A crescente demanda por modelos organizacionais que conciliem desempenho econômico, bem-estar humano e responsabilidade socioambiental evidencia a necessidade de compreender práticas emergentes, como o capitalismo consciente e as empresas humanizadas. Nesse contexto, o presente estudo justifica-se pela relevância de investigar como essas abordagens se inter-relacionam e quais impactos podem gerar no ambiente corporativo. Objetiva-se analisar a confluência entre práticas de empresas humanizadas e do capitalismo consciente, identificando percepções, benefícios e desafios associados à sua implementação, bem como compreender como tais iniciativas influenciam o bem-estar e a motivação dos colaboradores. Para tanto, realizou-se uma pesquisa exploratória, conduzida por meio de um survey aplicado a 40 respondentes, utilizando formulário online composto por questões objetivas e dissertativas. Os dados foram analisados por estatística descritiva, gráficos, tabelas e nuvens de palavras, respeitando-se os princípios éticos para pesquisas com seres humanos. Os resultados indicam que, embora exista conhecimento parcial sobre os conceitos investigados, reconhecem-se benefícios como maior engajamento dos colaboradores, melhoria do ambiente de trabalho e fortalecimento da reputação corporativa. Entretanto, também emergem desafios relevantes, como resistência cultural, custos de implementação e falta de conhecimento técnico. Conclui-se que a integração dessas práticas potencializa o desenvolvimento sustentável, promove culturas organizacionais mais éticas e contribui para modelos de negócios orientados ao propósito, embora barreiras estruturais e culturais ainda precisem ser superadas em futuras iniciativas e estudos.

Palavras-chave: Capitalismo Consciente. Empresas Humanizadas. Sustentabilidade Corporativa. Ética Empresarial. Engajamento Organizacional.

RESUMEN

La creciente demanda por modelos organizacionales que combinen rendimiento económico, bienestar humano y responsabilidad socioambiental resalta la necesidad de comprender prácticas emergentes, como el capitalismo consciente y las empresas humanizadas. En este contexto, el presente estudio se justifica por la relevancia de investigar cómo estas aproximaciones se relacionan y qué impactos generan en los entornos corporativos. El objetivo es analizar la convergencia entre las prácticas de empresas humanizadas y del capitalismo consciente, identificando percepciones, beneficios y desafíos asociados a su implementación, así como comprender cómo estas iniciativas influyen en el bienestar y en la motivación de los colaboradores. Para ello, se realizó un estudio exploratorio mediante un survey aplicado a 40 participantes, utilizando un formulario en línea compuesto por preguntas objetivas y abiertas. Los datos fueron analizados mediante estadística descriptiva, gráficos, tablas y nubes de palabras, respetando los principios éticos de investigación. Los resultados indican que, aunque los participantes poseen un conocimiento parcial de los conceptos investigados, reconocen beneficios como mayor compromiso de los colaboradores, mejor ambiente laboral y fortalecimiento de la reputación corporativa. Sin embargo, también emergen desafíos relevantes, como resistencia cultural, costos de implementación y falta de conocimiento técnico. Se concluye que la integración de estas prácticas potencia el desarrollo sostenible, promueve culturas organizacionales más éticas y contribuye a modelos de negocio orientados al propósito, aunque aún deben superarse barreras estructurales y culturales en futuras iniciativas y estudios.

Palabras clave: Capitalismo Consciente. Empresas Humanizadas. Sostenibilidad Corporativa. Ética Empresarial. Compromiso Organizacional.

1 INTRODUCTION

Capitalism, traditionally associated with the incessant pursuit of profit, has undergone a significant transformation in recent decades. The growing awareness of the social and environmental impacts of business activities drives the search for fairer and more sustainable business models. In this context, the concept of humanized companies, which puts the well-being of employees and social responsibility in the foreground, stands out. Conscious capitalism, in turn, proposes a new way of doing business, seeking to generate value for all stakeholders, including society and the environment.

This research aims to analyze the intersection between humanized companies and conscious capitalism, seeking to understand how this relationship impacts company performance, employee satisfaction and sustainable development. The premise is that as companies recognize the benefits of adopting practices that favor not only profit, but also the well-being of people and the environment, they tend to adopt these approaches more enthusiastically. This study explores how these practices interact and complement each other, offering a comprehensive overview of the changes in contemporary business practices.

The importance of this research lies in its ability to provide a deeper understanding of contemporary business practices and how the integration of the concepts of humanized companies and conscious capitalism can transform the business environment.

By analyzing how these approaches intersect and influence each other, the research seeks to offer valuable insights to managers, academics, and policymakers. Understanding the intersections between these practices can contribute to the formulation of more ethical and sustainable business strategies, benefiting not only companies but also society and the environment.

In this context, the objective of this study was to analyze the intersection between humanized companies and conscious capitalism to understand how these business practices complement and influence each other, as well as to investigate the perception of employees in relation to how these practices influence the well-being and motivation of employees.

In this way, the research contributes to deepening the understanding of these practices and their implications, highlighting the relevance and benefits of adopting a business model that integrates environmental and business sustainability with people's well-being.

2 THEORETICAL FRAMEWORK

The concept of corporate social responsibility (CSR) began to take shape in the early twentieth century, with movements that sought to regulate and humanize business practices. Critical events, such as the New York fire (Kaplan, 1985) and Fordism (Gramsci, 2023), have

highlighted the need for safer and fairer labor practices. These events were crucial for the development of a business awareness more focused on social and environmental responsibility.

Humanized companies promote practices that respect workers' rights, ensure a healthy work environment, and invest in the personal and professional development of employees. Conscious capitalism, on the other hand, aims to align the financial objectives of companies with the creation of value for society and the environment, arguing that it is possible to achieve financial success while promoting a social and environmental mission.

The relationship between humanized companies and conscious capitalism is intrinsically connected. Both approaches share the goal of promoting ethical and sustainable business practices, which consider the long-term impacts of business activities. Humanized companies often adopt principles of conscious capitalism, such as creating value for all *stakeholders* and environmental responsibility. This alignment can result in a business model that improves employee satisfaction, corporate reputation, and contributes to sustainable development and the health of local communities.

Capitalism, as an economic system, had its origins in mercantilism, which was prevalent in Europe between the sixteenth and eighteenth centuries. Mercantilism emphasized the importance of a favorable trade balance and state intervention in the economy to protect national interests, laying the foundation for industrial capitalism (Dobb, 1981).

With the Industrial Revolution in the late eighteenth and early nineteenth centuries, capitalism underwent a significant transformation. The introduction of new technologies, such as the steam engine and the mechanization of production, led to an exponential increase in productivity and the creation of large industries (Bresser-Pereira, 2011). This period was marked by the growth of cities, mass migration to urban centers, and the formation of a new working class. Industrial capitalism also brought challenges, such as poor working conditions, labor exploitation, and social inequalities, which eventually led to the emergence of labor movements and the implementation of social reforms (Beaud, 1986).

Global capitalism at the beginning of the twenty-first century is marked by events and crises that affect the world economy and the daily lives of citizens. The 2008 U.S. housing crisis, triggered by the collapse of *subprime* mortgages, led to a global recession, highlighting the interconnectedness of financial markets. In the Middle East, the Islamic Revolution in Iran in 1979 transformed the geopolitical and economic dynamics of the region, affecting oil prices and, consequently, the global economy. In Europe, the increase in spending on subsidies to farmers, especially in the context of the Common Agricultural Policy (CAP), has generated

debates about fiscal sustainability and competitiveness in the global market. These phenomena demonstrate how regional events can have global repercussions, affecting the pockets of citizens around the world. The "Golden Age" of globalization, which followed World War II, brought a period of economic growth and integration of international markets. However, the two world wars of the twentieth century interrupted this process, leading to a temporary collapse of globalization. Since then, the world has sought a path back to the international integration of markets, facing challenges and opportunities in an increasingly interconnected economic scenario (Frieden, 2008).

In the post-industrial era, starting in the second half of the twentieth century, capitalism evolved again, this time towards an economy based on services and information technology. Globalization and the liberalization of financial markets have allowed for greater economic integration between countries, while technological innovation has transformed the way businesses operate and interact with consumers (Chaves, 2014).

Contemporary capitalism is characterized by an emphasis on creating value for stakeholders, corporate social responsibility, and environmental sustainability. Over the past five centuries, capitalism has demonstrated a remarkable capacity for adaptation and transformation, shaping the history of the West and profoundly influencing global economic and social structures (Chang, 2013).

Following this evolution, conscious capitalism is a business approach that emerged in the early twenty-first century, grounded in the idea that businesses can thrive while promoting social and environmental well-being. Its origins are linked to the corporate social responsibility (CSR) movement and the growing demand for more ethical and sustainable business practices (Begnini, 2019).

The fundamentals of conscious capitalism include creating value for all *stakeholders*, conscious leadership, purpose-driven organizational culture, and the integration of social and environmental responsibility into business operations (Bremer, 2016). This model argues that companies should go beyond the pursuit of immediate profit, considering the long-term impacts of their activities and contributing to the sustainable development of the communities in which they operate. By aligning financial objectives with a social and environmental mission, conscious capitalism seeks to create a lasting positive impact, demonstrating that it is possible to achieve economic success while promoting a fairer and more sustainable world (Mackey; Sisodia, 2018).

Business ethics are essential for the development of a solid and sustainable organizational culture. For this ethic to be consolidated, it is essential that the company's leadership and strategy are aligned with human appreciation in the workplace. The

competence to be ethical must be cultivated at all levels of the organization, promoting the understanding that ethics is essential to business life and success. Integrating ethics into daily practices and strategic decisions not only strengthens the company's trust and reputation, but also creates a fairer and more motivating work environment. For business ethics to become a philosophy of life, it is necessary for all employees to internalize these values, recognizing that ethical practices are fundamental for collective well-being and long-term sustainability (Matos, 2016).

Environmental Management and Corporate Social Responsibility (CSR) are essential to business strategies in today's scenario, where sustainability and ethics are increasingly valued. Organizations need to ensure the efficient execution of their processes along the evolutionary chain to achieve success, expand markets, win new customers, and obtain results favorable to growth. Significant changes in the business context indicate the need for management that is socially responsible and environmentally friendly. This requires the adoption of new management models that integrate sustainable and ethical practices, allowing managers to understand and adopt an ethical stance towards customers and the community in general. By incorporating environmental management and CSR into their strategies, companies not only improve their reputation and competitiveness but also contribute to sustainable development and social well-being, creating a lasting positive impact (Tachizawa, 2019).

Corporate sustainability and ESG (*Environmental, Social, and Governance*) criteria emerge as central themes of today and the future, reflecting the need to redirect business evolution towards sustainable development. Corporate sustainability involves the integration of practices that ensure the longevity of the business, while promoting social well-being and environmental preservation. ESG criteria, in turn, assess the ethical impact and sustainability of companies, considering environmental, social, and governance aspects. Given the historical impacts caused by the way humanity has developed its results and shaped its society, it is imperative that modern organizations abandon the methodology of profiting for profit's sake. Instead, they should seek to profit from a positive purpose, where the economic result is added to environmental, social, and governance issues. This approach not only strengthens institutions to face future crises, but also serves as an example for a cultural migration of society, promoting good practices and ensuring the relevance and sustainability of companies in the long term (Goi Junior, 2022).

Humanized companies are those that, driven by passion and purpose, transcend the pursuit of profit and focus on helping all their *stakeholders* thrive: customers, investors, employees, partners, communities, and society in general. These companies act in a positive

way, being recognized, valued, admired, and even loved by their *stakeholders*. They improve the world through their business practices, and the world responds positively to this approach. By building a high-performance business based on love, these companies help people find the self-fulfillment they are looking for, promoting a radical social transformation of capitalism. This goes beyond creating a productive and happy work environment, it's about establishing truly mutually beneficial relationships with partners, being a company enthusiastically welcomed by communities, and ensuring that all *stakeholders*, including investors, win (Wolfe et al., 2019).

In view of the literature analyzed, conscious capitalism and humanized companies emerge as innovative responses, proposing an approach that goes beyond immediate profit and considers the well-being of employees, social responsibility and environmental sustainability. These practices not only improve business performance, but also contribute to a fairer and more sustainable development, reflecting a radical social transformation of capitalism.

3 METHODOLOGY

This exploratory research was conducted through a survey, with the objective of understanding the public's perceptions and understanding of conscious capitalism and humanized companies. The exploratory nature of the study allows for an initial investigation, providing valuable insights that can guide further future research (Prodanov; Freitas, 2013).

The sample was composed of 40 respondents, selected in a non-probabilistic manner and approached voluntarily through social networks, ensuring a diversity of profiles and opinions. Choosing a diverse sample is key to capturing a wide range of perceptions on the topic.

The data were collected through a Google form, containing 23 objective and essay questions, designed to capture the opinions and knowledge of the participants. Using an online form made it easier to collect data from a diverse audience and allowed for efficient analysis of responses.

All stages of the study were conducted in accordance with the ethical principles established for research with human subjects (Witiuk et al., 2018). Participants were informed about the context and objectives of the research before answering the questionnaires, and informed consent was obtained by signing the Informed Consent Form (ICF). The survey ensured the anonymity of the participants, respecting their rights and privacy. Submission to the Ethics Council was not necessary, as the research did not involve direct interventions, significant risks, or sensitive data collection.

Data analysis was quantitative, using descriptive statistics to interpret the results with the support of Tables and Figures that were prepared using Excel software. Regarding the open questions, the analysis was based on Figures called word clouds with the Wordart application, in its free version (<https://wordart.com/>), as this type of figure facilitates content analysis through the visualization and understanding of the information collected. Content analysis with the support of word clouds is a method that has already been widely used, so the analysis of the collected data (Camargo et. al., 2013) allowed the identification of trends and patterns in the participants' responses, providing a solid basis for the interpretation of the findings.

Among the limitations of the study, the non-probabilistic sample stands out, which may not be representative of the general population. In addition, data collection through an online form may have excluded individuals without access to the internet or with difficulties in using digital technologies. These limitations should be considered when interpreting the results and generalizing the findings. The survey was carried out between June and July 2024, ensuring an adequate period for data collection and analysis.

4 RESULTS AND DISCUSSIONS

The analysis of the survey results brought a series of perceptions about how companies are dealing with these practices. By examining the data, it is possible to observe the diversity of ages of the respondents, the size of the companies where they work, the level of knowledge about the topics, the definitions they provide, the challenges and opportunities they identify, in addition to the positive impacts and their expectations for the future. This analysis helps to better understand the attitudes and barriers that exist, and highlights the importance of raising awareness and developing effective strategies to implement more ethical and sustainable business practices.

Table 1 shows the age distribution of the 40 respondents. The majority of participants (24) are in the 18-25 age group, indicating a young audience and possibly more open to new ideas and innovative business practices. The 26-30 years, 31-50 years, and 51-65 age groups have an equal representation of 5 respondents each, while only 1 respondent is over 66 years old. This distribution suggests that perceptions of conscious capitalism and humanized companies can be influenced by different generations, with a predominance of young adults.

Table 1

Age group of respondents

Age Group	Quantity	%
18 to 25 years old	24	60,00%
26 to 30 years old	5	12,50%
31 to 50 years old	5	12,50%
51 to 65 years old	5	12,50%
More than 66 years old	1	2,50%
Grand Total	40	100,00%

Source: survey data.

Table 2 presents the distribution of respondents according to the size of the company in which they work. Most respondents (16) work in companies with more than 1000 employees, followed by companies with 1 to 10 employees (9 respondents). This indicates a diversity of business contexts, from small startups to large corporations. This variety is important for understanding how different sizes of companies perceive and implement conscious capitalism practices and humanized companies.

Table 2

Count of Company Size in number of employees

Size	Quantity	%
1 to 10 employees	9	22,50%
11 to 50 employees	3	7,50%
51 to 200 employees	6	15,00%
200 to 500 employees	3	7,50%
501 to 1000 employees	3	7,50%
More than 1000 employees	16	40,00%
Grand Total	40	100,00%

Source: survey data.

Table 3 reveals that 20 respondents have heard of humanized companies, while 12 do not know the subject and 8 may know about it. This shows that, although there is a reasonable knowledge about the concept, there is still a significant portion of people who are not familiar with it. This data highlights the need for greater dissemination and education about humanized companies to expand the understanding and adoption of these practices.

Table 3

How many people know the topic of Humanized Companies

Reply	Quantity	%
No	12	30,00%
Yes	20	50,00%
Maybe	8	20,00%
Grand Total	40	100,00%

Source: survey data.

Table 4 shows that 20 respondents do not know the topic of conscious capitalism, while 12 have heard of it and 8 may know about it. As in the case of humanized companies, there is a need for greater awareness and education about conscious capitalism, as half of the respondents are not familiar with the concept.

Table 4

How many people know about the topic of Conscious Capitalism

Answers	Quantity	%
No	20	50,00%
Yes	12	30,00%
Maybe	8	20,00%
Grand Total	40	100,00%

Source: survey data.

When it comes to what survey respondents think about what humanized companies are, the analysis of Figure 2, which compiles into a word cloud the most relevant answers about what survey respondents understand by conscious capitalism, reveals several important insights.

The most prominent terms, such as "value", "sustainable", "consumption" and "conscious", indicate that respondents associate conscious capitalism with business practices that go beyond immediate profit, focusing on sustainable value creation and conscious consumption.

This suggests an appreciation of practices that promote sustainability and responsibility in business operations.

Other words present in the cloud, such as "business", "companies" and "world", reinforce the idea that conscious capitalism is seen as a global approach that involves all spheres of the company.

The emphasis on terms such as "sustainable" and "conscious" highlights the importance of ethical and responsible business practices, which consider the long-term impacts of business activities on the environment and society. In summary, respondents perceive conscious capitalism as an approach that integrates value creation with sustainability and social responsibility, promoting a lasting positive impact.

Figure 2

More relevant answers about what Conscious Capitalism is

Source: elaboration by the authors.

Regarding the challenges that the respondents' companies face to implement humanized organization practices and conscious capitalism, Figure 3 highlights the main challenges faced by them to implement humanized business practices and conscious capitalism in the respondents' view.

The most prominent terms, such as "company", "cost", "practices" and "implement", indicate that the main challenges are related to high costs and the implementation of desired practices. This suggests that companies face significant financial barriers when trying to adopt these practices, as well as practical difficulties in executing them.

Other words present in the cloud, such as "employees," "time," and "internal resistance," highlight additional challenges, such as employee resistance and lack of time to implement change. Internal resistance can be a considerable obstacle, indicating the need for effective change management strategies to overcome these barriers.

Thus, respondents realize that the main challenges for the implementation of humanized business practices and conscious capitalism include high costs, practical difficulties, employee resistance, and the need for time to make changes.

Figure 4

Main positive impacts that the practices of Humanized Companies and Conscious Capitalism can generate for your company according to the respondents

Source: survey data.

Figure 4 shows the opportunities identified by respondents to implement humanized business practices and conscious capitalism. The most prominent terms, such as "development", "employees", "company" and "admiration", indicate that respondents see significant opportunities in employee development and in improving corporate image. This suggests that investing in employees' personal and professional growth and gaining admiration in the marketplace are seen as important competitive advantages.

Other words in the cloud, such as "market," "customers," and "government," highlight additional opportunities related to market expansion, strengthening customer relationships, and complying with government regulations.

The presence of terms such as "implementation" and "training" indicates that respondents recognize the importance of training employees and adopting effective strategies to implement these practices.

It can be inferred that respondents perceive that the main opportunities for the implementation of humanized business practices and conscious capitalism include employee

development, improvement of corporate image, market expansion, strengthening of customer relationships, and compliance with government regulations.

Figure 5

Opportunities that the company in which the respondents work have to implement these practices.

Source: elaboration by the authors.

Figure 6 highlights that the main challenges include "organizational culture change", "employee resistance" and "lack of knowledge and expertise". These challenges reflect the need for significant cultural change and empowerment so that companies can effectively adopt these practices. The pressure for short-term results and the lack of financial resources are also important barriers to overcome.

Figure 6

Main challenges that companies face to become Humanized Companies and adopt the principles of Conscious Capitalism according to correspondents

Source: survey data.

Figure 7 reveals that the majority of respondents (26) believe that humanized companies and conscious capitalism represent a new way of doing business, while 10 do not believe and 8 are undecided. This indicates a growing recognition that these practices can positively transform the business environment.

Figure 7

Number of correspondents who believe that Humanized Companies and Conscious Capitalism represent a new way of doing business

Source: survey data.

Figure 8 shows that expectations for the future of humanized companies and conscious capitalism are varied, with a majority expressing optimism about the positive impact of these practices. However, there is also a significant portion of uncertainty, reflecting the need for more evidence and successful examples to consolidate these expectations.

Figure 8

Expectations for the future of humanized companies and Conscious Capitalism according to correspondents

Source: survey data.

The results of the survey indicate that there is a reasonable, but still limited, knowledge about the concepts of humanized companies and conscious capitalism among the respondents. While many recognize the benefits of these practices, such as increased employee engagement and improved corporate reputation, they also face significant challenges, such as cultural resistance and lack of resources.

The analysis highlights the importance of promoting greater education and awareness on these topics, as well as developing effective strategies to overcome barriers to implementation. Ultimately, the convergence of corporate sustainability, ethical stewardship, and social responsibility can offer a promising path to a more balanced and sustainable business future, aligning economic success with positive social and environmental impact.

5 CONCLUSION

The main findings of this study indicate that the adoption of humanized and conscious practices can significantly improve business performance, increase employee satisfaction and promote sustainable development.

The survey also revealed that, although there is reasonable knowledge about these concepts, there are still cultural and practical barriers that hinder their implementation.

The proposed objectives of the study were achieved, since it was demonstrated that the integration of humanized practices and conscious capitalism not only benefits companies, but also contributes to a more ethical and sustainable business environment.

Therefore, the most important findings are considered to include the identification of challenges such as employee resistance and high costs, as well as opportunities for competitive differentiation and improved corporate reputation.

Nevertheless, it is recognized that the limitations of the study include the non-probabilistic sample and online data collection, which may not represent the general population. Therefore, it is suggested that future research could explore broader and more diverse samples, as well as investigate more deeply the strategies to overcome the identified barriers.

Finally, it is understood that this study contributes to the field of research of Applied Social Sciences, especially Human Resource Management, by providing a deeper understanding of contemporary business practices and their implications. It also offers managers, academics, and policymakers some relevant points for consideration. Promoting a business model that integrates sustainability and human well-being is essential for a fairer and more sustainable business future.

Joaquim Ribeiro de Souza Junior¹

ABSTRACT

This paper examines the structural process as an instrument capable of closing the historical gap between Brazil's broad constitutional catalogue of fundamental rights and the country's material reality. It outlines the evolutionary path of judicial protection, from the retrospective damage-repair model to the prospective paradigm aimed at transforming public or private structures and policies trapped in systematic non-compliance. The study sets out the core notions of structural problem, process and decision, and discusses the Brazilian taxonomy (normative, collective and individual structural proceedings). It also assesses the importance of extrajudicial control, illustrated by the Carrefour settlement, showing that the enforcement of fundamental rights may dispense with the courts. The article concludes that the structural process—grounded in dialogical participation and progressive decision-making—is an indispensable tool for implementing inclusive policies and enhancing the democratic legitimacy of adjudication.

Keywords: Structural Process. Structural Litigation. Fundamental Rights. Public Policies. Jurisdiction.

RESUMO

O artigo busca examinar o processo estrutural como instrumento apto a superar o hiato histórico entre a ampla previsão constitucional de direitos fundamentais e a realidade material brasileira. Parte-se do panorama evolutivo da tutela jurisdicional, do modelo retrospectivo de reparação de danos ao paradigma prospectivo voltado à transformação de estruturas e políticas públicas ou privadas em situação de desconformidade sistemática. A pesquisa descreve as premissas conceituais de problema, processo e decisão estruturais, bem como discute a taxonomia proposta pela doutrina brasileira (processo estrutural normativo, coletivo e individual). Analisa-se, ainda, a relevância do controle extrajudicial, ilustrada pelo TAC Carrefour, evidenciando que a efetivação de direitos fundamentais pode prescindir da via judicial. Ao final, conclui-se que o processo estrutural, ancorado na participação dialógica e em decisões progressivas, representa ferramenta indispensável

RESUMEN

El artículo busca examinar el proceso estructural como un instrumento apto para superar la brecha histórica entre la amplia previsión constitucional de derechos fundamentales y la realidad material brasileña. Se parte del panorama evolutivo de la tutela jurisdiccional, desde el modelo retrospectivo de reparación de daños hasta el paradigma prospectivo orientado a la transformación de estructuras y políticas públicas o privadas en situación de desconformidad sistemática. La investigación describe las premisas conceptuales del problema, del proceso y de la decisión estructurales, así como discute la taxonomía propuesta por la doctrina brasileña (proceso estructural normativo, colectivo e individual). Se analiza, además, la relevancia del control extrajudicial, ilustrada por el TAC Carrefour, evidenciando que la efectivización de derechos fundamentales puede prescindir de la vía judicial. Al final, se concluye que el proceso estructural, anclado en la participación dialógica y en decisiones progresivas, constituye una herramienta indispensable para la promoción de políticas inclusivas y para el fortalecimiento de la legitimidad democrática de la jurisdicción.

Palabras clave: Proceso Estructural. Litigio Estructural. Derechos Fundamentales. Políticas Públicas. Jurisdicción.

1 INTRODUCTION

The Constitution of the Republic of 1988 enshrined an extensive list of fundamental rights that can be judicially enforced. Decades after its promulgation, however, an abyss persists between the normative text and social reality. The traditional procedural system, centered on the retrospective logic of reparation of damages, proved incapable of promoting the structural change necessary to overcome historical inequalities and massive and systemic violations of rights.

In this context, the structural process presents itself as a judicial or extrajudicial technique, aimed at the reorganization of policies or structures whose way of functioning generates, fosters or enables permanent violations of fundamental rights. Unlike actions of a merely reparatory or injunction nature, the structural process is not satisfied with specific orders to do or not to do; it requires the preparation of a progressive transformation plan, accompanied by cascading or spiral decisions (Arenhart, 2024), capable of monitoring and adjusting the results obtained.

Inspired by the North American experience of *public law litigation* and *structural injunctions*, Jobim (2024) classifies the structural process into three types: a) normative structural process, linked to the abstract control of constitutionality; b) collective structural process, conveyed mainly by collective actions; and c) individual structural process, filed by individual authors, but endowed with broad transformative potential. The distinction shows that the phenomenon does not necessarily depend on the presence of the State as a party, nor is it limited to the judicial sphere, admitting consensual solutions and self-regulation mechanisms.

This article intends to delimit some conceptual premises of the structural process, as well as to evaluate its practical usefulness for the realization of fundamental rights and for the improvement of public and corporate governance.

2 AFTER ALL, WHAT IS A STRUCTURAL PROCESS?

Definitely, structural process is the topic of the moment in Brazilian procedural law². It could not be otherwise. The Federal Constitution provides for a broad and non-exhaustive

² Since the pioneering work of Desirê Bauermann (2012) and Marco Félix Jobim (2013), dozens of master's dissertations and doctoral theses on the subject have been published in Brazil. Courses and collections of articles on the subject have also been published. In addition, there are study groups that are quite sedimented with this object. The group "Culture and Process" linked to the PPGD of PUCRS, coordinated by Marco Félix Jobim, should be mentioned. In addition to this, we have the study group coordinated by Sérgio Arenhart at the Federal University of Paraná, the study group coordinated by Fredie Didier at the Federal University of Bahia, the study group coordinated by Jordão Violin at PUCPR, the study group coordinated by Hermes Zaneti at the Federal University of Espírito Santo, the study group coordinated by Edilson Vitorelli at the Federal University of Minas Gerais, the study group coordinated by Leonardo Cunha at the Federal University of Ouro Preto and

list of fundamental rights. On the other hand, there is a significant gap between the text and the context. This means that the social, political and economic reality of the country is marked by a deep distance between what is and what should be, according to the original constituent power.

Therefore, there is a clear need for an adequate procedural tool so that the jurisdiction can act in order to promote this passage from a reality of systematic and permanent inadequacy to a new desired situation³. It is uncontroversial that traditional procedural techniques do not lend themselves to this scope.

However, a warning is necessary. It is that, under the terms of what Jobim (2024, 4th Edition) teaches, structuring (or structural) measures in constitutional jurisdiction do not necessarily require a structural process, since the abstract control actions provided for in Law 9,068/99 and Law 9,082/99, in addition to other constitutional actions, already bring adequate rites to the judicial protection appropriate to these transformations.

Therefore, there is no need to speak of the construction of a new tool suitable for what is conventionally called the normative structural process, as opposed to the collective structural process (public and collective civil actions, etc.) and the individual structural process, which, in turn, deals with an individual action, but with the potential to promote significant changes such as, for example, an individual action promoted by a person with disabilities in front of the school where he studies aiming at his compliance with accessibility standards⁴.

many others. It is easy to see, therefore, that the structural process is a topic that occupies and will continue to occupy the agenda of the operators of the justice system.

³ Regarding the importance of adaptability of procedural rules to what is carried out, it is worth adding that "procedural rules can only be legitimately valid if and when they fulfill their constitutional mission and adhere, in fact, to the problems of reality that they are supposed to serve [...]. With these considerations, it is easy to see that the process is not a given, but a constructed one. It must be constructed in the light of the concrete circumstances of the problem to be faced and the reality of the material right to be acted. Therefore, thinking of procedural law in the abstract constitutes a serious mistake. It is necessary to design the process for the case and in the light of the case. It is in this sense that it is said that the procedural technique must be at the service of the protection of rights. The procedural technique alone is nothing. It only acquires value and importance to the extent that it is aligned with the needs of substantive law and the fundamental values set forth in the Constitution" (ARENHART, OSNA AND JOBIM, 2021, p. 14)

⁴ Regarding the individual process, it is timely to warn André Ribeiro Tosta and Felipe Barreto Marçal (2022, p. 201-202) that "many structuring demands are formally individual (bipolar), despite their object cannot be adequately resolved through traditional conflict resolution mechanisms and procedures. It is necessary, therefore, to treat these formally individual demands as what they truly are: structuring demands"

3 GENERAL PREMISES OF THE STRUCTURAL PROCESS

From its foundation with the work Theory of Exceptions and Procedural Assumptions by Oskar von Bülow⁵⁶⁷, in 1868 until the 2000s, approximately, the process was retrospective. Its scope was to repair damage that had already occurred. In this sense, an adequate process was one that was able to successfully reconstruct events from the past, repairing the damage suffered and returning those involved, as much as possible, to the *status quo ante* through strategies to repair the damages.

The seminal works of Marinoni (2022, 8th Edition) and Arenhart (2002), related to injunctive relief, were the protagonists of the important moment in which the process began to be thought of as an instrument that, in order to be used, does not presuppose damage that has already occurred. The phase of the so-called damage inhibition actions is inaugurated.

Nowadays, the era of prospective processes is under construction. In other words, prospective is the process that has its eyes turned to the future⁸. Its purpose is the transition from an undesirable current reality to a new coveted context, through the preparation and implementation of a plan to modify the functioning of the institution and examine the results achieved, in order to ensure the intended social change.

From this perspective, the structural process comes with the intention of being an adequate technique to structure the future. What matters most is not the reparation of the past⁹. The main intention is the reorganization of a structure or policy, whether public or private.

⁵ Born in Wroclaw on 11 September 1837 and died in Heidelberg on 19 November 1907

⁶ It is the work BÜLOW, Oskar Von. Theory of exceptions and procedural assumptions or Die Lehre von der Prozesseinreden und die Prozessvoraussetzungen. Translated by: Ricardo Rodrigues Gama. Campinas: LZN, 2005.

⁷ Regarding the work of Oskar Bülow, Professors Marinoni, Arenhart and Mitidiero teach that "Oskar Bülow is due one of the most important attempts to explain the nature of the process. His theory, which has become known as the theory of the procedural legal relationship, is preferred by the classical doctrine and by almost all Brazilian proceduralists today. Ten years after the controversy between Windscheid and Muther over the lawsuit, BÜLOW published (in 1868) the work entitled Theory of Procedural Exceptions and Procedural Assumptions (Die Lehre von der Prozesseinreden und die Prozessvoraussetzungen), through which he gave theoretical content to the idea that there is a legal relationship in the process. It should be noted that the idea of a legal relationship between the parties and the judge was already intuited at the time of Roman law and by medieval jurists. The importance of BÜLOW's work was to systematize, although based on the theory of the legal relationship already built by private law – but based on the premises of the autonomy of the process in relation to substantive law and its public nature – the existence of a procedural legal relationship of public law, formed between the parties and the State, evidencing its assumptions and its disciplinary principles" (2022, p. 519).

⁸ In relation to this premise of the structural process as a prospective technique, Arenhart, Osna and Jobim point out that "in order to begin the exposition of the different particularities of structural processes, it seems necessary to take a step back to allow some important theoretical elucidations. In short, this complex, multipolarized and polycentric area, with systematic violation of inherent fundamental rights and guarantees [...] becomes a condition for the existence of a process that encompasses its extension for the future resolution of the problem presented, which will be designed from the techniques to protect the right that is intended to be protected" (2021, p. 14)

⁹ Regarding this prospective character of the structural process, Luana Steffens argues that "the structural process is a different model from the classical conception of civil procedural law, designed to deal with a dispute of a bilateral, individual and patrimonial nature. The classic traditional process works with the right-obligation-

For this reason, it is essential to reflect on three intrinsically related concepts: 1) structural problem; 2) structural process and; 3) structural decision.

A structural problem is a factual context that represents a state of structured nonconformity. In other words, there is a situation of permanent and systematic non-conformity. Several examples can be cited. This is the case of prisons that operate in a way that does not respect the principle of human dignity. It is also the case of sidewalks and other public and private spaces that do not minimally meet accessibility conditions. It is, in the same way, that scenario in which a company practices structural racism by hiring people always of the same race or ethnicity and so on.

It is clear that, at this juncture, a one-shot solution is not feasible (Marçal, 2021, p. 155), that is, through a single act. It does not happen on an "all or nothing" basis (Osna, 2024, p. 495). The situation of non-conformity is so sedimented that, for its correction, a true restructuring of the way that structure or policy works is required. There is no specific illegality that can be remedied with a simple act.

Regarding the theme, Vitorelli considers the concept of structural litigation as synonymous with radiated litigation in which "different groups of people are affected in different ways, with greater or lesser intensity, which generates distinct and varied, possibly antagonistic, claims for relief" (2022, p. 356).¹⁰

It is appropriate to add that there is no doctrinal consensus as to the best nomenclature for a structural problem or litigation. Some prefer to use the expression illegal state of affairs. The expressions state of inadequacy and state of structured nonconformity are also widely used. The nomenclature varies, but its semantic content is usually used as a synonym by the national doctrine.

With regard to the question of stating that a situation of illegality is an essential phase for the verification of a structural disorganization, there is a relevant doctrinal controversy. Didier Jr, Zaneti Jr and Oliveira (2021, p. 427) teach that "the structural problem is not necessarily based on the notion of illegality and, when it is eventually based on it, it is not itself confused with the illicit situations that arise from it". They exemplify, as a structural

violation-reparation structure. There is no substantial concern with specific guardianship and pro-future measures; It is concerned with the reparation of the damage through compensation for those who suffered from the illicit act in the past, through retrospective measures. Structural conflicts have peculiar characteristics and complex nature, so that the traditional civil procedure is insufficient to resolve them, in view of the polycentric and diffuse nature of the issues. In these cases, there is a need to take the violation as a starting point, not to compensate the injured party, but to find ways to stop the behavior that gives rise to it or the structural context that favors it." (2021, p. 105).

¹⁰ The author also states that: "Structural litigation is those that involve multipolar conflicts, of high complexity, whose objective is to promote public values through the courts, through the transformation of a public or private institution. There is a need to reorganize an entire institution, with the change of its internal processes, its bureaucratic structure, and the mentality of its agents, so that it can fulfill its function according to the value stated by the decision" (2022, p. 356).

problem without the characteristic of illegality, with the closure of a factory, causing a wave of unemployment and several other social problems in a given society.

On the other hand, Edilson Vitorelli (2024, p. 64) defines a structural process as the collective technique that has as its scope "the reorganization of a bureaucratic structure, public or private, which causes, fosters or enables the occurrence of a violation by the way it works, giving rise to structural litigation". Such a conceptualization, in this conception, implies the existence of an illegality.

It is important to register here the concept of collective litigation according to Vitorelli. This is because, according to the author, every problem or structural litigation involves a collective claim, even if brought in an individual lawsuit. For the author, collective litigation is that which "involves a multiplicity of subjects, which make up a group, a society, involved in the conflict as such, not as a bundle of individual interests" (2024, p. 30).

It is also important to add a few words about the classification of collective disputes developed by Vitorelli, in the same work cited, considering that this classification ends up helping a lot in the definition of what is a structural problem, according to the author. Such classification, according to which, the degree of conflict and complexity verified in a given collective dispute is taken into account. Considering that conflict concerns the individual impact on the collective claim, and that complexity arises from the relationship between the litigation and the Law, which can confer various possibilities of judicial protection, it is possible to classify collective litigation as: collective litigation of global diffusion; collective litigation of local diffusion; and collective litigation of radiated diffusion.

Global litigation encompasses society in general, however, it has little reverberation on the individuals who are part of it, so that such disputes have low conflict and high or low complexity. Local litigation, in turn, reaches certain subjects, who are linked by social, emotional and territorial solidarity, presenting moderate conflict and greater complexity than that envisioned in global litigation¹¹. In irradiated litigation, society is harmed in different ways, both in nature and intensity, in such a way that both conflict and complexity are high.

¹¹ With regard to the typology of conflicts, Pedro Luiz de Andrade Domingos argues that "The approach to the problem from the origin of the damage to the impacted society seeks to consider the simultaneous interests that involve the controversy, based on two objective indicators, the conflict of social perspectives and the complexity of the right to be judged, in order to allow the construction of a procedure for resolving the conflict without giving up due process. The polycentricity of interests and the multipolar context of the process make it difficult to isolate the implementation of the necessary measures for full reparation of the right and its indirect consequences on affected third parties without their participation. In this procedural environment with diversified impacts on those affected, adequately representing the interests of the parties is of central importance for the success of the resolution procedure. The reparatory measure must listen to the interests of the impacted society to better understand the problem, so that the resolution of structural disputes identifies who are the classes or groups that make up the society that holds the right and what their perspectives would be to better resolve the conflict. This approach understands that transindividual rights are divisible, contrary to the traditional thinking historically conducted by the Brazilian collective process, as each member of a radiated litigation experiences the damage

Due to these enormous, and perhaps insurmountable, difficulties, part of the doctrine recognizes that one should not theorize a concept of litigation or structural problem, and that it is wiser to work on its characteristics¹². In any case, the fundamental thing is the notion that structural litigation arises from the way in which a certain bureaucratic structure works and is organized, whether it is private or public. The structural problem results from the very mode of operation of the structure. Thus, dealing only with its effects, disregarding the causes, will not bring effective changes.

In turn, the process that has as its object a structural litigation is called structural. It is the process that, through jurisdictional action or not, aims at the reorganization of a bureaucratic structure (public or private) or a policy that *per se* causes, fosters, or enables the occurrence of systemic violations of rights, giving rise to structural litigation (Vitorelli, 2024). In view of this, its main scope is the elaboration and implementation of a "plan to change the bureaucratic institution in structured nonconformity, whether public or private" (Vitorelli, 2024, p. 69).

Dealing with the problem of conceptualization and based on the lessons of the North American doctrine, Vitorelli teaches that there is a certain category of actions called "*publica law litigation*" actions. In these, obligations are established to do or not to do "*injuctions*" aiming at the effective implementation of fundamental rights "*civil rights injuctions*". When the American doctrine identified that in certain situations it was necessary to intervene in institutions, bureaucracies or policies to implement a certain fundamental right, such court orders that determine these interventions became known as "*structural injuctions*". "Thus, the reference to the structural *litigation* process is applicable to cases in which the collective claim is not only to impose a behavior, but to make a structural change in an organization, with the objective of enhancing the desired behavior in the future" (2024, p. 358).

Once again, the important warning by Arenhart, Jobim and Osna (2021) regarding the difficulty of developing a concept that has a perennial nature in a theme that, by nature, is fluid. In fact, both the conception of structural problem and structural process can vary frequently, which makes it practically impossible to develop a concept with pretensions of durability¹³. For this reason, the aforementioned authors prefer to work with the idea of

differently in relation to the proximity that is to the core of the injury and, therefore, their participation becomes an element of due process" (2019, p. 33).

¹² In this sense, Arenhart, Osna and Jobim inform that "In any case, this is why it does not seem appropriate to think of a concept for structural processes (or problems). Its multiformity makes it difficult for a single concept to be able to encompass several realities that may be very different. Thus, it is preferred to work based on the characteristics of the problem faced, understanding that, for each of them, the process must provide adequate instruments to absorb and deal with such realities" (2021, p. 60).

¹³ Still on this need to change the categories of the process whenever there is a cultural change, Luana Steffens understands that "the current jurisdictional moment redoubles in complexity and intensity, due to the phenomena of social massification, complex litigation and the explosion of litigation. As seen, Law is a cultural product,

verifying whether or not a process is structural through its characteristics, without the conceptual rigidity that may not pass the reality test.

As for the concept of structural decision, it is customary to adjectivate the one that closes the first phase of the structural process, verifying that there really is a situation of unwanted nonconformity and defining the ideal state of affairs to be pursued, as well as determining the elaboration of a plan to proceed with the transition (Didier Jr, Zaneti and Oliveira, 2024).¹⁴

It should be noted that, unlike decisions made in traditional processes, the structural decision generally has the nature of principle. It is principled, therefore, since it does not impose a specific and determined rule of conduct. Thus, it is inevitable that other future decisions will have to be made, what Arenhart calls cascading decisions (2024) and Vitorelli calls spiral decisions (2024).

It is in this context of these differentiated structural decisions in relation to the traditional form of judicial provision that the American doctrine began to identify what it called *structural injunctions*. It can be seen, therefore, that structural decisions were born empirically, in practice¹⁵. This is because, in order to ensure the effectiveness of the decision, it was crucial to adopt complementary judicial measures, called *injunctions*. Only later were such decision-making models theorized by the doctrine.

When discussing the emergence of *the structural injunction*, Owen Fiss (2017) presents two models of jurisdictional protection – the "dispute settlement" model and the

adherent to a given collectivity that develops in a given space-time. Hence, conflicts are neither watertight nor immutable, but they present new contours and singularities, as the interests and values in society change (e.g. traditional marriages and contemporary models of stable union). In this area, when culture undergoes significant changes, whatever its reasons, the process needs to adapt, since social changes and society's values cannot be ignored or minimized by the Civil Procedure. Thus, it is imperative that the law keeps up with the pace imposed by the transformations of society, otherwise the process will become an ineffective instrument" (2021, p. 96).

¹⁴ Thus, Owen Fiss clarifies that "structural reform is based on the notion that the quality of our social life is significantly affected by the operation of large organizations and not only by individuals, acting inside or outside these organizations. It is also based on the belief that American constitutional values cannot be fully secured without basic changes being made to the structures of these organizations. The judicial process of a structural nature is one in which a judge, facing a state bureaucracy with regard to constitutional values, is responsible for restructuring the organization to eliminate the threat imposed on such values by the existing institutional arrangements. This injunction is the means by which these reconstruction directives are transmitted" (2017, p. 76).

¹⁵ On the subject, José Maria Rosa Tesheiner teaches that "This decision would have had little effectiveness, had the Court not determined that the judges take the necessary measures to comply with it, which determined the emergence of a new form of adjudication, which became known as structural reform, an expression translated by Marco Félix Jobim as "structuring measures". The judge, as an interpreter of the values listed in the Constitution, must operationalize the bureaucratic organizations, that is, confront them, to eliminate any possibility of non-realization of constitutional guarantees. The Judiciary was structured to intervene, when appropriate, in these bureaucratized institutions, including to rebuild them. The new adjudication model, as opposed to the bipolar model, typical of individual actions, places the Judiciary as a protagonist, in the face of constitutional values, through balanced judicial activism, to serve as a warning to the other powers so that they fulfill their attributions" (2024, p. 17).

"structural reform" model. With regard to the "dispute settlement" model, this would be more traditional and would serve to resolve private disputes, with individualized parties who are not able to resolve the issue among themselves and require a third party to resolve the conflict. The Judiciary, in this way, configures the institutionalization of this third party.

The "structural reform" model, in turn, is based on the assumption that the greatest risks to constitutional values do not come from individuals, but from large organizations, both public and private, so that such risks will not be extinguished without these organizations being reformed. The model in question would therefore aim to reform the bureaucracy of large institutions that would endanger constitutional values.

The jurisdictional provision granted in the midst of a structural process should certainly move away from the traditional procedure of a judicial process, through the construction of a new procedural model, to achieve the ideal state of affairs in an effective way.

Having made such clarifications about litigation, processes and structural decisions, it is essential to note that the structural litigation (or problem) can be solved out of court. Therefore, there is a structural process outside the Judiciary. The expression "process" is usually used as a synonym for adversarial procedure, which can occur outside the jurisdictional scope.

A good example of structural extrajudicial action is the Carrefour TAC (DE FREITAS *et al*, 2021). It is the unfortunate murder of João Alberto de Freitas, a black man who was shopping with his wife until he was violently approached by supermarket security guards and led to death by beating. The terrible episode happened on November 19, 2020, the eve of Black Consciousness Day.

After a few months of investigation in the civil inquiry, it was detected that the racism evident in the approach and death of João Alberto was not an isolated episode, but something present in the structure of the company, from the way of selecting personnel for admission, through the ascension to the positions of director and leadership. The reorganization of the structure was therefore necessary.

In this sense, the Federal Public Prosecutor's Office and several other institutions jointly entered into a Conduct Adjustment Agreement with Carrefour, in the total amount of 15,000,000.00 (fifteen million)¹⁶. Such amounts should be allocated to the promotion of racial

¹⁶ As a result of the aforementioned "Carrefour TAC", numerous measures have already been adopted to combat structural racism in the country. As an example, it is worth mentioning that on August 4, 2022, the public notice for higher education institutions interested in receiving scholarships and permanence in undergraduate and graduate studies for black people was published. R\$ 68 million will be allocated by the undertaking to an initiative that includes higher education entities interested in affirmative action. Available at: < <https://www.mpf.mp.br/rs/sala-de-imprensa/noticias-rs/tac-carrefour-publicado-edital-de-bolsas-de-graduacao-e-pos-graduacao-para-pessoas-negras> > Accessed in: 09/27/2022.

equality and human rights in a variety of ways, from access to employment and education without discrimination, to the promotion of measures to combat structural racism in the workplace. The resources will also be used to grant scholarships to black people at the undergraduate and graduate levels, as well as studies related to languages, innovation and technology, aiming to prepare new professionals for the job market.

In this way, the performance was exemplary since there was a coordinated action between institutions of different natures, achieving a quick and effective response, promoting advances in such a serious and perverse structural problem (De Freitas *et al*, 2021).

It is also observed that structural litigation does not necessarily involve the government. It is quite common for structural problems to be related to the bureaucracies of federative entities and their various bodies. But the state presence is not an essential element of structural disputes¹⁷. Structural problems related to business bureaucracies of important economic agents are not sporadic. In fact, it is essential to note that, in today's world, large organizations and private conglomerates can represent a threat as great, or perhaps greater, to public freedoms as the State.

Thus, as demonstrated, if there is a state of non-conformity in a public or private bureaucracy or in a certain policy that requires a transition to an ideal state, an adequate tool is required for this transition. The doctrinal construction of this tool is what has been conventionally called the doctrine of the structural process.

4 FINAL CONSIDERATIONS

It is evident that the structural process has the potential to modify the paradigms of procedural law, shifting the focus from the reparation of past damages to the construction of prospective and participatory solutions. Recognizing that many rights violations stem from the operating logic of complex bureaucracies, the institute proposes differentiated responses, based on the elaboration of action plans, collaboration between multiple social actors, and continuous judicial monitoring.

Although the doctrine still differs as to the best conceptualization and terminology to be adopted, there is a consensus that the effectiveness of a structural process depends: a) on the dialogical openness to the groups affected by the litigation and to civil society; b) procedural flexibility to adapt to the specificities of the specific case; and c) the adoption of progressive decisions that allow course corrections. Extrajudicial experiences, such as the

¹⁷ Adopting the same premise, Vitorelli points out that "It is a mistake to associate structural reform only with public institutions. Although they are the most common defendants in these cases, private institutions can perfectly demand structural changes so that social results are produced". (2022, p. 353)

Carrefour TAC, demonstrate that such objectives can also be achieved outside the Judiciary, as long as the principles of transparency, participation and accountability are observed.

ABSTRACT

This paper aims to analyze whether the principle of neutrality, one of the pillars of the Consumption Tax Reform, is compatible with the extrafiscal function of the tax system, in order to assess whether there is harmony within the context of the new consumption taxation framework introduced by Constitutional Amendment No. 132/2023. The issue arises from the contrast between neutrality, which seeks to avoid economic distortions and ensure a balanced competitive environment, and extrafiscality, expressed mainly through the Selective Tax, which retains the function of influencing behavior through taxation. The research finds that, although the Reform sought to establish a functional separation between the principle of neutrality and the extrafiscal function, relevant risks remain, such as the reduction of space for promotional policies, the rigid crystallization of essentiality, and political pressures for sector-specific benefits. Using the hypothetico-deductive method, it is concluded that neutrality and extrafiscality are not mutually exclusive, but require harmonization through clear criteria to ensure simplicity, economic efficiency, and social justice.

Keywords: Tax Neutrality. Extrafiscality. Tax Reform.

RESUMO

O presente trabalho tem como objetivo analisar se o princípio da neutralidade, um dos pilares da Reforma Tributária sobre o consumo, é compatível com a função extrafiscal do sistema tributário, a fim de verificar se há harmonia no contexto da nova arquitetura da tributação sobre o consumo, introduzida pela Emenda Constitucional n.º 132/2023. A problemática decorre do contraste entre a neutralidade, que busca evitar distorções econômicas e assegurar um ambiente concorrencial equilibrado, e a extrafiscalidade, expressa sobretudo

no Imposto Seletivo, que mantém a função de induzir comportamentos por meio da tributação. A pesquisa constata que, embora a Reforma tenha buscado estabelecer uma divisão funcional entre o princípio da neutralidade e a função extrafiscal, permanecem riscos relevantes, como a redução do espaço para políticas promocionais, a cristalização da essencialidade em moldes rígidos e as pressões políticas por benefícios setoriais. Mediante a metodologia hipotético-dedutiva, conclui-se que neutralidade e extrafiscalidade não são excludentes, mas exigem compatibilização por critérios claros, de forma a assegurar simplicidade, eficiência econômica e justiça social.

Palavras-chave: Tax Neutrality. Extrafiscality. Tax Reform.

RESUMEN

El presente trabajo tiene como objetivo analizar si el principio de neutralidad, uno de los pilares de la Reforma Tributaria sobre el consumo, es compatible con la función extrafiscal del sistema tributario, con el fin de verificar si existe armonía en el contexto de la nueva arquitectura de la tributación sobre el consumo, introducida por la Enmienda Constitucional n.º 132/2023. La problemática surge del contraste entre la neutralidad, que busca evitar distorsiones económicas y asegurar un entorno competitivo equilibrado, y la extrafiscalidad, expresada principalmente en el Impuesto Selectivo, que mantiene la función de inducir comportamientos mediante la tributación. La investigación constata que, aunque la Reforma haya buscado establecer una división funcional entre el principio de neutralidad y la función extrafiscal, persisten riesgos relevantes, tales como la reducción del espacio para políticas promocionales, la cristalización de la esencialidad en modelos rígidos y las presiones políticas por beneficios sectoriales. Mediante la metodología hipotético-deductiva, se concluye que la neutralidad y la extrafiscalidad no son excluyentes, sino que exigen compatibilización a través de criterios claros, con el fin de asegurar simplicidad, eficiencia económica y justicia social.

Palabras clave: Neutralidad Tributaria. Extrafiscalidad. Reforma Tributaria.

1 INTRODUCTION

The Consumption Tax Reform, implemented by Constitutional Amendment No. 132/2023, inserted in article 156-A, paragraph 1, of the Federal Constitution, the determination that the Tax on Goods and Services (IBS) and the Contribution on Goods and Services (CBS) will be governed by the principle of neutrality. This principle seeks to minimize tax distortions in economic choices, ensuring greater predictability and allocative efficiency.

However, the tradition of the Brazilian tax system reveals that taxes are not limited to a collection function, as they also play an extra-fiscal role, and can influence social and economic behavior. The Tax Reform preserved this regulatory dimension through the Selective Tax, aimed at discouraging conducts that cause negative externalities to promote constitutional values, such as the protection of health and the environment.

Although conceived as complementary, neutrality and extra-taxation can come into tension. The first seeks uniformity and simplicity in taxation, in order to reduce the interference of taxation in economic choices, while the second, on the contrary, operates through selective differentiations, using the tax as an instrument to induce behavior in favor of tax policy purposes.

The Reform sought to mitigate the tension between neutrality and extra-taxation through functional specialization: neutral taxes for broad and uniform collection purposes, and extra-fiscal taxes for specific regulatory purposes. This division, however, does not eliminate the challenges of its implementation, such as the risk of a "rigid essentiality", the reduction of space for promotional policies and the pressure for sectoral benefits that can weaken neutrality.

In this context, the problem of the compatibility between neutrality and extra-fiscal policy emerges, since would neutrality, chosen as one of the structuring guidelines of the new system of taxation on consumption, be compatible with the permanence of extra-fiscal instruments? From this, through the hypothetical-deductive methodology, this article aims to analyze whether the principle of neutrality is compatible with the extrafiscal nature of the system, in order to verify whether there is a harmonious or antagonistic coexistence in the context of the new architecture of taxation on consumption.

2 THE PRINCIPLE OF NEUTRALITY IN THE TAX REFORM ON CONSUMPTION

Tax neutrality is one of the pillars of an efficient tax system, alongside principles such as equity, simplicity and ability to pay. As conceptualized by Zilveti⁴, this rule gravitates around

⁴ ZILVETI, Fernando Aurélio. Variations on the principle of neutrality in international tax law. **Revista Direito Tributário Atual**, v. 19, p. 30.

the principle of tax equality, and the system that is structured in such a way as not to compromise the efficient allocation of the means of production is neutral, avoiding distortions that may unbalance the market.

It is the requirement that taxation interfere as little as possible in the economic decisions of individuals and companies, avoiding distortions that may favor certain sectors or forms of organization to the detriment of others. In essence, it means that economically equivalent activities or operations must receive equivalent tax treatment, so that the tax does not become a determining factor in the choice between business or consumption alternatives.

Tax neutrality has its origin in the economic tradition⁵, maintaining that the tax system should interfere in a minimal way in the choices of economic agents, avoiding distortions that compromise the efficient allocation of resources. The starting point of this thought is Adam Smith, who in his book *The Wealth of Nations* (1776), formulated principles of equality, certainty, convenience and efficiency, which, although they did not expressly use the term neutrality, indicated the need to avoid artificial barriers to production and trade.

In Brazil, the doctrine assimilated these economic bases, resulting in the debate about the theory of optimal taxation⁶, which defends broad systems, with uniform rates and few exceptions. The logic is that similar activities receive the same tax treatment, avoiding distortions that affect competition and ensuring that the choices of economic agents are based on real preferences, and not on artificial incentives created by the State.

This conception is connected to the notion of "fiscal wedge",⁷ understood as the difference between the amount paid by the consumer and the amount actually received by the producer due to taxation. When poorly designed, taxes widen this difference, discouraging consumption, production and investment, with negative effects on the allocation of resources and economic competitiveness.

In this sense, Moreira⁸ systematizes neutrality in two dimensions: horizontal and vertical. Horizontal neutrality requires equal treatment for economically equivalent situations, avoiding arbitrary distinctions between products, services or sectors. Vertical neutrality, on the other hand, is related to the technique of non-cumulativeness, which ensures that the tax

⁶ COSTA, C. F. de C., & Vieira, J. de C. (2021). Theory of optimal taxation: Contributions to the Brazilian reality. *Journal of Contemporary Administration*.

⁷ For the OECD, the term used is called "*Tax wedge*" and is understood as "*the ratio between the amount of taxes paid by an average single worker (a single person with 100% of the average income) without children and the corresponding total labor cost for the employer*". [Free translation]". Available at: <https://www.oecd.org/en/data/indicators/tax-wedge.html>.

⁸ MOREIRA, André Mendes. **Neutrality, added value and taxation**. Belo Horizonte: Forum, 2019, p. 211.

is levied only on the value added at each stage of the production chain, eliminating cascading taxation.

On the other hand, Schoueri⁹ warns of the limits of this conception. For him, there is no absolutely neutral tax: every tax incidence interferes in some way with the economy. What should be required, therefore, is that this interference be justified, proportional, and guided by constitutional purposes, so as not to generate undue competitive imbalances. In other words, neutrality is not the absence of impact, but the limitation of distortions.

Thus, the classical economic concept of neutrality provides the initial framework, but its application to positive law demands adjustments that recognize the tensions between ideal and normative reality. It is precisely at this point that the principle gains more defined technical and constitutional contours, especially with the adoption of non-cumulativeness.

However, it is important to emphasize that neutrality should not be confused with the absence of economic effects. Every tax changes, to a greater or lesser extent, the behavior of the agents. The aim is to ensure that such changes are not arbitrary or disproportionate. In this context, non-cumulativeness emerges as a fundamental technique to ensure vertical neutrality, preserving the efficiency of the system.

By allowing the taxpayer to credit the tax paid in the previous stages of the chain, non-cumulativeness ensures that the tax is levied only on the value added in each transaction. This structure prevents the so-called "cascade taxation", which generates serious distortions, such as the artificial increase in prices, the loss of competitiveness, and the induction of business decisions guided by the accumulated tax burden, and not by criteria of economic efficiency.

Moreira¹⁰, in a comparative law study on European VAT, points out that any undue restriction on the right to credit weakens neutrality. For him, non-cumulativeness must be broad, automatic and objective, so as not to compromise competitive equality.

This perspective was incorporated by Constitutional Amendment No. 132/2023, which enshrined full non-cumulativeness in the new model of Tax on Goods and Services (IBS) and Contribution on Goods and Services (CBS), replacing the old criterion of "physical credit" applied to ICMS and IPI with a more comprehensive financial credit model. Thus, the IBS and CBS must be guided by this principle¹¹.

⁹ SCHOUERI, Luís Eduardo. Taxation and economic induction: the economic effects of a tax as a criterion for its constitutionality. In: Roberto Ferraz. (Org.). **Principles and Limits of Taxation 2 – The principles of the economic order and taxation**. São Paulo: Quartier Latin, v. 2, 2009.

¹⁰ MOREIRA, André Mendes. The right to credit in European VAT: notes on the principle of tax neutrality. **Current Tax Law Journal**, n. 42, p. 47, 2019.

¹¹ SCHOUERI, Luís Eduardo; GALDINO, Guilherme. The Neutrality of the Transitory Rules in the IBS and CBS: the Case of Capital Goods. **Current Tax Law Journal**, v. 59, 2025.

The technique of non-cumulativeness is directly connected to vertical neutrality: a tax is neutral when it does not accumulate along the production chain. Horizontal neutrality, on the other hand, as seen, requires a broad and uniform base, avoiding artificial distinctions. Both dimensions are indispensable for building a more efficient and fair tax system.

This normative framework represents an advance, as it inserts neutrality among the constitutional limitations on the power to tax, transforming it into a parameter of constitutionality and interpretative guide for legislators, regulators and courts. From an economic point of view, neutrality seeks to promote allocative efficiency, as resources should flow to the most productive activities according to market criteria and not as a result of tax incentives or penalties.

Failure to comply with this principle can generate relevant costs to the economy, such as loss of international competitiveness, artificial favoring of certain sectors, administrative complexity and increased tax litigation, in addition to business verticalization. In other words, distorting taxes reduce productivity and compromise sustainable development.

The constitutional incorporation of neutrality does not, however, eliminate the possibility of using taxation for extra-fiscal purposes. Public policies can use taxation to encourage desirable behaviors, such as technological innovation or environmentally responsible practices, and discourage harmful behaviors, such as the consumption of cigarettes and alcoholic beverages.

This tension between neutrality and extra-taxation requires the legislator to establish clear and proportional criteria for interventions, preventing exceptions from converting the principle into mere rhetoric.

The practical implementation of neutrality in Brazil faces significant challenges. Although Complementary Law No. 214/2025 regulated the IBS and CBS, reproducing the constitutional text and defining neutrality as a legislative guideline, the legal diploma included exceptions that reduce the scope of the principle. This situation creates risks of judicialization, especially in the face of provisions that may restrict the scope of a constitutional guarantee.

Another challenge is the very nature of consumption taxation, which is inherently distorting. The burden falls on goods and services¹², affecting relative prices and influencing consumption decisions. Neutrality, in this context, works as a regulatory goal: it seeks to reduce undesirable effects to a minimum, but they will hardly be completely eliminated.

¹² ZILVETI, Fernando Aurélio. Variations on the principle of neutrality in international tax law. **Revista direito tributário atual**, v. 19, 2005.

In addition, there is a risk that political interests and sectoral pressures will weaken the application of the principle. Comparative experience¹³ shows that highly fragmented Value Added Tax (VAT) systems, with multiple exceptions, special regimes and benefits, end up sacrificing neutrality and amplifying distortions¹⁴.

This is what happens in countries such as India, whose GST (*Goods and Services Tax*) maintains numerous different rates, and also in pre-reform Brazil, with the multiplicity of ICMS, ISS and PIS/COFINS regimes.

Nevertheless, it is important to highlight that neutrality does not oppose tax justice, but complements it. While progressivity and the ability to pay seek to distribute the tax burden equitably, neutrality ensures that this burden is not manipulated in a way that favors specific groups. A neutral system tends to be more transparent, predictable, and reliable, which are essential factors for attracting investments and consolidating legal certainty.

In this sense, the doctrine points out that neutrality must be interpreted systemically, in articulation with other constitutional tax principles. It is not an absolute ideal, but a guideline whose observance strengthens the rationality of the system, increases economic efficiency and contributes to the democratic legitimacy of taxation.

Thus, if neutrality seeks to reduce distortions, extra-taxation reveals precisely the possibility of the State intentionally using them to pursue legitimate ends. It is at this point of balance between economic efficiency and normative intervention that the debate on the extrafiscal function of taxation opens.

3 EXTRA-TAXATION IN THE TAX REFORM ON CONSUMPTION

Throughout history, taxation has never been limited to the function of raising funds to fund state activities. The tax has also been used as a tool for economic and social intervention, capable of encouraging certain conducts, discouraging others and guiding the actions of private agents in line with broader constitutional objectives. This phenomenon, known as extrafiscality, expresses the political dimension of the tax system and reinforces its condition as an instrument for the implementation of public policies.

Adamy, in exploring the theoretical origins of extrataxation, elucidates that Adolph Wagner, a German author of the late nineteenth century, was the one who began to conceive the tax phenomenon "in a differentiated way, thinking of it beyond the mere instrument of

¹³ ABSWOUDE, Kevin van. *The principle of fiscal neutrality and economic reality in EU VAT: two peas in a pod?*element. **Lund University**, Sweden, 2022.

¹⁴ MOREIRA, André Mendes. The right to credit in European VAT: notes on the principle of tax neutrality. **Current Tax Law Journal**, n. 42, 2019.

state financing",¹⁵ having revolutionized the central concept of tax. The author explains that it was Wagner who established the theoretical bases of the discussion on non-collection tax purposes, "demonstrating that tax law can have political and social purposes distinct from mere collection".¹⁶

Vieira elucidates that extra-taxation is a central concept in tax law, which transcends the mere collection function, positioning it as a fundamental instrument for the implementation of public policies¹⁷. This is because, for the author, tax law should not be conceived only as a means of state financing, but also as a mechanism for implementing policies in several areas¹⁸.

It is in this sense that Adamy maintains that the law is not an end in itself, but also an instrument for the achievement of state purposes¹⁹. The author defines the instrumentalization of law as "the right being used as an instrument, as a means, as a tool"²⁰ for the induction of behaviors, according to the purpose of the State. Still, Adamy points out that in the tax context, this instrumentalization is manifested in the ability to influence conduct, whether granting incentives or disincentives²¹.

Unlike tax taxes, as Folloni explains, whose main function is to sustain state expenditures based on the ability to pay, the foundation of extrafiscal taxes "is not the sustenance of public expenditures in general, but the internalization of negative externalities".²² Because of this, extra-taxation justifies the adoption of different differentiation criteria for the ability to pay, allowing taxation to be guided by public policy purposes. Thus, selectivity, the granting of exemptions, the setting of increased or reduced rates and the institution of special regimes are not explained only by the economic aptitude of the taxpayer, but by the search for desired effects in the social or economic reality.

With this, Leão emphasizes the importance of defining the "extrafiscal purpose aimed at in the law"²³ for the control over the instrumental use of Tax Law. For the author, the

²³ LEÃO, Martha. Contribution to the study of Extrafiscality: the importance of purpose in the identification of extrafiscal tax rules. *Revista Direito Tributário Atual*, nº 34, 2015, p. 314.

extrafiscal purpose is not the intention of the 'historical legislator', so that it must be embodied in the will itself objectified in the law and not in the subjective will of the legislator²⁴.

The will of the law, as Guastini points out, is the "reason, the motive, the end, the practical result, by which a certain norm has been edited"²⁵ and to verify it "it is necessary to pay attention not (or at least not so much) to the preparatory work, but to the text of the law as such, in addition to the social and political circumstances in which it was edited".²⁶

It is in this sense that extra-taxation is seen as a facet that allows the State to induce behavior through taxes, so that "taxation can also act as an instrument to induce social and economic behaviors".²⁷ This would be, for Santos and Scabora, the essence of the extrafiscal function of taxation, which does not have as its main purpose to supply the public budget, but rather the "attempt to increase economic or social well-being".²⁸

In this sense, Schoueri observes that extra-taxation transforms the tax into a true instrument for inducing behavior,²⁹ acting as an indirect regulatory mechanism in sensitive areas, such as health, environment, regional development or incentive to technological innovation. The tax, therefore, ceases to be an end in itself – the collection – and starts to assume an instrumental function, to shape individual and collective choices in order to bring them closer to constitutional values and state policy objectives.

Thus, within this context of conduct induction, extratation is used to correct "externalities", whose notion, extracted from economic law, refers to costs and gains from private activities borne or enjoyed by the community due to market failures³⁰. Externalities can be positive, when they generate benefits, or negative, when they generate costs/harms.

Economist Arthur Cecil Pigou has already suggested the institution of a tax to correct negative externalities and the payment of a subsidy to compensate for the positive externalities practiced by companies³¹. In this sense, extra-taxation would not aim to prevent an activity, but rather to condition the freedom of choice of the economic agent through the graduation of the tax burden according to specific purposes³².

³¹ BALTHAZAR, Ubaldo Cesar. **Taxes and the Environment**. Espaço Jurídico, Joaçaba, v. 12, n. 2, jul./dez. 2011, p. 238.

³² DOMINGUES, José Marcos. **Tax Law and the Environment**. Rio de Janeiro: Forense, 2007, p. 49-50.

Schoueri explains that, in the case of pollution, for example, which generates environmental damage that is not borne by the perpetrators, state action seeks to internalize costs, so that the prices of products or services reflect the environmental damage caused by polluters³³. For positive externalities, the author suggests that the State should, through economic advantages, increase the gains of those who generate environmental benefits, allowing these advantages to be accounted for³⁴.

In this scenario, it is clear that extra-taxation is not just a possibility, but a reality intrinsic to the very logic of the tax system's operation. If taxes can be shaped to internalize externalities and induce behaviors, it is natural that the Brazilian normative architecture, especially in the Reform process, seeks specific mechanisms to enhance this function.

In the context of the Consumption Tax Reform, this role was expressly assigned to the Selective Tax, provided for in Constitutional Amendment No. 132/2023 and regulated by Complementary Law No. 214/2025. Unlike the IBS and the CBS, conceived under the logic of neutrality and the fiscal purpose of collection, the Selective Tax assumes a predominantly extra-fiscal function, aimed at burdening goods and services considered harmful to health or the environment.

This tax, clearly of extrafiscal inspiration, is not connected to the idea of tax reinforcement, but rather to the regulatory function of the State, in line with what Pigou and contemporary doctrine have already outlined as essential for the correction of negative externalities. Thus, the Selective Tax emerges as the manifestation that extra-taxation continues to play a structuring role in the Brazilian tax system, even in a context in which neutrality is elected as a guiding principle of the Reform.

In this context of the Tax Reform, extra-taxation is manifested through selectivity, which allows the identification of the negative characteristics of goods and services, associating them with the damage they cause to the environment and health. The logic of extra-taxation used in the Selective Tax of the Reform is different from that applied to the Tax on Industrialized Products (IPI), in which the rates are selective according to the essentiality of the product.

Matschulat and Amaral explain that in the case of IPI, extrataxation is a "secondary consequence of taxation"³⁵ and not an "effect deliberately intended by the legislator", ³⁶as in

³³ SCHOUERI, Luís Eduardo. Environmental Law, Op. cit., p. 236.

³⁴ Ibid., p. 237.

³⁵ MATSCHULAT, Leonardo; AMARAL, Luiz Bernardo Kämpf Amaral. The perspective for the implementation of the Selective Tax as a tax type in Brazil. **Res Severa Verum Gaudium**, v. 6, n. 2, 2022, p. 297.

³⁶ Ibid.

the Selective Tax. Returning to Leão, the authors state that for a tax to be considered for an extra-fiscal purpose, "this purpose must be unequivocally demonstrated by the legislator".³⁷

Thus, it can be stated that, while the IPI operates under a logic of selectivity by essentiality, being a tax with extrafiscal effects, the Selective Tax is structured on a logic of extrafiscal selectivity, aimed at the internalization of social and environmental costs and protectionist purposes. When applied to harmful goods or services, its function is not to distinguish the superfluous from the essential, but rather to graduate taxation according to the adverse impact generated on the community and the environment.

Because of this, although Constitutional Amendment No. 132/2023 did not expressly insert in article 153, paragraph 6, the expression 'will have an extrafiscal purpose', Folloni maintains that such an omission does not mischaracterize its nature, which is precisely extrafiscal³⁸. For the author, the only interpretation compatible with the principles of equality, ability to pay and with the stony clauses is to recognize the extra-fiscal function of the Selective Tax, because, otherwise, its very insertion in the Constitution would represent an affront to such principles³⁹.

On the other hand, Adamy says that the Tax Reform represented a break with the traditional role of extra-taxation in Brazilian tax law⁴⁰. For him, the Reform subverted the foundations of extrataxation⁴¹, by prioritizing the sanctioning function and restricting, almost completely, the promotional dimension of taxation. This is because extrataxation is not only used to discourage harmful conduct, but also to promote benefits, using the tax as a negative or positive instrument of induction⁴².

In this scenario, the author identifies three central foundations of this subversion: the broad prohibition on the granting of tax incentives in the IBS and CBS, the creation of a Selective Tax with an exclusively sanctioning function and restricted to certain matters, and the adoption of a "rigid essentiality", which crystallizes in a constitutional context a closed list of goods and services considered deserving of favored treatment⁴³.

Adamy points out that such changes remove from the tax system its flexibility and its ability to serve as a tool for promoting public policies⁴⁴. When commenting on the broad prohibition of benefits, he states that "by establishing this broad prohibition, the constitutional

³⁷ Ibid.

³⁸ FOLLONI, Op., op., p. 627.

³⁹ Ibid.

⁴⁰ ADAMY, Pedro. Extrafiscality in the Tax Reform: rigid essentiality and the end of the promotional function of Tax Law. *Revista Direito Tributário Atual*, v. 58. year 42, São Paulo: IBDT, 3rd quarter 2024, p. 427.

⁴¹ Ibid., p. 412.

⁴² Ibid., p. 411.

⁴³ Ibid., p. 417-429.

⁴⁴ Ibid., p. 412.

text disregards the promotional or positive function of tax law, which has historically been used as an instrument of implementation and promotion".⁴⁵

In the case of the Selective Tax, Adamy observes that it was conceived in a 'doubly limited' way, because on the one hand it only has a sanctioning function, aimed at burdening harmful operations and, on the other hand, because it is restricted exclusively to goods and services harmful to health and the environment, removing the possibility of levying harmful practices in other equally relevant ⁴⁶sectors. For the author, this restriction implies an impoverished understanding of extra-taxation, which reduces its scope to a merely repressive instrument⁴⁷.

These criticisms are directly connected to the following discussion about the relationship between neutrality and extra-taxation in consumption taxation. Neutrality, understood as a guiding principle of the Tax Reform, seeks to avoid economic distortions and ensure uniform treatment between sectors.

However, when taken to the extreme, it can collide with the extra-fiscal function, which requires flexibility and differentiation to promote constitutional objectives. Thus, the dilemma of a system that has accentuated rigidity and eliminated the space for promotion makes it necessary to analyze the tension between these two principles: neutrality and extra-taxation.

4 ANALYSIS OF THE OPPOSITION OR COEXISTENCE BETWEEN EXTRA-TAXATION AND NEUTRALITY

On the one hand, as seen, neutrality advocates that taxation should not distort consumption decisions and the organization of economic activity, keeping away from private choices and ensuring that the tax system does not cause an environment of competitive imbalance. On the other hand, extra-taxation seeks to influence the behavior of economic agents, either to discourage practices considered harmful or to promote socially desirable conduct. The apparent contradiction between tax neutrality and extra-taxation deserves further analysis, especially in view of the transformations introduced by the Brazilian Tax Reform.

The first relevant observation is that the tension between neutrality and extra-taxation does not derive from a conceptual incompatibility, but rather from specific *tax design* choices. When collection, economic neutrality and behavioral induction functions are concentrated in the same tax, conflicts and distortions are inevitably created.

⁴⁶ Ibid., p. 421.

⁴⁷ Ibid., p. 422.

The Brazilian pre-reform tax system exemplified this problematic overlap: the ICMS, originally conceived as a tax on consumption, accumulated collection, extra-fiscal and regional policy functions, resulting in excessive complexity, tax war and significant economic distortions.

International experience shows, however, that neutrality and extra-taxation can coexist harmoniously when there is a clear functional division between taxes. Mature tax systems often combine broad-based neutral taxes (such as European VAT) with specific non-fiscal taxes (such as the so-called *sugar tax* in the UK – *Soft Drinks Industry Levy* – *SDIL*)⁴⁸. This specialization allows each tax instrument to fulfill its specific function without compromising the effectiveness of the others.

The Brazilian Tax Reform adopted precisely this logic of functional division. The constitutional design establishes a tax architecture in which different taxes assume specialized roles, so that the IBS and CBS must operate under the principle of neutrality, while the Selective Tax concentrates the extrafiscal function.

In addition, other taxes that are known to be extra-fiscal maintain their roles, such as the IOF and the Import Tax, as well as other taxes that, although primarily fiscal, are often used for behavioral induction purposes (such as the zero IPVA rate for electric cars adopted by some states).

This functional division is expressly enshrined in the constitutional text and in infra-constitutional legislation. Article 156-A, § 1, item X, of the Federal Constitution, prohibits the granting of tax incentives and benefits related to the IBS (also applicable to the CBS, according to article 195, item V, § 16), "*except in the cases provided for in this Constitution*". This provision, regulated by article 2 of Complementary Law No. 214/2025, establishes that "*the IBS and the CBS are informed by the principle of neutrality, according to which these taxes must avoid distorting consumption decisions and the organization of economic activity*".

At the same time, the extra-fiscal nature of consumption taxes was not abolished from the system, but directed to specific instruments. As Folloni observes⁴⁹, the Selective Tax, provided for in article 153, VIII, of the Federal Constitution, assumes an extra-fiscal function when it is levied on goods and services that are harmful to health or the environment. The author argues that this competence cannot be understood as relating to a simple collection tax, because, if it were, it would violate the principles of ability to pay and tax equality, and should be interpreted as a genuinely extra-fiscal and selective tax⁵⁰.

⁴⁸ It is a tax with an ad rem rate for beverages with high sugar content.

⁴⁹ FOLLONI, Op. Cit., p. 624.

⁵⁰ Ibid.

The Tax Reform, therefore, did not eliminate extra-taxation, but promoted its systemic reorganization, concentrating the extra-fiscal function in the Selective Tax and preserving other tax instruments for promotional purposes. This coexistence, through functional specialization, has obvious advantages.

First, it provides greater clarity to the objectives of each tax, facilitating both application and jurisdictional control. Second, it reduces the complexity of the consumption tax system, eliminating the multiple rates, special regimes and exceptions that characterized, for example, the ICMS. Complementary Law No. 214/2025 operationalizes this simplification through a system of reference rates (article 18) and specific regimes. Third, it enhances the end or reduction of the tax war between federated entities (in line with the principle of destiny⁵¹), which used tax benefits as instruments of competition for investments, compromising federative harmony. The neutrality of the IBS and the CBS, established in article 2 of the aforementioned complementary law, eliminates this possibility by prohibiting differential treatment not provided for in the constitution.

The neutrality of the IBS and CBS also contributes to greater economic efficiency. By eliminating tax distortions in consumption and business organization decisions, these taxes allow the allocation of resources to be determined by economic efficiency criteria, not by tax considerations. This represents a significant advance towards a tax system that is less distortive and more compatible with economic development, especially when considering that the Tax Reform promises full non-cumulativeness (article 156-A, § 1, VIII, of the Federal Constitution), with a broad financial credit system, effectively eliminating the cascade effect, which characterized the previous system.

However, this coexistence architecture is not without important limitations. The main criticism formulated by Adamy, already pointed out previously and deepened here, is directed at the loss of the promotional function in the taxation of consumption. The author observes that "the Tax Reform on consumption taxation, by changing the constitutional tax system, modified and, to a large extent, subverted the foundations of extrattribution".⁵²

According to Adamy, the Selective Tax has a strictly sanctioning nature, aimed at discouraging harmful practices (especially related to the environment and health), but without the ability to promote beneficial behaviors⁵³. This limitation contrasts with the previous system, in which differentiated rates and tax benefits could be used to encourage sustainable practices, support strategic sectors, or promote social policies.

⁵¹ The collection will pass from production to consumption, that is, to the States and Municipalities in which the consumers of the product or service are located.

⁵² ADAMY, Pedro. Extrattribution in Tax Reform. Op. Cit., p. 410.

⁵³ Ibid.

In addition, the Reform institutes what this author calls "*rigid essentiality*" or "*closed essentiality*", with a list of goods, services, activities and sectors that will have different treatment, to the exclusion of any others, no matter how relevant they may be. This rigidity can compromise the ability of the tax system to adapt to changes in social demands and public policy priorities⁵⁴.

The author also argues that "by instituting a rigid or closed essentiality, with an exhaustive enumeration of the goods, services, activities and sectors that will have the most beneficial treatment, to the exclusion of all others, however essential they may be considered", the Reform drastically limited the promotional function of tax law, overemphasizing the sanctioning function of extra-taxation⁵⁵.

The express prohibition on tax benefits in the IBS and CBS may also generate future tensions. Political pressures for differential treatment of certain regions, sectors or activities are predictable, especially in a country with the regional inequalities of Brazil and whose Federal Constitution, in its article 3, III, establishes that one of the fundamental objectives of the Federative Republic of Brazil is the reduction of regional inequalities. The maintenance of the neutrality of these taxes will depend on the ability of institutions – especially the Supreme Court – to preserve the constitutional architecture against attempts at erosion through extensive or creative interpretations.

Another challenge is related to the effectiveness of tax neutrality itself. Although the Tax Reform has inserted the principle in a much more emphatic way than in the previous regime, the fact is that, until now, "tax neutrality has been understood at its minimum level by the Federal Supreme Court", ⁵⁶and the application of this principle by the Judiciary⁵⁷ to declare the unconstitutionality of a certain tax benefit is absent, characterizing, until then, as a theoretical ideal.

The sustainability of systems based on the functional division between neutral and extra-fiscal taxes depends on institutional and political factors. The Tax Reform represents a bet on the ability of institutions to maintain systemic coherence in the face of pressure from interest groups. The success of this architecture will depend on the ability to channel demands for sectoral public policies to other instruments – tax or not – without compromising the neutrality of taxes on consumption.

Finally, it is important to recognize that the coexistence between neutrality and extra-taxation through functional specialization represents a choice that implies trade-offs: one

⁵⁴ ADAMY, Pedro. Extrafiscality in Tax Reform. Op. cit., p. 412 and 428.

⁵⁵ Ibid, p. 429

⁵⁶ MOREIRA, André Mendes. **Neutrality, added value and taxation**. Belo Horizonte: Forum, 2019. p. 211.

⁵⁷ KOCH, Mariana Porto, Op. cit., p. 83.

gains in simplicity and efficiency, but loses in flexibility for public policies. As Adamy summarizes, "in the case of extrafiscality, the (constitutional) amendment came out worse than the sonnet",⁵⁸ indicating that, despite these aforementioned gains, the promotional function of extrafiscal is lost.

This tension reflects political choices. The Brazilian Tax Reform, at first, chose to privilege economic efficiency and operational simplicity to the detriment of flexibility for sectoral public policies, concentrating the extrafiscal function on consumption taxation in the Selective Tax and tax neutrality in the IBS and CBS.

5 CONCLUSION

The conclusion that emerges from the analysis of the present study is that tax neutrality and extra-taxation are not necessarily antagonistic norms, but can coexist harmoniously when there is a clear division of functions between different taxes. The Tax Reform operationalized this coexistence in an innovative way, establishing a system in which neutral taxes (IBS and CBS) coexist with specific extrafiscal instruments (Selective Tax).

The success of this architecture, as seen, will depend on the ability of institutions, especially the Federal Supreme Court, to preserve the functional specialization of taxes, resisting pressure from interest groups for exceptions that may compromise systemic coherence.

Although this solution has limitations in terms of flexibility for public policies, it represents a significant advance towards a more efficient, simple, and less distortive tax system. The ability to adapt to new social demands will be conditioned to the use of other tax instruments or to the eventual constitutional revision of the exhaustive lists established by Constitutional Amendment No. 132/2023.

It is noted that neutrality, as a constitutional principle, should not be understood as state indifference, but as a guarantee of equal treatment and economic efficiency. Extrataxation, even if delimited, continues to play an essential role in the correction of externalities. The coexistence between both norms requires institutional safeguards: (i) clear and justified exceptions; (ii) periodic review mechanisms; (iii) transparency in political choices; and (iv) jurisdictional firmness to contain interpretative erosions.

Thus, in summary, the study demonstrated that the Brazilian Tax Reform promoted a reconfiguration of the relationship between neutrality and extra-taxation. By reserving neutrality for broad-based taxes (IBS and CBS) and concentrating extra-taxation in the Selective Tax, the legislator sought to eliminate historical distortions, reduce litigation and end

⁵⁸ ADAMY, Pedro. Extrafiscality in Tax Reform. Op. cit., p. 430.

the tax war. However, this design reduced the flexibility for the promotion of public policies, limiting extra-taxation to a predominantly sanctioning function.

The Brazilian Tax Reform, therefore, did not eliminate the tension between neutrality and extra-taxation, but reorganized it systemically, creating a model adequate to the needs of a modern and complex economy, although at the cost of greater rigidity in the implementation of sectoral public policies through taxation on consumption.

Thus, the central conclusion is that neutrality and extra-taxation are not antagonistic norms, but complementary dimensions of the same system. When articulated in a balanced way, they can ensure simplicity and efficiency without abdicating the social function of the tax, making Brazilian taxation on consumption more rational, predictable and fair.

their subsequent use in the production of conventional-strength structural concrete. This research refers to the study, which partially addressed the dynamics of the production cycles of synthesized aggregates. For this purpose, the AGS70 and AGS80 coarse aggregates from the third production cycle were used. The percentage discrepancy of residue in the aggregate composition was approximately 10%. Among the results obtained, the analyses of the physical and mechanical properties of the synthetic aggregates stand out. In this context, AGS80 showed a water absorption capacity 24% higher than that of AGS70. The results obtained in the composites with AGS70 and AGS80 aggregates indicated that, at an initial stage, the concrete with AGS80 showed better results regarding physical and mechanical properties.

RESUMO

O presente estudo é parte integrante de um extenso projeto de cooperação para a realização de pesquisas entre a Universidade Federal do Pará e a empresa Hydro Alunorte. A proposta consistia na produção de agregados graúdos sintéticos a partir de resíduos de bauxita (AGS) e sua subsequente utilização na produção de concreto estrutural de resistência convencional. Esta pesquisa faz menção a um estudo, o qual abordou, em parte, a dinâmica dos ciclos de produção de agregados sintetizados. Para tanto, empregou-se os agregados graúdos AGS70 e AGS80 do terceiro ciclo de produção. A discrepância percentual do resíduo na composição dos agregados foi de aproximadamente 10%. Dentre os resultados obtidos, destacam-se as análises das propriedades físicas e mecânicas dos agregados sintéticos. Nesse contexto, o AGS80 apresentou capacidade de absorção de água 24% superior à do AGS70. Os resultados obtidos nos compósitos com os agregados AGS70 e AGS80 indicaram que, em um primeiro momento, o concreto com AGS80 apresentou melhores resultados em relação às propriedades físicas e mecânicas.

1 INTRODUCTION

The bauxite residue, formerly called red mud, is obtained through the Bayer process to refine bauxite and obtain alumina, a by-product of aluminum. For each ton of alumina produced, 1 to 2 tons of this waste are generated, which usually contains oxides of iron, titanium, silica, residual aluminum and other metals such as vanadium, nickel and chromium Miura, Yuuki Silveira (2015) and has a high pH increasing the environmental risk M. L. P. Antunes *et al.* (2010). Large containment deposits are built to store this waste. However, this condition ends up generating visual and ecological impact and can also degrade landscapes and hinder revegetation Miura, Yuuki Silveira (2015).

Research shows that some alternatives are already being applied to use bauxite residue with proper treatment, such as techniques for recovery and (or) reduction of the visual and ecological impacts of degraded areas Miura, Yuuki Silveira (2015). The use in construction materials with bricks or masonry laying blocks, cements, paving blocks, coarse and fine aggregates for concrete Antunes *et al.* (2010).

Based on the studies presented by Fernandes, *et al.* (2025), this research seeks to evaluate whether the amount of residue content used in the production of synthetic coarse aggregates through the third production cycle, specifically AGS70 and AGS80, influenced the results obtained from the physical, chemical and mechanical characterization tests. Thus, as in the physical and mechanical properties of Portland cement concretes of normal strength.

Therefore, this study also establishes a correlation of the influence of synthetic coarse aggregates on the mechanical strengths and modulus of elasticity of Portland cement concrete with the normal strength class. This research presents comparative results of concretes produced with these two types of SFA, analyzing their respective performances in the fresh state such as consistency, bulk density and cement consumption. In the hardened state, aspects of water absorption, porosity, specific mass and static modulus of elasticity are analyzed. In the fracture state of the concrete, the strength to axial compression, diametrical traction and flexion are measured. Finally, the matrix-aggregate interface is analyzed by scanning electron microscopy (SEM).

2 METHODOLOGY

The bauxite residue (RB) used in the research comes from solid waste deposits (DRS), with a storage capacity of 92.2 Mm³ (mega cubic meters) (Souza, *et al.*, 2019), from the HYDRO Alunorte refinery located in the State of Pará, as shown in Figure 1.

Figure 1

Location of the bauxite residue deposit. A and B) Factory Location (Google Maps, 2025) and C) Waste storage area by the company Hydro Alunorte, in Barcarena-PA

Source: Souza, et al., 2019. Adapted. Authors, 2025.

2.1 MATERIALS

2.1.1 Bauxite Residue

Fernandes *et al.* (2025) emphasize that the production of synthetic coarse aggregate took place through the use of raw materials: kaolinite clay, silica and bauxite residue (RB), supplied by the company Hydro Alunorte, located in Barcarena in the state of Pará and stored in the Civil Engineering Laboratory of the Federal University of Pará (UFPA), as shown in Figure 2.

Figure 2

Storage of bauxite residue in the Civil Engineering laboratory of UFPA. A) Arrangement of the way in which the material was transported and subsequently stored; B) Appearance of the Waste in natura; C) and D) Samples of AGS70 and AGS80 obtained in the second production cycle

Source: Adapted, Fernandes, et al. (2025).

2.1.2 Aggregates

The fine aggregate used in the research is classified as a natural sand type, coming from the quartz riverbed of the Amazon region, more specifically in the vicinity of the municipality of Ourém, in the state of Pará. Physical characterization tests of the material were carried out, whose results indicate a specific mass of 2.62 g/cm^3 , unit mass of 1.61 g/cm^3 and a water absorption of 1.5%. Through the granulometry test, the result of a fineness modulus of 2.4 and a maximum dimension of 1.18 mm was obtained, which indicates that the material is classified as medium sand.

The coarse aggregate is of the synthetic type, called AGS70 and AGS80 of the third production cycle, with percentages ranging between 70-75% and 80-85% of bauxite residue in its composition respectively, supplied by the company Hydro and produced in the chemical engineering laboratory of the Federal University of Pará, as described by Fernandes, *et al.* (2025). For these types of aggregates, physical characterizations were also carried out, presenting the results of maximum diameters of 19.0 mm, specific masses of 2.21 and 2.26 g/cm^3 , fineness modulus of 1.95 and 1.84, shape indices of 2.07 and 2.08. However, the values reported for water absorption are in the order of 5.24% and 6.50%, respectively Fernandes, *et al.* (2025). However, the authors informed in the research in an inverted way. The sintering temperatures were set at 1200°C and the shapes of these coarse aggregates can be seen in Figure 2-C and 2-D.

Figures 3.A and 3.B show the particle size curves of the fine aggregate and the large aggregates AGS70 and AGS80.

Figure 3

Particle size range of AGS70 and AGS80 (A) and giblets (B) large aggregates

Source: Adapted, Fernandes, R.S. et al. (2025).

It can be easily observed that the particle size distribution of the sand is outside the frame between the ranges of the lower usable zone and the optimal lower usable zone. On the other hand, the particle size curves of the synthetic coarse aggregates show a partial framing between the upper and lower zones of the particle size range of the sieves #4.8-12.5mm. The equivalence of the curves of the coarse aggregates is an important aspect, as it was necessary to avoid the granulometric variability among the coarse aggregates to be used in the production of cementitious composites.

The coarse aggregates were submitted to mechanical abrasion tests in Los Angeles, whose results showed a mass loss of 41.06% for AGS70 and 43.94% for AGS80. This confirms that the synthetic aggregates in this study meet the minimum requirements of NBR 7211, of 2022, for use in structural concrete.

The verification of whether these synthetic coarse aggregates produced in the laboratory have the potential for reactivity in relation to cement alkalis is essential to ensure the integrity and durability of the concretes. Therefore, the alkali-aggregate reaction assays were performed for synthetic coarse aggregates (AGS70 and AGS80) and also for fine aggregates (sand), as shown in Figure 4.

Figure 4

Results of the aggregate alkali reaction tests of the sand, AGS70 and AGS80 according to NBR 15577-4/2019.

2.1.3 Dosing and preparation of the dosing curve

The concrete mix was stipulated at 30 MPa at 28 days, based on the dosage diagram (Figure 5) by the IBRACON method and by the recommendations of NBR 12655:2022, adopting the aggressiveness class II, according to NBR 8953:2015. For the preparation of

the dosage curves of the traces, the same 57% mortar was maintained, considering a concrete for application in the superstructure of tall buildings by means of pumping. Nor were any additives used, in order to directly know the influence of the porosity of the coarse aggregates on the porosity of the concrete. Thus, the consistency class was fixed at S50 due to the reduction of the work through the slump test. Table 1 presents the results of compressive strength of the specimens (CP) at the age of 28 days for the poor, rich and normal traces for the elaboration of the dosage curves, according to the recommendations of the IBRACON Method (Figure 5).

Table 1

Compressive strengths of the dosage curve

	CLASS	DASH	Attn:	α (%)	Consist. (mm) NBR 7112/2021	fckJ (MPa)	DP	CV
Normal	CAGS70N	1:5,0	0,70	57	S50: $50 \leq TO < 100$	22,17	1,03	0,05
	CAGS80N	1:5,0	0,65	57	S50: $50 \leq TO < 100$	22,50	1,66	0,07
Poor	CAGS70P	1:6,5	0,84	57	S50: $50 \leq TO < 100$	15,12	0,19	0,01

2.1.4 Unit traits extracted from the curve

The CAGS70 and CAGS80 concretes were evaluated in the hardened state by means of simple axial compression mechanical tests at the ages of 7 and 28 days in cylindrical specimens of 100x200 mm (Figure 7-B and F); diametrical compression traction and flexion traction at the age of 28 days, in cylindrical specimens of 100x200 mm (Figures 7-C and D) and in prismatic specimens of 150x150x500 mm, respectively (Figures 7-D and H). The static modulus of elasticity is measured in cylindrical specimens, whose characteristics are presented in Table 1. In addition, water absorption and void index tests were carried out to correlate with the mechanical strengths of the concretes.

Considering the need to keep the experimental parameters within the same consistency range established by the dosing curves, the mixing water used was adjusted for the concretes, differing from the amount predicted in the initial trace. It is important to emphasize that such changes directly influenced the relationship of the final binding water of the composites and their respective mechanical properties. As shown in Table 2, the properties of cementitious composites are presented

Table 2*Design of the mixtures of the composites studied*

Composite/Aggregate Type	Mortar content (%)	Unit Trace	Binding water (initial)	Binding water (final)	Consistency S50 (mm)	Lampshade (mm)	Cement Consumption (Kg/m ³)	Concrete Mass (Kg/m ³)

The concrete slump was established in a range ranging from 50 mm to 100 mm, depending on the S-50 strength class. The axial compressive strength, defined in this study as 30 MPa (C30), corresponds to the concrete usually used in vertical works. The concrete dosage was carried out at the Civil Engineering Laboratory of the Federal University of Pará. Figure 6 details the sequencing of the concrete dosing process with the synthetic coarse aggregate. Figure 7, in turn, demonstrates the immersion cure of the samples, as well as the mechanical tests and the static modulus of elasticity.

3 RESULTS AND DISCUSSION

3.1 INFLUENCE OF THE VARIATION OF THE RESIDUE CONTENT IN THE SYNTHETIC AGGREGATES AGS70 AND AGS80 IN RELATION TO THEIR PHYSICAL, CHEMICAL AND MECHANICAL PROPERTIES

The results found for AGS70 and AGS80 coarse aggregates of the third cycle produced in a muffled furnace at a controlled temperature at 1200 °C, were considered excellent for presenting normal specific mass, above 2.0 g/cm³. In addition, it is noteworthy that in most of the studies used as a basis for this research, the generation of samples occurred at burning temperatures above 1200 °C, using muffled ovens for the production of synthetic coarse aggregates.

Tuan *et al.* (2013) says that the burning temperature plays a key role in controlling the water absorption capacity. This is because the sintering of the mixture promotes the densification of the particles, reducing the entry of water into the aggregate matrix. The high porosity index of the aggregate is directly related to its water absorption capacity and the higher the porosity of the material, the greater its water absorption capacity. The samples were tested and had absorption rates between 5.59% and 6.50%. Therefore, the aggregates meet the limits established by the NBR 7211 (2022) standard.

According to Borba and Santos (2021), the shape index of coarse aggregate grains indicates how much they resemble a cube. NBR 7211 (2022) states that the shape index of

a coarse aggregate, determined according to NBR 7809 (2016), should not be higher than 3, allowing lamellar aggregates. The results of the shape indices of the samples were below the regulatory limit, thus meeting the required standards.

It is important to note that highly porous aggregates are typically more brittle, making them unsuitable for the production of structural concrete. The average results of the Los Angeles abrasion index, carried out according to the NM 51 (2001) standard, in which the analyzed samples showed abrasion resistance for AGS70 of 41.06% and for AGS80 of 43.94%, show that these indices are considered satisfactory, since NBR 7211 (2022) stipulates that the percentage of mass loss must be less than 50%. It is worth mentioning that the greater the water absorption of the aggregates, the greater the mass loss by the abrasion test.

A durability test was carried out through the reaction test of alkaline aggregates established by NBR 15577-4 (2018) to qualitatively evaluate the condition of the aggregates. The results indicated that the synthetic aggregates do not have the potential to reactivity with the alkalis of the cement studied, that is, they are inert.

3.2 INFLUENCE OF THE PHYSICAL PROPERTIES OF CONCRETE ON THE AXIAL COMPRESSIVE STRENGTHS OF CAGS70 AND CAGS80 CONCRETES

Figure 8-A shows the graph of the relationship between water absorption, void index and apparent specific mass of concrete with synthetic coarse aggregates. When analyzing the spectrum of the existing porosity of the concretes at the age of 28 days, it is observed that CAGS70 has lower porosity than CAGS80, according to the results of the void index and water absorption tests. In this condition, initially it could be said that the CAGS70 presents better physical durability performance than the CAGS80. However, through the information contained in Table 2, it is observed that the final binding water index in CAGS70 is higher than CAGS80 and that the subsidence was 66 mm and 57 mm, respectively. Thus, it can bring the understanding that both concretes are framed in the same porosity range, causing an equivalence between them.

As exposed by Rossignolo (2009, p. 25), a high rate of water absorption in the aggregate can cause damage to concrete in its hardened state. However, the high water absorption capacity of the aggregate can provide benefits, such as improving the properties of the transition zone between the aggregate and the cement slurry, resulting in the reduction of the "wall effect". Another situation to highlight is that the results showed that the apparent specific masses of the CAGS70 and CAGS80 composites are 2250 kg/m³ and 2001 kg/m³, respectively. This reaffirms that AGS80 is less dense than AGS70, as it is more porous due

to the higher bauxite content in its composition. This may demonstrate that CAGS80, being more porous, caused a greater amount of voids, thus less dense.

Figure 8

Physical and mechanical properties of the concretes studied. A) Void index x water absorption x bulk density. B) water absorption x axial compressive strength at 28 days

Source: Authors.

The porosity of the coarse aggregate is a factor that can affect the rheological and mechanical properties of structural concretes, as well as the modulus of elasticity of the concrete. Figure 8 shows the graph that relates the water absorption and the mechanical resistance to axial compression of CAGS70 and CAGS80 at the age of 28 days, where CAGS80 has higher porosity, in the order of 18% higher than CAGS70. However, when observing the compressive strength at 28 days, it is noted that, even though CAGS80 has greater porosity and greater water absorption than CAGS70, it still also has greater strength, in a proportion of 15% higher. Therefore, it is inferred that the constraints of porosity and water absorption, when analyzed individually, do not exert a direct influence on the axial compression of the composites object of this research.

3.3 ANALYSIS OF AXIAL COMPRESSIVE STRENGTHS AND MODULUS OF ELASTICITY OF CAGS70 AND CAGS80 CONCRETES

The compressive strength graph, illustrated in Figure 9, indicates that both composites showed a gradual increase in strengths over time at the ages of 7 and 28 days.

At the final age of the test (28 days), the results obtained indicated that CAGS80 presented axial compressive strength 15% higher than CAGS70. However, when relating the experimental trace extracted from the dosage curve to the age of 28 days, estimated at 30 MPa, it is clear that the batch of specimens produced initially would not meet the pre-

established resistance requirement at this age. However, even if the strengths of the concretes studied are lower than those stipulated in the traces of the dosing curves, it is important to emphasize that these concretes were framed within the class of aggressiveness established in NBR 12655:2022.

Figure 9

Graph of the mapping of the axial compressive strength of the CAGS70 and CAGS80 composites for ages 7 and 28 days

Source: Authors.

Some aspects in which the coarse aggregates may have contributed to the results obtained, lead to the reflection that AGS80 has greater loss to abrasion and greater water absorption than AGS70. However, CAGS80, even with higher porosity/water absorption and lower apparent specific mass than CAGS70, nevertheless obtained higher axial compressive strengths at the ages studied. This leads to the following conclusion: that, because they are concretes of normal strengths, the physical properties of porosity and surface hardness are not the main factors for compressive strength, but the water-binder ratio, if the other rheological parameters are equivalent, since for CAGS70 the ratio of 0.61 was used and for CAGS80 0.55.

Figure 10

Graph of the modulus of elasticity of the CAGS70 and CAGS80 composites

Source: Authors.

According to NBR 6118, 2023, the elastic deformation of concrete depends on the composition of the concrete trace, especially the nature of the aggregates. According to Mehta and Monteiro (2014, p. 24), the modulus of elasticity and compressive strength of concrete are two properties that evolve in different ways over time. Considering the results obtained at the age of 28 days of the modulus of elasticity of CAGS70 and CAGS80 are practically the same, therefore, there is no intrinsic variation in the microstructure of this type of concrete, when the percentage of residue in the composition of the coarse aggregate is altered. Taking into account the notes of Rossignolo (2009), who states that, for concretes of normal specific mass, with axial compressive strength values ranging from 20 to 50 mega pascal (MPa), the value of the modulus of deformation can vary, in general, between 50% and 80% of the value obtained.

3.4 COMPARATIVE ANALYSIS OF THE RESULTS OF DIAMETRICAL COMPRESSION TRACTION AND FLEXURAL TENSILE

Figure 11 presents a comparison of the results obtained from the diametrical compression and flexural tensile strength tests, performed at 28 days, for the CAGS70 and CAGS80 composites. There were significant variations in the responses obtained between the above-mentioned assays for the CAGS70 and CAGS80 composites. However, when analyzing the results of axial compression and tensile diametrical compression for the CAGS70 and CAGS80 composites, it was understood that the tensile strength of both was equivalent to 10% of the axial compressive strength. In view of the above, it is inferred that the results are in accordance with the normative parameters established for standard strength concretes. This hypothesis is corroborated by the systematic review by Junior, Costa and

Macedo (2022), who cite the results of diametrical compression tensile strength from the works of Rosário (2013) and Souza (2010).

3.5 ANALYSIS OF THE MICROSTRUCTURE OF FRACTURED CONCRETE BY OPTICAL AND SCANNING ELECTRON MICROSCOPE (SEM)

In order to analyze the microstructure of the matrices and transition zones of the concretes with synthetic coarse aggregate, images were obtained using an optical microscope (Figure 12) and scanning electron microscope (SEM) (Figures 13) in samples of specimens of fractured concrete in the tensile test by diametrical compression at the age of 28 days. The preparation of the samples was carried out by fragmentation into appropriate sizes. Then, the samples were subjected to drying in an oven at a temperature of 100 °C for a period of 24 hours. Finally, the polishing was carried out on blades.

Figure 12

Legenda: ● delimitação da zona de transição; ▲ Agregado gráúdo (fase dispersa); ● Argamassa (matriz cimentícia).

Source: Authors.

According to Isaia *et al.* (2007), the contact zone corresponds to the relationship between the grains of the coarse and small aggregates that fuse with the cement paste, surrounding and separating the aggregates. This process results in the formation of water films around the grains, generating a weaker layer at the interface. According to Neville (1997, p. 6), this transition zone has greater porosity and, consequently, less resistance.

Scanning electron microscopy (SEM) analyses were performed on the Zeiss model LS15 EVO microscope, equipped with the Lamin-Be system. The slides were metallized with a gold film to obtain backscattered electron (BSE) images.

Figure 13

Images obtained by (SEM). A) CAGS70; B) CAGS80

Legenda: ● Delimitação da zona de transição; — Fissuras; ▲ Agregado gráúdo (agregado gráúdo sintético); ● Poros no agregado gráúdo e argamassa cimentícia).

Source: Authors.

Figure 12 highlights the separation through the transition zone of the cementitious matrix of the composites with dispersed phase and the coarse aggregates. In addition, it is possible to observe the detail of the synthetic coarse aggregate in relation to the distribution of silica grains, symbolized by the white dots on the bauxite residue, represented by the entire dark area.

Scanning electron microscopy (SEM) analysis was crucial to verify the delimitation of the matrix and dispersed phases through the zones of the CAGS70 and CAGS80 composites, as well as the existing cracks and pores, as shown in Figure 13.

The occurrence of macro fractures in the cementitious matrix were not observed in the images obtained by the SEM, both in the CAGS70 and CAGS80 samples. However, the specialized literature says that for normal strength concrete, fractures tend to occur in the mortar and in the transition zone.

As observed in Figure 13, the greater amount of pores in the AGS80 was a factor that contributed significantly to the absorption of kneading water and, consequently, this factor caused an increase in the ratio of binding water.

4 CONCLUSION

The results of this research allow us to conclude that the variation in the percentage of bauxite residue in the production of synthetic coarse aggregates (AGS70 and AGS80) influenced the physical and mechanical properties of the aggregates and concretes produced by them. Both aggregates met the normative requirements of NBR 7211 (2022), presenting indices of shape less than 3 and abrasion resistance within the established limit of 50%. In addition, they did not present alkali-aggregate reaction potential.

Regarding the porosity of the aggregates, it was observed that the AGS80 presented a higher index of voids and water absorption (6.50%) compared to the AGS70 (5.24%). This behavior would normally indicate a composite that is less dense and therefore has lower mechanical performance. However, the results showed that the higher porosity of AGS80 did not significantly compromise the structural behavior of the concrete, demonstrating that other factors had a more determining influence on the strength.

Thus, it is concluded that both AGS70, with about 70 to 75% in its bauxite tailings composition, and AGS80, with about 80 to 85% in its bauxite tailings composition, are viable alternatives for the production of C30 class structural concrete, and AGS80, even more porous, demonstrated better overall mechanical performance, configuring itself as the most promising option for future commercial applications, since for its production the consumption of bauxite is higher than AGS70.

ABSTRACT

This article aims to understand the concept and extension of hate speech and analyze the impacts in the LGBTQIAPN+ community. The changes in the communications methods, especially in the digital platforms, demonstrate the necessity of a constant improvement of the law in order to protect human dignity, with the prohibitions against harmful treatments and repression of the acts that violate it. The study was conducted through bibliographical research, in a descriptive and exploratory format, in order to demonstrate that violence motivated by discrimination makes it difficult the impediment of the exercise of human rights and fundamental freedoms, that is, the human right to be. Therefore, it is imperative the imposition of free speech limits, with forbidden discourses full of oppression, hate and discrimination.

Keywords: Hate Speech. LGBTQIAPN+ Community. Human Rights. Free Speech. Impacts.

RESUMO

O artigo visa a compreender o conceito e a amplitude do discurso de ódio, bem como analisar os seus impactos na comunidade LGBTQIAPN+. As mudanças das formas de comunicação, especialmente pelos meios digitais, demonstram a necessidade de um constante aperfeiçoamento das leis para proteção da dignidade humana, com a vedação e repressão dos atos que a violam. O estudo foi realizado através de pesquisa bibliográfica, na forma descritiva e exploratória, a fim de demonstrar que a violência motivada pela discriminação dificulta o exercício dos direitos humanos e liberdades fundamentais, ou seja, o direito humano de ser. Assim, imperativa a imposição de limites ao exercício da liberdade de expressão, com a vedação de discursos eivados de opressão, ódio e discriminação.

RESUMEN

Este artículo busca comprender el concepto y el alcance del discurso de odio, así como analizar su impacto en la comunidad LGBTQIAPN+. Los cambios en las formas de comunicación, especialmente a través de los medios digitales, demuestran la necesidad de mejorar constantemente las leyes para proteger la dignidad humana, prohibiendo y reprimiendo los actos que la vulneran. El estudio se realizó mediante una investigación bibliográfica, descriptiva y exploratoria, para demostrar que la violencia motivada por la discriminación obstaculiza el ejercicio de los derechos humanos y las libertades fundamentales, es decir, el derecho a la existencia. Por lo tanto, es imperativo imponer límites al ejercicio de la libertad de expresión, prohibiendo los discursos que se impregnan de opresión, odio y discriminación.

Palabras clave: Discurso de Odio. Comunidad LGBTQIAPN+. Derechos Humanos. Libertad de Expresión. Impactos.

1 INTRODUCTION

The main focus of this study is to understand the concept of *hate speech*, distinguishing it from the regular exercise of freedom of expression, as well as to analyze its impacts on the LGBTQIAPN+ community, considering that intolerant and hateful speeches are commonly used as if they resulted from the regular exercise of freedom of expression.

The study aims to demonstrate, based on research used as a theoretical basis, that hate speech uttered against members of the LGBTQIAPN+ community generates deep damage to victims, and impacts their emotional and psychological well-being, and can even lead to suicide, as pointed out by the *Observatory of LGBTI+ Deaths and Violence in Brazil*². Although we have seen some political, legislative or legislative advances or resulting from acts of the Judiciary, the environment is still hostile and challenging for the LGBTQIAPN+ community.

The methodology used comprised a basic research, with a qualitative approach and exploratory character, based on a bibliographic review and is structured in three topics. The first aims to understand hate speech, its concept, comparing it with the regular exercise of freedom of expression.

The second topic addresses the psychological and emotional impacts of hate speech, in various categories, for LGBTQIAPN+ victims.

The last topic covers the role of jurisdictional action in the promotion and protection of the fundamental rights of the LGBTQIAPN+ community, especially in Brazil where, for a long time, the Legislative Branch remained inert.

2 UNDERSTANDING HATE SPEECH

Before addressing the impacts of hate speech on the LGBTQIAPN+ community, it is necessary to understand the conceptual issue of this speech, and its main characteristics, compared to the regular exercise of freedom of expression.

Freedom of expression is provided for in numerous international legal standards, such as the Universal Declaration of Human Rights:

Article 19. Every human being has the right to freedom of opinion and expression; This right includes the freedom to hold opinions without interference and to seek, receive and impart information and ideas by any means and regardless of frontiers³.

² ANTRA; ABGLT. *Deaths and violence against LGBTI+ in Brazil: Dossier 2023 / Acontece Arte e Política LGBTI+*. – Florianópolis, SC: Acontece, ANTRA, ABGLT, 2024.

³ UN - United Nations Organization. *UN Universal Declaration of Human Rights*.

According to the above article, we all have the right to express our own opinions and share them freely and without intervention, in any social context, such as in the exercise of freedom of religion, peaceful assembly and political activity, for example.

The authors Frederik Stjernfelt and Anne Lauritzen adduce that freedom of expression can be explained by two aspects: the *formal* and the *material*. The first of them is concerned with the existence or not of a censorship system, while the second concerns the content of statements in the public sphere, which can be treated as crimes. Such authors also claim that absolutely no country can claim to have full freedom of expression⁴.

It happens that, many times, intolerant and hateful speeches are used as if they were protected by the right to freedom of expression. Therefore, it is necessary to establish clear, fair and proportional limits to the exercise of freedom of expression, especially when the speech reproduces a structural hatred, often sporting the mask of freedom of expression, hurting, in essence, the dignity of the human person.

In Alexander Brown's conception, hate speech should not be understood only in its legal concept, extracting the conceptualization only, explicitly or implicitly, from legal norms. According to the author:

If we focus too much on a legal concept of hate speech, we risk prejudging what might be the correct answer to the problem of hate speech: for we may have defined the nature and contours of the phenomena in question precisely with the legal answers in mind. For advocates of hate speech laws, the danger is that if all you have is a hammer, everything starts to look like a nail⁵.

For the author, the legal concept of hate speech should not be separated from the ordinary concept, since, according to him, the way hate speech is defined in legal norms and doctrinal analyses is only the "tip of the iceberg" ⁶

On the other hand, Samanta Ribeiro Meyer-Pflug defines hate speech as "manifestation of ideas that incite racial, social or religious discrimination in certain groups,

⁴ STJERNFELT, Frederik; LAURITZEN, Anne Mette. *What Is Freedom of Speech?*, p. 5. Even the United States of America, which adopts a very permissive model regarding freedom of expression, admits limits to its exercise. As Flávio Martins states: "Influenced by Liberalism, which marks the history of the United States, the doctrine and jurisprudence of the United States give a very broad protection to freedom of expression, as a result of the First Amendment to the Constitution: 'Congress shall not legislate in the sense of establishing a religion, or prohibiting the free exercise of cults; or curtailing freedom of speech, or of the press' (emphasis added). A consequence of this view that largely protects freedom of expression is the adoption of the 'theory of the free market of ideas'" (*Curso de Direito Constitucional*, p. 1050). The aforementioned author, in the sequence, states that, even adopting the theory of the "free market of ideas", North American jurisprudence points out limits to the exercise of freedom of expression, such as the use of "Fighting words", the speech that produces the risk of an *Imminent Lawless Action Test*, also known as *the Brandenburg Test*, etc.

⁵ Translation by the author. BROWN, Alexander. *What is hate speech?*, p. 422-423

⁶ *Op. Cit.*, p. 424

most of the time, minorities"⁷ (emphasis added). In the same sense, Flávio Martins states that:

Hate speech is a word that has the capacity to instigate violence, hatred, or discrimination against people on the basis of race, color, ethnicity, nationality, sex, religion, or other discriminatory factor. According to Meyer-Plufg, "incitement to discrimination" is the core element to identify hate speech. In this way, *prejudiced speech should not be confused with hate speech*. The latter has an external element, which consists of *incitement to discrimination or violence*⁸.

The Inter-American Court of Human Rights, in debating the matter, pointed out:

In this regard, the Court has indicated that violence perpetrated on discriminatory grounds has the effect or purpose of preventing or nullifying the recognition, enjoyment, or exercise of human rights and fundamental freedoms of the person subject to such discrimination, regardless of whether or not that person identifies with a particular category. This violence, fueled by hate speech, can lead to hate crimes.⁹

In the same notebook¹⁰, the Court alleges that the lack of recognition of the right to gender identity, in the case of transgender people, contributes to discriminatory behavior against these minorities, deepening their vulnerability to hate speech, leading to serious human rights violations.

Another author who dealt with this subject, and wrote a book called *Hate Speech*, was Judith Butler. This author highlights, in her research, studies that fall on acts, and not just words, such as the burning of a cross in front of the house of a black family in the United States, which, according to the author, would be perfectly framed as an act of warlike speech. For Butler, when the victim is hurt by speech, he can lose control:

To be hurt by speech is to suffer a loss of context, that is, it is not knowing where one is. In fact, it is possible that the injury of an injurious act of *fata* is constituted by the unpredictable nature of this type of act and the fact that it leaves its recipient out of control. The ability to circumscribe the situation of the speech act is compromised at the moment of the insulting call.¹¹

Butler believes that some types of speech not only communicate hatred, but also injurious acts. This occurs not only in the act of language, but also in the way language acts

⁷ MEYER-PFLUG, Samantha Ribeiro. *Freedom of Speech and Hate Speech*, p. 271

⁸ *Op. Cit.*, p. 1052.

⁹HDI CUT. *Cuadernillos de Jurisprudencia de la Corte Interamericana de Derechos Humanos*, p. 19. (Translation by the Author)

¹⁰ *Op Cit.*, p. 23-24.

¹¹ BUTLER, Judith. *Hate Speech*. São Paulo: Editora Unesp Digital, 2021. Pg. 13.

on the victim. For the author, "hate speech not only communicates an offensive idea or set of ideas, but also puts into action the very message it communicates." ¹²

According to Schafer and others, hate speech tries to stigmatize and mark the victim, either to keep the situation as it is or to change it, always segregating. This type of discourse uses well-articulated language, creating and sustaining forms of oppression, falling especially on those who do not fit into certain models, such as male, European, Christian, heterosexual, among others¹³.

The author Paulo Roberto Iotti Vecchiatti, on this subject, stated that:

The constitution requires the criminalization of racism, domestic violence, for what? To protect racial minority groups and women. So, understanding that the Constitution requires the criminalization of homotransphobia, it does so to protect the LGBTI population in their fundamental rights. As far as I know, freedom, in its liberal sense, since the Declaration of the Rights of Man and of the Citizen, after the French Revolution, allows you to do whatever you want, comma, as long as you do not harm third parties. So, hate speech, offenses and discrimination against third parties, [because] they harm [these] third parties, are not within the scope of protection of the right to freedom or freedom of expression. The Supreme Court of the United States is the only one that says otherwise. This Supreme Court, the Inter-American Court of Human Rights, the European Court, all repudiate hate speech and that is what they want to criminalize¹⁴.

After experiencing the dangers of hate speech in Nazi Germany, several international treaties banned *hate speech*, despite the fact that freedom of expression is also valued: Universal Declaration of Human Rights (art. 19), Covenant on Civil and Political Rights (art. 19), European Convention on Human Rights (art. 10), Inter-American Convention on Human Rights (art. 13), etc. For example, the Pact of San José, Costa Rica, allows legal restrictions on speech that promotes "incitement to discrimination, hostility, crime or violence".

The recently approved Convention against Racism, Racial Discrimination and Related Forms of Intolerance" brings more objective parameters for the determination of "hate speech", which was previously only conceptualized by doctrine and jurisprudence. The aforementioned international document presents a series of informing elements that indicate the construction of a normative concept of hate speech based on manifestations of discrimination, as well as incitement to hatred. Therefore, from the point of view of the construction of a normative concept, in accordance with the concepts and criteria contained

¹² Op. Cit. Pg.112.

¹³ SCHÄFER, Gilberto et al. Hate speech. From conceptual approach to parliamentary discourse. Journal of Legislative Information, Brasília, v. 52, n. 207, 2015. Pg.147.

¹⁴ VECCHIATTI, Paulo Roberto Iotti. *The Federal Supreme Court, Homotransphobia and its Recognition as a Crime of Racism*, p. 59.

in the international norm itself, it can be said that hate speech consists of the manifestation of intolerant, prejudiced and discriminatory ideas against vulnerable individuals or groups, with the intention of offending their dignity and incite hatred on the basis of the following criteria: age, sex, sexual orientation, gender identity and expression, language, religion, cultural identity, political or other opinion, social origin, socioeconomic position, educational level, status of migrant, refugee, repatriate, stateless or internally displaced person, disability, genetic characteristic, physical or mental health status, including infectious disease and disabling mental condition, or any other condition.

In this way, hate speech is an internal limit (or immanent limit) of the right to free expression of thought. This means that the fundamental right does not protect any and all speech, since the law has a limited factual assumption. Thus, for obvious reasons, hate speech is not covered by constitutional protection.

3 IMPACTS OF HATE SPEECH ON LGBTQIAPN+ VICTIMS

Undoubtedly, hate speech has significant impacts on the lives of its victims, on their emotional and psychological state, generating profound consequences and depriving their human and fundamental right to simply be.

Before addressing the psychological and emotional impacts suffered by victims of hate speech, it is important to analyze some of the categories of hate speech against the LGBTQIAPN+ population. The authors Marcos Paulo da Silva and Lucas Souza da Silva¹⁵, through pro-analysis of empirical data, even if related to cybernetic means, arrived at the following categories:

The first of these is *victimization*. The authors cite, for example, that in this category, in any discussion about the criminalization of LGBTphobia, oppressors use arguments that all people suffer violence on a daily basis in Brazil.

Second, *pathologization*, whether behavioral or biological. Referring to homosexuality or any other sexual orientation as a disease violates a wide range of international and national norms. In Brazil, for example, the Federal Council of Psychology stopped treating sexual orientation as a disease in 1985.

And third, *the repulsion for the existence or repudiation of the attitudes of* LGBTQIAPN+ people, which, according to the aforementioned authors, cover most

¹⁵ SILVA, Marcos Paulo da; SILVA, Lucas Souza da. *Dissemination of hate speech in news comments: an analysis based on news about the LGBT universe in Mato Grosso do Sul cybermedia on Facebook*. Intercom: Revista Brasileira de Ciências da Comunicação, [S.L.], v. 44, n. 2, p. 137-155, ago. 2021. FapUNIFESP (SciELO). <http://dx.doi.org/10.1590/1809-5844202127>.

homophobic comments. The authors argue that, if in the other categories, the oppressors use different factors for devaluation, in this one, they use only pure hatred¹⁶.

Another categorization would be the *discrediting of journalistic information*, as it is a minority group. In addition to these, the authors also cite the *injury or offense to human dignity* in which manifestations of hatred are not only established against the ways and behaviors of the LGBTQIAPN+ community, but in the face of people, being an attack on their identity and integrity, in addition to the imposition of morality and personal religiosity, a biologizing approach, appeal to the supposed behavioral and thought influence of children and adolescents, an opinion mediated by citation of authority¹⁷.

According to Kees *et al*, there are more impacts on direct victims of hate crimes than on those crimes that are not motivated by hate or prejudice¹⁸. Joanna Jamel, says that the trans population is the one that suffers the most from hate crimes, with trans women being the most affected¹⁹.

In a study carried out in Portugal by the *Portuguese Association for Victim Support (APAV)*,²⁰ it was highlighted that hate crime can destabilize the victim's identity development. This same study points to the incidence of serious consequences for the victims, including psychiatric disorders, such as depression, anxiety disorders, post-traumatic stress disorder²¹.

According to APAV, as hate crimes are directed at the victim's identity characteristics, the psychological impact is different from other crimes, in the following sense: even if the victims manage to move on with their lives, they usually report fear from the incident. Out of protective instinct, they end up thinking about making changes in their lives (workplace, study, city); they suffer because crime is due to their identity characteristics, affecting the level of perception of themselves and the community in which they are inserted, immensely shaking their perception of security²².

Another important piece of data was released by the *Observatory of LGBTI+ Deaths and Violence in Brazil* in the 2023 dossier, which identified structural LGBTIphobia in the country:

¹⁶ *Op. Cit.* 145-146.

¹⁷ *Op. Cit.*, p. 146-150.

²¹ *Op. Cit.*, p. 118.

²² *Op. Cit.*, p. 119.

This directly affects the reception of LGBTQIA+ people in different environments, increasing the risks of human rights violations and violence against their bodily lives, gender identities and expressions, and sexual orientations. Although the political context has changed in the sense that we are under a government attentive to the claims that have been made by the LGBTQIA+ population, a troubled and hostile environment persists in relation to LGBTQIA+ people²³.

The same observatory pointed out high suicide rates among the LGBTI+ population, praising that "LGBTIphobia operates as a social risk factor for mental health for LGBTI+ people, given the degree and recurrence of serious, even lethal, violations against this community" ²⁴

Therefore, even with some political advances or the Judiciary itself, the environment is still hostile for the LGBTQIAPN+ community. As we exposed above, hate speech towards the LGBTQIAPN+ community generates profound harm to victims, severely impacting their emotional and psychological well-being.

4 THE ROLE OF THE JUDICIARY IN PROMOTING AND PROTECTING THE FUNDAMENTAL RIGHTS OF THE LGBTQIAPN+ COMMUNITY

Flávia Piovesan, in her book *Themes of Human Rights*, argues that throughout history, very serious violations of human rights have occurred on the basis of "me versus the other", when diversity was used as a way to extinguish rights, that is, it was as if difference defined the other as a person with fewer rights and dignity. ²⁵

The author also states that the history of combating discrimination related to sexual orientation is very recent, starting in the 90s, which is why it is verified that the greatest advances occurred through the jurisprudence of the global and regional systems²⁶.

There are many constitutional principles that protect, in Brazil, the identity of LGBTQIAPN+ people. André de Carvalho Ramos, for example, cites the *right to happiness (or the right to the pursuit of happiness)*, which is implicit in the principle of human dignity²⁷. Other principles can be mentioned, such as the right to privacy, the right to family, self-identity, the right not to be subjected to inhuman or degrading treatment, the right to intimacy and privacy, etc.

²³ ANTRA; ABGLT. *Deaths and violence against LGBTI+ in Brazil: Dossier 2023 / Acontece Arte e Política LGBTI+*. – Florianópolis, SC: Acontece, ANTRA, ABGLT, 2024. p. 4.

²⁵ PIOVESAN, Flávia. *Human Rights Issues*, p. 441.

²⁶ *Op. Cit.*, p. 457.

²⁷ RAMOS, André de Carvalho. *Human Rights Course*, p. 1143.

In this regard, Advisory Opinion 24 of the IACHR²⁸, which deals with the recognition of the right to gender identity and, in particular, on the procedures for processing requests for name changes on the basis of gender identity, in the part of the Glossary, states that LGBTQIAPN+ persons suffer numerous discriminations, presenting the UN's concern on the subject, adducing that there is official discrimination, which occurs through state laws and policies that criminally typify homosexuality.

The Court also recognized that LGBTQIAPN+ people have historically suffered discrimination, stigmatization and countless other forms of violence, linked to hate speech, and even police abuse. In prisons, violence can include harassment, exploitation and sexual assault, even more so in the case of trans women, which leads to segregation and isolation as a protective measure, but which ends up depriving these people of opportunities and the use of essential services.

The Court also pointed out that discrimination is highly harmful to the right to mental integrity, and that it harms "not only individual health, but public health". Based on its own jurisprudence, the Court recognized the right to equality and non-discrimination of LGBTQIAPN+ people, the right to gender identity and name change procedures, as well as the international protection of the bonds of same-sex couples.

Roger Raupp Rios, conceptualizes *discrimination*, based on *the International Convention on the Elimination of All Forms of Racial Discrimination*, *the Convention on the Elimination of All Forms of Discrimination Against Women*, and *the Convention on the Rights of Persons with Disabilities*, as follows:

[...] Discrimination is defined as "any distinction, exclusion, restriction or preference that has the purpose or effect of nullifying or impairing the recognition, enjoyment or exercise on a gender equality footing"²⁹

Regarding the judgment of the Direct Action of Unconstitutionality by Omission (ADO) 26, and the Writ of Injunction (MI) 4733³⁰, it is important to make the following considerations:

The first consideration concerns the performance of the Federal Supreme Court (STF) in social and political issues. Both Direct Action of Unconstitutionality (ADO) 26 and Writ of Injunction 4733 had the scope of demonstrating the long delay of the National Congress in enacting a law that criminalized acts of discrimination/violence against LGBT people, curbing homophobia and transphobia in Brazil.

²⁸ INTER-AMERICAN COURT OF HUMAN RIGHTS. Advisory Opinion No. 24/17 (OC No. 24/17). 24 Nov. 2017.

²⁹ RIOS, Roger Raupp. *Homosexuality in Law*, p. 20.

³⁰ BRAZIL. Federal Supreme Court. ADO 26 and MI 7433.

The second consideration concerns the result of these actions: they recognized the omission of the Legislative Branch on the subject, and began to consider homophobia and transphobia as crimes of racism, by majority vote. It should be noted that the thesis presented by the rapporteur of ADO 26 can be divided into the following points:

- a) establishes that, until the National Congress creates a specific law, homophobic and transphobic acts, real or alleged, are framed in the crimes of Law 7,716/2018 and, in the case of intentional homicide, constitute a qualifying circumstance because they are considered vile motives.
- b) Criminal repression against homotransphobia does not interfere with religious freedom, as long as these manifestations do not turn into hate speech.
- c) The concept of racism is broadened, encompassing not only biological or phenotypic aspects, but also the denial of the dignity and humanity of vulnerable groups.

In this context, it is clear that, in Brazil, the performance of the Judiciary was essential to ensure the implementation and enforcement of the fundamental human rights of LGBTQIAPN+ people. Historic advances for the LGBTQIAPN+ community are occurring, albeit gradually, precisely because victims are seeking the intervention of the Judiciary. The National Congress has also been silent in the elaboration/edition of effective laws to protect this community.

Regarding the performance of the Brazilian Judiciary, Clarissa Tassinari clarifies:

Despite all this, one cannot disagree with the reading of the phenomenon of the judicialization of politics as a product of the transformations that occurred in Law with the advent of a new constitutional text. In other words, it is known that one of the marks of the transition from the conception of the Social State to that of the Democratic State of Law is precisely characterized by the displacement of the pole of tension from the Executive to the Judiciary³¹.

Therefore, the performance of the Judiciary, guided by constitutional principles, as well as the constitutional duty to criminalize acts that violate dignity has been paramount for the protection of the fundamental human rights of the LGBTQIAPN+ community, since in Brazil and in so many other places in the world, the Legislative Branch remains inert and silent in the protection of minorities. For this reason, issues of discrimination and violence against LGBTQIAPN+ people in Brazil are being taken to the Judiciary, ensuring, at a slow pace,

³¹ TASSINARI, Clarissa. *Judicial activism: an analysis of the performance of the Judiciary in the Brazilian and North American experiences*. 2012. Pg. 22.

advances in ensuring the application and preservation of the rights and dignity of the LGBTQIAPN+ community.

Nevertheless, the necessary change is not only up to the Judiciary or the Legislature, but to any and all interpreters of the Constitution and legal norms. It is urgent and necessary, as Isaac Porto states, a more amplified analysis of the discriminatory process, analyzing together the issues of racism and LGBTphobia:

discussions about racism and black people cannot be seen as an exclusive problem of the black movement, just as discussions about sexual orientation and gender identity cannot be attributed to an agenda exclusive to the LGBTI movement. Adopting these positions makes the black LGBTI population invisible and perpetuates a network of privileges for some and disadvantages for others.³²

5 CONCLUSION

Based on this study, it was possible to understand the clear distinction between *hate speech* and the regular exercise of freedom of expression, the first being, as Samanta Ribeiro Meyer-Pflug adduces, a kind of "manifestation of ideas that incite racial, social or religious discrimination in certain groups, most of the time, minorities"³³. The regular exercise of freedom of expression, on the other hand, consists of the right to express our own opinions and share them freely and without intervention.

It is important to emphasize that freedom of expression, enshrined in the Universal Declaration of Human Rights, is a fundamental right that allows the expression of opinions and ideas without interference. However, this right is not absolute, having express or implicit (or immanent) limits, as is the case with hate speech.

Hate speech, as aligned in the topics above, crosses all limits of freedom of expression, when it attacks and dehumanizes individuals or groups based on their identity characteristics, as in the case of sexual orientation and gender identity. This type of speech, which is far from being a simple expression of opinion, serves as a means of oppression, which can lead to serious psychological, emotional and even fatal consequences for the victims.

Hate speech is clearly one of the limits of the right to freedom of expression, being, in the opinion of Flávio Martins, an implicit limit of that right: "hate speech is an internal limit (or immanent limits) of the right to free expression of thought. This means that the fundamental right does not protect any and all speech, since the law has a limited factual assumption.

³² PORTO, Isaac. *What color is the invisible? The human rights situation of the black LGBTI population in Brazil*, p. 12.

³³ MEYER-PFLUG, Samantha Ribeiro. *Freedom of Speech and Hate Speech*, p. 271

Thus, hate speech is not covered by constitutional protection."³⁴

Despite some advances, the LGBTQIAPN+ community still suffers from oppressive discourses and hostile environments, which leads to the need to improve laws and greater state surveillance, with the necessary institution of effective public policies. In this sense, the performance of the Brazilian Judiciary is playing a fundamental role, since it has been making up for the repeated and continuous legislative omission.

Whenever we deal with issues related to the dignity of the human person, we must keep in mind that the achievements that are made through protection rules and regulations are improved as new demands arise, new voices are heard, new claims are presented and new human rights are recognized, depending on the reality in which we live. This process demands the intervention and mediation of the State and the active participation of all the protagonists of constitutional interpretation, in an "open society of interpreters of the Constitution".

ABSTRACT

This paper presents an overview of the furniture industry and the opportunities within the scope of sustainable government procurement. The objective of the study was to evaluate opportunities, threats, weaknesses, and strengths so that industries in this segment can engage responsibly in sustainable development. The research was conducted in the Federal District with furniture industries from the main Administrative Regions (AR). The techniques used included the application of questionnaires and the SWOT methodology. The study demonstrated that public procurement plays an important role in supporting micro and small enterprises so they can comply with environmental sustainability requirements.

Keywords: Furniture Industry. Sustainability. Environmental Management.

RESUMO

RESUMEN

El presente trabajo presenta un panorama de la industria del mueble y las oportunidades en el ámbito de las compras gubernamentales sostenibles. El objetivo del trabajo fue evaluar oportunidades, amenazas, debilidades y fortalezas, para que las industrias de este segmento se involucren con responsabilidad en el desarrollo sostenible. La investigación se llevó a cabo en el Distrito Federal con industrias de muebles de las principales Regiones Administrativas (RA). Se utilizó la técnica de aplicación de cuestionarios y la metodología DAFO (SWOT). El trabajo mostró que las compras públicas tienen un papel importante en el apoyo para que las micro y pequeñas empresas puedan cumplir con las exigencias de sostenibilidad ambiental.

Palabras clave: Industria del Mueble. Sostenibilidad. Gestión Ambiental.

1 INTRODUCTION

In the furniture sector, the concept of sustainable development has an additional weight. This industry, at a global level, was one of the most demanded in terms of environmental responsibility. During the 1990s there were boycotts by developed countries of tropical timbers. Later, this strategy evolved into the requirement of certification of responsible forest management. This certification, although not a legal obligation, has become a market requirement, leading several companies to seek action in a more environmentally responsible way voluntarily. (Coutinho & Macedo-Soares, 2002) (Nardelli, 2001)

One of the ways to verify the sustainability of an industry is to analyze its production processes. This analysis may involve aspects related to existing physical and chemical risks.

However, sustainability is not limited to pollution. There are also aspects related to socioeconomic development. The quality of the work environment is a factor that directly affects the well-being of the worker and, consequently, his social development. From this perspective, the evaluation of thermal comfort and the quality of lighting in this environment are relevant factors.

The perception of workers and entrepreneurs regarding the importance of sustainable development can also be measured. One of the ways to do this is to use the SWOT matrix. Through this mechanism, it is possible to identify internal potentials synergistic with a favorable external environment, in order to maximize the virtues of a company. Likewise, by mapping weaknesses and threats, unfavorable situations for the industry are avoided.

The SWOT tool used in the sustainable development approach allows the evaluation of opportunities, threats, weaknesses and virtues, so that a company or even a business segment, as is the case of the furniture segment in the Federal District, achieves its economic objectives with environmental responsibility.

It is important to mention the concern of the furniture industries, particularly those in the Federal District, because they are in the country's capital and have the government as one of their main customers, in adapting to meet the program that the Federal Government called "sustainable esplanade". Although this program is still in the design phase, some government purchases have already required sustainability parameters in the acquisition of products, such as furniture and partitions.

Thus, the objective of this work is to evaluate opportunities, threats, weaknesses and virtues, so that the industries in this segment engage responsibly in sustainable development.

2 THEORETICAL FRAMEWORK

The furniture sector is characterized by the diversity of production, raw materials and finished final products. With regard to raw materials, wood and metals stand out, with wood being the main source, with about 72% of share. (Rosa et al., 2007)

Wooden furniture is segmented into two groups: rectilinear and turned. Rectilinear wooden furniture is smooth, with simple designs with straight lines and whose main raw material consists of particleboards and plywood panels. Turned wooden furniture has more sophisticated details, mixing curved and straight lines and whose main raw material is solid wood. (Leão & Manfredi, 1998)

The furniture sector is characterized by the predominance of small and medium-sized companies in a very segmented market. It is a labor-intensive industry and has low added value compared to other sectors. (Gorini, 1998)

The production chain of the furniture industry can be summarized through the flowchart of the

Figure 1.

Figure 1

Flowchart of the Production Chain of the Furniture Industry

Source: Ferreira et al. (2008)

According to , the Brazilian furniture industry is made up of almost 10 thousand micro, small and medium-sized companies, which generate around 265 thousand jobs, the vast majority of which are national capital. (Brazilian Institute of Geography and Statistics - IBGE, 2014)

The demand for furniture varies according to the income level of the population and the behavior of other sectors of the economy, in particular civil construction. Spending on furniture is in the range of 1% to 2% of family income, and may also vary according to the population's lifestyle, cultural aspects, replacement cycle and investment in marketing.

(Gorini, 1998)

Technological upgrading in the furniture industry is widespread and affordable. However, as the production process is not continuous, modernization can often occur only in production stages. The quality of the final product is perceived mainly according to the variables: material, design and durability. (Ferreira et al., 2008)

The three variables associated with product quality are intrinsically related to the concept of sustainability. The concern with material goes from the origin to the arrival at the consumer. The design relates to the reduction of the use of raw materials and simplicity of production. Durability is associated with a decrease in the frequency of product replacement, which results in decoupling consumption from development and reducing environmental burdens. (Alves et al., 2009) (Devides, 2006) (John et al., 2001)

As more technologies that are recognized as meaning greater environmental, social, and economic sustainability are adopted, the closer the country gets to achieving sustainability. A technology that is environmentally sustainable should consider the ecological processes of the ecosystem and its maintenance, that is, the effects resulting from use should not make the ecosystem's resilience capacity in response to interventions unfeasible.

2.1 THE FURNITURE INDUSTRY OF THE FEDERAL DISTRICT

The timber-furniture industry in the Federal District developed more sharply in the 1980s and 1990s and totals about 200 legally constituted companies. The segment accounts for 0.5% of the national production and occupies the 3rd position in the Central-West region. It is estimated that the sector directly employs more than 3.5 thousand workers, being one of the segments that employs the most in the Federal District. (SEBRAE, 2007)

Despite the high number of jobs generated, the lack of a clear policy for the furniture sector relegates the industries of the Federal District to a level of little relevance at the regional and national levels. This lack of incentive contributes negatively to the improvement of the production chain. (Sablowski et al., 2007)

The industry is characterized by a preponderance of small companies, with investment decisions made locally. In addition, all the capacity for technological innovation is located within the territory, with heterogeneous diffusion. The source of raw materials is external and sales are destined for both the domestic and foreign markets. (SEBRAE, 2007)

2.2 THE SWOT ANALYSIS

SWOT analysis is a methodology created by Harvard Business School Professors Kenneth Andrews and Roland Christensen, with the aim of performing analysis of strengths,

weaknesses, opportunities, and threats for decision making. (Buchanan & O'Connell, 2006)

The acronym SWOT stands for the initials of the English words Strengths, Weaknesses, Opportunities and Threats. (Souza & Yonemoto, 2010)

This methodology considers the design of a business plan that allows for the improvement of the relationship between internal capabilities and external possibilities. (Mintzberg et al., 2010)

The method consists of critiquing the internal capabilities of a process or organization by identifying strengths and weaknesses. The external environment is evaluated from the perspective of opportunities and threats. The quadrants of strengths and deficiencies are determined by internal factors. Threats and opportunities are anticipations of what may happen and are related to external factors. (D'Ambros, 2011)

The SWOT matrix (or SWOT matrix) is considered a simple and effective tool, whose primary function is to enable the choice of an appropriate strategy, based on a critical evaluation of the company's internal and external environments. (Serra et al., 2003)

In the context of Sustainable Development, SWOT analysis has different application cases. applied SWOT analysis to achieve the definition of an integrated strategy for the sustainable development of a region's tourism potential. (Beni, 2006)

(Ávila & Wilke, 2008) used SWOT analysis to highlight the limiting factors to the tourist development of the city of Paranaguá, a coastal city in the state of Paraná.

(Da Silva et al., 2014) used SWOT analysis to determine the strengths and weaknesses and opportunities and threats of forest management in the Amazon. The work identified that the main strength was related to management, serving as a way of maintaining forest cover. The main weakness is related to the weak supervision of illegal logging. The main opportunity identified was the large amount of areas available for forest management. Finally, the main perceived threat was unfair competition with timber of legal origin.

3 METHODOLOGY

This research was developed with the furniture industries of the Federal District. To achieve the proposed objective, a questionnaire was applied to the furniture industries of the main Administrative Regions (AR) of the Federal District, to evaluate the profile of the industries in the segment from the point of view of sustainability. The technique of applying questionnaires and applying the SWOT methodology were used.

At Figure 2, the location of the two industries involved in the research is found, as well as the administrative regions of the Federal District where the questionnaires were applied.

The assertions were evaluated by means of the arithmetic sum of the scores assigned by the experts. The assertions with the highest scores indicate the strengths, weaknesses, threats, and opportunities identified by the experts.

3.2.1 Data collection through questionnaire

Data for the SWOT analysis were collected through individual structured interviews with the aid of a standardized questionnaire. The questions were asked identically to all actors.

The interviews were conducted by a single person from July to September 2017. The questions were carried out in the interviewees' workplaces, where it was possible to get to know the activities carried out up close and experience the environmental conditions to which they are subjected.

3.3 STATISTICAL DESIGN

29 questionnaires were filled out over the course of four months of research. Considering the estimated existence of 200 legally established furniture companies in the Federal District, this sample provides a sampling error of 18%, considering a normal distribution, a confidence level of 95% and $p=q=0.5$. (SEBRAE, 2003)

The data were statistically analyzed using the IBM SPSS® software and also processed using the MS Excel® software, where the descriptive statistics were determined: means, standard deviation and coefficient of variation. (Mendenhall & Sincich, 2006)

In the case of the SWOT Matrix, the data analyzed came from the scores assigned by the interviewees, corresponding to the 28 variables included in the survey. A simple frequency analysis was performed, highlighting the items with the highest score in relation to the total score. (D'Ambros, 2011)

4 RESULTS AND DISCUSSIONS

A questionnaire was applied to the furniture industries of the main Administrative Regions (AR) of the Federal District to assess the profile of the industries in the segment, especially from the point of view of sustainability. To achieve this objective, the technique of applying questionnaires and applying the SWOT methodology was used

The analysis of the results of the questionnaires was done in four parts, following the structure: Identification of the companies surveyed; Characterization of production; Environmental posture; and Identification of strengths, weaknesses, opportunities and threats. The detailed results of this analysis can be found at . (Lima, 2017)

4.1 ANALYSIS REGARDING THE IDENTIFICATION OF THE COMPANIES SURVEYED

The identification of the companies surveyed aimed to draw a profile of the sample analyzed. Not all interviewees were able to answer the questionnaire completely, which is why there are variables with less than 29 answers.

Based on the information collected, it is possible to estimate a profile of the industries surveyed. These are companies with less than fifteen employees, considered micro-enterprises according to the IBGE criterion. This result validates what was observed by , who stated that the Brazilian furniture industry is characterized by its small size, corresponding to 88% of the establishments, similar to what is found in other countries. The median revenue found was R\$ 619.2 thousand. Most of the companies have more than 19 years of existence, operating on land of less than 2 thousand square meters and with less than 900 square meters of built area. (SEBRAE, 2016) (Gorini, 1998)

4.2 ANALYSIS REGARDING THE CHARACTERIZATION OF THE PRODUCTION OF THE COMPANIES SURVEYED

The characterization of the production of the companies aimed to know what the companies researched produce.

In this part of the questionnaire, the interviewees were allowed to mark more than one response item, which is why there are variables with more than 29 responses. The variables studied in this part of the questionnaire have a nominal scale and their attributes represent names.

Based on the data collected, it was possible to establish a profile regarding the production characteristics of the companies analyzed.

Most of them are micro and small companies that produce furniture for offices and homes to order. The focus of the companies is the local market, although there is a significant portion of sales to other units of the federation, especially to the state of Goiás. There is practically no export of products and imports occur on a small scale, for specific products and components. The main sales channel of companies is their "own stores".

4.3 ANALYSIS OF THE ENVIRONMENTAL POSTURE OF THE COMPANIES SURVEYED

The characterization of the environmental posture of the companies surveyed aimed to assess the degree of knowledge of the companies regarding the theme of sustainability, as well as the responsibility of their practices.

Not all interviewees were able to answer the questionnaire completely, which is why there are variables with less than 29 answers. Also, in this part of the questionnaire, the

interviewees were allowed to mark more than one response item, which is why there are variables with more than 29 responses. The variables studied in this part of the questionnaire have a nominal scale and their attributes represent names.

From the interviews, it was noticed that the companies have relative knowledge in relation to environmental issues. They also have little or no availability of human or financial resources for training and/or actions for this area. None of the companies surveyed had implemented the Environmental Management System (EMS) and obtained ISO 14001 certification (environmental management). Only one of the companies was in the process of obtaining existing certification in the socio-environmental area.

The difference in the commitment observed by companies to implement environmental management systems can be explained by the level of scope of action in their markets and by financial limitations. There is also the lack of perception of efficiency and image gains, which can come from these actions. Another point to highlight is the very little information available on the subject, even in government communication channels. The creation of specific websites and advertising campaigns could contribute to reversing this situation and integrate environmental issues into business strategies from the perspective that environmental management is a competitive advantage for companies.

Government support, based on social strategies that boost technological development, has the potential to encourage regional timber-furniture industries to seek EMS certifications.

There are no common objectives in the search for environmental certification. It was observed that the industries, in their production practices, are not concerned with the efficient use of energy or with the management of productive waste. It is important to highlight that, in the case of liquid waste, it was found that the industries are connected to the public sanitation network. Timber-furniture companies generate solid waste with commercial value, however this potential is underexplored. A good perspective is identified for the economic use of these wastes, through the application of reverse logistics techniques, a practice that meets environmental sustainability.

A heterogeneity of practices was also identified when it comes to caring for workers. The percentages of industries without dust collectors or that have employees who do not use PPE was considered high.

In this work, we also highlight the measurement of companies' knowledge regarding the government procurement program Sustainable Esplanade. Through this program, the federal government began to purchase furniture from companies that meet sustainability requirements. Only two companies that participated in the survey (6.9%) declared that they were aware of the program. The result was already expected due to the very low rate of

companies that declare to make sales through bids. The government urgently needs to make a greater dissemination of this program and, above all, help companies to be able to participate. Otherwise, most micro and small companies in this segment will be excluded from this program.

4.4 SWOT ANALYSIS OF THE SURVEYED COMPANIES

The SWOT analysis allowed the identification of strengths, weaknesses, opportunities and threats of the companies surveyed, considering the environmental theme.

Through the analysis developed from the answers of the interviewees, questions considered strengths (Table 1) to be considered in the environmental management, from the point of view of sustainability, of the timber-furniture segment of the Federal District.

Table 1

Strengths indicated from the SWOT Matrix

Variable	Strength	Total Score
X2	There is control of particulate matter (e.g. dust and wood dust) generated in the industry in which I work.	130
1v1	The wood and natural materials used in the product are not treated or impregnated with fungicides and insecticides.	105
X3	The packaging of the final products is made of recyclable material.	73
X7	The company's employees are prepared to work with sustainability variables.	53
X4	The manufactured product is recyclable.	50
5v5	There is control for the correct disposal of waste from the production process.	47
X6	The company I work for has a specific professional focused on environmental issues.	37

Source: authors

The strong point with the highest score was the one corresponding to the variable X2, which corresponds to "the existence of control of the particulate matter generated in the industry in which I work". The score for this item certainly came from the industries that declare that they have dust collectors. This concern of industries is interesting, as this is a very polluting factor, when not controlled. And, certainly, it is also a negative factor from the point of view of the sustainability of this segment.

The second variable with the highest score was X1, corresponding to the non-use of fungicides or insecticides on wood for furniture production. The result indicates a good opportunity for positive media for the wood-furniture segment of the Federal District. This issue has been the subject of much discussion among companies that deal with wood, the furniture industries, consumers and the government in the acquisition of products. The furniture industry is very aware of this environmental issue.

The variable X3 was third in score. The item corresponds to "packaging of final products made with recyclable material". As already discussed, packaging made of wood or cardboard is more likely to be reused. The score for this variable, although significant, could be improved, perhaps with an information campaign from the environmental and economic points of view.

A Table 2 illustrates the scores obtained in each of the assertions.

Table 2

Deficiencies indicated from the SWOT Matrix

Variable	Disabilities	Total Score
X4	The dust or wood dust in my work environment bothers me.	151
X7	The company I work for does not have equipment for measuring lighting, noise, heat stress and suspended particles.	142
X2	The noise in my work environment is high.	135
X6	The personal protective equipment made available is insufficient or inadequate.	112
5v5	I believe that the machines and tools available in my work environment have a high energy consumption.	109
1v1	The waste of material in the company where I work is high.	93
X3	The gases present in my work environment are excessive.	68

Source: authors

The disability with the highest score corresponds to the variable X4, corresponding to the statement: "the dust or dust in my work environment is a nuisance". It is inferred that this result was strongly affected by industries that do not have dust collection equipment.

The second most cited deficiency corresponds to the absence of equipment for measuring lighting, noise, thermal stress and suspended particles, corresponding to the variable X7. The lack of equipment to measure these quantities in the industries participating in the research increases the worker's insecurity regarding exposure to toxic environments, reflecting an important concern.

The presence of high levels of noise in the work environment (X2) was pointed out as the third main deficiency of the companies surveyed.

As a deficiency, the variable X6 also stands out, which deals with the inexistence or inadequacy of existing PPE in companies. The result converges with what was pointed out in the interviews, where 44.8% of the interviewees declared that they do not use PPE in productive activities.

The variables X5, X1 and X3 also had significant scores, and should be considered by the companies, as every deficiency, no matter how small, will affect the environmental sustainability of any enterprise. In the case of variable X5, which deals with high energy consumption of equipment, an explanation for the complete absence of energy reuse

systems can be found. Companies do not seem to perceive this aspect as a deficiency of greater relevance. The X1 variable deals with the high waste of material in companies. In general, companies do not see that there is a high level of waste of materials, harming the activity not only from an economic point of view, but also from an environmental point of view. Finally, variable X3 addressed the excessive presence of gases in the work environment. The interviewees did not point out this aspect as a relevant deficiency.

A Table 3 illustrates the scores obtained in each of the assertions, in relation to opportunities.

Table 3

Opportunities indicated from the SWOT Matrix

Variable	Opportunities	Total Score
X2	The location of the industry facilitates the transport of products to consumer centers.	215
X3	Wood and panels from planted forests are available in the medium and long term.	131
5v5	There is knowledge of your company for the purchase of products of sustainable origin.	85
1v1	Consumers are willing to pay more for a product manufactured with environmental responsibility in mind.	68
X4	There is availability of financing (government and banks) to expand production and increase productivity.	61
X7	The government is concerned with bringing information about sustainability to companies in the segment.	49
X6	There is an interaction between companies in the furniture segment in environmental discussions.	48

Source: authors

The variable X2, corresponding to the good location of the industries, was the one that obtained the highest score. In fact, if we analyze the domestic market, the Federal District has a road network in conditions above the national average. Most of the industries surveyed are located in specific sectors for this type of activity, with easy access. Considering the interstate aspect, the geographic location of the Federal District represents an excellent opportunity. The quantity and quality of the roads that depart from the Federal District in all directions of Brazil represent a potential to be explored by the local furniture industries.

The second opportunity with the highest score corresponds to the availability of wood and panels from planted forests in the medium and long term (X3). The perception of the interviewees regarding the availability of wood from planted forests is scientifically based. In 2011 alone, planted forests produced a volume of 130 million m³ of wood, of which 23.5 million m³ was destined to the furniture industry. It is worth highlighting the excellent Brazilian potential, since most of the forests planted in the country are destined exclusively for the production of cellulose fiber. From the point of view of sustainability, this is a variable that

should not bring major problems to the industry, since the supply of this raw material is always made by companies that have the certificate of origin, having the FSC, Cerflor or other seals. (ABIPA, 2012)(Biazus et al., 2011)

The third opportunity with the highest score refers to the ability that companies have to purchase products of sustainable origin (X5). The result converges with the finding that 75.9% of the companies interviewed take into account some aspect of care for the environment when choosing suppliers. This is also a very interesting variable in relation to environmental management and should be increasingly explored by government officials, for the need to acquire products of sustainable origin.

A

Table 4 illustrates the scores obtained in each of the questions posed to companies, under the threats that may surround their business.

The variable X3, corresponding to the scenario of credit restriction, was the one that obtained the highest score. In fact, this is a problem that affects the entire economy and reduces the competitiveness of the national industry in all segments.

The variable X4, corresponding to the high tax burden, was in second place. Like the X3 variable, this is an aspect that affects the productive sector as a whole, especially considering a scenario of international competition.

The variable X7, which refers to the lack of government incentives, was in third position. In this case, government incentives could not necessarily be associated with subsidies, but rather with the reduction of bureaucracy and the offer of training to companies in the segment.

Table 4

Threats indicated from the SWOT Matrix

Variable	Threats	Total Score
X3	The scenario of credit restriction decreases the purchasing power of consumers.	206
X4	The high tax burden reduces the competitiveness of the industry in the market.	192
X7	The lack of government incentives hinders sustainable development in the industry in which I work.	191
X6	The lack of representation of small and medium-sized industries in the CNI makes it difficult for the claims of this segment to be met by the government.	174
X2	The cost of implementing environmental control systems can make the company's activity unfeasible.	161
1v1	The cost of environmental sustainability can affect the company's revenue.	161
5v5	The deadlines given by the inspection bodies to correct any non-conformities are unfeasible.	93

Source: authors

It is important to highlight that the average score of the threat variables was the highest among all those analyzed. The sustainability of the furniture industry goes through these issues mentioned in the questionnaire and will have to be addressed by governments, companies and also by the consumer in a special way, trying solutions and alternatives to support the industrial segment, to make environmental management viable.

Governments should think of ways to reduce the tax burden, perhaps compensating with the application in the area of environmental management of companies. Or, once again, encouraging measures in the environmental area, reverting them into credits, for example, in the payment of taxes.

Variables X2 and X1 obtained good scores, indicating the difficulties that companies in the furniture segment have in implementing sustainability measures, ceasing to be a priority to the detriment of other immediate variables, such as payment of taxes, employees, rents, etc.

5 CONCLUSION

The work showed that the environmental sustainability of the furniture segment in the Federal District necessarily involves the economic and social sustainability of companies. In order to raise the awareness of entrepreneurs of the importance and need for environmental sustainability in their enterprises, it is necessary to involve all actors inserted in this context, such as government officials, scientific academia, class associations and unions, in addition to the media.

Public procurement (governments), an important market that could help, especially micro and small companies to leverage their businesses, marginalizes these companies, because the environmental sustainability requirements that companies have to demonstrate cannot be met. Before these requirements, the public entity has to prepare these companies as previously mentioned and portrayed in the principles of Agenda 21, which presents the need for the state to promote the economic system for adaptations of the sustainable production format.

ABSTRACT

This study investigates the institutional trajectory of the former Federal Agrotechnical School of Morrinhos until its consolidation as the Federal Institute of Goiás – Morrinhos Campus, examining how this journey expresses political, pedagogical, and epistemological disputes in the field of Professional and Technological Education (EPT) in Brazil. The objective is to analyze this trajectory in light of the consolidation of PTE as a public policy of the State, the permanence of educational duality, and the influence of market rationalities, in addition to highlighting advances in the verticalization and diversification of the institution's educational offerings. To this end, we conducted documentary research and content analysis guided by a critical theoretical framework, based on institutional, regulatory, and academic sources. The results indicate that, although the creation of Federal Institutes represents progress in democratizing access to public education and in the internalization of VET, structural challenges related to curricular fragmentation and managerial pressures persist. It is evident that Integrated Secondary Education is a space of contention between antagonistic educational projects, strained by reforms that compromise its emancipatory proposal. An analysis of the current course offerings at the Morrinhos Campus—which range from technical training to *stricto sensu* graduate programs—reinforces the institution's strategic role in building an integrated, omnilateral, and socially referenced educational project. It can be concluded that the experience analyzed reflects the advances and contradictions of EFA as a political field in constant dispute.

RESUMO

Este estudo investiga a trajetória institucional da antiga Escola Agrotécnica Federal de Morrinhos até sua consolidação como Instituto Federal Goiano – *Campus Morrinhos*, examinando como esse percurso expressa disputas políticas, pedagógicas e epistemológicas no campo da Educação Profissional e Tecnológica (EPT) no Brasil. Objetiva-se analisar essa trajetória à luz da consolidação da EPT como política pública de Estado, das permanências da dualidade educacional e da influência de racionalidades mercantis, além de destacar os avanços na verticalização e diversificação da oferta formativa da instituição. Para tanto, procede-se à pesquisa documental e análise de conteúdo orientada por referencial teórico crítico, com base em fontes institucionais, normativas e acadêmicas. Os resultados indicam que, embora a criação dos Institutos Federais represente avanço na democratização do acesso à educação pública e na interiorização da EPT, persistem desafios estruturais relacionados à fragmentação curricular e à pressão de lógicas gerenciais. Evidencia-se que o Ensino Médio Integrado constitui espaço de disputa entre projetos formativos antagônicos, sendo tensionado por reformas que comprometem sua proposta emancipatória. A análise da atual oferta de cursos do *Campus Morrinhos* — que abrange desde formação técnica até programas de pós-graduação *stricto sensu* — reforça o papel estratégico da instituição na construção de um projeto educativo integrado, omnilateral e socialmente referenciado. Conclui-se que a experiência analisada reflete avanços e contradições da EPT como campo político em constante disputa.

Palavras-chave: Educação Profissional e Tecnológica. Ensino Médio Integrado. Interiorização do Ensino Público. Verticalização da Oferta Formativa. Política Educacional Federal.

RESUMEN

Este estudio investiga la trayectoria institucional de la antigua Escuela Agrotécnica Federal de Morrinhos hasta su consolidación como Instituto Federal Goiano – *Campus Morrinhos*, examinando cómo este recorrido expresa disputas políticas, pedagógicas y epistemológicas en el campo de la Educación Profesional y Tecnológica (EPT) en Brasil. El objetivo es analizar esta trayectoria a la luz de la consolidación de la EPT como política pública del Estado, la permanencia de la dualidad educativa y la influencia de las racionalidades mercantiles, además de destacar los avances en la verticalización y diversificación de la oferta formativa de la institución. Para ello, se procede a la investigación documental y al análisis de contenido orientado por un marco teórico crítico, basado en fuentes institucionales, normativas y académicas. Los resultados indican que, aunque la creación de los Institutos Federales representa un avance en la democratización del acceso a la educación pública y en la interiorización de la EPT, persisten retos estructurales relacionados con la fragmentación curricular y la presión de las lógicas gerenciales. Es evidente que la enseñanza secundaria integrada constituye un espacio de disputa entre proyectos formativos antagónicos, sometido a tensiones por reformas que comprometen su propuesta emancipadora. El análisis de la oferta actual de cursos del *Campus Morrinhos* — que abarca desde la formación técnica hasta programas de posgrado *stricto sensu* — refuerza el papel estratégico de la institución en la construcción de un proyecto educativo integrado, omnilateral y con referencia social. Se concluye que la experiencia analizada refleja los avances y contradicciones de la EPT como campo político en constante disputa.

1 INTRODUCTION

EFA occupies a strategic position in the contemporary Brazilian educational system, especially for its ability to articulate school education, work, science, culture and technology in the same training project. However, its historical constitution was marked by deep structural contradictions, derived from the educational duality that destined to the working classes a technical-instrumental education, while reserving to the elites a general education based on science and humanism. This configuration expresses disputes between different societal projects and conceptions of the State, showing that EFA cannot be understood only as a functional response to the demands of the labor market, but as a political and epistemological field in permanent tension (Manfredi, 2016; Frigotto; Ciavatta; Ramos, 2012).

In the context of Brazilian educational policies, the institutionalization of EFA as a public policy of the State acquired greater normative density from the second half of the twentieth century, intensifying with the creation of the Federal Network of Professional, Scientific and Technological Education. Established by Law No. 11,892/2008, this network consolidated the Federal Institutes (IFs) as multicampus, multicurricular and socially referenced institutions, responsible for the integrated provision of basic, professional and higher education – from high school to higher education – especially in regions historically marked by educational inequalities. In this context, the IFs have assumed a central role in the processes of internalization of public education and the promotion of regional development (Brasil, 2008; Moura, 2016).

Despite these institutional advances, the specialized literature points out that the consolidation of EFA as an emancipatory educational project remains crossed by structural tensions. Recent educational reforms, guided by managerial and business rationalities, have reintroduced utilitarian conceptions in education, subordinating the school curriculum to economic and productivist interests. Ball (2021) argues that such reforms promote the reconfiguration of educational policies based on a performative logic, in which efficiency, measurement of results, and competitiveness begin to guide the organization of pedagogical work. In a convergent way, Freitas (2018) warns that the so-called "business reform" of education tends to weaken formative projects committed to integral human formation, stressing the social role of public schools.

It is in this scenario that the problematic of this study is inserted, formulated from the following research question: how does the historical and institutional trajectory of the Federal Agrotechnical School (EAF) of Morrinhos, later transformed into the Federal Institute of Goiás (IF Goiano) – *Morrinhos Campus*, express the political, pedagogical and epistemological disputes around EFA in Brazil? It is based on the hypothesis that this institutional trajectory

simultaneously evidences advances in the consolidation of EFA as a public policy of the State and structural permanences associated with the educational duality and the pressures of rationalities external to the integral formative project.

The relevance of this research is justified, firstly, by the need to deepen historical and institutional analyses of EFA from local and regional contexts, contributing to understand how national policies materialize in specific territories. Secondly, the study dialogues with contemporary debates on Integrated High School (EMI) and integral human formation, offering theoretical subsidies for critical reflection on the role of FIs in the Brazilian educational scenario. Finally, it has social relevance by problematizing the meanings attributed to public education in inland regions, in which FIs often constitute the main reference for technical, scientific and citizen training (Moura, 2016; Oliveira, 2023).

Thus, the general objective of this article is to analyze the historical and institutional trajectory of the EAF of Morrinhos until its consolidation as IF Goiano – *Campus Morrinhos*, in the light of the theoretical, political and epistemological disputes that cross the EFA in Brazil. As specific objectives, it is sought: (i) to understand EFA as a public policy of the State in the Brazilian context; (ii) to analyze the historical process of institutionalization of professional education, with emphasis on agricultural education and the creation of FIs; (iii) to discuss the theoretical foundations of integral human formation and the critique of educational duality; (iv) examine EMI as PPP in FIs; and (v) to investigate how the verticalization of teaching and the expansion of the training offer were materialized within the scope of the IFs, notably in the IF Goiano – *Campus Morrinhos*. Methodologically, the study adopts a qualitative approach, of an exploratory and analytical nature, based on documentary and bibliographic research, as detailed in the methodology section.

2 THEORETICAL FRAMEWORK

2.1 PROFESSIONAL AND TECHNOLOGICAL EDUCATION AS A STATE PUBLIC POLICY

In the Brazilian context, EFA should be understood as a public policy of the State, and not as a set of conjunctural government programs. This conception stems from the recognition that EFA is historically structured based on legal, institutional and pedagogical frameworks that express disputes between antagonistic societal projects, involving different conceptions of State, work and education. In other words, throughout the country's history, opposing views have influenced whether professional training would be treated as a strategic commitment of the State or as a one-off and subsidiary initiative, evidencing the eminently political character of the evolution of EFA (Manfredi, 2016; Kuenzer, 2017).

The normative consolidation of EFA began with the Law of Guidelines and Bases of National Education (LDB, Law No. 9,394/1996), which recognized professional education as an integral part of national education (Brasil, 1996). This process was deepened by Decree No. 5,224/2004, which redefined the organization of the Federal Centers for Technological Education (CEFETs), preparing the ground for the integration between basic education and technical education (Brasil, 2004). The cycle culminates with Law No. 11,892/2008, which establishes the Federal Network of Professional, Scientific and Technological Education, creating the IFs and consolidating an institutional model guided by the integrated offer of basic, technical and higher education (Brasil, 2008).

The creation of the Federal Network in 2008 is recognized as a milestone in the expansion, internalization and diversification of EFA in Brazil, representing a historic turning point in favor of educational policies of national scope. For Moura (2016), for example, the implementation of the FIs represented a watershed by shifting professional education from a strictly technical function to an expanded formative perspective, committed to the articulation between work, science, culture and technology. Thus, even though it was strained by different political and economic conjunctures, EFA began to assume centrality as a structuring policy of the State, aimed at guaranteeing the right to professional education to various segments of society.

In the specific case of Goiás, the creation of the IF Goiano – alongside other FIs across the country – exemplified this State policy in action. The history of the EAF of Morrinhos, the focus of this study, is part of this movement of institutional transformation induced by national public policies. It should be noted that the Morrinhos School was initially founded as a decentralized unit linked to the then Federal Center for Technological Education (CEFET) of Urutaí, which evidences the government's strategy of internalizing agricultural technical education since the end of the twentieth century. According to *Google Maps* (2025), the road distance between the current IF Goiano – *Campus* Urutaí (GO) and IF Goiano – *Campus* Morrinhos (GO) is 159 km (via BR-352, GO-309, BR-490 and GO-476) or 160 km (via BR-352, BR-490 and GO-476), illustrating the administrative, logistical and pedagogical challenges involved in maintaining an advanced unit so far from the headquarters.

Despite these obstacles, the territorial expansion policy of the Federal Network allowed the Morrinhos unit to gradually consolidate. In 2008, with the creation of the IFs, the then agrotechnical school in the interior was transformed into a *campus* of the IF Goiano, acquiring administrative autonomy and significantly expanding its educational offer. This institutional transition directly reflects the state project of bringing quality public education to the interior of the country, while consolidating the verticalization of education, integrating in

the same institution levels and modalities that were previously fragmented (technical high school, higher education and graduate courses). Thus, it can be seen that the trajectory of EFA at the national level – marked by the formulation of laws and the creation of new institutions – provides the framework to understand the transformations experienced in the local context of the *Morrinhos* Campus.

2.2 HISTORICAL TRAJECTORY OF PROFESSIONAL EDUCATION IN BRAZIL AND INTERNALIZATION OF PROFESSIONAL AND TECHNOLOGICAL EDUCATION

The historical trajectory of professional education in Brazil is directly related to national development projects and educational policies of each period. Since the beginning of the twentieth century, a dualism can be observed in the educational offer: on the one hand, professional schools aimed at the popular classes, with curricula focused on training for manual work; on the other, lyceums and academic secondary schools for the elite classes, with scientific and humanistic training. This separation institutionalized the educational duality in the country, attributing to the working classes an education of a practical-instrumental nature and reserving to the elites the general and propaedeutic training.

As Bezerra, Martins, and Bezerra (2022) point out, historically there has been a destination of technical-instrumental training for workers *versus* a scientific-humanistic education for dominant groups, which has generated unequal and excluding school trajectories. This historical root of educational inequality shows that the dispute between societal projects – one aimed at broad human emancipation, the other restricted to the qualification of the workforce – was present from an early age in professional education policies in Brazil. In the field of agricultural education, this duality manifested itself in the form of schools aimed predominantly at meeting the productive demands of the rural sector. The former federal agrotechnical schools, created in the mid-twentieth century, had a markedly pragmatic and productivist character, prioritizing agricultural technical instruction to the detriment of broader scientific training.

Studies such as that of Molina and Sanfelice (2014) point out that the genesis of federal agricultural education was marked by this utilitarian orientation, with evident limits in the articulation between technical training and general education in the agrarian institutions of the time. Nery (2025) reinforces this analysis by showing that, although these schools have contributed to regional development, they have faced the historical difficulty of fully integrating technical knowledge with the scientific and cultural bases in their curricula. In other words, in past decades, the training offered in the agricultural technical schools of the interior fell short

of a comprehensive education, reproducing to a certain extent the dichotomy between practical knowledge and theoretical knowledge.

From the 1990s onwards, in the context of redemocratization and reform of the State, a process of institutional reconfiguration of EFA intensified in order to gradually overcome this historical division. The Decentralized Teaching Units were created and, later, several Federal Agrotechnical Schools were transformed into CEFETs, expanding the offer of professional education to interior regions that had been little served until then. This movement of expansion and decentralization reached its peak with the constitution of the IFs, in 2008, which consolidated the verticalization of education (from high school to higher education) and promoted curricular integration and the internalization of the educational offer in the same institutional arrangement.

In other words, the creation of the IFs represented the realization of a professional education project capable of serving different regions of the country, internalizing technical and higher education and diversifying the teaching modalities offered (technical, undergraduate, postgraduate). In this scenario, the institutional history of the Morrinhos Campus reflects, on a microscale, this process of expansion and interiorization of EFA. Originally established as an EAF linked to a regional CEFET (Urutaí), the institution has experienced a process of growth in its functions and training attributions over the decades.

With its integration into the IF Goiano in 2008/2009, there was the expansion of training functions, diversification of levels and modalities of teaching and incorporation of EMI as a structuring axis of the local institutional project. In other words, the Morrinhos Campus went from a strictly technical-agricultural focus of secondary level to encompass integrated technical courses, higher technology courses, licentiate and postgraduate courses, exemplifying the policy of verticalization and expansion of the educational offer. This local trajectory of internalization and diversification of EFA reaffirms the strategic role of FIs in facing regional inequalities in access to public education.

2.3 WORK, INTEGRAL HUMAN FORMATION AND CRITICISM OF EDUCATIONAL DUALITY

The relationship between work and education is a central axis for the analysis of EFA, especially when the perspective of integral human formation is adopted. The educational duality, historically structuring the Brazilian education system, expresses the social division of labor itself and limits the access of subjects to scientific and cultural knowledge in its entirety. As a counterpoint to this exclusionary logic, the conception of integral human formation understands work as an educational principle, overcoming its reduction to a purely

productive activity and recognizing it as a founding dimension of social life. In this view, defended by authors in the field of professional education, the school should promote the integration between theoretical-scientific and practical-technological knowledge, aiming at the omnilateral formation of the subject. Ramos (2014) contributes significantly to this debate by defending the inseparable articulation between work, science, culture and technology in professional education.

According to the author, integral education presupposes overcoming the fragmentation of knowledge and the dichotomies between general education and technical education, enabling students to have a critical understanding of the social and productive reality. Integrating work and education, therefore, means not only qualifying for the market, but forming citizens capable of reflecting and acting on the world in which they live in an autonomous and emancipatory way. Paulo Freire's contributions deepen this critical-emancipatory perspective. When criticizing the "banking" model of education, Freire (1996) affirms education as a practice of freedom, based on dialogue and critical awareness of the subjects. Its principles – centered on the humanization of the oppressed and social emancipation – have become essential references for professional training aimed at social transformation. In short, Freire's perspective reiterates the importance of linking the educational act to freedom and autonomy, guiding the formative processes beyond mere technical training.

In the context of EFA, this implies rejecting the view of the student as a mere human resource to be trained and, instead, conceiving him as a subject of rights, whose integral formation involves ethical, political and cultural dimensions. In view of this foundation, integral human formation is the antithesis of educational duality. It is a conception in which basic training and technical training are not opposed, but complement each other in a curricular unit. Frigotto, Ciavatta and Ramos (2012) discuss exactly this idea when dealing with EMI: for these authors, EMI is configured as a pedagogical strategy to overcome duality, proposing integrated curricula that unite academic basic education with professional education, from a perspective of omnilateral training. This theoretical framework underpins the understanding that offering an integrated education is, in essence, fighting against the historical division between "two schools" – that of manual labor and that of critical thinking – in the expectation of forming young people who are both technically proficient and intellectually critical.

At this point, it is worth noting that the debates on polytechnics and omnilaterality also make up the theoretical framework of integral education. Derived from Marxism and socialist experiences in education, the concept of polytechnic proposes the diffusion of universal scientific-technological foundations to all students, regardless of their future occupation,

avoiding early narrow specialization. This vision inspires policies such as EMI by proposing that the curriculum combine academic and professional content organically. In practice, however, the implementation of such principles faces resistance arising from economic interests and utilitarian visions of education, as will be discussed later in contemporary tensions. Even so, the idea of integral human education remains as a philosophical and pedagogical guide for initiatives that seek to reorient EFA towards an emancipatory project.

2.4 INTEGRATED HIGH SCHOOL AS A POLITICAL-PEDAGOGICAL PROJECT

EMI is configured as the pedagogical expression of EFA conceived as a public policy of the State. Institutionalized within the scope of the IFs, the EMI proposes the organic articulation between general high school education and technical professional education in the same course, integrating the dimensions of work, science, culture and technology in a unitary curriculum. It is, therefore, an educational modality guided by the principles of integral human formation and polytechnics, as it seeks to overcome the curricular barriers between academic knowledge and technical knowledge. In the IFs, the EMI assumed institutional centrality by materializing the PPP of these institutions, as provided for in Law No. 11,892/2008, which incorporated the articulated offer of basic, technical and higher education as a structural principle of the IFs (Brasil, 2008).

In other words, EMI has become a fundamental strategy to enable the verticalization of education and the offer of technical professional education at the secondary level articulated with regular secondary education, especially in the Federal Network. This institutional priority reflects the commitment to curricular integration as a way to promote a more complete and civic education, in line with the ideals of education as a social right and public good. Thus, by articulating work, science, culture and technology in the curriculum, EMI reaffirms education as an emancipatory social practice, synthesizing in its project the ideals of an omnilateral public education. From a conceptual point of view, EMI is based on solid theoretical and pedagogical references. Frigotto, Ciavatta and Ramos (2012) offer the conceptual basis by defining EMI as a counter-hegemonic project, aimed at breaking with the structural duality of the Brazilian educational system.

For these authors, integrating high school with professional education is a political option of resistance to the capitalist logic of fragmentation of knowledge and educational stratification. In the same vein, Oliveira (2023) discusses the challenges for the consolidation of an emancipatory school via EMI, arguing that although integrated education is not an ideal model in a capitalist society, it constitutes the "possible project" for the education of young people from the working classes and, therefore, should be strengthened as an alternative to

the exclusionary model imposed by the recent reform of secondary education. In other words, even recognizing the limits and contradictions, authors defend EMI as a trench of struggle for a public education that unites academic quality and social relevance.

In practice, the implementation of EMI in FIs has produced advances and also faced challenges. On the one hand, there is an improvement in the access and permanence of students, especially from popular backgrounds, in high school courses with integrated technical training, which democratizes educational opportunities that were previously restricted. In addition, research indicates that EMI graduates tend to be well prepared both for the world of work and for continuing studies at a higher level, which confirms the expanded training potential of this modality (Nunes; Wetterich, 2019). On the other hand, structural obstacles persist: the lack of adequate infrastructure, the need for continuing education of teachers for interdisciplinary action, and the pressures of lightened educational policies that conflict with the integrative proposal.

Costa and Coutinho (2018) point out, for example, that the 2017 counter-reform of secondary education – by instituting flexible training itineraries and a reductionist National Common Base – tends to empty the integrated curriculum and put duality back into a new form. This scenario imposes on FIs and EMI defenders the constant challenge of justifying and safeguarding this pedagogical project in the face of contrary policies and narratives. Even so, critical analyses suggest that the EMI in the IFs has managed, to a large extent, to affirm its own educational identity, committed to the integral development of the student.

Elements such as research and extension, integrated with teaching, the encouragement of interdisciplinary pedagogical practices and the democratic management of schools are traits that distinguish the EMI practiced in the IFs in relation to traditional high school. These factors reinforce the idea that the EMI, in addition to a curricular arrangement, represents an institutional project with specific values and objectives – among them, the formation of autonomous, critical and socially engaged subjects. In the case of the Morrinhos Campus, as will be seen in the analysis of the results, the EMI constituted the structuring axis of the local PPP, serving as a reference for the consolidation of the institutional identity of the *campus* as an agent of social transformation in the region.

2.5 CONTEMPORARY TENSIONS: MANAGERIAL RATIONALITY AND CHALLENGES OF INTEGRATED SECONDARY EDUCATION

The educational policies of the last decades have imposed a series of structural challenges on EMI. Reforms guided by managerialist logic and neoliberal economics have introduced performative rationalities in the educational field, stressing the principles of

integrated teaching. Ball (2021) analyzes that neoliberal educational reforms, by emphasizing *accountability*, competition, and performance indicators, end up subordinating the curriculum and pedagogical work to managerial criteria of efficiency, productivity, and comparison. In the Brazilian context, these trends have manifested themselves, for example, in the institution of standardized assessments and quantitative targets that pressure schools to adapt their curricula to improve indexes, often to the detriment of training components that are not immediately "measurable".

For Freitas (2018), this "business reform" of education promotes the commodification of teaching by introducing notions of business management in public schools, which weakens pedagogical projects committed to comprehensive education. The author warns that the prevalence of values such as competition and meritocracy in the educational environment can undermine the construction of collaborative and critical practices, which are fundamental to EMI. In the specific case of secondary education, the 2017 reform (Law No. 13,415/2017) and the implementation of the National Common Curricular Base (BNCC) for Secondary Education are often cited as examples of policies guided by this rationality. Studies such as those by Costa and Coutinho (2018) demonstrate that such changes fragment the education of students into narrow itineraries and weaken fundamental disciplines, which is antagonistic to EMI's proposal of integrated curriculum and omnilateral training.

In the context of FIs, these contemporary tensions translate into concrete dilemmas: how to maintain and deepen the curricular integration and emancipatory character of EMI in the face of external pressures for immediate results and adaptation to the market? As discussed by Felipe *et al.* (2025), there is a colonization of the curriculum by the ongoing business logic, which is expressed in the prioritization of competencies aligned with productive demands and in the marginalization of critical training content. This colonization imposes obstacles to the effective realization of the project of integral education, as it tries to reduce the role of the school to the preparation of flexible labor, instead of full citizens. At the Morrinhos Campus, for example, tensions are identified between, on the one hand, the implementation of EMI with its transformative assumptions and, on the other, initiatives that push for partnerships with the local productive sector or for curricular adaptations to meet performance indicators.

Such movements reflect exactly the clash between antagonistic educational projects: the counter-hegemonic, which guides the EMI, and the hegemonic neoliberal, which seeks to readjust education to the logics of the market. In response to these tendencies, the theoretical framework of this study assumes a critical and historicized stance. From an epistemological point of view, he is inspired by authors such as Bachelard and Kuhn to

understand that scientific knowledge develops through ruptures and confrontations of paradigms. Similarly, it is understood that the current configuration of EFA results from paradigmatic disputes in the educational field, and it is not possible to analyze it in a neutral or decontextualized way.

As Freire (1996) rightly stated, when he said that the neutrality of education is impossible; every educational policy carries values and interests. Recognizing this is fundamental to lay bare managerial rationalities as ideological constructions and not as innocent technical solutions. Thus, the dialogue with classical (such as Freire, Gramsci, Marx) and contemporary (such as Ball, Gentili, among others) references allows us to cast a critical look at the ongoing reforms, strengthening the defense of a public education focused on human emancipation and not on mere adaptation to the market. In short, the contemporary tensions around EMI reveal the need to, at the same time, resist setbacks and advance in the radicalization of the integrative project, deepening its theoretical-practical foundations and evidencing its positive results for society.

Table 1

Main theoretical references and their contributions to the analysis of EFA

AUTHOR(S)	MAIN CONTRIBUTION TO THE STUDY
Manfredi (2016)	It analyzes EFA as a field of historical disputes between antagonistic societal projects, evidencing different conceptions of State, work and education throughout Brazilian history.
Moura (2016)	It highlights the creation of the Federal Network (IFs) as a milestone that shifts professional education from a strictly technical function to an expanded formative perspective, integrating work, science, culture and technology.
Bezerra, Martins and Bezerra (2022)	They carry out a historical analysis of the educational duality in Brazil, showing the destination of a technical-instrumental education to the working classes <i>versus</i> a scientific-humanist education to the elites, which generated unequal and excluding school trajectories.
Molina and Sanfelice (2014)	They investigate the genesis of federal agricultural education, evidencing the pragmatically productivist character of the old agrotechnical schools and their limits in the articulation between technical training and general training.
Nery (2025)	It addresses the contributions and limitations of federal agricultural schools to regional development, pointing out the historical difficulty of fully integrating technical training with general education in the curriculum of these institutions.

Frigotto, Ciavatta and Ramos (2012)	They discuss the conception of EMI as a pedagogical strategy to overcome duality, proposing integrated curricula that unite academic basic education with professional education, in a perspective of integral human formation.
Ramos (2014)	It defends work as an educational principle and the articulation between work, science, culture and technology in professional education, enabling subjects to critically understand reality and overcome the fragmentation of knowledge.
Freire (1996)	It criticizes the traditional model of teaching (banking education) and proposes education as a practice of freedom, based on dialogue and critical awareness, guiding training towards human emancipation.
Ball (2021)	It analyzes neoliberal educational reforms, introducing performative and managerial logics that subordinate the curriculum to efficiency indicators, creating tensions and challenges for critical educational projects.
Felippe <i>et al.</i> (2025)	They point to the penetration of business logic in the EMI, showing that the primacy of mercantile rationalities in the integrated curriculum can empty its emancipatory potential and contradict the objectives of integral education.
Oliveira (2023)	It discusses the challenges for the consolidation of an emancipatory school via EMI, arguing that integrated education, although not ideal, constitutes the "possible project" of education for young workers under capitalism, and should be strengthened as an alternative to the exclusionary model of the reform of secondary education.

Source: Prepared by the author, 2026.

As summarized in Chart 1, there is an articulation between classical authors, such as Freire and Frigotto, Ciavatta and Ramos, and contemporary researchers, such as Ball, Felipe *et al.* and Oliveira, providing an overview of the theoretical dialogue that underlies this work. It is observed that, throughout the theoretical framework, fundamental concepts (work as an educational principle, integral human formation, polytechnics, etc.) are revisited and updated in the face of current challenges (neoliberalism, performativity, high school reforms). This synthesis reinforces the understanding that the analysis of the trajectory of the IF Goiano – *Morrinhos Campus* requires a theoretical look capable of encompassing both the historical bases of EFA and the dynamics and contradictions of the present.

In this sense, the update of Chart 1 with data from 2025 reveals the consolidation of a process of formative verticalization at IF Goiano – Campus Morrinhos, expanding its offer beyond technical and integrated courses, reaching specialization, master's and doctoral levels. This expansion shows not only the fulfillment of the institutional mission of the Federal Network, but also the strengthening of EMI as an articulating axis of an omnilateral

educational project. Such an advance, however, coexists with the structural and epistemological challenges already discussed, reaffirming the contradictory character of EFA as a field of dispute between emancipatory rationalities and utilitarian logics.

3 METHODOLOGY

The present research is characterized as qualitative, of a theoretical-documentary nature and of exploratory and analytical objectives. This delineation is justified by the nature of the problem investigated, which involves understanding historical and institutional processes in depth. A case study of the *Morrinhos Campus* of the IF Goiano was chosen, with analysis of documents and related literature, seeking to articulate the empirical findings with the theoretical framework previously exposed. With regard to procedures, documentary analysis was adopted as the main technique, complemented by content analysis inspired by Bardinian inspiration (Bardin, 2016).

The *corpus* of the research was composed of educational legislation (laws, decrees and regulations referring to professional education), official institutional documents (institutional history of the *Morrinhos Campus*, reports, institutional development plans, statutes of the IF Goiano, etc.) and reference academic productions in the field of EFA (books, classic and current scientific articles). The selection of sources obeyed the principle of thematic relevance, considering exclusively materials directly related to the historical, pedagogical and political constitution of the *Morrinhos Campus* and the Federal Network as a whole. Thus, the laws that structure EFA (LDB/1996, Decree 5.224/2004, Law 11.892/2008), documents from the IF Goiano that narrate the evolution of the *campus*, and academic studies on educational duality, EMI, interiorization and verticalization of teaching were included.

Data collection took place entirely in digital media, accessing the documents via official repositories (Planalto portal for legislation and IF Goiano websites for institutional documents) and virtual libraries (SciELO, Google Scholar and institutional repositories) for academic literature. Care was taken to verify the authenticity and timeliness of each document. In addition, *Google Maps* was used to obtain relevant geographic data – for example, the distance between the original *campus* (Urutaí) and the decentralized *campus* (Morrinhos), information used to contextualize the challenges of interiorization.

For data analysis, the content analysis technique proposed by Bardin (2016) was used, suitable for treating qualitative information in a systematic way. Initially, the floating reading and general recognition of the documents were carried out, identifying registration units (words and key phrases) relevant to the objectives of the study. Next, the thematic

coding was carried out: previous analytical categories were created, derived from both the theoretical framework and the research questions, such as "EFA as a State policy", "Educational duality", "Integral training", "EMI", "Interiorization" and "Commercial rationality". This initial definition of categories was refined inductively as the in-depth reading of the empirical material progressed.

Each relevant excerpt or textual occurrence was classified within the categories, allowing quantifying the frequency and mapping the distribution of the themes in the documents. It is noteworthy that these procedures followed criteria of methodological rigor – such as exhaustiveness, representativeness, homogeneity and pertinence (Bardin, 2016) – in order to ensure the validity and reliability of the analysis. Such criteria, as Gil (2022) highlights, aim to reduce biases and ensure the consistency of the *investigative corpus*. After categorization, the interpretation stage was carried out. Here, the categorized data were articulated in the light of the theoretical framework previously discussed, seeking to understand the underlying meanings and implications of each finding.

This involved comparing the documentary evidence with the key concepts (for example, verifying how the institutional documents of the IF Goiano reflect – or not – the conception of integral education defended by the literature). We also sought to identify possible contradictions or internal tensions in the data, such as official discourses that emphasize emancipatory education, but, at the same time, reveal influences of managerial logics. This critical analysis was facilitated by the construction of synthesis tables. Chart 1, presented in the theoretical section, has already exemplified the synthesis of the main theoretical references. Later, in the results section, Table 1 with the emerging empirical categories and their definitions will be presented, as well as Table 2 with the epistemological map relating these categories to the key authors who support the interpretation.

It is important to emphasize that, as this was a study without direct involvement of human subjects (primary data from interviews or similar), the study did not require ethical procedures such as a consent form. Even so, the ethical principles of scientific integrity and respect for the reliability of sources were observed, duly citing the authors and documents consulted. All research was conducted in accordance with the guidelines of CNS Resolution No. 510/2016, which regulates research in the Humanities and Social Sciences (Brasil, 2016). In short, the methodology adopted – qualitative, documental and based on content analysis – proved to be adequate to the proposed exploratory objectives, allowing the articulation of historical and institutional evidence with a critical theoretical reading. Next, the results obtained are presented, structured in thematic categories, followed by the discussion articulated with the literature and the epistemological synthesis of the analysis.

4 RESULTS AND DISCUSSIONS

4.1 ANALYTICAL CATEGORIES EMERGING FROM CONTENT ANALYSIS

The systematic analysis of the *corpus* allowed the identification of six central analytical categories, which express the structuring axes of the debate on EFA and, specifically, reflect aspects of the trajectory of the IF Goiano – Morrinhos Campus. The emerging categories were: (1) EFA as a state policy; (2) Educational duality; (3) Integral human formation; (4) Integrated High School (EMI); (5) Internalization of EFA; and (6) Mercantile rationality. Each category corresponds to a set of references and meanings found in the documents, and is also interpreted in the light of the theoretical framework discussed. Table 2 summarizes these categories, presenting their operational description, the frequency of occurrence in the *corpus*, and the main theoretical references that guided the analysis in each case.

Table 2

Analytical categories, operational description, frequency and theoretical frameworks

No.	ANALYTICAL CATEGORY	OPERATIONAL DESCRIPTION	FREQUENCY	THEORETICAL FRAMEWORKS
01	EFA as a state policy	References to institutionalization, legal frameworks and the role of the State in the structuring of EFA.	High	Manfredi (2016); Moura (2016); Brazil (1996; 2004; 2008).
02	Educational duality	Mentions of the separation between general and technical training, associated with the social division of labor.	Average	Frigotto; Ciavatta; Ramos (2012); Bezerra; Martins; Bezerra (2022).
03	Integral human formation	Articulation between work, science, culture and technology as a formative principle.	High	Ramos (2014); Freire (1996); Moura (2016).
04	Integrated High School (EMI)	EMI as a PPP and as a strategy for curricular integration in the IFs.	High	Frigotto; Ciavatta; Ramos (2012); Oliveira (2023).
05	Internalization of EFA	Territorial expansion, decentralized units and institutional impacts in the interior.	Average	Moura (2016); IF Goiano (2024).

06	Mercantile rationality	Influence of business, managerial and performative logics on educational policies.	Average	Ball (2021); Freitas (2018); Costa; Coutinho (2018).

Source: Prepared by the author, 2026.

The data presented in Table 1 show the centrality of EFA as a state public policy and of EMI as a PPP, among the most frequent categories (classified as "High"). This indicates that, in the documents analyzed, there is a strong emphasis on the institutional narrative that presents the creation and consolidation of the IF Goiano – *Campus Morrinhos* as part of a long-term state policy (category 1) and that points to EMI as the flagship of the local training project (category 4). In turn, "Medium" frequency categories such as educational duality (2), internalization of EFA (5) and mercantile rationality (6) also emerge recurrently, reflecting tensions and specific contexts: duality appears associated with the historical difficulties faced by the *campus* in articulating general and technical education; internalization is mentioned in the context of campus expansion and its regional impact; and mercantile rationality arises in reference to recent challenges imposed by external educational policies.

On the other hand, the category integral human education (3) had a high incidence, revealing that concepts such as "omnilateral education", "work-science-culture-technology articulation" and "emancipation" permeate institutional documents and possibly discourses about the *campus*. This is consistent with the educational mission assigned to the IFs. However, the simultaneous presence of the category of mercantile rationality suggests that this integral formative project coexists, not without conflicts, with pressures of a managerial or pragmatic nature in the institutional routine. Another point to highlight are the theoretical references associated with each category, indicated in Table 1.

It is noted that the analysis relied heavily on the authors discussed in the theoretical framework: for example, documents related to category 1 (State policy) mention legal frameworks and conceptions aligned with what Manfredi (2016) and Moura (2016) discuss; in category 2 (duality), there are direct allusions to the ideas of Frigotto, Ciavatta and Ramos (2012) and to historical analyses such as that of Bezerra, Martins and Bezerra (2022). This demonstrates that there was an explicit dialogue between the empirical texts and the academic literature. In short, the survey of the categories provided a kind of thematic map of the documentation, which will be explored in depth below, in the analytical subsections (4.2 to 4.4), and complemented, at the end, by the epistemological articulation (subsection 4.5).

4.2 PROFESSIONAL AND TECHNOLOGICAL EDUCATION AS A STATE POLICY AND THE PROCESS OF INTERIORIZATION

The results indicate that the institutionalization of EFA as a public policy of the State constitutes a structuring axis of the trajectory of the IF Goiano – *Campus Morrinhos*. References in official documents often situate the creation and development of the *campus* within the context of national policies for the expansion of the Federal Network. For example, several excerpts make explicit mention of Law No. 11,892/2008 (creating the IFs) as a fundamental milestone, and emphasize that the consolidation of the Federal Network did not take place in an episodic way, but as part of a medium and long-term State project. Thus, the hegemonic perspective in the documents is that the *campus* is not an isolated initiative, but the result of government planning aimed at democratizing access to professional education.

In this sense, a strong emphasis is identified in the data on the internalization of the educational offer as an objective fulfilled by the FIs. Several documents – from institutional reports to the official history of the *campus* – highlight that the presence of IF Goiano in Morrinhos implied the provision of public education in a region of the interior previously lacking in technical and higher education options. This discourse is in line with the understanding that the territorial expansion of the Federal Network expresses a conception of regional development articulated with human formation. Moura (2016) corroborates this understanding by stating that the expansion of FIs in the interior of Brazil represented a state strategy to promote educational inclusion and socioeconomic development in historically marginalized areas of large centers.

In the case of Morrinhos, the documentary analysis showed concrete evidence of this impact: records indicate, for example, the significant increase in the number of enrollments and courses offered on *campus* after its integration into the IF Goiano, ranging from technical courses in agriculture to undergraduate and graduate degrees in strategic areas for the region. These data confirm that there was an expansion of the local training offer, in line with the expansion objectives foreseen in the public policy. In addition, the institutional documentation attributes to the Morrinhos Campus a role of regional development. Mention is made of extension projects and community partnerships that the *campus* has implemented, aimed at improving production practices in the field and the qualification of local workers, for example.

This is directly linked to the idea of EFA as a State policy: not only to train individuals for the market, but to act as an agent of social transformation in the territory. Such initiatives indicate that the *campus* seeks to materialize the legal imperative of "promoting local and

regional socioeconomic development" present in the Law of creation of the IFs (Brasil, 2008). However, the critical analysis also reveals that the consolidation of EFA as a state policy, even though it represents an advance, did not eliminate tensions. The documents indicate that, although the State has legally committed to the provision of EFA, structural limits persist. For example, internal memos mention budget constraints and staff shortages in certain periods, reflecting swings in government support.

This suggests that, in practice, the sustainability of EFA as a state policy faces setbacks as government changes and political priorities. Even so, from the local point of view, the trajectory of *the* Morrinhos Campus confirms the movement of interiorization and expansion: from its creation as a linked unit (Decentralized Teaching Unit – UNED) to its autonomy as a *campus* of the Federal Institute, it is possible to observe the growing institutionalization and legitimacy of EFA in the region. This trajectory was accompanied, as the documents show, by investment in infrastructure (construction of new buildings and laboratories) and diversification of courses, serving varied audiences (young people and adults, youth and adult education integrated with technical training – National Program for the Integration of Professional Education with Basic Education in the Youth and Adult Education Modality – PROEJA, etc.).

In summary, the findings in this category reaffirm the thesis that the Morrinhos case exemplifies the strategic character of EFA as a State policy for reducing regional educational inequalities. The internalization of the Federal Network appears as a key element: the presence of the *campus* in Morrinhos meant unprecedented educational opportunities for the local population, illustrating at the micro level the impact of a macro-political decision. At the same time, the institutional consolidation of the *campus* did not occur without facing administrative and financial challenges, showing that the guarantee of this social right requires continuous state commitment.

The integrated reading of the data allows us to infer that, in the overall balance, the implementation of the relocation policy via FIs was successful in the case studied, although unfinished as a project – given that local needs still require expansion (for example, creation of new courses) and structural support. This understanding dialogues directly with the literature: Manfredi (2016) has already pointed out that EFA in Brazil has always oscillated between advances and setbacks according to the degree of priority given by the State throughout history, and the case of Morrinhos confirms this dialectic, with clear structural advances obtained in the last decade, but subject to conjunctural pressures.

4.3 EDUCATIONAL DUALITY AND INTEGRAL HUMAN FORMATION

The category of educational duality appeared recurrently associated with the historical context and current challenges of the *Morrinhos Campus*. The historical documents of the *campus* (such as its "institutional history" available on the IF Goiano website) refer to the past of the agrotechnical school, in which the curriculum was strongly oriented towards agricultural practices and technical disciplines, while more in-depth academic components had reduced space. This legacy reflects, as theoretically discussed, the structural duality of the Brazilian educational system. In the results, this duality is manifested in the tensions between general education and technical training identified in the institutional routine.

For example, minutes of pedagogical meetings on *campus* record debates about the workload of propaedeutic *versus* technical disciplines in integrated courses, evidencing the effort (and sometimes the conflict) to balance these dimensions in the curricular matrix. However, the findings also show that the *Morrinhos Campus* has become a space for confronting duality through the implementation of EMI. Recent pedagogical reports indicate *campus* initiatives to integrate interdisciplinary content and projects, seeking to give training unity to students. One of the documents highlights, for example, the realization of didactic projects that jointly involve teachers of technical areas and basic disciplines (such as an agroecology project that covers knowledge of biology, chemistry and agricultural techniques).

Such practices confirm that the EMI adopted there is configured, in the experience of the *Morrinhos Campus*, as a counter-hegemonic project that articulates work, science, culture and technology in an integrated curriculum. The results indicate that EMI has been understood locally not only as a curricular structure, but as an institutional value – something mentioned in documents such as the campus PPP, which emphasizes integral education as a guiding principle. This counter-hegemonic conception of EMI on *campus* is corroborated by qualitative indicators present in the data. For example, statements from managers (present in institutional news) state that EMI graduates have entered universities and worked in different sectors, which suggests that they have received a broad education.

In addition, there are records of participation of *campus* students in science fairs and academic Olympiads, as well as in technical internship activities, illustrating the intended theory-practice articulation. These facts reinforce that, although duality persists as a challenge (structural inheritance), there is a concrete movement of overcoming it in progress. The analysis, however, revealed that the educational duality was not fully overcome. Even after 2008, certain divisions persist: some subsequent technical courses (offered at night, aimed at high school graduates, for example) still follow a more instrumental logic,

disconnected from general training – possibly due to national curricula or specific demands. In addition, the external pressures mentioned in the previous section, such as secondary education reforms, tend to reintroduce fragmentation, which can impact the *campus*.

The data show that local educators are aware of this; one document records an internal discussion on how to align EMI's integrated curriculum with the BNCC without losing the integral formative essence – which highlights the continuous struggle to maintain the original project. It is also important to highlight that integral human education, a high-frequency category, is intrinsically related to this discussion. The findings bring several references to the search for omnilateral education on *campus*. In institutional self-assessment reports, for example, there are indicators related to cultural, sports and scientific activities offered to students, which denotes concern with the full development (not just technical) of students.

These initiatives – choirs, theater groups, science clubs – are cited as part of the pedagogical project and express, in practice, the refusal to offer a "mutilated" education that is only technical. Such a posture is in line with Freire's references (education as a practice of freedom) and Ramos (work-science-culture-technology articulation) that base the campus's PPP. In other words, the ideas of Freire (1996) and Ramos (2014) directly inspire the perspective adopted, emphasizing that education must be liberating, dialogical and totalizing, aspects mentioned textually in the PPP and in other pedagogical documents of the *campus*. A symbolic point identified in the results is the valorization, by the *campus*, of the pedagogy of alternation and active methodologies centered on work as an educational principle.

One document mentions the realization of students' experiences in rural communities and extension projects with family farmers as part of the integrated curriculum. This practice demonstrates the application of the principle of uniting theory and social practice, reinforcing citizenship education. Such actions exemplify the operationalization of integral education and confront duality, by not separating academic knowledge from the concrete experiences of students. It is concluded, therefore, that the experience of the Morrinhos Campus reflects a double reality: on the one hand, it confirms the persistence of the educational duality, which is shown as an inherited structuring element, perceptible in the difficulties of full curricular integration and in the tensions between different educational conceptions; on the other hand, it reveals a continuous institutional effort to affirm the project of EMI and integral education as an alternative to this duality.

In summary, the findings indicate that the *campus* is configured as a terrain of dispute in which, contradictorily, advances towards an omnilateral education coexist with the remnants (or renewed pressures) of the old separation between education for the elite and education for the workers. This finding confirms analyses by authors such as Frigotto,

Ciavatta and Ramos (2012) – that duality is a historically ingrained phenomenon and that its overcoming requires solid political projects and resistance – and by Nunes and Wetterich (2019) – that even after ten years of FIs, there are unfinished trajectories in this crossing against duality.

4.4 INTEGRATED HIGH SCHOOL AS A POLITICAL-PEDAGOGICAL PROJECT

The results show that EMI occupies a central position in the institutional project of the IFs, and this is confirmed in the case of the *Morrinhos Campus*. In the documents analyzed, EMI is cited not only as one offer among others, but as the modality that best expresses the identity and mission of the institution. The campus PPP, for example, dedicates a specific section to the EMI, highlighting its philosophical foundations (inspired by authors such as Paulo Freire and the concept of polytechnic) and highlighting it as the "structuring axis" of the campus curriculum. In practice, as the findings point out, the Morrinhos Campus consolidated EMI as its pedagogical flagship. Currently, technical courses integrated with high school represent a significant portion of the total enrollments on campus, a fact recorded in management reports.

In addition, innovative pedagogical initiatives have been linked mainly to these courses – such as semester integrative projects, scientific exhibitions and study orientation activities that involve multiple disciplines – evidencing the commitment to making EMI a field of advanced pedagogical experimentation. One aspect highlighted in the results is that EMI on *campus* is perceived as an ongoing counter-hegemonic project. The qualitative findings indicate that the institutional actors (managers and teachers) see EMI as a way to offer a differentiated education, as opposed to the "traditional" high school education of the state networks. Words such as "emancipatory", "integral" and "citizen" appear frequently in internal documents when referring to EMI, reinforcing its character as a PPP committed to social transformation.

This confirms the alignment with the perspective that EMI, as discussed by Frigotto, Ciavatta and Ramos (2012) and Oliveira (2023), is a training project that resists the exclusionary tendencies of neoliberal educational policies. However, the results also reveal that EMI faces considerable contemporary challenges on *campus*. One trend identified is the need for constant curricular updating to dialogue with the new national guidelines. The recent implementation of the New High School (2017 reform) generated internal discussions at the IF Goiano on how to make the "training itineraries" provided for in the legislation compatible with the already consolidated EMI proposal.

The documents indicate a concern not to disfigure the integrated: it was preferred, for example, to adopt interpretations of the law that would allow for the maintenance of integrated technical training as one of the itineraries, guaranteeing the continuity of the original project. This solution highlights both flexibility and institutional resilience in favor of EMI. Another challenge pointed out is the infrastructure required for EMI. Integrated teaching, by articulating theory and practice, requires equipped laboratories, adequate spaces and an extended workload. The reports point to achievements in this area (expansion of science laboratories, experimental farm for agricultural courses, etc.), but also gaps – such as the need to expand libraries and technological resources. Such material issues influence the quality of curricular integration.

There is also mention of the need for continuing education of teachers to deal with interdisciplinarity and project work, which is central to EMI. This indicates a recognition that, in addition to the physical structure, it is necessary to invest in teacher professional development to consolidate the integrative project. A central emerging point is the impact of EMI on students and the community. Qualitative data (such as testimonies collected at *campus* events and disclosures in institutional media) suggest that EMI has been well received by families and students, seen as an opportunity to obtain both a high school diploma and a professional technical qualification. Many students come from low-income families in the region, who find on *campus* a path to educational advancement that combines preparation for work and for continuing their studies.

This dual potential of EMI – allowing insertion into the world of work and entry into higher education – is highlighted in reports by graduates. Such information confirms what Oliveira (2023) argues: EMI, although not the solution to all problems, represents the "possible project" of an emancipatory school for the working class, as it opens paths that were previously mutually exclusive (work *versus* university). Paradoxically, the category of mercantile rationality, already discussed, also applies here. The findings reveal signs of tension of the EMI by external logics: demands for approval rates in national exams, pressure to align with the immediate demands of the local market, etc. An internal document reports, for example, discussions about the offer of short-term FIC (Initial and Continuing Education) courses, more adjusted to the needs of employers, which could divert focus from the EMI.

This is perceived by part of the professors as the influence of a more market-oriented rationality penetrating the institution. As analyzed, Felipe *et al.* (2025) characterize this phenomenon as colonization of the curriculum by business logic, which in the context of EMI would manifest itself in the reduction of its critical potential in favor of an education more adjusted to "skills" demanded by the market. The campus data show resistance to this

colonization: the management has emphasized the maintenance of the EMI and resisted reducing the workload of general training, for example, even in the face of possible cuts in resources. In general, it can be said that the EMI at *the* Morrinhos Campus plays a strategic role.

It acts as a synthesis of institutional values (inclusion, quality and citizenship) and as a showcase of the positive impact of FIs in the region. The consolidation of the EMI, despite the regrets, reaffirms the commitment of the IF Goiano to omnilateral training and to the educational offer that breaks with the dual logic. At the same time, the continuous need to defend and improve the EMI shows that this is a project under permanent construction and negotiation, especially in a national context of reforms and uncertainties. Thus, the situation of the EMI in Morrinhos reflects well the broader scenario: consistent advances – such as recognition by the community and good educational results – coexist with structural and conjunctural challenges – such as adapting to new policies and facing antagonistic logics.

4.5 EPISTEMOLOGICAL ARTICULATION OF THE RESULTS

In order to deepen the understanding of the results, the epistemological axis that supports the analysis was explained, relating the empirical categories identified to the theoretical references mobilized. Table 3, below, systematizes this epistemological map of the analysis, showing how different theoretical conceptions guided the interpretation of the findings and the construction of the critical view adopted in this study.

Table 3

Epistemological map of the analysis

No.	EPISTEMOLOGICAL AXIS	THEORETICAL CONTRIBUTION	AUTHORS OF REFERENCES
01	Critique of the fragmentation of knowledge.	Overcoming the division between scientific and technical knowledge.	Bachelard (1996).
02	Paradigms and scientific disputes.	Understanding of institutional ruptures and permanences.	Kuhn (2017).
03	Educational policies and performance.	Analysis of managerial and business rationalities.	Ball (2021).
04	Integral human formation.	Work as an educational principle.	Freire (1996); Ramos (2014).
05	Education as a public policy.	Role of the State in guaranteeing the right to education.	Manfredi (2016); Moura (2016).

Source: Prepared by the author, 2026.

Table 2 shows that the analysis of the results is not restricted to an empirical description, but is anchored in a critical epistemological positioning. The articulation between classical and contemporary theoretical frameworks – such as Freire (1996) and Frigotto, Ciavatta and Ramos (2012) in the context of the critique of duality and the defense of integral education, of Ball (2021) and Freitas (2018) in the analysis of educational policies under neoliberal logics, and of Kuhn (2017) and Bachelard (1996) in the understanding of paradigmatic ruptures in science – allowed us to interpret EFA not only as an institutional arrangement, but as a field of paradigmatic disputes in which antagonistic societal projects confront each other. This theoretical-epistemological perspective showed that the institutional transformations observed can only be understood in the light of the historical conditions and the correlations of forces that structure contemporary educational policies, rejecting simplistic or decontextualized analyses of the phenomena.

In practical terms, each epistemological axis guided the reading of the findings in a different way: (1) the criticism of the fragmentation of knowledge underpinned the valorization of EMI and curricular integration as a response to duality – here we dialogue with Bachelard and Freire in defense of a unitary view of knowledge; (2) Kuhn's notion of paradigmatic disputes allowed us to see the institutional advances and setbacks (creation of FIs and reforms of secondary education) as part of paradigm shifts in education, with periods of rupture and continuity; (3) the lens of Ball's performative politics and Freitas' business reform made it possible to contextualize the managerialist pressures found on *campus* within a broader movement of neoliberalization of education; (4) the centrality of work as an educational principle rescues Freire and Ramos to interpret EMI and integrative projects as practices of emancipation; (5) finally, the vision of professional education as a public policy of the State was illuminated by authors such as Manfredi and Moura, who provide the historical-political background to understand the importance of the interiorization and verticalization of teaching.

In short, the epistemological matrix adopted conferred coherence and depth to the analysis, avoiding both descriptive technicality and criticism unrelated to the data. There was a deliberate concern to align empirical evidence and critical theory, so that each conclusion could be supported simultaneously by the documents analyzed and by the academic debate. This robust approach is consistent with the qualitative and critical-dialectical nature of the research, ensuring that the inferences and interpretations made had a consistent foundation.

5 CONCLUSION

The main objective of this study was to analyze the historical and institutional trajectory of the former EAF of Morrinhos until its consolidation as IF Goiano – *Campus Morrinhos*, seeking to understand how this path reflects the political, pedagogical and epistemological disputes in the field of EFA in Brazil. It was based on a research question aimed at investigating how this institutional trajectory reveals, simultaneously, advances in the consolidation of EFA as a public policy of the State and structural permanences linked to the educational duality and the pressures of rationalities external to the integral formative project. The results obtained show that the institutionalization of EFA within the scope of the Federal Network of Professional, Scientific and Technological Education – consolidated by the creation of this Network through Law No. 11,892/2008 (Brasil, 2008) – represented a significant advance in addressing historical inequalities in access to public education, especially in regions of the interior of the country.

The expansion of the FIs reaffirmed their strategic role in the internalization of the educational offer and in the verticalization of teaching, consolidating the EMI as the structuring axis of a PPP aimed at omnilateral training. On the other hand, the analysis also revealed that such advances did not imply the automatic overcoming of the historical contradictions of Brazilian education. The educational duality remained as a structuring element of the institutional path, manifesting itself in the tensions between general education and technical training, as well as between emancipatory conceptions of education and utilitarian demands linked to the labor market. Consequently, the initial hypothesis of the study is confirmed: the trajectory investigated evidences both processes of consolidation of EFA as a public policy of the State and structural limitations that still hinder the full realization of integral human education in the context analyzed.

In this sense, EMI emerges, in the experience of the *Morrinhos Campus*, as a privileged space for political and pedagogical dispute. The findings indicate that EMI is configured as a counter-hegemonic project by articulating work, science, culture and technology in an integrated curriculum, breaking with the historical fragmentation imposed on the formation of the working classes. However, the implementation of this project is conditioned by multiple institutional, formative and political factors, and is constantly stressed by educational reforms guided by managerial and business rationalities (Ball, 2021; Freitas, 2018). These tendencies externalize productivist pressures on the school, which reflects what Felipe *et al.* (2025) characterize it as a colonization of the curriculum by business logic, imposing impasses on the construction of a truly emancipatory education.

As discussed throughout the work, recent high school policies influenced by a performative and market logic tend to reiterate educational duality, putting old challenges back on the agenda. From the epistemological point of view, a critical stance was assumed in this study, which refuses the alleged neutrality of knowledge and understands education as a historically and socially situated practice. As Freire (1996, p. 56) rightly stated, "it is impossible, in fact, the neutrality of education". In line with this understanding, it was considered that the production of knowledge in education is not neutral, but committed to certain worldviews and social projects.

The dialogue with classical and contemporary theoretical references – such as Freire (1996) and Frigotto, Ciavatta and Ramos (2012) in the context of the critique of duality and the defense of integral education, of Ball (2021) and Freitas (2018) in the analysis of educational policies under neoliberal logics, and of Kuhn (2017) and Bachelard (1996) in the understanding of paradigmatic ruptures in science – allowed us to interpret EFA not only as an institutional arrangement, but as a field of paradigmatic disputes in which antagonistic societal projects confront each other. This theoretical perspective showed that the institutional transformations observed can only be understood within the historical conditions and the correlations of forces that structure contemporary educational policies.

In this way, any simplistic or decontextualized analysis was avoided: the advances of the Morrinhos Campus were interpreted as part of a historical project of educational inclusion, at the same time that its challenges were understood in the light of broader political-economic trends that affect education. The contributions of this study are situated in three interrelated dimensions. On the theoretical level, the work deepens the understanding of EFA as a public policy of the State, by highlighting its internal contradictions and structural limits. The historical and critical analysis developed reinforces the conception that professional education, in addition to its economic functionality, is permeated by ideological clashes regarding its formative and social meaning.

For example, it was evidenced how educational duality and the pressure for business logics are phenomena that carry divergent worldviews on the role of education (forming citizens or just training labor), confirming the contribution of authors such as Bezerra, Martins, and Bezerra (2022) on the roots of this inequality. On the methodological level, the research demonstrates the power of documentary analysis articulated with content analysis as a rigorous strategy to investigate institutional trajectories in education. The construction of a *diversified corpus* of sources (legislation, institutional documents and specialized literature) and their interpretation in the light of well-defined theoretical-analytical categories proved to

be effective in revealing hidden or little addressed aspects of the history of the institution studied.

This methodological option, in line with the exploratory and analytical objectives of the study, illustrates how rigorous qualitative procedures can generate consistent and reasoned findings, even in the absence of field data. On the practical and social level, the results offer important subsidies for critical reflection on the implementation of EMI and on the role of FIs in the defense of public, free and socially referenced education. By highlighting challenges such as the pressure to meet market interests and the difficulties of materializing a truly integrated curriculum, the study contributes to the debate on educational policies and practices committed to integral human formation. Such *insights* can guide managers, educators, and policymakers in strengthening emancipatory pedagogical projects, as well as warn of the risks of setbacks when reductionist views of education prevail.

Among the limitations of this investigation, the methodological approach centered on documentary and bibliographic sources stands out, which made it impossible to directly apprehend the perceptions and experiences of the institutional subjects involved (teachers, students, managers) in the historical process analyzed. This delimitation, although coherent with the objectives and the historical-analytical nature of the study, points to the need for future studies with complementary empirical approaches, capable of deepening the understanding of the concrete impacts of EMI on school daily life. As a result, it is recommended to conduct research that incorporates interviews, observations, and other field techniques, in order to capture the voices and perspectives of the local actors involved in the provision of EMI.

Additionally, it is suggested to undertake comparative analyses between different *campuses* and FIs, as well as to investigate the effects of the most recent educational reforms (e.g., the post-2017 curricular changes) on the continuity and quality of EMI projects. These investigations can expand knowledge about the internal and external dynamics that influence EFA, subsidizing the formulation of public policies that are increasingly committed to equality, quality and emancipation in EFA. In conclusion, the trajectory of the IF Goiano – *Morrinhos Campus* reaffirms the crucial role of the IFs in promoting integral human formation and regional development. At the same time, it shows that the consolidation of EFA as a public policy of the State is a process in dispute, which requires permanent vigilance and collective engagement so that the principles of a public, democratic and omnilateral education prevail over regressive tendencies.

The experience of Morrinhos shows both the significant achievements (such as the expansion and internalization of the educational offer, the verticalization of teaching and the

strengthening of research and extension in the Federal Network) that have been obtained in recent decades, as well as the persistent challenges – notably the need to resist the reconfigured educational duality and the onslaught of mercantile rationalities on the curriculum. In this sense, this study contributes critically and consistently to the debate on the direction of EFA in contemporary Brazil, signaling that the implementation of an emancipatory educational project requires not only legal and institutional changes, but, above all, a deep understanding of the historical and current contradictions that permeate the educational field. Only based on this understanding will it be possible to advance in the construction of a truly transformative public education, committed to social emancipation and integral human development.

ABSTRACT

This study examines the impacts of the COVID-19 pandemic on Brazilian basic education through the lens of supervised internship reports in Geography, produced between 2020 and 2022. Using a mixed-methods approach, it combines a quantitative content analysis of a corpus of 33 reports with a qualitative discursive analysis, aiming to map the deficiencies, efficiencies, and transformative potentials of Emergency Remote Teaching (ERT). Quantitative findings reveal a systemic crisis marked by the precariousness of digital access infrastructure (60.6% of the reports indicate unstable connectivity), which directly correlates with low student engagement (84.8% report low attendance) and a widespread perception of learning gaps (78.8%). Nevertheless, the data also highlight remarkable teacher resilience, with 54.5% of the reports describing creative pedagogical adaptations. The qualitative analysis deepens these insights, showing that infrastructure functioned as the determining variable for educational access and that pedagogical innovation often came at the cost of stress and professional burnout (33.3% of the reports). The study concludes that the pandemic did not create but rather exacerbated pre-existing structural inequalities, serving as a "stress test" that exposed the fractures of the educational system. Finally, the article moves beyond diagnosis, proposing an integrated framework of policy and pedagogical interventions, including the creation of territorial curation platforms, reverse mentoring programs, and teacher work observatories, with the goal of transforming the lessons of the crisis into a more resilient, equitable, and technologically integrated educational ecosystem.

Keywords: Distance Education. Pandemic. Transformation. Emergency Remote Teaching.

RESUMO

Este estudo analisa os impactos da pandemia de COVID-19 na educação básica brasileira através da lente de relatórios de um estágio supervisionado em Geografia produzidos entre 2020 e 2022. Utilizando uma abordagem de métodos mistos, o trabalho articula uma análise de conteúdo quantitativa de um corpus de 33 relatórios com uma análise discursiva qualitativa, visando mapear as deficiências, eficiências e potenciais transformadores do

Ensino Remoto Emergencial (ERE). Os resultados quantitativos revelam uma crise sistêmica, marcada pela precariedade da infraestrutura de acesso digital (60,6% dos relatos apontam conexão instável), que se traduz diretamente em baixíssimo engajamento discente (84,8% reportam baixa frequência) e em uma percepção generalizada de defasagem de aprendizagem (78,8%). Contudo, os dados também expõem uma notável resiliência docente, com 54,5% dos relatórios descrevendo adaptações pedagógicas criativas. A análise qualitativa aprofunda esses achados, demonstrando que a infraestrutura operou como a variável determinante do acesso educacional e que a inovação docente ocorreu frequentemente à custa de estresse e esgotamento profissional (33,3% dos relatos). O estudo conclui que a pandemia não criou, mas exacerbou desigualdades estruturais pré-existentes, funcionando como um "teste de estresse" que expôs as fraturas do sistema educacional. Finalmente, o artigo avança para além do diagnóstico, propondo um quadro integrado de intervenções políticas e pedagógicas, incluindo a criação de plataformas de curadoria territorial, programas de mentoria reversa e observatórios do trabalho docente, com o objetivo de converter as lições da crise em um ecossistema educacional mais resiliente, equitativo e tecnologicamente integrado.

RESUMEN

Este estudio analiza los impactos de la pandemia de COVID-19 en la educación básica brasileña a través de la lente de los informes de prácticas supervisadas en Geografía, producidos entre 2020 y 2022. Utilizando un enfoque de métodos mixtos, el trabajo articula un análisis de contenido cuantitativo de un corpus de 33 informes con un análisis discursivo cualitativo, con el objetivo de mapear las deficiencias, eficiencias y potenciales transformadores de la Enseñanza Remota de Emergencia (ERE). Los resultados cuantitativos revelan una crisis sistémica, marcada por la precariedad de la infraestructura de acceso digital (el 60,6% de los informes señalan conexión inestable), que se traduce directamente en un bajísimo compromiso estudiantil (el 84,8% reporta baja asistencia) y en una percepción generalizada de rezago en el aprendizaje (78,8%). Sin embargo, los datos también evidencian una notable resiliencia docente, con el 54,5% de los informes describiendo adaptaciones pedagógicas creativas. El análisis cualitativo profundiza estos hallazgos, demostrando que la infraestructura operó como la variable determinante del acceso educativo y que la innovación docente ocurrió frecuentemente a costa del estrés y del agotamiento profesional (33,3% de los informes). El estudio concluye que la pandemia no creó, sino que exacerbó las desigualdades estructurales preexistentes, funcionando como una "prueba de estrés" que expuso las fracturas del sistema educativo. Finalmente, el artículo avanza más allá del diagnóstico, proponiendo un marco integrado de intervenciones políticas y pedagógicas, que incluye la creación de plataformas de curaduría territorial, programas de mentoría inversa y observatorios del trabajo docente, con el objetivo de convertir las lecciones de la crisis en un ecosistema educativo más resiliente, equitativo y tecnológicamente integrado.

1 INTRODUCTION

The COVID-19 pandemic has caused an unprecedented disruption in education systems on a global scale, resulting in the closure of schools and the abrupt migration of pedagogical activities to the digital environment. In the Brazilian context, this transition did not configure a planned adoption of Distance Education (DE), but rather the massive and reactive implementation of what the specialized literature calls Emergency Remote Education (ERE)¹. The distinction between these two concepts is crucial for the critical analysis of the period.

1.1 FROM THE CLASSROOM TO THE SCREEN: THE RUPTURE OF EMERGENCY REMOTE TEACHING (ERE)

In the scenario of remote and hybrid classes, the Geography degree course at the Federal University of Triângulo Mineiro, especially the supervised internships, recognized as central moments of practical training and direct understanding of the teaching-learning process, had to adapt quickly. These stages became, simultaneously, spaces for experimentation and rupture, evidencing both improvisations and innovative pedagogical initiatives.

The internship reports constitute, in this context, immediate and direct records of the educational conjunctures of the period, functioning as privileged sources to understand how the teacher in training experienced and reacted to the shock of virtualization. This work is based on the assumption that the documentation produced by these interns is not limited to a technical record; it is also a social and pedagogical witness. Such documents allow diagnosing structural conditions (infrastructure and educational policies), teaching practices (methodologies and mediation) and effects on learning and student engagement.

While distance education is a teaching modality with a pedagogical project, methodology, instructional design and technological infrastructure conceived from the beginning for non-face-to-face learning, ERE is characterized as a temporary and improvised solution, a transposition of the logic of the face-to-face classroom to digital media, often without proper planning, teacher training or institutional support. The ERE, therefore, was not a pedagogical choice, but a contingency response to a health crisis. Its implementation was marked by urgency, by the absence of a prior diagnosis of the conditions of access of students and professors, and by the lack of investment in training and development actions.⁵ This improvised nature led some analysts to describe the ERE as a "workaround", a precarious solution to a complex problem, which rejected the accumulated knowledge about distance education and operated based on the individual adaptation of its actors. This terminological

distinction is not merely academic; it constitutes an analytical and political act. Framing the pandemic experience as ERE, and not as distance education, is to recognize that the failures observed do not stem from a specific educational model, but from a systemic failure to respond to an emergency, exposing the structural fragility of Brazilian education. The confusion between the terms often serves to legitimize a low-cost and highly precarious solution, obscuring the State's responsibility to provide the material and pedagogical conditions for quality education, whether face-to-face or distance.

1.2 THE GEOGRAPHY OF DIGITAL INEQUALITY IN BRAZIL: THE PRE-PANDEMIC SCENARIO

The crisis of Emergency Remote Education cannot be understood without an analysis of the terrain on which it has been installed. The pandemic did not create educational inequality in Brazil; It acted as a catalyst and a relentless diagnostic tool, exposing and deepening social and digital fractures that were already deeply ingrained in the country's structure. Brazil entered the health crisis with a scenario of deep digital apartheid. Data from national surveys, such as ICT Education in Cetic.br, already indicated, long before 2020, that access to devices and quality connectivity was dramatically unequal, reproducing and amplifying socioeconomic, racial, and regional inequities.

Studies and reports by organizations such as "Todos Pela Educação" already denounced that inequality in access to public education was a structural problem.⁹ Brazil was already classified as one of the most unequal economies in the world in terms of education, with a performance gap between students with higher and lower purchasing power. With regard to technological infrastructure, public schools were notoriously precarious, with insufficient or unmaintained computers and a lack of continuing education for teachers.¹⁰ Data from the School Census, compiled by INEP, corroborate this disparity, showing glaring differences in the technological support and teacher training offered by state and municipal networks compared to the private sector.¹⁴ In this context, the forced transfer to the ERE was not a leveler, but a multiplier of inequalities.

By making access to the internet and the possession of an electronic device prerequisites for the right to education, the education system effectively excluded millions of students who were already in a situation of vulnerability. The pandemic, therefore, functioned as a "forced experiment" on a national scale, whose tragic outcome was predictable: the collapse of access and learning for the poorest was the direct consequence of old and deliberately ignored structural inequalities.

1.3 INTERNSHIP REPORTS AS CRISIS SEISMOGRAPHS: JUSTIFICATION, METHODOLOGY AND OBJECTIVES

If macroeconomic data and national surveys reveal the scale of the educational catastrophe, it is the narratives of daily school life that expose its human texture. In this study, the supervised internship reports produced by Geography undergraduates are conceived as "seismographs" of the crisis: documents capable of recording the tremors of the school floor, the experiences lived, the survival strategies and the fractures exposed by the emergency.

The use of these documents as a source of research is supported by the pedagogical literature, which recognizes them as privileged spaces for reflection, where a fundamental dialogue is established between the theory learned at the university and the practice experienced in the school environment.¹⁶ The reports are not mere bureaucratic records; They are testimonies that reveal the way of being, living and understanding a social fact, allowing the analysis of the conceptions of future teachers about the educational context in which they are inserted.

The initial universe of the research comprised 39 unique reports. To ensure the homogeneity of the corpus and the analytical focus on the ERE experience, a rigorous filtering process was applied. Four documents were excluded from the main analysis because they deviated significantly from the contextual scope: two because they were theoretical essays without a report of internship practice and two because they were produced in 2023 and 2024, representing a post-pandemic context. The calculation basis for the quantitative analysis was thus established in 36 reports that directly described the remote and hybrid teaching experiences between 2020 and 2022.

After a final verification of textual integrity and formal consistency, the set actually used for in-depth statistical analysis and qualitative triangulation was consolidated into 33 reports. The validity of the use of such documents as a source of research is supported by their reflective nature, which allows the investigation of the educational problem in an indirect way, but rich in contextual details.

It is crucial to note that the need to exclude documents due to formal or analytical insufficiency is not just a technical procedure, but a substantive finding in itself. The literature on teacher education emphasizes that the supervised internship should be a moment of development of reflective practice, establishing a fruitful dialogue between the knowledge of experience and formal knowledge. Thus, the finding that a portion of the corpus did not reach a minimum standard of analytical coherence signals a fragility in the training process itself. This "documentary insufficiency" is therefore interpreted as a symptom of a gap in the undergraduate curricula, which sometimes fail to equip future teachers with the necessary

skills for scientific writing and critical reflection on their own practice. The methodology, by exposing this fragility, already produces a diagnosis of teacher training. These documents offer a unique perspective, that of the "participant observer", who, at the same time as experiencing the crisis, is entrusted with the task of critically analyzing it. They capture, firsthand, the difficulties of infrastructure, the reactions of students, the anxieties and innovations of supervising teachers, and the impacts on the teaching-learning process. In view of the above, the objectives of this work are:

1. Systematically map, through a mixed-methods approach, the deficiencies and efficiencies of Emergency Remote Teaching, as reported by Geography teachers in initial training in the period 2020 to 2022.
2. To analyze the causal relationships between material infrastructure, pedagogical practices, student engagement and learning outcomes, triangulating the data from the corpus with the Brazilian educational scenario.
3. Identify and analyze emerging innovative practices and, based on the evidence collected, propose a set of public policies and pedagogical interventions for the construction of a more equitable, resilient, and technologically integrated post-pandemic education system.

To achieve the proposed objectives, a mixed-methods research was designed, which combines quantitative content analysis with qualitative discursive analysis in an integrated way. This approach allows not only to identify the frequency and distribution of phenomena, but also to understand their depth, context, and meaning. The primary source of the study consisted of supervised internship reports produced by students of the Geography Degree course of a higher education institution.

2 DEVELOPMENT

2.1 RESEARCH DESIGN AND CORPUS CONSTRUCTION

To achieve the proposed objectives, a mixed-methods research was designed, which combines quantitative content analysis with qualitative discursive analysis in an integrated way. This approach allows not only to identify the frequency and distribution of phenomena, but also to understand their depth, context, and meaning. The primary source of the study consists of supervised internship reports produced by students of the Geography Degree course of a higher education institution.

The initial universe of the research comprised 39 unique reports. To ensure the homogeneity of the corpus and the analytical focus on the ERE experience, a rigorous filtering

process was applied. Four documents were excluded from the main analysis because they deviated significantly from the contextual scope: two because they were theoretical essays without a report of internship practice and two because they were produced in 2023 and 2024, representing a post-pandemic context. The calculation basis for the quantitative analysis was thus established in 36 reports that directly described the remote and hybrid teaching experiences between 2020 and 2022. After a final verification of textual integrity and formal consistency, the set actually used for in-depth statistical analysis and qualitative triangulation was consolidated into 33 reports. The validity of the use of such documents as a source of research is supported by their reflective nature, which allows the investigation of the educational problem in an indirect way, but rich in contextual details.¹⁸

It is crucial to note that the need to exclude documents due to formal or analytical insufficiency is not just a technical procedure, but a substantive finding in itself. The literature on teacher training emphasizes that the supervised internship should be a moment of development of reflective practice, establishing a fruitful dialogue between the knowledge of experience and formal knowledge.¹⁶ The finding that a portion of the corpus did not reach a minimum standard of analytical coherence signals a weakness in the training process itself. This "documentary insufficiency" is therefore interpreted as a symptom of a gap in the undergraduate curricula, which sometimes fail to equip future teachers with the necessary skills for scientific writing and critical reflection on their own practice. The methodology, by exposing this fragility, already produces a diagnosis of teacher training.

2.2 QUANTITATIVE ANALYSIS: CODING AND STATISTICAL TREATMENT

The quantitative phase of the study was operationalized through the construction of a detailed codebook, which established five central analytical dimensions: (1) Teaching Technique, (2) Infrastructure, (3) Engagement, (4) Resources/Strategies and (5) Learning. Each dimension was broken down into indicators of "deficiency" and "efficiency", coded in a binary way (presence/absence) based on clear and standardized textual signals. For example, the mention of "signal drops" or "impossibility of synchronous participation" was coded as the presence of the indicator "Unstable connection" in the Infrastructure dimension.

To ensure the reliability and objectivity of the coding process, a double coding protocol was implemented. A sample of 20% of the reports (7 documents) was independently coded by two researchers. The agreement between the coders was measured by Cohen's Kappa coefficient, adopting as an acceptance criterion a kappa value ≥ 0.70 , considered indicative of substantial agreement. The divergences identified were resolved through rounds of discussion and adjudication, with all decisions documented in a research diary.

The coded data were tabulated and analyzed with the aid of statistical software. Analyses included absolute and percentage frequencies, measures of central tendency and dispersion, and bivariate crossovers to explore associations between variables. To test the statistical significance of the associations between categorical variables, Pearson's chi-square test (χ^2) was used. In cases where the expected frequencies in any cell of the contingency table were less than 5, Fisher's exact test was applied, which is more robust for small samples. The strength of the associations was measured by Cramer's V. All tests were conducted with a significance level of $\alpha=0.05$.

2.3 QUALITATIVE ANALYSIS: TRIANGULATION AND INTERPRETATIVE VALIDATION

Quantitative analysis, while essential for identifying patterns and trends, would be insufficient to capture the complexity of lived experiences. For this reason, the qualitative approach was central to the research, operating in a continuous process of triangulation with the numerical data. The discursive analysis followed procedures of in-depth and reflective reading of the 33 reports. Units of meaning, excerpts, narratives, examples and reflections were identified and submitted to an open thematic coding, allowing the emergence of interpretative categories that complemented and sometimes tensioned the results of binary coding.

The core of the mixed method was the retrosynthetic integration: the numerical patterns (e.g., the high correlation between gamification and participation) were qualitatively investigated to understand how and why this association occurred in the context of the reported practices. Representative examples, borderline cases (atypical situations that defied the general trend) and counter-narratives were extracted and analyzed to give density and nuance to the interpretation. To strengthen the external validity and credibility of the findings, the main interpretations were submitted to a peer validation panel, composed of experienced professors and internship supervisors. This external fact-checking process helped refine the conclusions, ensuring that the interpretations were aligned not only with the data in the corpus, but also with the practical experience of educators who experienced the pandemic period.

2.4 RESULTS: A MULTIFACETED PORTRAIT OF PANDEMIC EDUCATION

The analysis of the 33 internship reports, totaling approximately 400 pages of narratives and reflections, offers a detailed and multifaceted overview of basic education during the height of the COVID-19 pandemic. Quantitative data reveals consistent patterns of structural difficulties and pedagogical impacts, while qualitative analysis illuminates the

human experiences behind the numbers. The following table presents a summary of the overall metrics, serving as a roadmap for the detailed discussion that follows. It exposes the central tension identified in the study: the coexistence of high rates of deficiency in structural dimensions (infrastructure, engagement) with significant indicators of efficiency and resilience in pedagogical dimensions (teaching technique, learning).

Table 1

Overall Metrics of Reported Deficiencies and Efficiencies (N = 33)

DIMENSION	METRIC, DEFICIENCY (N)	%	METRIC, EFFICIENCY (N)	%
Teaching technique	Technical Issues/Stress (11)	33,3%	Creative Adaptation (18)	54,5%
Infrastructure	Unstable Connection (20)	60,6%	Consistent Access (4)	12,1%
Appliances	Lack of devices (16)	48,5%		
Engagement	Low Frequency (28)	84,8%	Active Participation (18)	54,5%
	Lack of interaction (22)	66,7%		
Resources	Lectures (19)	57,6%	Gamification / Creative Projects (12)	36,4%
Learning	Lag / Difficulty (26)	78,8%	Effective Learning (17)	51,5%

Source: Authors.

2.5 INFRASTRUCTURE AS A PREPONDERANT FACTOR: THE MATERIAL BASIS OF EXCLUSION

The data in the corpus unequivocally confirm that the lack of technological resources (infrastructure and devices) was the main bottleneck of Emergency Remote Teaching. The "unstable connection" was mentioned in 20 of the 33 reports (60.6%), and the "lack of adequate devices" (computers, tablets or smartphones capable of supporting the platforms) was reported in 16 documents (48.5%). In contrast, only 4 reports (12.1%) described a scenario of consistent and uninterrupted access, all of which referred to experiences in private schools. The qualitative narratives detail the devastating impact of this precariousness: students who "disappeared" from synchronous classes due to the exhaustion of the mobile data package, families who shared a single cell phone for multiple school-age children, and teachers who taught classes from their own homes with unstable internet, generating frustration and discontinuity.

This micro reality, captured in the reports, is a direct reflection of the national crisis of digital inequality. Data from Cetic.br and INEP already pointed to a scenario of digital apartheid in Brazil, where access to quality internet and adequate devices is strongly stratified by social class and geographic location.⁹ INEP's survey "Educational response to the COVID-19 pandemic in Brazil" revealed that, in 2021, only 15.9% of schools in the state network and a derisory 2.2% of municipal schools adopted measures to provide free or

subsidized access to the internet for the students.¹⁴ The statistical analysis of our corpus solidifies this connection between infrastructure and participation: the crossing between the variables "Unstable connection" and "Low frequency" revealed a statistically significant association [$\chi^2(1, N=33) = 4.07$; $p=0.044$; Cramer's $V = 0.35$, indicating a moderate effect]. Of the 20 reports that cited connection problems, 19 (95%) also reported low student attendance. This empirical data is striking: engagement was not, in most cases, a matter of will or motivation, but of material possibility.

2.5.1 Engagement, Interaction, and Avoidance: The Human Consequences of Disconnection

As a direct consequence of infrastructural precariousness, student engagement indicators were drastically negative. "Low frequency" was the most cited problem in the reports, appearing in 28 of the 33 documents (84.8%). "Lack of interaction" (students with cameras and microphones turned off, lack of participation in chats or forums) was the second most common complaint, present in 22 reports (66.7%). The reports describe a scenario of "ghost virtual classrooms", with teachers speaking to a screen full of inactive icons, generating a deep sense of isolation and frustration. The situation was even more serious in Youth and Adult Education (EJA), where interns reported synchronous classes with only "one or two students" connected, evidencing the incompatibility of the ERE model with the reality of the student-worker, who already faces multiple challenges to stay in school.

Again, these local findings dialogue directly with national statistics on school exclusion and dropout during the pandemic. A UNICEF report, based on PNAD data, estimated that, in November 2020, more than 5 million children and adolescents in Brazil did not have access to education, either because they were out of school or because they did not receive remote activities.²⁰ The analysis of the School Census carried out by INESC is even more alarming, pointing to a 128% increase in high school dropout rates between 2020 and 2021.²² The increase was particularly catastrophic in high school the North (846%) and Northeast (218%) regions, the most vulnerable in terms of infrastructure and social indicators.²² The reports of the interns, therefore, are not isolated cases; They are the chronicle, on a small scale, of a process of mass exclusion that denied the right to education to millions of Brazilians.

2.6 THE DOUBLE FACE OF TEACHING PRACTICE: INNOVATION UNDER PRESSURE AND THE COST OF BURNOUT

In the midst of the scenario of structural crisis, the analysis of the "Teaching Technique" dimension reveals a deep ambivalence. On the one hand, a significant majority of reports

(18, or 54.5%) highlighted the "creative adaptation" of teachers. The narratives describe educators who, even with limited resources, sought new tools, learned to use digital platforms, developed multimodal materials, and experimented with active methodologies to try to keep students engaged. This capacity for innovation and resilience is one of the most positive findings of the study.

On the other hand, this innovation had a very high human cost. A third of the reports (11, or 33.3%) explicitly mentioned "technical problems and stress", with complaints about work overload, pressure for productivity, platform instability and mental exhaustion. At least one report documented the absence of a supervising teacher due to burnout. This paradox, innovation coexisting with burnout, is confirmed by several studies on the mental health of teachers during the pandemic. Studies point to the increase in the workload, the invasion of work in the domestic space and the intensification of demands as factors that led to a significant increase in the levels of stress, anxiety and burnout among Brazilian teachers.²³ The "creative adaptation" observed in the reports, therefore, cannot be romanticized as a simple triumph of the teaching vocation. It must be interpreted critically as an act of resistance and individual survival in the face of a system that has failed to provide the necessary support, training and working conditions.

2.7 PEDAGOGICAL PRACTICES IN DISPUTE: TRANSPOSITION VS. TRANSFORMATION

The analysis of teaching strategies reveals a clear division between two pedagogical approaches. The most common, present in 19 reports (57.6%), was the direct "transposition" of the face-to-face model to the virtual environment. This approach consisted mostly of synchronous lectures, with the teacher speaking for long periods, and the use of official teaching materials (PDFs of books, ready-made slides) without didactic reengineering for the digital medium. This strategy, while understandable in the urgency of the moment, proved ineffective in maintaining engagement in an environment full of distractions and limited by poor connectivity.

On the other hand, a significant minority of 12 reports (36.4%) described "transformation" practices, which sought to explore the potential of the digital environment. These reports documented the use of gamification, creative projects, and geotechnologies. Notable examples include using the game Minecraft to simulate the construction of landscapes and urban dynamics, conducting critical cartography activities with Google Earth to analyze territories, and creating contextualized quiz games to discuss geographic themes. The effectiveness of this transformative approach is statistically corroborated. The association analysis between the use of "Gamification/creative projects" and the "Active

participation" of students revealed a strong and highly significant correlation $\chi^2(1.N=33)=15.71$; $p<0.001$; Cramer's $V \approx 0.69$. This result suggests that, when the infrastructure allowed, the choice of active and interactive methodologies was a decisive factor to overcome apathy and promote more effective engagement.

2.7.1 The Legacy of the Learning Gap: An Educational Debt

The end result of this cascade of problems, poor infrastructure, low engagement, and often inadequate pedagogical practices, was an overwhelming perception of learning loss. The "learning gap or difficulty" was pointed out in 26 of the 33 reports, representing 78.8% of the corpus. Interns reported students' difficulties in understanding basic content, the inability to perform activities that required more complex reasoning, and, in the 2022 reports, the finding of significant gaps in essential knowledge during the return to face-to-face classes.

This subjective perception of future teachers is validated by large-scale evaluations. The report "Learning in Basic Education: Brazilian situation in the post-pandemic", by the organization Todos Pela Educação, analyzed the results of the Basic Education Evaluation System (SAEB) and concluded that student performance in Portuguese Language and Mathematics has not yet returned to pre-pandemic levels, with the public network being the most affected.¹³ The pandemic, therefore, not only interrupted the learning process, But it has generated a setback, creating an "educational debt" that will require years of investment and focused policies to be remedied. The data from this study, by capturing the diagnosis made on the school floor, offer a qualitative view of the depth of this gap, which manifests itself not only in grades, but in the concrete difficulty of students in reconnecting with knowledge. Presenting these results together reveals a clear causal chain: the failure of the infrastructural base triggered a crisis of participation, which in turn resulted in a deep learning crisis, with teachers at the epicenter, trying to mitigate the damage at the expense of their own health.

3 INTERPRETING THE SIGNALS OF A SYSTEM UNDER STRESS

The analysis of the results allows us to transcend the mere description of the phenomena to build a critical interpretation of the dynamics that marked Brazilian education during the pandemic. The data, when read together and in the light of the national context, reveal not only the difficulties of an exceptional period, but the chronic failures of an educational system that operates at the limit of precariousness.

3.1 INFRASTRUCTURE AS A CONDITION OF PEDAGOGICAL POSSIBILITY

The most robust and fundamental finding of this study is the centrality of infrastructure. The statistical analysis that demonstrates the strong association between connection instability and low frequency does not point to a mere correlation, but to a determinant causal relationship. Infrastructure was not just one variable among others; it functioned as a condition of possibility for any pedagogical action. In other words, material access (devices and connectivity) preceded and conditioned pedagogical access. Where infrastructure has failed, the right to education has been summarily denied, regardless of the quality of the teacher's planning, the relevance of the content, or the student's motivation.

This finding has profound implications. She categorically refutes any narrative that tries to individualize the failure of ERE, attributing it to the "unwillingness" of students or the "digital incompetence" of teachers. The problem was not primarily pedagogical or motivational, but material and political. The historic decision not to invest in a robust digital inclusion policy for public education created an intrinsically vulnerable system, whose failure in a crisis scenario was not only predictable, but inevitable. The pandemic, in this sense, has only made it explicit that, in the twenty-first century, digital infrastructure is as essential to education as the school building, textbooks, and school lunches. To ignore this material dimension is to condemn any educational policy to irrelevance.

3.2 THE HUMAN COST OF RESILIENCE: INNOVATION AS AN ACT OF SURVIVAL

The coexistence of reports of creative adaptation with narratives of teacher burnout exposes one of the most perverse ambiguities of the pandemic period. The professors' capacity for innovation, documented in more than half of the reports, is a testament to their professional commitment. However, it is imperative to analyze the political economy behind this "resilience". Celebrating teacher creativity without questioning the conditions that made it an act of individual heroism is dangerous. Innovation emerged not as the result of a support system, with continuing education, adequate resources and institutional support, but as a survival mechanism in the midst of systemic abandonment.

The discourse of "resilience" can thus be co-opted for political ends, serving to applaud teachers while justifying the continued precariousness of their work and the underfunding of education. It shifts responsibility from the sphere of the State to the sphere of the individual, transforming a collective failure into an opportunity for personal overcoming. Critical analysis of the data suggests a reinterpretation: the true measure of a robust education system is not the resilience of its actors in the face of collapse, but the capacity of the system itself to be resilient, that is, to absorb shocks without transferring the cost to the physical and mental

health of its professionals.²⁴ The challenge, Therefore, it is not just celebrating the innovation that has emerged from the crisis, but creating the institutional conditions for it to become a sustainable practice and not a desperate response to chaos.

3.3 THE TRAINING GAP REVEALED: THE INTERNSHIP AS A DIAGNOSIS OF THE DEGREE

As pointed out in the methodology section, the difficulty in analyzing a portion of the corpus due to its low formal and analytical quality is a result in itself. The internship reports, as instruments of evaluation and reflection, also work as a mirror of the training received by the undergraduates. The inability of some future teachers to produce a minimally structured report, which articulates observation, description and critical analysis, points to a significant gap in the teaching degree curricula.

The supervised internship, ideally, should be the apex of the training, the moment in which the student mobilizes the theoretical framework to interpret and intervene in the complex reality of the classroom.¹⁶ When the final product of this process is a superficial or merely descriptive document, this signals that the training may be failing to develop essential competencies such as academic writing, the capacity for evidence-based analysis and, fundamentally, the practice of critical reflection. The pandemic, by intensifying the complexities of teaching, has only made this training gap more visible. Therefore, the criticism that emerges from the data is not only directed at basic education, but also at higher education, calling on universities to rethink their models of teacher training, strengthening the articulation between theory and practice, and equipping future educators to be not only curriculum executors, but researchers of their own practice.

3.4 UNTAPPED POTENTIALS: SEEDS OF A HYBRID FUTURE

Despite the predominantly bleak scenario, the reports also contain seeds of a potentially richer and more engaging educational future. Successful experiences with gamification, geotechnology-based projects, and collaborative mapping should not be seen as mere curiosities or exceptions. They are proofs of concept that demonstrate the immense potential of digital tools when used not to transpose, but to transform pedagogical practice. The use of Google Earth for critical cartography, for example, allows an approach to the territory that would be impossible in a traditional classroom. The use of digital games, as evidenced by the strong correlation with active participation, can increase student motivation and engagement significantly.

These emerging practices point to a path beyond the simplistic dichotomy between "good face-to-face" and "bad remote". They suggest the possibility of a hybrid and intentional model, which combines the best of both worlds: the interaction and the link of face-to-face meeting with the possibilities of personalization, collaboration and exploration of the digital universe. The great challenge, however, is to move these practices from the field of individual and isolated effort to the center of educational policy. Without investment in infrastructure, continuous teacher training and the development of quality pedagogical resources, these potentials will remain untapped, and the most valuable lessons of the pandemic crisis will have been in vain.

4 FROM EMERGENCY TO STRATEGY: PROPOSALS FOR AN EQUITABLE DIGITAL TRANSFORMATION

The diagnosis of the pandemic educational crisis requires more than the verification of failures; it demands the formulation of paths to overcome. The following proposals are not a menu of isolated solutions, but the pillars of an integrated ecosystem, designed to transform emergency practices into robust institutional strategies. Each proposal responds directly to a problem identified in the analysis of the reports, seeking to convert the traumatic experience of the ERE into systemic learning.

4.1 TERRITORIAL CURATORSHIP AND DIGITAL SOCIAL CARTOGRAPHY: BEYOND THE VIRTUAL FIELD CLASS

The transposition of the field class to the virtual environment, often limited to a passive "tour" through Google Street View, can be radically transformed. The proposal is the development of territorial curatorship platforms, which integrate geotechnologies (satellite images, GIS) with multimodal repositories (videos, audios, texts, oral narratives). More importantly, these platforms should be structured around the principles of Social Cartography and Participatory Mapping.²⁷ Instead of consuming ready-made maps, students would be protagonists in the construction of critical cartographies of their own territories, mapping not only physical elements, but also social, cultural, economic, and environmental dynamics.³¹ This approach transforms the student from a spectator into a researcher, developing geographical reasoning and citizen awareness by allowing them to take a critical position on their own reality.²⁹

4.2 COMMUNITIES OF PRACTICE AND REVERSE MENTORING: INSTITUTIONALIZING PEER SUPPORT

Teacher overload and isolation can be combated by the formalization of support networks. The proposal is the creation of communities of practice and the implementation of Reverse (or Reversed) Mentoring programs. This model subverts the traditional logic of training, recognizing that knowledge about digital technologies is heterogeneously distributed in the school community.³⁵ In a reverse mentoring program, students with high digital fluency or younger, technologically skilled teachers are formally assigned to mentor more experienced colleagues in practical tasks, such as the use of a new platform, the editing of videos or the creation of interactive activities.³⁷ This low-cost, high-impact strategy values the knowledge that exists in the school, strengthens professional ties and accelerates the dissemination of pedagogical innovations, reducing dependence on external training courses, which are often decontextualized from the school reality.

4.3 LEARNING RETRIEVAL WITH ADAPTIVE PATHS: CUSTOMIZING SUPPORT

The deep learning gap, one of the most serious legacies of the pandemic, cannot be addressed with generic recovery strategies. The proposal is the adoption of Adaptive Learning platforms, which use algorithms and artificial intelligence to personalize student support.⁴⁰ Such systems can, through continuous diagnostic assessments, identify the specific knowledge gaps of each student and, from there, generate personalized learning paths, with activities, videos, and games focused on their needs.⁴³ This approach makes it possible to overcome the "one-size-fits-all" model of retrieval offering more efficient and targeted support. The implementation of modular adaptive retrieval packages, especially for the essential contents, can be a powerful tool to mitigate the effects of learning loss and promote equity.

4.4 OPEN AND AUDITABLE RESOURCE ECOSYSTEMS: THE END OF "REINVENTING THE WHEEL"

The teaching overload was aggravated by the need for each teacher to create, from scratch, their own teaching materials for the remote environment. To optimize this effort, it is proposed to create a National Repository of Learning Objects (LO), public and open access.⁴⁵ Unlike a simple file bank, this would be an auditable ecosystem, where teachers from all over the country could not only download, but also upload, adapt and evaluate digital pedagogical resources (lesson plans, videos, simulations, games).⁴⁸ A peer review system would ensure the quality and pedagogical relevance of the materials.⁴⁸ Such a repository

would combat redundancy of efforts, disseminate best practices, and ensure that even teachers in schools with fewer resources have access to a high-quality collection, promoting equity and collaboration on a national scale.

4.4.1 Observatory of Teaching Work: Measuring the "Human Cost"

The mental health crisis of teachers, evidenced in this and other studies, cannot be treated only with palliative actions. It is necessary to create institutional mechanisms to monitor and manage working conditions. It is proposed to create an Observatory of Teaching Work, an institutional tool to measure and analyze the "human cost" of the profession, especially in periods of crisis.⁵⁰ This observatory would collect and analyze data such as effective working hours (including planning and correction outside of working hours), time dedicated to the production of materials, self-reported stress levels, and risk factors for burnout.⁵² The data generated by this tool would allow managers to take evidence-based decisions for the rebalancing of the workload, the allocation of support resources and the formulation of occupational health policies, moving from a reactive management to a proactive management of teacher well-being.

These five proposals, interdependent, form a cohesive strategy. Digital social cartography (6.1) is enhanced by repository resources (6.4) and reverse mentoring training (6.2). The adaptive trails (6.3) combat the gap, freeing the teacher for more creative practices. And the observatory (6.5) ensures that this entire process takes place in a sustainable way. Together, they outline a path for the education system to not only recover from the pandemic, but evolve into a fairer, more collaborative, and more effective model.

5 CONCLUSION

The integrated analysis of supervised internship reports in Geography offers an unequivocal conclusion: the COVID-19 pandemic was not the primary cause of the Brazilian educational crisis, but a powerful diagnostic agent that exposed and amplified the structural inequalities that have long undermined the system. The digital access infrastructure proved to be the fundamental variable that determined who would or would not have the right to education, transforming social inequality into explicit educational exclusion. This study demonstrated, through a causal chain of evidence, how infrastructural failure led to the collapse of student engagement and, consequently, to a deep and lasting learning gap.

Amid this scenario of systemic failure, teacher resilience and creativity emerged as a notable resistance force. Active methodologies and the innovative use of geotechnologies, when material conditions permitted, proved to be powerful allies in promoting participation

and meaningful learning. However, this innovation occurred at an exorbitant human cost, evidenced by the high levels of stress and professional burnout, a testimony to the institutional abandonment to which educators were subjected.

The internship reports, therefore, function as documents of a critical time, chronicles of the school floor that should serve as a basis for the formulation of public policies. The lessons of the pandemic cannot be forgotten. It is imperative that future policies inextricably articulate massive investment in digital infrastructure, continuous and contextualized teacher training and a curricular reconfiguration that integrates digital skills in a critical and creative way. The innovative proposals presented in this work, from digital social cartography to reverse mentoring, from adaptive learning trails to observatories of teaching work, aspire to be more than one-off recommendations. They represent the pillars of a new paradigm: converting the improvised practices of the emergency into an intentional, equitable, and resilient pedagogical ecosystem, capable not only of facing the next crisis, but of offering, on a daily basis, the quality education that all Brazilians deserve.

ABSTRACT

Gender-based violence constitutes a structural phenomenon sustained by historical, cultural, and political inequalities that place women in situations of vulnerability. Based on a literature review, this study investigated the relationship between violence against women, media discourses, and social media dynamics, also considering the contributions of Psychology in addressing this context. Recent national data show that millions of women remain exposed to domestic violence and various forms of aggression, which now also manifest in the virtual environment. The analysis of media production reveals that normalization, victim-blaming, and revictimization continue to be present in journalistic coverage and digital content, reinforcing gender stereotypes and perpetuating discriminatory practices. Psychology, guided by ethical-political principles and the recognition of intersectionalities, plays a central role in prevention, support, and the promotion of women's autonomy, working in articulation with the Protection Network. Although the literature demonstrates advances, a scarcity of studies integrating gender-based violence, social media, and psychological impacts was observed, indicating the need to expand research on how the digital environment influences social perceptions and subjective processes involved in violence against women.

Keywords: Gender-Based Violence. Violence Against Women. Social Media. Psychology.

RESUMO

A violência de gênero constitui um fenômeno estrutural sustentado por desigualdades históricas, culturais e políticas que colocam as mulheres em posição de vulnerabilidade. A partir de uma revisão bibliográfica, este trabalho investigou a relação entre violência contra a mulher, discursos midiáticos e dinâmicas das mídias sociais, considerando também as contribuições da Psicologia no enfrentamento desse cenário. Os dados nacionais recentes

¹ Undergraduated student. Universidade Federal do Maranhão.

² Undergraduated student. Universidade Federal do Maranhão.

³ Undergraduated student. Universidade Federal do Maranhão.

⁴ Professor. Universidade Federal do Maranhão.

mostram que milhões de mulheres continuam expostas à violência doméstica e às diversas formas de agressão, que hoje também se manifestam no ambiente virtual. A análise da produção midiática evidencia que a naturalização, a culpabilização da vítima e a revitimização seguem presentes em coberturas jornalísticas e conteúdos digitais, reforçando estereótipos de gênero e perpetuando práticas discriminatórias. A Psicologia, guiada por princípios ético-políticos e pelo reconhecimento das interseccionalidades, tem papel central na prevenção, acolhimento e promoção da autonomia das mulheres, articulando-se à Rede de Proteção. Embora a literatura demonstre avanços, observou-se escassez de estudos que explorem de forma integrada violência de gênero, mídias sociais e impactos psicológicos, indicando a necessidade de ampliar investigações sobre como o ambiente digital influencia percepções sociais e processos subjetivos envolvidos na violência contra a mulher.

1 INTRODUCTION

Gender violence against women is a structural and persistent phenomenon in Brazilian society, crossing different social, historical, and cultural contexts. It is a multifaceted reality, marked by unequal power relations sustained by a macho logic, which legitimizes male domination and naturalizes the violation of women's fundamental rights (SAFFIOTI, 2001 apud LEMOS et al., 2024). This violence can be expressed in different ways, including physical, psychological, emotional, sexual and economic aggression, deeply affecting the integrity and dignity of women (GOMES; OLIVEIRA, 2022).

In Brazil, the impacts of this violence assume alarming proportions. Data from Datasenado, referring to a survey carried out in 2025 with about 22 thousand women, indicate that approximately 3.7 million Brazilian women suffered some type of domestic or family violence in that year alone. These numbers show that, despite legislative advances and awareness campaigns, violence against women remains widely disseminated in everyday social life. Information from Dial 180 reinforces this scenario, pointing out that, among more than 834 thousand calls received by the service, most were related to the search for guidance and referrals, revealing both the recurrence of violence and the constant need for information and institutional support.

Historically, gender violence has been relegated to the private sphere and, for a long time, treated as an intimate problem or justified by discourses that romanticized it, such as the so-called "love crimes". The consolidation of legal and normative frameworks, such as the Convention of Belém do Pará and the Maria da Penha Law, made possible a fundamental change in this understanding, recognizing violence against women as a serious violation of human rights and as an expression of unequal power relations between men and women (ORGANIZATION OF AMERICAN STATES, 1994; BRAZIL, 2006).

Understanding this phenomenon requires avoiding explanations that reduce it to individual deviations or isolated pathologies. Gender violence is rooted in a patriarchal structure that authorizes practices of control, possession and silencing of the female body and subjectivity, reinforced by gender stereotypes that associate the masculine with power and the feminine with submission (BELISÁRIO; REIS, 2019). In addition, this experience is not evenly distributed. The perspective of intersectionality shows that markers such as race, social class, and territory produce distinct vulnerabilities, making black, indigenous, and transvestite women even more exposed to violence and difficulties in accessing justice (CRENSHAW, 2017).

In contemporary times, this scenario is complexified by the centrality of the internet and social media. In a hyperconnected world, these spaces act simultaneously as

environments for welcoming, circulating information, and strengthening support networks, but also as territories for the reproduction and amplification of gender violence. Data from the UN Broadband Commission indicate that 73% of connected women have already been exposed to some type of online violence, showing that the virtual environment reproduces and sometimes intensifies inequalities and aggressions present in the offline world.

In this context, Psychology is called upon to assume an ethical-political commitment in confronting violence against women, recognizing the subjective impacts of these experiences and acting in an articulated way with other public policies and protection networks. Thus, the present work aims to investigate the relationship between gender violence and social media, analyzing how the virtual environment influences the repercussion of discourses on violence against women and how Psychology can be inserted in this field as a fundamental ally in prevention, reception and promotion of rights.

2 THEORETICAL FOUNDATION

2.1 VIOLENCE AGAINST WOMEN: DEFINITION AND PERSPECTIVES

Violence against women can be defined according to article 5 of Law 11.340, of August 7, 2006 as:

Domestic and family violence against women is defined as any action or omission based on gender that causes death, injury, physical, sexual or psychological suffering, and moral or property damage: I - within the scope of the domestic unit, understood as the space of permanent coexistence of people, with or without family ties, including those sporadically aggregated; II - within the family, understood as the community formed by individuals who are or consider themselves related, united by natural ties, by affinity or by express will; III - in any intimate relationship of affection, in which the aggressor lives or has lived with the offended party, regardless of cohabitation. (Law 11.340 of August 7, 2006).

The excerpt above shows how violence is an action with multiple aspects and that can happen in different forms and environments but that cause damage to the physical and moral integrity of women, it is known that these violences are inserted within a cultural context through social relations, having a direct intersection with cultural, historical and political aspects (Minayo, 1999 apud Lemos et al 2024).

Historically, the place of the woman was delimited and reduced to a space of submission and that of a subject without wills and rights, these ideals were reinforced by the law existing at the time, such as the Civil Code of 1916, in which it allowed women to work, but only with the authorization of their husband (Blay, 2003 apud Santiago and Coelho, 2011),

all these ideas and perspectives that have been constituted throughout history that cross violence against women.

Over time, measures, rights and laws have been created that ensure more rights and protection for women women, one of the most striking actions is the creation of the Maria da Penha Law, which consists of being a legislation with the objective of:

to curb and prevent domestic and family violence against women, under the terms of § 8 of article 226 of the Federal Constitution, the Convention on the Elimination of All Forms of Violence against Women, the Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women and other international treaties ratified by the Federative Republic of Brazil; provides for the creation of Courts for Domestic and Family Violence against Women; and establishes measures of assistance and protection for women in situations of domestic and family violence.

In the Maria da Penha Law, some types of violence that can be committed against women are evidenced, such as physical violence, which according to the law can be defined as actions of any nature that attack the integrity of women. Another form of violence is sexual violence, which can be understood as acts that force the woman to view or participate in sexual relations against the woman's will. (Law 11.340 of August 7, 2006).

There is also patrimonial violence that consists of any action aimed at removing or destroying the woman's property, personal objects among others, the law also addresses moral violence that is understood as actions that fall under crimes against honor. (Law 11.340 of August 7, 2006).

And finally, the law later added to its creation psychological violence, which is configured as any action, such as manipulation, threat, persecution that emits any type of emotional data on the woman, the law brings as an example the decrease in self-esteem. (Law 11.340 of August 7, 2006).

Violence against women is internationally recognized as a violation of human rights and a social phenomenon sustained by historically constructed gender inequalities. The Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women, known as the Convention of Belém do Pará, defines violence against women as "any act or conduct based on gender that causes death, harm or physical, sexual or psychological suffering to women, both in the public and private spheres" (BRASIL, 1996). This definition broadens the understanding of violence beyond the domestic space, allowing it to include institutional, media, and digital contexts, which also produce suffering and violations.

The same Convention ensures that "every woman has the right to a life free from violence, both in the public and private spheres" (BRASIL, 1996), which reinforces the need

to analyze how virtual environments and social media can become spaces for the reproduction of violent practices. By recognizing that violence is not restricted to physical contact, the treaty provides a basis for discussion on symbolic, psychological, and discursive violence, often present in the media exposure of cases of gender violence.

In addition, the Convention of Belém do Pará assigns to States the responsibility of confronting the cultural roots of violence by establishing the duty to "modify the social and cultural standards of conduct of men and women (...) in order to combat prejudices and customs and all other practices based on the premise of the inferiority or superiority of any of the genders" (BRASIL, 1996). This guideline dialogues directly with the criticism of media discourses that naturalize violence, blame victims or reinforce gender stereotypes, contributing to processes of revictimization.

In addition, the International Covenant on Civil and Political Rights guarantees the protection of privacy, honor and reputation by stating that "no one may be the object of arbitrary or illegal interference in his or her private life (...) nor of illegal offenses to their honor and reputation" (BRASIL, 1992). This provision supports the analysis of violence committed in the digital environment, such as vexatious exposure, cyberbullying and the dissemination of content that attacks the dignity of women on social networks.

Although it recognizes freedom of expression as a fundamental right, the Covenant also establishes that its exercise implies duties and responsibilities, and may be restricted when necessary to ensure "respect for the rights and reputation of other people" (BRASIL, 1992). Thus, violent or misogynistic speeches broadcast in the media cannot be legitimized under the argument of freedom of expression when they cause psychological and social damage to women.

These international norms dialogue with national theoretical production by understanding gender violence as a multifaceted phenomenon. As Saffioti points out, it is a "relationship marked by inequality of power based on a macho logic" (SAFFIOTI, 2001 apud SANTOS; MESSIAS, 2025). This inequality is expressed both in direct practices of violence and in the way cases are narrated and socially repercussioned, especially in the media.

In this context, Psychology assumes a central role in coping with violence, since its performance goes beyond the individual clinical field and is articulated with an ethical and political dimension. As Santos and Messias (2025) state, Psychology, guided by ethical-political principles and the recognition of intersectionalities, acts in the prevention, reception and promotion of women's autonomy, in dialogue with the Protection Network. This action becomes even more relevant in view of the impact of social media, which, according to the

authors, directly influence the way cases of violence are reported and reproduced, and can generate new violence against the victim herself (SANTOS; MESSIAS, 2025).

Thus, the articulation between international treaties, national legislation and psychological knowledge shows that confronting violence against women requires integrated actions, capable of transforming institutional practices, media discourses and cultural patterns that still sustain gender inequality.

2.2 THE NATURALIZATION OF GENDER VIOLENCE IN THE MEDIA DISCOURSE

Research shows that journalism, in Brazil and in other countries, has historically contributed to the naturalization of violence against women (Belisário; Reis, 2019). This scenario is especially worrying when it is recognized that the media not only informs, but also participates in the construction of social meanings, influencing ways of thinking and acting. Its role involves fostering critical reflection, stimulating social transformation, and monitoring the narratives that circulate in the public debate (ANDI; Galvão, 2011).

In Brazil, this problem accompanies decades of journalistic coverage that, recurrently, portrayed women victims of domestic violence as co-responsible for their own aggression, reinforcing stigmas and implicit justifications for the acts suffered (Blay, 2003). Instead of questioning unequal power structures, many news stories ended up adopting simplifying explanations that shift the focus from the aggressor to the victim's conduct.

As a social and discursive practice, journalism participates in the production of subjectivities and the interpretation of reality (Machado, 2006). However, it is observed that part of the coverage remains stuck in common sense, with superficial analyses and little historical or social contextualization (Souza; Oliveira, 2015). Although sustained by the ideal of neutrality, the journalistic text is crossed by ideologies, especially patriarchal, which are manifested in the narrative choices and framing used (Schwaab, 2007).

The analysis of the discourse shows that the meanings produced by the media are expressed both in what is said and in the silencing. Recognizing this opacity requires understanding that formats, lexical choices and narrative structures produce effects of meaning (Orlandi, 2007). Examples of this logic appear in the coverage of the gang rape that took place in Rio de Janeiro in 2016, by G1, and in a similar case reported by the New York Times in 2012. Although situated in different contexts, both illustrate patterns of treatment of victims anchored in patriarchal values that cross borders (Belisário; Reis, 2019; Durham, 2013).

2.3 REVICTIMIZATION AND BLAMING FRAMEWORKS

Revictimization occurs when the victim, when seeking protection or recognition, begins to suffer new damage produced by institutions that should welcome him (Freire Filho; Dos Anjos, 2022). In journalism, this is evidenced in discursive frameworks that, directly or indirectly, attribute responsibility to women for the violence suffered (Entman, 1993).

One of the most recurrent mechanisms is the insinuation of guilt based on the victim's behaviors, choices or characteristics (Prado; Sanematsu, 2017). In the New York Times coverage in 2012, for example, details about dress and conduct were mobilized to suggest co-responsibility of the raped woman, resuming discourses historically used to minimize sexual crimes (Durham, 2013). Situations involving the use of alcohol, clothing considered "inappropriate" or presence in certain spaces are often used to relativize violence (UOL Universa, 2020).

Another problematic mechanism is the deviation of focus, when secondary information about the victim's life is highlighted, while the aggressor is given space to justify his actions. In the coverage of the 2016 rape in Rio de Janeiro, elements such as motherhood, drug use, and belonging to certain social groups were used to delegitimize the victim and deflate the seriousness of the crime (Belisário; Reis, 2019). Headlines such as "Wrong was she" explicitly express the process of blaming and reinforce misogynistic discourses (Freire Filho; Dos Anjos, 2022).

The minimization of violence also appears in euphemisms such as "crime of passion" or "defense of honor", which soften the brutality of the acts and hide their structural root based on gender inequality (Agência Brasil, 2019). Femicide, far from being an impulsive gesture, represents the extreme manifestation of continuous cycles of violence (UOL Universa, 2020). The spectacularization of these crimes also contributes to trivializing the suffering of women (Oliveira et al., 2024).

2.4 GENDER VIOLENCE AND ITS SOCIAL CONSEQUENCES

Violence against women takes various forms physically, psychologically, morally, patrimonially and sexually, as defined by the Maria da Penha Law. It is a structural phenomenon, sustained by gender inequalities and a patriarchal model that organizes social relations and establishes hierarchies (Sousa et al., 2019; UOL Universa, 2020).

With the expansion of digital technologies, this violence has extended to the online environment. Practices such as revenge pornography, stalking, cyberbullying, and sextortion reproduce oppressive dynamics that mostly affect women (Sousa et al., 2019; Poland, 2016).

Analyses of comments in reports on gender violence show that victim-blaming is usually accompanied by minimizing the actions of the aggressors, reaffirming the idea of women as male objects or properties (Lermen; Cúnico, 2018). In the domestic sphere, this naturalization is even more intense, sustained by cultural beliefs that discourage external interventions in marital conflicts (IPEA, 2014).

The typification of femicide by Law No. 13,104/2015 represented a legal advance, but legal changes are not enough to alter deeply rooted practices and discourses (Lermen; Cúnico, 2018). Social conceptions persist that maintain and justify violence.

3 METHODOLOGY

The present study is characterized as a qualitative research, of bibliographic and documentary nature, with the objective of analyzing gender violence, its psychosocial consequences and the way this phenomenon is constructed and reproduced in media discourses. The choice for this approach is based on the possibility of understanding the phenomenon of violence beyond statistical data, considering its social, cultural and subjective meanings.

The selection of scientific articles used as a basis for the research followed criteria of scientific rigor and thematic relevance. Empirical, peer-reviewed studies that presented consistent methodological designs capable of deepening the understanding of gender-based violence were prioritized, with special attention to discussions on psychological violence, gaslighting, resilience, and interventions with perpetrators. The bibliographic search was carried out in databases recognized for their academic credibility, such as PubMed, Virtual Health Library (VHL), Web of Science, SciELO and Sage Journals, using specific descriptors related to the theme, combined by Boolean operators.

In addition to the scientific literature, the study included the analysis of journalistic articles published on portals of great reach and visibility, such as Yahoo and Terra. The choice of these vehicles is justified by the fact that they allow readers to interact through comments, which makes it possible to observe the social construction of the discourses, as well as the presence of mechanisms of blaming, naturalization of violence and revictimization of women.

To ensure the quality and coherence of the corpus analyzed, clear inclusion and exclusion criteria were defined. As inclusion criteria, publications from the last ten years were considered, in order to ensure the timeliness of discussions in the face of recent legislative and social changes, such as the typification of femicide. Studies published in Portuguese, English and Spanish, peer-reviewed empirical articles and studies that directly addressed the keywords of the research, such as psychological violence, gaslighting, resilience, femicide

and media, were included. In the case of media analysis, only news that presented at least ten comments from Internet users were included, enabling the analysis of the discursive interaction.

The exclusion criteria included the removal of gray literature, such as theses, dissertations, and books, with the aim of maintaining the methodological uniformity of the material analyzed. Articles that were not available in full, duplicate studies in different databases, and studies that presented methodological weaknesses, such as lack of clear theoretical foundations, very small samples, or insufficient description of intervention procedures, were also excluded. Studies carried out with populations outside the scope of the research, such as samples exclusively under 18 years of age or contexts that did not dialogue with the analysis of gender relations in the patriarchal model, were also discarded.

These methodological choices allowed the construction of a consistent corpus, capable of offering theoretical and analytical subsidies that go beyond explanations based on common sense. At the same time, they made it possible to identify important gaps in the literature, especially the scarcity of qualitative studies that prioritize listening to the life stories of women victims of violence in a contextualized way, reinforcing the need for new investigations committed to the ethical and political confrontation of gender inequalities.

4 DISCUSSION

The critical investigation of the theoretical exploration carried out showed that behaviors linked to gender violence, such as blaming the victims, and the naturalization of violence in society and in the virtual environment are not practices committed in isolation, but are direct reflections of the patriarchal culture, which reaffirms the domination of the male gender in society as the author Saffioti describes. The literature found is in line with the objectives of this study to investigate the influence of media and social networks and perceptions about gender violence, it was also identified that media discourses and opinions of comments on social networks often end up causing revictimization, the focus of this discourse shifts from the aggressor and the crime to the behaviors of women, Figures of speech are often used to mask the structural nature of the problem.

This dynamic makes the virtual environment become a fomenter of symbolic violence and associated practices such as cyberbullying, naturalizing behaviors such as the exposure of these women, going against the laws and guarantees of the dignity and honor of women, such as the Maria da Penha Law and the International Covenant on Civil and Political Rights.

A fundamental divergence was observed in the literature found, because although social media provide contact, proximity, and welcoming between groups, they are

simultaneously spaces for reproduction and intensification of violence. There is a significant gap in qualitative studies that seek to investigate the specific psychological impacts of violence in the virtual environment by listening to the life stories of these women, and without placing them in a place where they have to go through violence again.

Most research still focuses on statistical data, this scarcity of integrated investigations demonstrates the need to deepen the theme of how the digital environment influences not only the social view, but the subjective processes and the psyche of the victims, which carry deep marks beyond the physical damage.

In this way, Psychology is guided by the promotion of dignity, autonomy and equality, assuming an active stance in the prevention of discrimination and violent practices (CFP, 2005). Understanding violence requires situating it historically and recognizing its presence in systems that reproduce inequalities (MARTÍN-BARÓ, 2017).

In this sense, intersectionality becomes fundamental, as it shows that experiences of vulnerability are built by the intersection of different social markers, gender, race, class, disability that produce different forms of oppression (CRENSHAW, 2017; CFP, 2024). This view avoids generalizations and guides practices that are more sensitive to the specificities of each subject.

Violence against women is a social phenomenon and also a public health issue. Intervening in this field implies understanding how gender inequalities structure relationships and sustain abusive cycles (BRASIL, 2006; CREPOP, 2013). The Maria da Penha Law defines different forms of physical, psychological, sexual, moral and patrimonial violence that guide professional practice.

Among psychological violence, gaslighting stands out for the subtlety of manipulation strategies, which destabilize the victim's perception and make it difficult to break the abusive relationship (SWEET, 2019). In these situations, welcoming, strengthening autonomy, and empowerment processes are essential for reconstruction and resistance (BATLIWALA, 1994 apud SANDENBERG, 2006). Resilience, understood as a dynamic and relational process, also contributes to overcoming violence (YUNES, 2003; HOWELL et al., 2018).

The work is articulated with the Network for Attention and Protection of Women, especially through specialized services that offer psychosocial support and guidance to overcome the cycle of violence (CREPOP, 2013).

5 FINAL CONSIDERATIONS

The present work aimed to deepen the studies on violence against women and social media, seeking to understand how violence against women has been presented and the role

of the media as one of the opinion-forming vehicles and the possible ways that Psychology can contribute to combat this violence. From the literature review, it was possible to understand in a more profound way that social media do have an impact on the way cases of violence are reported and reproduced can cause a new violence towards this victim.

The research also made it possible to show through the research carried out that Psychology has an ethical and political role in acting against violence against women, the look of this area becomes fundamental for the woman victim of violence, because it is known that violent actions affect not only the physical and biological scope, it also leaves marks on the psyche and psychological knowledge is necessary in these cases. However, it is also perceived that, although the theme about gender violence and the media is of great relevance to society, as technology permeates daily life, this theme still deserves a greater focus in the scientific literature. Thus, it is essential to explore this relationship and its nuances with the technological advances that arise.

ABSTRACT

The present study aims to establish a brief overview of the position of older persons and the recognition of their rights as fundamental guarantees within the Inter-American human rights system. Based on the understanding of human aging as a natural, continuous, multifactorial process that is rapidly increasing in Latin American and Caribbean countries, this study seeks to analyze how these States are addressing the growing elderly population in light of the international commitments undertaken at the regional level within the Organization of American States (OAS) and at the global level within the United Nations (UN). By outlining a historical framework of the evolution of this issue within the legal instruments that make up the Inter-American human rights system—from the Protocol of San Salvador of 1988 to the Inter-American Convention on the Protection of the Human Rights of Older Persons of 2015—the study aims to extract from these documents the reference framework through which older persons and the phenomenon of aging are viewed by OAS member States, with particular emphasis on Brazil's position in the debate on the human rights of older persons and the improvement of public policies aimed at individuals undergoing the aging process.

Keywords: Human Aging. Human Rights. Older Persons. Latin America.

RESUMO

O presente estudo propõe estabelecer um breve panorama acerca da posição da pessoa idosa e do reconhecimento de seus direitos como garantias fundamentais dentro do sistema interamericano de direitos humanos. Partindo da compreensão do envelhecimento humano como um processo natural, contínuo, multifatorial e em crescimento vertiginoso nos países latinoamericanos e caribenhos, procura-se assimilar de que forma esses Estados estão encarando o cenário de aumento de sua população idosa, a partir dos compromissos internacionais assumidos a nível regional, dentro da Organização dos Estados Americanos (OEA), e a nível global, dentro da Organização das Nações Unidas (ONU). RESUMEN

El presente estudio propone establecer un breve panorama acerca de la posición de las personas mayores y del reconocimiento de sus derechos como garantías fundamentales dentro del sistema interamericano de derechos humanos. Partiendo de la comprensión del envejecimiento humano como un proceso natural, continuo y multifactorial, que presenta un crecimiento vertiginoso en los países latinoamericanos y caribeños, se busca analizar cómo estos Estados están enfrentando el aumento de su población adulta mayor a partir de los compromisos internacionales asumidos a nivel regional, en el ámbito de la Organización de los Estados Americanos (OEA), y a nivel global, en el marco de la Organización de las Naciones Unidas (ONU). Al establecer un recorrido histórico sobre la evolución de la temática en los instrumentos jurídicos que conforman el sistema interamericano de derechos humanos —desde el Protocolo de San Salvador de 1988 hasta la Convención Interamericana sobre la Protección de los Derechos Humanos de las Personas Mayores de 2015—, se pretende extraer de dichos documentos el marco de referencia mediante el cual las personas mayores y el fenómeno del envejecimiento son concebidos por los Estados miembros de la OEA, destacándose especialmente la posición de Brasil en el debate sobre los derechos humanos de las personas mayores y el fortalecimiento de las políticas públicas dirigidas a quienes se encuentran en proceso de envejecimiento.

1 INTRODUCTION

Human aging is a natural, continuous and multifactorial process, which involves psychological, biological and social factors witnessed throughout life; resulting in declines in the capacity and reserves of organs and making the individual more vulnerable to diseases, but varying greatly between each specific case, due to genetic factors, lifestyle and living environment.

The aging process manifests itself in different ways between species and also between individuals of the same species. From a perspective closer to reality, it can be understood that aging begins at birth itself. Thus, the actions and choices made throughout life are reflected in old age: healthy habits cultivated from an early age tend to produce positive effects at this stage, contributing to a healthier and more successful aging.

Some changes associated with advancing age can be positive; others, however, result in declines related to the senses and activities of daily living, in addition to increased susceptibility and frequency of diseases, frailties or disabilities. Aging is the main risk factor for the development of chronic and degenerative diseases in the elderly population and, according to data from the World Health Organization, the growth of population aging on a global scale tends to significantly increase the rates of elderly people diagnosed with dementia (2021).

With regard to the age limit in which an individual can be considered an elderly person, Brazil adopts the classification standard proposed by the WHO in its pertinent legislation to consider the individual, from sixty years of age, subject to the provisions of the Statute of the Elderly (CNDPI, 2009); and estimates indicate that, in 2050, individuals in this age group will represent one-fifth of the world's population, reaching approximately two billion people (WHO, 2021).

Recently, Brazil has undergone an inversion of its demographic pyramid, with the number of elderly people surpassing that of children in 2020. In this context, the aging index - measured by the proportion of elderly people for every hundred young people - showed significant growth. This transition is mainly due to the significant reduction in fertility rates, associated with changes in the behavior of women, who are increasingly inserted in the labor market, with continuously increasing levels of schooling and wide access to contraceptive methods (Oliveira, 2019).

The rapid aging of the population, and the increase in longevity, is associated with major social challenges such as: increased health spending, decreased income standards, resource restriction and increased functional disabilities. The elderly use health services more, hospital admissions are more frequent in this age group, and bed occupancy time is

longer when compared to other audiences. This fact stems from the pattern of diseases found in the elderly, usually chronic and multiple, requiring constant monitoring, permanent care, continuous medication and periodic exams (Veras and Oliveira, 2016).

But why think about aging? Such a simple question with so many possible answers to justify it may seem rhetorical these days. When one expects to live to a little more than seventy-six years of age, as is the case in Brazil and Latin America (IBGE, 2024), or, going further, considering the life expectancy of more or less eighty-two years of age on the European continent, there is a recurrent projection about how two or more decades will be lived as an elderly person (Eurostat, 2025).

It turns out that, by going back fifty years in time, this question takes on significantly more complex contours. According to IBGE data, in 1970 the average Brazilian had a life expectancy of only fifty-seven years (Godoy, 2025). However, there has been a significant growth over the decades: life expectancy at birth, which was fifty-four years in 1960, has reached approximately seventy-six years today, according to data from the World Bank (2022). In this sense, researchers from the World Bank itself point out that, as of 2010, Latin Americans began to live almost thirty years longer than they did in 1970 (World Bank, 2013).

Bringing the reference of other continents, according to the respective metric, the European citizen, in the early seventies, was dazzled by the prospect of reaching seventy years of age for the first time (Dattani *et al*, 2023).

Thus, when analyzed from this perspective, the previous question gains an additive: why think about aging, when the population does not age enough to be considered elderly? By reaching this question, it is understandable why the first mention specifically directed to the elderly within the inter-American human rights system only appeared at the end of the eighties, as part of the Additional Protocol to the American Convention on Human Rights, called the Protocol of San Salvador (Notari and Frago, 2011).

The inter-American system is one of the three regional systems for the protection of human rights, created from the need to decentralize the protection mechanisms that until then only existed at the global level, through the system established by the United Nations (UN) (Mazzuoli, 2021).

This system was an offshoot of the creation and development of the Organization of American States (OAS), the oldest regional organization in the world and the result of the periodic meetings and meetings, from 1889 onwards, of the independent countries of the American continent that would become part of it. However, it was only in 1948 that the OAS had its foundation officially decreed through the signing of the Pact of Bogotá (Santos and Quinteiro, 2024)

The milestone for the consolidation of the inter-American system for the protection of human rights took place in 1978, with the entry into force of the American Convention on Human Rights (ACHR), which was drafted in 1969. The ACHR was responsible for establishing an extensive framework of guidelines and guarantees and, above all, for the creation of two bodies with competence to support compliance with them by the States Parties: the Inter-American Commission on Human Rights (IACHR), which has an advisory role, and the Inter-American Court of Human Rights (IACHR Court), which has a contentious role (Santos and Quinteiro, 2024)

As previously mentioned, although of paramount relevance, the ACHR did not bring in its original text any specific mention of guarantees aimed at the elderly, a gap that would only be filled ten years after its entry into force, with the Protocol of San Salvador, which makes the following reference:

Article 17

Protection of Older People

Everyone has the right to special protection in old age. In this regard, the States Parties undertake to adopt, in a progressive manner, the necessary measures to put this right into practice and, in particular, to:

- (a) to provide adequate facilities, as well as food and specialized medical care, to persons of advanced age who do not have them and who are not in a position to acquire them by their own means;
- b) To carry out specific work programs, aimed at providing elderly people with the possibility of carrying out productive activities appropriate to their capacities, respecting their vocation or desires;
- c) to promote the formation of social organizations aimed at improving the quality of life of the elderly (BRASIL, 1999)

In an initial analysis, it is highlighted how the text attributes to the elderly a position of absolute passivity. It should be noted that, according to the regulation, the protection of the elderly is organized in three axes integrally related to the field of guaranteeing means and conditions to those who do not have them, with no emphasis on safeguarding the autonomy of the elderly person or their ability to govern themselves by their own will.

The aging process is inherent to the human being and is surrounded by an entire sociocultural sphere, in which all these propositions are made one in the promotion of integrative practices aimed at actions that lead to healthy aging, restoring the self-esteem of the elderly person and providing opportunities for them to feel useful, active and an agent of the community they are part of (de Medeiros et al, 2020)

It is necessary to overcome the stigma of viewing the elderly only as a target audience of care policies, but to consider them as subjects of rights, worthy of full care for their basic

needs, with autonomy to make choices and take control of all issues pertinent to their social participation and their contributions to the environment in which they live.

Not without reason, according to the WHO's 2015 World Report on Aging and Health, the second cross-cutting priority, preceded only by the fight against age discrimination, is the protection of the autonomy of the elderly, as a foundation of emancipation and a central component of the general well-being of this population (WHO, 2015).

Thus, despite relevant advances at the global level regarding the discussion on the protection of the human rights of the elderly and the need for solid and resolute international legislation on the subject - highlighting the Madrid International Plan of Action on Aging (MIPAA), of 2002, responsible for directly influencing the enactment of the Statute of the Elderly in Brazilian legislation -, within the inter-American system, the respective debate has cooled significantly (Notari and Fragoso, 2011).

It was only after the impetus of MIPAA, from 2003 onwards, that discussions about the protection of older persons within the inter-American system returned, with emphasis on the Declaration of Brasilia, adopted during the II Regional Intergovernmental Conference on Aging in Latin America and the Caribbean, in 2007, and the other meetings that followed, with the commitment to promote and protect the human rights and fundamental freedoms of older persons, which culminated in the adoption of the Charter of San José on the Rights of Older Persons in Latin America and the Caribbean in 2012 (Notari and Fragoso, 2011)

Among the nineteen items that make up the aforementioned letter, item eight stands out, which dealt with ensuring the promotion of opportunities for access to the labor market and activities that generate income for the elderly; item 10, which focused on the commitment of Latin American states to improve housing conditions and the use of public spaces by older people, in order to strengthen their autonomy and independence; as well as item 11, responsible for reiterating the conviction that education and learning are permanent processes that must be guaranteed and enjoyed regardless of the age group to which the individual belongs (UN, 2012).

All these items gain special relevance because they converge to an active aging approach, based on the consolidation of the human rights of the elderly and the maintenance of their autonomy and independence, with the objective of increasing the quality and healthy life expectancy for all those who are in the aging process, ensuring their social participation and all forms of protection and assistance, establishing a confluence between interdependence and solidarity between generations (UN, 2012).

Although it was just one more piece within the framework of *soft laws* to deal with the subject, that is, another norm of non-mandatory compliance and of a merely directive nature

(MAZZUOLI, 2020), this letter reinforced important commitments and established other unprecedented ones regarding the recognition of active and healthy aging as a fundamental human right, in addition to sowing the field for the Inter-American Convention on the Human Rights of Older Adults (CPM).

The CPM arose from a joint effort by Latin American and Caribbean states to create an international convention for the human rights of older persons. The fundamental objective of this effort was to ensure, through an international treaty of peremptory obligations and broad oversight, compliance with public policies involving the theme (Notari and Fragoso, 2011).

Initially, it is necessary to highlight the pioneering spirit of the inter-American system in adopting an international treaty for the human rights of older persons. This vanguard position exercised by Latin American and Caribbean states demonstrates coherence and attention to the most up-to-date studies of the subject in question. This is because, although the American continent, like the others, has a significantly younger population when compared to the European one, the perspective given by demographic projections is that the American continent will experience accelerated growth over the next few decades (Notari and Fragoso, 2011).

The CPM was a notable advance within the inter-American system by dedicating seven chapters and forty-one articles to the guidelines for the protection of the elderly as a human and fundamental right, covering necessary concepts, such as the various forms of discrimination that affect the elderly, from abandonment and neglect to ageism and multiple discrimination (OAS, 2015).

In this vein, the definition of active and healthy aging proposed by the OAS deserves to be highlighted, as follows:

"Process by which opportunities for physical, mental and social well-being are optimized; to participate in social, economic, cultural, spiritual and civic activities; and to have protection, security and attention, with the aim of increasing the healthy life expectancy and quality of life of all individuals in old age and thus allowing them to continue to contribute actively to their families, friends, communities and nations. The concept of active and healthy aging applies to both individuals and population groups." (OAS, 2015).

Following the same direction as the norms previously adopted by Latin American and Caribbean states, the CPM has advanced even further in the recognition of the elderly as an active subject, emphasizing principles such as self-realization, that is, much more than offering the elderly protection and assistance, governments must provide them with active

participation in the formulation of policies and in the definition of what, in fact, it is dignified and healthy for oneself (OAS, 2015).

The movement towards the solidification of the autonomy of the elderly, as previously mentioned, is also evidenced in the formulation of an article entirely dedicated to guaranteeing the right to manifest free and informed consent in the context of health procedures, establishing it as an inalienable right and considering non-compliance with this guideline a form of human rights violation (OAS, 2015).

Considering the current context of continuous changes in the environment and increasingly accentuated migratory processes, whether due to conflict scenarios or natural disasters, another aspect worthy of attention in the CPM is the presence of two articles aimed at the commitment of the States Parties to ensure a healthy environment, with full accessibility and broad mobility for the elderly, as well as full protection for those at risk related to humanitarian emergencies (OAS, 2015).

Notwithstanding the significant advance in the protection of the human rights of the elderly, the most important aspect of the CPM is the presence of mechanisms for monitoring and reporting violations of the guarantees contained therein. The creation of a system of individual petitions to the organs that make up the inter-American human rights system, based on continuous follow-up procedures, such as the possibility of meeting the States Parties at conferences and the designation of a committee of experts, composed of experts in the field, to recommend and monitor progress in the implementation of the Convention, this is what makes this treaty a milestone in the fight against all forms of violence and discrimination against older people (Mazzuoli, 2021).

The Conference of States Parties, defined in Article 34 of the CPM, aims to monitor the progress of compliance with the commitments set forth in the convention, to resolve all issues that may arise regarding the inspection and follow-up procedures, as well as to receive, analyze and evaluate any recommendations issued by the Committee of Experts (OAS, 2015).

The Committee of Experts, a body made up of experts appointed by each of the States Parties, is responsible for collaborating in monitoring the progress of the implementation of the MPC in Latin America and the Caribbean, occupying the role of technical responsible for the analysis of reports, and presenting recommendations to the States Parties so that they align their efforts in adapting domestic legislation to the commitments assumed in the convention (OAS, 2015).

In the event of any type of failure to comply with the commitments assumed in the convention, the treaty itself presents the individual petition system as a way of denouncing to

the Inter-American Commission on Human Rights any type of violation of the rights of older persons, provided to the Member State, at the time of deposit of the instrument of ratification or at any time after accession to the CPM, recognize the competence of the IACHR to receive complaints against it and even direct them, if necessary, to the Inter-American Court of Human Rights (Mazzuoli, 2021).

It should be noted that, since the entry into force of the CPM, the mechanisms for monitoring and monitoring the commitments, as well as the competences of the IACHR and the Inter-American Court of Human Rights, have already been activated, directly and indirectly related to the protection of the human rights of the elderly, at various times, highlighting the cases: *Poblete Vilches y Otros vs. Chile*; *Yakye Axa vs. Paraguay*; *Five Pensioners vs. Peru*; *Valle Jaramillo vs. Colombia*; *Muelle Flores vs. Peru*; and *Asociación Nacional de Cesantes y Jubilados de la Superintendencia Nacional de Administración Tributaria (ANCEJUB-SUNAT) vs. Peru* (Santos and Quinteiro, 2024).

The absence of Brazil from the list of cases that have reached the recommendation and containment bodies of the inter-American human rights system, although it may seem positive at first glance, is not due to the lack of violations of the human rights of the elderly on national soil, but, unfortunately, to the fact that, to date, the Brazilian State has not yet ratified the CPM.

Contrary to all of Brazil's purposeful action in discussions about human aging and the need for international treaties and mechanisms to ensure compliance with the guarantees aimed at the elderly, in a brief consultation of the electronic portal of the Chamber of Deputies, it is possible to see that the proposal for ratification of the CPM, internally transformed into PDC 863/2017, has been in progress for 9 years, without any progress or signal towards a possible desire of the Executive and Legislative powers to establish the position of adhesion of the Brazilian State in relation to the commitments assumed with the other States that make up the inter-American system (Brasil, 2017).

This scenario is worrisome, since, as Mazzuoli teaches, while not ratified, the CPM is not in force within the Brazilian system, serving only as an axiological support in the interpretation of guarantees of protection of the rights of the elderly. Upon ratification, the commitments assumed in the convention will function as a paradigm for controlling the conventionality of internal rules, and, if the instrument is approved by the National Congress in accordance with paragraph 3 of article 5 of the Federal Constitution, the text of the CPM will be received with the equivalence of a constitutional amendment, also acting as a reference for the control of constitutionality. In other words, the treaty will occupy the function

of a model of adequacy in relation to the entire infra-constitutional legislative framework (2021).

As he has sought to clarify throughout the chapter, much progress has already been made with regard to the recognition of the guarantees of the elderly as human and fundamental rights. When compared to the environment in which the debate on the subject was found in the last third of the last century, the current scenario clearly places the elderly in a position of much greater relevance and worthy of a wide range of prerogatives that safeguard their well-being.

When analyzing the debate from the perspective of the inter-American human rights system, the situation is even more favorable, since Latin American and Caribbean countries present a significantly more emphatic and purposeful posture in the consolidation of the fundamental guarantees of the elderly, when compared to other regions of the planet and, above all, to the global scenario.

However, there is still a long way to go, especially with regard to the consolidation of the human rights of the elderly on Brazilian soil. And there is, on the horizon of Brazil, no better way to take this important step towards the recognition of the elderly as a fundamental subject in the productive and demographic composition of the nation than the ratification of the CPM, based on a joint effort of all the powers that make up the governmental structure.

At the same time, it is urgent that not only Brazil, but the entire American continent, continue to seek to support the debate focused on the best studies and technical references in the area of the epidemiology of aging, with a focus on understanding and managing the demographic, health, and social implications of this global and accelerated phenomenon, aiming to adapt policies and services for a longer-lived population with new needs

By following this path, the Brazilian State will be able to concretely transform the human rights of the elderly into a fundamental foundation in legislation and in society, through the full realization of its guarantees, the active fight against prejudice and the continuous improvement of public policies aimed at individuals in the aging process, in order to guarantee them a dignified and participatory old age.

The poet Charles Bukowski, recognized for facing aging in a very characteristic and sometimes even humorous way, brings, in his poem entitled *Helping the Old*, the following verses:

Today I was in line at the bank
When an old guy in front of me
let your glasses fall (luckily, inside the case)
and as he bends down to pick them up
I could see how difficult it was for him

And I said, "Wait, let me take it..."
 But as soon as I got beaten
 He dropped his cane
 A beautiful, black, waxed cane
 And I gave him back his glasses
 And then I went to get the cane
 Supporting the old man
 while giving him back his cane.
 He didn't say anything, just smiled at me
 then turned forward
 I stood behind him
 waiting for my turn. (2009)

These simple verses, not very expressive to the inattentive reader, faithfully portray the scenario in which the global demography finds itself. There are those who have already reached old age and are letting their belongings fall to the ground. And there are those who are still behind them, waiting for their turn, and should never spare efforts so that the world in which they live guarantees them an active, healthy and dignified aging.

ABSTRACT

This study analyzes trends and predictive patterns in the evolution of the financial performance of Brazilian Health Plan Operators (HPOs), emphasizing the role of managerial accounting usability as a decision-support and early-warning mechanism. The analysis is based on secondary data from the Brazilian National Agency for Supplementary Health (ANS), covering the period from 2017 to 2024, and organized into a balanced panel dataset. Methodologically, the study combines descriptive statistics, trend analysis, and panel data econometric models, enabling the identification of both temporal dynamics and unobserved heterogeneity among operators. The results reveal significant persistence in financial performance, particularly in return on assets, as well as a strong sensitivity to claims ratio (loss ratio) and managerial cost indicators. Variables associated with managerial accounting practices, such as operating margins, combined ratios, liquidity, and capital structure indicators, demonstrate substantial predictive power in anticipating future financial deterioration or recovery. The findings indicate that the effective use of managerial accounting information enhances the capacity of health plan operators to anticipate financial risks, improve cost control, and support strategic decision-making, especially in a highly regulated and cost-intensive environment. From a regulatory and managerial perspective, the study highlights the relevance of integrating managerial accounting indicators into continuous monitoring systems to strengthen the economic and financial sustainability of the supplementary health sector.

Keywords: Managerial Accounting. Panel Data. Financial Performance. Predictive Analysis. Supplementary Health.

RESUMO

Este estudo analisa as tendências e padrões preditivos do desempenho econômico-financeiro das Operadoras de Planos de Saúde (OPSs) no Brasil, no período de 2017 a 2024, enfatizando o papel da usabilidade da contabilidade gerencial como instrumento de suporte à tomada de decisão. Utilizam-se dados secundários da Agência Nacional de Saúde Suplementar (ANS), organizados em painel balanceado, combinando estatística descritiva, análise de tendências e modelos econométricos em dados em painel. Os resultados indicam a existência de persistência temporal da rentabilidade, elevada sensibilidade à sinistralidade e relevância dos indicadores gerenciais na antecipação de deteriorações financeiras. Conclui-se que a contabilidade gerencial, quando adequadamente utilizada, contribui para a identificação precoce de riscos e para a sustentabilidade econômico-financeira das OPSs.

RESUMEN

Este estudio analiza las tendencias y los patrones predictivos del desempeño económico y financiero de las Operadoras de Planes de Salud (OPS) en Brasil, entre 2017 y 2024, destacando la utilidad de la contabilidad de gestión como herramienta de apoyo a la toma de decisiones. Se utilizan datos secundarios de la Agencia Nacional de Salud Suplementaria (ANS), organizados en un panel balanceado, que combina estadística descriptiva, análisis de tendencias y modelos econométricos sobre datos de panel. Los resultados indican la persistencia temporal de la rentabilidad, una alta sensibilidad a la siniestralidad y la relevancia de los indicadores de gestión para anticipar el deterioro financiero. Se concluye que la contabilidad de gestión, cuando se utiliza adecuadamente, contribuye a la identificación temprana de riesgos y a la sostenibilidad económica y financiera de las OPS.

1 INTRODUCTION

The growing complexity of the Brazilian supplementary health sector has intensified the need for management instruments capable of anticipating financial risks and supporting strategic decisions in an environment characterized by high economic uncertainty, strong regulatory intervention, and growing pressure for operational efficiency. Health Plan Operators (OPSs) simultaneously face challenges related to the continuous increase in care costs, the incorporation of new health technologies, the aging of the beneficiary population, and the limitation of revenue readjustment mechanisms, factors that compress margins and increase the risk of economic and financial imbalances.

In this context, the retrospective analysis of financial performance, traditionally based on indicators extracted from the financial statements, although necessary for monitoring and regulatory compliance purposes, is insufficient to ensure the sustainability of SPOs in the medium and long term. Ex post evaluation, focused only on past results, limits managers' ability to identify early signs of financial deterioration and to react in a timely manner to economic, regulatory, or care shocks.

In view of these limitations, management accounting emerges as a central instrument for improving the economic governance of the OPSs. By providing forward-looking information, cost control indicators, operational efficiency metrics, and decision-oriented analysis, management accounting enhances organizations' ability to plan, monitor, and adjust their financial strategies. Unlike financial accounting, whose emphasis is on meeting legal, regulatory and external accountability requirements, management accounting prioritizes the usefulness of information, focusing on supporting strategic planning, management control and forecasting future scenarios.

In heavily regulated and cost-intensive sectors such as supplementary healthcare, the usability of management accounting becomes even more relevant. Indicators such as loss ratio, operating margins, combined ratios, average receipt and payment terms, and liquidity and capital structure metrics work as anticipatory signals of financial performance, allowing the identification of trends, persistence patterns, and potential imbalances before they materialize in negative results or regulatory interventions.

In light of these considerations, this article constitutes an analytical continuation of the study that evaluated the economic and financial performance of the SPOs in the period from 2017 to 2024, moving towards a more dynamic and prospective approach. The focus shifts from merely descriptive analysis to the identification of trends, persistence and predictive patterns of financial performance, with emphasis on the usability of management accounting as a mechanism for anticipating risks and supporting strategic decision-making.

By integrating traditional economic and financial indicators with typical metrics of management accounting, analyzed through panel data, the study seeks to contribute to the deepening of the literature on financial sustainability in supplementary health, as well as to offer practical subsidies for managers and public policy makers, in order to strengthen the stability and efficiency of the sector.

1.1 RESEARCH OBJECTIVE/PROBLEM

In view of the environment of high economic complexity, strong regulation and continuous pressure on care costs that characterizes the Brazilian supplementary health sector, it is essential to understand if and to what extent the information generated by management accounting can be used not only for retrospective analysis, but also for anticipating risks and forecasting the financial performance of Health Plan Operators (OPSs).

In this sense, the following research problem emerges:

To what extent does the usability of management accounting contribute to the identification of trends, persistence and predictive patterns in the evolution of the economic and financial performance of health plan operators in Brazil?

This question guides the empirical investigation by seeking evidence that managerial indicators can function as anticipatory mechanisms of financial imbalances, expanding the planning and control capacity of OPSs in a highly regulated sector.

1.2 RATIONALE AND RELEVANCE

This study is justified by the growing economic, regulatory, and operational complexity that characterizes the Brazilian supplementary health sector, in which Health Plan Operators (OPSs) face structural challenges related to economic and financial sustainability. The continuous increase in care costs, the incorporation of new health technologies, the aging of the beneficiary population, and the rigidity of regulatory mechanisms for readjusting revenues impose significant pressures on operators' financial margins, increasing the risk of imbalances and regulatory interventions.

From an academic point of view, the study contributes to the advancement of the literature by integrating three dimensions that are still little explored together in the Brazilian context: (i) analysis of economic and financial performance in a panel data structure; (ii) investigation of trends, persistence and predictive patterns of financial performance; and (iii) application of management accounting as an instrument for anticipating risks, and not only as a tool for retrospective analysis. By proposing a dynamic and prospective approach, the

article broadens the scope of traditional studies, which mostly focus on descriptive or static analyses of the financial indicators of SPOs.

From a managerial perspective, the relevance of the study lies in the empirical demonstration that typical indicators of management accounting — such as loss ratios, operating margins, combined ratios, liquidity and capital structure — have explanatory and predictive capacity on the future evolution of financial performance. These findings reinforce the importance of the usability of management accounting as an instrument to support strategic decision-making, financial planning and control of care costs, providing practical subsidies for managers in the early identification of signs of economic deterioration.

In the regulatory and institutional sphere, the study is relevant by showing that the continuous monitoring of management indicators can complement the traditional mechanisms of economic and financial supervision adopted by the National Supplementary Health Agency (ANS). The identification of persistence patterns and anticipatory signs of risk contributes to the improvement of insolvency monitoring and prevention policies, strengthening the stability of the supplementary health system and reducing potential negative impacts on beneficiaries and service providers.

In addition, the use of public and standardized data from the ANS confers robustness, transparency, and replicability to the research, expanding its methodological relevance and allowing intertemporal comparisons and between different modalities of operators. By aligning methodological rigor, theoretical contribution, and practical applicability, the study is justified as relevant both for the academic community and for managers, regulators, and public policy makers, by offering empirical evidence that supports decisions aimed at the economic and financial sustainability of OPSs in the long term.

2 LITERATURE REVIEW

2.1 ECONOMIC AND FINANCIAL PERFORMANCE IN REGULATED SECTORS

The analysis of economic and financial performance is one of the main instruments for assessing the sustainability of organizations, especially in sectors characterized by strong state regulation and high operational complexity. In regulated environments, such as the supplementary health sector, financial performance not only reflects internal managerial decisions, but also institutional constraints, regulatory requirements, and macroeconomic constraints that affect revenues, costs, and capital structure (Greene, 2018; Wooldridge, 2010).

The literature points out that, in these sectors, traditional indicators of profitability, liquidity and indebtedness play a central role in the assessment of insolvency risk and

operational continuity. In the case of Health Plan Operators (PAHOs), national studies show that financial performance is directly associated with the ability to remain in the market and the probability of regulatory intervention by the National Supplementary Health Agency (ANS) (Silva & Loebel, 2016; Bragança et al., 2019).

In addition, empirical evidence suggests that the financial performance of regulated organizations presents high structural heterogeneity, even under the same normative framework, which reinforces the importance of methodologies capable of capturing persistent individual differences between firms (Xavier & Souza, 2020).

2.2 MANAGERIAL ACCOUNTING AND USABILITY OF INFORMATION

Management accounting is distinguished from financial accounting by its internal orientation and by prioritizing the usefulness of information in the decision-making process. While financial accounting primarily meets legal, regulatory, and accountability requirements, management accounting focuses on providing relevant information for planning, control, performance evaluation, and forecasting future scenarios (Horngren et al., 2014).

The contemporary literature emphasizes that the usability of management accounting depends not only on the availability of data, but on the ability to transform accounting information into effective decision support instruments. Indicators such as operating margins, combined ratios, care costs, average terms, and liquidity metrics allow you to monitor operational efficiency and anticipate financial imbalances before they are reflected in the final results (Macedo et al., 2021).

In the context of OPSs, management accounting assumes strategic relevance, since the management of care costs represents the main financial challenge of the sector. Studies indicate that operators that systematically use management indicators tend to have greater financial stability and a lower probability of abrupt deterioration in performance (Teixeira et al., 2022).

2.3 CLAIMS AND CARE COSTS AS DETERMINANTS OF PERFORMANCE

Claims are widely recognized as the main indicator of operational efficiency in the supplementary health sector, as it expresses the proportion of revenues committed to care expenses. The national and international literature converges in pointing out that high levels of claims have a direct negative impact on the profitability and solvency of operators (Silva & Loebel, 2017; Macedo et al., 2021).

Several empirical studies show that persistent increases in claims precede deterioration in financial performance and increase the risk of regulatory intervention or

liquidation of SPOs (Bragança et al., 2019). This behavior reinforces the anticipatory character of this indicator, especially when analyzed dynamically over time.

In addition, structural factors, such as aging of the beneficiary portfolio, technological incorporation and medical inflation, contribute to the increase in care costs, making the control of claims one of the main managerial challenges in the sector.

2.4 PERSISTENCE, TRENDS AND PREDICTIVE PATTERNS OF FINANCIAL PERFORMANCE

The literature on financial performance highlights the existence of temporal persistence, that is, the tendency for positive or negative results to be maintained over time due to structural characteristics, managerial strategies and specific competitive advantages of organizations (Wooldridge, 2010).

In the context of SPOs, studies indicate that financially sound operators tend to maintain superior performance over time, while operators with structural weaknesses have greater difficulty in reversing negative results (Silva & Loebel, 2017). This behavior justifies the use of dynamic models and dashboard data to capture persistent patterns and more robust causal relationships.

The identification of trends and predictive patterns expands the analytical potential of management accounting, by allowing current and outdated indicators to function as anticipatory signals of the future evolution of financial performance. Thus, the analysis is no longer merely descriptive and starts to incorporate a prospective dimension, fundamental for strategic decision-making.

2.5 EMPIRICAL EVIDENCE AND LITERATURE GAPS

Although the national literature on supplementary health has made significant progress in the analysis of the economic and financial performance of PAHOs, it is observed that most studies focus on static approaches, cross-sectional analyses, or descriptive evaluations of isolated indicators (Kudlawicz & Santos, 2014; Silva & Loebel, 2016).

Research that integrates management accounting, dynamic analysis in panel data, and identification of predictive patterns is still relatively scarce, especially using recent series and standardized public data from the ANS. In addition, few studies explicitly explore the persistence of financial performance and the anticipatory role of management indicators in the Brazilian context.

Thus, the present study contributes to filling these gaps by proposing an integrated, dynamic and prospective approach, reinforcing the role of management accounting as a central instrument for the economic and financial sustainability of SPOs.

3 RESEARCH HYPOTHESES

Based on the theoretical framework, the empirical evidence in the literature and the objectives of the study, the following hypotheses are formulated:

3.1 H1 – PERSISTENCE OF FINANCIAL PERFORMANCE

The economic and financial performance of health plan operators is persistent over time, so that positive (or negative) results tend to be maintained over time.

This hypothesis is based on the literature on panel data and financial performance, according to which structural and strategic characteristics of organizations continuously influence their results.

3.2 H2 – PREDICTIVE POWER OF MANAGEMENT ACCOUNTING INDICATORS

Management accounting indicators, such as loss ratio, operating margins, combined ratios and liquidity, have significant predictive capacity on the future evolution of the financial performance of OPSs.

This hypothesis reflects the premise that managerial metrics function as anticipatory signs of financial deterioration or recovery, going beyond simple ex post analysis.

3.3 H3 – NEGATIVE IMPACT OF CARE COSTS ON FUTURE PERFORMANCE

The increase in claims has a negative and statistically significant effect on the future economic and financial performance of health plan operators.

This hypothesis is in line with the national and international literature, which identifies care costs as the main factor of pressure on the financial sustainability of the sector.

3.4 LINKING WITH THE METHODOLOGY

The hypotheses formulated are empirically tested by means of econometric models in panel data, allowing the simultaneous evaluation of the temporal persistence of performance (H1), the predictive role of management indicators (H2) and the specific impact of care costs on future profitability (H3), controlling for individual and temporal effects.

Table 1*Operationalization of Research Hypotheses*

Hypothesis	Description of the Hypothesis	Dependent Variable	Independent Variables	Proxy/Indicator	Expected Signal	Analysis Technique	Source
H1	Financial performance shows temporal persistence	ROA	Lagging ROA (t-1)	Return on Assets	+	Dashboard data (dynamic model)	Authors (2025)
H2	Management accounting indicators have predictive power	ROA	SIN; MO; COMB; LC	Management Indicators (ANS/DIOPS)	SIN (-); MO (+); COMB (-); LC (+)	Multivariate panel data	Authors (2025)
H3	Care costs negatively impact future performance	ROA	SIN	Assistance Expenses / Consideration	-	Panel data with fixed effects	Authors (2025)

Source: The authors: 2025

The operationalization framework explains the relationship between the hypotheses formulated, the empirical variables used and the expected signals, ensuring coherence between the theoretical framework, the econometric methodology and the analysis of the results. The use of panel data allows us to simultaneously test temporal persistence, predictive effects and structural impacts on the financial performance of SPOs.

3.5 ECONOMETRIC MODEL AND HARMONIZATION WITH HYPOTHESES

The econometric model adopted in this study was structured in order to ensure full coherence between the hypotheses formulated, the operational variables presented in Table 1 and the estimation strategy based on panel data. The general specification of the model is given by:

$$ROA_{it} = \alpha + \beta_1 \cdot ROA_{it-1} + \beta_2 \cdot SIN_{it} + \beta_3 \cdot MO_{it} + \beta_4 \cdot COMB_{it} + \beta_5 \cdot LC_{it} + \mu_i + \lambda_t + \varepsilon_{it} \quad (1)$$

Where: ROA_{it} represents the financial performance of operator i in period t ; ROA_{it-1} captures the temporal persistence of performance (Hypothesis H1); SIN_{it} corresponds to the loss ratio, reflecting care costs (Hypotheses H2 and H3); MO_{it} and $COMB_{it}$ represent typical indicators of management accounting associated with operational efficiency (Hypothesis H2); LC_{it} refers to current liquidity; μ_i controls carrier-specific unobservable effects; λ_t captures common temporal effects; and ε_{it} is the idiosyncratic error term.

The inclusion of the lagged term of the ROA makes it possible to test the persistence of financial performance over time, while the management accounting indicators make it possible to evaluate its explanatory and predictive power on the future evolution of the profitability of the OPSs. Thus, the econometric equation presented is directly in harmony

with Table 1, ensuring theoretical and methodological consistency between hypotheses, empirical variables and technical analysis.

4 METHODOLOGY

4.1 RESEARCH DESIGN

The present study is characterized as a quantitative research, of descriptive and explanatory nature, whose objective is to identify trends, persistence and predictive patterns in the evolution of the economic and financial performance of Health Plan Operators (OPSS) in Brazil, focusing on the usability of management accounting. The quantitative approach is justified by the need for objective measurement of the relationships between economic and financial indicators and by the application of econometric techniques capable of capturing temporal dynamics and heterogeneity among operators.

4.2 POPULATION, SAMPLE AND PERIOD OF ANALYSIS

The survey population comprises all health plan operators regulated by the National Supplementary Health Agency (ANS) and operating in the Brazilian market. The sample is composed of the OPSSs that presented complete and consistent accounting information over the period from 2017 to 2024, allowing the construction of a database in a balanced panel.

The choice of the analyzed period is justified because it covers different economic and regulatory cycles relevant to the sector, including ANS regulatory changes, macroeconomic shocks and the impact of the COVID-19 pandemic, which makes it possible to assess the dynamic behavior of the financial performance of operators in different contexts.

4.3 DATA SOURCE AND COLLECTION

The data used are secondary and were extracted from official databases made available by the National Supplementary Health Agency, notably:

- Standardized Financial Statements (DIOPS);
- Product Information System (SIP);
- Panel of Economic and Financial Indicators of Supplementary Health;
- Supplementary Health Information Booklet.
- Meetings with Health Plan Cooperatives, obeying the secrecy and confidentiality of data related to academic research.

The use of these databases ensures standardization, reliability and intertemporal comparability of information. After collection, the data underwent consistency verification

procedures, exclusion of incomplete observations, and monetary standardization, with a view to ensuring the quality of the empirical base.

4.4 VARIABLES AND OPERATIONALIZATION

The dependent variable of the study is the economic and financial performance, measured by the Return on Assets (ROA), widely used in the literature because it reflects the efficiency in the use of the organization's total resources.

The independent variables include typical indicators of management accounting and the financial structure of the OPSs, as described in the Operationalization Table of Hypotheses, highlighting:

- **Claim Ratio (SIN):** care expenses in relation to effective consideration;
- **Operating Margin (OM):** operating income in relation to revenues;
- **Combined Ratio (COMB):** sum of assistance, administrative and commercial expenses over revenue;
- **Current Liquidity (LC):** short-term payment capacity;
- **Lagging ROA (ROAt₋₁):** Used to capture temporal persistence of performance.

These variables allow the evaluation of both the impact of health care costs and the predictive role of management indicators on the evolution of financial performance.

4.5 PANEL DATA STRUCTURE

The empirical basis was structured in data in a balanced panel, combining the cross-sectional dimension (operators) and the temporal dimension (years). This approach offers relevant methodological advantages, such as controlling for unobservable heterogeneity among OPSs and greater statistical efficiency of estimates (Wooldridge, 2010).

Formally, the general econometric model can be represented by:

$$ROA_{it} = \alpha + \beta_1 ROA_{it-1} + \beta_2 SIN_{it} + \beta_3 MO_{it} + \beta_4 COMB_{it} + \beta_5 LC_{it} + \mu_i + \lambda_t + \varepsilon_{it}$$

$$ROA_{it} = \alpha + \beta_1 ROA_{it-1} + \beta_2 SIN_{it} + \beta_3 MO_{it} + \beta_4 COMB_{it} + \beta_5 LC_{it} + \mu_i + \lambda_t + \varepsilon_{it} \quad (2)$$

Where: μ_i represents the specific unobservable effects of operators, λ_t captures the common temporal effects, and ε_{it} is the idiosyncratic error term.

4.6 DATA ANALYSIS PROCEDURES

Data analysis was performed in three complementary stages. Initially, descriptive statistics were applied, with the calculation of means, medians, standard deviations, minimum and maximum values, in order to characterize the behavior of the main variables over the analyzed period.

Then, the analysis of trends and persistence was carried out, through the evaluation of the temporal behavior of the indicators and the inclusion of lagged variables in the model, allowing the identification of patterns of continuity or reversal of financial performance.

Finally, econometric models were estimated in panel data, considering specifications of fixed and random effects. The Hausman test was used to choose the most appropriate model. In addition, multicollinearity (VIF), autocorrelation and heteroscedasticity tests were performed, with the application of robust standard errors when necessary.

4.7 METHODOLOGICAL LIMITATIONS

Although the methodology adopted is robust, some limitations must be recognized. The use of secondary data restricts the incorporation of qualitative aspects of management accounting, such as internal control practices and management information systems. In addition, despite the use of lagged variables, the model may not fully capture potential endogeneity problems, which opens space for future research with more advanced dynamic models.

5 ANALYSIS AND INTERPRETATION OF RESULTS

5.1 DATABASE AND PANEL STRUCTURE

The empirical analysis is based on secondary data extracted from the National Supplementary Health Agency (ANS), through the Product Information System (SIP), Accounting Statements of Operators and the Panel of Economic and Financial Indicators of Supplementary Health. The period analyzed comprises the years 2017 to 2024, allowing the identification of trends and predictive patterns in the evolution of the financial performance of the OPSs through the usability of management accounting.

The database was organized into a balanced panel, including health plan operators active throughout the analysis period. The panel structure makes it possible to simultaneously capture the temporal variation (dynamic effects) and the unobservable heterogeneity among the operators, as recommended by the econometric literature applied to corporate finance and the regulation of supplementary health.

The results obtained are presented below, through the presentation and interpretation of graphs.

5.2 ANALYSIS AND INTERPRETATION OF THE GRAPHS

5.2.1 Evolution of the Return on Assets (ROA) of SPOs (2017–2024)

Figure 1

Evolution of the Return on Assets (ROA) of OPSs (2017–2024)

Source: The Authors 2025.

The graph shows the trajectory of the average Return on Assets (ROA) of health plan operators over the analyzed period. It is observed that, between 2017 and 2019, the sector presented relatively stable levels of profitability, with ROA above 3%, indicating adequate capacity to generate results from the assets employed.

From 2020 onwards, there was a sharp drop in ROA, reaching the lowest level in 2021. This behavior is associated with the abrupt increase in care costs, the intensification of the use of health services, and the lag in regulatory readjustments in the post-pandemic period. Between 2022 and 2024, there is a gradual movement of profitability recovery, although the levels remain lower than those recorded in the pre-2020 period.

This empirical pattern confirms **Hypothesis H1**, by evidencing temporal persistence of financial performance, as well as sensitivity to external shocks, reinforcing the appropriateness of the use of dynamic models in panel data.

5.2.2 Evolution of the Claim Rate of OPSs (2017–2024)

Figure 2

Evolution of the Loss Ratio of OPSs (2017–2024)

Source: The Authors 2025.

The loss ratio graph shows an increasing trend between 2017 and 2021, reaching levels close to 90%, which indicates a strong commitment of revenues to care expenses. Such behavior reflects, above all, the impact of the COVID-19 pandemic, medical inflation, and the incorporation of higher-cost technologies.

As of 2022, there is a gradual reduction in claims, signaling efforts to control costs, restructuring contracts with providers, adoption of co-participation mechanisms, and greater rigor in care management. Even so, the levels remain high, indicating that the loss ratio continues to be the main factor pressuring the financial performance of OPSs.

These results corroborate **Hypothesis H3**, showing that the increase in care costs has a relevant negative impact on future financial performance, in addition to reinforcing the importance of management accounting as an instrument of continuous monitoring.

5.2.3 Evolution of the Current Liquidity of SPOs (2017–2024)

Figure 3

Evolution of the Current Liquidity of SPOs (2017–2024)

Source: The Authors 2025.

The analysis of current liquidity reveals that, between 2017 and 2019, SPOs maintained comfortable liquidity levels, above 1.30, indicating an adequate capacity to honor short-term obligations. However, between 2020 and 2021, there was a significant reduction in liquidity, reaching the lowest level in the series.

This behavior suggests a deterioration in working capital, associated with the increase in care costs, the increase in operating expenses and the pressure on cash flow. As of 2022, there is a gradual recovery in liquidity, reflecting managerial adjustments and financial recovery strategies.

The results indicate that current liquidity plays a relevant role in sustaining financial performance, in line with **Hypothesis H2**, by evidencing the explanatory and predictive power of management indicators on the evolution of the profitability of SPOs.

5.3 INTERPRETATIVE SYNTHESIS OF THE GRAPHS

The joint analysis of the graphs shows a clear inverse relationship between loss ratio and profitability, as well as the importance of liquidity as a mitigating factor against the adverse effects of care costs. The observed patterns confirm that the financial performance

of the OPSs presents trends and temporal persistence, being strongly conditioned by typical indicators of management accounting.

These findings reinforce the relevance of the usability of management accounting as a predictive instrument and support for decision making, allowing the identification of early signs of financial deterioration and subsidizing strategies aimed at the economic and financial sustainability of operators.

5.4 PROGRESS IN THE DISCUSSIONS:

5.4.1 Combined Analysis of Profitability and Care Costs

Figure 4

Comparative Evolution of the ROA and Claims of OPSs (2017-2024)

Source: Authors 2025.

5.4.2 Interpretation of the Combined Table: ROA and Loss Ratio

Figure 4 presents the comparative evolution of the Return on Assets (ROA) and the loss ratio of Health Plan Operators (OPSs) in the period from 2017 to 2024, allowing for an integrated visualization of the relationship between profitability and care costs. An inverse relationship between the two indicators is consistently observed, showing that increases in claims are associated with reductions in the profitability of operators.

In the period from 2017 to 2019, the loss ratio remained at relatively controlled levels, while the ROA presented higher and more stable levels, suggesting a more favorable financial environment for OPSs. From 2020 onwards, there was a significant increase in the loss ratio, reaching its peak in 2021, concomitantly with the sharp drop in the ROA, which reflects the

impact of care shocks and the intensification of medical-hospital costs on the financial performance of the sector.

In the subsequent years, between 2022 and 2024, there is a gradual movement to recompose profitability, accompanied by a reduction in the loss ratio. This behavior reinforces the predictive character of the indicators of care costs, since the reversal of the trajectory of the loss ratio precedes and accompanies the recovery of the ROA. Such empirical evidence corroborates **Hypotheses H2 and H3**, by demonstrating that typical indicators of management accounting have the ability to anticipate future variations in the economic and financial performance of the OPSs.

In general, the combined graph shows that the efficient management of care costs is a central element for the financial sustainability of health plan operators. The inverse relationship observed between claims and profitability highlights the importance of the systematic use of management accounting as an instrument for continuous monitoring and support for strategic decision-making, especially in a sector that is heavily regulated and sensitive to external shocks.

5.4.3 Illustration in Panel Data

Figure 5

Illustration in Panel Data: ROA and Loss Ratio by Operator (2017-2024)

Source: Authors 2025.

The figure above shows in an integrated way the temporal dynamics and structural heterogeneity of the economic and financial performance of Health Plan Operators (OPSs), by relating the Return on Assets (ROA) and the loss ratio over the period from 2017 to 2024. The graphical representation allows the simultaneous observation of the cross-sectional dimension, associated with the different operators, and the temporal dimension, corresponding to the evolution of the indicators over time, justifying the adoption of panel econometric models.

It is observed that, despite the differences in level between the OPSs, there is a common temporal pattern characterized by the generalized increase in claims between 2020 and 2021, accompanied by a significant reduction in ROA in all operators represented. This behavior indicates the presence of systemic shocks in the sector, such as care and regulatory pressures, which simultaneously affect the units analyzed and are captured by the temporal effects of the model (λ_t).

At the same time, the illustration reveals persistent heterogeneity among operators, expressed by structural differences in profitability levels and care costs throughout the period. Such differences suggest the existence of unobservable individual effects (μ_i), related to factors such as size, managerial efficiency, profile of the beneficiary portfolio and cost control strategies. The presence of these effects reinforces the inadequacy of purely cross-sectional models or isolated time series for the analysis of the performance of the SPOs.

The gradual recovery of ROA observed from 2022 onwards occurs heterogeneously among operators, indicating that the capacity to respond to care shocks depends on the use of management accounting instruments, operational efficiency, and the financial structure of each OPS. This evidence reinforces the predictive character of management indicators, since the reversal of the loss ratio precedes and accompanies the recomposition of profitability.

In general, the illustration empirically confirms **Hypotheses H1, H2 and H3**, by demonstrating the temporal persistence of financial performance, the negative impact of claims on profitability and the relevance of management accounting indicators in explaining the evolution of performance over time. Thus, panel data analysis contributes to a more robust understanding of the economic and financial sustainability of SPOs, by integrating individual and temporal effects into a single analytical framework.

6 CONCLUSIONS

This study analyzed the trends and predictive patterns in the evolution of the economic and financial performance of Health Plan Operators (OPSs) in Brazil, in the period from 2017 to 2024, with emphasis on the usability of management accounting as an instrument for

anticipating risks and supporting strategic decision-making. The research was based on secondary data from the National Agency for Supplementary Health (ANS), organized in a panel data structure, combining descriptive statistics, graphical analysis and econometric models.

The results show that the financial performance of the SPOs does not behave randomly, but presents significant temporal persistence, confirming Hypothesis H1. Operators that have superior performance tend to maintain it over time, while SPOs with structural weaknesses show greater difficulty in reversing negative results, which reinforces the importance of preventive management mechanisms.

In addition, it was found that the typical indicators of management accounting, especially loss ratios, operating margins, combined ratios and current liquidity, have relevant explanatory and predictive capacity on the future evolution of profitability, corroborating Hypothesis H2. The graphical analysis and the illustration in panel data clearly showed the inverse relationship between claims and profitability, highlighting the care costs as the main factor of pressure on the economic and financial performance of the OPSs, in line with Hypothesis H3.

The findings indicate that management accounting plays a central role in the financial sustainability of SPOs, by allowing the continuous monitoring of critical variables and the early identification of signs of economic imbalance. Thus, the study contributes to the literature by advancing from a merely descriptive approach to a dynamic and prospective perspective, evidencing the predictive potential of management information in a heavily regulated sector that is sensitive to external shocks.

6.1 STUDY LIMITATIONS

Despite the contributions presented, some limitations should be considered in the interpretation of the results. First, the research is predominantly based on secondary data made available by the ANS, which, although standardized and widely used, may not fully capture qualitative aspects of management accounting, such as internal information systems, specific cost control practices and decision-making processes adopted by the OPSs.

Another limitation refers to the possible endogeneity between financial performance and managerial decisions, especially with regard to the capital structure and strategies for controlling care costs. Although the use of lagged variables and panel data mitigates this problem, the model employed does not completely eliminate this possibility.

In addition, the study did not explicitly incorporate macroeconomic and institutional variables, such as medical inflation, interest rates, or specific regulatory changes, which can

simultaneously influence care costs and the profitability of operators. Finally, the use of a balanced sample may exclude SPOs that entered or exited the market over the period, limiting the generalization of the results to all operators in the sector.

6.2 PROPOSALS FOR FUTURE STUDIES

As a future research agenda, it is recommended to broaden the analytical scope through the incorporation of qualitative variables, obtained from survey surveys or interviews with managers, in order to capture the effective degree of use of management accounting by the SPOs and its influence on financial performance.

It is also suggested the application of more advanced dynamic models, such as the systemic GMM estimator, capable of treating potential endogeneity problems in a more robust way and capturing long-term persistence effects. Another possibility is the segmentation of SPOs by size, modality, or region, allowing for more refined comparative analysis and the identification of specific performance patterns.

Additionally, future studies can explore the integration between economic-financial indicators and macroeconomic and regulatory variables, as well as the use of predictive analysis and machine learning techniques, expanding the potential for anticipating financial risks in the supplementary health sector. Finally, international comparative analyses can contribute to the understanding of the particularities of the Brazilian model of supplementary health and to the generalization of the findings.

Joaquim Ribeiro de Souza Junior¹

ABSTRACT

Brazil's 1988 Constitution reframed the Public Prosecutor's Office (MP) as a guardian of the legal order and collective interests, widening its toolbox beyond litigation. This paper analyses four structural extrajudicial instruments available to the MP—inquérito civil (civil inquiry), administrative procedure, recommendation, and term of conduct adjustment—as mechanisms for preventing and resolving collective disputes. Based on doctrinal and normative research, we argue that the 'resolutive model', grounded in institutional dialogue and consensus, is better suited to address complex, polycentric conflicts than purely adversarial lawsuits. These instruments foster flexibility, speed and cost-effectiveness, but their success depends on methodological refinement and internal cultural change. We conclude that structural extrajudicial action represents a promising path towards de-judicialisation, enhancing the effective protection of fundamental rights and catalysing the transformation of dysfunctional public structures.

Keywords: Public Prosecutor's Office. Structural Litigation. Civil Inquiry. Term of Conduct Adjustment. Recommendation.

RESUMO

A Constituição Federal de 1988 redesenhou o papel do Ministério Público (MP), conferindo-lhe atribuições que extrapolam a atuação contenciosa tradicional. Este artigo examina os principais instrumentos de atuação extrajudicial voltados à prevenção e resolução de litígios coletivos de natureza estrutural — inquérito civil, procedimento administrativo, recomendação e termo de ajustamento de conduta. Parte-se da premissa de que o modelo resolutivo, alicerçado no diálogo institucional e na consensualidade, é compatível com a complexidade dos conflitos policêntricos que marcam a agenda pública brasileira. Combina-se pesquisa bibliográfica com análise documental normativa para demonstrar que tais instrumentos oferecem flexibilidade, celeridade e economicidade, ainda que demandem adequações metodológicas e mudança cultural internas ao MP. Conclui-se que a atuação extrajudicial estruturante se apresenta como via efetiva de

RESUMEN

La Constitución Federal de 1988 rediseñó el papel del Ministerio Público (MP), atribuyéndole competencias que exceden la actuación contenciosa tradicional. Este artículo examina los principales instrumentos de actuación extrajudicial orientados a la prevención y resolución de litigios colectivos de naturaleza estructural - investigación civil, procedimiento administrativo, recomendación y término de ajuste de conducta. Se parte de la premisa de que el modelo resolutivo, basado en el diálogo institucional y en la consensualidad, es compatible con la complejidad de los conflictos policéntricos que marcan la agenda pública brasileña. Se combina investigación bibliográfica con análisis documental normativo para demostrar que tales instrumentos ofrecen flexibilidad, celeridad y economicidad, aunque exigen adecuaciones metodológicas y un cambio cultural interno en el MP. Se concluye que la actuación extrajudicial estructurante se presenta como una vía eficaz de desjudicialización, capaz de promover la tutela efectiva de los derechos fundamentales y la transformación de estructuras estatales disfuncionales.

Palabras clave: Ministerio Público. Litigio Estructural. Investigación Civil. Término de Ajuste de Conduta. Recomendación.

1 INTRODUCTION

The 1988 Constitution of the Republic reshaped the Brazilian Public Prosecution Service, transforming it into an institution dedicated to defending the legal order, the democratic regime, and inalienable social and individual interests (art. 127, caput). Since then, the standing granted to the prosecution service to bring collective actions—public civil actions, popular actions, collective writs of mandamus, among others—has become a cornerstone for the protection of diffuse and collective rights. Four decades of experience, however, have shown that an exclusively judicial path, anchored in structural judgments with complex enforcement, has not been sufficient to provide adequate and timely responses to disputes marked by high factual density, multiple defendants, and significant social impact.

The proliferation of structural disputes involving health, education, housing, the environment, and public policies in general, combined with the chronic slowness of the Judiciary, has encouraged the development of a so-called "resolutive model," grounded in cooperative and consensual extrajudicial action. In this context, instruments such as the civil inquiry, the administrative proceeding, the recommendation, and, above all, the conduct adjustment agreement (Termo de Ajustamento de Conduta—TAC) have come to occupy a central place in the agenda of the Public Prosecution Service, functioning as arenas for negotiation, diagnostic assessment, and the negotiation of commitments capable of reshaping dysfunctional state structures.

The normative framework supporting these mechanisms is robust: art. 129, items III and VI, of the Federal Constitution; Law No. 7,347/1985 (the Public Civil Action Act); Complementary Law No. 75/1993; as well as resolutions of the National Council of the Public Prosecution Service (CNMP), notably Resolution No. 23/2007 (civil inquiry) and Resolution No. 179/2017 (regulation of TACs). These instruments grant the prosecution service investigative, negotiating, and monitoring powers that, if properly employed, reduce procedural costs, enhance transparency, and foster tailor-made solutions for polycentric conflicts.

Starting from the premise that structuring public policies goes beyond the binary logic of granting or denying claims, the following questions arise: to what extent can the extrajudicial instruments of the Public Prosecution Service be understood as genuine "structural remedies"? What factors condition their success, and what risks do they pose to institutional legitimacy and accountability? How can negotiating flexibility be reconciled with effectiveness and democratic oversight?

This article seeks to answer these questions through bibliographic and documentary research. It combines a review of the literature, an examination of the normative framework,

and a study of emblematic cases drawn from institutional reports and judicial databases. Finally, the concluding remarks synthesize the findings and suggest avenues for future research.

2 INSTRUMENTS FOR THE PUBLIC PROSECUTOR'S OFFICE'S EXTRAJUDICIAL STRUCTURAL ACTION

It is well known that the Federal Constitution of 1988 (Brazil, 1988) offered a new outlook on the Public Prosecutor's Office (Ministério Público), considerably expanding its role in the social framework. The institution came to be regarded as an essential function of justice, entrusted with defending the legal order and the interests of society. To achieve these aims, the Public Prosecutor's Office may rely on a variety of instruments to, out of court, resolve problems that require its intervention, especially structural disputes. Among the instruments available are the civil inquiry, the administrative proceeding, recommendations, and terms of adjustment of conduct (TAC).

Therefore, prosecutorial action should be facilitated by the provision of tools suited to its relevant functions. From this perspective, to achieve its objectives, the Public Prosecutor's Office may use various instruments to, extrajudicially, resolve swiftly and effectively problems that require its intervention, especially structural disputes. It is undisputed that the Public Prosecutor's Office has standing to seek the solution of social conflicts through both judicial and extrajudicial avenues, acting proactively in conflict resolution.

In this context, it is clear that the Public Prosecutor's Office's action is not limited to filing lawsuits. These, in turn, have not been effectively resolving collective disputes satisfactorily, so that, not infrequently, the judge dismisses the collective proceeding without duly examining the merits of the matter presented, given the backlog of cases the justice system faces and the delay it suffers.

Thus, although the Prosecutor's Office has a history that highlights a demand-driven model of action, after the 1988 Constitution entered into force the Public Prosecutor's Office has progressively embraced and refined the resolute model, which, it bears repeating, seeks to achieve consensual solutions without resorting to the Judiciary. The resolute model of prosecutorial action encourages dialogue, with the consequent exercise of dynamic law, capable of engaging with other fields of knowledge as well as adapting to the continuous changes in society.

Based on this premise, it should be noted that the Public Prosecutor must always pay attention to the circumstances present in the environment in which they are situated, so that

they can more clearly perceive the vicissitudes of their social reality and, thus, apply the resolute model more effectively.

Accordingly, it appears that a new perspective of action was presented to the Public Prosecutor's Office, since the resolute model is a new way of dealing with the community's collective conflicts (Almeida, 2019). This model is an effective and necessary route for the Prosecutor's Office to fulfill its constitutional duty to protect social rights, and it requires an internal cultural shift, preparing members and staff to foster dialogue and consensus regarding the solution of social conflicts. To this end, the Public Prosecutor's Office has extrajudicial action tools characterized as administrative proceedings in the *latu sensu* sense; that is, acts that, in general, give form to the institution's extrajudicial action.

The measures mentioned are quite convenient insofar as they can be proposed and, even if the expected solution is not achieved, their use does not prevent the filing of the pertinent judicial measure. In other words, the member of the Public Prosecutor's Office has two possibilities of action: they may submit their demands to the Judiciary, or they may obtain a solution to conflicts through the use of extrajudicial means. In view of this, it is evident that, in its resolute action in defense of social interests and non-disposable individual rights, the Public Prosecutor's Office may use instruments that promote extrajudicial resolution.

However, in a context of structural problems, it is observed that such tools must observe certain peculiarities in order to be truly effective. This is because a structural dispute is not resolved within a lawful-unlawful logic; it "arises from the way a given structure operates in society, generating certain consequences that one seeks to change" (Vitorelli, 2025, p. 60). Therefore, although the behavior of the structure is perceived as the cause of the violation of rights, that term must be understood in a broader context.

It should be noted that the administrative proceeding *latu sensu* is the genus of which the Civil Inquiry, the administrative proceeding *stricto sensu*, the term of adjustment of conduct, and the recommendation are species. Each of these instruments requires specific analysis due to its particularities.

3 CIVIL INQUIRY

The Civil Inquiry (Inquérito Civil) is an extrajudicial instrument available to the Public Prosecution Service (Ministério Público). Its emergence in the Brazilian legal system occurred with the enactment of Law No. 7,347/85 (Brazil, 1985), known as the Public Civil Action Act. Subsequently, the Federal Constitution ratified its existence, establishing in Article 129, item III, that "it is an institutional function of the Public Prosecution Service to institute a civil inquiry for the protection of public and social property, the environment, and

other diffuse and collective interests" (Brazil, 1988). In addition to the constitutional and statutory provisions, it is also worth noting that CNMP Resolution No. 23/2007 (Brazil, 2007) regulated the institute.

The civil inquiry is defined as an extrajudicial proceeding aimed at gathering the evidentiary elements necessary for filing a public civil action (Garcia, 2017). Secondly, it may also serve, within its scope, to enable the execution of a conduct adjustment agreement (Termo de Ajustamento de Conduta - TAC), the issuance of recommendations, and the scheduling of public hearings (Mazzilli, 2021). However, it is essential to clarify that the civil inquiry is a dispensable procedure (Ziesemer, 2021). This is because, if the prosecuting authority already has sufficient evidence to file the action, it may do so regardless of whether this instrument has been initiated.

In light of this, the civil inquiry is characterized by dispensability, exclusivity to the Public Prosecution Service, the absence of an adversarial proceeding, and the lack of interference by the Judiciary.

It is worth recalling that a civil inquiry may be initiated by ordinance, by an order admitting a complaint/petition, or by determination of either the Prosecutor-General of Justice (Procurador-Geral de Justiça) or the Superior Council of the Public Prosecution Service. Direct initiation by the Prosecutor-General occurs when the matter falls within the Prosecutor-General's original jurisdiction. Initiation by the Superior Council occurs when that body grants an appeal filed against a decision that denied a request to open a civil inquiry. Initiation may also occur when the Council refuses to approve the archiving of preliminary information records.

After the civil inquiry is initiated, the competent member, who presides over the investigation, will gather the essential evidentiary elements to properly ascertain the object under investigation. Thereafter comes the final phase, namely, closure, which may conclude with archiving (which depends on approval by the Superior Council of the Public Prosecution Service to produce concrete effects) or with the filing of the relevant judicial action.

It should be added that the civil inquiry has a reflex or secondary instrumentality (Garcia, 2017). In other words, although its purpose is to investigate a situation with a view to the future filing of a public civil action, it is not improper to use the information obtained to support other proceedings, such as a disciplinary administrative process or a criminal action.

It is also noteworthy that, although the civil inquiry may serve as a basis for a public civil action - whose list of parties with standing to sue goes beyond the Public Prosecution Service - the civil inquiry itself may only be instituted by the Public Prosecution Service. This

circumstance does not, of course, prevent other parties with standing from gathering evidence to support their own actions.

In the context of a structural problem, the use of the civil inquiry as an inducer of structural solutions may be feasible, insofar as it is capable of immersing itself in the underlying reality. To that end, it becomes necessary to shift the focus of the civil inquiry. Its scope cannot be limited to the search for a culprit, an unlawful situation, or grounds for a public civil action, only then to turn to the adoption of strategies.

On the contrary, this inquiry should serve to stimulate and promote changes in the structure, moving away from a state of nonconformity toward an intended ideal state. If the structural problem is not purely a matter of classifying conduct as legal or illegal, this instrument should be understood as a tool for intervening in the bureaucracy or policy that one seeks to restructure.

4 RECOMMENDATION

The instrument known as a recommendation is another important tool available to the Public Prosecutor's Office to seek the extrajudicial resolution of conflicts. Through this measure, the prosecutor warns the agents involved in the unlawful conduct of a possible irregular situation, thereby precluding any future allegation of good faith or ignorance on their part.

It should be noted that the possibility of issuing recommendations is provided for in the National Organic Law of the Public Prosecutor's Office (BRAZIL, 1993b) (Law No. 8,625/1993), since Article 26, item VII, states that, in the exercise of its functions, the Public Prosecutor's Office may "suggest to the competent authority the enactment of rules and the amendment of the legislation in force, as well as the adoption of proposed measures aimed at the prevention and control of criminality." In addition, the following article of the same statute provides that the Public Prosecutor's Office, in exercising the defense of the rights ensured in the Federal and State Constitutions, may issue "recommendations addressed to the bodies and entities mentioned in the caput, requesting that the addressee give them adequate and immediate publicity, as well as provide a written response."

It should also be emphasized that Supplementary Law No. 75/93 (BRAZIL, 1993a), in Chapter II, concerning the instruments of action of the Federal Public Prosecutor's Office (Ministério Público da União), provides that the MPU is empowered to "issue recommendations, aiming at improving public services and services of public relevance, as well as ensuring respect for the interests, rights and assets whose defense it is charged with promoting, setting a reasonable deadline for the adoption of the appropriate measures."

It should be highlighted that, considering the need to standardize the Public Prosecutor's Office's action with respect to issuing recommendations, as a guarantee to society and a legitimate mechanism for promoting individual and collective fundamental rights, the National Council of the Public Prosecutor's Office (CNMP) issued Resolution No. 164, of March 28, 2017 (Brazil, 2017b).

The non-binding nature of prosecutorial recommendations is undisputed. However, this does not mean they are ineffective. Hugo Nigro Mazzilli (1996) attributes to the recommendation a substantial degree of moral force, since the recipient agent must publicize it and will not be able to claim, in the future, lack of knowledge or good faith regarding the unlawful situation. Moreover, the recipient is also required to respond to the prosecutor, with reasons, indicating whether the suggested measures will be adopted.

This instrument is governed by several principles (CNMP Resolution No. 164/2017) (Brazil, 2017a), including: reasoning; formality; solemnity; speed and timely implementation of the recommended measures; publicity, morality, efficiency, impersonality and legality; the broadest possible scope of the object and the recommended measures; the guarantee of access to justice; maximum usefulness and effectiveness; the non-binding nature of the recommended measures; a preventive or corrective character; resolutiveness; legal certainty; and balancing and proportionality in cases of tension between fundamental rights.

Accordingly, it follows that it would be entirely appropriate for recommendations—provided they are grounded in the principles transcribed above—to be complied with by their respective addressees, since observing them, in most cases, prevents the prolongation of irregular situations, such as omissions in the implementation of public policies, which directly affect collective interests. In this way, the recommendation has an indirect coercive force, akin to a "soft law," capable of inducing the adoption of law-compliant practices, thus avoiding the filing of public civil actions.

It is essential to add that a recommendation may be used to propose new structural measures. Nonetheless, it is worth noting that recommendations by themselves may lack the coercive and imperative force required to completely put an end to a structural problem, given the complexity of such problems, which involve multiple issues and actors.

Edilson Vitorelli (2022, p. 156) takes a similar view, stating that "in the context of a structural change, complex and polycentric, a recommendation drafted unilaterally will hardly be effective." Complex problems do not arise all at once, in a single moment or act. On the contrary, they emerge from a confluence of factors and circumstances. Thus, a recommendation that merely asks the public manager to indicate solutions will very likely produce no effect whatsoever.

Nevertheless, recommendations, although they do not by themselves change the situation of non-compliance, can assist the process of solving the structural problem when combined with other instruments. In other words, recommendations can indeed be very helpful when, used within the framework of a civil inquiry or administrative proceeding, they aim to remove obstacles that hinder the transition from the state of non-compliance to the desired state of affairs.

Therefore, without ignoring the presence of obstacles that make the context unfavorable, it is concluded that the establishment of extrajudicial measures by the Public Prosecutor's Office to solve structural problems is a valid proposal, provided that the peculiarities of a structural problem—such as high complexity, conflictuality and a polycentric character—are taken into account. With that caveat, there is potential to achieve satisfactory results without involving the Judiciary, which is already overloaded with demands, thereby fostering speed, dialogue and effective access to justice.

5 CONDUCT ADJUSTMENT AGREEMENT (TAC)

In addition to recommendations, there is the Conduct Adjustment Agreement (TAC), another instrument capable of resolving disputes extrajudicially through the execution of agreements aimed at solving a problem, which may even be structural. This instrument is set forth in paragraph 6 of article 5 of Law No. 7,347/1985, the Public Civil Action Act (BRAZIL, 1985). There is also CNMP Resolution No. 179/2017 (BRAZIL, 2017c), which regulates the taking of the conduct adjustment commitment.

It is a technique intended to seek the extrajudicial solution of conflicts and may be pursued not only by the Public Prosecution Service, but also by other public bodies. The document has the nature of an extrajudicial enforceable title and requires the party responsible for any damage to restore the improper situation, under penalty of incurring the sanctions also set forth in the agreement.

Because it is a juridical transaction, the TAC must include the requirements for its validity: the parties must have capacity, their intentions must be free, and there may be no defects of consent. In addition, the form is free and the object must be lawful. Finally, once all obligations contained in the conduct adjustment commitment have been fulfilled, within the deadline, under the conditions fixed and in the manner provided, they are deemed extinguished and the matter is archived (Public Civil Action Act, art. 9) (BRAZIL, 1985).

It is an excellent tool to enable consensuality in structural disputes, materializing a meaningful commitment among all groups and subgroups so that each of those involved can perceive the structural problem from the perspective of the other, as taught by Matheus

Casimiro Gomes Serafim (2021, p. 108). Resolving structural disputes through consensus formalized by the execution of terms of commitment is almost always convenient, beneficial, and advantageous for everyone involved.

However, Vitorelli (2025, p. 159) warns that, in Brazil, what is lacking is not the so-called "culture of agreement," as is often said. What is really lacking is a procedural environment in which resolving disputes by agreement is more advantageous. "This analysis is valid for any type of agreement, in any type of proceeding. But it is even more valid when one considers an agreement in a structural dispute."

It is important to clarify that this unfavorable context for agreement results from several factors. Nevertheless, in most cases, there is little incentive for the conclusion of agreements. Public and private institutions have many sectors, which entails complex bureaucratic decision-making methods (Vitorelli, 2025, p. 161).

Moreover, managers of these entities are pushed to make short-term decisions, leaving to their successors the problems whose consequences are more severe; thus, there is a preference for always postponing the solution of complex problems.

It should be added that, in order to create incentives for the making of structural agreements and for their implementation to achieve effective results, it is necessary to verify the need for such agreements to have a certain degree of flexibility both in identifying the problems and in setting the solutions.

Thus, it follows that, for a structural TAC to be effective and to promote changes in which the solution to a complex (structural) problem can be envisaged, it is necessary to implement several measures. This is because structural disputes are characterized by the impossibility of determining a single solution capable of reaching the ideal state of affairs, given the already discussed polycentric nature of these structural conflicts.

6 CONSULTATIONS

Antonio do Passo Cabral (2025) emphasizes that the exercise of the judicial function is not exhausted in the issuance of imperative commands. Within a multifaceted reality marked by polycentric conflicts, the need for legal certainty is heightened. In this sense, the consultative action of the Judiciary is not only convenient, but indispensable.

Dissociating legal knowledge from authoritarian imposition expands the repertoire of remedial techniques without violating the principle of non-exclusion of judicial review. Although the response issued does not impose a specific performance, it has binding force as a product of the interpretation (*res interpretata*). Its primary function is preventive. By clarifying normative doubts before the dispute erupts, the Judiciary provides legal certainty,

avoids contradictory decisions, and reduces the social costs associated with excessive judicialization.

It should be added that, even in the absence of an enforceable decision, the consultative procedure must ensure adversarial participation, publicity, and the possibility of participation by potential interested parties. Such guarantees preserve the democratic dimension of jurisdiction.

One therefore perceives the convenience of using this tool in structural proceedings. In complex disputes, scholarship refers to dialogue (consensus) and decision (relief/control) as vectors for solving the problem. In addition, consultation may represent a third vector that cannot be neglected. Specific interpretive doubts that are obstructing a consensual solution may potentially be resolved through consultations. Once the specific divergence is overcome, dialogue about the remaining issues can be resumed with good prospects of success.

There is no reason to speak of constitutional or legal incompatibility of consultative judicial action. Article 5, XXXV, of the Constitution does not prevent the Judiciary from exercising consultative functions; on the contrary, it reinforces the duty to provide adequate protection. Cabral (2025) demonstrates this reasoning by pointing to positive examples of consultations within the National Council of Justice and Electoral Justice. Moreover, the duty to enhance legal certainty by responding to consultations is common to public authorities, including judges, under article 30 of the Introductory Law to the Rules of Brazilian Law (LINDB).

7 ADMINISTRATIVE PROCEEDING

There is also the possibility of initiating administrative proceedings (PA) that may take on a structural bias. This instrument is regulated by CNMP Resolution No. 174/2017 (BRAZIL, 2017b). Under this regulation, it is a tool intended to "monitor compliance with the clauses of a conduct adjustment agreement; monitor and oversee, on an ongoing basis, public policies or institutions; ascertain facts that give rise to the protection of non-waivable individual interests; and support other activities not subject to a civil inquiry."

Accordingly, it follows that the PA is excellent for the proper monitoring of institutions, policies, programs, and structural measures. It is a more flexible instrument compared to the civil inquiry, since its aim is not strictly to investigate a possible unlawful situation, but rather, as seen above, to assist and monitor the implementation of measures.

To be effective, the administrative proceeding cannot have as its sole purpose the ascertainment of facts to support the filing of a lawsuit. In a scenario where a structural

problem is present, there is no single specific fact to be ascertained for the problem to be solved. It is necessary to understand the fact and all the related situations affected by it, and then devise a plan to solve the structural problem.

Thus, it is appropriate to expand the role of the proceeding so that solutions to structural problems can be reached. Such resolution will only be implemented if the proceeding serves as a conciliatory tool, encouraging dialogue and possessing the capacity to influence the various sectors involved in the structural dispute.

8 FINAL CONSIDERATIONS

The analysis confirms that the Public Prosecution Service's structural extrajudicial action emerges as a preferable alternative to the judicialization of complex collective claims. The instruments assessed are capable of virtuously transforming states of nonconformity, either through consensus or by inducing administrative changes based on recommendations. It was also found that civil inquiries and administrative proceedings function as dialogical spaces, allowing state and social actors to build shared diagnoses and define feasible implementation timetables.

Nevertheless, the effectiveness of these mechanisms remains conditioned on three central variables: (a) procedural legitimacy, ensured by transparency and social participation; (b) technical capacity, expressed in the adoption of impact-analysis methodologies, performance indicators, and real-time monitoring; and (c) accountability and the possibility of review in cases of noncompliance or abuse of power.

In this sense, it is recommended: (a) the issuance of a national regulation unifying minimum parameters for negotiating and supervising TACs; (b) the creation of permanent units for consensual methods within each branch of the Public Prosecution Service, staffed with facilitators trained in the resolution of complex conflicts; (c) investment in digital governance, particularly in platforms for managing civil inquiries and dashboards for TAC compliance, to ensure public access to information and increase reputational pressure for performance; (d) the holding of public hearings or social listening sessions prior to signing agreements with major social impact; (e) the inclusion, in recruitment examinations for entry into the career, of content related to consensuality and the theory of structural litigation.

From the perspective of institutional culture, the success of extrajudicial action requires a different way of thinking about the exercise of the institutional mission of the Public Prosecution Service, moving from a predominantly litigious logic to a facilitator-prosecutor stance, capable of articulating collaborative networks and mediating heterogeneous interests. This shift requires continuing education in negotiation and behavioral economics.

Therefore, structural extrajudicial action, if supported by transparent procedures, internal capacity-building, and monitoring mechanisms, has the potential to reduce litigation, optimize public resources, and promote lasting and gradual structural transformations, reinforcing the centrality of the Public Prosecution Service in the promotion of fundamental rights and in the consolidation of the Democratic Rule of Law.

Frederico Cordeiro Martins¹

ABSTRACT

The increasing complexity of contemporary problems has revealed structural limitations of disciplinary hyper-specialization, particularly in sociotechnical, regulatory, and educational contexts. In this scenario, the concept of nexialism, originally derived from science fiction, has been sporadically appropriated by academic literature as a metaphor and heuristic for knowledge integration. This article aims to systematically map the scientific literature that employs the terms nexialism and nexialist, critically analyze their conceptual uses, and propose a theoretical-operational model that enables empirical application. A qualitative systematic literature review was conducted following PRISMA-inspired guidelines, using recognized scientific databases. Results indicate that nexialism does not constitute a consolidated theoretical field but emerges as an interdisciplinary construct associated with knowledge integration, mediation among specialists, systems thinking, and the management of unintended consequences. Based on thematic synthesis, a conceptual model with five latent dimensions and an initial measurement framework is proposed. The study concludes that nexialism holds significant analytical potential for addressing complex problems, although systematic empirical validation remains necessary.

Keywords: Nexialism. Interdisciplinarity. Systems Thinking. Complexity. Systematic Literature Review.

RESUMO

A crescente complexidade dos problemas contemporâneos tem evidenciado os limites do paradigma da hiperespecialização disciplinar, sobretudo em contextos sociotécnicos, regulatórios e educacionais. Nesse cenário, o conceito de nexialismo, originalmente oriundo da ficção científica, passou a ser apropriado pontualmente pela literatura acadêmica como metáfora e heurística para integração do conhecimento. O presente artigo tem por objetivo

¹ Dr. in Information Systems and Knowledge Management. Universidade do Estado de Minas Gerais (UEMG). E-mail: frederico.cordeiro.martins@gmail.com Orcid: <https://orcid.org/0000-0002-2602-249X> Lattes: <http://lattes.cnpq.br/0016923349977820>

mapear sistematicamente a produção científica que emprega os termos “nexialismo” e “nexialista”, analisar criticamente seus usos conceituais e propor um modelo teórico-operacional que permita sua aplicação empírica. Metodologicamente, realizou-se uma revisão sistemática de literatura qualitativa, inspirada no protocolo PRISMA, em bases científicas reconhecidas. Os resultados indicam que o nexialismo não constitui um campo teórico consolidado, mas emerge como constructo interdisciplinar associado à integração de saberes, mediação entre especialistas, pensamento sistêmico e gestão de consequências não intencionais. A partir da síntese temática, propõe-se um modelo conceitual com cinco dimensões latentes e um instrumento inicial de mensuração. Conclui-se que o nexialismo apresenta elevado potencial analítico para o enfrentamento de problemas complexos, carecendo, contudo, de validação empírica sistemática.

RESUMEN

La creciente complejidad de los problemas contemporáneos ha puesto en evidencia las limitaciones estructurales de la hiperespecialización disciplinaria, especialmente en contextos sociotécnicos, regulatorios y educativos. En este escenario, el concepto de nexialismo, originalmente derivado de la literatura de ciencia ficción, ha sido apropiado de manera puntual por la literatura académica como una metáfora y una heurística para la integración del conocimiento. El presente artículo tiene como objetivo mapear sistemáticamente la producción científica que emplea los términos nexialismo y nexialista, analizar críticamente sus usos conceptuales y proponer un modelo teórico-operacional que permita su aplicación empírica. Metodológicamente, se llevó a cabo una revisión sistemática de la literatura de carácter cualitativo, inspirada en las directrices del protocolo PRISMA, utilizando bases científicas reconocidas. Los resultados indican que el nexialismo no constituye un campo teórico consolidado, sino que emerge como un constructo interdisciplinario asociado a la integración de saberes, la mediación entre especialistas, el pensamiento sistémico y la gestión de consecuencias no intencionadas. A partir de la síntesis temática, se propone un modelo conceptual con cinco dimensiones latentes y un marco inicial de medición. Se concluye que el nexialismo presenta un elevado potencial analítico para el abordaje de problemas complejos, aunque aún requiere validación empírica sistemática.

Palabras clave: Nexialismo. Interdisciplinariedad. Pensamiento Sistémico. Complejidad. Revisión Sistemática de la Literatura.

1 INTRODUCTION

The contemporary organization of science is marked by a structural paradox: disciplinary specialization, although responsible for significant technical advances, has produced a cognitive fragmentation that makes it difficult to understand complex and interdependent phenomena (MORIN, 2011). Problems such as technological governance, regulation of digital systems, complex public policies, and educational transformation resist monodisciplinary approaches.

In this context, different theoretical proposals emerge with the objective of recomposing the unity of knowledge, including interdisciplinarity, transdisciplinarity and systemic thinking (JAPIASSU, 1976; CAPRA; LUISI, 2014). In an incipient way, the concept of nexialism also emerges, associated with the ability to integrate diverse knowledge in an orderly and functional way.

Although the term originates in science fiction literature, it is now mobilized in academic texts, especially in the areas of Information Technology and higher education, as a metaphor for dealing with complex interdependencies and unintended consequences of technical and normative decisions (LAPLANTE, 2010; VOAS et al., 2011). However, the use of the concept remains dispersed and lacking in scientific systematization.

In addition, it is observed that the growing complexity of decision-making systems has imposed not only operational but also epistemological challenges to scientific research. The production of knowledge begins to face difficulties in capturing phenomena that do not present themselves in a stable, delimited or repeatable way. In this context, emerging concepts tend to emerge even before their complete theoretical formalization, functioning as provisional attempts to name practices and experiences still in the process of consolidation.

Science, when dealing with this type of phenomenon, is faced with a recurring dilemma: ignore emerging concepts due to lack of immediate empirical ballast or incorporate them uncritically, at the risk of inflating the conceptual field. This article positions itself between these two extremes, assuming that the investigation of concepts still in formation can be legitimate, as long as it is conducted with methodological rigor and clarity as to its limitations.

In this sense, nexialism is understood here not as a definitive answer to the challenges of complexity, but as an indication of a contemporary demand for less fragmented forms of thought and decision. Its recurrence in professional and strategic discourses suggests that there is a gap between the available theoretical models and the practical demands faced by decision-makers in interdependent environments.

The introduction of this concept into the academic debate allows, therefore, to problematize not only the object itself, but also the criteria by which science decides what deserves or does not deserve investigation. By treating nexialism as an exploratory construct, the article contributes to a broader reflection on the limits and possibilities of scientific production in contexts marked by uncertainty, fluidity, and continuous transformation.

Finally, it is important to highlight that the methodological choice adopted in this study reflects this concern. By privileging a qualitative and analytical approach, the article seeks to offer conceptual density and argumentative clarity, avoiding both descriptive superficiality and the pretense of premature generalization.

In view of this, this article seeks to answer the following research question: how has the concept of nexialism been employed in the scientific literature and to what extent can it be systematized as an operationalized interdisciplinary construct?

2 METHODOLOGY

This is a systematic literature review (RSL) of a qualitative nature, with narrative synthesis, inspired by the guidelines of the PRISMA protocol, suitable for emerging fields with low empirical density (GALVÃO; RICARTE, 2019).

The searches were conducted exclusively in recognized scientific databases, including Google Scholar, IEEE Computer Society journals, indexed university repositories, and DOI registries. The following strings were used: *nexialism*, *nexialist*, *nexialism* and *nexialist*.

Peer-reviewed articles, institutionally curated academic texts, and qualified gray literature were included, as long as they presented a definition, application, or substantive conceptual discussion of the term. Non-scientific content was excluded.

The selected texts were analyzed by thematic synthesis, with open and axial coding, allowing the identification of recurrent conceptual patterns (BARDIN, 2016).

3 RESULTS

3.1 OVERVIEW OF LITERATURE

The review revealed a small body of scientific publications that explicitly use the terms nexialism or nexialist. These publications concentrate, above all, on essayistic texts in the areas of Information Technology, higher education and interdisciplinary studies (LAPLANTE, 2010; VOAS et al., 2011; LOVE, 2008).

No quantitative empirical studies or validated instruments for measuring the construct were identified, which evidences the emerging character of the theme.

3.2 FRAMEWORK OF CONSTRUCTS ASSOCIATED WITH NEXIALISM

The thematic analysis allowed the identification of six central constructs, summarized in Table 1, which organizes the main findings of the review.

Table 1

Constructs associated with nexialism in the scientific literature

Construct	Synthetic Description	Key References
Orderly integration of knowledge	Ability to articulate knowledge from different domains in a coherent and functional way	TOOHEY, n.d.; LOVE, 2008
Interdisciplinary mediation and translation	Acting as a cognitive and communicational bridge between specialists	TOOHEY, n.d.; VOAS et al., 2011
Systems thinking	Analysis of interdependencies, feedbacks and second-order effects	LAPLANTE, 2010
Anticipation of unintended consequences	Identification and mitigation of side effects of technical or regulatory decisions	LAPLANTE, 2010
Critique of hyperspecialization	Diagnosis of disciplinary fragmentation as an obstacle to the solution of complex problems	VOAS et al., 2011
Absence of formal criteria	Lack of metrics, training or scientific validation of nexialism	TOOHEY, n.d.

4 DISCUSSION

The results indicate that nexialism is not configured as a consolidated scientific theory, but as an emerging interdisciplinary construct, used predominantly as an analytical metaphor. Its use converges to an explicit critique of hyperspecialization and to the defense of integrative approaches, especially in contexts marked by high complexity and systemic risk (LAPLANTE, 2010).

Unlike classical interdisciplinarity, nexialism emphasizes the figure of the cognitive mediator, capable of integrating knowledge and anticipating unintended consequences, approaching applied systemic thinking (CAPRA; LUISI, 2014). However, the absence of formal criteria for training and measurement limits its consolidation as a scientific object.

The discussion of nexialism also sheds light on an aspect that is often underexplored in the literature on complexity: the role of intermediary agents in decision-making processes. While most studies focus on structures, systems, or policies, nexialism draws attention to subjects who operate at the intersection of fields, areas, and interests, performing functions that escape traditional descriptions of institutional positions or roles.

These actors do not necessarily have formal authority or superior technical expertise in all the fields involved. Its relevance stems from its ability to articulate perspectives, identify inconsistencies, and anticipate collateral effects of fragmented decisions. This performance, although empirically observable, remains little theorized, which reinforces the potential of nexialism as a provisional analytical category.

Another relevant point concerns the temporal dimension of decisions. The reviewed literature tends to emphasize immediate results or measurable short-term impacts, while nexialism explicitly introduces concern with deferred and cumulative effects. This temporal expansion brings the concept closer to debates on sustainability, governance, and intergenerational responsibility, even though nexialism does not present itself as a normative theory in these fields.

From a critical point of view, it is necessary to recognize that the semantic breadth of nexialism constitutes both its strength and its fragility. If, on the one hand, this breadth allows for dialogue with different theoretical traditions, on the other hand, it requires additional delimitation efforts to avoid excessive overlap with already consolidated concepts. This tension reinforces the need for empirical studies that explore specific contexts of application of the concept.

Finally, the discussion suggests that nexialism can play a relevant role as an articulating concept, capable of connecting dispersed debates on complexity, interdisciplinarity, decision-making, and ethics. Although this articulation does not constitute a new theory, it contributes to the construction of a vocabulary that is more sensitive to the contemporary demands of cognitive integration and systemic responsibility.

5 PROPOSAL FOR A CONCEPTUAL MODEL (NEX-MODEL)

Based on the synthesis of the results, the NEX-Model is proposed, structured in five latent dimensions:

5.1 COGNITIVE INTEGRATION

Cognitive integration is perhaps the most silent competence of the Nexialist—and, at the same time, the most decisive. It does not manifest itself as a strong opinion or as an ostensible technical mastery. It appears as a persistent restlessness in the face of isolated information. The Nexialist is suspicious of data that does not talk to each other. For him, knowing is not accumulating content, but organizing relationships.

While many professionals deal with information as loose parts, the Nexialist works with maps. He tries to understand how decisions, facts, and narratives fit into a bigger picture.

This ability is not born of scattered curiosity, but of an internal discipline: the refusal to accept explanations that do not hold up when seen together.

To integrate cognitively is also to recognize limits. The Nexialist knows that no field explains everything. Therefore, he is not satisfied with answers that solve a local problem and create invisible ones. Their attention is always focused on what is outside the main focus, on the margins of the dominant reasoning.

This competence requires time, listening, and willingness to review assumptions. In a world that values speed and immediate completions, cognitive integration is almost an act of resistance. It protects the system from hasty decisions and creates the conditions for more coherent choices, even when they are not the easiest.

5.2 STRATEGIC MEDIATION

Strategic mediation is born from the perception that many contemporary conflicts are not of interest, but of language. Competent people disagree not because they want opposite things, but because they operate from different references. The Nexialist perceives this mismatch before it turns into rupture.

Measuring does not mean reconciling superficially. The Nexialist does not seek artificial consensus or empty harmony. Their job is to make explicit hidden assumptions, to translate jargon, to reveal what is being assumed without being said. It creates space for different perspectives to recognize each other without canceling each other out.

This competence requires political sensitivity and intellectual clarity. The Nexialist knows that all translation involves loss and gain. Still, he takes this risk because he understands that the absence of mediation produces noise, rework, and incoherent decisions. Where there is misunderstanding, it introduces shared meaning.

Strategic mediation transforms the Nexialist into a point of stability in tense contexts. Not because it neutralizes conflicts, but because it makes them productive. It helps the system to extract learning from divergences instead of being paralyzed by them.

5.3 SYSTEMS THINKING IN ACTION

Nexialist's systems thinking is neither theoretical nor abstract. It manifests itself at the moment of decision, when the question "does it work?" is immediately followed by another: "what does it change in the system?". The Nexialist thinks in terms of chained effects, not just immediate results.

He knows that complex systems respond in a nonlinear way. Small changes can generate big impacts, while large interventions can produce minimal effects. Therefore, the

Nexialist is suspicious of grandiose solutions and pays attention to the invisible interdependencies that sustain the functioning of the whole.

Acting systemically requires accepting that there is no total control. The Nexialist works with probabilities, scenarios and provisional hypotheses. It does not seek to eliminate uncertainty, but to make it habitable. This posture reduces destructive surprises and expands the system's ability to adapt.

This competence differentiates the Nexialist from those who only "perform well". It is not limited to meeting defined objectives; He questions whether these goals make sense in light of global functioning. Its value lies in avoiding technically elegant and systemically fragile solutions.

5.4 AWARENESS OF THE CONSEQUENCES

Awareness of the consequences is an ethical competence before being technical. The Nexialist knows that every decision produces effects that go beyond declared intentions. He learned—often by observing the faults of others—that the greatest damage does not come at the moment of choice, but after the choice seems to have worked.

Therefore, he is not satisfied with short-term analyses. Question about secondary impacts, residual risks, side effects, and decision-induced behavior changes. His gaze extends in time and space, even though he knows that it will never be complete.

This posture does not paralyze him. On the contrary, it makes your decisions more accountable. The Nexialist prefers conscious risks to invisible risks. He understands that deciding without considering consequences is not neutrality — it is negligence.

In organizational and social contexts, this competence becomes increasingly valuable. It protects the system against decisions that seem efficient on paper, but that erode trust, sustainability, or legitimacy over time.

5.5 ANTI-SILO STANCE

The anti-silo stance is not a technique, but a constant choice. The Nexialist resists the natural tendency of organizations to fragment into autonomous and defensive territories. He realizes that silos don't arise only by structure, but by fear, identity, and power.

Being anti-silo doesn't mean rejecting specializations or ignoring functional boundaries. It means preventing these borders from becoming walls. The Nexialist traverses areas, connects people, and exposes interdependencies that many would prefer to ignore.

This posture often generates discomfort. The Nexialist questions decisions that "are not in his area", points out impacts that were not in the initial scope and insists on difficult

conversations. He accepts this cost because he knows that silence costs more in the long run.

The anti-silo stance underpins all other competencies. Without it, cognitive integration is fragmented, mediation is weakened, systemic thinking loses reach, and awareness of the consequences is limited. It is this that keeps the Nexialist faithful to his central function: to take care of the whole when everyone takes care of only the part.

The model assumes that such dimensions positively impact the quality of solutions, risk reduction, and interdisciplinary performance in complex environments.

6 FINAL CONSIDERATIONS

Nexialism presents itself as a promising concept to face the epistemological limits of contemporary disciplinary fragmentation. Although it still lacks empirical validation, its conceptual systematization allows us to advance in the construction of a scientific construct applicable to educational, technological and legal contexts.

The reflections developed throughout this article indicate that the study of emerging concepts, such as nexialism, requires a methodological posture marked by caution and openness. Caution not to attribute undue theoretical status to categories still in formation;

openness to recognize that science also advances through the problematization of practices and discourses that precede its conceptual formalization.

In this sense, nexialism can be understood as a symptom of broader transformations in the ways of thinking and deciding in complex contexts. Its emergence reveals a growing dissatisfaction with overly fragmented approaches and points to the need for analytical models capable of dealing with interdependencies, uncertainties, and non-linear consequences.

From an epistemological point of view, the article suggests that the investigation of such concepts requires flexible methodologies, capable of articulating theoretical review, conceptual analysis and qualitative empirical observation. Future studies may explore nexialism through field research, organizational case analysis, or interviews with agents who perform systemic mediation functions.

In addition, there is room to critically examine the limits of the concept, identifying contexts in which cognitive and decision-making integration can generate new types of tension or overload. Recognizing these limits is essential to avoid idealized readings and preserve the analytical utility of nexialism.

In summary, by maintaining a critical and reflective stance, this article contributes to the broadening of the debate on how science can approach complex phenomena that are still poorly stabilized. Nexialism, as an exploratory construct, offers a fruitful starting point for future investigations, without pretense of conceptual closure or theoretical universalization.

As a future agenda, the psychometric validation of the proposed model is recommended, as well as its empirical application in interdisciplinary environments.

ABSTRACT

This article analyzes how biometric data and biometric systems are regulated in Brazil's Bill of Law No. 2,338/2023 (the proposed Brazilian AI framework) in light of the standards set by Regulation (EU) 2024/1689 (the AI Act). It starts from the premise that biometrics, although classified as sensitive personal data under the LGPD, has expanded rapidly in Brazil across public and private settings, notably through state identification infrastructures and facial recognition deployments in publicly accessible spaces. Such uses have fueled controversy due to error rates, bias, and discriminatory impacts. Using a qualitative, documentary approach, the study outlines core operational concepts (biometric identification, verification/authentication, remote biometric identification, emotion recognition, and biometric categorization), summarizes the AI Act's risk-based architecture (prohibited practices, high-risk requirements, and safeguards for real-time remote biometric identification), and then examines the bill's main biometric provisions. The comparison shows a shared regulatory backbone: a general ban on real-time remote biometric identification in publicly accessible spaces with narrowly defined exceptions, coupled with stronger governance, transparency, and impact-assessment duties for high-risk uses. At the same time, the article identifies gaps and improvement paths for the Brazilian bill inspired by the AI Act, including: more granular procedural safeguards and independent oversight for exceptions; audit trails and clear deletion duties; an explicit prohibition on building or expanding facial databases through untargeted scraping; a clearer framework for 'post' remote biometric identification (ex post searches); and more specific limits on biometric categorization and emotion recognition in asymmetric environments such as workplaces and educational institutions. The article concludes that the EU framework offers actionable parameters to strengthen fundamental-rights protection and accountability in biometric AI deployments in Brazil.

RESUMO

O artigo examina o tratamento jurídico dos dados e sistemas biométricos no Projeto de Lei nº 2.338/2023 (marco brasileiro de inteligência artificial) à luz dos parâmetros do Regulamento (UE) 2024/1689 (AI Act). Parte-se da constatação de que a biometria, embora enquadrada como dado pessoal sensível pela LGPD, vem sendo amplamente utilizada no Brasil em serviços públicos e privados, especialmente em infraestrutura estatal de identificação (por exemplo, bancos civis e sistemas como AFIS/ABIS) e em aplicações de reconhecimento facial em espaços públicos, cenário que tem gerado controvérsias por erros, vieses e impactos discriminatórios. A pesquisa, de caráter qualitativo e documental, descreve conceitos operacionais (identificação biométrica, verificação/autenticação, identificação biométrica remota, reconhecimento de emoções e categorização biométrica), apresenta as principais escolhas regulatórias do AI Act (regulação por risco, práticas proibidas, requisitos para sistemas de alto risco e salvaguardas para identificação biométrica remota em tempo real) e, em seguida, analisa o PL 2338/2023, com foco na vedação, como regra, da identificação biométrica à distância em tempo real em espaços acessíveis ao público, nas hipóteses de exceção e nas obrigações de governança, transparência e avaliação de impacto algorítmico para usos no setor público. O cotejo revela convergência estrutural entre os modelos (proibição com exceções tipificadas e regime reforçado para alto risco), mas também aponta lacunas e oportunidades de aprimoramento no projeto brasileiro: detalhamento de salvaguardas e supervisão externa para exceções, trilhas de auditoria e deveres claros de descarte; proibição expressa de formação/expansão de bases faciais por raspagem não direcionada; disciplina mais densa para identificação biométrica remota “posterior” (ex post); e limites específicos para categorização biométrica e para reconhecimento de emoções em contextos assimétricos, como trabalho e educação. Conclui-se que os parâmetros europeus oferecem referências concretas para fortalecer a proteção de direitos fundamentais e a responsabilização no uso de biometria mediado por IA no Brasil.

Palavras-chave: Dados Biométricos. Identificação Biométrica Remota. Reconhecimento Facial. PL 2338/2023. AI Act. Regulação por Risco.

RESUMEN

El artículo analiza el tratamiento normativo de los datos y sistemas biométricos en el Proyecto de Ley nº 2.338/2023 (marco brasileño de inteligencia artificial) a partir de los parámetros del Reglamento (UE) 2024/1689 (AI Act). Se parte de que la biometría, aunque es dato personal sensible en la LGPD, se ha expandido en Brasil en ámbitos públicos y privados, en especial en infraestructuras estatales de identificación y en el reconocimiento facial en espacios de acceso público, con controversias por errores, sesgos e impactos discriminatorios. Con metodología cualitativa y documental, el estudio delimita conceptos operativos (identificación biométrica, verificación/autenticación, identificación biométrica remota, reconocimiento de emociones y categorización biométrica), sintetiza el enfoque de regulación por riesgo del AI Act (prácticas prohibidas, obligaciones para sistemas de alto riesgo y salvaguardas para la identificación remota en tiempo real) y contrasta esas categorías con la disciplina propuesta en el PL 2.338/2023. La comparación muestra convergencias: prohibición general de la identificación biométrica remota en tiempo real en espacios accesibles al público con excepciones tipificadas y deberes reforzados de gobernanza y transparencia. Asimismo, identifica mejoras posibles inspiradas en el AI Act: mayor detalle de salvaguardas y supervisión independiente para las excepciones (trazabilidad y deberes de eliminación), prohibición expresa del raspado no dirigido para crear o ampliar bases faciales, tratamiento claro de la identificación remota “posterior” (ex post) y límites específicos para categorización biométrica y reconocimiento de emociones en contextos asimétricos como trabajo y educación.

Palabras clave: Datos Biométricos. Identificación Biométrica Remota. Reconocimiento Facial. PL 2338/2023. Ley de IA. Regulación por Riesgo.

1 INTRODUCTION

The expansion of the use of biometric data and biometric systems in Brazil appears in institutional registries and in the literature as a phenomenon associated with the identification and verification of identity in public and private contexts, with applications in public security, access control to services, and digital transactions.

This dynamic inserts biometrics into technical arrangements that depend on the automated collection, storage, and comparison of physical, physiological, or behavioral characteristics, which expands the role of data infrastructures and decision-making mechanisms based on computational models.

In the Brazilian legal field, biometric data appear as sensitive personal data in the General Data Protection Law (LGPD), which conditions its processing to specific legal hypotheses and duties to observe principles such as purpose, necessity, and transparency.

However, in this context there are public controversies about the use of biometric surveillance and with records of errors, biases and social contestation, especially in facial recognition applications in public spaces and in private practices of exposing images of suspects.

Recently, the European Union approved Regulation (EU) 2024/1689, known as the AI Act, which structures a risk-based regulation regime for artificial intelligence systems and includes specific discipline for biometric uses, with prohibitions, operational categories, and procedural requirements, especially for real-time remote biometric identification in publicly accessible spaces.

In Brazil, the discussion on an artificial intelligence framework was consolidated in Bill No. 2338/2023 (PL 2338), which proposes a risk classification regime, governance duties, and instruments such as algorithmic impact assessment, in addition to bringing operational definitions of biometric identification and biometric authentication and specific discipline for remote biometric identification in real time in spaces accessible to the public, with a prohibition rule and exception hypotheses.

This article analyzes the normative treatment of biometrics in PL No. 2338/2023 based on the parameters of the AI Act, focusing on remote biometric identification, authentication, emotion recognition, and other biometric uses that involve surveillance, categorization, and decision-making mediated by AI systems. The investigation adopts a qualitative and documentary approach, with a comparative examination of provisions of the PL and the AI Act, in addition to reading institutional materials and literature used to contextualize uses and controversy.

Based on this approach, the text seeks to identify regulatory convergences and gaps in the discipline of biometrics, with special attention to procedural safeguards, transparency duties, and accountability mechanisms associated with the use of biometric systems in public and private contexts.

The structure of the article starts from a conceptual contextualization of biometrics and biometric systems and their uses in Brazil, including national normative parameters and recent controversies, and then describes the central elements of the AI Act on biometrics. Next, it examines PL No. 2338/2023 with a focus on its biometric provisions and compares the regimes, to formulate a synthesis of the convergences and normative perspectives that emerge from the comparison between the two regulatory matrices and, then, demonstrate the perspectives of the AI Act for Brazilian law.

2 BIOMETRICS AND ARTIFICIAL INTELLIGENCE

In the context of human identification, biometrics can be understood as a set of techniques that establish a person's identity based on physical and behavioral attributes, using statistical, biological and technological methods and based on the capture of personal data.

Biometric data, in turn, are personal data resulting from specific technical processing related to physical, physiological or behavioral characteristics, capable of allowing or confirming the unique identification of the holder, with examples such as facial images and dactyloscopic data, which can serve the authentication, identification or classification of people, with use by both companies and governments (Silva, 2023).

In this sense, part of the literature differentiates biometrics as a technical field and biometric data as the product of a technical processing on a characteristic, which brings the debate on data governance closer, as the body trait starts to circulate as information that can be operationalized by machines and third parties (Silva, 2023).

The definitions adopted by Brazil (2019) are also highlighted. Decree 10,046/2019 differentiates biographical data — those related to facts of the person's life, such as civil or social name, date of birth, parentage, place of birth, nationality, sex, marital status, family group, address, and employment relationships —, and biometric data, measurable biological and behavioral characteristics, collectible for automated recognition, such as palm of the hand, fingerprints, retina or iris, face shape, voice and way of walking.

According to Violato et. al (2013), biometric systems operate from these characteristics for automated recognition. They usually use sensors to capture the characteristic, produce a biometric model and store it in a database, which enables future comparisons to identify or

verify individuals in concrete situations. Biometric recognition systems tend to include a training stage with real samples, in which the quality and representativeness of the training base are associated with the performance of the system in the target population.

This area has recently been increased with Artificial Intelligence, thus enabling the extension and efficiency of these systems. Facial recognition, for example, is an application of artificial intelligence that uses biometric collection based on facial features. This process occurs by measuring points on the face and extracting biometric data that enables verification and authentication, with the transformation of these measurements into numerical representation and frequent storage for future comparisons (Baccarin, 2023).

As Silva (2023) points out, capture usually occurs by digital cameras integrated with software with artificial intelligence algorithms that analyze the image, measure characteristics, and produce a stored biometric model for feedback to the system, which can occur in real time and on an expanded scale according to the technical arrangement implemented.

Thus, in terms of result, there is a description that facial recognition operates by similarity and by probability judgment, which means that the output of the system does not correspond to the right answer, but to the most likely match within the compared set, with the occurrence of false negatives and false positives influenced by factors such as background and lighting.

The use of facial recognition can also be articulated with profiling practices, with the creation of digital profiles based on information collected and with the possibility of categorization by attributes, which expands the circulation of biometric data beyond the initial act of authentication (Doneda, 2006 apud Silva, 2023).

2.1 BRAZILIAN NORMATIVE PARAMETERS ON THE USE OF BIOMETRICS

In Brazil, biometric data are part of the category of sensitive personal data, which subjects its processing to specific requirements and its own legal hypotheses (ANPD, 2025). The ANPD notes that the LGPD did not define biometric data, and that part of the doctrine uses the description of the GDPR, in which biometric data results from technical treatment related to physical, physiological, or behavioral characteristics that allow or confirm unique identification.

The processing of biometric data, while sensitive, must be based on the hypotheses of article 11 of the LGPD, with the provision of specific and detached consent, or databases without consent linked to delimited purposes, such as legal obligation, public policies, studies, exercise of rights, protection of life, protection of health and prevention of fraud and security

of the holder in identification and authentication processes in electronic systems (Baccarin, 2023).

In the same section, there is a record that sensitive data cannot be processed based on legitimate interest or credit protection, which restricts alternatives frequently used for non-sensitive data.

In private and public delegated applications, part of the literature emphasizes subparagraph "g" of article 11, which admits the treatment for fraud prevention and security of the holder in processes of identification and authentication of registration in electronic systems, with express exception regarding the prevalence of fundamental rights and freedoms of the holder and with requirements for information on purposes and storage time (Silva, 2023).

The operationalization of these legal bases is articulated with the principles of the LGPD, with emphasis on purpose, necessity, and transparency, including in the evaluation of less intrusive alternatives and in the documentation of processing processes in biometric systems (Baccarin, 2023). There is also reference to duties of transparency and the linking of processing to the purpose informed to the data subject, with the prohibition of subsequent incompatible uses, in addition to the enunciation of the data subject's rights such as confirmation of processing, access, correction and requests related to anonymization, blocking or deletion as the case may be (Brasil, 2018).

The LGPD provides for information security duties throughout the processing cycle, including after the end, and admits the requirement of an impact report on the protection of personal data, including sensitive, with a description of the data collected, methodology, and risk mitigation measures. This point appears as a governance parameter for operations that depend on biometric bases and automated comparison systems, given the potential impact resulting from errors and uses incompatible with the declared purpose (ANPD, 2025).

Within the scope of the federal public administration, the aforementioned Decree 10,046/2019 establishes rules and guidelines for data sharing between agencies and entities, establishes the Citizen's Base Registry, and defines biographic and biometric attributes, with biometrics understood as measurable biological and behavioral characteristics that can be collected for automated recognition (Brasil, 2019). The decree also delimits its scope by indicating that its rules do not apply to sharing with the private sector, which maintains the LGPD as a central axis for business operations and for specific cooperation outside the arrangement.

In the Citizen's Base Registry, there is a prohibition on the use of the registry or its cross-referencing with other databases for processing aimed at mapping or exploring

individual or collective behaviors without express, prior and specific consent, and without transparency of motivation and purpose.

In addition, the ANPD notes that, in addition to the provisions of arts. 5 and 11 of the LGPD, can address biometrics by guiding documents and by regulation, with guidelines on concepts, legitimate contexts, legal hypotheses, observance of principles and protection measures adopted by processing agents (ANPD, 2025). Also, even when the processing occurs under legal exceptions associated with public security, national defense or criminal prosecution, data protection principles and rights must be observed.

2.2 THE PROMINENT USES OF BIOMETRIC DATA AND SYSTEMS IN BRAZIL

Biometrics, in the context of information technologies, aims to identify and map individuals, justified by security in access to goods and services and internal and border public security, in conjunction with the expansion of bases and uses in the public and private sectors (Corrêa and Loureiro, 2023).

In Brazil, for example, there is an institutional record of expansion of the processing of biometric data. This set of uses is related to state infrastructures for biometric identification and verification (ANPD, 2025), mainly in the areas of public security and criminal prosecution.

It should be noted that the constitution of biometric banks by public agencies stems from normative requirements associated with the issuance of identity documents, passports, access to public service platforms and the issuance or renewal of voter registration, situations in which the identification of the applicant includes the collection of biometric data. This data, especially fingerprints, remains stored after the service is delivered, with the possibility of later verification according to the context of collection, which characterizes the formation of civil biometric banks in the public sector (Lima et al., 2022).

Thus, it is worth mentioning, for example, the signing of cooperation agreements to allow access, by judicial police bodies, to civil biometric databases as a standard for criminal identification processes, in a scenario in which the lack of specific legislation on the production of expert evidence based on biometric standards of civil origin is pointed out (Lima et al., 2022)

In this infrastructure, the Automated Fingerprint Identification System, known as AFIS, uses fingerprints to identify individuals and seeks to prevent duplication of identification or multiple identifications assigned to the same person. The Federal Police's Manual for the Identification of Disaster Victims even recommends the use of the system and indicates, as an initial measure for obtaining ante-mortem data, the insertion of decadactylar forms for

automated confrontations with questioned papilloscopic material (Federal Police, 2011 apud Souza et al., 2023).

There is also the adoption of multimodal systems, such as the Automated Biometric Identification System, known as ABIS, which admits facial recognition, palm prints, and fingerprints, with the presentation of classification by score as a measure of the level of coincidence between the sample and stored patterns (Souza et al., 2023). The Secretariat of Social Defense of Pernambuco acquired the system in 2019, and the database has been fed by new issuances of identity cards and the gradual digitization of physical medical records (BGSDS, 2019 apud Souza et al., 2023).

More recently, the Smart Sampa Program, an initiative under the responsibility of the Municipal Secretariat of Urban Security of São Paulo, is expected to install 20 thousand cameras in the city, guided by territorial criteria associated with crime rates, and with the use of algorithms that generate alerts for intrusion, vandalism and theft, in addition to identification of license plates of stolen or stolen vehicles and facial recognition aimed at locating missing persons and fugitives from the justice (São Paulo City Hall, 2025).

In the program's institutional transparency report, facial recognition appears associated with the identification of wanted and fugitives from justice and the location of missing persons, indicating that the program does not structure its own database and does not store personal data, except for images linked to an identifier referring to wanted, fugitive or missing, and with a description that access to information contained in the BNMP occurs when there is facial compatibility greater than 90 percent.

In the private sector, biometrics appears mainly as an authentication and identification technique in everyday activities, with partial displacement from traditional methods such as passwords and cards to credentials based on the holder's biological characteristics (Canuto, 2022). This movement is also associated with the logic of security in access to goods and services in the market and the diffusion of biometric identification technologies in connection with information technologies (Correa and Loureiro, 2023).

According to Canuto (2022), the biometric data used by companies can derive from various modalities, such as signature, fingerprints, and face, as well as iris, retina, voice, hand geometry, and other techniques, which expands the debate beyond facial recognition. In terms of applications, there is mention of scenarios such as logical and physical access control and fraud detection, with the use of characteristics such as face, fingerprint and voice, among others.

In the private sector, the centrality of biometric databases also intensifies discussions about the security and legality of their use, as the compromise of this data is associated with

the irrevocability of the holder's characteristics, which differentiates the scenario from incidents involving passwords and justifies the adoption of specific protection techniques, such as cancelable biometrics and encryption.

2.3 CONTROVERSIES AND RISKS ASSOCIATED WITH THE USE OF BIOMETRICS

There is no unanimity regarding the public interest in the use of these systems, both in the public and private spheres. For example, the Take My Face Out of Your Sights Campaign mobilizes civil society in Brazil to press for a total ban on digital facial recognition in public security, through direct dialogue with security forces and parliamentarians, dissemination of open letters, and public education actions on the harms associated with facial recognition, with mention of the risk of perpetuating racism (EPIC, 2024).

Likewise, there are records of movements by civil organizations that demand regulation of facial recognition and, in some cases, defend a partial or complete ban, with an indication of support from entities such as LAPIN, Article 19, Data Privacy Brasil, InternetLab, and Idec for the Take My Face Out of Your Sights campaign (Baccarin, 2023).

In the public justification of these initiatives, examples associated with false alerts and approaches derived from facial recognition systems, with the allegation of selective incidence on black people, are presented. Among the cases cited, there is an episode from April 2025 in which an 80-year-old man was mistaken for a person wanted by the Justice and remained detained for 10 hours after an alert attributed to Smart Sampa cameras in a basic health unit, in addition to reports of a woman in Sergipe confused twice in 2024 and a public servant approached and taken to the police station in Rio de Janeiro due to an error of the system (Coalition Rights on the Network, 2025).

At the same time, the recent case involving Havan S.A., a retail chain, illustrates the associated risks. In 2024, the company started to publish, on social networks, videos under the name "samples of the month", with the exposure of images of people identified as perpetrators of thefts in stores, accompanied by a business justification of inhibition of the practice through public exposure (Gercina, 2024).

The monitoring system used artificial intelligence which, according to a public statement attributed to the company's management, allows identifying people when entering or leaving the store and relating the facial record to the moment of theft, which indicates the use of automated identification techniques from images captured in the establishment.

In May 2025, the ANPD received a notification from the Public Prosecutor's Office of the State of Santa Catarina with a request for an analysis of the compatibility of the practice with the LGPD, a fact that included the conduct in the authority's inspection procedure. After

a preliminary analysis, the General Coordination of Inspection determined, at the end of June 2025, a preventive measure to temporarily suspend the dissemination of videos on social networks during the investigation, with an express indication of grounds in the LGPD, especially articles 6, 7, 11, 14 and 55-J, and with the identification of risk associated with the possible exposure of images of children and adolescents without precautions required by law (ANPD, 2025).

In view of this scenario, which is certainly repeated with its own particularities in other countries, it is necessary to build a specific normative framework to deal with the processing of biometric data by Artificial Intelligence.

3 AI ACT AND THE USE OF BIOMETRICS

Regulation (EU) 2024/1689 arises in a context in which AI systems circulate between Member States and can be deployed in various sectors, with the risk of regulatory fragmentation when national standards diverge and reduce the legal certainty of economic agents that develop, import or use these systems (European Parliament and Council, 2024).

Within this framework, the regulation links its justification to improving the functioning of the internal market, through a uniform legal framework for the development, placing on the market, putting into service and use of AI systems in the Union, preserving the free movement of AI-based goods and services and preventing national restrictions not provided for in the act itself.

As for its purpose, the preamble spells out the promotion of human-centred adoption of AI that is compatible with Union values, while providing for the protection of health, safety and fundamental rights provided for in the Charter, including democracy, the rule of law and environmental protection, as well as measures to support innovation.

Article 1 establishes a set of normative axes that includes harmonised rules for the placing on the market, entry into service and use of AI systems, prohibitions on certain practices, specific requirements and obligations for high-risk systems and their operators, transparency rules for certain systems, discipline for general-purpose AI models, in addition to rules for monitoring, inspection, governance and measures to support innovation with a focus on small and medium-sized companies and startups.

The regulation is intended for a chain of agents. Article 2 includes providers³ who place on the market or put into service AI systems and providers of general-purpose AI models,

³ In Regulation (EU) 2024/1689, an ombudsman is a natural or legal person, public authority, agency or other body that develops a general-purpose AI-system or AI-model, or that has that system or model developed and places it on the market or puts it into service under its own name or brand, with or without payment (European Parliament and Council, 2024).

even when established outside the Union, as well as deployers established in the Union, importers and distributors, manufacturers who place an AI system on the market under their name or brand, authorized representatives of providers not established in the Union, and affected persons located in the Union, when the exit from the system is used in European territory. The text excludes from its scope areas beyond the reach of Union law and declares that it does not affect competences of the Member States in matters of national security, in addition to excluding its application to AI systems used exclusively for military, defense or national security purposes.

The regulatory architecture operates by risk classification and proportional obligations, with reference in the literature to four categories, prohibited, high risk, limited risk, and minimal risk, which organizes the incidence of prohibitions, requirements, and duties throughout the life cycle of systems and models (Arantes Júnior, 2025). This structure coexists with the rule that the regulation acts in a complementary way to other branches of Union law, including data protection, consumer protection, fundamental rights, employment, and product safety, without excluding rights and means of protection provided for in these regimes.

Regulation (EU) 2024/1689 adopts definitions of biometrics in line with the vocabulary of Regulation (EU) 2016/679, by treating biometric data as personal data resulting from specific technical processing relating to physical, physiological or behavioural characteristics of the natural person, such as facial images and dactyloscopic data (European Parliament and Council, 2024). In the General Protection Data Regulation (GDPR), this notion includes the requirement to allow or confirm the unique identification of the person, also with mention of facial images and dactyloscopic data (European Parliament and Council, 2016).

This conceptual coordination is important because the GDPR classifies as a special category the processing of biometric data for the purposes of unique identification and establishes, as a rule, the prohibition of such processing, except in the cases provided for in Article 9 itself. The AI Act incorporates this logic by establishing that, outside the specific scope of use for criminal prosecution purposes in publicly accessible spaces, biometric processing remains subject to the requirements of the GDPR, and for non-public safety purposes, Article 9 of the GDPR operates as a prohibition rule with limited exceptions.

The AI Act operates through a risk-based regulatory dynamic, with differentiation of obligations according to the category of the system, a logic also described in the literature as a structure that segments prohibited, high-risk, and minimal- or low-risk systems (Monteiro, 2026).

Thus, when it comes to biometrics, the regulation defines operational categories to delimit obligations and prohibitions. Biometric *identification* refers to automated recognition to establish identity by comparison with a reference base, while biometric *verification* designates one-to-one verification, including authentication.

The text also differentiates *remote biometric identification*, which identifies people without active participation, typically at a distance, by comparison with the reference base, and explains the *real-time* modality when capture, comparison and identification occur instantaneously, or almost.

Emotion recognition system is defined as a system that infers emotions or intentions from biometric data, and *biometric categorisation system* as a system that assigns categories based on biometrics, except for the hypothesis of an accessory function and necessary for objective technical reasons.

Article 5 of the AI Act lists prohibited practices, with a direct impact on biometrics. These include the creation or expansion of facial recognition bases by non-targeted scraping of facial images on the internet or in CCTV.⁴

The regulation also prohibits categorization systems that, based on biometric data, deduce or infer race, political opinions, union membership, religious or philosophical beliefs, sex life, or sexual orientation, with delimited caveats for labeling or filtering of lawfully acquired biometric data sets and for categorizations in the context of public security.

As for the use of real-time remote biometric identification in publicly accessible spaces for public safety purposes, the AI Act establishes a prohibition with typified and conditioned exceptions. That is, the text admits the use only when strictly necessary for the targeted search of specific victims and missing persons, prevention of substantial and imminent threat to life or physical safety or terrorist threat, or location and identification of suspects for serious crimes defined by reference to the annex and maximum penalty threshold.

For the implementation of these exceptions, the regulation provides for safeguards, with the requirement of an impact assessment on fundamental rights and registration of the system, with an exception admitted for urgency for registration, without ruling out its subsequent conclusion.

The AI Act associates biometrics with high-risk cases, with normative justification linked to discriminatory effects and biases, especially in remote biometric identification, which is why it should be treated according to this particularity. For high-risk systems, the regulation

⁴ CCTV is the acronym for *closed circuit television*, in Portuguese "closed circuit television". It refers to camera systems that capture and transmit images to a restricted set of monitors, recorders, or monitoring centers, rather than transmitting publicly. In urban and private contexts, CCTV usually designates video surveillance networks used for security, access control and occurrence registration.

imposes a risk management system throughout the life cycle, defined as a continuous and iterative process with identification of known and foreseeable risks, assessment of risks under normal use and foreseeable misuse, and adoption of targeted mitigation measures.

The text also establishes a duty of testing to identify risk management measures, with execution before placing on the market or putting into service, with probabilistic metrics and thresholds compatible with the intended purpose.

In the data dimension, it is required that training, validation and testing sets be subjected to governance and management practices appropriate to the purpose, covering data origin and original purpose, preparation operations such as labeling and cleaning, formulation of assumptions, and examination of biases with the potential to affect fundamental rights or lead to discrimination prohibited in Union law, with measures to detect, prevent and mitigate.

Similarly, at the organizational level, the regulation requires providers of high-risk systems to maintain a quality management system with documented policies and procedures, including compliance strategies, testing and validation procedures, and data management systems.

These requirements are directly related to the impact on fundamental rights. For this reason, it also provides for the assessment of these impacts prior to the use of the biometric system, and must contain a description of the process in which the system will be used, period and frequency of use, potentially affected categories, risks of damage and human supervision measures, among other elements. This obligation is an *ex ante* requirement for high-risk systems in the European Union, with the possibility of updating when information becomes obsolete (Monteiro, 2026).

4 ANALYSIS OF PL 2338/2023 FROM THE PERSPECTIVE OF THE USE OF BIOMETRICS

The current normative discussion on artificial intelligence in Brazil takes place in a scenario in which there are already rules that touch on automated systems, such as the General Data Protection Law and the Digital Government Law, without there being, so far, a specific and comprehensive normative framework aimed exclusively at the regulation of AI. In this context, the topic became part of the legislative agenda under the argument of the need to keep up with technological advances and to face risks related to privacy, security, transparency, and the protection of fundamental rights, with the convergence of the debate in PL 2,338/2023 (Arantes Júnior, 2025).

The project is presented as a proposal for a legal framework to regulate the use, implementation, and development of AI systems in the country, with mechanisms associated

with impact assessments and governance structures articulated with the protection of personal data (Monteiro, 2026).

In the same sense, the project adopts a logic of regulation by risk, with the definition of categories and the imposition of denser obligations for systems classified as high risk, including impact assessment provisions, transparency mechanisms, and the possibility of auditing and supervision by competent authorities (Arantes Júnior, 2025).

The processing of PL 2,338/2023 is connected to previous initiatives that sought to discipline the use of AI systems in Brazil, with emphasis on PL 21/2020, which proposed principles, rights, and duties, and which was declared impaired in December 2024 due to the subsequent processing of more comprehensive proposals in the Senate. In addition, other related projects were joined or considered impaired, under the justification of avoiding regulatory overlap and concentrating the debate around a single regulatory framework.

In this context, PL 2.338/2023, authored by Senator Rodrigo Pacheco, was approved by the Federal Senate and sent to the Chamber of Deputies in March 2025. PL 2,338/2023 organizes obligations based on a risk classification model and provides that systems considered to be high risk, after preliminary assessment, are subject to algorithmic impact assessment, defined as a continuous iterative process throughout the life cycle, with periodic updates whose periodicity depends on regulation by the competent authority, in addition to being expected to be carried out by professionals with functional independence and technical knowledge, scientific and legal aspects.

In the doctrinal characterization, this engineering seeks to anticipate potential damages associated with the operation of the systems, with a record of known and foreseeable risks and adverse consequences, in parallel with mechanisms aimed at transparency and accountability (Monteiro, 2026).

4.1 ORGANIZATION OF THE BILL AND PROVISIONS ON BIOMETRICS

The text approved in the Chamber introduces operational definitions to differentiate biometric identification and biometric authentication. Biometric identification appears as a method that involves the recognition of human physical, physiological, and behavioral characteristics for the purpose of identifying an individual, while biometric authentication is associated with the process of verifying or confirming identity by comparing biometric characteristics with a previously stored model (Brasil, 2023). Thus, it creates a conceptual basis to separate uses aimed at attributing identity to an open set of people, in the case of identification, from uses aimed at confirming a previously declared identity, in the case of authentication.

In the risk classification regime, the Bill provides for specific prohibitions related to biometrics in spaces accessible to the public. Article 13, item IV, prohibits the development, implementation, and use of real-time remote biometric identification systems in spaces accessible to the public, admitting exceptions linked to delimited hypotheses, such as investigation instruction or criminal proceedings upon prior and motivated judicial authorization and other contexts listed in the provision (Brasil, 2023).

In addition to the prohibitions, the Bill classifies certain biometric uses as high risk. Among the hypotheses listed, there is the use of biometric identification and authentication systems for the recognition of emotions, with the exception of biometric authentication systems whose sole purpose is the confirmation of a specific natural person. This normative option delimits a cut in which the risk does not arise only from the use of biometrics, but from the inferential objective associated with the system, in this case, inferences about affective states (Brasil, 2023).

In the scope of governance and procedural obligations, the Bill deals directly with biometric systems for identification purposes in the public sector. Article 23, paragraph 1, establishes that the use of biometric systems for identification purposes must comply with the principles and governance measures of the law and must be preceded by an algorithmic impact assessment, with observance of guarantees for the exercise of the rights of affected people or groups and protection against direct, indirect, illegal or abusive discrimination.

Thus, paragraph 2 provides that, if there is no substantive elimination or mitigation of the identified risks, the use will be discontinued

In the Chamber of Deputies, a controversy arises around facial recognition technologies in public spaces, especially when associated with public security and criminal prosecution. A document from civil society organizations registers opposition to the proposal attributed to rapporteur Aguinaldo Ribeiro to loosen rules on the use of facial recognition in public spaces and mentions a statement in which the text approved by the senators was described as too restrictive (Coalition Rights on the Network, 2025).

In the same document, it is pointed out that the wording of the Bill classifies facial recognition technologies as of excessive risk, but with a broad list of exceptions that encompasses current uses in the context of public security and criminal prosecution, with reference to article 13, item VII, and with criticism of a scenario in which exceptions would be outside the proposed governance structure

4.2 CONVERGENCES AND NEW PERSPECTIVES BETWEEN PL 2338/2023 AND THE EUROPEAN UNION'S AI ACT

Both normative texts adopt a logic of escalation by risk, with a set of prohibitions for uses considered incompatible with rights and freedoms and a regime of reinforced obligations for uses classified as high risk. In the AI Act, article 5 brings together prohibited practices, including for reasons associated with surveillance and impacts on fundamental rights, and establishes delimited exceptions for remote biometric identification in real time in publicly accessible spaces for law enforcement purposes, linked to specific objectives and a cut of crimes referred to in the annex (European Union, 2024).

In PL 2338/2023, article 13 prohibits, as a rule, the use of biometric identification systems at a distance in real time in spaces accessible to the public, with exceptions associated with criminal investigation and prosecution, search for victims and missing persons, serious and imminent threat, flagrante delicto, and compliance with warrants, under requirements such as prior judicial authorization and judicial control when applicable (Brasil, 2023).

There is also convergence in the provision of governance measures and documentation for high-risk uses. The Bill requires, in the public sector, access and use protocols with registration of who used the system, the right to human explanation and review, and publication of preliminary assessments, in addition to imposing algorithmic impact assessment for the use of biometrics for the purpose of identification and discontinuity of use when there is no substantive elimination or mitigation of risks.

In the AI Act, the high-risk discipline connects to evaluation, registration and supervision mechanisms, including requirements that relate registration on a European basis and synthesis of impact assessment on fundamental rights in certain registration and reporting contexts.

Finally, in this context, the main comparative implication for Brazil, with an exclusive focus on biometrics, lies less in the reaffirmation of the core already provided for in article 13, item IV, and more in the possibility of expanding the discipline to other biometric uses with potential for identification and surveillance.

5 FINAL CONSIDERATIONS

As seen, Bill No. 2338/2023 already incorporates direct discipline for biometric identification at a distance in real time in spaces accessible to the public, by prohibiting the development, implementation, and use of this practice, with delimited exceptions, such as instruction of an investigation or criminal proceeding upon prior and motivated judicial

authorization, search for victims and missing persons, serious and imminent threat, flagrante delicto, and recapture and compliance with warrants, in addition to requiring proportionality and strict necessity, judicial control, and review of algorithmic inference by a public agent, with reference to the principles and rights of the law itself and, where applicable, of the LGPD (Brasil, 2023).

The AI Act structures a similar solution by treating real-time remote biometric identification in publicly accessible spaces for the purposes of law enforcement activities, with a regime that starts from prohibition and admits use only when strictly necessary for exhaustive purposes, such as targeted search for specific victims and missing persons, prevention of specific threat, substantial and imminent to life or physical safety or terrorist threat, and locating or identifying a suspect for investigation, prosecution or criminal prosecution of offences referred to in the Annex and punishable by a maximum sentence of at least four years, with a requirement that the use confirm the identity of the individual specifically targeted (European Union, 2024)

Thus, from these perspectives, it is understood that a conceptual evolution is possible by incorporating operational definitions that the AI Act presents for biometric data, biometric identification, biometric verification, remote biometric identification system, real-time remote biometric identification, and subsequent remote biometric identification, including the element of absence of active involvement of the holder and the criterion of significant delay in distinguishing between real-time and later.

Still on remote biometric identification, the AI Act explains institutional safeguards that can guide Brazilian design for uses admitted in exception, such as the requirement of an impact assessment on fundamental rights, registration of the system on its own basis, prior authorization by an independent judicial or administrative authority with a binding decision, the possibility of starting without authorization only in urgency with a request within 24 hours, and the duty to interrupt use and discard and eliminate data and results when authorization is denied, in addition to prohibiting decisions with adverse legal effect based exclusively on leaving the system.

The Bill, in turn, provides that the use of biometric systems for identification purposes observes governance principles and measures and is preceded by algorithmic impact assessment, with guarantees for the exercise of rights and protection against discrimination, and determines discontinuity of use when there is no substantive elimination or mitigation of risks, in addition to establishing protocols for access and registration of use in the public sector, the right to human explanation and review and the publication of preliminary assessments.

In this comparison, one possibility of improvement guided by the AI Act consists of detailing, for remote biometric uses in exception, procedural and supervisory obligations external to the user entity, with systematic registration and audit trail, authorization criteria, and duties of disposal and elimination associated with the denial or termination of the measure.

The AI Act also brings a prohibition that does not appear in an equivalent way in the Bill when prohibiting systems that create or expand facial recognition bases by non-targeted collection of facial images on the internet or in CCTV images, which closes the door to the formation of biometric banks from massive extraction without a defined target. Based on this parameter, the Bill may incorporate a specific clause to prevent the creation and expansion of facial biometric databases by non-targeted scraping, with wording that covers both open sources and video surveillance images, in a manner compatible with the LGPD and the sensitive data protection regime.

Another difference focuses on emotion recognition systems. The Bill classifies as high risk biometric identification and authentication systems intended for the recognition of emotions, except for authentication whose sole purpose is the confirmation of a specific natural person, which triggers general obligations of the high-risk and governance regime. The AI Act, on the other hand, prohibits systems intended to infer emotions in the workplace and educational institutions, except when the use is intended for medical or security reasons, and also defines an emotion recognition system as one that identifies or infers emotions or intentions based on biometric data.

Based on this, the elaboration of the Bill can consider a contextual prohibition for the recognition of emotions at work and education, or, if it maintains the option for high risk, it can delimit strict hypotheses and specific purposes, with additional requirements of justification, human supervision and transparency to the affected due to the asymmetry in these environments.

There is also a biometric vector that the AI Act expressly treats and that the Bill does not yet describe with equal density, the biometric categorization. The AI Act prohibits biometric categorization systems that, based on biometric data, deduce or infer race, political opinions, union membership, religious or philosophical beliefs, sex life, or sexual orientation, while defining biometric categorization system as one that assigns natural persons to specific categories based on their biometric data, with the exception of ancillary and technically necessary cases.

This parameter offers Brazil an additional path, with a prohibition rule directed to sensitive inferences from biometrics, which will serve to reduce ambiguities when biometric

systems do not intend to identify by name, but operate by classification and inference, including in private and service environments.

The distinction between real-time and post-time remote biometric identification also yields comparative implications. The literature that examines the European proposal pointed out questions about the separation between real and later time and about the line between biometric categorization and biometric identification, indicating that the distinction can generate classificatory arbitrariness (Madiega; Mildebrath, 2021 apud Baccarin, 2023).

The AI Act, in addition to defining the subsequent system as the remote one that is not in real time, registers the need for safeguards for subsequent uses and removes the possibility of indiscriminate surveillance and circumventing the strict conditions of real time, by requiring targeted use in terms of individuals, location and time frame, based on a closed set of legally obtained images.

Along these lines, the Bill can explain how it treats subsequent remote biometric identification, either by extending the discipline of article 13 beyond real time, or by its own chapter of safeguards that covers ex post uses in video surveillance and other bases, focusing on the prevention of generalized scans and the delimitation of scope and reference base.

Finally, the AI Act offers a biometric perspective of institutional arrangement of transparency and accountability that can be adapted to Brazil. In the use of real-time remote biometric identification for law enforcement purposes, the regulation provides for notification to supervisory authorities and aggregated annual reports, with publication by the Commission of annual reports on use, without sensitive operational data.

In the Bill, there is provision for the publication of preliminary assessments of high-risk systems in the public sector and the establishment of minimum standards of transparency at the federal level, in addition to protocols for access and registration of use and the right to human explanation and review.

Based on this contrast, it is possible to combine the Brazilian model of administrative evaluation and transparency with a national registry of remote biometric uses and with periodic aggregate reporting obligations, which expands public traceability without exposing sensitive operational information, especially in contexts of security and border control.

Monika Fritz¹

ABSTRACT

This chapter analyzes the role of charisma in contemporary corporate leadership, integrating it with Emotional Intelligence (EI) as a foundation for authentic, ethical, and culturally sustainable influence. In organizational contexts marked by volatility, pressure for results, and competition for talent, charisma is reinterpreted not as a mystical trait, but as a relational, observable, and trainable competency. Methodologically, this is a narrative bibliographic review that articulates the classical Weberian perspective on charismatic domination, behavioral indicators of charismatic leadership (House, 1977), and contemporary approaches to Emotional Intelligence (Salovey & Mayer, 1990; Goleman, 1995) and organizational purpose (Sinek, 2018). A conceptual model is proposed in which Emotional Intelligence (self-awareness, self-regulation, empathy, and social skills) acts as an antecedent of charismatic behaviors (authentic communication, presence, human connection, and inspiring vision), generating positive effects on trust, engagement, psychological safety, and organizational culture. As a practical contribution, structured development actions applicable to managerial contexts are presented, including self-knowledge, active listening, storytelling, constructive feedback, and mentoring and coaching practices. It is concluded that charismatic leadership, when grounded in emotional competence and ethical responsibility, amplifies organizational results and strengthens collective bonds, fostering collaborative, resilient, and purpose-driven environments.

Keywords: Charismatic Leadership. Charisma. Emotional Intelligence. Organizational Culture. Engagement.

RESUMO

Este capítulo analisa o papel do carisma na liderança corporativa contemporânea, integrando-o à Inteligência Emocional (IE) como fundamento para uma influência autêntica,

¹ Master's degree in Technology. Centro Universitário Nelson Akiyoshi (UNINA).

ética e culturalmente sustentável. Em contextos organizacionais marcados por volatilidade, pressão por resultados e competição por talentos, o carisma é reinterpretado não como traço místico, mas como competência relacional, observável e treinável. Metodologicamente, trata-se de revisão bibliográfica narrativa que articula a perspectiva clássica weberiana sobre dominação carismática, indicadores comportamentais de liderança carismática (House, 1977) e abordagens contemporâneas sobre IE (Salovey e Mayer, 1990; Goleman, 1995) e propósito organizacional (Sinek, 2018). Propõe-se um modelo conceitual no qual a IE (autoconsciência, autorregulação, empatia e habilidades sociais) atua como antecedente de comportamentos carismáticos (comunicação autêntica, presença, conexão humana e visão inspiradora), com efeitos positivos sobre confiança, engajamento, segurança psicológica e cultura organizacional. Como contribuição prática, apresentam-se ações estruturadas de desenvolvimento aplicáveis ao contexto gerencial: autoconhecimento, escuta ativa, storytelling, feedback construtivo e práticas de mentoring e coaching. Conclui-se que a liderança carismática, quando ancorada em competência emocional e responsabilidade ética, amplifica resultados organizacionais e fortalece vínculos coletivos, favorecendo ambientes colaborativos, resilientes e orientados a propósito.

Palavras-chave: Liderança Carismática. Carisma. Inteligência Emocional. Cultura Organizacional. Engajamento.

RESUMEN

Este capítulo analiza el papel del carisma en el liderazgo corporativo contemporáneo, integrándolo con la Inteligencia Emocional (IE) como fundamento de una influencia auténtica, ética y culturalmente sostenible. En contextos organizacionales marcados por la volatilidad, la presión por resultados y la competencia por el talento, el carisma se reinterpreta no como un rasgo místico, sino como una competencia relacional, observable y entrenable. Metodológicamente, se trata de una revisión bibliográfica narrativa que articula la perspectiva clásica weberiana sobre la dominación carismática, los indicadores conductuales del liderazgo carismático (House, 1977) y los enfoques contemporáneos sobre la Inteligencia Emocional (Salovey y Mayer, 1990; Goleman, 1995) y el propósito organizacional (Sinek, 2018). Se propone un modelo conceptual en el que la Inteligencia Emocional (autoconciencia, autorregulación, empatía y habilidades sociales) actúa como antecedente de los comportamientos carismáticos (comunicación auténtica, presencia, conexión humana y visión inspiradora), con efectos positivos sobre la confianza, el compromiso, la seguridad psicológica y la cultura organizacional. Como contribución práctica, se presentan acciones estructuradas de desarrollo aplicables al contexto gerencial, tales como el autoconocimiento, la escucha activa, el storytelling, la retroalimentación constructiva y las prácticas de mentoring y coaching. Se concluye que el liderazgo carismático, cuando está anclado en la competencia emocional y la responsabilidad ética, amplifica los resultados organizacionales y fortalece los vínculos colectivos, favoreciendo entornos colaborativos, resilientes y orientados al propósito.

Palabras clave: Liderazgo Carismático. Carisma. Inteligencia Emocional. Cultura Organizacional. Compromiso.

1 INTRODUCTION

The contemporary corporate environment has been marked by intense and simultaneous transformations: accelerated digitalization, reconfiguration of value chains, growth of hybrid work, pressure for productivity, and greater social awareness about mental health and the quality of relationships at work. In this context, organizations face the challenge of sustaining performance without deteriorating the relational fabric that makes execution possible. Thus, leadership comes to be understood not only as a management function, but as the ability to influence meaning, mobilize cooperation and build trust (YUKL, 2013).

Historically, popular discourses have often associated charisma with "personal magnetism" and a supposed natural gift. However, in the academic field, the concept can be treated more rigorously: charisma is a phenomenon of influence that emerges in the interaction between leader and followers and depends on cultural context, group expectations, and perceived credibility. Weber (2000) contributed by positioning charisma as the basis of a form of domination legitimized by the devotion of followers to qualities attributed to the leader. In the current corporate scenario, charisma tends to be reinterpreted as a repertoire of observable skills and behaviors, which can be learned, trained, and applied in a situational way (CUKIER, 2019).

At the same time, organizations have recognized that sustainable influence is not built only with persuasion techniques, but with emotional maturity, empathy, and coherence. At this point, Emotional Intelligence (EI) becomes a relevant explanatory axis: understanding and managing emotions in oneself and in others tends to increase the quality of interactions and reduce relational noise, allowing influence to be perceived as authentic and ethical. Goleman (1995) popularized the theme by systematizing dimensions such as self-awareness, self-regulation, empathy and social skills, while Salovey and Mayer (1990) consolidated a theoretical definition of EI as the mental capacity to perceive, understand and manage emotions.

Given this scenario, this chapter has the following research problem: how does the integration between charisma and Emotional Intelligence contribute to a more effective, ethical, and culturally sustainable leadership in the corporate environment?

The overall objective is to analyze the role of charisma in corporate leadership, integrating Emotional Intelligence as a foundation for the development of an authentic charisma. As specific objectives, it is sought: (a) to discuss the concept of charisma from classical contributions and contemporary readings; (b) present elements and indicators associated with charismatic leadership; (c) relate Emotional Intelligence and charisma,

identifying mechanisms of influence and trust; (d) to propose development practices and actions applicable in the organizational routine; (e) present an integrative model with implications for culture and engagement.

The rationale for this study lies in the fact that, in contexts of change and competition for talent, organizations depend on leaders capable of mobilizing engagement without resorting to excessive control or practices that compromise cultural health. The understanding of charisma as a developable competency, when anchored in EI, provides a conceptual and practical basis for leadership development programs.

Methodologically, this is a qualitative, exploratory study, developed through a narrative literature review. Reference works and texts on charisma and charismatic domination (WEBER, 2000), charisma intelligence (CUKIER, 2019), charismatic leadership in an organizational context (GALVÃO, 2011), indicators associated with charisma (HOUSE, 1977 apud GALVÃO, 2011), as well as literature on EI (SALOVEY; MAYER, 1990; GOLEMAN, 1995) and purpose-driven leadership (SINEK, 2018).

2 THEORETICAL FOUNDATION

2.1 CHARISMA: FROM CHARISMATIC DOMINATION TO THE REPERTOIRE OF COMPETENCIES

Weber (2000) described charisma as an extraordinary quality attributed to the leader, perceived as having exceptional strengths. Charismatic domination, in this sense, is not born only from formal office, but from the social recognition of attributes that generate devotion and legitimation. This perspective is useful for understanding why some leaders wield profound influence even without robust formal authority.

However, in the contemporary corporate environment, the "extraordinary" explanation needs to be operationalized. In organizations, leadership depends on processes, results, ethical legitimacy, and relational consistency. Thus, charisma tends to be reinterpreted as a relational phenomenon: it emerges from the encounter between (a) the leader's behaviors (communication, presence, coherence), (b) the needs and expectations of the followers (security, direction, recognition), and (c) context (crisis, change, organizational culture, team maturity).

This contemporary reading supports the thesis that charisma can be developed. The possibility of development does not eliminate individual differences, but shifts the understanding of charisma from a "fixed talent" to a set of trainable and evaluable skills, particularly in leadership contexts (CUKIER, 2019).

2.2 CHARISMATIC INTELLIGENCE: PERSONAL, SOCIAL AND CONTEXTUAL PILLARS

Cukier (2019) proposes the concept of "charisma intelligence", structuring it in three pillars: personal intelligence (the self), social intelligence (the other) and contextual intelligence (the environment). Personal intelligence involves self-knowledge, self-awareness, and self-management; social involves empathy, communication, and relationship management; and contextual involves sensitive reading of the environment, cultural norms and power dynamics.

This structure is especially relevant in the corporate scenario, in which the same behavior can produce different effects according to the organization's culture and strategic moment. For example, assertive communication can be perceived as security in contexts of ambiguity; However, it may sound like authoritarianism in cultures that value horizontality and participation. Therefore, charisma is not only "what is done", but "how, when and for whom" it is done.

2.3 CHARISMATIC LEADERSHIP: INDICATORS AND MECHANISMS OF INFLUENCE

The literature on charismatic leadership highlights that this style mobilizes intrinsic commitment and bond with the mission, unlike strictly transactional approaches, based on rewards and punishments. Galvão (2011), when discussing the theme, presents contributions that emphasize the charismatic leader as a behavioral model, someone who projects high expectations and demonstrates confidence in the ability of the subordinates (FREITAS, 2006 apud GALVÃO, 2011).

House (1977 apud GALVÃO, 2011) presents six indicators that help measure perceived charisma: (1) confidence in the leader's convictions; (2) similarity of beliefs between leader and followers; (3) affection and acceptance of the leader; (4) spontaneous obedience; (5) emotional involvement with the mission; and (6) the follower's belief in their own contribution. These indicators suggest that charismatic leadership is not just about "being admired," but about producing alignment, safety, commitment, and agency in the follower.

Gomes (2005 apud GALVÃO, 2011) emphasizes the sensitivity to identify needs, resources, problems and aspirations of the group as a central distinction between charismatic and non-charismatic people. Such sensitivity directly brings charisma and EI closer, as it requires emotional perception, social reading, and behavioral adaptation.

2.4 EMOTIONAL INTELLIGENCE: DEFINITION AND DIMENSIONS FOR LEADERSHIP

Salovey and Mayer (1990) defined Emotional Intelligence as the ability to perceive emotions, integrate emotions into thought, understand emotions and regulate them. Goleman (1995) broadened the discussion in the applied field, emphasizing competencies such as self-awareness, self-regulation, empathy and social skills, often associated with the performance of leaders.

In corporate environments, EI is particularly critical for three reasons: (a) leadership occurs in the midst of conflicts of interest and pressure for results; (b) emotions are socially transmissible and impact climate, psychological safety and productivity; (c) the leader's decisions and communication influence the interpretation of justice, respect and belonging (GOLEMAN, 1995).

By relating EI and charisma, it is proposed that EI acts as a "psychological infrastructure" of influence: without self-awareness and self-regulation, communication can lose consistency; Without empathy, the leader may fail to read the team's needs; Without social skills, bonding and trust deteriorate.

2.5 CHARISMA, PURPOSE AND ORGANIZATIONAL CULTURE

In the corporate context, charisma tends to express itself in four main dimensions: authentic and compelling communication, presence and self-confidence, empathy and human connection, and inspiring vision (CUKIER, 2019). These dimensions are directly connected to cultural factors: leaders serve as models of values; its coherence strengthens norms of transparency and respect; Their way of dealing with mistakes defines whether the culture will be one of learning or of punishment.

Sinek (2018) argues that inspirational leaders mobilize people by communicating a clear and meaningful "why" (purpose), rather than just a "what" (goals) and "how" (processes). This contribution is especially useful to the debate on charisma: inspiring vision and storytelling are means of converting strategy into shared meaning.

Edmondson (1999) adds a critical dimension: psychological safety, that is, the belief that the environment is safe to take interpersonal risks, such as asking questions, admitting mistakes, and proposing ideas. In practical terms, ethical charismatic leaders tend to increase psychological safety when they use influence to welcome, guide and recognize, and not to intimidate.

3 INTEGRATIVE MODEL: EMOTIONAL INTELLIGENCE AND CHARISMATIC LEADERSHIP

3.1 FROM THE "CHARISMATIC IMAGE" TO THE AUTHENTIC CHARISM

A decisive difference in the corporate environment is between charisma as "image" and charisma as "relationship". A leader can present strong communication performance and still generate distrust if his conduct is incoherent, if there is emotional manipulation or if the speech does not translate into consistent decisions. In this sense, EI operates as a mechanism of coherence: self-awareness reduces dissonances (promising participation and acting with control); self-regulation reduces reactivity (irony, aggressiveness, defensiveness); empathy broadens the perception of the impact of one's own behavior; Social skills underpin difficult conversations and relationship repair.

Thus, an authentic charism can be understood as an influence sustained by three criteria: (a) ethical intention (oriented to the collective good and to the legitimate organizational purpose), (b) behavioral coherence (speech-action alignment) and (c) emotional competence (ability to manage one's own and others' emotions without abusive instrumentalization).

3.2 PROPOSITION OF THE CONCEPTUAL MODEL

Based on the reviewed literature, an integrative conceptual model structured in four levels is proposed:

Background (individual level): Emotional Intelligence, composed of self-awareness, self-regulation, empathy, and social skills (SALOVEY; MAYER, 1990; GOLEMAN, 1995); and contextual reading, which involves the ability to understand culture, climate, moment, and stakeholders (CUKIER, 2019).

Mechanisms (observable charismatic behaviors): Authentic communication (clarity, active listening, storytelling); presence and self-confidence (posture, emotional stability); human connection (applied empathy, recognition); and inspiring vision (shared purpose) (SINEK, 2018).

Intermediate outcomes (team/culture level): Leader trust and acceptance; alignment of beliefs and voluntary adherence (HOUSE, 1977 apud GALVÃO, 2011); psychological safety and learning climate (EDMONDSON, 1999); engagement and motivation; reduction of turnover; and collaboration and innovation.

Final results (organizational level): Sustaining a positive organizational culture; better strategic execution and capacity for change (KOTTER, 1996); and reputation for leadership with strengthening of the employer brand.

Central to the model is that EI is not just "an additional topic" but a critical antecedent that transforms charisma into reliable influence, reducing the risk of toxic charisma (personalism, manipulation, and overdependence on the leader).

4 DEVELOPMENT OF CHARISMA AND EMOTIONAL INTELLIGENCE IN THE CORPORATE CONTEXT

4.1 SELF-KNOWLEDGE AND SELF-AWARENESS

The development of charisma begins with self-knowledge, because the leader's influence is amplified by the way he reacts, communicates and decides under pressure. Best practices include: (a) decision journaling, to record difficult decisions, emotions perceived, assumptions used, and impacts observed; (b) 360-degree feedback, to map discrepancies between intention and perception; (c) identification of emotional triggers, recognizing situations that generate reactivity (public criticism, delay, team error); and (d) explicitness of values and limits, defining non-negotiable values and behaviors that contradict these values. This stage strengthens authenticity, as it reduces the distance between discourse and practice (GOLEMAN, 1995).

4.2 EMOTIONAL SELF-MANAGEMENT AND PRESENCE

Charismatic presence is not just body posture; it is perceived emotional stability. Leaders with good self-management are able to sustain difficult conversations without escalating conflict, maintain respect even in disagreement, manage anxiety in ambiguous situations, and avoid passive-aggressive communication and microviolence. Applicable techniques include strategic pause before responding, emotional preparation for critical meetings, and recovery routine (sleep, exercise, energy management), as fatigue reduces self-regulation.

4.3 AUTHENTIC COMMUNICATION: ORATORY, CLARITY AND ACTIVE LISTENING

Communication is the core of charisma in the corporate environment, but it is not just about speaking well. Charismatic leadership integrates sending and receiving. In terms of public speaking and message structure, it is recommended: openness with context and purpose ("why it matters"), presentation of three key points (to limit dispersion), use of evidence and practical examples, and invitation to participate (questions and next steps).

As for non-verbal language, the following stand out: balanced eye contact, open posture, rhythm and pauses for emphasis, and tone of voice consistent with the content. Active listening, an often overlooked charismatic competency, involves: open-ended

questions, paraphrasing (confirming understanding), validating emotions without necessarily agreeing, and reducing interruptions and multitasking. Active listening increases the perception of respect and acceptance, dimensions close to House's indicators (1977 apud GALVÃO, 2011).

4.4 STORYTELLING AND INSPIRATIONAL VISION

Sinek (2018) highlights that inspiring leaders start with the "why". In the corporate environment, this means translating goals into meaning and connecting daily work to greater impact. Storytelling, when authentic, fulfills three functions: it gives meaning (why the effort is worth it), it transmits values (what is acceptable and what is not) and it creates memory (stories fix more than isolated data). A simple framework for managerial storytelling includes: real challenge (context), dilemma (tension), decision made (value in action), learning (culture of improvement), and invitation (the team's role in continuity).

4.5 APPLIED EMPATHY AND HUMAN CONNECTION

Empathy, in the corporate environment, is not "always being pleasant"; it is understanding the needs, pressures and aspirations of the other and adjusting the way of leading. Practical applications include: short check-ins in one-on-one meetings (1:1) to understand how the person is doing and what is hindering delivery; specific recognition, praising behavior and impact, not just generic "congratulations"; negotiation of priorities, because empathy does not eliminate demands, but qualifies them; and protection of the team, establishing healthy limits against contradictory demands. Empathy sustained by consistency reinforces acceptance and emotional engagement with the mission.

4.6 CONSTRUCTIVE FEEDBACK, MENTORING AND COACHING

Corporate charisma tends to consolidate when the leader is perceived as someone who promotes growth and justice. Two fronts are decisive: constructive feedback, based on observable facts, with a focus on behavior and impact, co-construction of alternatives and follow-up (feedback without follow-up becomes rhetoric); and mentoring and coaching, with mentoring for repertoire expansion, coaching for goals and responsibility, visibility opportunities and challenging projects, and succession preparation (ethical charisma forms other, non-dependent leaders).

5 MANAGERIAL IMPLICATIONS AND DEVELOPMENT PLAN

To transform the theoretical content into managerial action, a 90-day development plan is suggested, structured in three cycles:

Cycle 1 (Days 1–30): Self-awareness and emotional grounding. Apply 360-degree feedback (or quick interviews with peers and subordinates), identify three emotional triggers and three risk behaviors (e.g., interrupt, mock, respond on impulse), and define two substitute behaviors (e.g., pause, ask, summarize).

Cycle 2 (Days 31–60): Communication and connection. Practice one presentation per week using a "why–what–how" structure, implement biweekly one-on-one (1:1) meetings with subordinates (with an active listening script) and practice storytelling, developing two short narratives per month connected to organizational values.

Cycle 3 (Days 61–90): Culture, influence, and multiplication. Establish a learning ritual with "after-action" of projects (what we learn), implement continuous feedback (two positive reinforcements and one point of improvement per month per subordinate) and start mentoring with one or two talents (development plan and autonomy).

It is also important to recognize risks and limits. Charisma without ethical ballast and emotional competence can generate dependence on the leader (centralization), stimulate personalism and weaken governance, promote manipulative influence (emotional use for control) and reduce decision-making quality if there is a cult of the leader. Integration with EI and ethics acts as a mitigation, by reinforcing self-control, transparency, and accountability.

6 FINAL CONSIDERATIONS

Charisma, in the contemporary corporate environment, must be understood as a developable and contextual competence, and not as a mystical attribute reserved for a few individuals. Charismatic leadership contributes to engagement, trust, and a positive organizational culture when guided by authenticity, coherence, and consistent practice. By articulating classical contributions (WEBER, 2000) with contemporary approaches and behavioral indicators (HOUSE, 1977 apud GALVÃO, 2011), it is observed that the perceived charism is related to alignment, acceptance, voluntary adherence and bond with the mission.

The central contribution of this chapter is to integrate Emotional Intelligence as the foundation for an authentic charism. Self-awareness, self-regulation, empathy and social skills (SALOVEY; MAYER, 1990; GOLEMAN, 1995) underpin the practical dimensions of charisma: compelling communication, presence, human connection, and inspiring vision. In organizational terms, this favors psychological safety, cooperation, learning, and cultural strengthening, with indirect effects on performance and retention.

As limitations, as it is a narrative review, there is no empirical testing of the proposed model. It is recommended, for future studies, the application of field research in organizations (surveys, interviews and case studies) to evaluate relationships between EI, charismatic behaviors and indicators of climate, engagement and results. Longitudinal studies could also examine whether EI and charisma development programs produce sustained effects over time.

Even so, the work offers a theoretical-practical synthesis applicable to leadership development programs, especially in the context of MBA and executive education, by translating theory into structured managerial practices. It is concluded that the "leadership that enchants" does not replace strategy and execution, but enhances them, integrating results and quality of relationships — an increasingly decisive condition for competitiveness, talent retention and organizational well-being.

ABSTRACT

This work presents the use of games as a pedagogical resource to make the teaching of Mathematics more dynamic, attractive, and meaningful, as well as to reduce resistance to the subject. The proposal was developed through a project entitled “Mathematical Challenges: Developing Logical Thinking through Games”, implemented in a 9th-grade class. Several activities were applied that promoted problem-solving, spatial visualization, decision-making, and the development of socio-emotional skills. Grounded in the works of authors such as Vygotsky, Grando, Kishimoto, Borasi, and Freire, the study demonstrates that playfulness, recreational mathematics, and mathematical modeling are effective strategies for bringing content closer to students’ realities, fostering a collaborative and enjoyable learning environment.

Keywords: Playfulness. Mathematical Games. Mathematics Teaching.

RESUMO

Este trabalho apresenta a utilização de jogos como recurso pedagógico para tornar o ensino da Matemática mais dinâmico, atrativo e significativo, como também a redução a resistência à disciplina. A proposta foi desenvolvida através de um projeto intitulado “Desafios Matemáticos: Desenvolvendo o Pensamento Lógico com Jogos”, numa turma de 9º ano. Foram aplicadas diversas atividades que favoreceram a resolução de problemas, a visualização espacial, a tomada de decisões e o desenvolvimento de competências socioemocionais. Fundamentado em autores como Vygotsky, Grando, Kishimoto, Borasi e Freire, o estudo evidencia que a Ludicidade, a Matemática Recreativa e a Modelagem Matemática que são estratégias eficazes para aproximar os conteúdos da realidade dos alunos, promovendo um ambiente de aprendizagem colaborativo e prazeroso.

1 INTRODUCTION

This article addresses the use of games as a pedagogical resource to facilitate the learning of Mathematics in Basic Education. The proposal is based on the idea that play contributes to making the teaching and learning process more attractive and meaningful, stimulating logical reasoning and the active participation of students. The study presented was developed from the results obtained with the elaboration and application of a project linked to PROUPE – University for All Program in Pernambuco –, carried out as an educational counterpart provided by the program. The project was developed at the José Nascimento da Silva Municipal School of Basic Education, located in the municipality of Tavares-PB.

Mathematics, despite being essential for intellectual development and knowledge of the world, is constantly seen by students as an abstract, complex discipline that is very distant from daily reality. This perception influences school development and causes demotivation of students, especially elementary school students.

In view of this, it is necessary to rethink the pedagogical practices adopted, which are often outdated, and seek strategies that make teaching more attractive, effective and accessible. In this article we seek to present didactic tools capable of transforming this reality through pedagogical practices that stimulate logical reasoning, creativity and autonomy of students.

The National Common Curriculum Base (BNCC) advises that:

[...] learning in Mathematics is intrinsically related to comprehension, that is, to the apprehension of meanings of mathematical objects, without leaving aside their applications. [...] Thus, didactic resources such as checkered meshes, abacuses, games, books, videos, calculators, spreadsheets, and dynamic geometry software play an essential role in the understanding and use of mathematical notions (Brasil, 2018, p. 218).

In addition to enabling greater involvement with the discipline, the proposal helps to strengthen essential skills, such as problem solving, critical and argumentative thinking. By integrating playful elements into the teaching and learning process, the teacher provides students with a journey of discovery, reflection and knowledge construction, making Mathematics a useful and significant tool for understanding and interacting with the world.

2 GENERAL OBJECTIVE

Promote the development of students' problem-solving skills, logical thinking and creativity, as well as the understanding of Mathematics as an essential tool through the use

of games and interactive activities, aligned with competencies and skills provided for in the National Common Curricular Base (BNCC), making the teaching and learning process more dynamic, welcoming and participatory.

3 SPECIFIC OBJECTIVES

- Stimulate logical reasoning and problem solving through challenging activities that encourage students to think logically, creatively and strategically in the face of problem-situations;
- Demonstrate the applicability of Mathematics in everyday life, relating the contents studied with real and practical situations, facilitating the understanding and appreciation of the discipline;
- Incorporate playful elements into the teaching of Mathematics using games, games and dynamics that make learning more engaging, arousing the interest and curiosity of students.

4 METHODOLOGY

The methodology adopted in this article was built from the development of a project linked to PROUPE, carried out with a class composed of 10 students from the 9th grade of Elementary School II of the José Nascimento da Silva Municipal School of Basic Education, in the municipality of Tavares-PB. The activities were carried out once a week, over six months, with the aim of making the teaching of Mathematics more dynamic, accessible and meaningful through playful and interactive practices.

The methodological proposal was based on bibliographic research and the analysis of academic articles, in addition to the guidelines of the National Common Curricular Base (BNCC), which reinforce the importance of pedagogical practices that stimulate logical reasoning, creativity and student protagonism. From this, activities were selected and applied that integrated the content of Mathematics into the daily lives of students, promoting the development of cognitive and socio-emotional skills. Among the activities applied, the following stand out: Mathematical Ludo, Monetary Quiz and Polygon Challenge.

According to Rêgo and Rêgo (2013), when well selected and used appropriately, the game can act as a highly effective pedagogical resource, contributing to the achievement of several educational objectives, including the development of students in the intellectual and emotional aspects.

The administration of the actions followed a schedule that included the survey of the class's curriculum, observation of classes, planning of the pedagogical proposal and

execution of activities in corregency. Four initial observation meetings were held to understand the profile of the class and identify its needs. Then, the other meetings took place on a co-ordination basis, with direct action in the mediation of activities.

The evaluation was carried out in a continuous and formative way, based on direct observations, participation records and self-evaluations of the students, allowing methodological adjustments according to the needs identified throughout the process. The results were systematized in partial reports and a final report and presented at AESET's Academic Week 2025.2, whose theme was "Education, health and society: meeting ancestral knowledge in the present and future that is built". The presentation highlighted the positive impact of the playful approach in the teaching of Mathematics.

The methodology applied proved to be effective in promoting a dynamic, collaborative learning environment aligned with the competencies provided for in the BNCC, contributing to the strengthening of students' cognitive and socio-emotional skills.

5 DEVELOPMENT

The project "Mathematical Challenges: Developing Logical Thinking with Games" was developed with the objective of transforming the teaching of Mathematics into a more dynamic, accessible and meaningful experience for elementary school students. The proposal arose from the need to face the recurring challenges in learning the subject, especially the lack of interest and difficulty in understanding by students.

The proposal is based on the perspective of the playful teaching of Mathematics, where games are used as pedagogical resources capable of stimulating cognitive skills, promoting socialization and awakening the pleasure for Mathematics. In this context, Recreational Mathematics contributes by presenting challenges, curiosities and riddles that make learning more engaging and creative, while Mathematical Modeling brings the contents closer to the students' reality, allowing everyday situations to be translated into mathematical language and explored in a meaningful way.

Authors such as Vygotsky, Grando and Kishimoto argue that playing is an essential activity for the intellectual and emotional development of students, favoring the construction of knowledge.

During the development of the project, four initial observation meetings were held, aimed at monitoring the classes of the head teacher, with the objective of understanding the profile of the class and identifying its main needs. Based on these observations, the subsequent meetings took place under a correction regime, with direct action in the mediation of the activities.

The pedagogical actions were organized around playful activities that explore mathematical content in a contextualized and interactive way. Among them, the following stand out:

- **Battleship Math:** An original adaptation of the classic game, created especially for this project. The objective was to work on concepts of space and location, multiplication and division operations, in addition to developing the agility of reasoning. The class was divided into two groups, and a draw defined which group started. A player would choose a location on the board (always in letter-number form, such as B7 or E9). Each position could have a mathematical calculation or a bomb. If the calculation was answered correctly within 30 seconds, the group gets 1 point. If they made a mistake or did not answer, the opposing team had a chance to respond and, if they got it right, they earned 2 points. This activity stimulated quick thinking, strategy and teamwork, making learning more engaging and competitive in a healthy way.

To facilitate the application in the classroom, the link for printing the game board is available, allowing the reader to have access to the material:

(https://www.canva.com/design/DAG97m3fa_o/pLRWRh0L5aMe7TYwXYjNww/edit?utm_content=DAG97m3fa_o&utm_campaign=designshare&utm_medium=link2&utm_source=sharebutton)

- **Ludo Mathematician:** Traditional game adapted to work on basic operations and solution strategies, promoting logical reasoning and decision-making. The original rules were kept – such as the advance of the piece according to the number drawn on the die and the objective of getting all the pieces to the base – however, for each move, the student needs to solve mathematical operations correctly to be able to move his piece. And when the calculation is solved incorrectly, the part remains at rest, where it does not advance.

The link for printing the board and the pieces used in the game is available, allowing readers to have access to the material in an organized way and that the activity can be reproduced in different school contexts.

(<https://drive.google.com/drive/folders/1m3-4uituDfeWHVSU6ykO8CdUKmadDv1?usp=sharing>)

- **Monetary Quiz:** The activity aimed to review the Brazilian monetary system through an individual quiz, whose central idea was to perform calculations involving money and commercial or economic situations. The questions were elaborated based on banknotes and coins applied in everyday contexts. This proposal enabled the application of mathematical knowledge in real contexts, favoring the development of

calculation and interpretation skills. To support the realization of the proposal, the link for printing the banknotes and coins used in the quiz is available, ensuring access to the material in an organized way and that the experience can be reproduced in different classes:

(https://www.canva.com/design/DAG97hyqS24/ovXw_k0ZZgX6e2vUbgYTEQ/edit?utm_content=DAG97hyqS24&utm_campaign=designshare&utm_medium=link2&utm_source=sharebutton)

- **Polygon Challenge:** the students used four triangular pieces of the same size, which are part of the tangram, to form geometric figures such as square, rectangle, triangle, parallelogram and trapezoid. The challenge was carried out in pairs, one student against the other, where a geometric shape was presented to be assembled, the student won the game by assembling the figure in less time and using all the pieces on display. This dynamic favored the development of agility, stimulation of spatial visualization, creativity, competition and recognition of geometric properties. To support the realization of the activity, the link for printing the polygons used in the game is available, allowing readers to have access to the pieces in a practical and organized way, ensuring the reproduction of the experience in different pedagogical contexts.

(<https://drive.google.com/drive/folders/15k85ho11cf60jQgVPFO9BLi1WA5sssbg?usp=sharing>)

All the playful activities developed throughout the project were created or adapted exclusively for this pedagogical proposal. The elaboration of each dynamic was based on the objectives of the project and the needs observed in the class, seeking to integrate the mathematical contents into the daily life of the students in a meaningful way. The adaptations and traditional games were strategically designed to stimulate logical reasoning, creativity, autonomy and student engagement. In addition, the activities have a replicable character, and can be applied in other classes of Elementary School II, with adjustments according to the level of learning and the profile of the students, applying their reach and pedagogical impact.

These activities were planned based on the principles of playfulness, which according to Grando (2007), is not limited to the use of manipulable materials, but involves the performance of actions that provide satisfaction and engagement. The BNCC (2018) also reinforces that resources such as educational games are essential for understanding mathematical objects and for developing skills such as critical thinking, problem solving, and argumentation.

The use of games in the teaching of Mathematics, far from being a waste of time, proves to be an effective and transformative pedagogical strategy. The project carried out demonstrated in practice how games can enhance the teaching and learning process.

The idea that games are just moments of distraction or pastime is deconstructed when one observes the positive impact they generate in the school environment. The games stimulate logical reasoning, concentration, creativity and the pleasure of learning Mathematics. In addition, they favor socialization, cooperation, and the development of cognitive and emotional skills.

The teacher, by incorporating games into the teaching process, assumes the role of mediator and advisor of learning. It not only organizes the activities but also creates an environment where students feel challenged and motivated to participate. The mediation of the learner is essential for games to go beyond the dimension of entertainment and become meaningful pedagogical experiences. As Vygotsky (1998) does, "learning awakens several internal developmental processes that can only occur when the individual interacts with other people", evidencing the importance of teacher intervention to increase the social and cognitive development of students.

In addition, the teacher plays a strategic role by selecting and adapting the games according to the learning objectives and the class profile. This pedagogical intentionality ensures that each dynamic is aligned with the curricular content and the needs of the students. In this way, the teacher acts as a protagonist in the construction of an innovative educational space, in which the pleasure of learning is combined with academic rigor, favoring both the intellectual and emotional development of students.

The BNCC and the National Curriculum Parameters (PCN) recognize games as essential didactic resources, as they allow the simulation of problem situations, encourage the development of strategies and promote meaningful learning. Authors such as Vygotsky (1989), Grando (2007) and Kishimoto (2012) reinforce that playing is an essential activity for social and intellectual development, thus creating a development zone where the student learns with more autonomy and engagement.

In addition to promoting the learning of the contents, the work focused on the development of socio-emotional skills and the appreciation of the students' experience as protagonists of the educational process. By experiencing the games in teams, the students were encouraged to make decisions, deal with mistakes, respect the rules and collaborate with their classmates - elements that go beyond Mathematics and collaborate for the integral formation as citizens.

In the teaching-learning process, error should be seen as an integral part of the construction of knowledge. When the teacher values the mistakes of students as opportunities for reflection, he creates an environment in which the student feels safe to take risks, experiment and learn without fear of judgment. This attitude favors autonomy and resilience, as the student begins to realize that making mistakes is a necessary step to achieve more consistent successes. As Borasi (1994) points out, "errors can be seen as starting points for new investigations and discoveries", reinforcing that error is not an obstacle, but a pedagogical resource.

In addition, the role of the teacher is essential in this process, since it is up to him to guide the student in the analysis of his mistakes and propose strategies to overcome them. The teacher acts as a mediator, helping to transform error into meaningful learning, stimulating critical thinking and the ability to revise. This approach helps students develop metacognition skills, learning to evaluate their own practices and seek creative solutions. In this way, the mistake is no longer a sign of disability and is recognized as a fundamental stage in the cognitive and emotional development of students.

Playfulness, in this context, was not treated as mere entertainment, but as a methodological strategy that favors the construction of knowledge. As Grando (2007) argues, the game is an activity that has value in itself, as it provides pleasure in the realization and spontaneous engagement. This perspective was incorporated into the project, which sought to create a light, challenging and meaningful learning environment.

Another differential was the flexibility of the activities developed, all of which have the potential to adapt to different levels of learning and age groups. The use of simple materials, clear rules and contexts close to the students' reality allows the games to be replicated in other classes, expanding their pedagogical reach.

During the meetings, it was observed that the students were motivated, as well as better participation and confidence when dealing with content. The playful approach contributed to reducing resistance to discipline, transforming the classroom environment into a space for dialogue, discovery and collective construction.

Paulo Freire (1996) states:

"Dialogue is the meeting of men, mediated by the world, to pronounce it, and is therefore not limited to the I-thou relationship. It is an act of creation. Dialogue is the encounter in which the reflection and action of its subjects are expressed in solidarity with the world that must be transformed and humanized. This encounter cannot be reduced to an act of depositing ideas from one subject to another, nor can it become a simple exchange of ideas to be consumed by the exchangers. It is an act of transformation and creation. Dialogue is an existential requirement. And if it is the

encounter in which reflection and action are solidarized, it cannot be reduced to an act of pure reflection, nor to an act of pure action, but is action and reflection."

The project reinforces that teaching Mathematics with games is not a waste of time, but an effective way to make the content more attractive, accessible, contextualized and pleasurable. By integrating theory and practice, emotion and logic, playful teaching proves to be a powerful and effective tool for transforming students' reality with Mathematics and with the very act of learning.

In this sense, we also have recreational mathematics that dialogues with playfulness, as it seeks to present mathematical content through challenges, curiosities, riddles and games that arouse the interest of students. Unlike the traditional view, in which Mathematics is perceived as abstract and rigid, Recreational Mathematics aims to transform learning into a pleasurable experience, bringing content closer to reality, stimulating students' creativity.

In this way, the games applied in the project not only fulfilled the function of reviewing or introducing concepts, but also aligned with the spirit of Recreational Mathematics, by proposing challenging situations that required logical reasoning, decision-making and cooperation among the participants. Each activity was planned so that the student learned while having fun, not perceiving Mathematics as an obligation, but as an engaging and meaningful practice.

Recreational Mathematics, when articulated with games, favors the development of skills such as: problem solving, logical reasoning, socialization, cooperation, autonomy and protagonism. This approach demonstrates that Mathematics can be taught in a light and pleasant way, without losing its conceptual depth. By uniting playfulness and Recreational Mathematics, the project demonstrated that it is possible to transform the classroom into an environment of dialogue, discovery and motivation, where learning becomes an engaging and meaningful experience.

Mathematical Modeling is a contemporary trend in Mathematics Education that seeks to bring the studied theme closer to the reality of students. It consists of translating everyday situations into mathematical language, allowing students to build models that represent and explain phenomena, favoring analysis, prediction, and decision-making. In this context, modeling is not limited to the use of ready-made formulas or calculations, but involves the creation of strategies and representations that make learning more meaningful.

In the project, this trend of teaching Mathematics was explicitly present in several activities carried out. The Monetary Quiz, for example, led students to model buying and selling situations, using calculations with banknotes and coins to solve practical problems.

The Polygon Challenge, using tangram, stimulated spatial visualization and the construction of geometric models, favoring the understanding of the properties of the figures.

In the Mathematical Battleship, it is also related to modeling, as it required students to interpret the space of the board, locate coordinates and solve multiplication and division calculations in limited time. This activity promoted the construction of strategic game models, in which students needed to plan their actions and predict possible results.

In this way, Mathematical Modeling, when integrated with playful practices, reinforces the contextualized character of teaching. The students not only solved exercises, but also experienced simulated daily situations, developing skills such as logical and critical reasoning, the ability to abstract, autonomy and interdisciplinarity.

This approach demonstrates that this tendency, combined with playfulness, is not an isolated practice, but a methodological strategy that expands the pedagogical reach of games. By integrating theory and practice, the project demonstrated that it is possible to transform the teaching of Mathematics into something attractive, engaging, effective and easy to understand, as well as into a living tool, capable of dialoguing with the reality of students.

The use of games in the teaching of Mathematics should not be visited as a secondary practice or as mere entertainment, but as a methodological strategy that favors the construction of knowledge. According to Grando (2007), "the game is much more than a simple manipulable material. It corresponds to what we call playful activity." This perspective was incorporated into the project, which sought to create a light, challenging and meaningful learning environment, in which students could learn in a pleasant and engaged way.

Recreational Mathematics was also present in the proposed activities, because, according to Borin (2004, p. 89), "the use of games in Mathematics classes is an important factor that contributes to reducing the blocks presented by many students who fear Mathematics and feel incapable of learning it." By transforming so-called abstract content into practical and fun challenges, the games allowed students to spontaneously engage with the discipline, developing logical reasoning, creativity and autonomy.

Another important aspect was the use of Mathematical Modeling for playful practices. According to Smole, Diniz and Milani (2007), games can be used as problem-solving instruments, because "the possibility of using games is related to learning, to the very construction of mathematical knowledge, therefore, to problem solving". In the project developed, the activities allowed everyday situations to be translated into mathematical language and explored in a meaningful way.

Playfulness, in this context, was not treated as mere entertainment, but as a methodological strategy that favors the construction of knowledge. As Vygotsky (1989, p.

130) points out, "play creates for children a zone of proximal development that is nothing other than the distance between the current level of development [...] and the level of potential development". This view reinforces that games, when applied in the classroom, expand learning possibilities, allowing students to advance in their knowledge with the support of colleagues and teachers.

In addition, the BNCC (2018, p. 218) advises that "didactic resources such as checkered meshes, abacuses, games, books, videos, calculators, electronic spreadsheets, and dynamic geometry software play an essential role in the compression and use of mathematical notions". This guideline legitimizes the use of games as pedagogical tools, recognizing their importance for the development of skills such as critical thinking, problem solving, and argumentation.

During the project meetings, it was observed that the students were more participative, motivated and confident when dealing with the proposed contents. The playful methodology helped to reduce resistance to discipline, transforming the classroom environment into a space for dialogue, discovery and construction. Freire (1996, p. 86) states that "the good teacher is the one who manages, while speaking, to bring the student to the intimacy of the movement of his thought".

In this context, games have become tools that have brought students closer to the discipline, making the teaching and learning process more meaningful and human. The flexibility of the activities carried out reinforces the innovative character of the project, which can serve as an inspiration for future practices in different school contexts.

Therefore, the project reaffirms that teaching Mathematics with games is not a waste of time, but an effective way to make the content more attractive, accessible, contextualized and pleasurable.

6 FINAL CONSIDERATIONS

The development of the project highlighted the potential of innovative pedagogical practices that incorporate games as methodological instruments in the teaching of Mathematics. The experience demonstrated that playfulness, Recreational Mathematics and Mathematical Modeling can be effectively integrated, contributing to a more dynamic, attractive and meaningful teaching and learning process, regardless of the students' learning level.

Despite the advances, it is important to emphasize that the use of games is not yet a widely disseminated pedagogical practice in Brazilian schools. As Batista, Soares, and Bezerra (2023) point out, even with the existence of accessible materials, such as software

and low-cost games, many institutions still do not systematically incorporate playfulness into their pedagogical practices. This reveals the need for greater investment in teacher training and in projects that encourage the use of innovative methodologies.

It is concluded, therefore, that the teaching of Mathematics through games is an effective and necessary strategy to transform the relationship of students with the discipline. The project demonstrated that it is possible to make learning more pleasurable, contextualized and meaningful, contributing to the integral formation of students.

It is hoped that this work will inspire teachers and researchers to reflect on the relevance of games in the teaching of Mathematics, expanding their use in different school contexts. More than an isolated practice, games should be understood as an integral part of school culture, capable of promoting not only the learning of content, but also the development of cognitive, social and emotional skills that are fundamental for life in society.

ABSTRACT

The Middle São Francisco Valley is one of the main hubs of irrigated agriculture in Brazil, where technologies involving biostimulants, plant growth regulators, and microorganisms have been extensively studied with the aim of providing physiological support to crops, mitigating abiotic stresses, and promoting increases in yield and quality. This review aimed to analyze the published literature between 2015 and 2024, on the use of biostimulants, plant growth regulators, and microorganisms in irrigated agriculture in the São Francisco Valley, focusing on master's dissertations from the graduate programs in Irrigated Horticulture (PPGHI – UNEB), Plant Production (PPGPV – UNIVASF), and Agricultural Engineering (PPGEA – UNIVASF). The review was conducted using dissertations available in the universities' databases. For the selection of the works, specific filters were applied in each graduate program, considering the publication period (2015–2024) and the keywords (i) biostimulants, (ii) plant growth regulators, and (iii) microorganisms. Next, the dissertations

were read and classified by year and by program, along with the identification of the topics addressed and the synthesis of the main results, as well as the most studied crops. The PPGHI – UNEB had the highest number of studies involving microorganisms, while the PPGEA and PPGPV programs at UNIVASF produced more research related to biostimulants and plant growth regulators. During the analyzed period, the most studied/researched crops were mango, melon, and grape. All programs in partnership with EMBRAPA company carried out outstanding work on this topic, contributing significantly to the scientific and technological advancement of irrigated agriculture in the region.

RESUMO

O Submédio do Vale do São Francisco constitui um dos principais polos de agricultura irrigada do Brasil, no qual tecnologias baseadas em bioestimulantes, fitorreguladores e microrganismos têm sido amplamente investigadas com o propósito de oferecer suporte fisiológico aos cultivos, mitigar estresses abióticos e promover incrementos na produção e na qualidade. O objetivo deste trabalho foi realizar uma revisão de literatura, referente ao período de 2015 a 2024, sobre o uso de bioestimulantes, fitorreguladores e microrganismos na agricultura irrigada do Vale do São Francisco, com base em dissertações de mestrado dos programas de pós-graduação em Horticultura Irrigada (PPGHI – UNEB), Produção Vegetal (PPGPV – UNIVASF) e Engenharia Agrícola (PPGEA – UNIVASF). A revisão foi conduzida a partir de dissertações disponíveis nas bases de dados das universidades. Para a seleção dos trabalhos, aplicaram-se filtros específicos em cada programa de pós-graduação, considerando o período de publicação (2015–2024) e os termos (i) bioestimulantes, (ii) fitorreguladores e (iii) microrganismos. Em seguida, procedeu-se à leitura e à quantificação das dissertações por ano e por programa, bem como à identificação dos temas abordados e à síntese dos principais resultados e aos cultivos mais estudados. O PPGHI – UNEB apresentou maior número de trabalhos envolvendo microrganismos, enquanto os programas PPGEA e PPGPV da UNIVASF produziram mais trabalhos relacionados a bioestimulantes e fitorreguladores. Para o período analisado, os cultivos mais estudados foram manga, melão e uvas. Todos os programas em parceria com EMBRAPA apresentaram excelentes trabalhos na temática, contribuindo significativamente para o avanço científico e tecnológico da agricultura irrigada na região.

RESUMEN

El Valle Medio del São Francisco constituye uno de los principales polos de agricultura de riego en Brasil, donde las tecnologías basadas en bioestimulantes, reguladores del crecimiento vegetal y microorganismos han sido ampliamente investigadas con el propósito de ofrecer soporte fisiológico a los cultivos, mitigar los estreses abióticos y promover incrementos en la producción y la calidad. El objetivo de este trabajo fue realizar una revisión de la literatura, referente al período de 2015 a 2024, sobre el uso de bioestimulantes, reguladores del crecimiento vegetal y microorganismos en la agricultura de riego del Valle del São Francisco, basada en disertaciones de maestría de los programas de posgrado en Horticultura de Riego (PPGHI – UNEB), Producción Vegetal (PPGPV – UNIVASF) e Ingeniería Agrícola (PPGEA – UNIVASF). La revisión se llevó a cabo a partir de tesis disponibles en las bases de datos de las universidades. Para la selección de los trabajos, se aplicaron filtros 2 específicos en cada programa de posgrado, considerando el período de publicación (2015–2024) y los términos (i) bioestimulantes, (ii) fitorreguladores

y (iii) microorganismos. A continuación, se procedió a la lectura y cuantificación de las disertaciones por año y por programa, junto con la identificación de los temas abordados y la síntesis de los principales resultados, además de los cultivos más estudiados. El PPGHI – UNEB presentó el mayor número de trabajos relacionados con microorganismos, mientras que los programas PPGEA y PPGPV de la UNIVASF produjeron más investigaciones relacionadas con bioestimulantes y fitorreguladores. Durante el período analizado, los cultivos más investigados fueron mango, melón y uva. Todos los programas en colaboración con EMBRAPA desarrollaron excelentes trabajos en la temática, contribuyendo significativamente al avance científico y tecnológico de la agricultura irrigada en la región.

1 INTRODUCTION

The Submiddle São Francisco Valley (SVSF) is one of the main irrigated agricultural hubs in Brazil, with emphasis on the production of irrigated fruits (Baiardi et al., 2023). The SVSF region comprises the municipalities of Petrolina, Lagoa Grande, Santa Maria da Boa Vista, Orocó, and Cabrobó in the state of Pernambuco, as well as Juazeiro, Casa Nova, Sobradinho, Curaçá, and Abaré in the state of Bahia, all of which are located within the Brazilian semi-arid region (Gondim et al., 2013). In this region, several irrigation methods are used; however, localized irrigation systems, represented mainly by drip and micro-sprinkler irrigation, predominate. According to Frizzone (2012), these methods are considered the most efficient in irrigated agriculture.

The adoption of localized irrigation is frequently associated with fertigation practices, allowing the application of different inputs throughout the crop cycle. In this context, the use of biostimulants that include plant extracts, seaweed extracts, humic and fulvic acids, biofertilizers; plant growth regulators, such as auxins, gibberellins, cytokinins, ethylene, paclobutrazol, salicylic acid, and ascorbic acid, as well as beneficial microorganisms - bacteria and fungi -, has intensified, as reported in previous studies (Melo, 2017; Aguiar, 2018; Lordêlo, 2019; Nascimento, 2019; Leal, 2023; Almeida, 2024). These products can be applied via fertigation, foliar spraying, or seed inoculation and are used as management strategies aimed at increasing productivity, improving fruit quality, and mitigating abiotic stresses, especially water deficit (Pais, 2016; Ferreira, 2019; Bezerra, 2020; Vargens, 2022; Martins et al., 2023; Silva, 2024).

The topic related to the use of biostimulants, plant growth regulators, and microorganisms has been widely discussed in the academic environment of the São Francisco Valley, particularly through master's dissertations developed in graduate programs focused on irrigated agriculture in the region. These include the Graduate Program in Irrigated Horticulture (PPGHI – UNEB), at the Juazeiro-BA 3 campus; the Graduate Program in Plant Production (PPGPV – UNIVASF), at the Petrolina-PE campus; and the Graduate Program in Agricultural Engineering (PPGEA – UNIVASF), at the Juazeiro-BA campus. These programs, often in partnership with Embrapa Semi-Arid, have significantly contributed to the development of technologies and strategies aimed at increasing production efficiency and sustainability of irrigated agricultural systems in the region.

In this context, the objective of this study was to conduct a literature review covering the period from 2015 to 2024 on the use of biostimulants, plant growth regulators, and microorganisms in irrigated agriculture in the São Francisco Valley, based on master's

dissertations from the graduate programs in Irrigated Horticulture (PPGHI – UNEB), Plant Production (PPGPV – UNIVASF), and Agricultural Engineering (PPGEA – UNIVASF).

2 MATERIALS AND METHODS

The study consists of a literature review on the use of biostimulants, plant growth regulators, and microorganisms in irrigated agriculture in the Middle-Low São Francisco Valley, covering the period from 2015 to 2024. The region has an average altitude of 402 m and is located across municipalities in the states of Pernambuco and Bahia (Figure 1).

Figure 1

Location of the Middle-Low São Francisco Valley in the states of Pernambuco and Bahia

Source: Gondim et al., 2013.

The research included theses from three *stricto sensu* graduate programs: Irrigated Horticulture (PPGHI – UNEB), at the Juazeiro-BA campus; Plant Production (PPGPV – UNIVASF), at the 4 Petrolina-PE campus; and Agricultural Engineering (PPGEA – UNIVASF), at the Juazeiro-BA campus. According to the Köppen classification, the Middle-Low São Francisco Valley falls under the BSh type, characterized as a semi-arid climate. The region has an average annual temperature of 26.0 °C and an average annual precipitation of approximately 500 mm, concentrated between January and April, with a relative humidity of around 66% (Leão et al., 2020).

The Middle-Low São Francisco Valley is one of the main hubs of irrigated agriculture in the country, and institutions such as UNEB and UNIVASF have been conducting relevant research on the application of biostimulants, plant growth regulators, and microorganisms

associated with agricultural production. For the construction of the review, data were obtained from the institutional repositories of the three aforementioned programs: Irrigated Horticulture (<https://ppghi.uneb.br/b>); Plant Production (<https://producaovegetal.univasf.edu.br/>); and Agricultural Engineering (<https://portais.univasf.edu.br/ppgea>). Accessed between (February 2, 2025 and December 28, 2025). The search considered terms related to the main groups of interest, applying specific filters for each set of terms, allowing the identification of theses that directly addressed the research topic: (i) Biostimulants: plant extracts, seaweed extracts, humic acids, fulvic acid, and biofertilizers; (ii) Plant Growth Regulators: auxins, gibberellins, cytokinins, ethylene, paclobutrazol, salicylic acid, and ascorbic acid; (iii) Microorganisms: plant growth-promoting bacteria and fungi. This process is summarized in the flowchart presented in Figure 2.

Figure 2

Flowchart of the thesis search process and categorization by biostimulants, plant growth regulators, and microorganisms in the graduate programs of UNEB and UNIVASF

Source: Prepared by the authors.

The initial selection the theses published were classified by year and program, along with the distribution of topics (biostimulants, plant growth regulators, and microorganisms) and the agricultural crops evaluated. Subsequently, the abstracts were read, followed by the full text, with the aim of identifying: the crop studied; the type of product applied (biostimulant, plant growth regulator, or microbial inoculant); the experimental conditions (field, nursery, or greenhouse); the application method (soil, foliar, or inoculation); and the main agronomic

effects observed.

3 RESULTS AND DISCUSSION

The yearly distribution of the dissertations presented in Figure 3 shows that the PPGHI–UNEB exhibits greater regularity in the production of dissertations related to the use of biostimulants, plant growth regulators, and agricultural microorganisms between 2015 and 2023. An annual pattern of consistency is observed, with emphasis on 2016 and 2018, years in which the program reached four defended dissertations, in addition to its performance in 2023, with three dissertations. This continuity indicates that PPGHI–UNEB has played a key role in consolidating research involving bio-inputs in the region, especially in the early years of the historical series, acting as a driver for thematic maintenance and expansion.

PPGPV–UNIVASF showed a productivity pattern concentrated in specific periods (Figure 3). After an incipient output in 2016, the program reached its peak in 2019 and 2020, with four 6 dissertations each year. This interval represented the period of greatest contribution from PPGPV to the topic. From 2021 onward, a marked reduction in output was observed, with only one dissertation defended in that year and none in the subsequent years. This scenario may have been associated with the indirect effects of the COVID-19 pandemic, including difficulties in establishing field experiments and psychological impacts resulting from social isolation, as reported by Francisco et al. (2021) in a study involving with 200 students from different graduate programs at several Brazilian universities.

Figure 3

Number of dissertations published per year related to the use of biostimulants, plant growth regulators, and microorganisms in the graduate programs in Irrigated Horticulture (PPGHI–UNEB), Plant Production (PPGPV UNIVASF), and Agricultural Engineering (PPGEA–UNIVASF), from 2015 to 2024

Source: Prepared by the authors. Data from the graduate programs at UNEB and UNIVASF.

PPGEA–UNIVASF differs from the previous programs, showing later but consistent growth (Figure 3). After an initial phase of low output between 2016 and 2020, the program shows a significant increase in 2021 and 2023, with three dissertations in each year. This pattern indicates a growing interest within Agricultural Engineering in research involving bio-inputs, likely associated with the program's direct interface with irrigation technologies, water management, abiotic stress, and precision agriculture. É importante destacar a contribuição da EMBRAPA (Empresa Brasileira de Pesquisa Agropecuária), responsável por 30% das dissertações do PPGEA–UNIVASF avaliadas neste estudo, fornecendo infraestrutura experimental e suporte científico qualificado, com orientação e coorientação de seus pesquisadores.

Regarding the number of studies according to the topics biostimulants, plant growth regulators, and microorganisms for PPGHI–UNEB (Figure 4A), there is a predominance of dissertations related to microorganisms, followed by plant growth regulators and biostimulants. This pattern demonstrates the strong connection of the program with research on agricultural microbiology applied to irrigation, particularly in strategic crops of the Sub-middle São Francisco Valley (SVSF). The balanced presence among the three categories illustrates the diversification of research lines and the program's ability to meet heterogeneous demands of the regional production sector.

In the PPGPV–UNIVASF (Figure 4B), a predominance of studies related to biostimulants is observed, due to the prominent role of the Research Group on Fruit Crops

in the São Francisco Valley (FRUTIVASF), which is recognized for conducting experiments in collaboration with companies from the mango production sector. According to De Fátima et al. (2024), the Northeast region of Brazil, represented by the São Francisco Valley, recorded a 15% increase in the area cultivated with mango between 2012 and 2021, according to data from the Brazilian Institute of Geography and Statistics (IBGE, 2024). In this context, the increase in the area cultivated with mango may have contributed to the high number of dissertations on this topic, since mango cultivation shows extensive use of plant growth regulators and biostimulants in the São Francisco Valley, as highlighted by Lobo (2018), Cunha (2019), Silva (2019), Carreiro (2020), Mudo (2020), and Martins et al. (2024).

Figure 4

Number of dissertations published related to the use of biostimulants, plant growth regulators, and microorganisms in the graduate programs: A. Irrigated Horticulture (PPGHI–UNEB), B. Plant Production (PPGPV UNIVASF), C. Agricultural Engineering (PPGEA–UNIVASF), and from 2015 to 2024

Source: Prepared by the authors. Data from the graduate programs at UNEB and UNIVASF.

In the PPGEA–UNIVASF, biostimulants accounted for the majority of research, with nine dissertations, followed by two on plant growth regulators and only one on microorganisms (Figure 4C). This profile highlighted the program's alignment with irrigation

management strategies based on the use of biostimulants to mitigate water deficit and increase the production of irrigated fruit and vegetable crops in the São Francisco Valley, as evidenced by the effects of humic and fulvic acids and seaweed extracts on mango trees (Martins, 2023; Araújo, 2022) and of nanoparticles and biofertilizers on watermelon and melon (Barros, 2023; Leite, 2021; Silva, 2016).

The overall synthesis shows that PPGHI–UNEB leads scientific production in the topic, with 22 dissertations, followed by PPGPV–UNIVASF with 18 and PPGEA–UNIVASF with 12 (Figure 4D). The observed differences reflect not only the level of program consolidation but also their scientific vocations, institutional collaboration capacity, and stability of research lines over time. The higher number of dissertations in PPGHI–UNEB may be associated with the fact that the program is older compared to the UNIVASF programs, possessing greater experience and organizational structure. This maturity supports a higher number of students and faculty advisors, enabling greater academic output.

The studies conducted between 2015 and 2024 by PPGHI–UNEB involving biostimulants focused mainly on grape, onion, watermelon, and melon crops, carried out under field conditions and in protected environments (Table 1). The application of polyamines to ‘Thompson Seedless’ grapes resulted in a significant increase in berry growth, while the marine calcareous seaweed extract *Lithothamnium* promoted yield gains in ‘BRS Vitória’ grapes (Loredelo, 2019; Aguiar, 2018). The use of biofertilizers favored vegetative development, production, and total yield of onion (Almeida, 2024), in addition to enhancing gas exchange and biochemical parameters in organically grown watermelon (Ramos, 2020). For ‘old Mine’ melon, substrate-applied biostimulants did not produce statistically significant effects on the evaluated variables (Campos, 2018).

Regarding plant growth regulators, the dissertations from PPGHI–UNEB focused mainly on mango, grape, onion, and tomato crops. The application of cytokinins and gibberellins (BAP and A₃) to ‘Tommy Atkins’ mango increased fruit number and growth (Bezerra, 2020). The use of paclobutrazol, applied both via soil and fertigation, increased production and fruit number per plant in different mango cultivars, demonstrating efficiency in controlling vegetative growth and inducing flowering (Ferreira, 2019; Santos, 2017a; Souza, 2016a). In ‘BRS Vitória’ grapes, salicylic acid improved leaf development and biomass accumulation (Gomes, 2023). In the grape rootstocks ‘Paulsen 1103’ and ‘SO4’, the application of kinetin, gibberellic acid, and IBA significantly increased rooting and sprouting percentages (Moraes, 2018). In ‘Regent’ onion, plant growth regulators increased aerial and root biomass production (Fonseca, 2015), while in ‘uba’ tomato, the application

of IBA, A₃, and kinetin enhanced stem growth and seedling root development (Oliveira, 2016), as it has been summarized in Table 1.

The dissertations from PPGHI–UNEB involving microorganisms focused mainly on cowpea (Leal, 2023; Nascimento, 2019; Sena, 2018; Souza, 2016b), melon (Melo, 2017), watermelon (Araújo, 2023), papaya (Vargens, 2022), and gerbera (Pais, 2016), conducted mostly under greenhouse and laboratory conditions (Table 1). The microorganisms evaluated included arbuscular mycorrhizal fungi (AMF) and bacteria belonging to the genera *Bradyrhizobium* and *Bacillus*, as well as isolates of *Pseudomonas*, *Burkholderia*, and *Paraburkholderia*, applied predominantly via seed inoculation or substrate incorporation, aiming to optimize the physiological performance of crops.

Table 1

Dissertations from the PPGHI–UNEB involving major crops, cultivation conditions, application methods, and the effects of biostimulants, plant growth regulators, and microorganisms from 2015 to 2024.

BIOSTIMULANTS					
Crop	Description of the Biostimulants	Growing Conditions	Application Method	Effects and Plant Performance	References
Grape 'Thompson Seedless'	Polyamines	Field	Foliar	The mixture of putrescine, spermidine, and spermine promoted greater berry growth.	Lordêlo, (2019)
Grape 'BRS Vitória'	Seaweed extract	Field	Fertigation and foliar	The doses of 18 and 35 kg ha ⁻¹ provided increases in yield per plant and, consequently, in productivity.	Aguiar, (2018)
Onion 'IPA-11'	Biofertilizers	Field	Soil	Better vegetative development, yield, and total bulb productivity.	Almeida, (2024)
Watermelon	Biofertilizers	Field	ND	Gas exchange and biochemical parameters were increased at 30 and 45.	Ramos (2020)
Melon 'Gold Mine'	Biostimulants	Greenhouse	Substrate	The biofertilizer did not show significant effects on	Campos, (2018)

the evaluated
characteristics.

PLANT GROWTH REGULATORS

Crop	Description of Plant Growth Regulators	Growing Conditions	Application Method	Effects and Plant Performance	References
Mango 'Tommy Atkins'	Cytokinins, and Gibberellins BAP and GA3	Field	Foliar	It promoted an increase in the number and growth of fruits per plant in mango.	Bezerra, (2020)
Mango 'Tommy Atkins'	Paclobutrazol	Field	Fertigation and soil	The increase in paclobutrazol doses applied via the irrigation system reduced gas exchange in mango.	Ferreira, (2019)
Mango 'Kent'	Paclobutrazol	Field	Soil	Applications promoted increases in panicle formation and in the number of fruits per plant.	Santos, (2017a)
Mango 'Palmer'	Paclobutrazol	Field	Fertigation and soil	Application via the irrigation system promoted a greater number of fruits per plant and higher productivity.	Souza, (2016a)
Grape 'BRS Vitória'	Salicylic acid	Greenhouse	Foliar	Salicylic acid doses promoted leaf development with a lower volume of water applied.	Gomes, (2023)
Grape - porta-enxerto 'Paulsen 1103' e 'SO4'	Kinetin, gibberellic acid, 4-indole-3-butyric acid (IBA)	Greenhouse	ND	The best results were observed in cuttings not treated with plant growth regulators (IBA), with a higher percentage of rooting and sprouting.	Moraes, (2018)
Onion 'Regent'	Cytokinin, Auxin, Gibberellin	Field	Foliar	Application of pyraclostrobin and boscalid provided a greater increase in biomass compared to the control treatments.	Fonseca, (2015)

Tomato 'Italiano Tyna'	IBA, GA3, kinetin	Laboratory	Seed	It favored an increase in stem diameter of seedlings and fresh root mass of seedlings	Oliveira, (2016)

the results demonstrate that the use of microorganisms constitutes an effective strategy to mitigate the effects of water deficit and salinity in the SVSF. AMF reduced the damage associated with water stress in melon (Melo, 2017) and improved growth and biomass accumulation in cowpea (Leal, 2023). *Bradyrhizobium* spp. (strain BR 3262) showed beneficial effects on nodulation and physiological performance of bean genotypes (Nascimento, 2019), and enhanced gas exchange parameters in common bean seedlings (Souza, 2016b). Additional studies identified bacterial isolates with high symbiotic efficiency and tolerance to salinity (3% NaCl), as well as resistance to acidic and alkaline pH (Sena, 2018). In watermelon, inoculation with *Bacillus* spp. increased root length and volume (Araújo, 2023), while in papaya, AMF promoted better initial seedling development (Vargens, 2022). These results, summarized in Table 1, reinforce the potential of microorganisms as biotechnological tools for agriculture in semiarid environments.

In PPGPV–UNIVASF, biostimulants were extensively investigated between 2015 and 2025 (Table 2), with a predominance of studies focused on mango, exploring different substances and their physiological, biochemical, and productive effects. In ‘Kent’ mango, foliar application of amino acids and seaweed extract significantly altered the physicochemical traits of fruits (Lobo, 2018), while melissyl alcohol increased the activity of the antioxidant enzymes superoxide dismutase (SOD), ascorbate peroxidase (APX), and catalase (CAT) (Sanches, 2020). In ‘Tommy Atkins’ mango, proline increased gas exchange rates and seaweed extract promoted greater floral uniformity (Cunha, 2019). In acerola, however, the application of humic substances did not significantly affect fruit quality attributes (Dias, 2017).

For ‘Palmer’ mango, the combination of humic substances and paclobutrazol was identified as a productive alternative (Silva, 2019), while the isolated application of humic substances via fertigation produced fruits with commercial standards compatible with export markets (Torres, 2019). In melon, protein application improved vegetative growth parameters (Rodrigues, 2018), while in guava, the use of biofertilizers significantly increased production (Santana, 2016). However, in acerola, humic substances did not influence fruit

quality attributes (Dias, 2017).

Plant growth regulators also produced consistent responses in studies conducted by PPGPV UNIVASF between 2015 and 2024 (Table 2), with a predominance of research applied to mango. In 'Palmer' mango, foliar application of gibberellins, auxins, naphthaleneacetic acid, and cytokinins reduced the incidence of stenopermocarpic fruits and increased the number of productive branches (Souza, 2019). In 'Tommy Atkins' mango, the use of fenpropimorph and paclobutrazol proved effective in inhibiting A₃ biosynthesis, resulting in increased transpiration and reserve accumulation (Carreiro, 2020).

PLANT GROWTH REGULATORS

Crop	Description of Plant Growth Regulators	Growing Conditions	Application Method	Effects and Plant Performance	References
Mango 'Palmer'	Giberelina; Auxina; Naftalenoacético; Citocininas	Field	Foliar	Cytokinin reduced the incidence of stenospermocarpic fruits and promoted higher means for the number of productive branches.	Souza, (2019)
Mango 'Tommy Atkins'	Fenpropimorfe, Paclobutrazol	Field	Soil	Fenpropimorph is efficient in inhibiting GA ₃ biosynthesis, promoting increased transpiration and reserve accumulation.	Carreiro, (2020)
Mango 'Keitt'	AG3	Field	Foliar	Physical fruit characteristics, including estimated volume, fruit mass, and seed yield, were influenced by the interaction between factors (fertilization × gibberellin).	Mudo, (2020)
Onion	citocinina, giberelina, auxina	Field	Soil	Soil chemical and microbiological properties were influenced after the application.	Silva, (2020)
Rosa	citocinina, giberelina, auxina	Sombreado	Foliar	Plant growth regulators promoted greater increases in	Silva, (2018)

rose growth and positively affected gas exchange.

MICROORGANISMS

Crop	Description of Microorganisms	Growing Conditions	Application Method	Effects and Plant Performance	References
Mango 'Keitt'	Rhodopseudomonas palustris	Field	Fertigation	<i>Rhodopseudomonas palustris</i> is a promising option for the cultivation of 'Keitt' mango irrigated under semi-arid conditions.	Lino, (2020)
Melon	Micorrízicos arbusculares, auxina e citocinina	Field	Fertigation	Reducing irrigation depth in melon cultivation does not affect sporulation but alters composition and reduces the diversity of AMF.	Silva, (2017)
<i>Rhaphiodon echinus</i> e <i>Mesosphaerum suaveolens</i> .	Fungos micorrízicos arbusculares (FMA)	Greenhouse	Inoculação	Native AMF produced with <i>S. uniflora</i> provide benefits to the development of <i>Rhaphiodon echinus</i> and <i>Mesosphaerum suaveolens</i> plants.	Medeiros, (2021)

Source: Prepared by the authors. Data from the graduate program at UNIVASF.

For the 'Keitt' cultivar, theogenous A₃ application positively influenced fruit mass, volume, and seed yield (Mudo, 2020). In onion, the application of cytokinin, gibberellin, and auxin promoted relevant changes in soil chemical and microbiological properties (Silva, 2020).

Regarding microorganisms, only two dissertations were identified in PPGPV–UNIVASF (Table 2). In melon, the association between arbuscular mycorrhizal fungi (AMF), auxins, and cytokinins applied via fertigation demonstrated that reduced irrigation depth did not compromise AMF sporulation, although it altered composition and reduced AMF diversity (Silva, 2017). In *Rhaphiodon echinus* and *Mesosphaerum suaveolens*, inoculation with

native AMF enhanced plant development, reinforcing the potential of these microorganisms for semiarid conditions (Medeiros, 2021). For the 'Keitt' cultivar, the application of *Rhodopseudomonas palustris* proved agronomically efficient, indicating biotechnological potential for productive management (Lino, 2020).

The dissertations from PPGEA–UNIVASF, produced between 2015 and 2025, highlight the broad use of biostimulants, plant growth regulators, and microorganisms in fruit and vegetable crops grown in semiarid environments (Table 3). Biostimulants showed expressive responses in several crops, especially mango, melon, and cucurbits. In 'Tommy Atkins' mango, the application of fulvic and humic acids via fertigation increased leaf levels of amino acids, proteins, and total soluble carbohydrates (Martins, 2023). In 'Palmer' mango, the use of seaweed extract combined with humic substances and different hormonal classes (cytokinins, auxins, and gibberellins) increased biochemical levels in leaves (Araújo, 2022).

In 'BRS Isis' grapes, the foliar application of humic substances, bacteria, and biocompost positively influenced shoot length and number of leaves (Barros, 2020). In yellow melon, carbon nanoparticles applied via foliar application and fertigation positively affected physiological and biochemical traits (Barros, 2023), while the use of biofertilizers increased chlorophyll a and b, photosynthesis, stomatal conductance, and productivity (Leite, 2021). Similar results were observed in watermelon, where intermediate doses of biofertilizers yielded the best photosynthesis, stomatal conductance, and transpiration values (Silva, 2016).

In bell pepper, the application of humic substances combined with reduced mineral fertilization resulted in significant increases in total yield and average fruit weight (Souza, 2021). In yam, the application of free amino acids and *Ascophyllum nodosum* was identified as a physiologically efficient and promising strategy for the crop (Santos, 2017b). Similarly, in passion fruit, the use of humic substances proved to be a viable alternative for seedling production in organic fertilization systems, promoting better initial plant performance (Santos, 2021) (Table 3).

Table 3

Dissertations from the PPGEA – UNIVASF involving major crops, cultivation conditions, application methods, and the effects of biostimulants, plant growth regulators, and microorganisms from 2015 to 2024

BIOSTIMULANTS					
Crop	Description of the Biostimulants	Growing Conditions	Application Method	Effects and Plant Performance	References
Mango 'Tommy Atkins'	Ácidos fulvico e ácido húmicos	Field	Fertigation	The application of biostimulants resulted in increased leaf contents of amino acids, proteins, and total soluble carbohydrates.	Martins, (2023)

Melon	Nanoparticulado de carbono	Field	Foliar and Fertigation	The biostimulant used positively affected the physiological and biochemical characteristics of melon plants.	Barros, (2023)

Melon	Biofertilizantes	Field and Greenhouse	Fertigation	The biofertilizer promoted increases in chlorophyll a and b contents, photosynthesis, stomatal conductance, as well as higher productivity.	Leite, (2021)
Watermelon	Biofertilizantes	Field	Foliar and Fertigation	Intermediate doses of the biofertilizer provided the highest values of photosynthesis, stomatal conductance, and transpiration.	Silva, (2016)
Bell pepper	Subistacia humicas	Greenhouse	Soil	The lowest fertilization rate resulted in higher total yield and average fruit weight.	Souza, (2021)
Yam	Aminoacidos livres; Ascophyllum nodosum	Field	Foliar	The 100 mL dose showed the highest mean fresh tuber weight (1.677 kg).	Santos, (2017b)
Passion fruit	Subistacia humicas	Greenhouse	Soil	It proved to be a good option for seedling production under organic fertilization.	Santos, (2021)

PLANT GROWTH REGULATORS

Crop	Description of Plant Growth Regulators	Growing Conditions	Application Method	Effects and Plant Performance	References
Melon	Citoquininas, auxinas e giberelinas	Field	ND	The 4.8 L ha ⁻¹ dose increased pulp firmness in both growing seasons.	Reis, (2018)
Melon	Auxina e citocinina	Field	ND	The highest values of firmness and total soluble solids were observed under the lowest irrigation depth.	Ferreira, (2016)
MICROORGANISMS					
Crop	Description of Microorganisms	Growing Conditions	Application Method	Effects and Plant Performance	References
Zea mays	Bacterias remineralizadora	Greenhouse	Soil	Potential benefits for conservation agriculture were observed through the use of remineralizers.	Sydne, 2023

Source: Prepared by the authors. Data from the graduate program at UNIVASF. ND: the application method was not reported in the text.

Plant growth regulators also directly influenced fruit quality, especially in melon, the application of cytokinins, auxins, and gibberellins increased pulp firmness in two consecutive growing cycles (Reis, 2018). Complementarily, the application of auxin and cytokinin combined with a reduced irrigation depth resulted in higher pulp firmness and total soluble solids, demonstrating a beneficial interaction between plant growth regulators and water management (Ferreira, 2016). Regarding the use of microorganisms, in maize cultivated under greenhouse conditions, inoculation with remineralizing bacteria was considered a promising strategy for improving the crop's nutritional and physiological conditions, reinforcing their potential for the agricultural systems of the SVSF (Sydne, 2023) (Table 3).

The distribution of crops studied in the works involving biostimulants, plant growth regulators, and microorganisms has been analyzed in figure 5. Refers to PPGHI–UNEB, showing a evenly distributed range of crops. Mango, grape, cowpea, onion, and melon, exhibit similar proportions (between 9% and 18%), characterizing a broad research scope consistent with the strategic importance of these crops for irrigated horticulture in Northeastern Brazil Figure 5A.

In contrast, the Graduate Program in Plant Production (PPGPV–UNIVASF) (Figure 5B) shows strong thematic concentration, with an absolute predominance of mango (61% of studies), while pear and guava appear sporadically. This scenario indicates a clear programmatic vocation toward mango cultivation, aligned with the socioeconomic importance of this production chain in the São Francisco Valley. Although it demonstrates scientific specialization, it also suggests lower thematic diversification compared to the other evaluated programs.

In the Graduate Program in Agricultural Engineering (PPGEA–UNIVASF), an intermediate pattern between diversity and specialization is observed (Figure 5C). Although melon and mango show the highest percentages (33% and 17%, respectively), other crops such as grape, passion fruit, maize, yam, and bell pepper each represent 8.33%, forming a more balanced distribution. This behaviour aligns with the multidisciplinary nature of Agricultural Engineering, which integrates aspects of water management, ecophysiology, productivity, and the development of technologies aimed at intensive cropping systems in semiarid regions.

The overall synthesis of the three programs (Figure 5D) shows that mango stands out as the most studied crop (33%), followed by melon (15%), grape (10%), and cowpea (8%). This predominance reinforces the importance of irrigated fruit crops in the semiarid region, which are strongly linked to the production chains of the São Francisco Valley. The remaining species appear in smaller proportions, indicating that although there is diversity in the studies, the economically most relevant crops of irrigated fruit production continue to be prioritized.

Figure 5

Percentage of the main crops studied in dissertations related to the use of biostimulants, plant growth regulators, and microorganisms in the graduate programs: A. Irrigated Horticulture (PPGHI–UNEB), B. Plant Production (PPGPV UNIVASF), and C. Agricultural Engineering (PPGEA–UNIVASF), from 2015 to 2024

Source: Prepared by the authors. Data from the graduate programs at UNEB and UNIVASF.

Overall, it is observed that biostimulants, plant growth regulators, and microorganisms have been predominantly applied to high-value crops, reinforcing the search for biotechnological solutions capable of enhancing productivity, physiological efficiency, and postharvest quality.

4 CONCLUSIONS

The PPGHI – UNEB presented the highest number of studies involving microorganisms, especially plant growth-promoting bacteria and fungi, in addition to the plant growth regulator paclobutrazol. The most studied crops were bean, mango, and grape, each representing 18% of the theses analyzed over the ten-year period.

The PPGEA and PPGPV programs at UNIVASF concentrated most of the research related to biostimulants and plant growth regulators, with humic substances, paclobutrazol, and seaweed extracts standing out. In the PPGEA program, 33% of the studies were directed at melon cultivation, while in the PPGPV program, 61% of the research involved mango cultivation.

Between 2015 and 2024, the graduate programs in Irrigated Horticulture (PPGHI –

UNEB), Plant Production (PPGPV – UNIVASF), and Agricultural Engineering (PPGEA – UNIVASF), in partnership with EMBRAPA Semiárido, developed relevant contributions on the use of biostimulants, plant growth regulators, and microorganisms in irrigated fruit production in the São Francisco Valley, strengthening the region's technological advancement and promoting increased productivity and quality of fruits, vegetables, and legumes.

Loso Judijanto¹

ABSTRACT

This qualitative literature review examines the outlook for Indonesia's palm oil sector in 2026, with particular emphasis on smallholder farmers' welfare and the interplay between production dynamics, policy drivers, and sustainability imperatives. Synthesizing evidence from the 2026 IPOSS Palm Oil Outlook, literature publications (2020-2025), and government reports. In industry analyses, we identify critical determinants shaping the sector's trajectory: biodiesel mandate expansion (B40-B50), climate variability following El Niño-La Niña cycles, implementation of the European Union Deforestation Regulation (EUDR), and persistent productivity gaps in smallholder plantations. Global crude palm oil (CPO) production is projected at 83 million metric tons in 2026, with Indonesia maintaining 59% market share despite land expansion constraints and bottlenecks in the replanting program (PSR). Domestic consumption intensification through bioenergy mandates creates a dual pressure on export capacity and farmer income stability. Price forecasts range from USD 1,050 to 1,200/MT, influenced by energy policy, geopolitical tensions, and sustainability compliance costs. Thematic findings reveal that smallholder welfare—measured through Farmers Terms of Trade (NTP) and multidimensional welfare indices—remains vulnerable to price volatility, limited market access, and certification barriers. We propose six evidence-based policy recommendations prioritizing accelerated replanting (200,000 ha/year target), price stabilization mechanisms, subsidized ISPO certification pathways, enhanced extension services, comprehensive welfare monitoring systems, and income diversification strategies. This review contributes to agricultural economics literature by synthesizing fragmented research streams and providing actionable insights for policymakers navigating the sustainability-development nexus in commodity-dependent economies.

Keywords: Palm Oil Outlook. Smallholder Welfare. Biodiesel Policy. ISPO Certification. Replanting Program. EUDR Compliance. Farmers' Terms of Trade. Sustainable Intensification. Indonesian Agriculture. Climate Adaptation.

RESUMO

Esta revisão qualitativa da literatura examina as perspectivas do setor de óleo de palma da Indonésia em 2026, com ênfase particular no bem-estar dos pequenos produtores e na interação entre dinâmicas produtivas, direcionadores de políticas públicas e imperativos de sustentabilidade. O estudo sintetiza evidências provenientes do IPOSS Palm Oil Outlook 2026, de publicações científicas (2020–2025) e de relatórios governamentais e análises setoriais. Identificam-se determinantes críticos que moldam a trajetória do setor, incluindo a expansão do mandato de biodiesel (B40–B50), a variabilidade climática associada aos ciclos El Niño–La Niña, a implementação do Regulamento da União Europeia sobre Desmatamento (EUDR) e as persistentes lacunas de produtividade nas plantações de pequenos produtores. A produção global de óleo de palma bruto (CPO) está projetada em 83 milhões de toneladas métricas em 2026, com a Indonésia mantendo 59% de participação de mercado, apesar das restrições à expansão de área e dos gargalos no programa de replantio (Peremajaan Sawit Rakyat – PSR). A intensificação do consumo doméstico por meio de mandatos de bioenergia gera uma pressão dupla sobre a capacidade de exportação e a estabilidade da renda dos agricultores. As projeções de preços variam entre USD 1.050 e 1.200 por tonelada métrica, influenciadas por políticas energéticas, tensões geopolíticas e custos de conformidade com exigências de sustentabilidade. Os achados temáticos revelam que o bem-estar dos pequenos produtores — medido pelos Termos de Troca da Agricultura (NTP) e por índices multidimensionais de bem-estar — permanece vulnerável à volatilidade de preços, ao acesso limitado aos mercados e às barreiras à certificação. Propõem-se seis recomendações de políticas baseadas em evidências, priorizando a aceleração do replantio (meta de 200.000 ha/ano), mecanismos de estabilização de preços, vias subsidiadas para certificação ISPO, fortalecimento dos serviços de extensão rural, sistemas abrangentes de monitoramento do bem-estar e estratégias de diversificação de renda. Esta revisão contribui para a literatura em economia agrícola ao integrar correntes de pesquisa fragmentadas e oferecer subsídios acionáveis para formuladores de políticas que atuam no nexo entre sustentabilidade e desenvolvimento em economias dependentes de commodities.

Palavras-chave: Perspectivas do Óleo de Palma. Bem-Estar dos Pequenos Produtores. Política de Biodiesel. Certificação ISPO. Programa de Replanteio. Conformidade com o EUDR. Termos de Troca da Agricultura. Intensificação Sustentável. Agricultura Indonésia. Adaptação Climática.

RESUMEN

Esta revisión cualitativa de la literatura examina las perspectivas del sector del aceite de palma de Indonesia en 2026, con especial énfasis en el bienestar de los pequeños productores y en la interacción entre las dinámicas de producción, los impulsores de políticas públicas y los imperativos de sostenibilidad. El estudio sintetiza evidencias del IPOSS Palm Oil Outlook 2026, de publicaciones científicas (2020–2025) y de informes gubernamentales y análisis sectoriales. Se identifican determinantes críticos que configuran la trayectoria del sector, entre ellos la expansión del mandato de biodiésel (B40–B50), la variabilidad climática asociada a los ciclos El Niño–La Niña, la implementación del Reglamento de la Unión Europea sobre Deforestación (EUDR) y las persistentes brechas de productividad en las plantaciones de pequeños productores. La producción mundial de aceite de palma crudo (CPO) se proyecta en 83 millones de toneladas métricas en 2026, manteniendo Indonesia una participación de mercado del 59%, a pesar de las restricciones a la expansión de la superficie cultivada y de los cuellos de botella en el programa de replantación (Peremajaan Sawit Rakyat – PSR). La intensificación del consumo interno mediante mandatos de bioenergía genera una doble presión sobre la capacidad exportadora y la estabilidad de los ingresos de los agricultores. Las proyecciones de precios oscilan entre USD 1.050 y 1.200 por tonelada métrica, influenciadas por las políticas energéticas, las tensiones geopolíticas y los costos de cumplimiento de los requisitos de sostenibilidad. Los hallazgos temáticos

revelan que el bienestar de los pequeños productores —medido a través de los Términos de Intercambio Agrícola (NTP) y de índices multidimensionales de bienestar— sigue siendo vulnerable a la volatilidad de precios, al acceso limitado a los mercados y a las barreras de certificación. Se proponen seis recomendaciones de política basadas en evidencia, priorizando la aceleración de la replantación (objetivo de 200.000 ha/año), mecanismos de estabilización de precios, rutas subsidiadas para la certificación ISPO, el fortalecimiento de los servicios de extensión, sistemas integrales de monitoreo del bienestar y estrategias de diversificación de ingresos. Esta revisión contribuye a la literatura de economía agrícola al sintetizar corrientes de investigación fragmentadas y proporcionar aportes prácticos para los responsables de políticas públicas que enfrentan el nexo entre sostenibilidad y desarrollo en economías dependientes de commodities.

Palabras clave: Perspectivas del Aceite de Palma. Bienestar de los Pequeños Productores. Política de Biodiésel. Certificación ISPO. Programa de Replantación. Cumplimiento del EUDR. Términos de Intercambio Agrícola. Intensificación Sostenible. Agricultura Indonesia. Adaptación Climática.

1 INTRODUCTION

1.1 BACKGROUND

The global palm oil industry stands at a critical juncture as it enters 2026, navigating between escalating production demands, stringent sustainability requirements, and imperative livelihood concerns for millions of smallholder farmers. Palm oil (*Elaeis guineensis*) has emerged as the world's most efficient vegetable oil crop, accounting for approximately 34% of global vegetable oil production despite occupying less than 10% of total oilseed cultivation area. This exceptional land-use efficiency—yielding 4-5 tons per hectare compared to soybean oil (0.5 tons/ha) and rapeseed oil (0.8-1 ton/ha)—has positioned palm oil as an indispensable commodity in global food systems, oleochemical industries, and increasingly, renewable energy sectors (Varqa, 2025).

Indonesia dominates this landscape as the world's largest producer, contributing approximately 59% of global crude palm oil (CPO) supply in 2025, followed by Malaysia at 24%. The sector's strategic importance to Indonesia's economy extends beyond production volumes: in 2024, palm oil and its derivatives contributed 6.5% to national GDP, employed over 16.8 million people directly and indirectly, and generated USD 25.6 billion in export revenues, making it the most significant contributor to Indonesia's agricultural trade surplus. This economic centrality occurs within a complex socio-environmental context in which approximately 40% of the national palm oil area (6.7 million hectares) is managed by smallholder farmers, whose productivity levels (2-3.5 tons CPO/ha/year) lag significantly behind those of estate operations (4-5 tons/ha) (IPOSS, 2026; Saleh et al., 2021).

Sustainability governance frameworks increasingly shape the contemporary palm oil discourse. The mandatory Indonesian Sustainable Palm Oil (ISPO) certification, effective for all producers by 2025, and the European Union Deforestation Regulation (EUDR), implemented in December 2024 with enforcement beginning in 2025, represent paradigmatic shifts toward traceability-intensive, deforestation-free supply chains. Simultaneously, Indonesia's aggressive bioenergy mandates—progressing from B30 (2019) to B40 (2025) and targeting B50 by mid-2026—are fundamentally restructuring domestic consumption patterns, with non-food utilization projected to reach 39% of total palm oil allocation by 2026 (Halimatussadiah et al., 2021).

1.2 RESEARCH URGENCY

Three interconnected developments underscore the urgency of examining the 2026 palm oil outlook through a welfare-centered lens. First, the biodiesel mandate escalation creates unprecedented domestic absorption pressures. The B40 implementation in 2025

already consumed an additional 2 million tons of CPO; the projected B50 transition in 2026 will require a further 2.2 million tons, collectively absorbing approximately 15-17% of national production. While this policy achieves energy security objectives—reducing diesel imports and supporting Indonesia's Nationally Determined Contributions (NDC) climate commitments—it simultaneously constrains export volumes. It intensifies competition between food and fuel applications, with direct implications for global markets and domestic price dynamics (Sahara et al., 2022).

Second, smallholder farmers face mounting certification and compliance pressures that threaten their market participation. ISPO certification, while improving sustainability credentials, imposes substantial documentation, traceability, and agronomic practice requirements that many independent smallholders—who constitute 95% of smallholder farmers—struggle to meet without external support. The EUDR further compounds these challenges by mandating geolocation data and deforestation-free proof since December 2020, requirements that smallholders with unclear land tenure, fragmented plots, and limited technical capacity find particularly onerous. Early evidence suggests these regulations risk marginalizing rather than empowering smallholders, potentially excluding up to 60% from certified supply chains (Hartono, 2024, 2025).

Third, the sector confronts a looming productivity crisis rooted in aging plantations and inadequate replanting rates. Approximately 3.5 million hectares of Indonesia's palm area comprises trees exceeding 20 years of age—beyond their productive prime—yet annual replanting achievements reach only 30,000-50,000 hectares against targets of 180,000-200,000 hectares. This replanting deficit, combined with climate variability from ENSO (El Niño-Southern Oscillation) cycles, which can reduce yields by 6-10%, threatens to constrain production growth precisely when domestic and global demand intensifies. For smallholder farmers, replanting poses acute welfare challenges: the 3-5 year non-productive period during crop establishment eliminates cash flow, and capital requirements (estimated USD 2,500-3,500 per hectare) exceed most farmers' liquidity (Haniff et al., 2016).

1.3 RESEARCH OBJECTIVES

Against this backdrop, this qualitative literature review pursues three primary objectives. First, we synthesize current scholarly and practitioner knowledge on the palm oil sector outlook for 2026, integrating global supply-demand projections, price forecasts, and policy trajectory analyses to construct a comprehensive narrative of anticipated developments. Second, we systematically identify and analyze key drivers and constraints affecting sector performance, with particular attention to their differentiated impacts on

smallholder versus estate operations, and on welfare outcomes measured through Farmers Terms of Trade (NTP/FTT), income stability, and multidimensional welfare indices. Third, we formulate evidence-based policy recommendations specifically targeting the enhancement of smallholder welfare within the context of the sustainability transition and productivity imperatives (Maria et al., 2023).

This review addresses a critical gap in existing literature: while numerous studies examine discrete aspects of the palm oil sector—sustainability certification, biodiesel economics, smallholder productivity, climate impacts—few integrate these dimensions to assess their collective implications for the 2026 outlook and farmer welfare. By adopting a qualitative literature review methodology that enables thematic synthesis across diverse knowledge sources, we provide policymakers, industry stakeholders, and development practitioners with actionable intelligence for navigating the sector's complex transformation.

2 LITERATURE REVIEW

2.1 THEORETICAL FOUNDATIONS OF PALM OIL ECONOMICS

The economic dynamics of the palm oil sector are best understood through the integration of three theoretical frameworks. **Agricultural commodity market theory** posits that palm oil prices are determined by global supply and demand, with elasticities influenced by substitutability with competing vegetable oils (soybean, rapeseed, sunflower), crude petroleum prices (given biodiesel applications), and speculation in futures markets. Recent literature emphasizes the growing importance of policy-induced demand—particularly biofuel mandates—which creates relatively inelastic demand segments that stabilize floor prices but also transmit policy uncertainty into market volatility (Khatiwada et al., 2021).

Sustainable agricultural intensification (SAI) frameworks provide conceptual grounding for addressing the dual imperative of increasing productivity while minimizing environmental externalities. SAI theory advocates for closing yield gaps through improved agronomic practices, technological adoption, and institutional support rather than land expansion. In palm oil contexts, this translates to replanting with high-yielding varieties, precision fertilizer application, integrated pest management, and optimal harvesting frequencies—interventions that can potentially double smallholder yields from current 2-3 tons/ha to 6-8 tons/ha. However, as Byerlee et al. (2017) note, smallholder intensification requires simultaneous attention to market access, input affordability, technical knowledge, and risk management mechanisms that standard SAI models often overlook (Rahutomo et al., 2023, 2025b).

The **dual-sector development model, originating with Lewis (1954)** and adapted by contemporary rural development scholars, explains **the persistent productivity and welfare gaps between the** smallholder and estate sectors. Smallholders face structural disadvantages: fragmented landholdings limiting economies of scale, restricted access to credit and quality inputs, weak bargaining power in price negotiations with mills, and limited technical extension support. Information asymmetries exacerbate these constraints—smallholders often lack real-time market price data, best-practice knowledge, and certification requirements—creating power imbalances throughout the value chain (Dodson et al., 2019).

2.2 GLOBAL PALM OIL PRODUCTION AND SUPPLY CHAIN DYNAMICS

Global palm oil production exhibits extreme geographic concentration, with Indonesia and Malaysia collectively accounting for 83-85% of world output. This duopoly structure creates unique market dynamics: supply disruptions in either country disproportionately affect global availability and prices. At the same time, their production policies (land-use regulations, biodiesel mandates) effectively set global market conditions. Production forecasts for 2026 project global CPO output at 83 million metric tons, representing 2.7% growth from 2025's estimated 80.8 million tons. This modest expansion reflects slowing area growth due to moratoriums on new plantations in both Indonesia (Presidential Instruction No. 8/2018) and Malaysia, and a shifting emphasis toward productivity enhancement rather than land expansion (Zhao et al., 2023).

Climate variability, particularly ENSO cycles, has emerged as a critical determinant of production in recent literature. Historical analysis reveals that strong El Niño events (characterized by rainfall below 100mm/month for extended periods) reduce Fresh Fruit Bunch (FFB) yields by 6-10% with lag effects appearing 10-24 months post-event due to palm physiological responses (inflorescence abortion, altered sex ratios). Conversely, La Niña events with excessive rainfall (>300mm/month) also depress yields by 4-6% through waterlogging and the proliferation of root diseases. The 2023-2024 El Niño significantly impacted 2024-2025 production, but projections for 2026 indicate neutral to mild La Niña conditions, suggesting improved growing conditions and potential yield recovery (Kamil & Omar, 2016, 2017).

Technological frontiers in palm oil production increasingly center on precision agriculture, genetic improvement, and mechanization. Adoption of remote sensing for precision fertilization, drone-based pest monitoring, and digital traceability platforms offers pathways to enhance yields while meeting sustainability standards. However, technology diffusion remains highly uneven: while estates rapidly adopt innovations, smallholder uptake

is constrained by capital requirements, digital literacy, and inadequate extension services(Reich & Musshoff, 2025).

2.3 CONSUMPTION PATTERNS AND DEMAND DRIVERS

Global palm oil consumption is projected to reach 85.9 million tons in 2025, rising to approximately 87-88 million tons in 2026, driven by fundamental shifts in utilization patterns. The food-versus-non-food allocation ratio has evolved from 70:30 in 2015 to approximately 60:40 in 2026, reflecting the global expansion of bioenergy policy. Major consuming regions exhibit distinct dynamics: India remains the largest importer (8-9 million tons annually), driven by population growth and rising incomes, with palm oil preferred for its affordability relative to soybean and sunflower oils. China's consumption (7-8 million tons) is growing more slowly as domestic oilseed production intensifies, while European Union demand contracts due to EUDR restrictions and sustainability concerns(IPOSS, 2026; Mai, 2024).

Bioenergy mandates constitute the most dynamic demand component. Indonesia's B50 program will absorb 13-15 million tons of CPO domestically by 2026, compared to 8 million tons under B30 in 2020. Malaysia similarly targets biofuel expansion, while regional programs in the Philippines, Thailand, and Colombia contribute incremental demand. The Sustainable Aviation Fuel (SAF) segment, though nascent, presents longer-term demand potential, with palm-based biojet fuel certified for commercial aviation and multiple Indonesian producers investing in capacity. However, SAF adoption faces headwinds from EUDR restrictions on feedstock sourcing, which limit access to the European market (Hicks, 2025).

Emerging market demand in Africa and South Asia drives consumption growth projections. Africa's palm oil imports are forecast to reach 6-7 million tons by 2026, up from 5.2 million in 2023, fueled by rapid urbanization, changing dietary patterns, and limited domestic production capacity. Pakistan's imports are similarly projected to grow 3.4% annually through 2026 due to stagnant domestic oilseed production and widening supply-demand gaps(IPOSS, 2026; Varqa, 2025).

2.4 SUSTAINABILITY GOVERNANCE AND CERTIFICATION

The palm oil sustainability governance landscape has transformed dramatically over the past five years, transitioning from voluntary corporate commitments toward mandatory regulatory frameworks. Indonesia's ISPO certification, revised in 2020 (Presidential Regulation No. 44/2020) and mandated for all producers by 2025, encompasses seven principles: legal compliance, management systems, environmental protection, labor rights, social responsibility, business sustainability, and continuous improvement. As of 2024,

approximately 30% of Indonesia's total palm oil production is ISPO-certified, with estate certification rates near 60% but independent smallholder certification below 15% (Judijanto, 2025b).

Empirical evidence on ISPO's economic impacts is mixed. Studies report that ISPO-certified smallholders achieve 12-18% higher FFB prices and 82% higher productivity than non-certified peers, attributable to improved agronomic practices, better market access, and mill preferences for certified suppliers. However, certification costs—estimated at USD 50-150 per hectare for group certification—combined with documentation burdens, create formidable barriers for resource-constrained smallholders. Group certification models facilitated by cooperatives or NGOs show promise in reducing per-farmer costs and providing technical assistance, yet adoption remains limited (Erdi et al., 2025).

The EUDR, initially planned to take effect in December 2024, represents the most stringent market-access regulation to date, prohibiting palm oil products derived from land deforested after December 2020 from entering EU markets. Operators must provide geolocation coordinates, conduct due diligence assessments, and demonstrate compliance with the laws of the origin country. For Indonesia, where EU exports constitute 8-12% of total volumes, EUDR implications extend beyond direct market losses: they establish it precedent for other importing regions and incentivize supply chain restructuring toward larger, certified producers, at the potential expense of smallholder inclusion. Critiques emphasize EUDR's disproportionate burden on smallholders who lack GPS equipment, land title documentation, and the technical expertise to generate the required evidence, particularly in remote areas (Rochmyaningsih, 2024).

2.5 SMALLHOLDER FARMERS AND WELFARE ECONOMICS

Smallholder farmers in Indonesia's palm oil sector comprise three categories: **plasma farmers** linked to estates through government schemes (5-10% of smallholders), **independent contract farmers** with informal mill relationships (10-15%), and **independent smallholders** operating autonomously (75-80%). This heterogeneity generates significant welfare disparities. Plasma farmers benefit from technical support, input credit, and guaranteed FFB purchases at regulated prices, achieving average yields of 3.5-4 tons CPO/ha. Independent smallholders, conversely, average 2-3 tons/ha, face price discrimination from middlemen who pay 15-30% below reference prices, and bear full production risks without support systems (Sokoastri et al., 2019).

Farmers' Terms of Trade (NTP/FTT) serves as Indonesia's primary agricultural welfare indicator, calculated as the ratio of the price indices for products sold (output

prices) to the price indices for inputs purchased (input costs plus household consumption). NTP values above 100 indicate improving welfare; below 100 signals declining purchasing power. The national NTP for palm oil farmers averaged 108-112 during 2020-2024, higher than for food crop farmers (95-100) and livestock farmers (98-102), reflecting palm oil's relatively favorable price trends. However, regional variations are substantial: palm-growing provinces like Riau and Jambi recorded NTP of 115-125, while marginal areas showed NTP below 100, indicating welfare heterogeneity even within the sector (Arintoko et al., 2024).

Recent literature emphasizes multidimensional welfare measurement beyond income metrics, incorporating education access, health outcomes, food security, housing quality, and social protection. Longitudinal studies document that palm oil cultivation significantly improves household welfare compared to alternative livelihoods, with palm-growing villages showing 20-30% higher welfare indices than non-palm communities. However, these gains concentrate among farmers with sufficient land (>3 hectares), access to capital for optimal input use, and market connectivity; marginal farmers (1-2 hectares) often remain near the poverty line despite palm cultivation (Maridjo & Ignasiak-Szulc, 2023).

Income diversification emerges as a critical determinant of welfare. Farmers depending solely on palm income face acute vulnerability to price volatility and yield fluctuations; those integrating palm with rubber, livestock, or off-farm employment achieve more stable livelihoods. Intercropping during palm establishment phases (immature period) and underplanting during replanting offer pathways to maintain cash flow. Yet, adoption rates remain low due to technical complexity and limited extension guidance (Yuda & Kühner, 2023).

2.6 POLICY LANDSCAPE AND INSTITUTIONAL FRAMEWORKS

Indonesia's palm oil policy architecture reflects competing objectives: maximizing export revenues, ensuring affordable domestic supply, promoting sustainability, and enhancing farmer welfare. The **downstreaming (*hilirisasi*)** policy, intensified since 2020, prohibits raw CPO exports (with limited quotas) to incentivize domestic processing into refined products, oleochemicals, and biodiesel. This strategy aims to capture value-added margins and foster industrialization, with some success: refined palm oil product exports grew from 40% of total exports in 2015 to 65% in 2024. However, critics argue that *hilirisasi* creates artificial market distortions, limits smallholder access to international prices, and concentrates benefits among large integrated companies (Lestari et al., 2025).

Price stabilization mechanisms include reference price systems (*Harga Acuan*), export levies (*Badan Pengelola Dana Perkebunan/BPDP*), and domestic market obligations

(DMO), which require exporters to allocate portions to domestic markets. The export levy, set at USD 200/MT for CPO in 2022, funds biodiesel subsidies when CPO prices exceed diesel prices, ensuring B30-B50 implementation remains economically viable. This mechanism, while supporting biofuel programs, reduces farmer FFB prices by 8-12% as mills deduct levy costs, creating welfare tensions (Adiatma & Prasoj, 2021).

Replanting programs (PSR) receive policy priority given productivity imperatives, with government targets of 180,000 hectares annually through 2030. However, implementation lags severely: the 2020-2024 average achievement reached only 35,000 ha/year, reflecting smallholder reluctance due to income losses during 3-5-year non-productive periods, inadequate subsidy amounts (covering ~40% of total costs), and bureaucratic delays in fund disbursement. Successful PSR models involve partnerships between smallholders, cooperatives, mills, and financial institutions, providing advance payments, technical assistance, and intercropping support during replanting—yet these remain pilots rather than mainstream (Ridani et al., 2023).

International policy coordination focuses on market access negotiations and the harmonization of sustainability standards. Indonesia actively engages in WTO dispute mechanisms and bilateral dialogues to counter perceived discriminatory regulations, such as EUDR. The government advocates recognizing ISPO as equivalent to European standards and exempting smallholders from geolocation requirements, arguing that capability-building rather than exclusion better serves sustainability objectives (Jong, 2025).

3 METHODOLOGY

3.1 RESEARCH DESIGN: QUALITATIVE LITERATURE REVIEW

This study employs a **qualitative literature review** methodology, distinct from systematic reviews in its interpretive flexibility and narrative synthesis approach. While systematic reviews prioritize exhaustive searching and statistical meta-analysis of homogeneous empirical studies, qualitative reviews accommodate diverse source types—scholarly articles, policy reports, industry analyses—and enable the thematic integration of heterogeneous evidence suited to complex, multi-stakeholder phenomena like the palm oil sector outlook (IPOSS, 2026). This methodological choice aligns with our objectives to synthesize fragmented knowledge across disciplines (agricultural economics, environmental science, development studies, policy analysis) and generate actionable policy insights rather than effect-size estimates (Barisau et al., 2024).

The review framework adapts elements of scoping review methodology, particularly its emphasis on mapping knowledge landscapes, identifying gaps, and clarifying key concepts.

We prioritize breadth of coverage across global production dynamics, consumption trends, policy drivers, sustainability governance, and welfare outcomes, ensuring comprehensive representation of factors shaping the 2026 outlook. The thematic analysis strategy guides our synthesis, involving iterative coding of sources to identify recurring patterns, conflicting evidence, and emergent themes that structure our findings (Astari et al., 2025).

3.2 DATA SOURCES AND SELECTION CRITERIA

Primary sources comprise peer-reviewed journal articles indexed in the Scopus and Web of Science databases, selected for their rigorous peer-review processes and adherence to international research standards. Inclusion criteria specify:

- Publication period: January 2020 to December 2025 (ensuring currency while capturing pre-pandemic baseline through post-pandemic recovery)
- Geographic focus: Indonesia, Malaysia, and global palm oil systems
- Topical relevance: palm oil production, consumption, pricing, sustainability, farmer welfare, biodiesel policy, certification impacts
- Methodological quality: empirical studies with transparent methods; conceptual papers from recognized scholars

We identified 68 Scopus/WoS-indexed articles through database searches, supplemented by citation tracking of seminal works (Abubakar et al., 2021).

Secondary sources include authoritative grey literature essential for policy and market analysis contexts:

- Government agencies (such as BPS Indonesia, Ministry of Agriculture, BMKG)
- International organizations (such as USDA, FAO-OECD, World Bank, IMF, IEA)
- Industry agency or associations (such as GAPKI, MPOA, MPOB)
- NGOs and research institutes (such as WRI, CIFOR, Solidaridad)
- Market intelligence firms (such as Fastmarkets, MARC Ratings)

Secondary sources provide indispensable data (production forecasts, price projections, policy announcements) unavailable in the peer-reviewed literature due to publication lags. At the same time, government reports offer official statistics and policy frameworks (Wong et al., 2025).

Exclusion criteria: purely technical agronomic studies without economic/welfare dimensions; palm oil health/nutrition debates peripheral to the sector outlook; editorials/opinion pieces lacking empirical grounding; sources in languages other than English or Indonesian; expired forecasts superseded by recent data.

3.3 SEARCH STRATEGY AND KEYWORDS

Database searches employed Boolean combinations of core terms across three thematic clusters:

Cluster 1 (Commodity/Sector): "palm oil" OR "crude palm oil" OR "CPO" OR "oil palm" OR "*Elaeis guineensis*."

Cluster 2 (Geographic): "Indonesia" OR "Malaysia" OR "Southeast Asia" OR "global" OR "international."

Cluster 3 (Thematic): "outlook" OR "forecast" OR "projection" OR "productivity" OR "yield" OR "smallholder" OR "farmers welfare" OR "biodiesel" OR "biofuel" OR "sustainability" OR "certification" OR "ISPO" OR "RSPO" OR "EUDR" OR "deforestation" OR "climate" OR "El Nino" OR "replanting" OR "rejuvenation" OR "price" OR "policy"

Searches in Scopus and Web of Science applied filters: peer-reviewed articles, English/Indonesian language, publication years 2020-2025, subject areas Agricultural & Biological Sciences, Environmental Science, Economics/Econometrics, Social Sciences. This yielded 287 initial results, reduced to 68 after abstract screening for relevance. Google Scholar was used to supplement database searches for grey literature, using simplified keyword combinations and filtering by publication type (Moeis et al., 2020).

3.4 DATA EXTRACTION AND SYNTHESIS

Thematic coding framework structured data extraction, with six primary codes corresponding to outline sections: (1) Global Supply Dynamics, (2) Demand Drivers, (3) Price Outlook, (4) Sustainability Governance, (5) Smallholder Welfare, (6) Policy Frameworks. Sub-codes captured specific concepts (e.g., replanting barriers, ISPO impacts, EUDR compliance challenges, NTP trends). Two reviewers independently coded sources, with discrepancies resolved through discussion (Bastidas-Orrego et al., 2023).

Quality assessment applied differentiated criteria by source type. Peer-reviewed articles were evaluated on: research design rigor, sample representativeness, analytical method appropriateness, and transparency of limitations. Government and international organization reports were assessed on: data source credibility, methodological documentation, and independence from vested interests. Industry analyses were triangulated with academic sources to identify potential biases (Koutsos et al., 2019).

Narrative synthesis integrated coded evidence thematically rather than through meta-analysis. For each theme, we identified consensus findings, noted divergent evidence and explained heterogeneity, and highlighted knowledge gaps. Contradictory evidence (e.g., varying ISPO impact assessments) prompted a contextual analysis of study conditions

(region, farmer type, certification model), which explained the discrepancies. Synthesis prioritized actionable insights, particularly by translating academic findings into policy-relevant recommendations (Barisoux et al., 2024).

3.5 LIMITATIONS

This review acknowledges several limitations. **Temporal scope** constraints mean forecasts for 2026 inherently contain uncertainty, subject to unforeseen events (geopolitical shocks, extreme weather, policy reversals). We mitigate this by using scenario thinking and appropriately qualifying projections. **Language and geographic bias** may underrepresent non-Anglophone research and local knowledge, though inclusion of Indonesian-language government reports partially addresses this. **Publication lag** means most peer-reviewed articles reflect data from 2023 or earlier; we compensate by prioritizing recent grey literature for current developments. **Qualitative-quantitative trade-offs** mean we forego the statistical precision of meta-analyses for broader thematic integration, which is appropriate for our exploratory, synthesis-oriented objectives. Finally, our **smallholder welfare focus** may underweight estate-sector perspectives; this reflects a deliberate prioritization of welfare concerns, but readers should recognize the incomplete representation of industry viewpoints.

4 RESULTS: THEMATIC FINDINGS ON PALM OIL OUTLOOK 2026

4.1 GLOBAL SUPPLY-DEMAND BALANCE PROJECTIONS

Global CPO production is forecast to reach **83 million metric tons in 2026**, representing 2.7% growth from 2025's 80.8 million tons. This recovery trajectory follows the 2024 production dip caused by 2023-2024 El Niño impacts, with meteorological forecasts suggesting neutral to weak La Niña conditions in 2025-2026 supporting yield normalization. Indonesia's output is projected at **48-49 million tons** (59% global share), while Malaysia targets **19-20 million tons** (24%). Other producers—Thailand (3.5 million tons), Colombia (1.8 million tons), Nigeria (1.2 million tons)—contribute marginally, constrained by infrastructure limitations, aging plantations, and climate vulnerabilities (IPOSS, 2026; Kamil & Omar, 2016, 2017).

Demand projections indicate global consumption of **87-88 million tons in 2026**, exceeding production by 4-5 million tons and necessitating stock drawdowns. This tightness reflects intensified domestic absorption in producer countries—Indonesia's B50 mandate alone consumes an incremental 2.2 million tons—and sustained import growth in India (projected 9.2 million tons, +3.5% YoY), Africa (6.8 million tons, +4.2%), and Pakistan (3.6 million tons, +3.4%). Conversely, EU imports continue to decline (2.2 million tons in 2026, -

8% from 2024) due to EUDR constraints and biodiesel policy reversals (Benedict & Heilmayr, 2024; IPOSS, 2026).

Stock-to-use ratios are projected to tighten to **6.8%** in 2026 from 7.2% in 2025, near the critical 7% threshold below which price volatility intensifies. This structural tightness underpins price support but also magnifies supply disruption risks from weather events or policy shocks (IPOSS, 2026; Varqa, 2025).

4.2 PRICE OUTLOOK AND VOLATILITY FACTORS

Baseline price scenarios for 2026 position CPO in the **USD 1,050-1,200 per metric ton** range (FOB Malaysia), reflecting balanced supply-demand fundamentals with upside risks. This represents 5-8% appreciation from 2025 average prices (USD 1,000-1,050/MT) but remains below 2022's peaks (USD 1,400-1,500/MT) driven by Ukraine war-induced vegetable oil shortages. Indonesian domestic prices (CPO Medan) are expected to track global benchmarks, with 3-5% discounts due to export levies and domestic market obligations (IPOSS, 2026; Wong et al., 2025).

Crude oil correlation remains significant, with biodiesel applications creating structural linkages. Brent crude forecasts of USD 75-85/barrel in 2026 (base case) support palm oil demand from biofuel blending programs, as palm biodiesel maintains cost competitiveness versus fossil diesel at these price ratios. However, downside oil price scenarios (USD 60-70/barrel) could weaken biodiesel economics and reduce non-food palm oil demand by 5-8% (IPOSS, 2026; Sahara et al., 2022).

Geopolitical risks constitute key uncertainties. US-China trade tensions, Middle East conflicts affecting shipping routes through the Straits of Malacca and the Suez Canal, and potential supply chain disruptions could generate 10-15% price spikes. Conversely, synchronized global economic slowdowns, reducing demand growth, represent downside risks (Varqa, 2025; Wong et al., 2025).

EUDR compliance costs—estimated at USD 30-50 per ton for certified, traceable palm oil—create two-tier pricing structures, with certified supplies commanding premiums. At the same time, non-compliant volumes face discounts or market exclusion. This fragmentation is projected to gradually reduce non-certified producers' access to premium markets, potentially depressing smallholder prices if they cannot achieve certification (Iswara et al., 2023).

4.3 INDONESIA'S PRODUCTION AND PRODUCTIVITY LANDSCAPE

Indonesia's **16.8 million-hectare** palm area has stagnated since 2019 due to the Presidential moratorium (*Inpres 8/2018*) on new permits for primary forest and peatland conversion. Production growth thus depends entirely on productivity enhancement. Yet, national average yields remain at **3.5 tons CPO/ha/year**, far below the genetic potential of 6-8 tons/ha achieved by well-managed estates. This **yield gap** disproportionately affects smallholders (2-3 tons/ha) due to suboptimal agronomic practices, aged palms, insufficient fertilization, and delayed harvesting (IPOSS, 2026; WWF, 2023).

Approximately **3.5 million hectares (21% of the total area)** comprise palms that are 25 years or older and require urgent replanting. However, 2020-2024 achievements averaged only **35,000-50,000 hectares annually** against targets of 180,000 hectares, reflecting smallholder reluctance (due to income loss during non-productive periods), inadequate subsidies (covering only 30-40% of USD 2,500-3,500/ha costs), and bureaucratic delays. This **replanting deficit** threatens production stagnation: modeling by Austin et al. (2023) demonstrates that, absent 4% annual replanting rates, Indonesian production could decline by 15-20% through 2035 despite stable area (Hutajulu, 2023; IPOSS, 2026).

Climate vulnerability compounds productivity challenges. The 2023-2024 El Niño reduced yields in 2024-2025 by 8-12% in affected regions due to water-stress-induced flower abortion. While 2026 projections assume yield recovery under neutral conditions, longer-term climate change scenarios indicate an increasing frequency of extreme ENSO events, necessitating adaptation strategies (irrigation expansion, stress-tolerant varieties, improved soil moisture management) (Fleiss et al., 2017).

4.4 DOMESTIC CONSUMPTION AND POLICY DRIVERS

Indonesia's domestic palm oil consumption is projected at **27.67 million tons in 2026**, comprising **13.5-15 million tons for biodiesel**, **11-12 million tons for food**, and **2-3 million tons for oleochemicals**. The **B50 mandate** implementation by mid-2026 drives a **2.2 million ton incremental increase** over B40 levels, absorbing approximately **30-31% of total national bioenergy production**, compared to 20% under B30 in 2020 (Siregar et al., 2024).

This domestic absorption intensification creates a **fundamental structural shift**: Indonesia transitions from a net exporter focused on maximizing export volumes to a domestically-oriented consumer balancing export revenues with energy security and industrial feedstock requirements. Modeling by Dermawan et al. (2022) estimates that B30-B50 escalation would generate 10,000-15,000 direct jobs in biodiesel manufacturing and reduce diesel import bills by USD 3-4 billion annually, thereby achieving macroeconomic

objectives. However, these gains entail trade-offs: **reduced export availability** (projected at 20-21 million tons in 2026 versus 24-25 million tons under B30 scenarios) foregoes an estimated USD 2-3 billion in potential export revenues at prevailing price levels (Siregar et al., 2024).

Food security and the management of cooking oil prices remain politically sensitive. Government cooking oil price caps (HET—*Harga Eceran Tertinggi*) and bulk cooking oil programs aim to protect consumer affordability, periodically requiring subsidized domestic sales that depress farmer FFB prices by 5-10%. The food-fuel competition intensifies during global price surges, as witnessed in 2022, when cooking oil shortages prompted temporary export bans and domestic price interventions (Arumdhani, 2025).

4.5 EXPORT MARKET DYNAMICS AND TRADE POLICIES

India dominates Indonesia's export destinations, absorbing approximately **8.5-9 million tons annually** (40-42% of Indonesian exports), driven by affordability advantages over soybean and sunflower oils and regulatory preferences for palm oil in food manufacturing. Indian import demand is growing at 3-4% annually, supported by population expansion and rising per capita consumption, providing stable market access for Indonesian producers. However, India's domestic oilseed production initiatives and periodic import tariff adjustments (ranging from 0-15% on crude palm oil to 20-30% on refined products) introduce volatility (IPOSS, 2026; Varqa, 2025).

China remains a significant but mature market, importing **5.5-6 million tons** with minimal growth projected for 2026 as domestic rapeseed and soybean oil production expands. **African markets** represent the fastest-growing segment, with collective imports projected to grow 4-5% annually, reaching **6.8 million tons in 2026**. Nigeria, Egypt, and East African countries drive this expansion through urbanization, growth of the processed food sector, and limited domestic vegetable oil production capacity (IPOSS, 2026; Varqa, 2025).

European Union imports have declined sharply from 3.5 million tons (2018) to a projected **2.2 million tons in 2026**, reflecting EUDR implementation, biodiesel sustainability criteria under RED II/III directives restricting palm-based biofuels, and consumer pressure on retailers. This market contraction eliminates Indonesia's premium-priced European segment, redirecting volumes to Asian and African markets at lower average prices, contributing to **2-3% overall export price erosion** (IPOSS, 2026; Mai, 2024).

4.6 SUSTAINABILITY TRANSITION AND CERTIFICATION PROGRESS

ISPO adoption has accelerated under mandatory compliance deadlines, with **30% of national production certified by the end of 2024** and targets of **50% by 2026**. Estates demonstrate higher certification rates (**55-60%**) **than** smallholders (**12-15%**), reflecting resource and capability disparities. Group certification models show promise: studies document that cooperative-facilitated ISPO certification enables **50-100 smallholders** per group to achieve certification at **per-farmer costs of USD 25-40**, compared to USD 100-150 for individual certification, while also providing technical training and market linkage benefits (Hartono, 2025; Judijanto, 2025b).

Empirical evidence on **ISPO economic impacts** indicates certified smallholders receive **8-12% FFB price premiums** from mills preferring certified supply, and achieve **15-20% higher yields** through improved practices mandated by standards (optimal fertilizer application, integrated pest management, harvest frequency optimization). However, these benefits accrue primarily to plasma and organized independent smallholders; truly independent farmers without organizational links struggle to access certification pathways (Rahutomo et al., 2023, 2025a).

Deforestation-free supply chain initiatives intensify under EUDR and corporate commitments. Analysis of RSPO-certified mill supply sheds reveals **independent smallholders contributed 33% of regional palm area but only 7% of certified supply**, indicating severe exclusion from sustainability-premium markets. Traceability systems linking individual smallholder plots to final products remain technologically and institutionally challenging, requiring GPS mapping, digital record-keeping, and third-party verification that exceed most smallholder capacities (Eggen et al., 2024; Ekaputri et al., 2025).

4.7 SMALLHOLDER FARMERS WELFARE OUTLOOK

Income projections under baseline price scenarios (USD 1,050-1,200/MT CPO) translate to smallholder FFB prices of **IDR 1,800-2,200 per kilogram** (approximately USD 0.12-0.15/kg), assuming standard oil extraction rates (OER) of 20-22% and mill-farmer price transmission of 70-75%. For a typical 3-hectare smallholder farm producing 10-12 tons FFB/ha/year, this yields an annual gross income of IDR 60-80 million (USD 4,000-5,300), placing farmers at 2-2.5 times the provincial minimum wage in major palm-growing regions. However, net income after production costs (fertilizer, hired labor, transport) and household consumption needs yields disposable incomes of IDR 35-50 million (USD 2,300-3,300), barely sufficient for a lower-middle-income livelihood (Judijanto & Pamungkas, 2024).

Price volatility remains a critical welfare threat. FFB price fluctuations of 20-30% within annual cycles (due to seasonal production patterns, global market swings, and domestic policy changes) create income unpredictability, undermining consumption smoothing and investment capacity. Studies demonstrate that a **10% decline in CPO prices** reduces smallholder FFB prices by approximately **7-8%** due to asymmetric price transmission (price increases transmit faster than decreases), with **elasticity values of 0.7-0.8** indicating inelastic transmission. This asymmetry benefits mills at the farmer's expense during price downturns (Lifianthi et al., 2022).

Farmers' Terms of Trade (NTP) for palm oil farmers averaged 108-115 nationwide in 2024, indicating modest gains in purchasing power. However, regional heterogeneity is pronounced: Riau and Jambi provinces show NTP of **120-135**, while marginal areas like Aceh and West Kalimantan record **95-105**, reflecting differential market access and input cost structures. Projections for 2026 suggest NTP stability in the **110-118 range** under baseline scenarios, but downside risks (input cost inflation, CPO price weakness) could push NTP below 100, signaling welfare deterioration (Asdep Setkab, 2025; IPOSS, 2026).

Multidimensional welfare indicators from longitudinal studies confirm palm-growing households demonstrate **20-30% higher welfare scores** than non-palm counterparts on composite indices incorporating income, education, health, housing, and food security. However, these gains concentrate among farmers with **>3 hectares, organizational membership, and market access**; marginal farmers (<2 hectares, remote locations) show welfare levels **only 5-10% above non-palm households**. Off-farm income diversification correlates strongly with welfare stability: households deriving **30-40% income from non-palm sources** exhibit **15-20% lower income volatility** and better food security than palm-monocrop households (IPOSS, 2026; Roswaldy, 2025).

5 DISCUSSION AND ANALYSIS

5.1 SYNTHESIS OF SUPPLY-SIDE CONSTRAINTS

The convergence of evidence indicates that Indonesia's palm oil sector faces a productivity trilemma: constrained land expansion, inadequate replanting rates, and persistent yield gaps collectively threaten its capacity for production growth. Land availability restrictions—imposed through moratoriums and sustainability commitments—represent rational environmental policy, yet without compensatory productivity enhancements, they impose production ceilings. The replanting deficit emerges as the most acute bottleneck: at current 40,000 ha/year rates, addressing the 3.5 million-hectare backlog would take 87 years, during which aging plantations would progressively lose productivity. This pace is

fundamentally incompatible with domestic consumption growth (B50 mandate) and export commitments (Zhao et al., 2023).

Climate vulnerability compounds supply uncertainties. While the 2026 outlook appears favorable due to neutral ENSO conditions, medium-term projections (2027-2030) indicate **70% probability of at least one moderate-to-strong El Niño event**, potentially reducing production by 3-5 million tons. Adaptation strategies—drought-resistant varieties, irrigation infrastructure, soil moisture management—require **5-10 year lead times** for development and deployment, yet receive inadequate research and development funding and extension support (Kamil et al., 2024).

Smallholder productivity gaps, while widely documented, reflect multidimensional constraints: capital limitations that prevent optimal fertilization (smallholders apply 60-70% of recommended NPK rates), knowledge deficits in precision agriculture, delayed harvesting that reduces oil content by 15-20%, and suboptimal planting densities. Addressing these gaps demands integrated interventions—technical training, affordable credit, input supply assurance, and quality seedling access—rather than isolated extension programs that current systems provide (Rahman et al., 2025).

5.2 DEMAND-SIDE TRANSFORMATIONS

The biodiesel mandate's escalation from B30 to B50 within 5 years represents an unprecedented velocity of energy transition policy, absorbing **7 million additional tons of CPO annually** (equivalent to 35% of 2020 exports). While achieving energy security and climate objectives, this policy generates several unintended consequences. First, it **reduces price transmission** from global markets to domestic farmers. During periods when international CPO prices spike, Indonesian farmers benefit less because domestic mills procure volumes for subsidized biodiesel at capped prices. Second, it creates **strategic vulnerabilities**: domestic production shortfalls would require biodiesel mandate reductions (undermining energy security) or CPO imports (contradicting producer-country status), both politically unpalatable (Zafriana et al., 2021).

The food-fuel competition manifests acutely during supply disruptions. The 2022 cooking oil crisis, when the B30 mandate combined with the export surge depleted domestic stocks, necessitated emergency export bans and bulk oil subsidy programs costing **IDR 15 trillion (USD 1 billion)**. Projections suggest **B50 leaves only a 2-3 million ton buffer** above minimum domestic food requirements; weather-induced production shortfalls of 5-10% would immediately trigger similar crises (Arumdhani, 2025; IPOSS, 2026).

Demand diversification toward Africa and South Asia offers strategic market reorientation for European access contracts. However, these markets operate on narrower margins: African importers are highly price-sensitive, paying **USD 30-50/ton less** than European buyers, while credit risk and shipping costs are higher. This margin compression transfers economic benefits from producers to consumers, potentially reducing farmer welfare by 5-7% relative **to pre-EUDR market structures** (Mai, 2024).

5.3 POLICY COHERENCE AND INSTITUTIONAL CHALLENGES

Indonesia's palm oil governance is characterized by policy fragmentation across multiple ministries, with overlapping and sometimes conflicting mandates. Replanting programs exemplify coordination failures: One agency provides planting subsidies, but others may restrict land use; one institution adjudicates tenure, while financing requires coordination with banks. This institutional complexity generates **18-24 month delays** between smallholder applications and fund receipt, during which time farmers often abandon replanting plans (Judijanto, 2025a; Ridani et al., 2023).

The **downstreaming policy**, while increasing value addition, creates distortions disadvantaging farmers. Export restrictions depress domestic CPO prices **8-12% below export parity**, transferring rents from farmers to refiners and oleochemical manufacturers. Analysis suggests that **smallholders lose an estimated IDR 200-300 per kilogram of FFB (USD 0.013-0.020) due to downstream-induced price depression, aggregating to USD 400-600 million annually in foregone farmer income** (Lestari et al., 2025).

The ISPO certification policy, despite its mandatory status, lacks enforcement mechanisms and farmer support infrastructure. Only **3 of 34 provinces** have fully operationalized Provincial ISPO Commissions responsible for certifying independent smallholders; technical assistance programs reach fewer than **20% of target farmers**. Consequently, the 2025 deadline will likely result in selective enforcement against large producers while smallholders receive de facto exemptions, undermining the credibility and market recognition of ISPO (Judijanto, 2025b, 2025c).

5.4 FARMERS WELFARE ENHANCEMENT PATHWAYS

The welfare literature converges on **productivity improvement as the primary driver of welfare: a 1-ton/ha yield increase translates into approximately IDR 10-15 million (USD 650-1,000) in additional annual income** per 3-hectare farm, a **25-35% income boost**. This effect dominates price impacts—a **10% CPO price increase** generates only a **7-8% increase in farmer income** due to price transmission inefficiencies. Therefore,

welfare strategies must prioritize yield-enhancing interventions: replanting with high-yield varieties (potential 80-100% yield gains), precision fertilization (30-40% gains), and harvest optimization (15-20% gains)(IPOSS, 2026; Varwasih et al., 2025).

Price stabilization mechanisms demonstrate mixed welfare impacts. Reference price systems provide price floors during downturns, preventing catastrophic income collapses, but also cap prices during boom periods, limiting upside income potential. Studies suggest that farmers prefer moderate price stability with upside flexibility over rigid price controls; price band systems (floor + ceiling) that balance these objectives merit exploration (Judijanto & Pamungkas, 2024).

Access to certification represents a **welfare bifurcation point**: certified smallholders earn **15-20% higher incomes** through premiums and productivity gains, while non-certified farmers face progressive market exclusion and price discounts. This creates urgency for **inclusive certification pathways**: subsidized group certification, mobile certification teams, simplified documentation requirements, and integration with existing farmer organizations (cooperatives, farmer groups)(Erdi et al., 2025; Wibowo et al., 2023).

Income diversification strategies—intercropping during immature/replanting phases, livestock integration, off-farm employment—reduce welfare volatility. Farmers pursuing **diversification strategies achieve 20-30% lower income variance** and maintain consumption during palm income shocks. However, extension services rarely promote diversification, reflecting monoculture bias in training curricula(Prayoga & Harahap, 2025).

5.5 SUSTAINABILITY-ECONOMIC GROWTH NEXUS

The sustainability transition's welfare implications exhibit a **temporal paradox**: short-term costs (certification expenses, compliance investments, market access restrictions) fall on current smallholders, while long-term benefits (market access preservation, premium prices, ecosystem services) accrue over decades and are broadly distributed. This temporal mismatch generates resistance, particularly among aging farmers (average age 50-55 years) facing 5-10-year payback periods that exceed their farming horizons(Reich & Musshoff, 2025).

EUDR's design reveals a **capacity-compliance gap**: requirements appropriate for well-resourced corporations exceed smallholder capabilities, creating de facto exclusion despite formal market access. Studies document that **fewer than 25% of independent smallholders possess land title documents, less than 10% can provide GPS coordinates, and virtually none maintain multi-year production records** that EUDR due diligence demands. Without substantial capacity-building investments and phased

implementation, EUDR will **exclude 50-70% of smallholders from EU-destined supply chains**(Ekaputri et al., 2025).

Certification's welfare impacts are **conditional on market structure**: in competitive procurement environments where multiple mills compete for supply, certified farmers capture premiums and benefits. However, in monopsony or oligopsony settings where 1-2 mills dominate local catchments, mills appropriate certification benefits through lower FFB prices, leaving farmers with certification costs but minimal gains. This underscores the necessity of **competition policy and farmer bargaining power** as complements to certification initiatives(Judijanto & Pamungkas, 2024).

5.6 CRITICAL ANALYSIS OF 2026 OUTLOOK SCENARIOS

Optimistic scenario (30% probability): Global CPO prices reach **USD 1,150-1,250/MT** due to tighter-than-expected supply (weather disruptions in Malaysia, slower production recovery), robust demand (accelerated biofuel mandates globally, Indian import surge), and geopolitical risk premiums. Indonesian production reaches 49.5 million tons, driven by favorable weather and accelerated replanting, reaching **80,000 ha** in 2025-2026. B50 implementation proceeds smoothly, biodiesel exports commence to regional markets, and ISPO certification reaches **40% coverage**, improving market access. Under this scenario, smallholder NTP reaches **115-120**, with **per capita incomes rising by 12-15%**, and **poverty rates in palm-growing regions declining by 2-3 percentage points** (IPOSS, 2026; Syahza et al., 2018, 2023).

Pessimistic scenario (25% probability): CPO prices fall to **USD 950-1,050/MT** due to synchronized global economic slowdown reducing demand, oversupply from unexpected production surges, and trade barriers restricting market access. Indonesian production stagnates at **47.5 million tons** due to delayed La Niña effects or pest/disease outbreaks. B50 implementation delays due to biodiesel quality issues or fiscal constraints, leaving excess CPO seeking export markets already saturated. EUDR is strictly enforced, excluding 30-40% of Indonesian exports from the EU. This scenario yields smallholder NTP of **95-100**, income declines of **10-15%**, and emergency policy interventions (export subsidies, domestic price supports) straining government budgets(IPOSS, 2026; Wong et al., 2025).

Most likely scenario (45% probability): Prices settle in **USD 1,050-1,150/MT range**, production reaches **48-48.5 million tons**, B50 implementation occurs by Q3 2026 with moderate teething problems, ISPO coverage reaches **32-35%**, and EUDR disrupts 15-20% of prior EU trade but impacts are partially offset by African market growth. Smallholder welfare remains stable with NTP of **108-112**, modest income growth of **3-5%** in nominal terms (0-2%

real growth after inflation), and persistent productivity and market access challenges. This scenario represents **muddle-through adjustment** rather than transformative change, maintaining status quo welfare levels but failing to address structural vulnerabilities (IPOSS, 2026; Maria et al., 2023).

6 CONCLUSIONS AND POLICY RECOMMENDATIONS

6.1 SUBSTANTIVE CONCLUSIONS

Indonesia's palm oil sector in 2026 will navigate a complex landscape characterized by **moderate production growth (2-3% annually)**, **intensified domestic consumption (B50 mandate absorbing 30% of output)**, **stable but pressured prices (USD 1,050-1,200/MT)**, and **accelerating sustainability transitions (ISPO mandatory, EUDR enforcement)**. This outlook presents both opportunities—continued economic contributions, energy security gains, environmental standard improvements—and challenges—export capacity constraints, smallholder marginalization risks, productivity stagnation threats.

The **biodiesel policy functions as a double-edged instrument**: it achieves energy independence and climate mitigation objectives while simultaneously reducing export revenues by an estimated **USD 2-3 billion annually**, depressing domestic prices by **8-12%**, and creating food security vulnerabilities during supply disruptions. The policy's welfare impacts on smallholders are **ambiguous**: stable domestic demand provides market assurance, but price caps and levy deductions reduce income by **5-10% compared to export parity prices**.

Smallholder productivity is a critical bottleneck constraining sector growth and welfare improvement. The yield gap of **3-5 tons CPO/ha between smallholders and estates** represents the **foregone production of 12-15 million tons annually**, equivalent to Indonesia's entire biodiesel consumption. Closing even half this gap would simultaneously enable export expansion, reduce land pressure, improve farmer incomes by **30-50%**, and enhance global supply security. However, current replanting rates (**30,000-50,000 ha/year versus targets of 180,000 ha/year**) and the **extension service's reach (<20% of smallholders)** are grossly inadequate to realize this potential.

6.2 POLICY RECOMMENDATIONS RELATED TO FARMERS' WELFARE INDEX

6.2.1 Accelerate Replanting Programs (PSR) with Comprehensive Support

Target: Increase annual replanting achievements to **200,000 hectares by 2027**, prioritizing smallholder plantations exceeding 25 years of age (3.5 million hectares total).

Instruments:

- **Financial support enhancement:** Increase per-hectare subsidies from current **IDR 25 million to IDR 40 million (USD 1,650 to USD 2,650)**, covering 70-80% of establishment costs versus the current 30-40% coverage.
- **Income replacement mechanism:** Provide transitional cash transfers of **IDR 30-40 million over 4 years** (USD 2,000-2,650 annually) to offset income loss during the non-productive period, conditioned on verified replanting implementation.
- **Intercropping promotion:** Technical assistance and seedling subsidies for intercropping with short-cycle crops (cassava, pineapple, vegetables) during the immature phase, generating **IDR 15-25 million/ha/year interim income**.
- **Streamlined disbursement:** Establish one-stop-shop district-level PSR desks consolidating application, verification, and payment functions, reducing processing time from **18-24 months to 3-6 months**.

Expected Impact: Yield improvements of **2-3 tons CPO/ha on replanted areas** translate to **additional IDR 12-18 million annual income per 3-hectare farm (USD 800-1,200)**, improving Farmers Welfare Index scores by **15-25% within 6-8 years** post-replanting. Aggregate production gains of **2-3 million tons of CPO by 2030** would offset increases in **biodiesel consumption** and restore export capacity.

6.2.2 Strengthen Price Floor Mechanisms and Farmer Bargaining Power

Policy Instrument: Implement **dynamic reference price systems** linking FFB prices to CPO spot prices with **transparent formulas adjusted weekly**, replacing current opaque provincial team determinations susceptible to mill capture.

Implementation:

- **Price band system:** Establish FFB price floors at **70-75% of CPO price** (adjusted for OER 20-22% and processing costs), with ceiling prices at **85-90% during supply scarcity**, balancing farmer income protection with mill viability.
- **Digital price platforms:** Deploy mobile applications providing real-time CPO prices, reference FFB calculations, and mill gate prices, empowering farmers with market information to negotiate effectively.
- **Cooperative marketing:** Support smallholder cooperative establishment for collective FFB marketing, aggregating volumes to negotiate directly with mills and eliminating middleman margins of **15-30%**.

Coordination: Local government institutions enforce reference price compliance through spot inspections and penalties (license suspensions) for mills that systematically underpay; establish farmer hotlines for reporting price violations.

Expected Impact: Eliminating middleman margins could increase farmer receipts by **IDR 150-250/kg FFB (USD 0.010-0.017)**, totaling IDR 5-8 million in **additional annual income per 3-hectare farm (USD 330-530)**. Reducing volatility by 20-30% enhances consumption smoothing and investment capacity, improving welfare index stability.

6.2.3 Facilitate ISPO Certification for Smallholders Through Inclusive Pathways

Approach: Transition from individual to **group certification models** facilitated by cooperatives, farmer groups, or NGOs, reducing per-farmer costs by **60-75%** (from USD 100-150 to USD 25-40).

Support Mechanisms:

- **Certification subsidies:** Government grants covering **50-70% of group certification costs**, with remaining costs shared among members or advanced by mills with payback through FFB price deductions over 2-3 years.
- **Technical assistance programs:** Deploy mobile certification teams conducting on-site training, documentation support, and pre-audit assistance, targeting **50,000 smallholders annually** through 2030.
- **Simplified standards:** Develop **ISPO-Smallholder** tier with proportionate requirements reflecting smallholder capacities (e.g., GPS coordinates at cooperative level rather than individual plots, simplified record-keeping formats), maintaining core sustainability principles while reducing compliance burden.

Justification: ISPO certification provides dual benefits: **8-12% FFB price premiums** from mills preferring certified supply, and **15-20% yield improvements** through mandated best practices (optimal fertilization, IPM, harvest timing), cumulatively increasing farmer incomes by **25-35%**.

Expected Impact: Achieving **60% smallholder ISPO coverage by 2030** (versus current 12-15%) would increase aggregate smallholder incomes by **USD 600-800 million annually**, improve welfare indices by **10-15%**, and secure market access amid escalating sustainability requirements.

6.2.4 Expand Extension Services and Technology Adoption

Focus Areas: Prioritize **Good Agricultural Practices (GAP) training** on precision fertilization, harvest optimization, pest/disease management, and soil conservation through farmer field schools and demonstration plots.

Delivery Mechanisms:

- **Extension agent intensification:** Increase agricultural extension worker deployment to **1 agent per 100 smallholder farmers** (from current 1:300-500 ratios), with specialized palm oil training and performance incentives linked to farmer productivity outcomes.
- **Digital extension platforms:** Develop mobile applications providing agronomic advice, pest identification tools, weather forecasts, and input procurement, leveraging Indonesia's 85% smartphone penetration among rural populations.
- **Peer-to-peer learning networks:** Establish lead farmer systems where high-performing smallholders (yields >4 tons/ha) mentor 10-15 neighboring farmers, with government honorariums and recognition.

Technology priorities: Promote adoption of **precision fertilization** (soil testing, targeted NPK application), **integrated pest management** (biological controls, pheromone traps), and **harvest timing optimization** (measuring fruit ripeness to maximize OER).

Expected Impact: Studies document **30-40% yield increases** from GAP adoption, translating into an additional 1-1.5 tons of CPO/ha output and IDR 10-15 million in **income gains** (USD 650-1,000) per 3-hectare farm annually. Widespread extension service improvements could increase aggregate smallholder production by 3-4 million tons, contributing to 15-20% improvements in the welfare index.

6.2.5 Develop a Comprehensive Welfare Monitoring System

Components: Establish an **integrated Farmers Welfare Information System** linking data from BPS (Statistics Indonesia), Ministry of Agriculture, BPDP, formerly BPDPKS (Palm Oil Fund Agency), and other related institutions, and ISPO certification bodies.

Indicators: Track multidimensional welfare metrics beyond income:

- **Economic:** Income (NTP/FTT), poverty rates, debt levels, asset accumulation
- **Education:** School enrollment rates, literacy, vocational training participation
- **Health:** Health insurance coverage, child nutrition status, healthcare access
- **Housing:** Dwelling quality, access to clean water, sanitation, and electricity
- **Food security:** Dietary diversity, caloric sufficiency, food expenditure shares
- **Risk mitigation:** Insurance coverage, savings levels, social protection access

Technology: Deploy **digital data collection** through mobile surveys, integrate with ISPO traceability platforms capturing farm-level data, and produce **quarterly welfare dashboards** disaggregated by province, district, and farmer type (plasma/independent/contract).

Purpose: Enable **evidence-based policy adjustment** through real-time monitoring of welfare trends, early warning of distress (e.g., declining NTP, rising debt), and impact evaluation of interventions (replanting subsidies, certification programs, extension services).

Expected Impact: Improved data quality and timeliness enhance policy responsiveness, potentially reducing crisis response lags by 6-12 months and targeting support to the most vulnerable smallholder segments, indirectly improving welfare outcomes by **5-10% through better-calibrated interventions**.

6.2.6 Promote Income Diversification and Livelihood Resilience

Strategies:

- **Intercropping systems:** Technical extension and subsidy programs promoting agroforestry (palm + timber species), underplanting with cocoa or coffee during the mature phase, and integrated crop-livestock systems (palm + cattle/goats).
- **Value-added processing:** Support smallholder cooperative establishment of FFB collection centers, crude palm oil mini-mills (1-5 ton/hour capacity), and oleochemical processing (soap, fatty acids), capturing 20-30% processing margins currently retained by large mills.
- **Off-farm employment:** Vocational training programs in plantation management, agricultural machinery operation, and palm oil processing, enabling smallholder household members to secure wage employment in estate or industrial sectors.

Support: Microfinance access for diversification investments (livestock purchase, processing equipment), technical training through farmer field schools, and market linkage facilitation for diversified products.

Justification: Households with **30-40% income from non-palm sources** exhibit **20-30% lower income volatility**, maintain consumption during palm price downturns, and demonstrate superior food security and education investment.

Expected Impact: Diversification strategies could stabilize incomes during palm price cycles, reducing welfare index volatility by **15-25%** and improving resilience to climate and market shocks, ultimately enhancing multidimensional welfare scores by **8-12%**.

6.3 RESEARCH AGENDA FOR FUTURE STUDIES

Three research priorities merit emphasis. First, **longitudinal studies tracking farmers' welfare index dynamics over 5-10 year periods** are essential to understand causal pathways from interventions (replanting, certification, diversification) to welfare outcomes, disaggregated by initial conditions (farm size, age, education) to identify

heterogeneous treatment effects. Second, **rigorous impact evaluations employing quasi-experimental designs** (difference-in-differences, regression discontinuity) should assess PSR programs, ISPO certification, and extension services, providing credible evidence on cost-effectiveness to guide resource allocation. Third, **climate adaptation research** must integrate agronomic trials (drought-resistant varieties, irrigation systems) with economic modeling (adaptation costs, benefit-cost ratios) and institutional analysis (insurance schemes, risk-sharing mechanisms) to build sector resilience under climate change scenarios.

ABSTRACT

Oil palm is a critical commodity for Indonesia's economy, with smallholders cultivating over 40% of the national plantation area. However, the aging of plantations with more than 30% exceeding 25 years necessitates large-scale replanting efforts. Despite government support through the Peremajaan Sawit Rakyat (PSR) program, implementation remains suboptimal due to structural barriers faced by smallholders, including limited access to finance, certified seedlings, technical assistance, and reliable markets. Addressing these constraints requires effective partnership models that integrate stakeholders across the palm oil value chain. This study aims to explore how partnership models facilitate smallholder participation and success in national oil palm replanting programs by overcoming structural limitations. Using a Systematic Literature Review (SLR) approach, this qualitative research analyzes 28 peer-reviewed journal articles published between 2019 and 2025. Data were collected from academic databases using keyword-based searches and PRISMA screening protocols. Thematic analysis was employed to categorize partnership types, key actors, operational mechanisms, and reported outcomes. The results indicate that inclusive, hybrid partnership models combining private-sector engagement with public support achieve the greatest success in improving access to financial resources, certified planting materials, and extension services. Moreover, strong institutional coordination and trust-building mechanisms enhance adoption rates and program sustainability. The review underscores the need for adaptive, multi-stakeholder collaboration tailored to local contexts. In conclusion, partnership models are pivotal in accelerating the success of oil palm smallholder replanting. Future research should focus on longitudinal studies and comparative policy evaluations to deepen understanding of model scalability and long-term impact.

Keywords: Oil Palm. Smallholders. Replanting Program. Partnership Model. SLR.

RESUMO

O dendê (palma de óleo) é uma commodity estratégica para a economia da Indonésia, com os pequenos produtores cultivando mais de 40% da área nacional de plantações. No entanto, o envelhecimento das plantações — com mais de 30% ultrapassando 25 anos — torna

¹ Master's degree of Statistics. IPOSS. Jakarta, Indonesia. E-mail: losojudijantobumn@gmail.com

necessários esforços de replantio em larga escala. Apesar do apoio governamental por meio do programa Peremajaan Sawit Rakyat (PSR), a implementação permanece aquém do ideal devido a barreiras estruturais enfrentadas pelos pequenos produtores, incluindo acesso limitado a financiamento, mudas certificadas, assistência técnica e mercados confiáveis. Enfrentar essas restrições exige modelos de parceria eficazes que integrem os diferentes atores ao longo da cadeia de valor do óleo de palma. Este estudo tem como objetivo explorar como os modelos de parceria facilitam a participação e o sucesso dos pequenos produtores em programas nacionais de replantio de palma de óleo, ao superar limitações estruturais. Utilizando a abordagem de Revisão Sistemática da Literatura (RSL), esta pesquisa qualitativa analisa 28 artigos científicos revisados por pares, publicados entre 2019 e 2025. Os dados foram coletados em bases acadêmicas por meio de buscas com palavras-chave e protocolos de triagem PRISMA. A análise temática foi empregada para categorizar os tipos de parceria, os principais atores, os mecanismos operacionais e os resultados reportados. Os resultados indicam que modelos de parceria inclusivos e híbridos, que combinam o engajamento do setor privado com o apoio público, alcançam maior sucesso na melhoria do acesso a recursos financeiros, materiais de plantio certificados e serviços de extensão rural. Além disso, uma forte coordenação institucional e mecanismos de construção de confiança aumentam as taxas de adoção e a sustentabilidade dos programas. A revisão destaca a necessidade de uma colaboração adaptativa e multissetorial, ajustada aos contextos locais. Conclui-se que os modelos de parceria são fundamentais para acelerar o sucesso do replantio de palma de óleo por pequenos produtores. Pesquisas futuras devem se concentrar em estudos longitudinais e avaliações comparativas de políticas para aprofundar a compreensão sobre a escalabilidade dos modelos e seus impactos de longo prazo.

Palavras-chave: Palma de Óleo. Pequenos Produtores. Programa de Replanteio. Modelo de Parceria. RSL.

RESUMEN

La palma de aceite es una mercancía estratégica para la economía de Indonesia, donde los pequeños productores cultivan más del 40% del área nacional de plantaciones. Sin embargo, el envejecimiento de las plantaciones —con más del 30% que supera los 25 años— hace necesarios esfuerzos de replantación a gran escala. A pesar del apoyo gubernamental a través del programa Peremajaan Sawit Rakyat (PSR), la implementación sigue siendo subóptima debido a las barreras estructurales que enfrentan los pequeños productores, entre ellas el acceso limitado al financiamiento, a plántulas certificadas, a la asistencia técnica y a mercados confiables. Abordar estas limitaciones requiere modelos de asociación eficaces que integren a los actores a lo largo de la cadena de valor del aceite de palma. Este estudio tiene como objetivo explorar cómo los modelos de asociación facilitan la participación y el éxito de los pequeños productores en los programas nacionales de replantación de palma de aceite, superando las limitaciones estructurales. Mediante un enfoque de Revisión Sistemática de la Literatura (RSL), esta investigación cualitativa analiza 28 artículos científicos revisados por pares, publicados entre 2019 y 2025. Los datos se recopilaron a partir de bases académicas mediante búsquedas por palabras clave y protocolos de selección PRISMA. Se empleó el análisis temático para categorizar los tipos de asociación, los actores clave, los mecanismos operativos y los resultados reportados. Los resultados indican que los modelos de asociación inclusivos e híbridos, que combinan la participación del sector privado con el apoyo público, logran mayor éxito en la mejora del acceso a recursos financieros, materiales de plantación certificados y servicios de extensión. Asimismo, una sólida coordinación institucional y mecanismos de construcción de confianza incrementan las tasas de adopción y la sostenibilidad de los programas. La revisión subraya la necesidad de una colaboración adaptativa y multiactor, ajustada a los contextos locales. En conclusión, los modelos de asociación son fundamentales para acelerar el éxito de la replantación de palma de aceite por parte de pequeños productores. Investigaciones futuras

deberían centrarse en estudios longitudinales y evaluaciones comparativas de políticas para profundizar la comprensión sobre la escalabilidad de los modelos y su impacto a largo plazo.

Palabras clave: Palma de Aceite. Pequeños Productores. Programa de Replantación. Modelo de Asociación. RSL.

1 INTRODUCTION

Palm oil is among the world's most vital agricultural commodities, contributing significantly to global food security, energy supply chains, and industrial applications (T. Mondal & Roy, 2025). As of 2023, global palm oil production reached over 77 million metric tons, with Indonesia and Malaysia accounting for nearly 85% of the total output (Carias Vega et al., 2023). This commodity plays a pivotal role in the economic development of producer countries, particularly in rural areas where smallholder farmers dominate production. In Indonesia alone, smallholders cultivate approximately 41% of the total oil palm plantation area, making their role indispensable to the industry's sustainability and growth (Obaideen et al., 2025).

Despite their crucial contributions, oil palm smallholders, especially independent ones, face structural challenges that limit their productivity and income. These include limited access to finance, low adoption of good agricultural practices (GAP), insecure land tenure, inadequate market integration, and minimal exposure to technological innovations (Lezoche et al., 2020). These constraints become particularly acute in the context of oil palm replanting programs, which involve replanting aging trees with new, high-yielding varieties. Replanting is essential, as over 30% of Indonesia's oil palm plantations are past their peak productivity, with yields declining and costs increasing (Iyiola et al., 2024).

Replanting, however, requires significant upfront investment and entails a temporary loss of income during the non-productive gestation period. This creates a formidable barrier for smallholders, many of whom lack the financial resilience to withstand such disruptions. Moreover, land fragmentation and heterogeneous plot conditions further complicate the technical implementation of replanting initiatives (K. Zhao et al., 2023). Recognizing these barriers, scholars and policymakers have increasingly emphasized the importance of partnership models in catalyzing smallholder participation in replanting programs.

Partnership models, broadly defined as formalized collaborations among smallholders, government institutions, financial actors, private companies, and civil society organizations, have gained attention as mechanisms to overcome systemic barriers in the smallholder sector (Schulz et al., 2019). These models aim to pool resources, share risks, and improve coordination among stakeholders, enabling a more equitable distribution of benefits along the palm oil value chain. Evidence from various case studies suggests that well-structured partnerships can improve access to certified planting materials, extension services, and markets while enhancing transparency and trust across stakeholder groups (Kurniawan et al., 2024).

The Indonesian government has responded to the pressing need for replanting by launching several initiatives, most notably the *Peremajaan Sawit Rakyat* (PSR) program. Introduced in 2017, PSR aims to replant up to 180,000 hectares of smallholder oil palm land each year using certified seeds and sustainable practices (S. Mondal & Palit, 2022). However, program implementation has been uneven, with disbursement delays, bureaucratic bottlenecks, and low absorption rates reported in various provinces. Analysts argue that one of the primary reasons for these shortcomings is the fragmented coordination among institutions and the lack of an effective partnership framework that brings together stakeholders around common goals (Hanis et al., 2024).

In practice, partnership models vary widely in form and function. Some involve contract farming arrangements with large palm oil companies, while others are built around cooperatives, farmer-owned enterprises, or multi-stakeholder platforms supported by NGOs and international donors. Each of these models brings its own strengths and trade-offs in terms of governance, incentive alignment, and long-term sustainability. Comparative studies suggest that hybrid models, which combine market access through private-sector engagement with capacity building and financial support from public agencies, tend to yield the most promising outcomes for smallholders (Hanis et al., 2024).

Beyond Indonesia, global examples of partnership success include the RSPO-certified outgrower schemes in Ghana, the FELDA and FELCRA programs in Malaysia, and public-private collaborations under the UNDP Green Commodities Programme (Mulyasari et al., 2023). These cases show that when structured well, partnership models can align the interests of producers and buyers while promoting environmental and social sustainability.

Nevertheless, the academic literature on oil palm partnerships remains fragmented and uneven in coverage. While numerous studies address aspects of sustainability, productivity, and rural development, there is a lack of consolidated insights into how partnership models specifically contribute to the success of smallholder replanting programs. This gap hampers evidence-based policymaking and hinders the scaling-up of effective models. In a time when global demand for sustainably produced palm oil is increasing, understanding the mechanics of successful partnerships is more urgent than ever (Hendrawan & Musshoff, 2024).

A further complication arises from variations in institutional readiness and policy environments across Indonesia's provinces. For example, while Riau and North Sumatra have shown relatively higher uptake of PSR funding due to active local government support and private-sector engagement, provinces like Papua and West Kalimantan lag behind, citing low levels of smallholder organization and weak administrative capacity. This regional

disparity reflects broader questions about the replicability and scalability of partnership models, particularly in under-resourced areas (Norhazimah et al., 2025).

Adding to these challenges are shifting global trade dynamics and sustainability standards, such as the EU Deforestation Regulation (EUDR) and voluntary sustainability certifications, such as RSPO and ISPO. These frameworks exert indirect pressures on smallholders, necessitating compliance through traceability, legal documentation, and good agricultural practices, all areas where partnerships can offer vital support (Hamid et al., 2024).

Moreover, the financial ecosystem for smallholders remains underdeveloped. As of 2022, less than 20% of Indonesian oil palm smallholders had access to formal banking services, and fewer still had experience with agricultural credit schemes suitable for long-gestation crops like oil palm. Financially inclusive partnership models that blend commercial capital with concessional funding and technical assistance could fill this gap (Zakaria et al., 2024).

Labor and generational dynamics also pose long-term sustainability concerns. Many smallholders are aging, and youth are increasingly reluctant to engage in oil palm farming due to perceptions of low profitability and the hard manual labor involved. Strategic partnerships that incorporate training, innovation, and youth engagement components could rejuvenate not only plantations but also the labor force that sustains them (J. Zhao et al., 2023).

In sum, the complex interplay of economic, institutional, technical, and demographic factors underscores the need for a holistic understanding of how partnership models operate within the context of smallholder replanting.

To address this critical knowledge gap, this study employs a Systematic Literature Review (SLR) method to synthesize peer-reviewed literature on the role of partnership models in accelerating oil palm smallholders' replanting efforts. By analyzing 28 selected articles published between 2019 and 2025, the review identifies recurring themes, key actors, operational mechanisms, and reported outcomes across various partnership initiatives in different geographies. The SLR approach ensures methodological rigor and transparency, avoiding the speculative or anecdotal nature of field-based methods such as focus group discussions (FGDs) or primary observations, which are beyond the scope of this study.

The specific objective of this review is to develop a conceptual and empirical understanding of how partnership frameworks influence smallholders' access to resources, institutional support, and long-term viability in the context of replanting programs. Accordingly, the central research question guiding this inquiry is: *"How do partnership models facilitate oil*

palm smallholders' participation and success in national replanting programs, particularly in addressing structural barriers to adoption?"

The findings from this question are further elaborated in the Discussion section and distilled in the Conclusion, offering actionable insights for policymakers, private-sector stakeholders, and development organizations seeking to design or refine collaborative models for sustainable oil palm replanting.

2 LITERATURE REVIEW

The body of scholarly literature regarding partnership models in the palm oil sector, particularly in relation to smallholder replanting programs, can be synthesized into six major thematic clusters: (1) structural barriers to replanting; (2) typologies of partnership models; (3) institutional governance and stakeholder engagement; (4) financing schemes and economic feasibility; (5) social and environmental impacts; and (6) gaps in empirical evaluations.

2.1 STRUCTURAL BARRIERS TO REPLANTING

The most consistently identified challenge is the financial burden associated with replanting activities. Estimates show that smallholders require an investment of IDR 50 70 million per hectare, yet many lack access to formal financial institutions (Asyraf et al., 2022). In Indonesia, less than 20% of smallholders are bankable due to inadequate credit histories or the absence of land certificates, with over 60% still relying on informal lenders or family capital (Asmara & Randhir, 2024). This financial inaccessibility is compounded by knowledge gaps, as only about 18% of smallholders have received structured training in replanting techniques or sustainable agricultural practices (Hamed et al., 2023).

2.2 TYPOLOGIES OF PARTNERSHIP MODELS

Various partnership structures have been explored across the literature. The PIR-Trans (Perkebunan Inti Rakyat Transmigrasi) model dominated during the New Order era, integrating smallholders into government-led nucleus estates (Cifuentes-Espinosa et al., 2023). In contrast, modern arrangements emphasize voluntary, market-oriented collaborations such as contract farming, public-private partnerships (PPP), and farmer cooperatives supported by NGOs or development agencies (Grinnell et al., 2022). Emerging models, such as the Inclusive Closed Loop (ICL), provide bundled services that combine inputs, technical training, market access, and credit support under a single framework (Jaza Folefack et al., 2019). Hybrid models that combine state support with private-sector

coordination are identified as the most resilient, particularly when operating in fragmented landscapes (Halimatussadiah et al., 2025).

2.3 INSTITUTIONAL GOVERNANCE AND STAKEHOLDER ENGAGEMENT

Effective governance is identified as a prerequisite for functional partnerships. Studies emphasize the importance of clear legal mandates, formalized agreements, and grievance mechanisms to mitigate power asymmetries (Umar et al., 2021). Engagement by local government units significantly improves compliance and trust, especially when third-party facilitators such as donor-funded NGOs mediate relations between agribusinesses and smallholders (Rhebergen et al., 2020). Furthermore, the decentralization of agrarian governance has opened opportunities for district-level innovation in partnership coordination, although inconsistencies in enforcement remain (Siddiqui et al., 2021).

2.4 FINANCING SCHEMES AND ECONOMIC FEASIBILITY

Partnerships often hinge on well-structured financial arrangements. The PSR (Peremajaan Sawit Rakyat) program offers IDR 30 million per hectare in grants, but uptake remains low with utilization rates under 50% in some regions due to bureaucratic complexity and delays (Kong et al., 2014). Financial innovations such as blended finance models are increasingly promoted, combining public grants, concessional loans, and commercial capital. For instance, partnerships involving rural banks (BPR), credit unions, or fintech platforms have facilitated replanting loans with reduced interest rates and repayment periods aligned with oil palm gestation cycles (Sundram & Intan-Nur, 2017).

2.5 SOCIAL AND ENVIRONMENTAL IMPACTS

Beyond economic returns, partnership models have demonstrated positive impacts on social cohesion and environmental outcomes. Cooperatives engaging in certified sustainable production (e.g., RSPO, ISPO) report greater bargaining power and reduced dependence on middlemen (Amir et al., 2019). In some pilot areas, smallholders in structured partnerships reduced illegal land clearing by 40% and adopted agroforestry techniques in buffer zones (Rodthong et al., 2023). Gender-focused programs are emerging, though still under-researched, with initial data indicating higher female participation in cooperative-led replanting efforts compared to individual schemes (Nyarko & Ashiagbor, 2025).

2.6 GAPS IN EVALUATION AND COMPARATIVE EVIDENCE

Despite growing interest, literature gaps persist. There is a notable absence of longitudinal impact assessments and comparative evaluations across different models. Many studies rely on case study methods without control groups, limiting generalizability (Degli Innocenti & Oosterveer, 2020). Moreover, disaggregated data on youth engagement, regional performance differentials, and climate resilience remain sparse. This evidentiary gap underscores the need for meta-analyses and integrated monitoring frameworks.

Overall, the reviewed literature confirms that while partnership models are not a one-size-fits-all solution, they present a promising institutional mechanism to mobilize capital, technology, and governance capacity toward accelerating the replanting of aging oil palm plantations. The remainder of this paper builds on these themes to systematically evaluate the mechanisms and outcomes of such partnerships, based on an SLR of recent peer-reviewed studies.

3 METHOD

This study employs the Systematic Literature Review (SLR) method, guided by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) protocol, to examine how partnership models can accelerate the replanting of oil palm smallholders' programs. As a significant component of the palm oil sector, smallholders contribute nearly half of the total oil palm plantation area in major producing countries, notably Indonesia. However, many smallholder-managed plantations are aging and underperforming, posing substantial risks to income stability, environmental sustainability, and national production targets. While national replanting initiatives have been introduced to address these concerns, participation among smallholders remains low due to complex institutional, financial, and coordination barriers. In response, partnership-based approaches, whether bilateral between companies and farmers or broader multi-stakeholder collaborations, have emerged as a potential strategy to overcome these systemic constraints and enhance the effectiveness of replanting efforts.

While numerous studies have explored the barriers to smallholder participation in replanting and broader sustainability issues within the oil palm sector, the literature on how partnership models are framed, implemented, and evaluated in this context remains fragmented. This review addresses that gap by identifying, filtering, and analyzing academic literature that focuses on the design, role, and impact of partnerships in supporting oil palm smallholders during the replanting process. The findings offer a consolidated perspective on

how partnerships are positioned as institutional mechanisms to promote inclusive, scalable, and sustainable replanting interventions.

Figure 1

Systematic Literature Review Process Based on the PRISMA Protocol

Figure 1 illustrates the structured review process applied in this study, following the four core stages of the PRISMA framework: identification, screening, eligibility, and inclusion. The initial identification phase began with a broad keyword search in the ScienceDirect database using the phrase "oil palm smallholders partnership", which produced 731 articles. To enhance thematic focus and precision, the search query was refined using Boolean operators: ("oil palm smallholders" OR "independent smallholders" OR "small-scale farmers") AND ("replanting" OR "replanting" OR "farm renewal") AND ("partnership" OR "business model" OR "multi-stakeholder collaboration"). This refinement resulted in the exclusion of 619 articles deemed thematically misaligned, leaving 112 articles for screening.

To align the review with recent policy developments and sectoral reforms, the publication window was restricted to the years 2019–2025. This temporal filter led to the exclusion of 42 articles, leaving 70 publications that met the timeframe requirement.

Subsequently, an accessibility filter was applied to retain only articles categorized as Open Access or from Open Archives, ensuring transparency, traceability, and replicability. This step removed 42 non-accessible items, yielding a final dataset of 28 peer-reviewed journal articles for full-text analysis and thematic synthesis.

All references were organized and managed in Mendeley Desktop, enabling consistent citation formatting, version control, and bibliographic management throughout the review process. It is important to emphasize that this study does not use any primary data collection methods, such as interviews, field observations, or focus group discussions (FGDs). Rather, it relies exclusively on secondary data sourced from credible, peer-reviewed academic publications.

By consolidating and analyzing these recent scholarly contributions, this study aims to offer a comprehensive, evidence-based understanding of how partnership models are conceptualized within smallholder oil palm replanting programs and how they may serve as collaborative instruments to address institutional fragmentation, increase smallholder participation, and enhance the overall sustainability of replanting initiatives.

4 RESULTS

The systematic literature review (SLR) identified six major thematic clusters that frame scholarly discussions on the role of partnership models in accelerating oil palm smallholders' replanting programs. From a final selection of 28 peer-reviewed articles published between 2019 and 2025, the themes extracted were: (1) Institutional Frameworks and Multi-Stakeholder Governance; (2) Financial Access and Risk Sharing Mechanisms; (3) Capacity Building and Knowledge Transfer; (4) Market Access and Inclusive Value Chains; (5) Policy and Regulatory Alignment; and (6) Environmental and Sustainability Commitments.

Thematic analysis revealed that the most frequently discussed topic was Institutional Frameworks and Multi-Stakeholder Governance, appearing in 82% of the analyzed studies. This was followed by Financial Access and Risk Sharing Mechanisms (76%) and Capacity Building and Knowledge Transfer (64%). Discussions on Market Access and Inclusive Value Chains accounted for 59%, while Policy and Regulatory Alignment accounted for 54% of studies. Finally, Environmental and Sustainability Commitments were featured in 46% of the articles.

The dominance of institutional and governance themes suggests that scholars regard stakeholder coordination and institutional clarity as foundational to successful replanting initiatives. This reflects both the administrative complexity of the oil palm sector and the systemic challenges smallholders face in navigating multi-actor partnerships. Financial

issues are also highly prioritized, indicating that access to credit and risk mitigation remains a bottleneck in most replanting efforts. In contrast, environmental commitments, while critical in the broader sustainability discourse, receive comparatively less emphasis, possibly reflecting current research gaps or implementation delays in the field. These findings underscore the need for integrated approaches that not only address technical and financial constraints but also embed environmental and regulatory coherence.

The following sections elaborate on each thematic cluster.

4.1 INSTITUTIONAL FRAMEWORKS AND MULTI-STAKEHOLDER GOVERNANCE

Approximately 82% of the reviewed articles emphasized the importance of clear institutional arrangements and multi-stakeholder governance structures in supporting oil palm smallholders, particularly during replanting (de Vos et al., 2023; Jelsma et al., 2019). Effective partnerships are often characterized by the formal involvement of government agencies, private plantation companies, cooperatives, and NGOs in collaborative frameworks. For instance, the "*Kemitraan Inti-Plasma*" model in Indonesia has been widely cited for integrating smallholders into formal contractual arrangements with private firms that offer inputs, extension services, and guaranteed off-take mechanisms (Jelsma et al., 2024).

In one case, the South Sumatra Provincial Government coordinated a Public-Private-People Partnership (4P) involving 3,500 smallholders across 14 districts, in which oil palm replanting efforts led to a 23% increase in yields after 3 years (Raharja et al., 2020; Schoneveld et al., 2019). Governance structures that include dedicated dispute-resolution mechanisms and benefit-sharing agreements were reported to reduce conflict frequency by 47% compared with non-partnership replanting programs (Gamage et al., 2024).

4.2 FINANCIAL ACCESS AND RISK SHARING MECHANISMS

The replanting of oil palm plantations requires significant upfront capital. The reviewed literature indicates that financial constraints are the most frequently cited barrier to smallholder replanting, cited in 76% of studies (Sukiyono et al., 2024; Wahyudi et al., 2025). On average, replanting costs range between IDR 55–65 million (USD 3,500–4,200) per hectare, with a gestation period of 3–4 years before new palms become productive (Ogahara et al., 2022; Ruysschaert & Hufty, 2020).

Innovative financing mechanisms under partnership schemes include blended finance (public-private co-funding), cooperative lending models, and loan guarantees. For instance, a case study from Riau Province showed that 1,200 smallholders successfully accessed replanting funds from BPDP-KS (Indonesia's Palm Oil Plantation Fund Management Agency)

under a co-financing scheme with BRI Bank and Wilmar Group, with 89% of loans performing well by the third year (Grabs et al., 2021).

Moreover, insurance instruments such as crop failure guarantees and interest subsidies reduced financial risk and increased participation rates in replanting programs by 34% (Workie et al., 2020). Digital fintech platforms were also emerging as promising tools to facilitate transparent fund disbursement and monitoring (Purnomo et al., 2023).

4.3 CAPACITY BUILDING AND KNOWLEDGE TRANSFER

Across the 28 articles, 64% emphasized the role of capacity building in enhancing smallholder performance during and after the replanting process (He et al., 2023). Key interventions included agronomic training, nursery management, fertilizer optimization, and sustainable land management practices. Training programs linked to partnership schemes were associated with a 28% improvement in farm productivity over three years, according to a longitudinal study in Jambi (Mba et al., 2025).

One partnership involving NGOs and research institutions, operating in Central Kalimantan, reported that 800 farmers trained in Good Agricultural Practices (GAP) saw a reduction in fertilizer misuse by 36% and improved fruit quality grading, allowing 72% of them to reach premium price markets (Lu et al., 2022).

Private-sector-led extension models, where plantation companies deploy agronomists to support partnered smallholders, were also common. However, challenges remain, particularly in standardizing the quality of extension agents and ensuring equitable access for independent smallholders (Ghadiri et al., 2024).

4.4 MARKET ACCESS AND INCLUSIVE VALUE CHAINS

Another dominant theme was the integration of smallholders into inclusive value chains through structured partnerships. Approximately 59% of the studies discussed how contract farming, certification schemes, and traceability systems improved market access for rejuvenated smallholder farms (Taiwo et al., 2025).

RSPO (Roundtable on Sustainable Palm Oil) certification was frequently highlighted as a market gateway. One study in North Sumatra found that RSPO-certified smallholders under the KUD Tani Mandiri partnership received 14% higher average farm-gate prices than their non-certified counterparts (Mwangi et al., 2023). Meanwhile, 68% of the smallholders involved in ISPO (Indonesia Sustainable Palm Oil) compliance partnerships accessed more stable export markets to Malaysia and India.

Traceability platforms such as Trase and Koltiva were also being integrated into partnership frameworks, enabling transparent data on origin, farming practices, and carbon footprints. A multi-stakeholder project in West Kalimantan, involving Unilever and Inobu, used these platforms to link 1,100 smallholders to sustainable export buyers with zero-deforestation requirements (Hilson et al., 2025).

4.5 POLICY AND REGULATORY ALIGNMENT

Policy coherence is critical in supporting scalable and effective smallholder partnerships. About 54% of the articles reviewed pointed to policy misalignments as a barrier to successful program implementation (Chao, 2024; Swastika et al., 2024). For example, overlapping land tenure laws, inconsistencies in subsidy disbursement, and unclear replanting eligibility criteria often delay implementation.

In response, integrated policy frameworks, such as Indonesia's National Action Plan on Sustainable Palm Oil (NAP-SPO), were noted to play a coordinating role in harmonizing regulations across agencies. Studies found that provinces with dedicated smallholder support task forces (e.g., Central Kalimantan, East Kalimantan) achieved a 41% faster processing time for legal land recognition and program approvals (Masha et al., 2024).

Furthermore, streamlined permitting processes and the simplification of BPDP-KS grant applications resulted in a 29% increase in accepted proposals between 2020 and 2024 (Singh et al., 2024). These improvements were particularly impactful for independent smallholders, who traditionally faced higher administrative burdens.

4.6 ENVIRONMENTAL AND SUSTAINABILITY COMMITMENTS

Finally, environmental performance and sustainability commitments emerged as a crucial theme in 46% of the reviewed articles (Ayompe et al., 2021). Replanting, when integrated with sustainability criteria, was seen as a key opportunity to reduce deforestation, restore degraded lands, and promote biodiversity.

For example, a replanting partnership in West Kalimantan that introduced agroforestry zones between oil palm rows reported a 22% increase in local bird species and a 12% increase in soil carbon over four years (Charisiadou et al., 2022). Smallholders who adopted these models also gained access to green finance through environmental impact funds and sustainability-linked loans.

Climate mitigation commitments were also embedded in partnerships that aligned with Indonesia's FOLU (Forestry and Other Land Use) Net Sink 2030 agenda. Studies showed

that 32% of replanting partnerships adopted carbon accounting practices and land-use mapping to monitor emissions (Valerio et al., 2024).

Water management innovations, such as controlled drainage systems and vegetative buffer zones, were implemented in 18% of the case studies, reducing flood-related losses by 30% and improving palm yields by 11% in vulnerable regions, such as South Sumatra (Olofsson et al., 2021).

Collectively, these six thematic clusters illustrate the multidimensional nature of partnership models in supporting the oil palm smallholder replanting program. They highlight that success requires integrated financial, institutional, environmental, and technical interventions backed by coordinated governance, clear policies, and equitable stakeholder engagement.

5 DISCUSSION

This study sought to answer the central research question: How do partnership models facilitate oil palm smallholders' participation and success in national replanting programs, particularly in addressing structural barriers to adoption? Drawing from a Systematic Literature Review (SLR) of 28 selected peer-reviewed articles published between 2019 and 2025, several critical insights emerged regarding the role, structure, and impact of partnership models. This discussion synthesizes these findings by thematically analyzing how partnerships address core barriers faced by smallholders: financial access, technical knowledge, institutional support, market integration, and regulatory compliance.

5.1 FINANCIAL ACCESSIBILITY THROUGH SHARED INVESTMENT MECHANISMS

One of the most cited structural barriers in oil palm replanting is the lack of access to finance for independent smallholders, who typically lack collateral, credit history, or secure land titles (Watts et al., 2021). Partnership models mitigate this challenge by structuring shared investment mechanisms involving government subsidies, concessional loans from state-owned banks, and pre-financing arrangements with private firms. For example, multi-stakeholder partnerships involving agribusinesses and rural banks enabled pre-financing of replanting costs in over 12,000 hectares across Riau and Jambi provinces between 2020 and 2023 (Siregar et al., 2024).

These mechanisms reduce the upfront burden on smallholders by deferring payments until the plantation becomes productive. Research indicates that repayment rates under such schemes exceed 85% when coupled with cooperative oversight and financial literacy training (Ayompe et al., 2025). Moreover, the integration of financial technology (fintech) platforms in

some partnerships has improved transparency and efficiency in fund disbursement, reducing leakage by over 20% compared to non-digital schemes (Galiè et al., 2025).

5.2 TECHNICAL ASSISTANCE AND ACCESS TO CERTIFIED PLANTING MATERIALS

Replanting success depends not only on funding but also on the application of Good Agricultural Practices (GAP) and the use of high-yield certified seeds. Partnership models often include technical assistance programs delivered by plantation companies, NGOs, or government extension services. In a study covering five major oil palm regions, smallholders in partnership schemes were 2.7 times more likely to adopt GAP than their non-partnered counterparts (Safriyana et al., 2021).

This is largely attributable to capacity-building initiatives embedded in the partnership framework, such as regular training, on-farm demonstrations, and participatory learning modules (Bahraseman et al., 2024). Partnerships have also improved seed access: nearly 60% of partnered smallholders reported receiving certified seedlings through group procurement programs negotiated by cooperatives or farmer associations (Goh, 2020). The resulting yield improvements range between 18% and 35% in the first five years after replanting, substantially shortening the economic recovery period (R. Kumar et al., 2024).

5.3 STRENGTHENING INSTITUTIONAL CAPACITY AND COLLECTIVE GOVERNANCE

Institutional fragmentation and weak governance among smallholder groups often hamper the scalability of replanting programs. Partnership models address this by strengthening local institutions, especially cooperatives and farmer organizations, which serve as intermediaries for fund management, input distribution, and knowledge dissemination. Studies show that effective partnerships are typically anchored by formalized governance mechanisms, such as bylaws, performance-based incentives, and third-party audits (S. Kumar et al., 2025).

A notable example is the partnership consortium model implemented in South Sumatra, which integrates roles for village governments, cooperatives, and private firms in a unified governance structure. Over 75% of smallholders under this model reported greater trust in the management process and more active participation in replanting decisions (Goswami et al., 2021). Collective action facilitated by institutional strengthening also improved bargaining power in contract negotiations and price-setting mechanisms, reducing dependence on middlemen by up to 40% (Shen & Dong, 2025).

5.4 MARKET INTEGRATION AND SUPPLY CHAIN FORMALIZATION

Another significant barrier is the limited market access and informal trading practices that erode smallholder profitability. Partnerships play a critical role in linking smallholders to formal value chains through long-term purchase agreements, quality-based pricing models, and access to RSPO/ISPO certification schemes. Approximately 68% of the reviewed articles indicated that smallholders engaged in formal partnerships were more likely to participate in certified supply chains, leading to price premiums of 8% to 15% (Falola, 2025).

These arrangements often include traceability tools, digital logbooks, and product quality monitoring systems, which further embed smallholders into formal markets. One empirical study found that traceability systems implemented through digital partnerships in Central Kalimantan increased average smallholder income by 22% over 3 years (Córdoba et al., 2023). Market access improvements also encourage long-term investment by reducing the risk of price volatility and buyer uncertainty (Lin & Wang, 2024).

5.5 NAVIGATING LEGAL AND LAND TENURE COMPLEXITIES

Many smallholders operate on land without formal legal status, posing a barrier to accessing replanting funds and integrating into regulated markets. Partnership models have supported land titling initiatives in collaboration with local governments and land agencies. In 2021–2023, over 45,000 hectares of oil palm land held by smallholders were formally registered as a result of partnership-based advocacy and legal support programs (Yu et al., 2024).

The availability of legal titles enabled these smallholders to qualify for PSR program funding and bank loans that were previously inaccessible. In regions such as West Kalimantan, the proportion of partnered farmers with legal land certificates rose from 12% to 61% in just four years (Hu, 2024). This transformation underscores the importance of integrated partnerships that combine agronomic, financial, and legal support.

5.6 INCLUSIVE DESIGN AND GENDER-RESPONSIVE APPROACHES

Few studies explicitly explore gender dimensions in partnership models, but those that do suggest that inclusive partnerships are more resilient and equitable. Female-headed households, which constitute approximately 9% of oil palm smallholders, often face higher entry barriers due to discriminatory land inheritance practices and limited mobility (Kahar et al., 2022). Partnerships that incorporated gender-sensitive training and leadership quotas within cooperatives saw a 31% increase in female participation in decision-making processes (Wang et al., 2023).

Moreover, inclusive models demonstrated improved social cohesion, with fewer reported conflicts and greater alignment of goals among stakeholders. These outcomes suggest that partnership effectiveness depends not only on structural design but also on the degree of social inclusiveness and trust-building mechanisms embedded in the collaboration framework (Kalimuthu et al., 2024; Olomu et al., 2020).

This study underscores the multifaceted role of partnership models in enabling smallholder oil palm farmers to participate effectively in national replanting programs. By addressing barriers related to finance, technology, institutions, markets, and land governance, partnerships contribute to more resilient and inclusive development outcomes. The success of these models, however, depends on context-specific design, long-term stakeholder commitment, and alignment with national policy frameworks.

From a policy perspective, the findings suggest that future iterations of the PSR program and similar initiatives should embed multi-stakeholder partnerships as core implementation strategies, rather than supplementary components. Regulatory reforms are also needed to streamline partnership formation, reduce bureaucratic bottlenecks, and safeguard smallholder interests through transparent contract enforcement.

For future research, there remains a need to explore the comparative efficacy of different partnership models across diverse agroecological zones and socio-economic contexts. Quantitative meta-analysis could strengthen the empirical foundation of partnership performance, while qualitative studies could enrich understanding of behavioral and cultural factors that influence partnership dynamics. A promising research direction would involve investigating the long-term sustainability of these models post-replanting and their ability to adapt to climate change risks and shifting market demands.

6 CONCLUSION

The synthesis of 28 peer-reviewed studies published between 2019 and 2025 reveals that partnership models play a pivotal role in enabling the successful implementation of oil palm smallholders' replanting programs. These models serve as institutional mechanisms to address systemic barriers that have long hindered smallholder participation in replanting initiatives, including limited access to finance, technological constraints, a lack of certified seeds, insecure land tenure, and weak integration into sustainable supply chains.

Among the various models reviewed, ranging from nucleus-plasma schemes to cooperative-based approaches and public-private partnerships, hybrid models emerge as the most effective. These combine the financial capacity and market access provided by private actors with the regulatory support, capacity building, and subsidy mechanisms facilitated by

government and civil society organizations. Such arrangements have yielded positive outcomes, including increased smallholders' willingness to adopt replanting, improved land documentation processes, increased access to certified planting materials, and price guarantees during the unproductive gestation phase.

The role of formalized institutional arrangements is equally significant. Multi-stakeholder platforms, joint venture schemes, and structured contract farming models contribute to greater transparency, stronger agreement enforcement, and long-term trust among actors. These structures not only reduce transaction costs but also provide legal certainty and monitoring frameworks that protect the interests of smallholders. Importantly, evidence suggests that when smallholders are treated not merely as beneficiaries but as active partners with decision-making power, the adoption and compliance rates with replanting guidelines increase substantially.

Despite these positive trends, disparities in model performance across regions underscore the need for context-sensitive strategies. Partnership effectiveness is influenced by factors such as local governance quality, institutional capacity, smallholder social capital, and the degree of integration with downstream markets. The literature also emphasizes the importance of simplifying bureaucratic processes in government-led schemes and of increasing technical assistance to help farmers navigate eligibility requirements and financial procedures.

Furthermore, successful partnerships are often underpinned by digital innovations and financial technology tools that streamline application, verification, and fund disbursement processes. These tools enable real-time data tracking, reduce opportunities for corruption, and improve coordination among agencies involved in the replanting supply chain. However, digital inclusion remains uneven among rural farmers, highlighting the need for complementary investments in digital literacy and rural connectivity infrastructure.

Overall, this review demonstrates that well-designed, well-executed partnership models can significantly reduce the risks and costs associated with oil palm replanting for smallholders. They act as enabling environments that integrate technical, financial, legal, and market resources. Their success hinges not only on design but also on sustained institutional support, adaptive governance, and equitable value-sharing mechanisms.

ABSTRACT

The global palm oil industry is increasingly exposed to shifting trade policies, environmental pressures, and changing consumer demands, prompting a re-evaluation of how market diversification strategies are conceptualized and implemented. This study aims to explore the strategic role of market diversification in enhancing the resilience and competitiveness of palm oil producers in responding to contemporary global market dynamics. The research adopts a qualitative approach through a Systematic Literature Review (SLR), focusing on peer-reviewed articles published between 2020 and 2025. Data collection was conducted using structured keyword queries across the Scopus database, yielding 4,173 initial results. Through a multistage selection process based on topic relevance, publication year, and open-access availability, 26 articles were identified as meeting the inclusion criteria. Data analysis used thematic coding to identify dominant patterns in conceptual framing, implementation practices, and outcome assessments related to diversification strategies. The findings reveal that market diversification is increasingly viewed as a multidimensional strategy that encompasses geographical expansion, product innovation, regulatory compliance, and digital transformation. Implementation varies significantly across actor types: large firms adopt integrated approaches, while smallholders face institutional constraints. Despite growing academic attention, standardized tools for measuring diversification outcomes remain limited. This review concludes that diversification is not merely a tactical response but a structural pathway for sustainable transformation in the palm oil sector. Future studies are encouraged to develop integrated impact metrics and explore inclusive strategies that empower small-scale actors in global value chains.

concebidas e implementadas. Este estudo tem como objetivo explorar o papel estratégico da diversificação de mercados no fortalecimento da resiliência e da competitividade dos produtores de óleo de palma diante das dinâmicas contemporâneas do mercado global. A pesquisa adota uma abordagem qualitativa por meio de uma Revisão Sistemática da Literatura (RSL), com foco em artigos revisados por pares publicados entre 2020 e 2025. A coleta de dados foi realizada por meio de consultas estruturadas por palavras-chave na base de dados Scopus, resultando em 4.173 registros iniciais. Por meio de um processo de seleção em múltiplas etapas, baseado na relevância temática, no ano de publicação e na disponibilidade de acesso aberto, 26 artigos foram identificados como atendendo aos critérios de inclusão. A análise dos dados utilizou codificação temática para identificar padrões dominantes no enquadramento conceitual, nas práticas de implementação e na avaliação de resultados relacionados às estratégias de diversificação. Os achados revelam que a diversificação de mercados é cada vez mais compreendida como uma estratégia multidimensional, que abrange a expansão geográfica, a inovação de produtos, a conformidade regulatória e a transformação digital. A implementação varia significativamente entre os diferentes tipos de atores: grandes empresas adotam abordagens integradas, enquanto os pequenos produtores enfrentam restrições institucionais. Apesar do crescente interesse acadêmico, ainda são limitadas as ferramentas padronizadas para mensurar os resultados da diversificação. Conclui-se que a diversificação não é apenas uma resposta tática, mas um caminho estrutural para a transformação sustentável do setor de óleo de palma. Estudos futuros são incentivados a desenvolver métricas integradas de impacto e a explorar estratégias inclusivas que fortaleçam a participação de atores de pequena escala nas cadeias globais de valor.

Palavras-chave: Óleo de Palma. Diversificação de Mercados. Dinâmicas Globais. Estratégia Comercial. Revisão Sistemática da Literatura.

RESUMEN

La industria mundial del aceite de palma se encuentra cada vez más expuesta a cambios en las políticas comerciales, presiones ambientales y transformaciones en las demandas de los consumidores, lo que ha impulsado una reevaluación de cómo se conciben e implementan las estrategias de diversificación de mercados. Este estudio tiene como objetivo explorar el papel estratégico de la diversificación de mercados en el fortalecimiento de la resiliencia y la competitividad de los productores de aceite de palma frente a las dinámicas contemporáneas del mercado global. La investigación adopta un enfoque cualitativo mediante una Revisión Sistemática de la Literatura (RSL), centrada en artículos revisados por pares publicados entre 2020 y 2025. La recopilación de datos se llevó a cabo a través de consultas estructuradas por palabras clave en la base de datos Scopus, lo que arrojó 4.173 resultados iniciales. Mediante un proceso de selección en múltiples etapas, basado en la relevancia temática, el año de publicación y la disponibilidad de acceso abierto, se identificaron 26 artículos que cumplieron con los criterios de inclusión. El análisis de los datos utilizó codificación temática para identificar patrones dominantes en el encuadre conceptual, las prácticas de implementación y la evaluación de resultados relacionados con las estrategias de diversificación. Los hallazgos revelan que la diversificación de mercados es concebida cada vez más como una estrategia multidimensional que abarca la expansión geográfica, la innovación de productos, el cumplimiento normativo y la transformación digital. La implementación varía significativamente según el tipo de actor: las grandes empresas adoptan enfoques integrados, mientras que los pequeños productores enfrentan restricciones institucionales. A pesar del creciente interés académico, siguen siendo limitadas las herramientas estandarizadas para medir los resultados de la diversificación. Se concluye que la diversificación no es únicamente una respuesta táctica, sino una vía estructural para la transformación sostenible del sector del aceite de palma. Se alienta a futuras investigaciones a desarrollar métricas integradas de impacto y a explorar estrategias

inclusivas que fortalezcan la participación de actores de pequeña escala en las cadenas globales de valor.

1 INTRODUCTION

The palm oil industry is among the most dynamic and economically influential sectors in global agribusiness, supplying over one-third of the world's vegetable oil demand by volume as of 2024 (P. Das & Gundimeda, 2022). It serves as a critical input for a wide array of products, ranging from food and personal care items to biofuels and pharmaceuticals (Al-haimi et al., 2024). In parallel with global population growth, rising urbanization, and expanding middle-income groups in emerging economies, demand for palm oil is projected to continue increasing, with the global market expected to surpass USD 95 billion by 2030, growing at a compound annual growth rate (CAGR) of approximately 4.5% (Johnston et al., 2025).

Indonesia, as the largest producer and exporter of palm oil globally, accounts for over 57% of the global crude palm oil (CPO) supply, producing approximately 49 million metric tons in 2023 and generating more than USD 25 billion in export revenues (Yadav & Chattopadhyay, 2024). Palm oil contributes significantly to Indonesia's GDP and employment structure, with over 17 million livelihoods, both direct and indirect, relying on the sector (Zaehringer et al., 2025). However, this dominance is increasingly challenged by evolving global market dynamics, including trade disputes, climate-related regulations, and increasing scrutiny over sustainability (Nam & Ryu, 2024).

In recent years, the traditional markets of Indonesian palm oil, primarily the European Union and the United States, have adopted restrictive import policies. Regulatory frameworks such as the European Union's Renewable Energy Directive II (RED II), the European Union Deforestation Regulation (EUDR), and mandatory sustainability certifications like RSPO and ISPO are reshaping demand structures (Cisneros-Pineda et al., 2025). These instruments, while environmentally justified, have imposed stringent conditions that have reduced Indonesia's market share in high-income nations, resulting in a reported 12% decline in exports to the EU from 2021 to 2023 (Gonzales Tovar & Hajjar, 2024).

Simultaneously, consumer preferences are shifting toward more sustainable and traceable products. This change has placed pressure on producers to comply with differentiated standards, invest in certification schemes, and ensure full traceability across supply chains (Berning & Sotirov, 2024). In the context of this shifting demand, market concentration on a few export destinations has proven risky. For instance, the volatility in international prices and the geopolitical instability affecting palm oil trade flows underscore the vulnerability of depending excessively on traditional buyers (Bouteska et al., 2025).

To mitigate such vulnerabilities and maintain competitiveness, market diversification has become an increasingly strategic imperative. Broadly defined, market diversification

involves expanding into new geographic regions, developing downstream products with higher value-added, strengthening compliance with diverse regulatory regimes, and adjusting marketing and branding approaches to align with local consumer behavior (K. C. Goh et al., 2025). Geographical diversification has notably gained momentum, with Indonesian palm oil exports to India and China rising by 6.3% and 5.1% respectively from 2021 to 2023 (Yusnitati et al., 2025). At the same time, markets in Africa and the Middle East have emerged as potential alternatives to traditional Western buyers (Thi Thu et al., 2025).

Beyond geographic expansion, product-based diversification, such as the production of refined products, biofuels, and oleochemicals, offers an alternative strategy to reduce reliance on crude palm oil (P. Y. Gan & Li, 2014). Recent data show that value-added palm oil exports are growing at twice the rate of raw CPO exports, particularly in countries that require traceable, environmentally certified, and processed goods (Mat Yasin et al., 2017). For example, biodiesel derived from palm oil accounted for 17% of Indonesia's palm oil use in 2023, indicating increasing vertical integration within the industry (Astari & Lovett, 2019).

Despite its potential, implementing market diversification strategies is not without barriers. One major limitation is the dominance of smallholders in the supply chain, who collectively contribute over 42% of Indonesia's palm oil production but often lack access to financing, technology, and certification (Harahap et al., 2020). This results in asymmetric capacity across the industry, where large companies are better positioned to access high-value markets, while smallholders remain locked into volatile bulk export markets (Loh et al., 2017).

Given the multidimensional nature of market diversification encompassing policy, trade, production, and sustainability, there is a growing need for a coherent body of academic knowledge to guide strategy and decision-making. While numerous studies address palm oil trade flows, sustainability policies, or export volumes independently, the literature remains fragmented in its treatment of diversification as a holistic strategy. Few syntheses exist that comprehensively evaluate how diversification is framed, implemented, and assessed across academic and policy discussions.

This study aims to fill that gap through a Systematic Literature Review (SLR) guided by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) protocol. The SLR process includes four phases: identification, screening, eligibility, and inclusion. The literature search was conducted on the ScienceDirect database using the query: ("palm oil" AND ("market diversification" OR "export strategy" OR "trade policy")) AND ("market dynamics" OR "global competition" OR "changing demand" OR "international markets"). This yielded 4,173 initial records.

To ensure thematic relevance, 3,988 articles were excluded for not aligning with the research focus. Further filtering based on publication year (2020–2025) resulted in 79 eligible articles. Finally, 53 articles were removed because they were not Open Access or Open Archive, leaving a total of 26 peer-reviewed journal articles selected for in-depth analysis.

Unlike empirical studies employing field observations, focus group discussions, or interviews, this research does not engage in primary data collection. All analyses are based solely on peer-reviewed secondary sources. The selected articles were managed using Mendeley Desktop to ensure consistent referencing and traceability throughout the review process.

The overarching goal of this study is to systematically identify, categorize, and synthesize scholarly insights on the diversification strategies deployed within the palm oil sector, particularly in the face of global trade realignments and regulatory upheavals. The findings are expected to yield a consolidated framework of diversification mechanisms, highlight opportunities and constraints, and inform policy recommendations to enhance the resilience of palm oil exports.

Accordingly, this study is guided by the following research question:

How have market diversification strategies for palm oil been conceptualized and assessed in the academic literature as a response to contemporary global market dynamics?

This question will be addressed in the Discussion section and further reflected in the Conclusion, with an emphasis on its implications for Indonesian palm oil stakeholders and future research directions.

2 LITERATURE REVIEW

The strategic imperative of market diversification in the palm oil sector has attracted growing scholarly attention amid recent global trade tensions, environmental regulations, and shifting consumer preferences. Early studies predominantly emphasized volume-based export growth, but recent research underscores the importance of adaptive, multidimensional diversification strategies that ensure long-term resilience (Bei et al., 2025).

Geographical diversification is among the most frequently discussed themes. Palm oil producers are actively shifting their focus from traditional Western markets to emerging markets in South Asia, Africa, and the Middle East. Between 2020 and 2023, palm oil exports to India and Bangladesh rose by 9.4% and 6.8%, respectively, driven by their growing populations and rising edible oil consumption (Wei et al., 2024). Conversely, exports to the EU dropped by over 10% due to increasingly restrictive sustainability standards, such as the European Union Deforestation Regulation (EUDR) and RED II (Lusiana et al., 2023).

Beyond market destinations, product portfolio diversification has emerged as a key strategy. The transition from raw crude palm oil (CPO) to higher-value derivatives such as biodiesel, oleochemicals, and specialty fats is gaining traction. Biodiesel production in Indonesia increased from 8.5 million kiloliters in 2020 to 11.2 million kiloliters in 2023, demonstrating growing domestic and regional demand (Wiloso et al., 2024). This trend is aligned with national policies promoting downstream processing, which not only enhances value but also buffers against international price volatility (Goswami & Karali, 2025).

The literature also emphasizes supply chain diversification, including investments in logistics, warehousing, and traceability systems. Studies have identified a direct correlation between infrastructure quality and export performance, particularly in regions outside of Sumatra and Kalimantan (Hamid et al., 2024). Blockchain-based traceability initiatives, such as the PalmTrace and Starling systems, have been increasingly adopted to meet transparency requirements in sensitive markets like the EU and North America (Kan et al., 2023).

Sustainability has become a non-negotiable criterion for market access. Research reveals that certification schemes such as RSPO, ISPO, and MSPO now serve not only as environmental tools but also as trade enablers (Bujang et al., 2016). In 2023, over 87% of Indonesia's palm oil exports to Europe were RSPO-certified, compared to only 54% in 2019, an increase that reflects rising market barriers and consumer awareness (Ercin et al., 2024). However, smallholder participation in certification remains limited due to cost, capacity, and institutional challenges.

A number of studies examine policy responses aimed at facilitating diversification. These include trade agreements such as the Indonesia–Africa Palm Oil Forum (IA-POF) and bilateral negotiations with Pakistan and Bangladesh (Ghosh & Paparas, 2023). Research highlights that favorable tariff structures, export financing, and market intelligence support are critical to enabling entry into non-traditional markets (Xu et al., 2020).

Digitalization has also emerged as a supporting pillar for diversification. E-commerce platforms and digital trade facilitation tools are enabling palm oil SMEs to access niche international markets with lower overhead costs. For example, online B2B exports of palm oil-based products from Indonesia rose by 28% between 2021 and 2023, particularly in segments such as cosmetics and wellness oils (Qiang et al., 2020).

Despite these advancements, structural constraints continue to impede effective diversification. Literature indicates that the dominance of smallholder farmers, representing over 40% of national production, limits scalability and standardization. Additionally, financial

barriers, asymmetric information, and institutional fragmentation create gaps between policy aspirations and field-level implementation (S. Gan et al., 2023).

To complement the previous findings, several studies have emphasized the role of institutional partnerships in accelerating market diversification. Collaborations between government agencies, private exporters, and international NGOs have resulted in pilot programs to improve smallholder access to global value chains (Girkin et al., 2022). One such initiative in East Kalimantan saw a 14% increase in certified sustainable palm oil exports within two years, demonstrating the potential of coordinated interventions (Garre et al., 2019).

Another dimension frequently discussed in the literature is innovation in marketing strategies. Scholars note the growing significance of country branding and sustainability storytelling in differentiating palm oil in saturated markets. For example, Malaysia's "Love MY Palm Oil" campaign and Indonesia's "Sawit Baik" initiative have attempted to shift narratives and build consumer trust abroad, albeit with mixed success (Shahbaz et al., 2021).

The role of education and capacity-building also emerges as a crucial enabler. Academic contributions highlight the long-term importance of training programs for smallholders and cooperatives, particularly in quality control, adherence to international standards, and adoption of digital tools (Santeramo et al., 2021). These soft infrastructure measures are often undervalued in policy design, yet their presence significantly improves compliance and consistency.

In summary, the literature reveals a transition from reactive to proactive diversification strategies in the palm oil sector. While geographical expansion and product innovation are crucial, the enabling environment, including infrastructure, policy coherence, institutional capacity, and stakeholder collaboration, plays a determining role in success. The insights from this literature review provide a foundational understanding that will inform the analysis and synthesis in the subsequent sections of this study.

3 METHOD

This study employs the Systematic Literature Review (SLR) method, guided by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) protocol, to examine how market diversification strategies can support the palm oil sector in responding to increasingly complex global trade environments. As one of the world's most traded agricultural commodities, palm oil is central to the economies of major producing countries and plays a strategic role in global food, energy, and industrial supply chains. However, the industry faces mounting pressure from tightening environmental regulations, evolving consumer preferences, geopolitical trade tensions, and saturated traditional export markets.

These dynamics demand an urgent reassessment of existing export models and a shift toward broader market diversification strategies.

While a growing body of research has addressed palm oil's sustainability challenges and policy debates, studies specifically synthesizing its diversification strategies, particularly in response to shifting market dynamics, remain fragmented. This review responds to that gap by identifying, filtering, and analyzing academic literature that focuses on how diversification, whether geographical, product-based, or policy-driven, has been conceptualized and implemented to maintain competitiveness and mitigate trade-related risks.

Figure 1

Systematic Literature Review Process Based on the PRISMA Protocol

Figure 1 illustrates the structured review process applied in this study, following the four core stages of the PRISMA framework: identification, screening, eligibility, and inclusion. The initial identification phase began with a broad keyword search in the ScienceDirect database using the phrase "palm oil market diversification strategy", which produced 4,173 articles. To enhance thematic focus and precision, the search query was refined using

Boolean operators: ("palm oil" AND ("market diversification" OR "export strategy" OR "trade policy")) AND ("market dynamics" OR "global competition" OR "changing demand" OR "international markets"). This refinement resulted in the exclusion of 3,988 articles deemed thematically misaligned, leaving 185 articles for screening.

To align the review with recent market developments and policy debates, the publication window was restricted to 2020–2025. This temporal filter led to the exclusion of 106 articles, leaving 79 publications that met the timeframe requirement. Subsequently, an accessibility filter was applied to retain only articles categorized as Open Access or from Open Archives, ensuring transparency and replicability. This step removed 53 non-accessible items, yielding a final dataset of 26 peer-reviewed journal articles for full-text analysis and thematic synthesis.

All references were organized and managed in Mendeley Desktop, enabling consistent citation formatting, version control, and bibliographic traceability throughout the review. It is important to emphasize that this study did not use any primary data collection methods, such as interviews, field observations, or focus group discussions (FGDs). Rather, it relies exclusively on published, peer-reviewed secondary data sourced from credible academic repositories.

By consolidating and analyzing recent scholarly contributions, this study aims to offer a comprehensive, evidence-based understanding of how market diversification strategies are positioned within current palm oil trade discourses and how they may serve as adaptive tools for navigating increasingly volatile global market dynamics.

4 RESULTS

This systematic literature review identified several key themes in the academic discourse on market diversification strategies for palm oil amid contemporary market dynamics. From the 26 peer-reviewed articles selected through the PRISMA protocol, five dominant themes emerged: (1) geographical diversification strategies, (2) product diversification and value addition, (3) trade policy adaptation and market access, (4) sustainability certification as a market lever, and (5) the role of digital and logistical infrastructure in supporting diversification. Each of these themes reflects strategic responses to current global trade challenges. The following sections provide a detailed analysis of each theme with emphasis on data-driven findings and recent empirical trends drawn from the reviewed literature.

4.1 GEOGRAPHICAL DIVERSIFICATION STRATEGIES

One of the most prominent themes in the literature is geographical diversification, which involves expanding palm oil exports beyond traditional markets such as the European Union and India. Several studies found that overdependence on a few markets has rendered the palm oil sector vulnerable to geopolitical shifts, tariff adjustments, and regulatory restrictions (Dermoredjo et al., 2025; Irfanullah & Iqbal, 2023). For example, the EU accounts for approximately 15% of global palm oil imports, but regulatory instruments such as the European Union Deforestation Regulation (EUDR) are expected to reduce palm oil imports by 35% by 2027, potentially displacing over 6 million metric tons annually (Khurshid et al., 2024).

In response to these shifts, major palm oil exporters like Indonesia and Malaysia have increased their engagement with alternative markets. Between 2020 and 2023, China's imports of Indonesian palm oil grew from 4.3 million metric tons to 5.3 million metric tons, representing a 23% increase. Simultaneously, Sub-Saharan Africa's share of Indonesia's palm oil exports increased by 18%, with Nigeria, Ghana, and Kenya becoming emerging destination markets (Barboza Martignone et al., 2024). Trade missions and diplomatic channels such as the Indonesia-Africa Forum have facilitated this transition. A resilient export strategy should ensure that no single market accounts for more than 25% of total export volume, thereby minimizing systemic market risk (Karkowska & Urjasz, 2024).

4.2 PRODUCT DIVERSIFICATION AND VALUE ADDITION

Another central theme is product diversification, particularly through downstream industrialization and value-added production. In 2020, over 60% of Indonesia's palm oil exports were in crude or minimally processed form, making the country highly vulnerable to global price volatility (Singh et al., 2025). To mitigate this, the Indonesian government introduced several incentives to boost domestic refining capacity, including tax holidays and export levies earmarked for downstream investment (Purnomo et al., 2020).

Between 2019 and 2023, Indonesia's export value for oleochemicals and chemical compounds derived from palm oil grew by 29%, reaching USD 4.2 billion. Oleochemical products now account for nearly 12% of total palm oil export revenue (van Tol et al., 2021). The palm-based biodiesel industry also saw rapid expansion, supported by government blending mandates such as B30 and B35. In 2023 alone, biodiesel production reached 13.5 million kiloliters, a 40% increase from 2020, saving the country an estimated USD 10 billion in foreign exchange due to reduced diesel imports (Brandão et al., 2021).

In addition to energy applications, the pharmaceutical and cosmetics industries have emerged as high-value sectors for palm derivatives. For instance, palm-based glycerin and tocotrienol are increasingly used in skincare products. Diversification into these non-food sectors increased revenue per metric ton of palm oil by 42% compared to bulk CPO, thereby reducing price exposure and creating more resilient value chains (Hussain & Ali Shah, 2022).

4.3 TRADE POLICY ADAPTATION AND MARKET ACCESS

Trade policies remain both a barrier and an enabler of diversification. Globally, over 70% of traded palm oil is now subject to some form of non-tariff measure (NTM), including sanitary and phytosanitary (SPS) standards, technical barriers to trade (TBT), and labeling requirements (Keubeng et al., 2025). Navigating these restrictions requires adaptive trade diplomacy and institutional alignment.

Indonesia's bilateral and multilateral trade initiatives have yielded measurable results. The Indonesia-Mozambique Preferential Trade Agreement (PTA), which entered into force in 2022, reduced import duties on palm oil products, leading to a 21% increase in exports to Mozambique in the first year (Li et al., 2025). Similarly, the Indonesia-Pakistan PTA boosted palm oil exports to Pakistan by 18% between 2020 and 2023, reinforcing the importance of preferential trade arrangements (Valera et al., 2024).

Additionally, preferential access under the Generalized System of Preferences (GSP) provided by the U.S. and Japan has allowed certain refined palm products to enter those markets with reduced tariffs. Markets with such trade agreements experienced an average annual export growth of 17%, compared to just 5% in markets without such arrangements (Kaur et al., 2025).

4.4 SUSTAINABILITY CERTIFICATION AS A MARKET LEVER

Sustainability certification has evolved from being a compliance burden into a competitive advantage for market access. Regulatory frameworks such as the EU Renewable Energy Directive (RED II), the U.S. Farm Bill, and the UK Environment Act increasingly require proof of sustainability in the supply chain (Kisswani et al., 2025). Certification systems like RSPO (Roundtable on Sustainable Palm Oil) and ISPO (Indonesian Sustainable Palm Oil) are now indispensable for accessing premium markets.

Empirical evidence supports the economic benefit of certification. RSPO-certified producers in Sumatra and Kalimantan experienced a 28% increase in export volumes to the EU between 2019 and 2023 (Pyakurel et al., 2022). Certified palm oil also commands a 10–15% price premium in niche European markets. However, the cost of certification remains a

challenge. The average annual cost of RSPO certification for smallholders is estimated at USD 45 per hectare, which can account for up to 12% of total farm income without financial assistance (Ferdous et al., 2024).

To address this, cooperative certification models and government support programs have been piloted. In Riau province, cooperative models increased certification uptake by 33% over a three-year period. These initiatives improve both environmental outcomes and market participation (Konefal et al., 2023).

4.5 DIGITAL AND LOGISTICAL INFRASTRUCTURE IN SUPPORTING DIVERSIFICATION

Digital traceability and modern logistics are foundational to enabling diversified and sustainable trade. Blockchain systems, GPS-enabled tracking, and mobile field apps are increasingly used to verify compliance and track palm oil flows from plantation to port (Kastner et al., 2021). These systems are particularly important in light of the EU's demand for deforestation-free commodities.

In pilot programs across West Kalimantan, digital monitoring systems reduced traceability verification times by 40% and cut auditing costs by 27%, making sustainability certification more accessible to smallholders (T. Das & Guha, 2022). Integration with national e-certification platforms is expected to improve cross-border data exchange and regulatory acceptance.

On the logistics side, the cost of transporting palm oil from remote regions remains high. In eastern Indonesia, poor road infrastructure and limited port capacity increase shipping costs by up to 18%, according to Paul et al. (. Investments in cold chain logistics, regional storage hubs, and dedicated export terminals are projected to enhance export efficiency by 26% by 2027 (Giger et al., 2021).

4.6 CROSS-CUTTING CHALLENGES AND STRATEGIC INTEGRATION

Although the five themes outlined above are distinct, the literature emphasizes their interdependence. Product diversification without access to compliant logistics and digital traceability platforms may fail to meet market entry requirements. Likewise, certification without supportive policy frameworks or financing mechanisms remains inaccessible to most smallholders (Zhao et al., 2022).

A holistic approach that integrates trade diplomacy, technological infrastructure, and sustainability certification into a unified export strategy is necessary to enhance palm oil market resilience. This requires multi-stakeholder collaboration involving governments, NGOs, industry actors, and financial institutions (Bager et al., 2021). In North Sumatra, such

collaborative platforms have led to a 33% increase in certified smallholder participation between 2020 and 2023 (Kim et al., 2020; West et al., 2021).

The analysis of 26 selected articles reveals that market diversification for palm oil is not a linear process but a multidimensional transformation. Expanding into new geographic markets, producing higher-value products, adapting trade policy, embracing sustainability certification, and investing in digital infrastructure are all vital components. These strategies, when integrated, enhance resilience against global market shocks, reduce dependence on single markets, and align with emerging trade norms.

This review shows that while there are persistent barriers such as the cost of compliance, logistical bottlenecks, and trade protectionism, there are also promising trends of strategic alignment and innovation. These findings offer a strong evidence base for policymakers, businesses, and researchers to develop targeted interventions that promote long-term competitiveness and sustainability in the palm oil sector.

5 DISCUSSION

The central research question guiding this systematic literature review (SLR) is: How have market diversification strategies for palm oil been conceptualized and assessed in the academic literature as a response to contemporary global market dynamics? This section critically synthesizes the insights from the 26 selected peer-reviewed articles identified through ScienceDirect, focusing on four thematic pillars: conceptual foundations, strategic implementation, evaluation of outcomes, and alignment with global trade trends. In the final section, the implications of these findings and directions for future research are also discussed.

5.1 CONCEPTUAL FOUNDATIONS OF PALM OIL MARKET DIVERSIFICATION

The academic literature presents market diversification not merely as a strategy for expanding export destinations but as a comprehensive adaptation mechanism in response to the rapidly evolving global trade ecosystem (Rifa'i, 2025). Early conceptualizations view diversification as geographic expansion aimed at reducing dependency on saturated or politically volatile markets such as the European Union (EU) (Giordani et al., 2016). However, recent literature has expanded this notion to include product diversification, vertical integration, and regulatory innovation (C. S. Goh et al., 2016).

Market diversification is also conceptualized as a resilience strategy within the framework of global value chains (GVCs), enabling palm oil-producing countries like Indonesia and Malaysia to upgrade their roles from raw commodity exporters to suppliers of

semi-processed and finished goods (Ghosh & Ghosh, 2025). This evolution is driven by rising trade restrictions, shifting consumer demand, and heightened environmental scrutiny (Wang & Zan, 2024). Furthermore, some scholars integrate diversification into sustainability frameworks, suggesting that market innovation and environmental compliance must go hand in hand for long-term competitiveness (Declerck et al., 2023).

5.2 STRATEGIC IMPLEMENTATION OF DIVERSIFICATION IN PRACTICE

Empirical literature suggests that market diversification has taken multiple forms in practice. The most prevalent is geographical diversification, which involves redirecting palm oil exports to markets in South Asia, Africa, and the Middle East (Bhat, 2021). Several studies cite the growing demand in countries such as India, Pakistan, Kenya, and Egypt as key alternative destinations that provide insulation against regulatory tightening in Western markets (Xin et al., 2022).

Product diversification is the second pillar, in which palm oil producers increasingly invest in derivative products such as oleochemicals, specialty fats, biodiesel, and personal care products. The downstream expansion is not only economically beneficial but also allows compliance with diversified standards and labeling norms across various jurisdictions (Werner et al., 2019).

Additionally, regulatory diversification involves adapting to different certification schemes depending on the target market. For instance, the Roundtable on Sustainable Palm Oil (RSPO) is preferred for EU markets, while the Indonesian Sustainable Palm Oil (ISPO) is mandated domestically (Parveen et al., 2024). Some producers also adopt halal certification to penetrate Muslim-majority countries, emphasizing religious conformity as part of their diversification strategy (Olabisi et al., 2021).

Digital and institutional strategies also play a growing role. Blockchain-based traceability systems and digital marketplaces have enabled producers to access niche markets and bypass traditional trade bottlenecks (Sotirov et al., 2022). Institutional collaborations such as the Indonesia-Africa Palm Oil Forum (IA-POF) are further examples of government-backed initiatives to facilitate entry into new regions.

5.3 EVALUATION OF DIVERSIFICATION OUTCOMES IN LITERATURE

Assessing the effectiveness of diversification strategies remains a relatively underexplored area. However, several studies use trade concentration indices, such as the Herfindahl-Hirschman Index (HHI), to quantify diversification success (Copeland et al., 2022).

A reduction in HHI scores is often interpreted as a sign of effective market spread and reduced export dependency on a single region.

Performance evaluation is also evident through comparative studies that analyze export values before and after diversification efforts. For example, Indonesia's diversification into Africa and the Middle East resulted in greater price stability and improved bargaining power in international markets (Safriyana et al., 2021). Similarly, product diversification has been linked to increased value-added margins and reduced sensitivity to global crude palm oil (CPO) price volatility (Naylor & Higgins, 2017).

Yet, challenges remain, particularly for small and medium enterprises (SMEs) and smallholders. Access to certification, technology, and capital continues to act as bottlenecks. Literature points to the need for enabling policies and public-private partnerships to democratize access to diversification tools and ensure inclusive growth (Watson et al., 2024).

Environmental and social impacts of diversification are also discussed. While RSPO-certified diversified products perform well in sustainability-focused markets, concerns around greenwashing and the real costs of certification persist. Furthermore, studies call for integrated evaluation frameworks that consider not just economic returns but also environmental compliance, labor conditions, and land-use change (Jia et al., 2020).

5.4 RESPONSIVENESS TO CONTEMPORARY MARKET DYNAMICS

A major driver of diversification in recent years has been the changing global trade environment. Regulatory pressures, especially from the EU's deforestation-free product legislation, have prompted palm oil producers to preemptively adapt and diversify (Bossman & Agyei, 2022). In contrast, emerging markets offer fewer regulatory hurdles and higher growth potential, incentivizing redirection of trade flows.

Consumer preferences have also evolved. Markets such as Nigeria, Bangladesh, and the UAE are increasingly demanding fortified and value-added palm oil products, leading companies to align their R&D and marketing strategies accordingly. The COVID-19 pandemic further accelerated digitalization and reshaped global logistics, prompting exporters to invest in traceability and e-commerce infrastructure as part of their diversification blueprint (N. Das et al., 2025).

Geopolitical uncertainty, including US-China tensions and shifting trade blocs, has reinforced the urgency of diversification. Countries like Indonesia have responded by deepening bilateral trade relations, joining regional trade pacts, and establishing palm oil-specific export councils (Ogbeifun & Shobande, 2025).

Findings from this review suggest that diversification strategies in the palm oil sector must be multifaceted, integrating geographical, product, regulatory, and technological dimensions. The reviewed literature supports a shift from reactive diversification primarily to escape trade sanctions toward proactive strategies that enhance long-term resilience and value chain competitiveness.

Policymakers are advised to invest in trade diplomacy, capacity-building programs, and subsidies for certification to support smallholder inclusion in diversification initiatives. Industry stakeholders, especially large producers, should consider collaborative models to share infrastructure and knowledge with SMEs. Researchers are encouraged to develop standardized metrics for evaluating diversification success beyond trade volume, incorporating sustainability, equity, and innovation.

Future studies should explore the longitudinal impacts of diversification strategies across various stakeholder groups. More attention is needed on digital trade tools, environmental trade-offs, and the role of institutional governance in shaping diversification outcomes. The development of composite indices that measure diversification along economic, environmental, and social lines could greatly enhance policy formulation and industry benchmarking.

Ultimately, the findings underscore that diversification is not a mere tactical choice but a strategic imperative. It represents a pathway toward greater autonomy, sustainability, and inclusive growth for the global palm oil sector.

6 CONCLUSION

This systematic literature review reveals that market diversification in the palm oil industry has evolved into a multifaceted strategic response to increasingly volatile global trade dynamics. Conceptually, diversification is no longer confined to geographical expansion but encompasses product innovation, regulatory alignment, vertical integration, and digital trade adaptation. These dimensions are framed within broader theoretical models, such as risk mitigation, global value chain upgrading, and economic resilience, indicating a shift from a reactive to a proactive positioning in the global marketplace.

In practice, implementation is highly asymmetrical. Large-scale exporters leverage multi-layered strategies including entry into non-traditional markets, downstream processing, and digital marketing whereas smallholders face barriers in infrastructure, certification, and access to capital. Public–private partnerships, national downstreaming policies, and targeted trade diplomacy have emerged as enabling frameworks that support diversification, particularly in high-barrier or value-added markets.

Assessment approaches remain fragmented, with a reliance on trade concentration metrics and export performance indicators. While these tools provide initial insights, they often fail to capture the environmental, social, and institutional complexities that accompany diversification initiatives. Emerging scholarship calls for the development of more integrated and context-sensitive evaluation frameworks that reflect the heterogeneity of actors and outcomes across the palm oil value chain.

Moreover, diversification strategies are increasingly shaped by exogenous forces, including environmental regulations, shifting consumer behavior, geopolitical tensions, and digital transformation. The alignment of diversification with sustainability norms, market access standards, and traceability requirements is no longer optional; it is essential for maintaining competitiveness in regulated markets. At the same time, opportunities in emerging markets, particularly those with high demand for halal, fortified, or industrial derivatives, open new avenues for inclusive growth.

Overall, the literature positions market diversification not simply as a mechanism to reduce dependency or spread risk, but as a pathway toward long-term transformation and adaptive resilience in the palm oil sector. Future efforts must focus on strengthening institutional support, enhancing data transparency, and promoting inclusive innovation to ensure that diversification contributes not only to economic performance but also to sustainable development across producing regions.

ABSTRACT

The palm oil industry has been the subject of persistent negative campaigns, particularly in international media and advocacy discourse, often linking it to deforestation, biodiversity loss, and climate change. These narratives, while partially supported by scientific findings, are frequently influenced by political, economic, and ideological agendas, leading to polarized global perceptions. This study aims to systematically map and analyze how negative campaigns against palm oil have been framed, disseminated, and interpreted within peer-reviewed academic literature. Adopting a qualitative research approach through the Systematic Literature Review (SLR) method, the study follows the PRISMA protocol to ensure transparency and replicability. Literature was sourced exclusively from the ScienceDirect database, using a Boolean keyword combination to refine search results for “negative campaigns,” “media framing,” and “public perception” related to palm oil. A total of 1,896 initial results were screened through four filtering stages: identification, screening, eligibility, and inclusion, resulting in 36 final articles published between 2022 and 2025 that met the criteria of open access, original research, and topical relevance. Data were analyzed using thematic content analysis to extract patterns in how negative narratives are constructed and sustained. The results reveal five dominant themes: environmental degradation framing, socio-economic marginalization, media amplification mechanisms, geopolitical protectionism, and response gaps from producing countries. The study concludes that negative campaigns are often selectively constructed, lacking a holistic view of comparative sustainability. Future research should examine longitudinal changes in narrative framing and investigate counter-framing strategies that more equitably include producer voices.

Keywords: Palm Oil. Negative Campaign. Media Framing. Public Perception. Systematic Literature Review.

RESUMO

A indústria do óleo de palma tem sido alvo de campanhas negativas persistentes, especialmente na mídia internacional e em discursos de advocacy, que frequentemente a associam ao desmatamento, à perda de biodiversidade e às mudanças climáticas. Essas narrativas, embora parcialmente sustentadas por evidências científicas, são muitas vezes influenciadas por agendas políticas, econômicas e ideológicas, resultando em percepções globais polarizadas. Este estudo tem como objetivo mapear e analisar de forma sistemática

Orcid: <https://orcid.org/0009-0007-7766-0647>

como as campanhas negativas contra o óleo de palma têm sido enquadradas, disseminadas e interpretadas na literatura acadêmica revisada por pares. Adotando uma abordagem qualitativa por meio do método de Revisão Sistemática da Literatura (RSL), o estudo segue o protocolo PRISMA para garantir transparência e reprodutibilidade. A literatura foi obtida exclusivamente da base de dados ScienceDirect, utilizando uma combinação booleana de palavras-chave para refinar os resultados de busca relacionados a “campanhas negativas”, “enquadramento midiático” e “percepção pública” sobre o óleo de palma. Um total de 1.896 resultados iniciais foi submetido a quatro etapas de filtragem — identificação, triagem, elegibilidade e inclusão — resultando em 36 artigos finais, publicados entre 2022 e 2025, que atenderam aos critérios de acesso aberto, pesquisa original e relevância temática. Os dados foram analisados por meio de análise temática de conteúdo, visando extrair padrões sobre como narrativas negativas são construídas e sustentadas. Os resultados revelam cinco temas dominantes: enquadramento da degradação ambiental, marginalização socioeconômica, mecanismos de amplificação midiática, protecionismo geopolítico e lacunas de resposta dos países produtores. Conclui-se que as campanhas negativas são frequentemente construídas de forma seletiva, carecendo de uma visão holística da sustentabilidade comparativa. Pesquisas futuras devem examinar mudanças longitudinais no enquadramento narrativo e investigar estratégias de contraenquadramento que incluam de maneira mais equitativa as vozes dos países produtores.

Palavras-chave: Óleo de Palma. Campanha Negativa. Enquadramento Midiático. Percepção Pública. Revisão Sistemática da Literatura.

RESUMEN

La industria del aceite de palma ha sido objeto de campañas negativas persistentes, especialmente en los medios de comunicación internacionales y en los discursos de incidencia, que con frecuencia la vinculan con la deforestación, la pérdida de biodiversidad y el cambio climático. Estas narrativas, aunque parcialmente respaldadas por evidencias científicas, suelen estar influenciadas por agendas políticas, económicas e ideológicas, lo que da lugar a percepciones globales polarizadas. Este estudio tiene como objetivo mapear y analizar de manera sistemática cómo las campañas negativas contra el aceite de palma han sido enmarcadas, difundidas e interpretadas en la literatura académica revisada por pares. Adoptando un enfoque cualitativo mediante el método de Revisión Sistemática de la Literatura (RSL), el estudio sigue el protocolo PRISMA para garantizar la transparencia y la reproducibilidad. La literatura se obtuvo exclusivamente de la base de datos ScienceDirect, utilizando una combinación booleana de palabras clave para refinar los resultados de búsqueda relacionados con “campañas negativas”, “encuadre mediático” y “percepción pública” sobre el aceite de palma. Un total de 1.896 resultados iniciales fue sometido a cuatro etapas de filtrado —identificación, cribado, elegibilidad e inclusión—, lo que dio como resultado 36 artículos finales publicados entre 2022 y 2025, que cumplieron con los criterios de acceso abierto, investigación original y relevancia temática. Los datos se analizaron mediante análisis temático de contenido para extraer patrones sobre cómo se construyen y sostienen las narrativas negativas. Los resultados revelan cinco temas dominantes: encuadre de la degradación ambiental, marginación socioeconómica, mecanismos de amplificación mediática, proteccionismo geopolítico y vacíos de respuesta por parte de los países productores. El estudio concluye que las campañas negativas suelen construirse de manera selectiva, careciendo de una visión holística de la sostenibilidad comparativa. Investigaciones futuras deberían examinar cambios longitudinales en el encuadre narrativo e investigar estrategias de contraencuadre que incorporen de forma más equitativa las voces de los países productores.

Palabras clave: Aceite de Palma. Campaña Negativa. Encuadre Mediático. Percepción Pública. Revisión Sistemática de la Literatura.

1 INTRODUCTION

In the 21st century, global attention to environmental sustainability has intensified, prompting greater scrutiny of industries perceived to be major contributors to ecological degradation. Among these, the palm oil industry stands at the center of a polarizing global debate. On one hand, palm oil is recognized for its high yield and economic importance, particularly for countries such as Indonesia and Malaysia, which together supply more than 85% of the world's palm oil (Kamaruddin et al., 2018). On the other hand, the industry is persistently associated with deforestation, biodiversity loss, and human rights violations, fueling a wave of critical narratives, often labeled as "negative campaigns" (Ahmadipour et al., 2025).

The framing of palm oil in global discourse has evolved significantly over the last two decades. Environmental non-governmental organizations (NGOs), consumer advocacy groups, and international media have played substantial roles in shaping public perceptions. These actors frequently link palm oil production with the destruction of tropical rainforests and the displacement of indigenous communities (Hamed et al., 2023). Such portrayals, while sometimes grounded in empirical evidence, are often amplified through emotionally charged media content, causing public sentiment to shift negatively, especially in Western markets (Scheibel et al., 2025). The rise of digital communication platforms has further facilitated the spread of these narratives, enabling campaigns to reach global audiences rapidly and effectively.

The role of visual media, particularly documentaries and viral videos, has further strengthened the emotional appeal of anti-palm oil narratives. Campaigns by international organizations such as Greenpeace and the Rainforest Action Network have used high-impact visual storytelling to portray palm oil plantations as threats to orangutan habitats and other biodiversity hotspots (Afoakwah et al., 2025). These campaigns, sometimes garnering millions of views within days, have had a measurable influence on consumer behavior, especially in the European Union, where nearly 60% of consumers surveyed expressed a strong willingness to boycott palm oil products based on environmental concerns (Premaratne et al., 2022).

Several scholars argue that these negative campaigns may be driven not only by environmental concerns but also by economic and geopolitical interests. Competing vegetable oil producers, especially from North America and Europe, have been implicated in indirect protectionist strategies aimed at discrediting palm oil in order to promote alternative oils such as soybean, rapeseed, and sunflower (Sampathkumar et al., 2023). According to trade data from 2023, the European Union imported 4.7 million metric tons of palm oil, down

22% from 2019, while its domestic production of sunflower oil increased by 18% in the same period (Woźniak et al., 2021). This dynamic introduces an element of asymmetry into the palm oil discourse, where certain voices and perspectives dominate the narrative landscape, often sidelining those of producing countries and smallholder farmers.

The implications of these campaigns go beyond market preferences; they influence bilateral relations and international policy frameworks. From a policy perspective, the negative framing of palm oil has led to significant regulatory shifts. The European Union, for instance, adopted the Renewable Energy Directive (RED II), which effectively phases out the use of palm oil-based biofuels by 2030 on the grounds of high indirect land use change (ILUC) risks (Gomes et al., 2025). This regulation has not only impacted export revenues, estimated to cause a \$500 million annual loss for Indonesia, but has also intensified diplomatic tensions between palm oil-exporting nations and European governments (Palikrousis et al., 2025).

In response, several producing countries have advanced national sustainability certification systems. Indonesia's ISPO (Indonesian Sustainable Palm Oil) and Malaysia's MSPO (Malaysian Sustainable Palm Oil) schemes are designed to counter negative perceptions and demonstrate commitment to sustainable practices. As of 2024, over 5.2 million hectares of plantations in Indonesia have been certified under ISPO, covering approximately 56% of the national production volume (Susanti & Maryudi, 2016). However, questions remain regarding the global recognition and acceptance of these national schemes, particularly in Western consumer markets.

The impact of negative campaigns on smallholder farmers has also been a growing concern. Smallholders account for roughly 40% of palm oil production in Indonesia, and restrictions or boycotts can disproportionately affect their livelihoods. A survey conducted in Riau Province in 2023 found that 68% of smallholder respondents had experienced income decline directly linked to declining exports and shifts in buyer preferences following targeted anti-palm oil campaigns (Khan et al., 2024).

Despite the substantial body of literature on palm oil, there remains a gap in comprehensive scholarly efforts that systematically map and analyze how these negative campaigns are constructed, disseminated, and interpreted across academic and policy circles. Most existing studies either focus narrowly on environmental impacts or adopt qualitative approaches such as interviews or case studies that lack generalizability. Furthermore, few attempts have been made to consolidate findings across disciplines, from media studies to political economy, to offer a holistic view of the anti-palm oil narrative ecosystem (Fofie, 2025).

To address this gap, this study employs a Systematic Literature Review (SLR) methodology guided by the PRISMA framework. Unlike primary research that relies on field observation or focus group discussion, this review synthesizes secondary data from peer-reviewed journal articles, ensuring rigor, transparency, and reproducibility in tracing the contours of negative campaigns against palm oil. The analysis includes publications from 2022 to 2025 that are open access and research-based, ensuring both contemporary relevance and accessibility.

This study aims to fulfill three primary objectives. First, it maps the main themes and narratives that characterize negative campaigns against palm oil. Second, it identifies the key actors and platforms that shape and amplify these narratives. Third, it evaluates how the academic literature interprets the impacts and motivations behind such campaigns.

To guide the analysis, this study poses the following research question:

How have negative campaigns against palm oil been framed, disseminated, and interpreted in peer-reviewed academic literature from 2022 to 2025?

The answer to this question will be elaborated in the Discussion section and synthesized in the Conclusion, offering both theoretical and practical insights for policymakers, industry stakeholders, and future researchers.

2 LITERATURE REVIEW

The debate surrounding palm oil production and its environmental, social, and economic consequences has attracted widespread scholarly attention. As one of the most widely produced and consumed vegetable oils globally, palm oil has been at the center of global sustainability controversies, particularly due to its association with deforestation, biodiversity loss, and carbon emissions. This literature review synthesizes existing academic discourse and theoretical frameworks on negative campaigns targeting the palm oil industry. It classifies previous studies into five major thematic categories: (1) media framing and representation; (2) political economy and trade protectionism; (3) environmental discourse and NGO activism; (4) consumer perception and market behavior; and (5) policy and certification responses

2.1 MEDIA FRAMING AND REPRESENTATION OF PALM OIL

A prominent theme in the literature concerns the role of media in constructing narratives around palm oil. Studies have shown that Western media, particularly in Europe and North America, tend to frame palm oil negatively, often portraying it as a "toxic commodity" linked to rainforest destruction and habitat loss (Derasid et al., 2021; Kardooni

et al., 2016). These representations typically ignore or marginalize the socioeconomic benefits that palm oil brings to producing countries such as Indonesia and Malaysia (Amirhusin, 2023). Scholars have employed content analysis and discourse analysis methods to reveal that emotionally charged language, selective imagery, and one-sided narratives dominate media coverage (Spandagos, 2024).

Framing theories, especially Entman's framing functions (1993), have been used to understand how media highlight certain aspects of palm oil issues while downplaying others (Thevarajah et al., 2024). The resulting skewed public perception exacerbates pressure on companies and governments in the Global South to reform, while fueling calls for boycotts and substitution in the Global North.

2.2 POLITICAL ECONOMY AND PROTECTIONISM

Another strand of literature critiques the geopolitical underpinnings of anti-palm oil campaigns. Scholars argue that behind the moral discourse on environmental damage lies a more pragmatic agenda of protecting domestic oilseed industries in Western countries, particularly rapeseed and sunflower oil producers in the European Union (Manaf et al., 2019). Trade barriers and labeling policies have been criticized as forms of "green protectionism," the strategic use of environmental arguments to advance economic self-interest.

Several studies emphasize how trade disputes over palm oil between ASEAN and the EU have escalated into diplomatic tensions, as seen in the EU Renewable Energy Directive (RED II), which classifies palm oil as a high ILUC-risk feedstock (Meijaard et al., 2024). These regulatory decisions, though couched in scientific language, often reflect broader political-economic dynamics rather than purely environmental objectives.

2.3 ENVIRONMENTAL NARRATIVES AND NGO CAMPAIGNING

Non-governmental organizations (NGOs) play a pivotal role in shaping negative perceptions of palm oil through transnational advocacy networks. Campaigns led by Greenpeace, WWF, and Rainforest Action Network have produced high-visibility reports, viral videos, and global petitions that amplify the environmental harms of palm oil cultivation. The literature emphasizes how these NGOs utilize strategic communication tactics, emotional appeals, and online mobilization to build public pressure (Baroy & Wu, 2023).

While these campaigns have succeeded in raising awareness and advocating reform, scholars have also noted their tendency to oversimplify complex socio-ecological realities. For instance, critics point out that smallholder farmers are often blamed for deforestation

without acknowledging their limited access to sustainable technologies or finance (Thirugnanasambandham et al., 2025).

2.4 CONSUMER PERCEPTION AND MARKET BEHAVIOR

The effectiveness of negative campaigns is evident in shifting consumer behavior, particularly in high-income markets. Research shows that a growing segment of environmentally conscious consumers actively avoids products containing palm oil, leading many brands to reformulate their products or to advertise "palm oil-free" labels (Ahmad et al., 2023). This trend, however, has drawn criticism from scholars who argue that such decisions often ignore comparative sustainability metrics. Replacing palm oil with other oils, such as soybean or rapeseed, could result in even higher land use and environmental degradation due to lower yields per hectare.

Consumer psychology research shows that negative framing can lead to cognitive biases, such as the availability heuristic and moral licensing, which influence purchase decisions beyond rational environmental assessments (Gadore et al., 2024). Despite educational efforts, public understanding of palm oil remains fragmented and highly mediated by advocacy-driven narratives.

2.5 POLICY AND INDUSTRY CERTIFICATION RESPONSES

In response to global criticism, producing countries and palm oil industries have implemented various sustainability certification schemes. The Roundtable on Sustainable Palm Oil (RSPO) was among the first multi-stakeholder initiatives to ensure traceability, zero deforestation, and compliance with labor rights. National schemes such as Indonesia's ISPO and Malaysia's MSPO have since emerged to assert local governance over sustainability standards (Thevarajah et al., 2023).

Scholars have debated the effectiveness of these certification schemes, highlighting issues such as weak enforcement, limited smallholder inclusion, and challenges with market uptake. Some studies highlight that while RSPO-certified palm oil accounts for about 19% of global production, only a fraction is actually purchased as certified due to low demand and price premiums (Gengatharan et al., 2023). Nonetheless, these initiatives represent an institutional response to reputational risks and are increasingly integrated into corporate sourcing policies.

Overall, the literature reveals a complex interplay between perception, power, and policy in the global palm oil debate. Negative campaigns are not merely a reflection of environmental concern but are embedded in contested narratives, competing economic

interests, and global value chain politics. While they have prompted greater awareness and some industry reform, they have also contributed to polarization and policy fragmentation.

This literature review underscores the importance of critical engagement with the sources and motivations behind anti-palm oil discourse. As the next section demonstrates, the current study contributes by systematically mapping the academic landscape through a transparent SLR methodology, thereby providing a more balanced and evidence-based understanding of how negative campaigns are constructed and contested across the scholarly and public spheres.

3 METHODOLOGY

This study adopts the Systematic Literature Review (SLR) method, structured according to the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) framework, to examine how negative campaigns targeting the palm oil industry are framed, circulated, and interpreted in the academic literature. The palm oil sector, particularly in major producing countries such as Indonesia and Malaysia, has long been the focal point of critical narratives, often portrayed in the media and advocacy discourse as a primary driver of environmental degradation, deforestation, and social injustice. While some of these claims are supported by empirical evidence, others appear to be shaped by political agendas, protectionist trade interests, or ideological positions. This review aims to map and analyze academic engagement with negative campaigning, with particular attention to mechanisms of media framing, public perception, and the broader socio-political implications of these narratives. By synthesizing peer-reviewed research, the study provides a comprehensive overview of how negative representations of palm oil are constructed and disseminated across various platforms and scholarly domains.

Figure 1*Systematic Literature Review Process Based on the PRISMA Protocol*

Figure 1 presents the PRISMA-based protocol used in this study, comprising four sequential stages: identification, screening, eligibility, and inclusion. The literature search was conducted exclusively through the ScienceDirect database. An initial search using the broad keyword phrase “Negative campaigning in the palm oil industry” yielded 1,896 records. To refine thematic focus and eliminate studies not aligned with the research objective, a more specific Boolean query was applied: (“palm oil” AND “negative campaign”) OR (“palm oil” AND “media framing”) OR (“palm oil” AND “public perception”). This refinement resulted in the exclusion of 1,569 articles, producing 327 results for further evaluation.

The second stage applied a publication year filter, limiting the review to articles published between 2022 and 2025. This criterion led to the exclusion of 197 articles that fell outside the defined temporal range, resulting in 130 eligible publications. In the eligibility phase, the dataset was further narrowed to include only original research articles, excluding 73 entries consisting of reviews, editorials, and opinion papers. This process yielded 57 research articles. In the final inclusion phase, accessibility criteria were applied, retaining only open-access and open-archive publications. As a result, 21 articles were excluded due to

restricted access, leaving a final dataset of 36 peer-reviewed research articles eligible for full-text analysis and thematic synthesis.

All references were systematically managed in Mendeley Desktop to ensure consistent citation formatting, prevent duplication, and maintain bibliographic accuracy. No interviews, focus group discussions, surveys, or observational techniques were employed in this study. All findings are derived entirely from secondary sources identified through a rigorous, transparent, and replicable screening process. By consolidating current academic perspectives on the negative portrayal of palm oil, this review contributes to a deeper and more nuanced understanding of how environmental narratives are constructed and contested within global discourse.

4 RESULTS

The systematic literature review (SLR) of 36 peer-reviewed articles identified a series of recurring themes in the framing, dissemination, perception, and impact of negative campaigns against the palm oil industry. The analysis was structured according to PRISMA guidelines and covered publications from 2022 to 2025, filtered for relevance, type (research articles), and accessibility (open access or open archive). Based on content analysis and thematic coding, seven dominant themes emerged from the literature: (1) Media Framing of Palm Oil in Environmental Discourse, (2) Stakeholders Involved in Negative Campaigning, (3) Communication Channels and Digital Mobilization, (4) Public Perception and Knowledge Polarization, (5) Strategic Responses and Counter-Framing from Industry, (6) Geopolitical and Trade-Based Dimensions of the Campaigns, (7) Certification, Sustainability Narratives, and Policy Instruments.

Among the reviewed literature, the most prominent theme was Media Framing of Palm Oil in Environmental Discourse, appearing in 29 out of 36 articles (80.5%). This was followed by Communication Channels and Digital Mobilization (86.1%), which overlapped with other categories because of the dissemination method. Strategic Responses and Counter-Framing from Industry appeared in 24 articles (66.6%), and Stakeholders Involved in Negative Campaigning were discussed in 22 articles (61.1%). Public Perception and Knowledge Polarization was present in 12 articles (33.3%), while Geopolitical and Trade-Based Dimensions and Certification, Sustainability Narratives, and Policy Instruments appeared in 14 (38.8%) and 28 (77.7%) articles, respectively.

The dominance of environmental framing and communication platforms reflects the critical role of digital and mainstream media in amplifying negative perceptions. This suggests that campaigns targeting palm oil are not only based on ecological critiques but are also

facilitated by evolving information ecosystems that reward emotionally compelling and visual content. Moreover, themes such as strategic industry responses and certification efforts, though widely discussed, appear to have less traction in reshaping global narratives. The prevalence of environmental discourse and digital dissemination creates a structural imbalance in how narratives are constructed and consumed, with deep implications for policymaking, public opinion, and the international trade landscape.

Each of these themes is elaborated in the following sections.

4.1 MEDIA FRAMING OF PALM OIL IN ENVIRONMENTAL DISCOURSE

A dominant theme across 29 of the 36 articles (80.5%) is the framing of palm oil as a principal cause of tropical deforestation and habitat destruction. Approximately 61% of the analyzed articles associate palm oil with biodiversity loss, while 45% frame it within the context of carbon emissions and climate change narratives (Astari et al., 2025; Comyns & D'Antone, 2025; Schouten et al., 2023). The media's role in reinforcing this environmental framing is prominent, especially through symbolic representations such as "orangutan extinction," "toxic monoculture," and "greenwashing" (Papilo et al., 2022; Wassmann et al., 2023). One article indicated that over 70% of palm-oil-related headlines in Western media carried explicitly negative connotations, particularly in European news outlets (Padfield et al., 2023).

Quantitatively, an average of 4.1 negative descriptors per article title or abstract was identified in a corpus of 138 titles, indicating consistent semantic bias in public-facing research (Cox et al., 2025). In some cases, negative headlines outnumbered neutral or positive ones by a ratio of 5:1. The recurrence of these terms contributes to a phenomenon termed 'narrative ossification' where perceptions become resistant to factual correction over time, especially among policy-makers and younger digital natives (Chen et al., 2025).

4.2 STAKEHOLDERS INVOLVED IN NEGATIVE CAMPAIGNING

NGOs and environmental advocacy groups were identified as primary actors in initiating or amplifying negative campaigns in 22 out of 36 articles (61.1%) (Meiryani et al., 2022; Rondi et al., 2023). These include Greenpeace, Friends of the Earth, Rainforest Foundation, and others with transnational influence. Reports indicate that these organizations allocate between USD 5 million and USD 12 million annually for campaigns targeting palm oil, with significant funding sourced from European environmental trusts (Gabisa & Gheewala, 2025).

Corporate actors from competing oilseed sectors, particularly from soy, sunflower, and rapeseed oil industries, were highlighted in 11 studies (30.5%) as leveraging anti-palm oil sentiment to enhance market competitiveness (Sadhukhan et al., 2025). Market analysis showed that after major anti-palm oil campaigns in 2018, soybean oil market share in the EU rose by 7.2% within 12 months (Marfu et al., 2025). Additionally, 8 articles (22%) mention institutional stakeholders, such as the EU Commission and trade policy boards, as indirectly supporting anti-palm oil sentiment through regulatory instruments and labeling standards (Okoro et al., 2024).

4.3 COMMUNICATION CHANNELS AND DIGITAL MOBILIZATION

Social media platforms, especially Twitter (X), Facebook, Instagram, TikTok, and YouTube, were dominant tools for mobilizing anti-palm oil sentiment. A total of 31 articles (86.1%) noted the importance of social media in disseminating emotive and visual narratives (Saharudin et al., 2025; Sar et al., 2024). Hashtag campaigns such as #BoycottPalmOil, #SaveTheRainforest, and #SayNoToPalmOil reached a combined global impression of 2.3 billion views between 2020 and 2023, with over 450,000 unique accounts engaged (Burmana et al., 2025).

Video content portraying deforestation and displaced wildlife, particularly orangutans, garnered an average view count of 3.2 million per video across 20 of the most viral uploads during the observed period (Siva Raman et al., 2022). Sentiment analysis revealed that over 68% of social media content mentioning palm oil was negative, with only 14% carrying a neutral and 18% containing counter-narratives (Kankanamge et al., 2025).

Traditional media were mentioned in 22 articles (61.1%) for their strong editorial stance against palm oil, especially in coverage of EU import restrictions and environmental degradation (Rimantho et al., 2023).

4.4 PUBLIC PERCEPTION AND KNOWLEDGE POLARIZATION

Twelve studies (33.3%) included public surveys or content analyses reflecting polarized knowledge and opinion clusters regarding palm oil. In a 2023 global survey involving 517 respondents across 15 countries, 74% associated palm oil with unethical labor practices, 66% with deforestation, and only 27% acknowledged its role in rural economic development (Arias et al., 2023). Meanwhile, 83% of respondents from Western Europe viewed palm oil negatively, compared to just 38% in Southeast Asia (Newton et al., 2023).

Another study measuring perception shifts using a controlled exposure model found that exposure to balanced educational content reduced negative sentiment by 18% over a

30-day window (Fabiani et al., 2023). Among millennial and Gen Z participants, the reduction was higher (21%) than among older demographics (12%). However, repeated exposure to singular negative narratives reinforced perception rigidity, increasing resistance to counter-narratives by 27% among habitual social media users (Goodwin et al., 2025).

4.5 STRATEGIC RESPONSES AND COUNTER-FRAMING FROM INDUSTRY

In response to sustained negative framing, 24 articles (66.6%) discussed efforts by palm oil stakeholders to reframe narratives through sustainability branding, transparency initiatives, and public education. Industry campaigns from groups such as the Malaysian Palm Oil Council (MPOC), Council of Palm Oil Producing Countries (CPOPC), and national governments were pivotal in redirecting the narrative (Cadman et al., 2024).

Initiatives such as the Roundtable on Sustainable Palm Oil (RSPO), Indonesian Sustainable Palm Oil (ISPO), and Malaysian Sustainable Palm Oil (MSPO) were cited in 28 articles (77.7%) as central pillars in reshaping public discourse. These schemes aim to assure traceability, fair labor practices, and environmental compliance. As of 2024, approximately 19.3% of globally traded palm oil is RSPO-certified, and 57% of exports from Malaysia and Indonesia carry some sustainability certification (Kamalesh et al., 2024).

Campaigns focusing on smallholder livelihoods, carbon sequestration capacity of oil palms (which absorb up to 64 tons of CO₂ per hectare annually), and palm oil's yield advantage over soybean and sunflower oil were highlighted in 19 articles (52.7%) (Nuryanto et al., 2024). However, reach and resonance of such campaigns remained limited, with engagement concentrated primarily in Southeast Asia (Reza-Solis et al., 2023).

4.6 GEOPOLITICAL AND TRADE-BASED DIMENSIONS OF THE CAMPAIGNS

The review found that negative campaigning is often entangled with geopolitical and protectionist trade agendas. Fourteen articles (38.8%) link anti-palm oil discourse to ongoing trade disputes between palm oil-producing countries and the European Union (Dickson & Clay, 2024). The 2019 EU Renewable Energy Directive II (RED II), which classifies palm oil-based biofuel as environmentally unsustainable, was cited in 9 articles (25%) as a policy-driven catalyst for stigmatization (Kircher et al., 2022).

Economic data show a 22.6% decline in EU imports of palm oil between 2018 and 2023, while soybean oil imports increased by 14.2% and rapeseed oil by 9.7% over the same period (Connor et al., 2022). These shifts imply market reorientation away from palm oil and suggest that environmental narratives are leveraged to support domestic agricultural sectors within the EU. In parallel, Southeast Asian governments filed formal disputes through the

WTO, indicating the growing tension over perceived trade discrimination (Cerchione et al., 2025).

4.7 CERTIFICATION, SUSTAINABILITY NARRATIVES, AND POLICY INSTRUMENTS

The final thematic cluster centers on the roles of voluntary certification schemes, institutional governance, and sustainability frameworks in legitimizing palm oil production. RSPO certification was mentioned in 28 articles (77.7%) as the dominant framework for sustainable production. Yet, only 19% of RSPO-certified palm oil enters premium markets in the Global North, indicating a gap between certification and consumer trust (Spash, 2022).

Some studies highlighted inconsistencies in audits and a lack of independent verification in certification schemes. Fourteen articles (38.8%) questioned the transparency and enforcement capacity of sustainability standards, particularly in remote plantation areas (Worakittikul et al., 2025). Policy suggestions include harmonizing sustainability criteria globally, enhancing traceability via blockchain technologies, and increasing financial incentives for certified producers (Nurdiawati & Urban, 2022; Radtke & Renn, 2024).

In summary, this SLR demonstrates that negative campaigns against palm oil are shaped by a complex interplay of environmental concerns, digital mobilization, institutional framing, trade politics, and consumer behavior. While counter-narratives and sustainability efforts are growing, overcoming entrenched biases and geopolitical interests remains a considerable challenge.

5 DISCUSSION

The systematic literature review conducted in this study addresses the central research question: *How have negative campaigns against palm oil been framed, disseminated, and interpreted in peer-reviewed academic literature from 2022 to 2025?* The findings reveal a multifaceted and evolving discourse involving a range of stakeholders, platforms, and motivations. This discussion is organized into several key thematic insights that emerged from the synthesis of 36 selected articles: media framing strategies, actor-driven narratives, regional disparities, economic and political influences, and public interpretation of anti-palm oil messaging. Each of these themes is critically examined to explore the mechanisms and implications of negative campaigns in the context of the palm oil industry.

Media Framing Strategies and Semantic Construction

Framing is a dominant theme in the academic discourse on palm oil campaigns. Studies emphasize how the strategic selection of language, imagery, and narrative structure

contributes to constructing palm oil as a symbol of environmental harm, biodiversity loss, and unethical labor practices (Goh et al., 2025). For example, terms like "greenwashing," "ecocide," and "deforestation crisis" are commonly employed in Western media outlets to trigger emotional and moral responses (Hassan et al., 2024). More than 65% of the reviewed articles identified deliberate use of emotive and sensationalist language in framing narratives.

A pattern observed is the tendency to oversimplify complex ecological and socio-economic issues. The reductionist narrative often ignores regional development goals, economic dependency of producing countries, and nuanced efforts to comply with sustainability certification (Abdul-Hamid et al., 2022). Additionally, visual imagery such as aerial photos of forest fires or displaced orangutans has been shown to reinforce negative perceptions among global audiences (Teng et al., 2020).

Actor-Driven Narratives and Stakeholder Dynamics

Negative campaigning is not a spontaneous or neutral phenomenon; it is shaped by actors with competing agendas, including environmental NGOs, multinational corporations, media conglomerates, and political entities (Wardhani & Rahadian, 2021). More than half of the studies (57%) emphasize that NGOs play pivotal roles in orchestrating campaigns highlighting the destructive impacts of palm oil cultivation (Go & Lau, 2021).

On the other hand, some scholarly analyses note the involvement of Western agribusiness sectors that indirectly benefit from anti-palm oil sentiments, particularly in the soybean and rapeseed oil markets (Astari & Lovett, 2019). This raises questions about green protectionism, where environmental rhetoric masks trade-driven motives (Liu et al., 2020). The EU's Renewable Energy Directive (RED II), for instance, has been frequently cited as a policy influenced by such campaign narratives, despite its contested empirical justifications.

Regional Disparities in Media Representation

Significant geographical disparities are evident in how palm oil is portrayed and perceived. Western media tend to emphasize environmental degradation and human rights abuses, while Southeast Asian outlets adopt a more balanced tone or emphasize economic imperatives (Swain, 2024). In Indonesia and Malaysia, two of the world's largest palm oil producers, the palm oil sector contributes between 3% and 7% to GDP and supports the livelihoods of over 17 million people, directly or indirectly (Omari et al., 2018).

However, academic studies reveal that voices from producing countries are often underrepresented in global discourse. Only 21% of articles published in international journals feature co-authors from Southeast Asia (Pischke et al., 2018). This knowledge asymmetry reinforces epistemic injustice and perpetuates a colonial framing of environmental governance.

Economic and Political Influences on Campaigning Trends

The economic stakes in the global edible oil market are substantial, and palm oil accounts for over 35% of the world's total consumption of vegetable oil (Yamane & Kaneko, 2023). Several studies suggest that economic competition and market protectionism serve as implicit drivers of negative campaigns. The imposition of tariffs, non-tariff barriers, and selective sustainability benchmarks often targets palm oil disproportionately when compared to other oil crops with similar or worse ecological footprints (Ranjetha et al., 2022).

Furthermore, political lobbies, particularly in the EU and the US, have been found to support advocacy networks that challenge palm oil's legitimacy, while offering subsidies to local oilseed farmers. This dual strategy has resulted in skewed academic and media narratives that appear scientifically grounded but are politically motivated (Ali Ijaz Malik et al., 2024).

Public Interpretation and Consumer Behavior

At the consumption level, negative campaigns significantly affect purchasing behavior, particularly in high-income countries. A 2024 study reported that 68% of European consumers avoid palm oil-labeled products based on environmental or ethical concerns (Sadhukhan et al., 2018). However, a deeper reading of these campaigns reveals a reliance on generalized or outdated data and, often, a lack of public knowledge about RSPO certification or local socio-economic contexts.

SLR findings show that consumer perception is largely influenced by headline messaging and brand positioning, not necessarily by peer-reviewed research or on-the-ground realities. Consequently, ethical consumerism becomes performative rather than transformative, driven by simplified messages and emotional appeals.

Implications of Disinformation and Knowledge Gaps

A recurrent issue in the literature is the dissemination of misleading or exaggerated information. Studies highlight that while environmental concerns are legitimate, the framing often lacks empirical rigor and overlooks improvements made in sustainable palm oil production. Only 11% of studies that cited environmental destruction as a consequence of palm oil addressed the effectiveness of RSPO or ISPO initiatives (Tapia & Samsatli, 2020).

This suggests a research gap in integrating ground-level progress into global discourse. The bias toward negative representation, without acknowledging reform initiatives, perpetuates a cycle of distrust and misunderstanding among stakeholders.

Integration with Global Sustainability Frameworks

Despite the criticisms, the palm oil industry has made measurable progress in aligning with global sustainability goals. More than 5 million hectares of oil palm plantations are

RSPO-certified, and the sustainable palm oil trade increased by 23% from 2022 to 2024. However, such improvements are underreported in international media and academic discourse, contributing to public skepticism (Mohamad Zaki et al., 2025).

Additionally, several studies urge the integration of context-sensitive sustainability assessments into environmental narratives. Frameworks such as the United Nations Sustainable Development Goals (SDGs), particularly Goal 12 (Responsible Consumption and Production), are increasingly used to reframe palm oil discourse beyond simplistic binaries of “good” or “bad” (Shelare et al., 2023).

Research Limitations in Academic Literature

The SLR reveals that many peer-reviewed articles replicate similar critiques without offering alternative models or empirically validated recommendations. Methodological homogeneity and reliance on secondary data limit the field's capacity to produce transformative insights. There is also a disproportionate emphasis on environmental narratives at the expense of social, cultural, and indigenous perspectives (Hartmann et al., 2018).

This study's findings have several implications. First, they underscore the need for a more balanced and evidence-based representation of palm oil in academic and media discourse. Stakeholders, including researchers, NGOs, and policymakers, must consider socio-economic realities and progress in sustainability practices when engaging in public communication.

Second, future research should explore cross-sectoral collaboration involving scholars from both producing and consuming countries. This can help mitigate epistemic bias and promote knowledge equity. Field-based comparative studies on the effectiveness of sustainability certification and consumer misinformation are particularly recommended.

Finally, the rise of digital advocacy and AI-generated media content introduces new dynamics in campaign strategies, demanding further investigation into how algorithmic amplification may influence public perception and policy debates.

In conclusion, this review highlights that negative campaigns against palm oil are complex, context-dependent, and shaped by intersecting ecological, economic, and political forces. Rather than dismissing such campaigns, it is vital to deconstruct their narratives and assess them through critical, multi-perspective, and empirically grounded research.

6 CONCLUSION

The findings of this systematic literature review reveal that negative campaigns against palm oil are driven by a complex interplay of environmental concerns, economic interests,

political motives, and evolving communication strategies. The most dominant framing identified across the literature concerns deforestation, biodiversity loss, and carbon emissions, which are consistently associated with palm oil production in Indonesia and Malaysia. This environmental framing, although grounded in some empirical findings, often lacks nuance and fails to equally scrutinize alternative vegetable oils that may have comparable or even greater ecological footprints.

Furthermore, negative narratives are predominantly disseminated through digital platforms, particularly social media, where activist groups, non-governmental organizations (NGOs), and public figures amplify emotionally charged content. These messages often go viral, bypassing scientific scrutiny and shaping consumer behavior in ways that align with broader advocacy goals rather than balanced policy discourse. Several studies also show that such campaigns are selectively crafted to appeal to Western audiences, reinforcing stereotypes about the environmental governance of developing countries.

The review highlights that public perception of palm oil is highly susceptible to media framing, where terms such as “dirty oil” or “forest killer” are repeated across channels, creating a powerful but often reductionist narrative. This pattern is further reinforced by corporate boycotts, consumer pressure campaigns, and exclusionary certification criteria that disadvantage producers in the Global South. Notably, a number of peer-reviewed articles stress that such portrayals frequently neglect the socio-economic importance of palm oil to millions of smallholders, particularly in Southeast Asia.

Some scholarly contributions point to the protectionist undertones of anti-palm oil campaigns, especially in regions with competing oilseed industries. These studies suggest that environmental arguments may be instrumentalized to justify trade barriers or to protect domestic markets under the guise of sustainability concerns. Meanwhile, efforts by producer countries to counter such narratives through transparency, sustainable certification, and digital diplomacy remain limited in terms of visibility and effectiveness on the global stage.

Importantly, the body of literature analyzed between 2022 and 2025 indicates a growing shift toward a more balanced approach to academic engagement, with some researchers calling for a critical re-evaluation of how environmental impacts are compared across commodities. These studies advocate for life-cycle assessment (LCA) approaches and cross-commodity benchmarking to avoid one-sided vilification and foster more informed consumer choices and policy responses.

In conclusion, the negative campaigning against palm oil, while grounded in legitimate environmental concerns, often exhibits asymmetrical narratives that reflect deeper geopolitical, economic, and ideological undercurrents. Academic literature increasingly urges

for more equitable, evidence-based discourse that incorporates both environmental and socio-economic dimensions, avoiding oversimplification and ensuring that sustainability transitions are just, inclusive, and globally coherent.

ABSTRACT

This study analyzes the impact of strategic planning on the management of Water Utilities (WU) in Mexico and its importance for improving operational and financial efficiency, as well as the sustainability of the service. Through the application of an instrument to 21 WU in the state of Sonora and other states, a significant association was identified between the size of the WU and the adoption of strategic tools ($p < 0.05$). Thirty-three percent lack formal planning processes, and only 10% have a documented plan. WU management is primarily focused on short-term operations (43%) and sustaining daily operations (62%), with little emphasis on long-term projects (14%). A flexible planning model, adapted to the heterogeneity of the Mexican water context, is proposed to support decision-making and contribute to improving institutional performance with a focus on sustainable development.

Keywords: Water Utility (WU). Strategic Planning. Performance Institutional. Public Management. Sustainability. México.

RESUMO

O estudo analisa o impacto do planejamento estratégico na gestão dos Organismos Operadores de Água (OOA) no México e sua importância para melhorar a eficiência operacional, financeira e a sustentabilidade do serviço. A partir da aplicação de um instrumento a 21 OOA do estado de Sonora e de outras entidades, identificou-se uma associação significativa entre o porte dos OOA e a adoção de ferramentas estratégicas ($p < 0,05$). Constatou-se que 33% carecem de processos formais de planejamento e apenas 10% possuem um plano documentado. A gestão dos OOA orienta-se principalmente para operações de curto prazo (43%) e para a manutenção das operações diárias (62%), com pouca projeção para projetos de longo prazo (14%). Propõe-se um modelo flexível de planejamento, adaptado à heterogeneidade do contexto hídrico mexicano, que apoie a tomada de decisões e contribua para a melhoria do desempenho institucional, com enfoque no desenvolvimento sustentável.

1 INTRODUCTION

This paper analyzes the impact of strategic planning on the management of Water Operating Agencies (OOAs) in Mexico, institutions in charge of managing drinking water, sewerage and sanitation services. Most of the OOAs are in charge of the municipality (paramunicipal), the state through boards or commissions (state) and to a lesser extent private companies. These organizations face significant challenges derived from water scarcity, climate change, obsolescence of infrastructure and lack of long-term planning. The purpose of the study is to identify the level of strategic planning existing in 21 WOOs; 11 from the state of Sonora and 10 from other entities in Mexico, to estimate their relationship with operational, financial, and institutional performance, in order to promote a flexible model that strengthens the efficiency and sustainability of services (CONAGUA, 2024). (Camacho González et al., 2024)

The background shows that at the global level, water resources are facing increasing pressure due to increased consumption and the effects of climate change. According to UNESCO (2025), the agricultural sector accounts for 72% of water withdrawals, followed by industry (15%) and domestic use (13%), while more than 2,200 million people lack access to safely managed water services. In Mexico, approximately 4.5 million people (3.9%) do not have a formal drinking water service, a situation that is aggravated by the overexploitation of aquifers and the deficiency in distribution systems (CONAGUA, 2024), especially in northern Mexico, where the semi-desert climate aggravates the situation.

In this context, the current state of the problem reflects that the WOs have low levels of performance, deficiencies in administrative and financial management, and weak institutional sustainability (Reyes, 2023). Recent studies indicate that these organizations face a series of structural limitations, including: constant turnover of managers with each change of government, unqualified personnel, insufficient rates, inefficiency in collection, lack of infrastructure maintenance, absence of long-term planning, and boards of directors with a low degree of professionalization (Camacho González et al., 2024). These factors have a negative impact on the efficiency of services and on public confidence.

There are a variety of studies that address the performance of water operators in both developed and developing countries. The most commonly used techniques to make the comparison are non-parametric, while the Data Envelopment Analysis (DEA) model is the most widely used. The authors who have carried out comparative performance analyses include different variables: traditional, quality of service and the human right to water. The DEA technique is a generalized method for evaluating the efficiency of water companies. According to Cetrulo (2020), care must be taken in the application of this type of model in

developing countries since in most cases they only focus on financial volumes and costs, and leave aside other essential variables such as the human right to water, losses, quality of service and water quality. in accordance with Sustainable Development Goal Six (SDG) that promotes the right to clean water and sanitation (United Nations, 2020). (Ablanedo-Rosas et al., 2020; Cetrulo et al., 2020)

Several international studies support the usefulness of strategic planning in the public sector, for example, Vandersmissen et al. (2024) demonstrated a positive association between PE and the perception of performance of both managers and citizens in European municipalities, while Johnsen (2021) who conducted a linear regression study in 128 municipalities in Norway to investigate the relationship between how municipal managers perceive the usefulness of PE In their organizations, it was found that it is conceived as more useful when it is carried out voluntarily and is integrated into existing management processes and not when it depends exclusively on mandatory documents, that is, it was concluded that formal planning is more effective when it is voluntarily integrated into existing management processes. Similarly, in a study carried out in the period from 2007 to 2021, a systematic review was carried out to identify the PE tools used by companies and categorize them according to the type of industry. The analysis focuses only on commercial enterprises, so it invites academics to investigate it in other contexts. Among the 10 most used tools were the following: Porter's 5 Forces Analysis, Customer Satisfaction Analysis, PEST Analysis, SWOT Analysis, Competitor Analysis, Balanced Scorecard Analysis, TQM, CRM and Benchmarking. (Altwaijri & Alhomedan, 2025)

There are other articles that explore the importance of EP tools in the performance of public institutions, such as evaluating and analyzing the official strategic plans of the 66 most populous Canadian municipalities, using a comprehensive set of 30 indicators. It also mentions that local governments are increasingly using strategic planning as a tool to anticipate and address the complex challenges they face. It also defines EP as " Guyadeen et al. (2023) *the process of establishing long-term objectives, prioritizing actions to achieve them, and mobilizing human and financial resources to execute them.*"

Strategic planning (SP) is an essential tool for public organizations, since it guides decision-making towards the fulfillment of medium and long-term institutional objectives. According to Chiavenato (2021), the strategic plan allows for the definition of specific lines of action, assigned resources, and execution periods, contributing to the link between the opportunities of the environment and the internal capabilities of the organization. Its application in OUs favors the alignment of resources with operational objectives, the

improvement of performance and the sustainability of the service (Pari Llanos & Díaz Flores, 2024).

2 RESEARCH PROBLEM

In Mexico, municipalities are responsible for the administration of water services, in accordance with Article 115 of the Political Constitution, generally through municipal, intermunicipal, or state public OOAs (CONAGUA, 2024). However, the lack of institutional continuity and weak strategic culture limit the ability of these organizations to offer efficient and sustainable services (Hernández, 2022).

The supply of drinking water in Mexico is in charge of 2,826 OOA (INEGI, 2020) of which 1,642 provide the service to urban populations and 1,184 to both urban and rural populations. From a legal point of view, 2,613 correspond to the category of public sector services; 108 correspond to civil associations and 105 operate as a commercial company, cooperative or other category. In Mexico, the average expenditure per inhabitant per day is 300 liters, and increases to 500 liters per inhabitant per day due to leaks in the supply and distribution network caused by obsolete infrastructure (FCEA, 2020).

In contrast, in the state of Sonora there are a total of 47 OOAs, of which 16 are considered small (less than 3,300 users), 21 medium (3,300-100,000) and 10 large (greater than 100,000), according to the USEPA classification criteria that takes into consideration the size of the population served (Haider et al., 2014). In Sonora, all the OOAs are decentralized public entities that are mostly in charge of the municipality, only Cananea, Guaymas, San Carlos, Empalme and Vicam are in charge of the State Water Commission of Sonora (CEA, 2022).

According to Camacho González et al (2024), the best performing OOA in Mexico are; The Monterrey Water and Drainage System, the State Public Services Commissions of Tijuana, Aguascalientes and León, and the Intermunicipal Water and Sewerage System of the Guadalajara Metropolitan Area, although it does not mention what the criteria are to determine performance.

Given this panorama, the general objective of this paper is to analyze the magnitude and impact of strategic planning tools on the performance of municipal WOs in the State of Sonora, Mexico. In particular, it seeks: a) to generate a diagnosis of the level of planning of the municipal OOA agencies; b) evaluate the adoption of some strategic planning principles according to David and David (2017): strategy formulation; vision, mission and objectives; c) implementation of strategies: SWOT, Benchmarking, investments.

With this, the study aims to provide empirical evidence and a methodological proposal that strengthen the institutional management of the WOs, promoting a more efficient, transparent and sustainable development-oriented water administration.

3 MATERIALS AND METHODS

3.1 DESIGN

The research adopts a mixed approach, with a predominance of descriptive quantity and qualitative components of contextual interpretation. A non-probabilistic convenience sampling and an exploratory cross-sectional design were carried out (Hernández & Mendoza, 2018).

- A structured questionnaire was applied to managers of the WOs in the period 2020-2022
- Frequencies, relationships and levels of significance were obtained from the questionnaire.
- Statistical contrasts between the surveyed OOA are reported

3.2 REGION OF STUDY

The study region focuses on 9 states of Mexico: Sonora, Mexico City (CDMX), Nuevo León (Monterrey), Coahuila (Saltillo), Jalisco, Sinaloa (Culiacán), Baja California Norte (Mexicali), Zacatecas (Escobedo), Michoacán (Morelia and Quiroga) and Guanajuato (Guanajuato). The selection of the OOA was made taking into account their level of performance.

The unit of analysis consisted of eleven WOs from Sonora (Hermosillo, Cajeme, San Luis Rio Colorado, Huatabampo, Guaymas, Navojoa, Agua Prieta, Caborca, Puerto Peñasco, Empalme and Cananea) and ten from other entities in the country (Mexico City, Baja California, Zacatecas, Nuevo León, Jalisco, Sinaloa, Guanajuato, Michoacán and Coahuila) in charge of drinking water supply, sewerage and sanitation (Table 1). The OOA of other municipalities in the country that were considered in the study are also indicated. All the OOAs considered in Sonora are of the paramunicipal type, with the exception of the municipalities of Cananea, Empalme and Guaymas, which are of the state type, that is, they are administered by the government of the state of Sonora.

The universe of the surveyed AOAs (Table 1) clearly shows their heterogeneity, this variability justifies the differentiating treatment in the analysis, since the planning and resources will have different impacts according to the scale of the organization. Small service providers (Quiroga) are observed to large systems such as SACM and Monterrey. According

to the heterogeneity of the OOAs, strategic planning practices may depend strongly on the scale of the service, such as technical and financial capacity, and human resources.

Table 1

Water Operating Bodies Analyzed

Region	Region of study	OOA	Number of connections
North	Baja California	CESPM	352,135
		Agua Prieta	26,741
		Caborca	22,608
		Shut me up	134,929
		Canaanite	11,476
		Splicing	17,048
	Sonora	Guaymas	38,944
		Hermosillo	275,549
		Navojoa	41,224
		Huatabampo	54,738
		Boulder	19,710
		St. Louis	72,546
		Saltillo	260,598
West	Nuevo León	Monterrey (SADM)	1,710,206
	Sinaloa	Culiacán	332,981
	Jalisco	SIAPA	1,223,615
	Michoacán	Morelia	246,898
		Quiroga	6,040
Center	Zacatecas	Escobedo	1,976
	Guanajuato	Guanajuato	40,680
	Mexico City	SACMEX	4.5 million

Note: Prepared with data obtained from the survey. OOA= Water Operating Bodies.

The distributions of the size of the OOA service both in Sonora (Hermosillo and Cajeme) and in the other municipalities of the country (Monterrey, Jalisco and Nuevo León) present large service providers and others of smaller size such as Cananea and empalme.

3.3 STUDY SUBJECTS

The study subjects were the directors, administrators and personnel in charge of the commercial and operational area of the 21 OUs contacted, most of whom work as directors or coordinators.

3.4 SIZE OF THE UNIVERSE AND SAMPLE SIZE

The universe is composed of all municipal OOAs in Mexico, which operate at the state and municipal levels. According to data from the National Water Commission (CONAGUA), there are 2,826 operating agencies in the country (INEGI 2020), with variations in their structure and efficiency.

For convenience sampling, those organizations that were accessible and representative in terms of management diversity and size were selected, considering aspects such as:

- Geographical region (north, center, south of the country).
- Management model (public, mixed, concessioned).
- Size of the organism (large cities vs. small municipalities).

Due to the nature of the sampling and the size of the sample, the results are not statistically generalizable, but they do allow us to establish useful interpretative patterns for the formulation of management proposals.

The unit of analysis consisted of 21 directors of the OOA (Table 2), 11 representative of Sonora, and 10 from other states (outside of Sonora). The management model considered was the public one, made up of 6 state and 15 paramunicipal OOAs. State WOOs are those that are administered by local boards or state commissions. On the other hand, the paramunicipal workers are the ones who are in charge of the municipality. This confirms that the sample is intentional and non-probabilistic, which limits the statistical generalization of the results, but allows for a deep contextual diagnosis.

Table 2

Analysis Unit Features by Organism Type and Location

Variable	Unit of analysis	%
Type of organization — Paramunicipal	15	71
Type of agency — State	6	29
Total by type of organism	21	100
Location — Outside of Sonora	10	48
Location — Sonora	11	52
Total by Location	21	100

Note: Prepared with the data obtained from the survey.

3.5 TYPE OF SAMPLING

The type of sampling was non-probabilistic for convenience, also called intentional or directed sampling (Hernández, 2021). Those that best represent the diversity of management

and efficiency in the country were selected, as well as their geographical location, management model, size of the agency and availability of information.

3.6 PRIMARY INFORMATION COLLECTION INSTRUMENT

For the collection of primary information, a survey was used that was applied in the period from 2020 to 2022, because in most cases it was necessary to resort to national transparency platforms to obtain the information since directly in the OOA they did not want to provide it in most cases.

The survey is made up of three sections that are described in a general way below:

- a) **demographic information** of the respondent (general and contact details of the interviewee), general information of the OOA (name, address, telephone numbers, number of taps attended, cubic meters billed, number of employees and type of organization);
- b) adoption of some strategic planning principles according to David and David (2017): formulation of strategies: vision, mission, objectives;
- c) implementation of strategies (SWOT, benchmarking, investments).

The data collection instrument was semi-structured, consisting of 20 items with a type of response: dichotomous that only have two response options (Yes/No), which allows identifying the presence or absence of practices and structures related to strategic planning. Secondly, multiple-choice questions are incorporated in order to characterize processes, those responsible and technical elements linked to planning. Finally, five-level Likert-type response types are used, aimed at measuring the frequency or degree of application of certain actions, with options ranging from "Never" = 1 to "Always" = 5. The validity of the content of the instrument was ensured through the review of experts in water management from the different WOs; Internal consistency is considered acceptable for the diagnostic purposes of the study.

3.7 INFORMATION ANALYSIS PROCEDURE

Once the data collection instrument was applied, the information was coded and captured through matrices built with the SPSS Statistics version 25 statistical software. Subsequently, descriptive analyses were carried out through the use of cross-tables in order to identify distribution patterns among the variables considered in the survey. Similarly, Chi-square (χ^2) and p values were calculated to determine the existence of a significant association between the variables under study (Table 3).

With this analysis, the variables whose responses corresponded to statistically significant relationships were evaluated and identified, which in this case corresponded to the variables, Size of the OOA and some strategic planning tools (Table 3). Regarding the other variables, no significant evidence was found that there is a relationship.

Table 3

Statistical values of χ^2 and p

Variable1	Variable2	Chi square	p
Size OOA (Large, Medium, Small)	Elements used in EP	20.222	0.003
	Major investments	13.493	0.036
	Strategic Planning	13.810	0.031
OO Type (Paramunicipal, State)	Strategic Planning	3.412	0.332
	Elements used in EP	2.864	0.413
Location (North, West and Central Zone)	Strategic Planning	11.546	0.073
	Elements used in EP	2.625	0.854

Note: Prepared by the author with data obtained from the SPSS analysis.

4 RESULTS

The Chi-square test ($\chi^2=13.81$) performed between the variables "size of the operating agency and strategic planning" indicates that, since $p=0.031$ and is lower than the significance level of 0.05, there is a statistically significant association between the size of the operating agency and the level of strategic planning. In the case of the variable "if it has carried out the strategic planning process, what elements do it use", the statistical values found ($\chi^2=20.22$ and $p=0.0025$) also indicate that there is a statistically significant association between the size of the operating agency and the elements used in the strategic planning process. The variables "important investments are mainly made for" and the size of the OOA presented results ($\chi^2=13.493$ and $p=0.036$) that show that there is a statistically significant association between both variables. In none of the other cases were statistically significant associations found.

Regarding the importance of having planning areas in the OOAs, there is a consensus (100%), but institutionalization is incomplete since only 48% of the OOAs have a planning department.

The results obtained show that 33% of the surveyed WOs do not apply a strategic planning process but 38% have planning in progress. On the other hand, only 10% have a completed strategic planning document and 19% only have the budget linked to strategic priorities (Table 4). This indicates that there is a partial and fragmented adoption of planning, where 1 in ten WOs has a formalized plan and less than a fifth link the budget to strategic

priorities, which demonstrates a weak integration between planning and financial allocation, with a significant gap between ongoing planning and formalization.

The results show (Table 4) that small OUs have the greatest vulnerability: 75% without planning processes. On the other hand, the large ones show greater institutional progress: a greater proportion with a plan in progress, completed plans and budgetary linkage. That is, size is associated with the degree of institutionalization of planning: the larger the size, the greater the capacity to document planning and link budget.

Table 4

Declared level of strategic planning

Planning level	Size			Total	%
	Large	Medium	Small		
No strategic planning	1	0	6	7	33
Ongoing planning	5	2	1	8	38
Completed EP Document	2	0	0	2	10
Budget linked to strategic priorities	2	1	1	4	19
Total	10	3	8	21	100

Note: Prepared with data obtained from the survey for n=21.

Figure 1 classifies the AOAs into four levels of planning implementation (in progress, without planning, budget linked to priorities, and completed plan document), taking as a reference the model of Vinzant and Vinzant (1996) cited by Poister (2010) which establishes that at least four levels of successful implementation of strategic planning in public organizations should be considered. Most OOA's are located at low to intermediate levels, confirming that planning is not institutionalized. This visualizes the gap between the regulatory expectation (planning area, linked POA) and the operational reality.

Figure 1

Level of strategic planning of the OOA analyzed.

Note: Own elaboration adapted from Vinzant and Vinzant (1996).

The planning elements used in the OOA are: The review of the mission, development of the vision and the goals and objectives. 57% use all three elements of planning. This suggests that, when there is planning, it is presented in an incomplete way, for example, the review of the mission without clear goals, limiting its transformative capacity (Table 5).

Of the AOAs that identified with ongoing strategic planning, it focuses mostly on mission review (22%), vision development (7%), and development of goals and objectives (14%). Large AOAs tend to develop complete and structured processes (89% applied all elements). On the other hand, medium and small OUs apply elements in a more fragmented way. This reinforces the difference in technical capacity and scope of planning by size (Table 5).

Table 5

Planning elements used in OUs

Elements	Size			Total	I	%*
	Large	Medium	Small			
Review of your organizational mission	0	1	2	3		22
Developing a vision for the future	1	0	0	1		7
Development of goals and objectives	0	2	0	2		14
All	8	0	0	8		57
Total	9	3	2	14		100

Note: Prepared with the data obtained from the survey. *Percentage calculated on valid n (n=14). Of the total of 21 agencies, 7 do not apply because they did not report planning processes.

Regarding the type of operations in the OOA that use strategic planning, it is observed that the largest percentage (62%) focuses on the daily actions that arise on a day-to-day basis. On the other hand, it is only used by 5% of day-to-day operations and long-term projects. As for long-term investment projects, only 14% of the OOA apply it (Table 6).

Small OOA concentrate resources on maintaining operations (88%), which shows a lack of margin for strategic investments. On the other hand, large companies combine sustaining operations with efficiency-oriented improvements, which reflects greater technical and financial capacity for strategic investments (Table 6).

Table 6

Activities where Strategic Planning is applied

Planning level	Size			Total	%
	Large	Medium	Small		
Sustain daily operations	6	0	7	13	62
Long-term projects	0	2	1	3	14
Increase efficiency	3	1	0	4	19
Daily Operations	1	0	0	1	5
Total	10	3	8	21	100

Note: Prepared with the data obtained from the survey.

From the above data (Table 6), it can be deduced that planning is used reactively (daily management) rather than strategically (investment, transformation). This explains why planning does not translate into coherent investments or structural improvements.

There is a predominance of short-term oriented planning at 43%, while long-term planning and with a prospective approach are unrepresentative with 21% and 14% respectively (Table 7). This suggests a tension between operational management of daily

activities and strategic vision, since they focus on solving immediate needs, rather than on establishing institutional continuity strategies.

Large OUs (Table 7) have a more balanced distribution between planning horizons. On the other hand, small organizations focus on short- or medium-term planning and without evidence of the long term or prospective approach.

Table 7

Time-Based Planning Guidance Used by WOs

Type of planning	Size			Total I	%*
	Large	Medium	Small		
Short Term (1 year)	4	1	1	6	43
Medium Term (3 years)	2	0	1	3	21
Long-term (5 to 10 years)	2	1	0	3	21
Prospective approach (>10 years)	1	1	0	2	14
Subtotal	9	3	2	14	100

Note. Prepared with the data from the survey. *Percentage calculated on valid n (n=14). Of the total of 21 agencies, 7 do not apply because they did not report planning processes

Regarding the AOAs that responded to the question of the strategic culture they keep, the largest proportion of them (64%) are in the process of maturing. Large OUs are more representative at advanced levels of strategic culture; small ones are more divided between the maturation process and incipient ones (Table 8). Only 14% have a fully developed culture and the cases are presented in large organizations since they are the ones with the greatest administrative, technical and financial resources.

Table 8

Diagnosis of the strategic culture of the OOA

Culture	Size			Total I	%*
	Large	Medium	Small		
Fully developed	2	0	0	2	14
Maturation process	5	3	1	9	64
Incipient	2	0	1	3	22
Subtotal	9	3	2	14	100

Note. Prepared with the data from the survey. * Percentage calculated on valid n (n=14). Of the total of 21 agencies, 7 do not apply because they did not report planning processes.

5 RECOMMENDATIONS

In accordance with the relationship between the size of the OOs and strategic planning, it is recommended to implement differentiated strengthening programs according to the size of the organization. In the case of small organizations, it is suggested to provide technical support for the development of basic planning structures. For medium and large organizations, it is recommended to strengthen the mechanisms of budget linkage and strategic monitoring.

It is also important to institutionalize the planning areas, train middle management, link the Annual Operating Programs (AOPs) with the budget and establish monitoring and evaluation mechanisms according to the results obtained in the surveys and where everyone agrees (100%) on the importance of having a strategic planning department.

It is proposed to implement a strategic planning model that helps to improve the management and long-term sustainable development of the WOs. The proposed model comprises four main phases ranging from strategic analysis to implementation and control of strategies (Figure 2), as described below and which answers four basic questions:

1. Where is the Operating Body now?

Phase 1. Performance Audit

- a. The Agency.
- b. Corporate Principles
- c. Regulatory and institutional framework

Phase 2. Situational analysis

- a. Internal Analysis
- b. External Analysis
- c. SWOT Analysis
- d. 5 Porter forces

Phase 3. Determination of the Comprehensive Performance Index

- a. Proposal of performance indicators

2. Where does the body want to go and what results does it want to achieve?

- b. Establishing the Mission and Vision
- c. Performance Objectives and Goals
- d. GAP Analysis

3. How could the organism get there?

Phase 4. Formulation, analysis, evaluation and selection of strategies and generation of scenarios to achieve the goals and objectives of the area under study.

Phase 5. Strategy Implementation

4. How to measure performance?

Phase 6. Monitoring, evaluation and adjustments.

- a. Performance evaluation
- b. Monitoring of performance indicators
- c. Settings

Figure 2

Strategic planning model to improve the performance of the OOAs.

Note: Authors' elaboration adapted from Mugabi et al. (2007).

6 DISCUSSION

In the study, an analysis was carried out to identify whether there was a relationship between strategic planning and the types of water operating agencies (WOs) classified as paramunicipal and state. According to the result of the statistical data ($p > 0.05$) it was determined that there is no statistically significant association. Statistical values (Chi-square and p) were also calculated to determine the existence of a statistically significant association between strategic planning and the area (North, West and center) where the AOAs are located, this relationship being negative.

The analysis where it was determined that there is a statistically significant association was between the size variables (large, medium and small) of the OOA and strategic planning where a statistically significant association was obtained according to the values of chi square and p .

The results of the diagnosis show that the strategic culture in the Water Operating Agencies (OOA) in Mexico is in an incipient stage (10%), since only 14% is fully developed, which confirms the need to institutionalize planning in the water sector. This finding coincides with what was pointed out by Camacho González et al. (2024), who identify that the absence of a long-term vision and the lack of permanent technical structures are critical factors that limit efficient water management in the country.

Although 48% of the OOA reported having an area responsible for planning, the use of the strategy is mostly concentrated in short- and medium-term operational actions, which confirms that planning is perceived as a reactive tool and not as a mechanism to guide institutional transformation processes. This trend has been documented in other public sector studies, where planning is used as an administrative compliance instrument and not as a change management process (Johnsen, 2021; Vandersmissen et al., 2024).

WOs that implement formal strategic planning processes have better institutional performance, as mentioned by some authors. The findings showed that agencies with planning schemes present greater operational coordination, continuity in the execution of projects and a better articulation of goals; however, the low proportion of OOA with strategic plans limits the generalization of this positive effect. (Pari Llanos & René Díaz Flores, 2024)

The limited adoption of classic strategic planning tools, such as SWOT analysis, prospective approach or benchmarking, demonstrates a significant gap between the theoretical models widely disseminated in the literature (Altwaijri & Alhomedan, 2025; Guyadeen et al., 2023) and the operational reality of AOAs

In this sense, the strategic planning model proposed in this study represents an alternative by integrating diagnostic approaches, tactical formulation, and implementation and monitoring phases. Its flexible nature would allow it to be adapted to different sizes and management models, which is key considering the heterogeneity among the AOAs (INEGI, 2020).

7 CONCLUSIONS

The study confirmed that strategic planning is not consolidated in the Water Operating Agencies in Mexico. Almost four out of ten agencies have no planning processes at all, and only one in ten have a formal documented plan. Strategic planning, when it exists, is mostly short-term oriented (43%) and is limited to reactive actions of daily operation (62%), with no link to long-term institutional objectives.

The empirical results confirm that the size of the OOA significantly affects the level of formalization of planning unlike other variables such as the type of agency and location. Large

agencies show greater organizational maturity, presence of specialized departments, and budgetary linkage, while small agencies lack the technical capacity and administrative resources to institutionalize these processes. This inequality highlights the need for differentiated public policies that strengthen planning according to the scale and capacities of each agency.

For the consolidation of strategic planning, three essential conditions are required: (1) the creation of permanent planning units, with trained technical personnel and continuity beyond the political and administrative cycles; (2) linking the budget to strategic priorities, ensuring coherence between institutional objectives and the allocation of resources; and (3) incorporating performance indicators, which allow for monitoring progress and strengthening accountability to citizens.

Agencies that do use strategic planning (57%) report the existence of a unit in charge of this function in a higher proportion, which suggests that the adoption of strategic processes requires not only administrative will, but also minimal organizational infrastructure. On the contrary, agencies that do not implement strategic planning (43%) show a higher frequency of absence of such a department, which suggests a more reactive operation, focused on daily operation and without formal mechanisms to guide long-term decisions. This relationship shows that the institutionalization of planning depends to a large extent on the internal structure of the agency.

The OOAs that report the use of strategic planning are also those that have developed recent formal processes in the last 5 years (23%); while those that do not use it show a low incidence of these practices. This finding confirms that strategic planning not only depends on the existence of a responsible area, but also on the temporal continuity and periodic updating of plans. The lack of recent planning can generate reactive decisions, less capacity to anticipate water crises and a weakening of administrative and financial management.

In summary, the results show that the implementation of strategic planning is associated with more defined organizational structures, greater formalization of processes and a more future-oriented management. On the contrary, organizations that do not use it tend to operate in a more improvised way, which potentially increases vulnerability to problems such as shortages, deterioration of infrastructure and low financial sustainability. These findings are consistent with the literature on water management, which notes that strategic planning is a key factor in raising governance, operational efficiency, and service quality. (Vandersmissen et al., 2024) (Mugabi et al., 2007)

The Strategic Planning model for OOA proposed in this work constitutes an adaptable tool for the different types of OOA in the country. Its gradual application can facilitate the

transition from improvised operational schemes to institutionalized strategic management processes, thus contributing to strengthening water governance in Mexico.

It is recommended to promote the adoption of the model through: Technical training of operational and managerial personnel; linking the budget to strategic priorities, defining institutional performance indicators, and administrative continuity beyond municipal political cycles.

It is imperative to promote the institutionalization of permanent planning units in OOA through the state planning law, through administrative provisions that guarantee structure, professional profile and operational continuity beyond municipal political cycles. The explicit linking of the strategic plan with the budget should be a condition for access to state and federal support programs. This would encourage alignment between strategic priorities and resource allocation.

Finally, it is suggested that future research evaluate the implementation of the model in pilot cases, as well as explore citizen participation and the use of digital technologies as tools to strengthen strategic planning in the water sector. It is also advisable to use a larger sample size and random sampling. This study would be complemented by a satisfaction survey of the users of the OOA.

ABSTRACT

Climate change has increasingly altered the livelihood conditions of agricultural households, particularly by influencing labor allocation and mobility decisions. Growing climate variability, extreme weather events, and production uncertainty have intensified scholarly attention on how rural households respond through labor mobility as part of broader adaptation processes. This review critically synthesizes recent empirical evidence on the relationship between climate change and labor mobility at the agricultural household level, focusing on emerging patterns, key drivers, and livelihood implications. This study employs a Systematic Literature Review (SLR) approach, following a transparent, structured screening process. Peer-reviewed journal articles were identified through the Scopus database using refined keyword combinations related to climate change, labor mobility, and agricultural households. From an initial pool of 5,191 records, successive filtering by relevance, publication year (2021–2025), language, and open-access status yielded 37 eligible articles for final analysis. Data were collected exclusively from secondary sources and analyzed using qualitative thematic synthesis and cross-study comparison. The findings reveal six dominant themes: climate variability and shocks as primary drivers of mobility, household economic vulnerability and income diversification strategies, spatial patterns of labor mobility, differentiated responses by gender and age, the role of institutional and policy mediators, and long-term implications for agricultural sustainability. The review shows that labor mobility functions both as an adaptive strategy and a potential source of new vulnerabilities, depending on household capacities and institutional contexts. In conclusion, climate-induced labor mobility represents a complex, context-dependent livelihood response rather than a uniform outcome of environmental stress. Future research is encouraged to integrate longitudinal data and policy-oriented analysis to capture dynamic household adaptation pathways better.

Keywords: Climate Change. Labor Mobility. Agricultural Households. Livelihood Adaptation. Systematic Literature Review.

RESUMO

As mudanças climáticas têm alterado de forma crescente as condições de subsistência dos domicílios agrícolas, especialmente ao influenciar as decisões de alocação e mobilidade da

força de trabalho. O aumento da variabilidade climática, a ocorrência de eventos climáticos extremos e a incerteza produtiva intensificaram a atenção acadêmica sobre como os domicílios rurais respondem por meio da mobilidade laboral como parte de processos mais amplos de adaptação. Esta revisão sintetiza criticamente evidências empíricas recentes sobre a relação entre mudanças climáticas e mobilidade do trabalho no nível dos domicílios agrícolas, com foco em padrões emergentes, principais determinantes e implicações para os meios de vida. O estudo adota uma abordagem de Revisão Sistemática da Literatura (RSL), seguindo um processo de triagem transparente e estruturado. Artigos científicos revisados por pares foram identificados por meio da base de dados Scopus, utilizando combinações refinadas de palavras-chave relacionadas às mudanças climáticas, mobilidade laboral e domicílios agrícolas. De um conjunto inicial de 5.191 registros, filtros sucessivos por relevância, ano de publicação (2021–2025), idioma e disponibilidade em acesso aberto resultaram em 37 artigos elegíveis para a análise final. Os dados foram coletados exclusivamente a partir de fontes secundárias e analisados por meio de síntese temática qualitativa e comparação entre estudos. Os resultados revelam seis temas dominantes: a variabilidade climática e os choques ambientais como principais indutores da mobilidade, a vulnerabilidade econômica dos domicílios e as estratégias de diversificação de renda, os padrões espaciais da mobilidade laboral, respostas diferenciadas segundo gênero e faixa etária, o papel de mediadores institucionais e de políticas públicas, e as implicações de longo prazo para a sustentabilidade agrícola. A revisão demonstra que a mobilidade do trabalho funciona tanto como uma estratégia adaptativa quanto como uma potencial fonte de novas vulnerabilidades, dependendo das capacidades dos domicílios e dos contextos institucionais. Conclui-se que a mobilidade laboral induzida pelo clima representa uma resposta de subsistência complexa e dependente do contexto, e não um resultado uniforme do estresse ambiental. Recomenda-se que pesquisas futuras integrem dados longitudinais e análises orientadas por políticas públicas para capturar de forma mais adequada as trajetórias dinâmicas de adaptação dos domicílios.

Palavras-chave: Mudanças Climáticas. Mobilidade do Trabalho. Domicílios Agrícolas. Adaptação dos Meios de Vida. Revisão Sistemática da Literatura.

RESUMEN

El cambio climático ha alterado de manera creciente las condiciones de subsistencia de los hogares agrícolas, en particular al influir en las decisiones de asignación y movilidad laboral. El aumento de la variabilidad climática, la ocurrencia de eventos climáticos extremos y la incertidumbre productiva han intensificado la atención académica sobre cómo los hogares rurales responden mediante la movilidad laboral como parte de procesos más amplios de adaptación. Esta revisión sintetiza críticamente evidencia empírica reciente sobre la relación entre el cambio climático y la movilidad laboral a nivel de los hogares agrícolas, centrándose en patrones emergentes, factores determinantes clave e implicaciones para los medios de vida. El estudio adopta un enfoque de Revisión Sistemática de la Literatura (RSL), siguiendo un proceso de selección transparente y estructurado. Los artículos científicos revisados por pares fueron identificados a través de la base de datos Scopus, utilizando combinaciones refinadas de palabras clave relacionadas con el cambio climático, la movilidad laboral y los hogares agrícolas. De un conjunto inicial de 5.191 registros, filtros sucesivos por relevancia, año de publicación (2021–2025), idioma y disponibilidad en acceso abierto dieron como resultado 37 artículos elegibles para el análisis final. Los datos se recopilieron exclusivamente a partir de fuentes secundarias y se analizaron mediante síntesis temática cualitativa y comparación entre estudios. Los resultados revelan seis temas dominantes: la variabilidad climática y los choques ambientales como principales impulsores de la movilidad, la vulnerabilidad económica de los hogares y las estrategias de diversificación de ingresos, los patrones espaciales de la movilidad laboral, respuestas diferenciadas por género y edad, el papel de los mediadores institucionales y de las políticas públicas, y las

implicaciones a largo plazo para la sostenibilidad agrícola. La revisión muestra que la movilidad laboral funciona tanto como una estrategia adaptativa como una posible fuente de nuevas vulnerabilidades, dependiendo de las capacidades de los hogares y de los contextos institucionales. En conclusión, la movilidad laboral inducida por el clima representa una respuesta de subsistencia compleja y dependiente del contexto, más que un resultado uniforme del estrés ambiental. Se recomienda que futuras investigaciones integren datos longitudinales y análisis orientados a políticas públicas para capturar mejor las trayectorias dinámicas de adaptación de los hogares.

1 INTRODUCTION

Climate change has emerged as one of the most pervasive global challenges of the twenty-first century, reshaping environmental systems, economic structures, and human livelihoods across regions. Rising temperatures, shifting precipitation patterns, and the increasing frequency of extreme weather events have destabilized natural resource-based sectors, particularly agriculture, which remains highly sensitive to climatic variability (Otieno et al., 2024). For millions of rural households worldwide, agriculture serves not only as a source of food but also as the primary foundation for income, employment, and social security. As climatic stress intensifies, agricultural systems are increasingly exposed to production risks that undermine household welfare and long-term livelihood sustainability (Degefu, 2025).

Among the groups most affected by climate change are agricultural households in low- and middle-income countries, where farming activities are often rainfed, labor-intensive, and weakly buffered by institutional support. Climate-induced shocks, such as droughts, floods, and heatwaves, have been widely documented to reduce crop yields, disrupt labor demand, and increase household income volatility (Nnadi et al., 2023). In contexts where access to insurance, credit, and adaptive technologies remains limited, these shocks heighten vulnerability, compelling households to seek alternative strategies to stabilize consumption and reduce exposure to climate-related risks.

Labor mobility has increasingly been recognized as a critical livelihood response to climate stress among agricultural households. Mobility encompasses a broad spectrum of movements, including seasonal migration, circular labor mobility, permanent rural–urban migration, and engagement in off-farm employment. Rather than representing isolated decisions, these mobility patterns are embedded within household-level strategies aimed at diversifying income sources and spreading risk across spatial and sectoral boundaries (Charlton et al., 2021). As climate variability disrupts agricultural productivity, labor mobility enables households to access non-climatic income streams, often through wage labor in urban or peri-urban economies, thereby functioning as an adaptive mechanism in the face of environmental uncertainty.

The relationship between climate change and labor mobility, however, is complex and multifaceted. While early migration studies often framed mobility as a response to economic differentials between rural and urban areas, more recent scholarship emphasizes the role of environmental stressors as compounding drivers of mobility decisions (Maliki & Pauline, 2023). Climate change does not operate as a singular push factor; instead, it interacts with socioeconomic conditions such as land scarcity, labor market access, education, gender

norms, and institutional capacity. As a result, mobility outcomes vary significantly across regions, household types, and demographic groups, reflecting diverse vulnerability profiles and adaptive capacities (Omerkhil et al., 2020).

At the household level, climate-induced labor mobility is closely linked to economic vulnerability and to livelihood diversification. Empirical studies have shown that declining agricultural yields and increased production uncertainty encourage households to reallocate labor away from on-farm activities toward off-farm employment and migration-based income sources (Wang et al., 2025). Remittances generated through labor mobility can play a stabilizing role by smoothing consumption, financing adaptation investments, and reducing short-term poverty risks. At the same time, labor mobility may introduce new challenges, including labor shortages in agriculture, increased workloads for remaining household members, and long-term demographic shifts in rural areas. These dual effects underscore the need for a nuanced understanding of labor mobility as both an adaptive strategy and a potential source of structural transformation within agricultural systems.

Despite the growing body of research examining climate change and labor mobility, the existing literature remains fragmented across disciplines, geographic contexts, and methodological approaches. Studies are dispersed within fields such as environmental economics, migration studies, development studies, and rural sociology, often employing diverse indicators, temporal scopes, and analytical frameworks. While numerous empirical investigations document localized mobility responses to specific climate shocks, fewer studies systematically synthesize this evidence to identify overarching patterns, dominant themes, and research gaps at the household level. Consequently, there is a limited consensus on how climate change shapes labor mobility decisions among agricultural households across regions and contexts (Budhathoki et al., 2020).

Moreover, existing reviews tend to focus either on climate-induced migration at the aggregate population level or on general rural livelihoods, without explicitly centering agricultural households as the primary unit of analysis. Agricultural households occupy a distinct position within climate–mobility dynamics due to their direct dependence on land, climate-sensitive production systems, and family-based labor allocation. Failure to disentangle household-level processes risks oversimplifying mobility as a uniform response, thereby obscuring heterogeneity in adaptive behavior and vulnerability (Barry, 2025). A focused synthesis that foregrounds agricultural households is therefore essential for advancing both theoretical clarity and policy relevance.

Methodologically, the diversity of empirical designs in climate–mobility research further complicates comparative analysis. Studies employ cross-sectional surveys, panel data,

econometric modeling, and qualitative case studies, producing findings that are often context-specific and difficult to generalize. While this diversity enriches the literature, it also underscores the need for a systematic, transparent review approach that can integrate evidence across methods and regions. Systematic Literature Review (SLR) methods, particularly those guided by the PRISMA framework, provide a robust mechanism for consolidating dispersed findings, identifying consistent patterns, and minimizing selection bias in evidence synthesis.

In response to these gaps, this study undertakes a Systematic Literature Review to synthesize contemporary peer-reviewed research on climate change and labor mobility among agricultural households. By systematically identifying, screening, and analyzing relevant studies indexed in the Scopus database, this review aims to provide an integrated overview of how climatic stressors influence labor mobility decisions, the forms mobility takes, and the socioeconomic and institutional factors that mediate these processes. The review is based exclusively on secondary data from peer-reviewed literature and does not involve primary data collection methods such as focus group discussions, interviews, surveys, or field observations.

The objective of this review is to critically synthesize existing evidence on the relationship between climate change and labor mobility at the agricultural household level, with particular attention to patterns, drivers, and implications emerging from recent scholarship. Through thematic analysis, the study seeks to clarify how climate variability and shocks shape labor allocation decisions, how households use mobility as part of broader livelihood strategies, and what these dynamics imply for agricultural sustainability and rural development pathways.

Based on this objective, the review is guided by the following research questions:

RQ1: How does climate change influence labor mobility decisions and patterns among agricultural households across different regional and socioeconomic contexts?

RQ2: What household, demographic, and institutional factors mediate the role of labor mobility as an adaptive response to climate-induced livelihood risks?

These research questions structure the analytical focus of the review and provide a foundation for the subsequent Results and Discussion sections, as well as for the conclusions drawn regarding future research and policy implications.

2 LITERATURE REVIEW

The relationship between climate change and labor mobility has become an increasingly prominent theme within development economics, agricultural studies, and

climate adaptation research. A substantial body of literature recognizes climate change not merely as an environmental phenomenon, but as a multidimensional stressor that reshapes livelihood structures, household decision-making, and labor allocation patterns, particularly within agrarian contexts. Agricultural households, whose livelihoods are highly dependent on climatic conditions, are among the most vulnerable groups facing climate-induced risks, including temperature variability, rainfall anomalies, extreme weather events, and long-term ecological degradation. As a result, labor mobility has emerged as a critical adaptive strategy employed by these households to mitigate income instability and livelihood insecurity under changing climatic conditions.

2.1 CLIMATE CHANGE AS A STRUCTURAL SHOCK TO AGRICULTURAL LIVELIHOODS

Existing studies consistently conceptualize climate change as a structural shock that disrupts agricultural production systems and household welfare trajectories. Empirical research across diverse geographic contexts indicates that rising temperatures and increased precipitation variability are associated with declining crop yields, heightened production risks, and greater income volatility among farming households (N-yanbini et al., 2024). These impacts are particularly pronounced in rain-fed agricultural systems, where limited irrigation infrastructure exacerbates exposure to climate variability. The literature emphasizes that such climate-induced production shocks undermine the viability of agriculture as a sole livelihood, thereby altering household labor supply decisions (Roy et al., 2024).

Several studies further highlight that climate change affects agricultural households not only through direct biophysical impacts but also through indirect channels, such as market instability, food price fluctuations, and increased production costs. These compound effects intensify livelihood stress and reduce rural households' resilience, pushing them to seek alternative income-generating opportunities beyond traditional farming. Within this context, labor mobility, both temporary and permanent, has been widely documented as a key household-level response to climatic stressors (Trujillano et al., 2021).

2.2 CONCEPTUALIZING LABOR MOBILITY IN AGRICULTURAL HOUSEHOLDS

Labor mobility in agricultural households is a multidimensional phenomenon encompassing seasonal, rural–urban, circular, and off-farm employment. The literature distinguishes between mobility as a distress-driven response to livelihood shocks and mobility as a strategic diversification mechanism to enhance household resilience. In climate-affected agricultural settings, these two motivations often overlap, reflecting the complex

interplay between vulnerability and agency in household decision-making processes (Tran & Bayrak, 2025).

Scholarly work emphasizes that labor mobility decisions are rarely individual choices; instead, they are embedded within collective household strategies designed to balance risk, labor allocation, and income diversification (Shinbrot et al., 2019). Migration of one or more household members allows farming households to smooth consumption, reduce dependence on climate-sensitive income sources, and access remittance flows that can be reinvested in agricultural production or used to buffer future shocks (Aryal et al., 2020). This perspective positions labor mobility as an adaptive response rather than merely a symptom of vulnerability, challenging earlier narratives that framed migration exclusively as a failure of rural development.

2.3 CLIMATE VARIABILITY AND MIGRATION PATTERNS

A growing empirical literature examines the causal links between climate variability and migration outcomes among agricultural populations. Quantitative studies using panel data and econometric modeling consistently find that higher temperatures, rainfall deficits, and extreme weather events are positively associated with higher rates of labor migration from rural areas. These effects are particularly evident in regions characterized by limited access to credit, insurance, and social protection mechanisms, where migration serves as a primary coping strategy (Chepkoech et al., 2023).

However, the literature also documents substantial heterogeneity in migration responses to climate stress. Some studies report that extreme climatic events can constrain mobility by eroding household assets and reducing the financial capacity required to migrate. This finding underscores the importance of distinguishing between short-term shocks and long-term climate trends, as well as between voluntary and involuntary forms of labor mobility (Eshetu & Yimer, 2024). As such, climate-induced labor mobility cannot be understood as a linear or uniform process but must be analyzed within specific socioeconomic and institutional contexts.

2.4 OFF-FARM EMPLOYMENT AS AN ADAPTIVE STRATEGY

Beyond physical migration, off-farm employment has been widely examined as a complementary or alternative form of labor mobility in climate-affected agricultural households. The literature suggests that engagement in non-agricultural wage labor, small-scale enterprises, or service-sector activities enables households to diversify income sources while maintaining ties to farming (Halliru et al., 2024). This form of labor reallocation is

particularly prevalent in regions where urban labor markets are accessible but permanent migration is constrained by social or institutional barriers.

Empirical evidence indicates that households experiencing greater exposure to climate variability are more likely to allocate labor toward off-farm activities, especially during periods of agricultural slack or crop failure. Such strategies are often facilitated by improvements in rural infrastructure, education, and labor market integration, highlighting the role of structural factors in shaping adaptive capacity. Nevertheless, the literature also notes that access to off-farm employment is unevenly distributed, with poorer households and marginalized groups facing greater barriers to participation (Cherinet et al., 2025).

2.5 SOCIOECONOMIC DIFFERENTIATION IN MOBILITY RESPONSES

A key theme emerging from the literature is the differentiated nature of labor mobility responses across socioeconomic groups. Gender, age, education, land ownership, and asset endowments significantly influence who migrates, where they migrate, and under what conditions (Fayomi & Ehiagwina, 2019). Studies consistently find that younger and more educated household members are more likely to engage in labor migration or off-farm employment, while older individuals remain in agriculture. Gender norms also shape mobility patterns, with men more likely to undertake long-distance migration and women more likely to engage in localized off-farm work or assume expanded agricultural responsibilities (Groth et al., 2020).

Land tenure and asset ownership further mediate the climate–mobility linkages. Households with larger landholdings and greater assets are better positioned to use migration as a proactive adaptation strategy, while asset-poor households may experience constrained mobility and heightened vulnerability. These findings underscore that labor mobility outcomes reflect existing structural inequalities, rather than functioning as a universally accessible adaptation pathway (Chithirairajan & Suvarna, 2021).

2.6 INSTITUTIONAL AND POLICY CONTEXTS

The literature increasingly emphasizes the role of institutional and policy environments in shaping climate-induced labor mobility. Access to social protection programs, migration networks, labor regulations, and rural development policies can either facilitate or constrain household mobility responses (Vidal Merino et al., 2019). Studies highlight that well-designed social safety nets and climate adaptation policies can reduce distress-driven migration while supporting voluntary and productive forms of labor mobility.

At the same time, inadequate policy coordination between climate adaptation and labor governance frameworks may exacerbate vulnerability among migrating agricultural households. The absence of legal protections for migrant workers, limited recognition of circular migration, and weak integration of rural–urban labor markets are recurrent challenges identified in the literature. Consequently, scholars argue for policy approaches that recognize labor mobility as an integral component of climate adaptation strategies rather than as an unintended consequence of climate stress (Gashure & Wana, 2023).

Despite the growing volume of research on climate change and labor mobility, the literature remains fragmented across disciplinary boundaries and geographic contexts. While numerous empirical studies examine specific dimensions of climate-induced migration or off-farm employment, there is a lack of systematic synthesis that integrates these findings at the level of agricultural households. Existing reviews often focus narrowly on migration outcomes or climate impacts without adequately capturing the household-level decision-making processes that link the two.

Furthermore, inconsistencies in methodological approaches, definitions of mobility, and measures of climate exposure limit the comparability of findings across studies. There is also limited attention to longitudinal dynamics, including how repeated climate shocks reshape mobility strategies over time. These gaps highlight the need for a comprehensive systematic literature review that consolidates empirical evidence, identifies thematic patterns, and clarifies the mechanisms through which climate change influences labor mobility among agricultural households.

In response to these limitations, this review synthesizes peer-reviewed studies published between 2021 and 2025 to provide an integrated understanding of the linkages between climate change and labor mobility at the household level. By systematically analyzing 37 selected articles, the review aims to advance conceptual clarity, highlight empirical regularities and divergences, and inform future research and policy debates on climate adaptation and rural labor transformation.

3 METHOD

This study employs a Systematic Literature Review (SLR) methodology guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework to synthesize and critically evaluate recent scholarly evidence on the relationship between climate change and labor mobility among agricultural households. Climate change has increasingly altered environmental, economic, and livelihood conditions in rural areas, particularly for farming households whose income and employment opportunities are highly

dependent on climate-sensitive agricultural systems. In this context, labor mobility manifested through migration, off-farm employment, and rural–urban transitions has emerged as a key adaptive response to climate variability, shocks, and long-term climatic impacts. By systematically consolidating peer-reviewed studies, this review provides an evidence-based overview of how climate-related stressors influence labor mobility decisions within agricultural households, while also identifying dominant analytical approaches and emerging research patterns in the literature.

Figure 1

Systematic Literature Review Process Based on the PRISMA Protocol

Figure 1 presents the structured process of article identification, screening, eligibility assessment, and final inclusion following the PRISMA protocol. The initial literature search was conducted using the Scopus database with the broad keyword combination “Climate Change” AND “Mobility,” which yielded 5,191 records, reflecting the extensive and multidisciplinary nature of research linking climatic factors and mobility dynamics. To improve thematic focus and ensure relevance to agricultural household contexts, the search strategy

was refined using a more targeted Boolean expression: (“climate change” OR “climate variability” OR “climate shocks” OR “climate impacts”) AND (“labor mobility” OR “labour mobility” OR “labor migration” OR “migration” OR “rural–urban migration” OR “off-farm employment”) AND (“agricultural households” OR “farm households” OR “smallholder farmers”). This refinement resulted in the exclusion of 5,076 records that did not align with the core scope of the review, leaving 115 articles for further screening.

Subsequently, a publication-year filter was applied to capture recent developments and contemporary empirical evidence, restricting the dataset to studies published between 2021 and 2025. This step eliminated 48 articles published outside the specified timeframe, resulting in 67 articles that met the temporal criterion. An additional eligibility screening focused on accessibility, retaining only studies available through open access or open archive sources to ensure transparency and reproducibility. As a result, 30 articles were excluded due to access limitations. At the conclusion of the PRISMA selection process, 37 peer-reviewed articles satisfied all inclusion criteria and were retained for full-text analysis and qualitative synthesis.

All bibliographic records were systematically managed using Mendeley Desktop to support reference organization, duplication control, and consistency in citation formatting throughout the review process. This study is based exclusively on secondary data derived from peer-reviewed literature indexed in Scopus; no primary data collection methods, such as focus group discussions, interviews, surveys, or field observations, were conducted. The findings presented in this review emerge solely from the systematic integration and comparative analysis of the selected 37 studies. Through this approach, the review aims to provide a comprehensive and methodologically robust synthesis of current knowledge on climate change–induced labor mobility among agricultural households, while highlighting conceptual trends and research gaps that warrant further investigation.

4 RESULTS

This systematic literature review identified six recurring thematic clusters based on the analysis of 37 peer-reviewed studies examining climate change and labor mobility among agricultural households. The six themes include: (1) climate variability and shocks as drivers of labor mobility, (2) household-level economic vulnerability and income diversification strategies, (3) patterns and directions of labor mobility, (4) differentiated mobility responses by gender, age, and household structure, (5) institutional and policy mediators of mobility outcomes, and (6) long-term implications of climate-induced mobility for agricultural sustainability and rural livelihoods.

The most frequently discussed theme was climate variability and shocks as drivers of labor mobility, reported in approximately 84% of the reviewed studies, reflecting the dominant focus on climatic stress as a primary trigger of mobility decisions. This was followed by economic vulnerability and income diversification (73%), emphasizing labor mobility as part of household adaptation strategies. Themes related to mobility patterns and spatial directions appeared in around 65% of studies, while gender- and age-differentiated responses were discussed in about 57%. Institutional and policy mediators were addressed in fewer studies (49%), and long-term sustainability implications were the least examined (41%). This distribution indicates that the literature prioritizes immediate climate and economic drivers, while institutional dimensions and long-term agricultural impacts remain comparatively underexplored.

The following sections elaborate each theme in detail, drawing on quantitative evidence, comparative findings, and regional patterns identified across the reviewed studies.

4.1 CLIMATE VARIABILITY AND SHOCKS AS DRIVERS OF LABOR MOBILITY

A dominant theme across the reviewed literature is the role of climate variability and extreme weather events as direct triggers of labor mobility among agricultural households. The majority of studies identify rainfall variability, prolonged droughts, floods, and heat stress as key stressors undermining agricultural productivity and labor stability. Quantitative evidence from multiple regions indicates that a one-standard-deviation increase in rainfall variability is associated with a 5–15% increase in the likelihood of household members engaging in temporary or permanent labor migration (Amjath-Babu et al., 2025). In drought-prone areas, crop yield reductions ranging from 10% to over 30% were consistently linked to higher rates of off-farm labor participation and rural–urban migration (Ghanayem et al., 2025).

Several studies emphasize that climate shocks exert both short-term and cumulative effects on labor mobility decisions. Short-term shocks, such as seasonal droughts or flood events, often lead to temporary migration or seasonal off-farm employment as coping mechanisms (Zenda et al., 2024). In contrast, repeated exposure to climate shocks over multiple years increases the probability of permanent migration, particularly among younger household members. For example, empirical evidence from South Asia and Sub-Saharan Africa shows that households experiencing three or more climate shocks within a five-year period exhibit migration rates that are 20–40% higher than those facing isolated events (Balasha et al., 2025).

Notably, the reviewed studies highlight that climate change does not operate as an isolated driver but interacts with existing socioeconomic vulnerabilities. Regions

characterized by rainfed agriculture, limited irrigation coverage (often below 30%), and high dependence on single-crop systems show significantly stronger mobility responses to climate stress. This reinforces the conclusion that climate variability amplifies pre-existing livelihood risks, thereby accelerating labor mobility as an adaptive response rather than a purely reactive behavior (Quarshie et al., 2023).

4.2 ECONOMIC VULNERABILITY AND HOUSEHOLD INCOME DIVERSIFICATION

Another prominent theme concerns the relationship between climate-induced economic vulnerability and household income diversification strategies. Across the reviewed studies, labor mobility is frequently framed as part of a broader portfolio of livelihood adjustments undertaken by agricultural households facing declining farm income. Empirical findings suggest that climate-related yield losses of 15–25% translate into reductions in farm income of up to 40% for smallholder households lacking access to credit, insurance, or adaptive technologies (Retkute et al., 2024).

In response, households increasingly diversify income sources through off-farm employment, wage labor, and non-agricultural self-employment. The literature documents that, in climate-exposed regions, the share of household income derived from non-farm activities ranges between 30% and 60%, compared to less than 25% in relatively climate-stable areas (Opoku Mensah et al., 2025). Labor mobility, whether seasonal, circular, or permanent, emerges as a central mechanism enabling this diversification. Several studies report that households with at least one migrant member experience income stabilization effects, with remittances accounting for 15–35% of total household income (Thorsen et al., 2025).

However, the benefits of labor mobility are unevenly distributed. While remittances can buffer consumption and reduce short-term poverty risks, the reviewed literature also notes trade-offs, including labor shortages in agriculture and increased workload for remaining household members (Magesa et al., 2023). In some cases, labor outmigration leads to reduced cultivated land area, with declines of 5% to 20%, particularly for labor-intensive crops (Bayrak et al., 2023). These findings underscore that labor mobility functions as both an adaptive strategy and a source of new vulnerabilities within agricultural systems (Ahmed & Givens, 2025).

4.3 PATTERNS AND DIRECTIONS OF LABOR MOBILITY

The reviewed studies reveal diverse patterns and directions of labor mobility shaped by climatic, economic, and spatial factors. Seasonal and circular migration emerges as the

most prevalent form of mobility in regions characterized by predictable climate variability, such as monsoon-dependent agricultural systems (Kandel et al., 2023). In these contexts, households strategically align migration timing with agricultural calendars, sending members to urban or peri-urban areas during agricultural slack periods (Martey & Etwire, 2025). Quantitative estimates indicate that seasonal migrants typically spend 3–6 months per year in off-farm employment, contributing between 20% and 45% of annual household income (Hendrawan et al., 2024).

In contrast, areas experiencing recurrent or severe climate shocks show higher rates of permanent migration. Studies from semi-arid and coastal regions report that permanent rural–urban migration rates among agricultural households range from 8% to 25%, depending on the frequency and intensity of shocks (Kumar et al., 2023). Permanent migration is often associated with younger, more educated household members, reflecting both push factors from climate stress and pull factors from urban labor markets (Bogale & Bekele, 2023).

The literature also documents significant regional variation in mobility destinations. Domestic migration accounts for over 70% of climate-related mobility flows in most low- and middle-income countries (Assen et al., 2024). International migration, while less common, plays a notable role in specific contexts, particularly where transnational labor networks exist. In such cases, remittances from international migrants can exceed domestic remittances by two to three times, substantially altering household resilience profiles (Antwi, 2024).

4.4 GENDER, AGE, AND HOUSEHOLD DIFFERENTIATION IN MOBILITY RESPONSES

A further theme emerging from the SLR is the differentiated nature of labor mobility responses across gender, age groups, and household structures. The majority of studies report that men are more likely to engage in long-distance or permanent migration, while women's mobility tends to be more localized and temporary (Munyaka et al., 2024). Quantitative evidence indicates that male household members account for 60–80% of labor migrants in most agricultural regions, particularly in contexts where social norms restrict female mobility (Mdoda et al., 2024).

At the same time, the literature highlights an increasing feminization of agriculture in climate-affected areas. As men migrate, women assume greater responsibility for farm management and household decision-making (Antwi-Agyei et al., 2021). This shift has mixed implications: while some studies report improved female autonomy and skill acquisition, others document increased labor burdens and time poverty among women, with daily workloads rising by 2–4 hours during peak agricultural seasons (Megersa et al., 2022).

Age also plays a critical role in shaping mobility decisions. Younger household members (typically aged 18–35) exhibit significantly higher migration propensities, with migration rates often double those of older cohorts (Saini et al., 2023). Education further mediates this relationship, as individuals with secondary education or vocational skills are more likely to access higher-paying non-farm employment (Berhanu et al., 2024). These patterns suggest that climate-induced labor mobility contributes to demographic restructuring within rural areas, with potential long-term implications for agricultural labor availability and knowledge transmission (Mukherjee & Fransen, 2024).

4.5 INSTITUTIONAL AND POLICY MEDIATORS OF MOBILITY OUTCOMES

The review identifies institutional and policy contexts as key mediators influencing whether labor mobility enhances or undermines household resilience. Access to irrigation, climate information services, and social protection programs significantly moderates the relationship between climate stress and mobility (Kidane et al., 2022). For example, studies report that households with access to irrigation infrastructure are 20–30% less likely to engage in distress-driven migration following climate shocks (Chegere & Mrosso, 2022).

Similarly, the presence of social safety nets, such as cash transfer programs or crop insurance schemes, reduces the necessity for immediate labor mobility by smoothing consumption and income volatility (López-Carr, 2021). In regions with well-established rural employment programs, temporary migration rates decline by up to 15% during drought years (Nofiu & Baharudin, 2024). Conversely, weak institutional support amplifies climate vulnerability, pushing households toward more disruptive forms of migration (Kandel et al., 2024; Mesfin et al., 2024).

Policy coherence across agricultural, labor, and climate domains is repeatedly emphasized as a determinant of mobility outcomes. The literature notes that fragmented policy frameworks often fail to account for the interconnected nature of climate adaptation and labor dynamics, leading to suboptimal outcomes for agricultural households (Antwi-Agyei & Nyantakyi-Frimpong, 2021). These findings underscore the importance of integrated policy approaches that recognize labor mobility as both an adaptation strategy and a development challenge.

4.6 LONG-TERM IMPLICATIONS FOR AGRICULTURAL SUSTAINABILITY

The final thematic cluster concerns the long-term implications of climate-induced labor mobility for agricultural sustainability and rural development. Several studies caution that sustained outmigration may erode the agricultural labor base, particularly in labor-intensive

farming systems (Nandi et al., 2022). Projections suggest that, in high-migration regions, agricultural labor availability could decline by 10–25% over the next two decades, potentially constraining productivity growth (Atinga et al., 2024).

At the same time, remittances and skill transfers associated with migration can enable investment in climate-resilient technologies, such as improved seed varieties, mechanization, and water-saving practices (Baylie & Fogarassy, 2022). Evidence indicates that households receiving remittances are 1.3 to 1.8 times more likely to adopt adaptive technologies compared to non-migrant households (Etana et al., 2021). This dual effect highlights the complex and context-dependent nature of labor mobility's impact on agricultural sustainability (Mustafa & Alotaibi, 2024).

Overall, the SLR findings demonstrate that climate change and labor mobility are deeply intertwined processes shaping the livelihoods of agricultural households. Labor mobility emerges not merely as a consequence of climate stress but as an integral component of adaptive livelihood strategies, mediated by economic resources, demographic characteristics, and institutional environments.

5 DISCUSSION

This discussion synthesizes and interprets the Systematic Literature Review's findings by directly addressing the two research questions formulated in the Introduction. Drawing on evidence from 37 peer-reviewed studies, the discussion situates climate-induced labor mobility within broader theoretical and empirical debates on livelihood adaptation, migration, and rural resilience. Rather than treating labor mobility as a linear outcome of climate stress, the reviewed literature reveals a complex, context-dependent process shaped by interactions among environmental, socioeconomic, demographic, and institutional factors. The discussion is organized around the two research questions, followed by an integrative reflection on implications and directions for future research.

Climate Change as a Driver of Labor Mobility Decisions and Patterns (RQ1)

In response to RQ1, the reviewed literature provides strong and consistent evidence that climate change significantly influences labor mobility decisions and patterns among agricultural households, albeit in heterogeneous ways across regions and socioeconomic contexts. Climate variability, including rainfall irregularity, rising temperatures, and increased frequency of extreme events such as droughts and floods, emerges as a fundamental stressor undermining the stability of agricultural livelihoods (Solomon et al., 2024). These climatic pressures directly affect crop yields, livestock productivity, and on-farm labor demand, thereby reshaping household labor allocation strategies (Ojo et al., 2021).

Across diverse agroecological zones, empirical studies demonstrate that adverse climate shocks increase both the likelihood and intensity of labor mobility. Quantitative analyses indicate that households exposed to prolonged droughts or recurrent floods exhibit migration rates that are 10–40% higher than those in climatically stable areas (Dartanto et al., 2025). However, the form of mobility varies. In regions characterized by seasonal climate variability, such as monsoon-dependent agricultural systems, labor mobility often takes the form of temporary or circular migration aligned with agricultural calendars (Kene et al., 2025). Conversely, in areas facing chronic or cumulative climate stress, including semi-arid and coastal regions, permanent rural–urban migration becomes more prevalent (Assefa & Gebrehiwot, 2023).

Socioeconomic context further differentiates mobility responses. In low-income settings where agriculture remains the primary livelihood source and access to risk-management instruments is limited, climate shocks frequently induce distress-driven mobility (Chetto et al., 2025). In contrast, in relatively diversified rural economies, labor mobility tends to be more anticipatory and strategic, functioning as a planned adaptation rather than an emergency response (Caproni et al., 2023; Liu & Wu, 2024). This distinction is critical, as it challenges simplistic narratives that frame climate-induced migration solely as forced displacement. Instead, the literature suggests that labor mobility exists along a continuum ranging from voluntary diversification to involuntary coping (Dupre et al., 2022; Mounirou, 2022).

Regional disparities also shape mobility patterns. Studies from Sub-Saharan Africa and South Asia report high reliance on domestic rural–urban migration, accounting for more than 70% of climate-related mobility flows (Tesfahun & Chawla, 2020). In contrast, in regions with established transnational labor networks, such as parts of Southeast Asia and Latin America, international migration plays a more pronounced role, with remittances substantially altering household resilience trajectories. These findings underscore that climate change influences not only whether households engage in labor mobility, but also where, how, and for how long mobility occurs, depending on structural and spatial conditions (Sreekumar & Mandal, 2024).

Overall, the SLR findings confirm that climate change acts as a catalyst, intensifying existing livelihood vulnerabilities and accelerating labor mobility. At the same time, regional development pathways and economic structures mediate the specific patterns of movement. Thus, RQ1 is answered by demonstrating that climate change reshapes labor mobility decisions through both direct environmental impacts and indirect socioeconomic mechanisms, producing differentiated mobility outcomes across contexts.

Mediating Roles of Household, Demographic, and Institutional Factors (RQ2)

Addressing RQ2, the reviewed studies highlight that labor mobility does not operate uniformly as an adaptive response; instead, its effectiveness and consequences are mediated by a range of household-level, demographic, and institutional factors. Household asset endowments, including land size, livestock ownership, savings, and access to credit, consistently emerge as critical determinants of mobility outcomes. Households with greater asset buffers are more likely to engage in proactive, opportunity-driven mobility, while asset-poor households tend to experience reactive, risk-laden migration (Nagarajan et al., 2025).

Demographic characteristics further shape mobility dynamics. Age and gender are particularly salient mediators. Younger household members, typically aged between 18 and 35, exhibit significantly higher migration propensities, reflecting both greater physical mobility and stronger attachment to non-farm labor markets (Cai & Cheng, 2025). Education amplifies this effect, as individuals with secondary or vocational training are better positioned to secure stable off-farm employment, thereby transforming mobility into a pathway for upward livelihood diversification (Mbiri et al., 2022).

Gendered patterns of mobility reveal persistent inequalities. The literature consistently reports that men dominate long-distance and permanent migration flows, while women's mobility remains more localized and constrained by social norms. As a result, male outmigration often leads to the feminization of agriculture, with women assuming increased responsibilities for farm management and household decision-making. While some studies document gains in female autonomy, others highlight rising labor burdens and time poverty, suggesting that labor mobility can generate uneven adaptive benefits within households (Choquette-Levy et al., 2021).

Institutional and policy environments play a decisive role in mediating whether labor mobility enhances or undermines household resilience. Access to irrigation infrastructure, climate information services, and agricultural extension significantly reduces reliance on distress migration by stabilizing on-farm livelihoods (Groth et al., 2020). Empirical evidence indicates that households with irrigation access are 20–30% less likely to migrate following climate shocks compared to rainfed households. Similarly, social protection mechanisms, such as cash transfers, public works programs, and crop insurance, mitigate income volatility and delay or prevent forced mobility (Saqib et al., 2025).

Conversely, weak institutional support exacerbates climate vulnerability and pushes households toward more disruptive forms of migration. Fragmented policy frameworks that treat climate adaptation, agricultural development, and labor migration as separate domains fail to account for their interconnected nature. The reviewed literature emphasizes that policy

coherence is essential for transforming labor mobility from a last-resort coping mechanism into a viable adaptation strategy (Zelege & Wordofa, 2024).

Collectively, these findings answer RQ2 by demonstrating that labor mobility's adaptive role is conditional rather than automatic. Household resources, demographic composition, and institutional contexts jointly determine whether mobility contributes to resilience, exacerbates vulnerability, or produces mixed outcomes.

Integrative Interpretation and Theoretical Implications

Taken together, the responses to RQ1 and RQ2 suggest that climate-induced labor mobility should be conceptualized as an embedded component of livelihood systems rather than a standalone phenomenon. The reviewed studies align with livelihood resilience and adaptation theories that emphasize diversification, flexibility, and multi-scalar interactions. Labor mobility emerges as one of several adaptive strategies available to agricultural households, interacting with technological adoption, social networks, and institutional support.

Notably, the SLR challenges deterministic interpretations of climate–migration linkages. While climate change clearly increases mobility pressures, the direction, form, and consequences of mobility are shaped by agency, constraints, and structural conditions. This nuanced understanding has implications for both academic debates and policy design, underscoring the need to move beyond binary distinctions between voluntary and forced migration.

Implications and Directions for Future Research

The findings of this SLR carry several important implications. From a policy perspective, recognizing labor mobility as a legitimate and potentially adaptive response to climate change calls for integrated policy frameworks that align agricultural adaptation, labor market development, and social protection. Supporting safe, dignified, and productive mobility while simultaneously strengthening local livelihood options can enhance rural resilience without undermining agricultural sustainability.

For research, the review identifies multiple gaps. First, longitudinal studies are needed to capture the long-term dynamics of climate-induced mobility and its cumulative effects on agricultural systems. Second, greater attention should be paid to intra-household impacts, particularly gendered and intergenerational consequences of migration. Third, future SLRs and empirical studies should explore under-researched regions and incorporate comparative cross-regional analyses to deepen understanding of contextual variation. Finally, integrating quantitative and qualitative evidence within systematic review frameworks could provide richer insights into the lived experiences behind observed mobility patterns.

In sum, this discussion demonstrates that labor mobility occupies a central yet complex position within agricultural households' responses to climate change. By addressing both research questions, the SLR advances a more differentiated and policy-relevant understanding of climate–mobility linkages, laying a robust foundation for future scholarship and evidence-based intervention.

6 CONCLUSION

This systematic literature review demonstrates that climate change and labor mobility are deeply interconnected processes shaping the livelihood trajectories of agricultural households across diverse regional and socioeconomic contexts. The reviewed evidence confirms that climate-related stressors such as increasing rainfall variability, temperature rise, droughts, and floods consistently disrupt agricultural production systems and alter household labor allocation, thereby increasing the propensity for labor mobility. However, the nature, direction, and duration of mobility vary substantially depending on the intensity of climate exposure, regional development pathways, and the degree of livelihood diversification available to rural households.

Labor mobility emerges as a multifaceted response rather than a uniform outcome of climate stress. In some contexts, it functions as a strategic and anticipatory adaptation that enables income diversification, risk spreading, and access to non-farm opportunities. In other settings, particularly where agricultural households face persistent climate shocks and limited institutional support, mobility reflects distress-driven coping that may expose households to new economic and social vulnerabilities. These contrasting patterns underscore that climate-induced labor mobility cannot be understood through deterministic or one-dimensional frameworks.

The review further establishes that household characteristics play a decisive role in shaping mobility outcomes. Asset endowments, access to financial resources, and livelihood portfolios determine whether labor mobility enhances resilience or exacerbates vulnerability. Demographic factors, especially age, education, and gender, systematically mediate who migrates, under what conditions, and with what consequences for household labor organization. The findings reveal persistent gender asymmetries, with male-dominated migration often leading to increased agricultural and domestic burdens for women, alongside selective gains in decision-making autonomy.

Institutional and policy environments critically condition the adaptive potential of labor mobility. Access to irrigation, climate information, agricultural extension, and social protection mechanisms consistently reduces reliance on distress migration by stabilizing on-farm

livelihoods and smoothing income volatility. Conversely, fragmented and poorly coordinated policy frameworks intensify climate vulnerability and push households toward more disruptive mobility pathways. These findings highlight that labor mobility outcomes are shaped not only by environmental pressures but also by governance structures and development institutions.

Overall, this review advances a nuanced understanding of labor mobility as an embedded component of agricultural household adaptation to climate change. Mobility is neither inherently adaptive nor inherently detrimental; its implications depend on the interaction between climatic stress, household capacities, demographic dynamics, and institutional support systems. By synthesizing evidence across multiple regions and disciplines, this study reinforces the need for integrated analytical and policy approaches that recognize labor mobility as part of broader livelihood systems under climate change. Such an understanding is essential for informing future research and policy interventions to strengthen rural resilience while avoiding the unintended consequences of climate-induced migration.

DEVELOPING AN INCENTIVE SCHEME OF USED COOKING OIL BUSINESS MODEL TO SUPPORT THE FEASIBILITY OF SUSTAINABLE AVIATION FUEL

DESENVOLVIMENTO DE UM ESQUEMA DE INCENTIVOS PARA O MODELO DE NEGÓCIO DE ÓLEO DE COZINHA USADO VISANDO APOIAR A VIABILIDADE DO COMBUSTÍVEL SUSTENTÁVEL DE AVIAÇÃO

DESARROLLO DE UN ESQUEMA DE INCENTIVOS PARA EL MODELO DE NEGOCIO DE ACEITE DE COCINA USADO CON EL FIN DE APOYAR LA VIABILIDAD DEL COMBUSTIBLE SOSTENIBLE DE AVIACIÓN

<https://doi.org/10.56238/sevened2026.008-068>

Loso Judijanto¹

ABSTRACT

The urgency to reduce aviation-related carbon emissions has intensified, driving a shift toward sustainable fuel innovations such as SAF. Owing to its accessibility, Used Cooking Oil (UCO) represents a promising, carbon-efficient feedstock for Sustainable Aviation Fuel (SAF) development, its waste-to-energy nature, and its compatibility with existing refining infrastructure. However, the economic feasibility and scalability of UCO-based SAF remain constrained by fragmented supply chains and inadequate business model structures. This study aims to systematically explore how incentive schemes influence the structure, viability, and scalability of business models for converting UCO into SAF. This research employs a qualitative Systematic Literature Review (SLR) method following the PRISMA protocol to synthesize peer-reviewed journal articles published between 2021 and 2025. A total of 2,206 articles were initially identified through the ScienceDirect database. After applying relevance criteria, time span, and access filters, 32 articles were selected for full-text thematic analysis. All references were organized using Mendeley Desktop to ensure citation accuracy and traceability. Analysis utilized thematic coding to reveal consistent themes in how incentives were structured, policy frameworks, and business model designs across different regions and regulatory contexts. It was found that economic policy tools such as tax incentives, carbon offsets, and feed-in tariffs are instrumental in minimizing production costs and boosting competitive positioning in the market. Additionally, non-financial incentives, such as traceability standards and waste management regulations, enhance supply chain integrity and investor confidence. The study concludes that well-designed incentive schemes are essential in advancing UCO-based SAF initiatives. Future research should explore region-specific implementation models and the integration of digital traceability tools.

RESUMO

A urgência em reduzir as emissões de carbono associadas à aviação tem se intensificado, impulsionando a transição para inovações em combustíveis sustentáveis, como o Combustível Sustentável de Aviação (SAF). Devido à sua ampla disponibilidade, o Óleo de Cozinha Usado (OCU) representa uma matéria-prima promissora e eficiente em carbono para o desenvolvimento de SAF, em razão de sua natureza de reaproveitamento energético de resíduos e de sua compatibilidade com a infraestrutura de refino existente. No entanto, a viabilidade econômica e a escalabilidade do SAF baseado em OCU ainda são limitadas por cadeias de suprimento fragmentadas e por estruturas inadequadas de modelos de negócio. Este estudo tem como objetivo explorar sistematicamente como esquemas de incentivos influenciam a estrutura, a viabilidade e a escalabilidade de modelos de negócio voltados à conversão de OCU em SAF. A pesquisa adota o método qualitativo de Revisão Sistemática da Literatura (RSL), seguindo o protocolo PRISMA, para sintetizar artigos científicos revisados por pares publicados entre 2021 e 2025. Inicialmente, foram identificados 2.206 artigos por meio da base de dados ScienceDirect. Após a aplicação de critérios de relevância temática, recorte temporal e filtros de acesso, 32 artigos foram selecionados para análise temática de texto completo. Todas as referências foram organizadas com o auxílio do Mendeley Desktop, assegurando a precisão e a rastreabilidade das citações. A análise utilizou codificação temática para identificar padrões recorrentes na estruturação de incentivos, nos arcabouços regulatórios e nos desenhos de modelos de negócio em diferentes regiões e contextos regulatórios. Os resultados indicam que instrumentos de política econômica, como incentivos fiscais, créditos de carbono e tarifas feed-in, são fundamentais para reduzir os custos de produção e fortalecer a competitividade no mercado. Além disso, incentivos não financeiros, como padrões de rastreabilidade e regulamentações de gestão de resíduos, contribuem para o fortalecimento da integridade da cadeia de suprimentos e para o aumento da confiança dos investidores. Conclui-se que esquemas de incentivos bem estruturados são essenciais para o avanço de iniciativas de SAF baseadas em OCU. Recomenda-se que pesquisas futuras investiguem modelos de implementação específicos por região e a integração de ferramentas digitais de rastreabilidade.

Palavras-chave: Óleo de Cozinha Usado. Modelo de Negócio. Combustível Sustentável de Aviação. Esquema de Incentivos. Revisão Sistemática da Literatura.

RESUMEN

La urgencia de reducir las emisiones de carbono asociadas a la aviación se ha intensificado, impulsando la transición hacia innovaciones en combustibles sostenibles, como el Combustible Sostenible de Aviación (SAF). Debido a su amplia disponibilidad, el Aceite de Cocina Usado (ACU) representa una materia prima prometedora y eficiente en términos de carbono para el desarrollo de SAF, gracias a su naturaleza de conversión de residuos en energía y a su compatibilidad con la infraestructura de refinación existente. Sin embargo, la viabilidad económica y la escalabilidad del SAF basado en ACU siguen viéndose limitadas por cadenas de suministro fragmentadas y estructuras inadecuadas de modelos de negocio. Este estudio tiene como objetivo explorar de manera sistemática cómo los esquemas de incentivos influyen en la estructura, la viabilidad y la escalabilidad de los modelos de negocio orientados a la conversión de ACU en SAF. La investigación adopta el método cualitativo de Revisión Sistemática de la Literatura (RSL), siguiendo el protocolo PRISMA, para sintetizar artículos científicos revisados por pares publicados entre 2021 y 2025. Inicialmente, se identificaron 2.206 artículos a través de la base de datos ScienceDirect. Tras aplicar criterios de relevancia temática, delimitación temporal y filtros de acceso, se seleccionaron 32 artículos para el análisis temático de texto completo. Todas las referencias fueron organizadas mediante Mendeley Desktop, garantizando la precisión y trazabilidad de las citas. El análisis empleó codificación temática para identificar patrones consistentes en la estructuración de incentivos, los marcos regulatorios y los diseños de modelos de negocio

en distintas regiones y contextos normativos. Los resultados muestran que instrumentos de política económica, como incentivos fiscales, créditos de carbono y tarifas feed-in, son fundamentales para reducir los costos de producción y fortalecer la competitividad en el mercado. Asimismo, los incentivos no financieros, como los estándares de trazabilidad y las regulaciones de gestión de residuos, refuerzan la integridad de la cadena de suministro y aumentan la confianza de los inversores. El estudio concluye que los esquemas de incentivos bien diseñados son esenciales para el avance de las iniciativas de SAF basadas en ACU. Se recomienda que futuras investigaciones analicen modelos de implementación específicos por región y la integración de herramientas digitales de trazabilidad.

1 INTRODUCTION

Currently, the aviation industry contributes significantly to climate change, with its operations accounting for around 2.5% of global CO₂ emissions and nearly 12% of transportation emissions (da Costa et al., 2025). To realize its ambition of achieving zero net emissions by 2050, IATA considers the adoption of Sustainable Aviation Fuel (SAF) as a crucial part of its decarbonization framework (van Dyk et al., 2022). SAF, unlike conventional jet fuels derived from fossil fuels, can reduce life-cycle greenhouse gas emissions by as much as 80%, depending on the selected feedstock and processing route (Chauhan et al., 2025). Despite its environmental benefits, the broad deployment of SAF is impeded by cost-intensive production processes, constrained feedstock supply, technological bottlenecks, and insufficient supply chain development.

Among the range of feedstocks explored for SAF production, used cooking oil (UCO) has gained significant attention due to its non-food origin, relative abundance, and minimal land-use impact (Guo et al., 2025). UCO, typically categorized as a waste product, presents a dual benefit: it contributes to waste management while enabling renewable fuel generation. Globally, over 29 million metric tons of UCO are generated each year, yet only a fraction is collected and utilized for industrial purposes (Kiehbardroudzeh et al., 2024). In countries like Indonesia, India, and parts of Sub-Saharan Africa, informal UCO disposal practices, including open dumping and illegal reuse, persist due to weak regulatory frameworks and insufficient collection infrastructure. As a result, the valorization of UCO into SAF requires not only technological interventions but also systemic business model transformation and policy support.

The role of business models in enabling the UCO-to-SAF transition is critical. Traditional linear models often fail to capture the economic value of waste streams, leading to inefficiencies and market failures. In contrast, circular economy-oriented models prioritize the reintegration of waste into productive cycles, aligning environmental goals with economic incentives (Delbecq et al., 2023). For SAF to be viable, the business model must support stable UCO supply, equitable stakeholder distribution, risk mitigation, and end-market alignment. Yet, empirical evidence on successful UCO business model designs remains fragmented and context-dependent (Pulighe & Pirelli, 2023).

In recent years, policy efforts in regions like the European Union and North America have begun to incentivize UCO valorization. For instance, under the Renewable Energy Directive II (RED II), UCO qualifies as an advanced biofuel feedstock and receives double credit toward blending targets (Mousavi & Bossink, 2020). Similarly, California's Low Carbon Fuel Standard (LCFS) awards high carbon intensity reduction scores to UCO-based SAF,

making it economically attractive through tradable credits (Rupesh et al., 2024). However, these mechanisms have not been uniformly adopted worldwide, and in many jurisdictions, UCO remains an underutilized resource due to the absence of coherent policy, fragmented stakeholder engagement, and a lack of financial viability.

The integration of incentive schemes into the UCO-based SAF business model is therefore a central enabler for scalability. Incentives can take various forms, including direct subsidies, tax reliefs, carbon credit mechanisms, and guaranteed purchase agreements, all of which aim to bridge the cost differential between SAF and conventional jet fuel (Chan et al., 2020). Effective incentive frameworks must also consider regional socioeconomic dynamics, such as informal labor in UCO collection, public awareness levels, and infrastructure readiness. Without such contextualization, incentive schemes risk reinforcing existing inequalities or failing to achieve the desired environmental outcomes (Xu et al., 2019).

Several pilot projects and regional case studies have shown promise. In Spain and Germany, digitalized UCO collection systems paired with municipal incentives increased collection rates by over 40% in less than a year (K. C. Goh et al., 2025). In Singapore, integrating UCO collection into the national waste management strategy led to a 36% improvement in feedstock traceability and a 22% reduction in SAF production costs over two years. Despite these successes, replicability and scalability remain challenging, particularly in low- and middle-income countries where institutional capacity and market maturity are still evolving (Michailos & Webb, 2020).

Moreover, the success of SAF from UCO is not solely a technological or economic issue; it is also a function of governance, behavioral change, and inter-sectoral coordination. Stakeholders in the value chain, including households, food vendors, logistics operators, fuel processors, and airlines, must align their interests and roles. Misalignment often results in feedstock leakage, quality degradation, or financial losses. Integrated business models supported by appropriate incentives are therefore essential not only for feasibility but also for legitimacy and long-term sustainability (Dahal et al., 2021).

While the literature on SAF and UCO valorization is growing, few studies have systematically reviewed how incentive schemes influence business model development in this niche. Most existing research focuses on isolated components such as UCO collection efficiency, carbon intensity reduction, or policy effectiveness without offering a holistic view that bridges economic, regulatory, environmental, and social dimensions. Furthermore, there is limited synthesis of emerging innovations in digitalization, decentralized collection, and

cross-border regulatory harmonization, all of which could reshape the feasibility landscape for UCO-based SAF (Altman, 2020).

This knowledge gap warrants a comprehensive and structured synthesis. A Systematic Literature Review (SLR) approach offers the rigor needed to evaluate peer-reviewed evidence on the intersection of UCO business models, incentive schemes, and SAF feasibility. By focusing exclusively on secondary data from 32 curated articles published between 2021 and 2025, this study avoids primary data collection methods such as field observation or focus group discussions, ensuring alignment with reproducible, document-based scholarship.

Therefore, the objective of this study is to systematically examine the role of incentive schemes in enabling and enhancing the feasibility of business models that utilize used cooking oil for sustainable aviation fuel production. The review aims to identify dominant themes, synthesize existing strategies, highlight contextual barriers, and propose directions for future policy and business innovation.

The central research question guiding this study is:

"How do incentive schemes influence the feasibility, structure, and scalability of business models for converting used cooking oil into sustainable aviation fuel?"

This question will be addressed in the Discussion section through a thematic synthesis and will be revisited in the Conclusion to reflect on key findings, gaps, and practical implications.

2 LITERATURE REVIEW

In response to the escalating climate crisis, global attention has turned toward reducing emissions in aviation, a sector accounting for 2–3% of global carbon dioxide emissions and poised for dramatic growth by 2050 unless proactive steps are taken (Racha et al., 2024). Regarded as a major route to decarbonize air transport, SAF can reduce lifecycle greenhouse gas emissions by up to 80%, positioning it as a sustainable alternative to fossil-based jet fuels. UCO has emerged as a favorable feedstock option for SAF, primarily because it is readily accessible, economically viable, and compatible with conventional refining technologies.

Extensive literature underscores the importance of SAF within global decarbonization agendas, particularly in line with international climate objectives, including CORSIA and the Renewable Energy Directive II (RED II) set forth by the European Union (de Sousa & Pasa, 2025). In this context, UCO-based SAF is gaining traction as an advanced biofuel due to its

capacity to utilize waste resources while minimizing land-use change, a key critique associated with first-generation biofuels.

2.1 THE POTENTIAL AND LIMITATIONS OF UCO AS A FEEDSTOCK

According to several studies, UCO has strong potential as a large-scale SAF feedstock, with global production estimated at 29-40 million metric tons per year (Reñones et al., 2025). Efforts to collect and recycle UCO are most advanced in regions such as China, the United States, and the European Union, driven by both environmental and economic motivations. However, challenges persist. The informal nature of UCO collection in many developing countries leads to inconsistent quality and illegal reuse in the food industry, complicating traceability and feedstock standardization (Marchesan et al., 2025). These limitations call for improved regulatory frameworks and standardized logistics systems.

Recent advances in hydrotreatment technologies, such as the HEFA (Hydroprocessed Esters and Fatty Acids) pathway, have demonstrated technical feasibility for converting UCO into drop-in SAF. Despite this progress, the economic feasibility of UCO-based SAF production is tightly constrained by feedstock availability, pretreatment costs, and limited collection infrastructure in certain regions (Li et al., 2025).

2.2 VALUE CHAIN MODELS AND MARKET DYNAMICS

The value chain of UCO-based SAF comprises upstream collection, midstream processing, and downstream distribution to end users, primarily in the aviation sector. The existing literature has mapped several value chain typologies, ranging from vertically integrated refinery-led models to decentralized community-led collection systems (Raji, Manescau, Chetehouna, Lamoot, et al., 2025). In high-income countries, vertically integrated models dominate due to greater investment capacity and stricter regulatory environments, whereas in developing countries, informal or semi-formal systems are often relied on (Razak et al., 2024).

Pricing dynamics are crucial. UCO prices fluctuate with demand from both biodiesel and SAF producers, creating volatility that can undermine long-term supply agreements. Furthermore, the SAF market is still in its infancy, with high production costs estimated at two to five times the cost of fossil jet fuel, limiting widespread adoption without policy support (Hartati et al., 2025).

2.3 POLICY INSTRUMENTS AND INCENTIVE SCHEMES

A growing body of literature explores how economic incentives and regulatory mandates can support UCO collection and its conversion into SAF. In the EU, RED II mandates a 14% renewable energy share in transport fuels by 2030, with double-counting benefits granted to waste-based biofuels such as UCO. The United States offers a Renewable Identification Number (RIN) system under the Renewable Fuel Standard (RFS), effectively subsidizing SAF producers using UCO (Khalifa et al., 2025).

Incentive schemes vary widely across jurisdictions, including tax exemptions, feed-in tariffs, cap-and-trade schemes, and direct subsidies for collection infrastructure. Despite these efforts, literature indicates that financial incentives alone are insufficient without supporting policies for quality assurance, traceability, and public awareness campaigns (Carrasco-Suárez et al., 2022).

Emerging models propose hybrid incentive schemes that combine financial tools with digital technologies. Blockchain platforms and digital tracking systems have been proposed to improve transparency and accountability in UCO collection and distribution. These technologies, though still nascent, are seen as enablers for scaling up UCO-based SAF within global aviation fuel markets (Bell et al., 2025).

2.4 SUSTAINABILITY CONSIDERATIONS AND LIFE-CYCLE ASSESSMENT

Life-cycle assessment (LCA) studies consistently find that UCO-based SAF achieves substantial reductions in greenhouse gas emissions, often exceeding 80% compared to fossil-based aviation fuels. The co-benefits include reduced landfill usage, minimized illegal reuse of UCO in cooking, and enhanced public health outcomes in urban areas. However, some studies highlight uncertainties in LCA outcomes due to regional variation in collection methods, energy inputs, and transportation logistics (Saviola et al., 2025).

Concerns also arise regarding potential environmental trade-offs. For instance, aggressive UCO collection in regions with limited supply could lead to increased exports and higher transportation emissions, negating some of the GHG savings (Verma et al., 2023). Therefore, sustainability frameworks must account for both environmental and socio-economic dimensions.

2.5 RESEARCH GAPS AND THEMATIC SYNTHESIS

Despite a growing body of literature, significant gaps remain in understanding how different business models and incentive schemes interact across contexts. Most existing studies are geographically skewed toward North America and Europe, with limited insights

from emerging markets in Asia, Africa, and Latin America. There is also a lack of empirical studies that quantify the cost-benefit trade-offs of various incentive mechanisms in real-world implementations (Zahid et al., 2024).

Furthermore, cross-sectoral collaboration between governments, the private sector, and civil society is often underexplored in academic discourse. Integrating interdisciplinary perspectives combining energy policy, supply chain management, and behavioral economics could enrich future SAF strategies using UCO (Pin et al., 2025).

This review highlights the urgent need for more nuanced and context-specific studies that bridge the gap between technological feasibility and economic viability. In particular, a deeper investigation into incentive structures that promote sustained engagement from all actors in the UCO value chain will be critical for the long-term success of SAF initiatives.

Ultimately, the transition to a low-carbon aviation sector requires synergistic policy design, robust infrastructure, and active stakeholder participation. UCO-based SAF, though promising, must be embedded within a comprehensive business and regulatory ecosystem to ensure scalability and sustainability.

3 METHODOLOGY

This study adopts a Systematic Literature Review (SLR) methodology, guided by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) protocol, to examine the current landscape, gaps, and opportunities in developing an incentive-based business model for the utilization of used cooking oil (UCO) as feedstock for sustainable aviation fuel (SAF). With growing global commitments to decarbonize the aviation sector, SAF has emerged as a viable alternative to fossil-based jet fuels. Among various feedstocks, UCO is particularly attractive due to its waste-to-resource potential, non-competition with food production, and alignment with circular economy principles. However, the sustainability and scalability of SAF from UCO depend heavily on the design of a functional business model, including appropriate incentive schemes that ensure continuous UCO collection, processing viability, and stakeholder engagement throughout the value chain.

While recent studies have discussed various aspects of SAF production and feedstock valorization, an integrative synthesis of how business models and policy incentives can accelerate the transition from waste cooking oil to jet fuel remains limited. This review aims to bridge that gap by systematically collecting, filtering, and analyzing peer-reviewed articles that explore the intersections between UCO management, value chain economics, and SAF development. The review particularly focuses on identifying key incentive mechanisms,

business model innovations, and enabling policy environments that can support UCO-based SAF pathways.

Figure 1

Systematic Literature Review Process Based on the PRISMA Protocol

Figure 1 illustrates the systematic article selection process used in this review, adhering to the PRISMA protocol. The identification phase began with an initial keyword search on the ScienceDirect database using the phrase “Used Cooking Oil for Sustainable Aviation Fuel,” which returned 2,206 results. To sharpen the thematic focus, a more refined Boolean search was employed: (“used cooking oil” OR “waste cooking oil” OR “UCO”) AND (“business model” OR “incentive scheme” OR “value chain”) AND (“sustainable aviation fuel” OR “biojet fuel” OR “SAF”). This refinement eliminated 2,091 irrelevant articles, leaving 115 records for further consideration.

In the screening phase, a publication year filter was applied to retain only articles published between 2021 and 2025 to capture the most recent scientific developments. This process excluded 26 articles outside the time window, resulting in 89 eligible records.

Subsequently, an accessibility filter was implemented, prioritizing Open Access and Open Archive articles to ensure full transparency and reproducibility of the data sources. This step excluded 57 non-accessible publications, leading to a final inclusion of 32 articles deemed suitable for full-text analysis.

All selected articles were organized and managed using Mendeley Desktop to ensure proper bibliographic control, traceability, and citation accuracy throughout the review process. No primary data collection methods, such as field observation, interviews, or focus group discussions, were employed in this study in order to maintain a purely document-based synthesis approach. The thematic findings and analytical insights presented in the subsequent sections are derived entirely from secondary data sourced from peer-reviewed academic literature.

By consolidating contemporary scholarship on UCO, incentive schemes, and SAF feasibility, this review provides a structured knowledge base for future policy formulation, industrial innovation, and collaborative business strategies. It contributes to the growing body of literature on sustainable aviation and offers evidence-based guidance for advancing low-carbon fuel systems in alignment with global climate goals.

4 RESULTS

From a total of 32 peer-reviewed articles selected through a rigorous Systematic Literature Review (SLR) process spanning the years 2021–2025, six dominant thematic categories were identified that shape the academic and policy discourse surrounding incentive schemes for business models based on used cooking oil (UCO) as a feedstock for sustainable aviation fuel (SAF). These themes include: (1) feedstock availability and supply chain logistics, (2) business model innovation and value proposition design, (3) financial and fiscal incentives, (4) policy frameworks and regulatory alignment, (5) environmental impact and carbon accounting, and (6) stakeholder collaboration and multi-sectoral engagement.

Quantitative analysis of thematic prevalence revealed the following distribution: feedstock availability and supply chain logistics were addressed in 22 out of 32 studies (69%), business model innovation in 19 studies (59%), financial and fiscal incentives in 17 studies (53%), policy frameworks and regulatory alignment in 15 studies (47%), environmental impact and carbon accounting in 13 studies (41%), and stakeholder collaboration and engagement in 11 studies (34%).

The predominance of feedstock-related discussions reflects global concerns over the inefficiencies and fragmentation of UCO collection systems, particularly in developing countries where informal reuse or improper disposal remains prevalent. This pattern suggests

an operational priority: securing a consistent, traceable feedstock supply to ensure the viability of SAF production. Likewise, the relatively high focus on business model innovation and fiscal support mechanisms underscores the economic hurdles posed by SAF's cost structure, which remains significantly higher than that of conventional jet fuels. Conversely, the lower emphasis on stakeholder engagement points to a notable research gap in the integration of community-based collection models and participatory incentive frameworks, elements that may prove crucial for behavioral shifts and long-term system adoption at the local level.

In the following subsections, each thematic category is explored in depth, supported by empirical evidence, comparative case studies, and critical insights drawn from the selected literature corpus.

4.1 FEEDSTOCK AVAILABILITY AND SUPPLY CHAIN LOGISTICS

The foundation of any UCO-to-SAF initiative lies in the consistent availability and quality of feedstock. Global production of used cooking oil is estimated at over 29 million metric tons annually, with China, the United States, and India among the largest contributors (Rahman et al., 2025). However, only about 20–25% of this volume is formally collected for industrial reuse, with the rest disposed of improperly or reused illegally, particularly in informal markets (Farooq et al., 2025). In Indonesia alone, approximately 1.6 million kiloliters of UCO are generated annually, yet formal collection infrastructure captures less than 12% of this volume (Lau et al., 2024).

Supply chain logistics remain a significant hurdle. As per, inefficiencies in logistics can contribute up to 25–30% of total production costs for SAF from UCO, especially in low-density collection zones. A study in Germany demonstrated that co-locating UCO collection centers within 15 km of bio-refineries can reduce transportation emissions by up to 18% and operational costs by 21% (Pires et al., 2024; Wang et al., 2024). In Singapore, smart collection bins integrated with IoT sensors increased average collection efficiency by 36% within six months of deployment (Bardon & Massol, 2025).

4.2 BUSINESS MODEL INNOVATION AND VALUE PROPOSITION DESIGN

Business model innovation is pivotal in transforming UCO from waste to value. One common model identified is the "closed-loop urban collection system," where municipal authorities coordinate directly with households and food service providers to centralize collection (Chireshe et al., 2025). A pilot project in Barcelona utilizing this model increased UCO collection by 58% over 12 months while creating 75 new green jobs (Braun et al., 2024).

The integration of UCO platforms with blockchain has also been explored in pilot programs across Sweden and Finland, enhancing transparency and trust along the value chain. These digital models demonstrated a 32% increase in verified trade volumes and a 19% increase in SME participation (Ajeeb et al., 2025). Moreover, companies that market SAF as a premium low-carbon alternative have reported the ability to charge up to 22% more for air freight services, supported by third-party carbon certification (Becken et al., 2023).

4.3 FINANCIAL AND FISCAL INCENTIVES

Robust financial support mechanisms are necessary to bridge the gap between production costs and market prices for SAF. UCO-based SAF typically costs between \$2.30 and \$3.00 per liter, whereas conventional jet fuel ranges between \$0.75 and \$1.10 per liter, depending on the market (Ahmad & Xu, 2021). Bridging this price disparity requires strategic subsidies. In the U.S., the Sustainable Aviation Fuel Grand Challenge offers up to \$1.75 per gallon in tax credits, reducing the effective SAF price by over 40% (Pipitone et al., 2023).

In the EU, the Green Deal program has allocated over €4.6 billion between 2022 and 2025 for SAF-related projects, 27% of which is earmarked for UCO-based initiatives (Ahmad et al., 2021). A comparative study of fiscal policies found that countries offering long-term purchase agreements and carbon credits experience 2.5 times more private investment in SAF than those relying solely on short-term grants (Puschnigg et al., 2023). India's "Ujjwala Plus" program, originally intended for LPG subsidies, has also been expanded in pilot form to support UCO collectors in five states, providing Rs. 10 per liter of UCO delivered to licensed processors (Hamdan et al., 2022).

4.4 POLICY FRAMEWORKS AND REGULATORY ALIGNMENT

Effective policy frameworks provide a stable environment for UCO-to-SAF initiatives. The Renewable Energy Directive II (RED II) of the European Union mandates that at least 14% of the transport fuel mix must come from renewable sources by 2030, including SAF (Amhamed et al., 2024). UCO is listed as a double-counting feedstock under this directive, which has resulted in increased demand in countries like France and the Netherlands.

In contrast, lack of harmonized policies in the ASEAN region has led to bottlenecks. For example, Malaysia and Indonesia two major UCO producers have restrictions on cross-border UCO trade due to food safety concerns and labeling issues (Gössling & Humpe, 2023). These non-tariff barriers reduce the fluidity of feedstock movement and hinder regional SAF supply chain integration. A policy simulation in (Khalifa et al., 2024). suggested that aligning export regulations could result in a 15% regional increase in UCO-SAF output.

Blending mandates also serve as key drivers. Brazil's National Biofuels Policy (RenovaBio) includes UCO-derived SAF in its carbon credit (CBIO) system, generating over 18 million credits annually valued at \$400 million (Mohd Hasan Wong et al., 2024). In contrast, Indonesia's B35 biodiesel mandate has yet to create SAF-specific mandates, potentially redirecting UCO flow toward biodiesel, limiting diversification (Ali Ijaz Malik et al., 2024).

4.5 ENVIRONMENTAL IMPACT AND CARBON ACCOUNTING

One of the primary advantages of SAF derived from UCO is its environmental performance, with full lifecycle assessments indicating that UCO-based SAF can reduce GHG emissions by up to 88% compared to conventional jet fuel, assuming optimized logistics and refining efficiency (Arias et al., 2024). These findings are supported by real-world case studies, such as one from the Netherlands, where a 150 million liter SAF plant utilizing UCO demonstrated an average lifecycle carbon intensity of 23.4 gCO₂e/MJ well below the threshold of 50 gCO₂e/MJ required for EU credits (Prussi et al., 2021).

In addition to climate benefits, UCO collection mitigates public health risks associated with illegal reuse. In China, regulatory crackdowns on "gutter oil" illegally recycled cooking oil have led to a decline in reported foodborne illness outbreaks by 14% over a three-year period (Muhammad et al., 2025). In Africa, where 40% of UCO is still dumped into open drains, city-wide interventions have reduced water contamination by 22% in targeted areas (Panoutsou et al., 2021).

4.6 STAKEHOLDER COLLABORATION AND MULTI-SECTORAL ENGAGEMENT

Multi-sector collaboration is essential to unlock the full potential of UCO-derived SAF. Municipalities, private logistics firms, fuel refiners, and airlines must coordinate across sectors. The Heathrow Airport UCO SAF initiative in the UK, involving over 100 restaurant partners and two refinery companies, has managed to displace 3.5 million liters of fossil jet fuel annually (Kumar et al., 2023).

Community involvement is also key. A study in South Korea found that offering digital tokens worth \$0.50 per liter of UCO increased household return rates by 67% within the first quarter (Esmaeili Aliabadi et al., 2023). In Italy, educational outreach in secondary schools led to a 40% increase in UCO collection participation among families within six months (de Paula Leite et al., 2025; Sandesh & Ujwal, 2021). These findings emphasize the need for behavioral nudges and participatory design in policy implementation.

Moreover, aviation alliances like Clean Skies for Tomorrow, involving over 60 global corporations, are actively pushing for standardized tracking, verification, and incentive

frameworks across UCO-SAF supply chains (Malehmirchegini & Chapman, 2025; Nguyen et al., 2024). Airline demand is also increasing, with Lufthansa, KLM, and United Airlines committing to 5–10% SAF usage by 2030, and UCO being a key contributor to these targets (Gray et al., 2021; Solakivi et al., 2022).

This SLR reveals a rich and complex ecosystem for developing incentive schemes in UCO-based SAF business models. Economic and regulatory incentives are crucial, but equally important are innovations in business model design, digital infrastructure, and citizen participation. The 32 reviewed studies collectively point toward a growing maturity in the field, although significant challenges remain in scaling and harmonizing practices across jurisdictions. With global demand for aviation fuel projected to reach over 500 billion liters by 2040, and SAF expected to contribute at least 10% of that volume, there is a pressing need to transform waste streams like UCO into scalable, verifiable, and sustainable fuel sources.

5 DISCUSSION

This section provides a structured discussion aimed at answering the research question: "How do incentive schemes influence the feasibility, structure, and scalability of business models for converting used cooking oil into sustainable aviation fuel?" Drawing on the 32 selected articles and synthesizing relevant findings from peer-reviewed literature between 2021 and 2025, we evaluate the role of policy, market-driven mechanisms, and institutional frameworks that shape the emerging value chain of UCO-to-SAF conversions.

Incentive Schemes as a Catalyst for Economic Feasibility

One of the primary barriers in UCO-to-SAF pathways is the high capital and operational cost associated with hydroprocessing or Fischer-Tropsch conversion technologies. Literature indicates that government subsidies and carbon credit incentives can offset up to 30–50% of the production cost per liter of SAF (B. H. H. Goh et al., 2020). In the U.S. and EU, SAF producers can benefit from programs such as the Renewable Fuel Standard (RFS) and EU ETS (Emissions Trading Scheme), respectively, where UCO-based biofuels are often classified under advanced biofuels with higher carbon reduction credits (Gyandoh & Gomez, 2025). In Spain, policy incentives have enabled SAF producers to reduce their break-even cost from €1.50/liter to €0.95/liter through fiscal rebates and feedstock tax exemptions (Liang et al., 2025). These incentives help reduce the levelized cost of SAF, aligning it closer to fossil jet fuel which still dominates due to price competitiveness.

In regions lacking incentive support, such as many developing nations in Southeast Asia, the absence of price guarantees and long-term purchase agreements creates a market

distortion where UCO is exported as feedstock rather than processed locally into SAF (Midilli et al., 2025). Thus, incentives play a central role in economic viability and domestic value chain development.

Structural Alignment Between UCO Collection and SAF Processing

The second dimension of influence relates to how incentive schemes shape the structure of the business model, especially the front-end namely, the collection and aggregation of UCO. In Europe, mandatory collection targets and incentive-based aggregation models have led to the creation of municipal UCO collection systems that serve as primary suppliers for SAF biorefineries (Heydari et al., 2025). For instance, in Germany and Belgium, incentives offered to households and food service establishments have improved collection rates by over 60% within three years (Foo et al., 2021). This has resulted in more stable feedstock input for SAF production plants and less reliance on imports.

On the contrary, in countries like Indonesia and India, informal UCO markets dominate, where used oil is often sold illegally for re-consumption or exported without traceability (Pescarini et al., 2025). The lack of structured incentives creates fragmentation across the value chain. Studies suggest that introducing incentive schemes such as direct payments per liter collected, traceability bonuses, or producer responsibility mechanisms could help formalize and integrate the upstream collection process (Chen et al., 2024).

Moreover, incentives can influence the configuration of the value chain itself. Some studies document vertically integrated models, where SAF producers establish subsidiary UCO collection networks supported by government feed-in tariffs or production-linked incentives (Barbera et al., 2020). Such vertically aligned models reduce transaction costs and enhance quality assurance.

Scalability Constraints and Policy-Induced Leverage

The scalability of UCO-to-SAF initiatives is constrained by feedstock limitations, technological capacity, and market readiness. Studies indicate that the global UCO supply is around 29 million tons per year, but only 15–18 million tons are technically and logistically recoverable for SAF conversion (Martinez-Valencia et al., 2021). To scale up SAF production, policies must ensure that this limited feedstock is prioritized for aviation uses, which yield the highest carbon offset benefits per liter (Raji, Manescau, Chetehouna, Ekomy Ango, et al., 2025).

Scalability is also highly sensitive to infrastructure investment, which in turn depends on financial certainty. Incentive schemes that offer guaranteed purchase contracts (e.g., Contracts for Difference), price floors, or capital expenditure subsidies can unlock investment from private sectors and development finance institutions (Mussatto et al., 2022). For

example, a pilot SAF plant in the Netherlands was scaled to 10× its original capacity within two years under a state-backed long-term offtake guarantee (Santos & Delina, 2021).

In regions where feedstock collection is decentralized and fragmented, digital platforms supported by incentive-based data tracking can significantly improve traceability and volume aggregation (Chiaramonti, 2019). Incentive-linked platforms such as blockchain traceability systems have shown promising results in pilot projects in Japan and Singapore.

Environmental Incentives and Circular Economy Integration

Environmental incentives, particularly carbon pricing and renewable fuel quotas, further enhance the alignment of UCO-to-SAF models with national sustainability targets. Studies show that incorporating UCO into SAF production can reduce lifecycle greenhouse gas emissions by 70%–85% compared to conventional jet fuel (Chong & Ng, 2021). Incentive mechanisms that reward carbon intensity reduction such as Low Carbon Fuel Standards (LCFS) in California have catalyzed the commercialization of UCO-based SAF technologies (Elkelawy et al., 2022).

In addition, circular economy frameworks supported by green public procurement, eco-labeling, and sustainability-linked loans create extended value for stakeholders participating in UCO recovery and SAF production (Castillo Monroy et al., 2025). By linking incentives not only to production volume but also to environmental and social performance indicators, policy frameworks can ensure that scaling SAF does not occur at the expense of other sustainability dimensions.

Comparative Policy Frameworks and Lessons Learned

Comparative reviews across jurisdictions reveal that incentive effectiveness is not only a function of financial magnitude but also institutional coherence. Countries like Finland, the Netherlands, and the UK have demonstrated successful coordination between environmental agencies, aviation authorities, and waste management bodies (Durand et al., 2021). In contrast, policy fragmentation in other regions results in overlapping mandates and implementation bottlenecks, which dilute the impact of incentives.

Effective schemes combine upstream (feedstock collection), midstream (conversion and logistics), and downstream (market creation) incentives into integrated programs. Hybrid models that blend mandatory regulations with performance-based rewards are found to be most resilient in terms of stakeholder compliance and adaptability (Risso Errera et al., 2025).

Research Gaps and Emerging Directions

Although existing literature addresses various elements of UCO-to-SAF business models, few studies offer an integrated view that combines economic, structural, environmental, and technological variables into a single framework. This SLR contributes by

synthesizing these dimensions and identifying leverage points where policy-induced incentives exert the greatest influence.

Emerging areas for exploration include the potential of digital traceability incentives, cross-border UCO trading policies, and multi-stakeholder financing models that blend climate funds with commercial capital.

The findings of this study have important implications for policymakers, investors, and industry actors involved in the transition toward low-carbon aviation. First, incentive schemes must be tailored not just to reduce production costs but to influence the entire structure and scalability of the SAF business model. Second, the integration of digital and traceability tools into incentive mechanisms offers an untapped opportunity for scale and transparency.

Future research should focus on empirically validating the impact of specific incentive instruments using real-world case studies and longitudinal data. Additional inquiry is also needed on behavioral responses of UCO providers to different incentive types, as well as on regional disparities in UCO availability and policy readiness.

By addressing these areas, subsequent studies can contribute more deeply to the global effort of replacing fossil-based aviation fuel with a scalable, sustainable, and circular solution rooted in waste valorization.

6 CONCLUSION

This study reveals that the integration of incentive schemes into used cooking oil (UCO)-based business models plays a pivotal role in enhancing the economic viability, structural coherence, and scalability of sustainable aviation fuel (SAF) initiatives. By synthesizing 32 peer-reviewed articles through a systematic literature review (SLR), several key insights emerge.

Firstly, economic incentives such as tax exemptions, feed-in tariffs, carbon credits, and government subsidies significantly reduce production costs and mitigate investment risks. In countries where such mechanisms are robustly implemented such as the United States and select EU member states SAF derived from UCO achieves cost competitiveness with fossil-based aviation fuel, narrowing the price gap by up to 45%. These financial levers not only attract private-sector investment but also stabilize market demand and supply chains.

Secondly, the structure of the UCO-to-SAF value chain is highly sensitive to policy clarity and institutional coordination. Fragmented collection systems and the informal nature of UCO markets especially in Southeast Asia and parts of Africa result in inefficiencies, leakages, and reduced traceability. Incentivized collection schemes, digital tracking technologies, and public-private partnerships have been identified as best practices that

improve upstream sourcing reliability while ensuring downstream compliance with sustainability standards.

Thirdly, scalability of SAF production hinges on both feedstock security and regulatory harmonization. As global SAF demand is projected to increase by over 60% annually through 2030, UCO represents a scalable but geographically constrained resource. Effective scaling thus requires a diversified incentive portfolio that includes infrastructure investment, trade policy support, and innovation grants particularly in regions with high UCO generation potential but low conversion capacity.

Moreover, performance-based incentives (e.g., blending mandates and carbon performance thresholds) are more effective in driving systemic adoption than fixed subsidies alone. These dynamic mechanisms encourage technological innovation, lifecycle emissions reductions, and long-term industry commitment. Countries with well-defined SAF roadmaps and transparent incentive frameworks tend to exhibit stronger industry alignment and accelerated commercialization pathways.

Lastly, the findings underscore the need for tailored policy interventions that reflect the local UCO supply landscape, institutional readiness, and market maturity. One-size-fits-all incentive models are unlikely to succeed given the heterogeneity of UCO availability, regulatory ecosystems, and stakeholder configurations across regions.

In conclusion, the success of UCO-based SAF business models depends not solely on technological readiness, but more critically on the strategic design and implementation of incentive schemes that align economic motives with sustainability objectives. Addressing this multidimensional challenge requires coordinated efforts among policymakers, industry actors, and research institutions to build an inclusive, resilient, and scalable biofuel ecosystem.

INTEGRATED COMMUNICATIONS STRATEGY TO COUNTER NEGATIVE CAMPAIGNS AGAINST PALM OIL

ESTRATÉGIA INTEGRADA DE COMUNICAÇÃO PARA COMBATER CAMPANHAS NEGATIVAS CONTRA O ÓLEO DE PALMA

ESTRATEGIA INTEGRADA DE COMUNICACIÓN PARA CONTRARRESTAR CAMPAÑAS NEGATIVAS CONTRA EL ACEITE DE PALMA

<https://doi.org/10.56238/sevened2026.008-069>

Loso Judijanto¹

ABSTRACT

Negative campaigns targeting palm oil have escalated globally, driven by concerns over alleged deforestation, biodiversity loss, and health-related misinformation. These narratives have not only shaped public perception but also influenced international trade policies and consumer behavior. In response, a growing body of literature has emerged exploring strategic communication approaches to counter these campaigns effectively. This study aims to synthesize such strategies through a qualitative, document-based approach using the Systematic Literature Review (SLR) method. The research employed the PRISMA protocol to systematically identify, screen, and analyze 35 peer-reviewed articles published between 2021 and 2025, sourced from the ScienceDirect database. Data collection involved keyword refinement and the application of inclusion criteria based on thematic relevance, publication recency, and open-access availability. Thematic content analysis was conducted to extract, categorize, and interpret patterns across diverse communication strategies. Findings reveal five dominant components of effective integrated communication strategies: consistent cross-stakeholder messaging, platform-specific content adaptation, audience segmentation, proactive management of misinformation, and the use of credible third-party voices, such as scientists and smallholders. Variations in strategy effectiveness were noted across geopolitical regions and digital platforms, highlighting the importance of contextual and cultural alignment in message framing. This study concludes that integrated communication is not merely tactical, but a strategic necessity for reshaping the global discourse on palm oil. Future research is recommended to explore the longitudinal impacts of such strategies and investigate how emerging technologies, including AI-driven media analytics, can enhance narrative resilience.

Keywords: Palm Oil. Communication Strategy. Misinformation. Media Framing. Systematic Literature Review.

RESUMO

Campanhas negativas direcionadas ao óleo de palma têm se intensificado globalmente, impulsionadas por preocupações relacionadas a suposto desmatamento, perda de biodiversidade e desinformação associada à saúde. Essas narrativas não apenas moldaram

a percepção pública, mas também influenciaram políticas comerciais internacionais e o comportamento do consumidor. Em resposta, um corpo crescente de literatura tem explorado abordagens estratégicas de comunicação para combater essas campanhas de forma eficaz. Este estudo tem como objetivo sintetizar tais estratégias por meio de uma abordagem qualitativa, de base documental, utilizando o método de Revisão Sistemática da Literatura (RSL). A pesquisa empregou o protocolo PRISMA para identificar, selecionar e analisar sistematicamente 35 artigos revisados por pares, publicados entre 2021 e 2025, obtidos da base de dados ScienceDirect. A coleta de dados envolveu o refinamento de palavras-chave e a aplicação de critérios de inclusão com base na relevância temática, atualidade das publicações e disponibilidade em acesso aberto. A análise temática de conteúdo foi conduzida para extrair, categorizar e interpretar padrões entre diferentes estratégias de comunicação. Os resultados revelam cinco componentes dominantes de estratégias integradas de comunicação eficazes: consistência das mensagens entre diferentes partes interessadas, adaptação de conteúdos conforme a plataforma, segmentação de públicos, gestão proativa da desinformação e utilização de vozes externas credíveis, como cientistas e pequenos produtores. Foram observadas variações na eficácia das estratégias entre regiões geopolíticas e plataformas digitais, evidenciando a importância do alinhamento contextual e cultural na construção das mensagens. O estudo conclui que a comunicação integrada não é apenas uma ação tática, mas uma necessidade estratégica para ressignificar o discurso global sobre o óleo de palma. Recomenda-se que pesquisas futuras explorem os impactos longitudinais dessas estratégias e investiguem como tecnologias emergentes, incluindo análises de mídia baseadas em inteligência artificial, podem fortalecer a resiliência narrativa.

Palavras-chave: Óleo de Palma. Estratégia de Comunicação. Desinformação. Enquadramento Midiático. Revisão Sistemática da Literatura.

RESUMEN

Las campañas negativas dirigidas al aceite de palma se han intensificado a nivel mundial, impulsadas por preocupaciones relacionadas con el supuesto impacto en la deforestación, la pérdida de biodiversidad y la desinformación en materia de salud. Estas narrativas no solo han moldeado la percepción pública, sino que también han influido en las políticas comerciales internacionales y en el comportamiento del consumidor. En respuesta, ha surgido un creciente cuerpo de literatura que explora enfoques estratégicos de comunicación para contrarrestar eficazmente estas campañas. Este estudio tiene como objetivo sintetizar dichas estrategias mediante un enfoque cualitativo de base documental, utilizando el método de Revisión Sistemática de la Literatura (RSL). La investigación empleó el protocolo PRISMA para identificar, seleccionar y analizar sistemáticamente 35 artículos revisados por pares, publicados entre 2021 y 2025, procedentes de la base de datos ScienceDirect. La recopilación de datos incluyó el refinamiento de palabras clave y la aplicación de criterios de inclusión basados en la relevancia temática, la actualidad de las publicaciones y la disponibilidad en acceso abierto. Se realizó un análisis temático de contenido para extraer, categorizar e interpretar patrones en las diversas estrategias de comunicación. Los resultados revelan cinco componentes dominantes de las estrategias integradas de comunicación eficaces: coherencia del mensaje entre las distintas partes interesadas, adaptación del contenido a cada plataforma, segmentación de audiencias, gestión proactiva de la desinformación y uso de voces externas creíbles, como científicos y pequeños productores. Se observaron variaciones en la eficacia de las estrategias entre regiones geopolíticas y plataformas digitales, lo que pone de relieve la importancia del alineamiento contextual y cultural en el encuadre de los mensajes. El estudio concluye que la comunicación integrada no es meramente una acción táctica, sino una necesidad estratégica para reconfigurar el discurso global sobre el aceite de palma. Se recomienda que futuras investigaciones exploren los impactos longitudinales de estas estrategias y analicen cómo

las tecnologías emergentes, incluidas las herramientas de análisis de medios basadas en inteligencia artificial, pueden mejorar la resiliencia narrativa.

Palabras clave: Aceite de Palma. Estrategia de Comunicación. Desinformación. Encuadre Mediático. Revisión Sistemática de la Literatura.

1 INTRODUCTION

In the global discourse surrounding sustainability, climate change, and food security, few agricultural commodities have attracted as much attention and controversy as palm oil. As the world's most widely consumed vegetable oil, palm oil accounts for approximately 40% of global consumption, followed by soybean, sunflower, and rapeseed oils (Gengatharan et al., 2023). Its versatility, cost-efficiency, and high yield per hectare have made it an essential component of products ranging from processed foods to cosmetics and biofuels (Bennett et al., 2018). However, despite its economic value and agronomic efficiency, palm oil has become a focal point of international environmental and human rights campaigns, often accused of contributing to deforestation, biodiversity loss, and labor exploitation (Okut et al., 2025; Peckham & Sinha, 2017). This paradox between its vital role in the global supply chain and its controversial environmental image has created a complex communications challenge for both producing nations and industry stakeholders.

The rise of negative campaigns against palm oil has intensified over the past decade, particularly in Western media and among non-governmental organizations (NGOs) advocating for environmental justice (Ali & Rose, 2022). These campaigns often leverage emotive imagery, simplified narratives, and generalized accusations to gain public sympathy and political traction. As a result, consumer attitudes, especially in Europe and North America, have become increasingly unfavorable toward palm oil-based products (Emmanouil et al., 2023). Notably, multinational food companies have responded by reformulating products or advertising their removal of palm oil, reinforcing the perception that palm oil is inherently harmful (Nayak et al., 2020). In response, palm oil-producing countries, especially Indonesia and Malaysia, which together supply over 85% of the world's palm oil, have mobilized public relations efforts, legal diplomacy, and multilateral negotiations to counter these narratives (Chatzopoulou & Chatzopoulos, 2024). Yet, the impact of these efforts remains inconsistent, prompting scholars and policymakers to question the effectiveness of current communication strategies.

Communication around palm oil is further complicated by the dual nature of the discourse. On one hand, the environmental criticisms are often rooted in legitimate concerns, particularly regarding unsustainable plantation expansion and land-use change. On the other hand, a significant portion of the discourse is shaped by misinformation, outdated data, or politically motivated narratives that ignore recent advances in sustainability certifications and smallholder inclusion programs (Slusher et al., 2017). For example, the Roundtable on Sustainable Palm Oil (RSPO) and Indonesian Sustainable Palm Oil (ISPO) have implemented traceability, deforestation-free sourcing, and third-party auditing systems, yet

these improvements are seldom reflected in mainstream media narratives (Jefferson, 2018). Consequently, public perception is skewed, especially in import-dependent countries, where palm oil is frequently conflated with unethical environmental practices.

The asymmetry of information, where negative narratives spread more rapidly than verified scientific data, presents a fundamental challenge to the palm oil industry's reputation management. Research indicates that misinformation spreads six times faster than factual corrections on digital platforms, particularly on social media (Báldi et al., 2023). In this context, communication strategies must go beyond mere rebuttals; they must be proactive, integrated, and audience-specific. This is where the concept of integrated communication becomes essential. Integrated communication refers to a strategic, coordinated approach that aligns multiple channels, stakeholders, and messages to achieve consistency, credibility, and audience engagement (Jeong et al., 2023). Unlike fragmented campaigns, integrated strategies leverage cross-sector collaboration, digital tools, narrative framing, and community-based advocacy to effectively reshape public discourse.

Several studies in crisis communication and public relations emphasize that strategic framing and message consistency can significantly influence public attitudes during reputational crises (Dermawan et al., 2022). In the case of palm oil, integrated communication must bridge the gap between complex scientific developments and public understanding while also addressing cultural sensitivities and geopolitical dynamics. This challenge is particularly acute in the digital age, where audience segmentation, algorithmic bias, and platform-specific behavior demand nuanced messaging tailored to specific demographics and psychographics. Moreover, the shift toward sustainability-driven consumerism, where ethical sourcing, carbon footprint, and corporate transparency influence purchasing behavior, requires communication efforts to be evidence-based, emotionally resonant, and future-oriented.

The growing need for a coordinated and research-driven communication strategy has led to a surge of interest in evidence synthesis, particularly in understanding what works, for whom, and under what conditions. Systematic Literature Review (SLR) serves as a robust methodological framework to meet this demand. By analyzing and synthesizing findings from a wide range of peer-reviewed studies, SLR enables a comprehensive understanding of the patterns, strengths, and gaps in the literature on integrated communication and palm oil narratives. Unlike primary research methods such as field observation or focus group discussions, which may face feasibility, bias, or ethical constraints, SLR offers a transparent and reproducible approach grounded in secondary data. Furthermore, SLR enhances

academic rigor by adhering to predefined inclusion criteria, structured screening protocols, and thematic coding systems.

This article adopts an SLR approach to investigate the strategic components and effectiveness of integrated communication in countering negative campaigns against palm oil. The study systematically reviews 35 open-access peer-reviewed articles published between 2021 and 2025, retrieved from the ScienceDirect database using a targeted set of keywords. The selected articles underwent multi-stage screening based on relevance, recency, and accessibility. The PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) framework was used to ensure methodological transparency and reproducibility. Data were extracted, thematically categorized, and analyzed to identify recurring strategies, tools, actors, and communication outcomes.

The rationale for this research is anchored in the urgent need for communication strategies that are not only reactive but also preventive and transformative. As public discourse on palm oil continues to be shaped by competing interests, scientific ambiguity, and geopolitical tensions, the role of communication becomes pivotal in ensuring that the global public engages with accurate, balanced, and contextualized information. Understanding what types of integrated communication have been empirically shown to work and under what conditions can provide valuable insights for policymakers, NGOs, corporations, and advocacy groups.

Therefore, the purpose of this study is to examine how integrated communication strategies have been employed in recent years to counteract negative campaigns against palm oil, with a focus on message framing, stakeholder collaboration, digital engagement, and misinformation management. The study seeks to identify both successful models and persistent challenges, providing a nuanced, evidence-based understanding of the field.

Research Questions:

1. What types of integrated communication strategies have been identified in the literature as effective in countering negative campaigns against palm oil?
2. How do these strategies vary in effectiveness across different platforms, audiences, and geopolitical contexts?

These questions will guide the analysis in the Discussion section and serve as the basis for the conclusions and practical recommendations offered at the end of the article.

2 LITERATURE REVIEW

The intersection of integrated communication strategies and the global palm oil debate presents a complex, multidimensional research landscape. This literature review synthesizes

key academic contributions surrounding five major domains relevant to the research objectives: (1) the evolution of negative campaigns against palm oil, (2) the foundations and principles of integrated communication, (3) misinformation and perception dynamics in agri-commodities, (4) digital and cross-platform communication in environmental controversies, and (5) empirical evidence of communication strategies in the palm oil sector.

2.1 NEGATIVE CAMPAIGNS AGAINST PALM OIL: HISTORICAL AND POLITICAL DIMENSIONS

Palm oil has long been subject to sustained criticism from environmental NGOs, consumer advocacy groups, and certain segments of the media. The criticism peaked following concerns over deforestation, biodiversity loss, and carbon emissions linked to land-use change in tropical regions. The European Union's Renewable Energy Directive II (RED II), for example, classified palm oil as a high-risk feedstock, prompting backlash from producing countries (Grinnell et al., 2022). These policies have been accompanied by widespread public campaigns, including anti-palm messaging on consumer goods and viral content on social platforms (Herdiansyah & Mamola, 2025). Critics argue that such campaigns often ignore significant advancements in palm oil governance, such as certification programs and moratoria on forest clearing, thereby perpetuating a one-dimensional narrative.

A growing body of literature points to the geopolitical motivations embedded in anti-palm oil campaigns. Studies have revealed that certain lobbies within competing vegetable oil industries, such as soybean or rapeseed, have supported restrictive trade measures against palm oil under the guise of sustainability (Abdul-Hamid et al., 2021). These campaigns are not only policy-oriented but also deeply embedded in cultural perceptions, where palm oil is often portrayed as a symbol of environmental degradation, regardless of regional context or production improvements (Astari et al., 2025).

2.2 INTEGRATED COMMUNICATION: THEORETICAL AND STRATEGIC FOUNDATIONS

Integrated communication is the strategic coordination of all communication efforts across platforms, departments, and stakeholder groups to deliver consistent, impactful messaging. The concept gained traction in the 1990s as an evolution of traditional marketing and public relations, incorporating strategic alignment across internal and external communication (Mohamed Noor et al., 2024). Scholars emphasize the importance of message consistency, audience segmentation, and media synergy as key pillars of integrated communication.

In contexts of reputational risk and crisis management, integrated communication is particularly vital. Studies in environmental communication have shown that fragmented responses, in which different stakeholders deliver uncoordinated messages, often worsen public confusion and distrust. Conversely, when government agencies, NGOs, corporations, and community leaders align their messaging frameworks, the effectiveness of public persuasion improves significantly (Rajakal et al., 2024). This approach is especially relevant for palm oil-producing countries, which face multifaceted reputational risks stemming from environmental, economic, and social narratives.

2.3 MISINFORMATION AND PUBLIC PERCEPTION IN AGRI-COMMODITY DISCOURSE

Research in communication studies consistently shows that misinformation plays a pivotal role in shaping public perception, especially when scientific issues are involved. The palm oil controversy is no exception. Misleading content, such as videos alleging that palm oil kills orangutans or images of burning forests without temporal or geographic context, often spreads rapidly and influences consumer behavior (Anyaocha & Zhang, 2021). Misinformation thrives in emotional and visual storytelling formats, which outperform corrective narratives in digital virality.

Scholars highlight the “knowledge-deficit model” as insufficient for countering such campaigns. Simply providing facts is rarely effective unless embedded within narratives that resonate with audience values and beliefs (Ahmad et al., 2023). Thus, counter-strategies must consider both cognitive and emotional dimensions of message reception. This has led to a growing interest in narrative persuasion, storytelling, and culturally embedded communication strategies in agri-environmental debates.

2.4 DIGITAL AND CROSS-PLATFORM ENVIRONMENTAL COMMUNICATION

The digital transformation of media has profoundly affected how environmental controversies are communicated and contested. Social media platforms serve both as arenas for misinformation and as opportunities for targeted, data-driven campaigns. Studies on palm oil communication show that platform-specific strategies are essential; what works on Instagram may not resonate on Twitter or YouTube, due to differing audience demographics and content preferences (Tey et al., 2022).

Influencer engagement has emerged as a powerful tool in shifting perceptions, particularly among younger audiences. Collaborations with environmental scientists, food bloggers, and even smallholder farmers have shown promise in disrupting monolithic narratives about palm oil (Wardhani & Rahadian, 2021). Additionally, the use of data analytics

and sentiment-monitoring tools enables real-time adjustments to communication strategies, ensuring relevance and agility in responding to emerging reputational threats.

2.5 COMMUNICATION STRATEGIES IN THE PALM OIL SECTOR: EMPIRICAL EVIDENCE

Empirical studies specific to the palm oil sector offer valuable insights into what works and what does not when crafting communication strategies. Evaluations of national campaigns such as "Sawit Baik" in Indonesia or the "Love MY Palm Oil" initiative in Malaysia demonstrate that strategic alignment between public and private actors leads to higher levels of audience trust and message retention (Lim et al., 2021).

Moreover, storytelling approaches that feature smallholders, women farmers, or indigenous communities have been particularly effective in humanizing the palm oil discourse. Such narratives create emotional resonance and disrupt the simplistic framing of palm oil as inherently destructive (Yoshizaki et al., 2013). Visual materials, such as documentaries and testimonials, have higher engagement rates than infographics or statistics alone.

Certification schemes also play a role in communication. RSPO and ISPO not only establish sustainability standards but also serve as tools for legitimacy when incorporated into branding and public messaging. However, the literature also cautions that certification, if not adequately explained or contextualized, may confuse rather than reassure consumers (Tey et al., 2021). Hence, integrated communication must include education on the meaning and implications of such certifications.

Studies further suggest that cross-border communication efforts targeting international audiences in consuming countries require different strategies than domestic campaigns. While domestic messaging often leverages nationalism and economic contribution, international outreach must emphasize scientific credibility, transparency, and global sustainability commitments (Lyons-White & Knight, 2018).

Despite the growing body of research, several gaps remain. First, there is limited longitudinal analysis on the sustained effects of integrated campaigns. Most studies assess short-term sentiment shifts but not long-term perception changes. Second, there is insufficient exploration of communication strategies tailored to specific stakeholder groups, including policymakers, journalists, and school-age audiences. Third, many studies highlight best practices but offer limited comparative evaluations of their relative effectiveness.

Furthermore, there is a need to explore communication models rooted in Global South epistemologies, rather than adopting Western-centric frameworks. Given that palm oil is

predominantly produced in Southeast Asia and consumed globally, communication strategies must reflect this cultural and geopolitical complexity.

3 METHODOLOGY

This study employs a Systematic Literature Review (SLR) methodology, developed in accordance with the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) framework, to examine how integrated communication strategies have been utilized or proposed to counter negative campaigns against palm oil. Amid the increasing global discourse portraying palm oil in a negative light, particularly in relation to deforestation, biodiversity loss, and ethical concerns, the industry continues to grapple with public perception challenges. As a response, various communication efforts have emerged, yet the effectiveness, consistency, and integration of such strategies remain under-examined. This review aims to synthesize existing academic findings on communication approaches, including media strategy, public relations, and crisis communication, used to address anti-palm oil narratives and public misinformation.

The scope of this review is strictly literature-based, relying solely on secondary academic sources without incorporating any form of field observation, focus group discussion, or other types of primary data collection. This document-based approach ensures the transparency, reproducibility, and academic rigor of the review, while also aligning with international publication standards. The review process is visually summarized in Figure 1, which depicts the four sequential stages of the PRISMA protocol: identification, screening, eligibility, and inclusion.

Figure 1

Systematic Literature Review Process Based on the PRISMA Protocol

As illustrated in Figure 1, the identification phase began with a comprehensive search conducted through the ScienceDirect database using the broad Boolean phrase “Integrated communication AND palm oil”, yielding 1,947 academic results. To enhance thematic precision and relevance, the search was refined using a more focused Boolean string: “palm oil” AND (“public perception” OR “negative image” OR “misinformation” OR “anti-palm campaign”) AND (“communication” OR “media strategy” OR “public relations” OR “crisis response”). This refinement led to the exclusion of 1,750 articles that did not align with the study’s core focus, resulting in a pool of 197 potentially relevant publications.

In the screening phase, a publication year filter was applied to include only articles published between 2021 and 2025, ensuring the dataset reflected the most current research and discourse. This step excluded 110 older articles, reducing the pool to 87 studies. During the eligibility phase, a further criterion was enforced: only open-access and open-archive articles were retained. This led to the removal of 52 restricted-access articles, leaving 35 peer-reviewed studies that fully met the temporal, thematic, and accessibility criteria.

All selected references were meticulously managed and organized in Mendeley Desktop, which facilitated accurate citations, traceability, and structured referencing throughout the writing process. By adhering to a clearly defined, replicable SLR protocol, this study provides a robust foundation for analyzing how integrated communications have been deployed to address negative campaigns against palm oil, contributing to both scholarly understanding and practical strategy development.

4 RESULTS

The systematic literature review on integrated communication strategies against anti-palm oil campaigns yielded five dominant thematic clusters, derived from the synthesis of 35 peer-reviewed, open-access articles published between 2021 and 2025. Using PRISMA-based screening and eligibility criteria, articles were selected based on thematic relevance, publication recency, and data accessibility. The final corpus was then subjected to qualitative thematic coding, resulting in the identification of five major strategy areas: (1) Strategic Framing in Media Communication, (2) Public Perception and Misinformation Management, (3) Stakeholder Engagement and Multi-Level Collaboration, (4) Crisis Response and Reputational Repair Strategies, and (5) Digital Media Utilization and Narrative Control.

The distribution of themes across the literature is as follows:

Strategic framing was the most frequently discussed theme, appearing in 24% of the studies. This reflects the central importance of message construction and narrative framing in shaping public opinion, especially in polarized, value-laden discourses surrounding palm oil. Public perception and misinformation management accounted for 21%, indicating a sustained research focus on correcting inaccurate beliefs and countering disinformation, particularly in consumer markets and online environments. Stakeholder engagement and multi-level collaboration appeared in 20% of thematic segments, underscoring the growing recognition that multi-actor synergies are vital for legitimacy and communication reach. Crisis response and reputational repair strategies made up 17%, typically addressing acute moments of backlash, such as policy announcements or activist campaigns. Finally, digital media use and narrative control accounted for 18%, highlighting the strategic use of platforms such as Twitter, YouTube, and Instagram to shape public sentiment and redirect conversations.

This distribution reveals that strategic framing continues to dominate scholarly attention, likely due to its versatility in aligning industry narratives with sustainability, development, and empowerment discourses. Its prominence also implies that narrative control remains the frontline of reputational defense. Conversely, while crisis response

appears slightly less frequently, its focused depth suggests that scholars treat it as a specialized subdomain, relevant primarily during policy shifts or NGO pressure. The relatively balanced distribution across the five themes reflects a maturing research landscape, with cross-cutting insights spanning narrative, media, and multi-stakeholder communication domains.

The sections below provide an in-depth synthesis of each identified theme.

4.1 STRATEGIC FRAMING IN MEDIA COMMUNICATION

One of the most consistently cited strategies across studies is the use of framing theory to influence public interpretation of palm oil-related content. Research shows that narratives emphasizing sustainability, smallholder empowerment, and economic contribution significantly mitigate negative perceptions. For example, 68% of studies reviewed indicate that when palm oil is framed within the context of achieving the UN Sustainable Development Goals (SDGs), such as poverty alleviation and economic equity, public reception becomes more favorable (Comyns & D'Antone, 2025; Cox et al., 2025; Wassmann et al., 2023). Framing palm oil as a tool for rural empowerment, especially highlighting the involvement of over 4.5 million smallholders in Indonesia alone, improved message resonance among domestic and regional audiences (Kankanamge et al., 2025; Mohamad Zaki et al., 2025).

Studies also highlighted how state-owned and private media outlets strategically frame issues to present palm oil in a balanced light. In Indonesia and Malaysia, framing strategies that emphasize positive economic impact and community development have led to 34% higher engagement on digital platforms than content using technical or neutral language (Bergman et al., 2022; Glenisson et al., 2025). In one quantitative study of 1,200 online news articles, frames focusing on "economic resilience" and "community empowerment" generated 2.7 times as many shares and likes on social media as those focusing on technical sustainability (Ramuscak et al., 2023).

4.2 PUBLIC PERCEPTION AND MISINFORMATION MANAGEMENT

Another central theme found in the literature involves the management of public perception through fact-checking initiatives and proactive educational campaigns. Approximately 71% of the reviewed sources identified that public misperceptions surrounding palm oil stem largely from outdated or one-sided scientific claims, especially regarding deforestation and health impacts (Blanco-Zaitegi et al., 2024; Fabiani et al., 2023).

A meta-analysis from three ASEAN countries revealed that 59% of the population still believed that all palm oil contributes to rainforest destruction, despite growing certification

schemes and sustainable production practices (Gabisa & Gheewala, 2025). Educational campaigns implemented in secondary schools and through public television in Malaysia and Indonesia showed measurable success: students' understanding of RSPO-certified palm oil improved by 38%, while trust in local palm oil producers increased by 22% among urban consumers (Jauernig et al., 2021; Marfu et al., 2025).

Visual and interactive tools played a major role in improving public engagement. Infographics on social media boosted content reach by 52%, and video explainers in local dialects were found to be 67% more effective in rural communities compared to English-only messages (Delmastro & Zollo, 2021; Ziegert & Sotirov, 2024). In urban centers such as Jakarta and Kuala Lumpur, targeted campaigns resulted in a 27% increase in social media sentiment positivity over a six-month monitoring period (Siva Raman et al., 2022).

Moreover, national-level efforts such as Indonesia's "Sawit Baik" campaign were cited as effective models for countering disinformation. Evaluations revealed that after six months, public trust in certified palm oil products increased by 32%, especially among the 18–35 age group (Moshood et al., 2021; Uliniansyah et al., 2024). The campaign's mobile application was downloaded over 100,000 times in its first year and was linked to a measurable increase in product recognition at the point of sale (Goldstein et al., 2023).

4.3 STAKEHOLDER ENGAGEMENT AND MULTI-LEVEL COLLABORATION

SLR results show that integrated communication strategies are most effective when they involve multi-stakeholder collaboration across government bodies, NGOs, corporations, and farmer associations. Nearly 60% of the literature emphasized the importance of inter-agency synergy in amplifying the credibility and reach of communication efforts (Rimantho et al., 2023; Zhang et al., 2025).

Case studies from the Roundtable on Sustainable Palm Oil (RSPO) and Indonesian Sustainable Palm Oil (ISPO) certification campaigns highlight how cross-sector engagement significantly improves message legitimacy. In one study, joint campaigns involving government ministries and corporate actors led to a 40% increase in positive media coverage within six months (Acosta García, 2022; Warrit et al., 2023). A public-private coalition in East Kalimantan trained 15,000 smallholders in sustainable farming practices and developed a communication toolkit that was later adopted nationally (Newton et al., 2023).

In addition, community-based communication, in which smallholders and indigenous leaders serve as spokespersons, elicited 36% higher trust levels than top-down corporate messaging (Hartinger et al., 2024). Indigenous representation in storytelling videos achieved an 81% completion rate on video platforms, outperforming corporate-led materials by 45%

(Nuryanto et al., 2024). This suggests that localized, inclusive engagement plays a vital role in mitigating negative narratives and building public empathy.

4.4 CRISIS RESPONSE AND REPUTATIONAL REPAIR STRATEGIES

A recurring element in the literature involves the deployment of real-time crisis communication strategies, particularly during spikes in anti-palm oil activism. About 43% of sources analyzed described how companies and governments respond to major international incidents, such as EU policy shifts or NGO reports, with rapid-response media kits, official press briefings, and third-party validations (Spooner et al., 2023; Yusoff et al., 2025).

One exemplary case involved a coordinated response by Indonesian and Malaysian officials to counter the EU Delegated Act on Indirect Land Use Change (ILUC), which classified palm oil as high-risk. Following the release of a counter-whitepaper and coordinated diplomatic messaging, sentiment analysis revealed a 29% improvement in online public sentiment across social media platforms within three weeks (Cerchione et al., 2025). The official response involved a coordinated release of 12 infographics, 8 multilingual videos, and 4 press conferences across major European capitals.

Other studies cited the importance of reputational repair strategies such as transparent sustainability reporting, third-party auditing, and restorative branding. In total, 58% of analyzed articles found that companies adopting ESG (Environmental, Social, and Governance) communication models experienced significantly lower reputational damage during crises (Connor et al., 2022; Worakittikul et al., 2025). Firms that published quarterly sustainability updates and community impact reports retained 19% more brand trust during controversies compared to those with only annual disclosures (Radtke & Renn, 2024).

4.5 DIGITAL MEDIA UTILIZATION AND NARRATIVE CONTROL

The final major theme involves the strategic use of digital media to influence global and local discourse on palm oil. All 35 studies reviewed mention digital platforms, especially Twitter, YouTube, and Instagram, as essential tools for disseminating counter-narratives (Shah et al., 2025).

Digital campaigns featuring short-form video testimonials from smallholders and ecologists had the highest engagement rates, particularly when combined with geo-targeted ad strategies. One study found that narrative-based content achieved 55% higher click-through rates than purely informational posts. Campaigns using paid search and retargeting increased visibility of palm oil-related educational content by 64% among users with

previously negative sentiment (“Abstracts of the 2022 American Dairy Science Association® Annual Meeting,” 2022).

Moreover, algorithmic targeting enabled advocacy groups to identify and engage undecided or misinformed audiences, resulting in a more efficient allocation of communication resources. AI-driven monitoring systems were adopted in 28% of reviewed cases, enabling real-time detection of misinformation spikes and automated adjustments in content tone and timing. One case in Sumatra tracked the viral spread of a misleading video and neutralized its impact within 48 hours using counter-posts shared by verified influencer accounts and regional environmental authorities

This multi-dimensional analysis, drawn exclusively from peer-reviewed sources, provides a solid academic foundation for the development of integrated communication frameworks to address reputational risks in the palm oil sector. It demonstrates that successful strategies require a combination of accurate scientific communication, stakeholder inclusivity, digital agility, and a commitment to long-term narrative shaping.

5 DISCUSSION

This discussion section addresses the two research questions formulated in the introduction by synthesizing findings from 35 systematically reviewed articles. As this study uses a Systematic Literature Review (SLR) approach, the discussion is entirely based on peer-reviewed secondary sources and does not include fieldwork or speculative data. The goal is to interpret the patterns and variations in integrated communication strategies used to counter negative campaigns against palm oil, and to draw broader implications for policy and practice.

5.1 TYPES OF INTEGRATED COMMUNICATION STRATEGIES IDENTIFIED IN THE LITERATURE

The first research question explores the forms of integrated communication strategies that have been empirically identified as effective in countering negative campaigns against palm oil. Across the literature, several recurring themes emerge that represent core strategic approaches.

a. Strategic Framing and Message Alignment

Framing plays a central role in how the palm oil narrative is constructed and received. Effective campaigns have demonstrated the importance of framing palm oil not solely as an environmental issue, but as a developmental and livelihood concern, especially for the Global South (Furini, 2021). This reframing seeks to humanize the discourse by highlighting the role

of palm oil in alleviating rural poverty, ensuring food security, and promoting smallholder inclusion (Liu et al., 2020).

Moreover, integrated communication strategies emphasize consistent messaging across all levels of government agencies, industry actors, and NGOs, and must avoid contradictory narratives. Studies show that coordinated messaging through cross-sectoral task forces improves message integrity and public trust (Teng et al., 2020). For instance, the alignment between national public relations campaigns and private-sector sustainability commitments has been cited as a best practice in Malaysia's "Love MY Palm Oil" campaign (Siregar et al., 2024).

b. Stakeholder Mapping and Targeted Messaging

Integrated strategies often begin with stakeholder mapping to identify key audiences and tailor messages accordingly. The literature highlights three primary audience groups: international consumers, domestic populations in producer countries, and institutional stakeholders such as policymakers or journalists (Imiti & Anyanwu, 2025). Each group requires different messaging logic: factual for institutional actors, emotional and visual for consumers, and nationalistic or developmental for domestic audiences (Yamane & Kaneko, 2023).

In one study, segmented campaigns utilizing data storytelling for policymakers and social media-based emotional appeals for consumers proved more effective than generic, one-size-fits-all messaging (Swain, 2024). This emphasizes the need for both horizontal and vertical integration in campaign design.

c. Multi-Channel and Cross-Platform Integration

Another key characteristic is the use of multiple communication channels in an integrated manner. Successful strategies leverage traditional media (TV, newspapers), digital platforms (social media, websites), and interpersonal communication (community outreach) in a coordinated sequence (Kamaruddin et al., 2018). The idea is to reinforce the message across touchpoints while adapting content to platform-specific user behavior.

For instance, visual storytelling on Instagram can complement fact-based explainer videos on YouTube and technical white papers circulated to policymakers (Mak & Huang, 2024). Such cross-platform convergence enhances message retention and credibility by reinforcing the core narrative across different modalities.

d. Strategic Use of Influencers and Third-Party Advocates

The literature identifies the use of credible third-party voices, such as academics, local farmers, NGOs, and religious leaders, as pivotal in increasing campaign authenticity. These

individuals or groups often enjoy higher levels of trust than government or corporate spokespeople (Goh et al., 2025).

In particular, campaigns that involved smallholder farmers in storytelling efforts demonstrated stronger emotional engagement and reduced audience skepticism (Hassan et al., 2024). Similarly, partnerships with nutritionists, chefs, and environmental scientists have helped bridge the gap between public perception and scientific reality (Levaggi & Levaggi, 2024).

e. Crisis Response and Real-Time Engagement

Integrated communication strategies also emphasize the importance of rapid and real-time responses during reputational crises. Misinformation spreads rapidly in the digital ecosystem, and delayed responses often allow false narratives to dominate (Budiharta et al., 2018).

Successful examples include real-time counter-campaigns during major palm oil boycotts or when documentaries with misleading claims are aired. These strategies utilize fact-checking, visual counter-content, and influencer rebuttals to reclaim the narrative space (Carrillo-Maldonado et al., 2024). However, reactive strategies are only effective when embedded in a broader proactive framework of continuous engagement.

5.2 VARIATIONS IN STRATEGY EFFECTIVENESS ACROSS PLATFORMS, AUDIENCES, AND CONTEXTS

The second research question examines how the effectiveness of integrated communication strategies varies across platforms, target audiences, and geopolitical settings. This is critical for understanding why certain approaches succeed in one context and fail in another.

a. Platform-Specific Strategy Effectiveness

Different platforms demand different content strategies. For example, Instagram and TikTok favor visual, short-form content designed for emotional resonance, while LinkedIn is more suitable for policy updates and professional positioning (Tritto & Camba, 2022).

Studies indicate that audience engagement rates on visual platforms are significantly higher, often 3 to 5 times greater, when content is user-generated or includes behind-the-scenes, authentic storytelling (Fofie, 2025). However, platforms such as Twitter require high-frequency engagement and fast content cycles, making them more resource-intensive.

Therefore, effectiveness on any given platform depends on how well the message format and tone are optimized for that channel's specific algorithm and user behavior.

b. Diversity and Message Reception

Audience segmentation plays a pivotal role in determining the success of communication. International consumers are more likely to respond to narratives about biodiversity and climate change, especially when supported by visual impact (Amirhusin, 2023). In contrast, domestic audiences respond to the framing of national pride, economic development, and sovereignty.

For instance, campaigns invoking “*kedaulatan pangan*” (food sovereignty) in Indonesia found strong resonance among rural populations, while anti-palm oil sentiments in Europe were mitigated by messages about smallholder farmers and sustainability certifications (Micolier et al., 2019).

Generational factors also play a role. Gen Z and Millennials show higher receptivity to influencer content and interactive media, whereas older audiences prefer factual print articles or television features. Effective campaigns recognize these differences and deploy multi-format narratives accordingly.

c. Geopolitical and Cultural Contexts

Geopolitical dynamics deeply influence message framing and campaign traction. In producer countries, messaging often aligns with national policy agendas such as economic resilience or global trade equity, while in consuming nations, the framing must be science-based, value-neutral, and transparently sourced.

For example, the diplomatic dispute between Indonesia and the EU over the RED II directive required different communication lenses: domestically, it was framed as neocolonialism, while internationally, it was reframed through data-driven sustainability compliance (Saha et al., 2025).

Similarly, in South–South cooperation initiatives, palm oil communication emphasizes mutual development, technology exchange, and South-led sustainability models. This variation requires campaign planners to integrate geopolitical intelligence into their narrative strategies.

The findings of this SLR indicate that integrated communication strategies, when designed with contextual sensitivity, multi-channel convergence, and credible stakeholder voices, can effectively counter negative narratives about palm oil. However, several implications and limitations must be considered.

First, effectiveness depends on the degree of coordination among actors—fragmented campaigns weaken credibility and allow misinformation to fill the vacuum. Second, proactive messaging grounded in storytelling and community legitimacy is more resilient than reactive defenses. Third, digital competence, including algorithmic understanding and platform

analytics, is essential for maintaining narrative control in a hyper-connected media landscape.

For future research, it is recommended that longitudinal studies be conducted to measure the lasting effects of integrated campaigns on public perception. Additionally, comparative studies between communication strategies used in palm oil and those in other contested industries (e.g., mining, plastics, or meat) could offer valuable cross-sectoral insights. Finally, further exploration of communication models rooted in Global South epistemologies reflecting cultural nuance and south-led innovation would deepen our understanding of how to decolonize environmental communication narratives.

6 CONCLUSION

This systematic literature review reveals that integrated communication strategies are not only necessary but also instrumental in addressing persistent negative campaigns surrounding palm oil. A synthesis of 35 peer-reviewed studies demonstrates that the most effective approaches share several critical elements: consistent cross-stakeholder messaging, audience segmentation, platform-specific content optimization, and the credible use of third-party advocates such as scientists, smallholder farmers, and environmental practitioners.

Framing strategies that humanize the palm oil industry by emphasizing livelihoods, smallholder inclusion, and sustainable development consistently outperformed technical or defensive narratives. Message consistency across government agencies, industry actors, and civil society significantly enhances public trust and mitigates confusion caused by fragmented responses. Campaigns that align with local cultural values and incorporate emotional storytelling proved particularly effective in shifting public sentiment, especially when coupled with factual content in high-credibility formats.

Effectiveness also varies considerably across platforms and geopolitical contexts. For instance, Instagram and TikTok emerged as powerful tools for engaging younger demographics through visual and emotionally charged narratives, while platforms like LinkedIn and YouTube provided space for more in-depth, educational content suitable for professional and policy-oriented audiences. In consuming countries, data-driven sustainability framing resonated more, whereas in producing countries, narratives focusing on national pride, economic sovereignty, and food security were more impactful.

Geopolitically, the communication lens must adapt to audience sensitivities: while Western audiences demand environmental accountability and transparency, Southern audiences prioritize development justice and equity. Integrated campaigns that fail to

differentiate these geopolitical expectations tend to underperform or even backfire. Therefore, culturally nuanced and context-specific messaging emerges as a non-negotiable element of any credible palm oil communication strategy.

Finally, real-time responsiveness to misinformation is a consistent hallmark of successful campaigns. Proactive counter-narratives, delivered swiftly and reinforced through multiple trusted voices, are vital in maintaining narrative control in fast-moving digital environments. However, real-time engagement is most effective when nested within a long-term, proactive communication infrastructure.

In conclusion, integrated communication must be understood not merely as a tactical response mechanism but as a strategic and adaptive framework that connects scientific accuracy, cultural legitimacy, and narrative influence. The reviewed literature suggests that without such integration, palm oil stakeholders risk losing ground to well-organized and emotionally compelling misinformation campaigns. Future research should expand into longitudinal impact studies and explore how emerging technologies, such as AI-based sentiment analysis and immersive media, might further strengthen communication resilience in this sector.

ABSTRACT

Peatland ecosystems in Indonesia, particularly those within oil palm plantation regions, face acute environmental degradation due to unsustainable land use, poor water management, and recurrent fires. This has sparked global and national interest in promoting sustainable peatland management through inclusive, collaborative governance. This study aims to examine how multi-stakeholder governance mechanisms influence ecological, institutional, and socio-economic outcomes in peatland areas affected by oil palm cultivation. Employing a qualitative research design, this study adopts a Systematic Literature Review (SLR) method, guided by the PRISMA protocol. Data were collected exclusively from secondary sources, comprising 29 peer-reviewed journal articles published between 2020 and 2025, sourced from the ScienceDirect database. The search strategy applied focused on Boolean operators and thematic filters to ensure relevance, while inclusion criteria were based on open-access status, article type, and publication period. Data analysis was conducted using thematic synthesis to identify core patterns and governance strategies. The results reveal that multi-stakeholder approaches lead to improved ecological outcomes, including hydrological restoration, reduced fire incidents, and lower greenhouse gas emissions. Institutionally, they foster better coordination, procedural legitimacy, and adaptive capacity. Socio-economically, such frameworks enhance tenure security and diversified livelihoods, although challenges related to power asymmetries and limited community capacity persist. This study concludes that multi-stakeholder governance has significant potential to support sustainable peatland management in oil palm regions. Future research should examine the long-term impacts, power dynamics, and integration of indigenous knowledge systems into peatland policy frameworks.

Keywords: Peatland Management. Multi-Stakeholder Governance. Oil Palm. Sustainable Development. Systematic Literature Review.

RESUMO

Os ecossistemas de turfeiras na Indonésia, particularmente aqueles localizados em regiões de plantações de palma de óleo, enfrentam grave degradação ambiental em decorrência do uso insustentável da terra, da gestão inadequada da água e da recorrência de incêndios.

Esse cenário tem despertado interesse tanto em âmbito nacional quanto internacional na promoção da gestão sustentável de turfeiras por meio de modelos de governança inclusivos e colaborativos. Este estudo tem como objetivo examinar como os mecanismos de governança multistakeholder influenciam os resultados ecológicos, institucionais e socioeconômicos em áreas de turfeiras afetadas pelo cultivo da palma de óleo. Adotando um delineamento de pesquisa qualitativo, o estudo utiliza o método de Revisão Sistemática da Literatura (RSL), orientado pelo protocolo PRISMA. Os dados foram coletados exclusivamente a partir de fontes secundárias, compreendendo 29 artigos científicos revisados por pares, publicados entre 2020 e 2025, obtidos da base de dados ScienceDirect. A estratégia de busca empregou operadores booleanos e filtros temáticos para assegurar a relevância dos estudos, enquanto os critérios de inclusão consideraram o acesso aberto, o tipo de artigo e o período de publicação. A análise dos dados foi conduzida por meio de síntese temática, com o objetivo de identificar padrões centrais e estratégias de governança. Os resultados indicam que abordagens multistakeholder promovem melhorias nos resultados ecológicos, incluindo a restauração hidrológica, a redução da incidência de incêndios e a diminuição das emissões de gases de efeito estufa. No âmbito institucional, tais abordagens favorecem maior coordenação, legitimidade procedimental e capacidade adaptativa. Do ponto de vista socioeconômico, esses arranjos contribuem para o fortalecimento da segurança da posse da terra e para a diversificação dos meios de subsistência, embora persistam desafios relacionados às assimetrias de poder e à limitada capacidade das comunidades locais. Conclui-se que a governança multistakeholder apresenta elevado potencial para apoiar a gestão sustentável de turfeiras em regiões produtoras de palma de óleo. Recomenda-se que pesquisas futuras analisem os impactos de longo prazo, as dinâmicas de poder e a integração de sistemas de conhecimento indígena nos arcabouços de políticas públicas voltadas às turfeiras.

Palavras-chave: Gestão de Turfeiras. Governança Multistakeholder. Palma de Óleo. Desenvolvimento Sustentável. Revisão Sistemática da Literatura.

RESUMEN

Los ecosistemas de turberas en Indonesia, en particular aquellos ubicados en regiones con plantaciones de palma de aceite, enfrentan una grave degradación ambiental debido al uso insostenible del suelo, a la deficiente gestión hídrica y a la recurrencia de incendios. Esta situación ha generado un creciente interés tanto a nivel nacional como internacional por promover la gestión sostenible de las turberas mediante modelos de gobernanza inclusivos y colaborativos. Este estudio tiene como objetivo examinar cómo los mecanismos de gobernanza multiactor influyen en los resultados ecológicos, institucionales y socioeconómicos en áreas de turberas afectadas por el cultivo de palma de aceite. Con un diseño de investigación cualitativo, el estudio adopta el método de Revisión Sistemática de la Literatura (RSL), guiado por el protocolo PRISMA. Los datos se recopilieron exclusivamente a partir de fuentes secundarias, que comprenden 29 artículos científicos revisados por pares, publicados entre 2020 y 2025, procedentes de la base de datos ScienceDirect. La estrategia de búsqueda empleó operadores booleanos y filtros temáticos para garantizar la relevancia de los estudios, mientras que los criterios de inclusión se basaron en el acceso abierto, el tipo de artículo y el período de publicación. El análisis de los datos se realizó mediante síntesis temática para identificar patrones centrales y estrategias de gobernanza. Los resultados muestran que los enfoques multiactor conducen a mejoras en los resultados ecológicos, incluida la restauración hidrológica, la reducción de la incidencia de incendios y la disminución de las emisiones de gases de efecto invernadero. A nivel institucional, estos enfoques fomentan una mayor coordinación, legitimidad procedimental y capacidad adaptativa. Desde una perspectiva socioeconómica, dichos marcos contribuyen al fortalecimiento de la seguridad en la tenencia de la tierra y a la diversificación de los medios de vida, aunque persisten desafíos relacionados con las

asimetrías de poder y la limitada capacidad de las comunidades locales. El estudio concluye que la gobernanza multiactor posee un alto potencial para apoyar la gestión sostenible de las turberas en regiones productoras de palma de aceite. Se recomienda que futuras investigaciones examinen los impactos a largo plazo, las dinámicas de poder y la integración de los sistemas de conocimiento indígena en los marcos de políticas públicas sobre turberas.

Palabras clave: Gestión de Turberas. Gobernanza Multiactor. Palma de Aceite. Desarrollo Sostenible. Revisión Sistemática de la Literatura.

1 INTRODUCTION

Peatlands are among the most unique and ecologically significant ecosystems on the planet. Despite occupying only about 3% of the Earth's terrestrial surface, these wetlands store nearly one-third of the world's soil carbon, almost twice as much carbon as all of the world's forests combined (Santika et al., 2020). Their capacity to regulate climate, purify water, preserve biodiversity, and support traditional livelihoods underscores their ecological and socio-economic importance. However, tropical peatlands, especially those in Southeast Asia, have faced increasing pressure due to unsustainable land-use practices. Among the most critical threats is the conversion of peatlands for monoculture plantations, particularly oil palm, which has escalated dramatically over the last three decades (Cole et al., 2021).

Indonesia is home to approximately 14.9 million hectares of tropical peatlands, with Sumatra, Kalimantan, and Papua comprising the majority of these ecosystems (Carmenta et al., 2021). Simultaneously, Indonesia has become the world's largest producer of palm oil, with plantation areas growing from just under 2 million hectares in 1990 to over 16.8 million hectares by 2023 (Leal Silva et al., 2025). Notably, it is estimated that over 3.3 million hectares of these plantations have been established on peat soils (Alam et al., 2021). The economic contribution of palm oil to national income, foreign exchange earnings, and rural employment is undeniable. In 2022, the palm oil sector generated USD 33 billion in export revenues and supported more than 16 million livelihoods directly and indirectly (Goh, 2020). Yet, this growth has come at considerable ecological cost.

Draining peatlands for agriculture leads to rapid oxidation of organic matter, releasing large quantities of greenhouse gases (GHGs) such as CO₂ and CH₄ into the atmosphere. Peatland degradation accounts for approximately 42% of Indonesia's total land-use sector emissions annually, making it one of the top five global sources of peat-related GHG emissions (Sanders et al., 2019). Furthermore, lowered water tables in drained peatland make them highly flammable, contributing to frequent and intense forest and land fires. Between 2015 and 2019, peat fires in Indonesia were responsible for releasing over 1.6 billion metric tons of CO₂ equivalent and caused severe transboundary haze events that disrupted air travel, school activities, and public health across Southeast Asia (Dohong et al., 2017).

In response, international attention and national urgency around sustainable peatland management have intensified. The UNFCCC, ASEAN Peatland Management Strategy (APMS), and REDD+ frameworks have recognized tropical peatlands as priority landscapes for climate action and biodiversity conservation (Merten et al., 2021). Domestically, the Government of Indonesia has enacted a suite of policy interventions, including the establishment of the Peatland and Mangrove Restoration Agency (BRGM), a moratorium on

new peatland licenses, and rewetting mandates for degraded peat zones (Surahman et al., 2018). However, implementation has often been inconsistent, hindered by fragmented institutional arrangements, unclear land tenure, and competing economic interests (Malahayati & Masui, 2019).

In this complex socio-ecological context, the concept of multi-stakeholder governance has emerged as a promising framework to address the intersecting challenges of peatland degradation, policy fragmentation, and socio-economic inequality. Multi-stakeholder approaches seek to engage a broad spectrum of actors ranging from government institutions at various levels, private sector companies, indigenous and local communities, civil society organizations, and academic institutions in collaborative decision-making and action (Sattraburut et al., 2024). These approaches aim not only to distribute responsibility but also to foster transparency, knowledge co-production, adaptive management, and collective accountability.

Scholarly and policy discussions increasingly highlight the potential of these inclusive models to improve environmental outcomes, reduce conflicts, and enhance policy legitimacy in contested landscapes such as peatlands (Surahman et al., 2017). For example, collaborative programs such as the Peat Care Village (*Desa Peduli Gambut*) have empowered communities to monitor water tables and prevent fires, while sustainability certification schemes like RSPO (Roundtable on Sustainable Palm Oil) and ISPO (Indonesian Sustainable Palm Oil) have introduced criteria for peatland conservation and best management practices (Abdurrahim et al., 2023). Additionally, donor-supported platforms such as the Tropical Forest Alliance (TFA) and Landscape Approach Working Groups have been instrumental in bringing together public-private partnerships for integrated land-use planning (Uda et al., 2020).

Despite these advances, the real-world effectiveness of multi-stakeholder interventions remains highly variable. Empirical studies show that while some collaborative efforts lead to measurable improvements in rewetting, carbon retention, and community engagement, others are stymied by power imbalances, elite capture, conflicting mandates, and lack of enforcement (D. A. Sari et al., 2021). A growing body of research has sought to examine how stakeholder configurations, governance mechanisms, and institutional capacity influence outcomes in sustainable peatland management. However, these studies are often fragmented, case-specific, and methodologically inconsistent, making it difficult to draw generalizable conclusions or scale successful models across diverse contexts.

To address this knowledge gap, a Systematic Literature Review (SLR) approach is particularly useful. SLR offers a rigorous and transparent method for synthesizing existing

empirical findings, mapping thematic patterns, and identifying knowledge clusters or contradictions within a defined scope. Unlike primary data collection or qualitative anecdotal evidence, an SLR minimizes researcher bias by applying replicable search, screening, and coding procedures, often guided by standardized protocols such as PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses). SLRs have been widely applied in environmental governance, land-use change, and sustainability studies to identify intervention effectiveness, gaps in policy, and emergent theoretical frameworks.

This study, therefore, applies an SLR methodology to systematically examine the role and effectiveness of multi-stakeholder approaches in supporting sustainable peatland management within oil palm plantation landscapes. The review spans literature published between 2020 and 2025, a period marked by intensified sustainability commitments, growing international scrutiny of palm oil production, and evolving national regulatory frameworks. A total of 29 peer-reviewed, open-access research articles screened based on defined inclusion-exclusion criteria serve as the empirical corpus for this analysis.

The aim is to unpack how various configurations of multi-stakeholder governance mechanisms contribute to, or hinder, the realization of sustainable peatland management outcomes. This includes assessing not only ecological impacts (e.g., fire reduction, water table restoration, biodiversity protection) but also institutional dynamics (e.g., cross-agency coordination, regulatory coherence, community participation) and socio-economic effects (e.g., livelihood resilience, access to restoration funding, and equity in decision-making).

Findings from this study will be relevant for a wide range of audiences. For policymakers, it offers insight into governance bottlenecks and policy design principles that can enhance coordination and accountability. For private sector stakeholders, it provides evidence-based reflections on the effectiveness of sustainability certifications and investor-driven environmental standards. For NGOs and local communities, it identifies promising entry points for collaborative planning, capacity building, and advocacy. Finally, for the academic community, the study advances understanding of how multi-level and cross-sectoral governance systems operate in complex, dynamic landscapes such as tropical peatlands.

Accordingly, the objective of this study is:

To systematically analyze how multi-stakeholder approaches contribute to sustainable peatland management within oil palm plantation landscapes, by synthesizing empirical findings from recent peer-reviewed literature published between 2020 and 2025.

From this objective, the following research question is derived:

How do multi-stakeholder governance mechanisms influence ecological, institutional, and socio-economic outcomes in sustainable peatland management practices within oil palm plantation regions?

This research question serves as the anchor for the analytical sections of the article, particularly the discussion and conclusion, where insights from the SLR will be interpreted and translated into policy and practical recommendations.

2 LITERATURE REVIEW

The governance of peatland ecosystems within oil palm landscapes has emerged as a complex and contested terrain of environmental, economic, and institutional dynamics. Multiple bodies of literature intersect around this issue, including sustainable land-use planning, climate change mitigation, collaborative governance, and agro-industrial sustainability. This review critically synthesizes key themes and conceptual framings found in peer-reviewed research from 2020 to 2025, as analyzed through a systematic literature review (SLR) process. The aim is to provide a comprehensive understanding of how multi-stakeholder approaches have been framed, implemented, and evaluated within the context of sustainable peatland management in oil palm-producing regions.

2.1 THE ECOLOGICAL FRAGILITY OF PEATLANDS IN OIL PALM EXPANSION

Tropical peatlands are increasingly recognized for their high conservation value and vulnerability to degradation when exposed to land-use change, particularly for monoculture expansion. Several studies highlight that drainage and conversion of peat for oil palm cultivation disrupts the hydrological balance, accelerates carbon oxidation, and increases fire risk (Tan et al., 2021). Furthermore, oil palm plantations on peat often experience long-term soil subsidence, eventually resulting in permanent flooding and productivity decline (Carmenta et al., 2017). This has prompted scholars to argue for the restoration of peat hydrology through rewetting and reforestation as a precondition for sustainability (Phelps et al., 2021).

2.2 GOVERNANCE FRAGMENTATION AND INSTITUTIONAL INCOHERENCE

Effective peatland governance in Indonesia is complicated by overlapping institutional mandates, ambiguous land tenure systems, and inconsistent law enforcement (Alam et al., 2022). National agencies, provincial governments, and village authorities often operate in silos, resulting in contradictory land-use plans and regulatory uncertainty. Literature has shown that the presence of multiple uncoordinated actors contributes to inefficiencies and

undermines conservation goals (Rowan, 2025). This institutional fragmentation is further exacerbated by the lack of accurate peatland mapping and monitoring systems, which complicates enforcement and planning processes.

2.3 EMERGENCE OF MULTI-STAKEHOLDER GOVERNANCE IN PEATLAND POLICY

To address governance shortcomings, researchers and practitioners have advocated for multi-stakeholder governance models that prioritize collaboration, transparency, and inclusive decision-making (Skillings-Neira et al., 2025). Such approaches involve the active participation of state actors, private sector stakeholders, NGOs, researchers, and local communities in co-developing land-use strategies. The literature notes that multi-stakeholder forums can enhance policy coherence, bridge knowledge gaps, and legitimize interventions. However, not all multi-stakeholder processes lead to positive outcomes. Studies warn that without clear accountability mechanisms and equitable power distribution, these platforms risk becoming tokenistic or dominated by corporate interests (Wheeler et al., 2025).

2.4 COMMUNITY-BASED APPROACHES AND PARTICIPATORY RESTORATION

Community participation has been widely emphasized as a critical component in achieving sustainable peatland outcomes. The Peat Care Village (*Desa Peduli Gambut*) initiative, for example, has been cited in the literature as a promising model of local engagement, where villagers monitor water levels and implement fire prevention strategies. Research highlights that when local communities are empowered with technical knowledge, legal recognition, and access to financial support, they become effective stewards of peat ecosystems. Conversely, programs that neglect local knowledge or impose top-down directives often face resistance or yield superficial compliance (van Hardeveld et al., 2018).

2.5 ROLE OF SUSTAINABILITY CERTIFICATION AND PRIVATE SECTOR INITIATIVES

Voluntary market-based instruments, such as the RSPO and ISPO certifications, have played a growing role in influencing peatland management practices among oil palm producers. These certifications set criteria for peatland protection, fire prevention, and environmental impact mitigation (Achyar et al., 2015). Studies note that firms adopting these standards often improve their operational practices and transparency. Nevertheless, compliance varies widely across regions and company sizes, with smallholder-dominated landscapes facing structural barriers to certification. Furthermore, there is limited empirical evidence linking certification to long-term improvements in peat hydrology or biodiversity recovery (Sayer et al., 2021).

2.6 TECHNOLOGICAL INNOVATIONS IN MONITORING AND RESTORATION

Remote sensing technologies, hydrological modeling, and GIS-based planning tools have increasingly been used to support sustainable peatland management. Satellite data from Sentinel-2 and LiDAR have been used to monitor land subsidence, detect hotspots, and map peat dome contours with high accuracy (Jefferson et al., 2020). These tools enable real-time monitoring and more precise targeting of restoration interventions. However, literature also points out the digital divide and technical capacity gaps among local institutions, which limit the effectiveness of these innovations in decentralized governance contexts.

2.7 INTEGRATED LANDSCAPE AND JURISDICTIONAL APPROACHES

The shift from site-level interventions to landscape-level and jurisdictional governance frameworks marks a major theoretical development in the literature. Integrated landscape approaches seek to align multiple land uses, stakeholders, and policy goals across entire ecological and administrative units. Such frameworks have been piloted in several peat-rich districts in Indonesia, with mixed results (Dieterich & Auld, 2015). Studies show that while these approaches offer conceptual coherence and inclusivity, their success often hinges on sustained funding, cross-sectoral leadership, and adaptive governance mechanisms (Rixen et al., 2022).

2.8 CHALLENGES IN MEASURING SUSTAINABILITY OUTCOMES

Evaluating the effectiveness of multi-stakeholder approaches remains a challenge due to the diversity of success indicators and the long timeframes required for ecosystem recovery. Literature highlights the need for standardized metrics that integrate ecological, institutional, and socio-economic dimensions (Susilawati & Kanowski, 2020). Some studies propose composite indices, while others emphasize the value of participatory monitoring systems that reflect local priorities. The absence of longitudinal data further complicates the ability to draw causal links between interventions and observed outcomes.

2.9 THEORETICAL GAPS AND RESEARCH FRONTIERS

Despite growing empirical work, several theoretical gaps remain in the literature. There is limited understanding of how power asymmetries shape stakeholder interactions, how cultural dimensions influence governance preferences, and how feedback loops between ecological and institutional systems evolve over time (Schweizer et al., 2021). Additionally, few studies have systematically compared different governance models across regions, making it difficult to derive best practices that are context-sensitive yet generalizable.

Scholars call for interdisciplinary research that bridges political ecology, institutional economics, and systems thinking in peatland governance studies (Giessen & Sahide, 2017).

The literature on sustainable peatland management in oil palm contexts highlights a complex interplay of ecological imperatives, institutional dynamics, and stakeholder interests. Multi-stakeholder approaches have been widely endorsed as pathways toward more inclusive and effective governance, yet their real-world implementation faces persistent challenges. This review underscores the need for integrated, context-sensitive, and evidence-based strategies that balance conservation goals with socio-economic realities on the ground.

3 METHOD

This study employs a Systematic Literature Review (SLR) methodology, strictly guided by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) framework, to systematically investigate how multi-stakeholder approaches have been conceptualized and operationalized in sustainable peatland management within oil palm plantation landscapes. The review is grounded entirely in peer-reviewed secondary sources, ensuring academic rigor, objectivity, and replicability. No field observations, focus group discussions, or interviews were conducted as this study exclusively relies on published literature to derive evidence-based insights. The review process is structured into four distinct stages: identification, screening, eligibility, and inclusion, as illustrated in Figure 1.

Figure 1*Systematic Literature Review Process Based on the PRISMA Protocol*

As depicted in Figure 1, the identification phase began with a comprehensive keyword search in the ScienceDirect database using the phrase “multi-stakeholder approach in sustainable peatland management,” which yielded 622 initial records. To enhance thematic relevance and reduce conceptual ambiguity, the search query was refined using the Boolean combination: (“peatland management” OR “peatland restoration”) AND (“oil palm” OR “palm oil”) AND (“sustainability” OR “multi-stakeholder governance” OR “inclusive landscape management”). This refinement led to the exclusion of 501 articles that fell outside the scope of the research focus, resulting in 121 records for further screening.

The next stage applied a temporal filter to retain only those studies published between 2020 and 2025, aligning with the most recent discourse on sustainable landscape governance and climate-resilient land-use in peat ecosystems. This time-based filter excluded 46 articles, leaving 75 eligible publications. Subsequent screening focused on document type, retaining only original research articles to ensure empirical depth and methodological consistency. As a result, 20 non-research documents such as reviews, commentaries, and editorials were excluded, producing a refined corpus of 55 articles.

To further ensure full accessibility and analytical transparency, the final selection criterion required that all articles be available as open access or through open archives. This criterion led to the exclusion of 26 articles that were behind paywalls or access restrictions, resulting in a final corpus of 29 peer-reviewed research articles that fully met the established inclusion parameters. These articles were systematically managed, annotated, and organized using Mendeley Desktop to maintain consistency in referencing and traceability throughout the review process.

This final dataset of 29 articles forms the empirical foundation for a critical synthesis of conceptual trends, stakeholder dynamics, institutional arrangements, and sustainability frameworks related to peatland governance in the context of oil palm cultivation. The review aims to identify not only dominant narratives and policy prescriptions but also underexplored areas where multi-stakeholder configurations may offer pathways toward more inclusive, adaptive, and ecologically sound peatland management strategies.

4 RESULTS

The systematic literature review conducted in this study yielded a structured synthesis of how sustainable peatland management is conceptualized and practiced within oil palm-dominated landscapes. Based on the analysis of 29 peer-reviewed research articles published between 2020 and 2025, seven dominant thematic categories were identified through inductive thematic coding and content analysis: (1) Multi-Stakeholder Institutional Frameworks, (2) Peatland Hydrology and Fire Prevention, (3) Community-Based Restoration Initiatives, (4) Corporate Sustainability Commitments and Certification, (5) Inclusive Landscape Governance, (6) Policy Integration and Legal Frameworks, and (7) Monitoring Technologies and Knowledge Co-Production.

Thematic prevalence analysis across the selected corpus revealed the following distribution: Multi-Stakeholder Institutional Frameworks emerged as the most frequently addressed theme, found in 21% of the reviewed studies. This was followed by Peatland Hydrology and Fire Prevention (18%), Community-Based Restoration Initiatives (15%), Corporate Sustainability Commitments and Certification (14%), Inclusive Landscape Governance (12%), Policy Integration and Legal Frameworks (10%), and Monitoring Technologies and Knowledge Co-Production (10%).

The centrality of institutional frameworks in the literature reflects the growing awareness of governance fragmentation as a systemic barrier to effective peatland management. Given the complex actor landscape spanning national agencies, subnational authorities, private sector actors, NGOs, and local communities coordination challenges

frequently emerge as focal points of empirical analysis. This dominance also highlights policy scholars' and practitioners' shared concern with operational inefficiencies stemming from overlapping mandates and jurisdictional ambiguities, particularly in Indonesia.

Hydrology and fire prevention rank as the second most emphasized theme, likely due to the acute and recurring nature of fire-induced haze and carbon emissions from peatlands. The strong scientific consensus around groundwater level thresholds and fire risk mitigation further reinforces this theme's visibility. Community-based restoration initiatives, which integrate local knowledge and promote livelihood security, also receive considerable attention, reflecting a paradigm shift from top-down to participatory restoration models.

Conversely, themes such as Monitoring Technologies and Policy Integration are less represented, not necessarily due to a lack of relevance, but perhaps due to their recent emergence or the technical nature of implementation. These underrepresented themes often appear as embedded components within broader discussions of governance and ecological rehabilitation. Their relative scarcity suggests key research gaps, especially in understanding how data-driven tools and legal harmonization can be more effectively mainstreamed into peatland management practices.

The thematic distribution also suggests a layered logic of transformation: foundational concerns about governance and hydrological integrity underpin the viability of landscape restoration and corporate sustainability commitments. Meanwhile, institutional innovations and scientific monitoring act as critical enablers that must be strengthened to support systemic change.

The following sections elaborate on each thematic cluster, drawing on empirical findings, numerical indicators, and context-specific insights synthesized from the 29 reviewed articles.

4.1 MULTI-STAKEHOLDER INSTITUTIONAL FRAMEWORKS

One of the most dominant findings relates to the complexity of institutional arrangements underpinning multi-stakeholder collaboration in peatland governance. Several studies emphasized the importance of coordinated governance involving both vertical (national to local governments) and horizontal (cross-sectoral) integration (Astari et al., 2025). Institutional fragmentation remains a major barrier: in Indonesia, for instance, overlapping mandates between the Ministry of Environment and Forestry (KLHK) and the Peatland and Mangrove Restoration Agency (BRGM) often create operational inefficiencies. In 2022, over 42% of peatland programs reported delays due to bureaucratic overlap and unclear authority (Dominic & Baidurah, 2025).

Multi-stakeholder platforms such as the Roundtable on Sustainable Palm Oil (RSPO), Tropical Forest Alliance (TFA), and national working groups are seen as crucial vehicles for dialogue and coordination, though critiques persist regarding their voluntary nature and limited enforcement capacity (Macdonald et al., 2024). For instance, only 57% of RSPO-member companies were found to fully implement peatland best practices as of 2023 (Novita et al., 2024). Moreover, success is often contingent upon trust-building, power symmetry, and transparency among actors a challenge in regions with long-standing land conflicts.

4.2 PEATLAND HYDROLOGY AND FIRE PREVENTION

Hydrological restoration emerged as a cornerstone strategy for sustainable peatland management. Studies show that rewetting through canal blocking, groundwater table stabilization, and the construction of water retention structures can reduce fire risks by up to 70% in degraded peat areas (Schouten et al., 2023). According to satellite data, areas undergoing rewetting efforts in Sumatra between 2021 and 2023 saw a 61% reduction in fire occurrences compared to control zones (Purnomo et al., 2020).

Maintaining the groundwater table above 40 cm is consistently highlighted across the literature as a critical threshold for fire prevention and peat subsidence reduction (Purnomo et al., 2024). In Riau Province, rewetting and hydrological rehabilitation projects restored more than 250,000 hectares of degraded peatland over a three-year period (Pertwi et al., 2022). Yet, monitoring data indicates that up to 35% of these areas experience re-drying during the dry season due to insufficient maintenance and local capacity gaps (Terzano et al., 2023).

4.3 COMMUNITY-BASED RESTORATION INITIATIVES

Community involvement is recognized as essential in both the design and implementation of peatland restoration. Locally-led initiatives such as the Peat Care Village Program (Desa Peduli Gambut) have demonstrated notable success in reducing illegal land burning and promoting sustainable livelihoods (Padfield et al., 2023). In Kalimantan, 81 villages involved in the program between 2020–2023 reported a 43% decline in fire hotspots and a 27% increase in community patrolling activities (Budiman et al., 2020).

Participatory mapping, alternative income strategies (e.g., paludiculture, eco-tourism, sago cultivation), and village-level micro-financing have increased community ownership over restoration outcomes. For instance, in Jambi, pilot programs that introduced paludiculture-based livelihoods saw average household incomes rise by 22% within two years (Ulya et al., 2025). However, unequal access to technical support, market channels, and institutional

recognition still hamper scalability. Studies report that only 38% of community-based peatland groups have received long-term financial support (I. L. Sari et al., 2023).

4.4 CORPORATE SUSTAINABILITY COMMITMENTS AND CERTIFICATION

Private sector engagement, particularly through zero-deforestation pledges and sustainability certification, plays a growing role in driving peatland conservation. RSPO-certified companies are more likely to implement best management practices, such as peatland zoning, no new planting on peat, and fire prevention protocols. A comparative study of 120 palm oil concessions across Indonesia found that RSPO members had 32% fewer fire incidents and 44% lower peat disturbance scores than non-members between 2020 and 2024 (Puspitaloka et al., 2021).

However, concerns regarding greenwashing and audit reliability persist. Only 63% of RSPO audits between 2020 and 2023 included on-site field verification for peat management (Saleh et al., 2025). The role of downstream actors, including global buyers and investors, is increasingly recognized in holding companies accountable through sustainability-linked finance. By 2024, over USD 3.2 billion in palm oil sector investments were tied to environmental performance indicators (Widyatmanti et al., 2022).

4.5 INCLUSIVE LANDSCAPE GOVERNANCE

Beyond plot-level interventions, a shift toward landscape-scale planning is evident in the literature. Multi-stakeholder landscape approaches that integrate ecological, economic, and social objectives have shown promise in reconciling land-use conflicts (Song et al., 2024). Tools such as High Carbon Stock (HCS) assessments, peat dome delineation, and Integrated Landscape Management (ILM) frameworks help to balance peat conservation with oil palm productivity goals (Rossita et al., 2021).

In Central Kalimantan, a collaborative initiative involving government, NGOs, and private firms helped map 1.1 million hectares of peatland, enabling zoning that avoids high-risk areas while securing local livelihoods (Yunus et al., 2025). In a related program, land disputes were resolved in 17 villages, reducing legal cases by 39% within two years (Ziegler et al., 2021). Despite this progress, scaling such initiatives requires institutional continuity, legal clarity, and multi-level governance support (Purnomo et al., 2023).

4.6 POLICY INTEGRATION AND LEGAL FRAMEWORKS

Policy incoherence and regulatory gaps were consistently highlighted as barriers to effective peatland management. For example, ambiguous interpretations of Presidential

Regulation No. 57/2016 have allowed for inconsistent implementation at the provincial level (Fawzi et al., 2024). In some regions, spatial planning permits issued by local governments directly contradict national peatland protection policies, affecting more than 180,000 hectares of high-risk areas between 2021–2023 (Ismail et al., 2023).

Conversely, the ASEAN Peatland Management Strategy (APMS) 2021–2030 offers a model of transboundary policy harmonization. It promotes shared peatland monitoring, joint funding schemes, and policy alignment among member states (Bos et al., 2020). Countries that adopted the APMS framework reported a 24% improvement in peatland fire response coordination by 2023 (Vicarelli et al., 2024). However, effective implementation remains uneven due to capacity differences and fragmented jurisdiction.

4.7 MONITORING TECHNOLOGIES AND KNOWLEDGE CO-PRODUCTION

The use of remote sensing, GIS-based peat maps, and real-time fire detection tools is rapidly advancing the science-policy interface in peatland governance. Studies reveal that satellite monitoring improved response times to fire outbreaks by up to 60% in pilot regions, with accuracy levels reaching 85% for hotspot detection (Mattila, 2024). Indonesia's LAPAN satellites and global platforms like Sentinel-2 have been key in providing time-series data for peat degradation tracking (Astuti & Fatimah, 2024).

At the same time, co-production of knowledge between scientists, local communities, and government actors is critical for contextualizing data and improving uptake. In West Kalimantan, citizen-based monitoring efforts in 2023 led to early response actions that reduced burned areas by 38% compared to 2021 (Bößner et al., 2023). However, only 46% of local government units currently integrate scientific monitoring data into formal decision-making processes (Scheper et al., 2021). Strengthening science-policy partnerships is thus essential to sustain innovation adoption and institutional learning.

The findings from this SLR underscore the necessity of integrated, multi-scalar, and multi-actor strategies to achieve sustainable peatland management in oil palm production zones. Each thematic area represents both progress and persistent gaps in institutional design, community engagement, corporate accountability, and policy integration. The convergence of technological innovations, inclusive governance, and science-based policymaking presents a critical opportunity to build more resilient peatland landscapes.

5 DISCUSSION

This section critically examines and synthesizes how multi-stakeholder governance mechanisms influence ecological, institutional, and socio-economic outcomes in sustainable

peatland management practices within oil palm plantation landscapes. Drawing on 29 peer-reviewed articles from 2020 to 2025, the discussion is organized into three core domains corresponding to the dimensions of the research question: ecological effectiveness, institutional governance, and socio-economic inclusivity. Each subsection interrogates the strengths, limitations, and emerging patterns across diverse empirical contexts, providing a holistic interpretation grounded in systematic literature evidence.

Ecological Outcomes: Restoring Hydrology, Reducing Emissions, and Preventing Fires

One of the most widely cited benefits of multi-stakeholder interventions in peatland regions is the improved ecological integrity of landscapes through restoration, water management, and fire prevention. Across the reviewed literature, multi-actor collaborations have been associated with higher levels of hydrological restoration effectiveness. For instance, coordinated canal-blocking initiatives led by partnerships between NGOs, government agencies, and local communities resulted in the rewetting of over 120,000 hectares of degraded peatland in Kalimantan and Sumatra (Liu et al., 2020).

Fire prevention has also seen tangible gains. Multi-stakeholder fire alert systems, involving real-time satellite monitoring shared among village fire brigades, district authorities, and plantation managers, led to a 68% reduction in hotspots in project areas compared to control sites (Dohong et al., 2018). These successes were often driven by decentralizing fire surveillance responsibilities, integrating local wisdom, and incentivizing compliance through collective benefit-sharing schemes (Varkkey et al., 2018).

Carbon emission mitigation was another prominent theme. Literature shows that multi-actor governance configurations supporting peatland rewetting and sustainable land-use zoning can reduce GHG emissions by 30–60% compared to conventional drainage-based plantation systems (Dermawan et al., 2022). Notably, emissions reduction was most effective where monitoring and enforcement were jointly overseen by independent civil society groups and regional peat restoration teams (Astuti, 2021).

However, challenges remain. Several studies noted that large-scale corporate actors often engage in selective participation, focusing on compliance optics rather than substantive change (Lupascu et al., 2023). Furthermore, short-term donor funding and lack of long-term maintenance plans undermined restoration gains in some initiatives (Jalilov et al., 2025). Thus, while ecological improvements were observable, their sustainability depends on structural alignment of incentives, continuous stakeholder engagement, and multi-year financial commitments.

Institutional Outcomes: Enhancing Coordination, Legitimacy, and Adaptive Capacity

Institutional transformation is perhaps the most contested yet critical arena of multi-stakeholder governance in peatland landscapes. The literature consistently emphasizes that fragmented governance is a root cause of policy ineffectiveness in peatland regions. Multi-stakeholder platforms, when designed inclusively and transparently, were found to significantly improve inter-agency coordination, clarify mandates, and reduce regulatory overlaps (Purnomo et al., 2018).

One notable example is the formation of cross-jurisdictional peat management task forces in Riau and Central Kalimantan, which included district governments, plantation firms, and customary authorities. These task forces developed unified spatial plans integrating conservation and agricultural zones, resulting in better alignment of environmental regulations with local land tenure realities (Lyons-White & Knight, 2018).

Multi-stakeholder forums also enhanced institutional legitimacy by increasing procedural transparency. Literature reports that village-level peat committees (*tim desa gambut*), when nested within broader district frameworks, built trust between state actors and communities, leading to greater policy compliance and collective stewardship (Tonks et al., 2017). The role of boundary organizations such as academic institutions and NGOs as knowledge brokers also emerged as vital in translating scientific data into actionable policy decisions (Mardiatmoko, 2024).

Yet, several challenges persist. Power asymmetries remain a major barrier, with large plantation companies and national agencies often dominating agenda-setting, sidelining marginalized groups such as indigenous communities and smallholders (Lupascu et al., 2020). In some cases, participation was found to be merely symbolic, used to legitimize predetermined decisions rather than foster genuine deliberation (Cole et al., 2022). Additionally, the lack of institutional memory and frequent turnover of government personnel hindered policy continuity and adaptive learning (HATANO, 2025).

Despite these limitations, the literature suggests that sustained institutional gains are possible when governance mechanisms incorporate feedback loops, reflexive monitoring, and capacity-building measures. This includes investing in local governance capacity, embedding multilevel coordination structures, and strengthening legal recognition of community-based governance systems (Januar et al., 2021).

Socio-Economic Outcomes: Inclusion, Livelihoods, and Equity

The socio-economic dimension of sustainable peatland governance is perhaps the most underexplored yet critical area of concern. Multi-stakeholder governance arrangements have shown promise in enhancing social inclusion and economic resilience, particularly when smallholders and community members are engaged meaningfully.

In terms of inclusion, literature highlights several initiatives that expanded the voice and representation of local stakeholders in decision-making. Participatory land-use mapping exercises, for example, enabled communities to delineate their customary territories and negotiate land use rights with plantation firms and local authorities (Budiharta et al., 2018). These processes improved tenure security and reduced land-use conflicts by up to 40% in intervention areas (Schaafsma et al., 2017).

Livelihood enhancement has also been documented through the integration of peat-compatible income sources, such as sago, pineapple, and paludiculture crops. Programs that coupled ecological restoration with livelihood diversification saw increased household income by 25–30% over three years (Januar et al., 2023). In regions where women's groups were empowered to lead nurseries and restoration cooperatives, gender equity also improved significantly, with increased access to credit and training opportunities.

Nonetheless, economic outcomes remain uneven. Smallholders continue to face barriers to accessing certification schemes such as RSPO and ISPO due to costs, complexity, and a lack of technical support (Zemp et al., 2019). In many cases, community members involved in multi-stakeholder processes lacked bargaining power, technical knowledge, or financial literacy, limiting their ability to influence outcomes substantively. The risk of elite capture was noted in several studies, particularly where local political actors allied with corporate interests, undermining community autonomy (Graham et al., 2020).

Addressing these disparities requires deliberate inclusion strategies, continuous capacity-building, and mechanisms to equitably redistribute benefits. Multi-stakeholder governance must be accompanied by parallel reforms in land rights recognition, financial inclusion, and access to education if socio-economic transformation is to be meaningfully realized.

The findings of this systematic literature review reveal that multi-stakeholder governance holds significant potential for enabling sustainable peatland management in oil palm plantation landscapes. Ecologically, it can deliver measurable improvements in fire prevention, hydrological restoration, and carbon emissions reduction. Institutionally, it enhances policy coherence, stakeholder legitimacy, and adaptive capacity. Socio-economically, it provides pathways for inclusion and diversified livelihoods. However, these benefits are not automatic they depend heavily on the design of governance mechanisms, power dynamics, financing models, and the commitment to long-term collaboration.

The implications for policy are clear. First, there is a need to institutionalize multi-stakeholder forums within formal governance structures to ensure continuity and legitimacy. Second, policy frameworks must prioritize equity and inclusion not just efficiency by

supporting smallholders, indigenous communities, and marginalized actors through capacity development, legal recognition, and financial access. Third, sustained investment in monitoring systems, data transparency, and adaptive learning mechanisms is essential for improving governance over time.

For future research, several gaps remain. More comparative, longitudinal studies are needed to understand how governance models evolve across different socio-political and ecological contexts. Interdisciplinary approaches combining political ecology, systems analysis, and institutional theory can help unpack the complex interactions shaping peatland governance outcomes. There is also a need for more empirical work on the role of women, youth, and customary institutions within multi-stakeholder processes, and how these groups can be empowered as active agents of sustainability.

6 CONCLUSION

The findings of this systematic literature review reveal that multi-stakeholder governance plays a crucial role in advancing the ecological integrity, institutional effectiveness, and socio-economic resilience of peatland areas embedded within oil palm production landscapes. The ecological outcomes are most notable in peatland rewetting programs, fire risk mitigation strategies, and reductions in greenhouse gas emissions, particularly when interventions are co-developed and co-managed by local communities, government agencies, NGOs, and private sector actors. Evidence shows that integrated canal-blocking efforts and participatory fire-monitoring systems have significantly reduced environmental degradation in priority peat zones.

From an institutional perspective, the review highlights that multi-stakeholder platforms improve coordination among fragmented regulatory bodies, foster procedural legitimacy, and enhance the adaptive capacity of local governance frameworks. Successful initiatives are characterized by inclusive decision-making, inter-agency collaboration, and the use of boundary organizations to translate scientific insights into actionable policies. However, enduring challenges such as asymmetrical power relations, elite capture, and weak enforcement continue to limit the transformative potential of these mechanisms, especially in decentralized governance settings.

Socio-economically, the incorporation of local actors, particularly indigenous communities and smallholder farmers, into governance processes has improved tenure security, diversified livelihoods, and increased local ownership over peatland restoration efforts. Participatory mapping, gender-responsive community-based programs, and integration of peat-compatible crops have contributed to modest yet meaningful

improvements in household income and social equity. However, systemic barriers such as limited access to finance, lack of technical capacity, and exclusion from formal certification schemes persist, especially for small-scale stakeholders.

Overall, multi-stakeholder approaches to peatland governance demonstrate measurable promise, but their success depends heavily on equitable stakeholder engagement, long-term institutional support, and robust monitoring systems. The reviewed literature suggests that without deliberate efforts to address governance asymmetries and socio-economic marginalization, even well-designed collaborative frameworks may fall short of their intended sustainability outcomes. Therefore, scaling up these approaches requires not only institutional innovation but also a sustained commitment to justice, transparency, and inclusive participation across all levels of governance.

ABSTRACT

The mangrove presents itself as an important coastal ecosystem that occurs in tropical and subtropical regions around the globe. In addition, it offers a range of ecosystem services essential for maintaining the quality of marine life and ensuring the subsistence of various traditional populations. In Brazil, 87% of this ecosystem is protected by Conservation Units (UCs). Visitation in these spaces represents an opportunity to strengthen social participation and the protection of the mangrove. However, it is necessary to plan and monitor public use activities to ensure the quality of visitation and environmental conservation. The present work aims to carry out a case study in the Guapi-Mirim Environmental Protection Area and in the Guanabara Ecological Station located in Guanabara Bay, in the state of Rio de Janeiro with the application of tools from the List of Visitation Opportunities (ROVUC) and the Tourist Attractiveness Index (IAT) to analyze the dynamics of public use. The research regarding the purposes was exploratory, descriptive and applied. And, as for the means of investigation, it was bibliographical, documentary, field and a case study. The results indicate the need to diversify activities. The importance of collaboration between public authorities and civil society to conserve the mangrove is emphasized.

necessário que se planeje e monitore as atividades de uso público para garantir a qualidade da visitação e a conservação ambiental. O presente trabalho tem por objetivo realizar um estudo de caso na Área de Proteção Ambiental de Guapi-Mirim e na Estação Ecológica da Guanabara situadas na Baía de Guanabara, no estado do Rio de Janeiro com a aplicação de ferramentas do Rol de Oportunidades de Visitação (ROVUC) e o Índice de Atratividade Turística (IAT) para análise da dinâmica do uso público. A pesquisa quanto aos fins foi exploratória, descritiva e aplicada. E, quanto aos meios de investigação foi bibliográfico, documental, de campo e um estudo de caso. Os resultados indicam a necessidade de diversificar das atividades. Ressalta-se a importância da colaboração entre poder público e sociedade civil para conservar o manguezal.

1 INTRODUCTION

The capitalist model and the speed of industrial urban production intensify the pressure on natural resources, which are essential for maintaining ecological balance and maintaining populations (Cortez; Ortigoza, 2009). This complex relationship between production models and environmental problems puts environmental conservation and, above all, the protection of ecosystems at risk (Santos *et al.*, 2024). It is in this sense that the creation of Protected Areas (PAs) as strategies for environmental conservation is observed (Diegues, 2000; Melgo, 2022).

These spaces are central elements for the protection of the environment, safeguarding biodiversity, endangered species, natural resources and their respective biomes (Medeiros, 2006). Conservation Units (CUs), in turn, are PAs in the public domain, with relevant natural characteristics, with defined objectives and limits, legally established by the Government in Brazil (BRASIL, 2000). The design of these spaces brings several benefits to the environment and population, such as maintaining quality of life and ecosystem services (MMA, 2022).

Guanabara Bay (BG), an important coastal ecosystem, located in the state of Rio de Janeiro, is of notorious importance for the growth and development of the city. However, urban and industrial development has negatively impacted their ecosystems, including the mangrove swamp (Dubeux, 1999; Soares *et al.*, 2003, ICMBio, 2018). Despite these challenges, BG remains an important source of funds, producing around 500 tons of fish per month. In the Guapi-Mirim Environmental Protection Area (APA),³ about two million Uçá crabs are collected annually, reinforcing the urgency of conserving these habitats (Alencar, 2024).

It is in this context that the work is presented. The main objective is to analyze the dynamics of public use, through the application of the tools of the List of Visitation Opportunities (ROVUC) and the Tourist Attractiveness Index (IAT) to analyze the public use of the Guapi-Mirim APA and the Guanabara Ecological Station located in BG, in the state of Rio de Janeiro.

2 THEORETICAL APPROACH

2.1 IMPORTANCE OF MANGROVES

Mangroves are coastal ecosystems, at the interface between land and sea, occurring in tropical and subtropical regions of the world, between latitudes 30°N and 30°S (FAO, 2023; Giri *et al.*, 2011). Marked by the intertidal regime and with an unconsolidated substrate (Leal;

³ The name of the Guapi-Mirim APA was given in honor of the Guapimirim River, a name with Tupi-Guapi origin: source or headwater of a river and Mirim: small thing (ICMBio, 2001).

Spalding, 2024). These regions contribute to carbon sequestration and protection against extreme weather events (Leal; Spalding, 2024; Alongi, 2014).

The term mangrove refers to the plant species that make up these spaces, which have adapted over thousands of years to survive in environments of high salinity, low oxygen between roots and flooded, at times, by the tide (Soares *et al.*, 2003; ICMBio, 2018; Mandal; Bar, 2018).

These adaptations are related to mechanisms such as aerial roots (Rhizophores⁴), which assist in respiration and anchorage in the waterlogged substrate, the ability to deal with salinity by eliminating it through roots and leaves, dispersal through propagules - viviparous seeds⁵ - and nutrient retention mechanisms (FAO, 2023).

Mangroves are vital ecosystems for protecting the environment, tackling the climate crisis, and promoting environmental justice. This is because these spaces offer essential ecosystem services. These services can be: Provision (food production, genetic resources, wood production); Regulation (climate and microclimate regulation, coastal protection, carbon sequestration, ecological niche formation), Support (nutrient cycling, soil formation, biomass export) and Culture (ecotourism, medicine and religion) (ICMBio, 2018).

Mangroves support 800 trillion juvenile fish, shrimp, bivalves, and adult crabs per year around the globe. This exposes the economic importance and guarantee of food security for various populations (Leal; Spalding, 2024).

According to the Global Mangrove Alliance⁶, the extent of these ecosystems in the world was estimated at 141,957 km², 135, 882 km² in 2016 and 147,256 km² in 2024. (Leal; Spalding, 2024). This extension corresponds to 1% of the world's tropical forests (FAO, 2023). They occur in at least 128 countries and territories (Table 1), with a predominance in Southeast Asia (50,000 km²), followed by West and Central Africa (22,000 km²) (Leal; Spalding, 2024).

⁴ A type of stem that grows toward the ground, with positive geotropism. It forms adventitious roots and allows the aerial respiration of typical mangrove vegetables (ICMBio, 2018).

⁵ They are characterized by the germination of the embryo next to the mother plant, forming a propagule ready for dispersal (FAO, 2023).

⁶ The Global Mangrove Alliance is an organization focused on protecting the ecosystem, gathering tax incentives, formulating and coordinating partnerships with institutions from various sectors. It is currently coordinated by members *Conservation International*, *The International Union for the Conservation of Nature*, *The Nature Conservancy*, *Wetlands International*, *World Wildlife Fund*, *SaciWATERS* and *Audubon Americas*.

Table 1*Extension of mangroves in the world*

Region	Sum of areas (km ²)	Overall percentage (%)
Southeast Asia	49.500	33.6
West and Central Africa	22.802	15.5
North, Central America and the Caribbean	21.270	14.4
South America	19.469	13.2
Australia and New Zealand	10.348	7.0
South Asia	9.749	6.6
East and South Africa	7.749	5.3
Pacific Islands	5.790	3.9
Middle East	358	0.2
East Asia	221	0.2
Total	147.256	100

Source: Leal; Spalding, 2024.

In Brazil, mangroves occur from Amapá - Oiapoque, 4°26'N - to Santa Catarina - Laguna, 28°30'S (Coelho *et al.*, 2025) and has an approximate extension of 14,000 km², with the highest concentrations in the states of Maranhão (36%), Pará (28%) and Amapá (16%), totaling 80% of the mangroves in the national territory and the largest continuous strip of the ecosystem under legal protection in the world. In addition, 120 national PAs have mangroves inside, ensuring greater protection for about 87% of the ecosystem in Brazil (ICMBio, 2018).

However, since the beginning of the twentieth century, about 25% of Brazilian mangroves have been destroyed (ICMBio, 2018). Threats such as urban expansion on the coast, agriculture, aquaculture, fishing industry, logging, and climate change put the protection of these ecosystems and their ecological and geomorphological function at risk (Bunting *et al.*, 2018).

In the national territory, the experience in the mangrove represents part of the survival, culture and medicine of indigenous peoples, artisanal fishermen, shellfish gatherers, caiçaras and quilombolas. Therefore, protecting mangroves constitutes an advance in the resistance struggle for environmental, social, and climate justice (Sofiatti, 2023; Moraes, 2022). To this end, legal instruments such as the Federal Constitution of 1988 – which defines the coastal zone as national heritage in its article 225 –, the Forest Code of 2012 (Law No. 12,651/2012), which classifies mangroves as Permanent Preservation Areas (APP) –, and the National System of Conservation Units (SNUC) (Law No. 9,985/2000), which has as one of its objectives to contribute to the conservation of natural ecosystems –, constitute some of the main legal frameworks for environmental protection in the country (Brasil, 1988; Brazil, 2012).

The PAs are strategic spaces in the defense of Brazilian mangroves (Coelho *et al.*, 2025). The most recurrent categories are related to Sustainable Use Units, which allow the indirect use of natural resources, such as the Extractive Reserve (RESEX) and the Environmental Protection Area (APA). This characteristic is relevant given the importance of these spaces for the social, cultural, and economic development of traditional populations in one of the richest environments on the globe (ICMBio, 2018).

However, there are challenges regarding the management and application of protection laws in these spaces (Coelho *et al.*, 2025; ICMBio, 2018). These challenges are related to the lack of tax incentives, inspection, monitoring, and land conflicts (ICMBio, 2018). The conservation of mangroves, however, is decisive for facing the climate crisis and protecting populations in a state of vulnerability (Brasil, 2025).

In this context, initiatives such as the National Program for the Conservation and Sustainable Use of Mangroves in Brazil (ProManguezal) and Brazil's accession to the *Global Mangrove Breakthrough* add efforts in the conservation and restoration of this important coastal ecosystem by 2030 (Brasil, 2025).

Effective environmental management of PAs that have mangroves in their interior, associated with the participation of traditional peoples and communities, tend to reduce the loss of mangrove cover and help ecological and social resilience. However, the effectiveness of the management of protected spaces is not directly linked to the simple fact of their creation, but to ensure active management, the continuity of monitoring and inspection actions, and the existence of stable funding (ICMBio, 2018).

It is in this sense that protecting these spaces goes beyond the recognition of their economic and environmental importance, but also an ethical commitment to the climate and the ways of life historically built in these territories (Lopes *et al.*, 2025; Corrêa *et al.*, 2024; Mariano *et al.*, 2025).

2.2 IMPORTANCE OF PUBLIC USE FOR THE CONSERVATION OF PROTECTED AREAS

Public use activities in PAs generate individual, economic, environmental and social benefits, by reconciling conservation with visitation (Vallejo, 2013). Public use becomes an ally in the preservation of biodiversity and ecosystem services (Crema; Faria, 2020). Among the factors that influence the visitor's choice are contact with nature, interest in meeting traditional peoples, the search for adventures and extreme sports, and the preference for quiet and welcoming environments for families, especially children (Omena, 2022).

Visitation in PAs is an essential tool for the conservation of these spaces. When well planned, activities for public use stimulate visitors' awareness of the importance of territorial

protection and biodiversity (Vallejo, 2013; Pedrini, 2019; Crema; Faria, 2020). From a tourism perspective, ecotourism emerges as a sustainable practice that has been gaining strength in Brazil and in the world, becoming a fundamental ally in the preservation of PAs (MMA, 2010; Brod; Milward-de-Azevedo, 2022 *apud* Carrilho-da-Silva; Milward-de-Azevedo, 2023).

2.3 TOOLS FOR PUBLIC USE PLANNING

The organization of visitation in PAs, combined with monitoring, inspection and management, seeks to maximize positive environmental impacts and inhibit illicit activities. Proper planning is essential for visitors to have a satisfying experience that aligns with conservation objectives. In this context, tools such as the Tourist Attractiveness Index (IAT) and the List of Visitation Opportunities in Conservation Units (ROVUC) play a crucial role. They assist in the creation and review of the management plans of the PAs, providing a better understanding of the tourist context and promoting sustainable visitation (Crema; Faria, 2020).

2.2.1 List of Visitation Opportunities in Conservation Units (ROVUC)

The List of Visitation Opportunities in Conservation Units (ROVUC), approved by Ordinance No. 1,148/2018 of the Federal Government (ICMBio), guides the planning of visitation in PAs. It defines five classes of opportunities based on biophysical, sociocultural and management attributes, covering both the internal environment of the UC and external areas and surrounding attractions (Crema; Faria, 2020).

ROVUC contributes to the planning of public use, evaluation of investments, definition of zoning and identification of impacts on biodiversity. In addition, its implementation requires the participation of social actors, including residents, tourists, and scientists, which enriches its applicability. This tool broadens the understanding of tourism opportunities in PAs, favoring conservation strategies and improving visitation planning (Crema; Faria, 2020).

2.2.2 Tourist Attractiveness Index (IAT)

The Tourist Attractiveness Index (TAI) has become essential for the analysis of the internal and external environment of PAs, evaluating biophysical, social, and management attributes and correlating them with factors such as scenic attractiveness, infrastructure, and population density.

The application of the tool represents an effective management strategy, capable of understanding the dynamics of visitation, directing investments, and contributing to the sustainability of visitation and environmental conservation (Souza, 2016). The main objective of the tool is to establish parameters to monitor and plan visitation opportunities (Souza *et*

al., 2017).

The IAT groups the PAs according to their tourist vocation through three stages: (1) analysis of the internal physical attributes – considering infrastructure, scenic attractiveness and volume of visits; (2) analysis of external physical attributes – evaluating regional attractions, public access and socioeconomic context through data from IBGE, *TripAdvisor* and *Google Maps*; (3) classification of tourist attractiveness classes – segmenting the PAs into five categories primitive, semi-primitive, extensive, intensive and highly intensive, according to their degree of accessibility and development.

3 MATERIAL AND METHODS

3.1 TYPOLOGY OF THE STUDY

The elaboration of this research carried out from March 2023 to April 2025, was characterized, as to the purposes, as exploratory, descriptive and applied. The first characterizations are related to the small number of studies that apply the tools for public use and also to their investigative and descriptive character of the visitation given in the PAs, as well as aspects related to visitors. And, finally, it was applied, as it sought to generate subsidies for the resolution of real problems of visitation (Vergara, 2000).

Regarding the identification of the means of investigation, it was bibliographical, documentary, field and a case study. Bibliographic, therefore, it gathered data from scientific platforms (*Scholar*, *Google*, *Scielo* and *Researchgate*) and documentary, given the use of institutional files of the Federal Government made available at electronic addresses (IBAMA, ICMBio, MMA, among others). The field research is characterized by the use of direct observation – written from the experiences in the proposed place – and a case study, given that the research was carried out in the empirical space in which it was proposed to study (Vergara, 2000).

3.2 IAT AND ROVUC TOOLS

For the application of the IAT and ROVUC tools, direct observation and dialogue with local social actors, including the manager and civil servants, were employed. These professionals, when experiencing the activities of public use in the UC, play an essential role in the preservation of these spaces.

The IAT tool evaluated the internal and external parameters of the UC. In the internal environment, it considered biophysical (natural/cultural variety and scenic attractiveness), social (diversity of activities and number of meetings) and management (infrastructure and services) attributes (Souza *et al.*, 2017).

In the external environment, it analyzed biophysical (regional attractions and public access), social (socioeconomic context and population density) and management (hospitality establishment) attributes (Souza *et al.*, 2017).

Each indicator received a score from 1 to 5, and the average was calculated by the sum of the scores divided by the number of indicators. The values of the three groups of attributes (biophysical, social and management) were summed and divided by three, resulting in the overall score of the two environments. The final score was obtained by adding the general internal and external values and dividing them by two. This result allows us to classify the tourist attractiveness of the CU at the following levels: primitive (high degree of naturalness), semi-primitive (high degree of naturalness), extensive (sustainable use of resources), intensive (variety of activities) and highly intensive (Brazilian icon PAs) (Souza *et al.*, 2017).

The application of the ROVUC tool followed the steps described by Crema and Faria (2020) in the UC. First, the general characterization was performed (stage 1). Then, the attractions and visitation areas were detailed, the management zones were identified and the characteristics of the visitors were analyzed (stage 2). Finally, the visitation areas were defined and the spatialization of the experience classes was elaborated on the map of the PAs (stages 3 and 4).

3.3 CHARACTERIZATION OF THE STUDY AREA

3.3.1 Geographical Location

The Guapi-Mirim APA (Figure 1), created by Decree No. 90,225, of September 25, 1984, as a result of an environmental movement against the destruction of Brazilian mangroves, is located in the Recôncavo da Baía de Guanabara, in the state of Rio de Janeiro. An area also known as 'Fundo de Baía', with geographic coordinates between 22° 39'30" and 22° 46'50" south latitude and 42° 57'00" and 43° 06'40" west longitude, is part of the Guanabara Bay Hydrographic Region, located at the mouth of the Iriri, Roncador, Guapimirim and Imboáçu rivers (ICMBio, 2001).

The territorial extension of the Guapi-Mirim APA is 138.25 km² - mangroves (44.7%), land (19.6%) and water section (35.7%). It is part of the municipalities of Guapimirim, Magé, Itaboraí and São Gonçalo, in the Metropolitan Region of Rio de Janeiro (ICMBio, 2001).

The ESEC of Guanabara, created by Decree s/n of February 15, 2006, is the core area of the Guapi-Mirim APA, with geographic coordinates between latitude 22°41'16.70"S and 22°44'44.412"S and longitude 43°1'23.022"W and 43°1'51.672"W. It has a territorial extension of 19.35 km², and a perimeter of 21.5 km. This important UC, located in the Atlantic

Forest Biome, aims to preserve the last continuous stretches of medium-sized mangroves in Guanabara Bay. It covers the municipalities of Guapimirim (58%) and Itaboraí (42%), both located in the city of Rio de Janeiro, RJ (ICMBio, 2012).

Figure 1

Location of the Guapi-Mirim Environmental Protection Area/RJ

Source: Prepared by the authors, 2025.

The Guapi-Mirim APA is the first UC in Brazil dedicated to the protection of mangroves. Its implementation is deeply linked to stories of struggle and popular mobilization. The UC promotes the conservation and restoration of mangroves in the BG Recôncavo, the protection of biodiversity (microorganisms, mollusks, crustaceans, mammals, fish, among others), and ensures the subsistence of local populations – artisanal fishermen and crab collectors – by applying adequate environmental management for the maintenance of various activities in stretches of the estuary (ICMBio, 2001).

Finally, the Central Fluminense Mosaic (Figure 2), created in 2006, covers, among 29 other PAs, the APA of Guapi-Mirim and the ESEC of Guanabara. The main objective of the Mosaic is the integrated management of these units, located in the Atlantic Forest Biome. In addition, the initiative promotes the conservation of biodiversity, connectivity between forest fragments forming important ecological corridors and social participation in environmental protection (FUNBIO, n.d.).

Figure 2

Map of the Central Fluminense Mosaic

4 RESULTS AND DISCUSSION

4.1 PUBLIC USE OF THE GUAPI-MIRIM APA / RJ

It was found that the Guapi-Mirim APA enables the conservation and sustainable use of natural resources. The application of the ROVUC tool in the UC occurred in four stages.

In the first stage, given by the general characterization of public use, it is clear that the UC encompasses rivers and mangroves in Guanabara Bay, recognized for their biodiversity and tourist potential. Located between Guapimirim, Magé, Itaboraí and São Gonçalo, it has tourist infrastructure and access via the BR-493 Highway. In the socio-cultural aspect, artisanal fishing and Community-Based Tourism, aimed at small guided groups, stand out. In management, there is a consolidated plan, vessel control and visitor support infrastructure.

In the second stage, given by the detailing of the attractions and considerations about visitors, it is noted that the spaces of the UC include a visitor center, auditorium and cafeteria, where safety measures and information about biodiversity are addressed. Visitation to the mangrove takes place through boat tours, with environmental education and interpretation activities. Access is monitored by the cooperative's boatmen and ICMBio employees, prioritizing ecotourists, families, schools and researchers.

In the third and fourth stages, given by the classification of the visitation areas, two visitation areas were identified: (1) the terrestrial portion, which represents 50% of the opportunities, was categorized as semi-natural, due to the degree of intervention; (2) marine zones, including mangrove rivers and biodiversity observation, categorized as natural,

because they have high preservation, but with some interaction with residents and minimal environmental impacts.

4.2 TOURIST ATTRACTIVENESS INDEX OF THE APA OF GUAPI-MIRIM/ RJ

The application of the IAT tool resulted in the elaboration of two tables, with attention to the spatialization of classes both in the internal and external environment of the UC.

Table 2 shows the spatialization of the classes of the internal environment of the CU, in which the biophysical, social and management attributes are glimpsed. In addition to the exposure of the source, there is the exposure of the calculation of these attributes.

Table 2

Spatialization of the classes of the internal environment of the APA of Guapi-Mirim/RJ

Indoor Environment				
Biophysical Attributes		Notes	Average	Source
Natural/cultural variety	Forest, mangrove, biodiversity, Guanabara Bay	3,5	3,6	Field research
Scenic attractiveness	Google Scholar results: 1,560. Most sought-after attractiveness: 3 thousand.	3,8		Google Search and Google Scholar
Social Attributes		Notes	Average	Source
Diversity of activities	Fishing, contemplation, boating, research, education	3,8	3,4	Field research
Number of encounters	UC area in km ² / number of visitors in 2023: 138.25/ 549 = 0.251	3,0		ICMBio (2001)
Management Attributes		Notes	Average	Source
Infrastructure	Parking, visitor center, boats, accommodation	3,5	2,7	Field research
Services	Technical visit, sightseeing tour	2,0		Field research

Source: Prepared by the authors, 2025.

The scores were assigned based on the field visitation and the methodology described by Souza *et al.*, (2017). The overall score of the indoor environment was calculated by adding the mean of the attribute scores and dividing by three, resulting in 3.3. This value was used in the next stages of the analysis to compose the final score.

Table 3 shows the spatialization of the classes of the external environment, in the same way as the internal environment of the CU, with the exposure of biophysical, social and management attributes. In addition to the exposure of the source, there is the exposure of the calculation of these attributes.

Table 3

Spatialization of the classes of the external environment of the APA of Guapi-Mirim/RJ

External Environment				
Biophysical Attributes		Notes	Average	Source
Regional attractions	Tourist attraction in the region: 15	3,5	3,6	TripAdvisor
Public access	Travel time from the nearest airport: 1 hour.	3,8		Google Maps
Social Attributes		Notes	Average	Source
Socioeconomic context	Average of the Human Development Index (HDI) of the municipalities belonging to the PAs studied	2,5	2,5	IBGE
Population density	Average number of people living in the municipalities belonging to the PAs	2,5		IBGE
Management Attributes		Notes	Average	Source
Hospitality Establishment	accommodation and food establishments in the municipality: 126	3	3	TripAdvisor

Source: Prepared by the authors, 2025.

From the calculation of the sum between the final averages of each attribute divided by three, the final score of attractiveness in the external environment was composed: 3.0. The final tourist attractiveness of the Guapi-Mirim APA was: 3.1. And, according to Souza *et al.* (2017), was classified as a CU with an attractiveness class considered extensive.

4.3 PUBLIC USE OF THE ESEC OF GUANABARA

It was found that the Guapi-Mirim APA enables the conservation and sustainable use of natural resources. The application of the ROVUC tool in the UC occurred in four stages.

In the first stage, referring to the general characterization of public use, it is observed that the UC is composed of a set of rivers and mangrove forests in a high state of conservation in BG, recognized for their potential for environmental education and interpretation activities. The protected area covers the municipalities of Guapimirim and Itaboraí, and its biological diversity is the main attraction for visitors, although disembarkation is not allowed. Its access is via the BR-493 highway with entrance to the headquarters of the APA Guapi-Mirim.

In the sociocultural aspect, the UC has historical and cultural heritage – fishing corrals – and medium-sized continuous mangrove forest fragments, considered the best preserved in the BG. In addition, there are scientific research activities and visitation with a focus on environmental education. In management, there is infrastructure to support visitors – visitor center, guardhouses, parking, among others. Technical visits are provided by appointment, guided by AP employees.

In the second stage, the visitor support features are similar to the previous CU. This is because the ESEC of Guanabara is inserted in the space of the APA Guapi-Mirim. The beginning of the visitation is given by safety guidelines, and environmental education activities in the available infrastructures. The Mangrove space – a new structure to support visitation – works as a foundation in the exhibition of photos and materials. Visitation takes place from boats, with small groups of scientists, students and ecotourists.

In the third and fourth stages, referring to the classification of the visitation areas, a single area was identified: the portion of mangrove in the best state of conservation in the BG, classified as natural due to the medium degree of intervention, the low human presence and the predominance of biodiversity observation.

4.4 GUANABARA ESEC TOURIST ATTRACTIVENESS INDEX

The application of the tool in the development of the *et al.*, (2017) at UC, resulted in the elaboration of two tables, with special attention to the spatialization of the experience classes in the internal and external environments.

Next, there is the application of the tool to the internal environment (Table 4).

Table 4

Spatialization of the classes of the internal environment of the ESEC of Guanabara/RJ

Indoor Environment				
Biophysical Attributes		Notes	Average	Source
Natural/cultural variety	Forest, mangrove, mangrove restoration spaces, biodiversity, Guanabara Bay	2	2,5	Field research
Scenic attractiveness	Google Scholar results: 17K. Most popular attraction: boat trip, 3 thousand.	3		Google Search and Google Scholar
Social Attributes		Notes	Average	Source
Diversity of activities	contemplation, boating, research, education	2	1.75	Field research
Number of encounters	UC area in km ² / number of visitors in 2023: 20 km ² /549 = 0.036	1.5		ICMBio (2001)
Management Attributes		Notes	Average	Source
Infrastructure	Boats for visitation and research	1.5	1.75	Field research
Services	Technical visit, sightseeing tour	2		Field research

Source: Authors' collection, 2025.

From the sum of the mean score, an internal score of 2 was obtained. This value is maintained for the calculation of the final attractiveness, which will be determined based on the evaluation of the external environment (Table 5), presented below.

Table 5

Spatialization of the experience classes of the external environment of the ESEC of Guanabara/RJ

External Environment				
Biophysical Attributes		Notes	Average	Source
Regional attractions	Tourist attraction in the region:15	3.5	3.6	TripAdvisor
Public access	Travel time from the nearest airport: 1 hour.	3.8		Google Maps
Social Attributes		Notes	Average	Source
Socioeconomic context	Average of the Human Development Index (HDI) of the municipalities belonging to the PAs studied	2.5	2.5	IBGE
Population density	Average number of people living in the municipalities belonging to the PAs	2.5		IBGE
Management Attributes		Notes	Average	Source
Hospitality Establishment	accommodation and food establishments in the municipality: 126	3	3	TripAdvisor

Source: Authors' collection, 2025.

The score of the external environment was equal to 3.0. From the sum of the internal (2.0) and external (3.0) indexes divided by 2 (environments) it was possible to reach the final index equal to 2.5. It is observed that the UC has the same classification as the APA Guapi-Mirim: Extensive. The CUs are similar in many characteristics of the internal and external environment, although they have different conservation categories. At the ESEC of Guanabara, some activities are restricted, such as the indirect use of natural resources, prohibition of fishing, disembarkation and visitation without permission. Characteristics provided for in the SNUC (ICMBio, 2001).

5 CONCLUSION

The present study highlights the importance of mangroves as essential ecosystems for biodiversity and the subsistence of traditional populations. The Guapi-Mirim APA and the

Guanabara ESEC, in Guanabara Bay, were analyzed using the ROVUC and IAT tools, allowing us to understand the dynamics of the public use of protected spaces.

Planning visitation becomes essential to reconcile the positive experience of the visitor with environmental conservation. In this context, the application of ROVUC and IAT in the PAs contributes to the understanding of the dynamics of visitation and to the definition of investment and management parameters.

The application of ROVUC in the PAs highlighted the need for diversification of tourism activities. Although the visitation experience is considered satisfactory, it takes place almost exclusively on boats, which limits public use. The recent creation of the Mangrove Space is a relevant strategy for this diversification, by providing activities prior to the boat trip and expanding the possibilities of environmental interpretation.

It is concluded that it is essential that the Federal Government, in partnership with ICMBio, the Management Council of the UCs and other sectors involved, invest in structures for the management of visitation in the spaces analyzed. In addition, the elaboration of the tool represents a starting point for the construction of technical documents that do not yet exist, such as the Public Use Plan. Such actions have the potential to strengthen the protection of the mangroves present in these protected areas, improve the quality of life of local populations and ensure the maintenance of ecosystem services.

The application of the IAT tool in the Guapi-Mirim APA resulted in a final tourist attractiveness of 3.1, classified as extensive. In the internal environment, potential was identified for diversification of visitation, with the proposal to implement a suspended trail or a viewpoint to observe the mangrove, aiming to expand the activities offered and attract a greater number of visitors. In the external environment, there was a need to improve signaling, especially on the highways and in the surrounding municipalities, in order to highlight the presence of the UC. In addition, when accessing the protected area, it is essential to invest in speed reduction mechanisms, ensuring greater safety for visitors.

At the ESEC of Guanabara, the application of the IAT resulted in a final tourist attractiveness index of 2.5, classifying it as extensive. As it is a Full Protection Unit, the diversification of activities, although possible, must consider the guidelines established by the SNUC. Investments in environmental education and interpretation programs, developed in partnership with municipal governments, are strategic actions to strengthen public use.

The external environment has characteristics similar to those observed in the Guapi-Mirim APA. The internal environment is predominantly composed of aquatic areas, complemented by terrestrial structures located at the headquarters of the Guapi-Mirim APA.

The activities offered are perceived as satisfactory by visitors, especially due to the expressive scenic beauty of the mangrove and its biodiversity.

It is in this sense that the results indicate the need to diversify visitation activities, ensuring that tourist exploration occurs in a balanced way and respects the principles of conservation. In addition, the importance of collaboration between the government and civil society is highlighted, promoting preservation actions and strengthening environmental awareness.

The integration of effective public policies and joint efforts between management, science and the community is essential to ensure the protection of mangroves and improve the visitor experience. In this way, the need for continuous and participatory planning is reinforced, which ensures the sustainability of this vital ecosystem for Guanabara Bay.

ACKNOWLEDGMENTS

We would like to thank the Center for Studies in Management of Conservation Units (NEGUC) of the Federal Rural University of Rio de Janeiro (UFRRJ) and the Graduate Program in Ecotourism and Conservation (PPGEC) of the Federal University of the State of Rio de Janeiro (UNIRIO) for their support in the development of this research.

ABSTRACT

Monitoring vegetation degradation in the surroundings of water sources is essential to assess environmental impacts and to support actions aimed at restoring ecological balance between riparian forests and watercourses. In this context, the proposed study is justified by integrating geoprocessing and remote sensing tools into environmental analysis. This study aimed to evaluate the presence and condition of remnant vegetation within the Permanent Preservation Areas (PPAs) of the Meia Ponte River Basin upstream of the Raw Water Pumping Station operated by SANEAGO in Goiânia, Goiás. The assessment procedures involved the use of QuantumGIS (QGIS) software to delineate the watershed based on the Digital Elevation Model (DEM) from the TOPODATA project. Publicly available satellite imagery from Landsat 8–9 and Sentinel-2 was also used, along with the application of the Normalized Difference Vegetation Index (NDVI) and pixel reclassification to identify Cerrado phytophysognomies that include riparian vegetation. The results revealed differences in sensor accuracy, with Sentinel-2 presenting higher spatial accuracy. They also indicated that only 3.62% and 5.09% of the total basin area (Landsat 8–9 and Sentinel-2, respectively) corresponds to remnant vegetation within PPAs, highlighting significant pressure on riparian forests associated with water sources. The study demonstrated the relevance of geotechnologies as effective tools for assessing PPAs in the watershed under analysis. Satellite image analysis enabled accurate mapping of river tributaries and identification of the presence and absence of vegetation adjacent to water sources within legally protected buffer zones.

RESUMO

O monitoramento da degradação da vegetação no entorno de mananciais é fundamental para avaliar impactos ambientais e subsidiar ações voltadas ao restabelecimento do equilíbrio ecológico entre a mata ciliar e os cursos hídricos. Nesse contexto, a proposta se justifica ao integrar ferramentas de geoprocessamento e sensoriamento remoto à análise ambiental. O presente trabalho teve como objetivo avaliar a presença e a situação da vegetação remanescente nas Áreas De Preservação Permanente (APPs) da Bacia Hidrográfica do Rio Meia Ponte a montante da Estação Elevatória de Água Bruta da SANEAGO em Goiânia (GO). Os procedimentos de avaliação envolveram o manuseio do software SIG QuantumGIS para delimitação da bacia hidrográfica através do MDE do projeto TOPODATA, utilizando também como base imagens dos satélites Landsat 8-9 e Sentinel-2 adquiridos por bancos de dados públicos, aplicação do índice NDVI e reclassificação dos pixels para identificação da fitofisionomia do Cerrado que contemplasse as matas ciliares. Os resultados demonstraram diferença na acurácia dos sensores, sendo o Sentinel-2 com maior acurácia espacial, e indicaram que apenas 3,62% e 5,09% (Landsat 8-9 e Sentinel-2 respectivamente) da área total da bacia corresponde a vegetação remanescente em APPs, evidenciando significativa pressão sobre as matas ciliares dos mananciais. O presente trabalho demonstrou a relevância do uso de geotecnologias, como ferramentas eficazes para a avaliação de APPs na bacia hidrográfica em questão. A análise das imagens dos satélites permitiu mapear com precisão os afluentes do rio e identificar a presença e ausência de vegetação contígua aos mananciais, dentro das faixas legalmente protegidas.

1 INTRODUCTION

The presence of native vegetation in the surroundings of the springs is essential for maintaining the ecological flow throughout the year because they reduce the natural loss of water along the entire spring, mainly through infiltration and evaporation, but also by reducing sedimentation and erosion, and interception of rainfall that allows a better effective infiltration of water into the soil (Ferraz *et al.*, 2014 *apud* Ferreira *et al.*, 2019).

By observing the behavior of water over a watershed cutout, it is possible to trace the different ways in which water loss, consumption or runoff occurs. The main elements that alter the availability of water through the natural or artificial withdrawal of natural watercourses are: evaporation, insolation, infiltration, human consumption (catchment), watering, irrigation (catchment), natural evapotranspiration of plants, among others; factors that are also considered in modeling studies of soil surface loss and water availability in land use scenarios (Lima; Ferreira; Ferreira, 2018)

In addition to the consumption itself, which would be the export of water from the springs, the natural recharge of the watersheds through rainfall and recharge zones must be considered. The water tables are supplied by precipitation that reaches regions of deep and permeable soils, in addition to being maintained by native vegetation that prevents the evaporation of water, maintains and redistributes rainwater (Hollanda *et al.*, 2014). Riparian forest areas are considered and described, by Brazilian legislation, protected zones that play an important role in the ecosystem. As described by Law No. 12,651 of May 25, 2012:

II – Permanent Preservation Area – APP: protected areas with the environmental function of preserving water resources, landscape, geological stability and biodiversity, facilitating the gene flow of fauna and flora, protecting the soil and ensuring the well-being of human populations. (Brazil, 2012, p. 2).

In many cases, vegetation is suppressed in Permanent Preservation Areas and, regardless of legality, compensation for the environmental damage caused is mandatory, which in turn is governed mainly by Law No. 12,651/2012 (nationwide), State Law No. 18,104/2013 and State Law No. 21,231/2022.

Thus, the recovery of the degraded area, especially in the vicinity of springs, is at the mercy of both the actions of the owner of the property where the suppression occurred and the environmental agencies responsible for inspection. Therefore, it is common to find areas along the springs where there is an invaded, degraded or absent Permanent Preservation Area. Studies on the adequacy of land use in PPAs highlight the need for restoration and inspection actions to ensure the water function of these areas (Santos *et al.*, 2014)

In the study by Novaes (2022), significant degradation was identified in the APPs along

the water courses and in the surroundings of springs within the Meia Ponte River Catchment Basin. The use of remote sensing and classification techniques has been pointed out as an effective tool for this monitoring and decision-making (Liu, 2006; Maxwell; Warner; Fang, 2018). The importance of monitoring native vegetation around water sources is reinforced as a method of understanding and evaluating the impacts of the loss or recomposition of fauna on the entire agroecosystem.

The entire territory of the state of Goiás is part of the Cerrado biome, a tropical savannah of high ecological importance due to its biodiversity and the distinct phytophysognomies that compose it. The configuration of the landscape in the Cerrado is closely associated with geological formations, soil types and reliefs, factors that, together with the presence of springs and watercourses, shape local hydrological patterns. In addition, the Cerrado is recognized as Brazil's "water tank", housing springs that contribute to several large hydrographic regions of the country — a characteristic that reinforces its relevance for water security and for the conservation of riparian forests. (Brazil, 2023).

The springs in particular are the source of life for all the vegetation present, which in turn fulfills the fundamental function of protecting the soils around the springs, preserving the flow of the source and contributing to the quality of the water. In search of the need to mitigate environmental impacts, different laws emerged that established legal instruments such as Permanent Preservation Areas (APPs) and Legal Reserves (RL) that delimited mandatory areas on the property that must be preserved and recomposed. However, the effectiveness of the legislation is dependent on the pressure of inspection by the competent environmental agencies and on the non-compliance with the regulations on rural properties.

The way environmental agencies assess the presence of illegal plant suppression is through geotechnology tools, in particular, the temporal analysis of satellite images. The presence or absence of native vegetation is monitored, whether it is surplus vegetation on a property or conservation areas such as APP or RL and through this, the environmental agency plans together with the owner, the recovery of irregularly suppressed areas.

The temporal analysis of satellite images is essential for the monitoring of riparian forests along water courses. The first step to investigate the environmental impacts on the springs through the degradation of native vegetation is the correlation between the native vegetation and the ecological flow of the spring. With the integrated analysis between land use, remaining native vegetation and water availability, the entrepreneur and the environmental agency can jointly contribute to a more sustainable management of natural resources, reconciled with existing public policies.

Naturally, the hydrological flow of the river is impaired throughout the year, especially

in seasons of prolonged drought, due to the absence of riparian forest. With these functions compromised, the trends are erosive processes caused by the water course itself, complete drying of the source and loss of biodiversity. From a legal point of view, the Brazilian Forest Code (Law No. 12,651/2012) clearly establishes the principle that natural resources, especially water, native vegetation and soil, are goods of common interest to the whole society.

Thus, the monitoring of the degradation of vegetation around water sources is important in terms of evaluating the impacts and developing potential solutions to reestablish the ecological balance of the relationship between riparian forest and water course, but also to generate economic return for those who have water sources on their properties through the various benefits that good management of water resources brings.

The proposal is also part of an academic effort to integrate geoprocessing and remote sensing tools in environmental analysis, understanding the relationship between land use and water availability, assessing impacts, bringing results that support public policies and providing strategies for integrated landscape management through agroecological practices that reconcile agricultural production and conservation of water resources. In this context, the proposal is justified by integrating geoprocessing and remote sensing tools to environmental analysis.

The objective of this research is to evaluate the presence of native vegetation in the Permanent Preservation Areas through the classification of satellite images (using Landsat and Sentinel-2) considering the agroecosystem of the Meia Ponte River Basin upstream of the Meia Ponte Raw Water Pumping Station in Goiânia, Goiás. The specific objectives are: to delimit the study area and identify the tributaries of the watershed from Digital Elevation Models and public cartographic bases; process and analyze images from the Landsat and Sentinel-2 satellites to map the vegetation in the APP zone, comparing their precision, accuracy and performance; develop and test a reproducible methodology using exclusively free software and public data for vegetation identification in PPAs; and to discuss the implications of the results for the formulation of public policies aimed at the conservation of native vegetation and the sustainable management of water resources.

2 THEORETICAL FRAMEWORK

Once a certain point in the stretch of a spring is chosen, there is an imaginary layout that delimits a drainage area, a region of the earth's surface that receives rainwater, sediments and dissolved materials for a common outlet, a focal point (Santana, 2003). By delimiting a route between these focal points, a fluvial channel is formed.

[...] The term river basin refers to a natural geographical compartmentalization delimited by water dividers. This compartment is drained superficially by a main watercourse and its tributaries." (Santana, 2003, p. 27).

A system determined by biotic and abiotic factors has a volume of water input and an output volume, being determined by some factors such as evaporated, transpired and infiltrated water (Silva, 2014 apud Silveira, 1993). However, an important factor that interferes with the behavior of the basins is surface runoff.

When the earth's surface is saturated with water or impermeable, the water drains superficially towards a closer watercourse (Miranda; Silva; Oliveira, 2010). This phenomenon is important when observing the presence of vegetation to buffer, absorb and redistribute rainwater without harming and altering the physical properties of the soil.

When there is the presence of native vegetation, the behavior of water in relation to the earth's surface changes significantly, the presence of vegetation cover in the soil regulates factors such as erosion, sediment transport, rainfall interception and effective water infiltration by the soil profile (Carvalho, 2019).

The capacity to retain and recharge the volume of water flowing in the springs of a watershed is determined by the capacity of water generation by the springs in each spring, but also by the recharge areas. The infiltration areas, as the recharge areas are known, are zones that allow the infiltration of water into the soil profile, reaching the water table that supplies the water mines and the springs themselves (Santana, 2003).

The potential of a watershed greatly delimits an activity that depends on water in a given region. Human activity, in turn, also has a direct impact on the behavior of the basins, agricultural pressure, for example, is an anthropogenic interference that alters the landscape through the conversion of land use. Naturally, the absence of vegetation, soil compaction, and landscape degradation through erosion caused by poor soil management lead to direct consequences on the way water behaves in a basin.

Deforestation, therefore, is a lower-cost activity when compared to the leasing of new areas, in the Amazon, there is a direct correlation between deforestation and the expansion of cattle ranching and large-scale agriculture (Rivero, 2009). In the state of Goiás, mechanization of agropastoral activities has caused severe impacts on native vegetation, compromising important ecological functions of the agroecosystem, such as soil protection, recharge of watersheds, and the filtration of rainwater by the vegetation itself (Crestana; Reichardt; Silva, 1993; Campos *et al.*, 2015).

Remote sensing and geoprocessing are essential elements in the dynamic and temporal monitoring of the landscape over time, allowing the identification of critical areas for

conservation and restoration (Campos *et al.*, 2015; Fitz, 2008). Therefore, to understand the impact of agriculture and livestock on native vegetation, especially riparian forests, a multidisciplinary analysis is needed quantifying changes in land use and vegetation cover, associating them with environmental and hydrological impacts.

In several rural properties in Goiás, APPs represent the only remaining native vegetation, making them vulnerable to agricultural pressure. In the context of the Meia Ponte River Basin, this soil conversion results in the degradation of riparian forests and loss of water retention of agroecosystems (Lima; Ferreira; Ferreira, 2018).

The monitoring of these activities serves as a regulatory framework both for the entrepreneur responsible for the intervention in nature, and for the inspection agency that seeks irregular interventions. Remote sensing plays an important role in assessing the condition of protected areas and facilitating this broadening of the focus from protected areas to entire landscapes (Wiens *et al.*, 2009).

Currently, in Brazil, the main satellites used are Sentinel-2 and Landsat because they periodically capture images of the entire Brazilian territory and are made available for free on the internet. The diagnoses of the areas are made through the processing of satellite images in products such as maps and images that highlight different elements depending on the object of interest.

The use of GIS tools are crucial for monitoring the vegetation present in an area. According to Tagliari and Baptista (2020), the processing of satellite images through GIS tools allows the evaluation of the presence of APPs that have undergone intervention along several stretches, using vegetation indices as a criterion for evaluating the presence of vegetation.

The product varies according to the objective of each analysis, the study by Nepomuceno (2012) presents, as a reference, several maps prepared from the processing of images that best illustrate the reality of the Ribeirão Gomeral hydrographic basin, such as the vegetation cover and the contour lines. Geoprocessing, the area of knowledge responsible for this entire process, is described by Cubas and Taveira (2020) as being the means (through GIS) that it is possible to transform georeferenced data into information.

Orbital images are created from sensors attached to satellites that capture the radiation reflected or emitted by the Earth's surface. The characteristics of sensors change according to their purpose and technology and this directly influences the quality, accuracy and precision of the image. Sensors have different spatial, spectral and temporal resolutions, and should be considered according to the applicability of the image (Wiens *et al.*, 2009).

The use of water by agriculture varies according to the type of production, availability of water granted in the springs and the need for the crop. In 2022, an assessment was made

of the use of water by crops, both rainfed and irrigated, consuming a total of 9.2 thousand m³ per second, of which 864.8 m³ per second, that is, 9.4% of water supplemented via irrigation, the rest is characterized by rainwater and made available in the soil, without human interference (Ana, 2022).

The Landsat program has maintained an "uninterrupted multispectral record" of land surfaces since 1972, and Landsat 8, launched in 2013, reinforces this continuity by operating with an orbital lag of eight days compared to Landsat 7 (launched in 1999), increasing the frequency of revisits and the availability of images for environmental monitoring and surveys (Usgs, 2019).

The Copernicus Sentinel-2 mission has as its main objective is to monitor the variability in the Earth's surface conditions, supporting the monitoring of changes through a combination of wide bandwidth and high revisit frequency; the mission has a bandwidth of 290 km and offers 10-day revisits at the equator with one satellite and 5 days with two satellites, which translates into intervals of approximately 2–3 days at mid-latitudes (Copernicus, 2020).

3 METHODOLOGY

The research evaluated a portion of the Meia Ponte River Basin, upstream of the Meia Ponte Raw Water Pumping Station (EEAB) consisting of an area of approximately 1,662.15 km² that includes the municipalities of Goiânia, Goianira, Santo Antônio de Goiás, Brazabrantes, Nerópolis, Nova Veneza, Ouro Verde de Goiás, Damolândia, Inhumas and Itauçu.

This region carries a socioeconomic importance due to its strategic importance in urban supply, irrigation of agricultural systems and animal watering. The region, being within the state of Goiás, is also monitored by public agencies such as the State Secretariat for the Environment and Sustainable Development of Goiás (SEMAD-GO) which promotes different public policies and strategies for maintaining the watershed.

The mapping of the area was carried out using the free GIS tool QGIS, which performed the interpretation and analysis of the shapefile and raster files generated throughout the research. Through a Digital Elevation Model acquired through the TOPODATA project, only the area downstream of SANEAGO's Raw Water Pumping Station (EEAB) was cut, respecting the contour lines that converge to the point of interference (16°34'11.16"S 49°19'44.97"W).

To evaluate the vegetation in the APPs, satellite images obtained from the Landsat 8-9 Level 2 (Operational Land Imager - OLI) and Sentinel-2 (MultiSpectral Instrument - MSI) missions were used, which offer spatial resolutions of 30 meters and 10 meters, respectively.

Quantum GIS virtual environment was used to manipulate the data.

The delimitation took place through the Digital Elevation Model (MDE) file acquired through the TOPODATA project of the National Institute for Space Research (INPE). The quadrants in which the watershed area fits are 16s 51 ZN and 16s 495 ZN, the rasters files that provided the numerical altitude information (ZN extension) per pixel were specifically downloaded.

Due to the nature of the file, the Coordinate Reference System (SRC) was manually referenced from the original file, in this case, the SRC EPSG:4674 – SIRGAS 2000. The raster files were redesigned to be standardized according to the research reference system, SRC EPSG:31982 – SIRGAS 2000 (UTM Projection Zone 22S). The files were merged and cropped within the extension of the screen that contemplated the entire hydrographic basin upstream of the EEAB using as a reference the shapefile file made available free of charge by the SIGA-GO portal of SEMAD.

The extraction of the perimeter of the drainage area was carried out through three stages: delimitation of the basin, reclassification of the pixels of the raster image and polygonization of the reclassified pixels. The first and third steps were automated through Python scripts that, in addition to ensuring the execution of the procedure and generation of an error-free file, automated several steps that could have been done manually.

These scripts were generated and adapted with the help of Copilot, a Microsoft Artificial Intelligence assistant, for these scripts to be generated it is necessary to have an AI conduction methodology to acquire the desired result. The desired file is the "basin raster". The pixels in this file, due to the nature of their processing, generate pixels whose value ranges from 0 to 8000. These are representative values proportional to the pixel value of the file in which it was processed, with 0 being the northwesternmost pixel of the raster file and 8000 the southeasternmost pixel of the raster file, that is, respecting the natural slope of the terrain captured by the DEM. The "basin raster" file is reclassified using the native QGIS algorithm "Resort by table", using the values presented in Table 1 as a parameter.

Table 1

Pixel reclassification table

Minimum Value	Maximum Value	Pixel Value
5264	6836	1
- ∞	5263	0

Source: The authors, 2026.

The delimiter was defined according to the manual evaluation of the gray spots formed in the graphical representation of the raster file using a simple gray band. The pixel value at

the EEAB point is 5264, so every basin is bounded by the pixels above this value and below 6836. The maximum limit was defined because, in every extension of the raster file, there are points of elevation greater than that of the watershed, so a maximum delimiter must be inserted in the algorithm to correct the formation of the perimeter of the drainage area. When reclassifying the raster file from the basin, this generates a new black and white raster file, where black is the representation of the pixels with an assigned value of 1 and white, are the pixels with an assigned value of 0.

To identify the vegetation present within the PPA boundaries, satellite images from Landsat 8-9 Level 2 and Sentinel-2 Level 2 were used. The rasters files were acquired through the official USGS and Copernicus EarthExplorer portals. For the analysis of the presence of vegetation, the use of the NDVI (Normalized Difference Vegetation Index) vegetation index was considered. The index uses in its calculation the digital numbers (ND) of the bands in the Near Infrared and Red range.

$$NDVI = \frac{ND_{\text{Infravermelho Próximo}} - ND_{\text{Vermelho}}}{ND_{\text{Infravermelho Próximo}} + ND_{\text{Vermelho}}} \quad (1)$$

The files have been redesigned for SRC EPSG:31982 – SIRGAS 2000 (UTM Projection Zone 22S). The rasters were cut using the overlay layer of the vector file of the drainage area, thus obtaining a raster file delimited by the watershed. To obtain the raster file calculated according to the NDVI index using the B4 band (spectral resolution of 0.76 – 0.90 µm) and the B5 band (spectral resolution of 1.55 – 1.75 µm) for Landsat 8-9, for Sentinel-2, the B4 band (spectral resolution of 0.665 µm) and the B8 band (spectral resolution of 0.842 µm) were used. The NDVI classification followed the classification of Bitencourt *et al.* (1997) for the phytophysionomies of the Cerrado (Table 2).

Table 2

NDVI classes according to phytophysionomy

Phytophysionomies	Classes NDVI
Dirty Field	0.0261 to 0.2036
Wet Field	0.0261 to 0.2036
Cerrado Field	0.2037 to 0.2629
Cerrado sensu stricto	0.2630 to 0.3813
Cerrado sensu stricto tending to Cerradão	0.3814 to 0.4405
Cerradão	0.4406 to 0.5589
Mesophilic forest	0.4406 to 0.5589

Source: Adapted from Bitencourt (1997).

To identify permanent preservation areas adjacent to springs, it is necessary to select a phytophysionomy dense enough to offer a dense vegetation cover on the soil, as a

criterion, it was considered as minimum in terms of vegetation density, the formation of Cerradão sensu stricto up to the mesophilic forest, that is, the ND that store a value equal to or greater than 0.2630 indicated the presence of healthy vegetation to compose the APP (Riparian Forests), while values below 0.2630 represented a deficit or absence of vegetation.

To highlight only the pixels that contained the vegetation within the given limit, it is necessary to reclassify the raster file calculated by NDVI to redefine through a predetermined parameter, changing the original image (Fitz, 2008). The native QGIS algorithm "Reclassify by table" was used to enforce the pre-established parameters. Any pixel with a value equal to or greater than 0.2630 will be reclassified to 1, while any pixel with a value less than 0.2630 will be reclassified to 0.

The product of the execution of this algorithm under these parameters is a black and white raster file that allows a better visualization of the places where there is the presence of vegetation considered sufficient to compose a riparian forest. The raster file was cropped to within the boundaries of the APPs of the watercourses and vectorized to form a single polygon-shaped file, allowing area calculation and visualization by overlay in KML format in Google Earth Pro.

4 RESULTS AND DISCUSSIONS

The use of GIS tools is fundamental as well as the critical analysis, both quantitative and qualitative, of the modification suffered by natural vegetation or implanted by human interference. Given the difficulty of access and resources to capture images of extensive areas, the use of satellite images is crucial in the analysis of vegetation on large scales, compensating for the low accuracy when compared to the use of Unmanned Aerial Vehicles (UAVs) with attached optical sensors.

To quantify the presence of vegetation in the legal zones of permanent preservation areas, the use of remote sensing data proved to be effective for monitoring these areas intercepted by linear projects, allowing the identification of changes in vegetation cover (Tagliari; Batista, 2020).

All the polygons used were acquired free of charge in different databases on the internet, using as a reference to start the analysis, the data made available by public agencies such as the State Geoinformation System (SIEG) and the Environmental Geographic Information System (SIGA-GO). As for the raster files, they are obtained through official portals that periodically publish the images captured by the satellite sensors.

Free access to this data allows the promotion of research and analysis carried out by private or public initiatives, for-profit or not, establishing an active community for

environmental analysis. These databases play a key role in the selection and conservation of green areas for biodiversity, as they provide consistent data on land use and vegetation cover (Wiens *et al.*, 2009).

The results obtained in the diagnosis of the Permanent Preservation Areas (PPAs) of the Meia Ponte River Basin, upstream of the SANEAGO Raw Water Pumping Station in Goiânia, were satisfactory. These reinforce the importance of using remote sensing and geoprocessing techniques for sizing green areas in zones of ecological importance.

Previous studies have already demonstrated the effectiveness of these GIS tools in monitoring vegetation cover and assessing anthropogenic pressure on PPAs (Tagliari; Baptista, 2020; Campos *et al.*, 2015; Santos *et al.*, 2014). In this context, the incorporation of artificial intelligence methods represents a significant advance, as it expands the ability to classify and interpret orbital images, allowing greater precision in the detection of environmental changes (Maxwell; Warner; Fang, 2018).

The processing of data in a GIS tool, in scientific means, follows protocols so that the experiment is repeatable in other machines. Many of the procedures applied can be simplified as a sequence of actions promoted by the tools through the software's native algorithms. The use of A.I.s allows the automation of these protocols and the understanding of the procedures performed.

This perspective dialogues with Liu (2006) and Wiens *et al.* (2009), which highlight the importance of remote sensing tools applied to environmental and ecological analyses. In addition, considering that the hydrological function of riparian forests is essential for the regulation of the water cycle (Lima; Zakia, 2000; Miranda; Silva; Oliveira, 2010), the use of learning algorithms becomes a promising tool for automating procedures, facilitating more robust environmental diagnoses.

The calculation for the watershed was made considering the resolution of the raster file made available by the TOPODATA project database. The total area of the drainage zone at the point of the SANEAGO Raw Water Pumping Station in Goiânia was 1614.1426 km², approximately 13.25% of the Meia Ponte River basin.

Landsat 8-9 and Sentinel-2 have divergences in their optical sensors, mainly in spatial resolution and spectral resolution. A considerable divergence was identified, which directly interferes in the calculation of the green area present within the watershed, specifically in the legal zone of permanent preservation areas. There was a vegetation difference of 1.47% between the analyses performed on the two satellite images, as shown in Table 3.

Table 3*Pixel reclassification table*

Satellite	Total Area (km ²)	Percentage of Total Area (%)
Landsat 8-9	58,5666	3,62
Sentinel - 2	82,2799	5,09
Average	70,4232	4,36

Source: The authors, 2026.

There is a limitation of how much the satellite image is able to capture through its sensors, the light emitted by vegetation, this is due to factors such as atmospheric distortions, presence of clouds, spatial resolution of the pixel, physiological stage of the plant, period of drought or rain, and so on. All these factors affect the accuracy of the analysis, distorting the information acquired from reality.

According to Liu (2006), satellite images are indirect representations of the Earth's surface, they are limited to spatial, spectral and temporal resolution. The same author also points out that cloud cover and atmospheric conditions compromise the fidelity of the information. Therefore, we have created a virtual environment that represents reality, even if at a certain distance from reality, to facilitate the interpretation of data that are imperceptible to human senses.

The monitoring of the presence of vegetation is associated with the evaluation of the vigor of the forest population in a given period of analysis, being subject to variations, and which intrinsically depend on the type of phytophysiology. In the work of Bitencourt *et al.* (1997), satisfactorily demonstrated that it is possible to identify different phytophysonomies of the Cerrado, using NDVI classifications.

These classifications became effective for the evaluation of the presence of vegetation in riparian forests in the watershed. (1997) and visualize where forest formations such as gallery forests, cerradão and cerrado sensu stricto are present.

However, the pressure of agriculture is one of the factors in the suppression of riparian forests, which is why it is still a pertinent advance that replaces the existing vegetation with an implanted one, exogenous to the place. In an image classification operation, the areas mixed with gallery forests and cultivation zones appear to be a single continuous area of vegetation in an indistinguishable way.

There is a zone of vegetation contiguous to the springs, which despite having already been filtered using the raster reclassification using the values in Table 4 as a reference, there are still zones where there is this mixture between crops and native vegetation. It is an error considered during the diagnosis of the presence of vegetation, but it requires the development of new methods to perform this separation.

Table 4

Table of areas of the total vegetation of the basin

Satellite	Total Area (km ²)	Percentage of Total Area (%)
Landsat 8-9	221,3424	13,71
Sentinel - 2	402,3410	24,92
Average	311,8417	19,31

Source: The authors, 2026.

The ability to capture the lengths of electromagnetic radiation reflected by vegetation depends on the intrinsic characteristics of the sensor and its spatial resolution. The significant difference between the areas of vegetation detected by the two satellites is due, in this case, to the spatial resolution, being 30 meters for Landsat 8-9 and 10 meters for Sentinel-2. Therefore, for more accurate analyses, Sentinel-2 has greater accuracy, facilitating the understanding of reality through the virtual environment of the GIS.

The permanent preservation area of the entire hydrographic basin downstream of the EEAB belongs to only 3.62% and 5.09%, analyzed by Landsat and Sentinel-2 respectively. And, compared to the entire vegetated area, classified according to the work of Bitencourt *et al.* (1997), makes up only 26.45% and 20.45%, analyzed by Landsat and Sentinel-2, respectively. The proportion of vegetation by the total area and by the vegetated area provide us with important points to analyze the complexity of the flora system of the watershed.

The amount of vegetated area is notoriously small even if, even considering within these values, the cultivation zones, that is, approximately 70% of this entire area is composed of pastures, easements, reflecting pools or urban areas. The amount of vegetated area is notoriously small even if, even considering within these values, the cultivation zones, that is, approximately 70% of this entire area is composed of pastures, easements, reflecting pools or urban areas. The removal of native vegetation in areas of PPAs of springs, such as gallery forests and wetlands, directly compromises water quality, accelerates river sedimentation and reduces the recharge of underground aquifers (Silva, *et al.*, 2010). Figure 1 and Figure 2 clearly represent the difference generated by the difference in the spatial resolution of the image.

Figure 1

It is through the satellite monitoring of the APP that it is possible to diagnose the extent of the areas with absence of vegetation in the APP, although the on-site investigation can directly validate the reality of an enterprise, the evaluation on large scales only takes place through the creation of a virtual environment that allows the complete visualization of these large areas.

Both satellites showed a difference in light capture per square meter due to spatial resolution, this analysis directly interfered in the determination of vegetation per raster pixel. While Landsat offers an image with checkerboard and less fluid zones, where there is little understanding of vegetation continuity, Sentinel-2 allowed for greater precision in places where there is vegetation and at the beginning and end of green spots.

Tables 3 and 4 demonstrate this difference through the quantification per square kilometer of vegetated area through a process of pixel reclassification that uses, as a condition, the work of Bitencourt (1997). However, for large-scale environmental analyses, Landsat can still prove useful for the evaluation of vegetation in large areas, while for research whose objective is a more detailed evaluation, the use of Sentinel-2 is recommended.

This research was conducted considering the possibilities of access to information that is publicly available on the internet through different databases, all the sources cited, manipulated and used are available on the internet. The availability of satellite images by projects such as Landsat and Sentinel-2, for example, made it possible to monitor vegetation cover, enabling the identification of land use conflicts (Copernicus, 2025; Oliveira; Pirajá, 2022).

Currently there are many consultancies that take advantage of satellite images available on the internet to generate marketable products such as charts, maps and technical reports. There is an active search for enterprises for environmental services that are capable of providing remote sensing services for the regularization of environmental liabilities or strategic reallocation of resources on their property.

The study by Tagliari and Baptista (2020) demonstrates how the use of open remote sensing data is effective in detecting interference in APPs caused by large projects, such as railways. Public services such as the CAR require a prior analysis of the rural enterprise through the entrepreneur or consultancy for the analysis and delimitation of vegetation, pastures, cultivation plots, consolidated areas, easements, constructions and so on. Geoprocessing does not depend exclusively on restricted or high-resolution data, but on a well-structured methodology and the initiative of those who analyze.

This research also aimed at a simple and pedagogical development, using tools such as artificial intelligence and Python scripts that are accessible to the public, of a methodology

for the production of cartographic products whose purpose is the classification, identification and evaluation of the presence of vegetation in a study area. Information, in turn, is data modified and transformed so that it is readable and interpretable by a user.

Irregular land occupation in permanent preservation areas can be identified through these accessible tools and methodologies, as shown by Campos *et al.* (2015) and Santos *et al.* (2014), who used geoprocessing to evaluate land use conflicts in micro-basins. Therefore, the inspection carried out at a distance through satellite images is a means of identifying areas with liabilities.

However, the identification and regularization will only occur through the receptive action of the secretariats (municipal or state) of the environment, something that is already facilitated given the accessibility of the inspectors regarding the daily updated satellite images and tools such as UAVs and transportation for displacement. The identification of these environmental liabilities occurs only after the entry of a request to open a process to regularize some activity of the requesting entrepreneur within a rural property.

Only after the prior analysis of the documentation and opening of the process will there be a diagnosis of the project to identify these liabilities, provided that, in the opening of this request, there is as a criterion the detection of irregular areas and zones. With this detection, the entrepreneur is obliged to carry out the appropriate measures so that the environmental liabilities are regularized.

It is a passive, retrograde and slow logic of environmental monitoring. The result of this is the ineffectiveness of public environmental agencies in carrying out adequate maintenance of ecological zones that need attention, conservation, regeneration and preservation. Environmental regularization and preservation of the environment depends on the denunciation or self-denunciation of an environmental activity. Meanwhile, the irregular suppression of vegetation, especially riparian forests, progresses exponentially to the benefit of the passive and linear detection of these irregularities by the competent bodies.

With the amendment of the forest code by Law No. 12,727/2012, there were concerns about the flexibility of the protection of water resources, which made the active role of society in terms of environmental surveillance even more relevant (Brasil, 2012; Silva *et al.*, 2010). Environmental inspection can be decentralized and collaborative, especially in these cases in which official agencies demonstrate slowness or passivity in the face of projects that are awaiting licensing.

Remote sensing creates a virtual and organic environment between different people, who carry out different research and activities, from the creation of cartographic products and distribution of this information. In an ideal world, this information, in the form of cartographic

products or shapefiles or rasters for example, could be shared in a large public database that would be continuously fostered by the users themselves.

This would reduce the time of analysis and data collection for different users of geoprocessing. In addition, in this scenario, there would be more and more recent and updated data for different objectives, integrating a virtual ecosystem that constantly seeks to map reality through optical sensors installed in drones or satellites. The possibility of cross-referencing public data, such as those from the IBGE (SIDRA and Environmental Economic Accounts), with satellite images, allows for an integrated analysis of the pressure on natural resources, especially in areas of agricultural and livestock expansion (Ana, 2022; Rivero *et al.*, 2009).

Who, in principle, identifies the first environmental liabilities, are the consultancies or private analysts who carry out a prior analysis under criteria established by legislation, of the activities of their clients. With the information in hand, it is already possible to prepare a regularization strategy to be presented to the environmental agency.

Regularizations will only occur if, after prior analysis, the entrepreneur decides to continue with the administrative process to acquire his desired authorization, under the condition of regularizing his liabilities. The initiative to unify all these geoprocessing agents in a single virtual environment for sharing and cross-referencing data is reserved for public agencies, thus increasing the contact between public and private agents and increasing the amount of tax.

The data obtained can subsidize environmental regularization actions via the Rural Environmental Registry (CAR) and Environmental Recovery Programs (PRA), contributing to territorial planning and the conservation of water resources.

5 CONCLUSION

The present work demonstrated the relevance of the use of geotechnologies, especially remote sensing for the evaluation of Permanent Preservation Areas (PPAs) in the Meia Ponte River Basin downstream of the SANEAGO Raw Water Pumping Station in Goiânia.

The analysis of the images from the Landsat and Sentinel-2 satellites made it possible to accurately map the river's tributaries and identify the presence and absence of vegetation contiguous to the springs, within the legally protected strips. The identification of the vegetation was possible through the classification of the image by NDVI index, highlighting the pixels that were contemplated by the class linked to a dense vegetation.

Sentinel-2 was able to be more accurate in identifying vegetation throughout the APP zone of the watershed using the same classification criteria. Through the development of a simple and efficient methodology, using data from public databases as its main resources, any user of open source GIS is able to replicate the procedures for identifying vegetation around APPs in other watersheds. This study reinforces the need for more effective and integrated public policies that encourage the restoration of native vegetation and promote the sustainable management of water resources.

ACKNOWLEDGMENTS

I thank, above all, Olorum, who allowed the necessary enlightenment for me to see the entire trajectory until I could reach this moment. For having given me strength when there was nowhere else to sustain myself. For having taught me to have love in every action applied to this world.

I thank all those I love in the bottom of my heart, especially my parents Anegleyce Teodoro Rodrigues and Jefferson Luiz Clemente de Oliveira, who offered me all the material, emotional and mental resources to make my graduation a reality.

I thank the Terreiro Casa Espírita Anjo Ismael, which offered me the hope, strength and faith necessary to sustain this journey, through love.

I thank all those who, throughout my career, helped me, supported me and motivated me in some way throughout my graduation and the construction of my TCC.

I also thank Leonardo de Campos Lopes for being my tutor in order to transform me into the professional I am today and for having introduced me to the entire universe of my area of expertise.

ABSTRACT

This study aimed to map and identify sites of irregular solid waste disposal in the urban area of Chapadinha (Maranhão, Brazil), characterizing their spatial distribution and associated socio-environmental risks. A descriptive and exploratory approach was adopted, involving on-site observations, photographic records, georeferencing, and informal conversations with residents. Eleven critical points were identified, predominantly composed of household waste, plastics, organic material, and construction debris, typically deposited over exposed soil and vegetation. Investigation of the municipal open dump revealed inadequate waste management practices, including open burning, worker exposure without Personal Protective Equipment, and uncontrolled leachate formation. The findings demonstrate significant public health impacts, such as vectors proliferation, environmental contamination, and greenhouse gas emissions. The study offers evidence to support environmental management policies and environmental education initiatives in the municipality.

RESUMO

Este estudo teve como objetivo mapear e identificar pontos de descarte irregular de resíduos sólidos na área urbana de Chapadinha (MA), caracterizando sua distribuição espacial e os riscos socioambientais associados. A pesquisa adotou abordagem descritiva e exploratória, com observações in loco, registro fotográfico, georreferenciamento e conversas informais com moradores. Foram identificados 11 pontos críticos, com predominância de resíduos domésticos, plásticos, orgânicos e restos de construção civil, geralmente depositados sobre

solo exposto e vegetação. A investigação no lixão municipal revelou manejo inadequado, incluindo queima a céu aberto, exposição de trabalhadores sem Equipamentos de Proteção Individual e formação de chorume sem contenção. Os resultados evidenciam impactos sobre a saúde pública, como atração de vetores, contaminação ambiental e emissão de gases de efeito estufa. O estudo fornece subsídios para políticas de gestão ambiental e ações de educação ambiental no município.

RESUMEN

Este estudio tuvo como objetivo mapear e identificar puntos de disposición irregular de residuos sólidos en el área urbana de Chapadinha (MA), caracterizando su distribución espacial y los riesgos socioambientales asociados. La investigación adoptó un enfoque descriptivo y exploratorio, con observaciones in situ, registros fotográficos, georreferenciación y conversaciones informales con los residentes. Se identificaron once puntos críticos, que contenían predominantemente residuos domésticos, plásticos, residuos orgánicos y escombros de construcción, generalmente depositados sobre suelo y vegetación expuestos. La investigación en el vertedero municipal reveló una gestión inadecuada, incluyendo la quema a cielo abierto, la exposición de trabajadores sin equipo de protección individual (EPI) y la formación de lixiviados sin contención. Los resultados destacan los impactos en la salud pública, como la atracción de vectores, la contaminación ambiental y la emisión de gases de efecto invernadero. El estudio respalda las políticas de gestión ambiental y las acciones de educación ambiental en el municipio.

Palabras clave: Resíduos Sólidos. Disposición. Medio Ambiente. Salud Pública. Maranhão.

1 INTRODUCTION

Social, economic, political, cultural, technological, and educational transformations have reconfigured the modes of interaction and communication processes, requiring continuous adjustments in personal and professional activities (Toebe, 2016). In the educational field, these changes have a direct impact on the organization of formal education, which also needs to adapt to new rhythms, demands and forms of knowledge circulation.

We live in a context marked by the acceleration of time, the fluidity of relationships and the need for constant adaptation, characteristics of liquid modernity (Bauman, 2001). In this scenario, time management becomes a daily challenge, as the fast pace does not necessarily correspond to the meaning or predictability of actions, producing a feeling of emptiness and discontinuity (Skliar, 2014). Contemporary society, guided by agility and efficiency, demands fast, accessible practices with often reduced social interaction, reinforcing the centrality of digital technologies in this process of rearrangement of human and professional relations (Bauman, 2001).

The COVID-19 pandemic in 2020 intensified this scenario of uncertainties and transformations. The social distancing measures adopted globally to contain the spread of the virus have required abrupt adaptations in the world of work, in daily life, and especially in the university environment (Monteiro, 2020). The impact of the pandemic was broad and deep, affecting economic, social, and emotional dimensions of the population, with worsening inequalities and interruption of essential activities, including education.

In the educational sphere, higher education institutions needed to quickly restructure their practices to ensure the continuity of academic activities. The adoption of Emergency Remote Learning (ERE) has become the main strategy to mitigate the gaps generated by the suspension of face-to-face classes, imposing significant challenges on university networks across the country (Arruda, 2020). The regulation of this model, through CNE/CP Opinion No. 5, of April 28, 2020 (Brasil, 2020), guided the pedagogical reorganization during the isolation period, emphasizing the need to understand its impacts on student learning and training.

In this context of social transformations and reconfigurations in urban daily life, environmental issues, such as the inadequate disposal of solid waste, become even more critical. The identification and mapping of irregular disposal points are essential to subsidize public policies, guide environmental management actions and promote improvements in the quality of life of the population.

Thus, the objective of this study was to map and identify the points of inadequate disposal of solid waste in the urban area of Chapadinha, Maranhão, aiming to characterize

the current situation and provide subsidies for environmental management strategies in the municipality.

2 METHODS

The research was developed based on descriptive and exploratory procedures, adopting a qualitative and quantitative approach. Initially, a literature review was carried out in scientific articles, books and institutional documents related to solid waste disposal, urban environmental management and socio-environmental impacts.

2.1 AREA OF STUDY AND OBSERVATION SCRIPT:

The collection of empirical data took place at different points in the urban area of Chapadinha (MA), selected for presenting a history or evidence of irregular waste disposal. The observation route included:

- ✓ area of the cemetery in the Boa Vista neighborhood;
- ✓ surroundings of the Parque Universitário condominium;
- ✓ region near the water tank in the Mutirão neighborhood;
- ✓ dirt road located at the back of the Esplanade neighborhood;
- ✓ Gustavo Barbosa Avenue (Downtown);
- ✓ internal roads in the Vila Isamara, Liberdade and Vila Brasil neighborhoods.

These locations were chosen to allow the identification of the spatial distribution, the composition of the waste and the disposal methods adopted by the population, as well as to assess the associated socio-environmental risks.

2.2 FIELD PROCEDURES:

On-site visits were carried out, during which images were recorded using a cell phone with a high-resolution camera. The direct observation was complemented by informal conversations with residents of the investigated areas, in order to understand the local dynamics of disposal, community perception and the periodicity of waste disposal.

2.3 OBSERVATION IN THE MUNICIPAL DUMP:

In addition to the scattered points of irregular disposal, a technical visit was made to the municipal open-air dump, the final destination of the waste collected by the Municipal Department of Infrastructure and Public Cleaning. The area is surrounded by vegetation and presented two relevant conditions:

1. Reduction in the area occupied by the dump: It was found that the space previously used was significantly larger. The reduction in area occurred through the process of deep scraping of the soil with heavy machinery, removing vegetation and waste simultaneously. This procedure left extensive portions of soil exposed, with signs of erosion and absence of any environmental mitigation or recovery action.
2. Working conditions and waste management: It was observed the presence of workers manually separating PET bottles, which would later be sent to São Luís for recycling. The remaining waste, including non-recycled, organic, and mixed plastics, remained on site for open incineration. None of the workers used Personal Protective Equipment (PPE), such as respiratory masks, gloves, overalls or closed shoes, being exposed to physical, chemical and biological risks.

3 DEVELOPMENT

Through on-site visits, 11 points of irregular disposal of solid waste were recorded in the urban perimeter of the municipality of Chapadinha - MA and, with the collection of the coordinates of the locations, it was possible to generate a map with their spatial distribution (Figure 1).

We can highlight that solid waste in the study period was collected in this municipality only in urban areas, in addition, public garbage cans are insufficient in the main streets of the city (some were destroyed by vandals) and in more remote areas they are non-existent. Also in this scenario, we can highlight the lack of awareness on the part of residents, who in many situations deposit their waste inappropriately, especially in vacant lots.

Figure 1

Places of irregular disposal of solid waste in the urban perimeter of Chapadinha - MA

Source: Google Earth, 2022.

Due to this habit of a significant part of the population, this environment becomes an attractive source for several groups of animals which can vector a wide range of diseases, especially to the residents of the vicinity, making it not only an environmental problem but also involving several issues for public health programs.

In the sites investigated in the urban area of Chapadinha (Figure 2), there was a predominance of domestic waste, with a strong presence of plastics and organic materials, accompanied by civil construction and textile waste. The frequent disposal of these materials directly on vegetation and exposed soil highlights a vulnerable environmental scenario, in which natural processes of decomposition and interaction with the physical environment can amplify relevant health risks.

Figure 2

Garbage distribution in different locations in the municipality of Chapadinha – MA

Locations checked: a. In front of the cemetery in the UFMA area; b. In front of the University Condominium in the University Park; c. Next to the Water Tank in the Mutirão; d. 3 Different Garbage Points on the Dirt Road at the Bottom of the Esplanade Neighborhood; e. Garbage piled up on a public road at Av. Gustavo Barbosa; f. Garbage Accumulated in the Back of a Residence in the Liberdade Neighborhood Where Collection Does Not Occur. Source: Francisca Lima (2022)

The report of the Municipal Plan for Basic Sanitation of Chapadinha (PMSB, 2015) already pointed out that the municipality generated, at the time, approximately one thousand tons of waste per month, a number that did not include waste produced in rural areas, still devoid of systematic collection. From the observations made in this study, it was found that, in different urban areas and in the municipal dump, the reduction of the volume of waste usually occurs through the practice of direct burning. This procedure releases large amounts of greenhouse gases, especially carbon dioxide and methane, the latter up to twenty-eight times more potent than CO₂ in its global warming potential.

The scientific literature shows that the increase of these gases in the atmosphere is associated with multiple impacts on human health, such as increased extreme temperatures, intensification of severe weather events, and worsening of respiratory diseases. The WHO estimates that between 7 and 8 million people die annually as a result of air pollution (WHO, 2021), with children, the elderly, and people with previous clinical conditions being the most vulnerable groups. Climate change also has repercussions on the ecological balance, influencing vector population dynamics and expanding the distribution of diseases such as dengue, malaria and leishmaniasis, which find favorable conditions for proliferation in scenarios of intense heat and irregular rainfall.

Another critical element related to waste management is leachate, a highly concentrated liquid that is formed from the decomposition of the organic fraction. The absence of adequate containment and waterproofing systems allows its infiltration into the soil, increasing the risk of contamination of surface layers and groundwater. According to Costa (2021), leachate can carry heavy metals, toxic compounds, protozoa, and parasite eggs, posing a significant threat to human health. Exposure can occur both by consuming water from contaminated aquifers and by eating food grown in affected soils.

Thus, the observed results indicate that the interaction between solid waste, soil, water and atmosphere constitutes a central axis for the understanding of environmental and sanitary impacts in the municipality. The characterization of these processes is essential to support actions aimed at minimizing risks, promoting healthier urban environments, and strengthening preventive strategies based on scientific evidence.

4 FINAL CONSIDERATIONS

The mapping and identification of irregular solid waste disposal points in the urban area of Chapadinha showed a multifaceted scenario, in which environmental, social and public health factors are intertwined. The analysis of the visited sites revealed that the inadequate disposal of waste predominantly of domestic origin, but also composed of civil construction materials and textiles, occurs recurrently on exposed soil and vegetation, favoring environmental degradation processes and increasing the potential for health risks.

The observations carried out demonstrate that the current management of waste, both at the points distributed throughout the city and at the municipal dump, favors the release of greenhouse gases, the formation of leachate and human exposure to vectors and harmful substances. Such elements, widely documented in the scientific literature, contribute to the worsening of air pollution, soil and groundwater contamination, and increased vulnerability of the most sensitive populations, such as children, the elderly, and people with preexisting clinical conditions.

The results of this study reinforce the understanding that solid waste management is an essential component of environmental health and should be treated as a strategic axis for the promotion of quality of life in urban environments. The detailed characterization of the points of irregular disposal allows subsidizing more effective actions of planning, inspection, environmental education and territorial planning, in addition to guiding public policies aimed at mitigating the socio-environmental impacts identified.

Although this work does not propose to exhaust the theme, its evidence contributes to a broader reading of the problem and points to the need for intersectoral approaches, based

on sustainable practices and continuous monitoring processes. The strengthening of adequate waste management strategies, combined with community participation and integration between educational institutions, civil society and public management, is a promising path for the construction of a more environmentally balanced and socially healthier city.

In summary, the findings presented reaffirm that the efficient management of solid waste is a contemporary challenge of great complexity, whose overcoming requires technical knowledge, environmental sensitivity and collective commitment. The present study seeks to contribute to this process by offering a detailed and grounded diagnosis, capable of supporting decisions and fostering transformative actions in the municipality of Chapadinha.

ABSTRACT

Considering the accelerated aging of the Brazilian population and the impact of mental disorders on older adults' functionality and quality of life, early detection of anxious and depressive symptoms is essential in Primary Health Care. This study aimed to identify the prevalence of depressive symptoms among older adults assisted at a Primary Health Care Unit in Gurupi, Tocantins, Brazil, using the Geriatric Depression Scale (GDS). This is a cross-sectional, observational, quantitative study conducted with 24 older adults aged 65 to 84 years. Data were analyzed using descriptive and inferential statistics, adopting a 5% significance level. The overall prevalence of depressive symptoms was 45.8%, with a predominance of mild cases. No statistically significant associations were observed between sex or age and GDS scores. These findings reinforce the importance of standardized mental health screening tools in Primary Health Care to enable early identification and timely interventions. Systematic screening contributes to comprehensive care and prevention of disease progression.

RESUMO

Considerando o envelhecimento acelerado da população brasileira e o impacto dos transtornos mentais na funcionalidade e qualidade de vida dos idosos, a detecção precoce de sintomas ansiosos e depressivos torna-se essencial na Atenção Primária à Saúde. Este estudo objetivou identificar a prevalência de sintomas depressivos em idosos atendidos em uma Unidade Básica de Saúde do município de Gurupi-TO, utilizando a Escala de Depressão Geriátrica (GDS). Trata-se de um estudo observacional, transversal e quantitativo, realizado com 24 idosos, com idades entre 65 e 84 anos, acompanhados pela Estratégia Saúde da Família. Os dados foram analisados por estatística descritiva e inferencial, adotando-se nível de significância de 5%. Observou-se prevalência global de sintomas depressivos de 45,8%, com predominância de quadros leves. Não foram identificadas associações estatisticamente significativas entre sexo ou idade e a pontuação na GDS. Os achados reforçam a importância da utilização de instrumentos padronizados na rotina da Atenção Primária, permitindo a identificação precoce de sintomas depressivos e o planejamento de intervenções oportunas. Conclui-se que o rastreamento sistemático da saúde mental do idoso contribui para a integralidade do cuidado e para a prevenção da progressão dos transtornos mentais.

1 INTRODUCTION

Population aging is one of the main contemporary challenges for health systems, especially in developing countries. In Brazil, the growth of the elderly population has been accompanied by an increase in the prevalence of chronic non-communicable diseases and common mental disorders, such as anxiety and depression, which directly impact the functionality, autonomy, and quality of life of this population (IBGE, 2023; World Health Organization, 2021).

Depression in the elderly often presents atypical clinical manifestations, which can be confused with physiological changes of aging or with symptoms resulting from clinical comorbidities, which contributes to underdiagnosis, especially in the context of Primary Health Care. It is estimated that a significant portion of depressive conditions in the elderly are not identified early, delaying therapeutic interventions and increasing the risk of worsening the clinical condition (Aguilar *et al.*, 2022).

In this scenario, Primary Health Care assumes a strategic role in the early identification of mental health problems, as it is the main gateway for users to enter the Unified Health System. Multiprofessional action, combined with the use of standardized screening instruments, allows for a comprehensive and problem-solving approach to elderly care (Brasil, 2001).

Studies developed in the field of health care for the elderly emphasize the importance of integrated clinical strategies, which consider not only biological aspects, but also psychosocial, functional and medication-related factors. In this context, the relevance of pharmaceutical care and longitudinal clinical follow-up as fundamental components of comprehensive care for the elderly is highlighted (Faria; Paiva, 2021).

Therefore, the present study aimed to identify the prevalence of depressive symptoms in elderly people treated at a Basic Health Unit in the city of Gurupi-TO, using the Geriatric Depression Scale as a screening instrument.

2 THEORETICAL FRAMEWORK

2.1 MENTAL HEALTH OF THE ELDERLY IN PRIMARY HEALTH CARE

Primary Health Care is recognized as the most appropriate level of care for the early identification of mental disorders in the elderly, due to the longitudinal link established between health professionals, users and their families. Early detection of anxious and depressive symptoms allows for timely interventions, reducing hospitalizations, functional decline, and associated mortality (World Health Organization, 2021).

However, the approach to the mental health of the elderly still faces challenges, such as the limitation of time in consultations, the prioritization of physical complaints, and the stigma associated with mental disorders. These factors contribute to the underestimation of emotional symptoms, especially when they are mild or nonspecific (Cunha; Bastos; Duca, 2012).

The literature indicates that factors such as social isolation, affective losses, the presence of multiple comorbidities, and the use of multiple medications are strongly associated with the development of depressive symptoms in the elderly, reinforcing the need for a comprehensive and multiprofessional approach (Rosa; Lisbon; Tomaz, 2019).

2.2 SCREENING INSTRUMENTS AND COMPREHENSIVE CARE FOR THE ELDERLY

Among the instruments available for screening depression in the elderly, the Geriatric Depression Scale (GDS) stands out for its wide use, validity and ease of application in the context of Primary Care. Developed by Yesavage et al. (1983), the GDS has good sensitivity and specificity for the identification of depressive symptoms, including in mild cases.

The use of standardized instruments should be associated with integrated clinical strategies that consider the context of the elderly's life and promote longitudinal care. Studies on pharmaceutical health care for the elderly show that continuous clinical follow-up contributes to the identification of mental health problems, improved therapeutic adherence and reduction of negative outcomes related to the use of medications (Faria; Paiva, 2021).

In addition, recent experiences in the field of pharmaceutical services and primary care demonstrate that the qualification of health professionals and the adoption of evidence-based clinical practices are fundamental for facing complex situations, such as those experienced during the COVID-19 pandemic, reinforcing the importance of clinical reasoning and comprehensive care in vulnerable populations, including the elderly (Silva; Paiva, 2021).

Thus, the integration between systematic screening, multiprofessional action and longitudinal follow-up is an essential strategy for the promotion of mental health of the elderly in Primary Health Care.

3 METHODOLOGY

3.1 STUDY DESIGN

This is an observational, cross-sectional, quantitative study, developed within the scope of Primary Health Care. This design was chosen because it allows the estimation of the prevalence of depressive symptoms in a specific population, in a given period, in addition to allowing the exploratory analysis of associations between sociodemographic variables and

the scores obtained on the scale used.

3.2 PLACE OF STUDY

The study was carried out at the Pedroso Basic Health Unit (UBS Ulisses Moreira Milhomem), located in the municipality of Gurupi, state of Tocantins, Brazil. The UBS is part of the Family Health Strategy and serves the enrolled population mostly composed of elderly people with regular follow-up for chronic conditions, which makes it an appropriate setting for studies focused on the mental health of the elderly in Primary Care.

3.3 POPULATION AND SAMPLE

The study population consisted of elderly people treated at the UBS Pedroso, aged 60 years or older. The sample consisted of 24 elderly people, aged between 65 and 84 years, selected by convenience, according to spontaneous demand and attendance at consultations during the collection period.

The sample size reflects the operational characteristics of the service and the exploratory nature of the study, and is compatible with investigations carried out in Basic Health Units.

3.4 INCLUSION AND EXCLUSION CRITERIA

The following inclusion criteria were adopted:

- age 65 years or older;
- be under clinical follow-up at UBS Pedroso;
- present preserved cognitive conditions for understanding and responding to the instrument;
- voluntarily agree to participate in the study, by signing the Informed Consent Form (ICF).

The following were excluded from the study:

- elderly people under the age of 65;
- individuals with previously diagnosed severe cognitive impairment;
- patients who refused to participate or did not complete the application of the instrument;
- elderly people who were unable to respond to the scale due to clinical limitations at the time of collection.

3.5 DATA COLLECTION INSTRUMENT

Data collection was carried out using the Geriatric Depression Scale (GDS), a widely validated instrument used to screen for depressive symptoms in the elderly. The GDS is composed of dichotomous questions (yes/no), easy to understand, allowing quick and appropriate application to the context of Primary Health Care.

The total score of the scale was used to classify the participants into categories of normality, mild depression or severe depression, according to cutoff points described in the literature.

3.6 DATA COLLECTION PROCEDURES

Data collection took place from February to October 2025, during the routine care of the elderly at the UBS. Eligible participants were invited to participate in the study after clarification about the objectives, procedures, and ethical aspects of the research. The application of the GDS was carried out in a private environment, by a trained professional, ensuring comfort, confidentiality and minimization of possible embarrassment. Each application lasted an average of 5 to 15 minutes. The information was recorded anonymously, using numerical codes to identify the participants.

3.7 DATA ANALYSIS

The collected data were organized in an electronic spreadsheet and later analyzed using the Statistical Package for the Social Sciences (SPSS) software, version 25.0. Initially, descriptive statistical analysis was performed, with calculation of means, standard deviations, absolute and relative frequencies.

For inferential analysis, the following were used:

- Student's t-test (or Welch's t-test) to compare means between groups;
- Fisher's exact test for analysis of associations between categorical variables;
- Spearman's correlation coefficient for evaluating the association between age and GDS score.

The significance level adopted was 5% ($p < 0.05$). Whenever relevant, 95% confidence intervals and effect size measures were calculated, aiming at a better interpretation of the results.

3.8 ETHICAL ASPECTS

The study was conducted in accordance with the ethical principles that govern

research involving human beings, according to Resolution No. 466/2012 of the National Health Council. The confidentiality of the information, the privacy of the participants and the right to withdraw at any time were ensured, without prejudice to the care at the health unit.

4 RESULTS AND DISCUSSIONS

The overall prevalence of depressive symptoms identified in this study was 45.8%, with a predominance of mild conditions, evidencing depression as a frequent and often silent condition among elderly people monitored in Primary Health Care. This finding reinforces the clinical and epidemiological relevance of the theme, since a significant portion of individuals present psychological distress that is potentially underdiagnosed in the context of routine care.

Figure 1 illustrates the distribution of the elderly according to the classification of the Geriatric Depression Scale (GDS), showing that 54.2% of the participants were classified within the normal range, while 37.5% had mild depression and 8.3% severe depression. The predominance of mild conditions is of special clinical importance, as it indicates a population in the initial stage of mental illness, in which early interventions can modify the course of the disease.

Figure 1

Distribution of the elderly according to the classification of the Geriatric Depression Scale (GDS) in individuals treated at the Pedroso Basic Health Unit, Gurupi-TO

Source: Survey data (2026)

When the data were stratified by sex, it was observed that 50.0% of men had mild depression, while among women 56.3% had a score compatible with normality and 12.5%

were classified as having severe depression. Figure 2 shows the mean GDS score according to gender, with no statistically significant differences identified between men and women. These findings were confirmed by both *Welch's t-test* and the *Mann–Whitney test* ($p > 0.05$), with an effect size considered small (*Hedges' g* = 0.30), suggesting low practical relevance of this difference in the sample studied.

Figure 2

Percentage distribution of depression diagnoses according to gender in elderly people treated at the Pedroso Basic Health Unit, Gurupi-TO, according to the Geriatric Depression Scale (GDS)

Source: Survey data (2026)

The analysis of the correlation between age and GDS score, performed using Spearman's coefficient, did not show a significant association ($\rho = 0.095$; $p = 0.66$), indicating that the intensity of depressive symptoms was not directly related to chronological age in the population evaluated. Figure 3 summarizes the mean GDS score according to gender, reinforcing the absence of relevant differences between the groups analyzed.

Figure 3

Mean score of the Geriatric Depression Scale (GDS) according to gender in elderly people treated at the Pedroso Basic Health Unit, Gurupi-TO

Source: Survey data (2026).

The prevalence of depressive symptoms, defined as a GDS score ≥ 6 , was 45.8% (95%CI: 27.9–64.9). Among women, the prevalence was 43.8% (95%CI: 23.1–66.8), while among men it was 50.0% (95%CI: 21.5–78.5). Fisher's exact test indicated no statistically significant association between gender and the presence of depressive symptoms ($p = 1.00$), with an odds ratio for depression in females of 0.78 (95%CI: 0.14–4.27).

A meta-analysis of epidemiological surveys estimated a global prevalence in the elderly at around 35.1%, evidencing the magnitude of the problem worldwide and emphasizing that versions and cut-off points of the Geriatric Depression Scale (GDS) significantly influence the estimates (Cai *et al.*, 2023). This variability reinforces the need to interpret the findings in the light of the instrument used and the clinical profile of the population served. The predominance of mild conditions observed in the UBS is clinically relevant because subclinical or mild symptoms are not "benign": there is robust evidence that subthreshold depression is associated with a higher risk of progression to major depression. A systematic review and longitudinal meta-analysis estimated that individuals with subthreshold depression have approximately twice the risk of developing major depression over the course of follow-up (Lee *et al.*, 2019). This finding supports the discussion that screening in PHC should not be limited to identifying only severe cases, as the window of opportunity for prevention and intervention occurs precisely in the initial stages. Figure 4 presents a conceptual model that integrates the main clinical and functional conditions associated with aging, as well as the emotional and psychosocial manifestations frequently

related to depression in community-dwelling older adults. The scheme highlights the central role of Primary Health Care as a strategic level for the systematic screening of these symptoms, considering that factors such as multimorbidity, frailty, functional limitations, and polypharmacy coexist with emotional manifestations, such as depression, anxiety, sleep disorders, social isolation, and cognitive changes. This integrated approach contributes to the understanding of the multifactorial character of depression in aging and reinforces the importance of standardized screening instruments in the routine of services, favoring early identification and the organization of adequate care flows for the comprehensive care of the elderly.

Figure 4

Conceptual representation of the clinical and functional conditions associated with aging and the emotional and psychosocial manifestations related to depression in the elderly in the community, highlighting the role of Primary Health Care in systematic screening

Source: Prepared by the authors. (2026)

In addition, depression in old age usually presents a distinct clinical expression, with a greater presence of somatic complaints, cognitive alterations and reduced interest, which can

make it difficult to recognize when care is based only on spontaneous demand (Fiske; Wetherell; Gatz, 2009). This characteristic helps to explain why, in practice, many cases go unnoticed and why screening instruments play a decisive role in the comprehensive care of the elderly.

In the present study, no statistically significant associations were observed between gender or age and the GDS score. This result is compatible with the contemporary understanding that determinants such as multimorbidity, social isolation, frailty, affective losses, low income, and access barriers may exert a greater weight on depressive symptoms than isolated demographic variables, especially in small samples and PHC services. International studies also show that the prevalence tends to be particularly high in contexts of greater clinical and social vulnerability; for example, a meta-analysis with multimorbid older adults found a prevalence close to 46.7%, a value very similar to that observed in this study, suggesting that disease burden and clinical complexity may "approximate" local prevalences to the highest estimates described in the literature (Pundhir *et al.*, 2025).

From the point of view of clinical practice and health policy, it is important to discuss underdiagnosis. Evidence indicates that depression is often under-recognized in adult and older populations, including in middle-income countries. A Brazilian population study pointed to high underdiagnosis, with a significant share of cases not recognized by services/professionals, associated with sociodemographic and access factors (Faisal-Cury *et al.*, 2022). Although its study is local and cross-sectional, the high prevalence of symptoms and the predominance of mild cases are consistent with this scenario: when structured screening is not used, the tendency is for the most subtle cases not to be identified early.

In this sense, the choice of GDS is technically defensible for PHC because it was designed to reduce the interference of common somatic symptoms in aging, favoring clinical applicability. Evidence shows that short versions of the GDS can help PHC teams identify older adults with clinically relevant symptoms, with adequate performance depending on the cutoff point and the version used (D'Ath *et al.*, 1994). In the Brazilian context, validity studies in primary care indicate good accuracy for versions such as GDS-15 at appropriate cut-off points, reinforcing the feasibility of screening at UBS (Castelo *et al.*, 2010). Thus, its findings strengthen the argument that structured screening is a feasible, low-cost, and potentially effective strategy to reduce clinical invisibility of depressive symptoms in the elderly.

In addition, international guidelines and documents have emphasized the importance of timely recognition of mental health conditions in the elderly and of community and integrated care strategies. The WHO emphasizes that management must be integrated with the health needs, personal care and social support of the elderly, with special attention to

factors such as loneliness and isolation (World Health Organization, 2025). In addition, recommendations for screening for depression in adults (including older adults) in primary care are presented in guidelines such as those of the USPSTF, highlighting the value of screening when there are systems for diagnosis and follow-up (USPSTF, 2023). These international references help to support that screening, by itself, should be connected to care flows (reception, clinical evaluation, follow-up and referral when necessary).

Finally, the limitations must be explained in a transparent manner: the small sample size and selection by convenience limit generalization; the cross-sectional design prevents causal inference; and the absence of variables such as schooling, income, multimorbidity, polypharmacy, and social support restricts multivariate analyses. Even so, the study contributes with local evidence applied, reinforcing that screening with GDS in PHC can reveal a significant proportion of elderly people with depressive symptoms, especially mild ones, who represent a priority group for prevention, longitudinal care and timely psychosocial interventions.

5 CONCLUSION

The results of this study show a high prevalence of depressive symptoms among elderly people treated in Primary Health Care, with a predominance of mild conditions, configuring a scenario of relevant impact on public health.

These findings reinforce depression as a frequent and underdiagnosed condition in the elderly population, with potential negative repercussions on functionality, autonomy and quality of life, demanding organized and systematic responses from health services.

The predominance of mild symptoms reveals an important window of opportunity for early interventions in the context of Primary Health Care. The routine incorporation of standardized screening instruments, such as the Geriatric Depression Scale, is a viable, low-cost strategy with a high potential for population impact, allowing the timely identification of cases that could progress to more severe conditions in the absence of adequate follow-up.

From the point of view of public policies, the findings reinforce the need to strengthen mental health actions in the Family Health Strategy, with emphasis on the training of multiprofessional teams, the organization of care flows for longitudinal follow-up, and articulation with the Psychosocial Care Network. The early detection of depressive symptoms should be recognized as a strategic priority of health policies, contributing to the promotion of healthy aging, the reduction of inequalities and the strengthening of comprehensive care for the elderly population.

ACKNOWLEDGMENTS

The authors would like to thank the Family and Community Medicine Residency Program for its academic and institutional support during the development of this study. They also thank the residency scholarship, financed by the Federal Government, through the Ministry of Education, which enabled the training and performance of residents in the context of Primary Health Care. They also extend their thanks to the University of Gurupi and the Municipality of Gurupi, for the institutional support and for the granting of a scholarship for the execution of care and academic activities in the municipality, contributing significantly to the strengthening of health education and to the production of scientific knowledge applied to the local reality.

ABSTRACT

The article investigates whether the land tenure regularization policy of the State of Pará, within the scope of the Environmental and Territorial Planning Program (2020–2023), is compatible with the legal recognition of agroecological possession by traditional communities. It is based on the hypothesis that, despite quantitative advances in the issuance of land documents, the policy follows a predominantly individualizing logic, which strains the recognition of collective holdings and common-use areas. It is argued that the legitimacy of possession by traditional communities does not depend on state action, being based on labor on the land, sustainable practices, and fulfillment of the social function of the property. However, administrative recognition is essential for the enforcement of fundamental rights, especially for rural workers' retirement. The research adopts an inductive method, with bibliographic review and documentary analysis of state legislation and reports from the Instituto de Terras do Pará (ITERPA). It is concluded that land tenure regularization policy in the state of Pará, although presenting relevant quantitative results, still requires normative and institutional adjustments to ensure the effective recognition of collective and agroecological forms of land possession.

Keywords: Agrarian Possession. Agroecological Possession. Traditional Communities. Land Tenure Regularization. Territorial Rights.

RESUMO

O artigo investiga se a política de regularização fundiária do Estado do Pará, no âmbito do Programa Meio Ambiente e Ordenamento Territorial (2020-2023), é compatível com o reconhecimento jurídico da posse agroecológica das comunidades tradicionais. Parte-se da hipótese de que, apesar dos avanços quantitativos na emissão de documentos fundiários, a política segue uma lógica predominantemente individualizante, tensionando o reconhecimento de apossamentos coletivos e áreas de uso comum. Defende-se que a legitimidade da posse das comunidades tradicionais independe de ato estatal, fundamentando-se no trabalho na terra, nas práticas sustentáveis e no cumprimento da função social do imóvel. Entretanto, o reconhecimento administrativo é imprescindível à

RESUMEN

El artículo investiga si la política de regularización fundiaria del Estado de Pará, en el marco del Programa Medio Ambiente y Ordenamiento Territorial (2020–2023), es compatible con el reconocimiento jurídico de la posesión agroecológica de las comunidades tradicionales. Se parte de la hipótesis de que, a pesar de los avances cuantitativos en la emisión de documentos de tenencia de la tierra, la política mantiene una lógica predominantemente individualizante, lo que tensiona el reconocimiento de las posesiones colectivas y de las áreas de uso común. Se sostiene que la legitimidad de la posesión de las comunidades tradicionales es independiente de un acto estatal, al fundamentarse en el trabajo sobre la tierra, en las prácticas sostenibles y en el cumplimiento de la función social de la propiedad. No obstante, el reconocimiento administrativo resulta imprescindible para la efectivización de derechos fundamentales, especialmente el derecho a la jubilación por edad del campesino. La investigación adopta el método inductivo, con revisión bibliográfica y análisis documental de la legislación estadual y de los informes del Instituto de Tierras del Pará (ITERPA). Se concluye que la política de regularización fundiaria en Pará, aunque presenta resultados cuantitativos relevantes, aún requiere ajustes normativos e institucionales capaces de garantizar el reconocimiento efectivo de las posesiones colectivas y agroecológicas.

1 INTRODUCTION

Land regularization in the Brazilian Amazon is one of the main challenges of contemporary territorial planning, especially with regard to the legal recognition of the multiple forms of possession exercised over public lands. In the State of Pará, the implementation of land regularization policies aimed at the issuance of domain documents has revealed tensions between individualizing legal models of titling and the collective and agroecological forms of appropriation traditionally exercised by traditional communities.

Traditional Amazonian communities have historically exercised ownership of public lands through direct work on the land, the common use of natural resources, and the fulfillment of the socio-environmental function of the property, although, in many cases, without formal administrative recognition (Benatti and Bentes, 2024). This lack of state recognition produces relevant legal effects, especially in access to public policies and rural social security, evidencing the centrality of the territory for the realization of fundamental rights.

At the state regulatory level, Law No. 8,878, of July 8, 2019, which provides for the land regularization of rural and non-rural occupations on public lands in the State of Pará, defines land regularization as the set of legal and technical actions aimed at the regularization of occupations in state public areas, with a view to their allocation to third parties for the fulfillment of the socioeconomic function of the land. Based on this legal framework, the territorial planning policy of the State of Pará was structured within the scope of the Multiannual Plan (PPA) for the period 2020–2023, guiding the implementation of government actions for land regularization.

In view of this scenario, this article investigates whether the land regularization policy implemented by the State of Pará between 2020 and 2023, within the scope of the Environment and Territorial Planning Program, is compatible with the legal recognition of agroecological possession exercised by traditional communities.

It is supported as a hypothesis that, although the state policy presents relevant quantitative advances in the issuance of land documents, it still reproduces a predominantly individualizing logic of titling, which stresses the recognition of collective appropriations and areas of common use traditionally occupied by these communities.

The research adopts the inductive method, with a qualitative approach, combining bibliographic review and documentary analysis. It is based on state land legislation, on the legal-critical analysis of the national regulatory framework and on institutional reports produced by the Land Institute of Pará (ITERPA), including the systematization and interpretation of official data related to the issuance of land documents in the period from

2020 to 2023, with contextual update for the year 2024, in order to critically evaluate the impacts of the land regularization policy on the territorial rights of communities traditional ones.

By articulating the policy of land regularization in Pará with the legal recognition of agroecological tenure, the article seeks to contribute to the theoretical and empirical debate on the limits of the individualizing model of titling, evidencing its impacts on the realization of fundamental rights, especially access to social security by traditional communities occupying public lands. The analysis reaffirms the centrality of territory as a condition for the social, economic, and cultural reproduction of these communities and for the realization of the social function of land in the Amazonian context (Benatti, 2018).

2 THE POSSESSION OF PUBLIC LANDS BY TRADITIONAL COMMUNITIES

In the Brazilian legal system, meek, fair and peaceful possession of public lands enjoys legal protection, especially when exercised by indigenous peoples, quilombolas and traditional communities that historically occupy certain territories. In these cases, the recognition of the legitimacy of possession is not limited to a factual fact, but stems from the social, cultural and productive relationship established with the land, which is projected as the legal basis of the right to territory.

The Constitution of the Federative Republic of Brazil (CRFB) of 1988 represents a fundamental normative milestone in redefining the legal regime of public lands and tenure. At the same time that it reaffirms state control over the destination of these lands, the Constitution conditions the recognition of private property to the acquiescence of the Government, restricting the possibility of acquiring public land on the exclusive initiative of the private party, except in the cases expressly provided for in the constitutional text (Barreto, 2012).

Before the consolidation of this constitutional understanding, it was admitted, in certain situations, the claim of possession through the action of adverse possession. However, after intense legal, legislative and doctrinal debates, the prohibition on adverse possession of public assets was established. The CRFB/88, especially in its articles 188 and 189, submits the allocation of public lands to state control, ruling out the possibility of original acquisition of public rural property by the exclusive initiative of the private party, through the simple passage of time.

In this sense, with the constitutional prohibition on adverse possession of public properties, there was a restriction on the acquisition of property by possession exercised in isolation by the private party, with the recognition of possession and ownership being linked

to acquiescence and to the regular state act (Barreto, 2012). Thus, except for exceptions expressly provided for, the lawful acquisition of agrarian property now depends on an administrative procedure for the allocation of public lands, which includes the formal recognition of possession, since such properties are not subject to adverse possession, as provided for in article 191, sole paragraph, of the Federal Constitution.

This restriction, however, does not extend to the appropriations traditionally exercised by indigenous peoples, quilombola communities and other traditional communities. The Federal Constitution guarantees these groups the original right to the territory, regardless of a constitutive act of the State, and the Government is only responsible for the formal recognition of these rights, under the terms of articles 231 and 225 of the Constitution, as well as article 68 of the Transitional Constitutional Provisions Act (ADCT). Such constitutional protection is based on the differentiated way in which these subjects conceive, use and relate to the land, marked by collective, historical and sociocultural ties (Barreto, 2012).

Thus, although the prohibition on adverse possession limited the acquisition of property on the exclusive initiative of the private party, it did not exclude the possibility of agrarian possession of public lands. On the contrary, the Federal Constitution began to admit possession authorized or recognized by the Government, as well as that legitimately exercised by indigenous peoples, quilombola communities, traditional communities and rural workers and their families, provided that the social, economic and environmental purposes of the land are observed (Gonçalves, 2008; Barreto, 2012).

The legal understanding of the possession of public lands, especially in the Amazonian context, requires dialogue with the social reality of the peasantry and traditional communities. These groups, over generations, occupy and use the land collectively or as a family, building their productive, cultural, religious and political practices in the territory, as well as their own rules for the use and management of natural resources. It is a land grabbing that is legitimized by work, housing, and social reproduction, central elements of the principle of the social function of land (Benatti, 2018).

In Brazil, the squatter is defined as the farmer who works the land without a formal registered title, living predominantly from agricultural production aimed at family subsistence, with the occasional commercialization of surpluses (Martins, 1980). From this perspective, the squatter cannot be attributed any presumption of clandestinity or bad faith, since his relationship with the land is based on the need for survival and the fulfillment of the social, environmental and productive functions of the rural property (Miranda, 1988).

Martins (1980) points out that the squatter is, as a rule, the poor farmer who depends on the land to ensure the family's livelihood, using the surplus income from agricultural

production to purchase essential goods, such as food, clothing and inputs for farming. Despite its social and economic relevance, the squatter is often excluded from access to rural credit and public policies to promote family farming, precisely because of the absence of formal land titling.

This exclusion is not limited to the economic field, producing direct impacts on the realization of social rights. As Benatti and Bentes (2024) point out, the peasant, as a squatter of public land, faces significant barriers in the recognition of his condition as a special insured in the context of social security, since proof of the exercise of rural activity remains strongly linked to the presentation of formal land documents, incompatible with the reality of traditional land tenures.

In this context, the legitimation of collective property assumes centrality. For Benatti (2002), collective property is built from the capacity of the social group to appropriate certain natural resources and, over time, establish its own rules of use and management, respected by the members of the community. It is a primary seizure, characterized by the occupation of the territory with the intention of exercising social dominion over it, regardless of formal authorization from third parties.

The analysis of these forms of possession reveals that the legal recognition of traditional seizures of public lands is an indispensable condition for the realization of fundamental rights, for the promotion of social justice in the countryside and for the construction of a land policy compatible with the plurality of possessory regimes existing in the Amazon.

2.1 AGRARIAN TENURE AND AGROECOLOGICAL TENURE

In the Amazonian agrarian reality, the ownership of rural lands exercised by different social groups must be understood beyond the arrangements defined in classical possessory theories, such as those elaborated by Savin and Ihering (Mattos Neto, 2024).

According to Mattos Neto (2024), agrarian possession contemplates the direct, continuous, and rational exercise of the land, for an uninterrupted time, in which the purpose is to use it for economic, social, and environmental well-being, so that the effective exercise of agrarian activity only occurs through possession.

In this sense, agrarian possession requires the immediate attachment of the possessor to the land, being composed of the elements *corpus* and *animus*: the first refers to the direct, material, immediate attachment of the possessor to the land, it is the objective, practical factor; the second constitutes the subjective factor in which the intention is represented by the work that the agrarian possessor performs on the land, that is, to work on the land, and

not the immediate intention of the right to property as if it were its holder (*animus domini*) (Mattos Neto, 2024).

Therefore, the fact that man relates directly to the land he occupies, conferring on it his social function, constitutes a legal value that fulfills the content of the foundation of agrarian possessory protection (Mattos Neto, 2024).

The possessor must use the land rationally, respect its limits and natural resources, that is, the cultivation of the land must meet certain levels of economic and social rationality, guaranteeing the social function of property. Thus, the squatter must "faithfully comply with all obligations and duties arising from agrarian and environmental normative provisions and other laws" (Mattos Neto, 2024, p. 105).

Agrarian possession is, therefore, the direct, continuous, rational and peaceful exercise of agrarian activities on the occupied land, which reflects on the ability to create sufficient and necessary conditions for its economic use, by which it conceives to the possessor a "legal power of a real and definitive nature, with broad repercussions on the Law, with a view to its progress and economic and social well-being" (Mattos Neto, 2024, p. 116).

In the field of agri-environmental law, possession is protected through the performance of agricultural work (Mattos Neto, 2024). In this vein, Benatti (2018) defends the understanding of the different types of appropriations by traditional communities in the Amazon based on agroecological possession, understood as the exercise of power over a given space, which may include forest and/or aquatic resources.

Agroecological possession is configured as a juridical-social phenomenon of a factual nature, which emerges from the continuous relationship between the subjects, the land and the natural resources. It is a land grabbing materialized by the rational use and management of the territory, through sustainable agroextractivist practices, guided by family work and the collective awareness of belonging, whose legitimacy derives from the fulfillment of the social, environmental, and cultural function of the land, regardless of a formal time frame (Benatti, 2018).

In the case of quilombola communities, it is recorded that the recognition of their possession guarantees the ownership and title of the land for the community. However, in the case of conservation units for sustainable use – extractive reserves (RESEX) and the Sustainable Development Project (PDS) – and sustainable settlements – agroextractive settlement project (PAE), sustainable development project (PDS) and forest settlement project (PAF) – the areas are in the public domain, with usufruct of the land and renewable natural resources granted to traditional populations (Benatti, 2011).

In summary, agroecological possession is configured as a specific form of agrarian possession, socially constructed and territorially situated, which is legitimized by the continuous, rational and collective use of natural resources. It is a seizure based on family and agroextractivist work, guided by sustainable practices and a collective awareness of belonging to the territory (Benatti, 2018). By incorporating economic, social, cultural, and environmental dimensions, agroecological possession challenges traditional legal categories and requires the State to recognize possessory regimes compatible with the Amazonian reality, under penalty of making historically consolidated legitimate forms of occupation invisible.

2.2 THE PEASANT SUBJECT AS A SQUATTER OF PUBLIC LAND

In this research, we consider as peasants the family farmers and extractivists who organize themselves into family productive units and use the land as a material basis for their social (re)production, simultaneously constituting themselves as units of consumption and production. These are subjects whose relationship with the land goes beyond the merely economic dimension, being directly linked to family survival, social organization and the construction of collective identities in rural areas.

The peasant is conceived as a rural worker whose production aims primarily to ensure the sustenance of his own family, and the surplus is eventually sold for the acquisition of goods indispensable to the reproduction of his living conditions. In this sense, Queiroz (1973, p. 29–30) points out that, from the economic point of view, "the peasant is defined by the objective of producing for consumption, while, sociologically, the peasantry constitutes a subordinate layer within global society, marked by relations of economic, political and social subordination".

In the context of public policies, from the 1990s onwards, the Brazilian State began to officially adopt the category "family farming", especially with the creation of the National Program for the Strengthening of Family Agriculture (Pronaf), instituted in 1994, aimed at supporting productive activities organized by and for the family (Abramovay, 1998). This category began to guide the design of public policies aimed at rural subjects.

At the legislative level, Law No. 11,326, of July 24, 2006, defined the family farmer as one who carries out activities in rural areas in an area of up to four fiscal modules, with a predominance of family labor and income mostly from the establishment itself. Although this definition fulfills a relevant normative function, it does not remove the reality that a large part of these subjects exercise possession over public lands, without formal domain title.

At the state level, Law No. 8,878/2019, which provides for land regularization in the State of Pará, also recognizes the family farmer or rural family enterprise, considering criteria related to consolidated occupation, the predominant use of family labor, and the origin of income. State legislation, by admitting the regularization of occupations on public lands, highlights the centrality of the figure of the family farmer as a squatter, whose permanence in the territory depends on the legal recognition of his possession.

Despite the diversity of denominations and classifications attributed to the subjects who live and work in the countryside, these different categories refer to a common reality: the existence of agricultural producers linked to families and social groups whose relationship with the land is organized around family heritage (Wanderley, 2014). It is these family, community and territorial ties that allow these subjects to be understood as peasants, beyond the specificities of each concrete situation. For the purposes of this research, these categories are understood in an articulated way, insofar as they express the condition of the peasant subject as a squatter of public land.

Thus, although peasantry and family farming are not conceptually confused, both allow the identification of subjects whose social reproduction is directly linked to the legal recognition of the possession exercised over public lands. The peasant condition, in this context, is central to the analysis of the limits of the land regularization policy, especially with regard to the realization of territorial rights, including access to public policies and social security.

3 OF THE LAND REGULARIZATION POLICY OF PARÁ

Pará is the second largest Brazilian state in territorial extension, with approximately 1,248,000 km² (IBGE, 2024). Located in the northern region of the country, in the eastern portion of the Amazon, the territory of Pará is composed of 144 municipalities, organized into 12 Integration Regions, defined based on criteria of socioeconomic similarity, patterns of territorial occupation and economic and social relations established between the municipalities (Pará, 2008).

This regionalization is an instrument for planning, monitoring and evaluating state public policies, and is guided by the objective of reducing regional inequalities through the implementation of strategic actions adjusted to territorial specificities. The Integration Regions of the State of Pará are: Araguaia, Baixo Amazonas, Guamá, Carajás, Lago de Tucuruí, Marajó, Metropolitana, Rio Capim, Rio Caeté, Tapajós, Xingu and Tocantins, as illustrated in Figure 1. It is an administrative division that allows us to understand the

heterogeneity of the territory of Pará and the different socio-territorial contexts in which land planning and regularization policies are developed.

Figure 1

Map of Indicators of the Integration Regions

Source: FAPESPA, 2024.

At the state level, the land regularization policy is operationalized through actions aimed at promoting access to land, legal security of tenure and socio-environmental sustainability, especially in relation to subjects who exercise possession of public lands without formal recognition by the State. In this context, the Land Institute of Pará (ITERPA), a state agency established by Law No. 4,584/1975, is the body responsible for the execution of the state agrarian policy and the management of vacant lands, and it is responsible for promoting land regularization, recognizing the validity of the titles issued and ensuring the socially appropriate destination of public lands.

Among the actions of Pará's agrarian policy, the Environment and Territorial Planning Program stands out, inserted in the Multiannual Plan (PPA) of the State of Pará for the period from 2020 to 2023. It is a structured public policy with objectives, goals, indicators and strategies defined for a four-year cycle, which justifies the time frame adopted in this research for the systematic analysis of its results and impacts on the existing tenure regimes in the territory of Pará. Although the analytical focus falls on the period from 2020 to 2023,

information related to the year 2024 is considered in a contextual way, with the objective of identifying trends in the institutional continuity of the state land policy.

Within the scope of this Program, ITERPA developed actions aimed at territorial planning, land and environmental regularization and the issuance of land documents, primarily benefiting small rural producers, family farmers, traditional communities, quilombola communities and state settlement projects, aiming at strengthening family farming, promoting sustainable development and mitigating land conflicts (ITERPA, 2021).

The analysis of ITERPA's Management Reports for the years 2020 to 2023 shows the issuance of various types of land documents, both individual and collective. Among the instruments used, individual definitive titles, collective titles for quilombola communities, patrimonial league titles, concessions of real right of use, land certificates, exchange terms and terms of redemption of *aforamento* stand out.

As shown in table 1, in the period analyzed, 13,503 land documents were issued, exceeding by 6.26% the programmed goal for the PPA cycle (programmed goal was 12,710 land documents). Among these documents, there are the issuance of 8,194 individual definitive titles, 26 collective titles for quilombola communities, 18 patrimonial league titles, 3,627 urban regularization documents, 1,047 concessions of real right of use, 7 concessions of real right of collective use, 487 land certificates, in addition to terms of exchange and *aforamento* (ITERPA, 2024).

The annual analysis of the data reveals oscillations in the fulfillment of the established goals. In the years 2020 and 2022, the programmed goals were not fully achieved. On the other hand, in 2023 there was a significant growth in land regularization actions, with the issuance of 5,823 documents, exceeding by approximately 67% the target set for the year (3,492 land documents). This performance suggests an intensification of state actions in the last year of the PPA cycle, possibly associated with the institutional consolidation of the policy and the need to meet the planned goals.

Table 1

Land documents issued in Pará in the years 2021 to 2024

Documents issued	2020	2021	2022	2023	Total
Scheduled in the period	1.023	1.967	5.509	3.492	12.710
Certificates issued	111	147	170	58	486
Individual Land Titles	360	1.200	2.063	4.571	8.194
Collective Titles	3	3	5	15	26
Heritage league titles	3		8	7	18
Urban regularization titles		868	1.704	1.055	3.627
Concessions of real right of use	349	193	417	88	1.047
Concessions of collective rights in rem	2	1	3	1	7
Lease terms	4	4	8	3	19

Terms of exchange	11	17	26	25	79
Total land documents in the period	843	2.433	4.404	5.823	13.503

Source: ITERPA management reports, 2021, 2022, 2023 and 2024.

From the territorial point of view, the actions of the Environment and Territorial Planning Program reached all the Integration Regions of the State of Pará, although unequally. In 2020, the regions that benefited the most from the issuance of land documents were the Rio Capim Region, responsible for 47.0% of the total, with emphasis on the municipality of Ipixuna do Pará, which received 348 documents, and the Araguaia Region, corresponding to 21.1%, with a highlight to São Félix do Xingu, which received 150 documents. Together, these two regions concentrated 72% of the total number of documents issued. On the other hand, the least benefited regions were Lago de Tucuruí and Marajó, with only 4 documents each, and the Xingu Region, with only 1 document issued (ITERPA, 2021).

In 2021, the State of Pará issued 258 land documents for the Tocantins Region, 238 for the Guamá Region, and 166 for the Carajás Region. The least benefited regions were: Xingu (7), Tapajós (4), Marajó (1) (ITERPA, 2022). In 2022, the Tocantins Region presented a significant number of land regularization, with 1256 documents issued, followed by the Guajará Region, with 1,312 documents, and the Guamá Region with 610 titles issued. However, Marajó (4) and Xingu (2) remain among the regions with the lowest issuance of land documents (ITERPA, 2023).

In 2023, the regions that benefited the most from the issuance of land documents were: Guamá (1577), Caetés (1244), Tocantins (1225), Guajará (1,066) and Capim (435), and the regions with the fewest land documents issued were: Xingu (20), Lago Tucuruí (13) and Marajó (6) (ITERPA, 2024). This distribution shows the persistence of territorial asymmetries in the implementation of the land regularization policy in the State of Pará, indicating that the intensification of state actions in the last year of the PPA cycle did not occur homogeneously among the Integration Regions.

With regard specifically to the titling of rural lands occupied by traditional communities, the data reveal a significant asymmetry between individual titling and collective titling. While 8,194 individual definitive titles were issued in the period analyzed, only 26 collective titles were allocated to traditional communities and 7 concessions of Real Right of Collective Use for State Projects of Agroextractivist Settlements (CDRUs), which highlights the centrality conferred by the State to land regularization through the fragmentation of the territory into individualized family units.

The most benefited regions concentrate areas of greater economic dynamism, land tenure pressure and consolidated presence of small producers and settlements, which tends

to facilitate the operationalization of land regularization under the logic of individual titling. On the other hand, regions such as Marajó, Xingu and Lago de Tucuruí, characterized by extensive areas of common use, a strong presence of traditional communities and greater logistical and institutional obstacles, remain with a low incidence of regularization actions, revealing structural limits of the state land policy to meet more complex socio-territorial contexts.

Although the quantitative results indicate relevant advances in the expansion of formal access to land, it is essential to problematize the legal model that guides the land regularization policy in the State of Pará. The predominance of individual titling reveals the persistence of a patrimonialist rationality of the land, which does not always dialogue with the socio-territorial complexity of the Amazon and with the collective forms of use and occupation traditionally exercised by traditional communities.

As Monteiro et al., (2019) point out, Brazilian land policy has prioritized the individual titling of public lands in the Amazon, even in the face of a significant liability related to the recognition of collective territories. This orientation disregards, in many cases, the relevance of environmentally differentiated settlement projects and forms of appropriation based on the common use of the land, which are fundamental both for income generation and for environmental protection.

This empirical scenario allows us to move towards a legal-critical analysis of the land regularization model adopted, especially with regard to the normative choices that guide the prioritization of individual titling to the detriment of the recognition of collective territories. The critical reading of the data cannot be restricted to the measurement of the formal fulfillment of administrative goals, but must consider the qualitative impacts of the land regularization policy on the different tenure regimes existing in the territory of Pará.

The centrality of individual titling, when analyzed in the light of agrarian and environmental law, reveals political options aligned with the national normative framework, especially Law No. 13,465/2017, which reformulated the legal regime of land regularization in Brazil. This legislation, by reinforcing individual titling as the main instrument of territorial planning, including on public lands located in the Legal Amazon, has been the object of criticism for favoring the commodification of land and for disregarding the specificities of collective and agroecological appropriations exercised by traditional communities.

In this context, the land regularization policy, when guided exclusively by the parameters of Law No. 13,465/2017, runs the risk of reproducing a legal rationality incompatible with the principles of agrarian and environmental law, especially with regard to the social function of land, the protection of the environment, and the recognition of the

territorial rights of traditional communities. Although the institutional advances of the land policy in Pará and the expansion of the issuance of land documents in the period analyzed are recognized, the asymmetry between individual and collective titling shows structural limits of the model adopted.

The prioritization of individual titling, by disregarding areas of common use and collective forms of possession, can weaken the territorial integrity of traditional communities and compromise their social, cultural and economic reproduction. This state option is part of a broader context of reorganization of the Brazilian land regime, marked by the growing economic valuation of land as a financial asset, often associated with the neoliberalization of agrarian policies. In the Amazonian context, this legal rationality is particularly problematic, as it disregards the ways of life of traditional communities and weakens forms of appropriation based on the common use of natural resources, such as agroecological possession.

From the above, the analysis shows that, although the land policy in Pará has significantly expanded formal access to land, its normative orientation reveals structural limits for the full recognition of the territorial rights of traditional communities.

3.1 UPDATE OF THE LAND REGULARIZATION POLICY IN PARÁ

Considering the institutional continuity of land policy in the State of Pará and the relevance of situating the reader in the most recent scenario, information related to the results obtained in the year 2024, which makes up the new cycle (2024-2027), is incorporated, in a complementary and contextual way, without prejudice to the delimited methodological cut.

The most recent data from ITERPA indicate the expansion of land regularization actions after the end of the 2020–2023 cycle. In 2024, the State of Pará, through ITERPA, issued 6,729 land titles under the Socio-Environmental Management and Territorial Planning Program, of which 6,597 were individual titles, 19 were intended for quilombola communities and only 3 CDRUs for State Projects of Agroextractivist Settlements (ITERPA, 2025). These numbers show the continuity of the individualizing logic in the state land policy, highlighting that, although the collective CDRUs represent more appropriate instruments to guarantee the territorial security of traditional communities, their use is still extremely limited.

Although these data indicate significant quantitative advances, their reading in the light of the results observed in the period from 2020 to 2023 reveals the maintenance of the legal-institutional pattern that guides the state's land policy. As verified in the multi-year cycle analyzed, most of the documents issued in 2024 corresponded to individual titling, while collective titling for traditional communities remained residual, even in the face of the

constitutional and infra-constitutional recognition of collective forms of land use and occupation.

The absence of formal recognition of agroecological possession exercised by traditional communities compromises the territorial security of these groups and produces relevant legal effects, such as the difficulty of access to public policies and social security. Thus, land regularization must be understood beyond the simple issuance of titles, requiring an approach capable of recognizing the plurality of forms of possession existing in the Amazon and the centrality of the territory for the social, cultural and economic reproduction of traditional communities.

The asymmetry between individual and collective titling confirms that the advances observed in subsequent years do not represent a structural inflection in the land regularization model, but rather the continuity of a predominantly individualizing logic, based on territorial fragmentation and the centrality of individual private property. Such legal rationality is shown to be tensioned with the recognition of agroecological possession and areas of common use traditionally occupied by traditional communities, especially in the Amazonian context.

In addition, the incorporation of the 2024 data shows that, despite the quantitative expansion of land policy, the legal effects associated with the low incidence of collective titles remain, such as the difficulties faced by traditional communities in accessing public policies and proving territorial and labor ties for social security purposes. Thus, the empirical update reinforces the central hypothesis of this study, by demonstrating that the land regularization policy in Pará, although continuous and expanded over time, still lacks normative and institutional adjustments capable of ensuring the effective recognition of the plurality of possessory regimes existing in the Amazon.

4 FINAL CONSIDERATIONS

The State of Pará has developed policies for territorial planning and land regularization in line with constitutional principles linked to land and the social function of property, enabling the realization of fundamental rights arising from access to land, such as the recognition of possession exercised by traditional communities, promoting the sustainable management of natural resources and social reproduction, cultural and economic of these groups.

The actions implemented under the Environment and Territorial Planning Program (2020–2023) produced positive impacts for rural workers and traditional communities, by enabling the issuance of land documents, recognizing local knowledge and practices, and ensuring formal means of proving the exercise of rural activity. Such measures also

strengthened the state's capacity to manage public lands, contributing to environmental protection and regional socioeconomic development.

Although the legitimacy of the possession exercised by traditional communities is independent of a state act, as it is based on work on the land, sustainable practices and the fulfillment of the social function, formal recognition by the State is essential for the realization of social rights, especially access to retirement due to age of family farmers occupying public land. The requirement of documentary proof of the link with the land highlights the limitations faced by peasant subjects when their possessions are not legally recognized.

In view of this, the research demonstrates that the land regularization policy in Pará, despite presenting relevant quantitative advances, still operates under a predominantly individualizing logic of titling, which stresses the recognition of collective appropriations, areas of common use and agroecological possession exercised by traditional communities. Such an orientation limits the full realization of the territorial and social rights of these groups.

It is concluded that the improvement of the state land policy requires normative and institutional adjustments aimed at recognizing the plurality of possessory regimes existing in the Amazon. The strengthening of legal instruments for collective titling, the protection of areas of common use, and the adoption of administrative procedures sensitive to the socio-territorial reality of the Amazon are fundamental measures to ensure the integrity of traditionally occupied territories and avoid their fragmentation. Only from the recognition of this diversity will it be possible to consolidate a land policy committed to social justice, environmental sustainability and respect for the sociocultural diversity of the Amazon.

ABSTRACT

Use of ATLAS.ti Software as a Methodological Resource in the Structuring of Data in Qualitative Studies” presents the practical experience of faculty members and students from the Professional Master’s Program in Radiological Protection at the Federal Institute of Santa Catarina in the use of ATLAS.ti software to support qualitative analyses. The central objective is to demonstrate how the tool contributes to methodological rigor, the organization of large volumes of data, and the enhancement of research quality in the field of radiological protection. The study describes the software usage process, including installation, project creation, document import, code development, citation generation, network creation, and report export. ATLAS.ti is presented as an essential technology for contemporary qualitative research, especially in interdisciplinary health contexts. Its use facilitates data categorization, occurrence analysis, visualization of conceptual relationships, and analytical traceability, while maintaining fidelity to the theoretical frameworks defined by the researcher. The article highlights tools such as the document manager, code groups, Sankey diagrams, analytical memos, and networks, which expand the understanding of phenomena investigated in radiological protection and related areas. In addition to presenting practical examples from

RESUMO

Uso do Software ATLAS.ti como Recurso Metodológico na Estruturação de Dados em Estudos Qualitativos" apresenta a experiência prática de docentes e discentes do Mestrado Profissional em Proteção Radiológica do Instituto Federal de Santa Catarina, no uso do software ATLAS.ti para apoiar análises qualitativas. A proposta central é demonstrar como a ferramenta contribui para o rigor metodológico, a organização de grandes volumes de dados e a qualificação das pesquisas desenvolvidas na área de proteção radiológica. O estudo descreve o processo de utilização do software, incluindo instalação, criação de projetos, importação de documentos, elaboração de códigos, geração de citações, criação de redes e exportação de relatórios. O ATLAS.ti é apresentado como uma tecnologia essencial para pesquisas qualitativas contemporâneas, especialmente em contextos interdisciplinares da saúde. Seu uso facilita a categorização de dados, a análise de ocorrências, a visualização de relações conceituais e a rastreabilidade analítica, mantendo a fidelidade às bases teóricas definidas pelo pesquisador. O artigo destaca ferramentas como gerenciador de documentos, grupos de códigos, diagramas de Sankey, registros analíticos e redes, que ampliam a compreensão dos fenômenos investigados na radioproteção e em áreas correlatas. Além de apresentar exemplos práticos de dissertações que utilizaram o software, o artigo discute limitações, como o risco de segmentação excessiva e mecanizada dos dados, ressaltando que a interpretação crítica continua sendo responsabilidade do pesquisador. Conclui afirmando que o ATLAS.ti é uma ferramenta eficaz, acessível e alinhada às exigências de cientificidade das pesquisas qualitativas, contribuindo para a evolução do campo da proteção radiológica e da segurança do paciente.

RESUMEN

Uso del software ATLAS.ti como recurso metodológico en la estructuración de datos en estudios cualitativos" presenta la experiencia práctica de docentes y estudiantes de la Maestría Profesional en Protección Radiológica del Instituto Federal de Santa Catarina en el uso del software ATLAS.ti para apoyar análisis cualitativos. La propuesta central es demostrar cómo la herramienta contribuye al rigor metodológico, a la organización de grandes volúmenes de datos y a la cualificación de las investigaciones desarrolladas en el área de la protección radiológica. El estudio describe el proceso de utilización del software, incluyendo la instalación, creación de proyectos, importación de documentos, elaboración de códigos, generación de citas, creación de redes y exportación de informes. El ATLAS.ti se presenta como una tecnología esencial para las investigaciones cualitativas contemporáneas, especialmente en contextos interdisciplinarios de la salud. Su uso facilita la categorización de datos, el análisis de ocurrencias, la visualización de relaciones conceptuales y la trazabilidad analítica, manteniendo la fidelidad a las bases teóricas definidas por el investigador. El artículo destaca herramientas como el gestor de documentos, grupos de códigos, diagramas de Sankey, registros analíticos y redes, que amplían la comprensión de los fenómenos investigados en la radioprotección y en áreas afines. Además de presentar ejemplos prácticos de disertaciones que utilizaron el software,

el artículo discute limitaciones, como el riesgo de una segmentación excesiva y mecanizada de los datos, subrayando que la interpretación crítica sigue siendo responsabilidad del investigador. Concluye que el ATLAS.ti es una herramienta eficaz, accesible y alineada con las exigencias de científicidad de la investigación cualitativa, contribuyendo a la evolución del campo de la protección radiológica y de la seguridad del paciente.

1 INTRODUCTION

The present study aims to share the practical experience in the use of the ATLAS.ti software as a tool for qualitative analysis within the scope of the Professional Master's Degree in Radiological Protection, of the Graduate Program of the Federal Institute of Education, Science and Technology of Santa Catarina. Emphasis is placed on the contributions to the strengthening of methodological rigor and to the qualification of professional practices in radiological protection in the multidisciplinary context and in nursing.

In addition to the dissertations that made use of the tool, on the occasion, the special topic entitled Technology and Operational Techniques in the Research Process was offered, instrumentalizing the methodological resource adopted.

The use of technological tools in qualitative research has been increasingly relevant, especially in *stricto sensu* training programs, such as the Professional Master's Degree in Radiological Protection. In this context, the ATLAS.ti software stands out for being developed based on the principles of Grounded Theory, offering resources that enhance the inductive methodological approach. Its application allows the researcher to carefully organize the data, facilitating the categorization, interpretation and theoretical construction based on the information collected. By providing greater analytical rigor and data traceability, ATLAS.ti consolidates itself as an effective methodological resource for professors and students engaged in qualitative investigations, contributing significantly to scientific advancement and to the quality of research developed in radiological protection.

Currently, technologies affect several areas of knowledge, especially the research process. Computational resources emerged in the 1980s and since then software has been available in its diversity for use in qualitative and quantitative research (ATLAS TI, 2023; SORATTO; PIRES; FRIESE, 2020).

Atlas.ti is a computer tool used in qualitative research to assist in the analysis, interpretation, and organization of data from interviews, focus groups, user research, and literature review, in a rapid way to obtain research results (ATLAS TI, 2025).

Developed between 1989 and 1992 by Thomas Muhr and collaborators at the Department of Psychology of the Technical University of Berlin, its first version was marketed in 1993. Several researchers have used this software in their analyses, ensuring its potential in the most diverse areas of knowledge (GONDIM et al., 2018; SILVA JUNIOR; LEÃO, 2018).

The software has the ability to store documents of various formats and allow encoding, marking, annotations on these files, allowing the crossing of data and organization of information (FRIESE, 2014). Its objective is to help researchers to discover and analyze, in a systematic way, relevant phenomena hidden in unstructured data. ATLAS.ti offers

instruments that make it possible to identify, codify and record the results found in the data, evaluate their importance and observe the interrelationships (CORUJO; RELAY; SILVA, 2019). ATLAS.ti has been used in the areas of education, engineering, criminology, administration, anthropology, as well as health professionals such as nurses, doctors and psychologists. The application can be used with different theoretical approaches and multiple data analysis processes ((FRIESE, 2019; SORATTO; PIRES; FRIESE, 2019).

In the professional master's degree in radiological protection, the use of the software is indicated for integrative and literature reviews, for analysis and organization of data from interviews, documents, diaries and observation notes, among other research data collection instruments. Radiological protection is intended for the study of the safe handling of radiation. In the health area, it aims to minimize radiation exposure for both patients and occupationally exposed individuals (TAUHATA, 2014). This is a very important theme in some medical specialties, but it has not been shown to have the same relevance in the practice of medicine (VANO, 2011).

With the tools made available by the software for the organization and categorization of data on radiological protection, it was possible to realize how fast and facilitating the Atlas Ti represents.

In the context of the Professional Master's Degree in Radiological Protection, the use of technological tools to support qualitative research has been shown to be essential to ensure methodological rigor, data reliability, and in-depth analysis. The ATLAS.ti software, widely recognized in the area of applied human and social sciences, has been incorporated as a strategic instrument for the organization, categorization and interpretation of large volumes of textual, audiovisual and documentary data. Its application enhances the understanding of complex phenomena, such as professional practices, perceptions about biosafety and patient safety, allowing the researcher to integrate evidence with clarity and systematization. In the field of radiological protection, this approach contributes directly to the strengthening of safe practices, based on evidence and supported by in-depth analyses of the professional reality experienced in health services.

How does the use of the ATLAS.ti software contribute to the organization, analysis and systematization of qualitative data produced by professors and students of the Professional Master's Degree in Radiological Protection at the Federal Institute of Santa Catarina?

1.1 OBJECTIVES

To share practical experience in the use of the ATLAS.ti software as a tool for qualitative analysis in research developed within the scope of the Professional Master's

2 METHOD

This description shows the main tools offered by the atlas ti version 25 software, and practical examples of the usefulness of the software used in the dissertations of students in the Professional Master's Degree in Radiological Protection.

Initially, the activities using the software consisted of its installation. When accessing the software website (<https://atlasti.com/pt>) it was necessary to download it to the computer with desktop applications on Windows and macOS or Web version for browsers, using the license in the free version or purchasing a paid license. In the free version, ATLAS.ti 25 (trial), requires the following conditions: the license expires 20 calendar days after the request, within this period, you can use the software for up to 5 days of active use, which do not have to be consecutive, that is, you can start, pause and return to using ATLAS.ti on different days, until you complete the 5 days allowed within the total 20 days.

After the end of the evaluation period, ATLAS.ti moves to a limited mode of use ("read-only"), in which you can view the projects, but you will not be able to edit them if they exceed certain limits (more than 10 documents, 50 citations, 25 codes, 2 memos) (MUHR, T. 2023; MILES, M. 2014).

It is worth mentioning that after the expiration of the free license, there is a need to obtain a paid license key, which gives full access to all the features of the software, as well as the possibility to export the project (bundle). The procedures described below are specified starting with versions 22 and 24:

Step 1 – Creating a new project, at this point the project will be named according to the theme or the name of the research, e.g., Radiological Protection Review. Step 2 - All documents, files will be inserted in the document tab, they can be inserted in word, pdf or odt format. After all the files are indexed, they can be grouped as well, in case the searcher wants to segment by

content, such as by authors, countries, journals or the researched base, according to the interest of the researcher oriented by the research objective. The entire view of the documents is carried out in the "manage documents" tab, where it is possible to add, remove, rename, comment, open and renumber the files.

Step 3: Creation of codes, usually in qualitative research, codes are generated, which are short expressions oriented according to a theoretical framework, linked to a speech excerpt, in the case of interviews, or an abstract in the case of articles. To create codes click

on "new code", then name the code and then click on create. After creating the codes, each piece of text that is pertinent to the created code, click on the left mouse button or on the code manager and apply the new code.

Step 4: Citations are the selected excerpts (interviews, article texts, images) and coded. Through the citation manager, it is possible to create different types of analysis, such as a report or word cloud, this tool presents an image with the most used terms in the selected studies, emphasizing the word that proved to be the most frequent.

Step 5: Creation of the networks, the networks provide a didactic visualization of the analyzed data, such as the citations according to the codes linked to it or only the codes and their interrelationships. To create a network, open the code manager, select the codes to be listed, and then click show on network, generating it.

The software also makes it possible to export the data compiled during the analysis in text files or spreadsheets, in addition to allowing the export of the project as a whole to another researcher, through the "export" tool and "project packages". This feature is very useful for teamwork, collaborations between researchers, and for backing up projects without losing any research data.

3 RESULTS AND DISCUSSION

The results represent some of the tools offered by the software for the analysis of articles. Some of the dissertations, intentionally chosen on health and nursing work in the scope of "Radiological Protection", will be presented.

The process of organizing and managing qualitative data from interviews in ATLAS.ti version 25 follows some fundamental steps. Below, we describe a practical script aligned with the recommended procedures in the qualitative research assisted by him.

In ATLAS.ti 25, a new project is created, which will serve as the basis of all the analysis. It is important to name the project with the title of the survey or an identifier that facilitates its management.

When it comes to interviews, the most used instrument in the dissertations presented, these must be transcribed in full in electronic text format, preferably in .docx or .pdf formats, compatible with ATLAS.ti., it is recommended to review the transcripts before inserting them into the software, ensuring fidelity to the participants' discourse. Anonymous identifiers may be entered (e.g. Interviewee 1, Interviewee 2) to ensure ethical confidentiality. Next, the interview files are inserted through the "Import > Documents" tab. Each interview becomes a Primary Document. ATLAS.ti organizes these documents in an internal library, allowing for quick and secure access.

It is possible to assign metadata to the primary documents: participant's name, study group, age group, gender, etc. The metadata is useful later for segmenting analyses by subgroups. Before formal coding, the researcher can perform exploratory readings and produce initial memos in the software itself. Memos serve as reflective notes, recording preliminary impressions, hypotheses, or emerging categories.

The coding of the relevant excerpts from the interviews begins:

Open coding: creation of free codes while reading, representing concepts, categories or units of meaning.

Pre-coding: if there is a theoretical framework or defined categories, codes can be created before and applied during reading.

In ATLAS.ti 25, encoding can be done by text selection and direct association with the created code. You can organize the codes into Code Groups. After coding, relational analysis begins: Identification of patterns, co-occurrences and relationships between codes. Creation of visual Networks in the software, allowing to map the conceptual connections and support the analytical construction.

Also in ATLAS.ti 25 it allows you to generate reports of codes, coded segments, frequency of occurrence and overlapping of categories. These reports support the interpretative analysis and writing of the results. It is recommended to perform periodic backups of the project, and it allows you to export the complete project for backup or sharing with co-advisors.

At the end of the analysis, the researcher can export, according to the need, the code report, the conceptual networks, the citation lists and the data for inclusion in the dissertation and publications.

ATLAS.ti 25 brought greater integration with the cloud (ATLAS.ti Cloud) and better graphic usability, which facilitates the monitoring of the project by the advisor and favors collaborative analysis within the scope of professional master's programs.

After identifying the search strategies in the determined databases, the analysis of the articles found was carried out. These will be displayed illustrating the tools available in the software that contribute to the organization of the data. It is essential to emphasize that the process of creating and coding, as well as the organization of the networks, are not determined by the program, but by the researcher according to the theme, methodology and theoretical framework or need of the research, from the files inserted in the software.

In its operationalization, it offers a basic model formed by objects: primary documents (primary data from various sources: articles, interviews, photos, music, films, maps, etc.); quotations (fragments of audiovisual images, text or audio); codes (concepts arising from

external and/or internal reference through what is being analyzed at the moment); notes (record of reflections, observations and interpretations of the material being evaluated); families (grouping of objects such as codes, notes, or primary documents) and networks (associations that allow you to visualize the connections between encoded information).

The elements mentioned above make up the Hermeneutic Unit (HU) which refers to an electronic space that organizes the entire database and the concepts, comments, notes and citations that emerge from the analyses, shown in figure 01.

Figure 1
Document Manager

Source: by the authors (2025).

It is through the document manager that ATLAS.ti is able to integrate a large number of documents into its workspace, in addition to keeping control over all the notes, codes and comments that are produced during the analyses. It also allows you to work with various formats of text, audio, video, geographic data and image files.

The software helps in the organization of qualitative data with different objectives, optimizing the information analysis process. We emphasize that the organization of a network occurs through all the relationships between codes and all the discussion and subsequent conclusion is due to the theoretical foundation of the researcher.

The main software tools that were used in the simulation can be described, according to Friese (2012), as follows: - Project: place within the software that will store all the data collected in the research, which will be saved and named at the researcher's discretion; - Documents: the researcher has the possibility to import documents in various formats into the software, files in PDF, word and odt format; - Codes: the researcher creates and defines the codes, considering the objectives and references that underlie the theoretical context.

The codes translate through small sentences the most important expressions within the texts, figure 02 exposes the codes as an example "occupational safety" relating each occurrence on occupational health identified in the articles.

Figure 2

Network showing the codes identified in the documents

Source: by the authors (2025).

- Citations: are parts of the texts highlighted by the researcher stored within the software and also in the format of the networks created and shown in the software, as shown in figure 03.

Figure 3*Illustration of codes and citations*

Source: by the authors (2025).

- Group of codes: according to the researcher's objective, this tool organizes the codes, with the association of expressive terms within the text. - Networks: illustrations created based on stored documents, codes and citations, as well as groups, created by the researcher. In general, the software fulfills its role well, which is to assist in the organization of data by assisting in the process of analysis in qualitative research of information obtained through the stored data. This fact allows the display of the layered information of the files within the software.

ATLAS.ti has practical operational resources, in addition to networks, showing other distribution formats and relationships between codes, possibilities and offering the researcher autonomy to innovate, exemplifying results visualized in graphic form (GONDIM et al., 2018).

The sankey diagram is one of these alternatives, obtaining a look at the distribution and frequency with which the codes appear, the graphs when interconnected demonstrate combination and relationship, called co-occurrence, observed in figure 4.

Figure 4**Sankey Diagram of Co-Occurrence of Codes**

Source: by the authors (2025).

In the figure, co-occurrence can be observed, that is, relationships between the codes, radiation therapy (radiological therapy) versus informed consent (informed consent) related to medical complications (disease condition), related to medical imaging (description of a region visualized by the physician).

Figure 5 illustrates the citations and codings, and allows you to view the excerpts from the articles with their codes, frequency, and number of codes assigned to each of the citations. From the selection of a paragraph in the document, or an expression, it is possible to view the frequency and numerical distribution of the encodings assigned in the respective citation. This format can be extracted from the software as a report in excel format, obtaining the list of codes and/or citations, gathered or separated.

Figure 5**Citations with their respective codes**

Source: by the authors (2025).

In figure 5, it shows us the citation linked to the expressive code disaster assigned 51 times, and the tool allows us to view the document from which each of the citations was identified and its reference.

Of the many tools available to the software, there are counterpoints that emphasize the fear that the researcher will produce too many and mechanical cuts that distance him from the general context and the meanings produced by it (CORUJO; RELAY; SILVA, 2019). The precautions that must be considered in this process are peculiar to other qualitative approaches, since the data do not speak for themselves and the meanings that emerge from them are part of the researcher's perspective.

To assist the process of organizing large volumes of information data from research, computational technologies (CAQDAS – Computer Assisted Qualitative Data Analysis Software) emerge, with different types of software for data analysis, which in their versatility have been used in research management, facilitating the analysis process, mainly by organizing large amounts of data, to optimize time and contribute to rigor and scientificity, especially in qualitative research. Artificial intelligence has helped humanity in different sectors of life, including the academic universe, providing researchers with the opportunity to optimize time in management and facilitating the process of data analysis, maintaining scientific and methodological rigor, enabling them to be more available to play the main role of critical and reflective analyst of research.

4 FINAL CONSIDERATIONS

The functionality of the Atlas.ti. software is an important tool that facilitates the storage and analysis of data, contributing to the challenge of providing quality and credibility in qualitative studies. The use of the software proved to be suitable for use in different approaches, especially in the qualitative one, saving time and facilitating the organization and analysis of data. In addition to being an uncomplicated operationalization, the software allows the researcher the possibility of analyzing qualitative data in less time and with greater reliability. In the set of articles analyzed, the contribution of research on the evolution of radiological protection over the years in the establishment of radiological protection standards and legislation is highlighted.

ABSTRACT

Aquaculture has grown globally due to limitations in extractive fishing and the increasing demand for fish; however, intensive systems generate significant environmental impacts, especially due to nutrient accumulation and deterioration of water quality. The aim of this study was to conduct a meta-analysis of bibliographic data related to research on integrated fish and macroalgae farming systems, highlighting the strategic relevance of the topic in the international scenario and its emerging importance in the Brazilian Aquaculture context. Thirteen studies were selected, totaling 27 valid comparisons. The analysis, performed using multilevel models with $\ln RR$ as the effect size, revealed that farming with macroalgae significantly increased fish growth ($\ln RR = 0.1492$; $p = 0.0184$), corresponding to an average increase of 16.1% compared to monoculture. The heterogeneity among the studies was significant, although partially explained by the evaluated moderators. Among the macroalgae species studied, *Gracilaria* sp. stood out with the most pronounced positive effect ($p = 0.0025$), while the duration of the experiments did not significantly influence the results. The absence of publication bias reinforces the reliability of the estimates obtained. In general, the findings show that integrated systems with macroalgae contribute to improving water quality, especially by reducing total ammoniacal nitrogen (TAN) and other nitrogenous compounds, while also favoring fish growth (SGR), based on a systematic review that selected 13 studies, totaling 27 valid comparisons. The analysis, performed using multilevel models with $\ln RR$ as the effect size, revealed that the present favors fish growth and increases the environmental and productive sustainability of fish farming. Despite these benefits, there is still a scarcity of studies, especially in tank systems and recirculating aquaculture systems (RAS), indicating the need for further, more standardized, and long-term research to consolidate the mechanisms involved and strengthen the ecological and economic potential of this approach.

RESUMO

A Aquicultura tem crescido globalmente devido à limitação da pesca extrativista e à crescente demanda por pescado, porém os sistemas intensivos geram impactos ambientais relevantes, especialmente pelo acúmulo de nutrientes e pela deterioração da qualidade da água. O objetivo deste estudo consistiu em realizar uma meta-análise de dados bibliográficos referentes a pesquisas sobre sistemas integrados de cultivo de peixes e macroalgas, destacando a relevância estratégica do tema no cenário internacional e sua importância emergente no contexto aquícola brasileiro. Foram selecionados 13 estudos, totalizando 27 comparações válidas. A análise, realizada por meio de modelos multiníveis utilizando $\ln RR$ como tamanho de efeito, revelou que cultivos com a presença de macroalgas promoveram aumento significativo no crescimento dos peixes ($\ln RR = 0,1492$; $p = 0,0184$), correspondendo a um incremento médio de 16,1% em relação ao monocultivo. A heterogeneidade entre os estudos foi significativa, embora parcialmente explicada pelos moderadores avaliados. Entre as espécies de macroalgas estudadas, *Gracilaria* sp. destacou-se com efeito positivo mais pronunciado ($p = 0,0025$), enquanto a duração dos experimentos não influenciou significativamente os resultados. A ausência de viés de publicação, reforça a confiabilidade das estimativas obtidas. De modo geral, os achados evidenciam que sistemas integrados com macroalgas contribuem para a melhoria da qualidade da água, especialmente pela redução de nitrogênio total amoniacal (TAN) e outros compostos nitrogenados, ao mesmo tempo favorece o crescimento dos peixes (SGR), a partir de uma revisão sistemática que selecionou 13 estudos, totalizando 27 comparações válidas. A análise, realizada por meio de modelos multiníveis utilizando $\ln RR$ como tamanho de efeito, revelou que o presente favorece o crescimento dos peixes e aumenta a sustentabilidade ambiental e produtiva da piscicultura. Apesar desses benefícios, ainda há escassez de estudos, especialmente em sistemas de tanques e sistemas de recirculação (RAS), indicando a necessidade de pesquisas adicionais, mais padronizadas e de longo prazo, para consolidar os mecanismos envolvidos e fortalecer o potencial ecológico e econômico dessa abordagem.

1 INTRODUCTION

Since the 1990s, Aquaculture has been consolidated as one of the fastest growing productive sectors in the world agricultural scenario, standing out for its growing capacity to meet the global demand for aquatic foods (Troell et al., 2009; Abreu et al., 2011; FAO, 2022). Data from the Food and Agriculture Organization (FAO) show that the cultivation of aquatic organisms showed the highest average growth rates between the years 2000 and 2016, remaining in 2020 as one of the main food products traded internationally, with about 60 million tons exported, excluding algae (FAO, 2018; Ahmed et al., 2019; FAO, 2022). The sector's advance is driven, above all, by the stabilization of extractive fishing, which has ceased to keep up with the increase in global demand, positioning Aquaculture as an essential alternative in a context of limited natural resources (Waite et al., 2014). In 2022, the sector reached a historic milestone by surpassing, for the first time, extractive fishing, registering approximately 94 million tons — about 51% of all production of aquatic organisms (Seafood, 2024; FAO, 2024).

World production is heavily concentrated in Asian countries, with China and Indonesia leading the way in marine cultivation since the 1990s. In Brazil, a country with vast aquaculture potential, shrimp farming, bivalve mollusk farming, and continental fish farming stand out as the main activities in operation (Nascimento et al., 2022). Despite the promising start in the 1930s, national marine fish farming remains little explored, reflecting structural, technological and coastal environment use planning challenges (Cavalli et al., 2009; FAO, 2022).

The expansion of fish farming—particularly those conducted in intensive monoculture systems—has been accompanied by a series of environmental impacts and production limitations (Naylor et al., 2000; Valiela et al., 2001). The accumulation of nutrients, especially nitrogen and phosphorus, can cause chemical changes in sediments, compromise the benthic community, and reduce local biodiversity (White et al. 2004; Naylor et al., 2005). Studies show that these effects deteriorate environmental quality, increase operating costs and increase economic risks for producers, especially due to dependence on external inputs and the vulnerability of the production system to environmental fluctuations (Cabelo 2006; Mazur & Curtis 2008; Bergqvist & Gunnarsson 2013; Kerrigan et al., 2018).

In the face of these challenges, alternative production models have been gaining prominence, especially Integrated Multitrophic Aquaculture (IMTA). Although species integration is an ancient practice, with millennial records in traditional Asian systems, the modern concept of IMTA gained notoriety in the early 2000s, driven by research that demonstrated its ability to mitigate the environmental impacts of intensive fish farming

(Chopin, 2001; Mirzoyan et al., 2010). In this system, cultivated species of different trophic levels interact in a complementary way: organic and inorganic extractive organisms take advantage of metabolic waste generated by fish, promoting bioremediation, economic diversification and greater production efficiency (Chopin et al., 2010). Thus, this integrated production system seeks to minimize the ecosystem impacts of monoculture, as well as to optimize fish production, reaching the growth potential of Aquaculture, and bringing a better financial cost-benefit (Rhyter et al., 1975; Neori et al., 2004).

Among the most promising extractive components, macroalgae occupy a prominent position (Castelar et al., 2014). Endowed with a high capacity for assimilating nutrients, these organisms act as true biological filters, removing nitrogenous compounds, stabilizing the pH and raising the dissolved oxygen in the water (Neori et al., 2004; Kang et al., 2012). As a consequence, they contribute to the improvement of water quality, the well-being of farmed fish, and the reduction of the system's environmental impacts (Araújo et al., 2018). In addition, they have low production costs and wide potential for economic use, whether in the food, pharmaceutical, cosmetic, biofuel or animal feed industries (Lal et al., 2005; Suutari et al., 2014). Rhodophytes are widely cultivated for the production of carrageenan and agar, while chlorophytes, although less produced, represent an important source of ulvan, a polysaccharide of growing industrial interest (Torres et al., 2019; Lakshmi, 2020).

Despite their advantages, integrated systems with macroalgae and fish still face operational and technological challenges, especially in open marine environments, where biomass control, the risk of escapes, and hydrodynamic variations make management difficult (Buschmann et al., 2001). In addition, regulatory limitations, the absence of specific regulations and the resistance of some producers, often associated with the lack of technical knowledge and the initial costs of adaptation, still restrict the commercial expansion of IMTA in several countries (Troell et al., 2003; Barrington et al., 2009; Granada et al., 2016).

In this context, understanding the development of Aquaculture, its challenges and the emerging sustainable alternatives is essential to guide the sector's transition towards more resilient, efficient and environmentally responsible production models. Integrated systems, especially those based on the incorporation of macroalgae, represent a promising strategy to reconcile economic production, sustainability and conservation of aquatic ecosystems.

The integrated system with macroalgae appears in the literature as an excellent alternative to mitigate or solve the main problems of intensive fish farming, being, however, a recent practice and with few studies that synthesize and compare the research elaborated on this theme. Thus, the objective of this study was to carry out a meta-analysis of bibliographic data related to research on integrated fish and macroalgae cultivation systems,

highlighting the strategic relevance of the theme in the international scenario and its emerging importance in the Brazilian aquaculture context.

2 MATERIALS & METHODS

2.1 LITERATURE REVIEW AND DATA COMPILATION

A bibliographic database on integrated fish and macroalgae cultivation systems was carried out through Google Scholar (<https://scholar.google.com/>), Science direct (<https://www.sciencedirect.com/>), Wiley (<https://onlinelibrary.wiley.com/>), Periodicos Capes and Academy (<https://www.periodicos.capes.gov.br/> and Academia.Edu). The following keywords were used: "IMTA"; "seaweed"; "TAN", "fish", "growth", "bioremediation" and "polyculture", selecting works written since the year 2000. The first 1000 publications retrieved from the survey were screened. In addition, an intense search was carried out in the bibliographic data of each article, to add works to the present study. The data were extracted only from scientific articles published and freely available. Gray literature was excluded from the database.

The studies with recirculating water (RAS) that reported the specific growth rate (SGR) of the fish, duration of the experiment (days), macroalgae and fish species, total ammonia nitrogen (or TAN) content, type of cultivation (polyculture or monoculture), experimental control conditions and number of replicates were compiled in a single database (Figure 1). Works that did not have one or more necessary information were excluded from the present study. In addition, authors were asked whenever these data were not available. To compose the database, the year of publication and the location, when available, were also inserted. Some studies presented more than one measured abiotic variable associated with water quality, which were not selected because they were not common to all publications.

Figure 1

Flowchart of methodology for selecting articles, determining the selection criteria

2.2 STATISTICAL ANALYSES

Statistical analysis was conducted according to the guidelines proposed by Harrer et al. (2021), in the manual *Doing Meta-Analysis in R*, using the R Core Team software (version 4.5.1; 2025) and the metafor package (Viechtbauer, 2010). The values absent standard deviation were imputed, based on the average coefficient of variation per fish species, given by the formula, according to the methodological recommendation of Higgins & Green (2008) and Nakagawa & Santos (2012), in order to avoid the loss of valid comparisons and reduce the bias associated with the exclusion of incomplete studies.

For each study included in the database, the log response ratio (lnRR) was calculated, which expresses the magnitude of the effect of the treatment in relation to the control (Hedges & Vevea, 2005; Lajeunesse, 2010). Expressed by, where $\bar{X}^{trat}$ and $\bar{X}^{cont}$, are the means of the specific growth rate (SGR) of fish in the treatments with and without macroalgae respectively. The variance of lnRR was calculated based on the propagation of the error of the means and their respective standard deviations and sample sizes (n^{Trat} and n^{Cont}), according to the classical formula of (Hedges et al, 1999): where is the standard deviation and the number of replicates. The formulas were applied using automatic functions available in the metafor package. Multilevel models with and without moderators were adjusted, using the Restricted Maximum Likelihood Estimator (REML), with a hierarchical structure of random

effects, considering the existence of multiple comparisons in the same study, allowing the variance between studies and within studies to be estimated separately (Konstantopoulos, 2011; Nakagawa & Santos, 2012).

The basic model can be expressed as $y_{ij} = \mu + u_j + v_{ij} + \varepsilon_{ij}$; the y_{ij} , effect size observed in the j - comparison of the study μ the global $u_j \sim N(0, \tau_{entre}^2)$ average effect represents the variance between studies $v_{ij} \sim (0, \tau_{intra}^2)$ represents the variance between comparisons within the studies; is the sampling error associated with variance v_{lnRR} . The model with moderators (explanatory variables), corresponding to the algae species and the duration of the experiment, thus the model is expressed by $y_{ij} = \beta_0 + \beta_1(espécie\ de\ alga) + \beta_2(duração) + u_j + v_{ij} + \varepsilon_{ij}$, allowing to investigate the heterogeneity observed in the differences between the species used or in the time of the experiment.

Due to the limited interpretation of I², it was decided to report the τ^2 values by level, as recommended by Konstantopoulos (2011) and Viechtbauer (2010). The Egger test (Egger et al., 1997) was used to investigate the presence of publication bias, selecting a simpler study comparison for later application of the regtest function, with the absence of significance indicating symmetry in the funnel graph and reducing the probability of publication bias. The prediction was obtained using the predict() function, with point estimates ($\hat{\mu}$), standard error (SE), confidence intervals (CI) and prediction intervals (PI).

3 RESULTS

Most of the selected works were found on the Google Scholar platform. The other databases provided low return of works, both in general, with the use of keywords, and for the selection of articles following the specifications necessary for inclusion in the meta-analysis. The bibliographic references of the selected works also helped to quantitatively optimize this work (Figure 2).

Figure 2

Summary of the results found in online searches for experiments in published articles

In all, only 13 studies were found that compared the breeding of at least one species of fish integrated to a species of macroalgae, with a control group, presenting data on the specific growth of the fish both in the control and in the experiment (Figure 3) and presenting culture in the same tank or in a recirculation system. Of these selected studies, 27 experiments were screened for use in the meta-analysis, presenting all the data necessary for their integration (Table 1).

The adjusted multilevel model considered the dependence between comparisons of the same study, using a total of 27 comparisons and showed adequate convergence under the REML method. For the model, the random effects nested between the studies and between the comparisons within the same study were considered, evaluating the influence of the macroalgae species and the duration of the experiment (in days) on the combined effect of integrated fish and macroalgae cultivation.

Initially, a multilevel meta-analysis (model without moderators) was conducted to estimate the overall effect size, considering the hierarchical structure of the data. The analysis revealed an estimated overall effect size LnRR of 0.1492 (SE = 0.0593), which was statistically significant ($z = 2.51$; $p = 0.0184$; 95% CI [0.0272; 0.2712]; AIC = 0.0101; BIC = 3.8). This result indicates that, in general, the experimental treatment promoted a significant increase in the fish-specific growth rate, with an average increase of about 16.1% in the macroalgae group compared to the control group (since positive LnRR indicates an increase) (Viechtbauer, 2010). Cochran's heterogeneity test indicated significant heterogeneity between the studies ($Q(26) = 196.09$; $p < 0.0001$). The residual variability between studies ($= 0.0249$) was considerably higher than the variability between comparisons within the same study ($= 0.0017$). This suggests that methodological or biological differences between studies contribute more to the observed heterogeneity than variations within the same experiment. $\tau_{\text{entre}}^2 \tau_{\text{intra}}^2$

In order to investigate the sources of this heterogeneity, a multilevel meta-regression model was adjusted including the moderating variables "Macroalgae Species" and "Duration of the Experiment" (days). The test for the moderators was statistically significant ($F(11,15) = 3,530$; $p = 0.0128$), indicating that the variables included explain a significant portion of the

variability of the effect sizes. Residual heterogeneity remained significant ($QE(15) = 100.1$; $p < 0.0001$), suggesting the existence of other unmeasured factors that still influence the results.

In the analysis of the individual coefficients of the meta-regression, the continuous variable referring to the duration of the experiment did not present statistical significance ($\tau^2 = 0.0034$; $p = 0.9542$), indicating that the exposure time, within the analyzed interval, was not a determinant linear predictor for the variation in the size of the effect. On the other hand, the categorical analysis of the macroalgae species revealed specific differences. *Gracilaria* sp. showed a positive and highly significant effect ($\tau^2 = 0.4279$; $p = 0.0025$; 95% CI [0.1767; 0.6791]), which corresponds to a mean increase of about 53.4% in treatment compared to control. The other species and consortia did not present statistically significant differences in relation to the baseline level of the model ($p > 0.05$ for the other coefficients), although there were wide confidence intervals for categories with lower sample representativeness (Figure 4). On the other hand, the ratio between the highest and lowest sampling variance was extremely large, resulting in unstable results. This was confirmed in the result for the Akaike model (AIC = 17.34) and the Bayesian Information Criterion (BIC = 27.25) which are significantly higher for this model, which indicates an unfavorable performance.

Figure 4

Standardized effects by algae species. Each point represents the estimated mean effect (lnRR). The error bars are the confidence intervals (95% CI). The overlapping of colors indicates the contribution of further studies for each species. Mix = treatments that used more than one species of algae (*Ulva*, *Enteromorpha* and *Cladophora*)

In this moderator analysis, the residual variability between studies was nil ($\tau_{entre}^2 = 0$) relative to the variability between comparisons within the same study ($\tau_{intra}^2 = 0.04$). This suggests that, after the inclusion of the moderators, there was no further variation between the studies analyzed.

The Egger test, modified for multilevel models, evaluated the robustness of the results in terms of publication bias, using a representative comparison per study to ensure data independence. The test did not show significant asymmetry in the funnel graph ($z = 0.2079$; $p = 0.8353$), which suggests the absence of detectable publication bias in this sample of studies (Figure 5). This result reinforces the symmetry in the distribution of the studies and the robustness of the estimates obtained, suggesting that there is no evidence of publication bias among the studies included in the meta-analysis (Egger et al., 1997).

Figure 5

Funnel Chart - Asymmetry Assessment. Dots represent an effect size as a function of their standard error (precision). The symmetrical shape of the funnel around the centerline indicates the absence of publication bias. Mix = treatments that used more than one species of algae (Ulva, Enteromorpha and Cladophora)

4 DISCUSSION

In general, the results reveal that the presence of macroalgae in fish farming systems promotes positive and consistent effects, especially through ecological mechanisms of synergy and biofiltration, such as those presented in Table 1 (Neori et al., 2004). From the synthesis of the data and the marked reduction in total ammonia nitrogen (TAN) levels, it is possible to infer that the fish-macroalgae interaction plays a central role in optimizing productivity in integrated systems (Chopin et al., 2001). The increases in fish-specific growth rate (SGR) observed in the studies are attributed to the improvement in water quality due to efficient nutrient recycling mediated by macroalgae (Neori et al., 2004; Chopin et al., 2001; Msuya & Neori, 2008; Neori et al., 2004).

Macroalgae use the nitrogenous excreta of fish as a source of nutrition, converting these compounds into their own biomass (Ramli et al., 2020). This internal nutrient cycle reduces nitrogen loss to the system, while improving overall energy efficiency, as less energy is wasted in detoxification processes or oxidative stress caused by unused ammonia (Troell et al., 2003). For example, the classic study by Zhou et al. (2006) showed that *Gracilaria*

G. lemaneiformis integrated with the cultivation of *Sebastodes fuscescens* in coastal waters, can remove significant amounts of dissolved nitrogen and phosphorus, functioning as an efficient "nutrient pommel", reducing the waste load and contributing to the ecological sustainability of the system. Additionally, macroalgae perform a crucial ecosystem service in the physicochemical stabilization of the water column. Through photosynthesis, they promote the sequestration of dissolved CO₂ and oxygen supplementation, acting directly in pH buffering and mitigating hypoxia or acidification of water (Msuya & Neori, 2008). This environmental stability reduces the metabolic cost associated with osmoregulation and acid-base balance of fish (Barrington et al., 2009). By minimizing energy expenditure in compensatory responses to respiratory stress, a more efficient allocation of resources for somatic growth and immune integrity is observed (Barrington et al., 2009). Therefore, the greater biological efficiency in integrated systems does not only result from decontamination, but also from the reduction of environmental fluctuations that required constant homeostatic adjustments.

The quantitative analysis of the data (Figure 3) corroborates the efficiency of bioremediation in mitigating nitrogen toxicity. A drastic reduction in total ammonia nitrogen (TAN) concentrations is observed in integrated systems, which is exemplified by the cultivation of macroalgae. A similar pattern has been documented for *Lates calcarifer* integrated with *Caulerpa lentillifera*, indicating an absorption capacity that prevents the accumulation of nitrogenous compounds at lethal or sublethal levels (Chaitanawisuti et al., 2011). In addition, the cultivation of macroalgae can bring indirect ecological benefits: for example, studies have shown that the presence of *G. lemaneiformis* can increase plankton biodiversity and modulate the microbial community in coastal systems, which can favor a more stable and balanced aquatic environment (Chai et al., 2018). Therefore, the presence of macroalgae in their experiments, reflected in total ammonia nitrogen (TAN) reductions and relatively low standard deviations in some control points, is consistent with the literature that reinforces the ecological value of integrated systems.

The values of the fish-specific growth rate (SGR) observed in figure 3, on the other hand, vary greatly. This variability may reflect methodological differences between studies (e.g. in algae density, not incorporated here) or in the culture mode (IMTA, RAS, bioflocs), in fish species, and in the duration of the experiments. Studies such as De Morais et al. (2023), show that the density of *Ulva ohnoi* in biofloc systems can influence both nutrient recovery and total productivity. The authors compared three treatments (without algae, 1 g·L⁻¹ e 2 g·L⁻¹ of *U. ohnoi*) and observed that both treatments with algae promoted greater nitrogen and phosphorus recovery, in addition to increased overall productivity, without significant impairment in fish and shrimp growth (De Morais et al., 2023). The physiological relevance

of this removal lies in the prevention of histopathological and metabolic damage. Chronic exposure, even at moderate ammonia levels, induces branchial hyperplasia, impairs gas exchange, and inhibits central nervous system enzymes, resulting in seizures and appetite suppression (Ip & Chew, 2010). Therefore, the presence of macroalgae acts as a toxicological barrier, keeping water quality within physiological tolerance limits and ensuring the osmoregulatory integrity of fish.

The bioremediation role of macroalgae extends to the management of the balance of nutrients essential for the ecological health of the system. Empirical evidence, such as the work carried out in Brazil by (Castelar et al., 2015), demonstrates that species such as *U. fasciata* and *G. birdiae* are able to efficiently remove ammonia and nitrate from effluents, reaching rates of more than 98% of ammonia removal in a five-day cycle in tanks. These authors also emphasize that the simultaneous assimilation of phosphate by these macroalgae contributes to the maintenance of a healthy nutritional balance in the effluent (Neori et al., 2004). This extraction of multiple nutrients prevents excessive accumulation that triggers eutrophication, the proliferation of unwanted microalgae and extreme oxygen fluctuations in the environment (Neori et al., 2004), ensuring ecological stability and reducing the environmental impact of the integrated system (Buschmann et al., 2008).

Within the premises of a quantitative review with a moderate number of comparisons ($k=27$) involving different species, the results of the meta-analysis are considered statistically consistent. As evidence to support this robustness, Egger's alternative test can be considered, which did not indicate asymmetry in the funnel. This suggests that the results are not inflated by publication bias, allowing greater confidence in the estimates obtained (Egger et al., 1997). Another factor indicates the low variance between studies, reinforcing the good calibration of the effects within the samples carried out. Among the factors, the set of moderators "macroalgae species + duration" was significant, indicating that the model has real explanatory capacity, and not just noise. Corroborating this, the average effect ($\pm 16\%$) suggests a positive overall trend without exaggeration (Cohen, 2013), with the amplitude of the interval being aligned with the sample size (Borenstein et al., 2021). This pattern is common in ecological reviews when few categories show truly high effects (Koricheva; Gurevitch; Mengersen, 2013), while the others remain close to neutrality. In multilevel meta-analysis models, such behavior suggests the presence of biologically relevant moderators influencing specific responses (Konstantopoulos, 2011).

The absence of a significant effect of the duration of the experiments indicates that the exposure time, within the range included in the studies, did not systematically contribute to explain the magnitude of the results. This absence of temporal trend is common in ecological

syntheses and usually indicates that physiological and ecological responses tend to stabilize rapidly (Gurevitch et al., 2018), or that studies use similar temporal windows (Koricheva et al., 2013).

The strongly significant result found for the species *Gracilaria gracilis* sp and the absence of effect for other species is an expected pattern when few macroalgae have really high effects, or when species treated as categories show marked ecological differences (Bokhtiar et al., 2022; Li-Hong et al., 2002). In summary, this suggests that, although the average effect is positive, the magnitude of this result is not uniform across species or studies. The low inter-study variance ($\tau^2 \approx 0$) indicates that most of the detected variability is attributed to the differences within the studies themselves, which is consistent with controlled and reproducible experimental structures (Bokhtiar et al., 2022; Patterson & Thompson, 1971). The highly significant effect observed for *Gracilaria* sp demonstrates that this genus exerts a disproportionately greater impact when compared to the other macroalgae species analyzed here. For example, Wang et al. (2014) showed that the species *Gracilaria tenuistipitata* has a high growth rate under moderate concentrations of salinity (12–20) and high levels of inorganic nitrogen (NH_4^+ and NO_3^-), in addition to a marked preference for NH_4^+ , which helps explain its ability to form blooms in estuarine environments. In addition, there is evidence that the experimental results for this genus are quite reproducible in different controlled studies. In cultivation on the coast of Cox's Bazar (Bangladesh), Bokhtiar et al. (2022), found systematic ways to optimize yield through manipulation of the lunar cycle, harvest interval, type of crop row, and sowing spacing.

The analysis of the data, reinforced by the specialized literature, highlights crucial methodological challenges that limit the generalization of the results of studies in integrated systems. First, the experimental design often lacks sufficient replicates or adequate cultivation scales for the intrinsic complexity of the system. This low replication compromises statistical validity and extrapolation, especially due to the great intrinsic variability between tanks, resulting from the complex interaction of organisms, nutrients, and microenvironments (Buschmann et al., 2001). One of the main critical limitations is the duration of the experiments, which in the review ranges from 30 to 365 days. Short-term studies can capture rapid improvements in total ammonia nitrogen (TAN) without, however, elucidating the long-term effects, such as nutrient saturation or competition for light and space, that influence the biomass allocation of algae.

Finally, the taxonomic variability among macroalgae is a determining factor for the heterogeneity of the results of fish-specific growth rate (SGR) and total ammonia nitrogen (TAN). Species such as *Gracilaria* sp and *Ulva* sp demonstrate different nutrient uptake

kinetics (e.g. different affinities for ammonia and nitrate) which requires a more robust methodological standardization to optimize nutrient extraction and maximize the growth of cultured organisms (Neori & Msuya, 2008). However, this review showed that there must be a good selection of species to be included in integrated cultivation systems, especially of macroalgae. It is known that each group has a better uptake of nutrients. In addition, the influences of different biomasses among the macroalgae could not be evaluated, which may evidence the need for different initial biomasses for each type of macroalgae in order to optimize their functions. Thus, studies that evaluate which species of macroalgae are more specifically indicated to be cultivated with certain species of fish become extremely important.

5 CONCLUSION

The integrated analysis of empirical data and specialized literature confirms that integrated cropping systems constitute a functional and sustainable advance compared to traditional monoculture models. The inclusion of macroalgae contributes decisively to the mitigation of nitrogen toxicity and to the stabilization of physicochemical parameters, by converting metabolic by-products into useful biomass and closing essential biogeochemical cycles. In physiological terms, this more balanced environment favors greater biological efficiency and higher growth rates, since it reduces the energy demand for homeostatic maintenance and allows greater investment in anabolism. However, the consolidation of this technology still faces interpretative challenges. The heterogeneity of the statistical results, added to recurrent methodological limitations — such as low experimental replication, large temporal amplitude between studies, and high interspecific variability in the kinetics of nutrient uptake — highlights the need for standardization in research protocols. Thus, future investigations should prioritize long-term studies and pilot-scale experiments, in order to improve carrying capacity models and ensure that the observed ecological feasibility translates into productive and economic stability.

ACKNOWLEDGEMENTS

We thank the Laboratory of Applied Ecology (LEA) and the Experimental Ichthyology Animal Facility for providing infrastructure support for data analysis and processing, and FAPERJ proc. E26/202826/2019 for funding the research.

DIDACTIC SIMULATION OF A SELF-STABILIZING SYSTEM: A PEDAGOGICAL APPROACH TO TEACHING EMBEDDED SYSTEMS

SIMULAÇÃO DIDÁTICA DE UM SISTEMA AUTOESTABILIZADOR: UMA ABORDAGEM PEDAGÓGICA PARA O ENSINO DE SISTEMAS EMBARCADOS

SIMULACIÓN DIDÁCTICA DE UN SISTEMA AUTOESTABILIZADOR: UN ENFOQUE PEDAGÓGICO PARA LA ENSEÑANZA DE SISTEMAS EMBEBIDOS

<https://doi.org/10.56238/sevened2026.008-078>

Antonio Henrique Figueira Louro¹

ABSTRACT

This work presents a proposal for a didactic simulation of a two-dimensional self-stabilizing system, inspired by the conceptual operation of a 2D gimbal, developed on the Raspberry Pi Pico W platform. The main motivation is to provide an accessible pedagogical resource for teaching embedded systems, prioritizing the conceptual understanding of execution flow, data acquisition, processing, and feedback, without the inherent complexity of real mechanical systems. The simulation employs controlled inputs and visual and auditory outputs to represent the dynamic behavior of the system, allowing students to immediately observe the relationship between stimuli and responses. The proposal is intended for technical and undergraduate courses, as well as teacher education, standing out as an intermediate stage between theoretical study and more advanced physical projects.

Keywords: Embedded Systems. Didactic Simulation. 2D Gimbal. Technological Education. Raspberry Pi Pico W.

RESUMO

Este trabalho apresenta uma proposta de simulação didática de um sistema autoestabilizador bidimensional, inspirada no funcionamento conceitual de um gimbal 2D, desenvolvida sobre a plataforma Raspberry Pi Pico W. A motivação central é oferecer um recurso pedagógico acessível para o ensino de sistemas embarcados, priorizando a compreensão conceitual de fluxo de execução, aquisição de dados, processamento e realimentação, sem a complexidade inerente a sistemas mecânicos reais. A simulação utiliza entradas controladas e saídas visuais e sonoras para representar o comportamento dinâmico do sistema, permitindo que estudantes observem, de forma imediata, a relação entre estímulos e respostas. A proposta é voltada a cursos técnicos, de graduação e à formação de professores, destacando-se como uma etapa intermediária entre o estudo teórico e projetos físicos mais avançados.

1 INTRODUCTION

Teaching embedded systems involves the simultaneous articulation of hardware, software, and, in many cases, physical modeling concepts. For students at early levels of education, this overlapping knowledge can lead to learning disabilities, especially when coupled with complex mechanical devices and real sensors. In this scenario, simulation-based didactic approaches have been shown to be effective in reducing the initial cognitive load, allowing the student to focus his attention on the fundamental principles of the system's functioning.

This article presents a didactic simulation of a two-dimensional self-stabilizing system, inspired by the concept of a 2D gimbal, implemented on the Raspberry Pi Pico W platform. Unlike projects aimed at real physical stabilization, the proposal has an essentially pedagogical character, seeking to represent in an abstract and visual way the dynamic behavior of the system and the role played by the embedded software.

The use of computer simulations has been consolidated as a relevant pedagogical strategy, especially in the teaching of abstract or difficult-to-visualize concepts, as discussed by Valente (2014) in the context of the use of digital technologies in education.

The work was developed with a focus on educational applications, and can be used in lectures, laboratory activities or introductory projects. The main contribution lies in the transformation of a complex technical problem into an accessible learning object, favoring the progressive understanding of the concepts involved.

2 THEORETICAL BASIS

2.1 EMBEDDED SYSTEMS IN THE EDUCATIONAL CONTEXT

Embedded systems are characterized by the integration of hardware and software dedicated to the execution of specific functions. In the educational context, low-cost and easy-to-program platforms have expanded access to this type of technology, allowing its use in technical and undergraduate courses. However, the direct introduction of complete physical systems can hinder initial learning, since it requires the student to simultaneously understand multiple layers of the system.

The use of didactic simulations emerges as a strategy to mitigate this problem, by allowing the abstraction of less relevant elements at first and highlighting the logical flow of the system's operation.

2.2 SELF-STABILIZING SYSTEMS AND GIMBALS

Self-stabilizing systems are widely used in applications such as camera stabilization, drones, and mobile platforms. A two-dimensional gimbal is a typical example, composed of two orthogonal axes that allow control of the angular orientation of an object.

In real-world applications, this control involves inertial sensors, actuators, and control algorithms. In the proposal presented in this work, these elements are represented in a conceptual way, through a computer simulation that reproduces the expected behavior of the system, without the physical implementation of the components.

Figure 1 shows the slopes in a three-dimensional system, which a self-stabilizing system has the function of reducing them to zero.

2.3 SIMULATION AS A DIDACTIC RESOURCE

From a pedagogical point of view, simulation allows the student to explore varied scenarios, observe system responses, and establish cause-and-effect relationships. This type of approach favors active learning and the gradual construction of knowledge, serving as a bridge between theory and experimental practice.

The approach adopted in this work prioritizes the conceptual understanding of the phenomenon studied, aligning itself with the perspective of meaningful learning proposed by Ausubel (1968), where new knowledge is integrated into the learner's previous cognitive structure.

Figure 1

The slopes with respect to the X, Y, and Z axes are often referred to as Pitch, Roll, and Yaw, respectively

3 DIDACTIC METHODOLOGY OF SIMULATION

3.1 PRINCIPLES OF THE PROPOSED SIMULATION

The simulation was designed to represent, in an abstract way, the operation of a self-stabilizing system. Real physical sensors are replaced by controlled inputs, while actuators are represented by visual and audible outputs. This choice allows isolating the role of embedded software, highlighting processing and decision logic.

The interaction with the system occurs through well-defined events, which simulate the acquisition of data and the activation of the stabilization process. In this way, the student can understand how embedded systems operate in a cyclical and reactive manner.

The use of visual and interactive resources favors student engagement and expands the possibilities of pedagogical mediation, as argued by Moran (2007) when dealing with the integration between technology and education.

The behavior of the simulated system is based on classical control principles, widely discussed in the control engineering literature (OGATA, 2010), but presented here in an abstract and didactically accessible way.

3.2 FUNCTIONAL ARCHITECTURE OF THE SYSTEM

From a didactic point of view, the architecture of the system can be understood in three main blocks:

- **Simulated data input:** responsible for providing values that represent slopes or disturbances of the system.
- **Logical processing:** a step in which data is interpreted and used to update the state of the system, simulating the action of a stabilization algorithm.
- **Didactic outputs:** responsible for presenting the current state of the system to the user, through visual and sound resources.

This organization in blocks facilitates the understanding of the separation of responsibilities typical of embedded systems.

3.3 EXECUTION FLOW

The operation of the simulation can be understood from a conceptual flow of states, which represents the typical execution cycle of an embedded system. This flow can be presented didactically through a flowchart, making it easier to visualize the steps involved.

In an abstract way, the conceptual flowchart of the system can be described as follows:

1. **System Startup:** The microcontroller is energized and configures its basic capabilities, entering an initial standby state.

2. **State of readiness:** The system remains waiting for an external event that authorizes the start of the simulation, representing the logic of reactive systems.
3. **Simulated data input:** after authorization, data representing system disturbances or inclinations is provided, replacing real physical sensors.
4. **Logical processing:** the input data is interpreted and used to update the internal state of the system, simulating the behavior of a stabilization algorithm.
5. **Update of didactic outputs:** the new state of the system is presented to the user through visual and sound resources, allowing immediate observation of the response.
6. **Return to equilibrium:** the system makes a gradual transition to a reference state, reinforcing the concept of stabilization.
7. **Cycle replay:** The flow returns to the state of readiness, characterizing the main execution loop typical of embedded systems.

Figure 2

Conceptual Flowchart

Source: The Author (2026).

Figure 3 shows the LED array used in the simulation, in which the inclinations in the X and Y axes are represented by means of color coding. Pitch slopes are indicated by the colors green (negative pitch) and red (positive pitch), while roll slopes are represented by the colors blue (negative roll, slope to the left) and yellow (positive roll, slope to the right). Color combinations are used to indicate simultaneous tilts in the two axes, such as the overlapping of the blue and red colors, which results in the color purple.

The intensity of the slope is represented by the number of LEDs lit, so steeper slopes correspond to a greater number of illuminated elements in the matrix.

In the example in Figure 3, a soft Roll to the right lights up a single row of yellow LEDs and to the left lights up the blue ones. A soft downward pitch lights up a row of green LEDs and upwards lights up the red ones. On the lower left side of the matrix is an OLED display with the values of X, Y (and Z), which are continuously updated according to the action of self-stabilization.

Figure 3

The array of LEDs simulating the X and Y inclinations

In Appendix A, there is a link to the GitHub page, which contains the software developed for the simulation, as well as an explanatory video.

4 RESULTS AND DISCUSSION

The use of simulation in educational contexts demonstrates potential to facilitate the understanding of the fundamental concepts of embedded systems. The immediate visualization of the system's responses to the inputs provided contributes to the association between theory and practice, as well as increasing student engagement.

By abstracting the mechanical and electronic complexity of a real system, the proposal reduces initial frustration and allows the focus to be directed to the operating logic and the role of the software.

5 EDUCATIONAL APPLICATIONS

Simulation can be used in different educational contexts, such as introductory courses on embedded systems, technical courses in automation and teacher training activities. In addition, it can serve as the basis for more advanced projects, in which actual physical components are gradually incorporated.

6 LIMITATIONS AND FUTURE WORK

As it is a didactic simulation, the proposal does not include advanced control algorithms or the detailed physical modeling of a real gimbal. These limitations are intentional and coherent with the pedagogical objective of the work. As future works, it is suggested to expand the simulation to include new modes of operation and integration with real physical systems.

7 FINAL CONSIDERATIONS

This work presented a didactic simulation of a two-dimensional self-stabilizing system, developed with a focus on the teaching of embedded systems. The proposed approach favors the conceptual understanding and visualization of the system's behavior, offering an accessible and low-cost alternative for educational environments. The results indicate that simulation can act as an effective tool in the teaching-learning process, serving as a link between theory and practice.

ACKNOWLEDGMENTS

The author thanks the State University of Santa Cruz (UESC) for the institutional support to the development of this work, as well as for the conditions offered for the realization of teaching, research and extension activities related to the project.

ABSTRACT

This study aims to analyze the scientific evidence regarding the implementation of Collaborative Online International Learning (COIL) and its impact on the development of soft skills in virtual internationalization contexts in higher education. A systematic exploratory review of academic literature published between 2020 and 2025 was conducted, consulting specialized databases and relevant grey literature. A total of 56 empirical studies met the inclusion criteria, analyzing variables related to intercultural competencies, communication, collaboration, critical thinking, and creativity. The evidence indicates that COIL generates significant positive impacts on the development of soft skills (61.8% positive outcomes). The most developed competencies include intercultural competence (average increase of 23%), effective communication (19% improvement), multicultural teamwork (26% development), and global critical thinking (17% advancement). The COIL methodology has proven to be particularly effective in Latin American contexts, where institutions in Peru, Mexico, Colombia, and Brazil report successful experiences of accessible and equitable virtual internationalization. COIL represents an innovative and effective pedagogical strategy for developing essential 21st-century soft skills in virtual learning environments. Its implementation requires intentional pedagogical design, specialized faculty training, and sustained institutional support. The methodology significantly contributes to democratizing international experiences in higher education, particularly benefiting students with economic or geographic limitations for physical mobility.

RESUMO

A presente pesquisa propõe analisar as evidências científicas sobre a implementação do Collaborative Online International Learning (COIL) e seu impacto no desenvolvimento de habilidades socioemocionais em contextos de internacionalização virtual do ensino superior. Foi realizada uma revisão exploratória sistemática da literatura acadêmica publicada entre 2020 e 2025, com consulta a bases de dados especializadas e literatura cinzenta relevante. Foram identificados 56 estudos empíricos que atenderam aos critérios de inclusão, analisando variáveis relacionadas às competências interculturais, comunicação, colaboração, pensamento crítico e criatividade. As evidências mostram que o COIL gera impactos positivos significativos no desenvolvimento de habilidades socioemocionais (61,8% de resultados positivos). As competências mais desenvolvidas incluem: competência intercultural (incremento médio de 23%), comunicação efetiva (melhoria de 19%), trabalho em equipe multicultural (desenvolvimento de 26%) e pensamento crítico global (avanço de 17%). A metodologia COIL mostrou-se particularmente eficaz em contextos latino-americanos, nos quais instituições do Peru, México, Colômbia e Brasil relatam experiências bem-sucedidas de internacionalização virtual acessível e equitativa. O COIL representa uma estratégia pedagógica inovadora e eficaz para o desenvolvimento de habilidades socioemocionais essenciais do século XXI em ambientes virtuais. Sua implementação requer desenho pedagógico intencional, capacitação docente especializada e suporte institucional contínuo. A metodologia contribui de forma significativa para a democratização das experiências internacionais no ensino superior, beneficiando especialmente estudantes com limitações econômicas ou geográficas para a mobilidade física.

RESUMEN

La presente investigación propone Analizar la evidencia científica sobre la implementación del Collaborative Online International Learning (COIL) y su impacto en el desarrollo de habilidades blandas en contextos de internacionalización virtual de la educación superior. Se realizó una revisión exploratoria sistemática de la literatura académica publicada entre 2020 y 2025, consultando bases de datos especializadas y literatura gris relevante. Se identificaron 56 estudios empíricos que cumplieron con los criterios de inclusión, analizando variables relacionadas con competencias interculturales, comunicación, colaboración, pensamiento crítico y creatividad. La evidencia muestra que COIL genera impactos positivos significativos en el desarrollo de habilidades blandas (61.8% de resultados positivos). Las competencias más desarrolladas incluyen: competencia intercultural (incremento promedio del 23%), comunicación efectiva (mejora del 19%), trabajo en equipo multicultural (desarrollo del 26%), y pensamiento crítico global (avance del 17%). La metodología COIL ha demostrado ser particularmente efectiva en contextos latinoamericanos, donde instituciones en Perú, México, Colombia y Brasil reportan experiencias exitosas de internacionalización virtual accesible y equitativa. COIL representa una estrategia pedagógica innovadora y efectiva para desarrollar habilidades blandas esenciales del siglo XXI en entornos virtuales. Su implementación requiere diseño pedagógico intencional, capacitación docente especializada y soporte institucional sostenido. La metodología contribuye significativamente a democratizar experiencias internacionales en educación superior, particularmente beneficiando a estudiantes con limitaciones económicas o geográficas para movilidad física.

1 INTRODUCTION

Globalization and technological advances have radically transformed the landscape of higher education in the twenty-first century. In this context, the development of soft skills – also known as transversal or twenty-first century competencies – has become an imperative to prepare professionals capable of successfully performing in increasingly interconnected, diverse, and complex work environments (Bruhn-Zass, 2022; Çalıkoğlu, 2025).

Soft skills, particularly those grouped into the "4Cs" (communication, collaboration, critical thinking, and creativity), are recognized as fundamental competencies that complement technical and disciplinary knowledge (Care et al., 2023). Employers in various sectors are looking for professionals who not only possess technical expertise, but also demonstrate advanced skills in cross-cultural communication, working in diverse teams, complex problem solving, and adaptability to change (Barbosa et al., 2020).

Traditionally, the internationalization of higher education has depended primarily on the physical mobility of students and faculty through exchange programs, academic stays, and studies abroad. However, this modality presents significant barriers to access: high economic costs, time constraints, visa restrictions, family and work responsibilities, in addition to growing concerns about environmental sustainability (Knight, 2005; Bruhn, 2020). These limitations disproportionately affect students from vulnerable socioeconomic contexts, deepening inequities in access to international training experiences.

In response to these challenges, the Internationalization at Home (IaH) paradigm has emerged, which seeks to integrate international and intercultural dimensions into the formal curriculum without requiring physical mobility (Beelen & Jones, 2015). Within this framework, the Collaborative Online International Learning (COIL) —also called Virtual Exchange— has emerged as an innovative pedagogical methodology that democratizes access to quality international experiences (Rubin & Guth, 2022; O'Dowd, 2018).

COIL is defined as a teaching-learning methodology that connects students and teachers from institutions located in different countries to participate in structured collaborative projects, using digital technologies and intentional curriculum design (SUNY COIL Center, 2024). Unlike conventional online courses, COIL emphasizes authentic intercultural interaction, collaborative project-based learning, and the intentional development of global and intercultural competencies (Guth & Rubin, 2015).

The relevance of COIL in Latin America is particularly significant. The region faces specific challenges in terms of internationalization: limited budgets for student mobility, developing technological infrastructure, and the need to strengthen academic quality with global perspectives (Rama, 2013). At the same time, there is a growing recognition of the

value of virtual intercultural experiences as a complement or alternative to physical mobility, especially after the transformations accelerated by the COVID-19 pandemic (Barbosa et al., 2020).

Despite the growing interest and adoption of COIL in higher education institutions globally, there is still a need to systematize knowledge about its specific effectiveness in the development of soft skills, particularly in Latin American contexts. This exploratory review seeks to contribute to filling this gap by providing a comprehensive synthesis of the available evidence on COIL implementation and its impact on the development of transversal competencies essential for professional success in the twenty-first century.

1.1. PROBLEM STATEMENT

Contemporary higher education faces the challenge of training professionals with competencies that transcend the disciplinary technical domain. Today's labor market demands individuals who are able to communicate effectively in multicultural contexts, work collaboratively in diverse teams, think critically about complex problems, and adapt creatively to changing environments (Sánchez et al., 2018; Araya-Fernández & González, 2019).

At the same time, internationalization based exclusively on physical mobility has proven to be insufficient to reach the majority of students. Recent data indicate that less than 15% of university students in Latin America participate in international mobility experiences during their training (Rama, 2013). This limitation creates educational inequities where only students with sufficient economic resources have access to international experiences that develop valued global competencies.

COIL is presented as a promising alternative that could democratize access to international experiences. However, there is fragmentation in the evidence on their actual effectiveness in developing specific soft skills. While some studies report significant positive impacts (Helm et al., 2023; Fukkink et al., 2024), others point to neutral or even negative results in certain dimensions (Bedenlier & Marín, 2020). This heterogeneity in the findings makes it difficult for educational institutions to make informed decisions about investing in COIL programs.

Additionally, there is little contextualized evidence on the implementation of COIL in Latin America and specifically in Peru. Given that cultural, infrastructural, and pedagogical factors can significantly influence the effectiveness of educational interventions, it is crucial to examine how COIL works in various contexts, particularly in regions of the Global South that exhibit different socioeconomic and educational characteristics from the countries of the Global North where the methodology originated.

Therefore, there is a need for a systematic review that synthesizes the available evidence on COIL and soft skills development, identifying patterns, conditions of effectiveness, barriers, and facilitators, with particular attention to Latin American experiences. This integrated understanding can inform the design, implementation, and evaluation of COIL programs that maximize their potential to develop critical 21st century competencies in an accessible and equitable manner.

1.2 RESEARCH OBJECTIVES

1.2.1 General Objective

To systematically analyze the available scientific evidence on the implementation of Collaborative Online International Learning (COIL) and its impact on the development of soft skills in contexts of virtual internationalization of higher education, with emphasis on Latin American experiences.

1.2.2 Specific Objectives

- To identify and characterize the pedagogical models and methodologies for the implementation of COIL reported in the recent academic literature (2020-2025).
- To synthesize empirical evidence on the impact of COIL on the development of specific soft skills: intercultural competence, effective communication, collaboration in multicultural teams, critical thinking, and creativity.
- To determine the facilitating factors and barriers that influence the effectiveness of COIL programs for the development of transversal competencies.
- To examine experiences of COIL implementation in Latin American higher education institutions, identifying regional particularities and lessons learned.
- Provide evidence-based recommendations for the design, implementation, and evaluation of COIL programs geared toward soft skills development.

2 CONCEPTUAL FRAMEWORK

2.1 COLLABORATIVE ONLINE INTERNATIONAL LEARNING (COIL)

Collaborative Online International Learning (COIL) is a teaching-learning methodology that integrates digital technologies with intentional pedagogical design to connect students and teachers from institutions located in different countries (Rubin & Guth, 2022). Pioneered by the State University of New York (SUNY) at the beginning of the 21st century, COIL distinguishes itself from other models of online education by its explicit emphasis on three fundamental dimensions:

- **Structured international collaboration:** Two or more teachers from institutions in different countries co-design and co-facilitate modules or entire courses, establishing shared learning objectives and collaborative activities for their students (Hackett et al., 2024).
- **Intentional intercultural learning:** Activities are specifically designed to promote meaningful interactions between students from different cultural contexts, facilitating the development of intercultural competence through authentic experiences (Fukkink et al., 2024; Helm, 2020).
- **Curricular integration:** COIL is not an optional extracurricular program, but is integrated as a module or formal component within regular courses, ensuring that all enrolled students participate in the international experience without additional costs or travel requirements (FIU COIL, 2024).

Typical COIL implementation involves multicultural teams of students working collaboratively on projects over periods of 4 to 16 weeks, using a combination of synchronous (video conferencing, virtual meetings) and asynchronous (forums, collaborative wikis, project management tools) communication. Teachers actively facilitate interactions, promote critical intercultural reflection, and provide ongoing formative feedback (O'Dowd, 2018).

COIL is theoretically grounded in social constructivism (Vygotsky) and experiential learning (Kolb), emphasizing that knowledge is socially constructed through meaningful interactions, and that concrete experiences followed by critical reflection generate deep and transformative learning (Guth & Rubin, 2015).

2.2 SOFT SKILLS OF THE XXI CENTURY

Soft skills, also called transversal competencies, twenty-first century competencies or "soft skills", represent a set of cognitive, social, and emotional capacities that allow individuals to effectively navigate complex environments, collaborate with various actors, communicate appropriately in multiple contexts, and continuously adapt to changes (Sánchez et al., 2018; Care et al., 2023).

Unlike "hard skills" or technical competencies specific to particular disciplines, soft skills are transferable between contexts, fundamental for professional success regardless of the field, and increasingly valued by employers who recognize that technical expertise alone is insufficient in globalized and dynamic labor markets (Amirian, 2023).

The most widely adopted framework for conceptualizing soft skills is the "4Cs," which identifies four foundational competencies (Partnership for 21st Century Skills, 2019):

- **Communication:** Ability to articulate thoughts and ideas effectively using oral, written, and nonverbal communication skills in diverse contexts and with multiple audiences, including cross-cultural communication (Care et al., 2023).
- **Collaboration:** Ability to work effectively and respectfully with diverse groups, exercise flexibility and willingness to commit to common goals, and assume shared responsibility for collaborative work (Cariaga, 2024).
- **Critical Thinking:** Ability to reason effectively, use systems thinking, make informed judgments and decisions, and solve complex problems by considering multiple perspectives (Amirian, 2023; Rahman et al., 2024).
- **Creativity:** Ability to generate new and valuable ideas, elaborate, refine, analyze, and evaluate one's own and others' ideas to improve and maximize creative efforts (Care et al., 2023).

Complementing the 4Cs, the Center for Curriculum Redesign (2024) identifies additional critical competencies: intercultural competence (ability to interact effectively and appropriately with people from different cultural contexts), digital literacy (mastery of technological tools for learning, working, and problem-solving), and metacognition (awareness and regulation of one's own thought processes).

In the context of higher education, the intentional development of soft skills requires educational experiences that go beyond the transmission of theoretical knowledge. Active, authentic, and experiential methodologies are needed that place students in situations that demand the practical application of these competencies in real or simulated contexts (Amirian, 2023). COIL represents precisely this type of experiential methodology.

2.3 VIRTUAL INTERNATIONALIZATION OF HIGHER EDUCATION

The internationalization of higher education is defined as the process of integrating international, intercultural, and global dimensions into the purposes, functions, and provision of postsecondary education (Knight, 2003). Traditionally, this process has materialized mainly through physical mobility: students and academics traveling between countries for study, research or teaching.

However, the Home Internationalization (IAH) paradigm has emerged as a complement and alternative to physical mobility, defined as "the intentional integration of international and intercultural dimensions into the formal and informal curriculum for all students within home learning environments" (Beelen & Jones, 2015). IaH seeks to democratize access to international experiences, recognizing that most students will never participate in physical mobility programs due to economic, family, work, or other constraints.

Virtual Internationalization (IV) represents a specific dimension of IaH that leverages information and communication technologies to create international and intercultural experiences without requiring physical copresence (Bruhn-Zass, 2022). Bruhn (2022) proposes a conceptual framework that organizes the IV into seven categories:

- **Virtual mobility:** Structured exchange or study experiences that occur entirely online, including COIL, telecollaboration, and international virtual internships.
- **Internationalization of the curriculum:** Integration of international content, perspectives and resources in courses using digital technologies.
- **Teacher Professional Development:** International training of academics using online platforms.
- **International collaborative research:** Transnational research projects facilitated by collaborative technologies.
- **Support services for international students:** Digital platforms for guidance, counseling and services for physically mobile students.
- **International Marketing and Recruitment:** Digital Strategies to Attract International Students and Partners.
- **Transnational Education:** Comprehensive academic programs offered across borders using digital technologies.

COIL is primarily located in the category of virtual mobility, although it frequently incorporates elements of internationalization of the curriculum. Its distinctive feature lies in the centrality of authentic intercultural interaction and structured international collaboration, differentiating itself from other forms of IV that may focus more on access to international content or resources without necessarily promoting deep interactions between participants from different cultures (Helms et al., 2023).

For Latin America, virtual internationalization represents a particularly valuable opportunity. The region faces significant structural challenges: limited institutional budgets for mobility programs, heterogeneous technological infrastructure, and the need to strengthen international academic ties to improve quality and innovation (Rama, 2013). At the same time, there is growing experience and capacity building in virtual education, accelerated by the COVID-19 pandemic, which can be capitalized to promote IV programs such as COIL (Ngalomba et al., 2025).

3 METHODOLOGY

3.1 RESEARCH DESIGN

An exploratory review of the academic literature was carried out following the methodological guidelines of Arksey and O'Malley (2005) and the updated recommendations of the Joanna Briggs Institute (Peters et al., 2020). The exploratory review was considered appropriate given the objective of mapping the available evidence on a relatively emerging field of research, identifying key concepts, types of evidence, and gaps in current knowledge about COIL and soft skills development.

The process followed five systematic stages: (1) identification of the research question, (2) identification of relevant studies, (3) selection of studies, (4) data extraction and graphing, and (5) synthesis and interpretation of results.

3.2 RESEARCH QUESTION

The central question that guided this review was: What is the available evidence on the implementation of Collaborative Online International Learning (COIL) and its impact on soft skills development in higher education contexts, particularly in Latin America?

Specific secondary questions included: What specific soft skills have been assessed in COIL programs? What implementation and evaluation methodologies have been used? What are the main enablers and barriers reported? What are the particularities of the implementation of COIL in Latin American contexts?

3.3 SEARCH STRATEGY

A systematic search was conducted in multiple academic databases during the period September-December 2024, covering publications from January 2020 to December 2024. The databases consulted included:

- Web of Science Core Collection
- Scopus
- ERIC (Education Resources Information Center)
- SpringerLink
- ScienceDirect
- PubMed (for interdisciplinary studies in health)

In addition, specialized repositories in Latin American higher education were consulted: SciELO, RedALyC and institutional repositories of leading universities in COIL in the region.

The search terms used included: ("COIL" OR "Collaborative Online International Learning" OR "virtual exchange" OR "virtual mobility" OR "telecollaboration") AND ("soft skills" OR "21st century skills" OR "transversal competencies" OR "intercultural competence" OR "communication" OR "collaboration" OR "critical thinking" OR "creativity") AND ("higher education" OR "university" OR "tertiary education").

For the Latin American context, Spanish terms were added: ("COIL" OR

"international collaborative online learning" OR "virtual internationalization" OR "virtual mobility") AND ("soft skills" OR "transversal competences" OR "intercultural competence") AND ("higher education" OR "university").

3.4 SELECTION CRITERIA INCLUSION CRITERIA:

- Empirical studies (quantitative, qualitative, or mixed) on COIL implementation
- Participants: Higher education students (undergraduate or graduate)
- Assessment of at least one soft skill or transversal competence
- Publications in English or Spanish
- Period 2020-2024 (emphasis on recent post-pandemic evidence) **Exclusion criteria:**
- Exclusively theoretical or conceptual studies without empirical data
- Basic or secondary education as a study population
- Virtual exchange without a structured collaborative component
- Publications without access to full text

3.5 SELECTION PROCESS

The initial search identified 387 potentially relevant records. After elimination of duplicates (n=92), 295 titles and abstracts were reviewed. Of these, 98 articles were selected for full-text review. Finally, 56 studies met all the inclusion criteria and were included in the qualitative synthesis.

The selection process was carried out by two independent reviewers, with discrepancies resolved by consensus and consultation with a third reviewer when necessary.

3.6. Data Extraction and Analysis

A data extraction matrix was developed that captured: author(s) and year, country/region, academic discipline, sample size, methodological design, soft skills assessed, measurement instruments, duration of COIL intervention, main findings, facilitators, and reported barriers.

The data were analyzed through thematic narrative synthesis, identifying common patterns, divergent findings, and gaps in evidence. Particular attention was paid to studies from Latin America to identify contextual particularities.

Given the exploratory nature of the review, no formal methodological quality assessment of the included studies was carried out, although the level of evidence (experimental vs. observational designs) was considered in the interpretation of findings.

4 RESULTS

4.1 CHARACTERISTICS OF THE INCLUDED STUDIES

The 56 studies included in this review represent empirical research conducted in 28 different countries, with a geographic distribution that reflects both the predominantly Global North origin of the COIL methodology and its increasing adoption in the Global South. The analysis of general characteristics reveals important patterns about the current state of research in this field.

Table 1

Geographical Distribution of Studies on COIL (n=56)

Region	N° Studies	Percentage	Main Countries
North America	18	32.1%	USA (15), Canada (3)
Europe	21	37.5%	Netherlands (6), Spain (5), United Kingdom (4)
Latin America	9	16.1%	Mexico (3), Peru (2), Colombia (2), Brazil (2)
Asia	5	8.9%	China (2), Japan (1), Turkey (2)
Africa	2	3.6%	Tanzania (1), Egypt (1)
Oceania	1	1.8%	Australia (1)
TOTAL	56	100%	28 countries

Source: Authors' elaboration based on a systematic review of literature 2020-2024

The geographical distribution shows a predominance of research in the Global North (69.6% between North America and Europe), although with a growing representation of Latin

America (16.1%). It is notable that approximately 67% of Latin American studies were published in 2023-2024, suggesting recent acceleration in COIL adoption and research in the region.

Table 2

Methodological Designs of COIL Studies (n=56)

Methodological Design	Frequency	Percentage	Level of Evidence
Quasi-experimental with control group	12	21.4%	High
Pre-test / Post-test without control group	19	33.9%	Moderate
Mixed methods (quantity + quali)	18	32.1%	Variable
Qualitative descriptive	7	12.5%	Low
TOTAL	56	100%	-

Source: The authors.

4.2 IMPACT OF COIL ON SOFT SKILLS DEVELOPMENT

Analysis of the 56 studies reveals robust evidence on the positive impact of COIL on the development of multiple soft skills. The results are organized according to the main competencies evaluated, following the framework of the 4Cs extended with intercultural competence as a fundamental dimension.

4.2.1 Intercultural competence

Intercultural competence emerged as the most consistently positive outcome in COIL programs. Of 52 studies that evaluated this dimension, 48 (92.3%) reported significant improvements. Helm et al. (2023), in a quasi-experimental study with 108 students (Netherlands-USA), found a statistically significant increase in intercultural competence for the experimental group ($p < 0.01$), measured through the Cultural Intelligence Scale (CQS) and the Multicultural Personality Questionnaire (MPQ).

The mechanisms identified for this development include:

- **Authentic exposure to cultural differences:** Students interact directly with peers from different cultural contexts in real, non-simulated collaborative situations (Fukkink et al., 2024).

- **Negotiation of differences:** Need to resolve cultural misunderstandings, differences in communication styles, and divergent expectations during project collaboration (O'Dowd, 2021).
- **Guided critical reflection:** Structured intercultural reflection activities facilitate metacognition about one's own cultural frameworks and biases (Helms et al., 2023).
- **Development of intercultural empathy:** Prolonged work with international colleagues generates empathic understanding of diverse perspectives (Anderson & Or, 2023).

In the Latin American context, Vega Chica (2024) reported that students from Colombia and Peru in COIL business programs demonstrated greater development of sustainable community practices linked to cultural collectivist orientation, suggesting that regional cultural characteristics can enhance certain aspects of intercultural competence.

4.2.2 Effective Communication

COIL demonstrated significant impact on communication skills, particularly in multilingual and intercultural contexts. 38 studies evaluated communicative dimensions, with 28 (73.7%) reporting improvements. A study with 157 students from three countries (Japan, Turkey, Spain) found a statistically significant increase in self-perceived communication competence and a reduction in communication anxiety after participation in COIL (Ramírez et al., 2024).

Specifically developed communicative aspects include:

- **Intercultural expressive clarity:** Ability to articulate ideas in a way that is understandable to audiences from different linguistic and cultural contexts, avoiding colloquialisms or culturally specific references (Care et al., 2023).
- **Intercultural active listening:** Ability to understand messages considering the interlocutor's cultural frameworks, asking appropriate clarifying questions (Fukkink et al., 2024).
- **Multimodal communication:** Effective use of varied digital tools (text, voice, video, visualizations) for asynchronous and synchronous communication (Hackett et al., 2023).
- **Managing Language Barriers:** Strategies for Effective Communication When Participants Have Varying Levels of Common Language Proficiency (Ramírez et al., 2024).

4.2.3 Collaboration and Teamwork

Collaboration in virtual multicultural teams showed significant development in 42 of 50 studies (84%) that assessed this dimension. The inherently collaborative nature of COIL provides authentic context for the development of teamwork competencies. COIL projects typically require students from different countries to coordinate efforts, distribute tasks, integrate diverse contributions, and achieve quality collaborative products.

Specific collaboration competencies developed include:

- **Virtual coordination:** Managing teamwork across time zone differences, using project management tools and effectively asynchronous/synchronous communication (Bassani & Buchem, 2019).
- **Negotiation of differences:** Constructive resolution of conflicts arising from cultural differences in work styles, expectations, and approaches to tasks (Helms, 2020).
- **Distributed leadership:** Shared leadership capacity building where different members assume leadership roles based on tasks and strengths (Commander et al., 2022).
- **Integration of diverse perspectives:** Ability to synthesize contributions from peers with different conceptual frameworks and disciplinary approaches (Gallego & Meneses, 2023).

4.2.4 Global Critical Thinking

Critical thinking, particularly in its dimension of consideration of multiple global perspectives, showed development in 25 of 35 studies (71.4%) that evaluated it. COIL provides unique context for critical thinking development by exposing students to multiple conceptual frameworks and approaches to complex problems.

Specific dimensions developed include: analysis from multiple cultural perspectives, questioning of ethnocentric assumptions, critical evaluation of one's own biases, and synthesis of information from various international sources (Amirian, 2023; Rahman et al., 2024).

Table 3

Synthesis of COIL's Impact on Soft Skills

Soft Ability	Total Studies	Positive Results	% Positive	Effect Size
Competition Intercultural	52	48	92.3%	Moderate-High

Collaboration	50	42	84.0%	Moderate
Communication	38	28	73.7%	Moderate
Thought Critical	35	25	71.4%	Low- Moderate
Creativity	18	12	66.7%	Low
Digital Literacy	31	24	77.4%	Moderate

Source: Analysis by Fukkink et al. (2024); Helm et al. (2023); Ramírez et al. (2024)

4.3 ENABLERS AND BARRIERS TO COIL EFFECTIVENESS

The systematic analysis identified multiple factors that facilitate or hinder the effectiveness of COIL programs. These factors can be organized into three levels: pedagogical, technological, and organizational, following the TPACK (Technological Pedagogical Content Knowledge) framework adapted by Fukkink et al. (2024).

4.3.1 Facilitators

A. Pedagogical factors:

- **Intentional collaborative design:** Careful co-design among faculty partners of activities that require genuine positive interdependence among international students (Helms, 2020).
- **Structured intercultural reflection:** Systematic inclusion of critical reflection activities on intercultural encounters, facilitated by teachers (O'Dowd, 2021).
- **Authentic and relevant tasks:** Projects connected to real challenges that require multiple perspectives for effective resolution (Rubin & Guth, 2022).
- **Continuous formative assessment:** Frequent feedback on both content and collaborative and intercultural processes (Commander et al., 2022).

B. Technological Factors:

- **Appropriate selection of tools:** Use of platforms that facilitate both synchronous communication (Zoom, Teams) and asynchronous collaboration (Google Workspace, Moodle) (Hackett et al., 2023).
- **Prior technical training:** Effective induction of students and teachers in the use of technologies before the start of international collaboration (Bassani & Buchem, 2019).
- **Reliable infrastructure:** Stable internet access and basic equipment for all participants (Ngalomba et al., 2025).

C. Organizational Factors:

- **Visible institutional support:** Recognition and assessment of COIL in teaching workload and budgets for professional development (Rubin & Guth, 2022).
- **Effective administrative coordination:** **Dedicated** staff for logistics coordination, partner matching, and troubleshooting (Hackett et al., 2024).
- **Curricular flexibility:** Institutional capacity to adapt calendars, requirements, and assessments to accommodate international collaboration (Beelen & Jones, 2015).

4.3.2 Barriers

A. Language Barriers:

- Differences in common language proficiency (typically English) generate inequalities in participation and communicative confidence, particularly for students whose first language is not English (Bassani & Buchem, 2019).
- Students with lower language proficiency may feel marginalized or experience high communicative anxiety that inhibits active participation (Ramírez et al., 2024).

B. Time Zone Differences:

- Synchronous session coordination becomes complex with significant time differences, potentially requiring some students to participate in inconvenient schedules (Bassani & Buchem, 2019).
- It can generate a perception of inequity if some groups consistently have to accommodate other groups' schedules (Helm, 2020).

C. Digital Divide:

- Unequal access to technology (computers, stable internet) particularly in institutions in the Global South may limit effective participation of some students (Ngalomba et al., 2025).
- Heterogeneous prior digital competencies may require additional time-consuming training from the COIL module (Çalıkoğlu, 2025).

D. Perceived Workload:

- COIL can be perceived by students as significant additional work, especially if it is not organically integrated into existing courses (Bedenlier & Marín, 2020).
- Coordination with international peers requires time and effort beyond typical individual work in courses (Ramírez-Marín et al., 2020).

E. Differences in Academic Cultures:

- Divergent expectations about academic communication styles, citation norms, approaches to group work, and student-teacher relationships can generate misunderstandings and friction (King de Ramirez, 2021).
- Without appropriate teacher facilitation, these differences can be a source of conflict rather than intercultural learning (O'Dowd, 2021).

4.4 COIL EXPERIENCES IN LATIN AMERICA

Latin America has experienced significant growth in COIL adoption during the 2020-2024 period, accelerated by transformations in post-pandemic higher education and recognition of structural limitations for traditional physical mobility. The nine Latin American studies identified in this review provide valuable evidence on regional particularities in COIL implementation and effectiveness.

4.4.1 Institutional Networks and Programs

The Universidad Veracruzana (Mexico) has emerged as a regional leader, having established in 2021 the Latin American COIL Network (Red LatAm COIL Network), which connects more than 45 higher education institutions in 12 Latin American countries. This network provides free training to teachers, facilitates matching of international partners, and promotes research on COIL in regional contexts (Rodríguez Luna, 2023).

In Peru, the Pontificia Universidad Católica del Perú (PUCP) has institutionalized COIL as a central component of its Internationalization at Home strategy. During 2024-2025, it offered 20 courses with integrated COIL modules, benefiting more than 800 students from various faculties. The PUCP strategy includes three modalities: International Week (intensive courses with foreign teachers), regular courses in English, and COIL modules themselves, allowing students to access international experiences without physical mobility requirements (Betancourt, 2024).

In Colombia, the César Vallejo University and the Minuto de Dios University Corporation implemented a joint COIL project focused on educational research, developing soft skills of graduate students through structured virtual international collaboration (Gallego & Meneses, 2023). This project demonstrated the viability of COIL between institutions in the same country but different regions, taking advantage of internal regional diversity.

4.4.2. Specific Findings of the Latin American Context

Vega Chica's (2024) study with master's students in business from Colombia and Peru revealed that COIL not only developed expected intercultural and communicative competencies, but also strengthened commitment to sustainability practices. Students from cultures with a more collectivist orientation demonstrated a particular willingness to integrate community sustainability considerations into collaborative projects, suggesting that regional cultural values can enhance certain learning objectives in COIL.

A consistent finding in Latin American studies is the high student motivation to participate in COIL. In a context where international physical mobility is the privilege of economically favored minorities, COIL is perceived by students as a valuable and

democratizing opportunity for international experience that would otherwise be inaccessible (Restrepo, 2022; Ramírez & Bustos-Aguirre, 2022).

However, challenges specific to the Latin American context also emerged:

(1) Heterogeneous technological infrastructure within countries and between institutions requires careful planning to ensure equitable access; (2) Institutional budgetary constraints restrict capacity for sustained investment in teacher professional development and specialized administrative coordination; (3) Diverse academic calendars among Latin American countries complicate synchronization, although less so than with partners in the Global North; (4) Limited English proficiency among students may require COIL in Spanish-Portuguese or specific strategies for linguistic inclusion (Ngalomba et al., 2025).

5 DISCUSSION

This exploratory review provides robust systematic evidence on the role of COIL in the development of essential 21st century soft skills in contexts of virtual internationalization of higher education. The findings confirm that COIL, when implemented with intentional pedagogical design and appropriate institutional support, generates significant positive impacts in multiple dimensions of transversal competencies.

5.1 THEORETICAL CONTRIBUTIONS

The results support and extend social constructivist theory on learning. COIL creates intercultural zones of proximal development where students, with the support of facilitating teachers and international peers, develop competencies that exceed what they could achieve by working exclusively with peers from their same cultural context (Vygotsky, 1978). Interaction with genuine cultural otherness generates productive cognitive dissonance that drives the development of more complex, flexible, and culturally relativistic thinking (Bennett, 2017).

The consistent finding of intercultural competence development through COIL validates models of intercultural sensitivity development that postulate that experiences of authentic interaction with cultural difference, accompanied by guided critical reflection, are central mechanisms for the transition from ethnocentrism to ethnorelativism (Bennett, 2017). COIL provides precisely this kind of experience at accessible and sustainable scale.

The findings also resonate with experiential learning theory (Kolb, 1984). COIL positions students in concrete experiences of intercultural collaboration, followed by observational reflection on intercultural dynamics, abstract conceptualization of principles of communication and effective collaboration, and active experimentation with new strategies in

subsequent interactions. This experiential cycle generates deep and transformative learning beyond the acquisition of declarative knowledge about cultures.

5.2 PRACTICAL IMPLICATIONS

For higher education institutions considering adopting or scaling COIL, this review suggests several evidence-based implementation principles:

- **Prioritize quality over quantity:** Better to implement a few well-designed COIL projects with appropriate support than to scale quickly without ensuring conditions for effectiveness. Evidence shows that intentional pedagogical design is critical for positive outcomes (Fukkink et al., 2024).
- **Invest in teacher professional development:** Robust training in intercultural facilitation, collaborative design, and assessment of transversal competencies is essential. Teachers require specialized competencies beyond disciplinary expertise (Rubin & Guth, 2022).
- **Establish coordination infrastructure:** Dedicated offices or coordinators that facilitate partner matchmaking, logistical problem solving, and quality monitoring significantly improve viability and effectiveness (Hackett et al., 2024).
- **Proactively addressing the digital divide:** Providing access to equipment and connectivity for students with technological limitations ensures equitable participation and avoids reproducing inequities (Ngalomba et al., 2025).
- **Integrate soft skills assessment:** Develop rubrics and assessment methods that capture the development of transversal competencies, not just disciplinary content domain, values and makes these important learnings visible (Care et al., 2023).

5.3 LATIN AMERICAN CONTEXT

For Latin America, COIL represents a particularly strategic opportunity. The region faces tension between aspirations for internationalization of higher education and structural limitations for physical mobility. COIL offers a way for more accessible, equitable and environmentally sustainable internationalization, aligned with social justice and sustainable development objectives (Rama, 2013; Barbosa et al., 2020).

Evidence of high student motivation in Latin American contexts suggests that COIL can contribute not only to the development of soft skills but also to equity in access to international training experiences. However, realizing this potential requires deliberate attention to digital divides and sustained institutional capacity building.

The emergence of regional networks such as Red LatAm COIL constitutes a positive development that can catalyze adoption through the provision of training, resources, and communities of practice. Strengthening these networks and developing regionally contextualized repositories of good practices can accelerate the diffusion of effective COIL in Latin America.

5.4 LIMITATIONS OF THE STUDY

This review has limitations that should be considered when interpreting findings:

- **Methodological heterogeneity:** Included studies used diverse designs, instruments, and populations, limiting direct comparability and the possibility of rigorous quantitative meta-analysis.
- **Publication bias:** Studies with positive results may be more likely to be published than those with neutral or negative results, potentially overrepresenting the effectiveness of COIL.
- **Limited longitudinal evidence:** Most studies evaluate immediate or short-term impact. More research is required on the persistence of competencies developed in the medium and long term.
- **Under-representation of the Global South:** Although growing, evidence from Latin America, Africa and Asia remains limited compared to the Global North, restricting generalizability to diverse contexts.
- **Emphasis on self-reporting:** Many studies rely on students' self-reported perceptions rather than objective measures of competencies, introducing potential social desirability bias.

6 CONCLUSIONS AND RECOMMENDATIONS

This systematic exploratory review provides comprehensive evidence that Collaborative Online International Learning (COIL) constitutes an effective pedagogical strategy for the development of essential soft skills of the twenty-first century in higher education contexts. The findings are particularly relevant for institutions in Latin America that seek to democratize access to international training experiences by overcoming limitations of traditional physical mobility.

6.1 MAIN CONCLUSIONS

- **Proven effectiveness:** COIL generates positive impacts consistent in the development of intercultural competence (92.3% of studies), collaboration in multicultural teams (84%), effective communication (73.7%), and global critical thinking (71.4%).
- **Democratization of access:** COIL provides quality international experiences to students who face economic, geographic or personal barriers to physical mobility, contributing to equity in higher education.
- **Critical success factors:** COIL's effectiveness depends critically on intentional pedagogical design, specialized teacher training, appropriate technological support, and sustained institutional commitment.
- **Growth in Latin America:** Region shows accelerated adoption of COIL with preliminary evidence of effectiveness and high student motivation, although infrastructure and institutional capacity challenges persist.
- **Need to address gaps:** Language barriers, digital divide, and differences in academic cultures require deliberate strategies to ensure inclusion and equity in COIL experiences.

6.2 RECOMMENDATIONS FOR POLICIES AND PRACTICES

6.2.1 For Higher Education Institutions

- Incorporate COIL into institutional internationalization strategies as a complementary (not a substitute) component of physical mobility.
- Establish dedicated offices or coordinators to facilitate sustainable implementation and scaling of COIL programs.
- Recognize COIL in teaching workload systems and academic evaluation metrics.
- Develop funds to mitigate the digital divide by providing access to equipment and connectivity for students with disabilities.

6.2.2 For Teachers

- Participate in specialized training in international collaborative design, cross-cultural facilitation, and cross-competency assessment.
- Co-design COIL projects with international partners focusing on genuine positive interdependence and relevant authentic tasks.
- Integrate structured activities of critical intercultural reflection to maximize learning from collaborative experiences.

- Provide continuous formative feedback on both disciplinary content and collaborative and intercultural processes.

6.2.3 For Education Policymakers

- Develop financing policies and programs that promote the adoption of virtual internationalization as an equitable complementary strategy.
- Invest in educational technological infrastructure and reduce the digital divide to enable equitable participation in international virtual programs.
- Strengthen regional COIL networks that facilitate collaboration, training, and exchange of good practices between institutions.
- Include intercultural competences and soft skills as explicit learning outcomes in national qualifications frameworks.

6.3 DIRECTIONS FOR FUTURE RESEARCH

- Longitudinal studies that evaluate the persistence of competencies developed in the medium and long term after the COIL experience.
- Research with robust experimental designs (control groups, random assignment) to establish causality with greater certainty.
- Studies contextualized in the Global South, particularly Latin America, Africa and Asia, to understand regional particularities.
- Research on the cost-effectiveness of COIL compared to other internationalization modalities.
- Development and validation of regionally contextualized instruments for soft skills assessment in virtual intercultural contexts.
- Studies on the intersection of COIL with other active learning modalities (project-based learning, service-learning, etc.).

6.4 FINAL REFLECTION

In an increasingly interconnected and culturally diverse world, the ability to communicate effectively, collaborate constructively, think critically considering multiple perspectives, and adapt creatively to changing contexts are fundamental competencies for active global citizenship and professional success. COIL represents an innovative and evidence-informed pedagogical methodology that can contribute significantly to the development of these essential skills, democratizing access to international formative experiences that have traditionally been the privilege of minorities. Realizing this

transformative potential, particularly in Latin American contexts, requires sustained institutional commitment, investment in teacher capacity development, deliberate attention to equity and inclusion, and ongoing research to refine practices based on contextualized evidence. The future of the internationalization of higher education will be hybrid, combining the best of physical mobility with the democratizing opportunities of virtual internationalization. COIL is a powerful tool in this future.

ABSTRACT

The land regularization of quilombola territories in the state of Tocantins, although guaranteed by Article 68 of the Transitional Constitutional Provisions of the 1988 Brazilian Constitution, faces significant obstacles to its implementation. The process is hindered by the lack of specific state legislation, limited resources, bureaucratic delays, and political omission. Of the 52 quilombola communities officially recognized by the Fundação Cultural Palmares, only one has had its territory titled, and only through a court decision. This situation reveals a deep gap between legal recognition and the realization of territorial rights. This study uses a mixed methodology (documentary, census, and empirical data) and is grounded in the theoretical frameworks of ethnodevelopment, participatory democracy, and human rights. It highlights the crucial role of social movements, the justice system, and academic production as forms of democratic resistance. A comparison with states like Pará and Maranhão shows how specific legal frameworks can significantly advance quilombola land titling. The study concludes that overcoming state omission requires the establishment of state-level legislation, active participation of quilombola communities, and stronger institutional commitment. Land regularization is not merely a technical or legal issue—it is a matter of social justice, historical reparation, and sustainable territorial development for quilombola peoples in the heart of Brazil.

Keywords: Quilombolas. Tocantins. Land Regularization.

RESUMO

A regularização fundiária quilombola no Tocantins, embora assegurada pelo artigo 68 do ADCT da Constituição de 1988, encontra entraves significativos à sua efetivação. No estado, o processo esbarra na ausência de legislação estadual específica, escassez de recursos, morosidade administrativa e omissão política. Apenas uma das 42 comunidades quilombolas

reconhecidas pela Fundação Cultural Palmares teve seu território titulado, e apenas após decisão judicial. Essa realidade evidencia o descompasso entre o marco normativo e a efetividade dos direitos territoriais. A pesquisa adota uma abordagem mista (documental, censitária e empírica), com base teórica no etnodesenvolvimento, democracia participativa e direitos humanos. Destaca-se o papel essencial dos movimentos sociais, das comunidades quilombolas, do sistema de justiça e da produção acadêmica como formas de resistência democrática. O estudo também compara a situação tocantinense com a de estados como o Pará e o Maranhão, cujas legislações específicas possibilitaram avanços significativos na titulação quilombola. Conclui-se que a superação da omissão estatal passa pela criação de um marco legal estadual, pela participação ativa das comunidades e pelo fortalecimento institucional. A regularização fundiária é mais do que uma demanda jurídica: trata-se de um imperativo de justiça social, reparação histórica e desenvolvimento territorial sustentável para os povos quilombolas no coração do Brasil.

RESUMEN

La regularización de tierras para las comunidades quilombolas en Tocantins, si bien está garantizada por el Artículo 68 de las Disposiciones Transitorias de la Constitución de 1988, enfrenta importantes obstáculos para su implementación. En el estado, el proceso se ve dificultado por la ausencia de legislación estatal específica, la escasez de recursos, las demoras administrativas y la omisión política. Solo una de las 42 comunidades quilombolas reconocidas por la Fundación Cultural Palmares ha obtenido la titulación de su territorio, y únicamente tras una decisión judicial. Esta realidad pone de manifiesto la discrepancia entre el marco normativo y la efectividad de los derechos territoriales. La investigación adopta un enfoque mixto (documental, censal y empírico), basado en el marco teórico del etnodesarrollo, la democracia participativa y los derechos humanos. Se destaca el papel fundamental de los movimientos sociales, las comunidades quilombolas, el sistema de justicia y la producción académica como formas de resistencia democrática. El estudio también compara la situación en Tocantins con la de estados como Pará y Maranhão, cuya legislación específica ha permitido avances significativos en la titulación de tierras quilombolas. Se concluye que superar la omisión estatal requiere la creación de un marco jurídico estatal, la participación activa de las comunidades y el fortalecimiento institucional. La regularización de la tierra es más que una exigencia legal: es un imperativo de justicia social, reparación histórica y desarrollo territorial sostenible para los pueblos quilombolas en el corazón de Brasil.

Palabras clave: Comunidades Quilombolas. Tocantins. Regularización de Tierras.

1 INTRODUCTION

The struggle for land in Latin America has historically been a key component of democratization processes and social mobilizations for rights, significantly influencing the guarantee of territorial rights for traditional communities. In Brazil, the constitutional recognition of the territorial rights of traditional peoples and communities was marked in 1988, with the enactment of article 68 of the Transitional Constitutional Provisions Act (ADCT). This legal-political advance, however, has not been translated equitably into effective access to land, especially in regions where state action has been minimal or non-existent.

In the state of Tocantins, located in northern Brazil, the situation of quilombola communities is still marked by territorial insecurity, the lack of specific state legislation and an inefficient bureaucracy that postpones land titling. Although there are federal norms that regulate the process of land regularization, the scarcity of resources, bureaucratic slowness and political omission have contributed to the inefficiency of the application of the constitutional right to land, which can be mitigated by the states of the federation.

These issues are aggravated by the limited academic production on quilombola land regularization in Tocantins. Although the topic is recognized in legislation and has been the focus of several social struggles, the lack of research that specifically addresses the obstacles faced in Tocantins reflects a significant gap in the scientific field. Studies such as that of (Franco, Sousa and Ferreira 2024, p. 12) point to the urgent need to deepen the analysis on the subject in Tocantins, since the scarcity of publications and academic debates limit the formulation of more effective and informed public policies.

This article seeks to contribute to overcoming this academic gap in the context of Tocantins, as well as to reflect on the contradictions between the formal recognition of territorial rights and their denial, in practice. It is a political and democratic issue, which transcends legal and administrative aspects: How does the State articulate itself with the historical demands for reparation and social justice? What is the role of social movements in monitoring and demanding these rights?

Based on an approach that combines theories of ethnodevelopment, human rights, and participatory democracy, the article analyzes the main challenges faced by quilombola communities in Tocantins and proposes guidelines for more effective, responsible state action committed to territorial equity.

2 METHODOLOGY

The research adopts a mixed approach, combining qualitative and quantitative methods, to offer a comprehensive analysis of the situation of quilombola land regularization

in the State of Tocantins. The choice for this methodological approach is justified by the complexity of the phenomenon, which requires the triangulation of documentary, census and empirical data for a deeper understanding.

From the documentary point of view, national and international normative instruments were analyzed, such as article 68 of the Transitional Constitutional Provisions Act (ADCT), Decree No. 4,887/2003, ILO Convention No. 169 and reference state legislation (Pará and Maranhão). Institutional recommendations (such as Recommendation No. 6/2017 of the MPF, MPE and DPE) and judicial decisions were also examined, with emphasis on the case of the Ilha de São Vicente community, whose territory was titled by court order, in addition to the Rio Preto and Barra do Aroeira quilombos that suffer from the inertia of state power.

In the census plan, data from the 2022 Demographic Census, from the Brazilian Institute of Geography and Statistics (IBGE), referring to the quilombola population in Tocantins, as well as information from the Palmares Cultural Foundation on certified communities, were used.

The empirical dimension of the research was built on the basis of recent public reports, such as the document of the Pastoral Land Commission (2023), which highlights land conflicts involving quilombola communities in the state, and the data systematized in the public consultation of the Multiannual Plan (PPA) 2024–2027, which identifies quilombola titling as a priority for the population.

The analysis was conducted under the theoretical framework of ethnodevelopment, participatory democracy and human rights, with emphasis on state responsibility and the role of social movements as agents of democratic resistance. The triangulation of these sources and approaches enabled a critical and contextualized understanding of the problem.

3 CONSTITUTIONAL RECOGNITION AND POLITICAL OMISSION

Article 68 of the Transitional Constitutional Provisions Act (ADCT), by recognizing the definitive ownership of lands occupied by quilombo remnants, guarantees more than a possessory right. It establishes a fundamental foundation for the preservation of their traditions, cultural practices and forms of social organization, essential elements for the continuity and strengthening of these communities, the result of a long struggle for the recognition of rights historically denied to the black population in Brazil and represents a milestone in the reparation of the injustices inherited from slavery.

In this sense, the political omission of federated entities, especially state governments, translates into an act of institutional negligence that contributes to the deepening of racial and territorial inequalities. In the case of Tocantins, the absence of specific legislation, of a public

budget for land regularization and of political will to implement effective measures shows a scenario of structural invisibility of these communities. The lack of action on the part of the State not only compromises the effectiveness of article 68 of the Transitional Constitutional Provisions Act (ADCT), which recognizes the right of quilombola communities to definitive ownership of their territories, but also constitutes a direct violation of Convention No. 169 of the International Labor Organization (ILO), ratified by Brazil through Decree No. 10,088/2019. In particular, Article 14 of the Convention establishes that the rights of ownership and possession over traditionally occupied lands must be recognized, requiring States to adopt measures to identify them and ensure their effective protection. The state's omission, therefore, represents not only a failure to comply with domestic constitutional norms, but also a failure to comply with international obligations assumed by the country in the field of human rights.

4 QUILOMBOLA COMMUNITIES IN TOCANTINS

In 1988, the National Constituent Assembly created the State of Tocantins, the most recent federative unit of Brazil, located in the geodesic center of the country. However, the presence of quilombola communities in their territory long predates their institutionalization. According to the Palmares Cultural Foundation (2024), the state has 42 certified quilombola communities. The origin of these groups dates back at least to the nineteenth century, when enslaved black people and their descendants began to occupy areas of difficult access as a form of resistance, organizing their own and collective ways of life. In these territories, located mostly in cerrado regions and on the banks of rivers, their own and collective ways of life were developed, based on agricultural production, cultural reproduction and the preservation of black collective memory. Despite being historically marginalized by public policies, these communities play a central role in the construction of the socio-territorial identity of the State, organizing politically in defense of the realization of their rights. As a result of this mobilization, the Permanent Forum for Monitoring the Quilombola Issue in the State of Tocantins was created in January 2010, with the objective of pressuring the State to complete the processes of identification and land regularization of quilombola territories (APA-TO, 2012).

However, in a study published in 2024 on areas of restricted legal use and with potential for environmental conservation, the State of Tocantins presented a georeferenced map with the location of certified quilombola communities, evidencing the state's land tenure reality: only one quilombola community has full title to its territory.

Figure 1*Location of certified quilombola communities in Tocantins*

Source: TOCANTINS (2024)

The only quilombola community with fully titled territory, as shown in figure 1, is the Island of São Vicente, located in the municipality of Araguatins, in the region of Bico do Papagaio, in the extreme north of Tocantins. However, this recognition was not the result of a spontaneous initiative of the Brazilian State, but rather of the intervention of the Judiciary. The land regularization process was driven by a decision of the 1st Federal Court of Araguaína, in case No. 1001658-74.2020.4.01.4301, which determined the titling of the territory in favor of the community, evidencing the administrative slowness and state omission. Considering that there are 42 certified quilombola communities in the state, the titling of the Island of São Vicente represents less than 2.5% of the total, not counting those communities that do not even have certification. These data reveal the fragility of public policies aimed at quilombola land regularization in Tocantins and indicate that this agenda is not yet a priority for the State.

5 QUILOMBOLAS AS DEMOCRATIC SUBJECTS AND AGENTS OF RESISTANCE

The concept of quilombo, historically linked to resistance to the slavery system, has evolved to encompass contemporary forms of resistance and organization of black communities. This understanding is crucial for the interpretation of quilombola territorial claims, as it highlights the continuous character of resistance and the intrinsic connection between land, culture and identity. In this sense, contemporaneously, the term quilombo does not refer to archaeological residues or remnants of temporal occupation or biological proof. Nor are they isolated groups or a strictly homogeneous population (O'Dwyer 2008, 10).

In this regard, as guided by the CNJ's Protocol of Judgment with a Racial Perspective, the use of the term "remnant" can lead to misinterpretations, by suggesting that such communities would only be historical remains. On the other hand, it is noteworthy that these communities maintain cultural, social and economic practices that are constantly updated and constitute contemporary forms of sociocultural resistance. For this reason, it is recommended to use the term "quilombola community", which expresses the historical continuity, social differentiation, and autonomy of these groups, recognized as subjects of law by ILO Convention No. 169 (National Council of Justice, 2024).

In view of this expanded and updated conception of quilombo, it becomes evident that the issue of land regularization of quilombola communities in Tocantins transcends mere land ownership, configuring itself as a matter of social rights, public policies and regional development.

In the case of Tocantins, this demand for land regularization has progressively intensified. Recommendation No. 6/2017, issued by the Federal and State Public Prosecutor's Office and the Public Defender's Office, reinforces the need for concrete actions by the State to ensure the implementation of the territorial rights of these communities. Added to this is the Public Consultation of the Multiannual Plan (PPA) 2024/2027, which highlights the protagonism of the local population itself by electing the demarcation of quilombola territories as one of the main priorities, especially in the Jalapão region. Thus, the recognition of these demands by civil society and public agencies constitutes a relevant step towards the construction of a dialogue between the State and the communities, promoting a mutual understanding aimed at the realization of territorial rights.

From this perspective, data from the 2022 Demographic Census, carried out by the IBGE, reveal the existence of 13,077 quilombola people distributed in 39 municipalities in Tocantins. However, the land regularization of these communities still faces significant challenges. The report "Conflicts in the Countryside Brazil 2023", by the Pastoral Land Commission (CPT), points out that Tocantins recorded 13 land conflicts involving quilombola

communities in that year, which highlights the urgency and seriousness of the situation.

An emblematic example of this reality is the case of the Rio Preto Quilombola Community, located in Lagoa do Tocantins and certified by the Palmares Cultural Foundation through Ordinance 275/2023. Despite the official recognition, the community was the target of a violent attack on September 24, 2023, involving arson and gunfire (FIOCRUZ, 2024). Such an episode exposes the contradiction between the legal frameworks for the protection of traditional territories and the reality of state violence and negligence. Although the judicial decision of the Court of Justice of Tocantins, dated 09/08/2023 in case file 0000174-53.2017.8.27.2728 and ratified by the Federal Court in case file 1013274-44.2023.4.01.4300, has formally guaranteed the safety of the community, its effectiveness was compromised by state omission. Thus, the case of the Rio Preto Community makes explicit the failure of the State to ensure constitutional rights such as land titling and protection against violence, revealing that judicial decisions, although symbolically relevant, are not enough to change, by themselves, the correlation of forces in the territory.

In a similar way, the quilombola community of Barra do Aroeira also represents another cut of resistance among many in Tocantins. Located in the municipality of Santa Tereza do Tocantins, its history dates back to the Paraguayan War. According to Amaral and Pereira (2016), Félix José Rodrigues, considered the hero of Barra, volunteered to join the imperial army in the Paraguayan War (1854–1870). After the Brazilian victory, the combatants were rewarded, and Félix, summoned by Dom Pedro II, was able to choose the desired reward, opting for an area of land to live with his family.

Currently, according to Alves (2021), the quilombola community of Barra da Aroeira maintains a participatory and continuous struggle for the regularization of its territory. In the absence of progress in their demands, its members have mobilized strategies of resistance and strengthening of collective organization, with the aim of sensitizing the authorities to a historical problem experienced for many years. An example of this mobilization is the act of interdiction of the TO 247 highway, reflecting the history of resistance of black populations, especially in states such as Tocantins, marked by the expansion of agribusiness and the exploitation of land for cattle ranching and soy agriculture, standing out as an example of organization and resistance in the national scenario.

Figure 2

Interdiction of the TO 247 highway that crosses the Quilombo Barra do Aroeira, TO

Source: Personal collection, 2021.

In September 2021, after almost two decades of formal claims, the Government of Tocantins handed over to the Barra do Aroeira Quilombola Community the collective title of ownership of an area of 1,000 hectares. The delivery was preceded by a direct action of resistance: the interdiction of the TO-247 highway by members of the community, who, in June of the same year, held a protest with banners and a sound car, denouncing the delay in titling and demanding measures from the public authorities (Gazeta do Cerrado 2021). Then-governor Mauro Carlesse participated in the handover ceremony and declared that the recognition of the territory was an "obligation of the State" (Government of Tocantins, 2021). Despite this partial achievement, the community is still waiting for the titling of the territory in its entirety, estimated at around 62 thousand hectares, according to the delimitation already recognized in an official technical report (COEQTO 2025). The episode exemplifies how popular mobilization has been a central element in the realization of territorial rights of quilombola communities. Santos (2024) observes that the quilombola movement has been strengthened in recent decades through the articulation of legal actions, protests, and political strategies to ensure their right to territory. Leite (2008) already warned that the mere existence of legal provisions does not guarantee, by itself, the realization of the rights of quilombolas, and that a constant and politically active action of black social movements is necessary. The case of Barra da Aroeira illustrates this dynamic, reaffirming that organized resistance is a fundamental condition for transforming historical demands into legal recognition.

6 STATE RESPONSIBILITY AND THE CHALLENGE OF REGULATION IN STATE LANDS

In Brazil, the land regularization of quilombola territories is supported by federal legislation, such as Decree 4,887/2003 and Normative Instruction 57 of INCRA, which establish the procedures for the identification, recognition, delimitation, demarcation and

titling of these lands.

Figure 3

Map of quilombola communities titled and in the process of regularization in Brazil

Source: PRO-INDIAN COMMISSION OF SÃO PAULO, 2023.

The map above shows the disparity between the states with regard to the progress of the regularization processes, highlighting those with the highest number of titles issued and ongoing processes. This variation is largely due to the performance of the federative entities. The competence to legislate on state lands lies with the states themselves. Some, such as Pará, Maranhão and Bahia, have already advanced in the regulation of the quilombola issue with their own laws and decrees, which facilitates and speeds up the process of land regularization in their territories.

On the other hand, according to the Institute of Man and the Environment of the Amazon (IMAZON, 2021), approximately 56.5% of the entire territory of the State of Tocantins has no defined destination or lacks information about its destination.

Figure 4

Distribution of areas not designated or without destination information in the State of Tocantins by responsible government sphere

Source: <https://imazon.org.br/wp-content/uploads/2021/03/LeisRegularizacaoFunditariaTocantins.pdf>

Therefore, the high proportion of land without a defined destination in Tocantins reveals not only a structural deficit in the state's land governance, but also an omission by the government to ensure legal certainty and territorial justice, especially for historically marginalized populations.

According to the Pro-Indian Commission of São Paulo, Brazilian states have played a crucial role in the land regularization of quilombola territories, accounting for about 79% of the titles carried out since the promulgation of the 1988 Constitution, which recognized the right of quilombolas to land. This state protagonism reflects the capacity of local administrations to promote public policies aimed at guaranteeing the territorial rights of these communities, often with greater agility than the Federal Government.

In this context, the state of Pará stands out as one of the states that has made the

most progress in the titling of quilombola lands in recent years. In 2023, the Land Institute of Pará (Iterpa) was responsible for the titling of 15 territories, benefiting more than a thousand quilombola families, which shows the local commitment to the regularization of these areas (PARÁ, 2023). In addition to Pará, Maranhão has also shown significant advances in the land regularization of quilombola territories. Through the Land Institute of Maranhão (Iterma), the State has titled three territories, benefiting more than 300 families in 2023.

In contrast, in Tocantins, the absence of specific state legislation for the regularization of quilombola lands in state areas creates a significant obstacle. Without clear guidelines and defined procedures, the process becomes more complex and time-consuming, making it difficult to guarantee the territorial rights of quilombola communities and perpetuating situations of legal insecurity and social vulnerability.

Given this scenario, the legal gap in Tocantins highlights the urgent need to create a state regulatory framework that complements federal legislation, streamlining and facilitating quilombola land regularization on state lands. The experience of other states shows that the existence of specific laws can bring more speed, legal certainty and effectiveness to the process, guaranteeing the right to land and the sustainable development of these communities.

Little (2014) argues that ethnicity development and economic advancement are intertwined, so that the absence of adequate economic development for an ethnic group can lead to marginalization and poverty. In addition, an economic development that ignores and destroys the cultural bases of this ethnic group would be a setback to the cultural homogenization promoted by modernization (LITTLE, 2014, p. 40).

In this scenario, land regularization should not be understood only as a legal obligation, but as a central strategy for regional development. By ensuring land tenure for quilombola communities, the State fosters food production, strengthens environmental conservation practices and encourages the development of sustainable economic activities. At the same time, it promotes the appreciation of Afro-Brazilian culture and contributes to the construction of a more just and equitable society, as recommended by the Statute of Racial Equality (Law No. 12,288/2010).

7 STATE OF PARÁ AS A REFERENCE IN TITLING

The State of Pará has made significant progress in the construction of a legal framework aimed at promoting the rights of quilombola communities, especially with regard to access to land, cultural identity and development with social justice. State Law No. 8,878/2019, Decree No. 1,190/2020 and, more recently, Decree No. 4,372/2024 form a

normative tripod that establishes and operationalizes the land policy and the full protection of quilombola rights in the state.

Since the promulgation of the Federal Constitution of 1988, with article 68 of the Transitional Constitutional Provisions Act, quilombola communities have the right to the recognition and titling of their traditional territories. Pará legislation incorporates this guideline at several levels. Law No. 8,878/2019, for example, recognizes "quilombola state territories" as one of the specific forms of land regularization, by including in article 4, item IX, "quilombola state territory – TEQ" as a legitimate category for the allocation of state public lands. This regularization, according to article 12 of the same law, can occur in a non-onerous way, that is, through donation to consolidated occupations, without charging the Value of Bare Land (VTN) or administrative fees: "In the non-onerous sale (donation) individual or collective, the beneficiary will be exempt from the Value of Bare Land (VTN) and procedural and agrarian costs" (§1, art. 12).

Decree No. 1,190/2020, which regulates this law, reinforces the priority of traditional peoples in regularization processes. According to its article 6, in case of conflict of land interests over the same area, the remnants of quilombola communities, traditional communities and family farmers will have priority in regularization. Such a priority recognizes not only the historical vulnerability of these groups, but their legitimacy in the continuous and collective use of the land.

With the advent of Decree No. 4,372/2024, the State of Pará took a step forward by instituting the State Policy for Quilombola Communities, a legal framework that structures the rights of these peoples in a transversal way. Article 1 of this decree establishes that the policy will be implemented "based on a set of plans, projects and systematic and articulated actions between the bodies of the direct and indirect state Public Administration." In paragraph 2 of the same article, the text defines "quilombola communities" as "ethnic groups made up of descendants of enslaved black people who share identity, ancestry, traditions, cultural practices, common historical references and endowed with specific territorial relations."

One of the central axes of the decree is territorial recognition. Article 21 establishes that "the recognition, identification, demarcation, titling and registration of lands occupied by quilombola communities shall respect the self-recognition of the community and the self-identification of the territory." In addition, paragraph 2 of the same article ensures that the territory to be titled comprises not only the living area, but also "spaces for environmental conservation, economic exploitation, socio-cultural activities, including spaces for religious worship and leisure."

Titles issued to these communities must respect special legal guarantees. Article 22 is

clear in determining that the title will be registered "with clauses of indivisibility, non-transferability, imprescriptibility, unseizability and inalienability", ensuring that the territory continues to be for the collective use of the community and cannot be fragmented or negotiated, not even in the case of debts.

With regard to social participation, the decree creates the State Council of Policies for Quilombola Communities, a joint collegiate body, with representatives of the government and civil society, as provided for in article 25. Article 26 defines the council as "a privileged space for the participation of quilombola communities, acting as a forum that facilitates and proposes the actions of the Government aimed at meeting the needs of these communities."

This set of norms consolidates a public policy model based on historical reparation, social justice, and the appreciation of diversity. He recognizes that land, for quilombola peoples, is more than an economic good, it is the basis of their identity, culture and collective existence. By ensuring secure titling, sustainable development and the direct participation of communities in decisions that concern them, the State of Pará contributes to the construction of a more equitable and plural society, which respects the past and projects the future with dignity.

According to data available on the official website of the Land Institute of Pará (ITERPA), the state of Pará currently registers 96 titled quilombola communities, the result of a land policy supported by specific state legislation, such as Law No. 8,878/2019 and Decrees No. 1,190/2020 and No. 4,372/2024 (ITERPA, 2025). In contrast, the state of Tocantins has only one quilombola community with titles and lacks its own legal regulations that discipline the land regularization of quilombola territories. This disparity reveals the centrality of the state legal framework in the process of enforcing the territorial rights guaranteed by article 68 of the Act of Transitory Constitutional Provisions of the Federal Constitution. The existence of specific legislation is a determining factor for the structuring of continuous public policies, endowed with institutional and operational mechanisms capable of ensuring the identification, demarcation, titling and legal protection of traditional territories, according to constitutional guidelines and international commitments assumed by Brazil, such as ILO Convention 169.

8 QUILOMBOLA LAND REGULARIZATION IN TOCANTINS

The search for land regularization of quilombola communities in Tocantins is part of a broader context of dispute for resources and power in the public sphere. As Silva and Almeida (2020) point out, the public sphere is a field of dispute where several actors, with often divergent interests, negotiate and seek to influence public policies. This complex dynamic makes consensus-building a constant challenge. In this sense, the demand for recognition

and titling of quilombola territories is another chapter in this dispute, marked by a constant tension between private, market and state interests. Understanding this dynamic is essential to analyze the challenges and opportunities present in the land regularization process in the state

According to the Atlas of Quilombola Territories of the State of Tocantins (GONÇALVES et al., 2024), the state currently has 52 communities recognized by the Palmares Cultural Foundation, organized into 41 quilombola associations. Despite the normative framework and the socio-political mobilization around the agenda, only one of these communities had its territory fully regularized, while 13 others are in different stages of administrative processing, and 25 are still awaiting the formal start of the land regularization process (GONÇALVES et al., 2024, p. 3). This reality points to a worrying asymmetry between ethnic-cultural recognition and the legal realization of the right to territory.

Such a scenario becomes even more challenging when observing the state's land structure. It is estimated that 56.5% of the territory of Tocantins remains without specific destination. Of this percentage, most (51%) corresponds to state public lands, while the rest is divided between federal areas and those under destination analysis (GONÇALVES et al., 2024, p. 3). On the other hand, only 43.5% of the state's land has already been officially allocated, revealing a significant stock of public lands still subject to agrarian reform policies and land regularization of traditional territories, according to the provisions of article 188 of the Federal Constitution and article 13 of Law No. 8,629/1993.

Nevertheless, land governance encounters institutional obstacles that hinder the advancement of quilombola regularization. The absence of documentary validation of private properties registered in the Land Management System (SIGEF/INCRA), for example, raises suspicions about the legitimacy of part of these possessions, which requires a careful review of existing records, in order to ensure legal certainty and avoid undue land conflicts (GONÇALVES et al., 2024, p. 15).

Quilombola land regularization cannot be reduced to the merely formal fulfillment of a constitutional precept, but must be understood as a strategic public policy, capable of promoting redistributive justice, cultural recognition and sustainable territorial development. In this sense, the vast tracts of undesignated state public lands are configured as a relevant geopolitical resource, whose proper use can substantively reconfigure the state's land structure and consolidate rights historically denied to quilombola populations.

9 CONCLUSION

The reality of quilombola land regularization in Tocantins makes explicit a serious

mismatch between the legal framework that guarantees rights and the concreteness of the public policies that should make it viable. Although the Brazilian constitutional system and international treaties ratified by the State recognize the legitimacy of the territorial rights of quilombola communities, these rights, in the context of Tocantins, remain largely denied. The titling of the community of the Island of São Vicente, conquered only by virtue of a judicial decision, is emblematic of the pattern of omission and institutional inertia that prevails in the state.

The absence of specific state legislation emerges as one of the main obstacles to the effectiveness of the right to land, perpetuating the slowness and fragility of administrative processes. On the other hand, experiences developed in states such as Pará and Maranhão demonstrate that political commitment, translated into their own normative instruments, is capable of significantly boosting the processes of recognition, demarcation and titling of traditional territories. This contrast shows that the realization of rights does not depend only on the existence of general norms, but on the concrete action of the federative entities, through articulated public policies, sustained by political will and guided by the active listening of the collective subjects of law.

In this scenario, social movements, the justice system, and academia play fundamental roles as counterweights to the omission of the state Executive. The work of the Public Defender's Office, the Public Prosecutor's Office, and community organizations has been consolidated as mechanisms of resistance and democratic affirmation, even though they often operate in contexts of institutional adversity and scarcity of resources. It is these forces that, articulated, have kept the quilombola agenda alive, demanding the fulfillment of the constitutional and international commitments assumed by the Brazilian State.

To understand quilombola land regularization in Tocantins only as a technical or legal challenge is to reduce its complexity and empty its transformative potential. It is, above all, an ethical, political and historical requirement, which calls on the State to recognize and repair structural inequalities produced and reproduced over centuries. The construction of the idea of competition of obligations between the State and the Union and prioritizing historical reparation, based on territorial justice, racial equity, ethnodevelopment, and democratic participation, is the way to break with the invisibility imposed on quilombola communities and fully guarantee their dignity, autonomy, and future.

ABSTRACT

Gestational syphilis is an important public health problem due to the high risk of vertical transmission and the severe repercussions for the mother-child dyad. This is a descriptive epidemiological time-series study with a quantitative approach, using secondary data from the Notifiable Diseases Information System (SINAN) and the Live Birth Information System (SINASC). Detection rates per thousand live births were calculated, and trend Figures were produced. This study aimed to analyze the temporal trend of gestational syphilis in Brazil from 2012 to 2022. The results showed a continuous increase in reported cases of gestational syphilis, rising from 16,444 cases in 2012 to 78,872 in 2022, with a detection rate of 30.79 per thousand live births in the last year analyzed. Most infected pregnant women were aged 20–29 years, were of mixed race (brown), and had low educational attainment. The Southeast and Northeast regions accounted for the highest number of notifications, and the latent clinical form was the most prevalent. Gestational syphilis shows an upward trend in the country, associated with social inequalities and weaknesses in prenatal care. The need to strengthen surveillance actions, expand testing and treatment coverage, and enhance the role of nursing in the prevention and control of this condition is emphasized.

Keywords: Gestational Syphilis. Epidemiological Surveillance. Women's Health. Nursing. Sexually Transmitted Infections.

RESUMO

A sífilis gestacional constitui um importante problema de saúde pública devido ao elevado risco de transmissão vertical e às graves repercussões para o binômio mãe-filho. Trata-se de uma pesquisa epidemiológica descritiva de série temporal, com abordagem quantitativa, utilizando dados secundários provenientes do Sistema de Informação de Agravos de Notificação (SINAN) e do Sistema de Informações sobre Nascidos Vivos (SINASC). Foram calculadas taxas de detecção por mil nascidos vivos e elaborados gráficos de tendência. Este estudo teve como objetivo analisar a tendência temporal da sífilis gestacional no Brasil

no período de 2012 a 2022. Os resultados evidenciaram aumento contínuo das notificações de sífilis gestacional, passando de 16.444 casos em 2012 para 78.872 em 2022, com taxa de detecção de 30,79 por mil nascidos vivos no último ano analisado. A maior parte das gestantes infectadas tinha entre 20 e 29 anos, era parda e apresentava baixa escolaridade. As regiões Sudeste e Nordeste concentraram o maior número de notificações, e a forma clínica latente foi a mais prevalente. Conclui-se que a sífilis gestacional apresenta tendência ascendente no país, associada a desigualdades sociais e fragilidades na atenção pré-natal. Ressalta-se a necessidade de fortalecer as ações de vigilância, ampliar a cobertura de testagem e tratamento e valorizar o papel da enfermagem na prevenção e controle desse agravado.

RESUMEN

La sífilis gestacional constituye un importante problema de salud pública debido al alto riesgo de transmisión vertical y a las graves repercusiones para la díada madre-hijo. Se trata de un estudio epidemiológico descriptivo de series temporales con un enfoque cuantitativo, que utiliza datos secundarios del Sistema de Información de Enfermedades de Declaración Obligatoria (SINAN) y del Sistema de Información de Nacidos Vivos (SINASC). Se calcularon las tasas de detección por cada mil nacidos vivos y se crearon gráficos de tendencias. Este estudio tuvo como objetivo analizar la tendencia temporal de la sífilis gestacional en Brasil de 2012 a 2022. Los resultados mostraron un aumento continuo en las notificaciones de sífilis gestacional, que pasaron de 16.444 casos en 2012 a 78.872 en 2022, con una tasa de detección de 30,79 por cada mil nacidos vivos en el último año analizado. La mayoría de las embarazadas infectadas tenían entre 20 y 29 años, eran de raza mixta y presentaban bajo nivel educativo. Las regiones Sudeste y Noreste concentraron el mayor número de notificaciones, siendo la forma clínica latente la más prevalente. Se concluye que la sífilis gestacional muestra una tendencia ascendente en el país, asociada a desigualdades sociales y deficiencias en la atención prenatal. Se destaca la necesidad de fortalecer las acciones de vigilancia, ampliar la cobertura de pruebas y tratamiento, y valorar el papel de enfermería en la prevención y el control de esta enfermedad.

1 INTRODUCTION

Syphilis is a sexually transmitted infection (STI) caused by the bacterium *Treponema pallidum*, which throughout history has been an important public health problem. The infection occurs mainly through sexual contact, through contact with active lesions, but it can also be transmitted vertically from mother to fetus during pregnancy or at the time of delivery. Among STIs, syphilis remains one of the most worrisome for public health, as it is fully preventable, treatable, and has consolidated clinical protocols, but still has a high burden of maternal and child morbidity and mortality (Brasil, 2024).

Gestational syphilis has shown an increasing trend in recent decades, becoming an important challenge for Brazilian public health. According to the Epidemiological Bulletin of the Ministry of Health, between 1999 and June 2024, more than 340 thousand cases of congenital syphilis were recorded in children under one year of age, reflecting the persistence of vertical transmission in the country. In 2023 alone, 86,111 cases of syphilis were reported in pregnant women, corresponding to a detection rate of 27.1 cases per thousand live births, a value higher than the previous year (Brasil, 2024). Although part of this increase may be related to the expansion of testing actions and the improvement of notifications, the data also show persistent weaknesses in prevention strategies and prenatal care (Cavichioli *et al.*, 2024).

The analysis of the reported cases reveals significant regional disparities and a sociodemographic profile characteristic of the affected pregnant women. In 2023, 60.1% of pregnant women diagnosed with syphilis belonged to the age group between 20 and 29 years old, and the highest concentration of cases was observed in the Northeast and Southeast regions, where higher population rates and social inequalities are concentrated (Brasil, 2024). These findings suggest that factors such as socioeconomic vulnerability, low education, and limited access to health services directly influence the risk of infection and the maintenance of transmission (Cardoso *et al.*, 2023).

In view of this scenario, the fight against gestational syphilis requires integrated actions aimed at prevention, early diagnosis and timely treatment, with emphasis on the qualification of prenatal care and the strengthening of Primary Health Care. In this context, nursing plays a strategic role, both in direct care for pregnant women and in epidemiological surveillance and health education actions.

In view of the facts presented, this study is justified by the relevance of gestational syphilis as a public health problem, due to the high potential for vertical transmission and the consequences for the mother-child binomial. Although there are clinical guidelines for screening and treatment, there is a continuous increase in cases in the country, evidencing

limitations in current control strategies. The analysis of the temporal trend of this disease makes it possible to evaluate the effectiveness of the public policies implemented and to identify regional and structural failures that make it difficult to cope with the disease, especially in contexts of social vulnerability.

1.1 OBJECTIVES

1.1.1 General

To analyze the temporal trend of gestational syphilis in Brazil from 2012 to 2022, based on secondary data available in TABNET/SINAN.

1.1.2 Specifics

- a) To describe the evolution of the number of reported cases of gestational syphilis in Brazil per year;
- b) To identify the sociodemographic profile of pregnant women with syphilis;
- c) Compare the distribution of cases between the different regions of the country.

2 THEORETICAL FRAMEWORK

Syphilis is a sexually transmitted infection caused by the bacterium *Treponema pallidum*, whose first documented records date back to the late fifteenth century, a period in which an epidemic outbreak spread rapidly across Europe after the military campaign of King Charles VIII of France in Naples in 1494. According to Ferreira *et al.* (2019), this initial episode was marked by severe clinical manifestations, such as ulcerated lesions and high mortality, attracting the attention of medicine at the time.

Although the first written records date back to the fifteenth century, recent scientific discoveries point to an even more remote origin of the disease. Paleogenomic studies have identified genetic evidence of *Treponema pallidum* that is approximately 9,000 years old in the Americas, reinforcing the Colombian hypothesis that syphilis was brought to the European continent during the great navigations, through contact with indigenous American populations (Barquera *et al.*, 2025).

From a clinical point of view, syphilis has four evolutionary phases: primary, secondary, latent and tertiary. The primary phase is characterized by the presence of hard chancre, painless and highly infectious ulcer; The secondary phase is marked by systemic manifestations, such as generalized skin rash, mucocutaneous lesions, and lymphadenopathy. After this stage, the infection can evolve to the latent phase, characterized by the absence of clinical signs and symptoms, although with reactive serology, being

subdivided into recent and late. The tertiary stage, currently less frequent due to early diagnosis, can appear years after contagion and present severe complications, such as neurosyphilis, cardiovascular syphilis, and gummy lesions in different organs (Brasil, 2024; Brasil, 2025).

The diagnosis of syphilis is based on treponemal and non-treponemal tests, such as VDRL, FTA-ABS, and rapid tests, widely available in the public health network for screening and confirmation. The treatment, based on the administration of benzathine penicillin, is effective, safe, and capable of interrupting the chain of transmission, reinforcing the importance of adherence to clinical protocols, especially during prenatal care (Brasil, 2024).

Gestational syphilis is defined as the infection caused by *Treponema pallidum* diagnosed during pregnancy, regardless of the presence of clinical signs or symptoms. This condition has relevant particularities, because in addition to affecting maternal health, it has a high potential for vertical transmission, which can compromise fetal development (Silva *et al.*, 2024).

The risk of vertical transmission is directly related to the clinical stage of the disease and the time of exposure of the fetus to the infectious agent. Transmission can occur at any stage of pregnancy or during childbirth, and is more likely in the primary and secondary phases, when there is a higher bacterial load. According to the Ministry of Health (2024), the intrauterine transmission rate can reach up to 80% in cases that are not properly diagnosed or treated.

The consequences of maternal infection for the fetus are serious and widely documented. Untreated syphilis during pregnancy can result in miscarriage, stillbirth, premature birth, low birth weight, and congenital syphilis, often associated with neurological manifestations, bone deformities, and skin lesions (Costa, 2024). In addition, Tourinho (2025) highlights that intrauterine exposure to syphilis increases the risk of hospitalizations in children in the first years of life, evidencing the prolonged impact of this infection on child health.

The social determinants of health play a central role in the epidemiology of gestational syphilis in Brazil. Conditions such as poverty, low education, lack of reproductive planning, and barriers to access to prenatal care hinder early diagnosis and appropriate treatment. Studies also point out that discontinuity in care and non-adherence of sexual partners to treatment contribute to the persistence of infection, increasing reinfection rates and the incidence of congenital syphilis (Laranjeira *et al.*, 2024). Thus, understanding the epidemiological context of gestational syphilis requires not only the analysis of notification data, but also the consideration of the social and structural determinants that support the

problem at the national level.

The fight against gestational syphilis in Brazil is supported by a set of public policies and guidelines instituted by the Ministry of Health, aimed at the prevention, diagnosis and timely treatment of the infection. Since 1986, with Ordinance No. 542/1986, congenital syphilis has been included in the list of notifiable diseases, which was later expanded to syphilis in pregnant women in 2005 and to the form acquired in 2010, consolidating the Notifiable Diseases Information System (SINAN) as an essential tool for epidemiological monitoring and surveillance (Brazil, 1986; Brazil, 2005; Brazil, 2010).

Among the strategies implemented by the Ministry of Health to combat syphilis in Brazil, the National STD/AIDS Program, the Stork Network and the Syphilis No Project stand out, which reinforce epidemiological surveillance and the qualification of prenatal care.

In 2025, the National Campaign "Syphilis has a cure - Get tested, treated and prevented", promoted by the Ministry of Health, reinforces the commitment to social mobilization, testing and free treatment within the scope of the Unified Health System (SUS) (Brasil, 2021; Services and Information of Brazil, 2025). Rapid testing in Primary Health Care represents one of the pillars of coping actions, allowing early diagnosis and immediate initiation of treatment during prenatal care (Brasil, 2024).

Despite regulatory and operational advances, significant challenges persist for the effective control of gestational syphilis in the country, such as intermittent shortages of benzathine penicillin, underreporting of cases, incomplete completion of forms, and low adherence of pregnant women and their partners to treatment (Cavichioli *et al.*, 2024). These factors weaken surveillance actions and make it difficult to achieve the goals of eliminating vertical transmission.

The role of nursing is central in the prevention, diagnosis, and control of gestational syphilis, acting in early screening, monitoring of pregnant women and their sexual partners, health education, and adequate completion of notification forms (Brasil, 2022; Cofen, 2023). Epidemiological surveillance uses systems such as SINAN and the TABNET platform to monitor cases, enabling temporal, regional and demographic analyses of the disease (Brasil, 2012).

The use of secondary data from official databases offers advantages such as broad national coverage, longitudinal analyses, and resource savings, although it has limitations related to underreporting and the quality of records, which should be considered when interpreting the results (Laranjeira *et al.*, 2024; Cavichioli *et al.*, 2024).

3 METHODOLOGY

3.1 RESEARCH DESIGN

This is a descriptive time series research, with a quantitative approach, based on the analysis of secondary data of notified cases of gestational syphilis in Brazil, from 2012 to 2022.

3.2 DATA SOURCE

Data were obtained through the TABNET/DataSUS platform, in the Notifiable Diseases and Conditions module of SINAN - 2007, considering all notifications of gestational syphilis registered between 2012 and 2022.

In addition, the databases of the Information System on Live Births (SINASC), used to obtain the total number of live births in the same period, were consulted in order to support the calculation of detection rates.

3.3 VARIABLES

They were organized according to the following blocks:

- Sociodemographic: age group, education and race/color of the pregnant woman;
- Clinical: case classification, evolution and type of diagnosis;
- Epidemiological: year of notification, region and federative unit of residence.

3.4 ANALYSIS PROCEDURES

The extracted data were organized in electronic spreadsheets in Microsoft Excel, allowing the visualization and manipulation of the information. Figures of temporal trend, sociodemographic, clinical, and epidemiological distribution were elaborated, enabling the visual analysis of the evolution of cases and the identification of relevant patterns.

3.5 CALCULATION OF THE DETECTION RATE

To calculate the detection rate of gestational syphilis, the number of confirmed cases of syphilis in pregnant women divided by the total number of live births in the same year was used, multiplying the result by 1000 and according to the formula below:

$$\text{Taxa de detecção} = \frac{\text{Número de casos confirmados de Sífilis em Gestantes}}{\text{Número total de nascidos vivos}} * 1.000 \quad (1)$$

3.6 ETHICAL ASPECTS

As this is a research that uses secondary, aggregated and public domain data, obtained from official databases of the Ministry of Health, there was no direct contact with participants, nor collection of information that would enable the identification of individuals.

Thus, according to Resolution No. 510/2016 of the National Health Council, this study is one of the situations that do not require consideration by the Research Ethics Committee, as it does not involve personally identifiable data. Even so, the principles of secrecy, confidentiality and exclusive use of information for scientific purposes were preserved

4 RESULTS AND DISCUSSIONS

4.1 CHARACTERIZATION OF SYPHILIS NOTIFICATIONS IN PREGNANT WOMEN IN BRAZIL

In the period from 2012 to 2022, 533,046 cases of syphilis in pregnant women were reported in Brazil. The temporal analysis shows a continuous growth in notifications over the years. In 2012, 16,444 cases were registered, a number that has progressively increased: 20,915 in 2013, 26,630 in 2014, 32,788 in 2015 and 38,311 in 2016. From 2017 onwards, the pace of growth became more pronounced, with 49,854 cases. In 2018, there was a new jump, totaling 63,428 notifications, remaining at high levels in subsequent years: 64,579 in 2019, 66,067 in 2020, 75,158 in 2021 and reaching 78,872 cases in 2022, the highest number in the entire period analyzed (Figure 1).

Overall, an average increase of approximately 6,692 cases per year was observed. The average annual growth rate was 16.97%, showing a consistent upward trend in syphilis notifications in pregnant women throughout the time series.

Figure 1

Evolution of reported cases of syphilis in pregnant women, Brazil, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN, 2025

According to Lima et al. (2022), the epidemiological behavior of gestational syphilis may be associated with multiple factors, including the real increase in the incidence of the disease, the expansion of access to health services, improvements in notification systems, and greater awareness of primary care professionals regarding the importance of testing during prenatal care.

The Ministry of Health (Brasil, 2023) highlights that the expansion of rapid prenatal testing and the strengthening of epidemiological surveillance explain, in part, the increase in notifications observed in recent years. Complementing this perspective, Silva *et al.*, (2025) indicate that improvements in prenatal coverage and in the notification system contributed to the increase in the number of registered cases. In addition, Pavinati *et al.*, (2025) point out that challenges such as insufficient early screening, adherence to treatment, and reinfection remain, factors that help to understand the persistence of high rates of gestational syphilis in Brazil.

Regarding the detection rate of gestational syphilis, it was observed that in the study period it showed a significant increase throughout the period. In 2012, the indicator was 5.66 per 1,000 live births, increasing to 7.20 in 2013 and 8.94 in 2014. In 2015, it reached 10.87, and in 2016 it jumped to 13.41 per 1,000. In 2017, the rate reached 17.05, in 2018 it was 21.54. In the following years, the indicator maintained the upward trend, reaching 22.67 in 2019, 24.20 in 2020, and reaching 28.07 in 2021. The highest value in the time series was recorded in 2022, with 30.79 per 1,000 live births (Figure 2).

Figure 2

Gestational syphilis detection rate per 1,000 live births, Brazil, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN, 2025

The data show a consistent increase over the decade, signaling the persistence of gestational syphilis as a relevant public health problem in Brazil (Ministry of Health, 2023).

In addition, these results are in line with the Ministry of Health's Syphilis Epidemiological Bulletins (Brasil, 2021; 2022), which point to advances in expanding testing, strengthening epidemiological surveillance, and, at the same time, the persistence of high rates of infection transmission in Brazil.

Regarding the distribution of cases of gestational syphilis considering the regions of the country, it was observed that the southeast region concentrated the highest number of records, with 246,749 notifications (43.9%). This high number may be associated with population size, the more intense urbanization process, and the greater capillarity of notification and testing systems. Next, the Northeast Region had 111,419 cases (20.9%), followed by the South Region, with 79,841 cases (14.2%). The northern region recorded 52,378 cases (9.8%) and the central-west region, 42,659 cases (7.6%) (Figure 3).

Figure 3

Cases of Syphilis in Pregnant Women by region of Brazil, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN, 2025

These data show that, although gestational syphilis is present throughout the national territory, there is a greater concentration in the Southeast and Northeast regions, which together correspond to more than 60% of the notifications. This distribution reinforces the need for specific regional strategies, considering inequalities in access, prenatal coverage, service infrastructure, and socioeconomic conditions. Rodrigues *et al.*, (2022) highlight that factors such as accelerated urbanization and social inequality contribute to the higher number of cases in these regions.

In addition, according to the Ministry of Health (Brasil, 2023), the expansion of the use of rapid tests in Primary Care favored the early identification of infected pregnant women.

However, there are still barriers to access and weaknesses in the continuity of care, especially in the North and Northeast regions.

For Nursing, this scenario signals the importance of organizing territorialized practices, adapted to local specificities, with a focus on qualifying prenatal care and strengthening Primary Care (Reis *et al.*, 2024; Fontinele *et al.*, 2023). The planning of health education, testing, and follow-up actions for pregnant women should consider the regional epidemiological profile, ensuring expanded access to prenatal care, the offer of rapid tests in Basic Health Units, and the monitoring of maternal and partner treatment.

The Ministry of Health recommends that screening for syphilis be carried out in the first and third trimesters of pregnancy, in addition to the time of delivery, reinforcing the importance of protocols that ensure retesting and continuous follow-up of pregnant women by nursing teams (Brasil, 2022).

4.2 SOCIODEMOGRAPHIC PROFILE OF SYPHILIS NOTIFICATIONS IN PREGNANT WOMEN IN BRAZIL

According to the age group, about 73.2% of the pregnant women with syphilis reported were between 20 and 39 years old. Pregnant women aged between 15 and 19 years also had a significant participation, totaling 125,983 cases (23.6%). The age groups of children under 15 years of age and women over 40 years of age had significantly lower proportions. Among those under 15 years of age, 6,413 cases (1.2%) were registered, while the age group of 40 to 49 years totaled 9,958 notifications (1.9%). Among pregnant women aged 50 years or older, 381 cases (0.07%) were reported (Figure 4).

Figure 4

Percentage of gestational syphilis by age group, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN, 2025

This age profile coincides with the most active reproductive phase of women, which reinforces the need to expand screening strategies in prenatal care and reproductive planning. According to the Syphilis Epidemiological Bulletin (Brazil, 2024), in 2023, the highest proportion of cases occurred in pregnant women aged 20 to 29 years (50.5%), followed by 30 to 39 years (26.9%) and adolescents aged 15 to 19 years (21.2%). These findings confirm the greater vulnerability of women of childbearing age and highlight the relevance of interventions aimed at prevention, early diagnosis, and timely treatment.

Regarding race/color, most of the reported cases were of women who declared themselves brown, totaling 268,362 cases (50.3%), followed by white (28.9%) and black (12.2%). Indigenous women represented 0.5% and yellow women 1.0%, while 7.1% of the records did not have information on race/color (Figure 5).

Figure 5

Percentage of gestational syphilis cases by race/color, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN, 2025

These findings dialogue with data from the 2024 Syphilis Epidemiological Bulletin, according to which the highest proportion of cases in pregnant women occurred among brown women (61.5%), followed by black (16.6%) and white (19.8%) women (Brasil, 2024). The bulletin points out that such distribution reflects social inequalities and barriers in access to timely prenatal care.

In the same sense, Laranjeira *et al.*, (2024), identified a higher prevalence of gestational syphilis in young, brown, and socially vulnerable pregnant women. These data reinforce that the intersection between race/color and social determinants of health influences the risk of infection and late diagnosis.

The distribution of cases according to education shows that the highest number of records occurred in pregnant women with complete high school (20.4%), followed by incomplete elementary school (17.6%) and incomplete high school (14.9%). In a smaller proportion, pregnant women with complete elementary education (9.5%), up to the incomplete 4th grade (3.9%), and complete 4th grade (3.2%) appear. The illiterate group corresponded to 0.5% of cases.

The presence of infection among women with a higher level of education was significantly lower: 7,580 cases occurred in pregnant women with incomplete higher education (1.4%) and 6,314 in complete higher education (1.2%). Only 227 records (0.04%) were classified as "not applicable", and in 145,577 notifications (27.3%) the education field was left blank or ignored (Figure 6).

Figure 6

Percentage of gestational syphilis cases according to the education level of pregnant women, Brazil, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN/TABNET (2025)

These data confirm that, although gestational syphilis is present in all levels of education, it is more prevalent among women with low or medium formal education. The Syphilis Epidemiological Bulletin highlights that low education is associated with worse socioeconomic conditions and greater difficulty in accessing health services, impacting early screening of infection (Brasil, 2024).

Similarly, Cardoso *et al.*, (2023) identified a higher prevalence of gestational syphilis among women with low education, reinforcing the need for educational strategies and expanding access to prenatal care as fundamental measures to reduce vertical transmission.

4.3 CLINICAL PROFILE OF SYPHILIS NOTIFICATIONS IN PREGNANT WOMEN IN BRAZIL

Most cases of syphilis in pregnant women were classified as latent syphilis, totaling 185,073 notifications (34.7%). This clinical form is characterized by the absence of signs and symptoms, although with reactive serological tests, which can hinder timely diagnosis during prenatal care. The second most frequent form was primary syphilis, with 144,684 cases (27.1%), followed by tertiary syphilis (49,202 cases; 9.2%) and secondary syphilis (25,832 cases; 4.8%).

It is noteworthy that, in 128,255 notifications (24.1%), the clinical classification was recorded as *unknown or not informed*, which limits a more precise analysis of the distribution

of clinical forms and compromises the understanding of the evolution of cases. This high percentage of incomplete data reinforces weaknesses in the completion of notification forms and may impact the quality of epidemiological surveillance (Figure 7).

Figure 7

Percentage of Gestational Syphilis Cases by Clinical Classification, 2012 to 2022

Source: Notifiable Diseases Information System - SINAN/TABNET (2025)

The higher proportion of notifications classified as latent syphilis can have different interpretations. On the one hand, it reflects the effectiveness of serological screening performed in prenatal care, since it makes it possible to identify asymptomatic pregnant women still in silent phases of infection. On the other hand, it may signal delays in the detection of the early stages of the disease, suggesting failures in early screening and timely access to health services (Nakano *et al.*, 2022).

Thus, the Syphilis Epidemiological Bulletin highlights that this scenario reinforces the need to repeat testing at different times of pregnancy at the beginning of prenatal care, in the third trimester and at birth, as well as to improve the completion of notification forms, in order to reduce underdiagnosis and improve epidemiological surveillance (Brasil, 2024).

In a complementary way, a study by Morais and Teixeira (2025) points out that the recurrence of syphilis in pregnant women is directly related to failures in early diagnosis, adequate treatment, and the structure of prenatal care, elements that perpetuate maternal-fetal vulnerability.

5 CONCLUSION

The analysis of the temporal trend of gestational syphilis in Brazil, from 2012 to 2022, showed a significant and continuous growth in notifications, confirming the persistence of this disease as a relevant public health problem. The increase in detection rates reflects both the expansion of testing and epidemiological surveillance and the persistence of weaknesses in prenatal care and social inequalities that make it difficult to control vertical transmission.

The findings showed a higher concentration of cases in the Southeast and Northeast regions, as well as a predominance among young, brown pregnant women with low education, evidencing the influence of social determinants of health on the occurrence of gestational syphilis. The predominance of the latent clinical form was also observed, which reinforces the importance of timely serological screening during prenatal care. The high proportion of notifications with incomplete information is also noteworthy, indicating limitations in the quality of records and information systems.

In this context, qualified prenatal care is a central strategy for the prevention, early diagnosis and appropriate treatment of gestational syphilis. Strengthening the role of nursing, especially in Primary Health Care, is essential for carrying out rapid tests, monitoring pregnant women and their sexual partners, providing health guidance and monitoring treatment adherence.

It is concluded that the fight against gestational syphilis requires continuous and integrated actions, with the strengthening of epidemiological surveillance, qualification of records, expansion of access to quality prenatal care and reduction of social inequalities. Such strategies are essential to reduce vertical transmission and to advance in the achievement of national goals for the elimination of congenital syphilis in Brazil.

ABSTRACT

This study analyzes the combination of active learning methodologies applied at a higher education institution, UNIFIPMoc, during the period from 2007 to 2021, considering a constructivist reinterpretation and the humanization of guidance in terms of the advisor–advisee relationship during the production of the Undergraduate Final Project (UFP), as well as the development of specific procedures for organizing the supervision process. The objective is to highlight the method created for supervising scientific research based on the experience gained through undergraduate thesis supervision in the Law program. This is an experience report resulting from both faculty and student praxis in the production of the Undergraduate Final Project in the Law program at UNIFIPMoc. In this context, the collective writing experience developed here drew on contributions from major scholars of learning methodologies, notably Piaget (1987), Ausubel (2000), Edgar Morin (2015), Novak and Gowin (1996), and Moreira (2011). Among the problems arising from the traditional supervision of scientific work in the Law program, the emergence of a backlog of students in a system marked by dependency and disengagement was observed, as students showed significant difficulty in progressing in the development of their research projects. The encouragement to establish a qualified Core of Academic Advisors contributed to reflection on appropriate supervision procedures developed over time. In pursuit of greater organization and optimization of academic work and supervisory relationships, these procedures, combined with the use of integrated active learning methodologies, proved essential for establishing a humanized approach to student guidance. Together, these initiatives resulted in a proprietary method for supervising undergraduate theses in the Law program at UNIFIPMoc, grounded in the organization of specific supervisory procedures, curriculum

restructuring, and the combined use of active learning methodologies. This method fostered the development of scientific research within the Law program despite the challenges related to academic training processes in contemporary society, contributing to the reduction of student backlog in dependency systems, improving approval rates among regular students, and positively influencing the overall quality of undergraduate final projects.

RESUMO

Este estudo analisa a combinação de metodologias ativas de aprendizagem aplicadas em uma instituição de ensino superior, a UNIFIPMoc, no período compreendido entre 2007 e 2021, considerando uma releitura construtivista e a humanização do atendimento em termos de relacionamento orientador e orientando, durante a produção do trabalho de conclusão de curso (TCC), e compreendendo a construção de procedimentos específicos para a organização dos trabalhos de orientação. Tem por objetivo evidenciar o método criado para orientação de trabalhos científicos a partir da experiência vivenciada durante a orientação de TCC na graduação em Direito. Trata-se de um relato de experiência, resultado de praxis, docente e discente, na produção do Trabalho de Conclusão de Curso de Graduação do Curso de Direito da UNIFIPMoc. Nessa direção, a experiência de escrita coletiva aqui elaborada, buscou a contribuição de grandes pensadores sobre metodologias de aprendizagem, destacando-se Piaget [(1987)], Ausbel (2000), Edgar Morin (2015), Novak e Gowin (1996) e Moreira (2011). Dentre os problemas advindos da orientação de trabalhos científicos de modo tradicional no âmbito do curso de Direito, despontou a formação de uma demanda reprimida em sistema de dependência e desídia dos alunos, que demonstravam uma grande dificuldade de evoluir na elaboração dos trabalhos científicos. O incentivo para a formação de um Núcleo de Professores Orientadores qualificados, contribuiu para a reflexão quanto aos procedimentos adequados ao processo de orientação estabelecidos no curso do tempo. Em busca de maior organização e otimização dos trabalhos e das relações de orientação, tais procedimentos, aliados à utilização de metodologias ativas combinadas, foram importantes para estabelecer um atendimento humanizado aos alunos. Reunidas, estas iniciativas criaram um método próprio de orientação ao TCC na graduação em Direito da UNIFIPMoc, consubstanciado na organização de procedimentos específicos para a orientação, na reestruturação da grade curricular, na utilização de metodologias ativas de aprendizagem combinadas. Tal método impulsionou o desenvolvimento da pesquisa científica no âmbito do curso Direito apesar dos desafios em relação aos processos de formação acadêmica na sociedade contemporânea, contribuindo para redução da demanda reprimida em sistema de dependência e melhorando o índice de aprovação de alunos regulares bem como influenciando positivamente para a qualidade final dos trabalhos de TCC.

RESUMEN

Este estudio analiza la combinación de metodologías activas de aprendizaje aplicadas en una institución de educación superior, la UNIFIPMoc, en el período comprendido entre 2007 y 2021, considerando una relectura constructivista y la humanización de la atención en términos de la relación entre orientador y orientando durante la producción del Trabajo de Fin de Grado (TFG), así como la construcción de procedimientos específicos para la organización de los procesos de orientación. El objetivo es evidenciar el método creado para la orientación de trabajos científicos a partir de la experiencia vivida durante la orientación de TFG en la carrera de Derecho. Se trata de un relato de experiencia, resultado de la praxis

docente y discente, en la producción del Trabajo de Fin de Grado del curso de Derecho de la UNIFIPMoc. En este sentido, la experiencia de escritura colectiva aquí desarrollada buscó el aporte de importantes pensadores sobre metodologías de aprendizaje, destacándose Piaget (1987), Ausubel (2000), Edgar Morin (2015), Novak y Gowin (1996) y Moreira (2011). Entre los problemas derivados de la orientación tradicional de trabajos científicos en el ámbito del curso de Derecho, surgió la formación de una demanda reprimida en un sistema de dependencia y desidia por parte de los estudiantes, quienes demostraban grandes dificultades para avanzar en la elaboración de trabajos científicos. El incentivo para la creación de un Núcleo de Profesores Orientadores calificados contribuyó a la reflexión sobre los procedimientos adecuados al proceso de orientación establecidos a lo largo del tiempo. En la búsqueda de una mayor organización y optimización de los trabajos y de las relaciones de orientación, dichos procedimientos, aliados al uso combinado de metodologías activas de aprendizaje, fueron fundamentales para establecer una atención humanizada a los estudiantes. En conjunto, estas iniciativas dieron lugar a un método propio de orientación del TFG en la carrera de Derecho de la UNIFIPMoc, materializado en la organización de procedimientos específicos de orientación, en la reestructuración de la malla curricular y en la utilización de metodologías activas de aprendizaje combinadas. Este método impulsó el desarrollo de la investigación científica en el ámbito del curso de Derecho, a pesar de los desafíos relacionados con los procesos de formación académica en la sociedad contemporánea, contribuyendo a la reducción de la demanda reprimida en el sistema de dependencia y a la mejora del índice de aprobación de estudiantes regulares, así como influyendo positivamente en la calidad final de los trabajos de TFG.

1 INTRODUCTION

It is a scientific publication with a view to sharing with the academic community the good practices experienced over time by the Law Course Completion Work Guidance Center and the results achieved since its creation.

Established 17 years ago, that is, existing since the first graduating class in Law at UNIFIPMoc, the TCC Center faced the most diverse challenges in search of the pedagogical, didactic, methodological and intellectual maturity necessary for the individual and, especially, collective performance of its research professors.

The TCC Center was composed of two doctors, eight masters and a specialist. The training was interdisciplinary since the basic training of the group was in Law, but the *stricto* and *lato sensu* training transited through the applied social sciences and human sciences. The management of the group was exercised by a coordinator with experience in guiding course completion works in the area of Law.

In order to meet the demands and needs of each student, whether they were regular or dependent, the work of the TCC Center has always been guided by quality and excellence, both in the guidelines and in its products: monograph or scientific article, a practice that persisted as one of the differential elements to the organization and efficiency of all work.

The organization of the dynamics of the orientation work led to the institutionalization of the TCC Center itself and a set of guidelines to be observed in the conduct of the work, whether in relational matters between the different actors involved, student-advisor-coordination, or in terms of rules and standardization standards to be observed throughout the research: TCC Regulation, Standardization Manual and Standard Project to be considered by teachers and students.

The planning and conduct of tasks, as well as the preparation of classes, have always been established in schedules designed and organized at the beginning of each academic semester, a practice that persists as one of the differential elements to the organization and efficiency of all work.

The purpose of this text is not only to present the work developed, but also to highlight the process of transformations that led to the inclusion of new pedagogical practices including the use of active methodologies, providing the creation of a proper method for successful guidance in terms of scientific quality, in the midst of an interesting context of orientation to scientific works.

To this end, aiming at better understanding and didactics, the text will be distributed in five parts, the first being this introduction, followed by the sections First phase of the TCC Center from the Law course at UNIFIPMoc: 2007 to 2011; Second phase of the Final Paper

of the UNIFIPMoc Law course: 2012 to 2019; Third phase of the Final Paper of the UNIFIPMoc Law course: 2019 to 2021; The method and, finally, the final considerations.

2 FIRST PHASE OF THE TCC CENTER OF THE UNIFIPMOC LAW COURSE: 2007 TO 2011

This section aims to explain how the development of the TCC orientation work took place during what is considered the first phase of the TCC Center of UNIFIPMoc. In this period, between 2007 and 2011, the students dedicated themselves to the writing and defense of the monograph for three consecutive semesters, and only in the 9th period did they present their work and complete the TCC stage.

The TCC modality adopted at the time - in the 1st academic semester of 2007 - was the legal monograph. The first criterion for its achievement corresponded to the production of a research project, which was developed throughout the 7th period, under the guidance of a single professor, as a discipline of the regular curriculum of the institution's Law Course.

In the following period, that is, in the 8th period, the approved students were assigned to the advisors, who, attending after hours, in the morning shift, and pre-hours, in the afternoon, led their advisees, individually, in the construction of the research and writing of the entire text of the work, until its completion.

Once completed and approved by the advisor, the monograph was deposited so that, in the following semester, that is, in the 9th period, its defense could be made, in a session that involved the exam and examination by a panel formed by the advisor and two other professors who, at other times, were components of the TCC Nucleus, then composed of 4 professors, now belonging to the teaching staff of the institution's Law Course.

Thus, the TCC had its cycle completed after the completion of three different disciplines by the student: Monograph I, regularly offered in the 7th period of the course; Monographs II and III to be completed outside the regular class hours, in a pre and post schedule, both for regular students and dependents. This work system adopted the model traditionally used in Law courses for the preparation of the TCC until the 2nd semester of 2011, and this period is considered as the first phase of the TCC of the UNIFIPMoc Law course.

It was possible to collect data from the institution's Academic Registry in class diary reports that began to be digitized from 2009 onwards. It was found that, in the period between the 1st semester of 2009 and the 2nd semester of 2011, over these three years of

In this study, 457 enrollments were made in Monograph I, 232 in Monograph II, and 207 in Monograph III, totaling 896 enrollments, with 16 failures.

3 SECOND PHASE OF THE FINAL PAPER OF THE UNIFIPMOC LAW COURSE: 2012 TO 2019

Attentive to excellence and constant search to improve pedagogically, didactically and methodologically the work carried out, constant reviews regarding the procedure in relation to the development of the course completion work are promoted by the coordination of the Law course and by the TCC Center.

From these revisions, it was realized that the fact that the orientations were given only in the pre and post-hour system, as commonly happens in higher education institutions (HEIs), contributed to an evasion and neglect of students who ended up not attending the orientations, postponing the preparation of the TCC. In addition, the periods in which the TCC was prepared coincided with the completion of the Brazilian Bar Association (OAB) exam by the students, a fact that, although outside the scope of decisions of the HEIs, causes an overload of study for law students who, because they prioritize the OAB exam, ended up procrastinating the conclusion of the TCC.

Such factors contributed to the formation of a repressed demand in a dependency system. Based on this perception, important changes were proposed that will be explained below, and which started the second phase of the TCC from the 1st semester of 2012. This phase presents two important novelties. The first is the change of period of the discipline Monograph I, anticipating it to the 6th period of the Law course, and the insertion of the disciplines Monograph II and Monograph III in the regular grid of the 7th and 8th periods of the Law course, respectively. Consequently, the defense will take place in the 8th period of the course, anticipating the conclusion of the stage.

The second novelty is that the orientations begin to be individualized from the 6th period, that is, from the conception of the theme and structuring of the research project to the defense. It is worth mentioning that the presence and monitoring of the advisor with the advisee since the initial conception of the work represented an important milestone, since, compared to the previously adopted methodology, consistent results were observed with the insertion of the disciplines in the course curriculum and the use of the classroom's space-time for the orientations.

It should be noted that, for students in dependency, the attendances remained in pre and post schedules, without any change or prejudice in the monitoring of the work. But, for this new format, the individualized orientations, different from the previous phase, already begin in the 6th period, when the project began to be completed under the care of the advisor himself, and the preparation, orientation, revision and finalization of the writing of chapter I of the monograph began.

This early interaction between advisors and regular students was possible because the space-time of the classroom was divided by a specific group of teachers. Thus, it was possible to create a valuable opportunity for the exchange of experience and knowledge due to the group classes, held in the 6th period, aimed at the elaboration of the project and scientific writing.

The reported changes optimized the process of preparing the project and the final work in one semester, allowing the regular student to finish the writing of his work in the 7th period, leaving only the oral presentation of the monograph pending for the 8th period. It was a relevant anticipation when considering that the student, still in the 8th period, could dedicate himself to other projects such as studying for the exam and for the OAB exam, which had always been encouraged by the institution.

Another relevant point, very characteristic of this phase, is the preparation of a schedule with the definitions and standardization of the deadlines for deliveries of all activities to be carried out by students and the deadlines for the return of corrections by the advisors, as well as complete planning of the stages, deliveries and returns of the semester, with information on the contents to be worked on in each class.

The TCC Center also pays special attention to the Standardization Manual and the TCC Regulation, documents updated regularly, considering updates to ABNT regulations, as well as the insertion or remodeling of procedures previously adopted, all with a view to improving the existing dynamics.

Despite the zeal and organization that involved the procedures and documents, there was still a considerable increase in the repressed demand of students in a system of dependence that fed back on each other, creating a vicious circle.

This 2nd phase was the longest and lasted until the 2nd half of 2019, thus adding up to 8 years of work. According to data from the institution's Academic Record, during this period, 1833 enrollments were made in Monograph I, 1888 in Monograph II, and 1131 in Monograph III, totaling a number of 4852 enrollments, and there were 1224 failures. Of these, 53 occurred on 02/2014, with a jump in the number of failures on 01/2016, when there were 105 failures, a number that increased on 02/2016, 01/2017 and 02/201, when there were 137, 152 and 180 failures, respectively.

4 THIRD PHASE OF THE FINAL PAPER OF THE UNIFIPMOC LAW COURSE: 2020 TO 2021

Especially the last semesters of the 2nd phase presented a critical moment, with a high failure rate, which demonstrated the need for structural, pedagogical and didactic

changes. At this time, there was already a great interaction between the advising professors and the coordination of the TCC Center and the Law course, which allowed us to analyze the problem and propose actions compatible with its adequate confrontation.

It was precisely this interaction that fostered and allowed the introduction of active methodologies in the context of group classes, in regular student classes, from the 1st semester of 2018, an innovation that progressively optimized learning to achieve the TCC, through group work and individual guidance, resources that strengthened the students' protagonism in order to involve them, both in group dynamics and in their individual research.

In the 2nd semester of 2019, the 3rd phase of the TCC effectively begins, marked by the exclusion of the discipline Monograph III from the curriculum, and the replacement of the disciplines Monographs I and II, as already indicated, regularly offered in the 6th and 7th periods, respectively, by the disciplines TCC I and II, whose product becomes a scientific article, under the terms of Resolution No. 5, of December 17, 2018, which established the New National Curriculum Guidelines for the Law course of HEIs⁴.

It should be noted that with the advent of the COVID-19 pandemic, the orientation work adapted to the remote model, being carried out virtually and offered to both regular and non-regular students, with services via digital platform. In 2020, in the 1st semester, the service was provided through the Blackboard and Google meet platform, and from the 2nd semester onwards through the Canvas and Zoom platform.

Allied to the gradual implementation of the change in the format of the TCC from monograph to scientific article, the development and use of active methodologies with students in the regular classes of 6th and 7th periods was intensified during collective classes and group or individual orientations, such as problematization; concept map⁵; Case study with identification of research elements – from TCCs already completed; debate with analysis and discussion of students' themes and problems.

The systematization of combinations of the methodologies adopted can be better explained in the following flowchart:

⁴ Available at <http://portal.mec.gov.br/component/content/article?id=12991>. Accessed in Oct. 2021

⁵ Concept maps aim to represent meaningful relationships between concepts in the form of propositions. A proposition consists of two or more conceptual terms linked by words in order to form a semantic unit [...]. The elaboration of concept maps is a technique to externally patent concepts and propositions. Up to this point, one can only make conjectures about the degree of precision with which concept maps represent the concepts we possess, or the range of relationships between concepts we know (and which we can express as propositions). There is no doubt that, in the process of making maps, we can develop new conceptual relationships, especially if we actively seek to build prepositional relationships between concepts that we did not consider related until then: The students and the

Figure 1

Flowchart of the combined active methodologies used in the process of elaboration and teaching of the TCC during the undergraduate course in Law at UNIFIPMOC

Source: Prepared by the authors.

From the use of these methodologies, an improvement was observed in the students' performance and approval rates, contrary to the high rates of failure and dropout by students, as was common in these disciplines when the traditional methodology with expository class was used, even if dialogued.

In the first half of 2020, the transition of the TCC format from monograph to scientific article was finally consolidated. There were, then, a total of 318 students under the responsibility of the TCC Center, 149 in regular classes and 169 in dependency classes. During this period, 137 oral communications were made to defend the articles

Teachers often note, during the elaboration of concept maps, that they recognize new relationships and therefore new meanings (or at least meanings that they did not consciously possess before elaborating the map). In this sense, the elaboration of concept maps can be a creative activity and can help foster creativity (NOVAK, 2000, p. 31-33) and there were 53 failures.

In the second semester of 2020, at the height of the COVID-19 pandemic, the number of enrollments in the TCCI and TCCII disciplines totaled 292, with 156 students in regular classes and 136 in dependency classes. In the same period, 109 oral communications were made for the defense of scientific articles and 60 rejections. It should be noted that, for the first time in many years, the number of enrollments in regular classes exceeded the number of enrollments in dependent classes.

In the first semester of 2021, there were 235 students enrolled in the TCCI and TCCII disciplines, of which 110 were regular and 125 were dependency students. The semester ended with 108 oral communications for the defense of scientific articles, with 63 failures.

As can be seen, there was a better use of the orientation process by the students, which was also reflected in the failure rate with a considerable decrease, returning to the numbers of semester 01/2016.

With the new method applied, even in the period of the COVID-19 pandemic, a greater approval was achieved in regular and dependency classes, no longer feeding the number of students in dependence and contributing to the approval of students who were already in this condition. All without neglecting the quality and the criteria of scientificity required.

5 THE METHOD

The upported by methodological paradigms that privilege the complexity of thought, the valorization of students' previous knowledge and the stimulation of their learning, such as, proposed by Morin (2015), the need for the individual to build his knowledge from preexisting cognitive structures, in the terms of Piaget's Constructivist Theory, updated by Ausbel's Theory (2000) argues that learning must be meaningful.

Considering these pedagogical premises as a starting point, the teaching of the TCC discipline is based on teaching by competencies and on the construction of skills and competencies with the active participation of the academic, within the perspective of making the experience of TCC and research a meaningful learning, as proposed by contemporary theories on learning.

The aim was to streamline the conclusion of the work by the students, so that those regular students finish the scientific article and present it in the 7th period.

All this optimization was didactically planned without neglecting the quality and excellence of the work that has always been carried out by the TCC Center, in order to consider that a specific method for guiding and preparing the TCC was created within the scope of the UNIFIPMoc Law Course. This method can be systematized as follows:

- 1) inclusion of disciplines related to the TCC and orientation of the work in the regular class schedules;
- 2) monitoring of the work of preparation of the TCC by the advisor from his field of research;
- 3) individualized guidance during regular class hours, from the construction of the project to the oral communication of the scientific article;

- 4) observation of the established procedures and the documents that guide the conduct of the work, such as the TCC General Regulation and the TCC Manual;
- 5) group classes with the use of combined active methodologies for regular students, based on exclusive material, prepared by the TCC Center itself;
- 6) individualized service to students in a dependency system, with the elaboration of its own agenda considering the student's demand.

As can be seen, the work is currently carried out in a humanized, directed and procedural way, organized in a way that considers the specificities of each student, without neglecting the scientificity and quality requirements of the product. With these changes, it has been noticed over the last semesters, an improvement in the approval rate and a greater use by students of regular and dependency classes.

The practical results of the application of the above method were not long in coming. In addition to participating in congresses, students are encouraged to publish book chapters and scientific articles in journals external to the institution, not to mention that the works highlighted by the examining boards during the defenses are directed to publication in the institution's internal journal, the Multidisciplinary Journal.

Finally, the method presented here humanized the procedure of orientation to the TCC and boosted the development of scientific research within the scope of the Law course, breaking the vicious circle and giving way to a virtuous circle in the context of the elaboration of the TCC within the scope of the Law Course of UNIFIPMoc.

In the face of the challenges in relation to academic training processes in contemporary society and even the obstacles imposed by the COVID-19 pandemic, it was possible to

to verify its contribution to a considerable reduction of the repressed demand in the dependency system, and improvement of the approval rate of regular students.

6 FINAL THOUGHTS

The study of the procedures adopted and reviewed over the years within the scope of the disciplines aimed at the preparation and conclusion of the TCC of the UNIFIPMoc Law course made it possible to create a method.

Among its great differentials is the fact that the work for the preparation of the TCC research project and part of the textual development of the article, begins in the 6th period, and its completion, with the oral communication of the works and deposit in the library's institutional repository, is carried out in the 7th period. Thus, the approved student can

dedicate himself to the other opportunities that the course proposes, such as preparatory workshops for the OAB, ENADE and other competitions.

In addition, all the guidance work is individualized, considering the demands and needs of the student. For a more uniform work regarding the deadlines for the delivery of activities, returns of corrected work, a plan is made based on a schedule that establishes all the steps to be observed by those involved, from the beginning to the end of the semester. The Standardization Manual and the TCC Regulation are used as guidelines for the work and are regularly updated.

Another differential of the work carried out by the center is aimed at students in dependence or adaptation. In these cases, the orientations are offered in pre- and post-hour shifts, without coinciding with the schedules of other disciplines, perhaps, taken by the student, which allows a greater possibility for the student, even in dependence, to adjust to comply with this stage even before the fulfillment of his regular schedule.

Although at different times from the orientations for regular classes, the work is developed with the same attention to the advisees, whether in dependence or adaptation, so that the specificities of each student are observed, in order to achieve success, not only in the approval of the written work, but also in its defense.

The result of this targeted and humanized work, attentive to the specificities of each student, has been noticed over the last semesters with an improvement in the approval rate and greater use by students, enabling the production of quality work and impacting to reduce the repressed demand of students in dependency.

ABSTRACT

We evaluate the effects of phosphate fertilization on the leaf blade productivity of unburned *Brachiaria brizantha*, cv. Marandu, as well its chemical-bromatological composition compared to the pasture burning in the southwestern Amazon. Brazilian Amazon has one of the highest proportion of planted pastures in Brazil and the *Brachiaria brizantha* is the most used species. The burning is an important factor that lead to the gradual degradation of pastures. These circumstances generate pastures with low capability of providing feed for cattle farming. The improvement caused by burnings occurs only in short periods after burning. Some alternative sources with a low content of soluble P, in turn, increases biomass productivity and the nutritional value of cultivated species. A field experiment was carried out in a completely randomized blocks design. The treatments consisted of unburned pasture treated with 0, 25, 100 and 200 kg ha⁻¹ of P compared to the pasture burning. After applying the treatments, the pasture was desiccated in order to homogenize the plant emergence and growth after the period without rain from July to September. The dose of 100 kg ha⁻¹ of P for unburned pasture promoted better productivity and mineral nutrient concentrations, and leaf quality for animal consumption was improved. Values of acid detergent fiber, neutral detergent fiber, lignin and crude protein indicate an adequate bromatological composition of leaf for animal consumption at 56 days of growth. The practical and theoretical implications of this research are discussed, providing insights into how the results can be applied or influence practices in the field of pasture management without fire using. These implications could encompass on how to apply and how much of an alternative phosphate must be applied to the soil to supply phosphorus for *B. brizantha* instead of using fire in the pasture management. This study contributes to the literature by highlighting the superiority of phosphorus application from alternative sources allied to N and K fertilization compared to the pasture burning practice in the Southwestern Amazon. This innovative approach can be used as a base for new researches and applied in the level of cattle farmers.

RESUMO

Avaliamos os efeitos da adubação fosfatada sobre a produtividade da lâmina foliar de *Brachiaria brizantha* cv. Marandu em pastagem não queimada, bem como sua composição químico-bromatológica, em comparação com a prática da queima de pastagens no sudoeste da Amazônia. A Amazônia brasileira possui uma das maiores proporções de pastagens plantadas do Brasil, sendo a *Brachiaria brizantha* a espécie mais utilizada. A queima é um fator importante que leva à degradação gradual das pastagens, gerando áreas com baixa capacidade de fornecimento de alimento para a pecuária, e a melhoria proporcionada por essa prática ocorre apenas por curtos períodos após sua realização. Algumas fontes alternativas, com baixo teor de fósforo solúvel, por sua vez, aumentam a produtividade de biomassa e o valor nutricional das espécies cultivadas. O experimento de campo foi conduzido em delineamento de blocos completamente casualizados, com tratamentos consistindo em pastagem não queimada submetida às doses de 0, 25, 100 e 200 kg ha⁻¹ de P, comparadas à pastagem queimada. Após a aplicação dos tratamentos, a pastagem foi dessecada com o objetivo de homogeneizar a emergência e o crescimento das plantas após o período sem chuvas, de julho a setembro. A dose de 100 kg ha⁻¹ de P na pastagem não queimada promoveu maior produtividade, melhores concentrações de nutrientes minerais e melhoria da qualidade da folha para o consumo animal, sendo que os valores de fibra em detergente ácido, fibra em detergente neutro, lignina e proteína bruta indicaram composição bromatológica adequada da lâmina foliar aos 56 dias de crescimento. As implicações práticas e teóricas desta pesquisa são discutidas, fornecendo subsídios sobre como os resultados podem ser aplicados ou influenciar práticas no manejo de pastagens sem o uso do fogo, incluindo orientações sobre como e quanto de uma fonte alternativa de fosfato deve ser aplicada ao solo para suprir fósforo para *B. brizantha* em substituição à queima no manejo das pastagens. Este estudo contribui para a literatura ao evidenciar a superioridade da aplicação de fósforo proveniente de fontes alternativas associada à adubação com N e K em relação à prática da queima de pastagens no sudoeste da Amazônia, configurando uma abordagem inovadora que pode servir de base para novas pesquisas e ser aplicada em nível de produtores pecuários.

RESUMEN

Se evaluaron los efectos de la fertilización fosfatada sobre la productividad de la lámina foliar de *Brachiaria brizantha* cv. Marandu en pasturas no quemadas, así como su composición químico-bromatológica, en comparación con la práctica de quema de pasturas en el suroeste de la Amazonía. La Amazonía brasileña presenta una de las mayores proporciones de pasturas cultivadas del país, siendo *Brachiaria brizantha* la especie más utilizada. La quema es un factor importante que conduce a la degradación gradual de las pasturas, generando áreas con baja capacidad para suministrar alimento a la ganadería, y la mejora ocasionada por esta práctica ocurre únicamente en cortos períodos posteriores a su aplicación. Algunas fuentes alternativas, con bajo contenido de fósforo soluble, incrementan la productividad de biomasa y el valor nutricional de las especies cultivadas. El experimento de campo se realizó bajo un diseño de bloques completamente al azar, con tratamientos consistentes en pasturas no quemadas sometidas a dosis de 0, 25, 100 y 200 kg ha⁻¹ de P, comparadas con pasturas quemadas. Tras la aplicación de los tratamientos, la pastura fue desecada con el fin de homogeneizar la emergencia y el crecimiento de las plantas después del período sin lluvias, entre julio y septiembre. La dosis de 100 kg ha⁻¹ de P en pasturas no quemadas promovió mayor productividad, mejores concentraciones de nutrientes minerales y una mejora en la calidad foliar para el consumo animal, y los valores de fibra detergente ácida, fibra detergente neutra, lignina y proteína bruta indicaron una composición bromatológica adecuada de la lámina foliar a los 56 días de crecimiento. Se discuten las implicaciones prácticas y teóricas

de esta investigación, aportando elementos sobre cómo los resultados pueden aplicarse o influir en las prácticas de manejo de pasturas sin el uso del fuego, incluyendo orientaciones sobre cómo y cuánto de una fuente alternativa de fosfato debe aplicarse al suelo para suministrar fósforo a *B. brizantha* en sustitución de la quema en el manejo de pasturas. Este estudio contribuye a la literatura al destacar la superioridad de la aplicación de fósforo a partir de fuentes alternativas asociada a la fertilización con N y K en comparación con la práctica de quema de pasturas en el suroeste de la Amazonía, constituyendo un enfoque innovador que puede servir de base para nuevas investigaciones y ser aplicado a nivel de productores ganaderos.

1 INTRODUCTION

The area for cattle breeding in Brazilian Amazon has one of the highest proportion of planted pastures in Brazil (Baggio *et al.*, 2021). The *Brachiaria brizantha* is the most used species in pasture-based systems (Silva *et al.*, 2016b). Nevertheless, cattle overgrazing and the lack of soil nutrient reposition, besides the high release and loss of nitrogen (N), phosphorus (P) and potassium (K) to the soil and forms of carbon (C) and N to the atmosphere (Rumpel *et al.*, 2015; Dias-Filho, 2014b; Luizão *et al.*, 2013) caused by burning are factors that lead to the gradual degradation of pastures, like in the southwestern Amazon.

These circumstances generate pastures with low capability of providing feed (leaves) for cattle farming (Pequeno *et al.*, 2015). Cardoso *et al.* (2003) confirmed that when verified just a slight superiority on the nutritional value of dry mass of *Andropogon bicornis* grass burned only in the first months after the fire application. This finding is attributed to the ashes produced by the fire, which provide available forms of nutrients for freshly sprouting plants (López-Mársico *et al.*, 2019). However, there is evidence that even the improvement caused by burnings on soil attributes and nutrient availabilities occurs only in short periods after burning (Dick *et al.*, 2008). Girona-García *et al.* (2018) studied subalpine vegetation that includes grasses. In twelve months after burning, they detected a decrease on topsoil nutrient availability. Despite that, the line of thinking that still persists around the world is that burning stimulates the regrowth of grasses with high nutritional value for grazing animals (Van Der Werf *et al.*, 2008).

On the other hand, cattle breeders in the southwestern Amazon region resort to this practice because they do not have governmental incentives to change the way they have done pasture biomass production for cattle feed. They are limited by the common lack of credit to the adoption of technical knowledge (Aryal *et al.*, 2020) to recover soil fertility and biomass productivity. That situation leads to the continuous use of fire as a strategy for managing *B. brizantha* that shows to be unproductive and with a low long-term nutritional value.

In turn, the low soil P availability limits pasture production on the nutrient-poor soils of the southwestern Amazon (Campos *et al.*, 2012). In that region, the phosphate fertilization and burning suppression, as observed by other authors, can increase P availability and the biomass productivity of different planted pastures (Aryal *et al.*, 2020; Souza *et al.*, 2020; Farias *et al.*, 2016; Marahata *et al.*, 2014).

There is a lack of information about biomass productivity and chemical-bromatological quality of leaf blade on not burned pasture under the effects of phosphate fertilization compared to the periodical burning on the Amazon livestock agroecosystems. Considering

these information, we evaluate the effects of phosphate fertilization with burning suppression on the leaf blade productivity of *Brachiaria brizantha* (Hochst ex A. Rich.) Stapf. cv. Marandu as well its chemical-bromatological composition compared to pasture burning in the southwestern Amazon.

2 THEORETICAL FRAMEWORK

Relative similar studies to this one on P for pasture fertilization have been carried out with different sources of the nutrient, whether or not in a soluble form, whether or not at the same time, to N sources in order to evaluate the production, chemical composition and nutritional value of *Brachiaria* spp (Ileiri *et al.*, 2010; Magalhães *et al.*, 2007; Machado; Valle, 2011). Heringer; Jackes (2002c) found higher dry mass yields and CP contents on areas where the soil was corrected and fertilized compared to the burning. These authors observed that the P, K, Ca and Mg contents were higher in the dry mass on the area that received fertilization and, additionally, the burning reduced the amount of nutrients in the pasture. Porto *et al.* (2012) applied increasing doses of soluble P for *Brachiaria brizantha* cv. Marandu and observed 24% higher dry matter production on leaves at the dose of 147 kg ha⁻¹ of P₂O₅ compared to the absence of fertilization. According to Machado *et al.* (2011), the increase of the P dose increases the nutrient content on pasture leaf tissue.

In this sense, some alternative P sources with a low content of soluble P, like partially acidulated phosphate rocks, bring other nutrients in their composition, such as calcium (Ca), magnesium (Mg) and sulfur (S). That fact is important because S and Mg has its own availability improved together with P availability that, in turn, increases biomass productivity (Hopkins; Hansen, 2019) and, possibly, the nutritional value of cultivated species. According to Silva; Lobo (2024), the application of 100 kg ha⁻¹ of phosphorus from alternative phosphate rock and nitrogen and potassium fertilization increase topsoil availability and absorption and accumulation of P, Mg and S by *B. brizantha*. Their results indicate, additionally, that even the absence of P application with nitrogen and potassium fertilization shows to be superior to the burning, becoming this practice unnecessary to the pasture management.

Pastures have been seen as a potential reducer of greenhouse gases (GHG) emissions by the inputs on soil surface biomass, providing animal products for human consumption and increasing the sustainability of livestock farming (Mottet *et al.*, 2017; Vetter *et al.*, 2017; IPCC, 2014; Gerber *et al.*, 2013a, b). Inputs on the biomass productivity mean pasture restoration and available feed for cattle farming (Lal, 2011; Conant, 2010). In this sense, well-fertilized pastures provide important environmental services to the ecosystems

(Sollenberger et al., 2019) by suppressing the burnings, being considered a strategy for mitigating climate change (Lal, 2011; Conant, 2010).

3 METHODOLOGY

B. brizantha not burned and fertilized with four doses of P was compared to simple pasture burning in the field conditions. The experiment was performed from September to November 2015 at the Vanazzi Cattle Farm, BR 319, km 12, on a transition between the Amazon forest and natural fields in Humaitá (7° 35' S and 63° 6' W, 90 m a.s.l.), southwestern Amazon. The climate of the region is Af according to Köppen climate classification, and present a rainy season from September to July, mean air temperature of 26.5 °C. The total annual rainfall is 2500 mm and the relative humidity ranges from 85% to 90%.

The experimental area measured 25.0 m x 45.0 m of an acidic Oxisol (Alic Cambisol) (Santos et al., 2018) homogeneously covered by *Brachiaria brizantha* (Hochst ex A. Rich.) Stapf. cv. Marandu, at stage II of degradation according to Dias-Filho (2011b). The pasture was not burned or grazed from September 2014 to September 2015. A manual extraction of weeds in September 2014 made that practice unnecessary in 2015, since the rapid pasture growth covered the soil and suppressed 100% of these plants.

For the establishment of blocks and plots on the experimental area, a homogeneous cutting process with garden shears levelled the pasture at a 0.20 m height at 07/23/2015, in order to simulate the traditional Amazon grazing of a hundred percent of the pasture leaf area. At 09/12/2015, the blocks were established at a subarea on the experimental area. The plots measured 4.50 m in length by 3.50 m (15.75 m²) and 0.80 m in the borders (Cayley; Bird, 1996). Plot delimitation was carried out with nylon threads fixed to the end of iron bars vertically fixed to the ground. On 09/13/2015, a representative 0.60 kg soil sample (20 simple samples) was collected from the area at 0.0-0.05 m depth (topsoil layer) with the aid of a dutch auger (*TF10-Sonda Terra, Piracicaba, Brazil*). A 0.40 kg subsample was air-dried and broken and passed through a 2.0 mm sieve for the chemical and physical analysis, prior the experiment.

The topsoil presented (Silva, 2009): pH (water) = 5.00, Al³⁺ = 1.02 cmol_c dm⁻³, H+Al = 5.00 cmol_c dm⁻³, Ca²⁺ = 2.01 cmol_c dm⁻³, Mg²⁺ = 1.50 cmol_c dm⁻³, K⁺ = 0.09 cmol_c dm⁻³, CEC = 8.33 cmol_c dm⁻³, SB = 4.50 cmol_c dm⁻³, P (Mehlich-1) = 3.0 mg dm⁻³, V = 42%, m = 8.75%, SOC = 11.36 g kg⁻¹, Cu²⁺ = 4.25 mg dm⁻³, Fe = 297.59 mg dm⁻³, Mn²⁺ = 8.02 mg dm⁻³, Zn = 2.29 mg dm⁻³. A 0.20 kg topsoil subsample was analysed for: B (hot water) = 0.08 mg dm⁻³, and SO₄²⁻ = 9.0 mg dm⁻³ (Raij et al. 2001). The topsoil presented: sand = 349.7, silt = 452.15 and clay = 181.87 g kg⁻¹ (EMBRAPA, 1997).

The following treatments were applied: Pnb = *B. brizantha* not burned; Pnb+25 = Pnb + 25.0 kg ha⁻¹ of P; Pnb+100 = Pnb + 100.0 kg ha⁻¹ of P; Pnb+200 = Pnb + 200.0 kg ha⁻¹ of P for comparison to the pasture burned, represented by Pb = burning of *B. brizantha*, with 4 replicates. A partially acidulated phosphate rock (PPR) was used as the P source and its chemical and granulometric characteristics (Brasil, 2014) are provided in the Table 1.

The P doses were applied at 09/14/2015, after a rainfall higher than 2.0 mm (Figure 1) by manual and homogeneous distribution of 0.0, 0.22, 0.88 and 1.76 kg plot⁻¹ of PPR, dry mass, to the soil surface of the plots for supplying, respectively, the Pnb, Pnb+25, Pnb+100 and Pnb+200. The Pb was applied after removal of the nylon threads that delimited the plots, and after the firebreaks establishment around the area reserved for each plot of this treatment. Firstly, the fire was set in the center of each plot area and controlled with water spray in the boundaries. Then, the plots were delimited again with the nylon thread relocation on to the end of the vertically fixed iron bars.

Table 1

Chemical characteristics and granulometry of the partially acidulated phosphate rock¹.

Phosphorus source	Total phosphorus content				Granulometric fraction retention (mm) ⁶						
	TP ²	TP ₂ O ₅ ³	P ₂ O ₅ (CNA+H ₂ O) ⁴	P ₂ O ₅ (H ₂ O) ⁵	0.075	0.10	0.25	0.50	1.0	2.0	4.0

The homogenization of plant emergence and physiological development of *B. brizantha* was performed at 09/18/2015 in all experimental plots. This procedure consisted of the desiccation of newly emerged tillers by pulverizing 200 L ha⁻¹ of gramoxone 200 syrup.

Figure 1

Level of precipitation during the experimental period.

The macronutrient cycles are closely associated in pastures (Soussana; Lemaire, 2014). Therefore, at 09/19/2015, a homogeneous dose equivalent to 120.0 kg ha⁻¹ of N (as urea) plus 29.1 kg ha⁻¹ of K (as KCl) was manually and homogeneously distributed on the soil surface of the plots of the treatments Pnb, Pnb+25, Pnb+100 and Pnb+200, after a rain higher than 5.00 mm (Figure 1). The fertilizations with N and K effectively began the experimental period.

At 10/01/2015, the topsoil layer of the Pb plots areas was sampled with the aid of a dutch auger (*TF10-Sonda Terra, Piracicaba, Brazil*) for the chemical analysis according to Silva (2009): pH (water) = 6.60, Al³⁺ = 0.0 cmol_c dm⁻³, H+Al = 1.80 cmol_c dm⁻³, Ca²⁺ = 5.55 cmol_c dm⁻³, Mg²⁺ = 4.14 cmol_c dm⁻³, K⁺ = 0.14 cmol_c dm⁻³, CEC = 11.75 cmol_c dm⁻³, SB = 9.83 cmol_c dm⁻³, P (Mehlich-1) = 6.0 mg dm⁻³, V = 84%, m = 0.0%, SOC = 8.52 g kg⁻¹, Cu²⁺ = 3.13 mg dm⁻³, Fe²⁺ = 1039.95 mg dm⁻³, Mn²⁺ = 77.45 mg dm⁻³, Zn²⁺ = 4.0 mg dm⁻³. The topsoil boron (B) and sulphate availabilities were, respectively, 0.10 mg dm⁻³ (SO₄²⁻) and 12.0 mg dm⁻³ according to Raij *et al.* (2001).

The data of pasture leaf blade dry mass productivity (LDM) were collected on a useful sampling area of 3.50 m by 3.0 m (10.50 m²) delimited within each plot. At 56 days after beginning the experimental period, at 11/14/2015, all the plants inside a jig of 1.20 m² were cut close to the ground with garden shears, packed and identified. The leaf blade biomass was separated from the rest of the plant by cutting with manual cutting shears and a triple wash was carried out with potable water before double washes on HCl solution (0.5%) and distilled water.

On 11/16/2015, the leaf blade biomass was repacked on identified 0.18 m x 0.36 m newsprint bags and dried at a forced circulation oven (*Tecnal TE-394/5-MP, Piracicaba,*

Brazil) at 67 °C for 72 hours. The LDM dry mass productivity was obtained by weighing on a precision scale (*Tecnal, SHI-BL-3200H, Piracicaba, Brazil*) whose values, g jig⁻¹, were converted to t ha⁻¹ in an Excel worksheet.

Twenty five percent of the leaf blade dry mass were separated for the chemical analysis of N, P, K, Ca, Mg, S (g kg⁻¹), B, Cu, Fe, Mn and Zn (mg kg⁻¹) according to Silva (2009). Another 25% of the LDM were kept properly packaged on a triple plastic bag and refrigerated until entering the Laboratory of Animal Nutrition of Universidade Federal do Paraná, Curitiba, Brazil, where the samples were ground for the analysis of crude protein (CP), neutral detergent fiber (NDF), acid detergent fiber (ADF) and lignin (LIGN), according the methodologies of the AOAC (1990).

Experimental data of leaf blade dry mass productivity and chemical-bromatological composition of the leaf blade of *B. brizantha* were subjected to Cochran's homocedasticity test ($p \geq 0.05$). The significance of means was identified with the F-test ($p \leq 0.05$) in the MStatC Software (Michigan State University, USA), in accordance with a randomized block experimental design. The means comparison was carried out with Tukey's test ($p \leq 0.05$) in the same software. Pearson's linear correlation among the data of leaf blade productivity and chemical-bromatological composition were calculated in an Excel Worksheet using the t-test ($p = 0.05$) for the hypothesis testing on a non-zero correlation.

4 RESULTS

Analysis of variance indicated significant difference among the treatments ($P \leq 0.05$). Doses of 100 and 200 kg ha⁻¹ of P lead to the highest LDM of the pasture (Table 2). The first one was about 66.32% higher than that observed for Pb, with over 2.60 Mg ha⁻¹ no longer immediately available for animal consumption at 56 days of pasture growth. Nevertheless, one must consider that even Pnb (0 kg ha⁻¹ P) produced an LDM around 28.64% higher than Pb.

Table 2

Means of leaf dry mass productivity, mean of phosphorus, magnesium, sulfur, manganese, iron in the leaf of B. Brizantha.

Treatment	Leaf dry mass productivity and phosphorus, magnesium, sulfur, manganese, iron					
	LDM	P	Mg	S	Mn	Fe
	Mg ha ⁻¹		g kg ⁻¹		mg kg ⁻¹	
Pnb	1.85 b	1.60 c	4.11 bc	0.617 c	77.6 bc	52.63 c
Pnb+25	2.01 b	1.85 bc	4.47 abc	0.630 c	67.98 c	52.30 c
Pnb+100	3.92 a	1.93 b	5.13 a	0.932 a	87.45 ab	61.25 b
Pnb+200	3.82 a	2.32 a	4.96 ab	0.830 ab	87.79 ab	48.92 c
Pb	1.32 c	2.14 ab	3.95 c	0.750 bc	98.83 a	193.58 a
LSD	0.285	0.318	0.959	0.236	0.0071	6.19
MS _{Residue}	0.016***	0.02***	0.018***	0.011***	44.287***	7.537***
CV (%)	4.78	7.17	9.40	13.92	7.93	3.36
C	0.513	0.548	0.285	0.590	0.385	0.455

Values followed by different letters within the same column are significantly different at $p \leq 0.05$ by the Tukey's multiple range test. MS_{Residue}: mean square residue. CV (%): coefficient of variation. C: Cochran's statistic. LSD: less significant difference of the Tukey's test. *: significant at 0.05 probability level, **: significant at 0.01 probability level, ***: significant at lesser than 0.01 probability level, NS: not significant.

The foliar concentration of P observed for the dose of 200 kg ha⁻¹ of P (Pnb+200) was statistically superior to the values provided by 100 kg ha⁻¹ of P (Pnb+100) and Pb practice, which did not differ from each other (Table 2). The highest concentrations of Mg and S were verified for 100 kg ha⁻¹ of P while the highest P dose provided superior Mn values that were nonetheless statistically similar to the Pb practice. In the case of Fe, the micronutrient appears in a very high and statistically superior concentration in the Pb treatment.

As expected on short-term assessments, the content of CP in this study was not altered by the treatments (F^{NS}, $p \leq 0.05$). The global mean of CP in the leaf of *B. brizantha* at 56 days was 8.23%. Higher percentage of ADF, NDF and Lignin was observed for treatments in which the pasture was not burned, with or without P application (Table 3).

In the Figure 2, one may observe that there were moderate and positive correlations between LDM and Fo-Mg and LDM with Fo-S, and a low and negative correlation between LDM and Fo-Fe. Fo-P presented low correlations with the structural carbohydrate concentrations of NDF and ADF besides Fo-Mn and Fo-S. Fo-Mg was low correlated to Lignin, Fo-Fe and Fo-S, which presented just a low correlation with the Lignin concentration. Fo-Mn was moderately and negatively correlated to NDF and ADF, and moderately and positively correlated with Fo-Fe. Fo-Fe, in turn, was highly and negatively correlated with the structural carbohydrates NDF and ADF and moderately and negatively correlated with Lignin. NDF sulfur and a low correlation with the lignin and sulfur.

Table 3

5 DISCUSSION

According to Mwendia *et al.* (2022), the productivity and quality of tropical pastures are among the basis for evaluating the capacity for feeding animals on cattle farming systems. In the present work, the statistically superior behaviour of LBM productivity observed for 100 kg ha⁻¹ of P (Pnb+100) validates this level of P fertilization as a possibility to increase the feed availability to animals in 56 days of pasture growth. Several authors observed an increase of biomass production, including leaf biomass, when P and other nutrient management is adopted in similar conditions (Aryal *et al.*, 2020; Souza *et al.*, 2020; Farias *et al.*, 2016;

Marahata *et al.*, 2014). Results reported by Porto *et al.* (2012) also agree with the present results. These authors verified 24% higher dry mass production on leaves of *B. brizantha* cv. Marandu with the dose of 147 kg ha⁻¹ of P₂O₅. These findings represent more available feed for the cattle compared to the burning treatment. Furthermore, this may constitute an encouragement for cattle breeders to adopt them as a technology for *B. brizantha* management and contribute to avoid the intensification of the negative environmental impacts reported by Rumpel *et al.* (2015) and Luizão *et al.* (2013) in the Brazilian Amazon livestock systems.

Furthermore, the LDM productivity levels observed for 0 and 25 kg ha⁻¹ of P lead to the statement that a mere suppression of the pasture burning, along with an agronomic dose of N and K, are an adequate management for better leaf availability compared to the use of fire. Other authors also observed results that agree with the present results under different experimental conditions (Dias *et al.*, 2015; Ileri *et al.*, 2010), including one whose methodology and results (Heringer; Jackes, 2002c) are very similar to the verifications made with this work. Regarding the economical concern, the use of P_{nb}+100 of P applied together with agronomic doses of N and K reduces the cost of production in relation to the dose of 200 kg ha⁻¹ of P. This is a fact simply because the similar LDM value observed for this treatment (Table 2) was obtained with twice the fertilizer material.

The results under discussion still showed that both P and S were within the sufficiency range for the normal growth of *Brachiaria* spp (Brasil *et al.*, 2020). The Mg concentration was above the species requirements according to the same authors. These facts are related to the presence of these nutrients on the composition of the PPR used as P source (Table 1). Therefore, an increase on the P dose from the PPR increases, concomitantly, the dose of these nutrients present on it. Similarly, Machado *et al.* (2011) also reported an increase of P concentration in leaf tissue of the studied pasture when increasing doses of soluble P were applied. It is also important to clarify that the nutrient P is important not only for plant growth, but also for the effective development of rumen microbes in ruminants (Satter *et al.*, 2005), among other functions in animal metabolism.

In relation to Mn and Fe, the values observed with the dose of 100 kg ha⁻¹ of P are in accordance with the normal values verified for *Brachiaria* spp. Leaf tissue (Brasil *et al.*, 2020) that vegetates on a normal growth condition. The adequacy to the pattern of requirements for *Brachiaria* spp. promoted by P fertilization is in contrast with the very high value of Fe concentration provided for the Pb treatment. The high quantity of this micronutrient on the burned pasture leaf may constitute a problem for high grazing quantities by the animals since

the chemical composition of the pasture must be coupled with an adequate quantity of pasture biomass production (Brâncio *et al.*, 1997).

According to Brasil *et al.* (2020), the global means of N (adequate), K (adequate), Ca (inadequate) concentrations on the leaf tissue of *Brachiaria* spp., respectively, of 12.2, 17.2, 2.38 g kg⁻¹ did not limit pasture growth and leaf productivity at the 56-day mark. The global concentrations of B, Cu and Zn were, respectively, 4.44, 3.52 and 12.5 mg kg⁻¹ (F^{NS}, p≤0.05) and are below the pasture requirements according to the same reference. So, it is possible to affirm, for a short-term evaluation in discussion, that pasture fertilization with 100 kg ha⁻¹ of P improves the chemical composition for important nutrients that occur in low availability in acidic soils (Campos *et al.*, 2012) under livestock systems in the southwestern Amazon.

It is pertinent at this time to point out that, for many authors, the critical values for pasture growth may be different from the animal requirements for mineral elements. It is also clear that for P, Ca, Mg and most of the micronutrients, the cattle requirements exceed the plant requirements, with the exception of K. Anyway, the difference between nutrient availability in leaf tissue and animal needs is balanced by the adequate amount of LDM made available by the dose 100 kg ha⁻¹ of P. These findings are thus very important, since one can state that the foliar nutrient concentrations observed in this work were not limitant factors neither for pasture growth nor for their use on animal feed at 56 days of pasture growth.

All the doses of P without pasture burning presented statistically superior values of ADF compared to Pb (Table 2). In turn, all the treatments without burning, with or without P application, promoted statistically superior values of NDF contents, which showed to be ever higher than 65%. A similar behaviour was observed for lignin, with statistically superior values for treatments with P application compared to the Pb treatment.

The results exposed in Table 2 indicate a more soluble and digestible cellular content for animal consumption. Nevertheless, all values were framed slightly below the appropriate values for proper digestibility and consumption by ruminants, as reported by Van Soest (1994). The NDF values above 65% indicate a contribution to the reduction of the nutritional value of the leaf lamina of the pasture. Similar behaviour was verified for the lignin content in the leaf blade (Table 2), with values shown to be statistically superior in the treatments without burning, with or without P application. According to Jung *et al.* (1993) the process of lignification in plant cell walls has been considered an impediment to forage digestibility. According to Echeverria *et al.* (2016), the fact may be attributed to a reduced production of new leaves and the senescence of the old leaves in the start of the rainy season in the Amazon. That fact concomitantly causes a reduction of the cell contents and an increase of carbohydrates and lignin contents, decreasing the nutritional value of the pasture leaf.

The ADF contents in the leaf of *B. brizantha* observed in this study are next to a limiting range of consumption and the NDF contents are below it, including in the Pb treatment. These observations indicate that these contents are more related to physiological and structural characteristics of *B. brizantha* cv. 'Marandu' than to the supply of P or N and K fertilizations.

In relation to CP, the global mean observed of 8.23% is a desirable value for ruminant feed (for example) since a CP percentage below 7% leads to a lower forage digestion (Van Soest, 1994). According to Detmann *et al.* (2014), values of digestibility of *B. brizantha* cv. 'Marandu' are generally adequate as an animal feed. The values described here are not limiting to feed animals like ruminants (Van Soest, 1994) even within a short observation timeframe (56 days). On the other hand, Fischer *et al.* (1996) concluded that small increments on the nutritional value of pastures produced under the effects of fires occur occasionally. Other authors have observed improvements in the nutritional value, especially on the CP and digestible biomass production on different but recently burned pastures (Boughton *et al.*, 2022; Scasta *et al.* 2016; McGranahan *et al.*, 2014).

An extensive review indicates that the best alternative for eliminating pasture burning is the use of pasture improvement with the introduction of adequate management that prioritizes the maintenance of pasture sustainability (Zanini; Sbrissia, 2013). From a practical standpoint, animals kept in areas of burned pastures compared to unburned areas showed no difference in productive performance (Brâncio *et al.*, 1997).

The main relationships between LDM Productivity and chemical leaf composition indicate joint behaviour that avoids the pasture productivity normally occurring by the 56th day of growth. That fact is particularly confirmed by the adequate concentrations of P, Mg and S (Brasil *et al.*, 2020), which presented clear relationships among each other that influence the pasture's LDM productivity. The lignin concentration, in turn, increased on the leaf tissue as far as the LDM productivity concomitantly also increased. That verification, coupled with the high and negative associations among the structural carbohydrates and Fo-Fe likely denote the influence of Fe absorption on lignin, ADF and NDF contents on the leaf of *B. brizantha*, but without drastically reducing the leaf value as feed for grazing animals.

Despite that, pasture fertilization with 100.0 kg ha⁻¹ of P provided more leaves available for animal consumption in relation to the burning application, and makes the agroecosystem more sustainable on the agronomic, economic and environmental point of view.

6 CONCLUSION

The dose of 100 kg ha⁻¹ of phosphorus from the partially acidulated phosphate rock applied to unburned *B. brizantha* compared to the burnt version promoted: i) the highest leaf

blade dry mass productivity; ii) mineral nutrient concentrations not limitant to the pasture leaf productivity or to the leaf quality for animal consumption, and; iii) values of acid detergent fiber, neutral detergent fiber, lignin and crude protein means that indicate an adequate bromatological composition, which means high animal consumption of the leaf blade of *Brachiaria brizantha* cv. Marandu. We recognize the limitations of this work regarding the short time of observations, and mainly because other variables of nutritional value should be analysed for a more complete evaluation.

ACKNOWLEDGEMENTS

We are grateful to the Fundação de Amparo à Pesquisa do Estado do Amazonas-FAPEAM for financial support granted to the project of the first author, and to the Coordenação de Aperfeiçoamento de Pessoal de Nível Superior-CAPES, for the scholarship also provided for the first author.

ABSTRACT

Septic shock is a critical condition characterized by the combination of sepsis (a systemic inflammatory response triggered by an infection) and severe cardiovascular dysfunction, including hypotension resistant to volume replacement. In Brazil, the incidence of septic shock in children is high, with mortality rates ranging from 10.8% to 33.5%. Immediate and appropriate treatment, especially in the first 24 hours of hospitalization, is crucial to reduce morbidity and mortality, particularly in children. The primary objective of this literature review is to structure and gather data on septic shock in pediatric emergency rooms, aiming at early diagnosis and rapid and efficient establishment of a course of action to reduce complications and, mainly, mortality. There are several methods used in emergency rooms to ensure rapid, systematic and organized care, such as the Manchester Scale, Pain Intensity Scale, and Pediatric Basic and Advanced Life Support (PALS) protocol. The diagnosis is confirmed based on the Phoenix Sepsis Score (PSS), considering the presence of severe hypotension and other criteria such as elevated lactate levels. The severity of septic shock depends on multiple factors, including the virulence of the pathogen, the patient's immunity, and the duration of the clinical picture. The methodology will be established by bibliographic reviews on the Scientific Library Online (SciELO) platform, FIOCRUZ, Brazilian Society of Pediatrics, Latin American Institute of Sepsis, II Brazilian Multidisciplinary Congress in Urgency and Emergency Online, and also the Sepsis Protocol of the Federal University of Pará together with the João de Barros Barreto University Hospital, over the last 24 years. It is expected that from the analysis of the information it will be possible to quickly identify the physiological state and initiate appropriate therapeutic measures, which are fundamental to reducing morbidity and mortality.

séptico em crianças é elevada, com taxas de mortalidade variando entre 10,8% e 33,5%. O tratamento imediato e adequado, especialmente nas primeiras 24 horas de internação, é crucial para reduzir a morbimortalidade, particularmente em criança. O objetivo primário desta revisão bibliográfica é estruturar e reunir dados sobre o choque séptico na emergência pediátrica visando o diagnóstico precoce e o estabelecimento rápido e eficiente de uma conduta para reduzir complicações e, principalmente, a mortalidade. Há vários métodos utilizados na emergência para garantir atendimento rápido, sistematizado e organizado, como a Escala de Manchester, Escala de Intensidade da Dor, Protocolo de Suporte Básico e Avançado de Vida Pediátrico (PALS). O diagnóstico é confirmado com base no Escore de Sepsis de Phoenix (PSS), considerando a presença de hipotensão grave e outros critérios como níveis elevados de lactato. A gravidade do choque séptico depende de múltiplos fatores, incluindo a virulência do patógeno, a imunidade do paciente, e a duração do quadro clínico. A metodologia será estabelecida por revisões bibliográficas na plataforma Scientific Library Online (SciELO), FIOCRUZ, Sociedade Brasileira de Pediatria, Instituto Latino Americano de Sepsis, II Congresso Brasileiro Multidisciplinar em Urgência e Emergência Online, e também Protocolo de Sepsis da Universidade Federal do Pará junto com o Hospital Universitário João de Barros Barreto, nos últimos 24 anos. Espera-se que a partir da análise das informações possa ser possível identificar rapidamente o estado fisiológico e iniciar medidas terapêuticas adequadas são fundamentais para a redução da morbimortalidade.

RESUMEN

El shock séptico es una afección crítica caracterizada por una combinación de sepsis (una respuesta inflamatoria sistémica desencadenada por una infección) y disfunción cardiovascular grave, incluyendo hipotensión resistente a la reanimación con líquidos. En Brasil, la incidencia de shock séptico en niños es alta, con tasas de mortalidad que oscilan entre el 10,8 % y el 33,5 %. El tratamiento inmediato y adecuado, especialmente en las primeras 24 horas de hospitalización, es crucial para reducir la morbilidad y la mortalidad, especialmente en niños. El objetivo principal de esta revisión bibliográfica es estructurar y recopilar datos sobre el shock séptico en el servicio de urgencias pediátricas, con el objetivo de lograr un diagnóstico precoz y establecer de forma rápida y eficiente un plan de acción para reducir las complicaciones y, especialmente, la mortalidad. En el servicio de urgencias se utilizan diversos métodos para garantizar una atención rápida, sistemática y organizada, como la Escala de Triage de Manchester, la Escala de Intensidad del Dolor Pediátrico y el protocolo de Soporte Vital Básico y Avanzado Pediátrico (PALS). El diagnóstico se confirma con la Escala de Sepsis de Phoenix (PSS), considerando la presencia de hipotensión grave y otros criterios como niveles elevados de lactato. La gravedad del choque séptico depende de múltiples factores, como la virulencia del patógeno, la inmunidad del paciente y la duración del cuadro clínico. La metodología se establecerá mediante revisiones bibliográficas en la plataforma Scientific Library Online (SciELO), FIOCRUZ, la Sociedad Brasileña de Pediatría, el Instituto Latinoamericano de Sepsis, el II Congreso Brasileño Multidisciplinario de Urgencia y Emergencia Online, y el Protocolo de Sepsis de la Universidad Federal de Pará, en colaboración con el Hospital Universitario João de Barros Barreto, durante los últimos 24 años. Se espera que, a partir del análisis de la información, sea posible identificar rápidamente el estado fisiológico e iniciar las medidas terapéuticas adecuadas, fundamentales para reducir la morbilidad y la mortalidad.

1 INTRODUCTION

Septic shock is a clinical, critical and potentially fatal condition of a severe bacterial, viral, fungal, protozoal or parasitic infection that leads to dysfunctions of the cardiovascular and/or non-cardiovascular system associated with refractoriness to volume replacement.

The patient in this condition is characterized as a medical emergency due to the fact that it needs a quick and efficient intervention because of the rapid progression that affects several organs of the body, especially the heart, compromising the physiological flow of the systems.

Thus, this condition becomes alarming in pediatric patients due to factors such as greater vulnerability to dehydration and hydroelectrolytic disorders, immature immune system, difficulty in identifying symptoms, incomplete maturation of some organs, and low energy reserve.

For these reasons, the management of septic shock in pediatrics is a challenge for health professionals, since it requires specialized care, early diagnosis, and efficient treatment in order to minimize complications and reverse hemodynamic instability.

According to the Guidelines Manual of the Brazilian Society of Pediatrics, "Severe Sepsis and Pediatric Septic Shock". Surviving Sepsis Campaign (SSC) 2017", the early identification of septic shock and the following of protocols that have an immediate intervention with the rapid stabilization of the patient decreased the number of deaths from 4% to 2%. This shows the importance of following guidelines with scientific foundations for the management of septic shock in pediatric patients are pillars to maximize results and implement effective practices. Complications of septic shock in children include deficit, decreased cardiac output, increased dead space in the lungs, decreased immunity, tissue death, and multiple system failure.

Considering the factors presented, it is observed that it is necessary for health professionals to make an early diagnosis, adequate hemodynamic support, antibiotic therapy, infection control and adherence to treatment protocols are fundamental elements in the management of this fatal syndrome. Thus, this theoretical and informative review seeks to present updated and evidence-based recommendations for clinical practice in the management of septic shock in pediatric emergency care .

2 OBJECTIVES (GENERAL AND SPECIFIC)

2.1 GENERAL (PRIMARY)

The purpose of this review is to structure and gather data on septic shock in pediatric patients in the emergency room with a view to early diagnosis and specific procedures due

to the need for rapid intervention to reduce mortality, classify it, and perform specific procedures quickly and efficiently to minimize complications.

2.2 SPECIFIC (SECONDARY)

- To describe the pathophysiology and etiology of septic shock in pediatric patients in the emergency room.
- To clarify the treatment and prognosis of pediatric septic shock in an emergency situation.
- Clarify the complications of septic shock in pediatric patients in the emergency room.
- To highlight prevention methods in order to reduce the number of cases of septic shock in children in emergency care.
- Inform the public health repercussions of septic shock in pediatric patients in the emergency room.

3 MATERIALS AND METHODS (METHODOLOGY)

This project is a literature review using the most relevant articles, websites, and guidelines published between the years 2001 and 2024. For the elaboration of the systematic review, Boolean operators and key terms will be established for research that used ecological study and inductive and statistical approach, as well as methodological criteria, theoretical deepening, ethical aspects and research instruments, including studies by students from various areas of health, such as medicine, pharmacy and nursing. All the study material was read and the information present in it was extracted and organized in a systematic way to compose this scientific work. There will be no exclusion regarding the profile of the university (public or private) and the stage of training.

A part of the selected articles were searched in the Scientific Electronic Library Online (SciELO), and only 2 were chosen as part of the literature review. The descriptors used were: "sepsis", "septic shock" and "sepsis". The sites used were FIOCRUZ, the Brazilian Society of Pediatrics, the Latin American Sepsis Institute, the II Brazilian Multidisciplinary Congress on Urgency and Emergency Online, and also the Sepsis Protocol of the Federal University of Pará together with the João de Barros Barreto University Hospital. The investigation made it possible to collect instructions organized in alphabetical order registered in the "References" sector located on page 26.

4 DISCUSSION

Septic shock is the presence of sepsis (inflammation that spreads rapidly throughout the body by an infecting organism that raises blood pressure, causes failure of several organs, among other symptoms) plus cardiovascular dysfunction, hypotension refractory to volume. (SBP, 2019)

The term sepsis is defined as Systemic Inflammatory Response Syndrome (SIRS) resulting from infection by bacteria, fungi, protozoa, and viruses. The term shock, on the other hand, is characterized by the disparity between blood volume and vascular bed capacity, with systemic tissue hypoperfusion due to the decrease in cardiac output and/or reduction in effective circulating blood volume. (Failure, J.F, 2008)

This systemic inflammatory response is characterized by endothelial cell activation, tissue edema, disseminated intravascular coagulation, and metabolic derangements. (Robbins and Cotran, 2016). Such as hypermetabolism, with increased glycogenolysis and hepatic gluconeogenesis, increased lipolysis and muscle, intestinal and connective tissue protein catabolism. (Siqueira-Batista, R et al, 2011) In this way, these mechanisms lead to organ failure and death due to tissue hypoxia, lactic acidosis and cell death.

Septic shock becomes an emergency because it requires immediate care due to its rapid progression and is potentially fatal.

Thus, it is extremely important to use tools that aim to assist, organize, and speed up care, such as the Manchester Scale, which can help quickly and accurately identify the patient's level of severity and the recommended waiting time. This protocol uses a color chart, so each color represents the patient's level of severity (red: emergency / attended immediately; orange: very urgent / can wait a maximum of 10 (ten) minutes to be seen; yellow: urgent / can wait up to 50 minutes; green: little urgent / can wait up to 2 (two) hours; blue: not urgent / waiting time can be up to 4 hours. (Ministry of Health, 2014)

It is important to remember that pediatric patients have an age range (0 – 18 years) and thus express the feeling of pain in different ways, such as crying, screaming, cringing, pointing, moaning, among other ways. Thus, by using the Pain Intensity Scale, which ranges from 0 to 10, it is possible to better understand the patient's pain aspect. (São Paulo State Secretariat, 2022)

When the patient has already been triaged, a systematic evaluation of the child should be carried out, following a sequence already established by the Pediatric Basic and Advanced Life Support Protocol (PALS), which aims to make a quick and accurate assessment of airway, respiratory, circulatory, and neurological support to minimize complications and reduce the mortality rate in pediatric emergencies.

The diagnosis of septic shock is established in children with sepsis who have at least 1 point in the cardiovascular component of the Phoenix Sepsis Score (PSS), i.e., severe hypotension for age, blood lactate >45 mg/dL, serum lactate > 5 mmol/L, or need for vasoactive medication). (SBP, 2024).

Usually, septic shock is caused by infections resulting from Gram-positive bacteria, Gram-negative bacteria, fungi, and protozoa, the most common being the former. Therefore, treatment is based on antibiotic therapy, volume replacement, vasodilators, oxygen supplementation (avoiding tissue hypoxia and maintaining blood pressure).

Complications resulting from septic shock in children are deficit of renal function due to lactic acidosis, decrease in cardiac output, increase in dead space in the lungs due to hypoventilation and hypoxemia, decreased immunity, tissue death, and system failure.

In emergency situations, identifying the physiological state and initiating initial therapeutic measures are the key points in reducing morbidity and mortality. (FIOCRUZ, 2024).

In addition, the severity and outcome of the clinical picture of septic shock are also dependent on the virulence of the infection, system involvement, levels of mediator production, patient's immunological status, presence of comorbidity, origin of shock and its duration. (Robbins and Cotran, 2016)

5 RESULTS

The analysis of the selected literature demonstrated that pediatric septic shock remains one of the main medical emergencies, with a high mortality rate, especially in the first hours of care. Studies indicate that most deaths are associated with delays in recognizing the condition and initiating therapeutic interventions.

It was evidenced that the early identification of signs of tissue hypoperfusion is the main factor for the initial diagnosis, highlighting tachycardia, changes in the level of consciousness, prolonged capillary refill, cold extremities, oliguria, and hypotension. It was observed that children often present nonspecific manifestations, which contributes to underdiagnosis and worse prognosis.

"Most deaths in children occur as a result of treatable diseases within the first 24 hours of hospital admission. Prompt and appropriate treatment significantly reduces morbidity and mortality in pediatric emergencies." (Hansoti et al., 2017; WHO, 2016.) and The incidence of septic shock in children in Brazil was approximately 53.7% in places with many resources and 81.3% with few resources and mortality was 10.8% and 33.5%, respectively (SBP, 2024). This highlights the need for health professionals to know the biological and psychological

peculiarities of pediatric patients, who are subject to aggravations resulting from iatrogenic events performed by the physician who was not properly involved in dealing with such a situation.

Regarding the initial management, the studies indicate volume resuscitation with crystalloid solutions as the first therapeutic approach, which should be performed immediately and with frequent clinical reassessments. Monitoring of vital signs, Glasgow Coma Scale, and urine output after each volume expansion was essential to assess the therapeutic response.

The results also showed that, in cases where there is no adequate response to volume replacement, the early introduction of vasoactive drugs is necessary to restore tissue perfusion. In addition, the increase in serum lactate and the need for vasoactive support were pointed out as important markers of severity.

Finally, the literature analyzed demonstrated that the adoption of clinical protocols and the training of emergency teams are directly associated with the reduction of complications, progression to multiple organ failure, and mortality in pediatric patients with septic shock.

6 CONCLUSION

Relevance of the study of septic shock in pediatric patients in the emergency room by health students, delving into its early diagnosis, pathophysiology, etiology, treatment, complications, prevention and prognosis.

Septic shock in children has a great impact on Brazilian public health, in terms of the number of admissions, rapid progression, severity, and lethality. Thus, the analysis of factors is extremely important to help doctors have an efficient conduct, immediate intervention and ensure the patient's well-being.

ABSTRACT

This research aims to understand, through Dworkin's political theory of rights as trumps, the concepts of human dignity and judicial activism. According to the theory under study, rights as trumps seek to protect individuals from unjust public policies of the government, which can harm the equal distribution of rights. In this context, the study explores the concept of rights as trumps in order to understand human dignity and the counter-majoritarian role of the judiciary, and how these concepts help in the protection of fundamental rights and the distribution of rights based on equal consideration. Regarding the methodology used in this article, discourse analysis will be employed, as the objective is to understand the discourse used in the concept of rights as trumps. Thus, at the end of the work, the results obtained during the research on the analyzed topic will be presented.

Keywords: Unjust Public Policies. Equal Distribution of Rights. Protection of Fundamental Rights.

RESUMO

A presente pesquisa tem a finalidade de compreender por meio da teoria política de Dworkin dos direitos como trunfos os conceitos da dignidade humana e do ativismo judicial. De acordo com a teoria em estudo, os direitos como trunfos buscam proteger os indivíduos de políticas públicas injustas do poder público, que podem prejudicar a distribuição igualitária de direitos. Nesse contexto, o estudo explora a concepção de direitos como trunfos a fim de entender a dignidade humana e a atuação contramajoritária do judiciário, e como esses conceitos ajudam na proteção de direitos fundamentais e na repartição de direitos com base na igual consideração. No que se refere à metodologia utilizada no artigo será a análise do discurso, pois o artigo tem o objetivo de compreender o discurso empregado no conceito de direitos como trunfos. Assim, ao final do trabalho, será exposto os resultados obtidos durante a pesquisa sobre o tema em análise.

Palavras-chave: Políticas Públicas Injustas. Distribuição Igualitária de Direitos. Proteção de Direitos Fundamentais.

RESUMEN

Esta investigación busca comprender, a través de la teoría política de los derechos como triunfos de Dworkin, los conceptos de dignidad humana y activismo judicial. Según la teoría en estudio, los derechos como triunfos buscan proteger a los individuos de políticas públicas injustas del gobierno, que pueden perjudicar la distribución equitativa de los derechos. En este contexto, el estudio explora el concepto de derechos como triunfos para comprender la dignidad humana y el papel contramayoritario del poder judicial, y cómo estos conceptos ayudan en la protección de los derechos fundamentales y la distribución de derechos basada en la igualdad de consideración. Con respecto a la metodología utilizada en este artículo, se empleará el análisis del discurso, ya que el objetivo es comprender el discurso utilizado en el concepto de derechos como triunfos. Por lo tanto, al final del trabajo, se presentarán los resultados obtenidos durante la investigación sobre el tema analizado.

Palabras clave: Políticas Públicas Injustas. Distribución Equitativa de Derechos. Protección de los Derechos Fundamentales.

1 INTRODUCTION

This article will analyze the principle of the dignity of the human person in the phenomenon of judicial activism from the perspective of Dworkin's concept of law as trump cards, which consists of the use of rights as trump cards to seek a more appropriate solution to guarantee fundamental rights in the face of the arbitrariness of the state. According to Dworkin, it is necessary for courts to use principles based on moral justification to ensure a fair distribution of rights. (Dworkin, 2007)

Judicial activism is characterized by the counter-majoritarian action of the Judiciary in the face of the insufficiencies of the Legislative Branch, especially when fundamental rights are not adequately protected. In the Dworkinian perspective, this action can be legitimized as long as it is based on legal principles endowed with moral content, oriented to the promotion of equality and freedom. (Dworkin, 2002)

Furthermore, the concept of rights as trump cards includes human dignity, as a means to guarantee basic rights to individuals. Considering that this principle seeks to ensure the way of life of the citizens of the community, thus helping in the fair distribution of rights. (Dworkin, 2014)

In view of these premises, the article in view of the concepts that will be used in relation to Dworkin's theory, aims to answer the following question: How does Dworkin's concept of Rights as trump cards analyze the Principle of the Dignity of the Human Person in the phenomenon of Judicial Activism?

The central hypothesis of this study is the concept of rights as trumps, developed by Dworkin, which provides an adequate theoretical foundation for the application of the principle of the dignity of the human person in the context of judicial activism, legitimizing the counter-majoritarian action of the Judiciary in the realization of an equal distribution of rights. Thus, the relevance of this article contributes to the academic debate on judicial activism, especially when based on the principle of human dignity in the theory of rights as trump cards.

The general objective of this article is to analyze, through the theory of rights as trumps, the distribution of rights from a counter-majoritarian action of the Judiciary. In addition, it is highlighted that the specific objectives established in this study are: To understand the importance of the judicialization of arbitrary public policies; Analyze the role of human dignity in the protection of fundamental rights and clarify the role of the judiciary in the distribution of rights.

Regarding the methodology, the method of discourse analysis will be used in this work, having as object of study the principle of human dignity in judicial activism, analyzed from the concept of rights as trumps. Thus, this method consists of analyzing an object of research,

based on the language in which it produces in the face of a theory, in this case it is Dworkin's theory of rights as trumps.

The present research adopts the qualitative approach, and the means used to carry out searches were Dworkin's works, articles and periodicals that deal with the theme. In this sense, the work presents the theoretical framework based on Dworkin's political theory that will be analyzed in this article.

The results of the research are presented in the following topics: The concept of rights as trump cards; Judicial activism from the perspective of rights as trump cards; and The principle of human dignity according to rights as trumps. Finally, at the conclusion of the work, the recapitulation of the objectives and premises of each topic will be presented, as well as the examination of the confirmation or not of the research hypothesis.

2 THE CONCEPT OF RIGHTS AS TRUMP CARDS

In this topic, the concept of rights as trumps will be explained. Firstly, according to Dworkin, rights as trump cards means that the right should be understood as a way for citizens to protect themselves against the arbitrariness of the state. (Dworkin, 2014)

Rights as trump cards is a concept that Dworkin developed as a way to make an analogy to card games, with law being a kind of surprise card to protect fundamental rights and guarantees against actions of the public power. Thus, individuals would have legal instruments to claim fundamental rights before the public power. (Novais; Miranda, 1996)

Dworkin argues that not every right can be considered as an asset, because this right must be pre-existing in a community of principles, as Martel states:

Dworkin distinguishes several categories of rights. It is not just any right that assumes the position of trump right. Trump-rights are those pre-existing, identified in a community of principles - a personified community, whose link between people is fraternity and not a mere geographical accident or a mere convention. The identification of such rights occurs with the fulcrum of the substantive connection with their foundation, the liberal conception of equality, with an examination of the distribution of rights (as a rule, trump rights cannot be recognized to one group and not to others), as well as through recourse to tradition, institutional history and community morality. In the case of the United States, some trump rights are also included in the text of the Constitution. Dworkin does not offer a list of trump rights, nor does he conceive a mechanical formula that allows their identification. Recognizing a trump card right is an interpretative task, for which it is essential to assume the communication between morality and law. (Martel, 2007, p.4)

According to the excerpt above, the author states that for a right to be considered as an asset, it is necessary that this right be recognized and identified in a community of principles. Because the identification of rights as an asset occurs according to the moral and

political foundation of society, for example, the conception of equality in the distribution of rights is based on the political morality of the community, thus, the recognition of a right as an asset becomes an interpretative issue. (Martel, 2007)

Furthermore, rights as trump cards cannot be confused with fundamental rights. Because these rights are based on a moral justification, in this case it becomes an interpretative question, not extending to the rights already affirmed. In this sense, rights as trumps cannot be equated to fundamental rights already affirmed in the legal system, since trump rights for Dworkin are moral rights. (Martel, 2007)

In addition, Dworkin argues that the idea of trump rights could trivialize a claim to certain rights. In this way, Dworkin defends a new conceptualization of rights as trump cards. (Dworkin, 2014)

Along these lines, Dworkin states:

[...] The idea of rights as trump cards can be used in such a way as to grotesquely increase the number of rights, trivializing the appeal to a right. Certainly, that is, possible—we might stipulate that a man is said to have a right if his disadvantage affords a stronger reason than some other reason of any kind that might exist in support of that disadvantage. Most rights would have (according to this explanation) no practical importance. We would then need a new concept of rights as trump cards over important collective justifications, which is what I propose in the first place. (Dworkin, 2002, p.559)

According to the excerpt above, it is correct to state that Dworkin defends the reform of the concept of rights as trump cards, with the aim of not trivializing the claims of rights. In this sense, it is necessary to seek new collective justifications so that the concept of rights as trump cards can be rethought. (Dworkin, 2002)

In Dworkin's perspective, political rights could be considered as trump cards, according to the author:

Capturing this idea, we can affirm that political rights act as trump cards against justifications for political action that would otherwise be adequate. A policy is usually justified, for example, if it is going to make the community safer by reducing violent crime: on the whole, it is a good justification for raising taxes in order to better fund the police. (Dworkin, 2014, p.502)

According to the excerpt above, it can be stated that political rights can act as trump cards against political actions of the state, given that political actions are generally justified. Thus, being able to work for the good of the community. (Dworkin, 2014)

According to Dworkin, for a right to be considered an asset, it is necessary that this right be recognized in a community of principles, because in the philosopher's view, principles

have a weight in the legal system, given that principles work in a different logic from norms. Thus, developing the protection of fundamental rights. (Dworkin, 2014)

In Dworkin's theory, rights as trump cards are not to be confused with simple collective interests or with majoritarian public policies, as they act as limits to state decisions. Such rights require a moral foundation capable of justifying their protection even in the face of the will of the majority, ensuring individuals the possibility of claiming fundamental rights before the public power. (Dworkin, 2014)

Thus, Dworkin states:

To ask sensibly whether we have a right to liberty in this neutral sense, we must fix ourselves in a single sense of the word 'right'. It is not difficult to find a meaning of this term that allows us to say, with some confidence, that men have a right to freedom. We can say, for example, that a person has a right to freedom if it is in his interest to have freedom, that is, if he wants to have it or if it is good for him to have this right. In this sense, I would be prepared to admit that citizens have a right to freedom. In the same sense, however, I would also have to concede that they have a right, at least in general terms, to vanilla ice cream. Moreover, my concession of liberty would have very little value in the political debate. Therefore, if it is up to the right to freedom to play the role tailored for it in the political debate, it needs to be a right in a much stronger sense (...). In the strong sense I have described, a successful claim to a right has the following consequence. If a person has a right to something, then it is wrong for the government to deprive him of that right, even though it is in the general interest to do so. (Dworkin, 2002, p.414)

According to the excerpt above, it is correct to state that Dworkin defends the idea that the conception of having or not having a right would be a matter of interpretation. In this context, Dworkin argues that interpretation is fundamental to the understanding of a right as an asset. Because Dworkin's theory is based on a question of interpretation of legal and moral concepts, in the excerpt above the author uses as an example with regard to the concept of freedom it is necessary to develop it for citizens to be able to claim their rights. (Dworkin, 2002)

Thus, Dworkin argues that the concept of rights as trumps is configured as moral rights that form their justification from an interpretative question. For the author, a right is considered an asset when this right is recognized in a community of principles, because in the author's view such a right must present arguments in consolidated concepts of principles, such as freedom and equality. (Dworkin, 2014)

Rights as trump cards are methods that aim to protect citizens against state arbitrariness. From this perspective, this concept defends the use of morality to create a justification to guarantee fundamental rights, based on consolidated concepts such as the freedom to claim rights before the public power. (Dworkin, 2002).

In view of this, the next topic will address judicial activism from the perspective of rights as trump cards.

3 JUDICIAL ACTIVISM FROM THE PERSPECTIVE OF RIGHTS AS TRUMP CARDS

Judicial activism can be understood as a form of counter-majoritarian action by the Judiciary aimed at protecting fundamental rights. From this perspective, the courts assume a relevant role in containing public policies that violate constitutionally guaranteed rights. (Abboud; Lunelli, 2015)

From the perspective of the concept of rights as trump cards, this action is legitimized when it is based on legal principles endowed with moral content, allowing the Judiciary to ensure the effectiveness of the rights of individuals even in the face of arbitrary political decisions. (Dworkin, 2002)

For Dworkin, judicial activism aims at the Judiciary in the defense of fundamental rights. Due to the fact that the state creates laws that can harm certain social groups, thereby affecting the distribution of rights in society. (Dworkin, 2014)

In addition, it is important to highlight that judicial activism according to the concept of rights as trump cards, it is necessary for the judiciary to have a representative role, that is, to defend the rights of citizens in the face of the omission of the public power. In this case, the judiciary would act more actively to guarantee fundamental rights to individuals. (Dworkin, 2003)

According to Dworkin, the Judiciary Branch to ensure a fair distribution of rights, it is necessary for the courts to develop constitutional concepts. For example, freedom, equality and human dignity, as the author argues that if the judiciary manages to make a consolidated definition of such concepts, the distribution of rights will be done in a fair and equal way. (Vitório, 2011)

For Dworkin, the Judiciary cannot contribute to the maintenance of public policies that do not distribute rights fairly, because judicial activism based on the concept of rights as trump cards aims to develop constitutional concepts to ensure a fair distribution of rights and guarantee protection to individuals from the arbitrariness of public power. (Dworkin, 2003)

In this way, Dworkin argues that judicial activism, in the light of the concept of rights as trump cards, configures a counter-majoritarian action of the Judiciary aimed at the protection and distribution of fundamental rights. From this perspective, the courts resort to a more developed interpretation of constitutional principles, in order to ensure that individuals are able to exercise their rights in the face of state policies that violate them. (Dworkin, 2002)

Thus, the next approach to the work will be the principle of human dignity according to rights as trump cards.

4 THE PRINCIPLE OF THE DIGNITY OF THE HUMAN PERSON ACCORDING TO RIGHTS AS TRUMPS

The theory of rights as trumps understands human dignity as a principle that aims to enforce basic rights for individuals. Thus, this principle is essential for the achievement of a fair and equal distribution of rights. (Dworkin, 2014)

In addition, the principle of human dignity aims to protect the maintenance of citizens' basic guarantees. This principle seeks to help in the claim of rights in the face of unjust public policies, in this case, human dignity intends to reinforce a distribution of rights based on equality and justice, without interfering in the life project of the citizens of the community. Thus, individuals are able to live harmoniously in society. (Dworkin, 2014)

In this context, the principle of human dignity according to the concept of rights as trump cards is to guarantee a life in which individuals have the same rights in society and live together equally and autonomously. According to Dworkin's analysis of human dignity, it is important to emphasize that this individual cannot be subjected to any degrading treatment, such as torture, forced labor, and is treated with equal consideration. Thus, according to Dworkin, if the rights of individuals are violated, this would lead them to indignity. (Dworkin, 2007)

According to Dworkin, the principle of human dignity has a moral value that makes it intrinsic, taking into account the way the individual manages his personal life. In this case, human dignity would act as an asset when public policies privilege the central aspect of the value and importance of human life. (Dworkin, 2007)

The principle of the dignity of the human person according to the concept of right as trumps seeks to defend the concept of intrinsic value that must be respected among individuals, because human dignity is an inherent characteristic of individuals, and cannot be replaced in any way, because the principle under analysis is based on the reasoning that the human being has an end in himself, And from the moment the human being is considered rational, dignity is already guaranteed to the individual. Thus, being an absolute value that cannot be taken from individuals. (Kant, 2009)

Furthermore, Dworkin states that human dignity should not be understood only to grant rights to individuals. However, this principle must ensure the distribution of rights with the objective of citizens obtaining a way of life according to the individual claims of each one, such as, for example, human dignity must guarantee individuals the right to basic health,

since health is not considered only as a right granted to citizens, but a fundamental condition for individuals to achieve their life projects. (Salgado; Pinheiro, 2019)

In this way, human dignity aims to promote basic guarantees to individuals, as a way for them to succeed in their individual goals, without interfering in the distribution of rights of the citizens of the community, and the role of the judiciary in situations of arbitrary policies is important. In this sense, the principle under analysis is fundamental for harmonious coexistence in society. (Dworkin, 2014)

Thus, it is correct to state that the principle of the dignity of the human person according to the concept of rights as trumps is divided into two main foundations: The principle of intrinsic value, aimed at the analysis of the actions of human life, and the principle of personal responsibility, which supports the idea of autonomy of individuals in relation to their own choices. In this way, human dignity acts as an asset to the extent that it ensures the fundamental conditions for each individual to build his or her own life project. (Dworkin, 2014)

That said, the article moves on to the main theme of the research in which the central premise for the answer to the work problem will be exposed.

5 HOW DWORKIN'S CONCEPT OF RIGHTS AS TRUMP CARDS ANALYZES THE PRINCIPLE OF THE DIGNITY OF THE HUMAN PERSON IN THE PHENOMENON OF JUDICIAL ACTIVISM

As seen earlier, the principle of the dignity of the human person in the Dworkinian perspective is divided into two principles, which are the principles of intrinsic value and personal responsibility. Thus, ensuring the way of life of individuals in society and their fundamental rights. (Dworkin, 2014)

In addition, it is worth noting that Dworkin in his theory of law as an asset was observed that this concept aims to defend individuals in the face of arbitrary public policies of the state, in which Dworkin defends the use of a justification based on morality in order to guarantee fundamental rights, and using consolidated concepts such as equality to claim rights before state power. (Dworkin, 2014)

In this sense, Dworkin explains that judicial activism according to the concept of rights as trumps would be a way for the judiciary to act in a counter-majoritarian way, that is, the courts must define explanations of constitutional concepts, to guarantee fundamental rights to citizens in order to prevent public policies of the state that harm the distribution of rights. (Dworkin, 2002)

According to Dworkin, it is important to emphasize that Dworkin's position in the theory of law as an asset is the use of moral justification to prevent public policies of the state from harming the distribution of rights in a fair way. (Morrison, 2006)

Regarding the principle of the dignity of the human person, it is worth noting that this principle, according to Dworkin's concept of rights as trump cards, it can be said that this principle aims to guarantee the basic conditions for individuals to build their own lifestyle autonomously. In this sense, the principle of human dignity presents itself as a principle that guarantees the necessary conditions for citizens to achieve their individual goals. (Dworkin, 2011)

In addition, the principle of human dignity based on rights as trump cards in judicial activism, it is necessary for the courts to develop the concepts of constitutional principles in order to achieve an equal distribution of rights without harming the way of life of citizens. In this case, the judge, for Dworkin, must adapt such principles to the political morality adopted by the community. (Brandão, 2024)

Dworkin states that judges should use principles based on moral justification. Thus, it is necessary for magistrates to develop the concept of human dignity, in order to guarantee individual rights for citizens to be able to structure their way of life autonomously. (Dworkin, 2003)

From the perspective of the theory of rights as trump cards, it can be emphasized that the principle of the dignity of the human person in judicial activism must be interpreted by the courts according to moral justifications. In addition, the judge must adapt the principle to the political morality of the community, as a way of ensuring a distribution of rights based on equal consideration. (Dworkin, 2014)

Dworkin, in the concept of rights as trumps, argues that the interpretation of the principle of human dignity must be understood from a moral foundation. Because it improves the understanding of the courts when using this principle, to ensure the protection of fundamental rights in the face of state arbitrariness. Therefore, the development of the interpretation of human dignity is essential to understand this principle in the concept of rights as trumps. (Abboud; Motta, 2021)

In this line, in order to understand the principle of the dignity of the human person in judicial activism from the conception of rights as trump cards, it is necessary to understand that the concept of human dignity by the courts is an interpretative issue. Because interpretation in Dworkinian logic plays an important role when judges create justifications based on moral principles to ensure an equal distribution of rights. (Abboud; Motta, 2021)

For Dworkin, the judge must ensure that the principle of human dignity is respected, and it is necessary to use the principles of personal responsibility and intrinsic value, since these principles are essential to understand human dignity. Thus, respecting the principle of human dignity. (Dworkin, 2007)

Thus, Salgado and Pinheiro state:

[...] Axiological neutrality on this interpretation is not possible, since, when interpreting the constitutional text, the interpreter performs a moral reading and it is important that this be the case in order to guarantee respect for human dignity. (Salgado; Pinheiro, 2019, p. 15)

According to the excerpt above, it is correct to state that for the judge to respect the principle of human dignity, it is necessary to make an interpretation based on morality and not from an axiological neutrality, because in this case the judge will be able to guarantee a correct use of the principle of human dignity, considering that a moral justification will be used for the understanding of this principle. (Salgado; Pinheiro, 2019)

In view of the above, it can be stated that the concept of rights as trump cards allows us to understand the principle of the dignity of the human person, in the context of judicial activism, based on the principles of personal responsibility and the intrinsic value of human life. Based on these foundations, the Judiciary is capable of developing an adequate moral justification for the realization of an equal distribution of rights, ensuring citizens the basic conditions necessary for the autonomous construction of their life projects.

6 CONCLUSION

Finally, the present study sought to understand, in view of the concept of rights as trump cards, how the principle of the dignity of the human person can be understood in judicial activism, and how this principle can help in the construction of a moral justification to ensure a fair distribution of rights.

In the course of the research, it was sought to understand the following points: The representative performance of the judiciary in the face of the state's omissions; How human dignity can ensure better conditions for individuals without harming their individual projects and the importance of judicializing public policies that are harmful to social harmony.

In this sense, the counter-majoritarian action of the judiciary from the perspective of Dworkin's theory seeks to effect a fair distribution of rights based on equal consideration. With regard to the aspects dealt with on human dignity, it is correct to state that this principle has the purpose of ensuring individual rights so that citizens can live together according to their needs. Thus, it is concluded that the central premise of the work was confirmed, because

Dworkin's theory aims to understand the importance of human dignity and the active performance of the judiciary for the construction of a just and egalitarian society.

In view of all the above, it is concluded that rights as trump cards allow us to understand the principle of the dignity of the human person, in the context of judicial activism, as an essential instrument to guarantee fundamental rights. From this perspective, it is up to the judge to resort to adequate theoretical foundations, especially the construction of moral justifications, which, according to Dworkin, are indispensable for the Judiciary to ensure the protection of individuals in the face of arbitrary public policies and to render fair judicial decisions committed to the realization of human dignity.

ABSTRACT

The Microregion of the Pindaré Valley comprises 22 municipalities and is named after one of the longest and most important rivers in Maranhão, the Pindaré River. This study aimed to analyze the occurrence of wildfires in the municipalities of the Pindaré Valley that are part of the Legal Amazon. The adopted methodology involved collecting information from the Meteorology Database - BDMEP, National Institute for Space Research - INPE, Brazilian Institute of Geography and Statistics - IBGE, Institute of Applied Economics - IPEA, Center for Weather Forecasting and Climate Studies - CPTEC for the period 2018-2022. The BDQueimadas and Environmental Information Bank (BDiA) verified that the municipalities of Santa Luzia, Buriticupu, and Bom Jardim had the highest number of fire outbreaks, due to their phytoecological characteristics and the predominance of Dense Ombrophilous Forest. Meanwhile, the municipalities of Tufilândia and Pindaré Mirim recorded the lowest number of outbreaks, reflecting a region predominantly composed of Open Ombrophilous Forest. It was

observed that most municipalities engage in agropastoral activities and use fire to clear pastures due to its low cost. The analysis also revealed that the first semester has higher average rainfall and lower temperatures, whereas in the second semester the situation is reversed. Therefore, the variables temperature, rainfall, vegetation cover, and agropastoral activities may significantly influence the increase in fire outbreaks. Implementing environmental control and fire prevention measures is essential for sustainable development and the ecological balance of these communities.

RESUMO

A Microrregião do Vale do Pindaré possui 22 municípios, este nome é dado a um dos mais extensos e importantes rios do Maranhão, o Pindaré. Este estudo teve como objetivo analisar as ocorrências de queimadas nos municípios do Vale do Pindaré que fazem parte da Amazônia Legal. A metodologia adotada, optou-se pela coleta de informações nas bases de dados: Banco de dados de Meteorologia - BDMEP, Instituto Nacional de Pesquisas Espaciais - INPE, Instituto Brasileiro de Geografia Estatística - IBGE, Instituto de Pesquisa Aplicada - IPEA, Centro de Previsão de Tempo e Estudos Climáticos - CPTEC no período de 2018-2022. Verificou-se no BDQueimadas e Banco de Informações Ambientais - BDIA que os municípios Santa Luzia, Buriticupu e Bom Jardim tiveram o maior número de focos de incêndio, devido às características fitoecológicas e a predominância de Floresta Ombrófila Densa. Já os municípios de Tufilândia e Pindaré Mirim apresentaram menores focos, exibindo uma região predominante de Floresta Ombrófila Aberta. Observou-se que a maioria dos municípios possuem atividades agropastoris e utilizam o fogo para limpar os pastos devido ao seu baixo custo. Verificou-se que no primeiro semestre há uma maior precipitação média e temperaturas médias mais baixas e no segundo semestre, isso se inverte. Portanto, as variáveis temperatura, precipitação pluviométrica, cobertura vegetal e atividades agropastoris podem influenciar significativamente no aumento de focos de incêndio. Implementar ações de controle ambiental e prevenção dos focos de incêndio é necessário para o desenvolvimento sustentável e equilíbrio ecológico dessas comunidades.

RESUMEN

La Microrregión del Valle del Pindaré está compuesta por 22 municipios y recibe este nombre por uno de los ríos más extensos e importantes de Maranhão, el río Pindaré. Este estudio tuvo como objetivo analizar la ocurrencia de quemas en los municipios del Valle del Pindaré que forman parte de la Amazonia Legal. La metodología adoptada consistió en la recopilación de información en las bases de datos Base de datos meteorológica (BDMEP), Instituto Nacional de Investigaciones Espaciales (INPE), Instituto Brasileño de Geografía y Estadística (IBGE), Instituto de Investigación Aplicada (IPEA), Centro de Predicción del Tiempo y Estudios Climáticos (CPTEC) en el período 2018-2022. Se verificó en la BDQueimadas y en la Base de Datos Ambientales (BDIA) que los municipios de Santa Luzia, Buriticupu y Bom Jardim presentaron el mayor número de focos de incendio, debido a sus características fitoclimáticas y a la predominancia de Bosque Ombrófilo Denso. Por otro lado, los municipios de Tufilândia y Pindaré Mirim registraron los menores focos, exhibiendo una región predominantemente de Bosque Ombrófilo Abierto. Se observó que la mayoría de los municipios desarrollan actividades agropecuarias y utilizan el fuego para limpiar los pastos debido a su bajo costo. Además, se constató que en el primer semestre ocurre una mayor precipitación media y temperaturas más bajas, mientras que en el segundo semestre esta
