge or experience on environmental issues?	Organizational culture	Gao & Yang (2022); Chen et al. (2022); Valdez-Juárez et al. (2019)
Q3	What is the company's field of activity?	Environmental behavior	Calisto et al. (2021); Veronica et al. (2020); OECD (2021)
Q4	Does the company conduct environmental training (e.g., recycling, safe disposal)?	Organizational culture	Calisto et al. (2021); Valdez-Juárez et al. (2019); Chen et al. (2023)
Q5	Does the company promote training of managers in sustainability?	Organizational culture	Gao & Yang (2022); Chen et al. (2023); Jabbour & Santos (2021)
Q6	Does the company use renewable or clean energy sources?	Environmental engagement	Nguyen & Tran (2020); Rosa et al. (2022); Khizar et al. (2023)
Q7	Does the company promote campaigns on the rational use of energy or natural resources?	Environmental engagement	Gao & Yang (2022); Veronica et al. (2020); Rosa et al. (2022)
Q8	Does the company provide educational materials on sustainability and climate change?	Organizational culture	Valdez-Juárez et al. (2019); Chen et al. (2022); Rosa et al. (2022)
Q9	Does the company integrate environmental practices into corporate policies?	Environmental behavior	Chen et al. (2023); Calisto et al. (2021); Jabbour & Santos (2021)
Q10	Does the company make employees aware of biodiversity preservation?	Environmental engagement	Rosa et al. (2022); Gao & Yang (2022); Saez-Martínez et al. (2016)
Q11	Does the company raise awareness about reducing the consumption of natural resources?	Environmental engagement	Nguyen & Tran (2020); Valdez-Juárez et al. (2019); Khizar et al. (2023)
Q12	Does the company raise awareness for the rational use of water?	Environmental engagement	Rosa et al. (2022); Calisto et al. (2021); Nguyen & Tran (2020)
Q13	Does the company adopt environmental policies integrated with the SDGs?	Environmental behavior	Chen et al. (2023); Veronica et al. (2020); OECD (2021)

Q14	Does the company publicly report on its environmental actions?	Environmental behavior	Hatmanu et al. (2019); Veronica et al. (2020); GRI (2021)
Q15	Does the company develop environmental actions in partnership with institutions?	Environmental behavior	Gao & Yang (2022); Rosa et al. (2022); Saez-Martínez et al. (2016)

3.3 DATA ANALYSIS

The collected data were organized and analyzed with the aid of the *R software*, using *RStudio* 2025.09.2. The analysis followed methodological recommendations for the treatment of ordinal data and for the application of statistics in the social sciences (Hair et al., 2009; Marôco, 2014; Damásio, 2012; Field, 2013; Barbetta, 2017; Gil, 2019). Thus, all analyses respected the nature of the data and the empirical design of the research.

The initial analysis focused on descriptive statistics, with the use of absolute and relative frequencies to characterize the profile variables of the respondents and the companies. As well as median and Interquartile Range (IQR) for environmental issues on the *Likert scale*, adequate measures for ordinal data (Hair et al., 2009; Marôco, 2014; Damásio, 2012; Barbetta, 2017; Severo; Guimarães, 2017). This information allowed the sample to be contextualized in terms of individual and organizational characteristics, without inferential purpose, according to the methodological literature on descriptive statistics in social research (Barbetta, 2017; Gil, 2019).

The internal consistency of the instrument was assessed using Cronbach's alpha coefficient, applied to the set of questions Q4 to Q13, according to recommendations for Likert-type scales (Hair et al., 2009; Gliem; Gliem, 2003; Marôco, 2014; Nunnally; Bernstein, 1994; Damásio, 2012). The value obtained indicated adequate internal consistency, validating the joint use of the items.

In addition, inferential analyses were performed using *Spearman's* correlation between questions Q4 and Q13, a technique indicated for ordinal variables and adequate to identify monotonic associations between environmental practices (Hair et al., 2009; Marôco, 2014; Field, 2013; Damásio, 2012; Gil, 2019). The correlations were interpreted as to the direction and intensity of the associations, without presupposition of causality. Thus, the procedure made it possible to identify patterns of association between the environmental practices analyzed, in line with the descriptive design of the study (Hair et al., 2009; Marôco, 2014).

3.4 RELIABILITY AND VALIDITY

The reliability of the instrument was evaluated using Cronbach's alpha coefficient, widely used to verify the internal consistency of Likert-type scales (Hair et al., 2009; Gliem; Gliem, 2003; Marôco, 2014; Nunnally; Bernstein, 1994; Damásio, 2012). The procedure was applied to the set of questions Q4 to Q13, according to methodological recommendations for psychometric instruments. The coefficient obtained presented a value equal to or greater than the threshold of 0.70, considered a reference for acceptable reliability in the literature (Nunnally; Bernstein, 1994; Hair et al., 2009; Marôco, 2014). In this way, the questions could be used together in the analysis of environmental practices (Gliem; Gliem, 2003; Damásio, 2012).

Content validity resulted from the alignment between the theoretical constructs adopted, the international standards that guided the elaboration of the questions, and empirical studies on environmental practices in MSEs (Barbieri, 2022; Jabbour; Santos, 2021; ABNT, 2021; ISO, 2018; Chen et al., 2023; OECD, 2021). This alignment ensured that the items adequately represented the concepts investigated in the study. Thus, the instrument maintained conceptual coherence with the theoretical and normative framework used.

Construct validity was examined based on the coherence of the association patterns observed between the items, considering their adherence to the literature and to the normative references of environmental management (Hair et al., 2009; Damásio, 2012; Marôco, 2014; Chen et al., 2022; Khizar et al., 2023). The observed associations were interpreted in a manner consistent with the defined theoretical constructs. Thus, the procedures adopted ensured coherence between theory, empirical instrument and statistical analysis, in accordance with the descriptive design of the study.

4 RESULTS AND DISCUSSIONS

4.1 DESCRIPTIVE RESULTS

The descriptive analysis allowed to characterize the distribution of environmental practices adopted by MSEs from questions Q4 to Q13, organized in the axes organizational culture, environmental engagement and environmental behavior. Frequencies, median, and interquartile range (IQR) were used, which are appropriate measures for ordinal data from Likert scales (Hair et al., 2009; Marôco, 2014; Barbetta, 2017). This procedure is recommended when the objective is to describe patterns without assuming normality of the data (Field, 2013). The approach is consistent with empirical studies on environmental practices in small businesses (Barbieri, 2022; Chen et al., 2022; Rosa et al., 2022).

The data in Table 2 show the respondents' academic background (Q1). The results indicate high education of the respondents, with 53.8% having a specialization and 23.1% having a master's degree. The literature points out that higher educational levels are fundamental for organizational learning and greater assimilation of environmental practices (Valdez-Juárez et al., 2019; Chen et al., 2022). This profile reduces comprehension biases in self-report-based research (Creswell, 2014; Gil, 2019). ISO 14001 recognizes training as a structuring element on organizational environmental sustainability (ISO 14001).

Table 2

Respondents' education (Q1)

Education	Percentage (%)
Specialization (lato sensu / mba)	53,8
Master's Degree	23,1
Graduation	15,4
PhD	1,9
Other	5,8

Source: Prepared by the author (2025).

Regarding environmental knowledge (Q2), most respondents reported medium or high environmental knowledge (Table 3). The results indicate that 48.0% of the respondents declared a high level and 38.5% a medium level, while 13.5% indicated low knowledge. Empirical evidence shows that higher levels of knowledge precede the formalization of practices and influence the consolidation of environmental culture (Valdez-Juárez et al., 2019; Rosa et al., 2022). Gao and Yang (2022) highlight that knowledge applied to organizational daily life strengthens environmental routines. This finding reinforces that these actions reflect on the incorporation of practices related to the rational use of resources, the reduction of impacts and environmental awareness into corporate sustainability (ISO, 2015).

Table 3

Knowledge and experience in environmental issues (Q2)

Declared level	Percentage (%)
High	48,0
Medium	38,5
Low	13,5

Source: Prepared by the author (2025).

On the other hand, the presence of 13.5% of respondents with low knowledge shows relevant variability among the MSEs analyzed. This variability is recurrent in organizational

studies involving heterogeneous populations (Hair et al., 2009; Marôco, 2014). Rosa et al. (2022) associate this heterogeneity with structural and contextual differences of workers that affect business behavior. Thus, the results indicate that the level of environmental knowledge is not homogeneous among MSEs, constituting a relevant conditioning factor for the incorporation of environmental practices.

As for the sector of activity (Q3), the predominance of the services sector (75%), followed by trade (15.6%) and industry (9.4%) was observed. This pattern is consistent with national institutional data, which indicate a greater concentration of MSEs in the services and trade sectors due to the lower initial capital requirement and greater operational flexibility (IBGE, 2022; SEBRAE, 2022). Thus, the lower participation of the industrial sector is associated with higher regulatory requirements and operating costs, which tend to hinder the institutionalization of environmental sustainability in MSEs in this segment (Calisto et al., 2021; Rosa et al., 2022).

The environmental practices Q4 to Q13 presented medians between 2.0 and 4.0, as shown in Table 4. Operational and educational practices, such as environmental training (Q4; median = 4.0; IQR = 1.0) and rational use campaigns (Q7; median = 4.0; IQR = 2.0), showed greater centrality. Educational actions tend to be the first to be incorporated (Rosa et al., 2022; Gao & Yang, 2022). ISO 14001 highlights training as an initial stage of environmental management. These results highlight training as an initial stage, which reflects engagement in environmental practices.

On the other hand, practices of a strategic nature, such as integration with corporate policies (Q9) and alignment with the SDGs (Q13), showed lower medians and greater dispersion, (Q9; median = 3.0; IQR = 3.0) and SDG-aligned policies (Q13; median = 2.0; IQR = 3.0). The literature points out that strategic institutionalization occurs after the consolidation of operational routines (Calisto et al., 2021; Jabbour & Santos, 2021). ISO 14031 highlights the progressiveness in the evolution of environmental sustainability. These values show low uniformity and lack of strategic homogeneity among the MSEs.

Table 4

Descriptive statistics of environmental practices (Q4–Q13)

Issue:	Environmental practice	Median	IQR
Q4	Environmental training	4,0	1,0
Q5	Training of managers	3,5	2,0
Q6	Use of renewable energy	3,0	2,5
Q7	Rational use campaigns	4,0	2,0
Q8	Educational materials	4,0	2,0

Q9	Integration with corporate policies	3,0	3,0
Q10	Biodiversity awareness	3,0	2,0
Q11	Reduction of natural resource consumption	3,0	2,5
Q12	Rational use of water	3,0	2,0
Q13	Environmental policies integrated with the SDGs	2,0	3,0

Source: Prepared by the author (2025).

Figure 1 presents the *boxplots* of questions Q4 to Q13, allowing the visualization simultaneously of the central position (median) and the dispersion of the answers (IQR), a recommended procedure for the analysis of ordinal data on *Likert* scales (Marôco, 2014). It is observed that Q13 has lower medians and high IQR, indicating high variability and heterogeneity in practices of a more strategic and institutional nature.

In addition, questions Q9, Q10 and Q11 exhibit intermediate medians (≈ 3.0) and comparable dispersion, suggesting moderate adoption of these practices, but with relevant differences between MSEs. This visual pattern corroborates the numerical results presented in Table 3 and reinforces the adequacy of the IQR as a central descriptive measure (Marôco, 2014).

In contrast, questions Q4, Q7 and Q8 have higher medians (≈ 4.0) and less dispersion, evidencing greater recurrence and uniformity of educational, awareness and training practices in the organizational routine of MSEs. Institutional evidence indicates that strategic, governance, and alignment practices with SDG Q13 require greater organizational capacity and formalization of processes, which represents a recurring challenge for small businesses (OECD, 2021; SEBRAE, 2022).

Figure 1

Boxplots of environmental practices (Q4–Q13)

Source: Prepared by the author (2025).

The practices related to the rational use of energy, water and natural resources, Q6, Q11 and Q12, presented intermediate medians around 3.0, and IQR varying approximately between 3.0 and 2.5, as evidenced in Figure 1. This pattern indicates moderate adoption, but with variability among companies, characteristic of practices that depend on continuous organizational engagement and routines that are still being consolidated (Saez-Martínez et al., 2016; Gao & Yang, 2022). The literature associates this variability with limited resources and less formalization of processes in MSEs (Calisto et al., 2021). ISO 14004 recognizes these practices as operational and strongly dependent on internal engagement, which explains the observed dispersion.

The open questions Q14 and Q15 show the predominance of informal communication and occasional institutional partnerships, a recurrent pattern in MSEs. Institutional evidence shows that this business size uses simplified records and social networks as the main means of environmental communication, due to structural constraints and organizational capacity (UN, 2018; GRI, 2021; OECD, 2021). These findings reinforce the heterogeneity observed in the descriptive results.

In summary, the descriptive results indicate greater consolidation of practices associated with organizational culture and environmental engagement, evidenced by higher medians and less dispersion in Q4, Q7 and Q8 (median ≈ 4.0). In contrast, strategic and institutional practices, such as integration with corporate policies (Q9) and alignment with the SDGs (Q13), have lower medians (≈ 3.0 and ≈ 2.0) and high IQR, indicating heterogeneity among MSEs (Barbieri, 2022; Chen et al., 2022; Rosa et al., 2022). The guidelines of ISO 14001 and ISO 14031 corroborate this progressive process of consolidation, in which operational practices tend to precede strategic institutionalization. This chain is the basis for the following subsection, dedicated to the inferential analysis of the associations between the items of the instrument.

4.2 INFERENTIAL RESULTS

The inferential analysis examined the associations between the environmental practices of questions Q4 to Q13, aligned with the axes of organizational culture, environmental engagement, and environmental behavior of the instrument (Gil, 2019; Creswell, 2014). To this end, Spearman's correlation was adopted, indicated for ordinal data on a Likert scale and appropriate for investigating monotonic associations without assuming normality or linearity (Hair et al., 2009; Marôco, 2014).

This methodological decision maintained coherence with the descriptive and cross-sectional design and with the measurement logic recommended for environmental practices

in MSEs (Damásio, 2012; Field, 2013). The interpretation of the associations was conducted in line with the normative references of environmental sustainability (ISO, 2018; ABNT, 2021).

The internal consistency of questions Q4 to Q13 was assessed using *Cronbach's alpha*, obtaining $\alpha = 0.94$, a value classified as excellent in the psychometric literature and quantitative methods (Nunnally; Bernstein, 1994; Hair et al., 2009). This result indicated high coherence between the items, supporting the joint reading of the practices as an empirical domain related to the internalization and engagement of sustainability in the organizational daily life (Marôco, 2014; Damásio, 2012).

In normative terms, consistency was compatible with the need for systematic instruments to monitor environmental practices, as emphasized by recognized environmental management and assessment guidelines (ISO, 2018; ABNT, 2021). Thus, the reliability observed reinforced the robustness of the instrument by sustaining the inferential discussion in the context of MSEs (Gil, 2019; Barbieri, 2022). Table 4 shows Spearman's matrix of correlations between the questions of the instrument.

In the organizational culture axis. Positive and low-magnitude associations were observed between environmental training (Q4) and managers' training (Q5; $\rho = 0.11$), as well as between (Q4) and educational materials (Q8; $\rho = 0.03$) and between Q5 and Q8 ($\rho = 0.02$). These coefficients suggest the coexistence of training practices, but without strong interdependence, consistent with the view of learning and culture as incremental and heterogeneous processes in MSEs (Valdez-Juárez et al., 2019; Gao & Yang, 2022). This evidence dialogues with the role of awareness as a structuring requirement for environmental practices, according to management guidelines and organizational responsibility (ISO, 2015; ISO, 2010).

Table 5

Correlation matrix between the questions in the questionnaire

Issue:	Q4	Q5	Q6	Q7	Q8	Q9	Q10	Q11	Q12	Q13
Q4	1,00	0,11	—	—	0,03	—	—	—	—	—
Q5	0,11	1,00	—	—	0,02	—	—	—	—	—
Q6	—	—	1,00	0,10	—	—	0,08	-0,13	0,06	—
Q7	—	—	0,10	1,00	—	—	0,05	0,05	-0,01	—
Q8	0,03	0,02	—	—	1,00	—	—	—	—	—

Q12	—	—	0,06	-0,01	—	—	0,12	0,15	1,00	—
Q13	—	—	—	—	—	0,04	—	—	—	1,00

Source: Prepared by the author (2025).

In the environmental engagement axis, the associations between the use of renewable energy (Q6) and campaigns for the rational use of resources (Q7; $p = 0.10$), awareness about biodiversity (Q10; $p = 0.08$) and rational use of water (Q12; $p = 0.06$) were positive and weak, as shown in Table 4. Negative associations of low magnitude were also observed, such as between Q6 and reduced resource consumption (Q11; $p = -0.13$). The empirical literature points out that operational engagement practices tend to be adopted in a punctual and fragmented way in MSEs, due to financial and operational constraints (Nguyen & Tran, 2020; Rosa et al., 2022). This pattern reinforces the adequacy of *Spearman's* correlation to capture nonlinear associations between environmental practices.

In the axis of environmental behavior as organizational empirical evidence, there was practically no association between the integration of practices with corporate policies (Q9) and environmental policies aligned with the SDGs (Q13; $p = 0.04$), indicating low co-occurrence between internal formalization and alignment with global agendas in the analyzed sample (Calisto et al., 2021; Chen et al., 2023).

This pattern is compatible with the reading that environmental behavior is manifested by recurrent practices, but does not always automatically translate into strategic integration or SDG-oriented policies (Jabbour & Santos, 2021; Khizar et al., 2023). Institutional evidence reinforces that organizational constraints and low formalization can limit the institutionalization of these practices in MSEs (OECD, 2021; SEBRAE, 2022). From a normative point of view, the need for progressivity in the consolidation of systems, policies and monitoring is consistent with guidelines for management and evaluation of environmental performance (ISO, 2015; ISO, 2018; ABNT, 2021).

In summary, *Spearman's* correlations, which are predominantly weak, indicate that the incorporation of environmental sustainability in MSEs does not occur in a linear or cumulative way (Hair et al., 2009; Marôco, 2014). This result points out that environmental advances develop as an incremental organizational process, in which operational practices can coexist with low levels of strategic formalization (Calisto et al., 2021; Jabbour; Santos, 2021; Khizar et al., 2023).

This pattern shows that daily engagement does not automatically convert into structured environmental sustainability, due to recurrent organizational and managerial limitations in this business size (OECD, 2021; Rosa et al., 2022; SEBRAE, 2022). Thus, the inferential analysis reinforces the interpretation that the incorporation of environmental sustainability in MSEs occurs gradually, conditioned by learning processes, organizational routines and available structural capacities.

5 CONCLUSION

The objective of this study was to analyze the environmental practices adopted by MSEs, considering the articulation between organizational culture, environmental engagement and environmental behavior in the process of incorporating environmental sustainability. The results confirmed that this objective was achieved. The analyses showed distinct patterns of consolidation between operational, educational and strategic practices.

The findings indicated that environmental practices are organized in an incremental and non-linear way. There was a greater consolidation of actions associated with organizational culture and daily engagement. In contrast, strategic institutionalization, which remained heterogeneous. Thus, environmental sustainability in MSEs manifested itself as a progressive process, conditioned by routines, learning and organizational capacities.

The main contribution of the study lies in offering integrated empirical evidence on how culture, engagement and environmental behavior are articulated in the context of MSEs, based on an instrument aligned with recognized normative references. From a theoretical point of view, the study contributes by reinforcing environmental sustainability as a gradual organizational process, in which culture, engagement and behavior are articulated in a non-linear way in the context of MSEs. From a practical perspective, the results provided subsidies for managers and entrepreneurs by showing that the strengthening of educational and operational practices precedes the consolidation of environmental sustainability.

Among the limitations of the study, the cross-sectional design stands out, which did not allow us to observe the temporal evolution of environmental practices. In addition, the use of self-reported data, which could reflect individual perceptions of the respondents, and the sample restricted to MSEs, which limits the generalization of the results. These limitations, however, are compatible with the descriptive and exploratory objective of the research.

As an agenda for future research, it is recommended to carry out longitudinal studies that allow monitoring the maturation of environmental practices over time. It is also suggested to expand the sample to other segments of MSEs and to incorporate environmental performance indicators. These approaches can deepen the understanding of the mechanisms that favor the transition of operational practices to more structured levels of institutionalization of environmental sustainability.

ABSTRACT

Ethnomathematics has emerged as a relevant approach for contextualizing the teaching of Mathematics in specific sociocultural realities, such as the Amazon. This article aims to analyze the contributions of Ethnomathematics to Rural Education and to riverside communities, with an emphasis on pedagogical practices and teacher education. This is a qualitative study of a bibliographic nature, based on the analysis of scientific articles, dissertations, and theses that discuss the articulation between traditional knowledge and Mathematics teaching and learning processes. The results indicate that, although academic production on Ethnomathematics in the Amazon is still limited, there is consistent evidence of mathematical knowledge embedded in cultural practices such as agriculture, artisanal fishing, Brazil nut harvesting, and the production of utensils. It was also observed that teacher education constitutes one of the main challenges, due to the lack of specific preparation for working in Rural Education. It is concluded that Ethnomathematics represents a promising

RESUMO

A Etnomatemática tem se destacado como uma abordagem relevante para a contextualização do ensino de Matemática em realidades socioculturais específicas, como a Amazônia. Este artigo tem como objetivo analisar as contribuições da Etnomatemática para a Educação do Campo e para comunidades ribeirinhas, com ênfase nas práticas pedagógicas e na formação docente. Trata-se de uma pesquisa de abordagem qualitativa, de natureza bibliográfica, fundamentada na análise de artigos científicos, dissertações e teses que discutem a articulação entre saberes tradicionais e processos de ensino-aprendizagem em Matemática. Os resultados indicam que, embora a produção acadêmica sobre Etnomatemática na Amazônia ainda seja limitada, há evidências consistentes de conhecimentos matemáticos presentes em práticas culturais como a agricultura, a pesca artesanal, a coleta da castanha e a confecção de utensílios. Observou-se também que a formação docente constitui um dos principais desafios, em razão da insuficiência de preparo específico para a atuação na Educação do Campo. Conclui-se que a Etnomatemática se configura como uma perspectiva promissora para a construção de uma educação matemática crítica, inclusiva e contextualizada, ao valorizar os saberes locais e fortalecer a identidade cultural dos estudantes.

RESUMEN

La Etnomatemática se ha destacado como un enfoque relevante para la contextualización de la enseñanza de las Matemáticas en realidades socioculturales específicas, como la Amazonía. Este artículo tiene como objetivo analizar las contribuciones de la Etnomatemática a la Educación Rural y a las comunidades ribereñas, con énfasis en las prácticas pedagógicas y en la formación docente. Se trata de una investigación de enfoque cualitativo y de carácter bibliográfico, basada en el análisis de artículos científicos, disertaciones y tesis que discuten la articulación entre los saberes tradicionales y los procesos de enseñanza y aprendizaje de las Matemáticas. Los resultados indican que, aunque la producción académica sobre Etnomatemática en la Amazonía aún es limitada, existen evidencias consistentes de conocimientos matemáticos presentes en prácticas culturales como la agricultura, la pesca artesanal, la recolección de la castaña y la elaboración de utensilios. Asimismo, se observó que la formación docente constituye uno de los principales desafíos, debido a la insuficiente preparación específica para actuar en la Educación Rural. Se concluye que la Etnomatemática se configura como una perspectiva prometedora para la construcción de una educación matemática crítica, inclusiva y contextualizada, al valorar los saberes locales y fortalecer la identidad cultural de los estudiantes.

1 INTRODUCTION

Ethnomathematics has been consolidated as a relevant field of investigation in the field of Mathematics Education by understanding mathematical knowledge as a historical construction, produced in the social, cultural and symbolic practices of different human groups. This perspective breaks with universalist and excessively abstract views of traditional teaching, by recognizing that knowledge is elaborated in specific contexts, linked to the ways of life, work, and social relations of peoples (D'Ambrosio, 2019). In the Amazonian context, marked by wide cultural, territorial and social diversity, this approach takes on special relevance as it enables the valorization of local knowledge and its articulation with school educational processes.

The Amazonian reality is made up of riverside, rural and peasant communities whose ways of life are deeply linked to the relationship with the land, the forest and the rivers. In these communities, practices such as family farming, artisanal fishing, and extractivism organize daily life and mobilize implicit mathematical knowledge related to counting, measuring, estimating, and organizing collective work (Serrão, 2018). However, such historically produced knowledge remains, to a large extent, invisible in the formal teaching of Mathematics.

In this sense, the school, as a formative space, needs to dialogue with the sociocultural reality of students, valuing the knowledge built in daily life and enabling its articulation with school content. Lopes, Ghedin and Mascarenhas (2019) highlight that recognizing sociocultural practices as a pedagogical basis is a fundamental step towards the construction of meaningful learning, especially in contexts such as the Amazon, where community knowledge plays a central role in the formation of subjects.

From this perspective, mathematical knowledge is produced and mobilized in different social contexts and cultural practices, which evidences the existence of multiple mathematics linked to the cultures, contexts and social experiences of human groups (Ascher, 2002). This understanding displaces mathematics from an abstract and universalizing conception, allowing it to be understood as a symbolic construction related to the ways of life and sociocultural relations of the subjects, still little incorporated into pedagogical practices in the Amazonian context.

As Rodrigues, Ferreira and Matos (2024) point out, in many schools, the teaching of Mathematics remains decontextualized, prioritizing abstraction and memorization, which hinders the dialogue between school content and the reality experienced by students. In addition, it is observed that academic production on Ethnomathematics in the Amazon is still incipient, especially with regard to the articulation with Rural Education (Silva; Leite, 2021).

Another relevant aspect refers to teacher training. Research shows that many teachers did not receive, during their initial training, specific preparation to work in riverside and rural contexts, which limits the incorporation of traditional knowledge into pedagogical practices (Almeida; Antunes, 2020; Lopes; Ghedin; Mascarenhas, 2019). This formative gap contributes to the reproduction of urban and homogeneous pedagogical models, little sensitive to the cultural and territorial specificities of the Amazon.

Given this scenario, there is a need to deepen the understanding of how Ethnomathematics has been discussed and mobilized in academic productions focused on the Amazonian context. Thus, the question that guides this study is: how has Ethnomathematics contributed to pedagogical practices and teacher training in the Amazon, especially in the context of Rural Education and riverside communities?

Based on this problematization, this article aims to understand, through a bibliographic review, the contributions of Ethnomathematics to pedagogical practices and teacher training in the Amazon, considering the sociocultural specificities of riverside and rural populations and the challenges that are imposed on teaching in this context.

2 ETHNOMATHEMATICS IN THE AMAZONIAN CONTEXT: PERSPECTIVES AND CONTRIBUTIONS

Ethnomathematics, as proposed by D'Ambrosio (2019), understands Mathematics as knowledge produced in the cultural contexts and social practices of different peoples. In the Amazonian context, this perspective contributes to valuing local knowledge and to bringing the teaching of Mathematics closer to the daily experiences of riverside and peasant communities, strengthening contextualized and culturally significant pedagogical practices.

2.1 ACADEMIC PRODUCTIONS ON ETHNOMATHEMATICS IN THE AMAZONIAN CONTEXT

The choice of the title of this subtopic is justified by the need to show how Ethnomathematics, beyond the original conception proposed by D'Ambrosio, has been discussed in the Amazonian scenario through academic productions. Studies carried out in the region seek to articulate the teaching of Mathematics with the cultural practices of riverside, rural and indigenous communities, recognizing the relevance of this knowledge for the educational process.

This understanding is directly related to the Ethnomathematics Program, conceived by Ubiratan D'Ambrosio, whose central objective is to investigate the various forms of production of mathematical knowledge in specific cultural contexts. As the author states,

the great motivator of the research program that I call Ethnomathematics is to seek to understand mathematical knowing/doing throughout the history of humanity, contextualized in different interest groups, communities, peoples, and nations (D'Ambrosio, 2019, p. 17).

Such a definition shows that Ethnomathematics goes beyond the limits of school mathematics, recognizing the knowledge produced in everyday practices as a legitimate part of mathematical knowledge. In this sense, Ethnomathematics is configured as a field of investigation that makes it possible to understand Mathematics as a culturally situated knowledge, built in the social relations and ways of life of the different peoples of the Amazon.

When considering the Amazonian reality, researchers have highlighted that academic production on Ethnomathematics needs to take into account the territorial and historical specificities of the region. Studies such as those by Serrão (2018) demonstrate that the organization of the Amazon territory, marked by the centrality of rivers, floodplains, and terra firme, directly influences the ways of life, productive practices, and forms of social organization of communities. Municipalities on the middle Amazon River, such as Urucará, had their socioeconomic base historically linked to subsistence agriculture, extractivism and fishing, configuring a set of knowledge that crosses generations and structures implicit mathematical practices.

In this context, the processes of peasant territorialization have been shaped by the exchange of knowledge, collective work, and adaptation to the environmental conditions of the Amazon region (Serrão, 2018). The construction of the territory, understood as the projection of work, energy and information in space, reveals that knowledge emerges from social practice and from the relationships established between subjects and the environment. This perspective reinforces the importance of research that investigates how such knowledge can be recognized and integrated into the teaching of Mathematics through Ethnomathematics.

Despite this potential, Lopes, Ghedin and Mascarenhas warn that efforts to identify and value ethnomathematical practices as a pedagogical basis are still recent. According to the authors,

"efforts to identify Ethnomathematical practices and recognize them as a basis of great value in education are relatively recent, and the full potential of a pedagogical model in mathematics based on the transition from practices prior to schooling or to practices of an academic nature has not yet been analyzed" (Lopes; Ghedin; Mascarenhas, 2019, p. 455).

This finding highlights the existence of gaps in academic production, especially with regard to the consolidation of contextualized pedagogical models. Although Ethnomathematics was conceived several decades ago, the recognition of its practices as a pedagogical foundation is still a recent movement in the educational scenario. It is, therefore, a gap to be overcome: to build a pedagogical model capable of articulating the previous knowledge brought by students from their communities with the formal knowledge of school mathematics.

Other studies reinforce that, even in the face of the Amazonian cultural richness, the teaching of Mathematics is still presented in a decontextualized way in many schools, prioritizing abstraction and memorization (Rodrigues; Ferreira; Matos, 2024). Such a scenario highlights the distance between school content and the sociocultural reality of students, which makes it difficult to build meaningful learning. On the other hand, pedagogical experiences reported in the literature, such as the use of didactic games contextualized in the fauna and conservation units of the Amazon, demonstrate concrete possibilities of approximation between local knowledge and formal education.

In addition, academic production has also emphasized the importance of collective work and teacher training for the consolidation of Ethnomathematics in the Amazonian context. Gomes and Melo (2020) highlight that aligning the interests of teachers in the region with the production and resignification of pedagogical knowledge has been fundamental for the strengthening of contextualized practices. Thus, the analyzed research indicates that the advancement of Ethnomathematics in the Amazon depends both on theoretical deepening and on teacher engagement and the expansion of studies that give visibility to the educational experiences developed in the region.

At this juncture, Silva and Leite (2021, p. 132) add that "although ethnomathematics is defined and theoretically referenced in the works presented at CBEm¹⁰, this did not occur with rural education", pointing out a gap that still exists in research. This data reinforces that academic production needs to expand the dialogue between the references of Ethnomathematics and the foundations of Rural Education, in order to build curricula that are more connected to the reality of riverside and rural populations.

2.2 PEDAGOGICAL PRACTICES AND TRADITIONAL KNOWLEDGE IN THE AMAZON

In Amazonian schools, the daily experience of students reveals practices permeated by mathematical knowledge that cannot be ignored by teaching. Lopes, Ghedin and

¹⁰ CBEm refers to the Brazilian Congress of Ethnomathematics, the main national scientific event focused on the discussion of this area, in which researchers and teachers socialize practices and reflections that articulate mathematics to different cultural contexts.

Mascarenhas (2019) highlight that these learnings emerge from social interactions and are manifested in their own ways of measuring, constructing, comparing and organizing work, constituting logical instruments present in community action.

In the Amazonian context, such practices are directly linked to peasant, riverside and extractivist ways of life, historically built in territories marked by floodplains, terra firme and forest (Serrão, 2018). By recognizing this knowledge, the school expands its pedagogical possibilities and brings formal knowledge closer to the realities experienced by students.

Traditional production practices, such as the cultivation of cassava, cocoa, guarana, artisanal fishing, and extractivism, constitute cultural matrices that structure the daily lives of Amazonian communities (Serrão, 2018). These actions not only guarantee subsistence, but organize time, space and collective work, mobilizing implicit mathematical knowledge related to counting, estimation, proportion and measurement.

This means that when incorporated into the school context, such practices allow the teaching of Mathematics to dialogue with the concrete experience of students, valuing the historicity and identity of the subjects who build their lives from the relationship with the land, water and forest.

In this sense, Mattos, Mattos, and Ferreira Neto (2022) point out that pedagogical practices linked to extractivism, such as the collection of Amazon nuts, can subsidize the teaching of mathematical content such as ratio and proportion. The relationship between collection time, quantity obtained and organization of collective work enables the teacher to mobilize local knowledge as a didactic resource, making Mathematics closer to the daily life of students. This integration shows that Amazonian cultural contexts not only contain mathematics, but also offer concrete conditions for the development of meaningful and contextualized learning.

The valorization of community practices is also fundamental for an education committed to the social reality of rural populations. Barreto and Vaz (2023) argue that pedagogical practices articulated with family farming, artisanal fishing, and the making of utensils strengthen the cultural identity of students and break with the logic of a school detached from the territory.

In the case of the Amazon, this approach becomes even more relevant in the face of the multiplicity of territorialities experienced by the subjects, who act simultaneously as farmers, extractivists, and fishermen, articulating different knowledge according to the relationship established with the land, the forest, and the river (Serrão, 2018).

Another relevant aspect refers to the possibility of using forest elements as pedagogical resources in the teaching of Mathematics. Filho and Nicot (2021) highlight that

materials from the Amazonian environment itself can be used to build authentic didactic resources, capable of meeting the lack of instructional materials in schools. Elements such as the tucumã seed and the buriti bush can assume symbolic representations of geometric solids, such as spheres, prisms and polyhedra, making it possible to work with spatial geometry concepts in a concrete and contextualized way.

In addition, the use of these materials allows the exploration of different mathematical contents, such as fractions, measurements and spatial relationships, through the construction of rulers, puzzles and other pedagogical artifacts (Filho; Nicot, 2021). By employing elements of the forest as objects of manipulation, analogy and construction, the teacher values local knowledge and recognizes the Amazon region as a legitimate space for the production of knowledge. This perspective reinforces the idea that the forest is not only a source of natural resources, but also a promoter of learning, contributing to the consolidation of contextualized and culturally significant pedagogical practices.

2.3 TEACHER TRAINING AND CHALLENGES IN RURAL AND RIVERINE EDUCATION

Teacher training in the Amazon faces challenges that dialogue with historical national problems, but that take on their own contours due to the territorial, cultural, social and geographical specificities of the region. Lopes, Ghedin and Mascarenhas (2019) point out that there is still a significant distance between the initial training offered in teaching degree courses and the concrete demands of pedagogical practice in rural schools and riverside communities.

Such distancing is expressed, above all, in the fragile articulation between theory and practice, in the limited approach to digital technologies and, mainly, in the little appreciation of the socio-cultural knowledge of Amazonian communities as legitimate foundations of the educational process.

In this scenario, the teaching performance ends up being marked by pedagogical practices that reproduce urban and homogeneous teaching models, little sensitive to local realities. This logic compromises the construction of contextualized educational proposals, making it difficult for the school to dialogue with the ways of life, times, and knowledge of riverside and peasant populations (Serrão, 2018). In a complementary way, Lopes, Ghedin and Mascarenhas (2019) point out that this disconnection between teacher training and the sociocultural reality of students weakens pedagogical practice and limits the appreciation of local knowledge in the educational process.

Thus, teacher training in the Amazon needs to be understood as a process that goes beyond the mere transmission of disciplinary content, requiring a critical preparation that

considers the territory, culture and social practices as constitutive elements of teaching.

The understanding of what is meant by formal mathematical knowledge occupies a central place in this debate. Dall'Agnol and Soares (2016) define formal mathematics education as that acquired within school institutions, characterized by the systematization of contents and pedagogical mediation exercised by the teacher, through didactic materials and socially legitimized practices. Although this dimension of knowledge is fundamental, its absolute centrality tends to reinforce an abstract mathematics, decontextualized and distant from the reality experienced by students in the countryside and riverside communities.

In view of this, Ethnomathematics presents itself as a theoretical-methodological perspective capable of tensioning the limits of traditional school mathematics. For Dall'Agnol and Soares (2016), one of the main proposals of Ethnomathematics consists of valuing and rescuing the mathematical knowledge produced in cultures and social practices, as well as recognizing the knowledge that students bring with them from their community experiences. This approach allows the teaching of Mathematics to move away from its excessively abstract routine, approaching concrete and socially significant applications.

This valorization of local knowledge implies recognizing that there are different forms of production of mathematical knowledge, often made invisible by the school. Fiorentini (1994) calls these productions non-academic or non-systematized mathematics, characterized by oral, informal and spontaneous practices, developed by specific cultural groups. In the Amazonian context, such practices emerge from the daily lives of communities, manifesting themselves in agriculture, fishing, extractivism, the construction of utensils and the collective organization of work, revealing their own ways of classifying, ordering, measuring and modeling reality.

In order for this knowledge to be incorporated into teaching, the role of the teacher becomes central. Mattos, Mattos, and Ferreira Neto (2022) highlight that the teacher is the main mediator between traditional knowledge and school content, being responsible for transforming community experiences into formal learning situations. This mediation is not limited to the technical domain of the discipline, but involves relational, communicative and affective aspects, such as how to welcome students, listen to their experiences and build a respectful and dialogical pedagogical environment.

From this perspective, Barreto and Vaz (2023) argue that the Rural Education teacher should assume a critical-reflective posture, understanding himself as a link between the school and the community. This mediation requires a solid training, which allows the teacher to understand the fundamentals of Ethnomathematics and translate them into consistent pedagogical practices. By integrating academic mathematics with everyday knowledge, the

teacher contributes to the construction of an emancipatory education, capable of strengthening the cultural identity of students and expanding the social meaning of the school.

However, teacher training in the Amazon still faces structural limitations that make it difficult to consolidate this perspective. Fraiha-Martins and Gonçalves (2021) point out that there are multiple challenges that discourage and intimidate the continuing education of Science and Mathematics teachers in the interior of the region, highlighting the geographical difficulties, the precariousness of the infrastructure, and the restricted access to training programs. These conditions directly impact the quality of teaching, restricting the possibilities of pedagogical innovation and theoretical deepening.

In addition, the process of internalization of education in the Amazon requires that training policies consider the diversity of regional contexts. Fraiha-Martins and Gonçalves point out that the use of different teaching modalities can represent a viable alternative to meet the specificities of each micro or mesoregion, as long as it is based on local research. This approach reinforces the need for flexible, contextualized teacher training that is sensitive to the sociocultural particularities of the communities served.

Another recurring challenge refers to the concrete working conditions of teachers, which directly influence the implementation of contextualized pedagogical practices. Filho and Nicot (2021) report that many teachers claim not to have enough time to build instructional materials aimed at teaching Mathematics and Physics. This limitation highlights the work overload faced by teachers and the need for institutional policies that guarantee better conditions for pedagogical planning.

Despite these difficulties, the same authors point out that the teacher's creativity demonstrates the feasibility of building an Amazonian didactics, anchored in the elements of the forest and in local knowledge. This finding reinforces that, even in adverse contexts, it is possible to develop innovative pedagogical practices, as long as the teacher is supported by consistent training processes and educational policies committed to the regional reality.

Finally, the analyzed research converges in indicating that teacher training in Rural Education and in riverside communities needs to assume a critical, reflective and culturally situated character. Silva (2022), Almeida and Antunes (2020) and Silva and Leite (2021) point out that many teachers were not prepared, during initial training, to work in rural and riverside contexts, evidencing significant training gaps. Overcoming these gaps implies investing in initial and continuing education that articulates Ethnomathematics with the foundations of Rural Education, strengthening teaching in the Amazon and promoting a mathematics education committed to the knowledge, identities and ways of life of traditional populations.

3 METHODOLOGY

This article is characterized as a qualitative research, of a bibliographic nature, whose objective was to analyze the contributions of Ethnomathematics to pedagogical practices and teacher training in the Amazonian context, with emphasis on Rural Education and riverside communities. The qualitative approach was adopted because it allows an in-depth understanding of educational phenomena based on their meanings and sociocultural contexts, and is indicated for studies that seek to interpret the experiences and perspectives of the subjects (Sampieri; Collado; Lucio, 2013).

As for the technical procedures, it is a bibliographic research, developed from the analysis of scientific articles, dissertations and theses that address Ethnomathematics in the Amazon. According to Gil (2010), this type of investigation makes it possible to systematize knowledge already produced, identify trends and theoretical gaps, and deepen the understanding of the investigated field. The corpus consisted of productions selected based on criteria of thematic relevance and alignment with the objectives of the study.

The analysis of the material occurred through exploratory and interpretative reading, allowing the organization of the results into thematic axes that guided the discussion of the article. The methodology adopted made it possible to articulate theory and practice, contributing to the critical reflection on the challenges and possibilities of Ethnomathematics in the teaching of Mathematics and in teacher training in Amazonian contexts.

4 RESULTS AND DISCUSSIONS

The analysis of academic productions on Ethnomathematics in the Amazonian context shows that the field has been gradually consolidating, although marked by theoretical and empirical gaps, especially with regard to Rural Education and riverside communities.

The studies analyzed converge in recognizing Ethnomathematics as a powerful perspective to understand Mathematics as culturally situated knowledge, produced in the social practices and ways of life of Amazonian populations, in line with the Ethnomathematics Program proposed by D'Ambrosio (2019). However, the results indicate that this conception has not yet been systematically translated into consolidated pedagogical models in the school routine.

With regard to academic productions, it was observed that a large part of the studies emphasize the need to consider the territorial, historical and cultural specificities of the Amazon as structuring elements of educational practices. Research such as that of Serrão (2018) demonstrates that mathematical knowledge emerges from the relationships established between the subjects and the territory, marked by the floodplain, the terra firme,

the rivers, and the forest, configuring implicit practices of counting, measuring, estimating, and organizing work.

However, as Lopes, Ghedin and Mascarenhas (2019) point out, efforts to recognize these practices as a pedagogical basis are still recent, which reveals a distance between the theoretical potential of Ethnomathematics and its effective incorporation into school curricula.

The results also show that, despite the sociocultural richness of the Amazon, the teaching of Mathematics remains, in many contexts, centered on decontextualized practices, with a strong emphasis on abstraction and memorization, as pointed out by Rodrigues, Ferreira and Matos (2024). This data confirms the persistence of a homogeneous school model, little sensitive to local realities, which contributes to the distancing of students from mathematical knowledge.

On the other hand, pedagogical experiences reported in the literature, such as the use of contextualized didactic games and problem-situations anchored in the Amazonian daily life, demonstrate that it is possible to build strategies that bring school knowledge closer to the lives of students.

In the axis of pedagogical practices, the results indicate that traditional knowledge constitutes a significant repertoire for the teaching of Mathematics, especially when articulated with the productive activities of the communities, such as family farming, artisanal fishing and extractivism. Studies analyzed show that practices such as the collection of Amazon nuts allow working on formal mathematical concepts, such as ratio, proportion and data organization, based on real situations experienced by students (Mattos; Mattos; Ferreira Neto, 2022). This articulation reinforces the idea that learning becomes more meaningful when the school content dialogues with the concrete experience and cultural identity of the subjects.

Another relevant point refers to the use of forest elements as pedagogical resources. The experiences described by Filho and Nicot (2021) show that materials from the Amazon environment itself, such as tucumã seeds and buriti bushings, can be used in the construction of concepts of spatial geometry, measurements, and fractions. These practices demonstrate that the scarcity of teaching materials in schools can be addressed by valuing local knowledge and teacher creativity, while reaffirming the forest as a legitimate space for the production of knowledge and learning.

However, the analysis of the studies also reveals that the consolidation of these pedagogical practices depends, in a decisive way, on teacher training. The results indicate that many teachers did not receive, during their initial training, specific preparation to work in Rural Education and in riverside communities, which makes it difficult to incorporate

Ethnomathematics as a pedagogical foundation (Almeida; Antunes, 2020; Silva, 2022). This training gap reinforces the reproduction of urban teaching models, which are not very sensitive to Amazonian realities, as already pointed out by Lopes, Ghedin and Mascarenhas (2019).

The discussion on teacher training also shows that the understanding of formal mathematical knowledge as the only legitimate knowledge contributes to the invisibility of mathematics produced in cultural practices. As discussed by Dall'Agnol and Soares (2016) and Fiorentini (1994), non-academic mathematics, oral and informal, constitutes a legitimate form of knowledge production, especially in specific cultural contexts. Recognizing this plurality implies rethinking teacher training, so that he or she is able to act as a mediator between traditional knowledge and school content, transforming community experiences into formal learning situations.

The results also point out that the structural and geographical conditions of the Amazon represent additional challenges to the continuing education of teachers. Fraiha-Martins and Gonçalves (2021) highlight that the difficulty in accessing training programs, combined with the precariousness of the infrastructure and the overload of teaching work, limits the possibilities of pedagogical innovation. Even so, the studies analyzed indicate that, even in adverse contexts, there are experiences that demonstrate the feasibility of building an Amazonian didactics, as long as the teacher is supported by public policies and contextualized training processes.

In general, the results and the discussion show that Ethnomathematics represents a promising path for the construction of a critical, inclusive and contextualized mathematics education in the Amazon. However, its consolidation depends on the expansion of research in the area, the strengthening of initial and continuing teacher training and the construction of curricula that systematically integrate traditional knowledge with formal mathematical knowledge. Thus, Ethnomathematics is not only configured as a pedagogical approach, but as an ethical and political perspective of valuing the identities, territories and ways of life of Amazonian populations.

5 CONCLUSION

This study aimed to analyze the contributions of Ethnomathematics to pedagogical practices and teacher training in the Amazonian context, with emphasis on Rural Education and riverside communities. From the bibliographic review carried out, it was possible to show that Ethnomathematics is configured as a powerful theoretical-methodological perspective

for the valorization of traditional knowledge and for the construction of a more contextualized, critical and socially referenced Mathematics teaching.

The results showed that, although the academic production on Ethnomathematics in the Amazon has been expanding, there are still significant gaps, especially with regard to the articulation between this approach and the foundations of Rural Education. The analyzed research demonstrates that mathematical knowledge is intrinsically present in the cultural practices of Amazonian communities, manifesting itself in activities such as family farming, artisanal fishing, extractivism and the collective organization of work. However, such knowledge is still little recognized and systematized in the school environment.

With regard to pedagogical practices, the study showed that educational experiences that incorporate elements of the local culture and the Amazonian environment enable more significant learning, by bringing formal mathematical content closer to the reality experienced by students. The use of resources from the forest, as well as problem situations anchored in the daily life of the communities, proved to be a viable strategy to resignify the teaching of Mathematics and strengthen the cultural identity of the students.

However, the consolidation of these practices is directly related to teacher training. The analysis revealed that many teachers did not receive, during their initial training, specific preparation to work in rural and riverside contexts, which makes it difficult to incorporate Ethnomathematics as a pedagogical foundation. Added to this are the structural and geographical challenges of the region, which impact continuing education and limit the possibilities of pedagogical innovation.

In view of this scenario, it is concluded that the strengthening of Ethnomathematics in the Amazon requires investments in initial and continuing education policies that consider the territorial, cultural and social specificities of the region. In addition, the need to expand research on the subject is highlighted, in order to consolidate theoretical and methodological references that support curricula that are more connected to the reality of rural populations and riverside communities. Thus, Ethnomathematics reaffirms itself as a promising path to promote a mathematical education committed to the appreciation of local knowledge, social justice and the recognition of Amazonian cultural diversity.

ABSTRACT

The understanding of concepts approached from a physicochemical perspective, whether kinetic or thermodynamic, in the classroom through calculations without conceptual visualization can represent, for most students, a major abstract paradigm. Thus, the possibility of using a common process in various activities—from its application in homemade filters to wastewater treatment—is highlighted. Adsorption was explored in the present study as a semi-analytical demonstrative approach for obtaining values of kinetic parameters present in the Arrhenius equation, as well as for determining classical thermodynamic quantities. The process occurred through the adsorption of orange-flavored soft drink (considering the beverage as a dye) onto paper towels, studying adsorption in the UV–Vis region of the electromagnetic spectrum. Initially, the absorption spectrum profile was verified, and a maximum value of 481 nm was found. Based on this result, dilutions were used to construct a calibration curve, observing a linear correlation. The equilibrium time, yield, and adsorption capacity at each determined time were studied under constant agitation of 150 rpm and variable temperatures of 25 °C, 35 °C, and 45 °C. The mechanisms studied were pseudo-first-order, pseudo-second-order, and the Elovich model, enabling the determination of kinetic parameters. Experiments carried out with different initial concentrations, monitored until equilibrium, allowed for the evaluation of the Langmuir and Freundlich models, together with thermodynamic data.

maior parte dos estudantes um grande paradigma abstrato. Assim, a possibilidade de utilizar um processo comum em diversas atividades, desde seu uso em filtros caseiros como em tratamento de efluentes. A adsorção foi explorada no presente trabalho como demonstrativo semi analítico na obtenção de valores de parâmetros cinéticos presentes na equação de Arrhenius assim como a obtenção de grandezas termodinâmicas clássicas. O processo ocorreu por meio da adsorção de refrigerante sabor laranja (considerando a bebida como corante) em papel toalha, estudando a adsorção na região UV-Vis do espectro eletromagnético. Inicialmente foi verificado o perfil do espectro de absorção, sendo encontrado o valor máximo de 481 nm, com esse resultado pôde ser aplicado, a partir de diluições, a construção de uma curva de calibração observando uma correlação linear. O tempo de equilíbrio, rendimento e capacidade de adsorção em cada tempo determinado, foram estudados sob agitação constante de 150 rpm e temperaturas variáveis 25 °C, 35 °C, e 45 °C. Os mecanismos estudados foram: pseudo primeira ordem, pseudo segunda ordem e modelo Elovich, possibilitando encontrar parâmetros cinéticos. Experimentos realizados com concentrações iniciais diferentes, acompanhados até o equilíbrio, proporcionando avaliações dos modelos de Langmuir e Freundlich, juntamente com os dados termodinâmicos.

RESUMEN

La comprensión de conceptos abordados desde un punto de vista fisicoquímico, ya sea cinético o termodinámico, en el aula mediante cálculos sin visualización conceptual puede representar, para la mayoría de los estudiantes, un gran paradigma abstracto. De este modo, se destaca la posibilidad de utilizar un proceso común en diversas actividades, desde su uso en filtros caseros hasta el tratamiento de efluentes. La adsorción fue explorada en el presente trabajo como un enfoque demostrativo semianalítico para la obtención de valores de parámetros cinéticos presentes en la ecuación de Arrhenius, así como para la determinación de magnitudes termodinámicas clásicas. El proceso se llevó a cabo mediante la adsorción de refresco sabor naranja (considerando la bebida como un colorante) en papel toalla, estudiando la adsorción en la región UV-Vis del espectro electromagnético. Inicialmente se verificó el perfil del espectro de absorción, encontrándose un valor máximo de 481 nm. Con este resultado, fue posible aplicar, a partir de diluciones, la construcción de una curva de calibración, observándose una correlación lineal. El tiempo de equilibrio, el rendimiento y la capacidad de adsorción en cada tiempo determinado fueron estudiados bajo agitación constante de 150 rpm y temperaturas variables de 25 °C, 35 °C y 45 °C. Los mecanismos estudiados fueron: pseudo-primer orden, pseudo-segundo orden y el modelo de Elovich, lo que permitió determinar parámetros cinéticos. Experimentos realizados con diferentes concentraciones iniciales, seguidos hasta el equilibrio, posibilitaron la evaluación de los modelos de Langmuir y Freundlich, junto con los datos termodinámicos.

Palabras clave: Adsorción Cinética Química. Isotermas.

1 INTRODUCTION

Adsorption processes are of great importance in the removal of contaminants, so it has environmental and industrial interest. The process occurs with the presence of two phases: a fluid (gaseous or liquid) in which the contaminant is present, the second a solid matrix that, by physical and chemical interactions, tends to incorporate the analyte. (HILLER CONNELL; KOZAR, 2017; JORDAN; BROEGA; MARTINS, 2019; PETERS; SIMAENS, 2020) (DABROWSKI, 2001; NASCIMENTO et al., 2014; SUBHI; AL-NAJAR; NOORI, 2022)

The process is widely studied in an attempt to search for new adsorbent materials or in an attempt to remove certain ions, complexes or dyes. Therefore, the interest in the technique generates environmental relevance. Many dyes promote organoleptic evaluation in humans, especially in the visual aspect in clothing dyes and other materials, for food dyes on taste and smell. (GEETHA; PRATHEEKSHA; SUBRAHMANYA, 2020; MOSTAFA; ABD EL-HAMID; AKL, 2023; SCHMITZ et al., 2021; SHEN et al., 2018; TAN et al., 2015a) (BRITO et al., 2021; LEHMKUHLER et al., 2023)

In the textile part, there is a major risk factor related to the disposal of waste in effluents, promoting the contamination of wastewater, imbalance in the biochemical oxygen demand (BOD), reducing the passage of light for the photosynthesis of primary beings in the aquatic food chain, contamination of groundwater and contamination of fish and waters with possible human use. (HILLER CONNELL; KOZAR, 2017; JORDAN; BROEGA; MARTINS, 2019; PETERS; SIMAENS, 2020)

In food, the dyes, although they have pleasant flavors and odors, are subject to possible health disorders such as allergies, hyperactivity, food poisoning, asthma, bronchitis, rhinitis, eczema and others. A color of great prominence is Tartrazine, one of those responsible for the orange color of foods such as carbonated drinks, cakes, powdered juices, energy drinks, mustard, colored breakfast cereals, meat and chicken broths and other wide variety of foods. (LEHMKUHLER et al., 2023) (KOMISSARCHIK; NYANIKOVA, 2014)

Adsorption has some characteristics and perspectives of obtaining kinetic and thermodynamic properties. The reduction in the concentration of dyes, from the laboratory aspect, is monitored by spectroscopy in the visible region of the electromagnetic spectrum (340-720nm). (LEVINE, 2014) (AHMADI; GHASEMPOUR; HASANZADEH, 2023; NASCIMENTO et al., 2014)

Seeking to promote the understanding of the adsorption process as a whole, the present work seeks to perform in a semiquantitative way the interpretation of the concepts of adsorption (equilibrium, kinetic and thermodynamic), using orange flavored soft drinks on paper towels as an absorptive model.

1.1 FOOD COLOURS

Substances from natural or synthetic sources that have pigments, being added to foods in small quantities, with or without nutritional value, exerting modifications in organoleptic properties capable of altering or not the state of physicochemical properties of industrial foods. (BRITO et al., 2021)

Artifices can cause damage to health, and their recommendation and use are practically supported by technological and commercial issues. Usually the visual aspect is highly accepted, in addition to promoting superior stability and uniformity when compared to the natural ones. However, they can still hide the low content of certain nutrients in industrial foods, (2023) (SANTOS, A. A. dos; CALIXTO, S. J. A. de O.; NEUMANN, K. R. da S.

In Brazil there are about eleven artificial dyes allowed, when compared to international legislation, the difference between the acceptance of dyes is noticeable, the American legislation has greater rigor in relation to the permission of the use of food dyes, as reported in Table 1 adapted from . (BRITO et al., 2021)

Table 1

List of food colourings permitted or not permitted by FDA and EFSA

Dye	FDA Permission	EFSA Permission
Tartrazine	Yes	Yes
Twilight Yellow	Yes	Yes
Azorubin	No	Yes
Amaranth	No	Yes
Ponceau 4R	No	Yes
Erythrosine	Yes	Yes
Red 40	Yes	Yes
Blue Patent V	No	Yes
Indigotine Blue	Yes	Yes
Bright Blue	Yes	Yes
Fast green	Yes	No

Source: Brito et al., 2021 adapted.

From the legal aspect, there are regulatory bodies in several, the main ones being the Food and Drug Administration (FDA) in the United States; the European Food Safety (EFSA) in the European Union, in Brazil the National Health Surveillance Agency (ANVISA) is responsible. (BRITO et al., 2021)

1.2 ABSORPTION

Adsorptive processes are low cost, justifying their wide use in industrial processes. During the process, the analyte (adsorbent) interacts with the matrix (adsorbent). The matrix has superficial imperfections (active sites), sites with the ability to anchor the adsorbate. Whether through weak (physisorption) or strong (chemisorption) interactions, the process occurs until the saturation of the porous solid. (DABROWSKI, 2001; NASCIMENTO et al., 2014)

In general, the reaction can be described by Equation 1, occurring in three stages:

The steps described below are illustrated in Table 2.

Initially: there is an unwanted agent dissolved in the fluid ($A_{(aq)}$), the adsorbate with a known mass dissolved in a certain volume, then there is the initial concentration of the dye, which will be put in contact with the adsorbent ($B_{(s)}$).

Duration of the reaction: Part of the dye mass is transferred to the adsorbent providing a reduction in the concentration of the adsorbate in the solution and an increase in the adsorption ratio ($AB_{(s)}$).

Table 2

Demonstrative of chemical equilibrium

$A_{(aq)} + B_{(s)} \rightarrow (AB)_{(s)}$			
	Reagents		Products
Components	$A_{(aq)}$	$B_{(s)}$	$(AB)_{(s)}$
Stage 1 t0	$C_0 = m_{corante} / Volume_{solução}$	$m_{adsorvente}$	-----
Step 2 tx	$-C$	Does not change	$+m_{ads}$
Step 3 Balance	$C_0 - C$	Does not change	$m_0 + m_{ads}$

Source: The author.

Equilibrium is reached, we have the analyte present in the two parts, the concentration in solution and the adsorbed mass, called the amount adsorbed per adsorbent mass (q), for each time of the process a q_t value can be assigned. By looking at the table, it is possible to deduce the relationship represented by equation 2.

$$q_t = (C_0 - C) \frac{Volume_{solução}}{m_{adsorvente}} \quad (2)$$

In order to find the percentage efficiency of the removal process (R), we have equation 3.

$$R = \frac{100(C_0 - C)}{C_0} \quad (3)$$

1.3 ADSORPTION KINETICS

Every reaction that reaches equilibrium has a forward velocity equal to the inverse velocity occurring simultaneously. (HOUSECROFT; SHARPE, 2008; LEVINE, 2014; SKOOG; HOLLER; CROUCH, 2006)

To this end, the kinetics of adsorption is related to the speed of the diffusion transport of the substance and its movement. In addition, in adsorption kinetics there is the transport of the adsorbate and its binding to available sites of the adsorbent until it reaches equilibrium. This process describes the relationship of the interaction that occurs between the adsorbent and the adsorbate, which can be influenced by some factors such as: temperature, pH, concentration and property of the substance. Thus, the most common kinetic models are: pseudo-first-order, pseudo-second-order, and intraparticle diffusion.

Thus, as shown in Figure 1, which demonstrates the adsorption process. We have that, in this case, the molecules of atoms (red dots, Figure 1) of a certain substance (adsorbate) adhere to the surface of another substance that is called adsorbent.

Figure 1

Description of the adsorption process

Source: The author, 2024.

With the monitoring of adsorption at various times, it is possible to find the time when the concentration in solution no longer varies, the so-called equilibrium time. The first important factor to be determined is the order of reaction, a mathematical model in the quantitative aspect (capable of relating the speed and concentration of the reactants), qualitatively (indicates the kinetic reaction mechanism, forms of contact, presence of active sites, weak or strong interactions). (NASCIMENTO et al., 2014) (TAN et al., 2015b)

1.3.1 Pseudo-first-order kinetic mechanism

Qualitatively, it describes physical adsorptions, with the adsorption rate being proportional to the amount of active sites present in the adsorbent. Quantitatively, the model is represented by equation 4. (CHAIRAT et al., 2008; NASCIMENTO et al., 2014)

$$q_t = q_e(1 - e^{-k_1 t}) \quad (4)$$

q_t represents the amount of adsorbate adsorbed at time t

q_e represents the amount of adsorbate adsorbed at equilibrium

k_1 represents the adsorption rate of the pseudo first-order model

1.3.2 Pseudo-second-order kinetic mechanism

Qualitatively it is related to chemical adsorptions between the solid matrix and analyte, in the process the adsorption rate dependent on the amount of solute superficially adsorbed on the adsorbent and how much can be adsorbed at equilibrium, quantitatively it is represented by equation 5. (CHAIRAT et al., 2008; NASCIMENTO et al., 2014)

$$q_t = q_e \frac{k_2 q_e t}{1 + k_2 q_e t} \quad (5)$$

q_t represents the amount of adsorbate adsorbed at time t

q_e represents the amount of adsorbate adsorbed at equilibrium

k_2 represents the adsorption velocity of the pseudo second-order model

1.3.3 Elovich kinetic model

The model tends to describe processes in which heterogeneous adsorbents are used. The matrix presents sites with different energies, also considers that the interactions between adsorbed particles and the desorption process do not significantly affect the adsorption kinetics. Equation 6 represents the model. (DABROWSKI, 2001; NASCIMENTO et al., 2014)

$$q_t = \frac{1}{\beta} \ln(\alpha\beta t) \quad (6)$$

q_t represents the amount of adsorbate adsorbed at time t

α indicates the adsorption rate at the beginning of the process

β desorption constant

Some factors affect the kinetic relationship of processes, including the concentration of reagents, surface area of contact, temperature, pressure and use of catalyst. (HOUSECROFT; SHARPE, 2008; LEVINE, 2014)

In an attempt to understand such factors, the monitoring of the reaction at different temperatures allows the application of equation 7, developed by Arrhenius, making it possible to find two kinetic parameters. (LEVINE, 2014)

Pre-exponential factor (A): related to the effective shocks of the process, collision frequency.

Activation energy: energy required for the reaction to occur adsorption

$$k = Ae^{-E_a/RT} \quad (7)$$

R indicates the gas constant

T the temperature at which the process took place in Kelvin

1.4 ADSORPTION ISOTHERMS

Isotherms are experiments carried out at constant temperature, in the case of the adsorptive process, they indicate the relationship between the amount of adsorbate retained in the matrix and the concentration remaining in the solution. The isotherms indicate

information that can help to elucidate the adsorption mechanism (unlike the reaction mechanism predicted by the adsorption kinetics that aimed to relate the mechanism related to the speed of the process), it allows to predict the retention capacity of different adsorbents, the mass of pollutant that will be retained. Such information makes it possible to compare adsorption systems either by observing the matrix or the contaminant.

In processes involving solid-liquid adsorption, classified isotherms into four types as shown in Figure 2. (GILES et al., 1960)

Figure 2

Classical classification of isotherms

Source: Giles, 1960.

The presence of four columns (the types) and five rows indicating subclasses is observed.

Adsorptions that assume the S type:

They represent systems where:

The contaminant molecules are monofunctional.

The interactions between adsorbate and adsorbent must be intermolecular attraction, allowing vertical and regular interactions over the entire surface.

Possess competition for active sites between solvent and analyte molecules

For type L:

Adsorption occurs horizontally in layers.

The competition for the active sites of the matrix is less intense than the S-type isotherm.

Type H, similar to type L

Cases in which there is a high affinity between the matrix and the analyte, since in diluted solutions the adsorption occurs with a yield close to 100%, leaving in the fluid phase practically undetectable tractions.

Type C, processes in which there is a partition coefficient

Regions with different degrees of crystallinity promote the flexibility of the adsorbed species.

The interaction with the solute is greater than the interaction as an analyte.

The molecular geometry of the adsorbent can promote flexibility by altering the contact of the active sites with the adsorbate.

A simpler way of representing solid-liquid isotherms has been presented as shown in Figure 3. (MCCABE; SMITH; HARRIOTT, 1993)

Figure 3

Classification of isotherms

Source: McCabe; Smith; Harriott, 1993.

The main issue represented in the classification is the behavior that exists, favorable adsorptions, whether very or only favorable, show an exponential growth with the region of maximum differentiating at the beginning of the curve, very favorable has a high capacity in low concentration and in the displacement of the maximum point. The unfavorable one also has an exponential growth, but it has a region of minimum, we also have the linear and the irreversible.

1.5 ISOTHERM MODELS

1.5.1 Langmuir

It considers uniform distribution of the adsorbate on the surface with monolayer formation, consequently the surface of the matrix must be energetically homogeneous, adsorbed particles do not interact with each other. Its expression is represented by equation 8. (AL-GHOUTI; DA'ANA, 2020; NASCIMENTO et al., 2014)

$$q = \frac{q_{max}K_L C_e}{1 + K_L C_e} \quad (8)$$

q Amount of Adsorbed Solute per Unit Mass of Adsorbent

q_{max} Maximum adsorption capacity

K_L Adsorbate/adsorbent interaction constant

C_e Concentration of the adsorbate in solution

1.5.2 Freundlich

It can be adopted for models that have multilayers and heterogeneous characteristics, consequently the active sites are of different energies, causing different interactions between the adsorbent and the analyte. The model is interpreted with the help of equation 9. (AL-GHOUTI; DA'ANA, 2020; NASCIMENTO et al., 2014)

$$q = K_F (C_e)^{1/n} \quad (9)$$

q Amount of Adsorbed Solute per Unit Mass of Adsorbent

K_F Freundlich adsorption capacity constant

C_e Equilibrium constant in solution

$1/n$ Constant related to system homogeneity

By monitoring the isotherms at different temperatures, it is possible to find the main thermodynamic factors, (thermodynamic constant). Using the fundamental equations of

thermodynamics, equations 10, 11 and 12. $\Delta H \Delta S \Delta G K$ (LEVINE, 2014; LIU; LEE, 2014; NOREEN et al., 2021; SHAHWAN, 2021)

$$\Delta G = -RT \ln K \quad (10)$$

$$\Delta G = \Delta H - T \Delta S \quad (11)$$

$$\ln K = -\frac{\Delta H}{RT} + \frac{\Delta S}{R} \quad (12)$$

2 OBJECTIVES

2.1 GENERAL OBJECTIVE

- To evaluate the adsorption of orange-flavored soda on paper as a model for future adsorption studies.

2.2 SPECIFIC OBJECTIVES

- Study the adsorption equilibrium by means of process throughput.
- Apply and compare models of reaction mechanisms.
- Calculate kinetic factors.
- Perform adsorption isotherm studies.
- Compare isotherm models.
- Estimate thermodynamic parameters.

3 MATERIALS AND METHODS

The experiments were carried out in the didactic laboratories of the UEMG unit on the campus of Ituiutaba, with the availability of a shaker table with temperature control and UV-Vis spectrophotometer.

- 8.3L Refrigerated Benchtop Shaker Incubator, Model IST-4075R
- UV-Vis Spectrophotometer Thermo Scientific Evolution One Series

The soft drink to be studied and the paper towels were purchased in the regional trade.

Initially, to perform the tests, the refrigerant gas was removed by means of a magnetic stirrer at room temperature for approximately 45 minutes.

The measurements performed in the spectrophotometer were scans in the range between 400-750nm with velocity rate and 1nm/s.

In the tests proposed in this work, all soft drinks were considered as a dye without distinction of their composition, considering that the present work is a semi-quantitative

model. The working solutions were prepared in distilled water considering the mass of refrigerant and not its volume, obtaining concentrations in $g_{refrigerante}/L_{solução}$.

The methodology consisted of 5 stages, named from "A" to "E", described below and represented in a didactic way in Figure 4.

Figure 4

Experimental Script

Source: The author.

In order to find a way to quantify the concentration of the refrigerant in solution, an initial spectrum was performed in a solution with a concentration of 391g/L, later for the highest value of maximum wavelength dilutions were read in the same. The dilutions of the initial solution were prepared for the following $(\lambda_{max})\lambda_{max}$.351.9; 312.8; 293.25; 234.6; 195.5; 97.75; 39.1 g/L, thus, it was possible to obtain the calibration curve (step A).

In the following tests, the concentration of the initial solution () was 391g/L, with aliquots of 100mL and stirring speed of 150rpm. C_0

For the study of the adsorption time, the variation of the concentration of the solution by UV-Vis spectroscopy at a controlled temperature of 25°C was studied at intervals of 2; 5; 7; 10; 30; 60; 90 minutes, with paper towel dough (adsorbent) of approximately 0.600g. Obtaining the yield and a semi-quantitative analysis of the adsorptive process and mechanism (end of step A). In addition to the kinetic mechanism at this temperature (step B).

To study the kinetic parameters, studies of adsorption time variation in the previous conditions were carried out for two other temperatures, 35°, 45°C. Allowing to analyze the kinetic mechanism (step B), and from the mechanism find the kinetic parameters (step C).

In order to study adsorption models, an experiment was carried out with a controlled temperature of 25°C, fixed mass of adsorbent 600mg, varying the initial concentration of the contact solution (391, 351.9, 312.8, 293.25, 234.6, 195.5, 97.75, 39.1 g/L), following the concentration of the solution at the end of the 90 minutes. The obtaining of adsorption isotherms or adsorption models was possible (step D), repeating the experiment for two other temperatures (35°C and 45°C), the three isotherms obtained generate the studies of the thermodynamic variables (step E).

4 RESULTS AND DISCUSSIONS

4.1 STEP A

The results obtained enabled the initial qualitative study of the analyte under study, obtaining an analytical quantification curve that is fundamental in the rest of the study.

4.1.1 Evaluation of soft drinks in the uv-vis region

The initial evaluation was performed with a scan in the region between 400-750nm and dilution of 1.5mL/3mL in the quartz cuvette, in order to know the behavior of the refrigerant in the visible region of the spectrum, as represented by Figure 5. A broadband between 425 and 555nm was found with a maximum absorbance of 481nm. The presence of this broadband may indicate various electronic transitions in the region or electronic relocation. In carbonated beverages there is not a single type of dye, probably a mixture of at least two main dyes: twilight yellow (food yellow 3, yellow 5, sunset yellow) and tartrazine, in the literature, several studies with food dyes are carried out in the region between 426nm and 430nm suggesting that the value found is reasonable for the mixture of dyes, which have maximum absorption respectively at 480nm and 425nm, with the possibility of overlapping bands, as indicated by . (SKOOG; HOLLER; CROUCH, 2006) λ_{max} (DOTTO et al., 2011; SAHNOUN; BOUTAHALA, 2018) DOS SANTOS; DEMIATE; NAGATA, 2010

Figure 5

Physical characterization by spectroscopy in the UV-Vis region of the analyte

Source: The author.

4.1.2 Calibration Curve

With the knowledge of the behavior of the refrigerant in the visible region of the spectrum, it is possible to make a calibration curve, considering the absorbances in the value of the maximum wavelength, the values are present in Table 3. With the results obtained, it is possible to plot the calibration curve, represented in Figure 6.

Table 3

Relationship between concentration and absorbance for curve construction of calibration

Concentration	Absorbance (481nm)
195,5	0,458
175,95	0,404
156,4	0,353
146,625	0,333
117,3	0,263
97,75	0,218
48,875	0,112
19,55	0,057

Source: The author.

The values of the angular and linear coefficients are 0.00227L/g and 0.00284, with an

adjustment coefficient R^2 of 0.99707, a value close to those found by DOTTO et al., 2011, for calibration curves of twilight yellow dyes and tartrazine at concentrations of 100mg/L.

Figure 6

Refrigerant solution calibration curve

Source: The author.

The equation that correlates the absorbance values obtained with the concentration is represented by the expression: $C = (Abs - 0,00284)/0,0227$, used for the following determinations of the study.

4.1.3 Study of equilibrium time and performance

The adsorption profile of the refrigerant solution, studied at three temperatures (25°C; 35°C; 45°C), to verify the time it takes for the system to reach equilibrium. Under the following experimental conditions: solution volume () 0.1L; initial concentration () 391g/L; adsorbent mass () 0.600g; 150rpm rotation. VC_0m

The monitoring of the concentration reduction was performed by reading in a spectrophotometer with a wavelength of 481nm. The monitoring is described in Table 4.

Table 4

Monitoring of adsorption over time

Temperatur e	Time (minutes)	Concentration (g/L)	Yield (%)	Adsorbed Grease
-----------------	----------------	------------------------	-----------	-----------------

				(Grefrigerante/Gad sorbent)

	120	22,87	43,01	28,02

Source: The author.

The yield and adsorbed concentration values were obtained by applying Equations 2 and 3. For all temperatures, the monitored time intervals between 2 minutes and 120, finding the equilibrium time, in 90 minutes. Time in which the variation in removal or adsorbed concentration tends to no longer vary significantly, as shown in Table 4. It is possible to plot the equilibrium path, the relationship of the reduction of the concentration of reactants, together with the yield Figure 7.

Figure 7

Evaluation of the reduction in the concentration of the soft drink in the solution and evaluation of the percentage of removal

Source: The author.

The decrease in the concentration of the refrigerant in solution occurs as expected, since the adsorption process occurs, having at all times analyzed the greatest reduction to the temperature of 45°C, since higher temperatures promote greater molecular agitation, favoring molecular shocks and consequently greater speed. and the highest yield occurs for the experiment carried out at a temperature of 45°C.

As for the yield, in the order of 40%, the studied process presents similarity to yields described for other adsorbents for removal of similar dyes. Studying the adsorption of Tartrazine, they found for 90 minutes of adsorption at pH 7 and temperature of 23°C, values between 22 and 34% of removal, using eggshell, kaolin (kaolin), zeolite (zeolite) and rice husk (rice husk). While KHADER; MOHAMMED; ALBAYATI, 2021 SAHNOUN; BOUTAHALA, 2018, studying chitosan modified with polyaniline obtained a yield in the order of 40% of tartrazine removal under the conditions of pH 7.2; initial concentration of 25mg/L; initial volume 25mL; 10mg of adsorbent at 25°C. Removal values very close to those reported.

Figure 8 shows the relationship between the adsorbed mass and the time, with the profiles having exponential growths, because the mass retained by the adsorbent increases over the contact time, it is possible to state that the equilibrium time for the adsorption process

occurs from 90 minutes onwards. Time also reported for other adsorbent in the removal of tartrazine (KHADER; MOHAMMED; ALBAYATI, 2021) .

Figure 8

Adsorption kinetics of soft drink on paper towels

Source: The author.

4.2 STEP B

The studies of kinetic mechanisms represent the type of interaction between the solid phase and the liquid phase, three models were studied, from the result of the models it is possible to find the kinetic parameters of the process.

4.2.1 Pseudo-first-order mechanism

Evaluating the possibility that the active sites are proportional to the adsorption rate, the experimental data of the adsorption capacity at the three temperatures studied were adjusted to the model of Equation 4, represented by Figure 9.

The adjustments are very close to the experimental points, with the time of 30 minutes for the three temperatures having the greatest visual deviation, the highest adsorption of the dye at the temperature of 45°C.

Figure 9

Tuning to the pseudo-first-order kinetic mechanism

Source: The author.

Table 5 verifies the parameters and for the pseudo first-order mechanism. $q_e k_1$

Table 5

Pseudo-first-order engine parameters

Pseudo 1st order	q_e	k_1	R^2
25°C	25,856	0,06624	0,9827
35°C	26,254	0,07311	0,9613
45°C	27,409	0,07962	0,9755

Source: The author.

The values found indicate a good fit to the mechanism, compared to other studies, according to a review published by . The values of very divergent as values are slightly divergent from other studies in the literature for dyes similar to other adsorbents AMAKU et al., 2024 $q_e k_1$ (DAI et al., 2021; LIMA et al., 2019; RECK et al., 2018; YU et al., 2016) .

4.2.2 Mechanism of pseudo-followed order

With the possibility that adsorption can occur both on the surface electrostatically (physical process) and through chemical interaction, the pseudo-second-order model was studied, using Equation 5, as shown in Figure 10.

Figure 10

Tuning to the pseudo-second-order kinetic mechanism

Source: The author.

As with the pseudo-first-order mechanism, the adjustments to the pseudo-second-order mechanism are in accordance with the experimental data.

Table 6 presents the values of the constants for the pseudo-second-order mechanism.

Table 6

Pseudo-second-order engine parameters

Pseudo 2nd order	q_e	k_2	R^2
25°C	30,002	0,00222	0,994
35°C	29,897	0,00279	0,982
45°C	31,040	0,00325	0,981

The R^2 values are higher than those observed for the pseudo-first-order mechanism, so the pseudo-second-order mechanism should be the preferred one for the process studied, a fact that is in agreement with other studies in the literature on works for Tartrazine adsorption and yellow 03. The parameters of and , present values with divergence and approximation to other studies, respectively. (DAI et al., 2021; LIMA et al., 2019) (YU et al., 2016) $q_e k$ (AMAKU et al., 2024)

4.2.3 Elovich mechanism

The last mechanism to be compared with the experimental data was Elovich's, which indicates a greater predominance of chemical interactions. The comparison is present in Figure 11, and the adjustments follow Equation 6, the results are presented.

Figure 11

Adjustment to Elovich's kinetic mechanism

Source: The author.

The mechanism visually is the one with the least adjustment, being confirmed by the values of R^2 in Table 7. No studies were found in the literature presenting this mechanism for the adsorption of dyes similar to those that may compose the orange-flavored soft drink.

Table 7

Kinetic parameters of the Elovich model

Elovich model	α	β	R^2
25°C	3,795	0,1493	0,985
35°C	5,112	0,1560	0,980
45°C	6,067	0,1614	0,977

Source: The author.

Regarding kinetics, it is possible to infer that the pseudo-second-order model is the most favorable, as reported in the literature. While the pseudo-first-order model is also reported in the literature with values slightly lower than the pseudo-second-order model, as

verified in the study. On the other hand, the Elovich model, although it presents good similarity (although inferior to the others), has practically no reports in the literature.

q_e Values of the adsorption constants do not have similar values in the literature, most likely due to the way the adsorbent was studied, solid sheet of paper in the present work and granules or smaller pieces in practically all the studies verified.

Values of the velocity constants are not so far apart because the process has yields compatible with those of other works.

4.3 PART C

From the three adsorption curves and the values of k or $\beta \ln k \times 1/T$ described by the mechanisms, the correlation was constructed, making it possible to evaluate the kinetic parameters described in the Arrhenius equation. The representation of the correlation information as well as their linear adjustments are described in Figure 12 in Table 8.

Figure 12

Relationship between $\ln k$ and $1/T$

Source: The author.

The relation describes a decreasing line, indicating that the increase in temperature the value of the velocity constant also increases, the correlation adjustment R^2 was 0.981, indicating a good fit of the relation with its linearization.

Table 8

Kinetic parameters for the pseudo-second-order mechanism

K	lnk	T	1/TX10-5	lnA	A	EA/R	Ea	R ²

4.4 PART D

Seeking to know the adsorption mechanisms, experiments with solutions of variable initial concentrations of soft drink were placed in contact with paper towels (0.600g mass) under 150rpm agitation at controlled temperature, for 90 minutes, allowing to calculate the amounts of dye adsorbed at equilibrium and the amount present in solution using Equation 2. The results are presented in Table 9.

Table 9

Adsorption Balance

Temperature	Initial concentration	Ce (90 minutes)	Qe (90 minutes)
25°C	391	184,54537	36,75667
	351,9	153,68811	35,57248
	312,8	115,80852	33,81004

	234,6	120,90455	18,68761
	195,5	89,70455	14,79271

Source: The author.

The tabulated data can be plotted through the ratio $C_e \times q_e$, providing the adsorption isotherms, Figure 13 presents three isotherms, one for each temperature, and it is observed that the amount adsorbed q_e is greater for the temperature of 25° C.

The isotherms are similar to the classical classification of the L2 type, indicating horizontal adsorptions in layers, also classified as favorable.

Figure 13

Adsorption Isotherms

Source: The author.

4.4.1 Langmuir isotherms

The typical model of chemisorption, Figure 14, provides the adjustment of the experimental points with Equation 8. The parameters are presented in Table 11.

The isotherms indicate that the increase in temperature, the curve tends to lower adsorption capacity and higher concentration in C_e solution, a fact also verified by studying poly(trimethyl allyl ammonium chloride) nanoparticles grafted with chitosan in Fe (YU et al., 2016) ₃₀₄ to adsorb the yellow food coloring 03.(RECK et al., 2018)

Results similar to those present at maximum adsorptive capacity in the Langmuir isotherm model for tartrazine adsorption were observed by ; 31.10 mg/g using Activated carbon of babassu coconut at pH 2, 12 hours and 25°C and 35.72mg/g using Activated bone carbon at pH 2, 10 hours and 25°C.

4.4.2 Freundlich isotherms

In the possibility of evaluating the experimental data as a system of heterogeneous characteristics, Figure 15 presents the fit of the isotherms to the Freundlich model, using Equation 9, and Table 11 the adjusted parameters.

The description of the Freundlich adsorption model determines a heterogeneous surface, the lower the values of $1/n$ (closer to zero) the more heterogeneous the surface tends to be, similar values of $1/n$ are reported for adsorption of the twilight yellow dye in biopolymers are described by (NAGARPITA et al., 2017) LIMA et al., 2019 .

The R^2 correlation values were high, a fact that indicates that the model may be competing with Langmuir's, despite having a lower correlation.

Figure 15*Isotherms fitted to the Freundlich model*

Table 11*Parameters of Freundlich constants*

Freundlich	K_F	n	$1/n$	R^2
25°C	11,023	4,223	0,237	0,887
35°C	4,9521	2,782	0,359	0,898
45°C	0,530	1,366	0,732	0,958

Source: The author.

As discussed earlier, Langmuir's model is predominant for the adsorption of soft drink on paper towels, although both models have had ewashed-up settings.

4.5 PART E

All physicochemical processes have thermodynamic parameters that can be calculated (ΔG ΔH ΔS) or ΔG can be calculated for each temperature through Equation 10, the other parameters are obtained by the relation of the slope and linear coefficient of the ratio. $\ln Kx^{1/T}$ Based on the Langmuir isotherm model reported in the present study, Figure 16 shows the adjustment of the relationship to obtain the thermodynamic and Table 12 presents the values.

Positive values for entropy, ΔS , indicate an increase in the degree of freedom of the studied process.

The Gibbs free energy variation increases in modulus, indicating that the system demonstrates an increase in the degrees of freedom at the adsorption boundary (solid-liquid), a fact also verified in other works (GUPTA; JAIN; VARSHNEY, 2007; JAIN; GUPTA; SIKARWAR, 2010; KHADER; MOHAMMED; ALBAYATI, 2021)

The values between 2.1 and 20.9 KJ/mol indicate weak adsorptions and 20.9 and 418.4 KJ/mol strong adsorptions, in the present work it is proven a value of variation in the enthalpy that indicates strong adsorptions, differently from what was observed in other works,

since our analyte is not only dye, we can infer that the sugar present in the soft drink can favor chemisorption. ΔH (HOSSEINI et al., 2011; SAHNOUN; BOUTAHALA, 2018)

5 CONCLUSIONS

- The experimental model was successful for application as an adsorption model.
- The best kinetic mechanism for the equilibrium curves was the pseudo-second-order mechanism, showing similarity to the best model for adsorption of dyes that can compose the soft drink (tartrazine, twilight yellow, yellow 03, yellow 05...).
- The experiment allows the calculation of kinetic parameters.
- The most suitable isotherm was that of Langmuir.
- The work made it possible to calculate the thermodynamic parameters.
- The predicted model has a greater tendency to the chemisorption process, proven through adsorption kinetics as well as isothermal experiments.

ABSTRACT

Cocoa (*Theobroma cacao*) production is an agribusiness of great economic importance worldwide, as it provides the main raw material for the production of a centuries-old product: chocolate. Brazil ranks as the 6th largest cocoa producer in the world, with approximately 600,000 hectares under cultivation and 75,000 producers. *Forastero* is the most predominant variety globally, representing approximately 80% of production due to its disease resistance and high productivity. Therefore, given the growing demand for rootstocks and the importance of germination for the formation of good seedlings, this study aimed to evaluate the germination of seeds from different parts of the *Forastero* cocoa fruit, common type genotype. For the experiment, the fruits were divided into three treatments, where T1 is the base, T2 the middle, and T3 the apex. The treatments were processed, weighed, and placed to germinate in an oven at 30°C for twenty-five days. At the end of the experiment, analyses of germination, final weight, weight gain, vegetative mass, seedling emergence, among others, were performed. The results were statistically similar between the middle and apex treatments. However, the base treatment had significantly lower results than the others. It can be assumed that the low results of the base treatment may have occurred due to metabolic characteristics. Although the middle and apex treatments are considered better for seedling formation, the study highlighted the importance of further research focused on germination and its relationship with metabolic and physiological processes of *Theobroma cacao* seeds.

RESUMO

A produção do cacau (*Theobroma cacao*) é um agronegócio de grande importância econômica no mundo, pois fornece a principal matéria prima para a produção de um produto secular, o chocolate. O Brasil ocupa a posição de 6º maior produtor mundial de cacau, com cerca de 600 mil hectares cultivados e 75 mil produtores. O *Forastero* é a variedade mais predominante globalmente, representando aproximadamente 80% da produção devido à sua resistência a doenças e alta produtividade. Dessa forma, visto o crescimento da demanda de porta-enxertos e a importância da germinação para a formação de boas mudas, esse trabalho teve o objetivo de avaliar a germinação de sementes de diferentes partes do fruto do cacau *Forasteiro*, genótipo tipo comum. Para o experimento, os frutos foram divididos em três tratamentos, onde T1 é a base, T2 o meio e T3 o ápice. Os tratamentos foram tratados, pesados e colocados para germinar em estufa com 30°C durante vinte e cinco dias. Ao final do experimento foram feitas análises de germinação, massa final, ganho de massa, massa vegetativa, emissão de plântulas, dentre outros. Os resultados foram estatisticamente parecidos entre o tratamento meio e ápice. Contudo, o tratamento base teve resultados significativamente inferiores aos demais. Pode-se supor que os baixos resultados da base podem ter ocorrido devido a características metabólicas. Apesar de considerar os tratamentos meio e ápice melhores para a formação de mudas, o estudo ressaltou a importância de mais pesquisas voltadas a germinação e sua relação com processos metabólicos e fisiológicos de sementes de *Theobroma cacao*.

Palavras-chave: Teste de Germinação. Tamanho de Sementes. Posição das Sementes no Fruto.

RESUMEN

La producción de cacao (*Theobroma cacao*) es un agronegocio de gran importancia económica a nivel mundial, ya que proporciona la principal materia prima para la elaboración de un producto centenario: el chocolate. Brasil se ubica como el sexto mayor productor de cacao del mundo, con aproximadamente 600.000 hectáreas cultivadas y 75.000 productores. *Forastero* es la variedad más predominante a nivel mundial, representando aproximadamente el 80% de la producción debido a su resistencia a enfermedades y alta productividad. Por lo tanto, dada la creciente demanda de portainjertos y la importancia de la germinación para la formación de buenas plántulas, este estudio tuvo como objetivo evaluar la germinación de semillas de diferentes partes del fruto del cacao *Forastero*, genotipo tipo común. Para el experimento, los frutos se dividieron en tres tratamientos, donde T1 es la base, T2 el centro y T3 el ápice. Los tratamientos se procesaron, pesaron y colocaron para germinar en un horno a 30 °C durante veinticinco días. Al final del experimento, se analizaron la germinación, el peso final, la ganancia de peso, la masa vegetativa y la emergencia de las plántulas, entre otros. Los resultados fueron estadísticamente similares entre los tratamientos de la parte media y la parte superior. Sin embargo, el tratamiento base presentó resultados significativamente inferiores a los demás. Cabe suponer que los bajos resultados del tratamiento base podrían deberse a características metabólicas. Si bien los tratamientos de la parte media y la parte superior se consideran mejores para la formación de plántulas, el estudio destacó la importancia de realizar más investigaciones centradas en la germinación y su relación con los procesos metabólicos y fisiológicos de las semillas de *Theobroma cacao*.

1 INTRODUCTION

The production of cocoa (*Theobroma cacao* L.) is an agribusiness of great global economic relevance, as it provides the main raw material for the manufacture of chocolate, a product of wide historical and cultural diffusion (HO; ZHAO; FLEET, 2015). In addition to industrial processing, the cocoa production chain involves agricultural and commercial stages that directly impact income, employment, and sustainability in tropical regions.

Historically, cacao was exploited by Mesoamerican peoples in humid forest areas, possibly since about 1000 BC, being used in the preparation of a strong, bitter and spicy drink in political and religious rituals by civilizations such as the Mayans and Aztecs (MODA; BOTEON; RIBEIRO, 2019). Subsequently, during the maritime expansions, cocoa was introduced to Europe in the sixteenth century, where the original drink was modified, incorporating sugar and milk and expanding its acceptance (HENDERSON et al., 2007).

From a botanical point of view, the cacao tree is a cauliflora plant, with flowers that emerge on floral cushions on the trunk and on woody branches. In the Amazon Region, a seasonal pattern is observed with two peaks of flowering associated with the rainfall regime, with emphasis on a main peak at the end of the dry season and the beginning of the rainy season (ALVIM, 1977).

The cocoa fruit can be approximately 15 to 30 cm long, with an oval shape and insertion in thicker branches. Each fruit can contain about 35 seeds, which have recalcitrant characteristics, a factor that strongly conditions their post-harvest management (VERÍSSIMO, 2012; CRUZ, 2002).

Recalcitrant seeds do not complete natural drying on the mother plant and are released with high water content. Even under controlled storage, reduction of water content below a critical, usually high, level can lead to loss of viability and embryo death (KING; ROBERTS, 1979; KING; ROBERTS, 1980a; PAMMENTER; BERJAK, 2014). This limitation is attributed, in part, to the maintenance of continuous metabolic activity, which restricts seed conservation to short periods and, frequently, until the beginning of germination (PAMMENTER; BERJAK, 2014).

In this context, germination is a central stage of the plant life cycle, involving physiological and morphological events that culminate in the formation of a structure with reproductive potential (KERBAUY, 2004; BEWLEY et al., 2013). In seed species sensitive to desiccation, such as cocoa, understanding the factors that modulate germination is decisive to ensure the formation of vigorous seedlings.

In Brazil, seed propagation has historically been predominant in the implementation of crops; However, vegetative propagation by grafting has been widely indicated aiming at

disease resistance and productivity increase. Even so, the production of rootstocks remains mostly seminal, which makes mastery of the germination process essential, due to its direct relationship with the cost and quality of seedlings (SENAR, 2018; SERRA; SODRÉ, 2021; VENIAL et al., 2017).

In view of the increase in demand for rootstocks and the importance of germination for the formation of quality seedlings, this work aims to evaluate the germination of Forasteiro cocoa seeds as a function of the location in the fruit, contributing to technical recommendations applicable to the production of more uniform and efficient seedlings.

2 OBJECTIVE

The general objective of this work is to investigate the influence of seed location in the fruit on the germination performance of cocoa seeds (*Theobroma cacao* L.) of the Forasteiro type, considering parameters of viability, germination speed and uniformity, in order to support the optimization of seedling/rootstock production in nursery.

In addition to the specific objectives: To compare the germination performance between seeds from different regions/positions of the fruit, through the percentage of germination, speed (or average time) of germination and uniformity of the process; identify the region/position of the fruit associated with the best germination performance, aiming to guide the selection of seeds for seedling production; and to generate technical recommendations applicable to the management of recalcitrant cocoa seeds in the nursery, aiming to reduce losses and increase efficiency in the formation of rootstocks.

3 METHODOLOGY

The study was conducted at the Forest Seeds Laboratory of IBEF/UFOPA, located in Santarém, Pará, with the objective of evaluating the influence of seed location in the fruit on the germination performance of cocoa seeds (*Theobroma cacao* L.) of the Forasteiro type, considering germination parameters (viability), speed and uniformity of the germination process.

Ripe fruits, intact and without signs of mechanical injury or rot were selected. After opening, the seeds were removed and classified according to their position in the fruit, establishing three treatments: basal region (close to the peduncle), median region and apical region (opposite to the peduncle). Then, the seeds were pulped (mucilage removal) and used immediately, in order to reduce viability losses associated with the recalcitrant nature of the seeds.

The experiment was carried out in a completely randomized design (DIC), with three treatments (basal, median and apical), each consisting of 4 replicates of 100 seeds, totaling 400 seeds per treatment. Sowing was carried out in a substrate composed of expandable clay and vermiculite, previously moistened and maintained with adequate moisture throughout the experimental period.

Germination was conducted under a controlled temperature of 27 °C, with follow-up for 25 days. The evaluations were performed by daily counts of the germinated seeds, adopting standardized morphological criteria for germination (e.g., radicle protrusion), applied uniformly to all treatments.

The variables evaluated were: germination percentage (G%), germination speed index (IVG) and average germination time (MGR), in addition to a measure of uniformity of the germination process, obtained by the temporal distribution of germinations throughout the evaluation period. The data were organized and submitted to statistical analysis, with prior verification of the assumptions (normality and homogeneity of variances). Next, analysis of variance (ANOVA) was performed and, when a significant effect was observed, the means were compared using Tukey's multiple comparison test, adopting a significance level of 5%.

4 DEVELOPMENT

According to Lajus (1982), the *Forastero*/common variety has fruits with a rounded shape, a rigid skin and a practically smooth surface. According to Ferreira et al. (2013), this is the true Brazilian cocoa, as it is the most cultivated in Brazil and has good resistance to pests and diseases. The summary of the analysis of variance of the characteristics evaluated as a function of the treatments applied is shown below, in Table 1.

Table 1

Initial Mass (g), Final No. of germinated seeds, Germination (%), Mortality (%), No. of seedlings emitted, Final Mass (g), Vegetative Mass (g) of the evaluated treatments

	BASE (T1)	MEDIUM (T2)	APEX (T3)
Initial Mass (g)	65.16 a	63.76 A	55.77 b
Final No. of Sprouted Seeds	185 b	189 to	191 to
Germination (%)	93.5 b	96 to	96.75 to
Mortality (%)	7.5 b	5.5 A	4.5 A
No. of Seedlings Emitted	12 b	40 to	42 to
Final Mass (g)	79.58 to	78.17 a	72.60 b
Vegetative Mass (g)	25.50 b	27.72 to	29.42 to

*Means followed in the line by the same letter are not different from each other by Tukey's test.

Source: Authors.

Regarding the initial mass, it was found that the means of the base (65.15g) and the middle (63.75g) were statistically similar, while the apex had a lower mean (55.77g). This distinction may have occurred due to the common variety being characterized by having a more rounded shape, however, its diameter decreases as it reaches the apex, causing the size of the seeds to become smaller (Cruz, 2012).

According to Cilas et al. (2010), genetic improvement favors seeds to have larger sizes, as seen in genotypes derived from crosses between cultivated cocoa trees. According to Carvalho and Nakagawa (2012), larger or denser seeds probably have greater vigor, due to their well-formed embryo and more reserves, but this can be influenced by many factors, such as humidity, temperature, among others. Viena et al (2017), did a study comparing eight genotypes of *Theobroma cacao*, in this one, the genotype TSH1188 which presented higher biometric values (including mass), had more tolerance to thermal stresses, however, the study did not emphasize whether only this parameter would be indicative for the formation of more vigorous plants.

In the present study, the three treatments had the same water and temperature regime (30°C). Figueiredo (1986b) did not describe the cocoa variety studied, but considered the temperature of 30 °C ideal, since it provided the maximum number of seedlings in the shortest period of time. For Freitas (2013), germination is one of the most important phases of the cultivation process. The germination percentage of the treatments was determined by the ratio of the total amount of germinated seeds at the end of the count, by the amount of seeds placed to germinate, multiplying by 100 to obtain the result in percentage. Figure 1 represents the germinated percentage of treatments at the end of the 25 days.

Figure 1

Germinated percentage of treatments at the end of the 25 days

Source: Authors.

As expected, primary root protrusion was verified in 90% of the seeds of all treatments in the first analysis, in 5 days. It is possible to deduce that the properties of the cocoa tree related to seed development had an impact on this response. Given that the embryo is well developed during seed dispersal and the moisture level is high, the processing process that involves pulp removal favors rapid germination.

It is seen in figure 5 that at the end of the 25 days, the base had a lower germination percentage than the others, 92.5%, which corresponds to 185 seeds, the middle had 94.5% and 189 seeds, and the apex 95.5% and 191 seeds, the last two did not differ statistically. However, this lower germination of the base treatment, in view of the others, may have been related to its high mass gain, through water imbibition throughout the experiment (Figure 2).

Figure 2

Mass gain from the treatments at the end of the 25 days

Source: Authors.

The base mass reached 79.5g at the end of the experiment, this value was considered high, since the treatment was the one that had the most seeds discarded due to mortality. The apex, which had a higher number of germinated seeds, had a lower mass than the same (72.5g), which suggests that the significant increase in base mass did not translate into benefits for survival or vegetative growth.

Schulz et al., (2014) in a study carried out with cocoa, observed that the respiration of the seeds is greater in the regions close to the fruit peduncle, where there is a higher concentration of sugars and greater enzymatic activity. Thus, the base treatment (T1) may have absorbed a significant amount of water due to its high physiological activity, but failed to transfer it for survival. As a result, it exhibited a higher weight at the end of the experiment and a higher mortality rate.

Contributing to the information cited, figure 3 expresses the mortality of the treatments, in which the base had the highest percentage of dead seeds throughout the experiment. Therefore, it is assumed that characteristics described about the different metabolic rate in the fruit explain the percentage of mortality and germination of the base if it differs from the other treatments.

Figure 3

Mortality of treatments at the end of 25 days

The Mortadlity data shown in figure 6 reveal that the imbibition speed can markedly alter the germination and vigor of the seeds, and that when the recalcitrant seeds maintain this intense physiological activity, which includes increased absorption of water, therefore, from the mass, but cannot complete the germination process, the metabolism can become disorganized, leading to the consumption of reserves and the release of free radicals. Both of these activities accelerate its rapid deterioration and death (Barbedo & Marcos Filho 1998, Ferreira & Borghetti 2004, Andréo et al. 2006, Berjak & Pammenter 2008).

Seed germination is a complex physiological process that begins with the absorption of water that leads to root protrusion, with the next stage being called post-germination development, characterized by the growth and development of seedlings (Dousseau et al. 2013). To evaluate the number of seedlings, the root protrusions that developed to generate leaflets were considered. In general, seedling formation was low, in view of the number of germinated seeds, in the three treatments (Figure 4). Unlike the base, which produced only 14 seedlings, the medium developed 40 and the apex 42, where the last two did not present statistically significant differences.

Figure 4*Germinated seeds and seedlings emitted in the treatments*

Source: Authors.

Lavanhole et al., (2019) point out that this result can be understood due to the complexity of post-germination development, which is considered more complicated than germination itself. This is because seedling formation depends on a wider variety of physiological processes, such as tropisms, photomorphogenesis, root hair expression, and growth of both roots and shoots of the plant. Long et al., (2014) state that seedling malformation can also occur due to effects of cytosol viscosity, membrane fluidity and integrity, antioxidant activity, and transcription and translation rates.

With regard to the ability of a seed to preserve its germination potential, the longevity of seeds refers to the period during which they remain alive, that is, capable of germinating (MARCOS-FILHO, 2015). However, the true longevity period of seeds could only be established if it were possible to keep them in optimal conditions, which in practice is difficult to achieve. It is possible, however, to determine viability, which represents the effective life span of the seed in a specific environmental condition (CARVALHO & NAKAGAWA, 2012). The loss of viability results in germination failures, even under favorable conditions, since it represents an irreversible degenerative change, leading to seed death.

The seeds from the middle of cocoa (T2), even with a germination result statistically equal to that of the apex, showed greater viability throughout the experiment (figure 5), demonstrating that over the days it was the treatment that had the greatest capacity to keep the seeds alive, and demonstrating its germination potential. In addition, it can be seen in the table that the seeds of the treatment were the ones that had the highest emergence rate throughout the experiment. Silveira et al., (2002), suppose that the emergence index can be

a good indicator to evaluate the vigor of the seeds of a specific matrix, as it offers more accurate predictions about how the seeds will behave when sown.

Figure 5

Feasibility of treatments at the end of the 25 days

Source: Authors.

ISTA, (2014) highlights that vigor can be defined as the set of characteristics that influence the activity and satisfactory performance of seeds in various environments. Seeds considered vigorous are those capable of performing well even in adverse environmental conditions for the species, and have great potential for a rapid and uniform germination of normal seedlings in the field (Guedes in 2009).

As for the variables evaluated, it was observed that the base treatment resulted in lower germination rate, vigor, viability and seedling formation. Therefore, it is suggested that further studies be carried out on the physiological and maturation processes of seeds located near the stalk of the cocoa fruit. These studies can help to understand the factors that led to these results, in addition to serving as a basis for future comparison and discussion.

EMBRAPA (2020) reinforces that a good seed for seedlings must have high physiological, genetic and sanitary quality, that is, it must have high germination, vigor, purity, identity and health. Seed quality directly influences the establishment, development and productivity of seedlings, as it determines the speed, uniformity and percentage of germination, resistance to pests and diseases, adaptation to the environment and expression of genetic potential.

In the treatments, the middle and apex did not present significant differences in most parameters, and were higher than the base in the variables evaluated. Thus, it can be considered that these seeds have superior quality, in ecophysiological terms. Therefore, lots

from these matrices can be more effective when used as propagation material in seedling production.

In general, the Common genotype is quite uniform, however, it has a slower development, requiring a longer period of nurseries to reach the grafting standard (Arévalo et al. 2012). Thus, the relevance of scientific research on germination is highlighted, aiming at the development of knowledge that improves the quality of plants destined for nurseries.

5 FINAL CONSIDERATIONS

Regarding the germination of the seeds as a function of different parts of the cocoa, the base was the one with the lowest performance. The middle and apex treatments showed statistically equal responses to most of the variables evaluated. In this way, the seeds of the middle and apex may have a greater chance of forming more vigorous seedlings.

There are several studies in the literature that investigate the biochemical properties of cocoa seeds. However, most of this research focuses on the modifications that occur during the drying and fermentation stages, with the main purpose of establishing a link with the quality of chocolate. (Chang et al., 2014; Febrianto et al., 2016; Gil et al., 2016). Considering that rootstock propagation is conducted mainly through seeds, studies on biochemical and physiological changes aimed at germination are extremely important, so that this knowledge can be applied in cocoa tree improvement strategies.

ABSTRACT

The growing demand for organizational models that combine economic performance, human well-being, and socio-environmental responsibility highlights the need to understand emerging practices such as conscious capitalism and humanized companies. In this context, this study is justified by the relevance of investigating how these approaches intersect and what impacts they generate in corporate environments. The objective is to analyze the convergence between the practices of humanized companies and conscious capitalism, identifying perceptions, benefits, and challenges associated with their implementation, as well as understanding how such initiatives influence employee well-being and motivation. To this end, an exploratory study was conducted through a survey applied to 40 respondents using an online form composed of objective and open-ended questions. Data were analyzed using descriptive statistics, charts, tables, and word clouds, while complying with ethical research principles. The results indicate that, although participants have partial knowledge of the investigated concepts, they recognize benefits such as increased employee engagement, improved work environment, and strengthened corporate reputation. However, relevant challenges also emerge, including cultural resistance, implementation costs, and lack of technical expertise. It is concluded that integrating these practices enhances sustainable development, promotes more ethical organizational cultures, and contributes to purpose-driven business models, although structural and cultural barriers must still be overcome in future initiatives and research.
