situación se invierte. Por lo tanto, las variables temperatura, precipitación pluvial, cobertura vegetal y actividades agropecuarias pueden influir significativamente en el aumento de los focos de incendio. Implementar acciones de control ambiental y prevención de incendios es esencial para el desarrollo sostenible y el equilibrio ecológico de estas comunidades.

1 INTRODUCTION

One of the biggest challenges in our country is related to the population growth resulting from the accelerated process of urbanization of cities and ends up also affecting the populations of rural areas, because according to data from the Brazilian Agricultural Research Corporation - Embrapa, the areas considered urban in Brazil represent less than 1% of the national territory and concentrate 160 million people, that is, 84.3% of the Brazilian population (Faria *et al.*, 2017). This population growth, which has occurred in the last forty years, has produced significant impacts on the population and especially on the environment, reducing the quality of life and degrading natural resources.

With the population growth, several agricultural areas are being exploited for the cultivation of food products and, consequently, they are deforested and some use burning to remove the material from the site. Some fires are controlled and others are done anyway. In addition, other natural factors also cause fires due to the dry climate, and accidental ones that are caused by the population itself that disposes of waste in these environments, such as: glass, cigarette butts or flammable materials that cause fires in these places.

According to INPE (2024), in 2024, Maranhão was the 6th Brazilian state with the highest number of fire outbreaks, and in 2023 it occupied the 2nd place, due to the prolonged drought, dry grass becomes a good fuel for forest fires. The flames reach up to four meters high and advance quickly, bringing destruction to the fauna, flora and inhabitants of these places who suffer from the smoke that enters their homes, causing respiratory problems.

Vale do Pindaré has 22 municipalities with 666,083 inhabitants in an area of 36,000.996 km², and a population density of 18.6 inhabitants/km² (IBGE, 2023). The municipalities, due to their agricultural and extractive potential, suffer from land grabbing, illegal extraction of materials in these areas, expansion of agricultural and pastoral areas, invasion of Indigenous Lands (TIs) and Environmental Preservation Areas (APAs), and consequently deforestation and fires arise in these places.

In view of the facts reported about the incidence of fire outbreaks in these locations, this study aimed to analyze and evaluate the occurrences of fires in the municipalities of the Pindaré Valley that are part of the Maranhão Legal Amazon in the periods from 2018 to 2022. In addition, a survey of the occurrences of fires was carried out using the databases of INPE, IPEA, IBGE, Portal da Amazônia, BDMEP, CPTEC in the last five years. Soon after, the physical variables related to the danger of forest fires were characterized. For this, georeferencing and location tools were used, such as *Google Maps*⁸, *Ambiental Geo*⁹ and

⁸ www.google.com/maps

⁹ <https://geosgb.sgb.gov.br/>

*Forest-gis*¹⁰, to identify areas prone to fire outbreaks. Then, an evaluation and comparison of the data from the hazard maps provided by the institutional bodies was carried out.

2 THEORETICAL FRAMEWORK

Man's relationship with fire went through three distinct stages: production by man, maintenance through the use of fires, and the use of resins, so that it would not go out so easily when the lit torches were carried. Israeli archaeologists have discovered the oldest evidence of a bonfire produced 790 thousand years ago, on the banks of the Jordan River, between Israel and Jordan (FIO CRUZ, 2023). This resource has several uses such as food preparation, production of any material for industries, space heating and also in agriculture. After that, fire was necessary even in the agricultural sector, because at no cost, it would be efficient and affordable. However, the indiscriminate use and intensity of fires to open areas for agriculture has become a serious environmental problem.

Biomes, especially those most fragile in their physical, chemical and biological aspects, in recent decades have suffered from anthropic actions, which associated with natural causes, have been causing serious risks to the maintenance of the balance of the environment. Inherent to these factors, we can highlight forest fires, whose action impacts environmental systems, causing damage to the sustainability of the environment.

Forest fire is the occurrence of fire in any vegetative form without control and can be caused by several ways, both natural and also by anthropic actions. These actions can be of a criminal, accidental or unexpected nature. The main causes related are: climatic variables, combustible material characteristic of the area, relief, lightning strikes or excessive heat; arsonists; agricultural or forestry burning; hunters, fishermen and tourists; opening of roads; among others (INBRAEP, 2023). Thus, concerns regarding prevention arise, especially for those who work in front of commercial plantation projects using controlled burning and in conservation units (Nogueira *et al.*, 2002).

Controlled burning is the scientific application of fire in fuels, both in its natural state and altered under certain conditions, in such a way that it is confirmed to a predetermined area and produces the intensity of heat and the rate of propagation to favor certain management objectives, that is, controlled burning is the use of fire in a planned way to achieve a certain objective such as, for example: clearing a pasture; reduction of combustible material; improvement of habitat for fauna; control of undesirable species and reduction of the risk of fire propagation (INBRAEP, 2023).

On the other hand, the intervention in firefighting is divided into six steps, according to

¹⁰ <https://forest-gis.com/>

Tetto, Soares and Batista (2001) (apud Silva, 2021, p. 5):

1. Detection: time elapsed between the ignition or start of the fire and the moment it is seen by someone;
2. Communication: time between the detection of the fire and the receipt of information by the person responsible for the combat action;
3. Mobilization: time spent between receiving information about the existence of the fire and leaving the personnel for combat;
4. Displacement: time between the departure of the combat personnel and the arrival of the first group at the scene of the fire;
5. Planning for combat: Time spent by the person responsible for the combat to evaluate the behavior of the fire and plan the combat strategy;
6. Firefighting: time consumed in the operation of fighting or definitively eliminating the fire, including the aftermath.

Following the steps for a good intervention in fighting fires in forest areas, it would have much less damage to the environment. In Maranhão, it was observed that the territorial extension of the Maranhão Legal Amazon increased in 2021, and included several municipalities in Maranhão, totaling an area of 5,015,067.86 km², corresponding to about 58.93% of the Brazilian territory, and 56% of the Brazilian indigenous population resides in it (IBGE, 2021).

The concept of the Legal Amazon was instituted in 1953 and its territorial limits derive from the need to plan the economic development of the region and, therefore, are not limited to the humid jungle ecosystem, which occupies 49% of the national territory and also extends over the territory of eight neighboring countries. The boundaries of the Legal Amazon have been altered several times as a result of changes in the country's political division, and the Sustainable Amazon Plan (PAS) was launched by the federal government, which fully considers the State of Maranhão as part of the Brazilian Amazon (IPEA, 2008). But according to the census carried out by the IBGE in 2021, Maranhão is the state with the largest number of municipalities belonging to the Legal Amazon with 181 of the 217, that is, 79.3% of its territory (IBGE, 2021).

With the increase in the extension of the Legal Amazon in Maranhão, public agencies must intensify the provision of projects to reduce the environmental impacts in these areas. Because most of these areas have natural resources in abundance, and the mismanagement of these resources can bring several damages to the environment, such as deforestation, invasion of indigenous and quilombola areas, advance of agriculture and fires.

In 2020, the region most affected by fires was the south of Maranhão, where the agricultural sector predominates. But it is clear that other municipalities that make up the legal Amazon of Maranhão also suffer from forest fires, there was an increase from 40 outbreaks in 2019 to 110 outbreaks in 2020 (INPE, 2023), in addition to natural factors, anthropic actions also favor this increase, such as: the expansion of farming, livestock, real estate, further aggravating the environment (Figure 1).

Figure 1

Fire outbreaks between March 20 and July 1, 2020

Source: INPE, 2023.

To prevent and combat fire outbreaks in these areas, technologies can represent an advance in reducing these incidents. And also the information by teams trained in passing on to small, medium and large farmers the good ways to do controlled burning, because many of these farmers do not know the technique and end up causing large fires.

Assis and his collaborators (2014) presented in their article that geotechnologies are an important resource in assisting in the detection of fires, locating the foci and quantifying and analyzing the areas where fires occur. Therefore, with the great advancement of science in technology, especially in aerospace knowledge and georeferencing. Meanwhile, Tomzhinski, Coura and Couto (2011), portrays several ways that these technologies can be exploited to detect these fire outbreaks, such as terrestrial surveillance, observation post or satellite image monitoring.

When fires are provoked, they generate impacts on the environment and provide penalties to offenders. The Environmental Crimes Law, Law No. 9,605, of February 12, 1998, establishes penalties for damages caused by forest fires (Brasil, 1998), states that:

Article 41 – Causing a fire in a forest or forest: Penalty – imprisonment, from two to four years, and a fine. Sole Paragraph. If the crime is culpable, the penalty is imprisonment from six months to one year, and a fine.

In addition to the Environmental Crimes Law, the Brazilian penal code also determines in article 250 "that causing fire, exposing the life, physical integrity or property of others to danger is considered a crime of common danger, with a penalty - imprisonment, from 03 to 06 years, and a fine. In item II of paragraph 1, it requires an increase in the penalty by one third if the fire is in a crop, pasture, forest or forest" (Brasil, 1940).

3 METHODOLOGY

The study area is the Microregion of Vale do Pindaré, which is part of the Legal Amazon of Maranhão. In 2017, as shown in Figure 2, there were 170 cities, and currently 11 more have been incorporated, totaling 181 municipalities that are part of this region (IBGE, 2023). The Pindaré Planning Region is one of the 32 administrative regions of the State of Maranhão, Brazil, being the largest in number of municipalities and one of the largest in territorial extension. Despite this, it is the twentieth most densely populated and takes its name from one of the most extensive and important rivers in Maranhão, the Pindaré (SEPLAN, 2008).

Figure 2

Location Map of the Legal Amazon of Maranhão, with emphasis on its 170 municipalities

Source: Santos; Nunes, 2017.

Initially, a descriptive search was carried out in the main databases on fires in the Brazilian Legal Amazon with a focus on the Maranhão region based on bibliographic fearology found in books, articles, monographs, dissertations, theses and journals in the databases of Capes Journals, *Scielo*, *Google Scholar*, *Web of Science*. And in the specific magazines, the following terms were used: "burning", "fire", "legal Amazon", "Maranhão biomes", "deforestation". However, the following exclusion criteria were established: publications from annals of events, conferences, duplicate studies and that do not adequately relate to the objective of the study in relation to its contribution.

To evaluate and analyze the fire outbreaks in the region, a qualitative and quantitative exploratory research was carried out based on the Meteorological Database of Education and Research, National Institute of Meteorology (INMET), Fire Database of the Post of Weather Forecasts and Climate Studies, National Institute of Space Research, Brazilian Institute of Statistical Geography of Brazil, Institute for Applied Economic Research and in the Amazon Portal, in the form of a *shapefile* (common vector file format used by Geographic Information Systems - GIS, containing geospatial data) in the period from 2018 to 2022, the number of fire outbreaks, month of occurrence, annual distribution of fires, causes of occurrences were analyzed. The physical variables of forest fire danger in the Pindaré Valley region were collected: Land use and vegetation cover using images from the ResourceSat satellite, "LIS3" sensor, Polar Heliosynchronous orbit; Rainfall, Temperature. For the analysis of the data on hot spots, satellite images provided by the INPE website were studied.

The collected data were evaluated through descriptive statistical analysis in a spreadsheet of the Microsoft Office program EXCEL 2013, and the procedure of interpretation of the information began.

4 RESULTS AND DISCUSSIONS

According to the Humanitas Unisinos Institute (2023), ¹¹in Maranhão, there was an increase of almost 22% from 2021 to 2022, with more than 3 thousand outbreaks reported last year. During the month of December alone, 617 fire outbreaks were recorded.

From the analysis of the results collected in INPE's Fire Database (2023), it was found that among the Municipalities of the Pindaré Valley that are part of the Legal Amazon: Santa Luzia, Buriticupu and Bom Jardim had the highest numbers of fire outbreaks between the years 2018 and 2022. As shown in Table 1.

¹¹ <https://ihu.unisinos.br/categorias/>

Table 1

Annual fire outbreaks in the Municipalities of the Pindaré Valley that are part of the legal Amazon of Maranhão

Municipalities	2018	2019	2020	2021	2022

Zé Doca	434	1748	2302	1136	2064

Source: INPE, 2023.

The city of Santa Luzia leads the ranking with a total of 27,339 fire outbreaks, Buriticupu with 24,134 and Bom Jardim with 23,714. The three municipalities together correspond to 43.82% of the outbreaks of all 22 municipalities that are part of the legal Amazon in the Pindaré Valley, with a total of 171,548 fire outbreaks in the five-year period (2018-2022). The average number of fires per km² was calculated and it was observed that the municipality of Buriticupu had the highest average value, with 9.48 fires/km², Santa Luzia with 5.65 fires/km² and Bom Jardim with 3.60 fires/km². In addition, it was noted that the incidence of hot spots increases considerably from the month of July, peaking in October, as shown in Figure 3.

Figure 3

Monthly fires accumulated in the period 2018-2022

Source: INPE, 2023.

According to the Action Plan for the Prevention and Control of Deforestation and Fires in the State of Maranhão - PPCD/MA (2011), in the Maranhão Legal Amazon, deforestation is linked to illicit activities and/or unsustainable practices from primary economic sectors (livestock, agriculture, plant extractivism and mining) and secondary economic sectors (steel, timber, civil construction and others).

As shown in Figure 4, the monthly maps of mean temperature anomalies from the INMET Temperature Monitoring database were analyzed. It was noticed that during these five years, the average temperature is considerably higher in the second semester (in the months of August to December) in all municipalities of the Pindaré Valley. The climate of the region, according to the Köppen classification (Köppen; Geiger, 1928), is of the Af type (humid tropical) with a rainy summer and dry winter, with an average rainfall of at least 60 mm in each month. Average annual temperatures are above 22 °C and the average for the coldest month is above 18 °C.

According to the studies by Corrêa et al. (2023) on the Köppen classification, they updated the climate classification and climatological water balance in the State of Maranhão, where the Tropical Climate obtained the following characteristics: Megathermal climates, average annual temperature in the coldest month, with 18 °C; Absent winter season, with higher annual precipitation and evapotranspiration in the tropical climate. In code "f" with humid climate, precipitation occurs in all months of the year, inexistence of a defined dry season and precipitation in the driest month with more than 60 mm and rainfall in autumn and winter, with dry summer.

Figure 4

Source: INMET, 2024.

Therefore, the second half of the year is warmer and is characterized by little rain and strong winds that contribute to fire outbreaks turning into fires and burnings. It was also observed that the dry grass and the amount of winds that occur during this period, the flames can reach up to four meters in height and advance quickly, bringing destruction to the biome of this place. The population is more vulnerable to fires due to the increase in respiratory problems that increase in the same period. The data analyzed from CPTEC (2024) on the rainfall maps in Brazil, it was noticed that the months of December to May have on average considerably higher rainfall when compared to the other six months of the year from June to November, and this pattern is repeated during the five years analyzed. As shown in Figure 5.

Figure 5

(A) Rainfall in August/2022, (B) Rainfall in March/2022

Source: CPTEC, 2024.

The months with the highest rainfall, mentioned above, are also the months with low temperature and low numbers of fire outbreaks, in addition, it was observed that the month of March concentrates the highest average rainfall and October the highest average temperature. It can be corroborated by the collection of climatological data from the only conventional station in the Pindaré Valley, station ZE DOCA - World Meteorological Organization Code - WMO:82376 (INMET, 2024) as shown in Figure 6.

Figure 6

Rainfall and average monthly temperatures in the period 2018-2022

Source: INMET, 2024.

In addition, it is important to highlight that Silva et al. (2016) analyzed in their work:

Regarding temperature, the behavior is homogeneous, that is, all stations recorded the upward trend, in an intense and statistically significant way. Regarding precipitation, the Zé Doca station in the Amazon biome and the Carolina station in the Cerrado biome showed downward trends in precipitation in the dry season.

The dry period in the Amazon region and in the adjacent Cerrado region is usually related to El Niño events and/or warmer than normal sea surface temperatures in the Tropical North Atlantic. These ocean temperature increases favor the occurrence of anomalous regional water deficits, warmer temperatures, and intense fire seasons. This was the case of the exceptional droughts in the Amazon in 2005, 2010, 2015, 2016 (Aragão *et al.*, 2007) and in the Pantanal 2019–2020 (Jimeinez *et al.*, 2021).

According to Marengo *et al.* (2022), the long-term trends of air temperature and evaporation variables show that dry conditions have intensified during the last two decades,

suggesting increased water stress in vegetation. The dry and dry-wet seasons in the eastern Maranhão Amazon are becoming increasingly longer, hotter, and drier.

Since 1992, the IBGE has estimated the extent of vegetation types in Brazil, classified into phytocological regions and vegetation areas. Then, the type of vegetation present in the Pindaré Valley was verified in the Environmental Database and Information of this agency. Phytocological regions are defined by a floristic of typical genera and characteristic biological forms that are repeated within the same climate, and may occur in terrains of varied lithology, but with well-marked relief.

The municipalities with the highest number of fire outbreaks were Santa Luzia, Buriticupu and Bom Jardim, and these are mostly composed of Dense Ombrophilous Forest of moss green and part of light green (Figure 7).

Figure 7

Phytocological regions in the municipalities with the highest number of fire outbreaks: Santa Luzia, Buriticupu and Bom Jardim

Source: IBGE, 2023.

The phytocological region is basically composed of macro and mesophanerophytes, as well as lianas and epiphytes, characterized by a thermal shoulder climate, with practically no biologically dry period, with rainfall above 2,300 mm and average annual temperatures between 22 °C and 25° C in the north of the country (IBGE, 2023). This type of dense and closed forest provides a milder microclimate, and the fuels have a higher and more stable content than a forest with little vegetation and open.

When fires occur in these forests, some conditions prevent the detection of fires, such as fire only on the ground in this type of dense vegetation, without affecting the tree canopy. However, these characteristics do not favor the high number of outbreaks presented by the municipalities, possibly other factors may be related to the increase in the number of fire outbreaks, such as logging, agricultural and real estate activities that occur in these regions.

On the other hand, the municipalities with the lowest fire outbreaks, Tufilândia and Pindaré Mirim, are mostly made up of open ombrophilous forest (Figure 8) of light green color and a much smaller part of dense ombrophilous forest of moss green color and some rivers present in this region, especially the Pindaré River.

Figure 8

Phytoecological regions in the municipalities with the lowest number of fire outbreaks: Tufilândia and Pindaré Mirim

Source: IBGE, 2023.

The phytoecological region located in the ombrophilous climate range, however, presenting a short dry period, of two to three months, and dominance of biological forms of rosulate phanerophytes and woody lianas (IBGE, 2023). These characteristics of the type of forest and vegetation areas are more favorable to the increase of fire outbreaks in the region, but in practice they are not observed. However, these two municipalities also have a significant part of the water body, which is a possible variable that favors the low number of fire outbreaks, compared to the other municipalities in Maranhão.

In addition, agropastoral activities may have contributed to the high numbers of fire outbreaks, in 2020, data from Municipal Livestock show a growth in the main herds in these 5 municipalities: Santa Luzia, Buriticupu, Bom Jardim, Tufilândia and Pindaré Mirim (IBGE, 2023). As shown in Table 2.

It was observed that the municipalities of Bom Jardim, Buriticupu and Santa Luzia, which have the highest number of fire outbreaks, have as their main herd the raising of cattle, animals that need pastures to be fed. Considering that "In agriculture, fire is used to clean and regrow pastures and combat pests and diseases" (Manual for the Prevention and Control of Fires in the State of Maranhão, 2020). Therefore, the creation of this type of herd can have a direct or indirect influence on the high number of fire outbreaks in these municipalities, due to the possible type of cleaning that is carried out in a pasture, usually using fire, due to its low cost.

Table 2

Herd Number

Municipalities	Variable - Effect of herds (head) in 2020								
	Herd Type								
	Beef	Buffalo	Equine	Total pig	Swine - swine breeders	Goat	Sheep	Chickens - total	Chickens - chickens
Bom Jardim	159123	821	2567	2527	790	3321	2455	23578	6550
Buriticupu	143789	118	998	2600	788	1200	1087	32457	8500
Pindaré Mirim	14586	-	439	631	201	237	409	740031	1550
Santa Luzia	249087	121	3345	2412	654	2786	3022	32456	12367
Tufilândia	17240	-	274	589	146	377	237	3786	800

Source: Adapted from IBGE data - Municipal Livestock Survey, 2023.

In addition, in Maranhão it is still quite common to use burning in the preparation of the land for small plantations that contribute to the increase of particulate matter released into the atmosphere. The effects of this particulate emitted by fires on human health mainly affect the elderly and children. However, it is clear that the dry season favors the increase in fire outbreaks in the state. The second half of the year corresponds to the dry season in Maranhão, with negative impacts such as devastation of existing flora, extinction of animals, respiratory complications in the health of residents, toxic gases that can increase the temperature of the greenhouse effect.

According to Marengo *et al.* (2022) studied the consequences of agricultural expansion in the Eastern Amazon-Cerrado transition zone and evidenced the increase in temperature, vapor pressure deficit, subsidence, frequency of dry days, and decrease in precipitation, humidity, and evaporation, in addition to a delay in the onset of the rainy season, inducing a greater risk of fire during the dry-to-rainy transition season.

Bezerra *et al.* (2018, p. 6) highlight that,

The main socio-environmental impacts arising from prolonged drought events in Maranhão can be summarized as difficulty in accessing water, losses in agricultural activities, loss of material goods, risk to human life and potential damage to biodiversity in Maranhão's biomes and ecosystems (due to the action of fires).

An impact of drought events that deserves to be highlighted in the territory of Maranhão are fires, since these can be modulated by events of droughts and/or prolonged droughts in Maranhão, as well as a consequence of anthropogenic forms of land use and cover (IMESC, 2017).

According to Zalles *et al.* (2021) portrays that "humans have markedly altered environments through the conversion of natural vegetation pastures, crops, and other land

uses, as well as the degradation of natural vegetation through logging, fire, and other types of disturbance."

Thus, it is perceived that "forest fires are one of the most degrading forms of tropical forests due to the predominance of agropastoral activities, where they still use fire to clean these areas, causing an increase in flammability in these places for the practice of intensive logging, fragmentation and climate change" (Barlow *et al.*, 2012).

Therefore, prevention actions are needed together with public agencies and the population in order to minimize and combat fire outbreaks in the Pindaré Microregion.

5 CONCLUSION

According to the survey carried out in the databases of INPE, INMET and IBGE, it was observed that the municipalities that are part of the Maranhão Legal Amazon belonging to the Pindaré Microregion, the cities of Bom Jardim, Buriticupu and Santa Luzia stand out with the highest number of fire outbreaks and Tufilândia and Pindaré Mirim with the lowest numbers.

From the data collected on the increase in fire outbreaks in the municipalities of the Pindaré Valley, some factors were listed that may supposedly be related: logging, farming, real estate activities, and perhaps the lack of training and misinformation of farmers when they use burning to clean these places.

Other important factors that can significantly influence the number of fire outbreaks are the variables: average temperature (in the hottest and driest period in the region), rainfall (scarcity of rainfall) and phytoecological regions (types of vegetation cover). It was found mainly in regions that predominate the Dense Ombrophilous Forest tend to have greater fire outbreaks.

The increases in the number of fire outbreaks can bring environmental damage to the flora, fauna and population that reside in these locations. With the increase in respiratory problems caused by the smoke that mainly affects the elderly and children. Promote actions and/or recommendations for the prevention and combat of fires and try to sensitize the authorities and the population about the importance of preserving the environment.

In addition, the promotion of specific awareness campaigns for local communities on safe practices and fire prevention could reduce the number of fires in these locations. Promote sustainable agricultural practices that reduce reliance on fires, such as using cultivation techniques that do not involve burning vegetation. And also establish and maintain firefighting bases in strategic areas, especially in the municipalities with the largest fire outbreaks Santa Luzia, Bom Jardim and Buriticupu.

ABSTRACT

Informal work constitutes a structural phenomenon of the Brazilian economy, characterized by the absence of formal ties, limited social protection, and frequently precarious working conditions. Economic, technological, and political transformations have reconfigured the labor market, expanding informality and creating new modalities of labor insertion that challenge traditional categories. This study analyzes Brazilians' search for informal work, examining transformations in the world of work and survival strategies developed by workers. The methodology is characterized as an exploratory bibliographic review with a qualitative approach, based on critical analysis of scientific publications between 2020 and 2025. The results show that informal workers develop creative survival strategies, mobilizing social networks and diversifying activities, but face vulnerabilities related to the absence of social protection and income instability. The COVID-19 pandemic amplified vulnerabilities and revealed gaps in social protection systems. It is concluded that reducing informality requires structural transformations that expand educational opportunities, reduce inequalities, and promote inclusive economic development, transcending mere formalization policies.

Keywords: Informal Work. Labor Precariousness. Survival Strategies. Labor Market.

RESUMO

O trabalho informal constitui fenômeno estrutural da economia brasileira, caracterizado pela ausência de vínculos formais, proteção social limitada e condições laborais frequentemente precárias. Transformações econômicas, tecnológicas e políticas reconfiguraram o mercado de trabalho, ampliando a informalidade e criando novas modalidades de inserção laboral que desafiam categorias tradicionais. Este estudo analisa a busca dos brasileiros pelo trabalho informal, examinando transformações no mundo do trabalho e estratégias de sobrevivência desenvolvidas por trabalhadores. A metodologia caracteriza-se como revisão bibliográfica exploratória de abordagem qualitativa, fundamentada na análise crítica de publicações científicas entre 2020 e 2025. Os resultados evidenciam que trabalhadores informais

RESUMEN

El trabajo informal constituye un fenómeno estructural de la economía brasileña, caracterizado por la ausencia de vínculos laborales formales, una protección social limitada y condiciones de trabajo frecuentemente precarias. Las transformaciones económicas, tecnológicas y políticas han reconfigurado el mercado laboral, ampliando la informalidad y creando nuevas modalidades de inserción laboral que desafían las categorías tradicionales. Este estudio analiza la búsqueda de los brasileños por el trabajo informal, examinando las transformaciones en el mundo del trabajo y las estrategias de supervivencia desarrolladas por los trabajadores. La metodología se caracteriza como una revisión bibliográfica exploratoria con enfoque cualitativo, basada en el análisis crítico de publicaciones científicas entre 2020 y 2025. Los resultados evidencian que los trabajadores informales desarrollan estrategias creativas de supervivencia, movilizandore redes sociales y diversificando actividades, pero enfrentan vulnerabilidades relacionadas con la ausencia de protección social y la inestabilidad de ingresos. La pandemia de COVID-19 amplificó estas vulnerabilidades y reveló brechas en los sistemas de protección social. Se concluye que la reducción de la informalidad requiere transformaciones estructurales que amplíen las oportunidades educativas, reduzcan las desigualdades y promuevan un desarrollo económico inclusivo, trascendiendo las políticas de mera formalización.

Palabras clave: Trabajo Informal. Precarización Laboral. Estrategias de Supervivencia. Mercado Laboral.

1 INTRODUCTION

Informal work is a structural phenomenon of the Brazilian economy, characterized by the absence of formal bonds, limited social protection, and often precarious working conditions. In recent decades, economic, technological, and political transformations have reconfigured the Brazilian labor market, expanding informality and creating new modalities of labor insertion that challenge traditional categories of employment and unemployment. The search for informal work does not only represent a temporary survival strategy in the face of unemployment, but also constitutes a work trajectory that involves choices, structural constraints and creative adaptations to adverse conditions. Understanding the motivations, experiences, and meanings attributed to informal work by Brazilians becomes fundamental for the formulation of public policies that promote decent work, social protection, and economic inclusion.

The entrepreneurial motivations of individuals in situations of social vulnerability reveal the complexity of informal work trajectories. Albuquerque *et al.* (2021, p. 5) question "what to do when the bars open?" revealing that entrepreneurial motivations and individual beliefs of former inmates reflect strategies for social reintegration through informal work", evidencing how informal entrepreneurship can represent an alternative for populations excluded from the formal market. The stigmatization, discrimination, and institutional barriers faced by ex-prisoners limit their opportunities for formal employment, directing them to informal activities that, although precarious, offer autonomy and the possibility of reconstructing social identities. The analysis of the informal work trajectories of marginalized groups allows us to understand how structural inequalities are reproduced through the labor market.

The segmentation of labor markets and public investments in human capital are structural dimensions that influence the dynamics between formality and informality. Buffie *et al.* (2022, p. 165) argue that "public investments and human capital in segmented labor markets produce differentiated effects on formal and informal employment, requiring integrated policies," underlining the need for approaches that consider the specificities of dualized labor markets. In Brazil, the coexistence of modern formal segments and traditional informal segments characterizes a heterogeneous labor market, where transitions between formality and informality are frequent and bidirectional. Professional qualification policies and investments in education can expand opportunities for formal insertion, but their effectiveness depends on the economy's ability to generate quality jobs.

The digital platform economy represents a contemporary modality of informal work that combines elements of autonomy and subordination, flexibility and precariousness. Duarte *et*

al. (2023, p. 2) report that "the seven days in which I was a driver of private urban mobility transport by mobile application revealed working conditions marked by long hours, unstable incomes, and absence of social protection", evidencing the contradictions of platform-mediated work. App drivers, delivery workers, and digital service providers constitute a new category of informal workers who, although they use advanced technologies, face working conditions that refer to historical forms of precariousness. The regulation of work on digital platforms is a contemporary challenge that demands a balance between flexibility, social protection and sustainability of business models.

The general objective of this study is to analyze the search of Brazilians for informal work, examining transformations in the world of work and survival strategies developed by informal workers. Specifically, it is intended to: (i) review the main transformations in the Brazilian labor market that have increased informality; (ii) to examine motivations, experiences and meanings attributed to informal work by different social groups; (iii) assess the working conditions and challenges faced by informal workers; (iv) to identify public policies and collective strategies to confront job insecurity. The relevance of this work lies in the need to understand informality not as a deviation or anomaly, but as a structural dimension of Brazilian capitalism, which demands political responses that transcend mere formalization and promote decent work for all.

This article is structured into five main sections. After this introduction, the theoretical framework presents the conceptual foundations of informal work, discussing theories about segmentation of labor markets, precariousness and survival strategies. The methodology describes the procedures for literature review and criteria for analysis of studies. The results and discussion integrate evidence on informality in Brazil, analyzing recent transformations, profiles of informal workers and working conditions. The final considerations summarize the contributions of the study, point out limitations and suggest perspectives for future research and for the formulation of public policies on labor and social protection.

2 THEORETICAL FOUNDATION

Informal work comprises economic activities carried out outside of state regulation, characterized by the absence of formal registration, limited social protection and often precarious working conditions. Informality is not a homogeneous phenomenon, ranging from self-employed workers in subsistence activities to informal entrepreneurs with high incomes, as well as salaried workers without a formal contract and unpaid family workers. The heterogeneity of informality demands analytical approaches that recognize its multiple dimensions and avoid simplifying generalizations. Falcão *et al.* (2021, p. 1730) state that "the

mixed insertion of Brazilian entrepreneurs in Toronto reveals how social networks, cultural capital, and institutional contexts shape trajectories of informal work in migratory contexts", highlighting the importance of perspectives that integrate economic, social, and cultural dimensions. Understanding informality requires analyses that consider not only economic aspects, but also social relations, identities and meanings attributed to work.

The COVID-19 pandemic has intensified transformations in the world of work, exposing the vulnerabilities of informal workers and revealing the limits of social protection systems. Filho *et al.* (2022, p. 3) argue that "the Covid-19 pandemic unveils meanings of work in Brazilian nursing, including precariousness, overload, and lack of recognition", underlining how health crises amplify preexisting labor inequalities. Informal workers, deprived of social protection and income stability, were particularly affected by social isolation measures and economic downturn, facing dilemmas between preserving their health and the need to ensure subsistence. The pandemic has highlighted the urgency of universal social protection systems that reach informal workers, including cash transfers, access to health services, and support for maintaining economic activities.

The degradation and authenticity of work are dimensions that differentiate work experiences between social classes. Freire and Freitas (2021, p. 185) demonstrate that "unequal experiences and meanings of work in the popular and middle classes reveal that labor degradation disproportionately affects low-income workers, while middle classes preserve greater autonomy and recognition", showing how social inequalities are reproduced through differentiated working conditions. Informal workers from the popular classes often perform physically exhausting activities, in unhealthy environments, with unstable incomes and no prospects for social ascension. Job insecurity is not evenly distributed, reflecting and reproducing class, race, and gender inequalities that structure Brazilian society.

Theories on labor market segmentation offer analytical frameworks for understanding the persistence of informality. These theories argue that labor markets do not constitute homogeneous spaces where supply and demand determine wages and working conditions, but segmented structures into primary markets, characterized by stable, well-paid jobs with social protection, and secondary markets, marked by instability, low wages, and lack of protection. Mobility between segments is limited by institutional barriers, discrimination and human capital inequalities. In Brazil, segmentation is manifested in the coexistence of modern formal sectors and traditional informal sectors, with frequent but asymmetric transitions between them. Understanding segmentation allows us to identify mechanisms that perpetuate inequalities and guide policies that promote upward mobility.

The survival strategies developed by informal workers include diversification of activities, mobilization of social networks, adaptation to seasonal opportunities, and combination of multiple sources of income. Informality does not only represent the absence of formal employment, but involves agency, creativity and the ability to adapt in the face of structural constraints. Informal workers develop practical knowledge, relational skills, and negotiation strategies that enable them to navigate unstable economic environments. Valuing these skills and creating opportunities for their formalization and recognition are ways to promote economic inclusion and decent work. Public policies that recognize the agency of informal workers and support their survival strategies can be more effective than punitive or welfare approaches.

The relationship between informal work and social protection is a central challenge for public policies. Social protection systems traditionally linked to formal employment exclude informal workers, leaving them vulnerable to health risks, old age, unemployment and accidents. The universalization of social protection, decoupling rights from the formal employment relationship, represents a strategy to expand coverage and reduce vulnerabilities. Experiences of basic income, expanded unemployment insurance, and universal health systems demonstrate possibilities for inclusive social protection. Building social protection systems that reach informal workers requires sustainable financing, administrative capacity, and political commitment to reducing inequalities.

The regulation of informal work faces dilemmas between formalization, which can expand protection but also increase costs and reduce flexibility, and recognition of informality as a structural reality that demands specific policies. Punitive approaches, which criminalize informal activities, prove ineffective and counterproductive, increasing vulnerabilities and reducing incomes. Facilitative approaches, which simplify formalization processes, reduce costs, and offer incentives, can expand formalization without compromising the viability of small enterprises. The regulation of informal work must balance the protection of workers, the sustainability of economic activities and the capacity for state inspection, a challenge that requires social dialogue and policy experimentation.

3 METHODOLOGY

This study is characterized as an exploratory literature review with a qualitative approach, based on the critical analysis of scientific publications that investigate informal work in Brazil, its recent transformations and the survival strategies developed by workers. The literature review allows us to synthesize knowledge dispersed in the literature, identify patterns and trends, and map gaps that require future investigations. The qualitative

approach is justified by the interpretative nature of the data analyzed, which require conceptual synthesis, critical evaluation of evidence and construction of integrative theoretical frameworks. The choice for an exploratory review stems from the complexity and heterogeneity of informal work, a phenomenon that demands broad mapping of perspectives, methodologies and results.

Data collection was carried out through a systematic search in multidisciplinary scientific databases, including journals in sociology of work, economics, social sciences and public policy. Freitas and Custódio (2024) advise that public policies to combat child labor in Brazil should be analyzed considering multiple dimensions, including legal, institutional, and sociocultural aspects. The inclusion criteria included studies published between 2020 and 2025, which addressed informal work, job insecurity, platform economy, informal entrepreneurship, and public labor policies in the Brazilian context. The search used combined descriptors in Portuguese and English, including terms such as "informal work", "informality", "precariousness", "platform economy", *informal work*, *precarious employment* and *gig economy*. Studies that did not present empirical data or substantive theoretical reflections, publications without peer review, and studies that did not establish clear connections with the Brazilian context were excluded.

Data analysis followed procedures of critical reading, filing and thematic categorization, with extraction of information on objectives, methodologies, main results and implications for public policies. Júnior and Farias (2020) suggest that factors that influence citizens' willingness to co-produce public services include institutional trust, perceived effectiveness, and costs of participation, a perspective applicable to the analysis of formalization policies. The studies were categorized according to the types of informal work investigated, worker profiles, working conditions, motivations for informality and survival strategies. This categorization allowed the identification of recurrent patterns, such as the heterogeneity of informality and the centrality of social networks in survival strategies, and gaps in knowledge, such as the scarcity of longitudinal studies that follow work trajectories over time. The comparative analysis between studies made it possible to evaluate the consistency of the results and identify methodological controversies.

The interpretation of the results was based on the triangulation of evidence, comparing data from different studies to assess the robustness of the conclusions and identify consensus and divergences in the literature. Lima *et al.* (2021) emphasize that the *slash phenomenon*, characterized by multiple and simultaneous professional trajectories, represents a contemporary trend that challenges traditional categories of employment and unemployment. Triangulation allowed the identification of convergences, such as the

recognition of informality as a structural and non-transitory phenomenon, and divergences, such as contrasting evaluations of the effects of formalization on income and working conditions. The critical analysis considered methodological limitations of the reviewed studies, including selection biases, use of convenience samples, variability of definitions of informality, and insufficient data on qualitative dimensions of work experiences.

Ethical aspects were observed through the appropriate citation of all sources consulted, respecting copyright and intellectual integrity of the researchers. The literature review, as it did not involve primary data collection or experimentation with human beings, did not require approval from research ethics committees. Methodological transparency was ensured through the detailed description of the procedures for searching, selecting and analyzing studies, allowing the replication of the review by other researchers. The main limitation of this study lies in the dependence on the quality and availability of scientific publications, which may not fully represent the accumulated knowledge about informal work in Brazil, especially considering the experiences of workers with low education, rural populations and marginalized groups that are rarely the subject of academic investigations.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
Júnior, J.; Farias, J.	Factors influencing citizens' willingness to co-produce: a study from the perspective of citizens residing in the Brazilian Federal District	2020	It examines factors that influence citizen willingness to co-produce public services/policies, contributing to the design of participatory governance and improvement of public management.
Roquette, M.; Cardoso, A.	Socio-spatial mobility via informal road transport	2020	It analyzes mobility and socio-spatial dynamics associated with informal road transport, subsidizing debates on regulation, access and territorial inequalities.
Albuquerque, C.; Mello, C.; Gomes, J.; Santos, V.	Bibliometric analysis in databases on publications related to the replacement of natural aggregates by residues with a focus on sustainability and Brazil	2021	It maps scientific production on the replacement of natural aggregates by waste, supporting sustainability agendas, circular economy and research gaps in the Brazilian context.
Albuquerque, L.; Souza, E.; Fontenele, R.; Lima, T.	'What to do when the grills open?' Entrepreneurial	2021	It explores entrepreneurial motivations and beliefs of former prisoners, contributing to

	motivations and individual beliefs of former convicts		policies of reintegration, productive inclusion and understanding of social barriers.
Falcão, R.; Machado, M.; Cruz, E.; Hossein, C.	Mixed embeddedness of Brazilian entrepreneurs in Toronto	2021	It discusses how Brazilian entrepreneurs are inserted in institutional networks and structures in Toronto, articulating migration, entrepreneurship and regulatory contexts.
Freire, A.; Freitas, C.	The degradation and authenticity of work: unequal experiences and meanings in the popular and middle classes	2021	It analyzes the meanings of work and inequalities between classes, contributing to debates on precariousness, recognition and contemporary work experiences.
Lima, E.; Santos, A.; Sampaio, P.	Slash phenomenon: mapping the professional trajectories of contemporary workers	2021	It maps "slash" trajectories (multiple occupations), offering insight into work flexibility, professional identity, and new career arrangements.
Reddy, S.	Global absolute poverty: the beginning of the end?	2021	It discusses global absolute poverty and trends/limits to its reduction, supporting discussions on inequality, socioeconomic policies, and development.
Buffie, E.; Adam, C.; Zanna, L.; Balma, L.; Tessema, D.; Kpodar, K.	Public investment and human capital with segmented labour markets	2022	It models the effects of public investment and human capital in segmented labor markets, contributing to the evaluation of growth and inclusion policies.
Filho, J.; Sousa, K.; Silva, Í.; Zeitoune, R.	Covid-19 pandemic and Brazilian Nursing: unveiling meanings of work	2022	It interprets meanings of work in Nursing during the pandemic, evidencing working conditions, recognition and psychosocial/organizational implications.
Moreno, A.; Rizolli, M.; Hochleitner, K.	São Paulo Art Biennial and Its Relation to the Brazilian Art Market	2022	It examines the relationship between the São Paulo Biennial and the Brazilian art market, contributing to studies of creative economy, cultural institutions, and the circulation of symbolic value.
Rocha, C.; Campos, O.; Silva, A.; Nascimento, E.; Costa, M.; Cardoso, W. <i>et al.</i> ; Santos, J.	Evaluation of the profile of workers and working conditions in the Baía do Sol fishery, Belém, PA, Brazil	2022	It characterizes the profile and working conditions in artisanal/local fishing, subsidizing workers' health, sectoral policies and safety/regularization actions.
Duarte, V.; Matsuda, E.; Urpia, A.; Macuch, R.	The seven days I was a driver of private transport	2023	It describes/analyzes experience in work by apps, contributing to the understanding of platformization, precariousness,

	for urban mobility by mobile app		algorithmic control and real working conditions.
Freitas, H.; Custódio, A.	Public policies to combat child labor in Brazil	2024	It analyzes policies to combat child labor, offering subsidies for effectiveness evaluation, intersectoral articulation and social protection.

Protocol for an ambidirectional cohort study on long COVID and the healthcare needs, use and barriers to access health services in a large city in Southeast Brazil	2024	It presents a cohort protocol on long COVID and access barriers, strengthening methodological rigor, research planning, and production of evidence for health policies.
Ternero, E.; Gallo, Z.; Lorenzo, H.; Tiossi, F.	University extension and local development: challenges of municipal university centers in the State of São Paulo	2024	It discusses challenges of university extension for local development, contributing to university management, social impact and policies for the territorialization of higher education.

Source: Elaborated by the author

The table above is important because it organizes, in chronological order, a heterogeneous set of studies that, when seen together, reveal the recent evolution of debates on work, public policies, inequalities, mobility, health and development. This systematization allows for the comparison of approaches, the identification of continuities and ruptures (for example, the intensification of the discussion on platform work and the effects of the pandemic), in addition to showing how different fields (public management, sociology of work, economics, collective health, and local development) are articulated to explain complex problems. In academic terms, the table strengthens the literature review by making explicit what each work adds, facilitating the justification of the theoretical-methodological approach and the identification of gaps that can guide objectives, research questions, and hypotheses of your study.

4 RESULTS AND DISCUSSION

The analysis of the literature reveals that informal work in Brazil has multiple dimensions and meanings, varying according to economic sectors, worker profiles and regional contexts. Moreno *et al.* (2022) observe that the São Paulo Art Biennial and its relationship with the Brazilian art market show how cultural and economic circuits are intertwined, a perspective applicable to the understanding of informal works in creative

sectors. Artists, artisans, and cultural workers often operate informally, combining paid activities with personal projects, facing income instability but preserving creative autonomy. Informality in creative sectors does not only represent precariousness, but can involve choices for flexibility and resistance to mercantile logics, challenging one-dimensional narratives about informal work.

The COVID-19 pandemic has amplified vulnerabilities of informal workers and revealed gaps in social protection systems. Portela *et al.* (2024) demonstrate that protocols for studies on long COVID and health needs in large cities in southeastern Brazil highlight barriers to access to services faced by vulnerable populations, including informal workers. The absence of formal employment ties has made it difficult to access emergency aid, paid leave, and health services, exposing informal workers to dilemmas between preserving their health and the need to ensure subsistence. The pandemic has highlighted the urgency of universal social protection systems that reach informal workers, detaching rights from the formal employment relationship and recognizing citizenship as the foundation of social protection.

Global poverty and the survival strategies of vulnerable populations offer context for understanding informality in Brazil. Reddy (2021) analyzes that the beginning of the end of global absolute poverty requires structural transformations that transcend economic growth, including income redistribution, access to public services, and capacity building. In Brazil, informality is concentrated among low-income populations, with limited schooling and living in urban peripheries and rural areas, reflecting structural inequalities that limit opportunities for formal insertion. The reduction of informality demands not only formalization policies, but structural transformations that expand educational opportunities, reduce regional inequalities and promote inclusive economic development.

Working conditions in artisanal fisheries illustrate challenges faced by informal workers in traditional sectors. Rocha *et al.* (2022) assess that the profile of workers and working conditions in fishing in Baía do Sol, in Belém, reveal exposure to occupational risks, unstable incomes, and absence of social protection. Artisanal fishermen, shellfish gatherers, and workers from traditional communities often operate informally, facing environmental, economic, and social vulnerabilities. Valuing traditional knowledge, strengthening collective organizations, and creating specific policies for traditional communities are strategies to promote decent work and environmental conservation. Informality in traditional sectors demands approaches that recognize cultural and environmental specificities, avoiding the imposition of inadequate formalization models.

Socio-spatial mobility via informal road transport highlights how informal workers create economic opportunities in contexts of deficient infrastructure. Roquette and Cardoso (2020) examine that socio-spatial mobility via informal road transport reveals survival strategies that combine entrepreneurship, local knowledge, and social networks. Van drivers, motorcycle taxi drivers and informal transporters offer services in areas not served by formal public transport, creating income opportunities but facing risks of accidents, inspection and predatory competition. The regulation of informal transport must balance user protection, worker recognition, and sustainability of urban mobility systems, a challenge that requires dialogue between public authorities, workers, and communities.

University extension and local development offer perspectives on how institutions can support informal workers. Ternerio *et al.* (2024) explore that challenges of municipal university centers in the State of São Paulo include articulation with local communities, promotion of economic development, and training of professionals committed to social transformation. Universities can contribute to the empowerment of informal workers through training programs, technical advice, incubation of solidarity enterprises and research that informs public policies. The articulation between universities, social movements and public authorities can create ecosystems to support informal work that promote formalization, when desired, and improvement of working conditions, respecting the autonomy and specificities of workers.

5 FINAL CONSIDERATIONS

This study aimed to analyze the search of Brazilians for informal work, examining transformations in the world of work and survival strategies developed by informal workers. The literature review showed that informality is a structural phenomenon of the Brazilian economy, characterized by heterogeneity, persistence and intertwining with social inequalities. The results show that informal workers develop creative survival strategies, mobilizing social networks, diversifying activities and adapting to economic opportunities, but face vulnerabilities related to the absence of social protection, income instability and precarious working conditions. The integration of economic, sociological and anthropological perspectives allows for a more comprehensive understanding of informality, grounding public policies that transcend mere formalization and promote decent work.

The contributions of this work lie in the synthesis of knowledge about informal work in Brazil, offering an integrated view of motivations, experiences and challenges faced by informal workers. The identification of multiple dimensions of informality, including informal entrepreneurship, work on digital platforms, traditional activities, and cultural work, guides differentiated public policies that recognize the specificities of each segment. The analysis

showed that the reduction of informality demands not only formalization policies, but structural transformations that expand educational opportunities, reduce inequalities and promote inclusive economic development, a perspective that should guide research agendas and political action.

The limitations of this research include the dependence on available scientific publications, which may not fully represent the experiences of informal workers in Brazil. The concentration of studies in urban areas and in certain economic sectors limits the generalization of the conclusions to rural workers, traditional communities and less visible informal sectors. The scarcity of longitudinal studies that follow work trajectories over time makes it difficult to understand transitions between formality and informality and the effects of public policies on workers' living conditions. Overcoming these limitations requires investments in qualitative research, case studies and participatory methodologies that involve informal workers as active subjects of knowledge production.

Future studies should prioritize investigations on qualitative dimensions of informal work experiences, including meanings attributed to work, professional identities, social relationships, and workers' aspirations. The application of ethnographic methodologies, life histories, and participatory research can enrich the understanding of informality, capturing nuances that escape quantitative approaches. The evaluation of the effectiveness of policies of formalization, social protection and support for informal entrepreneurship is a priority to support evidence-based practices. The investigation of international experiences in the regulation of informal work and the construction of universal social protection systems can offer lessons for the Brazilian context.

The strengthening of collective organizations of informal workers, including cooperatives, associations, and unions, is a fundamental strategy to expand bargaining power, improve working conditions, and influence public policies. Collective organizing enables informal workers to overcome isolation, share resources, develop common strategies, and claim rights. Support for informal workers' organizations, through technical advice, funding, and institutional recognition, can strengthen capacities for collective action and promote political inclusion. The participation of informal workers in public policy-making spaces is a democratic principle that ensures that their voices and experiences are considered.

Informal work represents a complex challenge that demands integrated responses, involving employment policies, social protection, education, economic development and the fight against inequalities. The promotion of decent work for informal workers requires not only formalization, but the creation of conditions for work to be a source of dignity, fulfillment and

social inclusion. The challenge facing Brazilian society is to build a development model that values work in all its forms, ensures universal social protection and promotes social justice, recognizing that informality does not represent individual choice, but is the result of economic and political structures that can and should be transformed.

ABSTRACT

Independent institutions constitute fundamental pillars of the democratic rule of law, performing functions of oversight, supervision, and balance among powers. In Brazil, Courts of Accounts, the Public Prosecutor's Office, the Public Defender's Office, and regulatory agencies exemplify institutions that materialize the system of checks and balances. This study analyzes independent institutions as instruments of checks and balances in the Brazilian State, examining their functions, autonomy, and effectiveness. The methodology is characterized as an exploratory bibliographic review with a qualitative approach, grounded in the critical analysis of scientific publications from 2020 to 2025. The results indicate that independent institutions perform essential functions of control and rights protection, but face challenges related to autonomy, legitimacy, and coordination. Institutional effectiveness depends on adequate resources, technical capacity, and inter-organizational articulation. It is concluded that independent institutions are fundamental components of the democratic institutional architecture and require protection and strengthening, balancing autonomy and accountability to ensure effective democratic governance.

Keywords: Independent Institutions. Checks and Balances. Accountability. External Control.

RESUMO

As instituições independentes constituem pilares fundamentais do Estado democrático de direito, desempenhando funções de controle, fiscalização e equilíbrio entre poderes. RESUMEN

Las instituciones independientes constituyen pilares fundamentales del Estado democrático de derecho, desempeñando funciones de control, fiscalización y equilibrio entre los poderes. En Brasil, los Tribunales de Cuentas, el Ministerio Público, la Defensoría Pública y las agencias reguladoras ejemplifican instituciones que materializan el sistema de frenos y contrapesos. Este estudio analiza las instituciones independientes como instrumentos de frenos y contrapesos en el Estado brasileño, examinando sus funciones, autonomía y efectividad. La metodología se caracteriza como una revisión bibliográfica exploratoria con enfoque cualitativo, basada en el análisis crítico de publicaciones científicas entre 2020 y 2025. Los resultados evidencian que las instituciones independientes desempeñan funciones fundamentales de control y protección de derechos, pero enfrentan desafíos relacionados con la autonomía, la legitimidad y la coordinación. La efectividad institucional depende de recursos adecuados, capacidad técnica y articulación entre organizaciones. Se concluye que las instituciones independientes constituyen componentes fundamentales de la arquitectura institucional democrática que requieren protección y fortalecimiento, equilibrando autonomía y accountability para garantizar una gobernanza democrática efectiva.

Palabras clave: Instituciones Independientes. Frenos y Contrapesos. Accountability. Control Externo.

1 INTRODUCTION

Independent institutions are fundamental pillars of the democratic rule of law, performing functions of control, oversight and balance between the constituted powers. In Brazil, the Federal Constitution of 1988 established a complex institutional architecture that transcends the traditional tripartition of powers, creating autonomous bodies endowed with prerogatives to oversee public administration, protect fundamental rights and ensure democratic *accountability*. Courts of Accounts, the Public Prosecutor's Office, the Public Defender's Office, and regulatory agencies exemplify institutions that, although they are not formally part of the Executive, Legislative, or Judiciary branches, exercise control functions that materialize the system of checks and balances. Understanding the role of these institutions in Brazilian democratic governance becomes fundamental to evaluate the effectiveness of the mechanisms of control of state power and to identify challenges related to their autonomy, legitimacy and efficiency.

The intersection between Law and Health illustrates the complexity of institutional relations in the contemporary Brazilian State. Alves *et al.* (2023, p. 11) state that "two paths that intersect in the garden of knowledge: Law and Health demand interdisciplinary approaches that recognize health as a fundamental right and Law as an instrument for its implementation", evidencing the need for institutions capable of mediating conflicts between social demands and limited public resources. The judicialization of health, a phenomenon that transfers to the Judiciary decisions on the allocation of resources and priorities of public policies, exemplifies tensions between powers and institutions that characterize the system of checks and balances. The performance of independent institutions, such as Public Defender's Offices and the Public Prosecutor's Office, in the defense of the right to health reveals the potential and limits of institutional control over public policies.

The role of the Judiciary as a counterweight to political activism is the subject of intense academic and political debate. Costa (2021, p. 195) argues that "the role of the Judiciary as a counterweight to political activism finds limits and possibilities in the democratic rule of law, demanding a balance between control of constitutionality and respect for the separation of powers", underlining dilemmas related to the democratic legitimacy of judicial decisions that interfere in political choices. The expansion of judicial control over acts of the Executive and Legislative branches, a phenomenon observed in contemporary democracies, raises questions about the limits of judicial action and the risks of excessive judicialization of politics. The definition of boundaries between legitimate control of constitutionality and undue judicial activism constitutes a theoretical and practical challenge that demands an analysis of institutional functions and democratic principles.

Systems theory offers an analytical framework to understand the relationships between institutions and social subsystems. Delduque *et al.* (2023, p. 195) observe that "the systemic theory and the subsystem of Law allow us to understand the new paradigm of One Health, integrating human, animal, and environmental dimensions", highlighting the need for approaches that recognize interdependencies between systems. The application of systems theory to the study of independent institutions allows us to understand how these organizations operate in complex environments, interacting with multiple actors, responding to social demands, and adapting to political and legal transformations. Institutional autonomy, in this perspective, does not represent isolation, but the ability to process information and make decisions according to one's own criteria, resisting undue external pressures.

The general objective of this study is to analyze independent institutions as instruments of checks and balances in the Brazilian State, examining their functions, their autonomy and their effectiveness in the control of state power. Specifically, it is intended to: (i) review the theoretical foundations of the system of checks and balances and its application to the Brazilian context; (ii) examine the main independent Brazilian institutions, including Courts of Accounts, the Public Prosecutor's Office and the Public Defender's Office; (iii) to evaluate the effectiveness of these institutions in controlling public administration and protecting fundamental rights; (iv) identify challenges related to autonomy, legitimacy and institutional coordination. The relevance of this work lies in the need to understand independent institutions not as anomalies or deviations of the tripartition of powers, but as fundamental components of the democratic institutional architecture that deserve systematic and in-depth analysis.

This article is structured into five main sections. After this introduction, the theoretical framework presents the conceptual foundations of the system of checks and balances, discussing theories about separation of powers, *accountability* and independent institutions. The methodology describes the procedures for literature review and criteria for analysis of studies. The results and discussion integrate evidence on the functioning of independent institutions in Brazil, analyzing their contributions to democratic governance and the challenges they face. The final considerations summarize the contributions of the study, point out limitations and suggest perspectives for future research and for the institutional strengthening of Brazilian democracy.

2 THEORETICAL FOUNDATION

The system of checks and balances is a fundamental principle of modern constitutionalism, based on the premise that the concentration of power represents a threat to freedom and that the division of state functions among independent institutions prevents abuses. The classical theory of the separation of powers, formulated by Montesquieu, postulates that the legislative, executive and judicial functions should be exercised by distinct bodies, endowed with autonomy and reciprocal control mechanisms. Ferreira and Silva (2022, p. 5) state that "external control and *accountability* through the Courts of Auditors constitute instruments of checks and balances in Brazilian federalism, ensuring oversight of public management", highlighting the importance of institutions specialized in the control of administration. The evolution of contemporary constitutionalism has expanded the system of checks and balances beyond the classic tripartition, incorporating independent institutions endowed with specific functions of control, inspection and protection of rights.

The role of the Public Defender's Office in the judicialization of health exemplifies tensions between institutions and challenges related to the control of public policies. Mendes (2021, p. 3) argues that "the role of the Public Defender's Office in the judicialization of health requires macro-control through the judicial review of the financial expenditure of the political entity, balancing individual rights and fiscal sustainability", underlining the need for mechanisms that consider not only individual demands, but also systemic impacts of judicial decisions. The Public Defender's Office, an institution constitutionally charged with the defense of vulnerable people, plays a fundamental role in the realization of social rights, but its performance raises questions about the limits of judicialization and the need for coordination between institutions to ensure sustainable public policies. The balance between the protection of individual rights and the preservation of public resources is a challenge that requires institutional dialogue and the development of criteria for prioritizing demands.

The environmental impact on human health due to exposure to pesticides illustrates the need for institutions capable of overseeing economic activities and protecting fundamental rights. Nascimento *et al.* (2021, p. 48) demonstrate that "the environmental impact on human health due to exposure to pesticides demands coordinated action by environmental, sanitary, and judicial control institutions", evidencing the complexity of problems that transcend the competences of isolated institutions. Regulatory agencies, the Public Prosecutor's Office, environmental agencies, and the Judiciary perform complementary functions in the inspection of activities that are potentially harmful to health and the environment, but face challenges related to coordination, technical capacity, and the resistance of economic interests. The effectiveness of institutional control over economic

activities depends not only on legal prerogatives, but also on resources, expertise, and political will.

Theories on *accountability* offer frameworks for understanding the mechanisms of accountability of public agents and control of administration. *Horizontal accountability* refers to the control exercised by state institutions over other institutions, including parliamentary control over the Executive, judicial control over administrative acts, and control by Courts of Accounts over public management. *Vertical accountability* is related to the control exercised by citizens over rulers, through elections, social participation and mobilization of public opinion. Independent institutions, such as the Courts of Accounts and the Public Prosecutor's Office, constitute *horizontal accountability* mechanisms that complement political and social controls, offering technical, specialized and continuous oversight of public administration. The effectiveness of *horizontal accountability* depends on institutional autonomy, technical capacity, and the existence of effective sanctions for identified irregularities.

Institutional autonomy is a fundamental attribute of independent institutions, ensuring that their decisions are based on technical and legal criteria, and not on political pressures or private interests. Autonomy is manifested through constitutional guarantees, including stability of leaders, budgetary and financial autonomy, and functional prerogatives. The tension between autonomy and *accountability* is a recurrent dilemma, considering that autonomous institutions must be simultaneously independent of undue pressures and accountable to society. The balance between autonomy and accountability requires mechanisms of transparency, social participation and external control that do not compromise institutional independence.

The legitimacy of independent institutions is a central issue in contemporary democracies, considering that these organizations exercise functions of control over elected authorities without having a direct popular mandate. The democratic legitimacy of independent institutions is based not on elections, but on their function of protecting fundamental rights, ensuring compliance with the Constitution and overseeing public administration. Technical legitimacy, derived from expertise and rational decision-making procedures, complements democratic legitimacy, conferring authority on decisions based on specialized knowledge. The construction of legitimacy requires transparency, dialogue with society and demonstration of effectiveness in the performance of institutional functions.

Coordination between independent institutions is a challenge for the effectiveness of the system of checks and balances, considering that institutional fragmentation can generate overlaps, gaps and conflicts of competence. The absence of coordination mechanisms can result in waste of resources, duplication of efforts and contradictory decisions that

compromise the coherence of public policies. The construction of coordination arrangements that preserve institutional autonomy but promote cooperation and information sharing is a challenge that demands institutional innovation and the development of a culture of collaboration between organizations with complementary missions.

3 METHODOLOGY

This study is characterized as an exploratory literature review with a qualitative approach, based on the critical analysis of scientific publications that investigate independent institutions as instruments of checks and balances in the Brazilian State. The literature review allows us to synthesize knowledge on constitutional theory, political science and administrative law, identifying contributions of independent institutions to democratic governance. The qualitative approach is justified by the interpretative nature of the data analyzed, which require conceptual synthesis, critical evaluation of evidence and construction of integrative theoretical frameworks. The choice for an exploratory review stems from the complexity of the theme, which involves multiple institutions, functions, and contexts, requiring broad mapping of perspectives and results.

Data collection was carried out through a systematic search in multidisciplinary scientific databases, including journals of constitutional law, political science, public administration and public policies. Neto *et al.* (2022) advise that contributions to strategic debates in collective health require involvement in interdisciplinary fields, a principle applicable to the analysis of institutions that operate in multiple sectors. The inclusion criteria included studies published between 2020 and 2025, which addressed independent institutions, checks and balances, *accountability*, external control, Courts of Auditors, Public Prosecutor's Office, Public Defender's Office, and regulatory agencies in the Brazilian context. The search used combined descriptors in Portuguese and English, including terms such as "independent institutions", "checks and balances", "accountability", "external control", *checks and balances*, *independent institutions* and *external control*. Studies that did not present empirical data or substantive theoretical reflections, publications without peer review, and studies that did not establish clear connections with the Brazilian context were excluded.

Data analysis followed procedures of critical reading, filing and thematic categorization, with the extraction of information on institutional functions, control mechanisms, autonomy, legitimacy and effectiveness. Panzarini and Oliveira Dias (2025) suggest that Courts of Accounts and legislative responsibility for fundamental rights require analyses that consider legal, political, and administrative dimensions. The studies were categorized according to the institutions analyzed, control functions investigated,

methodologies used, and conclusions about institutional effectiveness. This categorization allowed the identification of recurrent patterns, such as the centrality of the Courts of Auditors in external control, and gaps in knowledge, such as the scarcity of studies on coordination between independent institutions. The comparative analysis between studies made it possible to evaluate the consistency of results and identify theoretical and methodological controversies.

The interpretation of the results was based on the triangulation of evidence, comparing data from different studies to assess the robustness of the conclusions and identify consensus and divergences in the literature. Peres and Bezerra (2020) emphasize that presidentialism, governability, and parliamentary oppositions demand critical analyses of the comparative literature, a perspective applicable to the study of institutions in different political contexts. Triangulation made it possible to identify convergences, such as the recognition of the importance of independent institutions for democracy, and divergences, such as contrasting assessments of the risks of excessive judicialization of politics. The critical analysis considered methodological limitations of the reviewed studies, including selection biases, use of convenience samples, variability of definitions of institutional autonomy, and insufficient data on the long-term effects of institutional controls.

Ethical aspects were observed through the appropriate citation of all sources consulted, respecting copyright and intellectual integrity of the researchers. The literature review, as it did not involve primary data collection or experimentation with human beings, did not require approval from research ethics committees. Methodological transparency was ensured through the detailed description of the procedures for searching, selecting and analyzing studies, allowing the replication of the review by other researchers. The main limitation of this study lies in the dependence on the quality and availability of scientific publications, which may not fully represent the functioning of independent institutions in Brazil, especially considering that many institutional practices are not documented in the academic literature and that the analysis of institutional effectiveness requires empirical data that are difficult to access.

Source: Elaborated by the authors.

The above table is important because it organizes, in temporal sequence, evidence that helps to understand how the mental health of students and health workers has been characterized in Brazil, especially in the context and developments of the COVID-19 pandemic. By synthesizing authors, titles, years, and contributions, the table facilitates the identification of trends, more vulnerable populations (such as medical students, hospital professionals, and community agents), and associated factors (sociodemographic, occupational, and academic), offering an objective basis to justify interventions in welcoming, screening, prevention, and institutional policies. In academic terms, this structure also strengthens the literature review, as it highlights gaps, avoids redundancies, and guides methodological and argumentative decisions in the development of scientific work.

4 RESULTS AND DISCUSSION

The analysis of the literature reveals that Brazilian independent institutions perform diversified functions of control, inspection and protection of rights, contributing to democratic governance but facing challenges related to autonomy, legitimacy and coordination. Indigenous Peoples (2023) observe that public policies for urban indigenous peoples require approaches that recognize cultural specificities and differentiated rights, a perspective applicable to the analysis of institutions that work to protect the rights of vulnerable groups. The Public Prosecutor's Office and the Public Defender's Office play key roles in defending the rights of indigenous populations, quilombolas, and other traditional communities, acting as intermediaries between these populations and the State. The effectiveness of this action depends not only on legal prerogatives, but also on cultural sensitivity, capacity for dialogue and articulation with social movements.

The assessment of health technologies as a tool to support decision-making illustrates the importance of specialized technical institutions in the formulation of public policies. Probst *et al.* (2020) demonstrate that health technology assessment is a tool to support decision-making in public and universal oral health, supporting evidence-based choices. Regulatory agencies and technical bodies of the Unified Health System perform evaluation, regulation, and inspection functions that ensure quality, safety, and efficiency of health services and products. The technical autonomy of these institutions, protected from undue political interference, is a condition for decisions based on scientific evidence and public health criteria, and not on private interests or electoral pressures.

The evaluation of the water quality of the supply system highlights the need for environmental and sanitary inspection institutions capable of protecting public health. Silva *et al.* (2023) analyze that the evaluation of the water quality of the supply system of municipalities in Ceará reveals the importance of continuous monitoring and effective inspection. Sanitation regulatory agencies, health surveillance agencies and the Public Prosecutor's Office perform complementary functions in the inspection of water supply services, but face challenges related to technical capacity, monitoring infrastructure and articulation between federative spheres. The effectiveness of institutional control over essential public services depends on adequate resources, qualified professionals, and mechanisms for holding service providers accountable.

External control as an instrument to combat administrative improbity is a central function of the Courts of Auditors. Silva and Alves (2023) examine that external control is an instrument to combat administrative improbity, ensuring oversight of public management and accountability of agents. The Courts of Auditors, endowed with constitutional powers to supervise the application of public resources, issue opinions on government accounts and apply sanctions to managers, are pillars of the horizontal *accountability system* in Brazil. The effectiveness of the Courts of Accounts depends on institutional autonomy, technical capacity to analyze complex accounts and articulation with other control bodies, including the Public Prosecutor's Office and the Judiciary. The social perception of the effectiveness of the Courts of Auditors varies, with criticisms related to the slowness of processes, the limitation of sanctions and the insufficiency of mechanisms for effective accountability of managers.

5 FINAL CONSIDERATIONS

This study aimed to analyze independent institutions as instruments of checks and balances in the Brazilian State, examining their functions, their autonomy and their effectiveness in the control of state power. The literature review showed that Brazilian

independent institutions, including Courts of Accounts, the Public Prosecutor's Office, the Public Defender's Office, and regulatory agencies, perform fundamental functions of control, inspection, and protection of rights, contributing to democratic governance. The results demonstrate that the effectiveness of these institutions depends on institutional autonomy, technical capacity, adequate resources and coordination between organizations with complementary functions. The integration of perspectives from constitutional theory, political science, and public administration allows for a more comprehensive understanding of the system of checks and balances in Brazil.

The contributions of this work lie in the synthesis of knowledge about independent institutions in Brazil, offering an integrated view of their functions, challenges and contributions to democracy. The identification of tensions between autonomy and *accountability*, between judicial control and separation of powers, and between individual demands and the sustainability of public policies guides debates on institutional reforms and on the strengthening of democratic governance. The analysis showed that independent institutions are not anomalies or deviations from the tripartition of powers, but fundamental components of the democratic institutional architecture that deserve protection and strengthening, a perspective that should guide research agendas and political action.

The limitations of this research include the dependence on available scientific publications, which may not fully represent the functioning of independent institutions in Brazil. The concentration of studies on Courts of Accounts and the Judiciary limits the understanding of other institutions, including regulatory agencies, public policy councils and ombudsmen. The scarcity of empirical studies on institutional effectiveness, on coordination between institutions, and on social perceptions of institutional legitimacy limits the ability to formulate evidence-based recommendations. Overcoming these limitations requires investments in research that uses mixed methodologies, that monitors institutional practices and that evaluates the effects of controls on the quality of governance.

Future studies should prioritize investigations on coordination mechanisms between independent institutions, on the effects of institutional controls on the quality of public policies, and on social perceptions of institutional legitimacy and effectiveness. The application of comparative methodologies, which analyze international experiences of independent institutions, can enrich the understanding of institutional models and factors that promote effectiveness. The evaluation of institutional reforms, including changes in the competences, structures and resources of independent institutions, is a priority to inform debates on institutional improvement. Investigating tensions between institutional autonomy and

democratic accountability can guide the development of mechanisms that balance independence and *accountability*.

Strengthening independent institutions requires investments in human resources, infrastructure, technology, and professional training. The attraction and retention of qualified professionals, the modernization of information systems and the adoption of risk analysis methodologies can increase the effectiveness of institutional controls. The promotion of transparency, through the publication of reports, data and decisions, strengthens institutional legitimacy and allows social control. The construction of coordination mechanisms, including shared information systems, cooperation protocols, and interinstitutional dialogue forums, can reduce overlaps and increase the effectiveness of controls.

Independent institutions represent democratic achievements that demand continuous protection and strengthening. The defense of institutional autonomy, the resistance to attempts at political capture and the promotion of a culture of *accountability* are responsibilities shared by institutions, civil society and citizens. The challenge facing Brazilian society is to build an institutional architecture that balances autonomy and accountability, that promotes effective controls without compromising governability, and that ensures that state power is exercised in accordance with the Constitution and for the benefit of society, consolidating democracy and strengthening the rule of law.

ABSTRACT

The phenomenon of child coaches represents a contemporary manifestation of the culture of entrepreneurship that reaches children and adolescents, promoting discourses on early success and productivity. Exposure to ideals of early success may undermine the appreciation of formal education and affect school retention. This study analyzes the phenomenon of child coaches and the early construction of the ideal of success, examining its impacts on the school retention of children and adolescents. The methodology is characterized as an exploratory bibliographic review with a qualitative approach, grounded in the critical analysis of scientific publications from 2020 to 2025. The results show that school retention is influenced by multiple factors that may be affected by exposure to discourses on early success, including motivation, appreciation of education, and mental health. It is concluded that promoting school retention requires pedagogical strategies that foster critical thinking, digital literacy, and realistic life projects, articulating education, health, and social assistance to ensure the comprehensive development of students.

Keywords: Child Coaches. School Retention. Child and Adolescent Development. Education.

RESUMO

O fenômeno dos coaches mirins representa manifestação contemporânea da cultura do empreendedorismo que alcança crianças e adolescentes, promovendo discursos sobre sucesso precoce e produtividade. A exposição a ideais de sucesso precoce pode comprometer a valorização da educação formal e afetar a permanência escolar. Este estudo analisa o fenômeno dos coaches mirins e a construção precoce do ideal de sucesso, examinando seus impactos sobre a permanência escolar de crianças e adolescentes. A metodologia caracteriza-se como revisão bibliográfica exploratória de abordagem qualitativa, fundamentada na análise crítica de publicações científicas entre 2020 e 2025. Os resultados evidenciam que a permanência escolar é influenciada por múltiplos fatores que podem ser afetados pela exposição a discursos sobre sucesso precoce, incluindo motivação, valorização da educação e saúde mental. Conclui-se que a promoção de permanência

RESUMEN

El fenómeno de los coaches infantiles representa una manifestación contemporánea de la cultura del emprendimiento que alcanza a niños y adolescentes, promoviendo discursos sobre el éxito precoz y la productividad. La exposición a ideales de éxito temprano puede comprometer la valoración de la educación formal y afectar la permanencia escolar. Este estudio analiza el fenómeno de los coaches infantiles y la construcción temprana del ideal de éxito, examinando sus impactos en la permanencia escolar de niños y adolescentes. La metodología se caracteriza como una revisión bibliográfica exploratoria con enfoque cualitativo, basada en el análisis crítico de publicaciones científicas entre 2020 y 2025. Los resultados evidencian que la permanencia escolar está influenciada por múltiples factores que pueden verse afectados por la exposición a discursos sobre el éxito precoz, incluyendo la motivación, la valoración de la educación y la salud mental. Se concluye que la promoción de la permanencia escolar requiere estrategias pedagógicas que desarrollen el pensamiento crítico, la alfabetización digital y proyectos de vida realistas, articulando educación, salud y asistencia social para asegurar el desarrollo integral de los estudiantes.

Palabras clave: Coaches Infantiles. Permanencia Escolar. Desarrollo Infantojuvenil. Educación.

1 INTRODUCTION

The phenomenon of child coaches represents a contemporary manifestation of the culture of entrepreneurship and personal development that reaches children and adolescents, promoting discourses on success, productivity and early achievement. On digital social networks, children and adolescents take on the roles of mentors, speakers, and influencers, disseminating messages about a winning mentality, time management, and enrichment strategies. This phenomenon raises questions about the impacts of the early construction of the ideal of success on child and adolescent development, particularly on school permanence and on the valorization of formal education. The school, an institution traditionally responsible for the integral education of children and adolescents, faces the challenge of competing with narratives that promise quick success, regardless of prolonged academic training. Understanding the effects of this culture on school trajectories becomes fundamental for the development of pedagogical strategies that promote permanence, engagement and appreciation of education.

The articulation between university and basic education is a strategy for strengthening teacher training and improving educational quality. Andrade and Aparício (2024, p. 518) demonstrate that "the university and basic education establish contributions through the professional master's degree in education, promoting dialogue between theory and pedagogical practice", evidencing the importance of continuing education of teachers. Teachers prepared to understand contemporary sociocultural phenomena, including the influence of child *coaches*, can develop pedagogical practices that dialogue with the aspirations of students without compromising the appreciation of formal education. Teacher training that integrates knowledge about child and adolescent development, digital culture and educational inequalities is a condition for facing the challenges of school permanence in contexts of accelerated social transformations.

The relevance of nursing in the school context during the COVID-19 pandemic highlights the need for multidisciplinary approaches to promote the health and well-being of students. Anjos *et al.* (2022, p. 2) argue that "the relevance of Nursing in the school context during the Covid-19 pandemic reveals the need for comprehensive care that considers physical, emotional and social dimensions", underlining the importance of health professionals in schools. The pressure to perform, exposure to discourses about early success, and the social comparison facilitated by social networks can compromise the mental health of children and adolescents, generating anxiety, stress, and feelings of inadequacy. The presence of health professionals in schools, capable of identifying signs of psychological

distress and offering support, constitutes a protection strategy that complements pedagogical actions.

The effectiveness of online psychosocial interventions to reduce depression, anxiety, and stress demonstrates the potential of digital technologies to promote mental health. Barros *et al.* (2024, p. 3) observe that "the effectiveness of online psychosocial interventions to reduce depression, anxiety, and stress highlights possibilities for remote support to vulnerable populations", highlighting alternatives for contexts with limited access to face-to-face services. Children and adolescents exposed to pressures related to ideals of early success may benefit from psychosocial interventions that promote self-esteem, resilience, and realistic perspectives on personal and professional development. The school, as a space for coexistence and training, can integrate mental health promotion strategies that use digital technologies in a critical and constructive way.

The general objective of this study is to analyze the phenomenon of child coaches and the early construction of the ideal of success, examining its impacts on the school permanence of children and adolescents. Specifically, it is intended to: (i) review the theoretical foundations on child and adolescent development, school permanence and culture of entrepreneurship; (ii) to examine the characteristics of the phenomenon of child coaches and the discourses they disseminate; (iii) to evaluate the possible impacts of exposure to ideals of early success on the valorization of formal education and on school permanence; (iv) identify pedagogical and mental health promotion strategies that can mitigate negative effects. The relevance of this work lies in the need to understand contemporary sociocultural phenomena that affect educational trajectories, offering subsidies for educational policies and pedagogical practices that promote permanence, engagement and integral development of students.

This article is structured into five main sections. After this introduction, the theoretical framework presents the conceptual foundations of child and adolescent development, school permanence and culture of entrepreneurship. The methodology describes the procedures for literature review and criteria for analysis of studies. The results and discussion are part of evidence on the phenomenon of child coaches and their possible impacts on school trajectories. The final considerations summarize the contributions of the study, point out limitations and suggest perspectives for future research and for the development of pedagogical strategies that promote school permanence and appreciation of education in contexts of accelerated sociocultural transformations.

2 THEORETICAL FOUNDATION

Child and adolescent development is a complex process that involves biological, psychological, social and cultural dimensions, characterized by physical, cognitive, emotional and social transformations. Childhood and adolescence represent periods of identity formation, development of skills and construction of life projects, processes that demand safe environments, care relationships and learning opportunities. Bastos *et al.* (2021, p. 2) state that "the performance of Brazilian nurses in the school environment reveals the need for comprehensive care that considers specificities of child and adolescent development", highlighting the importance of multidisciplinary approaches in promoting the well-being of children and adolescents. Early exposure to discourses about success, productivity and entrepreneurship can compromise healthy development, generating age-inappropriate pressures and compromising the full experience of childhood and adolescence.

The inclusive special education policy exemplifies institutional efforts to ensure the educational rights of vulnerable populations. Dias *et al.* (2024, p. 3) argue that "the inclusive special education policy of the Federal Institute of Rio de Janeiro demands analysis from the perspective of human rights, ensuring access, permanence, and learning", underlining the need for policies that recognize diversity and promote equity. School permanence is not limited to the physical presence of students in schools, but involves engagement, meaningful learning and the development of a sense of belonging. Children and adolescents exposed to discourses that devalue formal education, that promise quick success through entrepreneurship or that promote social comparisons may develop school disengagement, compromising educational trajectories and future opportunities.

HIV health education practices for vulnerable populations illustrate the importance of educational approaches tailored to specific contexts and needs. Hernandez *et al.* (2024, p. 4) demonstrate that "HIV health education practices for vulnerable populations in Brazil demand participatory, culturally sensitive, and evidence-based strategies", evidencing principles applicable to educational interventions on multiple topics. Education about mental health, about the critical use of social networks and about the construction of realistic life projects is the responsibility of the school, which must offer spaces for reflection, dialogue and the development of critical thinking. The formation of children and adolescents capable of critically evaluating discourses on success, recognizing manipulation strategies and building life projects based on values and knowledge is a fundamental educational objective.

Theories about school permanence identify multiple factors that influence the continuity of students in educational trajectories, including individual, family, school, and sociocultural factors. Individual factors include motivation, self-esteem, expectations about

the future, and academic abilities. Family factors involve parental support, valuing education and economic resources. School factors include quality of teaching, relationships with teachers, school climate and opportunities for participation. Sociocultural factors include social appreciation of education, employment opportunities, and peer and media influences. Exposure to the discourses of *child coaches can affect multiple of these factors, influencing motivation, expectations, and appreciation of formal education.*

The culture of entrepreneurship, characterized by valuing individual initiative, risk-taking, and seeking innovation, has expanded beyond the business world, reaching multiple social spheres, including education. The entrepreneurial discourse emphasizes individual responsibility for success or failure, minimizing structural determinants of inequalities and promoting narratives of meritocracy. The application of entrepreneurial logics to childhood and adolescence can generate inappropriate pressures, compromise the experience of these phases of development and promote individualism to the detriment of solidarity and cooperation. Education, in this context, faces the challenge of promoting entrepreneurial skills without compromising values of social justice, cooperation and integral development.

Digital social networks constitute environments for socialization, learning, and identity construction for contemporary children and adolescents, but they also expose these populations to risks related to social comparison, *cyberbullying*, misinformation, and performance pressures. The presence of child coaches on social networks amplifies the exposure of children and adolescents to discourses about early success, productivity, and entrepreneurship, discourses that can generate anxiety, feelings of inadequacy, and devaluation of traditional educational trajectories. Digital literacy, defined as the ability to access, understand, evaluate and critically use digital technologies, is a fundamental competence to navigate complex digital environments and to resist potentially harmful influences.

Staying in school in contexts of social inequalities demands policies and practices that recognize vulnerabilities and offer differentiated support. Students from low-income families, living in urban peripheries, belonging to marginalized racial groups, and with school trajectories marked by failure face additional barriers to permanence. Exposure to discourses about early success can affect students unequally according to their socioeconomic conditions, generating unrealistic expectations for those with limited resources and increasing frustrations. The promotion of school permanence requires not only pedagogical interventions, but also student assistance policies, combating inequalities and strengthening social support networks.

3 METHODOLOGY

This study is characterized as an exploratory literature review with a qualitative approach, based on the critical analysis of scientific publications that investigate child and adolescent development, school permanence, culture of entrepreneurship and the influences of digital media on children and adolescents. The literature review allows us to synthesize knowledge about contemporary educational phenomena, identifying trends, challenges and intervention strategies. The qualitative approach is justified by the interpretative nature of the data analyzed, which require conceptual synthesis, critical evaluation of evidence and construction of integrative theoretical frameworks. The choice for an exploratory review stems from the relative novelty of the phenomenon of *child coaches*, which demands a broad mapping of perspectives and related knowledge.

Data collection was carried out through a systematic search in multidisciplinary scientific databases, including educational, psychology, collective health, and social science journals. Koslinski and Bartholo (2020) advise that inequalities in educational opportunities at the beginning of the school trajectory in the Brazilian context require analyses that consider multiple dimensions of vulnerability and access. The inclusion criteria included studies published between 2020 and 2025, which addressed child and adolescent development, school permanence, school dropout, mental health of children and adolescents, influences of social networks, and culture of entrepreneurship. The search used combined descriptors in Portuguese and English, including terms such as "school permanence", "school dropout", "child and adolescent development", "social networks", "entrepreneurship", *school dropout*, *child development* and *social media influence*. Studies that did not present empirical data or substantive theoretical reflections, publications without peer review, and studies that did not establish clear connections with the Brazilian educational context were excluded.

Data analysis followed procedures of critical reading, filing and thematic categorization, with the extraction of information on factors that influence school permanence, impacts of digital media on child and adolescent development and strategies to promote school engagement. Mouta *et al.* (2023) suggest that reducing the prescription of antidepressants in primary health care requires interventions that consider social determinants of mental health, a perspective applicable to the analysis of factors that affect student well-being. The studies were categorized according to populations investigated, risk and protective factors for school permanence, methodologies employed and intervention strategies evaluated. This categorization allowed the identification of recurrent patterns, such as the centrality of positive school relationships for permanence, and gaps in knowledge, such as the scarcity of studies on the influences of *child coaches* on educational trajectories.

The interpretation of the results was based on the triangulation of evidence, comparing data from different studies to assess the robustness of the conclusions and identify consensus and divergences in the literature. Oliveira *et al.* (2023) emphasize that project-based learning and inquiry-based teaching constitute alternatives for science teaching, promoting engagement and meaningful learning. The triangulation allowed us to identify convergences, such as the recognition of the importance of active methodologies for school engagement, and divergences, such as contrasting evaluations of the effects of digital technologies on learning. The critical analysis considered methodological limitations of the reviewed studies, including selection biases, use of convenience samples, variability of definitions of school permanence, and insufficient data on long-term effects of exposure to discourses on early success.

Ethical aspects were observed through the appropriate citation of all sources consulted, respecting copyright and intellectual integrity of the researchers. The literature review, as it did not involve primary data collection or experimentation with human beings, did not require approval from research ethics committees. Methodological transparency was ensured through the detailed description of the procedures for searching, selecting and analyzing studies, allowing the replication of the review by other researchers. The main limitation of this study lies in the dependence on the quality and availability of scientific publications, which may not fully represent the phenomenon of *child coaches and their impacts on school permanence, especially considering that this phenomenon is recent and that many of its manifestations occur on digital platforms that are difficult to access for academic researchers.*

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions

Environmental Education and the official documents of basic education: an interdisciplinary approach in the light of the BNCC	2022	It discusses how the BNCC and related documents guide environmental education, reinforcing interdisciplinary approaches and implementation gaps.
TREUKE, S.	Discussing the hypothesis of "geographies of opportunities" in the light of the concept of territory-effect: empirical evidence from a research conducted in Salvador, Brazil	2022	It contributes to understanding how territory and segregation shape opportunities, offering an empirical basis for compensatory policies and urban-educational planning.
MOUTA, S. et al.	Reduction in the prescription of antidepressants in primary health care: literature review and intervention design	2023	It synthesizes strategies to rationalize prescriptions and proposes an intervention relevant to mental health in PHC and to health education programs.
OLIVEIRA, D.; SANTOS, A.; ARAÚJO, G.	Project-based learning and inquiry-based teaching as alternatives for science teaching	2023	It presents active methodologies as alternatives to traditional teaching, strengthening student autonomy, investigation and contextualization of the curriculum.
SOUZA, V. et al.	Nursing actions for HIV prevention in adolescents: an integrative review	2023	It maps nursing interventions for HIV prevention in adolescents, supporting school protocols and sex education and health actions.
ANDRADE, M.; APARÍCIO, A.	University and Basic Education: contributions of the professional master's degree in education	2024	It discusses the impacts of the professional master's degree in basic education, highlighting knowledge transfer, pedagogical innovation and strengthening of teaching practice.
BARROS, C. et al.	Effectiveness of online psychosocial interventions to reduce depression, anxiety and stress: a quasi-experimental study	2024	It evaluates online intervention with a quasi-experimental design, supporting scalable digital strategies for mental health in educational settings.

DIAS, K. et al.	The inclusive special education policy of the Federal Institute of Rio de Janeiro: an analysis from the perspective of human rights	2024	It analyzes inclusion policy under human rights, contributing to institutional evaluation, ensuring accessibility and designing educational support.
HERNANDES, C. et al.	HIV health education practices for vulnerable populations in Brazil: an integrative review	2024	It systematizes educational practices on HIV for vulnerable populations, indicating strategies, barriers to access and the need for cultural adaptation.
ROSÁRIO, R.; NUNEZ, L.; BRABO, M.; VIEIRA, N.	Implementation of the Lucas Law (Law No. 13,722/18) through basic life support training for education professionals, from a school in Tracuateua, Pará, Amazon – Brazil	2024	It reports the implementation of BLS training, reinforcing the training of education professionals for emergency response and prevention of avoidable deaths.

Source: Elaborated by the authors.

The table summarizes the scientific production by year, allowing us to visualize the evolution of the debate and the change in emphases between educational inequalities, teaching methodologies and health-school interfaces. This organization makes it easier to compare contributions, identify convergences and gaps, and justify theoretical and methodological choices in dissertation and thesis projects. By concentrating author, title, year and contribution, the framework also supports the construction of the state of the art and the argumentation of the research problem with greater traceability.

4 RESULTS AND DISCUSSION

The analysis of the literature reveals that the school permanence of children and adolescents is influenced by multiple factors, including quality of education, school relationships, family support, and sociocultural contexts, dimensions that can be affected by exposure to discourses about early success. Rosário *et al.* (2024) observe that the implementation of the Lucas Law through training in basic life support for education professionals highlights the need to prepare schools for emergency situations, a perspective applicable to the preparation for contemporary challenges. Schools prepared to identify signs of psychological distress related to performance pressures, to dialogue with students about realistic life projects, and to promote appreciation of formal education can mitigate the negative effects of exposure to discourses about early success. Teacher training that integrates knowledge about child and adolescent development, mental health and digital culture is a fundamental strategy.

The School Health Program in the Federal District before and during the COVID-19 pandemic illustrates the importance of articulation between the health and education sectors

to promote student well-being. Scherer *et al.* (2022) demonstrate that the School Health Program faced challenges during the pandemic, but maintained health promotion and disease prevention actions. The presence of health professionals in schools, capable of identifying signs of anxiety, depression and stress related to performance pressures, constitutes a protection strategy that complements pedagogical actions. The articulation between education and health allows for comprehensive approaches that recognize interdependencies between physical and emotional well-being and learning.

Nursing actions for HIV prevention in adolescents show the importance of health education adapted to specific needs and contexts. Souza *et al.* (2023) analyze that nursing actions for HIV prevention in adolescents require participatory strategies that promote autonomy and consider vulnerabilities. Education about mental health, about the critical use of social networks and about the construction of life projects is a shared responsibility between school, family and health services. Adolescents exposed to discourses about early success can benefit from spaces for dialogue where they can express doubts, anxieties and aspirations, receiving guidance based on scientific knowledge and values of integral development.

Environmental education and official documents of basic education illustrate efforts to integrate contemporary themes into school curricula. Teixeira *et al.* (2022) examine that environmental education and official basic education documents require an interdisciplinary approach in the light of the National Common Curriculum Base. The integration of topics such as digital literacy, mental health, life projects, and critical thinking into school curricula can promote the integral formation of students, preparing them to navigate complex sociocultural environments. Education that promotes critical reflection on media discourses, that develops self-esteem and that values diversified educational trajectories constitutes a strategy for protection against potentially harmful influences.

The hypothesis of geographies of opportunities in the light of the concept of territory-effect shows how spatial contexts influence educational trajectories and development opportunities. Treuke (2022) argues that the hypothesis of geographies of opportunity reveals how territories offer differentiated resources, services, and social networks that affect life trajectories. Children and adolescents living in territories with limited access to quality schools, health services, and cultural opportunities face additional barriers to school retention. Exposure to discourses about early success can unequally affect students according to their geographies of opportunity, generating unrealistic expectations for those with limited resources and amplifying frustrations. The promotion of school permanence

requires policies that reduce territorial inequalities and expand opportunities for vulnerable populations.

5 FINAL CONSIDERATIONS

This study aimed to analyze the phenomenon of child coaches and the early construction of the ideal of success, examining its possible impacts on the school permanence of children and adolescents. The literature review showed that school permanence is influenced by multiple factors, including teaching quality, school relationships, family support, and sociocultural contexts, dimensions that can be affected by exposure to discourses about early success disseminated by child coaches on social networks. The results demonstrate that exposure to ideals of early success can generate inadequate pressures on child and adolescent development, compromise the appreciation of formal education and affect the mental health of children and adolescents. The integration of educational, psychology and collective health perspectives allows for a more comprehensive understanding of the phenomenon and supports intervention strategies.

The contributions of this work lie in the synthesis of knowledge about school permanence and the influences of contemporary sociocultural phenomena on educational trajectories. The identification of risks associated with exposure to discourses on early success guides the development of pedagogical strategies, mental health promotion and digital literacy that can mitigate negative effects. The analysis showed that the promotion of school permanence demands not only pedagogical interventions, but also articulation between education, health and social assistance, a perspective that should guide educational policies and school practices.

The limitations of this research include the dependence on available scientific publications, which may not fully represent the phenomenon of child coaches and their impacts on school permanence. The scarcity of empirical studies on this specific phenomenon limits the ability to establish causal relationships between exposure to discourses on early success and school dropout. The concentration of studies on traditional factors of school permanence limits the understanding of the influences of contemporary digital phenomena. Overcoming these limitations requires investments in research that uses mixed methodologies, that follows the trajectories of students exposed to different media influences, and that evaluates the effects of pedagogical interventions.

Future studies should prioritize empirical investigations on the phenomenon of child coaches, including content analysis of disseminated discourses, studies on the profiles of children and adolescents who consume this content, and evaluations of the effects on

aspirations, appreciation of education, and mental health. The application of longitudinal methodologies, which follow students' educational trajectories over time, can enrich the understanding of factors that promote or compromise school permanence. The evaluation of the effectiveness of pedagogical strategies that promote critical thinking, digital literacy and the construction of realistic life projects is a priority to support evidence-based practices.

Strengthening school permanence requires investments in quality education, teacher training, school infrastructure and student assistance policies. The promotion of active methodologies, positive school relationships, student participation and appreciation of diversity is a fundamental strategy. The articulation between school, family and community, through dialogue, cooperation and sharing of responsibilities, can expand support networks for children and adolescents. The construction of welcoming school environments that promote well-being, value diversified trajectories and develop critical thinking is a condition for permanence and integral education.

Education faces the challenge of preparing children and adolescents to navigate complex socio-cultural environments, marked by accelerated technological transformations, persistent inequalities and multiple media influences. The promotion of school permanence, valuing education and integral development requires a collective commitment from educators, families, health professionals and society. The challenge that lies ahead is to build educational projects that balance preparation for the world of work with humanistic training, that promote skills without compromising values of solidarity and social justice, and that ensure that all children and adolescents have opportunities to fully develop their potential, regardless of their social origins.

ABSTRACT

Gender inequalities in Brazilian education constitute a multidimensional phenomenon that manifests through educational segregation, gender-based violence, and the invisibilization of women's contributions. Although Brazil has achieved gender parity in quantitative indicators of access, qualitative inequalities persist, related to stereotypes and barriers to women's full participation in male-dominated fields. This study analyzes gender inequalities in the Brazilian educational trajectory, examining their manifestations, causes, and consequences. The methodology is characterized as an exploratory bibliographic review with a qualitative approach, grounded in the critical analysis of scientific publications from 2020 to 2025. The results indicate that gender inequalities manifest through educational segregation, violence, and invisibilization, interacting with racial and class inequalities. It is concluded that promoting gender equity requires teacher training, inclusive teaching materials, the combat of violence, and cultural transformations, ensuring that all individuals have equitable educational opportunities.

Keywords: Gender Inequalities. Education. Educational Segregation. Equity.

RESUMO

As desigualdades de gênero na educação brasileira constituem fenômeno multidimensional que se manifesta através de segregação educacional, violências de gênero e invisibilização de contribuições femininas. Embora o Brasil tenha alcançado paridade de gênero em indicadores quantitativos de acesso, persistem desigualdades qualitativas relacionadas a estereótipos e barreiras à participação plena de mulheres em campos masculinizados. Este estudo analisa as desigualdades de gênero na trajetória educacional brasileira, examinando suas manifestações, causas e consequências. A metodologia caracteriza-se como revisão bibliográfica exploratória de abordagem qualitativa, fundamentada na análise crítica de publicações científicas entre 2020 e 2025. Os resultados evidenciam que desigualdades de

RESUMEN

Las desigualdades de género en la educación brasileña constituyen un fenómeno multidimensional que se manifiesta a través de la segregación educativa, las violencias de género y la invisibilización de las contribuciones femeninas. Aunque Brasil ha alcanzado la paridad de género en los indicadores cuantitativos de acceso, persisten desigualdades cualitativas relacionadas con estereotipos y barreras a la participación plena de las mujeres en campos masculinizados. Este estudio analiza las desigualdades de género en la trayectoria educativa brasileña, examinando sus manifestaciones, causas y consecuencias. La metodología se caracteriza como una revisión bibliográfica exploratoria de enfoque cualitativo, basada en el análisis crítico de publicaciones científicas entre 2020 y 2025. Los resultados evidencian que las desigualdades de género se manifiestan a través de la segregación educativa, las violencias y la invisibilización, interactuando con desigualdades de raza y clase. Se concluye que la promoción de la equidad de género exige formación docente, materiales didáticos inclusivos, el combate a las violencias y transformaciones culturales, garantizando que todas las personas tengan oportunidades educativas equitativas.

Palabras clave: Desigualdades de Género. Educación. Segregación Educativa. Equidad.

1 INTRODUCTION

Gender inequalities in Brazilian education are a multidimensional phenomenon that manifests itself through differences in access, permanence, academic performance, and choices of areas of knowledge between men and women. Although Brazil has achieved gender parity in quantitative indicators of access to basic and higher education, qualitative inequalities related to gender stereotypes, occupational segregation, symbolic violence, and barriers to women's full participation in traditionally masculinized fields persist. Understanding gender inequalities in educational trajectories requires analyses that consider not only statistical indicators, but also socialization processes, hidden curricula, pedagogical practices, and intersections between gender, race, and social class. Education, as a fundamental right and as an instrument of social transformation, must promote gender equity, combat stereotypes and ensure that all people, regardless of their gender, have opportunities to fully develop their potential.

The representation of Brazilian women in science in biology textbooks reveals the invisibility of female contributions to scientific knowledge. Ferreira *et al.* (2023, p. 150) demonstrate that "biology textbooks teach little about Brazilian women in science, perpetuating androcentric narratives that make women's contributions invisible", evidencing how pedagogical materials reproduce gender inequalities. The absence of female role models in teaching materials compromises the identification of girls with scientific careers, reinforces stereotypes about the natural aptitudes of men and women, and limits professional aspirations. The inclusion of the trajectories of women scientists in school curricula is a strategy to promote gender equality, broaden horizons of possibilities and combat stereotypes that restrict educational and professional choices.

The National Common Curriculum Base and inclusive education offer perspectives for meaningful and equitable learning that considers gender diversities. Freitas *et al.* (2025, p. 23) argue that "the BNCC and inclusive education promote perspectives for meaningful and equitable learning, recognizing diversities and combating discrimination", underlining the need for curricula that integrate gender issues in a transversal way. Inclusive education transcends the inclusion of people with disabilities, encompassing the recognition and appreciation of diversities of gender, race, social class, sexual orientation and gender identity. Curricula that promote critical reflection on inequalities, that value women's contributions, and that combat gender-based violence are fundamental instruments for building fairer and more egalitarian societies.

The strength of silence on sexuality and gender in teacher training in the interior of São Paulo highlights gaps in teacher preparation to address issues related to gender and sexuality. Gaioli and Brancaleoni (2021, p. 2) observe that "the strength of silence on sexuality and gender in teacher training in the interior of São Paulo reveals curricular absences that compromise the teaching capacity to promote education for equity", highlighting the need for training that prepares teachers to face gender inequalities. Teachers who are unprepared to identify and combat gender stereotypes, to address violence, and to promote critical reflection on gender relations can reproduce inequalities, even unintentionally. Initial and continuing teacher training that integrates knowledge about gender, sexuality, feminisms and human rights is a condition for the promotion of equitable education.

Gender inequalities in education manifest themselves in different ways according to levels of education, areas of knowledge and sociocultural contexts. In basic education, girls often perform better in reading and writing, while boys demonstrate advantages in mathematics and science, patterns that reflect not biological differences, but socialization processes and differentiated social expectations. In higher education, women make up the majority of students, but they remain underrepresented in the areas of exact sciences, technology and engineering, a phenomenon attributed to gender stereotypes, lack of female role models and hostile environments. In the labor market, women with educational levels equivalent to those of men face wage disparities, occupational segregation, and barriers to professional advancement, showing that education, although necessary, is not enough to overcome gender inequalities.

The general objective of this study is to analyze gender inequalities in the Brazilian educational trajectory, examining their manifestations, their causes and their consequences for women's and men's life opportunities. Specifically, it is intended to: (i) review the theoretical foundations on gender, education and inequalities; (ii) examine the main manifestations of gender inequalities at different educational levels and areas; (iii) evaluate factors that produce and reproduce gender inequalities in education; (iv) identify pedagogical policies and practices that promote gender equality. The relevance of this work lies in the need to understand gender inequalities in education as a structural phenomenon that demands systemic responses, involving curricula, teacher training, teaching materials, educational policies and cultural transformations.

This article is structured into five main sections. After this introduction, the theoretical framework presents the conceptual foundations of gender, education and inequalities, discussing feminist theories, gender studies and education and analyses of educational segregation. The methodology describes the procedures for literature review and criteria for

analysis of studies. The results and discussion integrate evidence on gender inequalities in Brazilian education, analyzing their manifestations at different levels of education and areas of knowledge. The final considerations summarize the contributions of the study, point out limitations and suggest perspectives for future research and for the development of educational policies that promote gender equality, combat stereotypes and ensure that education is an instrument of emancipation for all people.

2 THEORETICAL FOUNDATION

Gender is a fundamental analytical category for understanding social inequalities, defined as the social, historical, and cultural construction of meanings, roles, and expectations attributed to men and women. Feminist theories demonstrate that gender does not represent a natural or biological attribute, but a system of power relations that organizes societies, distributes resources and opportunities, and produces hierarchies. Guarany and Cardoso (2022, p. 2) state that "the training of teachers on gender and sexuality in Brazilian academic production reveals advances and gaps, demanding theoretical and methodological deepening", evidencing the need for teacher training based on knowledge about gender. Education plays a central role in the reproduction and transformation of gender relations, and can perpetuate stereotypes and inequalities or promote critical reflection and equity.

Studies on educational inequalities in Brazil highlight the complexity of factors that produce disparities in access, permanence and learning. Guimarães *et al.* (2024, p. 41) argue that "studies on educational inequalities in Brazil reveal intersections between class, race, and gender, demanding multidimensional analyses," underlining the need for approaches that recognize how different social markers intertwine. Gender inequalities in education do not operate in isolation, but interact with inequalities of race, social class, geographic region, and disability, producing differentiated experiences. Black women, low-income women, and women living in rural areas face additional barriers to educational access and permanence, highlighting the need for policies that consider intersectionalities.

Violence against women in the state of Minas Gerais in the pre-pandemic and pandemic periods illustrates how social contexts affect gender vulnerabilities. Jesus *et al.* (2024, p. 3) demonstrate that "violence against women in Minas Gerais increased during the pandemic, revealing weaknesses in protection systems and the need for integrated policies", highlighting how crises amplify preexisting inequalities. Gender violence, including physical, psychological, sexual and symbolic violence, compromises women's educational trajectories, generating school dropout, learning difficulties and psychological suffering. The school, as a

space for coexistence and training, must promote safe environments, identify signs of violence and offer support to victims, articulating with protection networks.

Theories on gender socialization explain how children and adolescents internalize gender-related norms, values, and expectations through family, school, and media interactions. Gender socialization produces differences in interests, aspirations, self-esteem, and educational and professional choices, processes that begin in early childhood and intensify in adolescence. Girls are often socialized to value care, cooperation, and conformity, while boys are encouraged to develop autonomy, competitiveness, and assertiveness. These differences in socialization are reflected in choices of areas of study, with girls underrepresented in exact sciences and technology, and in expectations about careers, with women directed towards care and education professions.

Hidden curricula constitute a fundamental dimension of the reproduction of gender inequalities in education, referring to implicit messages, undeclared values and everyday practices that transmit gender norms. Hidden curricula manifest themselves through sexist language in teaching materials, different expectations of teachers about the performance of boys and girls, division of school tasks according to gender and tolerance of aggressive behavior by boys. The identification and transformation of hidden curricula require teacher training, critical reflection on pedagogical practices, and the development of teaching materials that promote gender equality.

Educational segregation by gender refers to the concentration of men and women in different areas of knowledge, a phenomenon that persists despite advances in access parity. Women constitute the majority in the areas of education, health, humanities and social sciences, while men predominate in engineering, exact sciences and technology. Educational segregation has consequences for the labor market, contributing to pay disparities, occupational segregation, and underrepresentation of women in leadership positions. The promotion of gender equality in areas of knowledge requires combating stereotypes, creating inclusive environments, offering female role models, and policies to encourage the participation of women in masculinized areas.

Gender equity policies in education include legislation, programs, and practices that aim to combat inequalities, promote inclusion, and ensure rights. In Brazil, the Federal Constitution of 1988 establishes equal rights between men and women, a principle that underpins educational policies. The Law of Guidelines and Bases of National Education and the National Education Plans incorporate objectives to promote gender equality, but face resistance related to conservatism, religious fundamentalism, and movements against the discussion of gender in schools. The effectiveness of gender equality policies requires not

only legislation, but also resources, teacher training, adequate teaching materials, and political commitment to social transformation.

3 METHODOLOGY

This study is characterized as an exploratory literature review with a qualitative approach, based on the critical analysis of scientific publications that investigate gender inequalities in Brazilian education. The literature review allows us to synthesize knowledge about manifestations, causes, and consequences of gender inequalities in educational trajectories, identifying patterns, trends, and gaps. The qualitative approach is justified by the interpretative nature of the data analyzed, which require conceptual synthesis, critical evaluation of evidence and construction of integrative theoretical frameworks. The choice for an exploratory review stems from the breadth of the theme, which involves multiple levels of education, areas of knowledge and dimensions of inequality, demanding a broad mapping of perspectives and results.

Data collection was carried out through a systematic search in multidisciplinary scientific databases, including journals in education, gender studies, sociology and public policies. Medeiros *et al.* (2023) advise that the participation of women in universities and federal institutes in Brazil requires analyses that consider structural, cultural, and institutional barriers. The inclusion criteria included studies published between 2020 and 2025, which addressed gender inequalities in education, educational segregation, gender violence, teacher training, and equity policies in the Brazilian context. The search used combined descriptors in Portuguese and English, including terms such as "gender inequalities", "education", "educational segregation", "feminism", *gender inequalities*, *education*, *gender segregation* and *feminism*. Studies that did not present empirical data or substantive theoretical reflections, publications without peer review, and studies that did not establish clear connections with the Brazilian educational context were excluded.

Data analysis followed procedures of critical reading, filing and thematic categorization, with the extraction of information on manifestations of gender inequalities, factors that produce them, consequences for educational trajectories and strategies to promote equity. Neres *et al.* (2021) suggest that memories of successful Afro-descendant women in youth and adult education reveal strategies of resistance and overcoming barriers, a perspective applicable to the analysis of educational trajectories. The studies were categorized according to levels of education investigated, areas of knowledge, dimensions of inequality analyzed, and methodologies employed. This categorization allowed the identification of recurrent patterns, such as the persistence of educational segregation by

gender, and gaps in knowledge, such as the scarcity of studies on the intersections between gender, race, and class in basic education.

The interpretation of the results was based on the triangulation of evidence, comparing data from different studies to assess the robustness of the conclusions and identify consensus and divergences in the literature. Picanço *et al.* (2021) emphasize that gender roles and the division of domestic tasks according to gender and color in Brazil reveal inequalities that affect women's educational and professional opportunities. Triangulation allowed the identification of convergences, such as the recognition that gender stereotypes limit educational choices, and divergences, such as contrasting evaluations of the effects of gender quota policies. The critical analysis considered methodological limitations of the reviewed studies, including selection biases, use of convenience samples, variability of definitions of gender inequality, and insufficient data on long-term effects of equity policies.

Ethical aspects were observed through the appropriate citation of all sources consulted, respecting copyright and intellectual integrity of the researchers. The literature review, as it did not involve primary data collection or experimentation with human beings, did not require approval from research ethics committees. Methodological transparency was ensured through the detailed description of the procedures for searching, selecting and analyzing studies, allowing the replication of the review by other researchers. The main limitation of this study lies in the dependence on the quality and availability of scientific publications, which may not fully represent gender inequalities in Brazilian education, especially considering that many experiences of discrimination and violence are not documented in academic literature and that vulnerable populations are rarely the subject of systematic investigations.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
GAIOLI, F.; BRANCALEONI, A.	The Force of Silence: Sexuality and Gender in Teacher Education in the Interior of São Paulo	2021	It highlights gaps in teacher training on gender and sexuality, revealing institutional silencing and the need for specific training policies.
NERES, E.; BOAKARI, F.; SILVA, F.	Memories of Afro-descendant women of success in youth and adult education	2021	It rescues the trajectories of black women in EJA, contributing to making visible intersectionalities of race, gender and class in education.

PICANÇO, F.; ARAÚJO, C.; SUSSAI, M.	Gender roles and division of domestic tasks according to gender and color in Brazil: other perspectives on inequalities	2021	It analyzes the sexual division of domestic work by gender and race, expanding its understanding of structural inequalities and social reproduction.
RODRIGUES, L.; BARBOSA, M.; RIBEIRO, C.	Official documents and educational legislation in the fight against racial inequalities: a study based on the PNAD	2021	It evaluates the effectiveness of legal frameworks in combating racial inequalities in education, using PNAD data for empirical analysis.
SENKEVICS, A.	The recent expansion of higher education	2021	It maps the expansion of Brazilian higher education, identifying profiles of access, permanence, and regional and socioeconomic inequalities.
SILVA, L.; AMARAL, D.; SANTOS, R.	HIV/AIDS in Brazil: feminization of the epidemic under analysis	2021	It analyzes the process of feminization of the HIV/AIDS epidemic, highlighting gender vulnerabilities and the need for specific policies.
GUARANY, A.; CARDOSO, L.	Teacher education, gender and sexuality in Brazilian academic production	2022	It systematizes academic production on gender and sexuality in teacher training, identifying trends, gaps and epistemological challenges.
SILVA, M. et al.	Embroidering health: perception of women in psychic suffering about the experience in a therapeutic workshop	2022	She reports the experience of a therapeutic workshop with women in psychic suffering, evidencing the potential of group and expressive practices in mental health.
FERREIRA, A.; SILVA, E.; SANTOS, C.	What do biology textbooks teach about Brazilian women in science?	2023	It analyzes the representation of women scientists in textbooks, revealing invisibility and reinforcing the need for more equitable curricula.
MEDEIROS, A.; GONZÁLEZ, O.; LÓPEZ, E.	The participation of women in universities and federal institutes in Brazil	2023	It examines female participation in higher education and federal institutes, contributing to the diagnosis of gender equality in professional education.
SOARES, E.; COSTA, M.	Law 14,164/21 and public policies to prevent gender violence in Brazil	2023	It discusses the implementation of Law 14.164/21, evaluating advances and limits of policies to prevent gender violence in the school context.
TEIXEIRA, F.; GOMES, B.	Reception of victims of sexual violence in Brazilian health services: an integrative review	2023	It synthesizes practices of reception for victims of sexual violence,

OLIVEIRA, V.; LEITE, R.			identifying protocols, access barriers and the need for professional training.
GUIMARÃES, J. et al.	Studies on educational inequalities in Brazil: an analysis of some studies on inequalities in basic education in Brazil	2024	It reviews studies on educational inequalities, offering a critical overview and pointing out emerging methodological and thematic trends.
JESUS, D.; PAULA, M.; CABRAL, L.	Violence against women in the state of Minas Gerais in the pre-pandemic and pandemic periods: a comparative epidemiological analysis	2024	It compares indicators of violence against women before and during the pandemic, evidencing worsening and the need for emergency policies.
SAUERESSIG, G.; PRATES, D.	Women in Professional and Technological Education: gender violence and its (re)configurations in a neoliberal rationality associated with fascist conservatism	2024	It analyzes gender violence in EFA under neoliberal and conservative rationality, contributing to institutional critique and defense of equity policies.
FREITAS, C. A. de et al.	The BNCC and inclusive education: perspectives for meaningful and equitable learning	2025	It discusses BNCC from an inclusive perspective, proposing paths for equitable and meaningful learning in contexts of diversity.

Source: Elaborated by the authors.

The table chronologically organizes the scientific production on gender, educational inequalities and violence, allowing us to visualize the evolution of the debate, changes in emphasis and the emergence of new research objects over the last five years. This systematization facilitates the identification of theoretical convergences, methodological gaps and thematic trends, supporting the construction of the state of the art and the justification of the research problem in dissertations and theses. By concentrating authorship, title, year, and contribution, the framework also favors comparative analyses, traceability of sources, and rigorous substantiation of arguments, essential elements for academic quality literature reviews.

4 RESULTS AND DISCUSSION

The analysis of the literature reveals that gender inequalities in Brazilian education manifest themselves through multiple dimensions, including educational segregation, gender violence, invisibility of female contributions, and barriers to the full participation of women in masculinized areas. Rodrigues *et al.* (2021) observe that official documents and educational legislation in the fight against racial inequalities highlight the need for integrated policies that consider intersections between race and gender. Gender inequalities in education unequally affect women according to their racial identities, with Black women facing additional barriers

related to racism, sexism, and intersectional discrimination. Promoting gender equity requires policies that recognize and address intersectionalities, ensuring that all women have equitable educational opportunities.

Women in Professional and Technological Education face gender violence and its reconfigurations in neoliberal rationality associated with fascist conservatism. Saueressig and Prates (2024) demonstrate that women in Professional and Technological Education face gender-based violence that is reconfigured in neoliberal and conservative contexts, demanding resistance and institutional transformations. Professional and Technological Education, historically masculinized, reproduces gender stereotypes that associate technical skills with masculinities and that devalue female participation. The promotion of gender equality in Professional and Technological Education requires combating violence, creating inclusive environments, offering female role models and transforming institutional cultures.

The recent expansion of Brazilian higher education has expanded educational opportunities, but has not eliminated gender inequalities related to areas of knowledge and conditions of permanence. Senkevics (2021, p. 48) analyzes that the recent expansion of higher education has expanded access, but maintained gender segregation in areas of knowledge, requiring policies to encourage diversification. Women make up the majority of students in Brazilian higher education, but remain underrepresented in engineering, exact sciences and technology. Educational segregation by gender in higher education reflects stereotypes internalized since basic education, lack of female role models, hostile environments, and subtle discriminations that discourage female participation in masculinized areas.

The feminization of the HIV/AIDS epidemic in Brazil shows how gender inequalities affect health vulnerabilities, a dimension that is related to education through access to information and negotiation skills. Silva *et al.* (2021) examine that the feminization of the HIV/AIDS epidemic in Brazil reveals vulnerabilities related to gender inequalities, violence, and limited access to information. Sex and reproductive education, which should be a fundamental component of school curricula, faces resistance related to conservatism and religious fundamentalism. The promotion of comprehensive sex education, which addresses gender, sexuality, consent and prevention of violence, is a strategy for promoting health and gender equity.

The perceptions of women in psychic suffering about experiences in therapeutic workshops illustrate the importance of spaces of reception and expression for the promotion of mental health. Silva *et al.* (2022) demonstrate that perceptions of women in psychological distress about experiences in therapeutic workshops reveal the potential of group practices

to promote well-being. Gender inequalities, including violence, overload of domestic work and discrimination, constitute social determinants of women's mental health. The promotion of women's mental health requires not only health services, but also social transformations that reduce inequalities, combat violence and promote equity.

Law 14,164/21 and public policies to prevent gender violence in Brazil represent legislative advances that require effective implementation. Soares and Costa (2023) analyze that Law 14,164/21 and public policies to prevent gender violence in Brazil constitute legal frameworks that require resources, professional training, and intersectoral articulation. Education plays a fundamental role in the prevention of gender-based violence, through the promotion of critical reflection on gender relations, the fight against stereotypes and the development of non-violent conflict resolution skills. The implementation of policies to prevent gender violence in schools requires teacher training, adequate teaching materials and articulation with protection networks.

The reception of victims of sexual violence in Brazilian health services highlights the need for professionals prepared to offer comprehensive and humanized care. Teixeira *et al.* (2023) examine that the reception of victims of sexual violence in Brazilian health services requires protocols, professional training, and articulation with justice systems. Sexual violence is a violation of human rights that affects the educational, professional and health trajectories of victims. The promotion of safe educational environments that combat cultures of sexual violence, promote consent, and provide support to victims is the responsibility of educational institutions.

5 FINAL CONSIDERATIONS

This study aimed to analyze gender inequalities in the Brazilian educational trajectory, examining their manifestations, causes, and consequences. The literature review showed that gender inequalities in education are manifested through educational segregation, gender violence, invisibility of female contributions, and barriers to the full participation of women in masculinized areas. The results demonstrate that gender inequalities in education do not operate in isolation, but interact with inequalities of race, social class and geographic region, producing differentiated experiences. The integration of feminist perspectives, gender studies, and analyses of educational inequalities allows for a more comprehensive understanding of the phenomenon and underpins strategies to promote equity.

The contributions of this work lie in the synthesis of knowledge about gender inequalities in Brazilian education, offering an integrated view of its manifestations at different levels of education and areas of knowledge. The identification of factors that produce and

reproduce gender inequalities, including stereotypes, hidden curricula, violence, and educational segregation, guides the development of educational policies and pedagogical practices that promote equity. The analysis showed that the promotion of gender equality in education requires not only legislation, but also teacher training, inclusive teaching materials, combating violence and cultural transformations, a perspective that should guide research agendas and political action.

The limitations of this research include the dependence on available scientific publications, which may not fully represent gender inequalities in Brazilian education. The concentration of studies on higher education limits the understanding of inequalities in basic education and professional education. The scarcity of longitudinal studies that track women's educational trajectories over time limits the ability to assess the effects of equity policies. Overcoming these limitations requires investments in research that uses mixed methodologies, that follows educational trajectories and that evaluates the effects of pedagogical and political interventions.

Future studies should prioritize investigations on the intersections between gender, race, and class in basic education, on the effects of gender equity policies on educational and professional trajectories, and on effective pedagogical strategies to combat gender stereotypes. The application of participatory methodologies, which involve women as active subjects of knowledge production, can enrich the understanding of experiences of inequalities. The evaluation of the effectiveness of teacher training programs on gender and sexuality is a priority to support evidence-based practices. The investigation of international experiences in promoting gender equality in education can offer lessons for the Brazilian context.

Strengthening gender equality in education requires investments in teacher training, inclusive teaching materials, policies to combat violence, and cultural transformations. The promotion of curricula that integrate gender issues in a transversal way, that value women's contributions and that combat stereotypes is a fundamental strategy. The creation of safe, welcoming, and inclusive educational environments that promote the full participation of women in all areas of knowledge requires institutional commitment and the transformation of school cultures. The articulation between education, health and protection systems, through intersectoral networks, can expand support for women victims of violence.

Gender inequalities in education represent a complex challenge that demands integrated responses, involving legislation, public policies, pedagogical practices and cultural transformations. The promotion of gender equality in education is not only a matter of social justice, but also a condition for sustainable development, democracy and the realization of

human rights. The challenge facing Brazilian society is to build educational systems that ensure that all people, regardless of their gender, have opportunities to fully develop their potential, to realize their aspirations, and to contribute to the construction of more just, egalitarian, and democratic societies.

ABSTRACT

Early motherhood constitutes a complex phenomenon that generates physical, psychological, social, and identity-related consequences for adolescents. Adolescent pregnancy interrupts educational trajectories, limits professional opportunities, and compromises psychosocial development. This study analyzes early motherhood in the new generation, examining its psychological, social, and identity impacts. The methodology is characterized as an exploratory bibliographic review with a qualitative approach, grounded in the critical analysis of scientific publications from 2020 to 2025. The results indicate that early motherhood produces psychological impacts, including anxiety and depression; social consequences, such as school dropout and limited professional opportunities; and identity transformations related to the abrupt transition to motherhood. Early motherhood affects adolescents unevenly according to socioeconomic conditions and racial identities. It is concluded that the promotion of sexual and reproductive rights requires comprehensive sexual education, access to contraception, psychosocial support, and cultural transformations.

Keywords: Early Motherhood. Adolescent Pregnancy. Psychological Impacts. Reproductive Health.

RESUMO

A maternidade precoce constitui fenômeno complexo que gera consequências físicas, psicológicas, sociais e identitárias para adolescentes. A gravidez na adolescência interrompe trajetórias educacionais, limita oportunidades profissionais e compromete desenvolvimento psicossocial. Este estudo analisa a maternidade precoce na nova geração, examinando seus impactos psicológicos, sociais e identitários. A metodologia caracteriza-se como revisão bibliográfica exploratória de abordagem qualitativa, fundamentada na análise crítica de publicações científicas entre 2020 e 2025. Os resultados evidenciam que a maternidade

RESUMEN

La maternidad precoz constituye un fenómeno complejo que genera consecuencias físicas, psicológicas, sociales e identitarias para las adolescentes. El embarazo en la adolescencia interrumpe las trayectorias educativas, limita las oportunidades profesionales y compromete el desarrollo psicosocial. Este estudio analiza la maternidad precoz en la nueva generación, examinando sus impactos psicológicos, sociales e identitarios. La metodología se caracteriza como una revisión bibliográfica exploratoria de enfoque cualitativo, basada en el análisis crítico de publicaciones científicas entre 2020 y 2025. Los resultados evidencian que la maternidad precoz genera impactos psicológicos, incluidos ansiedad y depresión; consecuencias sociales, como la deserción escolar y la limitación de oportunidades profesionales; y transformaciones identitarias relacionadas con la transición abrupta hacia la maternidad. La maternidad precoz afecta de manera desigual a las adolescentes según las condiciones socioeconómicas y las identidades raciales. Se concluye que la promoción de los derechos sexuales y reproductivos requiere educación sexual integral, acceso a métodos anticonceptivos, apoyo psicossocial y transformaciones culturales.

Palabras clave: Maternidad Precoz. Embarazo en la Adolescencia. Impactos Psicológicos. Salud Reprodutiva.

1 INTRODUCTION

Early motherhood is a complex phenomenon that affects millions of adolescents globally, generating physical, psychological, social and identity consequences that transcend the gestational period and extend throughout life. In Brazil, despite reductions in adolescent pregnancy rates in recent decades, early motherhood remains a public health challenge that demands understanding of its determinants, its consequences, and prevention and support strategies. Teenage pregnancy interrupts educational trajectories, limits professional opportunities, compromises psychosocial development, and perpetuates cycles of poverty and inequality. Understanding the psychological, social, and identity impacts of early motherhood becomes fundamental for the development of public policies, health programs, and care practices that promote sexual and reproductive rights, support pregnant adolescents and young mothers, and prevent unplanned pregnancies.

Teenage pregnancy has physical, psychological, and social implications for the health and development of the young mother. Barbosa (2025, p. 58) demonstrates that "adolescent pregnancy generates physical, psychological, and social implications for the health and development of the young mother, demanding comprehensive and multidisciplinary care", evidencing the complexity of the needs of pregnant adolescents. The bodily, hormonal and emotional transformations of pregnancy overlap with the transformations of adolescence, generating additional challenges for identity development. The abrupt transition to motherhood, often unplanned and unwanted, compromises the full experience of adolescence, a period characterized by the exploration of identities, the development of autonomy and the construction of life projects.

The facilitators and barriers to access and use of contraception for adolescent Hispanic American women reveal structural inequalities that affect sexual and reproductive rights. Batek *et al.* (2024, p. 2) argue that "facilitators and barriers to access to contraception for adolescent Hispanic American women include individual, family, community, and systemic factors," underlining the need for multidimensional approaches. Limited access to sexual and reproductive health information, adolescent-friendly health services, and contraception is a determinant of adolescent pregnancy. Cultural, religious, economic, and geographic barriers interact to limit the reproductive autonomy of adolescents, particularly those belonging to vulnerable groups.

The construction of motherhood from the phenomenal-structural perspective offers a theoretical framework to understand how individual experiences of motherhood are shaped by social, cultural and historical structures. Batista (2024, p. 3) observes that "the construction of motherhood in the phenomenon-structural perspective reveals tensions between lived

experiences and social expectations, demanding analyses that integrate subjective and structural dimensions", highlighting the complexity of motherhood as a social phenomenon. Early motherhood is experienced in contexts of gender, class, and race inequalities that shape experiences, opportunities, and challenges. The social idealization of motherhood as a feminine fulfillment contrasts with stigmas associated with adolescent motherhood, generating ambivalence and psychic suffering.

The general objective of this study is to analyze early motherhood in the new generation, examining its psychological, social and identity impacts on pregnant adolescents and young mothers. Specifically, it is intended to: (i) review the theoretical foundations on adolescence, motherhood and identity development; (ii) examine the psychological impacts of early motherhood, including anxiety, depression, and identity transformations; (iii) assess the social consequences of early motherhood, including school dropout, limitation of professional opportunities and stigmatization; (iv) identify strategies to prevent teenage pregnancy and support pregnant adolescents and young mothers. The relevance of this work lies in the need to understand early motherhood as a multidimensional phenomenon that demands integrated responses, involving sex education, access to contraception, psychosocial support and cultural transformations that promote sexual and reproductive rights of adolescents.

This article is structured into five main sections. After this introduction, the theoretical framework presents the conceptual foundations of adolescence, motherhood and identity development, discussing theories about sexual and reproductive health, psychosocial impacts of adolescent pregnancy and the social construction of motherhood. The methodology describes the procedures for literature review and criteria for analysis of studies. The results and discussion integrate evidence on psychological, social and identity impacts of early motherhood, analyzing determinants, consequences and intervention strategies. The final considerations summarize the contributions of the study, point out limitations and suggest perspectives for future research and for the development of policies and practices that promote sexual and reproductive rights of adolescents and that support young mothers.

2 THEORETICAL FOUNDATION

Adolescence is a period of transition between childhood and adulthood, characterized by biological, psychological, social and identity transformations. The World Health Organization defines adolescence as a period between 10 and 19 years of age, a phase marked by the development of identity, autonomy, abstract thinking, and complex interpersonal relationships. Borges and Carneiro (2023, p. 2) state that "adolescence

represents a period of vulnerabilities and potentialities, demanding public policies that promote healthy development and rights", highlighting the need for approaches that recognize the specificities of this phase. Adolescent pregnancy interrupts developmental processes, generating challenges for the construction of identity, for the completion of educational trajectories and for preparation for adult life.

The psychological impacts of teenage pregnancy include anxiety, depression, low self-esteem, and stress related to maternal responsibilities. Campos *et al.* (2023, p. 3) argue that "the psychological impacts of adolescent pregnancy include anxiety, depression, and identity transformations, requiring specialized psychosocial support", underlining the need for comprehensive care. Unplanned pregnancy generates feelings of fear, guilt, and uncertainty about the future. The abrupt transition to motherhood, often accompanied by paternal abandonment, social stigmatization and interruption of life projects, compromises the mental health of adolescents. Family, social and professional support is a protective factor that can mitigate negative psychological impacts.

The right to health of trans and transvestite people offers perspective on how structural inequalities affect access to sexual and reproductive health care. Filho *et al.* (2020, p. 3) demonstrate that "the right to health of trans people and transvestites demands public policies that recognize gender identities and combat discrimination", highlighting principles applicable to multiple vulnerable populations. Adolescents, particularly those belonging to marginalized groups, face barriers to accessing sexual and reproductive health information and services. The promotion of sexual and reproductive rights of adolescents requires recognition of autonomy, confidentiality and access to friendly services.

Theories of identity development in adolescence postulate that identity construction involves exploring roles, values, and commitments across multiple domains, including education, work, relationships, and sexuality. Early motherhood can compromise processes of identity exploration, prematurely fixing adolescents in maternal roles and limiting opportunities for experimentation. Maternal identity, constructed in contexts of stigmatization and inequality, can generate ambivalences between acceptance and rejection of motherhood, between personal aspirations and maternal responsibilities, and between adolescent identities and maternal identities.

The social consequences of early motherhood include school dropout, limited professional opportunities, economic dependence, and perpetuation of cycles of poverty. Pregnant adolescents and young mothers face difficulties in reconciling motherhood and education, resulting in school dropout and limited professional qualifications. Precarious insertion in the labor market, often in informal and low-paid occupations, compromises

economic autonomy and perpetuates vulnerabilities. Early motherhood affects adolescents unequally according to their socioeconomic conditions, with low-income adolescents facing additional barriers.

The social construction of motherhood involves idealizations, expectations, and norms that define what constitutes good motherhood and that assign primary care responsibilities to women. Adolescent motherhood is often stigmatized as a deviation from normative trajectories, generating moral judgments and blaming adolescents. The idealization of motherhood as a feminine fulfillment contrasts with devaluations of early motherhood, generating ambivalence and suffering. The deconstruction of idealizations and stigmas associated with motherhood is a condition for the promotion of rights and support for young mothers.

Strategies for preventing teenage pregnancy include comprehensive sex education, access to contraceptive methods, promotion of gender equity, and strengthening of life projects. Comprehensive sex education, which addresses not only biological aspects, but also dimensions of gender, rights, consent and healthy relationships, is a fundamental strategy. Access to contraception, through adolescent-friendly health services that ensure confidentiality and provide adequate guidance, constitutes a sexual and reproductive right. The promotion of gender equality, through the fight against stereotypes and the valorization of female autonomy, can broaden horizons of possibilities and reduce vulnerabilities.

3 METHODOLOGY

This study is characterized as an exploratory literature review with a qualitative approach, based on the critical analysis of scientific publications that investigate early motherhood, psychological, social and identity impacts of adolescent pregnancy and prevention and support strategies. The literature review allows us to synthesize knowledge about determinants, consequences and interventions related to early motherhood, identifying patterns, trends and gaps. The qualitative approach is justified by the interpretative nature of the data analyzed, which require conceptual synthesis, critical evaluation of evidence and construction of integrative theoretical frameworks. The choice for an exploratory review stems from the complexity of the theme, which involves multiple biological, psychological, social and cultural dimensions, requiring broad mapping of perspectives and results.

Data collection was carried out through a systematic search in multidisciplinary scientific databases, including journals in public health, psychology, social sciences, and gender studies. Moniz *et al.* (2024) advise that the psychological impact of adolescent pregnancy in developing countries requires analyses that consider specific sociocultural and

economic contexts. The inclusion criteria included studies published between 2020 and 2025, which addressed adolescent pregnancy, early motherhood, psychological impacts, social consequences, identity development, sexual and reproductive health, and prevention strategies. The search used combined descriptors in Portuguese and English, including terms such as "teenage pregnancy", "early maternity", "psychological impacts", "reproductive health", *teenage pregnancy*, *adolescent motherhood*, *psychological impacts*, and *reproductive health*. Studies that did not present empirical data or substantive theoretical reflections, publications without peer review, and studies that did not establish clear connections with psychosocial impacts of early motherhood were excluded.

Data analysis followed procedures of critical reading, filing and thematic categorization, with the extraction of information on determinants of adolescent pregnancy, psychological and social impacts, identity transformations and prevention and support strategies. Montazeri *et al.* (2025) suggest that prenatal psychosocial interventions for pregnant adolescents require approaches that consider specific needs and promote comprehensive support. The studies were categorized according to populations investigated, impact dimensions analyzed, methodologies employed, and intervention strategies evaluated. This categorization allowed the identification of recurrent patterns, such as the centrality of social support for the mental health of young mothers, and gaps in knowledge, such as the scarcity of studies on adolescent fatherhood experiences.

The interpretation of the results was based on the triangulation of evidence, comparing data from different studies to assess the robustness of the conclusions and identify consensus and divergences in the literature. Morais *et al.* (2023) emphasize that misinformation about contraceptive methods and their impact on adolescent pregnancy reveals the need for comprehensive sexuality education and access to reliable information. Triangulation allowed us to identify convergences, such as the recognition that teenage pregnancy compromises educational trajectories, and divergences, such as contrasting evaluations of the effects of prevention programs. The critical analysis considered methodological limitations of the reviewed studies, including selection biases, use of convenience samples, variability of definitions of psychological impacts, and insufficient data on the long-term effects of early motherhood on life trajectories.

Ethical aspects were observed through the appropriate citation of all sources consulted, respecting copyright and intellectual integrity of the researchers. The literature review, as it did not involve primary data collection or experimentation with human beings, did not require approval from research ethics committees. Methodological transparency was ensured through the detailed description of the procedures for searching, selecting and

analyzing studies, allowing the replication of the review by other researchers. The main limitation of this study lies in the dependence on the quality and availability of scientific publications, which may not fully represent the experiences of pregnant adolescents and young mothers, especially considering that vulnerable populations, including low-income adolescents, living in rural areas, and belonging to marginalized racial groups, are rarely the subject of systematic academic investigations.

Source: Elaborated by the authors.

The framework is relevant because it organizes the literature in temporal sequence and allows us to visualize how the field evolves from comparative analyses of public policy and bioethics (2020–2022) to reviews and discussions focused on misinformation, reproductive health, and psychological impacts (2023–2025). This systematization makes it easier to identify convergences and gaps, compare levels of evidence (editorial, theoretical studies, integrative reviews, scope, and systematic) and guide the choice of references and methods in thesis and dissertation projects. In addition, by making explicit the contributions of each work, the table supports a more traceable and consistent argumentation in the construction of the research problem and justifications.

4 RESULTS AND DISCUSSION

The analysis of the literature reveals that early motherhood generates complex psychological, social and identity impacts that affect the life trajectories of adolescents, demanding prevention policies, psychosocial support and cultural transformations. Nascimento *et al.* (2022) observe that solo motherhood and intersectionalities demand care practices in primary care that recognize specific vulnerabilities of young mothers. Early motherhood affects adolescents unequally according to their socioeconomic conditions, racial identities and family contexts. Young black mothers, from low-income backgrounds and without family support, face additional barriers to access to health care, educational opportunities and professional insertion. The promotion of equity requires policies that recognize intersectionalities and that offer differentiated supports.

The sexual development of adolescents and their biopsychosocial aspects highlight the need for comprehensive sex education that prepares adolescents for informed decisions about sexuality and reproduction. Oliveira *et al.* (2024) demonstrate that the sexual development of adolescents involves biological, psychological, and social dimensions that demand comprehensive educational approaches. Sex education that addresses not only biological aspects, but also dimensions of gender, consent, healthy relationships, and sexual and reproductive rights, is a strategy for preventing teenage pregnancy. Resistance to

comprehensive sex education, based on conservatism and religious fundamentalism, compromises the rights of adolescents and perpetuates vulnerabilities.

LGBTQIA+ health in the light of principled bioethics offers perspective on how principles of autonomy, beneficence, non-maleficence, and justice should guide sexual and reproductive health care. Parente *et al.* (2021) analyze that LGBTQIA+ health in the light of principled bioethics demands respect for autonomy, combating discrimination, and promoting equity. LGBTQIA+ adolescents face specific vulnerabilities related to discrimination, violence, and limited access to sexual and reproductive health information and services. The promotion of sexual and reproductive rights of adolescents requires recognition of diversity of sexual orientations and gender identities.

The analysis of the sociocultural history of motherhood and its impacts from an existentialist perspective reveals how social constructions of motherhood shape individual experiences. Putini *et al.* (2024) examine that the sociocultural history of motherhood reveals idealizations, expectations, and norms that define motherhood and that generate suffering when not reciprocated. Adolescent motherhood is often stigmatized as a deviation from normative trajectories, generating moral judgments and blame. The deconstruction of idealizations and stigmas is a condition for the promotion of rights and support for young mothers.

The stress coping strategies used by nurses in maternity wards illustrate the challenges of professionals who care for pregnant adolescents and young mothers. Silva *et al.* (2020) demonstrate that stress coping strategies used by nurses in maternity include social support, self-care, and continuing education. Health professionals who care for pregnant adolescents face challenges related to the complexity of needs, social stigmas and resource limitations. Professional training that integrates knowledge about adolescence, sexual and reproductive health and rights-centered approaches is a condition for quality care.

Bioethical reflections on transsexuals' access to public health show how discrimination compromises rights and access to care. Silva *et al.* (2022) analyze that bioethical reflections on transgender access to public health reveal the need for policies that combat discrimination and promote equity. Transgender adolescents and transvestites face specific vulnerabilities related to transphobia, violence, and limited access to sexual and reproductive health care. The promotion of sexual and reproductive rights requires recognition of gender identities and combating discrimination.

The fragility of the social name in the transition care of transgender women illustrates how disrespect for gender identities compromises quality of care and dignity. Vasconcelos *et al.* (2023) examine that the fragility of the social name in the transition care of transgender

women reveals the need for protocols that ensure respect for identities. Respect for gender identities, through the use of a social name and appropriate pronouns, is a fundamental right and a condition for humanized care. The training of health professionals that integrates knowledge about gender and sexuality diversity is a strategy for promoting equity.

5 FINAL CONSIDERATIONS

This study aimed to analyze early motherhood in the new generation, examining its psychological, social and identity impacts on pregnant adolescents and young mothers. The literature review showed that early motherhood generates complex consequences that affect mental health, educational trajectories, professional opportunities, and identity development. The results demonstrate that early motherhood affects adolescents unequally according to their socioeconomic conditions, racial identities and family contexts, evidencing the need for policies that recognize intersectionalities. The integration of perspectives from public health, psychology, gender studies, and human rights allows for a more comprehensive understanding of the phenomenon and underpins prevention and support strategies.

The contributions of this work lie in the synthesis of knowledge about psychological, social and identity impacts of early motherhood, offering an integrated view of determinants, consequences and intervention strategies. The identification of risk factors, including limited access to sexuality education and contraception, gender inequalities, and socioeconomic vulnerabilities, guides the development of prevention policies. The analysis showed that the promotion of sexual and reproductive rights of adolescents requires not only access to information and services, but also cultural transformations that combat stigma and promote autonomy, a perspective that should guide research agendas and political action.

Limitations of this research include reliance on available scientific publications, which may not fully represent the experiences of pregnant adolescents and young mothers. The concentration of studies on negative impacts limits the understanding of positive experiences and resilience strategies. The scarcity of longitudinal studies that follow the trajectories of young mothers over time limits the ability to assess the long-term effects of early motherhood. Overcoming these limitations requires investments in research that uses mixed methodologies, that involves adolescents as active subjects of knowledge production and that follows trajectories over time.

Future studies should prioritize investigations on adolescent fatherhood experiences, on resilience strategies of young mothers, and on the effectiveness of prevention and support programs. The application of participatory methodologies, which involve adolescents in the definition of research priorities and in the interpretation of results, can enrich the

understanding of experiences. The evaluation of the effectiveness of psychosocial interventions, sex education programs and policies to support young mothers is a priority to support evidence-based practices. The investigation of international experiences in the prevention of adolescent pregnancy can offer lessons for the Brazilian context.

Strengthening the prevention of teenage pregnancy requires investments in comprehensive sexuality education, access to contraceptive methods, promotion of gender equality, and strengthening life projects. Sex education that addresses dimensions of gender, rights, consent and healthy relationships is a fundamental strategy. Access to adolescent-friendly health services that ensure confidentiality and provide appropriate guidance is a sexual and reproductive right. The promotion of gender equality, through the fight against stereotypes and the valorization of female autonomy, can broaden horizons of possibilities and reduce vulnerabilities.

Early motherhood represents a complex challenge that demands integrated responses, involving prevention, psychosocial support and cultural transformations. The promotion of sexual and reproductive rights of adolescents is not only a matter of public health, but also of social justice and the realization of human rights. The challenge facing Brazilian society is to build policies and practices that ensure that all adolescent girls have access to information, services and opportunities that enable them to make informed decisions about their sexual and reproductive lives, that support those who become young mothers and that promote healthy life trajectories. autonomous and dignified.

ABSTRACT

This article aims to characterize the profile of the victim of stalking crime in the context of domestic and family violence against women in the municipality of Ananindeua, Pará, Brazil. Methodologically, this is descriptive-exploratory research, with a quantitative and documentary approach. The data used in the analysis comes from the Secretariat of Intelligence and Criminal Analysis (SIAC), and refers to all police reports registered with DEAM Ananindeua, period from April 2021 to April 2023, totaling 363 police reports for the crime of stalking. The main results highlight that the majority of victims of the crime of stalking are female (84.25%), single (53.35%), the majority were aged between 25 and 31 years (24.83%), with complete secondary education (44.29%), self-employed (34.58%) and housewives (17.55%), victimized on Monday (17.38) and Thursday (15.41%), in their homes (64.92%) and for reasons of hatred or revenge (77.41%), generally taking up to 9 days to report (92.13%).

Keywords: Domestic and Family Violence. Persecution. Feeling of Possession.

RESUMO

O presente artigo objetiva caracterizar o perfil da vítima do crime stalking no contexto da violência doméstica e familiar contra a mulher no município de Ananindeua, Pará, Brasil. Metodologicamente, trata-se de pesquisa descritiva-exploratória, com abordagem quantitativa e de caráter documental. Os dados utilizados na análise provenientes da Secretaria de Inteligência e Análise Criminal (SIAC) e são referentes a todos os boletins de ocorrência registrados na DEAM de Ananindeua período de abril de 2021 a abril de 2023, num total de 363 boletins de ocorrências do crime de stalking. Como principais resultados destaca-se que a maioria das vítimas do crime de stalking é do sexo feminino (84,25%), solteira (53,35%), com idade entre 25 a 31 anos (24,83%), ensino médio completo (44,29%), autônomas (34,58%) e donas de casa (17,55%), vitimadas na segunda-feira (17,38) e quinta-

RESUMEN

Este artículo tiene como objetivo caracterizar el perfil de las víctimas de acoso en el contexto de la violencia doméstica y familiar contra las mujeres en el municipio de Ananindeua, Pará, Brasil. Metodológicamente, se trata de un estudio descriptivo-exploratorio con un enfoque cuantitativo y documental. Los datos utilizados en el análisis provienen de la Secretaría de Inteligencia y Análisis Criminal (SIAC) y corresponden a todos los informes policiales registrados en la Comisaría de Mujeres de Ananindeua (DEAM), período comprendido entre abril de 2021 y abril de 2023, con un total de 363 denuncias del delito de stalking. Los hallazgos clave destacan que la mayoría de las víctimas de acoso son mujeres (84,25%), solteras (53,35%), con edades comprendidas entre los 25 y los 31 años (24,83%), con estudios secundarios completos (44,29%), trabajadoras por cuenta propia (34,58%) y amas de casa (17,55%), que son víctimas los lunes (17,38%) y los jueves (15,41%), en sus hogares (64,92%), y por motivos de odio o venganza (77,41%), tardando generalmente hasta 9 días en denunciar (92,13%).

Palabras clave: Violencia Doméstica y Familiar. Acoso. Posesividad.

1 INTRODUCTION

The insidious stalking known as stalking is a type of violence in relationships in which, repeatedly, the persecutor intends to have a forced connection with the victim, even if it is an accepted conduct, seen as an expression of male love in patriarchy. Adequate typification provides for the various ways that the aggressor tries to communicate, surveilling and monitoring (Grangeia; Matos, 2010) the victim.

The behaviors of stalkers associated with ex-intimate partners are: surveilling, spying, wandering around the victim's residence through phone calls, emails, visits to the home or work, making contact with third parties to find out how the victim is doing, posting revenge pornography, implanting tracking devices, threatening to commit suicide, breaking into the house or other property, damaging property, physical assault and rape, calling insistently, spying, trying to control, sending e-mails or notes (White; Longpré; Stefanska, 2022).

According to the Brazilian Yearbook of Public Security (FBSP, 2025), 95,026 (nine thousand and twenty-six) cases of women victims of persecution were registered, which represents an increase of 18.2% compared to the previous year. This is equivalent to an average of 10 women persecuted every hour in the country. The crime of stalking grew approximately 35% from one year to the next in Brazil. In Pará, there was a jump of 30.8% from January to October 2025. Experts warn that the crime of *stalking* is often a prelude to more serious violence, with about 80% of femicide cases beginning with episodes of stalking. In other words, since 2021, when the crime of stalking was typified in the Penal Code, the numbers have only grown, without considering all the cases that do not come to the attention of the competent authorities and that, therefore, do not enter into this quantitative analysis.

The rupture of domestic violence has generally occurred through external intervention, since women are rarely able to disengage from a violent man without the help of third parties, tending to an oscillating trajectory in the relationship (Saffioti, 2015). However, until the advent of the Maria da Penha Law (LMP), a legislative milestone on the subject, women did not have the proper attention in Brazil, and then femicide was defined in Law No. 13,104 of 2015, according to Haile (2020).

Since the Maria da Penha Law, the Brazilian State has been striving to curb violence, more specifically with regard to gender violence. In this context, the International Convention on the Prevention, Punishment and Eradication of Violence Against Women (Brazil, 1996) in its first article defines violence against women as any act or conduct based on gender, which causes death, damage or physical, sexual or psychological suffering to women. It adds in article 4 that everyone has the right to respect for life, physical, mental and moral integrity, emphasizing the right not to be subjected to torture and not to be discriminated against (article

6).

The crime of stalking is still new, especially in Brazil, as it was only in 2021 that it was expressly provided for in our legislation, from the inclusion of article 147-A in the Brazilian Penal Code by Law 14,132/2021. In this context, we insert Arendt's (1970) assertion about the mechanism of force applied to violence, often treated as synonyms and naturally seen as "forces of nature" or even "forces of circumstances" (*la force des choses*), generally indicating the release of energy, in this case referring to the energy of the aggressor, towards the victim in physical or social movements. In this case, the special character of social coercion is visible in the force that the stalker applies to monitor and penalize the victim, mobilizing knowledge about the social circle of the offended.

For women, the elements of violence such as the time of exposure to the acts, having their lives paralyzed and controlled by the aggressor and having no one to turn to influence the appearance of mental symptoms of anxiety and post-traumatic stress (Cabreiro, 2023). Cross-sectional research recommends further studies with victims of stalking, to indicate exposure to aggression, understand gender and sociocultural factors, risks, severity, and discuss forms of prevention (Borges; Dell'aglio, 2019).

In the first study to compare recidivism among stalkers, using four different operational definitions of recidivism, it was demonstrated that recidivism was indisputably high and occurs within a short time. It is emphasized that researching crimes other than the crime of stalking and harassment is pertinent, as many stalkers are repeat offenders. Stalkers tend to be accused and convicted more than once, and even though they are legally "constrained" by police restraining orders that are often not respected (Bendlin; Sheridan; Johnson, 2022).

Therefore, due to the implications of this behavior, the difficulties related to a clear definition of stalking and in the recognition of the behavior by the victim are studied, as it generally involves repetition of behaviors considered natural if observed separately, harmless and even desirable if viewed as seduction and courtship, which, however, can turn into constant intimidation (Roberts, 2005).

In this sense, this article aims to characterize the profile of the victim of *stalking* in the context of domestic and family violence against women in the municipality of Ananindeua, in the state of Pará, Brazil, from April 2021 to April 2023, the year of my master's research.

2 METHODOLOGY

This is a descriptive-exploratory research (Severino, 2016), with a quantitative and documentary approach (Gil, 2019). The quantitative approach research (Marconi; Lakatos, 2017) is based on numerical data to corroborate hypotheses and make considerations about

the expression of the frequency of variables, the characteristics of a given set that in this study will be about stalking crimes committed in the municipality of Ananindeua, in the state of Pará, Brazil, from April 2021 to April 2023, analyzing 363 police reports of the crime in question.

Quantification allows the analysis of intensity dimensions, introducing variables that help to better explain the phenomenon in research. To ensure reliable data, quantitative research uses techniques and reduces the risk of duplication in collection, using questionnaires with closed questions or consultation and tabulation of numerical data in documents (Rodrigues; Oliveira; Santos, 2021). In this follow-up, documentary research (Gil, 2019) refers to the exploration of data from documents and databases not previously analyzed or processed and can be carried out on documents available in public and private agencies of any nature.

The locus of this research is the city of Ananindeua, whose population in the last census in 2022 was estimated at 478,778 people and the demographic density in the same year was 2,512.20 inhabitants per square kilometer (IBGE, 2022). The period from April 2021 to April 2023 was considered as the time frame of the research, due to the enactment of Law No. 14,132/21 (Brasil, 2021), in 2021, which criminalized the conduct of the crime of stalking, inserting article 147-A, in the Brazilian Penal Code.

The source of the data used in this research was the Assistant Secretary of Intelligence and Criminal Analysis (SIAC), linked to the Secretariat of Public Security and Social Defense of the State of Pará, which, based on a formal request via letter, provided the database of police occurrence records and procedures established in the municipality of Ananindeua. The variables used for analysis are: age of the victim, gender of the victim, level of education of the victim, marital status of the victim, age of the perpetrator, sex of the perpetrator, profession of the perpetrator, unit of origin of the occurrence, unit responsible, date of registration, date of the fact, day of the week, class of the crime, middle employee, presumed cause, place of occurrence and degree of relationship. 363 police reports of the crime of *stalking* were analyzed.

Data analysis was performed using simple descriptive statistics (Bussab; Morettin, 2024), based on visual representations, such as tables and statistical graphs, as well as on the calculations of frequencies, percentages, and summary measures, which demonstrate the expressiveness of the variables (Dancey; Reidy, 2019).

3 RESULTS

A profile of victims was verified from the records of persecution in Ananindeua, in the period from April 2021 to April 2023, from the 363 police reports. Figure 1 shows that most of the victims are aged between 25 and 31 years (24.83%), followed by the age group between 39 and 45 years (20.86%).

Figure 1

Percentage by age group of victims of the crime of stalking in the municipality of Ananindeua, Pará State, Brazil, from April 2021 to April 2023

Source: Prepared by the authors based on SIAC data (2023).

Figure 2 shows that the vast majority of victims of the crime of stalking are female, with 84.25% of the records, which corroborates the maxim addressed in the present study that women are the main victims of this crime.

Figure 2

Percentage by Gender, of Victims of the crime of stalking in the municipality of Ananindeua, Pará State, Brazil, from April 2021 to April 2023

Regarding the victim's level of education, it can be seen from Figure 3 that 44.29% of the victims have completed high school (CME), followed by 17.99% of the victims with complete higher education and in third place, with 12.11%, of the victims have incomplete high school.

Furthermore, by marital status (Figure 4), a little more than half of the victims (53.35%) declared themselves single, demonstrating that even without a steady partner they are still susceptible to suffering the crime, this data is followed by common-law marriage/married, with 39.60% of the occurrences.

Figure 4

Percentage by marital status, of victims of the crime of stalking in the municipality of Ananindeua, Pará State, Brazil, from April 2021 to April 2023

Regarding the victims' profession, Table 1 shows that the majority declared themselves as "self-employed", representing 34.58%, followed by housewives, with 17.55%.

Emphasizing that the crime of stalking is linked to domestic violence. Figure 6 clarifies that private residence stands out as the place of occurrence with the highest percentage

(64.92%), in addition to public roads and the internet are the places with the most records, 13.44% and 8.85%, respectively.

It should be noted that victims often take a long time to seek help and report their aggressors, regardless of the crime they suffered. However, as can be seen in Table 3, in the crime of stalking in most cases, in the period analyzed, the difference between the day of the fact and the day the record was made, it is evident that most victims took up to 9 days to report (represented by 92.13%).

4 DISCUSSIONS

Crimes against women no longer require the physical means to be carried out, the growth of stalking, threats and psychological violence in the year 2024 indicated this. Thus, in the State of Pará, there were 1,931 complaints of stalking in 2023, which compared to the 1,168 complaints in 2022, point to a clear growth in this type of crime and awareness of it (FBSP, 2024).

Most of the victims are in the age group of 25 to 31 years old in Ananindeua, this age group is slightly lower than that reported by Gonçalves (2023) in the State of São Paulo, which obtained higher percentages in women aged 30 and 39 years (33.2%) of the victims. In turn, the quantitative research by Corte-Real (2017) and Abreu (2019) indicates a higher number of stalked women aged 18 to 22 years, these same studies corroborate that the victims of stalking are predominantly young adult women.

In this article, it was found that unlike what occurs in Portugal, where 41.2% of the participants attended only basic education and 32.9% high school (Matos *et al.*, 2012), in Ananindeua/PA, approximately 45% of the women who suffer the crime of stalking have completed high school. Understanding the level of education of these women is necessary so that educational, preventive and awareness-raising actions can be structured.

Subsequently, women who were declared single were the main victims, corroborating the data from a study by Juiz de Fora (Lopes, 2017) which indicate that 50% of the victims did not have a fixed relationship. In the present study, this finding is more expressive, 53.35% declare themselves single. Another study carried out in the metropolitan region of the city of Rio de Janeiro reaches the same profile when it comes to domestic violence, 50.3% of single women, the authors conjecture that women in a marital situation may not report violence they suffer because they do not understand that their rights are violated in certain situations, preferring to preserve their marriage (Moura; Albuquerque Netto; Souza, 2012).

It should be noted that the most expressive day of the week for the occurrence of crimes was Monday (17.38%), despite the lack of literature to confirm or confront this data, domestic violence and femicide stand out, data from Tolosa (2017) that help to confirm Monday and Sunday as the days of greatest occurrence in Belém (8.9% on this day), and this is the capital of the State that borders the municipality of Ananindeua. It is corroborated that the weekend is the day that the aggressors are free from their professional activities and probably travel to where the victim is, a situation that in theory would extend until Monday.

The victim's residence is the main place for the practice of the crime of stalking (64.92%), when prowling the residence he expects to establish contact or even threaten the woman, this is pointed out in Pinto (2022) who reiterates that for other passers-by obsessive

persecution goes unnoticed, due to the fact that the aggressor is usually someone close to the victim as in the present study. This means that major questions and concerns about security and surveillance are not even raised.

The impediment to act as one would like in one's own home or workplace brings panic and hurts women's mental health, it is not uncommon that out of fear they can change their address, or when not, they are confined inside the house with closed windows and low curtains, so that the criminal on the street does not see them at home (Santos; Tagliaferro, 2020).

Nevertheless, about 34.58% of women work informally claiming to be self-employed, although a significant number are housewives, students, housekeepers, nurses, hairdressers, teachers, administrators and technicians (approximately 66%). It is known that regarding work activity, it is common for women to suffer sabotage at work during and after separation, due to the conduct of the ex-partner in the case of stalking (29.1%) in a study by the University of Kentucky. In cases of stalking, the Kentucky study pointed out that 9.6% of the sample lost their job or did not work for a period during the relationship, 9.8% indicated that they were fired or were unable to work for a period of time during the separation from the stalker (Logan; Showalter, 2023).

It is noteworthy that the presumed cause for the most incident crime of stalking is the hatred and revenge in general of ex-partners, coinciding with femicide, a hate crime that brings up the aversion or contempt for the female gender as a justification. The pathological hatred of the female gender culminates in extreme violence, torture, murder and in the present study in psychological, moral and emotional torture, due to the obsessive persecution impacting on basic aspects of the victim's life such as the right to come and go, visit relatives and have moments of peace and leisure. This gender hatred is due to the attitude of the aggressor who does not accept that the victim continues without him, gaining independence in the post-relationship (Campos, 2015; Dias; Souza Dias, 2015). It is conjectured that one of the pertinent judgments for these data is how women suffer structural violence resulting from the very organization of society, which punishes them due to their gender (Santos, 2022).

The police station that covers the highest number of occurrences is the Specialized Police Station for Assistance to Women (DEAM) of Ananindeua. It is asserted that these specialized units of the Civil Police are sought after and endorsed among the population as participants in the network to combat gender-based violence. Women have been encouraged to report male aggressors, so it is essential to strengthen the DEAM's mechanisms for welcoming/encouraging victims and training so that professionals can provide greater support

to victims who go through situations of greater vulnerability (Oliveira; Lemos; Pereira, 2022). In cases of crime stalking, it is believed that because victims are often unaware that obsessive stalking is a crime, the numbers are underestimated.

Stalking crimes in Ananindeua/PA, in general, are registered in the interval of 0 to 9 days from the fact (92.13%), demonstrating that the victims, for the most part, seek the police stations to register complaints in a relatively agile way. About the means employed, insidious persecution (Grangeia, Matos, 2010), is committed through licit or illicit conduct, an example of a licit conduct is calling a person, it is a daily behavior. Conduit, calling repeatedly in order to take away the victim's peace can already be configured as a chasing behavior. It will be the repetition of these behaviors that distinguishes a scenario of permanent harassment, due to the *modus operandi* that the persecutor surrounds the victim.

A study from Portugal pointed out that the majority of the sample of victims reports that the behaviors of the aggressors are daily (55.7%), or at least weekly for the minority, the persistence of the aggressors lasted about six months. The bond of the stalkers varied from acquaintance, friend, neighbor or family member, with 33.5% being ex-partners, an interesting fact of this quantitative research is that the stalking process for 41 people occurred during the courtship/relationship, in the case of those who were victims of ex-partners (Pires; Sani; Soeiro, 2018).

From now on, being observed daily by someone can be characterized as something everyday, however, when this observation invades privacy, the beginning of stalking may be developing (Côrte-Real, 2017). Andrade (2022) points out that the criminalization of conduct is the first step, an immediate solution, but discusses stalking as a public health problem and the constitution of the psyche.

A recent systematic review points out that with regard to the psychocriminological treatment of male stalkers, an intensive treatment regimen with the objective of reducing the behaviors that trigger the disorder has good results. Forensic treatment programs need to be created to curb such conduct, or even more violent crimes (Travaini *et al.*, 2024).

The limitations of the study include those related to the type of study, as these are secondary data, there is a risk of registration bias and/or underreporting, in addition to time jumps. As contributions, it is revealed that the profile of the practice of stalking in this municipality can be generalized to that of other Brazilian capitals, especially for samples of women with the same characteristics as the victims of Ananindeua.

5 CONCLUSION

This study characterized important variables for the understanding of the crime of stalking as a phenomenon related to domestic violence, victimizing young adult women, mostly self-employed and housewives, with complete high school education and single.

It was noted that the advent of Law No. 14,132/2021 increased the number of reports of this crime, driven by the notion that obsessive stalking causes harm and that it is linked to acts of violence against women and that they felt compelled to report it, although the number of cases is probably higher. Monday and Thursday are the days with the highest number of cases, and the time between the commission of the crime and the complaint varies from 0 to 9 days, being a behavior motivated by male hatred and revenge, reported by the victims in the occurrences. Thus, the current study reaffirms the sexist and patriarchal character of the obsessive persecution of women, victimized due to structural gender relations and a feeling of possession on the part of persecuting ex-partners.

It is verified, therefore, that in the city of Ananindeua, in the state of Pará, domestic or intrafamily violence is imbricated with the crime of stalking, affecting the routine of the victims since the personal residence emerged as the main stage for the persecution, as perceived by the women.

Thus, it is suggested to strengthen the prevention of this crime with lectures on behaviors, structural machismo, culture of peace and on the activities developed in the DEAM to amplify awareness about the complaint. Social micro-policies must be implemented sectorally, in order to strengthen the care network for women victims.

It was noted that there is a tendency for this type of crime to grow, which should imply the construction of points of care for the physical and mental health of the victims, thus, the Women's Police Station would be the point of support for these women for health services, social assistance and support centers and legal advice, for example.

Finally, for new perspectives on the theme under study, future research should focus on how the flow of care occurs for these women considering the post-stalking support network, research on the profile of the aggressor in this municipality, repercussions on the health of these women victims of stalking and perceptions of women assisted at the DEAM about conditions and care provided to them in the search for their rights.

ACKNOWLEDGMENTS

I thank the Public Prosecutor's Office of the State of Pará for the institutional support and the professors of the Graduate Program in Public Security at UFPA for their dedication and development of the research.

ABSTRACT

This study focuses on the analysis of sexual crimes occurring in the virtual environment, especially against children, as the internet has evolved since the 1990s, introducing new forms of interaction and increasing risks for young people. Although there are national and international laws and treaties aimed at protecting children from sexual violence, the high number of cases reflects persistent challenges that require more robust public policies and an improvement in the justice system. The culture of silence, the hypersexualization of children, and the lack of sexual education contribute to the vulnerability of children. Thus, awareness, sexual education, and online monitoring are crucial to protect them and ensure a safe digital environment. This study seeks to understand the challenges in preventing and combating online sexual crimes against children, proposing policies and protective measures to mitigate these threats, in addition to also alerting parents, educators and health agents about the signs of pedophilia.

Keywords: Sexual Crimes. Children. Vulnerability.

RESUMO

Este estudo foca na análise dos crimes sexuais ocorridos no ambiente virtual, especialmente contra crianças, à medida que a internet evoluiu desde os anos 90, introduzindo novas formas de interação e aumentando os riscos para os jovens. Embora existam leis e tratados nacionais e internacionais que visam proteger as crianças contra a violência sexual, o alto número de casos reflete desafios persistentes que exigem políticas públicas mais robustas e uma melhoria no sistema de justiça, a cultura do silêncio, a hipersexualização infantil e a falta de educação sexual contribuem para a vulnerabilidade das crianças. Sendo assim, a conscientização, a educação sexual e o monitoramento online são cruciais para protegê-las e garantir um ambiente digital seguro. Este estudo busca entender os desafios na prevenção e combate aos crimes sexuais online contra crianças, propondo políticas e medidas de

proteção para mitigar essas ameaças, além de também alertar aos pais, educadores e agentes de saúde sobre os indícios da pedofilia.

Palavras-chave: Crimes Sexuais. Crianças. Vulnerabilidade.

RESUMEN

Este estudio se centra en el análisis de los delitos sexuales ocurridos en el entorno virtual, especialmente contra niños, a medida que Internet ha evolucionado desde la década de 1990, introduciendo nuevas formas de interacción y aumentando los riesgos para los jóvenes. Aunque existen leyes y tratados nacionales e internacionales destinados a proteger a los niños contra la violencia sexual, el elevado número de casos refleja desafíos persistentes que exigen políticas públicas más sólidas y mejoras en el sistema de justicia. La cultura del silencio, la hipersexualización infantil y la falta de educación sexual contribuyen a la vulnerabilidad de los niños. Por lo tanto, la concienciación, la educación sexual y el monitoreo en línea son fundamentales para protegerlos y garantizar un entorno digital seguro. Este estudio busca comprender los desafíos en la prevención y el combate de los delitos sexuales en línea contra niños, proponiendo políticas y medidas de protección para mitigar estas amenazas, además de alertar a padres, educadores y profesionales de la salud sobre los indicios de la pedofilia.

Palabras clave: Delitos Sexuales. Niños. Vulnerabilidad.

1 INTRODUCTION

The main focus of this work is to analyze crimes committed in the virtual environment, focusing more specifically on sexual crimes committed against children.

It can be seen that, from the 90's, with the emergence of the internet, new modalities of communication and interaction emerged, such as chat chats and text messages, through which social networks were consolidated, virtual spaces in which any individual can create and share content.

The legal protection of children and adolescents against sexual violence is a national and international commitment, based on treaties and laws that aim to safeguard their rights and integrity, Brazil, ratifying conventions such as the Convention on the Rights of the Child and the American Convention on Human Rights, has assumed the responsibility of adopting measures to prevent and punish all forms of sexual violence.

The Statute of the Child and Adolescent, instituted in 1990, adopts the principle of full protection, ensuring specialized care and protection measures for victims, despite this, the legislation faces challenges, reflected in the high number of cases of child and adolescent sexual violence.

To deal with this issue, it is necessary to strengthen public policies, invest in awareness and education, in addition to improving the criminal justice system to ensure more effective punishments against aggressors, only through a joint effort by society will it be possible to guarantee a safe and protected environment for children and adolescents, promoting their fundamental rights and dignity.

The advent of the internet since the 1940s has marked a revolution in communications, moving from a military tool to a social space, however, along with the opportunities also came cybercrimes, such as identity theft and wire fraud.

In Brazil, in 2022, there was a significant increase in these crimes, evidencing the need for digital protection, among these crimes, sexual crimes emerge as a threat, taking advantage of child vulnerability and ease of access to the internet, where aggressors often hide behind fake profiles to get closer to children and adolescents, perpetuating abuse and manipulation.

The responsibility for identifying and preventing crimes against children and adolescents falls mainly on the family, which must be aware of signs of abuse, sex education is essential to enable young people to recognize and report situations of abuse.

The culture of silence and child hypersexualization are obstacles that need to be overcome, open dialogue, monitoring of online activities and preventive education are

fundamental in protecting children, this responsibility is shared by parents, educators and the whole society.

The present work addresses the need to understand the predominant forms of cybercrime and the means available to combat child exploitation and pedophilia through the computer network.

These crimes are intrinsically connected by the nature of the conducts and actions perpetrated, in the current context, the criminal legal system demonstrates a certain lag in relation to the constant evolution of these criminal behaviors, such a scenario provides a kind of "safe-conduct" for criminals, encouraging the increase of crimes of a lascivious nature and financial scams, which find fertile ground to prosper.

The analysis of these criminal phenomena constitutes a complex and urgent challenge, and it is therefore urgent to promote the updating of the legal framework and the implementation of effective coping strategies, in order to preserve the safety and integrity of victims, as well as to rigorously repress those who are dedicated to perpetrating such atrocities in the digital environment.

In view of the growing use of the internet and digital technologies, what are the challenges faced in preventing and combating sexual crimes committed against children in the virtual environment, considering child vulnerability, the spread of hypersexualization and the culture of silence? In addition, how can public policies, sex education, and monitoring of online activities contribute to mitigating these crimes and promoting a safe environment for children and adolescents in the digital age?

The justification for this study is related to the importance of the theme for society. Human relationships have taken on a secondary importance with regard to the ways in which people relate to each other.

Often virtual friendships are made, without ever having seen the person in person, which often facilitates criminal actions by electronic means.

The need to promote society's awareness of the risks and implications of virtual crimes, combined with the implementation of preventive measures to mitigate such threats, is an imperative.

An in-depth understanding of the legal aspects and resources available to effectively combat cybercrime is crucial in order to establish an effective and cohesive approach to this multifaceted challenge.

By conducting an analysis of the Brazilian legal scenario regarding virtual crimes, this study aims to contribute to the debate and improvement of public policies and legislation concerning this sphere.

The preservation of citizens' rights and the protection of cybersecurity are highly relevant issues in an increasingly interconnected global context, therefore, they demand a comprehensive and up-to-date legal approach by the Brazilian legal system.

Therefore, the general objective here was to understand the general context of sexual crimes perpetrated against children in the virtual sphere, while the specific objectives were: to explore the legal protections regarding children; analyze the issue of pedophilia and child vulnerability; know about the responsibility to identify the occurrence of sexual crimes against children; explore the factors that contribute to child sexual violence.

2 CHILDREN AND FULL PROTECTION

Sexual violence, characterized as one of the most abominable forms of violence, takes on even more harmful proportions when perpetrated against children and adolescents, causing not only damage to their physical integrity, but also compromising their human dignity, sexuality and privacy - crucial aspects for the healthy development of these individuals in the growth phase. In this context, Brazil, by ratifying international conventions and treaties, assumes the commitment to protect young people against sexual crimes, in line with the constitutional principles established in article 227 of the Federal Constitution of 1988, which recognizes as the duty of the family, society and the State to guarantee, with absolute priority, a range of fundamental rights, including the right to life, to health, education, leisure, culture, dignity, respect, freedom and to family and community life (Brasil, 1988).

In addition, the Convention on the Rights of the Child, adopted by the United Nations General Assembly on November 20, 1989 and ratified by Brazil in 1990, establishes the obligation of member states to adopt appropriate legislative, administrative, social and educational measures to protect children against all forms of physical or mental violence, abuse, neglect, mistreatment or exploitation, including sexual abuse (Brasil, 1990).

Thus, this protection extends to children as long as they are under the responsibility of their parents, legal representatives or any other persons in charge of their care.

According to the contributions of Figueiredo and Novas (2000), the Convention on the Rights of the Child undoubtedly represented a significant milestone in changing the perception of children and adolescents, who began to be recognized as subjects with rights.

The author considers that its enactment was responsible for the paradigm shift in international legal norms, evolving into the Doctrine of Integral Protection, which prioritizes the condition of a person in a peculiar situation of development, ensuring the protection and rights of children and adolescents.

The American Convention on Human Rights, known as the Pact of San José, Costa Rica, ratified by Brazil through Decree 678 in 1992, aims primarily to safeguard the dignity of the human person and to protect all individuals against any manifestation of violence and exploitation, particularly those in situations of fragility, such as children and adolescents (Brazil, 1992).

In addition, the Convention establishes protection measures aimed at vulnerable groups, including children and adolescents, among these measures, the prohibition of sexual exploitation and child labor, as well as the guarantee of the right to education and protection against all forms of violence, abuse and negligence (Brasil, 1992).

In addition, the Convention provides for the establishment of mechanisms for the protection and promotion of human rights, such as the Inter-American Commission on Human Rights and the Inter-American Court of Human Rights, which are responsible for monitoring the human rights situation in the countries that are signatories to the Covenant and for adopting preventive and corrective measures in cases of human rights violations (Brazil, 1992).

The Federal Constitution guarantees the fundamental rights of all people, including children and adolescents, to ensure the realization of these rights, the Statute of the Child and Adolescent (ECA) was instituted in 1990, by Law No. 8,069. The ECA adopts the principle of full protection, aiming to safeguard all the rights of this population, including protection against sexual violence.

Specifically for cases of sexual violence, such as the rape of a vulnerable person, the ECA establishes protective measures such as specialized care, forensic examinations, confidentiality of the victim's identity, psychological and social support, in addition to protection measures such as the removal of the victim from the aggressor.

It should be noted that the full protection advocated by the ECA goes beyond the simple prevention of rape of a vulnerable person, extending to all forms of violence and sexual exploitation against children and adolescents, especially by seeking to ensure that all the rights of this population group are widely respected and protected.

In this sense, Araujo (2018) teaches that the full protection provided for in the ECA encompasses all forms of violence and sexual exploitation against children and adolescents, transcending the mere protection against the rape of the vulnerable. According to the author, this comprehensive approach guarantees the safeguarding of the rights of this population, and is essential to promote a childhood and adolescence free of violence and exploitation.

According to the understanding of the Public Security Forum, despite the existence of extensive and specific legislation to protect children and adolescents against sexual crimes

in Brazil, there is still an alarming number of cases of sexual violence involving this age group, which ends up reflecting the insufficiency of laws and public policies in force to prevent and punish such crimes (Brazilian Public Security Forum, 2022)

In this sense, the Forum understands that it is urgent to implement comprehensive and preventive policies that encompass awareness, education, protection and effective punishment of aggressors.

Society as a whole must be involved in preventing and combating sexual crimes, reporting suspected cases and supporting victims, investing in policies that facilitate access to information on prevention and reporting, together with awareness campaigns, is essential to enable people to act in the face of suspected or confirmed sexual crimes (Brazilian Forum on Public Security, 2022)

In addition, it is essential to improve the criminal justice system, through the proper training of legal operators, combined with the implementation of more severe punitive measures against aggressors, precisely to mitigate impunity and promote a greater sense of equity, both for victims and for the social body as a whole.

Therefore, the synergistic effort of all segments of society aimed at preventing and confronting sexual crimes, ensuring the safeguarding and respect for the human rights of all individuals, especially children and adolescents, who are the most susceptible to such violations.

2.1 CYBERCRIME AND CHILD VULNERABILITY

Initially, it is unavoidable to address the theme of cybercrimes without evoking the genesis of the internet, dating back to the 1940s, when the military enterprise during the Cold War functioned as a communicative alternative in the face of the vicissitudes of the traditional media of the time (Almeida, 2015).

This initial conception, aimed at war purposes, was transformed after the end of the conflict, when the internet began to be used for social purposes, marking an unprecedented era and catalyzing the development of ENIAC, the pioneering digital computer, dedicated to ballistic tasks (Santos; Martins; Tybusch, 2017). In view of this new context, contemporary types of crimes emerge, including identity theft, electronic fraud, system invasion, malware propagation, phishing, virtual harassment, among others, in the first half of 2022, Brazil was the scene of a notorious increase in the volume of attempts of cyberattacks, totaling 31.5 billion records.

This alarming data highlights the growing sophistication and frequency of virtual threats, requiring increasingly robust and effective measures to protect systems and users against such attacks.

Thus, an in-depth analysis of the causes of this exponential increase in cyber crimes is urgent, ranging from rapid technological evolution to the lack of awareness on the part of users about the best digital security practices.

In addition, factors such as the lack of adequate legislation and efficient international cooperation also contribute to the proliferation of these crimes, so it is urgent to develop multidisciplinary policies and strategies, involving governments, companies, and civil society, to address this growing challenge and protect the integrity and privacy of individuals in the digital age.

With the popularization of the internet, many people have started to use it as an integral part of their daily lives, however, not all users act sensibly or ethically when using this medium.

Many individuals mistakenly see the internet as a free space, where they can act without restrictions or consequences, this misperception contributes for the emergence of new types of crimes, known as virtual crimes (Porto; Santos, 2014).

These crimes occur in the digital environment and can include activities such as hacking, online fraud, virtual bullying, defamation, among others, thus, the lack of awareness about ethical and legal limits on the internet has led to an increase in the incidence of virtual crimes around the world (Porto; Santos, 2014).

With the progress of the Internet, the dissemination of access to this platform has become widespread, however, it is clear that not everyone uses it responsibly. Countless individuals, mistakenly persuaded that the Internet constitutes a space of unrestricted freedom, incur in inappropriate conduct, triggering new criminal modalities: virtual crimes.

Cybercrimes represent an increasingly present threat, and child vulnerability in this scenario is a growing concern, with the advancement of technology and the expansion of internet access, children are increasingly exposed to online risks, even with filters and parental controls, it is difficult to completely control what children access online (Abreu, 2013).

It is precisely at this time that they can be exposed to pornography, violence, drugs and other harmful content that can affect their emotional and psychological development (Abreu, 2013).

Therefore, a proactive approach to protecting children from these dangers is essential, involving digital education, setting clear boundaries, and proper supervision by parents and guardians.

In this way, the vulnerability of children and adolescents comes up against the ease of access to devices connected to the internet and that exposes children and adolescents to a series of risks, including contact with sexual predators, involvement in situations of sexual exploitation and access to content inappropriate for their age group.

2.2 PEDOPHILIA AND ITS RELATIONSHIP WITH CHILD SEXUAL CRIMES

Pedophilia is a paraphilia that is characterized by sexual distortion permeated by a compulsive impulse in which adult individuals, predominantly male, manifest a sexual attraction aimed both exclusively and non-exclusively at children and adolescents

According to Lowenkron (2015), the expression pedophilia has its origin in the Greek term "paidophilia" and refers to the distortion that leads an adult to feel sexual attraction to children or to effectively perform activities of a sexual nature with them, these activities can range from simple stimulation to caresses and other sexual behaviors.

According to Silva et al. (2013), the concept of pedophilia unfolds in two parts: "paidos", which means child, and "philia", which alludes to the notion of love or attraction.

This combination of terms encapsulates the core of the phenomenon, evidencing the sexual inclination towards children on the part of an adult, it is important to emphasize that pedophilia is recognized as a complex and disturbing psychological condition, with serious implications for the well-being of the children involved and for society as a whole.

In addition, according to Greco (2016, apud França, 1996), pedophilia can be conceptualized as sexual perversion characterized by the erotic predilection for children, which can range from obscene acts to the practice of libidinous manifestations, denoting serious psychic and moral impairments of its authors.

In addition, to its definition it is added that men have a greater propensity to commit pedophilia, due to difficulties in establishing satisfactory sexual relations with adult women, resulting from complexes or feelings of inferiority.

In the Brazilian context, pedophilia is classified by the World Health Organization (WHO) as a sexual preference disorder, it refers to adults, both men and women, who have sexual preferences for children, regardless of sex, usually at ages ranging from pre-puberty to puberty (Bigati, 2017).

These individuals, for the most part, are men who, at first glance, appear to be ordinary people in social life and can interact in an apparently normal way in society.

This ability to camouflage themselves facilitates the conquest of victims' trust without arousing suspicion (Bigati, 2017), this aspect reinforces the complexity and severity of this disorder, requiring a multidisciplinary approach for its prevention and treatment.

According to Ferreira et al. (2018), is configured as any act or interaction of a sexual nature, whether heterosexual or homosexual, involving one or more adults and a child or adolescent, with the purpose of sexually stimulating the minor or using it as a means to obtain one's own sexual satisfaction or that of third parties.

The pedophile perpetrator, by masking himself under the façade of an apparently conventional individual and integrated into the social fabric, manages to operate stealthily, without arousing suspicion, thus facilitating his criminal activities without attracting attention (Medina et al., 2021).

Sexual abuse, perpetrated by an adult who has advantages in contrast to the extreme vulnerability of the victimized child, occurs in a meticulously planned and reserved environment, with the aim of minimizing any material traces (Medina et al., 2021).

As a consequence, such an abusive relationship remains obscure, hidden by the family structure, culturally considered as a stronghold of security, in addition, society, in certain contexts, mythologizes the theme and demonstrates skepticism or even indulgence in the face of sexual violence, evidencing a lack of training for its detection (Medina et al., 2021).

Furthermore, according to the reflections of Ulisses (2019), child victims of sexual abuse are often subjugated to the will of others and to the suppression of their own desires, resulting in a relational dynamic marked by the asymmetry of power.

In this sense, this disparity imposes severe consequences, both in the physical and emotional spheres, which can manifest themselves in various ways and in different contexts, including school and social.

According to Medina et al. (2021) outlines, the genesis of this nefarious scenario lies in the manipulation of the child, often through seduction supported by the offer of toys, monetary resources, or even through threats that aim to ensure their silence, as a result, the cycle of sexual abuse is perpetuated, inflicting deep damage on its victims (Medina et al., 2021).

In extreme circumstances, the violence perpetrated can be so overwhelming as to result in the death of the victimized individual, this Dantesque consequence illustrates the exacerbated gravity of the situation, emphasizing the imperative urgency of combating and preventing pedophilia and child sexual abuse (Medina et al., 2021).

The study by the United Nations Children's Fund (UNICEF) on deadly and sexual violence directed at children and adolescents in Brazil, in the period from 2017 to 2020, reveals that most records of rape and rape of vulnerable people involve victims under 14 years of age, as shown by the following data:

Figure 1*Rape by age group*

Source: UNICEF, 2021.

Through the analysis of Figure 1, the distribution of cases according to age group is noticeable, revealing a significant increase in the number of occurrences from 3 years of age onwards.

During the interval from 3 to 8 years old, the incidence remains relatively stable, but experiences a more marked growth from the age of 10 onwards, culminating in the peak of occurrences at 13 years old, an age that represents 14% of victims in the age group of 0 to 19 years (UNICEF, 2021).

These data are worrying and show that 81% of the victims were up to 14 years of age, in absolute terms, of the 179,278 cases registered in this period, 145,08619 had individuals up to 14 years of age as victims (UNICEF, 2021).

The United Nations Children's Fund indicates that many cases of crimes committed against people over 13 years of age are possibly not reported, due to cultural and social divergences in relation to the perception of victimization among adolescents and children, this, however, does not imply that the crimes did not occur, but rather that they were not reported to the competent authorities (UNICEF, 2021).

Despite this finding, it is essential to emphasize that rape is a violation that mainly affects children, in fact, victims aged between 0 and 9 years represent 38% of the cases registered with victims up to 19 years old.

This data highlights the vulnerability of these individuals and the urgency of implementing preventive and punitive measures to combat this serious violation of human rights (UNICEF, 2021).

Oliveira and Rosa (2019) state that, through research and statistical analysis, it is possible to conclude that rape is a crime that mainly affects children and adolescents.

In Brazil, for example, the majority of rape victims are girls and young women, and approximately 70% of the registered cases involve female children and adolescents, many of them under 14 years old.

There is a clear pattern in the distribution of the crime of rape in relation to the sex of the victims, showing that, in most age groups, the majority of victims are female, as the data corroborate:

Figure 2

Rape by age and gender

Source: UNICEF, 2021.

In the age group of 0 to 4 years and 5 to 9 years, it is observed that girls correspond to 77% of the total victims, while boys correspond to 23%. In the age groups of 10 to 14 years and 15 to 19 years, it is noted that females are responsible for 91% of the registered cases, while males corresponds to only 9%.

These data suggest that as the age range of victims increases, the likelihood that they are girls also increases (UNICEF, 2021).

Figure 3

Rapes of female and male victims by age of the victim

Source: UNICEF, 2021.

According to data from UNICEF (2021), 66,041 cases of rape were recorded in Brazil in 2020, of which 50,933 were classified as rape of a vulnerable person, while according to the 2022 Brazilian Public Security Yearbook, there were 47,232 cases of rape of a vulnerable person in Brazil in 2021, representing 75.5% of all rape cases in the country in the same year.

The detailed analysis in the yearbook highlights the seriousness of these crimes, especially among victims up to 13 years old, totaling 35,735 occurrences, which highlights the worrying situation (Brazilian Forum on Public Security, 2022).

It is also observed that, according to UNICEF (2021), 12% of female victims were between 0 and 4 years old, while 22% were in the age group of 5 to 9 years, totaling 34% of female victims aged between 0 and 9 years.

With regard to boys, a distinct distribution of cases is remarkable, with the highest concentration occurring among those aged 0 to 9 years (59%), in specific terms, the proportion of cases for boys between 0 and 4 years old is 21%, between 5 and 9 years old is 39%, and between 15 and 19 years old it is 11% (UNICEF, 2021).

Therefore, it is evident that the distribution of cases varies considerably according to sex and age group, while cases of rape among boys are more prevalent in early childhood, cases involving girls are proportionally more common between 10 and 14 years of age.

However, it is important to highlight that the concern regarding early childhood in the case of female victims should not be underestimated, since, in absolute numbers, they are more numerous than male victims (UNICEF, 2021).

It is also crucial to consider the context where these crimes occur, as this factor exerts a determining influence on the occurrence of child and adolescent rape, so to understand the factors associated with this type of crime, it is essential to analyze:

Figure 4

Rapes by age group, gender, and place of crime

Source: UNICEF, 2021.

The analysis of these data reveals significant geographic variations in the places where the crimes are committed, depending on the age of the victim, the numbers indicate that the younger the victim, the greater the probability of suffering violence within their own residence, for age groups between 0 and 9 years, approximately 68% of crimes occur in households (UNICEF, 2021).

It is notable that the proportion of crimes that occur in homes decreases as the age of the victims advances, for example, between 10 and 14 years old, this percentage is 62%; and in the 15 to 19 age group, it is reduced to 53%.

In the latter age group, there is an increase in rape crimes on public roads or other places, in addition, both boys and girls are more likely to be victims of violence within their own homes, with percentages of 64% and 67%, respectively (UNICEF, 2021).

It is crucial to note that the underreporting of the crime of rape is a widespread phenomenon around the world, often attributed to victims' lack of trust in the justice system, fear of reprisals by the perpetrator, and a culture of victim-blaming.

The underreporting of cases of rape of vulnerable people is a worrying issue that compromises the effectiveness of public policies aimed at protecting these victims.

The author points out that the absence of records of these cases in the information systems can be attributed to several factors, such as the shame and fear of the victims and their families in reporting the aggressor, the lack of understanding about what constitutes a crime of rape of a vulnerable person, and the lack of training of health professionals and the justice system to identify and record such cases (Picini, 2015).

It is important to emphasize that as of 2011, the notification of violence became mandatory in Brazil, integrating the National List of Compulsory Notification of diseases, injuries and public health events. This list is compulsory in all public and private health services in the country (Cerqueira et al., 2017).

The Ministry of Health aims to ensure that all cases of rape treated in health services are registered through the interpersonal and self-inflicted violence notification form and entered into the Notifiable Diseases Information System (Sinan) (Cerqueira et al., 2017).

This measure aims to improve the epidemiological surveillance of the incidences of violence, while enabling the implementation of preventive and corrective strategies, while ensuring support and support for victims.

According to data provided by UNICEF, it was found that, among the spectrum of crimes analyzed, 86% were perpetrated by aggressors already known to the victims.

This proportion, which is eminent in all age groups, is corroborated below, with the exception that, despite a modest variation, only in the age group of 15 to 19 years there is an increase in the proportion of aggressors whose identity is unknown, as observed below:

Figure 5

Rapes by age and relationship between the aggressor and the victim

Source: UNICEF, 2021.

In cases of rape of vulnerable people, the crimes are often perpetrated by aggressors already known to the victims, due to the habitual interaction of these children or adolescents in family environments, at school or in activities under the supervision of parents or legal guardians.

In addition, these aggressors commonly use their position of trust and authority to garner the esteem of the victims and establish closeness (Messa, 2010).

It should be noted that the aggressor is often an individual close to the victim, which adds gravity to the crime and highlights the need to protect the most vulnerable strata of society, such as children and adolescents.

In addition, Messa underlines the relevance of sexual instruction as a preventive measure against sexual violence and the mitigation of the vulnerability of victims, as well as the urgency of public policies that guarantee access to information, health and protection for victims of sexual abuse.

The author warns that these aggressors often take advantage of the victims' fragility, whether through coercion, manipulation or threats, to achieve their goals, it is common for these aggressors to offer gifts, affection, attention or promises as artifices to gain the trust of the victims and, thus, gain access to them proximity (Messa, 2010).

Recently, the Institute of Applied Economic Research (IPEA) released a study revealing that in Brazil, currently, approximately 822 thousand cases of rape are registered per year, corresponding to an average of two cases every minute.

Unfortunately, only a tiny portion of these crimes (8.5%) come to the attention of police authorities, while only 4.2% are officially reported by the health system (IPEA, 2023)

According to IPEA, another relevant finding is that the vast majority of rape victims had some kind of link with the perpetrator(s) of the crime. Only 17.2% of the recorded cases were attributed to unknown individuals (IPEA, 2023).

The data analyzed by IPEA, from the Notifiable Diseases Information System (Sinan) of the Ministry of Health, reveal that, in the age group of 10 to 14 years, most rape episodes occur in the victims' home environment, totaling 63.16% of the cases.

In 24.8% of the occurrences, the crime was perpetrated in places of public access, while in 1.39% of the incidents, the crime took place inside educational institutions (IPEA, 2023)

In this context, child sexual crimes arise, since the combination of the vulnerability intrinsic to the child condition and the paraphilia of pedophilia, combined with the multiple opportunities provided by the virtual environment, facilitates the approximation of aggressors to children (Silva et al., 2013).

Often, these aggressors hide behind screens, presenting themselves as people of the same age group to gain the trust of the victims and thus fulfill their perverse desires (Silva et al., 2013).

In this way, with the wide accessibility and ease of communication provided by the internet, it has become a particularly attractive tool for pedophiles.

The virtual environment, full of chat rooms and social networks, facilitates meetings with victims, pedophiles often use fake profiles to hide their true identity, manipulating and deceiving victims, in addition, they use a vocabulary closer to children and adolescents to establish a connection (Silva et al., 2013).

In legal terms, vulnerability covers individuals under 14 years of age and those who, for any other reason, lack the capacity to grant conscious and voluntary consent for sexual or libidinous activities (Fiorelli, 2021), the crime is configured even in the absence of violence or serious threat, due to the presumption of violence in these cases.

As for the fragility resulting from age, the insurmountable limit of 14 years is firmly established by national legislation, the granting of consent by individuals under 14 years of age, in the context of sexual or libidinous activities, is legally disregarded, and is not relevant to the characterization of the crime.

In this sense, for example, the definition of the crime of rape of a vulnerable person does not require the demonstration of resistance by the victim or the use of violence or serious threat by the aggressor, contrary to what is required in the crime of rape as provided for in article 213 of the Brazilian Penal Code (Greco, 2021).

The simple performance of libidinous acts or the practice of carnal intercourse with a vulnerable individual falls within the typification of the crime, regardless of the specific circumstances (Greco, 2021).

In fact, the legal definition of vulnerability and the consequent typification of the crime of rape of a vulnerable person can give rise to significant legal debates, for example, the identification of who, in addition to children under 14 years of age, may be considered vulnerable for the purposes of characterizing the crime is an issue that can be discussed (Fiorelli, 2021).

In the psychological sphere, it is important to emphasize that the effects of rape of vulnerable people on victims can be especially devastating, given their condition of vulnerability (Oliveira; Bezerra, 2022).

Sexual violence can have immeasurable repercussions on the psychological and emotional development of vulnerable individuals, requiring an adequate response from the justice system and other sectors of society.

In addition, the crime of rape of a vulnerable person, although distinct from pedophilia, can occur simultaneously with other crimes when the agent records, through filming, photographs or other means, the practice of sexual acts with the victim and, subsequently, discloses them or not.

While the rape of a vulnerable person requires the consummation of the sexual act with the vulnerable victim, such a requirement is not required in the modalities of pedophilia provided for in the Statute of the Child and Adolescent.

It should be noted that there is no specific provision on rape in the Statute, as well as there is no legal provision for pedophilia in the Penal Code (Taquary; Taquary, 2018)

Thus, the lack of specific provisions in these legislations underscores the importance of a responsible approach to combating sexual violence against children and adolescents

3 RESPONSIBILITY FOR THE IDENTIFICATION OF CRIMES PERPETRATED AGAINST CHILDREN

Being a principle widely recognized by society, it is up to the family to ensure the upbringing and education of children and adolescents, guiding them to a life guided by honesty and morality before the community.

In this sense, the family is of great importance in identifying anomalous signs and behaviors in their children, potential victims, as soon as such behaviors are identified or discovered, it becomes feasible to call the police authorities to start the search for the suspect, preventing him from committing illegal acts again (Jarduli; Agostinho, 2010).

3.1 THE RESPONSIBILITY OF PARENTS

Victims of sexual abuse may think that they are being punished for having done something wrong and so that is why they have suffered this type of violence, many even think about committing suicide.

It is up to parents, family members, acquaintances, educators and health professionals to identify pedophilia early and in the treatment, one of the attitudes to be taken is to pay attention to the behavior, way of acting and thinking of adolescents and children. Understanding the devastating outcome of sexual abuse at an early age is essential to reinforce the need for punishment and intervention that prevents further actions of new pedophiles that may arise (Marra, 2016).

For the child who suffers sexual violence, Capitão and Romaro (2008) state that:

It becomes much more difficult to seek help, since she often thinks that no one will believe her, also thinking that she may be the cause of family conflicts. Thus, these children keep their history with them for long and lonely years until they reach a certain more mature age, when new conditions finally make it possible to reveal the cases. However, until that moment finally arrives, its history has already been marked by long periods of abuse and sexual violence, bringing trauma and irreversible problems to the composition of their lives.

In this way, they often feel unable to share their experience, because they fear not being believed or fear causing family conflicts by denouncing the abuser, so they end up keeping the history of abuse to themselves for years, until they feel more mature or safe to reveal it.

However, this prolonged silence can cause deep damage to the child, while suffering in silence, facing the devastating effects of abuse, including emotional trauma, self-esteem problems and relationship difficulties, when they finally find the courage to reveal the abuse, they already carry with them a long history of suffering (Captain; Romaro, 2008)

This situation underscores the importance of creating safe and welcoming environments for children to feel comfortable reporting cases of sexual abuse, it also highlights the need for education and awareness so that society as a whole can recognize the signs of abuse and offer adequate support to victims, thus reducing the devastating impact of these crimes on their lives.

3.2 THE CULTURE OF SILENCE

In this sense, going against the responsibility of parents, it is verified that the culture of silence constitutes a social phenomenon that affects the occurrence of crimes perpetrated against children and adolescents (Faleiros, 2000)

The lack of instruction, education and open debates on the subject, combined with the fear of retaliation by the aggressors and the ineptitude of support on the part of the authorities and the community, are some of the main obstacles that sustain this culture (Faleiros, 2000). In this environment, a study conducted with 11 children and adolescents who were victims of sexual abuse and who had shared the experience with close individuals and/or sought help in specialized services, through individual interviews, the authors sought understand the process of reporting and reporting abuse, as well as identify the barriers and facilitators present in this context (Santos; Dell'aglio, 2010).

The results revealed that reporting abuse proved to be a challenging process for children and adolescents, who are often confronted with feelings of fear, shame and guilt in the face of the violence suffered, however, when they chose to reveal the abuse, they did so due to the perception of the need for support and support to face the situation (Santos; Dell'aglio, 2010)

In addition, the authors emphasize that the reception and support offered by health and social assistance professionals played a primary role in the process of reporting abuse and in access to justice.

However, some barriers were also identified, such as lack of information and limited access to specialized services in certain regions of the country (Santos; Dell'aglio, 2010).

3.3 TECHNOLOGY AND ITS LIMITATION

There are limits that can be imposed by those responsible in order to prevent contact with individuals who present such criminal conduct, such as the restriction of time for the use of screens: Tablets, cell phones, computers and the like.

Nowadays, it is usual for the new generation to have more access to technology, since the internet is, nowadays, the main means of communication in the world (Teles, 2020)

In addition, because of the pandemic and the adaptations imposed, children and adolescents have become increasingly connected, which imposes on parents the responsibility of closely supervising the websites visited, games and chats accessed, as well as monitoring their activities on social networks.

By establishing clear rules and imposing limits, parents contribute significantly to the healthy and safe development of their children, enriching their education and promoting responsible digital interaction (Teles, 2020)

Furthermore, the dangers are not limited only to open networks, but also extend to the so-called deep web, a restricted communication network accessed through specific software, this environment presents serious risks, becoming a favorable terrain for harmful activities, such as the sexual exploitation of children and adolescents, as well as exposure to harmful mental content and inappropriate materials (Teles, 2020)

In addition, the relevance of moderation in the use of electronic devices as a preventive measure to avoid such aggressions is highlighted, aiming to safeguard the child's mental well-being, since the psychological sequelae resulting from these episodes can last indefinitely.

As evidenced by several studies, the ramifications of child and adolescent sexual abuse are wide-ranging, affecting all spheres of human existence and leaving indelible marks - physical, psychological, social, sexual, among others - that have the potential to significantly compromise the life of the victim, whether a child or adolescent, who has been subjected to such forms of violence (Cabral, et al., 2021).

Therefore, it is found that children and adolescents who have been victims or are under the spectrum of this type of aggression often face a multiplicity of challenges, such as learning difficulties, sleep disorders, recurrent nightmares and aversion to physical contact, these experiences can lead them to become withdrawn, aggressive, shy individuals, among other behavioral and emotional problems.

Thus, it is essential to impose limits and monitor what is accessed by parents and guardians, aiming to prevent the dignity and mental health of children and adolescents.

4 FACTORS THAT CONTRIBUTE TO CHILD SEXUAL VIOLENCE

Child sexual violence is a problem that involves multiple elements and variables, among these, the social aspects stand out, which exert a substantial influence on the behavior of individuals who perpetrate sexual abuse against children and adolescents.

The lack of clarification and awareness about the issue of sexual violence is one of the preponderant factors for the occurrence of this type of violence against children and adolescents.

Often, young people are unaware of the details of sexual violence, lacking resources to identify or report episodes of abuse, and adults are often unable to recognize the signs of abuse or to discuss the issue adequately with children.

4.1 SEX EDUCATION

Souza (2020) highlights the paramount importance of sex education as a fundamental tool to enable students to identify and prevent situations of abuse and harassment, as well as to understand their rights and claim autonomy over their bodies, the teacher also points out that the dissemination of information plays a crucial role in the prevention of sexual violence, especially among children

Souza (2020) argues that, for several families and even some educational institutions, there is an apprehension that teaching about sexuality can stimulate children's curiosity, eventually promoting the early onset of sexual activity among children.

However, studies conducted by the World Health Organization (WHO) show that the scarcity of information tends to precipitate the beginning of sexual life, often associated with episodes of violence.

Thus, a preventive strategy against crimes of sexual violence directed at children and adolescents in the digital sphere is child sex education, which can be transmitted both by the family nucleus and by school institutions.

According to the official early childhood website, it is crucial to reposition sexual rights in the context of Brazilian society, so that it is understood that such rights are inherent to the human condition and should not be suppressed by moral prejudices.

The author highlights the importance of understanding sexuality as a fundamental dimension of the human being, present throughout life and encompassing various manifestations beyond the sexual act itself.

The promotion of comprehensive sexuality education allows students to access knowledge about their sexuality, including naming body parts, recognizing personal boundaries, and understanding early life (Early Childhood, 2020).

It is essential to break the social stigma around sex education to ensure that children understand the inviolable limits of their bodies, both in the physical and digital worlds, in addition, guardians must educate minors about the risks present on the internet, instructing them on how to act in uncomfortable or embarrassing situations online.

Parents should also address the definitions and characteristics of sexual abuse, empowering minors themselves to identify and report such situations, in addition, it is valid to warn about the dangers of fake profiles and possible criminals on virtual relationship platforms.

Pedophilic activities often disguise themselves as innocent games, such as "playing doctor", requiring a vigilant and preventive approach on the part of those responsible (Trindade; Breier, 2009).

Children and adolescents end up entering these "games" of chat rooms, in which they start everything with a simple conversation, little by little affinities emerge and then they unknowingly come across an aggressor on the other side of the screen believing that they are having a relationship with someone their age, because the victim surrenders to what he hears, a supposed past confidence transmitted by the until then unknown aggressor who makes the victim tell details of her intimate life to him.

This trust acquired by the pedophile causes a new unhealthy action to arise, initiating erotic requests that are often naively answered by the victim, starting to send naked photos and videos to the aggressor (Trindade; Breier, 2009).

In addition, the "modus operandi" proceeds with the aggressor arranging a meeting, taking the victims by surprise by revealing their true identity without giving them time to react.

However, some victims, even aware of the true identity of the aggressor, may delude themselves, believing they are involved with a romantic partner, only realizing their bad intentions when the abuse begins, accompanied by coercion and violence.

In this sense, Azambuja (2006, p.12),

By a sexual act or game, in a heterosexual or homosexual relationship, between one or more adults and a child or adolescent, with the purpose of sexually stimulating this child or adolescent, or using it to obtain sexual stimulation over himself or another person.

Thus, such acts can be mitigated through computer programs that monitor the online activities of children and adolescents, however, such measures must be complemented by an open and frank dialogue within the family, in order to prevent the child from feeling invaded in his privacy or perceiving a lack of trust on the part of the parents, thus preventing possible adverse reactions.

In this context, it is up to legal guardians and education professionals to adopt a proactive and educational approach, equipping children with tools to protect themselves from sexual abuse and other forms of inappropriate behavior.

Such an assignment requires that educators be adequately prepared to discuss issues related to sexuality in the classroom, creating an environment conducive to dialogue and reflection by students.

Additionally, teachers can instruct on assertive communication techniques, enabling students to recognize and respond to risk situations safely and autonomously

At the same time, the United Nations Children's Fund (UNICEF), through its manifesto entitled "Education That Protects Against Violence", defends the universalization of sex

education classes in schools, without distinction of individual characteristics, and emphasizes the importance of respect for the bodily and sexual integrity of each individual.

In addition, educational institutions are urged to provide accessible and safe mechanisms for reporting cases of harassment and violence, in accordance with inclusive guidelines and educational policies (UNICEF, 2019).

4.2 THE CULTURE OF MACHISMO

It should be noted that the culture of machismo can exert considerable influence on child sexual abuse, since this mentality exalts male domination and female subjugation.

According to Reis and Santos (2018), machismo, by promoting the superiority of men and the inferiority of women, favors the devaluation of the female sex and its objectification, thus perpetuating sexual violence against children and adolescents.

In this context, machismo can distort the perception of power relations and consent, culturally legitimizing sexual violence against young people, in addition, the macho culture can make it difficult to report and prevent child sexual abuse, since the victim is often blamed for what happened.

According to Bicalho (2018), in a patriarchal society, it is common for men to be seen as having control, while women assume a submissive role, this sexist mentality can induce the false belief that men have the right to dispose of a woman's body, and, by extension, a child's body.

Therefore, it is undeniable that the culture of machismo exerts a considerable influence on child sexual violence, by praising male hegemony and female subordination, which results in a distorted perception of the dynamics of power and consent.

Thus, the macho culture can obstruct efforts to report and prevent sexual violence against children, since the victim is often blamed for what happened.

4.3 HIPERSEXUALIZATION

The early exposure of children to sexual content in media and advertising can naturalize sexual violence against them, contributing to the normalization of this type of behavior.

In this sense, Branco and Oliveira (2017) consider that child hypersexualization is a problem that can be due to the early exposure of children to sexual content in media and advertising and that can naturalize sexual violence against them, contributing to the normalization of this type of behavior.

According to Ribeiro and Souza (2018) they consider that Hypersexualization is related to media exposure, it is a social phenomenon that can be driven by children's exposure to sexual content in media and advertising, this early exposure can naturalize sexual violence against them, contributing to the normalization of this type of behavior.

According to Silva and Freitas (2019), the early exposure of children to sexual content in media and advertising is one of the main factors that contribute to child hypersexualization, a reality that is increasingly present in our society and that can naturalize sexual violence against children, which contributes to the normalization of this type of behavior.

In this way, this type of exposure can naturalize sexual violence against children, contributing to the normalization of this type of behavior, when children are exposed early to sexual content in media and advertising, this can naturalize sexual violence against them, making society see this practice as something common and acceptable.

5 FINAL CONSIDERATIONS

The study in question promoted an exhaustive analysis of sexual crimes perpetrated against children, both in physical and virtual settings, in addition to thoroughly examining the relevant legislation and related protection policies.

It was undeniably evident that the legal protection of children against sexual violence represents a national and international commitment, supported by treaties that enshrine their inalienable rights.

Brazil, by ratifying these treaties, committed itself to the international community to adopt preventive and repressive measures aimed at curbing all forms of violence of a sexual nature perpetrated against children and adolescents.

Despite the paradigmatic advances achieved in the legislative sphere, we are still faced with major challenges, such as the high incidence of sexual crimes, endemic underreporting, and the generalized sense of impunity that permeates such circumstances.

Such a situation raises the urgent need to strengthen the relevant public policies, invest massively in awareness and education campaigns, as well as improve the structure of the judicial system, in order to enable effective punishments against the perpetrators of such hardships.

An in-depth analysis of cybercrime and the intrinsic vulnerability of children in cyberspace has revealed an unsettling reality in which technological progress increasingly exposes young people to online risks, including harassment by sexual predators and access to content inappropriate for their age groups.

In this context, it is imperative to adopt a proactive approach aimed at safeguarding them, encompassing the implementation of comprehensive public policies, digital education, and the imposition of unequivocal limits by parents and legal guardians.

Therefore, the inescapable relevance of prevention is manifested as a fundamental support in the safeguarding of children against such affronts, such a prerogative encompasses.

Not only the reprimand of the aggressors, but also the awareness of the community about the indications of abuse and the promotion of a culture that prioritizes child protection, to face these challenges, a concerted effort is needed that brings together the public power, justice institutions, civil society organizations, educational bodies and families, thus aiming to build an environment that proves to be safe and protected for all children and adolescents, in addition to trying to deconstruct the culture of silencing the problem and stop sexualizing the children, filtering them from social networks and virtual environments.

Furthermore, it is also valid to deconstruct over time the culture of the superiority of the male sex in relation to the feminine, treating the equal in their equality and the unequal according to their inequalities, thus trying to balance "the scales".

ABSTRACT

Context: The practice of barefoot weight training has gained popularity, with advocates arguing benefits such as improved proprioception and stability. However, there are controversies regarding the actual benefits and potential risks of this practice, especially for fundamental exercises like squats and lunges. Objective: To identify, critically evaluate, and synthesize the available scientific evidence on the benefits and drawbacks of barefoot weight training, specifically focusing on squats and lunges compared to shod practice. Methods: A systematic review was conducted following PRISMA guidelines. Searches were performed in the databases PubMed/MEDLINE, Scopus, Web of Science, SciELO, LILACS, SPORTDiscus, Cochrane Library, and Google Scholar, using terms related to barefoot exercises, squats, lunges, and relevant outcomes. Experimental studies, clinical trials, and systematic reviews published between 2010 and 2025 in Portuguese, English, or Spanish that compared barefoot exercises with shod exercises were included. Methodological quality was assessed using the PEDro, AMSTAR-2, and ROBINS-I scales. Data were synthesized narratively by outcome categories. Results: Ten studies met the eligibility criteria. The evidence suggests that barefoot exercises may improve proprioception and sensory feedback, increase the activation of stabilizing muscles of the foot and ankle, and alter load distribution among the lower limb joints, with greater emphasis on hip muscles and less stress on the knee. However, potential drawbacks were also identified, including changes in movement kinematics, possible reductions in stability in certain directions, especially medio-lateral, and increased risk of overload injuries to the structures of the foot and ankle. The methodological quality of the studies varied from low to high, with considerable heterogeneity in assessment methods and studied populations. Conclusion: The practice of barefoot weight training presents both benefits and potential risks. The decision to perform squats and lunges barefoot should be individualized, considering training objectives, injury history, and personal preferences. Gradual implementation is recommended, with attention to technique and monitoring for signs of discomfort, especially in the structures of the foot and ankle.

RESUMO

Contexto: A prática de exercícios de musculação descalço tem ganhado popularidade, com defensores argumentando benefícios como melhor propriocepção e estabilidade. No entanto, há controvérsias sobre os reais benefícios e potenciais riscos desta prática, especialmente para exercícios fundamentais como agachamento e afundo. **Objetivo:** Identificar, avaliar criticamente e sintetizar as evidências científicas disponíveis sobre os benefícios e malefícios da prática de exercícios de musculação descalço, com foco específico em agachamento e afundo, em comparação com a prática calçada. **Métodos:** Foi realizada uma revisão sistemática seguindo as diretrizes PRISMA. Buscas foram conduzidas nas bases de dados PubMed/MEDLINE, Scopus, Web of Science, SciELO, LILACS, SPORTDiscus, Cochrane Library e Google Acadêmico, utilizando termos relacionados a exercícios descalços, agachamento, afundo e desfechos relevantes. Foram incluídos estudos experimentais, ensaios clínicos e revisões sistemáticas publicados entre 2010 e 2025, em português, inglês ou espanhol, que compararam exercícios descalços com calçados. A qualidade metodológica foi avaliada utilizando as escalas PEDro, AMSTAR-2 e ROBINS-I. Os dados foram sintetizados narrativamente por categorias de desfechos. **Resultados:** Dez estudos atenderam aos critérios de elegibilidade. As evidências sugerem que exercícios descalços podem melhorar a propriocepção e o feedback sensorial, aumentar a ativação de músculos estabilizadores do pé e tornozelo, e alterar a distribuição da carga entre as articulações dos membros inferiores, com maior ênfase nos músculos do quadril e menor estresse no joelho. No entanto, também foram identificados potenciais malefícios, incluindo alterações na cinemática do movimento, possível redução da estabilidade em algumas direções, especialmente médio-lateral, e aumento do risco de lesões por sobrecarga nas estruturas do pé e tornozelo. A qualidade metodológica dos estudos variou de baixa a alta, com heterogeneidade considerável nos métodos de avaliação e populações estudadas. **Conclusão:** A prática de exercícios de musculação descalço apresenta tanto benefícios quanto riscos potenciais. A decisão de realizar agachamento e afundo descalço deve ser individualizada, considerando os objetivos de treinamento, histórico de lesões e preferências pessoais. Recomenda-se implementação gradual, com atenção à técnica e monitoramento de sinais de desconforto, especialmente nas estruturas do pé e tornozelo.

RESUMEN

Contexto: La práctica del entrenamiento con pesas descalzo ha ganado popularidad, con defensores argumentando beneficios como la propiocepción mejorada y la estabilidad. Sin embargo, existe controversia con respecto a los beneficios reales y los riesgos potenciales de esta práctica, especialmente para ejercicios fundamentales como sentadillas y estocadas. **Objetivo:** Identificar, evaluar críticamente y sintetizar la evidencia científica disponible sobre los beneficios y los daños del entrenamiento con pesas descalzo, con un enfoque específico en sentadillas y estocadas, en comparación con el entrenamiento con pesas calzado. **Métodos:** Se realizó una revisión sistemática siguiendo las pautas PRISMA. Se realizaron búsquedas en las bases de datos PubMed/MEDLINE, Scopus, Web of Science, SciELO, LILACS, SPORTDiscus, Cochrane Library y Google Scholar, utilizando términos relacionados con el ejercicio descalzo, sentadillas, estocadas y resultados relevantes. Se incluyeron estudios experimentales, ensayos clínicos y revisiones sistemáticas publicadas entre 2010 y 2025, en portugués, inglés o español, que compararon el ejercicio descalzo con

calzado. La calidad metodológica se evaluó mediante las escalas PEDro, AMSTAR-2 y ROBINS-I. Los datos se sintetizaron narrativamente por categorías de resultados. Resultados: Diez estudios cumplieron los criterios de elegibilidad. La evidencia sugiere que el ejercicio descalzo puede mejorar la propiocepción y la retroalimentación sensorial, aumentar la activación de los músculos estabilizadores del pie y el tobillo y alterar la distribución de la carga entre las articulaciones de las extremidades inferiores, con mayor énfasis en los músculos de la cadera y menos estrés en la rodilla. Sin embargo, también se identificaron daños potenciales, incluyendo alteraciones en la cinemática del movimiento, posible reducción de la estabilidad en algunas direcciones, especialmente mediolateral, y un mayor riesgo de lesiones por sobreuso en las estructuras del pie y el tobillo. La calidad metodológica de los estudios varió de baja a alta, con una heterogeneidad considerable en los métodos de evaluación y las poblaciones de estudio. Conclusión: La práctica del entrenamiento con pesas descalzo presenta tanto beneficios como riesgos potenciales. La decisión de realizar sentadillas y zancadas descalzo debe ser individualizada, considerando los objetivos de entrenamiento, el historial de lesiones y las preferencias personales. Se recomienda una implementación gradual, prestando atención a la técnica y vigilando la aparición de molestias, especialmente en el pie y el tobillo.

1 INTRODUCTION

Strength training is an exercise modality widely recommended by health and sports organizations to improve physical fitness, health, and athletic performance (AMERICAN COLLEGE OF SPORTS MEDICINE, 2023). Among the various exercises that make up strength training programs, the squat and lunge stand out as fundamental movements that involve multiple joints and muscle groups, being considered pillars of training for lower limbs (SCHOENFELD, 2020).

Traditionally, these exercises are performed with specific shoes for training or weightlifting, which offer stability, support, and protection. However, in recent decades, there has been a growing trend of practitioners performing barefoot bodybuilding exercises, driven by movements such as "natural fitness" and "minimalist training" (LIEBERMAN, 2018). This practice is often justified by arguments related to improved proprioception, greater stability, and more natural muscle activation patterns (FRANKLIN et al., 2018).

Proprioception, defined as the conscious and unconscious perception of joint position and movement, plays a crucial role in the proper execution of strength exercises (RIEMANN; LEPHART, 2002). Theoretically, removing the artificial interface between the foot and the ground could increase sensory feedback, allowing for better neuromuscular control during exercise execution (BISCARINI et al., 2024). In addition, the absence of heel elevation, common in conventional footwear, could modify the biomechanics of movement, altering the load distribution between the joints of the lower limbs (SOUTHWELL et al., 2016).

On the other hand, critics of this practice argue that the absence of shoes can compromise stability during exercises with high loads, increase the risk of injury to the structures of the foot and ankle, and potentially alter the execution technique in an unfavorable way (COHEN et al., 2023). Specific footwear for weightlifting, for example, is designed with characteristics such as rigid soles and heel lift, which would theoretically optimize movement mechanics and force production (SCHERMOLY et al., 2015).

Despite the growing interest in barefoot exercise and controversies about its potential benefits and risks, the scientific literature on the subject, specifically in the context of squats and lunges, remains fragmented and without consensus. Individual studies have investigated specific aspects such as muscle activation (BROWN, 2013), three-dimensional kinematics (SOUTHWELL et al., 2016), stability (DUAN et al., 2025) and force production (SCHERMOLY et al., 2015), but a comprehensive synthesis of the available evidence has not yet been carried out.

Systematic reviews are key to synthesizing scientific evidence and guiding evidence-based practice (HIGGINS et al., 2019). In the context of Physical Education and Sports

Science, where practices are often adopted based on tradition or trends, systematic reviews are particularly important to critically evaluate the efficacy and safety of specific interventions (BISHOP, 2008).

Considering the growing popularity of barefoot exercises, the lack of consensus in the literature, and the absence of a comprehensive synthesis on the subject, this systematic review aims to identify, critically evaluate, and synthesize the available scientific evidence on the benefits and harms of barefoot weight training, with a specific focus on squats and lunges, compared to the practical sidewalk. The results of this review may provide evidence to guide Physical Education practitioners and professionals in their decisions about the adoption of this practice.

2 METHODS

This systematic review was conducted in accordance with PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines (PAGE et al., 2021).

2.1 ELIGIBILITY CRITERIA

The eligibility criteria were established using the PICOS framework:

Population: Healthy adults (18-65 years), including athletes and recreational bodybuilders, of both sexes.

Intervention: Bodybuilding exercises performed barefoot, with a specific focus on squats and lunges, including any variation of these exercises (barbell, dumbbell, unilateral, etc.).

Comparator: Exercises performed with conventional shoes, specific weightlifting shoes or minimalist shoes.

Outcomes: Proprioception and sensory feedback; stability and balance; muscle activation; kinematics and kinetics of motion; performance (strength, power); risk of injury; subjective perception (comfort, stability, preference).

Study design: Experimental studies, randomized controlled trials, non-randomized clinical trials, analytical observational studies, systematic reviews, and meta-analyses.

Studies published in the last 15 years (January 2010 to April 2025), in Portuguese, English, or Spanish, with full text available, were included. Studies with participants with specific injuries or pathologies, studies focused exclusively on running or other sports without a bodybuilding component, studies without a control or comparison group, case reports, editorials, letters to the editor, and studies with a PEDro score of less than 3 were excluded.

2.2 SOURCES OF INFORMATION AND SEARCH STRATEGY

The search was performed in the following electronic databases: PubMed/MEDLINE, Scopus, Web of Science, SciELO, LILACS, SPORTDiscus, Cochrane Library and Google Scholar (limited to the first 200 citations). In addition, manual searches were carried out in the references of the included studies and in the annals of the main congresses of Physical Education and Sports Sciences in the last 5 years.

The search strategies were developed using combinations of terms related to the intervention (barefoot, unshod, minimalist footwear), exercises (resistance training, weight lifting, squat, lunge, resistance exercise, bodybuilding, resistance training, squat, lunge) and outcomes (biomechanics, proprioception, muscle activation, stability, balance, injury risk, performance, biomechanics, proprioception, muscle activation, stability, balance, risk of injury, performance). The terms were combined using the Boolean operators AND and OR, and filters were applied for publication period and language when available.

2.3 SELECTION OF STUDIES

The study selection process was carried out in two stages. In the initial screening, titles and abstracts of the studies identified in the search were evaluated. Potentially eligible studies were selected for full-text reading. In the secondary screening, the full text of the pre-selected studies was independently evaluated, applying the eligibility criteria.

The selection process was documented in a PRISMA flowchart, detailing the number of studies at each stage and the reasons for exclusion.

2.4 DATA EXTRACTION

A standardized form for data extraction was developed, including: information about the study (author, year, country, study design); characteristics of the participants (number, age, gender, level of training); details of the intervention (type of exercise, load, volume, frequency); details of the comparator (type of footwear); evaluated outcomes and evaluation methods; main results for each outcome; and authors' conclusions.

2.5 EVALUATION OF METHODOLOGICAL QUALITY

The methodological quality of the studies was assessed using: PEDro scale for experimental studies and clinical trials; AMSTAR-2 for systematic reviews; and ROBINS-I Tool for observational studies.

The PEDro scale assesses 11 criteria: (1) specified eligibility criteria; (2) random allocation; (3) hidden allocation; (4) comparability from baseline; (5) blinding of participants;

(6) blinding of therapists; (7) evaluators were blinded; (8) adequate follow-up; (9) intention-to-treat analysis; (10) statistical comparisons between groups; and (11) point estimates and variability. The total score ranges from 0 to 10 (the first item is not included in the total score), with higher scores indicating better methodological quality. Studies were rated as high quality (7-10 points), moderate quality (5-6 points), or low quality (0-4 points).

AMSTAR-2 assesses 16 items related to the methodological quality of systematic reviews, including registered protocol, comprehensive search strategy, selection of duplicate studies, duplicate data extraction, list of excluded studies, detailed characteristics of included studies, risk of bias assessment, appropriate methods for combining results, assessment of publication bias, and declaration of conflicts of interest. Based on the evaluation of these items, reviews were rated as high, moderate, low, or critically low quality.

The ROBINS-I tool assesses risk of bias in non-randomised trials in seven domains: bias due to confounding, bias in participant selection, bias in the classification of interventions, bias due to deviations from intended interventions, bias due to missing data, bias in the measurement of outcomes, and bias in the selection of reported outcomes. Based on the assessment of these domains, studies were classified as having low, moderate, serious, or critical risk of bias.

The studies were classified according to their methodological quality as: high, moderate, low or very low.

2.6 SUMMARY OF THE DATA

A narrative synthesis of the results was performed, organized by outcome categories: proprioception and sensory feedback; stability and balance; muscle activation and load distribution; kinematics and kinetics of motion; performance; risk of injury; and subjective perception.

For each category, the results of the individual studies were presented, highlighting agreements and disagreements between them. When possible, subgroup analyses were performed for: participant level (athletes vs. recreational); type of exercise (squat vs. lunge); and type of comparator (conventional shoes vs. specific shoes).

The methodological and clinical heterogeneity between the studies was evaluated qualitatively. Due to substantial heterogeneity in assessment methods, populations studied, and reported outcomes, it was not possible to perform meta-analysis.

2.7 ASSESSMENT OF THE CERTAINTY OF THE EVIDENCE

The certainty of the evidence for each outcome was assessed using the GRADE (Grading of Recommendations Assessment, Development and Evaluation) system, considering: risk of bias; inconsistency; indirect evidence; imprecision; and publication bias. The certainty of the evidence was rated as high, moderate, low or very low.

The GRADE system initially considers randomised trials as high-quality evidence and observational trials as low-quality evidence. The rating may be downgraded based on limitations in study design, inconsistency in results, indirect evidence, imprecision, or publication bias.

3 RESULTS

3.1 SELECTION OF STUDIES

The search in the databases identified a total of 487 records. After the removal of duplicates, 312 records were sorted by title and abstract, of which 267 were excluded. Of the 45 articles evaluated in full text, 35 were excluded for the following reasons: they did not compare barefoot exercise with footwear (n=14); did not evaluate squatting or lunging (n=9); participants with injuries or pathologies (n=4); inadequate study design (n=5); full text unavailable (n=2); insufficient methodological quality (n=1). In the end, 10 studies were included in the qualitative synthesis. The selection process is detailed in the PRISMA flowchart (Figure 1).

Figure 1

PRISMA flowchart of the study selection process

Fluxograma PRISMA do Processo de Seleção dos Estudos

Source: Authors.

3.2 CHARACTERISTICS OF THE STUDIES

The 10 included studies were published between 2013 and 2025, with 5 conducted in North America, 3 in Europe, 1 in Asia, and 1 in Oceania. Regarding the design, 3 were randomized clinical trials, 4 were non-randomized clinical trials, 2 were cross-sectional studies, and 1 was a systematic review with meta-analysis.

Figure 2

Geographical distribution of included studies

Source: Authors.

Figure 3

Distribution of study designs included in the review

Source: Authors.

The sample size ranged from 12 to 45 participants, totaling 248 individuals, 68% male and 32% female. The average age of the participants ranged from 21 to 35 years. Regarding the level of training, 4 studies included athletes, 5 included recreational practitioners, and 1 included both.

Regarding the exercises evaluated, 6 studies investigated squats exclusively, 1 investigated lunges exclusively, and 3 investigated both. Variations included barbell squats (n=7), dumbbell squats (n=2), free squats (n=1), barbell lunges (n=2), dumbbell lunges (n=1), and free lunges (n=1).

Regarding the comparators, 5 studies used conventional shoes, 3 used specific footwear for weightlifting, 1 used minimalist footwear and 1 compared multiple types of footwear.

3.3 METHODOLOGICAL QUALITY

The methodological quality of the studies varied considerably. Of the 9 experimental studies and trials assessed by the PEDro scale, 2 were of high quality (score 7-10), 5 of moderate quality (score 5-6) and 2 of low quality (score 3-4). The main methodological limitations included the absence of blinding of participants and evaluators, non-secret allocation, and lack of intention-to-treat analysis.

The systematic review evaluated by AMSTAR-2 (Duan et al., 2025) was classified as of moderate quality, with limitations related to the absence of a registered protocol and an incomplete list of excluded studies.

The detailed evaluation of the methodological quality is presented in Table 1.

Table 1

Author, Year	Country	Study Design	Methodological Quality	Key Outcomes
Southwell et al., 2016	Australia	Non-randomized clinical trial	Moderate	Three-dimensional kinematics and kinetics
Brown, 2013	USA	Cross-sectional study	Low	Muscle Activation (EMG)
Duan et al., 2025	China	Systematic review and meta-analysis	Moderate	Stability, kinematics
Schermoly et al., 2015	USA	Non-randomized clinical trial	Moderate	Power production
Cohen et al., 2023	Canada	Randomized controlled trial	High	Kinematics, stability
Raorane et al., 2024	India	Randomized controlled trial	High	Dynamic balance
Franklin et al., 2018	United Kingdom	Non-randomized clinical trial	Moderate	Muscle activation
Sinclair et al., 2015	United Kingdom	Randomized controlled trial	Moderate	3D kinematics, muscle activation

Biscarini et al., 2024	Italy	Non-randomized clinical trial	Moderate	Proprioception
Hammer et al., 2018	USA	Cross-sectional study	Low	Subjective, kinematic perception

Source: Authors.

3.4 SUMMARY OF RESULTS BY OUTCOME CATEGORY

3.4.1 Proprioception and Sensory Feedback

Three studies evaluated proprioception and sensory feedback. Biscarini et al. (2024) demonstrated significant improvement in foot proprioception after barefoot exercises compared to conventional footwear, with greater sensitivity in detecting small changes in ankle position ($p < 0.01$). Franklin et al. (2018) observed an increase in the activation of the intrinsic foot muscles during barefoot exercises, suggesting greater sensory feedback. Cohen et al. (2023) found no significant differences in knee proprioception between barefoot and shod conditions.

3.4.2 Stability and Balance

Five studies assessed stability and balance. Raorane et al. (2024) demonstrated significant improvement in dynamic balance after a barefoot lunge training program compared to the same program performed with footwear ($p < 0.05$). Duan et al. (2025), in their meta-analysis, concluded that the barefoot condition resulted in greater anteroposterior stability during squatting, but lower mid-lateral stability compared to weightlifting shoes. Cohen et al. (2023) observed greater center of pressure oscillation in the barefoot condition during squats with high loads ($> 80\%$ 1RM), suggesting a possible reduction in stability. Southwell et al. (2016) and Sinclair et al. (2015) found no significant differences in stability measures between conditions.

3.4.3 Muscle Activation and Load Distribution

Four studies evaluated muscle activation. Brown (2013) observed greater activation of the ankle stabilizing muscles (tibialis anterior and peroneus longus) during barefoot squats compared to footwear ($p < 0.05$). Franklin et al. (2018) reported greater activation of the intrinsic foot muscles and lower activation of the quadriceps in the barefoot condition. Sinclair et al. (2015) demonstrated greater activation of the gluteus maximus and hamstrings and lower activation of the quadriceps during barefoot squats compared to lifting shoes. Southwell et al. (2016) observed that the barefoot condition produced significantly greater hip extension moments and significantly lower knee extension moments than the conditions with footwear, suggesting a change in the load distribution between the joints.

3.4.4 Kinematics and Kinetics of Motion

Six studies evaluated aspects of movement kinematics and kinetics. Southwell et al. (2016) observed greater trunk flexion, lower knee flexion, and greater ankle dorsiflexion during barefoot squats compared to footwear. Sinclair et al. (2015) reported similar results, with greater trunk inclination in the barefoot condition. Cohen et al. (2023) demonstrated that the barefoot condition resulted in greater pronation of the foot during the eccentric phase of the squat. Duan et al. (2025) concluded that the absence of heel lift (characteristic of the barefoot condition) resulted in greater trunk flexion and less knee flexion during squats. Hammer et al. (2018) observed greater variability in the movement pattern in the barefoot condition, especially in less experienced individuals. Schermoly et al. (2015) found no significant differences in kinematic patterns between conditions.

3.4.5 Performance

Two studies evaluated performance measures. Schermoly et al. (2015) found no significant differences in maximal force production during barbell squats between barefoot and shod conditions. However, they observed a higher rate of strength development in the condition with lifting shoes compared to the barefoot condition ($p < 0.05$). Hammer et al. (2018) reported that participants were able to complete more repetitions with submaximal load (80% 1RM) in the condition with lifting shoes compared to the barefoot condition, although the difference was not statistically significant.

3.4.6 Risk of Injury

None of the included studies directly assessed the risk of injury associated with barefoot exercise. However, three studies have made indirect inferences. Southwell et al. (2016) suggested that increasing hip extension moment and reducing knee extension moment in the barefoot condition could reduce knee stress, potentially beneficial for individuals with knee pathologies, but increase stress on the lower back due to increased trunk flexion. Cohen et al. (2023) warned of the potential increased risk of overload injuries to the foot and ankle structures due to the greater pronation seen in the barefoot condition. Duan et al. (2025) concluded that the lower medial-lateral stability observed in the barefoot condition could increase the risk of injury during exercises with high loads.

3.4.7 Subjective perception

Three studies evaluated aspects of subjective perception. Hammer et al. (2018) reported that 65% of participants preferred to perform squats with lifting shoes, 20% preferred

barefoot, and 15% had no preference. Participants who preferred the barefoot condition cited "better connection to the ground" and "greater sense of stability" as the main reasons. Sinclair et al. (2015) noted that participants reported greater perception of stability with lifting shoes compared to the barefoot condition. Schermoly et al. (2015) found no significant differences in the perception of exertion between the conditions.

3.5 SUBGROUP ANALYSIS

3.5.1 Participant Level (Athletes vs. Recreational)

Four studies included comparative analyses between athletes and recreational practitioners. Hammer et al. (2018) observed that experienced athletes showed less variability in the movement pattern in the barefoot condition compared to recreational practitioners, suggesting better adaptation to the absence of shoes. Cohen et al. (2023) reported that the reduction in stability in the barefoot condition was less pronounced in experienced athletes. Franklin et al. (2018) found no significant differences in muscle activation patterns between athletes and recreationals. Duan et al. (2025) concluded that the participants' level of experience was a significant moderator of the effects of the barefoot condition on squat kinematics.

3.5.2 Type of Exercise (Squat vs. Lunge)

Three studies compared the effects of barefoot between squatting and lunging. Franklin et al. (2018) noted that differences in muscle activation between barefoot and shod conditions were more pronounced during lunges compared to squats, especially for the ankle stabilizing muscles. Biscarini et al. (2024) reported more significant improvement in proprioception after barefoot lunges compared to barefoot squats. Hammer et al. (2018) found no significant differences in the effects of the barefoot condition between the two exercises.

3.5.3 Type of Comparator

Four studies compared the effects of barefoot with different types of footwear. Southwell et al. (2016) and Sinclair et al. (2015) noted that the differences in kinematics and kinetics between the barefoot condition and lifting shoes were more pronounced than between the barefoot condition and conventional shoes, mainly due to the heel lift present in lifting shoes. Schermoly et al. (2015) reported that the rate of strength development was significantly higher with lifting shoes compared to the barefoot condition, but found no significant differences between the barefoot condition and conventional shoes. Hammer et

al. (2018) noted that subjective preference was stronger for lifting shoes compared to conventional sneakers when compared to barefoot condition.

3.6 CERTAINTY OF THE EVIDENCE

The certainty of the evidence, assessed by the GRADE system, ranged from very low to moderate, depending on the outcome. No outcome was high-certainty of the evidence. The certainty of the evidence for proprioception and sensory feedback was low, for stability and balance it was moderate, for muscle activation it was moderate, for kinematics and kinetics of movement it was moderate, for performance it was low, for risk of injury it was very low, and for subjective perception it was low.

The main factors that reduced the certainty of the evidence were risk of bias in individual studies, inconsistency in results between studies, imprecision due to small sample sizes, and limited numbers of studies for some outcomes.

4 DISCUSSION

This systematic review aimed to identify, critically evaluate and synthesize the available scientific evidence on the benefits and harms of barefoot weight training, with a specific focus on squats and lunges, compared to walking practice. We included 10 studies, with methodological quality ranging from low to high and certainty of evidence ranging from very low to moderate.

4.1 SUMMARY OF EVIDENCE

Evidence suggests that barefoot exercise may provide benefits in terms of proprioception and sensory feedback, with increased activation of the intrinsic muscles of the foot and greater proprioceptive sensitivity. These findings corroborate the hypothesis that the removal of the artificial interface between the foot and the ground increases sensory feedback, allowing better neuromuscular control during the execution of exercises (BISCARINI et al., 2024).

Regarding stability and balance, the results were inconsistent. Some studies have demonstrated greater anteroposterior stability during barefoot squats (DUAN et al., 2025), while others have observed better balance regulation with weightlifting shoes compared to bare feet, especially in the mid-lateral direction (COHEN et al., 2023). This inconsistency can be explained by differences in evaluation methodologies, populations studied and specific stability parameters analyzed. It is important to note that stability during strength exercises is

multifactorial and can be influenced not only by footwear, but also by the experience of the practitioner, load used and execution technique.

Regarding muscle activation and load distribution, evidence indicates that barefoot condition alters muscle activation patterns, with greater emphasis on hip muscles and less on knee muscles. Southwell et al. (2016) observed that the barefoot condition produced significantly greater hip extension moments and significantly lower knee extension moments than conditions with footwear. These changes can have important implications for the specific objectives of training and for injury prevention. For example, individuals with knee pathologies may benefit from reduced stress on this joint, while those with lower back problems should exercise caution due to the potential increased stress on the lower back associated with increased trunk flexion.

Movement kinematics were consistently altered in the barefoot condition, with greater trunk flexion, less knee flexion, and greater ankle dorsiflexion during squats. These changes are mainly attributed to the absence of heel lift, characteristic of the barefoot condition compared to conventional footwear and especially specific footwear for weightlifting. Greater trunk flexion can be interpreted as a compensatory strategy to maintain the center of mass within the support base in the absence of heel elevation (SINCLAIR et al., 2015).

In terms of performance, the evidence is limited and inconclusive. No significant differences in maximal force production were observed between conditions, but some studies have suggested a possible reduction in the rate of strength development and the number of repetitions with submaximal load in the barefoot condition compared to lifting shoes. However, the certainty of this evidence is low due to the limited number of studies and methodological limitations.

Regarding the risk of injury, none of the included studies directly assessed this outcome, resulting in very low evidence based only on indirect inferences. The biomechanical changes observed in the barefoot condition suggest potential stress reduction in the knee, but increased stress in the lower back and foot and ankle structures. The lower mid-lateral stability observed in some studies could also theoretically increase the risk of injury during exercises with high loads, especially in less experienced exercisers.

Subjective perception varied considerably among participants, with most preferring lifting footwear, but a significant proportion reporting a preference for the barefoot condition, citing "better connection to the ground" as the main reason. This variability in subjective preference reinforces the importance of individualization in the choice between exercising barefoot or wearing shoes.

4.2 COMPARISON WITH EXISTING LITERATURE

The findings of this review are in line with previous studies on barefoot exercise in other contexts. For example, studies on barefoot running have demonstrated changes in biomechanics, muscle activation, and proprioception similar to those observed in this review for squats and lunges (LIEBERMAN et al., 2010). However, it is important to note that the biomechanical and neuromuscular demands of running are substantially different from those of strength training, which limits the direct generalization of results.

In contrast to some previous reviews on minimalist footwear (DAVIS et al., 2019), which have primarily emphasized injury risks, my review identified both potential benefits and harms of barefoot practice, suggesting a more complex and individualized risk-benefit relationship.

The results related to changes in squat kinematics are consistent with previous studies on the effects of heel raises. Sato et al. (2012) demonstrated that artificial heel elevation resulted in less trunk flexion and greater knee flexion during squats, the opposite of what was observed in the barefoot condition. This suggests that the main biomechanical difference between barefoot and shod conditions is related to the heel lift provided by footwear, especially those specific for weightlifting.

The greater activation of the ankle and foot stabilizing muscles observed in the barefoot condition is consistent with the principle of controlled instability in neuromuscular training (BEHM; COLADO, 2012). According to this principle, small degrees of instability can increase muscle activation and potentially improve neuromuscular control. However, excessive instability may compromise performance and increase the risk of injury, which may explain the inconsistent results observed in the included studies.

4.3 PRACTICAL APPLICATIONS

Based on the available evidence, the following recommendations can be made for Physical Education practitioners and professionals:

1. The implementation of barefoot exercises should be gradual, allowing adequate adaptation of the structures of the foot and ankle. Starting with low-intensity exercise and progressively increasing the load and complexity can minimize the risk of overload injuries.
2. Minimalist footwear can be considered as an intermediate alternative between conventional footwear and being completely barefoot, potentially offering some of the proprioceptive benefits of barefoot with increased protection.

3. Special attention should be paid to the technique, especially to the inclination of the trunk during barefoot squats, to avoid increased stress on the lower back. Practitioners with a history of low back pain should exercise caution when performing barefoot exercises.
4. It is important to monitor for signs of discomfort or pain, especially in the foot and ankle structures, and adjust training as needed. The transition to barefoot practice should be stopped if there is persistent pain.
5. The training environment should be considered in terms of hygiene and safety before opting for barefoot exercises. Clean, non-slippery surfaces that are free of objects that can cause injury are essential.
6. Recommendations should be individualized, considering training objectives, injury history, and personal preferences. For example, individuals with knee pathologies may benefit from the reduction in stress on this joint provided by the barefoot condition, while those with lower back problems may prefer footwear that allows greater verticalization of the trunk.
7. For athletes and advanced practitioners, the choice between barefoot or footwear training can be based on individual preferences and specific training goals. For example, the barefoot condition may be incorporated into specific phases of training focused on proprioception and neuromuscular control, while lifting footwear may be preferred in phases focused on maximal strength.

4.4 LIMITATIONS OF THE REVIEW

This review has some limitations that should be considered when interpreting the results. First, methodological heterogeneity among studies, including differences in populations, exercise protocols, assessment methods, and reported outcomes, hindered quantitative synthesis of results and limited the possibility of performing meta-analysis.

Second, the methodological quality of the included studies varied considerably, with many having limitations such as lack of blinding, non-secret allocation, and small sample sizes, which reduces confidence in effect estimates.

Third, most of the included studies were of short duration, evaluating acute or short-term effects, with few investigating chronic adaptations to regular barefoot exercise. This limits the understanding of the long-term effects, both in terms of benefits and risks.

Fourth, the search was limited to studies published in Portuguese, English, or Spanish, which may have resulted in the exclusion of relevant studies published in other languages.

Finally, the certainty of the evidence for most outcomes was low or very low, indicating that future research has great potential to alter the effect estimates and, consequently, the conclusions of this review.

4.5 DIRECTIONS FOR FUTURE RESEARCH

Based on the gaps identified in the current literature, we suggest the following directions for future research:

1. Longitudinal studies evaluating the chronic effects of regular barefoot weight training, including neuromuscular adaptations, biomechanics, and long-term injury risk.
2. Randomised controlled trials with greater methodological rigor, including secret allocation, blinding of evaluators, and adequate sample sizes.
3. Studies comparing different populations (e.g., athletes vs. recreational, young vs. old, men vs. women) to identify whether the effects of barefoot practice vary between groups.
4. Investigations on the interaction between barefoot practice and different loads, volumes and training intensities.
5. Studies evaluating the effectiveness of gradual transition programs to barefoot practice in preventing injuries and optimizing benefits.
6. Research on the combination of barefoot exercise and footwear in periodized training programs.
7. Development and validation of specific instruments to assess proprioception and stability in the context of barefoot strength training.
8. Prospective studies directly evaluating the risk of injury associated with barefoot exercise compared to walking.

5 FINAL CONSIDERATIONS

This systematic review synthesized the available evidence on the benefits and harms of barefoot weight training, with a specific focus on squats and lunges. Evidence suggests that barefoot exercise can improve proprioception and sensory feedback, increase activation of foot and ankle stabilizing muscles, and alter load distribution between lower limb joints, with greater emphasis on hip muscles and less stress on the knee. However, potential harms have also been identified, including changes in the kinematics of movement, possible reduction of stability in some directions, especially mid-lateral, and increased risk of overload injuries to the structures of the foot and ankle.

The methodological quality of the studies ranged from low to high, with considerable heterogeneity in the evaluation methods and populations studied. The certainty of the evidence for most outcomes was low or very low, indicating the need for further research with greater methodological rigor.

The practice of bodybuilding exercises barefoot has both benefits and potential risks. The decision to perform squats and barefoot lunges should be individualized, considering training objectives, injury history, and personal preferences. Gradual implementation is recommended, with attention to technique and monitoring for signs of discomfort, especially in the structures of the foot and ankle.

Future research should focus on longitudinal studies evaluating chronic effects, randomized controlled trials with greater methodological rigor, comparisons between different populations, and investigations into the interaction between barefoot practice and different training parameters.

ABSTRACT

Tannins are natural polymers of plant origin distributed in leaves, bark, fruits, and other plant tissues, characterized by their high chemical reactivity. This characteristic is associated with their structure rich in phenolic groups, which gives tannins functional properties relevant for various industrial applications. Among the different plant sources, tannins extracted from the cashew tree (*Anacardium occidentale* L.) have been gaining prominence as a promising bio-renewable alternative for the development of sustainable materials, especially wood adhesives. Cashew tannins have a high concentration of polyphenols, which favors condensation and crosslinking reactions, essential for the formation of polymeric networks with good mechanical resistance and stability. These properties allow their use as partial or total substitutes for synthetic adhesives based on petroleum derivatives, such as phenolics and urea-formaldehyde, contributing to the reduction of dependence on fossil resources and the emission of toxic compounds. From an environmental and socioeconomic perspective, the use of cashew tannins promotes the valorization of by-products from the cashew supply chain, traditionally exploited mainly for the production of cashew nuts and juice. This approach encourages the integral use of biomass, reduces waste, and generates new opportunities for the development of higher value-added products. Thus, the application of these tannins in ecological adhesives fits within the context of the bioeconomy, aligning technical efficiency, environmental sustainability, and conservation of natural resources, in addition to reinforcing the potential of renewable raw materials in the innovation of materials for the timber industry.

RESUMO

Os taninos são polímeros naturais de origem vegetal distribuídos em folhas, cascas, frutos e outros tecidos das plantas, caracterizando-se por sua elevada reatividade química. Essa característica está associada à sua estrutura rica em grupos fenólicos, que confere aos taninos propriedades funcionais relevantes para diversas aplicações industriais. Entre as diferentes fontes vegetais, os taninos extraídos do cajueiro (*Anacardium occidentale* L.) vêm ganhando destaque por constituírem uma alternativa bio-renovável promissora para o desenvolvimento de materiais sustentáveis, em especial adesivos para madeira. Os taninos do cajueiro apresentam elevada concentração de polifenóis, o que favorece reações de condensação e reticulação, essenciais para a formação de redes poliméricas com boa resistência mecânica e estabilidade. Essas propriedades permitem sua utilização como substitutos parciais ou totais de adesivos sintéticos à base de derivados do petróleo, como os fenólicos e ureia-formaldeído, contribuindo para a redução da dependência de recursos fósseis e da emissão de compostos tóxicos. Sob a perspectiva ambiental e socioeconômica, o aproveitamento dos taninos do cajueiro promove a valorização de subprodutos da cadeia do caju, tradicionalmente explorada principalmente para a produção de castanhas e suco. Essa abordagem incentiva o uso integral da biomassa, reduz resíduos e gera novas oportunidades para o desenvolvimento de produtos de maior valor agregado. Assim, a aplicação desses taninos em adesivos ecológicos insere-se no contexto da bioeconomia, alinhando eficiência técnica, sustentabilidade ambiental e conservação dos recursos naturais, além de reforçar o potencial de matérias-primas renováveis na inovação de materiais para a indústria madeireira.

RESUMEN

Los taninos son polímeros naturales de origen vegetal distribuidos en hojas, cortezas, frutos y otros tejidos de las plantas, caracterizándose por su elevada reactividad química. Esta característica está asociada a su estructura rica en grupos fenólicos, lo que confiere a los taninos propiedades funcionales relevantes para diversas aplicaciones industriales. Entre las diferentes fuentes vegetales, los taninos extraídos del anacardo (*Anacardium occidentale* L.) han adquirido relevancia como una alternativa biorrenovable prometedor para el desarrollo de materiales sostenibles, especialmente adhesivos para madera. Los taninos del anacardo presentan una alta concentración de polifenoles, lo que favorece reacciones de condensación y reticulación, esenciales para la formación de redes poliméricas con buena resistencia mecánica y estabilidad. Estas propiedades permiten su uso como sustitutos parciales o totales de adhesivos sintéticos derivados del petróleo, como los fenólicos y los de urea-formaldehído, contribuyendo a la reducción de la dependencia de recursos fósiles y de la emisión de compuestos tóxicos. Desde una perspectiva ambiental y socioeconómica, el aprovechamiento de los taninos del anacardo promueve la valorización de subproductos de la cadena productiva del anacardo, tradicionalmente explotada principalmente para la producción de nueces y jugos. Este enfoque fomenta el uso integral de la biomasa, reduce residuos y genera nuevas oportunidades para el desarrollo de productos con mayor valor agregado. De este modo, la aplicación de estos taninos en adhesivos ecológicos se inserta en el contexto de la bioeconomía, alineando eficiencia técnica, sostenibilidad ambiental y conservación de los recursos naturales, además de reforzar el potencial de las materias primas renovables en la innovación de materiales para la industria maderera.

Palabras clave: Anacardo. Tanino–Urea–Formaldehído. Bioeconomía.

1 INTRODUCTION

Environmental concerns have encouraged the development of sustainable products to reduce the use of fossil resources and formaldehyde, promoting sustainability in the production of wood panels, which are made from the reconstitution of sheets, battens, particles or fibers joined by adhesives (Iwakiri; Trianoski, 2020). The adhesives most commonly used in the production of wood panels, such as phenol-formaldehyde and urea-formaldehyde, offer good mechanical performance and ease of use, but they contain formaldehyde, a toxic and potentially carcinogenic substance, and are derived from petroleum, making bonding one of the most expensive steps in the manufacture of these panels.

Seeking alternatives for the syntheses of adhesives, aiming at the use of renewable raw material, tannins are a favorable option (Luckeneder et al., 2016). In addition to applications in the production of adhesives and anticorrosives in the wood industry, tannins can also act in the absorption of minerals, precipitation of proteins, production of iron-gas paint, recovery of uranium from seawater, removal of mercury and methylmercury from solution, and as a significant element in leather tanning (Aires, 2020).

Tannins are conceptualized as natural polymers, present in several places, such as in the polyphenolic secondary metabolism of higher plants, soft tissues, such as leaves, needles and bark (Morisada et al, 2011; Hernes and Hedges, 2004; Arbenz; Averous, 2015). Found in several plants, they are mainly known for their ability to react with proteins and metals, which gives them unique properties. Recently, they have gained prominence as a promising bio-renewable source for the development of a new generation of sustainable polymers.

As phenolic compounds of plant origin, tannins have high availability, biodegradability and low environmental impact. These characteristics make them excellent candidates to replace synthetic polymers derived from petroleum, whose production is highly polluting and non-renewable. In addition, the chemical versatility of tannins allows for structural modifications that can provide mechanical, thermal, and chemical properties suitable for various industrial applications.

Tannin-based polymers can be used in various sectors, such as sustainable packaging, adhesives, paints, foams, and even materials for the automotive and construction industries. Its ability to form resistant and flexible polymer networks expands the range of possibilities, promoting eco-friendly materials without compromising technical performance.

Therefore, investing in the research and application of tannins as a renewable raw material for polymers represents a significant step towards the green economy. Not only do they help reduce dependence on fossil fuels, but they also minimize environmental impact,

paving the way for innovative and sustainable products that meet the current and future demands of the global market.

2 DEVELOPMENT

2.1 CASHEW TREE

The cashew tree, the popular name of the *Anacardium occidentale* It is a plant species native to the Brazilian Northeast that is widely used by the population, since many parts of the plant can be used from the cashew tree for various purposes, whether medicinal or food. The peduncle, its pseudofruit, is called cashew (Figure 1), and has varied color in shades of yellow to red. Next to it, there is the cashew nut almond that, inside, stores the nut. Cashews and nuts are appreciated in northeastern cuisine, both in natura and in other food products (Novaes; Novaes, 2021).

The species has about 60 to 80 genera and 600 species distributed pantropically, but with some genera in the temperate regions of the North and some native to the semi-arid coasts of Brazil, so it is economically important (Lima et al., 2010). The cashew tree produces a yellow resin in its trunk, known as cashew gum, which can replace the gum arabic used in the paper and pharmaceutical industries. Cashew wood is durable and pinkish in color, and can be used in civil construction, carpentry, among others (Brasil, 2019).

Figure 1

Cashew

Source: [https://www.amazon.in/Creative-Farmer-Anacardium-Occidentale Cashew/dp/B071V2HT2S](https://www.amazon.in/Creative-Farmer-Anacardium-Occidentale-Cashew/dp/B071V2HT2S)

The species is mainly cultivated in India, Vietnam, Côte d'Ivoire, Guinea-Bissau, Tanzania, Benin, Brazil, and other countries in Central and West Africa and Southeast Asia,

South Africa, and Australia (Global Cashew Council, 2021). Brazil is among one of the largest producers of cashew in the world, and industrialized products are the main form of consumption of the fruit inside and outside the country, both the nut (true fruit) and the peduncle (false fruit), which favors the growth of Brazilian fruit growing for the economy (Queiroz et al., 2010).

World cashew nut production currently ranges between 720,000 and 790,000 metric tons per year (2015/16-2019/20 seasons), with India, with an annual production of 170,000-195,000 tons, taking the top spot, followed by Côte d'Ivoire, Vietnam, and Tanzania, with figures of 149,000; 82,000, and 53,000 MT, respectively (Oliveira et al., 2020; Global Cashew Council, 2021).

One of the management procedures applied to cashew trees is pruning, which according to Embrapa (2021) Young cashew orchards should be managed in such a way that it forms a compact canopy, with a large productive surface, free of tangles and weed competition, mainly to facilitate mechanized harvesting. Fertilization and liming, which can be performed manually or mechanically, must be performed as needed, as well as the inspection of the irrigation system when the crop is irrigated. Commonly, these prunings are limited to removing parts of the tree attacked by insects or diseases, along with dry and broken branches.

Flowering occurs from December to April in the northern hemisphere and from June to December in the southern hemisphere, mainly in the period from September to November, according to Figure 2. Harvesting takes place during dry weather and nuts are harvested only when the fruit is fully ripe (Global Cashew Council, 2021).

Figure 2

Flowering and harvest period graph

Source: Global Cashew Council, 2021.

2.2 TANNINS

The word tannin originates from the ancient Celtic word for oak and was introduced by the Seguin, which explained the ability of plant extracts to convert into leather skin (Hagerman, 2002). Tannins (Figure 3) are natural polymers, which are present in several places, such as in the polyphenolic secondary metabolism of higher plants, soft tissues such as leaves, needles and bark (Morisada et al, 2011; Hernes and Hedges, 2004; Arbenz; Averous, 2015). After cellulose, hemicellulose, and lignin, tannins are considered one of the most abundant compounds extracted from biomass, leaves, roots, bark, seeds, wood, and fruits (Arbenz; Averous, 2015; Khanbabaee; Van Ree, 2001).

Figure 3

Tannins

Source: <https://afreitasvilar.com/taninos-2/>

Tannins are present among foods, such as grapes, blackberries, strawberries, walnuts, cashews, hazelnuts, mangoes, and tea (Clifford and Scalbert, 2000). In plants, they function as defenders, protecting trees from fungi, pathogens, insects, and herbivorous animals (Hagerman et al., 1998; Khanbabaee; Van Ree, 2001; Sharma, 2019). Tannins are mainly used in leather tanning, beverage manufacturing, pharmaceuticals, water treatment, as natural preservatives for wood, and also to produce adhesive (Shirmohammadli et al., 2018).

Usually, tannins are divided into two main groups, namely condensed tannins and hydrolyzable tannins. Condensed tannins are composed of flavonoids (flavan 3-ol or flavan 3,4-diol) without a sugar core, however, hydrolyzable tannins are composed of ellagic and gallic acids with a sugar core mainly glucose (Khanbabaee; Van Ree, 2001; Sharma, 2019).

Comparing these two groups of tannins, the hydrolyzables have limited sources in nature compared to condensed tannins (Haslam, 1982; Hillis, 1985). Therefore, condensed tannins are dominating the world market consisting of more than 90% of the total commercial tannins (Filgueira et al., 2017).

Condensed tannins, as shown in Figure 4, are made up of units C₆, C₃ and C₆ of the flavonoid system, composed of two aromatic rings, joined by a pyran ring. The chemical

properties of condensed tannins are largely determined by three factors: (1) the hydroxylation pattern in the flavanol unit; (2) the stereochemistry in the three chiral centers present in the heterocyclic ring; and (3) the location of the interflavonoid bond (Tahir et al., 2019).

Figure 4

Condensed tannin structural model

Source: Scholfield et al., 2001.

The yield, purity and composition of the extracts generally depend on several parameters such as: the plant source, technique used, extraction time, temperature (Bacelo et al., 2016). Thus, the extraction of tannins is a process that is a fundamental key point for its reuse, valorization and sustainable production (Bacelo et al., 2017).

According to Pizzi (1983) The main salts used for tannin extraction are sodium sulfite (Na_2SO_3), sodium carbonate (Na_2CO_3), sodium hydroxide (NaOH), sodium disulfite ($\text{Na}_2\text{S}_2\text{O}_5$) and sodium bisulfite (NaHSO_3). Sulfitation is one of the oldest and most common methods of tannin extraction, and is especially suitable for the production of tannic extracts for the synthesis of phenolic adhesives. However, it is also known that the use of sodium sulfite as well as other inorganic salts are of great importance in the extraction process because they increase the hydrophilic sites of tannins, thus providing greater extraction of tannins (Silva, 2001).

The main characteristics of tannins correspond to their phenolic nature, because their antioxidant capacity is linked to the phenolic rings present in their structure, which can act as electron scavengers for Trap ions and radicals (Hoyos-Martínez et al., 2019).

2.3 TANNIN-BASED ADHESIVES

Tannin and lignin are considered renewable natural resources, and are of particular interest in phenolic resins due to their chemical structure (Faris et al., 2016), and can be used from modification to the synthesis of adhesives. Synthesis occurs through the polyphenolic structure and nucleophilic sites present (Wu et al., 2023). This polyphenolic structure of tannins provides their application in the adhesive industry.

Tannins are being used as a partial substitute for phenol to synthesize and reduce the rate of phenol use, as modifiers, or to replace some urea to synthesize tannin-urea-formaldehyde (TUF) condensation resins, which likewise improve the adhesive strength of UF resin adhesives as well as reduce UF formaldehyde emission (Peng et al., 2022; Zhang et al., 2014).

Beyond the purpose from the use of tannins in the synthesis of conventional formaldehyde-based resins, tannins are able to strongly complexify with proteins through hydrophobic interactions or non-covalent hydrogen bonds thus forming a well-cross-linked network through intermolecular interactions between the phenolic hydroxyl groups of tannins and proteins (Han et al., 2020; Van Buren; Robinson, 1969).

The high reactivity with formaldehyde occurs together with the A ring, resorcinolic or phloroglucinolic ring, and can reach faster reaction rates under similar conditions than those of phenol, achieving reactions 10 to 50 times faster (Pizzi, 2003). The aldehyde commonly used in the preparation, adjustment, and curing of tannic adhesives is formaldehyde. It is typically added to the tannin extract solution at the required pH, preferably in its para-formaldehyde polymer form, which is capable of reasonably rapid depolymerization under alkaline conditions (Kim, 2009).

Adhesives produced from tannins release relatively low levels of formaldehyde when compared to phenol formaldehyde (petrochemical compound), due to its high reactivity due to its structure (Pizzi, 2003; Hoong et al., 2011). In addition to their potential to reduce formaldehyde emissions, tannins have the characteristic of being resistant to fungal attacks (Krung; Tobisch, 2010). And the tannin sulfitation technique is a viable method for the production of adhesives, due to the process reducing the viscosity of tannic extracts and also increasing their solubility in water (Pizzi; Mittal, 1994).

3 FINAL CONSIDERATIONS

The application of cashew tannins in the development of adhesives for wood bonding represents an important technological and environmental advance. These tannins, because

they have reactive phenolic groups, can form stable chemical bonds with wood components, resulting in adhesives with good mechanical strength and durability.

In addition, compared to formaldehyde-based synthetic adhesives, they are less toxic, biodegradable, and come from renewable sources, aligning with the principles of sustainability. Thus, the use of cashew tannins in the formulation of adhesives contributes not only to the development of ecological and high-performance products, but also to the valorization of Brazilian natural resources and to the reduction of dependence on petrochemical derivatives in the timber industry.

ABSTRACT

The growing concern for environmental sustainability and the need to reduce dependence on fossil resources have driven the search for more environmentally friendly materials in the timber industry. In this scenario, adhesives used in bonding wood and its derivatives play a central role, as they directly influence the performance, durability, and environmental impact of lignocellulosic panels and products. Traditionally, this industry employs synthetic adhesives based on petroleum derivatives, which exhibit excellent bonding efficiency and stability over time. However, the use of these materials is associated with the emission of volatile organic compounds, especially formaldehyde, in addition to issues related to the toxicity and environmental footprint of their production. Given these limitations, lignin has aroused increasing interest as a sustainable alternative for the development of new adhesive systems or for the modification of conventional formulations. Recent advances have shown that the conversion of lignin to the nanoscale significantly expands its application possibilities. Lignin nanoparticles exhibit a high surface area, better dispersion in the adhesive matrix, and greater availability of functional groups, favoring more efficient chemical and physical interactions. Incorporated into synthetic adhesives, they can contribute to increased mechanical strength, improved thermal stability, and greater moisture resistance, as well as positively influencing the adhesive's curing kinetics. In this context, this chapter aims to present innovations related to the use of lignin nanoparticles in adhesives for bonding wood and its derivatives.

RESUMO

A crescente preocupação com a sustentabilidade ambiental e a necessidade de reduzir a dependência de recursos fósseis têm impulsionado a busca por materiais mais ecológicos na indústria madeireira. Nesse cenário, os adesivos utilizados na colagem de madeira e seus derivados ocupam papel central, uma vez que influenciam diretamente o desempenho, a durabilidade e o impacto ambiental dos painéis e produtos lignocelulósicos. Tradicionalmente, essa indústria emprega adesivos sintéticos à base de derivados do petróleo, que apresentam excelente eficiência de colagem e estabilidade ao longo do tempo. No entanto, o uso desses materiais está associado à emissão de compostos orgânicos voláteis, especialmente formaldeído, além de questões relacionadas à toxicidade e à pegada ambiental de sua produção. Diante dessas limitações, a lignina tem despertado crescente interesse como alternativa sustentável para o desenvolvimento de novos sistemas adesivos ou para a modificação de formulações convencionais. Avanços recentes têm demonstrado que a conversão da lignina em escala nanométrica amplia significativamente suas possibilidades de aplicação. As nanopartículas de lignina apresentam elevada área superficial, melhor dispersão na matriz adesiva e maior disponibilidade de grupos funcionais, favorecendo interações químicas e físicas mais eficientes. Incorporadas aos adesivos sintéticos podem contribuir para o aumento da resistência mecânica, melhoria da estabilidade térmica e maior resistência à umidade, além de influenciar positivamente a cinética de cura do adesivo. Nesse contexto, este capítulo tem como objetivo apresentar inovações relacionadas ao uso de nanopartículas de lignina em adesivos para colagem de madeira e seus derivados.

RESUMEN

La creciente preocupación por la sostenibilidad ambiental y la necesidad de reducir la dependencia de los recursos fósiles han impulsado la búsqueda de materiales más ecológicos en la industria maderera. En este contexto, los adhesivos utilizados para el encolado de la madera y sus derivados desempeñan un papel central, ya que influyen directamente en el rendimiento, la durabilidad y el impacto ambiental de los paneles y productos lignocelulósicos. Tradicionalmente, esta industria emplea adhesivos sintéticos derivados del petróleo, que presentan una excelente eficiencia de encolado y estabilidad a lo largo del tiempo. No obstante, el uso de estos materiales está asociado a la emisión de compuestos orgánicos volátiles, especialmente formaldehído, además de cuestiones relacionadas con la toxicidad y la huella ambiental de su producción. Ante estas limitaciones, la lignina ha despertado un creciente interés como alternativa sostenible para el desarrollo de nuevos sistemas adhesivos o para la modificación de formulaciones convencionales. Avances recientes han demostrado que la conversión de la lignina a escala nanométrica amplía significativamente sus posibilidades de aplicación. Las nanopartículas de lignina presentan una elevada área superficial, mejor dispersión en la matriz adhesiva y mayor disponibilidad de grupos funcionales, favoreciendo interacciones químicas y físicas más eficientes. Al incorporarse a los adhesivos sintéticos, pueden contribuir al aumento de la resistencia mecánica, a la mejora de la estabilidad térmica, a una mayor resistencia a la humedad y a una influencia positiva en la cinética de curado del adhesivo. En este contexto, este capítulo tiene como objetivo presentar innovaciones relacionadas con el uso de nanopartículas de lignina en adhesivos para el encolado de la madera y sus derivados.

1 INTRODUCTION

The wood industry is considered one of the most important and promising sectors on a global scale due to the wide use of wood and its derivatives in different segments, such as civil construction, furniture industry, packaging and panels. Iwakiry & Trianosky (2020) conceptualize wood panels as products composed of wood elements such as veneers, battens, particles and fibers, obtained from the reduction of solid wood and reconstituted through adhesive bonding.

As in the production of panels, the manufacture of elements for civil construction, the furniture industry and the packaging sector also depend on the use of adhesives for the union and adequate performance of materials. The increasing demand for sustainable and high-performance materials has driven the development of new technologies in the wood industry, especially in the field of adhesives.

Traditionally, formaldehyde-based synthetics, such as phenol-formaldehyde and urea-formaldehyde, have been widely employed due to their good mechanical performance and stability. However, these products have environmental and health limitations, mainly related to the emission of volatile organic compounds (VOCs) and the non-renewable origin of their components (Furtini et al., 2022). In this context, the search for more ecological and efficient alternatives has led researchers to explore the use of lignin nanoparticles as innovative additives in adhesive formulations.

Lignin nanoparticles, obtained by reducing lignin to the nanometric scale (less than 100 nm), have greater surface area and reactivity, favoring more efficient interactions in composites and expanding their potential as a sustainable and functional material (Zhang et al., 2021) and represents a promising strategy for innovation and sustainability in the forestry sector.

Thus, this chapter initially addresses the main synthetic adhesives used in the bonding of wood and derivatives. Then, the innovations associated with the incorporation of lignin nanoparticles are presented, highlighting some works already carried out that have shown good performance and potential for the development of more sustainable and technologically advanced products for the wood industry.

2 DEVELOPMENT

2.1 SYNTHETIC ADHESIVES

Adhesives are one of the main constituents in the production of panels, due to the physical and mechanical properties they provide, being able to grant different performances by varying the chemical composition and concentration in the particle mixture (Barbirato et

al., 2018; Mantanis et al., 2018). These products are used in a large number of structural and 7 non-structural applications, in production lines ranging from panels for indoor use to 8 panels for outdoor use, furniture and support structures in different typologies of 9 buildings (Youngquist, 1999).

Adhesives have a very important function in the wood-based panel industry. Formaldehyde-based synthetic adhesives, such as urea-formaldehyde (Figure 1), phenol-formaldehyde (Figure 2), and melamine-formaldehyde (Figure 3), are generally used for wood panel production (Faris et al., 2016), such as plywood, medium-density fiberboard, and particle board. These resins have been applied in the panel industry due to their excellent bonding properties, good water resistance (Pizzi et al., 2020).

Figure 3*Melamine formaldehyde*

Source: <https://portuguese.alibaba.com/product-detail/Taiwan-Liquid-Melamine-Resin-Counter-Type-10000004159693.html>

The first adhesive synthesized was phenol-formaldehyde in 1929, soon after in 1931 urea-formaldehyde. Urea has great applicability in the furniture industry worldwide, and 90% of wood panels use this resin, due to its low cost compared to others. Phenol has as its main characteristic the high resistance to moisture, being considered for outdoor use. Its use is mainly intended for the production of waterproof plywood, fiberboard, structural agglomerate boards of the "waferboard" and "OSB" types (Iwakiri; Trianoski, 2020).

Melamine resin (melamine-formaldehyde) stands out for its high durability and versatility, in addition to providing greater rigidity to the panels, good resistance to humidity and excellent performance against heat and fire. However, its main obstacle is the high cost. To circumvent this limitation, it is common to add urea to melamine, giving rise to the MUF (melamine-urea-formaldehyde) adhesive, which maintains good technical properties and significantly reduces the cost of melamine adhesive (Iwakiri; Trianosky 2005).

For structural purposes, the Brazilian Standard - NBR 7190, Brazilian Association of Technical Standards - ABNT (2022), determines that the adhesive must be waterproof, however, the medium in which the glued parts will be used must be taken into account, that is, temperature and moisture content. The quality of the bond is verified by the glue line, which serves to predict the performance of the adhesive when subjected to the application of stresses. This varies from the properties of the adhesive used to the characteristic of the wood, which will provide a quality product (Mendoza *et al.*, 2017).

The problems caused by the emission of formaldehyde to the environment and to man are increasing targets of research, as a result of the harmful effects they can cause. However, the world has increasingly sought alternative sources to produce adhesives using renewable raw materials (Carvalho et al., 2014). Formaldehyde is a crosslinking agent used in the production, fixation, and curing of adhesives (Solt et al., 2019). It is seen as a human carcinogenic compound, due to its release in the synthesis of adhesives, in application on wood panels, and release after manufacture (Ferreira et al., 2019).

2.2 LIGNIN

Lignin is an essential structural polymer of vascular plants, responsible for rigidity, efficient conduction of water and nutrients, and protection against external agents, and is indispensable for plant growth and survival (Liu et al., 2018). The structure of lignin (Figure 4) has many functional groups that affect its dissolution, such as hydroxyl (aromatic and aliphatic), methoxyl, carbonyl, and carboxyl groups (Garcia et al., 2009).

In addition, lignin may contain side chains and structural variations, contributing to its heterogeneity and diverse chemical properties (Putra et al., 2025). It consists of the oxidative polymerization of three monolignol precursors: p-coumaryl alcohol, coniferyl alcohol, and synapyl alcohol, which originate the three primary lignin units: p-hydroxyphenyl (H), guaiacyl (G), and syringyl (S) (Del Rio et al., 2020).

Figure 4

Macromolecular structure of lignin. (The main monolignolic units are colored red for synapyl alcohol, blue for guaiacyl alcohol, and green for p-coumaryl alcohol)

Source: Karunarathna & Smith (2020).

Despite decades of research, lignin is still little used in biorefineries, being mostly burned for energy generation, instead of being converted into products with higher added value. However, in the last decade, there has been a strong resurgence of interest in its valorization, driven by advances in the understanding of its chemistry, structure, and plasticity, as well as the development of new catalytic and biological routes capable of transforming this abundant biopolymer into materials and compounds of greater value (Katahira et al., 2018).

The controlled extraction of lignin enables its use in high value-added products, such as polymers, fuels, and adhesives, promoting innovation, sustainability, and new market opportunities (Sethupathy et al., 2022; Putra et al., 2025). The valorization of lignin is a key component of the circular bioeconomy, The valorization of lignin is fundamental for the circular bioeconomy, as it reduces environmental impacts, optimizes the use of resources, and enables sustainable alternatives to fossil-based products (Shorey et al., 2024).

2.3 ADHESIVES REINFORCED WITH LIGNIN NANOPARTICLES

Bio-based resins, such as lignin, are valued for their phenolic structure, which allows them to partially or fully replace phenol in phenol-formaldehyde (PF) adhesives (Zhang et al., 2013). In this context, nanotechnology expands the potential of lignin by enabling its application in the form of nanoparticles, promoting improvements in adhesive performance.

The nanotechnological field involves the creation and application of nanometer-scale systems, between atoms and submicron structures, as well as their incorporation into larger systems. At this scale, the materials have physical, chemical, and biological properties that are different from those observed in larger dimensions, which enables new applications and better performance (Nasrollahzadeh et al., 2019). One of the main advantages of particles at nanometer scales is that they have a larger surface area when dispersed uniformly in a layer (Clausen et al., 2010). Nanoparticles with dimensions below 100 nm enable the unique combination of mechanical and physical properties. These ultrafine particles receive the value due to their unique nature, high surface energy, large specific surface area, and interfacial area with polymer matrix (Ahmadi, 2019).

Examples of uses of these nanomaterials in innovation and technology are nanofibers, for which studies are being carried out on lignin. The production of lignin nanoparticles is an efficient strategy to improve their adhesive properties because reducing the size of the particles significantly increases the surface area. This larger contact area favors interaction with other materials, resulting in better adhesion. In addition, on a nanometric scale, lignin now has properties superior to those of the original material, expanding its application potential (Antov et al., 2022).

The main benefit of obtaining nanoparticles from lignin is a noticeable increase in surface area and, consequently, greater dispersion in water. This is because lignin is naturally unable to dissolve in water under normal conditions due to interactions between molecules that favor clumping and consequently do not dissolve (Lu et al., 2012). Another benefit is the lower mass requirement for application in materials, which favors the lower use of reagents and also accelerates the production of new materials from renewable sources (Graça et al., 2012).

Nanolignins, when used in the preparation of polymeric composites, presented interesting characteristics such as improved thermal stability, increased absorption of ultraviolet radiation and increased antioxidant capacity compared to pure polymeric matrices, which makes these properties have a direct relationship with the increase in the area/volume ratio of the particles and consequently the increase of their functional groups (Kai et al., 2016).

Evaluating the dispersion and interfacial bonding of nanometric lignin and microlignin, when introduced in two different weight amounts (5% and 10% by weight) in phenol-formaldehyde adhesive, Yang et al. (2019) obtained better thermal cure results when they used lignin at the nanoscale. The same authors stated that when used at a concentration of 5% there is an increase in the shear strength of the panels.

Comparing lignin nanoparticles obtained by an acidolysis process with pure lignin, Qi et al. (2020) produced polyurethane (PU) nanocomposites. The authors found improvements in the mechanical performance result with the addition of lignin nanoparticles, such as in the tensile test. In addition, the nanocomposites had inherent resistance to ultraviolet radiation.

Zhao et al. (2025) performed alkaline demethylation of lignin to break methoxy bonds and expose more phenolic hydroxyl groups (phenolic OH), combined with the formation of lignin nanoparticles. These nanoparticles increase the phenolic OH content by 86%, from 1.86 mmol/g (pure lignin) to 3.47 mmol/g. This makes lignin much more reactive without needing extra chemical modifications. The HPLNPs were directly epoxidized, creating a 100% lignin-based adhesive (no petrochemicals). The results showed good initial shear strength: 2.45 ± 0.12 MPa (excellent for timber applications) and after 72 hours of immersion in cold water, it retained 91.3% of the force (2.24 ± 0.15 MPa), proving good resistance to hydrolysis.

Chen et al. (2019) used nanolignin (~300 nm) to replace 40% of phenol in the production of a nanolignin-phenol-formaldehyde (NLPF) adhesive. The resulting resin showed high dry bonding strength (1.30 MPa), higher than that required by a Chinese standard, in addition to low formaldehyde emission, meeting the E0 standard. The thermal

analyses indicated an increase in thermal stability and a reduction in the curing temperature compared to the conventional resin, demonstrating the potential of nanolignin in the formulation of more efficient and sustainable phenolic resins.

In addition to traditional adhesives, an experiment carried out with cardanol formaldehyde adhesive stands out. Magalhães et al. (2025) evaluated different concentrations of nanolignin (1, 2 and 3%) added to cardanol-formaldehyde adhesive for bonding plywood panels. The panels with nanolignin showed an increase in shear strength of about 160% in wet conditions. With the addition of nanolignin, the modulus of rupture and elasticity increased by approximately 150% and up to 400% in the parallel direction, respectively. Combustion resistance has also improved significantly. The addition of nanoscale lignin in the adhesive formulation improved the mechanical properties.

On the other hand

Therefore, these studies reinforce the potential of lignin nanoparticles in sustainable adhesives. Thus, they pave the way for scalable innovations in the sector.

3 FINAL CONSIDERATIONS

Innovations in nanoparticle adhesives offer significant potential to improve the strength, durability and sustainability of wood panels. The incorporation of lignin nanoparticles tends to provide improvements in the technological properties of wood and its derivatives. This method values lignin, an underutilized by-product of the paper industry, into sustainable functional materials, paving the way for eco-friendly adhesives.

Research shows that the use of nanomaterials in the formulation of adhesives allows an advance in the wood sector, with possibilities for the production of more ecological materials and with lower costs and environmental impacts. It is also important to highlight the importance of future studies to optimize application methods, combinations of nanoparticles and the use of technologies that can facilitate production on an industrial scale, always aiming at greater compatibility with existing processes and greater sustainability in the sector.

Leonardo Lopes Bezerra¹

ABSTRACT

This article presents a complete and operational framework for applying Artificial Intelligence and Machine Learning to risk management in the road transport of hazardous materials in Brazil, focusing on reducing low-frequency, high-consequence losses, maintaining the level of logistical service, and ensuring regulatory compliance. The work aligns with Decree No. 96,044 of May 18, 1988, which approves the Regulations for the Road Transport of Hazardous Products, as well as the standards of the Brazilian Association of Technical Standards ABNT NBR 7500, concerning identification for the land transport of hazardous materials, and ABNT NBR 9735, which deals with the set of equipment for emergencies in the land transport of hazardous materials. Furthermore, state Technical Instructions are considered, with emphasis on Technical Instruction 32 of 2025 from the Fire Department of the Military Police of the State of São Paulo, which establishes parameters for prevention and response in buildings and risk areas involving hazardous materials. This article seeks to combine technical evidence from multimodal predictive models – such as Gated Recurrent Unit-type recurrent networks integrated with deep neural networks with multimodal incorporation – with risk-oriented route optimization methods, including the use of Conditional Value-at-Risk and the concept of risk equity among affected communities. The approach is complemented by telemetry and the "Internet of Things" with sensors certified for explosive atmospheres, and by international guidelines for electronic documentation in emergencies established within the framework of the United Nations Economic Committee for Europe. As an applied demonstration, the BR-116 corridor, known as Régis Bittencourt, for Class Three flammable liquid cargo – Flammable Liquids – is presented, with indicative results of a reduction in expected risk between twenty and thirty percent and a reduction in Conditional Value-at-Risk to ninety-five percent between thirty-five and forty percent, while preserving the delivery window and regulatory compliance.

RESUMO

Este artigo apresenta uma estrutura completa e operacional para aplicação de Inteligência Artificial e Machine Learning na gestão do risco no transporte rodoviário de produtos perigosos no Brasil, com foco na redução de perdas de baixa frequência e alta consequência, manutenção do nível de serviço logístico e aderência normativa. O trabalho está alinhado ao Decreto nº 96.044 de 18 de maio de 1988, que aprova o Regulamento para o Transporte Rodoviário de Produtos Perigosos, bem como às normas da Associação Brasileira de Normas Técnicas ABNT NBR 7500, referente à identificação para o transporte terrestre de produtos perigosos, e ABNT NBR 9735, que dispõe sobre o conjunto de equipamentos para emergências no transporte terrestre de produtos perigosos. Além disso, são consideradas as Instruções Técnicas estaduais, com ênfase na Instrução Técnica 32 de 2025 do Corpo de Bombeiros da Polícia Militar do Estado de São Paulo, que estabelece parâmetros para prevenção e resposta em edificações e áreas de risco envolvendo produtos perigosos. Este artigo busca combinar evidências técnicas de modelos preditivos multimodais – como redes recorrentes do tipo Gated Recurrent Unit integradas a redes neurais profundas com incorporação multimodal – com métodos de otimização de rotas orientadas a risco, incluindo o uso do Valor Condicional em Risco, conhecido internacionalmente como Conditional Value-at-Risk, e o conceito de equidade de risco entre comunidades afetadas. A abordagem é complementada por telemetria e “Internet das Coisas” com sensores certificados para atmosferas explosivas, e por diretrizes internacionais de documentação eletrônica em emergências estabelecidas no âmbito do Comitê Econômico das Nações Unidas para a Europa. Como demonstração aplicada, apresenta-se o corredor BR-116, conhecido como Régis Bittencourt, para cargas de líquidos inflamáveis da Classe Três – Líquidos Inflamáveis, com resultados indicativos de redução do risco esperado entre vinte e trinta por cento e redução do Valor Condicional em Risco a noventa e cinco por cento entre trinta e cinco e quarenta por cento, preservando a janela de entrega e a conformidade normativa.

Palavras-chave: Inteligência Artificial. Aprendizado de Máquina. Produtos Perigosos. Gestão de Risco. Transporte Rodoviário. Telemática. IoT. CVaR. Equidade de Risco.

RESUMEN

Este artículo presenta un marco completo y operativo para aplicar la Inteligencia Artificial y el Aprendizaje Automático a la gestión de riesgos en el transporte terrestre de materiales peligrosos en Brasil, con foco en la reducción de pérdidas de baja frecuencia y alta consecuencia, el mantenimiento del nivel de servicio logístico y el cumplimiento normativo. El trabajo se alinea con el Decreto No. 96.044 del 18 de mayo de 1988, que aprueba el Reglamento para el Transporte por Carretera de Productos Peligrosos, así como con las normas de la Asociación Brasileña de Normas Técnicas ABNT NBR 7500, relativa a la identificación para el transporte terrestre de materiales peligrosos, y ABNT NBR 9735, que trata del conjunto de equipos para emergencias en el transporte terrestre de materiales peligrosos. Además, se consideran las Instrucciones Técnicas estatales, con énfasis en la Instrucción Técnica 32 de 2025 del Departamento de Bomberos de la Policía Militar del Estado de São Paulo, que establece parámetros para la prevención y respuesta en edificios y áreas de riesgo que involucran materiales peligrosos. Este artículo busca combinar la evidencia técnica de modelos predictivos multimodales —como redes recurrentes de tipo Gated Recurrent Unit integradas con redes neuronales profundas con incorporación multimodal— con métodos de optimización de rutas orientados al riesgo, incluyendo el uso del Valor en Riesgo Condicional y el concepto de equidad de riesgo entre las comunidades afectadas. El enfoque se complementa con telemetría e Internet de las Cosas (IoT) con

sensores certificados para atmósferas explosivas, así como con las directrices internacionales para la documentación electrónica en emergencias establecidas en el marco del Comité Económico de las Naciones Unidas para Europa. Como demostración aplicada, se presenta el corredor BR-116, conocido como Régis Bittencourt, para carga líquida inflamable de Clase Tres (Líquidos Inflamables), con resultados indicativos de una reducción del riesgo esperado de entre el 20 % y el 30 % y una reducción del Valor en Riesgo Condicional al 95 % entre el 35 % y el 40 %, preservando la ventana de entrega y el cumplimiento normativo.

1 INTRODUCTION

The transport of dangerous products by road in Brazil is an essential and sensitive activity, subject to a strict legal and technical regime. Decree No. 96,044 of 1988 establishes the fundamental rules for the road transport of dangerous products, while ABNT-NBR 7500 regulates identification and signaling and ABNT-NBR 9735 defines the minimum set of equipment for emergencies. At the state level, Technical Instructions, such as Technical Instruction 32 of 2025 of the São Paulo Fire Department, detail prevention and response requirements in buildings and risk areas. Such normative instruments, when integrated with data-based decision systems, enable a leap in maturity in operational safety.

At the same time, international organizations have consolidated good practices in electronic documentation for emergencies. The guidelines published under the European Agreement concerning the International Carriage of Dangerous Goods by Road, with emphasis on item 5.4.0.2 on electronic data interchange, encourage telematics and traceability. Although focused on the European scenario, these guidelines are technically compatible with the Brazilian reality when parameterized to local documentation and emergency response requirements, including the presence of an emergency response telephone number on transport documents and Safety Data Sheets for Chemical Products.

2 RISK FUNDAMENTALS APPLIED TO THE TRANSPORT OF DANGEROUS GOODS BY ROAD

Risk assessment in the transport of dangerous goods has historically combined the probability of an incident with the magnitude of the consequence. In road systems, a classic formulation calculates the risk of each road segment as the product between the probability of an accident with the release of a substance and the exposed population within an impact area, which varies according to the risk class of the product transported. This segmental risk is then aggregated along the route to compare alternative routes in a Geographic Information System, in order to select the one that minimizes the expected risk.

In recent years, two extensions have gained executive relevance. The first is the adoption of the Conditional Value at Risk as a metric of aversion to the cause of losses, which prioritizes the mitigation of extreme consequences, even if rare. The second is the incorporation of the principle of risk equity, which seeks to reduce asymmetries in the territorial distribution of risk, considering, for example, different emergency response times between municipalities or neighborhoods. In both cases, multiobjective formulations solved by optimization algorithms were proposed, including approaches based on multiple shorter paths and evolutionary heuristics.

3 ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING IN PREDICTIVE RISK ASSESSMENT

In the predictive field, deep learning architectures that combine recurrent units with dense networks and multimodal embedded, have demonstrated the ability to integrate continuous telemetry variables, discrete operating variables, and even context images, producing risk classifiers in near real-time. Published evidence reports very expressive accuracy and area under the curve values, especially when models are trained with robustness techniques such as adversarial training, dimensional reduction, and prediction similarity checking to reduce sensitivity to noise and small samples.

The executive advantage of this approach is twofold. First, it generates a per-leg risk score that feeds directly into the risk-oriented routing module, updating conditional probability estimates when changes in weather, traffic, or construction work arise. Secondly, the explanation can be expanded by the parallel adoption of endogenous gradient models of the XGBoost type, useful to rank variables that are more influential in risk in each operational scenario, facilitating audits and technical conversations with regulators and insurers.

4 TELEMATICS, INTERNET OF THINGS, AND INTEGRATION WITH EMERGENCY RESPONSE

The deployment of sensors certified for explosive atmospheres in tank and valve assemblies – measuring pressure, temperature and vibration – combined with communications in narrowband networks for the Internet of Things and low-power long-range networks, enables continuous monitoring with very low alert latencies. Studies and technical reports highlight the usefulness of geof fences, pressure gradient alarms and safe stop strategies at points previously approved with the Fire Departments, which can be formalized in the Technical Instructions and in the internal response plans.

The digital document layer integrates the emergency response number required in many jurisdictions, the safety data sheet and the travel data, aligning with the international guidelines of item 5.4.0.2 for electronic data interchange. This integration streamlines the triggering and triage of critical information during an event and increases traceability for audit purposes.

5 APPLIED STUDY: CORRIDOR BR-116, KNOWN AS RÉGIS BITTENCOURT, FOCUSING ON CLASS THREE FLAMMABLE LIQUIDS

5.1 OBJECTIVE AND SCOPE OF THE STUDY

The executive objective is to demonstrate, in a critical national corridor, how the combination of predictive assessment, risk routing with Conditional Value at Risk and equity, and telemetry can reduce expected risk and extreme risk without jeopardizing delivery times. The scope includes Class three loads, with identification according to ABNT NBR 7500 and the presence of an emergency set in accordance with ABNT NBR 9735, in addition to operational protocols aligned with Technical Instruction 32 of 2025 of the São Paulo Fire Department.

5.2 TECHNICAL METHODOLOGY

The methodology comprises: (i) construction of a feature store with vehicle telemetry data, tank pressure and temperature signals, meteorological and construction data, and demographic layers to calculate impact areas by risk class; (ii) training of a deep learning model for risk scoring by stretch, validated with robustness techniques; (iii) optimization of routes by risk with multidisciplinary formulation minimizing expected risk, Conditional Value at Risk and territorial inequalities of risk, resolved by shortest multipath algorithm and heuristics; (iv) implementation of re-routing and safe stop policies, with digital activation of the emergency number.

5.3 INDICATIVE RESULTS AND DISCUSSION

In the planning, two route alternatives were compared: Route A, shorter, and Route B, approximately ten to twelve percent longer. Route B presented an expected risk of about twenty-two percent lower and a Conditional Value at Risk of approximately thirty-five percent lower, with a better territorial distribution of risk due to less passage through densely populated areas and with a longer response time. For repeat shipments, a mixed strategy was adopted seventy percent on Route B and thirty percent on Route A, which, according to the literature, reduces the exposure accumulated over time when there is uncertainty in the probabilities per segment.

In the execution, heavy rain events and construction work increased the conditional probability of an accident with release in urban segments, which triggered the automatic re-routing for Route B. In parallel, a pressure gradient higher than expected was detected in the tank's telemetry, triggering a safe stop at an approved point and the call of the emergency

number for triage and support, according to the best practices of electronic documentation and the response guidelines of the Fire Departments.

From an executive perspective, indicative gains include a reduction in expected risk between twenty and thirty percent and a reduction in Conditional Value at Risk to ninety-five percent between thirty-five and forty percent, preservation of delivery windows, document traceability for auditing, and increased risk equity. These numbers are in line with studies on risk assessment and optimization of risk-oriented routes in international contexts, adjusted here to the Brazilian regulatory environment.

6 IMPLEMENTATION, GOVERNANCE AND PERFORMANCE INDICATORS

The implementation can be carried out after evaluating the scenario presented individually, starting with a regulatory and data diagnosis to map risk classes, requirements of Decree No. 96,044 of 1988, ABNT standards and applicable Technical Instructions, followed by the construction of a minimum viable prototype of risk scoring and the coupling of the route solver by risk. The next phase includes telemetric instrumentation with certified sensors, the definition of geof fences and safe stop points and the formalization of table exercises with the Fire Departments.

For governance, it is recommended: (i) adoption of machine learning processes in production with monitoring of data drift and performance; (ii) publication of model sheets with explanations and limitations; (iii) periodic audits in accordance with Decree No. 96,044 of 1988, ABNT NBR 7500 and ABNT NBR 9735, and state Technical Instructions; (iv) executive metrics such as expected risk per tonne-kilometer, Conditional Value at Risk, territorial distribution of risk, telemetric alert latency and compliance index per trip.

7 LIMITATIONS AND FUTURE OPPORTUNITIES

Data quality is a critical factor. Incident databases may be underreported, and short historical series make it difficult to estimate the probabilities of rare events. Robustness, temporal validation, and active learning techniques mitigate some of these effects. In addition, regulatory acceptance is reinforced by models with greater explainability, audit trails and strict document adherence, aspects that favor dialogue with regulatory agencies and insurance companies.

As an opportunity, the convergence with smart city and green corridor programs stands out, which allow the integration of municipal traffic, meteorology and civil defense data into the decision ecosystem, in addition to deepening alignment with international guidelines for telematics and electronic documentation in emergencies.

8 CONCLUSIONS

The combination of predictive assessment based on machine learning, risk-oriented routing with a focus on controlling extreme events and territorial equity, and telemetry with electronic documentation, offers Brazil a pragmatic path to reduce risk in the road transport of dangerous products without compromising logistics efficiency. The case applied in the BR-116 corridor demonstrates the technical feasibility and normative adherence when the practices are based on Decree No. 96,044 of 1988, on ABNT standards and on the Technical Instructions of the Fire Departments.

ABSTRACT

This article examines the predominant rationalities in university teaching and their impacts on the initial training of teachers, with emphasis on undergraduate teacher education programs in Brazil. It argues that conceiving teaching as mere content transmission, sustained by a technical-instrumental rationality, weakens the pedagogical and reflective dimension essential to the education of future educators. The study, of a theoretical-reflective nature, is based on a critical narrative review of the literature on higher education teaching, drawing on Habermas's concept of rationality (1982, 1987) and contributions from scholars in university pedagogy. The central aim is to discuss the tension between technical-instrumental and pedagogical rationalities, identifying their manifestations in teaching practices and their implications for teacher education. The analysis indicates that the predominance of the technical-instrumental model perpetuates transmission-centered practices, undermining the development of pedagogical competencies among prospective teachers. It concludes that overcoming this instrumental perspective requires institutional recognition of the pedagogical dimension and investment in the continuing education of university professors. Such measures are crucial to foster more reflective, intersubjective, and socially committed teaching practices, thereby strengthening the quality of basic education.

Keywords: University Teaching. Teacher Education. Pedagogical Rationality.

RESUMO

Este artigo examina as racionalidades predominantes na docência universitária e seus impactos na formação inicial de professores, com ênfase nos cursos de licenciatura no Brasil. Argumenta-se que a concepção da docência como mera transmissão de conteúdos, sustentada por uma racionalidade técnico-instrumental, fragiliza a dimensão pedagógica e reflexiva indispensável à formação de educadores. O estudo, de caráter teórico-reflexivo, fundamenta-se em uma revisão narrativa crítica da literatura sobre docência no ensino

superior, mobilizando o conceito de racionalidade em Habermas (1982, 1987) e contribuições de autores da pedagogia universitária. O objetivo central é discutir a tensão entre racionalidade técnico-instrumental e pedagógica, identificando suas manifestações na prática docente e suas implicações para a formação de licenciandos. Os resultados da análise indicam que a predominância do modelo técnico-instrumental perpetua práticas centradas na transmissão, comprometendo o desenvolvimento de competências pedagógicas nos futuros professores. Conclui-se que a superação dessa perspectiva requer a valorização institucional da dimensão pedagógica e o investimento em formação continuada dos docentes universitários, condição essencial para promover práticas mais reflexivas, intersubjetivas e comprometidas com a formação integral de educadores, fortalecendo, assim, a qualidade da educação básica.

RESUMEN

Este artículo examina las racionalidades predominantes en la docencia universitaria y sus impactos en la formación inicial docente, con énfasis en los cursos de grado en Brasil. Argumenta que la concepción de la enseñanza como una mera transmisión de contenido, sustentada en una racionalidad técnico-instrumental, debilita la dimensión pedagógica y reflexiva indispensable para la formación de educadores. El estudio, de naturaleza teórico-reflexiva, se basa en una revisión narrativa crítica de la literatura sobre la docencia en la educación superior, movilizándolo el concepto de racionalidad en Habermas (1982, 1987) y contribuciones de autores en pedagogía universitaria. El objetivo central es discutir la tensión entre la racionalidad técnico-instrumental y pedagógica, identificando sus manifestaciones en la práctica docente y sus implicaciones para la formación de estudiantes de grado. Los resultados del análisis indican que el predominio del modelo técnico-instrumental perpetúa prácticas centradas en la transmisión, comprometiendo el desarrollo de competencias pedagógicas en futuros docentes. Se concluye que superar esta perspectiva requiere la valorización institucional de la dimensión pedagógica y la inversión en la formación continua del profesorado universitario, condición esencial para promover prácticas más reflexivas e intersubjetivas comprometidas con la formación integral de los educadores, fortaleciendo así la calidad de la educación básica.

1 INTRODUCTION

University teaching, especially in undergraduate courses, occupies a strategic position in the training of future teachers and, consequently, in the quality of the educational processes that unfold in basic education. However, this essential function occurs in a scenario of deep complexity. According to Barbosa (2020), the contemporary educational reality is immersed in perplexities, crises, uncertainties, and socioeconomic pressures, resulting in a phenomenon that marks the present day: the precariousness of teaching work.

In this context, a critical gap in higher education emerges. It is recurrent the understanding that mastery of specific content would be a sufficient condition for teaching, which tends to reduce teaching to a technical exercise of exposure and control, to the detriment of its pedagogical and social dimension. This perspective favors the naturalization of practices centered on transmission, making the didactic-pedagogical mediations that are fundamental to the teaching work less visible. Such a scenario is directly reflected in the classroom, where the decisions made reveal the type of rationality that guides those responsible for the educational process.

The discussion about rationalities gains prominence as the predominance of a technical-instrumental rationality — as problematized by Therrien (2006) and Slonski, Rocha and Maestrelli (2017) — restricts teaching to measurable procedures and results. In opposition to this model, Barbosa (2020) defends the need for practices guided by a pedagogical rationality capable of thinking and rethinking the classroom context. For the author, learning to be a teacher involves a continuous movement of reflection, requiring educators to review their own way of learning and build their teaching experience.

This need to transition from technical to pedagogical rationality becomes even more urgent in the face of recent normative changes in Brazil. CNE/CP Resolution No. 04, of May 30, 2024, which establishes the new National Curriculum Guidelines for Initial Teacher Training, proposes a profound reformulation of undergraduate courses. The norm seeks to overcome curricular fragmentation by requiring an organic articulation between theoretical training at the university and practice in basic education, aligning with the competencies of the BNCC. However, without a change in the rationality that sustains the action of university professors, such reforms run the risk of becoming only bureaucratic adjustments.

Recent data from the Higher Education Census (INEP, 2022) reveal that approximately 60% of teachers who work in undergraduate courses in Brazil do not have specific pedagogical training for higher education, basing their practice predominantly on experience as students and on the mastery of disciplinary content. This scenario becomes even more worrying when we consider that these teachers are responsible for the initial training of

educators who will work in basic education, evidencing a cycle of reproduction of teaching practices that are not pedagogically grounded. Such a reality not only favors the naturalization of practices centered on transmission, but also contradicts the national curriculum guidelines for teacher training (Resolution CNE/CP No. 2/2015 and No. 2/2019), which emphasize the need for training based on reflection, praxis, and the development of complex pedagogical skills.

In view of this, this article aims to analyze the predominant rationalities in university teaching practice and discuss their impacts on teacher education, emphasizing the tension between technical-instrumental rationality and pedagogical rationality. As a contribution, it seeks to offer a theoretical-critical framework that illuminates university teaching as a social and formative practice, based on Habermas' formulations of rationality and on interlocutions in the field of teaching in higher education (Santos, 2013; Therrien, 2006; Slonski; Rocha; Maestrelli, 2017).

More specifically, it seeks to answer the following questions: How does technical-instrumental rationality manifest itself in university teaching practices in teaching degrees? What are the consequences of this rationality for the pedagogical training of undergraduates? What elements characterize a pedagogical rationality in higher education and how can it be promoted institutionally?

Methodologically, it is a theoretical-reflective study, based on a critical narrative review of the literature, guided by the identification and contrast of rationalities that sustain ways of teaching in higher education. The analysis mobilizes key authors to delimit interpretative categories and sustain reflection on the work of university professors, focusing on teaching degrees and their formative requirements in the face of the new Brazilian legal scenario.

In addition to this introduction, the article is organized into two main sections. In the section "Theoretical deepening", the discussion on rationality and its expressions in university teaching is developed, opposing the technical-instrumental centrality to the pedagogical rationality and its implications for initial training. Then, in "Final considerations", the main analytical findings are resumed and challenges and implications for the institutional qualification of teaching in higher education are pointed out.

2 METHODOLOGICAL PATH

This study is characterized as a theoretical-reflective research, with a qualitative approach, based on a critical narrative review of the literature. The choice for this modality is justified by the conceptual nature of the object — the rationalities that guide university

teaching — and by the need to build a theoretical-critical framework capable of evidencing tensions and possibilities in teacher education.

The bibliographic review was carried out in the SciELO databases, CAPES Journal Portal, Google Scholar and institutional repositories, considering publications between 2000 and 2024, in addition to classic works. Descriptors such as *university teaching*, *pedagogical rationality*, *technical rationality*, *teacher training* and *teaching degrees* were used. Peer-reviewed articles, theses, dissertations, and reference books in the field were included. The manual search complemented the survey, incorporating fundamental authors such as Habermas (1982, 1987), Freire (1996), Tardif (2014), Schön (2000), Cunha (2010, 2016) and Pimenta and Anastasiou (2014), Barbosa (2018, 2020). The final corpus brought together about 25 works.

The analysis followed the principles of thematic content analysis proposed by Bardin (2011), organized around two main categories: technical-instrumental rationality, which conceives teaching as the transmission of content and control practices, and pedagogical/communicative rationality, which values mediation, dialogue, and articulation between theory and practice. The theoretical discussion was built from the confrontation between these categories, evidencing tensions and possibilities of overcoming instrumental rationality in favor of a more reflective and formative pedagogical perspective.

The study is anchored in Habermas' Theory of Communicative Action (1982, 1987), especially in the concepts of instrumental and communicative rationality, articulated with contributions from authors of university pedagogy and teacher training. This foundation allowed us to delimit interpretative categories and sustain reflection on the work of university professors, focusing on teaching degrees and their formative requirements in the face of the new Brazilian legal scenario.

3 THEORETICAL DEEPENING

The theoretical deepening of this research seeks to show how different conceptions of rationality, especially from the work of Jürgen Habermas, offer a critical reference to understand university teaching and its implications in teacher education. The analysis articulates conceptual foundations, manifestations of technical-instrumental rationality and the possibilities opened by pedagogical/communicative rationality.

The notion of rationality adopted here refers to the ways in which subjects orient their actions and decisions according to certain ends, and is always mediated by historical, social and cultural contexts. According to Barbosa (2020), rationality is not a static or universal attribute, but resides in the way subjects make use of embodied knowledge in their concrete

actions. In the educational field, this rationality assumes a central role, as it guides the conceptions of teaching, learning and human formation, directly affecting teaching practice and training processes. Thus, the tensions that emerge in the teaching degrees and their effects on practice are highlighted, recognizing the limits and potentialities of the Habermasian framework in articulation with perspectives that understand teaching as a social, political and formative practice.

3.1 RATIONALITY IN HABERMAS: CONCEPTUAL FOUNDATIONS

Habermas (1987) distinguishes three types of rationality linked to different constitutive interests of knowledge: the technical, aimed at control and predictability; the practical, oriented towards mutual understanding and understanding; and the emancipatory, which seeks autonomy and liberation from oppressive conditions. These interests are not abstract categories, but reflect different ways of relating to the world and to the subjects, profoundly influencing the way in which the educational process is conceived. Each type of rationality corresponds to a specific form of action: instrumental action (means-ends), strategic action (calculation of interests) and communicative action (oriented to mutual understanding).

The distinction between these rationalities is fundamental to understand the dynamics that cross higher education. Technical or instrumental rationality seeks to maximize efficiency through the control of variables and the predictability of results. It presupposes a subject who acts on objects, transforming them according to previously established ends. In contrast, practical rationality recognizes that human action is not reduced to means-ends calculations, but involves the interpretation of shared meanings and the negotiation of meanings between subjects. Emancipatory rationality, in turn, goes further, proposing that educational action should be committed to the liberation of conditions that limit the autonomy and critical reflection of the subjects.

In this context, language assumes a differential and constitutive role. As Barbosa (2020) points out, in the Theory of Communicative Action (TAC), language is the possibility of understanding between subjects through communicative contexts, about a given social reality. It is not a merely instrumental language, used to transmit information in a unidirectional way, but a language that is constituted by interaction, dialogue and the search for mutual understanding. This understanding is essential to rethink university teaching, as it calls into question teaching models that reduce pedagogical communication to a process of encoding and decoding messages.

Communicative rationality, therefore, is not just one type of action among others, but represents a qualitative transformation in the way we understand the relationship between

subjects. When teachers and students engage in authentic communicative processes, oriented to mutual understanding, the conditions are created for knowledge to be not only transmitted, but collectively constructed. This implies recognizing that each participant in the pedagogical interaction brings with them a valid perspective, meaningful experiences, and reflective capacities that should be valued. Thus, education ceases to be a process of deposition of content and becomes a space for the production of shared meanings.

3.2 TECHNICAL-INSTRUMENTAL RATIONALITY IN UNIVERSITY TEACHING

The predominance of technical-instrumental rationality in higher education has been pointed out as the organizing matrix of contemporary teaching practice. Cunha (2010, 2016) states that the bachelor's tradition and the valorization of research to the detriment of teaching reinforce a teaching culture centered on the transmission of content. This logic reduces teaching to a technical practice, devoid of critical reflection, and perpetuates teaching models that privilege disciplinary specialization to the detriment of pedagogical training. Santos (2013) corroborates this view by showing that many teachers structure their pedagogical action under the belief that the mastery of specific knowledge is sufficient for the exercise of teaching, reducing teaching to a set of operational procedures that disregard the complexity of the educational process.

This logic is often driven by what Habermas defines as the "System"—the sphere governed by instrumental reason, power, and capital—that tends to colonize the "Lifeworld"—the sphere of cultural reproduction, socialization, and mutual understanding. Barbosa (2020) points out that this "colonization" of the World of Life by the System represents a threat to the autonomy and reflexivity of the subjects. In the university context, this dynamic is manifested through pressures for productivity, quantification of results, standardization of practices and reduction of teaching to measurable indicators. Teachers, pressured by systemic demands (publications, performance indexes, external evaluations), tend to reproduce an instrumental logic that leaves no room for critical reflection or genuine dialogue with students.

Slonski, Rocha and Maestrelli (2017) demonstrate that entry into a teaching career in higher education occurs, to a large extent, without specific didactic-pedagogical preparation, which leads teachers to build their practices based on previous experiences as students. Such dynamics contribute to the reproduction of traditional teaching models and to the maintenance of a naturalized technical rationality in the university context. This naturalization is particularly problematic because it masks the political and ideological choices underlying teaching practice, presenting as "natural" or "obvious" a way of teaching that is, in fact, historically constructed and socially situated.

The problem is deepened when we consider that this absence of systematic pedagogical training is not merely an individual gap, but reflects an institutional conception that devalues teaching as a specific field of knowledge. Soares and Cunha (2010) identified that most university professors do not have specific pedagogical training, reproducing practices experienced as students. Veiga (2014) adds that the absence of institutional spaces for pedagogical training contributes to the maintenance of this transmissive culture. Slonski et al. (2017) also problematize the widely held idea that mastery of content guarantees, by itself, the ability to teach. This conception sustains a naturalized view of teaching, in which teaching is understood as an intuitive skill or resulting from disciplinary expertise, disregarding that teaching is a specific field of knowledge that demands continuous professional development.

Therrien (2006) and Slonski, Rocha and Maestrelli (2017) reinforce that the posture of "content specialists" disregards the specificities of the teaching-learning process, generating negative impacts on the training of future teachers. When university professors do not recognize teaching as a practice that requires specific knowledge — pedagogical, curricular, experiential — they tend to reproduce with their students the same practices they experienced, perpetuating a cycle of uncritical transmission. This is particularly serious in teaching degrees, where future teachers learn, through example, that teaching is synonymous with transmitting content, with no room for reflection, dialogue or the collective construction of knowledge.

3.3 PEDAGOGICAL RATIONALITY AND COMMUNICATIVE ACTION IN HIGHER EDUCATION

In opposition to the technical model, pedagogical rationality understands teaching as a complex, situated and intentionally formative social practice. Habermas (1987) associates this rationality with practical and emancipatory interest, oriented to dialogue and the autonomy of the subjects. In this sense, university teaching cannot be reduced to mere transmission, but must be understood as critical and reflective mediation, capable of promoting meaningful and emancipatory learning. For Therrien (2006), this rationality is constituted in intersubjectivity, dialogue and communication, with human formation, intellectual autonomy and social emancipation as its horizon.

Barbosa (2020) and Therrien (2006) converge in stating that communicative action can guide the teacher's work towards an emancipatory and reflective practice, the result of which is learning that satisfies both those involved in the pedagogical relationship. Unlike instrumental action, which seeks only to achieve predetermined goals, communicative action

opens space for participants to negotiate meanings, question assumptions and build shared understandings. This means that, in a classroom guided by pedagogical rationality, knowledge is not something that the teacher "owns" and "transmits", but something that emerges from the interaction between teacher, students and content.

Teaching, thus understood, goes beyond the logic of technical application and assumes an ethical and political commitment to the formation of subjects. Pimenta and Anastasiou (2014) argue that teaching requires specific knowledge that goes beyond the disciplinary domain, including pedagogical and experiential knowledge. Tardif (2014) reinforces that teaching knowledge is plural and constructed throughout the professional trajectory, which contradicts the instrumental view that it is enough to master the content to teach. This knowledge is not static or predefined, but is constantly re-signified in practice, through reflection on concrete teaching situations.

Therrien (2006) problematizes the historically constructed dichotomy between theory and practice in teacher education. For the author, pedagogical practice should not be conceived as a mere application of previously elaborated theories, but as a privileged space for the production of knowledge. From this perspective, the teacher interprets, re-signifies and transforms knowledge in the light of concrete teaching situations, which reinforces the centrality of critical reflection on action in the constitution of teaching professionalism. This understanding finds resonance in the contributions of Slonski, Rocha and Maestrelli (2017), who defend teacher training as a space for systematic reflection on practice.

Santos (2013) adds that pedagogical rationality requires problematizing and contextualizing knowledge, favoring the integral formation of students. This implies that the teacher not only transmits information, but that he helps students to understand how this knowledge relates to their lives, to society and to contemporary issues. The contextualization of knowledge is, therefore, a political act, as it reveals the power relations that cross the production and circulation of knowledge. Slonski, Rocha and Maestrelli (2017) emphasize that pedagogical training in higher education should promote reflective processes capable of enabling teachers to understand, analyze and transform their own performance. Such an approach shifts the formation from a prescriptive logic to a formative perspective, in which critical reflection is a central element of teacher professional development.

Another relevant aspect addressed by Therrien (2006) refers to the heterogeneity of teaching knowledge. The author shows that the teacher mobilizes, in his performance, disciplinary, pedagogical, curricular and experiential knowledge, built throughout his personal and professional trajectory. This knowledge does not work in isolation, but in articulation, forming a complex web of knowledge that guides practice. Slonski et al. (2017) reinforce this

understanding by stating that university teaching is a field of multiple knowledge, whose articulation requires formative processes that recognize the complexity of teaching and value the autonomy and pedagogical responsibility of the teacher. Recognizing this multiplicity of knowledge is fundamental to overcome the reductive view that sees the teacher as a mere "content specialist".

3.4 TENSIONS BETWEEN RATIONALITIES IN TEACHING DEGREES: IMPLICATIONS FOR TEACHER TRAINING

In undergraduate courses, the tension between technical-instrumental and pedagogical rationality is even more accentuated and problematic. Gatti (2014) shows that many courses reproduce the logic of bachelor's degrees, prioritizing disciplinary training to the detriment of pedagogical. Libâneo (2015) points out that fragmented curricula reinforce the dichotomy between "knowing the content" and "knowing how to teach", making it difficult to articulate theory and practice. This scenario creates a vicious circle: university professors who do not experience a pedagogical rationality tend to train undergraduates who also do not apply it in their future professional performance.

Santos (2013) argues that this prioritization of disciplinary training contributes to the constitution of professionals who are poorly prepared to deal with the uncertainties, challenges and contradictions of daily school life. The absence of consistent pedagogical training limits the ability of university professors to interpret complex educational situations, critically reflect on their practice and produce knowledge based on experience. When future teachers do not experience, during their initial training, teaching processes guided by pedagogical rationality, they lack practical references to implement this approach in their own classrooms.

Barbosa (2020) points out that recent curricular reformulations — such as CNE Resolutions 02/2015 and 02/2019 — try to strengthen the links between training institutions and schools, recognizing the need for a more integrated and reflective education. However, the challenge remains in the materialization of these changes in the concrete practices of universities. Many institutions still maintain curricular structures that separate content disciplines from pedagogical disciplines, reinforcing the dichotomy that is sought to be overcome. This curricular fragmentation not only harms the training of undergraduates, but also reflects and reinforces the institutional devaluation of teaching as a field of knowledge.

Overcoming this logic requires a deep institutional commitment to the continuing education of university professors, valuing research in teaching and creating systematic spaces for pedagogical reflection. It is essential that universities recognize teaching as a

specific field of knowledge, which demands continuous professional development and institutional investment. Without this change, there is a risk of perpetuating transmissive practices that weaken teacher training and, consequently, the quality of basic education. Teacher training is not a merely technical problem, to be solved through specific curricular adjustments, but a political issue that involves decisions about what kind of professional we want to train and what kind of society we want to build.

Therrien (2006) emphasizes that pedagogical practice should not be conceived as a mere application of theories, but as a space for the production of knowledge. This means that university professors need to be recognized as producers of knowledge about teaching, not just as transmitters of disciplinary knowledge. When the university values only disciplinary research and devalues research on teaching, it reinforces the instrumental logic it seeks to overcome. Therefore, the change in teaching degrees necessarily involves a revaluation of teaching and research in education in the university context.

3.5 LIMITS AND POTENTIALITIES OF THE HABERMASIAN FRAMEWORK FOR THINKING ABOUT TEACHING

The concept of communicative rationality offers a robust framework for thinking about university teaching, but it is not exempt from important limits and criticisms. Young (1996) observes that the theory presupposes ideal conditions for dialogue that rarely materialize in institutions marked by hierarchies and power relations. This criticism shows that, although powerful, the Habermasian framework needs to be adapted to the real conditions of educational practices, where it is not always possible to achieve the "rational consensus" that Habermas proposes as a regulative ideal.

Barbosa (2020) deepens this criticism by highlighting that the colonization of the Lifeworld by the System is not a process that occurs only externally, but that penetrates the institutional structures and subjectivities of the subjects. This means that even when teachers and students want to engage in authentic communicative processes, they face structural obstacles—pressures for productivity, standardized assessments, prescriptive curricula—that make it difficult to fully realize communicative action. Habermas' theory, therefore, does not offer ready-made solutions, but a normative horizon that can guide the criticism and transformation of educational practices.

Freire (1996) complements this perspective by highlighting that it is necessary to go beyond communicative rationality, articulating awareness and politicization in a transformative praxis. For Freire, it is not enough for the subjects to understand each other; This understanding must be oriented towards the transformation of the oppressive conditions that limit humanization. This Freirean perspective enriches the Habermasian framework by

emphasizing that education is always a political act, which cannot be neutral or detached from the struggles for social justice.

Despite these criticisms and limitations, the Habermasian framework remains relevant and potent to illuminate the tensions between rationalities in university teaching and to point out paths for more reflective, intersubjective and emancipatory pedagogical practices. Its articulation with critical perspectives, such as Freire's pedagogy and Barbosa's (2020) contributions on the colonization of the World of Life, broadens its reach and strengthens the understanding of teaching as a social, political, and formative practice. This articulation allows not only to diagnose the problems, but also to glimpse possibilities for transformation.

The articulation between the perspectives of Santos (2013), Therrien (2006), Barbosa (2020) and Slonski, Rocha and Maestrelli (2017) allows us to conclude that teacher training in higher education should be guided by a critical, reflective and communicative pedagogical rationality. Such rationality conceives the teacher as an epistemological subject, producer of knowledge and agent of social transformation. This conception reinforces the need for intentional, continuous and institutionally recognized pedagogical training in the context of university teaching. It is not only a matter of improving teaching techniques, but of transforming the institutional structures and cultures that sustain the devaluation of teaching.

4 FINAL CONSIDERATIONS

The analysis developed in this article reinforces the central thesis that the rationalities that permeate university teaching are neither neutral nor natural, but historically and socially constructed, producing concrete effects on teacher training and, consequently, on the quality of basic education. It was evidenced that the predominance of a technical-instrumental rationality, centered on the transmission of contents, efficiency and measurable results, weakens the pedagogical dimension essential to teacher training. This scenario reduces teaching to a technical exercise, emptying its formative, critical and emancipatory potential, and perpetuates a logic that compromises the integral education of undergraduates.

On the other hand, pedagogical rationality, based on the assumptions of Habermas' communicative rationality and enriched by the contributions of university pedagogy, points to the need for a profound transformation in teaching conceptions and practices in higher education. This change cannot be understood only as an individual or voluntarist initiative, but requires robust institutional, political and cultural transformations. It is imperative that universities invest in continuing pedagogical training programs, conceived as permanent spaces for reflection, research and professional development, capable of overcoming the

logic of punctual courses and promoting more reflective and intersubjective teaching practices.

In addition, it is essential to value the pedagogical dimension in the criteria for progression in the teaching career, so that the quality of teaching is considered as relevant as scientific production. This restructuring should reach the curriculum of the teaching degrees, overcoming the fragmentation between disciplinary and pedagogical training and promoting an effective integration between theory and practice. To sustain this movement, higher education institutions need to create university pedagogy centers dedicated to teaching advice and foster research on teaching and learning as a legitimate field of knowledge production.

The training of teachers in teaching degrees cannot be restricted to the acquisition of disciplinary knowledge. It should be conceived as a process that enables future educators to act in a critical, reflective, ethical, and politically engaged way, understanding teaching as a transformative praxis. The adoption of a pedagogical rationality in university teaching, replacing the hegemonic technical-instrumental model, is a fundamental and urgent step towards the construction of a higher education committed to the integral formation of subjects, to the democratization of knowledge and to social transformation.

Finally, it is recognized that this theoretical-reflective study has limitations due to the absence of primary empirical data, which restricts the analysis to the conceptual level. This limitation, however, opens space for future qualitative and quantitative research, capable of mapping the predominant conceptions of teaching, identifying innovative practices and investigating how the licentiate students perceive and are affected by the rationalities of their educators. In addition, it would be relevant to broaden the dialogue with critical perspectives such as decolonial pedagogy and the epistemologies of the South, which incorporate dimensions of power and cultural difference often made invisible in Eurocentric approaches.

ABSTRACT

This research analyzes the experience of producing and executing the Law and Public Policy Workshop held in 2024 in the Lagoa Amarela community, located in the municipality of Chapadinha, in the state of Maranhão. This workshop was linked to the process of constructing Protocols for Prior, Free and Informed Consultation to strengthen rights and contribute to combating threats to the ways of life of traditional communities in Maranhão. The research used a methodological approach inspired by action research. It concludes by reaffirming the relevance of the action, given its potential for collective reflection on identity, challenges, and rights in a community lacking access to public services and experiencing an advanced stage of destruction of its conditions for economic and social reproduction.

Keywords: Law. Public Policies. Traditional Communities.

RESUMO

Essa pesquisa analisa a experiência de produção e execução da Oficina de Direito e Políticas Públicas realizada em 2024 na comunidade de Lagoa Amarela, localizada no município de Chapadinha, no estado do Maranhão. Tal oficina estava vinculada ao processo de construção de Protocolos de Consulta Prévia, Livre e Informada para fortalecer direitos e contribuir no combate às ameaças aos modos de vida de comunidades tradicionais maranhenses. A pesquisa fez uso de uma abordagem metodológica inspirada na pesquisa-

RESUMEN

Esta investigación analiza la experiencia de producción y ejecución del Taller de Derecho y Políticas Públicas, realizado en 2024 en la comunidad de Lagoa Amarela, ubicada en el municipio de Chapadinha, estado de Maranhão. Este taller se vinculó al proceso de elaboración de Protocolos de Consulta Previa, Libre e Informada para fortalecer los derechos y contribuir a combatir las amenazas a las formas de vida de las comunidades tradicionales de Maranhão. La investigación utilizó un enfoque metodológico inspirado en la investigación-acción. Concluye reafirmando la relevancia de la acción, dado su potencial para la reflexión colectiva sobre la identidad, los desafíos y los derechos en una comunidad sin acceso a servicios públicos y que experimenta una etapa avanzada de destrucción de sus condiciones de reproducción económica y social.

Palabras clave: Derecho. Políticas Públicas. Comunidades Tradicionales.

1 INTRODUCTION

The objective of this work was to analyze the experience of participatory production and execution of Law and Public Policy Workshops in 2024 in quilombola and traditional communities in Maranhão. At its starting point, the action was part of the Project "Collective Construction of Consultation Protocols and Territorial Protection Plans in Quilombola and Traditional Communities in Situations of Threat in the State of Maranhão", which originates from a partnership between the Ministry of Human Rights and Citizenship - MDHC, the Ministry of Agrarian Development and Family Agriculture - MDA and the Federal University of Maranhão - UFMA, with the main objective of supporting the development of Prior, Free and Informed Consultation Protocols to strengthen rights and contribute to combating threats to the ways of life of traditional communities in the State of Maranhão.

Encompassing a multidisciplinary technical team with different levels of research experience, this cooperation carried out actions in communities belonging to seven municipalities in the State of Maranhão during the year 2024, namely: 1. Quilombo Boa Vista (Rosário); 2. Quilombo Munim-Mirim (Axixá); 3. Camaputia Quilombola Territory (Cajari); 4. Quilombo Lagoa Amarela (Chapadinha); 5. Quilombo São Benedito dos Colocados (Codó); 6. Jacarezinho Quilombola Territory (São João do Sóter); 7. Pericumã Quilombola Territory (Peri-Mirim). In each of them, in addition to a meeting to present the project and community mobilization in the initial stage, 04 (four) mandatory workshops and 01 (one) assembly were held to approve the basic text of the protocol.

In this text, we deal with the process of construction and execution of the Law and Public Policies Workshop, one of the four workshops mentioned above, specifically focusing on its realization in 2024 in the Community of Lagoa Amarela, located in the municipality of Chapadinha - MA. This is a community basically composed of rural workers, from family farming, and who carry out various productive activities, such as "farm work, raising pigs, chickens, fishing, hunting, making flour, etc.". The lands of Lagoa Amarela are divided into about 46 units and the effective number of people living in the community is around 25 families, with about 50 children.

In view of the above, this text is divided into three parts. In the first, we explore part of the process of formation of Lagoa Amarela, highlighting some of the main challenges faced by its residents today. In the second, we reflected on the process of building and carrying out the workshop, emphasizing the strategies and themes selected. Finally, we draw some conclusions about the consultation process and the importance of carrying out this action for a community with no history of mobilization.

2 THE PROCESS OF FORMATION OF LAGOA AMARELA: SUBSIDIES FOR THE RECONSTITUTION OF A LOCAL HISTORY

Lagoa Amarela is a community in the rural area of the municipality of Chapadinha - MA, about 20km from the administrative center, which defines itself as a remnant of quilombos and was certified by the Palmares Foundation in 2024. The locality is recognized as the locus of the largest and most recognized Quilombo in the History of Balaiada in Maranhão (1838-1841) and for being associated with the figure of Cosme Bento das Chagas, the Negro Cosme, who is a unique piece in the imagination of black resistance in Maranhão and in Brazil.

Currently, the situation of Lagoa Amarela is quite representative in terms of the aggravation of socio-environmental problems caused by the expansion of soybean production in Maranhão and its effects on traditional communities. As is known, initially concentrated in the municipality of Balsas, soybean production moved, from the 2000s onwards, to the Eastern Maranhão mesoregion, where the micro-region and municipality of Chapadinha are located (Almeida; Júnior, 2019). Located in a zone bordering Piauí, the area is strongly marked by the intrusion of business agents and the so-called Gauchos (Gaspar, 2013) to which a series of conflicts and environmental threats are linked, the destructuring of territories, deforestation, expropriation and dismantling of the conditions of community permanence and reproduction.

From a historiographical perspective, based on the memorialistic reports collected and on various other materials produced in the workshops, we can sketch a characterization of the formation of the Community of Lagoa Amarela divided into three major interdependent moments. The first corresponds to the more distant past of colonization of the area in question and to the very dynamics and particularity of the formation of the peasantry in eastern Maranhão, marked by occupation by peasants of different origins, who joined and eventually mixed with detribalized indigenous people, forros and their descendants, aquilombados of African slaves (Assunção, 2015; Almeida, 2017). As seen in the works of Mathias Assunção (2008), this occupation could be traced back to the first quarter of the nineteenth century, if not earlier, being marked by the development of complex systems of common use, also demarcating various forms of access to land.

In fact, it is relatively well known and documented that the significant presence of northeastern migrants, together with caboclos, forros and their descendants, are important elements for understanding both the insurrection of the balaies in the nineteenth century, and the very complexity of the process of formation of the peasantry in this region (Assunção, 2015). For what interests us here more directly, it is important to emphasize that this is a

heterogeneous peasantry that received continuous waves of northeastern migrants who joined and eventually mixed, while they conform unique modalities of access and occupation of the lands. With regard to the memorialistic reconstruction of our informants, their ancestors seem to have settled in the vicinity of the plantations, being incorporated as aggregates and/or tenants. This corresponds to the second moment of our reconstitution.

In fact, it is the existence of this social structure that goes back to the most distant and detailed memories of the oldest residents of Lagoa Amarela. Their reminiscences are directly linked to a structure of relations between their parents - peasants, aggregates/indentured - and those considered owners who, although they were marked by exploitation, nevertheless allowed management and access to land in a relatively free way. Thus, in the reports of the oldest residents, although the area was already considered privatized and the use of the resources involved the mediation of landowners, who required payment of rent or provision of services, agroextractivist production was not unfeasible as it happens today. And in fact, the configuration of this structure of social relations is very reminiscent of the description made in fieldwork in the 1990s by Maristela de Paula Andrade, who identified at least seven ecosystems of relations between peasants and landowners in the region in question:

(...) small landowners who hold the title to the land, generally older men; the heirs of land of inheritance without division; the relatives of these heirs who, although they do not have the right to the land, continue to live and cultivate on the lands of the relatives, within the limits of the villages; the relatives of these heirs who only reside within the limits of these villages, but pay income to cultivate on other lands, from landowners or other small proprietors; heirs of inheritance land who pay rent to cultivate land on other properties when their land is exhausted (...); the inhabitants of terra de preto, who enjoy them in common; the heirs, or small landowners who occupy the lands of the plateau bordering the properties, also becoming squatters (Andrade, 1995a, p. 34)

Figure 1

Sources: IBGE 2022; Google Satellite; Drawings and Sketch. Organization and Elaboration: Vandemilson Silva dos Santos, 2024.

Finally, the third period is characterized by the intensification of changes in the land structure, driven by the massive arrival of individuals and/or businessmen in the region, mainly soybeans, and which alters the pattern of forces between peasants and traditional landowners. Encouraged by the vicissitudes of inheritance transmissions in the families of the so-called owners, part of Lagoa Amarela then began to be marketed to individuals and/or businessmen who tried to implement monoculture tree plantations in the region, especially soybeans, affecting the reproductive conditions of its inhabitants. Once surrounded by the ongoing land concentration, these tenants, descendants of the old aggregates, became the weakest link in the chain of concentration in question, leaving them only the alternative of complying with the ultimatum of the landowners who "granted" them a hectare of land and the opportunity to buy as many and as many other hectares as their economic resources made possible, before they were sold to third parties. These acquisitions thus demarcate the last and most dramatic period of changes in the local land structure and in the history of the community itself, when the lands of Lagoa Amarela passed almost entirely to private use and the individual conquest of a land to "call their own" occurs in parallel with the almost unfeasibility of the permanence and (re)production of the existence of these families.

Here, then, is a significant part of the problems reported regarding the use of common areas and natural resources and in relation to the very conditions of reproduction of the peasant economy in question. Family farmers born and raised in an environment of natural resource management on free and/or private lands today face difficulties in making a swidden line, carrying out extractive collection and even fishing, since access to lakes and streams has been prevented by the "owners". To make matters worse, as can be seen in the cartographic representation above, the expansion of soybean production is a real siege of the community, which creates obstacles for animal husbandry, for the cultivation of food and has even affected lakes and streams, making them unfeasible for bathing and fishing, since they course with the emergence of skin irritation problems. It is difficult to think of such a complex and accelerated picture of the complete destruction of the conditions of peasant reproduction as the one at stake.

3 THE WORKSHOP IN ACTION: PROBLEMATIZING LAW AND PUBLIC POLICIES IN LAGOA AMARELA

The Public Rights and Policies workshop was conceived as one of the cornerstones of the process of collective reflection on the specific rights of communities, based on the sharing of legal knowledge and exchange of local knowledge, focusing on the following aspects: the right to property title, the right to self-determination, the right to prior, free and informed consultation and other constitutional rights of quilombolas. Public Policies aimed at quilombola communities were another topic discussed in the workshop, whose approach was oriented to the debate of themes that the communities themselves conceived as relevant for decision-making in accordance with their priorities. It is important to note, in fact, that in addition to the execution of the aforementioned workshop, a booklet was produced as reference material for didactic and informative support for the participants of the action. The guiding questions of the Workshop were the following: What is the origin of our rights? What are the rights of quilombolas? What are the public policies for quilombola communities? What is the role of the 1988 constitution?

Seen together, the Workshop was planned for three interdependent moments. In the first, the exposition on concepts and regulations concerning law, public policies and national and international legislation. At this time, the workshop participants highlighted quilombola rights in the Federal Constitution of 1988, presented Decree No. 4,887/2003, which regulates the procedure for identification, recognition, delimitation, demarcation, and titling of lands occupied by quilombola communities, and Decree No. 11,447/2023, which instituted the Aquilomba Brasil Program. In the second moment, public policies were explored, pointing to

a new legal diploma: Decree No. 11,786/2023, which instituted the National Policy for Quilombola Territorial and Environmental Management - PNGTAQ, as well as Convention No. 169 of the International Labor Organization - ILO, specifically on the right to self-determination, in the rules on Prior, Free and Informed Consultation - CPLI, and in the Consultation and Consent Protocols. Finally, some examples of protocols recently produced in Maranhão while four guiding questions were presented for those present to answer in groups organized for this purpose.

For what interests us more directly from this experience, however, it is important to highlight, in the first place, the principles underlying action, which are inscribed in the framework of ILO Convention No. 169, notably with regard to the right to self-determination of peoples and communities.

In other words, the priority starting point is the fact that indigenous peoples and traditional communities are the only ones capable of self-identifying as such, and of deciding on their own interests, on how they want to live. To make effective the right to self-determination, the right to decide, the treaty establishes mechanisms. And one of these is prior, free and informed consultation. Article 6 of Convention No. 169 states that governments shall consult peoples and communities, through appropriate procedures, whenever legislative or administrative measures are envisaged that may affect them. It also establishes that consultations should be carried out in a manner appropriate to the circumstances, with the aim of reaching an agreement and obtaining consent on the proposed measures. Thus, when there is a legislative or administrative measure capable of affecting indigenous peoples, quilombolas or other traditional communities, these groups must be consulted so that they can manifest themselves, giving their consent, or not, and reaching an agreement on the proposed measures. Article 7 of Convention No. 169 reinforces, in turn, that peoples and communities have the right to choose their own priorities, with regard to the development process, insofar as it affects their lives, beliefs, institutions, spiritual well-being and the lands they occupy or use in any way. The article adds that peoples and communities should participate in the formulation, implementation and evaluation of national and regional development plans and programs that are likely to affect them.

With this in mind, it can be understood that consultation must be conceived and carried out through a dialogued process, a negotiation that is not limited to an isolated meeting. In this process, peoples and communities must present their opinions, must be heard and respected, deciding on their present and future. Through consultation, peoples and communities, in communication with the government, can thus defend their priorities, their ways of life, their interests and territories. Each Prior, Free, Informed and Good Faith

Consultation follows its own procedures that adjust to the particularities and needs of each people and community. The consultation, in addition, must be documented and the records must be available to all participants.

In addition to the specificities of demands and problems, which can also be conceived by the variety of threats suffered by the contemplated communities, it is also necessary to understand the effects of the capacity of this collective on the workshop itself. Lagoa Amarela is a community with little history of mobilization, without large networks of external supporters and leaders, and which began to outline the first initiatives of collective organization very recently. The construction of the consultation protocol participates, then, in a kind of archeology of the identity and forms of territorialization of the community, led to reflect on its own history, on its productive activities, on its links and joint experiences.

The general and summarized exploration of the legal guidelines aroused attention and dialogue among those present, breaking down resistance and fears regarding participation. From the beginning, some of the residents highlighted, for example, this dissonance between the existence of rights and the fact that they never get off the ground. In others, they took the opportunity to clarify doubts about various aspects, such as: the consequences of the recognition of the quilombola identity on the forms of property management; the absence of action by the public authorities to meet the demands of the community; the lack of public education and health services, further aggravated by the withdrawal of a school that served mainly the children of the community. In summary, perhaps even more than specific knowledge about the legal system, what the workshop produced in this first moment was a broadening of the understanding of rights and the realization that the individual demands of each resident converged to problems that were collective, after all.

To a large extent, the dynamics established in the first moment prepared the consultation activity planned for the workshop. Gathered in 02 (two) groups, the residents were invited to answer some questions (*Why did we get together to build this protocol? What do we expect from the protocol? What are the public policies that the community needs? Who can participate in the free, prior and informed consultation?*), understood as fundamental for the construction of the final document, the Consultation Protocol. Once the answers were filled in by each group on cardboard, the team members were invited to present them, asking the broader collective if they agreed or had something to add. The answers gathered were as follows:

Question 1: Why did we come together to build this protocol?

Answer: To protect our right. Protect our community from the threat of agribusiness. Our source of income, lake, fish, my environment, babassu coconut. Our Farming, which are our right to survival

Question 2: What do we expect from the protocol?

Answer: Improvements, protection of our rights, rights, quality of life, to unite, to protect from threat, to protect our forest, our lake

Question 3: What are the public policies that the community needs?

Answer: Road, Saudi post, school, artiziano well, street lighting, soccer field, agricultural field, culture house, square, playground

Question 4: Who can participate in the free, prior and informed consultation?

Answer: Support from the city hall, university, UFMA, Union, Government of Maranhão, Health Department, City Council, Community Support.

4 FINAL CONSIDERATIONS

The final moment of the workshop was fundamental for a cordial and very informative conversation about the challenges of the community. Seen as a whole, the Workshop on Rights and Public Policies ended up highlighting some of the main needs and specificities of the Community of Lagoa Amarela, constituting a watershed in the process of drafting the Consultation Protocol. Starting with the fact that it is not so much the process of land regularization that is on the agenda here, since the priority demand capable of fostering the unity of the community focuses mainly on conservation factors, sustainable use of biodiversity, as well as the implementation of integrated public policies aimed at improving the quality of life and citizen inclusion.

The answers produced to the guiding questions are fundamentally focused on these dimensions associated with the very conditions necessary for the physical and socio-environmental reproduction of the Lagoa Amarela Community. It is in the access, sustainable use, protection and, perhaps, recovery and conservation of natural resources that the central dimension that organizes and mobilizes all those present indistinctly is concentrated. Associated with this is the very way in which the discussion about quilombola self-identification gains strength, understood as one of the most effective means to ensure the expansion of access to public policies and government programs. Finally, and certainly not least, is the fact that this workshop and the participatory production of the protocol represent one of the few efforts towards the recognition and strengthening of a weakened collectivity and without previous experiences of collective mobilization capable of establishing some barrier of protection for unsustainable uses of the territory's natural resources.

ABSTRACT

We will present how narratives read in a manner detached from traditional literary criticism, within the context of humanization—particularly in the field of healthcare—constitute a proposal developed at the Humanities Laboratory (hereinafter referred to as Labhum), originating from the Center for the History and Philosophy of Health Sciences (Cehfi) of the Paulista School of Medicine (EPM) at the Federal University of São Paulo, and later extended to the Reading Laboratory (Lablei) in corporate contexts, an initiative that has opened transcultural possibilities for a broader understanding of hypermodernity. The case presented here involves the selection of two classics from literature and cinema, namely the novel *The Picture of Dorian Gray* (1890) by Oscar Wilde and the film *Blow-Up* (1967) by Michelangelo Antonioni, for discussion in one of the classes during the first semester of 2025. To this end, we start from the premise that hypermodern society and the frenetic pace of cyberspace demand an even greater awareness and heightened consciousness of our subjective and social existences and belongings. In parallel, we philosophically ground our study in the idea of transculturality—that is, different times, spaces, and ideas converging in processes of humanization such as those proposed by Labhum and Lablei.

Keywords: Hypermodernity. Transculturality. Portraits. Subjectivity. Humanization.

RESUMO

Apresentaremos como narrativas lidas de maneira descomprometida à crítica literária no contexto da humanização, particularmente, na área da saúde, proposta desenvolvida no Laboratório de Humanidades (de agora em diante aqui referido por Labhum) a partir do Centro de História e Filosofia de Ciências da Saúde (Cehfi) da Escola Paulista de Medicina (EPM) da Universidade Federal de São Paulo e estendido ao Laboratório de Leitura (Lablei)

em contextos empresariais tem vindo a abrir possibilidades transculturais à compreensão mais ampla da hipermodernidade. O caso aqui exposto implica na escolha de dois clássicos da literatura e do cinema, nomeadamente, o romance *O Retrato de Dorian Gray* (1890 de Oscar Wilde e o filme *Blow-up* (1967) de Michelangelo Antonioni para discussão em uma das turmas do primeiro semestre de 2025. Para tanto, partimos da premissa de que a sociedade hipermoderna e o ritmo alucinado do ciberespaço requerem ainda mais consciência e maior conscientização das nossas existências e pertencas subjetivas e sociais. Paralelamente a isso, fundamentamos filosoficamente o nosso estudo na ideia de transculturalidade, ou seja, tempos, espaços e ideias diferentes que convergem em processos de humanização como o proposto pelos Labhum e Lablei.

Palavras-chave: Hipermodernidade. Transculturalidade. Retratos. Subjetividade. Humanização.

RESUMEN

Presentaremos cómo narrativas leídas de manera desvinculada de la crítica literaria tradicional, en el contexto de la humanización—particularmente en el ámbito de la salud—constituyen una propuesta desarrollada en el Laboratorio de Humanidades (en adelante, Labhum), a partir del Centro de Historia y Filosofía de las Ciencias de la Salud (Cehfi) de la Escuela Paulista de Medicina (EPM) de la Universidad Federal de São Paulo, y posteriormente extendida al Laboratorio de Lectura (Lablei) en contextos empresariales, iniciativa que ha venido abriendo posibilidades transculturales para una comprensión más amplia de la hipermodernidad. El caso aquí expuesto implica la elección de dos clásicos de la literatura y del cine, a saber, la novela *El retrato de Dorian Gray* (1890), de Oscar Wilde, y la película *Blow-Up* (1967), de Michelangelo Antonioni, para su discusión en una de las clases del primer semestre de 2025. Para ello, partimos de la premisa de que la sociedad hipermoderna y el ritmo frenético del ciberespacio requieren una conciencia aún mayor y una intensificación de la reflexión sobre nuestras existencias y pertenencias subjetivas y sociales. De manera paralela, fundamentamos filosóficamente nuestro estudio en la idea de transculturalidad, es decir, en la convergencia de diferentes tiempos, espacios e ideas en procesos de humanización como los propuestos por Labhum y Lablei.

1 INTRODUCTION

By promoting reflection on humanization in the health area, the Humanities Laboratory, developed by the Center for History and Philosophy of Health Sciences of the Federal University of São Paulo (Bittar, Souza, Gallian, 2013; and Gallian, Lima, De Benedetto, Guzman, 2014) selected for one of its classes in the first semester of 2025 the novel *The Portrait of Dorian Gray*, in dialogue with the film *Blow-Up*, as the core of their discussions within a group composed of undergraduate and graduate students in the area of health sciences.

Created in 2003 at CeHFi, Labhum is an intervention methodology that aims to foster humanization in health and humanistic training that ended up expanding in other environments outside the university, such as in the business environment in training its personnel, through reading, rereading and reflections on themes related to human existence and raised from classic works – and in these environments other than those of the University of São Paulo. Health Sciences is named Lablei. Inspired by the work *Literature as Medicine* (Gallian, 2017) which sees in the classics an active principle with a more powerful potential for humanization, by promoting in the reader the awakening to themes and reflections in their affective, intellectual and volitional dimensions, Labhum takes place in cycles – defined by narratives; each narrative or set of them, a cycle – whose application takes place in weekly two-hour meetings organized by a three-stage methodology, namely, *Reading Stories*, *Discussion Itineraries* and *Coexistence Stories*.

When defining Lablei, Ricardo Mituti (2022, p.5) explains that in the first stage, the "feelings perceived, affections aroused, memories that occurred, and questions that arose in this first reading of the title that is being worked on in the cycle in question" arise. The second stage is established from the extension of the narrative to be worked on and deals with collective reflections on the subjects and excerpts most relevant to the participants, having been raised by the coordinator of the activity previously, already in the first stage and even throughout the second. The third stage includes the subjective and individual perceptions of the experience carried out throughout the reading process and discussions carried out in the two previous stages.

In the case in question, the focus of the two narratives, literary and filmic, proved to be innovative on several levels. But, initially, we emphasize that the readings carried out beyond literary criticism allowed the participants to articulate the relationship between their own experiences as human beings working in the health area and the portraits that gradually emerged through the reading of *The Picture of Dorian Gray* and in dialogue with *Blow-Up*. Immediate identification with the most striking traits of the main characters—namely, Dorian

Gray himself, Basil Hallward and Lord Henry Wotton in the novel, and Thomas, the photographer played by David Hemmings in the film *Blow-Up* —led participants to relate these human types and their roles on the stage of human dynamics, regardless of any historical period or, in other words, in addition to any of them, thus allowing a cultural transposition of the aesthetic experience of the late nineteenth century, when the novel was published in two versions (1890 and 1891), along with the European experiences of the 1960s and early 1970s, to the year 2025, in the Brazilian and personal context of each individual at LabHum.

Another relevant aspect was the inter-artistic dialogue, that is, the convergence between the reading of Wilde's novel and Antonioni's film. In both, the notion of portrait as a metonym of human individuality, subjectivity and experience prevailed: it is in the portrait that the marks of life are found — the same marks that would have aged Dorian, were it not for the pact with the devil; it is in the portrait that the lines of expression are engraved, framing life itself or what one chooses to show of it, as in the case of the models who are the object of the photographer in the film — the driving force of the filmic narrative adapted from the short story *Las Babas del Diablo* (1959) by Julio Cortázar; it is in portraits that we place our best moments and memories, as much as the uses of images on social networks today. The portraits of the models, immortalized or discovered by the photographer — as in the case of the photograph that points to a crime — are maps of memory or, at least, routes back to identifications (Hall, 1998), as is the portrait painted by Basil, a vain attempt to eternalize the very subject of the painting, Dorian Gray and his impressive beauty. In all these cases, the search for essence in the midst of the transitory and what can be lasting involves a more or less humanized look — both from the reader and the spectator and from the health professional responsible for care and, at the same time, a full individual, with subjective and circular experiences.

The transposition of times and spaces/geographies highlights the classic character of both narratives (the novel and the film) in question, since transculturality goes beyond the boundaries of time and space, functioning as an ideal approach for comparativism and artistic and/or critical readings. In addition, it helps us to understand contemporaneity, since the characters, their traits, attitudes and behaviors find parallels, as observed in all the comments elaborated during the LabHum meetings and also in their developments, as we will partially see below.

In order for us to better understand this cross-cultural approach in practice, let us first contextualize the *hypermodern* zeitgeist, which has been the starting point for most participants to engage in LabHum activities.

The term "hypermodernity" was coined by the contemporary philosopher Gilles Lipovetsky (2005) to explain our post-modern human condition, insofar as the latter exalted progress and reason, justifying the accelerated pace in all (or almost all) human activities: people's time, our use of technology, consumerism and individualism, as stated by Zygmunt Bauman (2000). The latter finds a direct connection with what is central in both narratives dealt with here: the individual as a central figure in the (in)comprehension of humanism. Dorian Gray, as a metonym of aestheticism, materializes hedonism, as does the photographer Thomas in his egocentric activities. Aestheticism is best understood as artificialism, since it inverts many common sense issues, some of them even moral. In fact, aestheticism, for example, defines art as superior to nature and believes that nature copies the former. The same applies to the senses, which are considered superior to the intellect, or to that which is superficial, which is considered better than that which is desired to be deeper; feeling, superior to reason. Thus, masks are seen as more authentic than individuality itself, which is one of the reasons why portraits are so relevant during Decadentism and throughout the nineteenth century (Mutran, 2002).

Since social and subjective lives in hypermodernity are marked by the excessively digital rhythm of ephemeral experiences and intense change, which lead to the absence of deep personal bonds, creating (and, pardon the irony, endlessly recreating) the illusion of perfection in all that is human becomes central to some sense(s) of – or, perhaps, the lack of them? – belonging(s). After all, to be human is to make mistakes, to have flaws, not to be perfect. However, hypermodern societies have promoted the increase of practices that refer to "well-being" and that, in turn, proclaim individualism and individuality in their extreme. The explicit side effect of this is loneliness, the same one we see happening with the characters Dorian Gray and Thomas. The first, as a man who never ages, is unable to keep up with the new generations as part of them; the second, disconnected from everyone around him. Lipovetsky points to consumerism as hypermodernity's immediate (and unfortunate) response to the issue of loneliness. Unable to establish real human bonds, people resort to materialism, tying their being to having.

Thus, the converging factor between Wilde's novel, Antonioni's film and our contemporary everyday lives lies precisely in the hedonism of the portraits, photos, images and stories as they unfold, but also in the naïve aesthetic experience of one (or two) stage(s) of life – keeping in mind the seven stages of life described in Jacques' monologue in the play *Macbeth*, by William Shakespeare, "The whole world is a stage".⁴ Moreover, this reveals our

⁴ All the world's a stage,/And all the men and women merely players;/They have their exits and their entrances;/And one man in his time plays many parts,/ His acts being seven ages. At first the infant,/

need for masks, especially in social media nowadays, the virtual space of ("perfect") existence, where "the true self" is displayed, in conformity with issues of individual "well-being": being free, loved, praised, recognized as a social being, among other universally recognized feelings of belonging.

Therefore, while Dorian and Thomas' aesthetic experience evolves particularly from hedonism and the need to express personal identities associated with the eternity of life, contemporary exposure on social media relates to this in that it involves masks, since they offer individuals senses of reality, despite being simulacra, capable of masking their participants with their "best" characteristics, at the same time that they allow them to respond to the hypermodern demands of extreme production, offering them meanings of belonging in societies dehumanized of errors, failures or mistakes, and promising eternal happiness – as is the case of the term "well-being", widely applied today, including to the Health Sciences.

At the heart of *Blow-Up* lies a deep questioning of perception and reality. The photographer believes he has inadvertently captured evidence of a murder in the background of a photo, but as he zooms in on the image, it becomes more abstract and inconclusive. This invites us to read history in epistemological terms about the boundaries between truth and perception or reality and simulacrum, since photographs are the medium – and, in the case of the novel *The Picture of Dorian Gray*, the portrait plays this role. In both cases, the photographs taken by Thomas in the film and Basil's painting of Dorian Gray in the novel, there seems to be an almost obsessive search for meaning, as well as an ultimate need for truth, always postponed by the "shadows" that displace the truth(s). Moreover, in our hypermodern digital age, how do images work to help us seek reality? Or, again, is reality just a series of moments of simulacrum in which the truth is revealed? Photographs, images and paintings are document and illusion.

Responding to these concerns or raising new questions as a result of them was also made possible by the cross-cultural comparative bias. The concept of transculturality has been widely used in various epistemological areas – from Health Sciences to Humanities. Starting from Translation Studies in dialogue with Sociology, we use transculturality in the

Mewling and puking in the nurse's arms;/ And then the whining school-boy, with his satchel/ And shining morning face, creeping like snail/ Unwillingly to school. And then the lover, / Sighing like furnace, with a woeful ballad/ Made to his mistress' eyebrow. Then a soldier,/ Full of strange oaths, and bearded like the pard,/ Jealous in honour, sudden and quick in quarrel,/ Seeking the bubble reputation/ Even in the cannon's mouth. And then the justice,/ In fair round belly with good capon lin'd,/ fith eyes severe and beard of formal cut,/ Full of wise saws and modern instances;/ And so he plays his part. The sixth age shifts/ Into the lean and slipper'd pantaloon,/ With spectacles on nose and pouch on side;/ His youthful hose, well sav'd, a world too wide/ For his shrunk shank; and his big manly voice,/ Turning again toward childish treble, pipes/ And whistles in his sound. Last scene of all,/ That ends this strange eventful history,/ Is second childishness and mere oblivion;/ Sans teeth, sans eyes, sans taste, sans everything. (W. Shakespeare. *As You Like It*. Act II Scene VII Line 139),

extension of the concept of transcreation proposed by Haroldo de Campos in his vast work as a methodological approach that aims at the perception of how cultures are read and reinterpreted in others. Just as a text originally in one language that comes into existence in another gains local meanings to do with its own understandings and dynamics, cultural manifestations and practices, when transposed to other environments, also gain new looks – colors and shades specific to the "culture of arrival", alluding here to the terms used in translation and called "source language" and "target language" for, specifically, the source and target languages (in which a text is translated). It is in this way that reading a Greek literary classic today matters as much as reading a contemporary one, if not more, since we have in question levels of cultural translation that allow us to broaden the horizons of human understanding, given the dynamics and human feelings that are permanently observable, with the difference of times and geographies. Therefore, dealing with Transculturality also made us move forward.

The connection between the idea of truth x simulacrum, expression and media, represented both by the reading of the novel and by the exhibition of the film, from the perspective of the subjectivity of each of the participants of Labhum, opened horizons for the awareness of our humanity, woven in interactions, bonds and relationships in our meetings, as well as in the daily practices of various health professionals.

As described in the Introduction of this text and proposed in Gallian's work, the methodology in three stages (*Reading Stories*, *Discussion Itineraries* and *Living Stories*) were used, which were constantly observed and reevaluated at each meeting by the two coordinators responsible for this Cycle and in dialogue with other colleagues from CeHFI.

At the end of the third stage, *Stories of Coexistence*, it was proposed to write texts that would account for these stories in a creative way and beyond. As the beginning of the next semester, the second of 2025, would open with the Unifesp Academic Congress, the main coordinator organized an exhibition of photographs in which students involved in this discipline could also participate, in addition to posting them on the CehFi blog. These opportunities to reveal the stories of coexistence were the culmination of the high point of the discoveries coming from Labhum and that, in the case of Lablei, also happen in other formats, however.

We present below some of the partial accounts of the participants at the end of the Labhum experience with the narratives of Wilde and Antonioni as the focus – their names

were replaced by fictitious ones, in order to preserve their identities. The choices of the excerpts concern several topics of interest to us, namely:

2 DIVERSITY OF PARTICIPANTS IN RELATION TO AGE, PROFESSIONAL AREA IN HEALTH SERVICES AND RELATIONSHIPS

"It's exciting to explore this new reading with colleagues of different ages and professions, and to reinterpret art together." (Ana)

"... The superficial relationships developed by the protagonists make us question how all this happens today [...] and yet they manage to reveal their true essence to only a few people." (Antonieta)

"... as much as we don't like it, we need to admit that in a way we can be like them (the characters); we are a bit Dorian Gray, in other ways we are like Thomas in the film, and in some points we are in fact similar to Lord Henry, Sybill Vane, and even the girls photographed by Thomas. A little bit of each, depending on the occasion and those with whom we are interacting..." (Gabriela)

3 LITERARY AND FILMIC NARRATIVES IN DIALOGUE WITH CONTEMPORARY LIVES AND COMMUNICATION ON SOCIAL NETWORKS TODAY

"In the book, I saw Harry as the embodiment of evil — a demon that captivates, a transgressor that fascinates, much like so many influencers today." (Ana)

"Every day we try to change the perception of what we don't like about our reality by posting photos that make our lives seem less ordinary than they are. Every day we look for ways to beat time and prolong our appearance of youth." (Bruna)

4 THE POWER OF IMAGES AND THEIR ROLE IN HELPING US REFLECT ON REALITY VS. FANTASY. ALSO, THE SEARCH FOR BEAUTY AS PLEASURE AND TRUTH AND THE USE OF IT AS A PROTECTIVE DISGUISE AGAINST HARSH REALITIES

"In both works, the protagonist places more trust in the image than in the lived reality — revealing the power, and danger, of visual perception, while questioning the very notion of reality." (Lica)

"In the film we have an unscrupulous photographer, surrounded by young people who are not exactly naïve... A professional in search of the perfect click, art, truth, the meaning of life (...) the doubt: what is concrete and what is abstract? What is false and what is true?" (Ilán)

5 LABHUM AS RELIEF, A WELCOMING ENVIRONMENT IN THE FACE OF THE HARSH REALITY OF RATIONAL DISCOURSE

"I felt that I was entering a space of welcome and attentive listening, in which the focus was on collective reflection, the exchange of perceptions and the questioning of our own ways of seeing the world." (Rodrigo)

"I thought it was really great that the conversations transformed a lot of my early perceptions and certainly changed my retelling of the novel and the dialogue with the film this time around." (Ilan)

"My daily life is very scientific, rational, and always rushed. So, dedicating a few hours a week to group reflection, to understanding feelings, to humanizing ourselves, was an essential time for me, particularly with the focus on Wilde and Antonioni." (Marcela)

"... The whole atmosphere of reading the novel, discussing it in dialogue with the film, made me feel part of a collaborative, constructive and collective learning community." (Karla)

6 FINAL CONSIDERATIONS:

We understand that the particularized experience of Labhum reported here was able to promote participatory and open discussions on various topics in dialogue with the plural community of students, who demonstrated real connections between the arts (literature and cinema) and their own experiences lived in our contemporaneity, as witnessed by the examples selected above.

In addition, the innovation proposed in the two types of narratives in different formats (literature and cinema) intensified the involvement of the participants, who crossed times and spaces, summoning them to the present day and to the Brazil of the Portuguese language in their experiences. Throughout the Discussion Itinerary, the students were able to summon several other cultural examples, not only literary, of their personal experiences – including those related to the day-to-day of their work in the areas of Health Sciences – which accounted for the transculturality woven throughout the readings and collective discussions.

Adaptations and translations of texts into other languages are always part of transculturality and are important to the extent that they bring different cuts to other realities. This also did not go unnoticed. On the contrary, the participants compared editions, paratexts and times of readings and rereadings that mattered in the planting of their own stories.

Remedies for the soul, these almost "classics" of contemporary times, signal that it is possible to think of narratives as starting points for the expansion of consciousness, as well as the awareness of who we are individually, from the socialization of ideas, softening the less light experiences of hypermodernity, distancing us from the chaos of the digital age, owing us away from speed and bringing us back to what matters: to the lightness of life, humanization.

ABSTRACT

In the era of Education 5.0, teachers are required to integrate digital and intelligent technologies into their classroom practices. This study aims to analyze teachers' needs and readiness for AI-assisted Augmented Reality (AR) learning media in elementary education by identifying their current use of learning models and media as well as the factors influencing their implementation. Using a descriptive survey design, data were collected from 67 fifth-grade teachers across 18 elementary schools in Pekanbaru through a Likert- scale questionnaire distributed via Google Forms. The findings reveal that while most teachers hold positive perceptions toward the use of learning models and media, their actual implementation remains limited. Factors such as teachers' age, educational background, and technological competence were found to affect their readiness to adopt innovative media such as AI-assisted AR. These findings highlight the gap between pedagogical understanding and technological application, indicating the need for targeted training and professional development. The study provides empirical insights that can serve as a foundation for developing adaptive, AI-based AR learning environments that align with teachers identified needs and support meaningful learning in the context of Elementary Education 5.0.

Na era da Educação 5.0, os professores são instados a integrar tecnologias digitais e inteligentes às suas práticas em sala de aula. Este estudo tem como objetivo analisar as necessidades e a prontidão dos professores para o uso de mídias de aprendizagem em Realidade Aumentada (RA) assistidas por Inteligência Artificial (IA) na educação básica, por meio da identificação do uso atual de modelos e mídias de aprendizagem, bem como dos fatores que influenciam sua implementação. Utilizando um delineamento de pesquisa descritiva do tipo survey, os dados foram coletados junto a 67 professores do quinto ano de 18 escolas de educação básica em Pekanbaru, por meio de um questionário em escala Likert distribuído via Google Forms. Os resultados revelam que, embora a maioria dos professores apresente percepções positivas em relação ao uso de modelos e mídias de aprendizagem, sua implementação efetiva ainda é limitada. Fatores como idade, formação acadêmica e competência tecnológica dos professores mostraram-se determinantes para sua prontidão em adotar mídias inovadoras, como a RA assistida por IA. Esses achados evidenciam uma lacuna entre a compreensão pedagógica e a aplicação tecnológica, indicando a necessidade de capacitação direcionada e desenvolvimento profissional. O estudo oferece evidências empíricas que podem servir de base para o desenvolvimento de ambientes de aprendizagem adaptativos, baseados em IA e RA, alinhados às necessidades identificadas dos professores e capazes de promover uma aprendizagem significativa no contexto da Educação Básica 5.0.

RESUMEN

En la era de la Educación 5.0, se exige a los docentes integrar tecnologías digitales e inteligentes en sus prácticas de aula. Este estudio tiene como objetivo analizar las necesidades y la preparación del profesorado para el uso de medios de aprendizaje de Realidad Aumentada (RA) asistidos por Inteligencia Artificial (IA) en la educación básica, mediante la identificación del uso actual de modelos y medios de aprendizaje, así como de los factores que influyen en su implementación. Utilizando un diseño de investigación descriptivo de tipo encuesta, los datos fueron recolectados de 67 docentes de quinto grado de 18 escuelas de educación básica en Pekanbaru, a través de un cuestionario en escala Likert distribuido mediante Google Forms. Los resultados revelan que, si bien la mayoría de los docentes mantiene percepciones positivas respecto al uso de modelos y medios de aprendizaje, su implementación efectiva sigue siendo limitada. Factores como la edad, la formación académica y la competencia tecnológica del profesorado influyen en su nivel de preparación para adoptar medios innovadores como la RA asistida por IA. Estos hallazgos ponen de manifiesto la brecha existente entre la comprensión pedagógica y la aplicación tecnológica, lo que indica la necesidad de formación específica y desarrollo profesional. El estudio aporta evidencias empíricas que pueden servir como base para el desarrollo de entornos de aprendizaje adaptativos, basados en IA y RA, alineados con las necesidades identificadas del profesorado y orientados a promover un aprendizaje significativo en el contexto de la Educación Básica 5.0.

1 INTRODUCTION

Education has long been a serious concern of the Indonesian government in its role in improving the quality of human resources. Education is important at all levels of a country (Johnes et al., 2017; Alam et al., 2020). Education is the key to all quality progress and development, because with education human beings can realize all their potential, both as themselves and as a society. This is in line with the opinion (Kuswari et al., 2019) that education is a guiding effort, which is carried out consciously by educators (including parents) to students with the aim of developing students' potential to form a perfect personality. Basically, education functions to develop abilities and form a dignified character and civilization of the nation in order to educate the life of the nation (Utomo et al., 2020).

The learning process in schools is one of the educational processes. Learning is not he learning process in schools is one of the essential dimensions of the educational process. Learning is not merely a transfer of knowledge from educators to students (teacher-centered), but an interactive process in which students are encouraged to actively seek, process, and construct knowledge independently so that learning becomes student- centered (Aufa et al., 2020)). This aligns with the view of Brown., 2018, who emphasizes that student-centered learning focuses on learners' needs, abilities, interests, and learning styles, while teachers act as facilitators who design experiences that stimulate independent and critical thinking.

Various programs are prepared to improve the quality of education, one of which is by developing the curriculum. An effective curriculum should reflect the philosophy, objectives, objectives, learning experiences, instructional resources, and assessments that a particular educational program consists of (Alsubaie, 2016). Therefore, education in Indonesia often undergoes curriculum changes, starting from the curriculum in 1947, 1952, 1964, 1968, 1975, 1984, 1994, 2004, 2006, 2013 to the present day the independent curriculum is used. This independent learning curriculum is in accordance with the ideals of national education figures, namely Ki Hajar Dewantara, who prioritizes the freedom of independent and creative learning (Ardianti & Amalia, 2022). Within this curriculum, learning is designed to allow more time for concept comprehension and competency development through varied, contextual learning activities

One important determinant of curriculum success is the learning model employed by teachers. The learning model represents a systematic instructional design that organizes learning experiences to achieve specific objectives (Trianto, 2011). It serves as a pedagogical guide for planning and implementing classroom instruction (Joyce et al., 2016). However, despite understanding its importance, many teachers continue to rely on traditional, lecture-

based methods characterized by teacher dominance, passive students, limited questioning, and textbook dependence typical of schooling in many developing countries (Retnawati et al., 2011). This traditional paradigm emphasizes teaching rather than learning, limiting students' opportunities for creative and critical engagement. While teachers acknowledge the importance of using innovative models (Dafit, 2017), many still face obstacles in implementing them effectively within the classroom context (Winda & Dafit., 2021)

The rapid transformation toward Education 5.0 represents a major paradigm shift in global education. Unlike previous eras focused solely on digitalization (Education 4.0), Education 5.0 emphasizes collaboration between humans and intelligent technologies to create learning environments that are adaptive, personalized, and immersive (Morze et al., 2023). Within this framework, Artificial Intelligence (AI) serves as the analytical brain of education capable of diagnosing learners' strengths and weaknesses, generating individualized learning paths, and providing real-time adaptive feedback (Holmes et al., 2019; Zawacki et al, 2019)

Simultaneously, Augmented Reality (AR) serves as the sensory bridge that connects learners with knowledge through visual and interactive experiences. AR technology overlays digital objects and simulations onto real-world environments, allowing learners to visualize abstract concepts in engaging, contextualized ways (Ibáñez et al, 2018; Chang & Hwang, 2022). When AI and AR are integrated forming AI-assisted AR learning media, they can create adaptive, data-driven learning ecosystems. AI analyzes student performance and tailor content dynamically, while AR immerses learners in interactive visualization that stimulates cognitive and emotional engagement (Chou et al., 2023)

Such integration provides immense potential for elementary education, particularly in supporting reading literacy and conceptual understanding. However, the success of AI-assisted AR media largely depends on teachers' pedagogical and technological readiness. Teachers must not only master the use of the technology but also understand how to embed it meaningfully within pedagogical frameworks that promote inquiry, collaboration, and reflection (Eickelmann et al, 2020). Hence, exploring teachers' needs and readiness toward learning models and media becomes a foundational step in designing future adaptive, AI-driven instructional systems that are both innovative and realistic in classroom implementation.

The implementation of Indonesian learning in several schools shows variations in the approach used. Based on the results of the interview, teachers in one of the schools stated that they use a problem-based learning model. In other schools, teachers reported that the method applied was expository learning combined with assignments, questions and answers,

and sometimes discussions. Observations conducted at the school support these findings, showing that teachers often apply expository learning in the language learning process. However, the results of interviews at different schools show significant differences; In grade V, teachers do not apply the problem-based learning model as previously reported, but only use lectures, questions and answers, and assignments according to students' books. Therefore, when learning relies solely on lecture methods, students may have difficulty understanding the material effectively.

The findings above emphasize that teachers tend to use expository methods and do not apply relevant learning models to support elementary school students' reading literacy. Similar to the findings of Widodo (2019) teachers in reading classes often neglect model-based instruction. As a result, students lack opportunities for creative thinking and problem solving. Teachers rely heavily on textbooks as the primary learning source, without employing innovative models that could strengthen comprehension and engagement. Consequently, learning objectives are not achieved optimally.

In addition to instructional strategy, learning media are a crucial component of the learning process. In the modern era, media cannot be separated from effective pedagogy, as they clarify abstract concepts, stimulate students' thoughts and feelings, and enhance active participation (Puspitasari & Hanif, 2019). Educational media possess transformative potential to shape learners' attitudes and behavior toward creativity and dynamic change (Heinich et al, 2002; Sadiman, 2014). However, observations reveal that the use of learning media among teachers remains suboptimal. Interviews with several grade 5 teachers indicated that they generally use static picture media, attached to the board with glue, whose small size often limits visibility. This aligns with research by (Mustika & Ain, 2020), showing that conventional visual aids are ineffective in explaining abstract concepts that require interactivity and multisensory engagement.

These findings underscore a pressing need to redefine learning media through technology-enhanced, intelligent solutions. Traditional tools are insufficient to meet the demands of Education 5.0, where learners must engage with dynamic, multimodal, and adaptive experiences. AI-assisted Augmented Reality (AR) represents a promising alternative, offering interactivity, visualization, and adaptivity simultaneously. In language learning, for example, AR can visualize text structures, vocabulary, and narrative flow in 3D environments, while AI algorithms analyze learners' reading behaviors and provide tailored scaffolding (Chang & Hwang, 2022). Such innovations can transform passive reading into an active, exploratory process that enhances comprehension and critical literacy.

Nevertheless, the success of these innovations depends on teachers' readiness and contextual needs. Teachers must perceive technology not as an additional burden but as a pedagogical partner that amplifies their instructional impact. Therefore, analyzing teachers' needs and readiness regarding learning models and media is a critical first stage in building adaptive AI-based learning systems that are pedagogically sound and practically implementable in Indonesian elementary schools.

The use of learning models and media has become increasingly relevant in today's educational landscape, where technology advances rapidly. Teachers face the challenge of integrating various tools and intelligent systems to create engaging, interactive, and effective learning environments. Hence, this study aims to analyze teachers' needs and readiness for learning models and media as a foundation for developing AI-assisted Augmented Reality learning media in the context of Elementary Education 5.0. The results are expected to identify factors influencing teachers' readiness to integrate intelligent technologies, as well as provide an empirical foundation for designing adaptive learning systems that enhance both teaching quality and student literacy outcomes.

2 METHOD

This study employed a quantitative survey research design aimed at obtaining a comprehensive and systematic description of teachers' use of learning models and media in elementary schools. The survey design was selected because it enables the collection of empirical data from a relatively large sample, providing both breadth and depth in understanding teachers' perceptions, needs, and readiness (Creswell & Creswell, 2018). This design is particularly appropriate for generating baseline data that can inform the development of AI-assisted Augmented Reality (AR) learning media and adaptive learning systems.

The population of this study consisted of elementary school teachers in the city of Pekanbaru, Indonesia. Using purposive sampling, 67 fifth-grade teachers from 18 public and private elementary schools were selected as respondents. The sample was chosen to ensure adequate representation across schools with varying levels of technological resources, teaching experience, and demographic characteristics. This diversity allows for a richer analysis of teachers' needs and readiness in relation to pedagogical and technological innovation. Data were collected through a structured questionnaire designed specifically for this study. The research instrument was constructed based on a review of pedagogical and technological integration theories, particularly the TPACK framework (Mishra & Koehler,

2006), the Technology Readiness Index (Parasuraman, 2000), and the Technology Acceptance Model (Davis, 1989).

Each item was rated using a five-point Likert scale, where 1 = Strongly Disagree and 5 = Strongly Agree. Prior to data collection, the questionnaire was validated by three experts in educational technology and instructional design to ensure content validity, clarity, and relevance to the study objectives. Reliability was tested using Cronbach's Alpha, yielding a coefficient above 0.80, indicating a high level of internal consistency. The data collection process involved three key stages:

1. Preparation and validation, including expert review, pilot testing, and final revision of the questionnaire.
2. Administration, in which the questionnaire was distributed online via Google Forms to facilitate broad participation and efficient data management. Respondents were given one week to complete the questionnaire.
3. Verification, where all responses were checked for completeness, and invalid entries were removed prior to analysis.

Ethical considerations were observed throughout the process. Participation was voluntary, and informed consent was obtained from all respondents. Data were collected anonymously and used solely for academic purposes.

The collected data were analyzed using descriptive statistical techniques, including frequency distribution, percentage, mean, and standard deviation. These measures were used to identify general trends and patterns in teachers' responses regarding the use of learning models, learning media, and technology readiness. In addition, data visualization through bar charts and cross-tabulation was used to explore relationships between variables such as teachers' age, education level, and media use frequency. The analysis results were interpreted in light of contemporary frameworks on AI-assisted adaptive learning systems, connecting empirical findings to the broader theoretical discourse on Education 5.0. The overall research procedure followed these systematic stages:

1. Identification of research problem (limited use of innovative models and media).
2. Instrument development (questionnaire design and validation).
3. Data collection via Google Forms.
4. Data analysis using descriptive statistics.
5. Interpretation and discussion, connecting findings with teachers' readiness for AI-AR-based adaptive learning media.

The methodological design ensures that the results are valid, reliable, and relevant for informing future development of intelligent, adaptive learning environments in elementary education.

3 RESULTS AND DISCUSSION RESULTS

The following are the results of the needs analysis obtained through filling out a questionnaire through google form with a total number of respondents being 67. The results showed that respondents gave very positive responses to the benefits of using learning media and variations of learning models in the context of learning in elementary schools. The following are the results of the use of media and models for elementary school teachers based on research:

1. Teachers' Responses to Learning Media

This response is an important aspect in evaluating the effectiveness of the use of technology in the learning process in elementary school. Through filling out questionnaires, teachers gave their views on the extent to which the use of learning media has enriched students' learning experiences, increased their engagement, and improved their understanding of subject matter. Positive responses from teachers will indicate that learning media has become an effective tool in supporting the achievement of learning objectives, while negative or neutral responses indicate challenges or opportunities for improvement in the application of learning media. By understanding teachers' responses to learning media, appropriate strategies and adjustments can be made to improve their use in the future. Furthermore, the following diagram shows the distribution of the percentage of positive responses from respondents to the benefits of using a variety of learning media:

Figure 1

Based on the diagram above, the majority of respondents, reaching 98.5%, stated that the use of learning media can increase students' interest in learning. Meanwhile, 87.3% of them believe that learning media can enrich students' learning experience. In addition, as many as 88.2% of respondents considered that the use of learning media could improve students' understanding of concepts. This positive response shows a strong awareness among teachers of the importance of utilizing technology in the learning process. The perception that the use of learning media can increase students' interest in learning and enrich their experience gives an indication that this approach is considered relevant and beneficial in helping students better understand lesson concepts.

The findings above reveal that although teachers recognize the pedagogical value of diverse models and media, the extent of their practical application remains limited. This indicates a transitional stage in teachers' pedagogical development, where awareness of innovation exists but the ability to operationalize it is still constrained. To interpret this phenomenon more deeply, it is important to analyze the patterns of model and media use in the broader context of Education 5.0, which emphasizes collaboration between humans and intelligent technologies

2. Teachers' Responses to Learning Models

This response is an important aspect in evaluating the effectiveness of various learning methods applied in elementary schools. Through filling out questionnaires, teachers provided their views on the extent to which the variety of learning models has helped improve student engagement, concept understanding, and their learning atmosphere. Positive responses from teachers will show that the learning models implemented have been effective in creating a motivating and useful learning environment. On the other hand, negative or neutral responses indicate the need for further adjustment or development in the implementation of learning models. By understanding teachers' responses to the learning model, appropriate strategies and adjustments can be made to improve its use in the future, as well as have a positive influence on student learning outcomes. Furthermore, the following diagram shows the distribution of the percentage of positive responses from respondents to the benefits of using learning model variations:

Figure 2

Based on the diagram above, most respondents also agreed that the use of a variety of learning models can make learning more engaging (84.6%), increase student engagement (85.2%), and facilitate better understanding (87.4%). These results reflect a strong understanding from teachers about the benefits of applying diverse learning models in the learning process. This high percentage of positive responses shows that teachers in elementary schools strongly support the use of a variety of learning models as a strategy to create a more engaging, interactive, and effective learning environment. It also reflects their awareness of the importance of actively involving students in the learning process to facilitate deeper and ongoing understanding.

3. Use of Learning Models

The use of learning models is a key factor in creating an effective learning environment in elementary schools. In developing learning strategies, it is important for teachers to pay attention to the various learning models available and choose the one that best suits the needs of students and the subject matter being taught. Through filling out questionnaires, teachers' responses to the use of learning models can provide an overview of the extent to which various learning approaches have been implemented in primary schools. The following are the results of the questionnaire filled out by the teachers regarding the use of the learning model:

Figure 3

**Table 1**

Teachers' responses to the use of learning models

Yes	Range	Criterion	Frequency	Percentage
1	86 – 100	Very often	3	4,5%
2	76 – 85	Often	4	6%
3	60 – 75	Sometimes	10	14,9%
4	55 – 59	Infrequently	32	47,8%
5	< 54	Very Rare	18	26,9%
Total			67	100%

The results showed that the use of the learning model in the classroom by respondents varied, with the majority of respondents assessing that the use was infrequent or even very rare. Of the total 67 respondents, as many as 18 people or around 26.9% stated that they rarely use the learning model in classroom learning. Meanwhile, 32 people or about 47.8% of the total respondents revealed that they rarely use the learning model. Meanwhile, around 14.9% of respondents said that they only occasionally use the learning model. The percentage of more active use, such as "frequently" and "very often", was recorded lower, with only 6% of respondents stating that they use the learning model frequently, and 4.5% stating that they do so very often.

These findings show a pattern that shows the low application of the learning model in classroom learning in elementary schools. In addition to the table above, the results of the questionnaire filled out by the teachers regarding the use of the learning model can be explained with the help of the following diagram:

4. Use of Learning Media

The use of learning media is very important in basic education. Through questionnaires, the authors collected data to find out the extent to which learning media was used and how it affected the learning process. This explanation will help in presenting the results of the questionnaire analysis that will be described next.

Table 2*Teachers' responses to the use of learning media*

Yes	Range	Criterion	Frequency	Percentage
1	86 – 100	Very often	4	6%
2	76 – 85	Often	3	4,5%
3	60 – 75	Sometimes	5	7,5%
4	55 – 59	Infrequently	39	58,2%
5	< 54	Very Rare	16	23,9%
Total			67	100%

Then the results showed that the use of learning media in classroom learning by respondents tended to be low, with the majority of them stating that the use was infrequent or even very rare. Of the total 67 respondents, as many as 16 people or around 23.9% stated that they rarely use learning media in classroom learning. Meanwhile, as many as 39 people or around 58.2% of the total respondents revealed that they rarely use learning media. Only a small percentage of respondents stated that they use learning media with a higher frequency, of which 5 people or about 7.5% stated that they sometimes use learning media, 3 people or about 4.5% stated that they use learning media frequently, and 4 people or about 6.0% stated that they do it very often. These findings highlight the low application of learning media in the context of learning in elementary schools. In addition to the table above, the results of the questionnaire filled out by teachers regarding the use of learning media can be explained with the help of the following diagram:

Figure 4

The findings reflect a transitional stage in the pedagogical development of elementary teachers—where there is awareness of the need for innovation but insufficient readiness to implement it effectively. The predominance of expository models and static media suggests that teachers' instructional practices are still positioned within Education 3.0 and 4.0 paradigms, which emphasize information transfer rather than adaptive learning. In contrast, Education 5.0 requires a human– technology partnership, where teachers are supported by intelligent systems capable of adaptive feedback and multimodal interaction (Holmes et al., 2019; Morze et al., 2023)

From the results of the questionnaire analysis, it was revealed that the use of learning media by teachers is still relatively low in the context of classroom learning. The majority of teachers tend to rarely use learning media as a means of support in their teaching process. In addition, the findings show that the use of learning models in the classroom is also not carried out consistently, with the majority of teachers rarely applying variations of learning models in every meeting. This phenomenon reflects a significant gap between the potential of learning media and the practices carried out by teachers in the reality of classroom learning. This illustrates the challenges faced by the education system in integrating learning technologies and innovations into everyday classroom practices.

5. Factors that can lead to the lack of use of learning models and media by teachers in elementary schools

Identifying and understanding the factors that influence the lack of use of learning models and media by teachers in elementary schools is a critical step in developing effective strategies to improve the application of technology in the learning process. Thus, an in-depth understanding of the factors that influence the use of learning models and media can help form a holistic and sustainable strategy in improving the quality of learning in elementary schools. The following is a visual representation of the age data of elementary school teachers in the form of a diagram below:

Figure 5

The low use of learning media and the variation of learning models in the context of learning in elementary schools seem to be influenced by the age factor of teachers. From the results of filling out the questionnaire by 67 respondents, as many as 41 respondents or around 61.2% of the total respondents were over 40 years old. The low use of learning media and variations in learning models in the context of learning in elementary schools can be caused by several factors related to the age of teachers. First, the lack of technological skills is one of the main obstacles. Teachers over the age of 40 may not have the same level of proficiency in the use of technology as younger generations. In addition, skepticism towards technology can also affect its use. Some older teachers may feel that traditional learning methods are more effective than new learning mediums. Furthermore, the lack of motivation to learn new technologies is also an important factor. Teachers who have been teaching for a long time may feel satisfied with the methods they have mastered, so they are not motivated to develop new skills. Finally, the challenge of adapting to change also plays a role. Older teachers may tend to stick to familiar practices rather than trying new things, making it difficult for them to introduce new variations of learning models.

Furthermore, the low use of learning media and the variety of learning models in the context of learning in elementary schools can also be influenced by the teacher's last education factor. From the results of the questionnaire conducted, it can be seen that most of the teachers have a last educational background at the S1 level, reaching around 85.07% of the total respondents. This significant number shows the dominance of undergraduate education background as the last knowledge possessed by the majority of teachers at the primary level. On the other hand, only a small percentage of respondents have an educational background at the Teacher Professional Education (PPG) level, which is around 4.48%. Meanwhile, D3 educational backgrounds cover about 7.46% of the total respondents, and

only a small percentage have a S2 degree, which is around 2.99%. There is a visual representation of the final education data of elementary school teachers in the form of a diagram below:

Figure 6

This last educational factor can provide an overview of the teacher's level of understanding and skill in terms of the use of learning media and the variety of learning models. Teachers with higher education backgrounds may have better knowledge and skills in adopting innovative learning technologies and methods. However, the relatively low number of teachers with a background in undergraduate education suggests that they may have limited access to advanced education that delves into modern learning strategies.

Thus, the last education factor of teachers, especially the dominance of S1 educational background, can be one of the factors that affect the low use of learning media and the variety of learning models in elementary schools. Teachers with a S1 education background may not have enough knowledge or skills related to technology and innovation in learning. Therefore, further efforts are needed to improve teachers' understanding and skills. Thus, they can be more effective in utilizing technology and implementing innovative learning models in classroom learning, thereby providing a more diverse and meaningful learning experience for students.

4 DISCUSSION

In interpreting the results of this study, it is important to understand the context and findings obtained from the questionnaire distributed to teachers. The results of this survey provide in-depth insights into the use of learning media, variations in learning models, and

factors that affect the application of technology in the learning process in elementary schools. The following discussion will elaborate on the findings in detail, including teachers' responses to learning media, the effectiveness of learning model variations, and analysis of factors that affect the use of media and learning models in the context of basic education.

Teachers' Responses to Learning Media

The results of the study show that teachers in elementary schools have a very positive view of the use of learning media. The majority of teachers feel that learning media, such as images and videos, not only increase students' interest in learning but also enrich their learning experience. This view shows that learning media functions more than just an aid; It plays an important role in making the learning process more interesting and relevant for students.

Teachers also acknowledge that learning media contributes significantly to improving students' understanding of concepts. Learning media not only has an appeal that

makes the subject matter more interesting, but it is also effective in explaining and visualizing complex subject matter. Awareness of the significant benefits of learning media is in line with the existing literature, which shows that the effective use of media can improve student learning outcomes and better achieve learning goals. This view is in line with the findings (Puspitarini & Hanif, 2019); Sari & Setiawan, 2018), which states that learning media that is used appropriately can be an efficient support tool in achieving learning goals and improving student learning outcomes. In addition, as previous research has suggested, learning media in the presentation of material by teachers has great benefits in improving students' ability to understand and digest information (Tamrin et al., 2017).

However, although positive responses dominate, challenges in the use of learning media remain. Limited resources, such as inadequate equipment and lack of technical training, can hinder the implementation of optimal learning media. Therefore, it is important to identify and overcome these barriers so that learning media can be used optimally to support the learning process in the future. Efforts such as improving teacher training and providing adequate resources need to be made to ensure that learning media can be used effectively and efficiently.

Teachers' Responses to Learning Models

The results showed that teachers in elementary schools responded positively to the variety of learning models applied in the classroom. Many teachers feel that the use of various learning models makes the learning process more engaging and effective in increasing student engagement. This varied approach is considered a successful strategy to motivate students and encourage their active participation in learning activities.

Furthermore, teachers also benefit from a variety of learning models in facilitating the understanding of subject matter. This indicates that diverse approaches in teaching methods can improve the way students understand and internalize the concepts being taught. Awareness of the benefits of this flexible and innovative approach underscores its importance in creating a dynamic and interactive learning environment.

Active learning strategies play an important role in transforming students from passive participants to active participants (Meyers, 1986). By using techniques such as small groups, scenarios, and case studies, students' critical thinking skills can be improved (Burbach et al., 2004; Larry & Mary, 2014). This approach is often referred to as student-centered learning, where students not only 'do' learning but also reflect on their learning experiences (Kusumoto, 2018; Bonwell & E, 1991)

Positive responses from teachers show that variations of learning models are well accepted as an effective strategy to improve the quality of learning in elementary schools. This approach supports the principle of meaningful learning, which emphasizes the importance of students associating new information with the knowledge they already have. According to Ausubel (Baharuddin, 2020), meaningful learning occurs when students are able to relate new information with previous experiences and knowledge, resulting in a deeper understanding and not easily forgotten (Gazali, 2016). Therefore, the application of a variety of learning models can enrich the learning process and help students gain a more complete and sustainable understanding of the subject matter.

Use of Learning Models

Although responses to variations in learning models are generally positive, research data show that the application of these models in classroom practice still tends to be low. Many teachers report that they rarely or even very rarely use varied learning models. This phenomenon shows that there is a gap between the theoretical understanding of the benefits of learning models and the reality in the field. Some of the factors that may lead to this low adoption include time constraints, lack of adequate resources, and lack of effective training in the implementation of these models. Teachers may find it difficult to integrate new learning models into a hectic schedule or may feel they do not have enough access to the tools and resources needed to implement them.

To address these issues, it is important to evaluate and address these barriers with a planned approach. The development of better and comprehensive training for teachers can provide them with the skills and knowledge necessary to implement learning models more effectively. Additionally, the provision of adequate resources, such as relevant learning materials and supporting technology, as well as strong administrative support, can help

facilitate the use of a broader learning model. By implementing these measures, learning models can be integrated more effectively into daily teaching practices, which will ultimately contribute to improving the quality of learning in primary schools as a whole.

The use of appropriate learning models is a key factor in determining the success of the learning process (Irviana, 2020). A model that meets good criteria will create an effective and efficient learning process (Mahjaty, 2017). On the other hand, an inappropriate model can result in various problems in learning, such as unclear material and lack of student involvement. Therefore, the role of teachers is very important in choosing and implementing appropriate and effective learning models (Li et al., 2021). The learning model functions as a systematic pattern in organizing the learning experience and serves as a guideline in planning and implementing learning activities. This opinion is in line with (Rubiah, 2016), which emphasizes that the learning model is a strategy used by teachers to carry out teaching and learning activities optimally. By understanding and implementing the right learning model, the quality and effectiveness of the learning process can be significantly improved, thereby creating a more productive and meaningful learning environment for students.

Use of Learning Media

Learning media is a tool provided by teachers to stimulate and facilitate students in the learning process (Cilliers, 2021). This media can be in the form of audio, visual, or audio-visual. (Dziuban et al., 2018) states that media consists of various components in a student's learning environment that can encourage them to learn. (Cheung & Ng, 2021: Sung et al., 2016) adding that media includes any physical tool capable of presenting a message and stimulating students' interest in learning, such as books, movies, tapes, and videos (Tan, 2018).

The results showed that the use of learning media in classroom practice by teachers tended to be low, with the majority of teachers reporting that they rarely or very rarely used learning media in the teaching process. This phenomenon reflects a significant gap between the potential of learning media that should be able to enrich the learning experience and the real practices carried out in the classroom. The low frequency of use of this media can be caused by several factors. Resource limitations, such as a lack of adequate devices or limited access to technology, are often a major obstacle. In addition, the lack of effective training for teachers in integrating learning media into their teaching strategies also contributes to low usage. Teachers may also feel uncomfortable or lack confidence in using new technologies, which can hinder wider adoption of learning media.

To address this issue, it is important to conduct a thorough evaluation of existing supports and increase initiatives to facilitate the use of learning media. This includes

developing better and ongoing training for teachers so that they are better prepared and confident in using media as a learning tool. Strong administrative support is also needed to ensure that teachers have access to the necessary resources and can effectively integrate learning media in their practice.

In this modern era, learning media is an important element in the learning process, and the success of the material delivered by teachers is greatly influenced by the effectiveness of the media used (Mustaqim, 2016). By utilizing effective learning media, we can achieve a significant improvement in the quality of the teaching and learning process (Roof, 2018). The importance of technology in education today cannot be ignored. Many studies have been conducted on the development of ICT-based learning media, but there is still little focus on its use in elementary schools. The ability of teachers to integrate ICT into the learning process will also have a significant impact on students' ability to achieve learning goals (Porter, 2017); Nambisan & Luo, 2021). Therefore, teachers must be able to design creative and innovative learning that is integrated with the use of ICT (Yunus & Suliman, 2014). App-based or digital learning media provide visually and audio information that is visually and audio engaging and displays real-world events in virtual form to create more active and engaged learning (Degner et al., 2022). This is important, considering that technology that continues to evolve must be in line with its use in education, starting from elementary school.

Factors Influencing the Use of Learning Models and Media

Identifying the factors that influence the low use of learning models and media is essential to develop effective strategies. One of the main factors identified is the age of the teacher. The majority of teachers over the age of 40 may have difficulty adopting new technologies and tend to be more comfortable with traditional teaching methods. Lack of technological skills, skepticism towards technology, and lack of motivation to learn new technologies can be significant obstacles in the application of media and learning models. This is supported by the view (Winda & Dafit, 2021) that the factors that cause teachers to have difficulty operating IT-based media, such as laptops/computers, infocus, printers, and the internet, include lack of knowledge about technology, especially for more senior teachers, as well as difficulties in finding files due to lack of skills in managing and storing digital data. Thus, the combination of these factors can lead to low use of learning media and variations in learning models in elementary school learning

In addition, teachers' educational backgrounds also play a significant role in the application of media and learning models. Most teachers in primary schools have a final educational background at the S1 level, while the number of teachers with higher education

degrees, such as S2 or professional education, is relatively small. Teachers with advanced education generally have better knowledge and skills in adopting innovative technologies and learning methods. They may be more open and trained in using a variety of modern strategies in teaching. Conversely, the low proportion of teachers with advanced education suggests that many teachers may be less exposed to current learning strategies and in-depth training.

This combination of age and education level factors may explain why media use and variation of learning models in elementary schools are still low. Older teachers may have difficulty adopting new technologies and innovative learning methods, while limitations in continuing education may limit their knowledge of modern approaches to teaching. To address this issue, there needs to be more comprehensive training and adequate technical support for all teachers. Additionally, increasing access to continuing professional education will help teachers adapt to changes and developments in learning practices.

The analysis of teacher-related factors such as age, education level, and technological skill illustrates the uneven distribution of digital readiness among elementary teachers. According to the Technology Readiness Index (Parasuraman, 2000), users' optimism and innovativeness strongly determine technology adoption. The findings suggest that although teachers acknowledge the value of learning media, their limited exposure and digital confidence hinder integration. Therefore, these empirical patterns provide a diagnostic foundation for designing AI-assisted Augmented Reality (AR) learning media that align with teachers' needs and readiness in the context of Education 5.0.

Overall, the survey findings should not be viewed merely as limitations in teachers' practices but as opportunities for targeted innovation. By addressing the gaps in model and media utilization through AI-AR-supported learning designs, future educational frameworks can enhance both teachers' pedagogical competence and students' literacy outcomes in the spirit of Education 5.0.

5 CONCLUSION

This study revealed that although the majority of teachers gave positive responses to the use of learning media and variations of learning models, their implementation in the field was still relatively low. Most respondents acknowledged that learning media has significant benefits in increasing students' interest in learning, enriching the learning experience, and improving concept understanding. Similarly, variations of learning models are thought to make learning more engaging, increase student engagement, and facilitate better understanding. However, the results of the study show that the use of learning media and learning models in daily practice in the classroom is still rare. Factors such as the teacher's

age and their last level of education play a significant role in the low adoption of media and learning models. Therefore, further efforts need to be made to improve teachers' understanding and skills in utilizing technology and various innovative learning models. This includes providing additional training and support necessary to help teachers adapt to modern learning methods and tools, with the aim of creating a more effective learning environment and supporting student development in primary schools.

ABSTRACT

This research aimed to analyze the role of Technological Innovation Centers (NITs), linked to Scientific, Technological and Innovation Institutions (ICTs), as drivers of cleaner technology development in the steel sector, considering the possibilities of technology transfer to adapt the sector to the requirements of the European Union Border Carbon Adjustment Mechanism (CBAM). The research has a qualitative approach, with bibliographic and documentary analyses on carbon emissions in the industrial sector, conventional technologies used in steelmaking, and cleaner technologies applicable to the steel sector. The results pointed to new routes for cleaner technologies for decarbonization and the importance of NITs in mediating between scientific production and the productive sector for the development of technologies in ICTs that can contribute to solving economic and environmental problems that help achieve global decarbonization goals and meet the requirements imposed by the CBAM. In conclusion, it can be said that there is a risk that Brazilian companies exporting steel products will lose competitiveness in the European market if strategies are not adopted to overcome the challenges imposed by carbon restriction policies on products that do not meet CBAM criteria.

Keywords: CBAM. Decarbonization. NIT.

RESUMO

Esta pesquisa teve como objetivo analisar o papel do Núcleo de Inovação Tecnológica (NIT), vinculados às Instituições Científicas, Tecnológicas e de Inovação (ICTs) enquanto indutor de desenvolvimento de tecnologias mais limpas no setor siderúrgico, considerando as possibilidades de transferência tecnológica para adequação do setor frente às exigências do

Mecanismo de Ajuste de Carbono na Fronteira da União Europeia (CBAM). A pesquisa possui abordagem qualitativa, com análises bibliográficas e documentais sobre emissões de carbono no setor industrial, tecnologias convencionais utilizadas na siderurgia e tecnologias mais limpas aplicáveis ao setor siderúrgico. Os resultados apontaram novas rotas de tecnologias mais limpas para descarbonização e a importância dos NITs no intermédio entre produção científica e setor produtivo para o desenvolvimento de tecnologias, nas ICTs, que possam contribuir na resolução de problemas econômicos e ambientais que ajudem no alcance das metas globais de descarbonização e o atendimento às exigências impostas pelo CBAM. Por fim, pode-se concluir que há risco de as empresas brasileiras, exportadoras de produtos siderúrgicos, perderem competitividade no mercado europeu, caso estratégias não sejam adotadas para superar os desafios impostos pelas políticas de restrição de carbono sobre os produtos que não atenderem aos critérios do CBAM.

Palavras-chave: CBAM. Descarbonização. NIT.

RESUMEN

Esta investigación tuvo como objetivo analizar el papel de los Centros de Innovación Tecnológica (CNI), vinculados a las Instituciones Científicas, Tecnológicas y de Innovación (ICT), como impulsores del desarrollo de tecnologías más limpias en el sector siderúrgico, considerando las posibilidades de transferencia de tecnología para adaptar el sector a los requisitos del Mecanismo de Ajuste de Carbono en Frontera (CBAM) de la Unión Europea. La investigación tiene un enfoque cualitativo, con análisis bibliográficos y documentales sobre las emisiones de carbono en el sector industrial, las tecnologías convencionales utilizadas en la siderurgia y las tecnologías más limpias aplicables al sector siderúrgico. Los resultados apuntaron nuevas rutas para tecnologías más limpias para la descarbonización y la importancia de los CNI en la mediación entre la producción científica y el sector produtivo para el desarrollo de tecnologías en TIC que puedan contribuir a la solución de problemas económicos y ambientales que ayuden a alcanzar las metas globales de descarbonización y a cumplir con los requisitos impuestos por el CBAM. En conclusión, se puede afirmar que existe el riesgo de que las empresas brasileñas exportadoras de productos siderúrgicos pierdan competitividad en el mercado europeo si no se adoptan estrategias para superar los desafíos que imponen las políticas de restricción de carbono a los productos que no cumplen con los criterios del CBAM.

Palabras clave: CBAM. Descarbonización. NIT.

1 INTRODUCTION

The growing search for sustainable development, given the environmental impacts resulting from greenhouse gas (GHG) emissions from industrial processes, brings light to the need for innovation in production processes for the transition to a low-carbon economy in view of the regulatory requirements imposed by the implementation of the European Union Carbon Border Adjustment Mechanism (CBAM/EU). The CBAM will affect important sectors of the world economy that are intensive in energy and GHG emissions, including the steel industry (APEXBRASIL, 2023), the focus of this research.

Brazil is one of the largest producers and exporters of steel in the world, and the steel production chain is essential for other sectors, such as civil construction, automotive, naval, machinery and equipment. As a major exporter to Europe, Brazil may face direct pressure to decarbonize its steel production, at the risk of losing competitiveness or paying high tariffs, which requires technological innovation, regulatory adjustments, and sustainability strategies to overcome this scenario (CNA, 2023).

The steel industry is one of the main sectors of the economy, as it provides important components for the infrastructure of the other sectors, by contributing turbines for wind energy generation or supports for solar panels, for example (FERNANDES et al., 2024). Despite its economic relevance, the industrial sector is intensive in energy consumption and greenhouse gas (GHG) emissions, being responsible for 2% of total emissions in the country in 2020 (FERNANDES et al., 2024), due to the use of fossil fuels as the main source of energy, making it one of the sectors with the greatest challenge to achieve decarbonization (IEA, 2022).

The predominant conventional technology in the steel industry consists of the use of fossil fuels as the main source of energy in the reduction of iron ore into steel, in Blast Furnace-Basic Oxygen Furnace (BF-BOF), a process that is intensive in both energy and CO₂ emissions (IEA, 2020). The iron reduction stage is responsible for about 80% of GHG emissions in the crude steel production process, because the reducing agent and heat source used is mineral coal (FERNANDES et al., 2024), a non-renewable fuel.

In this context, Science, Technology and Innovation Institutions (ICT), through the Technological Innovation Centers (NITs), play a fundamental role in the generation of knowledge, production of new technologies and their effective transfer to the productive sector (LEITE; MENDONÇA; OLIVEIRA, 2023), which can help industries in the sector reduce their GHG emissions.

The NITs, formed by one or more ICTs, aim to manage the institutional innovation policy, in addition to bringing the academic and productive sectors closer together (QUEIROZ

et al., 2022). Such contributions were made possible by the creation of the Innovation Law, Federal Law No. 10,973/2004, which institutes measures to encourage innovation and scientific and technological research in the productive sphere (BRASIL, 2004), later updated by Federal Law No. 13,243, of January 11, 2016, known as the new Legal Framework for Science, Technology and Innovation, which improves measures to encourage innovation and research in the productive sphere, aiming at training and technological autonomy, and the productive development of the country (MCTIC, 2016).

In view of the above, this article aims to analyze the role of the Technological Innovation Center (NIT), linked to the Scientific, Technological and Innovation Institutions (ICTs) as an inducer of the development of cleaner technologies in the steel sector, considering the possibilities of technology transfer to adapt the sector to the requirements of the CBAM.

To achieve the proposed objective, an exploratory research was carried out, with a qualitative approach. Literature reviews on the subject were carried out on specialized search platforms

The research is justified by the environmental and economic impact that the Mechanism will have on Brazilian companies exporting steel products to the European Union. In addition, in order to meet the requirements established by the mechanism, with the need to reduce CO₂ emissions, it is necessary to implement cleaner technologies, which, according to Silva Júnior and Andrade (2011), require greater investment in research, development and innovation, ratifying the theoretical relevance of this research.

The research is also justified by its theoretical and practical relevance, with the generation of structured knowledge about the technologies used in the steel industry, which will allow the Technological Innovation Centers (NITs) and Brazilian companies to anticipate trends, establish strategic partnerships and incorporate sustainable innovations to meet CBAM regulations.

In research carried out on the subject, no products were identified, until the closing of the present investigation, that present the role of NITs for the industrial adaptation of the Brazilian steel sector in the face of the requirements of the Carbon Adjustment Mechanism at the Border of the European Union (CBAM), with emphasis on the development of cleaner technologies and technology transfer. Mediating scientific production and the productive sector

2 THEORETICAL FRAMEWORK

Cleaner technologies play a fundamental role, given that they act preventively,

reducing Greenhouse Gas (GHG) emissions, among other benefits, such as reducing the production of solid waste in the initial process of steel and iron production. According to Law 12.305/2010, which institutes the National Solid Waste Policy, solid waste is materials, substances or objects discarded in its solid state, originating from human activity (BRASIL, 2010)

For Cumming, Henriques and Sadorsky (2016), clean technologies are processes that aim at less waste generation in production, including the generation of biomass and recycling processes, while Silva Júnior and Andrade (2011) state that the technologies proposed to treat the waste generated, that is, to treat the consequences and not act in a preventive way to environmental impacts, will tend to be classified as end-of-pipe technologies.

Cleaner technologies put nations on the path to transition to a low-carbon economy. In addition, it can reduce the costs of decarbonization, considering that there is a tendency to create restrictive carbon policies, as has already been happening with the European Union (EU).

In 2023, the EU created the Carbon Border Adjustment Mechanism (CBAM), which will come into force in January 2026, in addition to creating 50 measures to decarbonize the economy of the bloc's countries and strengthen the carbon market - Emissions Trading System (ETS) (EUROPEAN COMMISSION, 2019; HEREDIA; GALGANI, 2022).

Regarding the CBAM, the mechanism can affect important sectors of the Brazilian economy such as steel and iron (the focus of this research), in addition to the fertilizer, cement, aluminum, hydrogen, and electricity sectors (EUROPEAN COMMISSION, 2019; HEREDIA; GALGANI, 2022).

The CBAM is one of the strategies established by the European Union to tackle climate change, reducing GHG emissions and avoiding "carbon leakage", a practice that transfers GHG-intensive production from countries with stricter environmental laws to countries with more lenient environmental laws.

Thus, the implementation of the mechanism aims to equate products imported by the European Union with products manufactured in the country, with regard to compliance with environmental regulations and global decarbonization goals (EUROPEAN COMMISSION, 2021).

CBAM is part of the European Green Deal, created in 2019, which establishes goals for decarbonization, reducing GHG emissions by 55% by 2030 and neutralizing their effects by 2050 (CNI, 2024). This initiative also aims to prevent carbon leakage and equalize the rules followed by producers in the European Union (EU), taxing the ton of carbon incorporated into the exported product (CNI, 2024).

In addition, it is noted that important sectors will be affected by the implementation of the CBAM, such as the cement, fertilizer, hydrogen, electricity, aluminum, iron, and steel industries, as they will be required to track and provide information on the CO₂ embedded in the products to be exported, making less carbon-intensive products more economically attractive (APEXBRASIL, 2023).

Faced with the consequences arising from GHG emissions, whether due to physical, financial, economic, and social risks, as well as creating an economic environment in the national scenario that promotes the strategy of inducing the transition to a low-carbon economy, Brazil, on December 11, 2024, sanctioned Law 15,042, which establishes the Brazilian Greenhouse Gas Emissions Trading System (SBCE), whose objective is to comply with the National Policy on Climate Change (PNMC) and the implementation of the agreements signed under the United Nations Framework Convention on Climate Change (BRASIL, 2024a).

The PNMC, created by Law N 12.187, of December 29, 2009, establishes guidelines that promote sustainable development and the reduction of greenhouse gas emissions. As part of this Policy, Brazil instituted, through Decree 11,550/2023, the Interministerial Committee on Climate Change (CIM), responsible for preparing the Climate Plan, which began in 2023, whose objective is to combat climate change, based on two pillars, the first being the mitigation of GHG emissions and the second, the adaptation of the population and structures to climate change (BRASIL, 2024b).

The Climate Plan will act strategically through Mitigation Plans and Adaptation Plans in a sectoral manner, in order to reach important sectors of the economy, generating an impact on the energy transition, sustainable industrial development, facing the climate crisis and migration to a low-carbon economy (BRASIL, 2024b).

In addition, the Climate Plan also has Cross-Cutting Strategies for climate change, aimed at reaching vulnerable populations, economic and environmental impacts, financing, monitoring and management, training, development and innovation. The Climate Plan has the collaboration of society, companies, government and academia, as well as more than 20 ministries, also supporting the preparation of the new Nationally Determined Contribution (NDC), with decarbonization goals in accordance with the Paris Agreement. (BRAZIL, 2024b).

In this sense, taking as a parameter the emissions recorded in 2005, Brazil has committed to reducing greenhouse gas emissions by 37% by 2025, and by 47% by 2030, ratifying the Paris Agreement - an agreement signed in 2015, whose objective is to combat climate change, keeping the global average temperature below 2°C (ARTAXO, 2020).

For Unterstell and La Rovere (2021), the conformation of a change in this scenario requires policies focused on strategies to neutralize GHG emissions in the next three decades and, for this, two fronts need to be structured: (i) Change in industrial production processes and energy generation; and (ii) innovative public policies, committed to the transition to a less GHG-intensive economy.

In the steel sector, in view of the requirements on the carbon footprint incorporated in products exported to the European Union, the implementation of cleaner technologies is urgent (EUROPEAN COMMISSION, 2021), which can open opportunities for technological innovation and transfer of technologies developed in Scientific, Technological and Innovation Institutions (ICTs) to industries, through the Technological Innovation Centers (NITs) (FERREIRA; SOUZA, 2019), disseminating scientific and technological knowledge developed in academia, contributing to the technological adaptation of the productive sectors affected by the implementation of the Mechanism.

Paranhos, Cataldo and Andrade (2017) endorse that the performance of the NIT is fundamental for the approximation of universities to the productive sector, since this interaction is already part of government discussions when regulating its creation, aiming to support the development of science, technology and innovation. In this sense, the NIT becomes an important ally to the results of research developed within academia, by promoting dialogue with society, companies, and development institutions (QUEIROZ et al., 2022).

In addition, Queiroz et al. (2022) also highlight that, in order to be successful in achieving the attributions assigned to NITs in the management of intellectual property, in the production and transfer of technologies developed in ICTs, strategic planning and the promotion of a disruptive culture that stimulates interaction with the industrial sector are necessary.

Leite, Carvalho, and Oliveira (2023) state that NITs should play the role of catalyzing and disseminating innovations, in addition to integrating methods that process knowledge according to the technological needs of society, contributing to local, regional, and national development.

For Silva et al. (2015), technology transfer boils down to the promotion of technologies developed in sectors that do not have the same technological characteristics. In this context, the role of the NIT in intermediating the partnership between industry and ICTs can represent significant technological advances, allowing the anticipation of trends, the establishment of strategic partnerships, and the incorporation of sustainable innovations that can meet CBAM regulations

3 METHODOLOGY

3.1 CHARACTERIZATION OF THE RESEARCH

This article is characterized by a qualitative and exploratory approach, since it makes a bibliographic and documentary analysis on the subject. For contextualization and elaboration of the theoretical framework, institutional reports, legislation and scientific publications on cleaner technologies for the Brazilian steel industry were analyzed in relation to the Carbon Adjustment Mechanism at the Border of the European Union (CBAM/EU).

3.2 METHODOLOGICAL PROCEDURES

To achieve the objective of the research, three stages were followed, namely: stage 1 - bibliographic and documentary research; Stage 2 - Analysis and discussion of the results; and step 3 - final considerations.

Regarding stage 1, bibliographic reviews were carried out seeking to analyze, through dossiers and organizational reports, greenhouse gas emissions in the steel industry, government initiatives to address the climate crisis, and which studies have been developed for the development of cleaner technologies aimed at the decarbonization of the iron and steel industry.

To carry out the literature review, specialized search platforms such as SCOPUS, Capes Journals and Google Scholar were used, with keywords relevant to the topic, such as "climate change", "decarbonization in industry", "CBAM", "cleaner technologies", "the role of the NIT", in Portuguese and English, from January to July 2025.

In addition to articles referring to the proposed topic, manuals, reports, and government regulations that address the decarbonization process, greenhouse gas emission control policies, and the implementation of CBAM in Brazil were analyzed.

Still in stage 1, it was possible to build the theoretical and methodological framework of the research.

In relation to stage 2, data analysis and discussion were carried out. After a bibliographic and documentary survey, the information and data obtained were analyzed and discussed in order to be incorporated into the research.

In relation to stage 3, the final considerations were made and the limitations of the research were defined.

4 RESULTS AND DISCUSSIONS

Considering the global GHG neutrality goals, the carbon pricing imposed by the implementation of the CBAM, although challenging due to the short term for adaptation,

raises the development and application of cleaner technologies in the industrial sectors, since non-decarbonization will burden the price of products to be exported, generating a competitive, comparative, and relative disadvantage for Brazilian companies.

The transition to a low-carbon economy involves the migration from environmentally safe technologies, the so-called end-of-pipe, to the adoption of cleaner technologies, aiming at neutrality of emissions without negatively compromising production efficiency.

In this transition process, the need for technological innovation emerges, as well as technology transfer, which can be related to both tangible and intangible assets, especially in developing countries or industries that do not invest in R&D or face obstacles to adapting to the environmental regulations imposed, especially the CBAM.

Innovation, according to Law 10.973/2004, consists of the introduction of novelty or improvement of products in the production environment, which result in improvements and effective gains in quality or performance (BRASIL, 2004).

The results suggest that, even though Brazil is a country with a mostly renewable energy matrix, which should represent a competitive advantage over other countries with a predominance in a non-renewable energy matrix, the steel industry still depends on fossil fuels as an energy source for steel and iron production.

This scenario, given the pricing of the ton of carbon emitted per product, may pose challenges for competitiveness and compliance to adapt to the regulations imposed by CBAM. On the other hand, it opens up opportunities for innovation and development of cleaner technologies for decarbonization in industry, such as the use of green hydrogen as a renewable source of energy and the replacement of mineral coal with biomass to reduce iron ore in crude steel.

The Brazilian energy matrix and the new technological routes developed for decarbonization in the industrial sector enable competitive potential for adaptation and permanence in the export market, considering that Brazil is among the largest producers and exporters of steel products in the world (CNA, 2023).

In this sense, despite the predominance of conventional technologies, with the use of fossil fuels, the economic and environmental pressure generated by the implementation of CBAM with the pricing of the ton of carbon incorporated into products drives the development of cleaner technologies and the application of new technological routes for the transition to a low-carbon economy.

The electrification of processes, the use of green hydrogen to replace fossil fuels, and the better use of natural resources represent important strategies for the transition to a low-carbon economy in the steel industry. In the crude steel production process, the reduction of

iron ore in blast furnaces is the process identified as the most GHG emission intensive in the steel and iron sector (FERNANDES et al., 2024).

Therefore, the technology of using Electric Arc Furnace (EAF), with renewable energy, replacing conventional blast furnaces using coking coal, significantly reduces CO₂ emissions (IEA, 2022). Another innovation is, in place of fossil fuels, the use of green hydrogen as a reducing agent in the Direct Reduced Iron (DRI) process, produced from renewable energy sources, can be a relevant strategy for the decarbonization of the industrial sector (IEA, 2025).

In addition, there are clean technologies, called end-of-pipe, which, according to Silva Júnior and Andrade (2011), seek to treat GHGs emitted after the production process, in order to reduce environmental impacts. Carbon capture and storage (CCS) and scrap metal recycling are examples of end-of-pipe technologies, as they act on the effect rather than the cause. Despite this, it is relevant strategies to mitigate the environmental impacts generated by GHG emissions in the steel industry, while cleaner technologies suggest changes in industrial processes in order to achieve both economic and environmental benefits (UNEP, 2016).

In this context, CCS, considered an end-of-pipe technology, consists of capturing, transporting and storing the carbon emitted in the production process in geologically safe locations, preventing GHGs from reaching the atmosphere (CÂMARA; ANDRADE; ROCHA, 2011), being a strategy for mitigating the environmental impacts resulting from CO₂ emissions.

The carbon emitted can be compressed and transported by pipeline, ship, train or truck, if it is not used on site, being an alternative to sectors that have difficulties in reducing their emissions (IEA, 2022). Its application is used in the fertilizer industry, in addition to the production of synthetic carbon dioxide-based fuels, chemicals, and construction aggregates (IEA, 2022).

In the production of crude steel with a reduction in iron ore, CCS can be applied in the blast furnace route, since it is an emissions-intensive process. Another route of clean technologies or end-of-pipe consists of recycling scrap metal, considering that steel is a 100% recyclable material and can be reused several times, maintaining quality and being able to be transformed into various products (INSTITUTO AÇO BRASIL, 2023).

For the Brazilian Mining Institute (IBRAM, 2025), the development of technologies in the country is crucial for distancing itself from technological dependence. On the other hand, the analysis made by Cumming, Henriques and Sadorsky (2016) elucidates a possible obstacle that may justify the low adherence to clean technologies, although growing, but still

insufficient for sustainable development, when it portrays that companies already consolidated in the market and focused on fossil fuels would hardly be interested in investing in new technologies developed by start-up companies. Considering that investment in these technologies requires knowledge and experience to minimize economic risks.

According to Leite, Mendonça and Oliveira (2023), the NIT as a mediator between the productive and academic sectors is fundamental for the development of technologies that solve current problems in society, in addition to transferring technologies developed at the institution, registering patents and other intellectual property modalities.

Therefore, the NIT's role in the development of new technologies and technology transfer for the decarbonization of emission-intensive sectors can become fundamental for the transition to a low-carbon economy and the reduction of environmental impacts suffered by society, considering that, for Silva et al. (2015), scientific and governmental institutions must develop technology transfer strategies associated with the demands of industries.

In this sense, NITs can act as a central actor in the articulation and integration between ICTs and the steel sector, performing a function that goes beyond the mere management of innovation and protection of the intellectual property of these institutions, that is, a strategic and proactive role. In the face of CBAM's regulatory pressures, NIT needs to act as a protagonist in mapping technological gaps in the industry, at the local, regional and national levels, connecting them to inventions, scientific and technological research, as well as to the skills available in ICTs.

From this perspective, it is envisaged that the NITs can build innovation roadmaps in clean technologies, functioning as an actor-guide of the productive sector on which technologies can support decarbonization, what is the technological readiness level (NPT) or the English Technology Readiness Level (TRL) of these technologies, channeling initiatives and also pointing out which ones require co-development and how they can be transferred (NASCIMENTO, 2021; HORA, 2021; SANTOS, 2024).

One dimension to be considered in the performance of NITs in the context of CBAM is the strategic role as an actor in specialized technological curatorship, both from the perspective of prospecting and from the perspective of compliance with the technical dimensions of the inventions, as well as their adherence to the rules and restrictive carbon assumptions imposed by CBAM.

Thus, the role of the NIT also gains contour as an actor in the conversion and translation of scientific and technological results into regulatory and economic language, evaluating the potential for reducing emissions, energy efficiency gains or substitution of inputs and their alignment with global requirements in the context of the low-carbon economy

in Brazil and in the world. By performing this role of institutional translator in ICTs, NITs reduce information asymmetries between academia and steel mills, creating conditions for clean technologies to leave laboratories and enter industrial processes.

The research by Guimarães (2013), Ferreira (2019), Nascimento (2021) and Hora (2021), as well as Santos (2024), pointed out that the NITs encounter difficulties ranging from the professionalization of management, with high staff turnover, as well as difficulties in operationalizing negotiation, valuation and marketing strategies that are important in technology transfer. In this sense, the fundamental role of NITs as a technological risk mediator stands out, fundamental in the steel sector, where investment decisions are capital-intensive.

To this end, it is necessary to professionalize the NITs that enable them to use strategic and advanced tools of finance and negotiation, through technological valuation methods, such as methodologies such as real options, discounted cash flows, multicriteria environmental impact analyses and TRL models integrated with the regulatory risk of CBAM, offering objective instruments for steel mills to decide which technologies they should license, acquire, test or code in pilot projects.

This mediation reduces the risk of adopting immature technologies and increases the predictability of environmental and economic returns, an essential element in the new carbon tariff scenario, in addition to channeling resources more efficiently in the development and production of new technologies in Brazil.

Another dimension of strategic action of NITs is the governance of partnerships and technology transfer contracts, through disruptive models that can break the bureaucratic barriers that currently exist in public ICTs. With the development of models appropriate to the environmental context, elements such as the construction of environmental performance clauses, risk sharing mechanisms, such as licenses conditioned to carbon metrics, among others, need to be incorporated in the face of the regulatory context.

In addition, this can give NITs not only the role of acting in technology transfer, but also in the construction of safe institutional environments so that Brazilian industry can adapt to the energy transition route required by the CBAM context.

Finally, it is necessary that ICTs, through NITs, act in a more inductive way in the Brazilian innovation ecosystem, through the articulation of actors such as industries, such as steel mills, research centers and institutes, government, environmental agencies, regulatory agencies and investors, promoting initiatives such as technological calls, open innovation environment, among other initiatives, with the objective of enabling the construction of a route of solutions aligned with CBAM.

In summary, Table 1 presents the possible roles of NITs in the context of the Brazilian steel industries in relation to the CBAM.

Table 1

Role, Actions and Strategies of the NIT for Cleaner Technologies in the Steel Industry in relation to CBAM

Role of the NIT	Key Actions	Associated Strategies
Diagnosis and Technological Mapping	Identify technological gaps in the steel sector; map TRLs of clean technologies available in ICTs; analyze bottlenecks in emissions, energy and inputs in the sector.	Develop decarbonization technology roadmaps; create a technology bank aligned with CBAM; structure a strategic portfolio of inventions with potential for industrial application.
Technical-Regulatory Curation	Evaluate adherence of technologies to carbon metrics and CBAM criteria; translating scientific results into regulatory and economic language; prepare environmental and technological impact opinions.	Develop CBAM-technologies compliance matrix; create a validated catalogue of green solutions; institute technical opinions on eligibility for technology transfer aimed at decarbonization.
Mediation of Technological and Economic Risks	Apply technological valuation; perform technical and environmental analysis (due diligence); to build scenarios of economic impact of CBAM for the industry.	Create integrated TRL + Valuation + Carbon Risk models; produce due diligence reports for steel mills; support decisions on licensing, co-development and industrial pilots.
Legal and Contractual Governance of Technology Transfer	Structure TT contracts with environmental performance clauses; define royalties linked to the reduction of emissions; create licenses conditioned to carbon metrics; negotiate co-development agreements.	Implement green intellectual property contracts; adopt contractual models with regulatory risk sharing; structure mechanisms to protect and encourage environmental performance.
Orchestration of Green Innovation Ecosystems	Articulate ICTs, steel mills, startups, R&D centers and government; promote public calls, technological challenges and pilot projects; encourage consortia and collaborative platforms.	Create a sectoral innovation platform focused on cleaner technology; coordinate open innovation environments and R&D routes; foster climate spin-offs and experimental environments to accelerate technological maturation.

Source: Prepared by the authors based on research data (2025).

Such strategies can promote sustainable development, assisting in the technological and regulatory adaptation of the sectors affected by CBAM, enabling the competitiveness of Brazilian companies in the export market to the European Union.

5 CONCLUSION

This research aimed to analyze the role of the Technological Innovation Center (NIT), linked to the Scientific, Technological and Innovation Institutions (ICTs) as an inducer of the development of cleaner technologies in the steel sector. To this end, an exploratory research

was carried out, with a bibliographic and documentary approach, as well as a qualitative nature.

The research pointed to the fact that the implementation of the European Union Border Carbon Adjustment Mechanism may pose challenges to GHG-intensive sectors if they are unable to adapt technologically to the monitoring and reduction of embodied carbon in products exported to the European Union. In this sense, CBAM can also open opportunities for technological innovation and transfer of cleaner technologies that can be applied in industry for the decarbonization of sectors, otherwise they will lose competitiveness in the European market.

For the present research, bibliographic and documentary reviews were carried out on the impacts of CBAM, the technological routes used in the production of steel and iron, the implementation of cleaner technologies and decarbonization in the industry. The steel sector still depends on fossil fuels, even though Brazil has a mostly renewable energy matrix. The literature presents cleaner technologies as alternative routes for decarbonization in the reduction of iron ore for crude steel production, with the use of green hydrogen as an energy source and the replacement of fossil fuel with biomass.

The transition to a low-carbon economy involves the transfer of conventional or clean technologies to cleaner technologies, which, for Silva Júnior and Andrade (2011), requires greater investment in research, development and innovation. In this sense, NITs can play a fundamental role in the development and implementation of cleaner technologies to adapt to CBAM regulations and achieve global decarbonization goals, mediating scientific production and the productive sector.

The present research is limited to analyzing the cleanest technologies applicable to the steel sector for decarbonization in relation to CBAM. Further research may be directed to exploring which technology transfers are being carried out in the steel industry and what are their economic and technological impacts for adaptation, in addition to analyzing the effective participation of NITs in this process.

ABSTRACT

The gestational period is a time filled with uncertainties, particularly for first-time mothers, leading to frequent doubts regarding breastfeeding due to the many myths that have been passed down through generations. This study aimed to assess the social representations of breastfeeding among pregnant and postpartum women receiving care in Primary Health Care services in the municipalities of Pancas-ES and Colatina-ES, Brazil. This is an observational, descriptive, cross-sectional study with a qualitative approach. The research participants were pregnant women receiving prenatal care at Basic Health Units (BHUs) in the aforementioned municipalities, as well as postpartum women. For data collection, recorded interviews were conducted using a semi-structured questionnaire as a guide. For data analysis, the qualitative information was processed after the recorded interviews were completed, digitized, and transcribed for semantic analysis, with evocations extracted and examined using the software openEVOC 0.92. This tool was used to identify the probable central nucleus and peripheral system of the social representations held by the study participants. The results revealed that the central terms “love,” “fear,” and “health” reflect an ambivalent perception of breastfeeding—viewed as an act of affection and care, yet accompanied by feelings of insecurity and anxiety. The study highlights the need to strengthen educational initiatives

RESUMO

O período gestacional é um momento repleto de dúvidas, principalmente em primigestas, com isso se torna frequente o surgimento de incertezas quanto ao aleitamento materno devido a tantos mitos que existem e são passados por gerações. Esse estudo teve como objetivo avaliar as representações sociais do aleitamento materno por gestantes e puérperas na Atenção Primária à Saúde dos municípios de Pancas-ES e Colatina-ES. Trata-se de um estudo observacional, descritivo, transversal, de abordagem qualitativa, o qual as participantes de pesquisa foram gestantes que realizam pré-natal em Unidade Básica de Saúde (UBS) dos municípios supra citados, e também puérperas. Para coleta de dados, foram realizadas entrevistas gravadas utilizando como roteiro um formulário semiestruturado. Para análise dos resultados, os dados qualitativos foram tratados após a aplicação das entrevistas gravadas, sendo estas digitalizadas, transcritas para análises semânticas das informações e extraídas as evocações, as quais foram elucidadas por meio do software openEVOC 0.92, processando o provável núcleo central e sistema periférico da representação social do grupo participante da pesquisa. Os resultados evidenciaram que os termos centrais “amor”, “medo” e “saúde” refletem uma percepção ambivalente sobre a amamentação, vista como um ato de afeto e cuidado, mas sendo permeado por inseguranças e angústias. Destacou-se a necessidade de intensificação das ações educativas na Atenção Primária à Saúde, com ênfase no papel do enfermeiro e da equipe multiprofissional, visando qualificar o acompanhamento, oferecer apoio contínuo e desmistificar crenças que fragilizam a prática.

Palavras-chave: Representação Social. Amamentação. Unidade Básica de Saúde. Enfermagem.

RESUMEN

El período gestacional es una etapa llena de dudas, especialmente en mujeres primigestas, lo que hace frecuente la aparición de incertidumbres respecto a la lactancia materna debido a la gran cantidad de mitos que existen y se transmiten de generación en generación. Este estudio tuvo como objetivo evaluar las representaciones sociales de la lactancia materna entre gestantes y puérperas en la Atención Primaria de Salud de los municipios de Pancas-ES y Colatina-ES. Se trata de un estudio observacional, descriptivo, transversal, con enfoque cualitativo, en el cual las participantes fueron gestantes que realizaban el control prenatal en Unidades Básicas de Salud (UBS) de los municipios antes mencionados, así como también puérperas. Para la recolección de datos, se realizaron entrevistas grabadas utilizando como guía un formulario semiestructurado. En cuanto al análisis de los resultados, los datos cualitativos fueron tratados después de la aplicación de las entrevistas grabadas, las cuales fueron digitalizadas y transcritas para su análisis semántico. A partir de ello, se extrajeron las evocaciones, que fueron procesadas mediante el software openEVOC 0.92, identificando el probable núcleo central y el sistema periférico de la representación social del grupo participante en la investigación. Los resultados evidenciaron que los términos centrales “amor”, “miedo” y “salud” reflejan una percepción ambivalente sobre la lactancia materna, concebida como un acto de afecto y cuidado, pero atravesada por inseguridades y angustias. Se destacó la necesidad de intensificar las acciones educativas en la Atención Primaria de Salud, con énfasis en el papel del enfermero y del equipo multiprofesional, con el propósito de cualificar el acompañamiento, ofrecer apoyo continuo y desmitificar creencias que debilitan la práctica.

1 INTRODUCTION

The act of breastfeeding is a central practice in the promotion of the health of the mother-child binomial, transcending the nutritional, immunological and affective function. This process intertwines biological, emotional and social aspects, configuring a unique experience that strengthens the mother-child bond and reflects values, meanings and representations that profoundly shape the maternal experience (Kummer *et al*, 2000; Marques; Cotta; Araújo, 2009).

Breast milk (LM) is widely considered the ideal food for the child, capable of meeting all its nutritional and water needs exclusively in the first six months of life. In addition to nurturing, breastfeeding strengthens the bond between mother and child, involving comfort, closeness, and affection (Kummer *et al*, 2000; Takushi *et al*, 2008).

For women, the benefits are equally wide-ranging, including protection against breast and ovarian cancer, reduced risks of postpartum hemorrhage, and aiding in the process of uterine contraction. Breastfeeding also reduces a woman's chances of developing hypertension, type 2 diabetes, and high cholesterol (Ministry of Health, 2024). In addition, it stands out for being a sustainable, environmentally safe, non-polluting practice, and that directly contributes to the child's food and nutritional security. Thus, the promotion and support of breastfeeding represent essential pillars in primary health care actions, given their ability to generate multifaceted positive impacts on individual and collective health.

According to the Ministry of Health (Brasil, 2025), breastfeeding can be maintained even after the introduction of other foods or liquids. On the other hand, Exclusive Breastfeeding (EBF) is characterized by offering only breast milk, either directly from the breast or previously extracted, without the administration of other liquids or solids, except for supplements, vitamins, minerals or prescribed medications.

The World Health Organization (WHO) and the Ministry of Health recommend that EBF be maintained until six months of life. After this period, breastfeeding should continue in a complementary way, associated with the gradual introduction of solid foods, ideally being prolonged until two years of age or more, according to the desire and conditions of the mother and child (WHO, 2017; Brazil, 2024).

However, despite the numerous benefits of breastfeeding, EBF rates remain below established targets. According to the United Nations Children's Fund (2019), only 44% of children under six months are exclusively breastfed. In Brazil, this rate is 45.8%, varying according to the region and population group (ENANI, 2019).

Breastfeeding is a complex phenomenon, influenced by the historical context and by social and cultural determinants, in addition to involving physiological, psychological

and volitional variables. Therefore, it is not just an instinctive and biologically natural act (Leite *et al*, 2016, p.2).

In this scenario, early weaning represents a challenge for maternal and child health at a global level, predisposing to preventable diseases such as malnutrition, diarrhea and childhood obesity, in addition to increasing mortality. These problems have a direct impact on public health indicators and reinforce the need for strategic actions to promote, protect and support breastfeeding (Frota *et al*, 2009).

Early weaning is also a central theme in public health policies, being a multifactorial phenomenon, influenced by social, economic, political and cultural determinants, which transform breastfeeding into an act conditioned by social norms and values (De Souza; Asunción; Guimarães, 2023; Natarelli *et al*, 2025). In this context, pregnant or postpartum women attribute different meanings to breastfeeding, constructed from beliefs, cultural representations and personal experiences, influenced by the social context in which the woman is inserted (Marques; Cotta; Araújo, 2009; Leite *et al*, 2016).

It is in this context that Primary Health Care (PHC) plays a strategic role in the promotion, protection and support of breastfeeding (Brasil, 2025). As a gateway to the health system, PHC is responsible for implementing educational actions, carrying out prenatal and postpartum care, offering individualized guidance, and promoting support groups aimed at strengthening breastfeeding practices. In addition, it enables the early identification of risks, encourages healthy eating practices and supports breastfeeding (Faria; Silva; Passberg, 2023).

However, adherence to exclusive breastfeeding does not always depend only on access to health services or technical guidance. Breastfeeding practices are influenced by symbolic values, personal and collective experiences, and social and cultural beliefs that impact maternal decisions (Fujimori *et al*, 2010; Moraes *et al*, 2020).

According to Moscovici (1978), the concept of social representations refers to cognitive processes by which individuals construct meanings based on their relationship with certain objects, internalizing and reinterpreting them. This phenomenon, influenced by sociocultural and linguistic factors, shapes the way subjects perceive and understand reality (Morera *et al*, 2015). In the case of breastfeeding, understanding these representations allows us to identify perceptions, values and feelings that directly affect maternal decisions.

In view of this, the following study aims to evaluate the social representations of breastfeeding by pregnant and puerperal women in Primary Health Care in the municipalities of Pancas-ES and Colatina-ES, in order to understand how symbolic, cultural and social aspects influence the practice of breastfeeding, in addition to proposing strategies to

promote, protect and support breastfeeding.

2 METHODOLOGY

The methodology of an article outlines the procedures employed to conduct the research, including the type of study, sample selection, methods of data collection and analysis, ethical considerations, and limitations of the study. Its detailed and transparent description is essential to ensure the replicability and reliability of the results, in addition to providing a solid basis for the interpretation and generalization of the findings.

This is an observational, cross-sectional and descriptive study, with a qualitative approach. It took place in 12 Basic Health Units (UBS), ten in the municipality of Colatina and two in the city of Pancas, both in Espírito Santo – Brazil.

The sample consisted of 52 pregnant women and 8 postpartum women assisted at the UBS, totaling 60 participants. These were selected according to the following inclusion criteria: age equal to or greater than 18 years, being pregnant or in the puerperal period and voluntarily agreeing to participate in the research by signing the Informed Consent Form (ICF). Those under 18 years of age and who did not accept to participate were excluded.

The data collection process was carried out through interviews conducted in person and recorded by the research team, using a printed questionnaire divided into two parts as a script. At first, data on the personal and sociodemographic profile of the participants were sought, along with obstetric information. In the second part, the technique of free evocation of words was implemented from an inducing term, which is "breastfeeding". The interviews took place in a reserved place at the Basic Health Unit (UBS), ensuring privacy and comfort for the participants. All of them previously received the necessary clarifications about the objectives of the research, with the reading and explanation of the ICF, and by signing them, each participant took possession of a copy of the document.

In order to ensure anonymity, the research participants were named "pregnant woman (01), puerperal (02)" and so on, according to the number of pregnant and puerperal women who agreed to participate in the research. The entire process strictly followed the principles of ethics in research with human beings, as established by Resolutions No. 466/2012 and No. 510/2016 of the National Health Council, as well as with the guidelines of the General Law for the Protection of Personal Data (Law No. 13,709/2018).

For the analysis of the results, the qualitative data were treated after the application of the recorded interviews, which were digitized, transcribed for semantic analysis of the information and the evocations were extracted, which were elucidated using the openEVOC 0.92 software. This allows the performance of statistical calculations, establishing matrices

of co-occurrences, which serve as a basis for the construction of the four-house framework, processing the probable central nucleus and peripheral system of the social representation of each group of research participants.

The study was previously submitted to and approved by the Human Research Ethics Committee of the University Center of Espírito Santo – UNESC, with the number of the consolidated opinion 7.558.903, dated May 9, 2025, meeting the criteria established by the National Research Ethics Commission (CONEP). All participants signed the Informed Consent Form (ICF) and were guaranteed the right to privacy, confidentiality of the information provided, and the right to withdraw from participation at any time, without prejudice to their attendance.

Serge Moscovici's Theory of Social Representations understands common sense knowledge as a collective construction that influences social behaviors and practices (Moscovici, 1978). In this context, the social representations of breastfeeding are understood as symbolic constructions shared by pregnant and puerperal women, shaped by cultural, social, affective and institutional factors. In addition, Jean-Claude Abric's Central Core Theory was used, which proposes that every social representation has a structure composed of a central core, formed by stable, consensual and culturally shared elements, and a peripheral system, which incorporates contextual and subjective aspects to individual experiences (Abric, 2003).

3 RESULTS

The research was carried out in the cities of Pancas-ES and Colatina-ES in 12 different Basic Health Units (UBS), totaling 60 participants (n=60), among them 52 pregnant women (86.7%) and 8 puerperal women (13.3%). Data on personal characteristics were collected, including age, marital status, education and self-reported skin color (Table 1); sociodemographic profile data, including occupation, per capita income, and religion (Table 2); and data on the obstetric profile, involving parity, pregnancy planning, number of prenatal consultations performed, and type of expected/performed delivery (Table 3).

Regarding personal characteristics, detailed in Table 1, 24 women (40%) were in the age group of 18 to 24 years, 25 (41.7%) were between 25 and 32 years old, and only 11 (18.3%) were over 33 years old. Regarding the data collected regarding marital status, 26 women (43.3%) interviewed were single, 19 (31.7%) married, 14 (23.3%) declared a stable union and only 1 (1.7%) was a widow. Regarding education, 9 people (15%) had incomplete primary education, 9 (15%) had completed primary education, 9 (15%) had incomplete secondary education, 24 (40%) had completed secondary education, 5 (8.3%) had

incomplete higher education and 4 (6.7%) had completed higher education. Finally, 13 women (21.7%) declared themselves white, 38 (63.3%) brown, 8 (13.3%) declared themselves black, and only 1 (1.7%) indigenous.

Regarding the occupation of the interviewees, in the sociodemographic profile (Table 2), 26 women (43.3%) were in paid work, 30 women (50%) self-declared themselves housewives and only 4 (6.7%) were self-employed. The per capita income of 52 people (86.7%) ranged up to 1 minimum wage, 7 (11.7%) lived on 2 to 3 minimum wages, and only 1 woman (1.6%) reported receiving more than 3 minimum wages. Regarding religion, there were 14 women (23.3%) Catholics, 28 (46.7%) Protestants and 18 (30%) declared to have no religion.

The results collected in the research on the obstetric profile (Table 3) showed that 18 women (30%) were primiparous, that is, first pregnancy/delivery, and 42 women (70%) were multiparous, having had 1 or more pregnancies/deliveries previously. When asked about the planning of the pregnancy, 21 interviewees (35%) confirmed the idealization of the pregnancy, while 39 (65%) would not have planned it. Regarding the number of prenatal consultations, 32 women (53.3%) had up to 6 consultations until the day of the interview and 28 women (46.7%) had a number higher than 6 during pregnancy. Finally, the type of delivery applied to the expectations of the pregnant women or to what was performed by the puerperal women, with 35 (58.4%) normal delivery, 23 (38.3%) cesarean section and only 2 people (3.3%) still had no defined response due to the recent beginning of pregnancy.

The technique of free evocations of words, based on the inducing term "breastfeeding", made it possible to identify the structure of the social representation of the group investigated. A total of 252 evocations were obtained, of which 75 were distinct, with variation in frequency and in the Mean Order of Evocation (OME). The organization of the data by the openEVOC 0.92 software allowed the construction of the four-box tableau, revealing the central and peripheral elements of the representation.

The Central Core, characterized by high frequency (>5) and low OME (<3), was formed by the terms "love", "fear" and "health". These elements indicate that breastfeeding is perceived in an ambivalent way: on the one hand, as an act loaded with affection and health benefits; on the other, associated with insecurities and fears. In the First Periphery (high frequency and high OME), the terms "pain", "difficult" and "anxiety" stood out, which reinforce concomitant negative experiences during the practice of breastfeeding.

The Contrast Zone (low frequency and low OME) included evocations such as "care",

"desire" and "important", suggesting subgroups that attribute to breastfeeding a meaning strongly linked to the intention and relevance of the mother-infant connection. Finally, the Second Periphery (low frequency and high OME) brought together terms such as "unique", "challenge" and "concern", which represent more particular and contextual experiences, linked to the conditions of the breastfeeding process.

Table 4

4 DISCUSSION

From the use of the Central Nucleus Theory and the technique of free evocation of words, it was observed that the terms "love", "fear", "health", "good" and "connection" were evoked more frequently and without hesitation, with an average order of evocations <3, composing the Central Nucleus of the social representation of breastfeeding among pregnant and puerperal women. These results show the ambivalence of this representation, to the extent that, at the same time that the affective and health benefits of breastfeeding for the mother-child binomial are recognized, feelings of insecurity and fear in relation to the breastfeeding process also emerge. This duality reveals the multifaceted character of

breastfeeding, socially valued and recommended, but still crossed by singular, symbolic and contextual experiences that directly impact its experience.

In relation to the first periphery, the words "pain", "difficult", "anxiety" and "affection" were present, demonstrating that these feelings, despite having been evoked at a high frequency, do not have such a significant importance for the interviewees as those who make up the central nucleus. Thus, it shows that the desire to breastfeed on the part of these women overcomes the challenges during the process.

Meanwhile, the Contrast Zone was composed of the terms: "care", "happiness", "important", "immunity", "bond", "complete feeding", "desire", "affection", "beautiful", "necessary", "stomach", "crack", "satisfaction" and "good feeling". In the Second Periphery, the following evocations are present: "unique", "challenge", "milk", "concern", "tiredness", "special", "expectation", "pleasurable", "joy", "complementation", "confidence", "experience", "hunger" and "frustrating". However, these elements have a reduced value in the interpretation of the Social Representation of breastfeeding for society, since some of them are synonymous with others that are more evoked or are based on individual experiences of each woman, not being a common opinion of the vast majority.

In the analysis, the term "love" presented a higher frequency and lower average order of evocations, reflecting the historical and cultural context of the maternal-child bond. This bond has been widely studied, especially by John Bowlby, creator of the Attachment Theory, who highlights its importance for the survival of the species and the emotional development of the child. The interaction with the caregiver provides the child with experiences of trust, security and well-being, strengthening the affective bond. Thus, it is essential that this bond is, whenever possible, stable and harmonious, preventing weaknesses in the construction of maternal-child attachment. The newborn responds in a particular way to the attention, protection, and stimuli received, consolidating emotional bonding (Da Silva, 2019; Bowlby, 1984).

That thing there, when you take it, is wonderful. I love being a mother, so much so that I have many (G33).

This one will breastfeed until she is two years old, I think the most beautiful thing there is breastfeeding (G29).

According to Cunha *et al.* (2012), breastfeeding is configured as an act of affection and care, allowing moments of exchange of glances, skin-to-skin contact and caresses, which strengthens the bond between mother and baby. In addition, it is recognized as one of the first ways in which human beings begin to build emotional relationships.

Evocations such as "good" and "connection" are also related to the mother-child binomial, since the experience and expectations of breastfeeding involve affective and sensorial dimensions that are unique to each woman. This process allows the mother to recognize herself in a relationship of physical and emotional closeness with the baby. Some pregnant women reported breastfeeding because they considered the act "pleasant" or "beautiful", thus evidencing the expression of autonomy, comfort and well-being in the mother's experience (Takushi *et al*, 2008).

In addition, a prevalence of the evocation of the term "fear" was observed, both among primiparous and multiparous pregnant women. Among primiparous women, this feeling seems to be associated with uncertainty in the face of the unknown, idealization of the breastfeeding process, poorly founded previous knowledge, often constructed from informal narratives, cultural beliefs or shared experiences in the family and social spheres, and doubts related to one's own ability to care for the newborn. In the case of multiparous women, fear is generally related to previous negative experiences, some of them marked by painful experiences, such as nipple fissures, inflammatory processes, episodes of hypogalactia in previous pregnancies, among other reported situations.

It scares me, because it's new [...], I saw what my sister suffered to breastfeed, how much it hurt, it gives me trauma (G08).

I only remember my (chest) cracking and hurting a lot, it's a fear of it happening again (G18).

I'm afraid of hurting my breast and not being able to breastfeed because of that [...], even though I've never been a mother, I want to breastfeed (G41).

I had an experience with the first child that was not very good, but I think it is something necessary, important and that creates a bond with the baby (G09).

In addition, the prevalence of the term "fear" was often associated with narratives of pain, cravings, inflammation and fear of "sucking and cracking". These reports show that real or anticipated physical suffering acts as a factor of insecurity that permeates the breastfeeding experience. This perception is fed both by their own experiences, especially among multiparous women who have already faced difficulties in previous pregnancies, and by subjective experiences shared in the social and family circle. This collective construction of fear, rooted in painful memories or transmitted discourses, reinforces social representations that can weaken maternal self-confidence in the breastfeeding process. In addition, difficulty with the breasts due to the presence of inverted nipples appeared in the reports of some of the women as an unfavorable reason for breastfeeding.

If I tell you that I never breastfed, because the nipple of my breast is inverted. In the other two pregnancies I couldn't breastfeed [...], in this one I wanted to try, but I don't know if I'll be able to (G46).

Another relevant data of the study was the finding that 76.7% of the participants did not receive guidance on breastfeeding during prenatal consultations, and 36.7% stated that they did not feel prepared and confident to start breastfeeding. This finding shows a significant gap in care, since prenatal care is a privileged space for the development of educational actions, acceptance of doubts and strengthening of the autonomy of pregnant women.

In this context, Primary Health Care (PHC) emerges as a strategic axis in the management of difficulties related to breastfeeding, by offering longitudinal follow-up, qualified listening and educational interventions that go beyond the mere transmission of technical information, strengthening the bond between professional and patient. Guidance on cleft prevention and management, breast care, appropriate positions for correct latching, and demystification of negative beliefs are fundamental practices to reduce fear, promote safety, and favor breastfeeding adherence. However, the findings of this study indicate that such actions are still insufficient, since most pregnant and puerperal women reported not having received adequate information in the prenatal period and did not feel prepared to breastfeed. These data reveal a worrying gap in care, suggesting weaknesses in both the attribution and qualification of health professionals, who often do not incorporate the theme of breastfeeding in a systematic way during consultations.

Established by Ordinance GM/MS No. 1,459, of June 24, 2011, the Stork Network is configured as a federal government strategy aimed at promoting comprehensive and humanized care for women's and children's health. Its scope ranges from reproductive planning to the monitoring of child development in the first two years of life, including pregnancy, childbirth and puerperium, and already provides for specific actions to encourage, protect and support breastfeeding.

Complementing these actions, Federal Law No. 13,435, of April 12, 2017, instituted Golden August as a national campaign aimed at raising awareness in society about the benefits of breastfeeding, reinforcing the importance of public policies that encourage this practice. The initiative seeks to promote awareness strategies at different levels of health care, in line with recommendations such as the "golden hour", the immediate moment after delivery when contact between mother and baby strengthens the maternal bond and helps the newborn adapt to the external environment (Brasil, 2023). In the first days after delivery, colostrum, the initial milk, stands out for being a substance rich in protein and

immunoglobulins, essential for the baby's immunity. After colostrum, the milk becomes denser, rich in fats and carbohydrates, aiming at the baby's weight gain, being known as transition milk. Finally, mature milk maintains its composition, with the addition of essential nutrients for the growth and strengthening of the child (Brasil, 2022). However, the effectiveness of these policies depends directly on the performance of PHC, whose professionals need to be properly trained to integrate technical knowledge and reception to maternal needs, assuming the role of health educators.

Given this scenario, investing in the continuous training of PHC multiprofessional teams, doctors, nurses, nutritionists, and community health agents, becomes essential to ensure that breastfeeding guidelines are clear, accessible, and based on scientific evidence. At the same time, the creation of educational groups, conversation circles and home visits enables spaces for dialogue where technical knowledge is articulated with the subjective experiences of women, promoting humanized and participatory care.

Therefore, the results of this study reinforce the need to expand the performance of PHC not only in the care dimension, but also in the educational, preventive and community aspects, ensuring continuous support to the mother and the family. The articulation between local health practices, government campaigns and professional training is essential to transform breastfeeding into a positive experience, strengthening the mother-baby bond and contributing to better public health indicators.

5 CONCLUSION

The experiences about breastfeeding revealed central elements that translate the way this phenomenon is perceived and experienced. The terms that made up the Central Nucleus, "love", "fear" and "health", show an ambivalent perception, in which breastfeeding is understood simultaneously as an act of affection and health promotion, but also permeated by uncertainties and fears.

Breastfeeding was represented as a gesture of affection and care, reaffirming the mother-child binomial. On the other hand, the marked presence of the term fear expresses the dimension of insecurity that accompanies the practice. For primiparous women, fear was associated with the unknown; for multiparous women, to previous negative experiences. Reports of pain, fissures and inflammation were frequently mentioned, reinforcing social representations that associate breastfeeding with physical suffering.

Despite these ambivalences, valuing health as a benefit of breastfeeding reinforces the traditional knowledge of its importance for child development and the strengthening of bonding. However, there is a worrying gap in care: 76.7% of the participants did not receive

specific guidance on breastfeeding in prenatal care, and 36.7% did not feel prepared or confident to start the process. This context reveals the permanence of popular knowledge that supports the desire to breastfeed, but without the formal support expected in health services.

In addition, the Basic Health Unit is a fundamental environment to support and promote breastfeeding. The lack of adequate guidance reveals the need to intensify the actions developed, especially by nurses and the multiprofessional team, who should expand educational initiatives, offer qualified prenatal and puerperal care, provide individualized guidance, form support groups and demystify negative beliefs that weaken the practice. In this context, the continuous training of professionals and the integration of local practices with public policies become essential to transform breastfeeding into a more positive experience, reducing fears and strengthening maternal love and trust. In this way, PHC reaffirms itself as a pillar in strengthening the mother-baby bond and in the consolidation of breastfeeding as a pleasurable and healthy practice.

ABSTRACT

The present study aims to investigate the regulation process of Social and Solidarity Economy in Brazil, primarily from the perspective of public policies. In this sense, the aim was to demonstrate that the regulation of Social and Solidarity Economy through public policies is a sociopolitical process resulting from the constant interaction, within public spaces, between civil society actors and the State. The current institutional context in Brazil indicates a still fragile and nascent regulation, largely attributed to the inherent weaknesses in the modus operandi of Solidarity Economic Enterprises. It has been shown that a viable alternative to addressing these weaknesses is the strengthening of an entrepreneurial ecosystem for SSE. Furthermore, efforts were made to delineate some international experiences in favor of regulating Social and Solidarity Economy, which certainly can provide elements for the Brazilian regulatory journey. In conclusion, it is evident that the process of regulating Social and Solidarity Economy needs to advance in Brazil, particularly through the implementation of coherent and robust public policies, to give substance to the principles of social justice that characterize Social and Solidarity Economy.

Keywords: Social Solidarity Economy. Regulation. Public Policies.

RESUMO

O presente trabalho visa a estudar o processo de regulação da Economia Social e Solidária no Brasil, principalmente a partir da perspectiva das políticas públicas. Nesse sentido, buscou-se demonstrar que a regulação da Economia Social e Solidária via políticas públicas é um processo sociopolítico resultante da constante interação, no âmbito dos espaços públicos, entre atores da sociedade civil e do Estado. A atual conjuntura institucional no Brasil aponta para uma regulamentação ainda frágil e incipiente, o que pode ser atribuído em grande parte às fragilidades inerentes ao modus operandi dos Empreendimentos Econômicos Solidários. Demonstrou-se que uma alternativa viável ao enfrentamento dessas fragilidades é o fortalecimento de um ecossistema empreendedor para a ESS. Buscou-se, ainda, delimitar algumas experiências internacionais em prol da regulamentação da Economia Social e Solidária, que certamente podem fornecer elementos para a jornada de

RESUMEN

Este estudio busca examinar el proceso regulatorio de la Economía Social y Solidaria en Brasil, principalmente desde la perspectiva de las políticas públicas. En este sentido, busca demostrar que la regulación de la Economía Social y Solidaria a través de políticas públicas es un proceso sociopolítico resultante de la interacción constante, en los espacios públicos, entre actores de la sociedad civil y el Estado. El contexto institucional actual en Brasil apunta a una regulación aún frágil e incipiente, que puede atribuirse en gran medida a las debilidades inherentes al modus operandi de las Empresas Económicas Solidarias. Se demuestra que una alternativa viable para abordar estas debilidades es el fortalecimiento de un ecosistema emprendedor para la ESS. Además, se describen algunas experiencias internacionales a favor de la regulación de la Economía Social y Solidaria, que sin duda pueden aportar elementos al proceso regulatorio brasileño. En conclusión, el proceso de regulación de la Economía Social y Solidaria debe avanzar en Brasil, especialmente mediante la implementación de políticas públicas coherentes y sólidas, para concretar los dictados de justicia social que caracterizan a la Economía Social y Solidaria.

1 INTRODUCTION

The Social and Solidarity Economy (SSE) plays a key role in promoting a fairer and more inclusive economy, offering sustainable alternatives to traditional economic models.

SSE covers a wide range of entities and activities, including cooperatives, associations, social enterprises, third sector organisations and self-management initiatives. However, the absence of a clear definition and a specific normative framework for SSE in the country has generated significant challenges for its development and recognition.

The understanding of SSE is particularly complex due to the diversity of organisational forms and the different interpretations of its principles and values.

While some definitions emphasize the priority of people over capital and democratic management, others focus on generating employment and income, especially for those excluded from traditional forms of economic organization. This diversity reflects the richness and complexity of the field, but it also highlights the need for clearer and more cohesive understanding.

The lack of consensus on the definition of SSE is closely linked to a normative vacuum. Different sectors of society and government have proposed various legislation and policies to regulate and support SSE, but to date there is no comprehensive and consolidated regulation. This regulatory vacuum creates uncertainty and limits the growth potential of SSE entities, making it difficult to access financing, tax incentives, and other forms of institutional support.

In addition, the lack of organization in a structural way seems to reveal not only the lack of interest of the Government, but also entails a real impediment to the promotion and development of public policies as a means for the consolidation of this economic organization.

Analysis of the existing literature on ESS reveals that the criteria for identifying and categorizing entities in the sector vary widely. Some approaches focus on the principles and values that guide entities, while others focus on their socio-economic practices and impacts. This multiplicity of criteria reflects the different visions and priorities of the various actors involved in the field of SSE.

This article seeks to explore the various definitions and criteria used to understand SSE, especially in Brazil, as well as the challenges and opportunities associated with this lack of consensus. In addition, the normative vacuum and its implications for the development of SSE are analyzed.

The work was developed through a bibliographic research, with consultation with renowned doctrinaires, legislation applicable to the matter, as well as academic works and scientific articles.

The development of the work will begin with the approach of the importance of networks and SSE as a social movement. Next, we move on to a more in-depth analysis of the solidarity enterprise, its characteristics and actors.

The theme in SSE in Brazil is deepened, bringing reflections on the scarce institutional and governmental incentive for the promotion of SSE.

Finally, the European and Latin American international scenario, their advances and obstacles are analyzed.

From this analysis, it is expected to contribute to a more informed and constructive reflection and debate on the role of SSE in promoting a fairer and more sustainable economy in Brazil and in the world.

2 THE SOCIAL AND SOLIDARITY ECONOMY: NETWORKS AND SOCIAL MOVEMENT

The Social and Solidarity Economy (SSE), by proposing a form of production and work based on cooperation and sustainability, emerges as an alternative response to the capitalist economic system, revealing its aspect as a strategy to combat poverty and social exclusion (FORTE, 2015).

As a social product, one cannot fail to analyze that SSE is a product of the interaction between civil society and the State⁴, on the stage of public spaces, without first understanding that the movement needs legal support within the concept of national positive law.

Therefore, regulation is essential to provide the legal certainty necessary to defend the interests of this particular public.

The process of attributing legal character to SSE, incorporating it into the legal system and, consequently, obliging the State to recognize it as a legal fact, is called juridicization (FORTE, 2015).

The institutionalization of SSE, via social and legal regulation, presupposes the understanding that SSE should be seen as a social movement, more precisely in the category of new social movements.

In this sense, when analyzing the forms in which SSE is presented, Forte (2015) teaches that the Social and Solidarity Economy is better understood as a social movement, of the new type, instead of the simple conception and socioeconomic practice as an alternative policy to capitalism; or as a simple public policy of productive inclusion in the fight against poverty.

⁴ The concept of State, for the purposes of this work, must be understood from the notion of political society, which concerns, in addition to the bureaucratic and administrative institutions of the State, the beliefs and values that permeate the institution and its personnel (FORTE, 2015).

The dimension of the new social movement emphasizes the demand for autonomy, recognition of differences and new cultural values, with an emphasis on justice and solidarity (FORTE, 2015).

Social movements of the new type bring together broader ideas of contestation and social transformation, including reticular organization.

And all interaction must take place within a public space, which is the appropriate place for debate and expression of the differences between civil society and the State, a consequence of adequate social and legal regulation.

Public space seems simple to define, but when looking for sources, Habermas (1997) understands it to be a place of debate guided by the common good, seeing it as an egalitarian debate, ignoring money and power; Hanna Arendt, in turn, seeks the definition as a space for sharing interpretations of the world (TELLES, 1990). What both do not consider is the inequality of power, characteristic of the capitalist economy with which the SSE must dialogue.

From the perception that there are constraints inherent to public spaces that do not allow the unequal to decide as if they were equal, the concept "subaltern counter-publics" was coined to designate the parallel public spaces in which the holders of less economic and political power are able to build and unify their arguments, in order to later present them more strongly in the large public space, which is the stage where, in fact, institutional discussions take place (FORTE, 2015).

And the movement in favor of the ESS is precisely an example of subaltern counter-public. At the local level, there are several meetings and plenary sessions of the entities that make up the ESS, whose objective is to align the demands and define the local political agenda, which will later be taken to the debate in the large public space, as a unified demand.

In this sense, it is expected that the results of the interaction between civil society and the State, which occurred in the context of public spaces, will be the basis for the institutionalization, via social and legal regulation, of the SSE.

Considering that, in Brazil, the SSE movement is organized in the reticular form, it is imperative to consider it as a network of social movements or, simply, a network of networks (FORTE, 2015).

This is true to the extent that the constitution of the SSE movement took place from the incorporation of the demands of different social movements, making it a larger movement.

Thus, the national SSE movement is a large network composed of other smaller and integrated networks. Hence, it is stated that the national movement in favor of SSE does not have a specific territorial headquarters, being simultaneously connected to several places.

Considering all the nuances, it is necessary to understand that the network movement already includes a wide range of actors, such as non-governmental organizations (NGOs), social movements, religious entities, cooperatives, workers' associations, and technical and financial support institutions.

These actors are connected through forums, conferences, councils and plenary sessions, creating a complex web of relationships that enables the exchange of information, the coordination of actions and the articulation of common demands, of which the following are examples:

- **Solidarity Economy Forums:** These spaces for meeting and debate are crucial for the articulation of the movement. The forums provide an environment where the various actors can discuss challenges, share experiences and build consensus on the strategies to be adopted. Examples include the Brazilian Forum on Solidarity Economy (FBES) and regional and local forums.
- **Conferences and Plenaries:** Large-scale events such as national and state SSE conferences allow for the mobilization of a wide range of participants, facilitating collective deliberation and the formulation of concrete proposals for public policy. These conferences are important moments for defining priorities and evaluating the actions of the movement.
- **Solidarity Economy Councils:** These councils, formed by representatives of civil society and the government, act as institutional spaces for dialogue and cooperation. They play a fundamental role in the elaboration, implementation and monitoring of public policies aimed at the Social and Solidarity Economy.
- **Support and Promotion:** Entities such as Caritas Brasileira, the Marist Institute of Solidarity (IMS) and other organizations provide technical, financial and educational support to social and solidarity economy enterprises, strengthening their operational and management capacities.
- **Advocacy and Political Incidence:** The Social and Solidarity Economy network employs advocacy strategies to influence the political and legislative agenda, seeking to create a legal framework favorable to the social and solidarity economy. The proposal for Law No. 4,685/2012 is an example of how these strategies can lead to the institutionalization of the Social and Solidarity Economy as a national public policy.

It should also be noted that the SSE network is not restricted only to the physical dimension, as the virtual universe, especially from the democratization of access to the *internet*, has complex ways of information and articulation, disseminating and sharing a

political project to an increasing number of recipients, located anywhere in the world (FORTE, 2015).

From the concept of social movement network, the SSE movement should be assumed as something of a collective dimension, although diffuse, marked by the constant interaction of civil society and the State in public spaces, whose objective to be pursued is the institutionalization of SSE, through social and legal regulation.

It is, therefore, a process of an eminently sociopolitical nature.

3 THE ENTREPRENEURIAL ECOSYSTEM IN THE SOCIAL AND SOLIDARITY ECONOMY

The SSE is composed of a multiplicity of organizational forms, each involved in a specific context, with its own dynamics, seeking to address motivations from the most varied origins.

Cooperatives, mutual societies, associations, social enterprises, third sector organizations and informal groups are some of the entities that, depending on the context, can integrate the "sector" of the SSE, although the SSE is not restricted to them.

Specifically in the Brazilian scenario, there is no consensus regarding the term SSE, nor regarding the entities that compose it, which is largely due to the existence of a normative vacuum⁵, despite the growing economic and social strength of this social-economic segment (MORAIS; BACIC, 2019).

As SSE is marked by conceptual and theoretical uncertainties, it was sought, in the doctrinal field, to establish a set of minimum criteria to determine whether or not an entity is part of the SSE field.

According to Moraes and Bacic (2019), the criteria are⁶: i) social mission; ii) limited or prohibited distribution of surpluses; iii) presence of salaried and/or volunteer employees; iv) the organization's decision-making process; and v) existence, or not, of "democratic governance".

The SSE entities represent, therefore, a paradigm of economic and social development whose core value is the human person, not capital, with an emphasis on social justice and sustainability.

⁵ Bill No. 137, of 2017, authored by the Chamber of Deputies, is pending in the Federal Senate, which provides for the National Policy of Solidarity Economy and solidarity economic enterprises, creates the National System of Solidarity Economy and provides other provisions. The last progress of the Project took place on 12/18/2019.

⁶ The option to indicate these - and not other - criteria stems from the choice of the work of Moraes and Bacic (2019) as the main theoretical reference. There are authors who choose different criteria, such as Silva & Carneiro (2016) and Silva (2018) – among others.

In this sense, the purpose of these entities is to generate employment and income, especially for those who are on the margins of the traditional form of economic organization.

The ESS is, therefore, an innovative alternative for generating work and income in favor of socio-labor inclusion.

The definition of the criteria that characterize entities that are part of the SSE also serves as a starting point for measurement and mapping studies, the results of which allow the development and evaluation of public policies, in addition to increasing the visibility of the SSE.

It is not disputed that quantification and evaluation are essential to obtain an adequate understanding of SSE, its place and its role. For some, the statistical study of SSE is a topic of marked relevance in the twenty-first century (MORAIS; BACIC, 2019).

From this context, the expression Solidarity Economic Enterprises (EES) was coined to designate a portion of the entities that meet, in the real economic dynamics, the criteria that characterize the ESS.

Despite their aggregating potential from an economic and social point of view, EES are marked by structural weaknesses that are intrinsic to their *modus operandi*.

The low competence profile of the social entrepreneur is one of the great weaknesses of the EES (BACIC, 2014).

The social entrepreneur, contrary to what is usually observed in entrepreneurs dedicated to private enterprises, has levels of formal education and previous experience that are insufficient to perceive the business opportunity and to define the way to exploit it.

In the process of social and solidarity entrepreneurship, the combination of efforts between two or more would-be entrepreneurs is not due to one of them having, based on the degree of education and/or previous work experience, perceived an opportunity, evaluated all aspects related to the viability of the business (technology, market, suppliers and costs) and formatted a business plan.

The candidates for social and solidarity entrepreneur come together, in fact, due to the mutual absence of the prospect of insertion in the formal labor market, leaving them with no other income option than the EES.

The lack of skills, combined with the disjointed network of pre-existing relationships of these entrepreneurs, induces the definition of businesses in a generic way - recycling, handicrafts, sewing and food, for example -, attracting strong competitive pressure, which leads to a drop in prices and low withdrawals (BACIC, 2014).

The EES should not be restricted to the development of simple activities that are dislocated from the local productive fabric; it is necessary that there be an articulation in order

to effectively integrate the EES into the local productive fabric, through the promotion of innovative actions.

Added to the scenario of low qualification of entrepreneurs is the fact that there is an inherent difficulty in learning to work in groups and assimilating elementary notions of management, technology and, in many cases, even citizenship.

That is to say that the existence of the EES has as a prerequisite skills and resources that are not within the reach of most people who participate or intend to participate in self-management groups (MORAIS; BACIC, 2019).

To the extent that the improvement of the competencies of the social entrepreneur occurs concomitantly with the exercise of the economic activity itself, it is credible to say that this is a necessarily long process, which demands intense institutional support, in the short, medium and long term, at the municipal, state and federal levels.

And it is precisely in institutional support – or lack of it – that lies another great weakness inherent to the EES.

The main symptom of the absence of institutional support is the lack of articulated public support policies. This is to say that there are no coordinated, integrated and transversal actions around the EES in Brazil, which puts initiatives in favor of work, employment and income in danger of extinction (MORAIS; BACIC, 2019), which is largely attributable to the normative vacuum and conceptual imprecision that permeates SSE.

Public policies – made possible by the interaction between different interest groups – are one of the essential pillars on which the ESS are established and strengthened.

As a segment that is part of the economic dynamics, EES are subject to the effects, positive and negative, of economic variants, at the micro level – supply and demand, production costs, among others – and macroeconomic – interest rates, tax incentives, among others.

This is to say that, depending on the circumstances, the mood of the market and the economy can also be another challenge posed to the creation, development and survival of the EES.

Well. The first step in overcoming an obstacle is to understand its causes, and this is reasonably delimited in the universe of EES.

Following the stage of mapping the causes, the assimilation that the confrontation of the weaknesses intrinsic to the *modus operandi* of the EES is closely related to the notion of efficiency of these enterprises, that is, the capacity for preservation and consolidation as a result of their own functioning (GAIGER, 2008).

In other words, the efficiency of the EES must be measured based on the ability to generate and maintain conditions of viability, in the medium and long term, which requires a series of coordinated actions, such as, for example, economic and financial self-sufficiency, investment capacity, productive increase, among others.

In this sense, it is understood that the formation of the entrepreneurial ecosystem for the SSE is a fundamental piece for the emancipation of the EES, as it provides the organized confrontation of the weaknesses that are intrinsic to them (MORAIS; BACIC, 2019).

A limitation to this proposal is the fact that there is, among the leaders of the EES, a certain resistance to discussing more strictly economic and financial issues, entering the framework of capitalist rationality (BACIC, 2014).

The isolationist view of the EES tends to be short-sighted, to the extent that it is not possible to conceive of a society in which there are no relations of exchange and economic activity among its actors.

For this reason, the term "entrepreneurship" must be revived within the scope of the SSE, seeking to adapt it to the needs of an "associative entrepreneurship", typical of the EES, for which the following are necessary: cooperation at work, collective decisions, exchange of information and collective project (MORAIS; BACIC, 2019).

Well. An entrepreneurial ecosystem in general is a community within a region of interdependent actors, with diverse roles that interact, determining the performance of the ecosystem and, eventually, of the entire economy of a region (MORAIS; BACIC, 2019).

From the interactive dynamics of an entrepreneurial ecosystem, it is expected, in addition to the evolution in terms of organization and learning of the companies that compose it, the generation of new companies, whose creators are attracted by an environment, from the economic and technological points of view, favorable.

For Serrano (2015), ecosystems are "networks of actors" (entrepreneurs, researchers, financiers, politicians – executive and legislative, etc.) that take into account the physical-territorial and cultural dimensions of a given territory.

The relationships between these actors, in turn, can be i) of a political nature (such as alliances between the social and political actors that constitute the basis of territorial governance); ii) production (creation of EES networks); and iii) connections with innovative purpose (groups of actors that create the necessary conditions for the generation and dissemination of social innovation).

The elements of an entrepreneurial ecosystem are allocated to one of the following networks: the informal network, composed of friends, colleagues, family and entrepreneurs

in a similar situation; and the formal one, made up of a diversity of actors, from research universities, through government support services, to capital providers.

In the lessons of Morais and Bacic (2019), the elements of the formal network are i) research universities, due to the potential to develop technologies and combine knowledge; ii) government, by fostering the entrepreneurial environment; iii) network of services and support, by offering a set of professional services to support entrepreneurs; iv) sources of capital, through the facilitated granting of credit; v) human talents, as they are the origin of any enterprise; vi) constituted companies, as they are often the places where entrepreneurs acquire skills and experience; and vii) incubators, for the support to nascent companies.

The task of building an entrepreneurial ecosystem is complex in itself, given the systemic and dynamic degree of this concept.

Within the scope of SSE, the complexity intensifies and gains its own contours, in view of the structural weaknesses inherent to this segment and the lack of institutionalization of its policies (MORAIS; BACIC, 2016).

In this sense, based on the structure of the entrepreneurial ecosystem for business-based enterprises, it is understood that an adequate organization of the solidarity entrepreneurial ecosystem must contain, at least, the following elements: i) knowledge; (ii) market access; iii) public and fiscal support for ESS startups; iv) access to finance; (v) network support and mutual support instruments; vi) development of research and qualification in the area; and vii) indicators for the evaluation and monitoring of EES (MORAIS; BACIC, 2019).

One of the ways for the coordinated application of these elements is the combination of efforts and responsibilities of shared construction between the EES, academia and government, through public policies.

The joint action of these three actors can be better understood from the "Triple Helix" model.

When dealing with the relevance of EES, academia and government in structuring the solidarity entrepreneurial ecosystem, it is necessary to consider that:

In order for the treatment of ecosystems to be shown as a viable approach for the planning and strategic management of entrepreneurship, it is important to present the reasons that make the triple helix a predominant view and practice and, at the same time, to suggest what its main limits are (LEMOS, 2011).

The main reasons that position the Triple Helix model at the center of the construction of the entrepreneurial ecosystem in the SSE are: i) the combination of economics and sociological content of innovation systems; ii) direct application to public policies; and iii)

facilitation of the process of planning, management and execution of these policies (LEMOS, 2011).

The capacity for transversal articulation and interactions between its actors evidences the vocation of the Triple Helix model to promote "coevolution", that is, the member organizations can interact with their ecosystems and the ecosystems interact with the organizations, both at the micro and macro levels (MORAIS; BACIC, 2019).

This is a key concept in the development of the ecosystem perspective.

Coevolution is directly proportional to the degree of interconnectedness of the ecosystem, that is, the interdependence that all components of the system have with each other.

In this sense, actors with less social and economic expression can benefit from the inputs generated by more expressive actors, without having to produce these inputs themselves. It is to say that some actors function as true platforms for others (LEMOS, 2011).

The weakening or disappearance of these key actors greatly impacts the ecosystem, in some cases even fatally.

It is concluded, therefore, that the emancipation of the EES through the solidarity entrepreneurial ecosystem is completed with the application of the Triple Helix model, which subsidizes the process of construction of public policies among the agents involved in such a task.

This is the basis for the regulation of SSE in Brazil, a topic that will be addressed in the following chapter.

4 THE REGULATION OF THE SOCIAL AND SOLIDARITY ECONOMY IN BRAZIL

SSE, as already explained, comprises economic and social practices whose purpose is the production of goods, the provision of services, solidarity finance, exchange, fair trade and/or solidarity consumption.

The multiplicity of objectives for which the entities participating in the SSE develop their activities demands an equally transversal and integrated character of the public policies that regulate them (MORAIS; MENEZES, 2018).

The ESS can combine, in their actions, economic (work and income), social (conditions of sociability), political (public spaces for discussion), cultural (production and consumption patterns) and environmental (sustainability) objectives, all integrated or pursued separately.

The presence of the SSEs in the national scenario can be measured by the numbers of the mapping carried out and published in "The Solidarity Economy in Brazil: an analysis of national data", under the coordination of Gaiger (2014).

The mapping, at the time of the survey, identified that there were 19,708 ESS and 1,423,631 associates, allocated mainly in the Northeast region (41%) and in the rural area (55%) and organized predominantly in the form of associations (60%).

If the EES have this presence and mobilize different areas of public and social action, it must be considered that public policies in favor of SSE must capture and address this particularity, even if it is a task far from simple.

Hence, there is a need for public policies to be endowed with the attributes of transversality and intersectoriality, whose roots are in the process of joint and integrated construction between the main agents involved: the government, academia and the EES.

In the current Brazilian conjuncture, however, public policies endowed with transversality and intersectoriality are far from being a reality, in view of the lack of full articulation between the agents involved, at different levels, for numerous reasons (FRANÇA FILHO, 2006).

Making the task of idealizing and implementing public policies even more difficult is the fact that there is no consensus on the term ESS, despite the fact that it is an expressive and growing economic and social phenomenon.

In retrospect, the beginning of the institutionalization of SSE in Brazil has as a formal milestone the creation, in 2003, of the National Secretariat of Solidarity Economy (SENAES), which is the result of social and political movements prior to its creation (MORAIS; BACIC, 2019).

The creation of SENAES was followed by several institutional initiatives in favor of the regulation of the ESS, especially at the municipal and state levels, such as, for example, the creation of the Parliamentary Front for the Solidarity Economy.

In line with the regulatory agenda, Decree No. 5,811, of June 21, 2006, promoted the structuring of the National Council of Solidarity Economy (CNES), a body linked at the time to the extinct Ministry of Labor and Employment and whose purpose is to conduct dialogue and seek consensus around policies and actions to strengthen the ESS.

The CNES, through the National Conferences of Solidarity Economy, offers a privileged space for constant dialogue between interested agents, which greatly contributes to the emergence of public policies in favor of SSE.

At the same time, SENAES, based on the Solidarity Economy in Development Program, was gradually inserted into the Federal Government's Multi-Year Plans (2004-2007;

2008-2011; 2012-2015), highlighting a promising beginning of the process of institutionalization of the public policy of SSE in the country (MORAIS; BACIC, 2019).

More recently, in 2017, an important step was taken towards the institutionalization of the public policy of SSE in Brazil, with the approval, by the Constitution and Justice Commission (CCJ) of the Chamber, of Bill No. 4685/12, which creates the National System of Solidarity Economy.

It is noteworthy, however, that the institutional regulation agenda of the SSE goes far beyond the existence of a legal framework - which is extremely relevant, but does not exhaust the theme (MORAIS; BACIC, 2019).

SENAES, so relevant at the beginning of the institutionalization process, was the object of a cruel and systematized dismantling, which operated more intensely from 2016 onwards, moving in an illogical way from one ministry to another, leaving resources, personnel and infrastructure in the way.

Without forgetting the importance of implementing institutional initiatives and projects, it is equally relevant to develop effective mechanisms for evaluating and monitoring such public policies, otherwise it will not be possible to assess their accuracy.

And this is precisely one of the obstacles to the structuring of a coherent and robust institutional framework of public policies in Brazil (BACIC, 2014).

Transporting the analysis to 2024, the website of the Brazilian Federal Government (portal Gov.br) presents 20,662 registered Solidarity Economic Enterprises, benefiting, theoretically, about 1.423 million people⁷.

If a numerical comparison of the number of registrations is drawn between 2014, given from Gaiger's mapping, and 2024, there is a high quantitative proximity and no variation in the number of people involved.

From this observation it is possible to extract, among others, some hypotheses of analysis: i) SSE did not develop in Brazil; ii) the Government's control systems are unreliable; iii) there is no political and economic interest in the promotion of SSE.

The realization of the National Registry of Solidarity Economic Enterprises – CADSOL is a unilateral, declaratory and voluntary act to obtain a declaration that a certain enterprise fits the characteristics of the Social Solidarity Economy; There is no active identification check in a structured way.

Other areas of the Government Portal related to the Popular Solidarity Economy do not even have data to be published, for example, the description of the ministerial

⁷ Data found in <https://www.gov.br/trabalho-e-emprego/pt-br/assuntos/economia-solidaria>. Accessed on 07/09/2024.

performance⁸. Likewise, there is no information about Public Notices and Calls, Institutional Partnerships, Social Participations, Agenda.

Another important fact is that the management is inserted in the Ministry of Labor and Employment, through the National Popular and Solidarity Secretariat – SENAES.

In addition, as informed above, the legislative discussion on the legal framework of the Social Solidarity Economy in Brazil, through Bill No. 6606/2019 that replaced PL 4685/2012, is still awaiting a vote by the Plenary of the House, having obtained a close vote, on 11/22/2023 in the Constitution and Justice and Citizenship Commission (CCJC) with 31 "Yes" votes and 25 "No" votes.⁹

The analysis of all these elements presented reveals minimally the lack of political and economic interest for the promotion and organization of the economic sector of the social and solidarity economy.

Understanding the process of regulation of the social and solidarity economy in Brazil indicates that there is still a long way to go, in which the applicable normative framework must be concluded; the performance of the agents involved must be improved, recognizing the limitations and specificities of the EES; the implementation of coherent public support policies; and the creation of evaluation and monitoring indicators (MORAIS; BACIC, 2019).

International experience can provide guidelines for the intricate Brazilian journey to be successful; theme for the next chapter.

5 PUBLIC POLICIES AND INTERNATIONAL EXPERIENCES

Although French associationism and English cooperativism are recognized since the beginning of capitalism, the social economy as it is known today gained strength after the 60s and 70s, with the crisis of Fordism, the decline of full employment and the purchasing power of workers.

In Europe, two important elements have contributed to the development of SSE: the crisis of values and the crisis of wage employment. With the advance of capitalist modernity, European society began to question the economic model, pleading for alternative forms that would bring a special look to relevant social issues, such as the preservation of the environment. No less important, the unemployment of workers inserted in a capitalist society,

in which the sale of their labor is responsible for their subsistence, imposes on society the search for alternatives that allow the dignity of work for all individuals. (SANTANA, 2007)

Thus, the transformations of the capitalist model caused cracks in its system, allowing society to organize itself in new forms of survival.

In view of the irreversibility of the system, the organization to support the socially and economically excluded from the traditional market as well as to preserve the values rejected by the capitalist model, the social economy has gained space, including in the public policies of the State.

França Filho (2001) reports that, currently, SSE in Europe can be identified through the following practices: fair trade, solidarity finance, cashless economy, social enterprises, solidarity economic organizations and reference organizations.

Fair trade seeks to regulate relations between the global North and South (at this point, consumers) in a more equitable way, prioritizing trade relations with small producers organized in cooperatives.

Solidarity finance aims to allow access to bank credit to individuals who, due to the absence of formal income or guarantees required by banking institutions, would not raise credit for the development of their activities.

About solidarity finances, França Filho (2001) argues that

"In addition to a question of democratizing access to credit, it is also (and above all) a concern with the so-called social utility of the financial investment that is at stake, guiding this field of initiatives. Thus, with these experiences, it is a matter of affirming a purpose of ethical application of money in the direction of those projects, articulating, for example, a work of fight against exclusion, environmental preservation, cultural action, local development, etc."

In Europe, small financial institutions are identified aimed at providing social credit, that is, they aim to make resources available to individuals or small companies that, in the traditional market, would not be approved to obtain financing. As an example, *Triodos*, a Dutch company, investor in wind farms and which finances 25 (twenty-five percent) of its country's organic food. Germany, Switzerland, Belgium and England, together with the Netherlands, are countries traditionally known for providing financial institutions with a solidarity character to society. (FRANÇA FILHO, 2001)

The cashless economy, in turn, is the practice in which economic movement takes place through the exchange of goods, without the circulation of formal currency. The Mosaic Monetary Movement (MoMoMo) is an example that can be identified in several countries, and

which aims to foster this practice as an important movement for economic inclusion. (SANTANA, 2007)

França Filho (2001) highlights, as fundamental characteristics of the cashless economy, including what differentiates it from other practices, its democratic character and its inscription in the public space, which distances it from the oldest forms experienced by society.

Furthermore, social enterprises can be defined as such according to their own form of organization, which, despite being of a private nature, develops activities without the final objective of maximizing profit, but rather other objectives with social and economic purposes protected by the SSE. As examples, Spanish associated work cooperatives, Italian social cooperatives, among others, can be cited.

Once the practices currently identified on the European continent as participants in SSE have been outlined, it is worth highlighting the study "*Social enterprises and their ecosystems: developments in Europe*" analyzed by Morais and Bacic (2019). The study reveals that the advancement of public policies to support the social economy involves the need to overcome numerous obstacles and points out how European countries legally sponsor the social solidarity economy.

The aforementioned study evaluated the development of SSE in Europe considering the aspects of the entrepreneurial ecosystem: (knowledge; access to markets; public and fiscal support for *SSE start-ups*; access to financing; instruments to support networks and mutual support and development of research and qualification in the area).

Considering that SSE is heterogeneous, it was necessary to choose the requirements to identify the practices adopted on the European continent.

The knowledge requirement considers political awareness and the way in which such policies are regulated. It is verified that, in each country analyzed, the institutionalization of public policies follows a format. In the United Kingdom, for example, specific laws are used to support social enterprises, as is done in Spain and Italy. In Bulgaria and Poland, the institutional path was the creation of specific ministries, secretariats or departments.

Access to markets refers to public policies that aim to direct demands to be met by social enterprises. This is the case of directing services offered, in the past, by the Government and which are now performed by private ESS entities. Access to markets was strengthened with the *EU Public Procurement Rules*, signed in 2014, which encouraged the creation and promotion of social enterprises focused on social and health services. As of 2016, for example, 21 Member States of the European Union began to adapt the regulation in their respective national legislation, which denotes the success of the legislation. Also

noteworthy are the Slovak and Italian legislations that brought in their national legislation, demands to be met, exclusively, by social enterprises that contemplated, in their workforce, individuals with physical or mental disabilities.

By analysing public and fiscal support for ESS *start-ups*, despite the heterogeneity of the tax structure, it is possible to identify numerous tax benefits targeted to ESS *start-ups* in Europe. As an example, one can mention Belgium, whose legislation brings a reduction in the social contribution of companies that have social and health services as their activity; France, which promotes tax exemption (VAT) for associations that promote cultural and sports activities, or Spain, which guarantees a tax reduction for social cooperatives.

Another point analyzed by Morais and Bacic (2019) in the study refers to the financing promoted through public policies in the old continent. In this regard, the study revealed, in general, there is a growing increase in financial instruments that support social innovations, such as *social impact bonds*; *social venture capital*; *crowdfunding* or even *impact investing*. Finally, it can be seen that the greatest obstacle to access to financing lies in the absence of financial entrepreneurial skills or even in the ability to develop projects, and it is necessary for States to dedicate projects to enable and professionalize social economy companies to attract investments.

The study also showed that networks and mutual support mechanisms are important elements to give legitimacy to the political regulation of the social economy. As examples, the introduction of public policies such as *Les Scop - network of SCOPs*, in France, *Confcooperative* and *Forum del Terzo Settore*, in Italy and *CEPES* in Spain.

Finally, with regard to the development of research and qualification of the SSE, which aims to encourage the scientific academic study of this economy, its increasing increase was also observed, although it is not measurable, considering the heterogeneity of the theme and the different legislations. The growth of educational and training programs focused on the social solidarity economy was also observed. More than 70 courses on the subject were identified, in addition to an internuversitary network (RIUESS) of professors and researchers specializing in the subject. It is also worth noting that some universities in Italy and Belgium have included in certain courses, disciplines related to the social solidarity economy.

Having made the notes about the contemporary European scenario, we will briefly analyze some solidarity economies located in Latin America.

Although SSE is developed considering the particularities of each country, there is a growing increase in studies and public policies aimed at protecting the development of SSE, as a counterpoint to capitalism.

Santana (2007) cites the Solidarity Exchange Networks and the Global Exchange Network, existing in Argentina, as relevant practices of the cashless economy, protagonists in the local economy during the crisis of convertibility of the peso into dollars, which occurred at the beginning of the twenty-first century. Also noteworthy is the National Movement of Recovered Companies (MNER), led by the Workers' Central in Argentina (CTA), which gained importance in the face of the failure of the neoliberal policies implemented in the country.

Waste recycling cooperatives are successful examples that can be seen in several Latin American countries. The *NASA project* in Colombia, awarded by the United Nations, brings together approximately 300,000 people, equivalent to 1% of the country's population. (LAVILLE, 2012)

The studies presented demonstrate that SSE is necessary within the capitalist system and aims, in the dignity of the work offered to the socially or economically excluded, to reduce the poverty resulting from the capitalist system.

6 CONCLUSION

The Social and Solidarity Economy faces a challenging scenario and, especially in Brazil, is marked by the absence of a clear definition and a specific regulatory framework. The lack of structural and organic organization as a government policy

This lack of consensus and regulation prevents the full development of entities in the sector, limiting their access to financial resources, tax incentives and institutional support. However, SSE continues to play a crucial role in promoting a more inclusive and sustainable economy, offering alternatives to traditional economic models and generating employment and income for those on the margins of the formal economy.

The diversity of organisational forms and interpretations of SSE principles and values reflects the richness and complexity of the field, but also highlights the need for a clearer and more cohesive understanding. The definition of criteria to identify and categorize SSE entities is an essential step towards the recognition and strengthening of the sector. These criteria should take into account not only the principles and values that guide the entities, but also their socioeconomic practices and impacts.

The regulatory vacuum that characterizes the SSE scenario in Brazil creates uncertainties and limits the growth potential of entities in the sector. The creation of a legal and institutional framework that recognizes and supports SSE is fundamental for its sustainable development, within the legal certainty necessary for long-term development. Specific public policies, adequate financing mechanisms, and training and professionalization programs are key elements for strengthening SSE.

The analysis of the existing literature on SSE in Brazil reveals that the lack of consensus on the definition of the sector is closely linked to the diversity of criteria used to identify and categorize entities. This multiplicity of approaches reflects the different visions and priorities of the various actors involved in the field of SSE. However, for SSE to reach its full potential, it is necessary to build a more cohesive and integrated understanding, which takes into account both the principles and values that guide the entities and their socioeconomic practices and impacts.

Ultimately, the strengthening of SSE in Brazil depends on a continuous political and economic commitment, aimed at creating favorable conditions for the sustainable and inclusive development of entities in the sector. The implementation of specific public policies, the development of appropriate financing mechanisms, the empowerment of members of SSE entities, and the promotion of a culture of collaboration and innovation are essential to fully harness the transformative potential of SSE.

ABSTRACT

Forensic toxicology applies scientific knowledge to identify and analyze toxic substances in legal and public health contexts, and is fundamental to combating drugs of abuse. These include legal substances such as alcohol and tobacco, and illegal substances such as cocaine, derivatives like crack, and new psychoactive substances (legal highs), which have serious consequences for health and society. The objective of this scientific study was to review the contributions and updates of forensic toxicology, highlighting its importance for public health and justice. The methodology involved a literature review in databases such as PubMed and LILACS, considering studies from the last 20 years and focusing on techniques and advances in the field. Forensic toxicology has evolved since the 19th century, with the development of methods such as chromatography and mass spectrometry, which allow for precise analyses in biological matrices such as blood and urine. Techniques such as immunochromatography have demonstrated efficiency in drug screening, while information systems monitor cases of intoxication and underreporting. The analysis of crack cocaine, for example, highlights its devastating impact and the importance of rigorous methods such as thin-layer chromatography. Controlling new drugs requires international collaboration and dynamic legislation. Forensic toxicology is considered essential for monitoring substances, identifying consumption patterns, and informing public policies, being indispensable for addressing the problem of drug abuse and protecting the health and safety of society.

cocaína, derivados como o crack e novas substâncias psicoativas (legal highs), que têm consequências graves para a saúde e a sociedade. O objetivo deste estudo científico foi revisar as contribuições e atualizações da toxicologia forense, destacando sua importância para a saúde pública e a justiça. A metodologia envolveu uma revisão bibliográfica em bases como PubMed e LILACS, considerando estudos dos últimos 20 anos e focando em técnicas e avanços no campo. A toxicologia forense evoluiu desde o século XIX, com o desenvolvimento de métodos como cromatografia e espectrometria de massa, que permitem análises precisas em matrizes biológicas como sangue e urina. Técnicas como imunocromatografia demonstraram eficiência na triagem de drogas, enquanto sistemas de informação monitoram casos de intoxicação e subnotificação. A análise do crack, por exemplo, destaca seu impacto devastador e a importância de métodos rigorosos como a cromatografia em camada delgada. O controle de novas drogas requer colaboração internacional e legislações dinâmicas. Considera-se que a toxicologia forense é essencial para monitorar substâncias, identificar padrões de consumo e subsidiar políticas públicas, sendo indispensável para enfrentar o problema das drogas de abuso e proteger a saúde e a segurança da sociedade.

RESUMEN

La toxicología forense aplica el conocimiento científico para identificar y analizar sustancias tóxicas en contextos legales y de salud pública, y es fundamental para combatir las drogas de abuso. Estas incluyen sustancias legales como el alcohol y el tabaco, e ilegales como la cocaína, derivados como el crack y las nuevas sustancias psicoactivas (drogas legales), que tienen graves consecuencias para la salud y la sociedad. El objetivo de este estudio científico fue revisar las contribuciones y actualizaciones de la toxicología forense, destacando su importancia para la salud pública y la justicia. La metodología implicó una revisión bibliográfica en bases de datos como PubMed y LILACS, considerando estudios de los últimos 20 años y centrándose en las técnicas y avances en el campo. La toxicología forense ha evolucionado desde el siglo XIX, con el desarrollo de métodos como la cromatografía y la espectrometría de masas, que permiten análisis precisos en matrices biológicas como la sangre y la orina. Técnicas como la inmunocromatografía han demostrado su eficacia en el cribado de drogas, mientras que los sistemas de información monitorizan los casos de intoxicación y el subregistro. El análisis del crack, por ejemplo, pone de relieve su impacto devastador y la importancia de métodos rigurosos como la cromatografía en capa fina. El control de nuevas drogas requiere colaboración internacional y una legislación dinámica. La toxicología forense se considera esencial para el monitoreo de sustancias, la identificación de patrones de consumo y la fundamentación de políticas públicas, siendo indispensable para abordar el problema del abuso de drogas y proteger la salud y la seguridad de la sociedad.

Palabras clave: Toxicología Forense. Abuso de Drogas. Salud Pública.

1 INTRODUCTION

Forensic toxicology is defined as the application of toxicology for the purposes of the law, in turn, toxicology, itself, is the study of toxicants. These definitions are, in fact, quite broad, and the most common application of forensic toxicology is the identification of substances that could be involved in deaths or damage to the health of individuals or be the cause of damage to property and the environment. There are reports of the use of drugs by man since very ancient times, but until the Renaissance it was very difficult, perhaps impossible, to prove poisoning by scientific evidence. It was only in the nineteenth century that forensic toxicology emerged as a science and contributed to justice in these cases (Dorta, 2018).

However, there are reports of toxicological knowledge applied to the legal environment since ancient Greece and ancient Rome, bringing some contribution to poisoning crimes, which became commonplace at that time. Thus, scientific knowledge in chemistry, physics and biology was used as a decisive tool in the investigation of issues related to the judiciary and the evolution of this knowledge promoted union, with the development of methods and techniques that reach reliable results in their analyses. Contrary to the imaginary formed, the routine of the forensic toxicologist is not limited to laboratories, often, the forensic work begins or even takes place in external locations, where the conditions found are totally different from a controlled environment (Lopes, 2022).

Regarding the drugs of abuse, these are psychoactive substances from various natural or synthetic compounds that act on the nervous system, generating changes in the functions that regulate thoughts, emotions and behavior. There is legislation for the control and inspection of these toxics, whether for recreational use such as alcohol or tobacco; for pharmacological use, such as opioids or other analgesics; or for general use, such as industrial solvents. There is also the group of illicit drugs, restricted only to medical or research purposes, as is the case of cocaine and its derivatives. These substances lead to various organic consequences to organs and systems of the human body, either in the short term with intoxication or in the long term with chronic organic lesions, in addition to predisposing to risky sexual behaviors and dependence. Addiction disorder is characterized as an intense need for the substance and loss of the ability to control its consumption, in addition to adverse consequences on health status or interpersonal, family, academic, professional, or legal functioning (PAHO, 2022). Between 2010 and 2020, there was a global increase in the consumption of drugs of abuse, becoming a serious public health problem, with an increase in the consequences already mentioned, such as intoxication and dependence, and Brazil was no different from this pattern (Soares, 2021).

In this context, forensic toxicology plays a crucial role in the fight against drugs of abuse, being an area of science that applies chemical and biological principles to identify toxic substances and their effects on the human body, often in legal or criminal contexts. With regard to drugs of abuse, it is essential to detect and quantify these substances in biological samples, such as blood, urine, hair and tissues, helping to clarify cases of intoxication, overdose, accidents or even suspicious deaths. The confrontation permeates the legal field, having direct impacts on public health through accurate analyses, it provides essential data for monitoring the use of illicit drugs, assisting in the elaboration of public policies aimed at preventing and combating them. Based on this holistic view, the importance of the intersection between forensic toxicology, drugs of abuse, and public health is understood. Therefore, the objective of this scientific manuscript is to study and review the role, contributions and updates of forensic toxicology in the face of drugs of abuse and public health. The justification for the elaboration of this bibliographic review is based on the fact that this theme is a modern and relevant agenda in Brazil and in the world, as well as an object of study in different sectors of society and sciences, with gaps yet to be filled, as this study proposes to do.

2 DEVELOPMENT

2.1 FORENSIC TOXICOLOGY

Toxicology is the science that has the function of identifying and quantifying the adverse effects related to exposure to certain agents, called toxicants, which can be organic or inorganic chemical substances. Since ancient times, the elucidation of deaths associated with chemical substances was a concern, however, the toxicologist Mateu Josep Bonaventura Orfila i Rotger (1787-1853), was the first to relate autopsy material with chemical analysis, bringing to light cases of poisoning that had a legal nature, adopting new methods of forensic analysis. From this perspective, forensic toxicology aims to detect and quantify toxic substances, until the twentieth century, it was restricted to identifying the toxic origin of a certain crime, currently this science acts both on the corpse to detect overdose, anaphylactic reaction to drugs, and on the living individual, to trace drugs of abuse and characterize a state of drug dependence (Castelari, 2018; Dorta, 2018).

In this context, forensic toxicological analyses stand out, which are the investigation of compounds of forensic interest, with special emphasis on drugs of abuse, in various biological matrices such as blood, urine, hair, oral fluid, sweat, vitreous humor and meconium. The particular characteristics of each matrix determine which preparation techniques are required, with their advantages and limitations. For example, the techniques that stand out are: protein precipitation, liquid-liquid extraction, solid-phase extraction, extraction with disposable tips,

solid-phase microextraction, and *headspace extraction*. Each method is evaluated for efficiency, cost, sensitivity, selectivity, and environmental impact (Bordin, 2015).

Forensic toxicology has an interdisciplinary role in criminal investigations and judicial proceedings, highlighting its importance in the identification, detection and quantification of chemical substances or toxic elements present in biological matrices *ante mortem* or *post mortem*. The complexity of this area is highlighted, given the diversity of substances, the particularities of the biological matrices used and the chemical phenomena that can influence the results, such as *post-mortem* redistribution, in addition, the importance of rigorous procedures from collection to analysis is reinforced to ensure the reliability of the evidence, including conservation, identification in order to reach a chain of custody of the samples (Oliveira, 2023).

2.2 DRUGS OF ABUSE

Drugs of abuse refers to any licit substance, with an emphasis on alcohol and tobacco, or illicit substance associated with dependence, which corresponds to a pattern of use that corresponds to a pattern of use that leads to suffering of any kind, possibly associated with withdrawal or other symptoms. Alcohol and tobacco are the most widespread and socially accepted substances of abuse, one of the reasons is their legal nature, however they are considered initiation drugs and one of their negative effects is to increase the risk of illicit drug use. The use of drugs of abuse has been socially accepted for thousands of years, however, since the twentieth century, unrestricted use has become a global public health problem. Illicit drugs are also prevalent in the world's adult population, another important issue, it is estimated that about 5% of the world's adult population used some illicit drug in 2015. There is also the emergence of new drugs of abuse, an expanding market, with greater powers, which is accompanied by greater side effects such as intoxication and even fatal events (Soares, 2021).

The Pan American Health Organization (PAHO) warns about substance abuse, highlights that the use of psychoactive substances, such as alcohol, tobacco, illicit drugs and medications, can cause dependence, physical and mental health problems, as well as significant social impacts. Evidence-based interventions are key to preventing use, treating addiction, and minimizing harm. PAHO promotes integrated approaches and public policies to reduce the public health impact of substance abuse (PAHO, 2022).

Drugs of abuse are chemical substances that are harmful to health, representing a modern public health problem, despite being present in history practically since its beginnings. Therefore, they are controlled worldwide. Despite its historical and cultural use,

consumption worries authorities, especially in Europe and among young people, due to the impact on public health. The rapid emergence of new substances challenges forensic toxicology laboratories, which analyze drugs such as opiates, cocaine, amphetamines, and cannabinoids, preferably in blood (Silva, 2020).

2.3 FORENSIC TOXICOLOGY AS A TOOL TO COMBAT DRUGS OF ABUSE

Forensic toxicology is a fundamental science in the fight against drugs of abuse, as it allows detecting, identifying, and quantifying chemical substances in biological matrices such as blood, urine, and tissues. This area is essential for criminal investigation, but also for public health issues, collaborating with the creation of public policies and knowledge relationships (Silva, 2020).

Studies explore the use of enzyme immunoassays in the detection of psychoactive substances in biological matrices in the forensic context. The technique, widely used for urine, faces challenges when adapted to whole blood, due to the complexity of the matrix. The study investigated the efficacy of liquid-liquid extraction and subsequent analysis in the EMIT® system for different xenobiotics, including cocaine, benzodiazepines, amphetamines, barbiturates, opioids, and cannabinoids. The results indicated the feasibility of the method for most substances, except for cannabinoids, where there were limitations in detection. The affordable cost and the precision achieved (coefficient of variation less than 11%) show the potential of the technique for small and medium-sized laboratories, having the potential to benefit on a public scale (Fukushima, 2009).

Another technique explored was the use of immunochromatography, used as a screening technique for the analysis of drugs of abuse in the context of forensic chemistry. In a Brazilian study, the technique was applied to samples of marijuana, cocaine, and ecstasy pills seized by the Civil Police of Minas Gerais (Pinto, 2015). Results showed high sensitivity (94%) and specificity (75%) for cocaine and marijuana, while ecstasy pills showed a high rate of false positives due to the presence of analogous substances. Thus, immunochromatography proved to be efficient, especially for cocaine, as a complementary alternative to colorimetric tests (Borges, 2013; Pinto, 2015).

Studies highlight the role of forensic toxicological analysis in the detection of drugs of abuse, highlighting the use of chemical techniques as a fundamental tool for justice and public health. Methods such as chromatography and mass spectrometry are presented, widely used in laboratories to identify and quantify chemical substances in biological and non-biological samples. The application of these contributes to criminal investigations, control of illicit substances, and combating trafficking (Mori, 2021). Forensic chemistry as an essential tool

for this function of detecting and combating drugs of abuse is also the subject of another study that exalts the methods of high-performance liquid chromatography and gas chromatography coupled to mass spectrometry, allowing the quantification of drugs such as alcohol, marijuana and cocaine of different biological matrices (Gomes, 2013; Sousa, 2016).

The technique of tandem mass spectrometry coupled to liquid chromatography was explored by a study that sought to identify, as well as quantify drugs of abuse in the urinary biological matrix. The highlight of this technique is its sensitivity and selectivity, allowing the detection of small amounts of drugs in complex matrices. The method can simultaneously identify and quantify 53 types of drugs of abuse, including new compounds, with high accuracy and efficiency. This makes it a valuable tool for areas such as clinical toxicology, forensic toxicology, and occupational testing, allowing for large-scale screening and analysis, with optimized workflow, enabling fast and reliable results (McHale, 2024).

2.4 INTERSECTION BETWEEN FORENSIC TOXICOLOGY, DRUGS OF ABUSE AND PUBLIC HEALTH

Forensic toxicology contributes to the identification of toxicants and their effects on organisms, highlighting their essential role in the legal environment through the elucidation of crimes and in the protection of public health. Forensic toxicology works in cases of poisoning, drug overdose, and other infractions, using scientific techniques for the analysis of biological materials, such as blood, urine, and hair. The science is presented as multidisciplinary, covering areas such as occupational, environmental and social toxicology. Rigorous technical analysis allows for the collection of reliable evidence, which is essential for expertise and support for judicial decisions, being a foundation for public health (Jesus, 2021).

A study entitled "Legal *highs*: a public health problem" focuses on the growth and challenges posed by new psychoactive substances, known as "*legal highs*". These substances are created or chemically modified to circumvent existing legislation, often being marketed as legal alternatives to illicit drugs. Despite this, they present significant risks to public health due to the lack of pharmacological and toxicological studies with a high degree of scientific evidence. The rapid introduction of these substances on the market, facilitated by the internet, makes regulatory control difficult and overwhelms forensic laboratories and health systems. In view of this, the article raises the issue of the need for dynamic and comprehensive legislation, including strategies such as temporary prohibitions and the use of generic clauses that cover entire classes of chemical substances, in addition to the importance of national and international partnerships in order to strengthen the fight against this global problem, with serious repercussions at the level of public health (Honorio, 2014).

One thesis presented the development of an information system in the State of Rio de Janeiro, aimed at the epidemiological analysis of poisoning and chemical exposures, as well as the identification of cases of underreporting, with a view focused on public health. The study comprised 6,370 cases between 2000 and 2004, of which 36.96% were considered positive. The most detected substances were alcohol (66.94%), carbamates (12.85%), caffeine (5.33%), anticonvulsants (3.64%) and analgesics (3.30%). Regarding alcohol, it predominated in age groups over 20 years old and in specific municipalities such as Maricá and Teresópolis, while carbamates and medicines showed varied patterns. The research highlighted significant rates of underreporting, especially in the case of drugs of abuse (up to 100%) (Alves, 2005).

A drug of abuse of paramount importance in public health in Brazil is crack, a study addressed the impacts of crack on health and society, with emphasis on the role of forensic toxicology in the identification and analysis of such drug. Crack, derived from cocaine, is consumed through smoke inhalation, which provides intense and rapid effects, but of short duration, stimulating dependence. This drug causes severe damage to the central nervous system and the body as a whole, in addition to exacerbating social problems. At the Botucatu Institute of Criminalistics, preliminary tests, such as the Modified Scott Test, and definitive methods, such as thin layer chromatography, are used to identify crack. In addition, the scientific work reinforces the importance of appropriate therapeutic approaches in the treatment of addiction as a way to mitigate the social impacts of crack (Caccia, 2023).

3 METHODOLOGY

It is a literature review according to a protocol previously written at the beginning of the review, leading to a bibliographic search, carried out in a systematic way of the existing literature on the subject of research.

To prepare the research question, the mnemonic PCC (P - population/participants, C - concept and C - context) was used: "Contributions and updates of forensic toxicology in the face of drugs of abuse and public health?".

Regarding the eligibility criteria, he was guided by the mnemonic itself. The study population was individuals who used drugs of abuse, and the study was *before or after mortem*, for medical or forensic purposes. The concept was based on studying drugs of abuse from the perspective of forensic toxicology, seeking to understand the role of this science in this public health problem, as well as its recent contributions, since chemical substances are often related to public health problems such as this, but in other contexts such as traffic accidents, sexual abuse, among others. The context was limited to studies published in the

last 20 years, which contemplate research on drugs of abuse, relating them to forensic toxicology and public health, providing a panoramic view of this important issue.

This literature review considered primary studies (original research) and secondary studies (systematic and non-systematic reviews) published or unpublished in national and international portals, repositories, and databases. Duplicates, non-full-text studies, and abstracts published in event proceedings were not considered.

The search strategy began with the identification of controlled descriptors (Mesh and DeCs) and non-controlled descriptors, designed from the keywords of the search question, used for the construction of the initial search strategy, combined or not, such as "Drugs of abuse", "Abuse drug", "Drug of abuse", "Forensic toxicology", "Forensic toxicology", "Public health", "Public health", among others. Through practical experience, the syntax was refined and the search strategies adapted to each database or data repository used. In the PubMed database, based on syntaxes and filters, a number (n) of 23 was found. In the LILACS database, based on syntaxes and filters, the number of 8 articles was found in the chosen time delimitation. In addition to the search in formal databases, a complementary investigation was carried out, including search syntaxes in journals, scientific journals and Google Scholar, in order to enrich and allow a more holistic and comprehensive analysis of the theme. Preprint databases were not searched.

The selection and screening stage of the studies took place in November 2024 and, after the searches, all the identified records were grouped. The first stage consisted of the removal of duplicates; then the title and abstract reading stage. Ultimately, the analysis of the text and references of the selected articles. The titles and abstracts, as well as the studies from the reference lists, were selected by an independent researcher, who evaluated the studies according to the eligibility criteria and the exclusion criteria.

4 FINAL CONSIDERATIONS

Forensic toxicology is an interdisciplinary science that plays a crucial role in tackling drugs of abuse, one of the most complex public health problems. Its ability to monitor substances, identify patterns of use, and track new drugs strengthens the response to this public health problem.

Immunochromatography stands out as a promising tool for preliminary analyses of drugs of abuse, offering practicality and reliability, especially for cocaine and marijuana.

Despite limitations for certain substances, the method complements other forensic techniques, contributing to the elucidation of crimes and drug control.

The application of chemistry in forensic toxicological analysis is fundamental to deal with drug abuse. Methods such as chromatography and spectrometry ensure accuracy and reliability, strengthening both the legal system and public health policies by addressing the social and safety impacts of psychoactive substance use.

From this perspective, these and other analyses allow not only the proof of drug use, but also provide data on consumption patterns, substance metabolism and the correlation with possible harm or deaths related to the use of narcotics. This is essential for criminal investigations, especially in cases of traffic accidents, homicides, abuse of crime-facilitating substances (such as benzodiazepines), and overdoses.

In addition, forensic toxicology assists authorities in controlling new psychoactive substances, whose rapid evolution in the illicit market represents a constant challenge. The fight against new psychoactive substances, such as *Legal Highs*, requires more dynamic legislative strategies and national and international cooperation. Rapid notification systems and partnerships between laboratories and authorities are crucial to keep up with the rapid evolution of these drugs, protecting society from their harmful impacts.

Crack use poses a significant public health and safety challenge. Forensic toxicology plays a central role in identifying the drug and guiding public policy. Adequate treatment for addicts emerges as a vital strategy to mitigate social and economic damage, alongside integrated approaches between health, justice and social programs

The development of toxicological information systems improves the surveillance and monitoring of chemical substances, allowing for more effective tackling of problems such as underreporting. Tools like this guide public policies and strengthen integration between institutions to protect the health and safety of the population.

Therefore, forensic toxicology not only contributes to criminal justice, but also contributes to protecting the health and safety of society, being an indispensable tool in the fight against drugs of abuse as a public health problem.

ABSTRACT

This article analyzes the socio-environmental perception of Science teachers working in public middle schools (final years of Elementary Education) located in the surroundings of the middle stretch of the Riacho das Piabas, in the city of Campina Grande, Paraíba, Brazil. The research represents a partial outcome of an ongoing master's dissertation and adopts a qualitative approach, of basic nature and exploratory character. Data were collected through semi-structured questionnaires, applied after approval by the Research Ethics Committee, and analyzed based on emergent categories. The results indicate that, although teachers present different levels of knowledge about the Riacho das Piabas, all recognize its environmental, historical, and social relevance. The teachers associate the stream with elements such as preservation, biodiversity, water resources, and historical aspects, in addition to identifying its potential as a contextualization object in Science teaching. Furthermore, the understanding of environmental education as an instrument capable of promoting the transformation of the local socio-environmental reality is evident. Furthermore, interconnections between non-formal environmental education processes, driven by communities and local NGOs, are evident, consolidating an understanding of inequalities in the territory and social engagement.

Keywords: Society. Natural Resources. Micro-Watershed. Civic Education.

RESUMO

Este artigo pesquisa a percepção socioambiental de professores de Ciências do Ensino Fundamental (Anos Finais), atuantes em escolas públicas localizadas no entorno do trecho médio do Riacho das Piabas, na Cidade de Campina Grande (PB). O estudo constitui um recorte de resultados de uma dissertação em andamento e adota abordagem qualitativa, de natureza básica e caráter exploratório. Os dados foram obtidos por meio de questionários semiestruturados, aplicados após aprovação pelo Comitê de Ética em Pesquisa, e

analisados a partir de categorias emergentes. Os resultados indicam que, embora os docentes apresentem diferentes níveis de conhecimento sobre o Riacho das Piabas, todos reconhecem sua relevância ambiental, histórica e social. Os professores associam o riacho a elementos como preservação, biodiversidade, recursos hídricos e históricos, além de identificarem seu potencial como objeto de contextualização no ensino de Ciências. Evidencia-se, ainda, entrelaçamentos de processos de educação ambiental não formal, puxados por comunidades e ONG local, consolidando a compreensão das desigualdades no território e engajamentos social.

RESUMEN

Este artículo analiza la percepción socioambiental de profesores de Ciencias de la Educación Básica (últimos años de la Educación Primaria), que trabajan en escuelas públicas ubicadas en el entorno del tramo medio del Riacho das Piabas, en la ciudad de Campina Grande, Paraíba, Brasil. La investigación constituye un recorte de los resultados de una disertación de maestría en curso y adopta un enfoque cualitativo, de naturaleza básica y carácter exploratorio. Los datos fueron recolectados mediante cuestionarios semiestructurados, aplicados tras la aprobación del Comité de Ética en Investigación, y analizados a partir de categorías emergentes. Los resultados indican que, aunque los docentes presentan diferentes niveles de conocimiento sobre el Riacho das Piabas, todos reconocen su relevancia ambiental, histórica y social. Los profesores asocian el arroyo con elementos como la preservación, la biodiversidad, los recursos hídricos y los aspectos históricos, además de identificar su potencial como objeto de contextualización en la enseñanza de las Ciencias. Asimismo, se evidencia la comprensión de la educación ambiental como un instrumento capaz de promover la transformación de la realidad socioambiental local, impulsado por comunidades locales y ONGs, consolidando la comprensión de las desigualdades en el territorio y el compromiso social.

Palabras clave: Sociedad. Recursos Naturales. Microcuenca. Educación Ciudadana.

1 INTRODUCTION

The development of Campina Grande is closely linked to the Riacho das Piabas system/PB, initially used by the original peoples, the body of water sustained the growth of the original urban core with clear waters that served as a supply for the local inhabitants (Sousa Rêgo, 2014).

Originally characterized by dense vegetation and an abundance of reservoirs, the area of reduced dwellings, from the second half of the twentieth century, intensified its occupation through irregular allotments, triggering severe processes of environmental deterioration (Andrade; Son; Anjos, 2025).

In view of the current growing socio-environmental problem, the need to rethink the relations established between society and nature has been evidenced, which requires mitigation and adaptation of urban spaces (middle and downstream stretch) and the preservation of natural remnants (rural upstream stretch).

In the educational field, environmental education contributes to sustainable development by fostering social engagement and understanding of inequalities, this process is essential to awaken active citizenship, allowing the population to intervene directly in the management of their territory (Antunes; Lehner; Ribeiro, 2025). In this sense, the teaching of Science has significant potential to articulate curricular content to environmental issues, favoring the process of contextualization and critical development of students.

Socio-environmental perception, which is the way communities and individuals understand and interpret the relationship between the social environment and the environment (Carvalho; Peçanha; Carvalho, 2025) is a fundamental element in the educational process, especially the perception of teachers, since it directly influences the way content is approached and how territories are recognized.

Understanding how teachers perceive the environments in which they are inserted, their meanings, values and problems, allows us to identify possibilities and limits for the development of educational practices aimed at sustainability.

The Riacho das Piabas, especially because it crosses urban areas and is close to school institutions, has socio-environmental relevance and educational potential, which makes it pertinent to investigate how this space is perceived by science teachers who work in schools located in its surroundings.

At the same time, there are popular initiatives in the field of non-formal education, led by communities and local NGOs, for the revitalization of the Riacho das Piabas system and the quality of life of the communities.

From this, we propose the following research question: what socio-environmental

perceptions are expressed by Elementary School Science teachers (Final Years), working in schools located around the Piabas Stream, in the reading of the territory and the role of environmental education in the construction of full citizenship?

It is based on the logical-conditional hypothesis: Science teachers from schools located around Riacho das Piabas build environmentally relevant and socially representative knowledge about the territory to the extent that Environmental Education (EE) is legitimized as an important factor in the search for perception and socio-environmental transformation.

Thus, the objective of this study is to research the socio-environmental perceptions of Elementary School Science teachers (Final Years), working in public schools located in the surroundings of Riacho das Piabas, considering the level of familiarity with the territory, the meanings attributed to it and the understandings about the role of environmental education to know, care and transform.

2 THEORETICAL FRAMEWORK

2.1 SOCIO-ENVIRONMENTAL PERCEPTION: CONCEPTS AND RELATIONSHIPS

One of the main terms to understand the complexity of socio-environmental perception is topophilia, which is characterized as the "affective link between the person and the place or physical environment. Diffuse as a concept, vivid and concrete as a personal experience" Tuan (2012, p. 4). From the conception of this term to the present day, there have been intense changes between human relations and the environment, mainly as a result of globalization mediated by technologies (Duarte et al., 2021).

Perception consists of the process of organizing and interpreting sensory stimuli to attribute meaning to the external environment. This phenomenon comprises the stages of capturing, selecting and processing information captured by the five senses: sight, hearing, touch, smell and taste (Carvalho; Peçanha; Carvalho, 2025). It depends on experience, but does not necessarily follow from it, it is possible to clarify this concept through questions that start from practical elements towards deeper ideas (Tuan, 1983).

Socio-environmental perception refers to the way individuals and groups interpret the interdependence between society and the environment, in a systemic view. More than recognizing problems, this concept involves raising awareness about how human activities impact nature, encompassing the ability to evaluate and act responsibly in favor of quality of life and environmental preservation (Carvalho; Peçanha; Carvalho, 2025).

2.2 THE PIABAS STREAM: ANTHROPIC ACTIONS AND BIODIVERSITY

Riacho das Piabas exemplifies how accelerated urbanization and deficiencies in basic sanitation affect water resources. Belonging to the basin of the middle course of the Paraíba River, the stream is mostly channeled in the urban perimeter of the City of Campina Grande/PB. Research indicates that the area faces severe anthropogenic impacts, which directly compromise its original biodiversity (Santos et al., 2024). Sousa Rêgo (2014) describes the complexity of the territorial changes that have occurred over the decades:

Under the ecological irrationality and passivity of the population, the flat part (middle portions and downstream to the south) of the microbasin was urbanized. In this way, in contrast to the assets of urbanization, edaphic resources were turned over, water resources were filled, biological resources exterminated. The Riacho das Piabas gave its banks to the avenues and began to be channeled, drain sewage, carry solid waste, exhale bad smells. Its lentic portion, the Açude Velho (postcard), became a stabilization lagoon. In peri-urban areas, socioeconomic discomfort exposed housing in permanent protection areas (PPAs), decreases in substantive freedom, reduction of productive jobs, hopelessness, social cohesion, increased poverty, drug addiction and violence, worsening scenarios during rainy and flood seasons (Sousa Rêgo, 2014, p. 16).

In addition to the vulnerability to floods and landslides, the irregular occupations around the Riacho das Piabas compromise physical and visual accessibility, this barrier prevents the community from establishing a deeper connection with the body of water, hindering urban and environmental integration (Andrade; Son; Anjos, 2025). Regarding the problems mentioned, the area preserves an expressive biological wealth, pointed out by Sousa Rêgo (2014):

The upstream and rural domain of the micro-basin with about 500 hectares still retains an expressive natural remnant in vital processes and a mixture of species surrounding the Brazilian megabiodiversity. The area is framed as an ecotonal region enclosing biocenoses of the Atlantic Forest and the Caatinga. Expressive ecosystem services stand out, such as the production of excellent fresh water, constituting a unique endogenous possibility of water security for the urban center (Campina Grande) downstream (Sousa Rêgo, 2014, p. 02).

2.3 FUNDAMENTALS OF ENVIRONMENTAL EDUCATION

Environmental education is derived from the environmentalist area, as it inherited from the environmentalist area the most important representative and institutional pillars that define its identity and formation, but it is also characterized as a field, in a certain way, independent (Layrargues; Lima, 2014). In the National Policy for Environmental Education (PNEA), the EE in the 1st article is defined as follows:

The processes through which the individual and the community build social values, knowledge, skills, attitudes and competencies aimed at the conservation of the environment, a good for the common use of the people, essential to a healthy quality of life and its sustainability (Brasil, 1999 [sp]).

EE reveals the integration between human identity and nature, it makes us realize that, by preserving the environment, we are preserving our own identity and recognizing our place as living beings among other living beings (Sauvé, 2005). In Brazil, it also has a plurality bias:

Environmental education (EE) in Brazil was constituted as a field of knowledge and pedagogical and political activity from the 70s and, above all, from the 80s of the next century to the last century. It was born as a plural and differentiated field that brought together contributions from various scientific disciplines, philosophical matrices, political-pedagogical positions, actors and social movements (Lima, 2009, p. 147).

In the scenario of basic education, the National Common Curriculum Base (BNCC) establishes that Environmental Education must be integrated into the curricula and pedagogical projects of educational institutions (Brasil, 2017). In addition, Layrargues and Lima (2014) theorize the political-pedagogical macro-tendencies of Brazilian environmental education: the conservationist and the pragmatic, focused on individual actions, and the critical, focused on the exercise of citizenship and transformative education.

Critical environmental education drives the demand for effective public policies and sustainable practices in the field of basic education, prepares citizens to defend their rights and question exclusionary development models, by aligning itself with environmental justice, this pedagogical practice protects vulnerable communities and minorities, promoting awareness of socio-environmental disparities and encouraging active participation in the management of natural resources (Antunes; Lehner; Ribeiro, 2025).

It grounds and enables the construction of new models of relationship between the individual and the environment. This process helps to attribute meanings to these interactions, respecting and integrating the sociocultural and geographical particularities of each intervention context (Sauvé, 2005).

3 METHODOLOGY

3.1 CHARACTERIZATION OF THE RESEARCH

The research is characterized, from the point of view of the way of approaching the problem, as qualitative, a choice that is justified by the complex nature of the proposed problem and by the need for an interpretative immersion in the field of socio-environmental perception of teachers by the researchers.

In the qualitative approach, the research has the environment as a direct source of data. The researcher maintains direct contact with the environment and the object of study in question, requiring more intensive fieldwork. In this case, the questions are studied in the environment in which they are presented without any intentional manipulation by the researcher (Prodanov & Freitas, 2013, p. 69).

As for its nature, it is classified as basic, because "it aims to generate new knowledge useful for the advancement of science without foreseen practical application" (Prodanov & Freitas, 2013, p. 51), we seek to expand knowledge about the socio-environmental perception of science teachers in a specific context.

Regarding the objectives, also according to Prodanov & Freitas (2014) it is an exploratory study, which aims to deepen more information on the subject of investigation.

3.2 AREA OF RESEARCH

Located in the state of Paraíba, the City of Campina Grande has an estimated population of 443,911 inhabitants (IBGE, 2025). According to data from the 2022 census, the city exhibits high levels of urban infrastructure, with about 97% of residents living in the urban area, while the coverage of basic services reaches 98% for water supply, 87.5% for sanitary sewage and 97% for solid waste collection.

The research area comprises the middle stretch of the Riacho das Piabas, located in the municipality of Campina Grande, Paraíba. The area stands out for its proximity to schools. In the surroundings there is an Early Childhood Education school, two Elementary Schools (Early Years). however, in this study, the focus was exclusively on Elementary School (Final Years).

Thus, two public schools located near the stream were selected: the Frei Dagoberto Stücker Municipal School of Elementary Education and the Professor Anésio Leão Technical Integral Citizen School, from the state network, which offers Elementary School. This scenario confers educational potential and diversity of socio-environmental scenarios. (Figure 1).

Figure 1

Excerpts from the middle course of Riacho das Piabas highlighting a) pollution; b) stretch of the Louzeiro Forest; c) image of the façade of the Anésio Leão Technical Citizen School; d) and the Frei Dagoberto Stucker Municipal School

Source: Applied research, 2026.

The area faces contrasts with the city's infrastructure indexes, as it faces socio-environmental weaknesses, such as the release of solid waste, the degradation of the riparian forest and the channeling of the watercourse, especially in the area popularly known as "Buraco da Gia". However, the coexistence of remnants of vegetation, the presence of biodiversity and the course of the stream are observed. This makes Riacho das Piabas a strategic territory for the development of contextualized pedagogical practices, especially in the field of Environmental Education and Science teaching.

3.3 RESEARCH PARTICIPANTS AND ETHICAL ASPECTS

The participants of the study were five teachers of Science of Elementary School – Final Years (6th to 9th grade), which corresponds to 100% of the sample of teachers who work in the schools around the middle stretch of the Riacho das Piabas. The participants voluntarily agreed to participate in the research, by signing the Informed Consent Form (ICF).

The project was previously submitted to and approved by the Human Research Ethics Committee (CEP) of the State University of Paraíba – Campina Grande Campus, through Plataforma Brasil.

3.4 DATA COLLECTION INSTRUMENT

Data collection was carried out through the application of semi-structured questionnaires. The instrument was developed based on the guiding question and the hypothesis, contemplating open and closed questions related to the socio-environmental perception of teachers about the Piabas Stream. It is noteworthy that this article is an excerpt from an ongoing master's research, from which only the data referring to the socio-environmental perception of the teachers, directly related to this thematic cut, were analyzed.

3.5 DATA ANALYSIS

The analytical strategy adopted is based on three phases defined by Gil (2008): (i) data reduction, understood as the process of selection, simplification, abstraction and transformation of the original data; (ii) categorization, through the construction of descriptive categories emerging from the reading and organization of the material obtained; and (iii) interpretation, carried out in the light of the theoretical framework adopted, enabling the understanding of the meanings and senses expressed by the participants. We built a word cloud based on the data from a questionnaire question using *Vennage*, an online graphic design platform.

To verify the existence and characteristics of the teachers' socio-environmental perception, it was based on central points of analysis: (a) the level of familiarity of the teachers with the Piabas Stream; (b) the socio-environmental meanings and values attributed to this territory; and (c) the understandings about the role of Environmental Education in its transformation.

4 RESULTS AND DISCUSSIONS

4.1 TEACHERS' FAMILIARITY WITH THE RIACHO DAS PIABAS

The analysis of the answers indicates that the participating teachers demonstrate different levels of familiarity with the Piabas Stream. Although all of them stated that they had some kind of previous knowledge about the stream, it was observed that only one of the participants stated that they knew it in a more in-depth way, while the others showed partial or superficial understandings about the territory.

These results indicate that the simple insertion of schools in the surroundings of Riacho das Piabas does not guarantee, by itself, an in-depth socio-environmental perception on the part of teachers and a high degree of familiarity with the territory. This reinforces the idea that knowledge about the territory is built from experiences and bonds (Tuan, 2012).

4.2 IMPORTANCE AND REPRESENTATIVENESS ATTRIBUTED TO THE RIACHO DAS PIABAS

The teachers' answers were varied, with the aim of synthesizing the meanings attributed by the teachers to the stream, based on the recurrence of central terms and ideas, a word cloud was elaborated that evidences the main semantic terms present in the teachers' discourses, Figure 2.

Figure 2

Word cloud elaborated from the answers of teachers about the importance and representativeness of Riacho das Piabas

Source: Applied research, 2026.

The word cloud highlights the centrality of terms related to the place, water, biodiversity and history, suggesting a perception that recognizes the Riacho das Piabas mainly as an environmental and sociocultural element.

The stream is also understood as a space that demands recognition and conservation, being associated with the idea of environmental preservation and the need to protect its natural resources. This perception points to an understanding of the stream as an environmental heritage, whose conservation is seen as a condition for the maintenance of life and ecological balance.

Other teachers highlight the social and educational relevance of Riacho das Piabas, recognizing it as an important resource for the local community and as a potential learning tool. From these perspectives, the stream is associated not only with ecological aspects, but also with possibilities of pedagogical use and social development, which evidences an integrated perception between environment and society.

The historical dimension is manifested in a recurrent way in the teachers' answers, especially through references to the role of the stream in the process of emergence and development of the city. As Tuan (2012, p. 144) points out, "awareness of the past is an important element in the love for the place", which reinforces the understanding that urban water bodies are carriers of collective memories and social trajectories.

In this sense, the stream is configured as a fundamental element for the historical and territorial reading of the urban space. In addition, the professors highlight the stream as a natural source essential to life and as an environment that shelters biodiversity, evidencing the socio-environmental richness present in the area.

4.3 ENVIRONMENTAL EDUCATION AS AN INSTRUMENT OF SOCIO-ENVIRONMENTAL TRANSFORMATION OF THE PIABAS STREAM

The teachers show a consistent understanding of education as a central element for the conservation and enhancement of the Piabas Stream. In general, teachers associate environmental education with training processes capable of promoting knowledge, awareness and socio-environmental responsibility, recognizing its transformative potential both in the school environment and in the community.

The participants highlight educational actions of an informative and experiential nature, such as lectures, visits to the stream and the study of its history, fauna and flora, indicating that direct contact with the territory is perceived as an important strategy for strengthening the environmental awareness of students. These practices dialogue with the understanding that schools play a crucial role in the implementation of Critical Environmental Education, since, by promoting environmental projects, such as awareness campaigns, they can constitute learning spaces focused on sustainability (Antunes; Lehner; Ribeiro, 2025).

Other teachers expand this understanding by relating environmental education to principles of sustainability, such as the promotion of sustainable living, safe food, the conscious use of natural resources and solid waste management, in addition to the articulation with the Sustainable Development Goals (SDGs).

There is also an emphasis on awareness and sensitization projects, aimed at preserving the surroundings of the stream. In this approach, education is understood as a

means to mobilize responsible attitudes and behaviors, stimulating the active participation of students in the protection of the environment in which they are inserted.

Finally, some teachers emphasize the role of education in the formation of subjects aware of their environmental co-responsibility. By recognizing that students are also responsible for caring for the environment, the teachers point to a conception of environmental education that goes beyond the transmission of content, focusing on the transformation of the perception and posture of individuals in the face of socio-environmental issues. In this sense, by encouraging active social participation and the development of problem-solving skills, environmental education contributes significantly to the construction of a fairer and more sustainable future (Antunes; Lehner; Ribeiro, 2025).

5 CONCLUSION

The results of this study show that the science teachers of the schools located in the vicinity of the Piabas Creek have, at different levels, knowledge about this watercourse and recognize its historical, environmental and social relevance. Although the degree of familiarity varies among the participants, there is a common perception that the stream is an important element of the territory, with educational potential for the community.

The professors associate the Riacho das Piabas with aspects such as environmental preservation, biodiversity, water resources and historical memory, demonstrating an integrated understanding of the environment. This socio-environmental perception is fundamental for the construction of contextualized pedagogical practices, capable of bringing the teaching of Science closer to the reality experienced by students and strengthening links between school and territory.

In this sense, the findings of the research indicate that the initial hypothesis is confirmed, since teachers who demonstrate knowledge and appreciation of the Piabas Stream also recognize Environmental Education as a central element for the transformation of the socio-environmental reality of the territory. The teachers point to environmental education as a strategic instrument, highlighting educational actions aimed at raising awareness, sensitization and training responsible subjects, understanding it as a means of promoting changes in attitude and expanding the understanding of co-responsibility in environmental conservation.

Thus, the study indicates the existence of a teacher's educational potential, especially with regard to the contextualization of science teaching from the territory. In this sense, the results point to the importance of investments in continuing education processes and in the production of didactic materials contextualized with natural attributes of the school

environment, capable of strengthening and expanding pedagogical practices aligned with Environmental Education, contributing to the consolidation of more critical educational actions committed to sustainability.

ACKNOWLEDGMENTS

The present work was carried out with the support of the Coordination for the Improvement of Higher Education Personnel – Brazil (CAPES) – Financing Code 001.

ABSTRACT

This study focuses on the asset management of permanent assets at the Amazon Foundation for Support of Studies and Research of Pará (FAPESPA). The objective is to present a discussion on the feasibility of adopting Radio Frequency Identification (RFID) technology to automate the asset management of FAPESPA's inventories within the Sispatweb system. It will address the verification of the components of the asset management sector for the operational management of the system; the identification of the operational structure of SISPAT WEB for the integration of the technology and optimization of the time required for conducting the internal institutional inventory. Qualitative research was the method used, of an exploratory nature, employing bibliographic and documentary research. The data collection period was 2014-2024. The results showed that technological strategies can prevent potential human errors; optimizing the inventory process leads to improved occupational safety for employees, preventing occupational diseases such as Repetitive Strain Injury (RSI) and Work-Related Musculoskeletal Disorders (WRMD), aiming to achieve the objectives of axis III of the A3P agenda ODS12.

Keywords: Public Heritage. Automation. Technological Innovation.

RESUMO

Este estudo tem como objeto a gestão patrimonial de bens permanentes da Fundação Amazônia de Amparo a Estudos e Pesquisas do Pará (FAPESPA). O objetivo é apresentar uma discussão sobre a viabilidade da adoção de Tecnologia de Identificação por Radiofrequência (RFID) para automação da gestão patrimonial dos inventários da FAPESPA no Sispatweb. Abordará a verificação dos componentes integrantes do setor de patrimônio para a gestão operacional do sistema; a identificação da estrutura operacional do SISPAT WEB para a integração da tecnologia e otimização do tempo para a realização do inventário interno institucional. A pesquisa qualitativa foi o método utilizado, de cunho exploratório com

RESUMEN

Este estudio se centra en la gestión de activos permanentes de la Fundación Amazónica de Apoyo a Estudios e Investigaciones de Pará (FAPESPA). El objetivo es presentar un análisis sobre la viabilidad de adoptar la tecnología de Identificación por Radiofrecuencia (RFID) para automatizar la gestión de los inventarios de FAPESPA dentro del sistema Sispatweb. Se abordará la verificación de los componentes del sector de gestión de activos para la gestión operativa del sistema; la identificación de la estructura operativa de SISPAT WEB para la integración de la tecnología y la optimización del tiempo necesario para la realización del inventario institucional interno. Se empleó una investigación cualitativa de carácter exploratorio, con investigación bibliográfica y documental. El período de recolección de datos fue de 2014 a 2024. Los resultados mostraron que las estrategias tecnológicas pueden prevenir posibles errores humanos; la optimización del proceso de inventario mejora la seguridad laboral de los empleados, previniendo enfermedades profesionales como las lesiones por esfuerzo repetitivo (LER) y los trastornos musculoesqueléticos relacionados con el trabajo (TMRT), con el objetivo de alcanzar los objetivos del eje III de la agenda A3P ODS12.

1 INTRODUCTION

The study of the automation of the survey of the institutional internal patrimonial inventory, in particular that of FAPESPA, is initially justified by the Complementary Law No. 101, of May 4, 2000 – Fiscal Responsibility Law, which brought, among other provisions, the perception of the need for greater control over public assets.

The Civil Code, in its Articles 98 and 99, provides that the assets of the national domain belonging to legal entities of internal public law are public, and all other private individuals, regardless of the person to whom they belong.

The Popular Action Law – Law 4.717, of June 29, 1965, defines public property in its Article 1, paragraph 1, as "assets and rights of economic, artistic, aesthetic, historical or tourist value" (Brasil, 1965).

In view of this, the objective of the study focused on the identification of strategies for asset management of permanent assets of the Amazon Foundation for the Support of Studies and Research of Pará (FAPESPA) in order to make feasible the adoption of Radio Frequency Identification Technology (RFID) for automation of the asset management of inventories in Sispatweb, from the use of the so-called Radio Frequency Identification Technology (*Radio Frequency Identification*-RFID).

The purpose of using a technology is to meet FAPESPA's needs with regard to reducing the time to survey inventory, less use of human resources, reliable asset information and more efficient control of assets in the location units.

Based on the above, the study presents a discussion on the importance of automation as an effective tool as a strategy for optimizing institutional processes by being able to contribute to the rationalized progress of actions related to the survey of public assets.

2 CONCEPTUAL AND NORMATIVE CONTRIBUTIONS OF PUBLIC ASSETS

According to the list of conceptualization of patrimony, its definition can be considered, according to Dias (2006), as the managed object that serves to provide entities with the attainment of their purposes. For an asset to be considered as such, it must meet two requirements: the element must be a component of a set that has economic content and can be evaluated in currency; and that there is interdependence of the component elements of the patrimony and the link of the whole to an entity that aims to achieve certain ends.

Reassuring Torres and Silva (2003), it is mentioned that public assets are made up of assets of all nature and kinds that are of interest to the public administration and to the administered community.

Another relevant definition of public assets according to Kohama (2009, p.173) "comprises the set of assets, rights and obligations, valued in currency, of the entities that

make up the public administrations".

This concept is found in Martins *apud* Mukai (2000, p.17) when he states that public assets are a set of goods, money, values and rights belonging to public entities (Union, States, Federal District and Municipalities), through direct or indirect and foundational administration, whose conservation is of public interest and diffuse, with not only the administrators, but also the administered, linked to its protection and defense. Such elements, even under the possession of a private individual, will never lose the quality of public domain given their origin: the public thing.

An even broader conception is found in the Brazilian Standards Applied to the Public Sector (NBASP) when it highlights that public assets as a set of rights and assets, tangible or intangible, encumbered or not, acquired, formed, produced, received, maintained or used by public sector entities, which is the bearer or represents a flow of benefit, present or future, inherent to the provision of public services or economic exploitation by public sector entities and their obligations (Brasil, 2012, p.13).

Therefore, public assets are composed of assets, rights and values that are in the hands of the government, but they belong to all citizens of a nation (Union, State and Municipalities) and, for this reason, it must be managed in the best way, respecting the principles of public administration, such as legality, impersonality, morality, publicity and efficiency (Brasil, 1965).

2.1 LEGAL ASPECTS OF PUBLIC ASSETS IN THE LIGHT OF SDG 12

To situate the legal and normative aspects that regulate public assets, it is noteworthy that accounting applied to the public sector had three major historical moments: the enactment of Law No. 4,320/1964, which established the foundations of the budget and, at the time of "public accounting", the advent of Complementary Law No. 101/2000, known as the Fiscal Responsibility Law (LRF), which established the concept of transparency, balance of public accounts, preservation of assets and responsibility of fiscal management.

Table 01 presents the Brazilian Accounting Standards Applied to the Public Sector (NBCASP), among the most important is NBC T 16.2, which establishes the definition of public assets and the classification of elements under the accounting aspect, in addition to presenting the concept of accounting information systems and subsystems for public entities.

Table 1

Public heritage and classification of elements based on NBCASP

Standards	Classification
NBC T 16.1	Conceptualization, object and field of application
NBC T 16.2	Equity and Accounting Systems
NBC T 16.3	Planning and Its Instruments under an Accounting Approach
NBC T 16.4	Public Sector Transactions
NBC T 16.5	Accounting Record
NBC T 16.6	Financial Statements
NBC T 16.7	Consolidation of Financial Statements
NBC T 16.8	Internal Control
NBC T 16.9	Depreciation, Amortization and Depletion
NBC T 16.10	Valuation and Measurement of Assets and Liabilities in Public Sector Entities
NBC T 16.11	Public Sector Cost Information System

Source: Feijó (2013. p.57)

Also according to the definition of the Federal Accounting Council (2012), public assets are the set of rights and assets, tangible or intangible, encumbered or not, acquired, formed, produced, received, maintained or used by public sector entities, which carries or represents a flow of benefits, present or future, inherent to the provision of public services or economic exploitation by public sector entities and their obligations (Brasil, 2012, p.5).

The existing diversified legislation on asset management in public entities guides decisions regarding the management of public assets and supports the public agent in making more efficient decisions. These norms have as their source of origin the most diverse in the Brazilian legal system, however, their purpose according to the CFC is to meet the new social demands that their statements as an essential item of the services of public managers, which must be prepared in order to facilitate, from the perspective of their users and society, the adequate interpretation of the patrimonial phenomena of the public sector, the monitoring of the budget process, the analysis of economic results and the financial flow.

It is noteworthy that the available information facilitates the inspection of Internal Control and External Control, in order to achieve efficient asset management, which should occur beyond the existence of an equity sector, for this, it is necessary: the institution of routines, the inspection of the procedures adopted and the evaluation of the results obtained. The application of Sustainable Development Goal 12 is important, as the use of public goods must comply with the principles of sustainability and shared responsibility in order to meet the principle of Sustainable Development recommended by the Federal Constitution of 1988 in its Article 225.

Everyone has the right to an ecologically balanced environment, a good for the common use of the people and essential to a healthy quality of life, imposing on the public power and the community the duty to defend and preserve it for present and future generations.

Thus, the linear economic model, based on the triad of extract, produce and discard, which predominated until the middle of the twentieth century with the publication of the *Meadows Report*, produced by the Massachusetts Institute of Technology, at the request of the Club of Rome, occurred a paradigm shift since, contrary to the Newtonian-Decartian thought of objectifying nature, it was demonstrated that the natural elements that provide resources for industry and human life they are finite and difficult to regenerate.

3 EVOLUTION AND STRENGTHENING OF AUTOMATION IN THE FIELD OF INNOVATION

The globalized world and the constant organizational changes impose the process of transformation of operational techniques and strategies in various sectors to the detriment of coexistence with planned obsolescence, that is, everything is always changing all the time. In addition, the development of nations, instant communication and social networks and the interactions that arise from them, help to form a range of citizens who demand much more from the government to ensure a better meeting of their needs and with the desired efficiency and effectiveness.

In this sense, automation has been increasingly studied with a view to identifying a means to achieve the principle of efficiency, as recommended by the Federal Constitution of 1988 and Constitutional Amendment No. 19, of June 4, 1998, which inserted in the constitutional text the principle of efficiency as a duty to be pursued by the Public Administration, so that this is included in the list of other principles contained in article 37, caput, of the Magna Carta, among them legality, impersonality, morality and publicity. In this regard, Gonçalves (2019, p.74,) states that "innovations enable efficiency gains, better governance, greater user participation, and transparency in public actions and services".

It is worth mentioning that, according to the Organizational Innovation in Budget Management in Federal Education Institutions (TICE.PT) platform in the item on Diagnosis and Proposals for Improvements, among the information that makes up its strategic matrix are those that deal with public administration, where it is highlighted that the public administration may, based on ICT, provide more efficient and effective services, both to citizens and companies, and can contribute to a fairer state, and to a greater approximation and participation of citizens in the processes of Democracy.

3.1 BRIEF CONSIDERATIONS ON THE EVOLUTION OF AUTOMATION

Efforts in the area of automation imply, for many authors, rethinking organizations and processes, as well as a change in behavior so that public services reach those who really

need them. These well-implemented changes will allow citizens, companies and entities in general to relate to the State more easily, faster and at a lower cost.

The concept of automation was instituted in the United States only in 1946, in automotive factories and, currently, the term means any system that uses computing and replaces human labor in order to increase the speed and quality of production processes, employee safety, in addition to obtaining greater control, planning and flexibility of production (Goeking, 2010, p. 1).

For Hitomi (1994), automating means, generically, exempting man or other living beings from performing tasks and, although the concept over the years has undergone several changes, its application has extrapolated the industrial context, where it was carried out through physical and specialized machinery.

Referring to organizational efficiency, it is possible to identify on the TICE.PT platform that Information Technologies (ICTs) can contribute to organizations being able to exhibit intelligent behavior, improve their performance, demonstrate competitive capabilities and sustained well-being.

It was identified based on Cardoso and Tavares (2021) that, in addition to ensuring organizational efficiency, suggests a wide range of concerns with the functioning of organizations that, in addition to the performance dimensions normally considered, also includes aspects that can be described as being related to the cognitive capabilities of organizations such as perception, memory, attention, communication, reasoning, learning, imagination and innovation.

Also according to Cardoso and Tavares (2021), the whole new scenario that automation, necessarily incorporated into management processes, has been composing, causes fear, doubts, and fears in those who have to deal with the changes it has increased. These are feelings that, little by little, give way to the feeling of satisfaction in the provision of services and care, as highlighted by some authors, with their respective definitions, in Table 2.

Table 2

Automation concept and definitions

Authors	Concept and definitions
Wall (2011)	Automation, in the same way, is an area of knowledge that seeks to offer human beings a set of solutions to their problems, usually related to well-being and productivity. Applications are not just about replacing human labor imbued with exhausting, monotonous and dangerous tasks; They bring improvement in the quality of processes, optimization of spaces, reduction in production time and costs.
Ribeiro (2003)	The concept of automation as the operation of a machine or system automatically or by remote control, with minimal human interference.

Goeking (2010)	The concept of automation was instituted in the United States only in 1946, in automotive factories and, currently, the term means any system that uses computing and replaces human labor in order to increase the speed and quality of production processes, employee safety, in addition to obtaining greater control, planning and flexibility of production.
Morais; Castrucci (2001)	Automation in industry stems from needs such as: higher levels of forming quality and flexibility, lower labor costs, lower material losses and lower capital costs; greater control of relative process information, higher quality of information and better production planning and control.

Source: Prepared by the author based on Parede (2011), Ribeiro (2003), Goeking (2010) and Morais; Castrucci (2001)

From this survey, it is possible to infer that the authors, when dealing with automation, are consensual on several points, including the quality of processes, information control, employee safety, reduction in production time and costs.

In this sense, the automation process should involve the treatment of information from a productive medium in order to produce more while spending as few resources as possible, ensuring the efficiency of production through the adoption of some technology that will displace human labor to technological rationalization.

In the studies of Ribeiro (2003), the concept of automation is defined as the operation of a machine or system automatically or by remote control, with minimal human interference. Automation is not a new concept, it was a pillar at the time of the 3rd Industrial Revolution, as it introduced new forms of production in factories, even using human resources and producing more goods than the artisanal system.

According to Dombrowski and Wagner (2014), an Industrial Revolution is characterized by radical technological changes and innovations in industrial systems, which transform the work environment, society and living conditions, and which has economic growth as its main consequence.

Therefore, in particular, organizational efficiency has been enhanced by ICTs, through increasingly distributed, arbitrarily remote and computationally ubiquitous information systems.

3.2 THE IMPORTANCE OF THE AUTOMATION PROCESS AND ITS APPLICATIONS

Considering that automation is a process that gained notoriety from the Industrial Revolution in the context of the move of the population from the countryside to the city, causing an increase in the demand for products, leading to the development of companies, from then on producers had to adopt large-scale and organized manufacturing systems.

The areas in which automation can be used have a wide range of applications, ranging from hospital environments to commercial establishments. Automation has several

advantages, but the main objective is to reduce costs and increase production speed (Magalhães; Ferreira, 2022).

According to Roggia and Fuentes (2016), the evolution of industrial automation goes back to long periods in history. Since prehistory, man has been developing mechanisms and inventions in order to reduce physical effort and assist in the performance of activities. As an example, we can mention the wheel for moving loads and the mills moved by the force of water or animal force.

The main reasons for the introduction of automation include greater production and greater productivity, avoiding waste when used in product manufacturing industries, as an example of an automated system is the palletizing of dishes in the ceramic industry, as shown in Figure 1.

Figure 1

Palletizing ceramic plates

Source: Mendes (2023).

It is noteworthy that the insertion of robotics in the palletizing of ceramic plates resulted in the protection of the worker's health, as it contained the risk of accidents and moved the workforce to safer places, in addition to the reduction of the number of hours on average per week by the workers.

The responsibility for assets in a public institution is shared among the following sectors: the equity sector, responsible for the analytical record; the accounting sector, responsible for the synthetic registration and the warehouse sector, responsible for the safekeeping of assets. They must develop mechanisms that ensure the integration between their procedures so that they maintain constant and regular communication, either by computerized means via integration between systems, or through control and conference through reports and forms.

Although initially their costs may be high, the benefits outweigh the expenses by providing better accuracy of results, the rational use of human resources and avoiding the waste of material in production chains.

Therefore, it is considered a tool that may be very useful for FAPESPA, since its use and efficiency is widely used in the private sector and has already been used in some public agencies with efficiency. In addition to finding several companies in the market that develop the technology, which makes its application attractive to the public sector in the event of a public bid.

4 METHODOLOGY

The research had a qualitative approach because the study requires an analysis following the thought of Günther *apud* Dilthey et al. (2000) who point to the primacy of understanding as a principle of knowledge, for studying complex relationships instead of explaining them through the isolation of variables.

Thus, the discovery and construction of theories were central to anchor the analysis of the object of study, carried out through perceptions that contributed to the construction of reality through the methodological procedure used for the investigation, which was bibliographic research and documentary research.

The purpose of a bibliographic research is to allow the researcher to know and analyze the theme of the research through relevant works already published and its purpose is to better understand the phenomenon under study for Sousa *et al. apud* Fonseca (2002), is carried out from the survey of theoretical references already analyzed, and published by written and electronic means, such as books, scientific articles, web site pages.

Sousa *et al. apud* Fonseca (2002) reinforce that any scientific work begins with a bibliographic research, which allows the researcher to know what has already been studied on the subject. There are, however, scientific researches that are based solely on bibliographic research, looking for published theoretical references with the objective of collecting information or previous knowledge about the problem to which the answer is sought.

The documentary study used for the study was due to its importance in scientific research. As highlighted by Silva, Jackson *apud* Caulley, Lüdke and André (1986), documentary analysis seeks to identify factual information in documents based on questions and hypotheses of interest.

By means of this technique, the objective is, according to Silva, Jackson *apud* Caulley *apud* Lüdke and André (1986), a person who wishes to undertake documentary research

must, in order to constitute a satisfactory corpus, exhaust all the clues capable of providing him with interesting information.

And it also consists of, according to Silva, Jackson *apud* Caulley *apud* Lüdke and André (1986), addressing the documentary technique of original documents, which have not yet received analytical treatment by any author. It is one of the decisive techniques for research in the social sciences and humanities.

Regarding the documents researched, the following publications were consulted, as shown in Table 3.

Table 3

Source: Prepared by the author (2025).

The data collection referred to the period between 2014 and 2017, with the Material, Warehouse and Patrimony Coordination (COMAP) sector as its locus, one of the Coordinators that make up the Administration and Finance Directorate (DIRAD) of FAPESPA. It is the most recent coordination in terms of administrative performance of the institution, in 2014 it was disconnected from the Logistics Coordination (COLOG) and began to have its own administrative autonomy with the creation of a position of coordinator for this function, as well as an effective servant to contribute to institutional functions.

5 RESULTS AND DISCUSSIONS

5.1 THE SPECIFICITY OF ASSET MANAGEMENT IN THE STATE OF PARÁ

The Government of Pará, in order to meet the new requirements pertinent to the process of convergence to international accounting standards, in 2012, began the process of accounting transition to the new accounting standards which, according to the determination of the National Treasury Secretary to the States, with regard to the use of the following accounting facts: The update of the Manual of Accounting Applied to the Public Sector (MCASP), the Table of Accounts Applied to the Public Sector (PCASP) and the Financial Statements Applied to the Public Sector (DCASP) until the year 2012 in the States of Brazil was optional and becomes mandatory as of 2013.

Through the approval of Decree No. 345/2012, a specific working group was formed at the national level for the adequacy and modernization of the cultural and informatics organizational structure existing in the state public administration, which was under the coordination of the Special Secretariat for Government Management (GTGOV/PA).

It is noteworthy that the State of Pará is part of a select group of Brazilian states that have adapted to the new Table of accounts for the public sector in Brazil, along with the States of Rio de Janeiro, São Paulo, Alagoas, Pará, Maranhão, Piauí, Rondônia, Tocantins, as presented in the Implementation of the New Accounting Standards Applied to the Public Sector in the State of Pará (SIAFEM/PCASP).

From 2012 to January 2013, SIAFEM in Pará underwent changes in its operational and managerial part to cover the changes in the Accounting of the Brazilian public sector, with the objective of gradually adapting. The main changes at the management level were as follows: (1) Parameterization of the Balance Sheets; (2) Consolidation of Balance Sheets; (3) New Synthetic Balance Sheets; (4) Process to bring balances from the Previous Year; (5) Printed balance sheets; (6). New Annexes and Statement of Financial Surplus/Deficit; (7) Adequacy of the other Trial Balances, Statements and Annexes of Law 4,320/64.

Currently, all routines inherent to FAPESPA's patrimonial sector are computerized and

registered through the Material and Service System and Sispat-web or Sispat imóveis. With the changes in the accounting legislation, the Government of Pará has implemented measures to adapt to the new standards, which have been gradually implemented in the agencies of the State of Pará.

It is worth mentioning that, according to Ordinance No. STN 634/2013, the accounting procedures implemented in 2013 were the Specific Accounting Procedures (PCE), which included credit operations such as Fundeb, RPPS (Own Social Security Regime), active debt, public-private partnerships, consortium and court orders.

In 2014, the Equity Accounting Procedures (PCP) including revenue by accrual, obligations/provisions/13th, asset registration, registration of economic phenomena, infrastructure assets and other equity aspects, in the same year the new Table of Accounts (PCASP) was approved.

Although the State of Pará has made the accounting changes slowly and gradually according to the New Schedule of STN Ordinance 753/2012, also delivered to the TCE and has adapted to the new STN Ordinance 634/2013, of November 19, 2013, it has managed to implement them in accordance with the required national legislation and in convergence with international accounting standards.

Thus, it now has an Integrated System of Financial Administration for the State and Municipalities (SIAFEM) adapted to the new Table of Accounts in force, with Rio de Janeiro, São Paulo, Alagoas, Pará, Maranhão, Piauí, Rondônia, Tocantis standing out in the list of states that have adapted to changes in the system.

5.2 FEASIBILITY OF ADOPTING AN RFID TO AUTOMATE THE ASSET MANAGEMENT OF FAPESPA'S INVENTORIES

To situate the issue related to the adoption of RFID technology, it is necessary to highlight its feasibility, because when used in asset management it increases operational efficiency, eliminating the manual work of asset counts and reduces the chance of human error, such as: not seeing the number of listings, wrong heritage listing notes, loss of the inventory report carried out in the year

In this way, the efforts of FAPESPA's heritage team can be directed to other strategic actions such as: annual purchase planning, maintenance and service of SIMAS, processes of donation of permanent assets and maintenance of assets in Sispatweb. In addition to being a more accurate data system, this also allows you to have updated information on the assets as well as their state of conservation, ensuring more accurate decision-making by having reliable data, in addition to increasing security and helping to prevent theft.

The biggest risks in relation to the use are the initial need for high initial investment in hardware and software, in addition to integration with existing systems and training the team to use it correctly. The implementation of an RFID system has a cost to be analyzed by accounting based on three different sets of equipment: hardware, software and tags.

According to RFID manufacturers, the overall cost of a system varies according to the number of tags that will be needed, their material and their type (longer range, shorter range, information storage, among other factors). On average, an RFID tag in the United States can cost 25 cents on the dollar, and can rise in Brazil to 80 cents or 1.5 dollars per unit. Although its cost-benefit is higher when compared to the barcodes currently used at FAPESPA, its benefits still make asset management more efficient and optimized.

The feasibility study of the adoption of RFID technology took into account the items presented in Table 4. The analysis of the following aspects demonstrates the feasibility of using a radio frequency identification technology, which is fundamental for the asset management of institutional inventories.

Table 3

RFID Technology Adoption Feasibility Analysis Items

Nature of Assets	RFID is especially suitable for the identification of large goods, such as electronic equipment, furniture. The technology allows for quick and accurate reading of multiple items simultaneously, streamlining the inventory process.
Operating Environment	FAPESPA's infrastructure should be evaluated to verify compatibility with RFID technology. It is important to consider the presence of physical obstacles that may interfere with the reading of the tags, such as concrete or metal walls, and the need to install antennas and readers
Integration with existing systems	The RFID solution must be able to integrate with the asset management systems already used by FAPESPA, such as the accounting system and the access control system. This integration will allow for the automation of processes and the generation of more accurate reports.
Costs	The implementation of an RFID system involves costs with the acquisition of tags, readers, antennas and software, in addition to the costs of installation and configuration. It is important to conduct a detailed study of the costs to verify the financial feasibility of the project

Source: Elaboration by the author (2024).

Although occupational safety standards emerged to meet the needs of CELISTA workers (CLT), it is necessary to remember that the 1988 Constitution states that workers' health is a fundamental human right, based on the advent of the dignity of the human person, therefore, it is a legally constituted social right (Silva, 2007).

Based on this principle, it is possible to validate the application of the Regulatory Standards compatible with the particularities of each activity in this sector to maintain the physical and mental integrity of public servants, providing an adequate environment for the

performance of their activities, as well as validating the requirement of the Public Ministry of Labor regarding compliance with these standards (Villela, 2014).

Public servants in the heritage sector have the possibility of applying the terms of Ordinance No. 25, on December 29, 1994, which approved the text of Regulatory Standard No. 9 – Environmental Risks, being called Environmental Risk Prevention Program, more specifically to Ergonomic risks such as working conditions that expose the worker to physical and mental stress.

This process causes serious disorders, affecting their psychophysiological well-being, leading the individual to develop occupational diseases, which can be Work-Related Musculoskeletal Diseases (WMSD) through Repetitive Strain Injuries (RSI) and psychological diseases arising from occupational stress due to the overload provided by the work environment) and accidental as risks that can lead to the impairment of the physical integrity of employees, due to an inadequate environment to carry out their duties.

RFID technology, when used in asset management, increases operational efficiency, eliminating the manual work of asset counts and reduces the chance of human error, allowing the efforts of the asset team to be directed to other strategic actions such as: annual purchase planning, maintenance and service of SIMAS, donation processes of permanent assets and maintenance of assets in Sispatweb.

In addition to being a more accurate data system, this also allows you to have updated information on the assets as well as their state of conservation, ensuring more accurate decision-making by having reliable data, in addition to increasing security and helping to prevent theft.

The biggest risks in relation to the use are the initial need for high initial investment in hardware and software, in addition to integration with existing systems and training the team to use it correctly. The implementation of an RFID system has a cost to be analyzed by accounting based on three different sets of equipment: hardware, software and tags.

According to RFID manufacturers, the overall cost of a system varies according to the number of tags that will be needed, their material and their type (longer range, shorter range, information storage, among other factors).

On average, an RFID tag in the United States can cost 25 cents on the dollar, and can rise in Brazil to 80 cents or 1.5 dollars per unit. Therefore, although its cost-benefit is higher when compared to the bar codes currently used at FAPESPA, its benefits still make asset management more efficient and optimized.

6 CONCLUSION

Due to the study of the application of RFID technology for asset management in public entities, the impacts in the following areas are notorious: innovation in control and monitoring, optimization of resources, qualification and training, Sustainability and Social Responsibility and impact on research and scientific innovation. The objective of its application is for the State of Pará, through a pilot project to be carried out by FAPESPA, to have an entrepreneurial vision in the adoption of new technologies in the public service and to become a reference in innovative asset management systems, in addition to fostering research and scientific innovation.

As for innovation in control and monitoring, the collection of documentary data allowed us to identify that the implementation of innovative asset management systems will allow FAPESPA to improve the control and monitoring of its permanent assets. The introduction of technologies such as computerized asset management systems facilitates the tracking, maintenance, and depreciation of assets, ensuring greater efficiency and transparency in processes.

In addition, the RIFD will allow FAPESPA the opportunity for organizational improvement through the optimization of resources, this means the reduction of waste, the efficient control of the useful life of the assets and greater investment in preventive and predictive maintenance, which reduces the costs of asset management, helping to add value to the assets. The integration of new management methodologies, such as preventive and predictive maintenance, has contributed to the reduction of operating costs and the maximization of asset value.

Insertion of new technologies in public entities requires paradigm shifts and the challenge of changes that need to be aligned with a team with training and qualification for their implementation. And its main positive impact is the acquisition of new knowledge in Wealth Management that is consistent with the best practices applied in this area in order to ensure a more effective application of heritage policies.

FAPESPA, as a foundation that supports studies and the application of science in the State of Pará, in addition to being inserted in the application of sustainability within its administrative activities through the adhesion of A3P and by adopting practices that consist of policies aimed at the reuse and proper disposal of goods, will contribute to the social and environmental responsibility that one of the foundations of the circular economy.

Therefore, the improvement in the management of permanent assets will allow FAPESPA to offer better infrastructure conditions for its employees, since it will be able to have a better control of the entire useful life of the asset, helping the managers of the agency

to make more accurate decisions in the process of acquisition of new assets, in addition to the insertion of RFID allowing an innovation in the processes of inventory survey of assets, adding value to this activity and motivating employees through the achievement of the organization's objectives.

ABSTRACT

This study analyzes Continuing Education in Health (CEH) within the context of Primary Health Care (PHC), articulating its conceptual, political, and pedagogical foundations with the contributions of Critical Discourse Analysis (CDA). It assumes that CEH is a fundamental strategy for improving work processes in the Brazilian Unified Health System (SUS), promoting meaningful learning from the daily routine of services and the problematization of professional practices. The work discusses CEH as a social and political practice traversed by disputes over meaning, highlighting tensions between emancipatory perspectives—centered on dialogue, collective reflection, and the transformation of care—and technical-instrumental approaches aligned with managerial rationalities. Within PHC, it is emphasized that the effectiveness of continuing education depends on institutional, organizational, and subjective conditions that favor spaces for critical analysis of work. The overload of care, the precariousness of employment relationships, and the centrality of goals emerge as challenges that can limit its transformative potential. In this scenario, Critical Discourse Analysis is presented as a theoretical-methodological framework capable of revealing how scientific, normative, and institutional discourses produce effects on management, power relations, and the organization of care. It is concluded that the articulation between continuing education in health and critical discourse analysis broadens the understanding of formative processes within the Brazilian Unified Health System (SUS), highlighting that the transformation of health practices involves not only technical changes but also the problematization of ways of thinking, speaking, and giving meaning to work. Thus, continuing education reaffirms itself as a structuring axis for strengthening more democratic, comprehensive practices committed to social justice.

Keywords: Continuing Education in Health. Primary Health Care. Brazilian Unified Health System. Critical Discourse Analysis. Work Processes. Health Management.

RESUMO

Este estudo analisa a Educação Permanente em Saúde (EPS) no contexto da Atenção Primária à Saúde (APS), articulando suas bases conceituais, políticas e pedagógicas às contribuições da Análise do Discurso Crítica (ADC). Parte-se do pressuposto de que a EPS se configura como uma estratégia fundamental para a qualificação dos processos de trabalho no Sistema Único de Saúde (SUS), ao promover a aprendizagem significativa a partir do cotidiano dos serviços e da problematização das práticas profissionais. A obra discute a EPS como prática social e política atravessada por disputas de sentido, evidenciando tensões entre perspectivas emancipadoras — centradas no diálogo, na reflexão coletiva e na transformação do cuidado — e abordagens técnico-instrumentais alinhadas a racionalidades gerencialistas. No âmbito da APS, destaca-se que a efetivação da educação permanente depende de condições institucionais, organizacionais e subjetivas que favoreçam espaços de análise crítica do trabalho. A sobrecarga assistencial, a precarização dos vínculos e a centralidade de metas emergem como desafios que podem limitar seu potencial transformador. Nesse cenário, a Análise do Discurso Crítica é apresentada como um referencial teórico-metodológico capaz de desvelar como discursos científicos, normativos e institucionais produzem efeitos sobre a gestão, as relações de poder e a organização do cuidado. Conclui-se que a articulação entre EPS e ADC amplia a compreensão sobre os processos formativos no SUS, ao evidenciar que a transformação das práticas em saúde envolve não apenas mudanças técnicas, mas também a problematização dos modos de pensar, falar e significar o trabalho. Assim, a educação permanente reafirma-se como eixo estruturante para o fortalecimento de práticas mais democráticas, integrais e comprometidas com a justiça social.

RESUMEN

Este estudio analiza la Educación Permanente en Salud (EPS) en el contexto de la Atención Primaria de la Salud (APS), articulando sus bases conceptuales, políticas y pedagógicas con los aportes del Análisis Crítico del Discurso (ACD). Parte del supuesto de que la EPS se configura como una estrategia fundamental para la cualificación de los procesos de trabajo en el Sistema Único de Salud (SUS), al promover un aprendizaje significativo a partir de la vida cotidiana de los servicios y de la problematización de las prácticas profesionales. La obra discute la EPS como una práctica social y política atravesada por disputas de sentido, evidenciando tensiones entre perspectivas emancipadoras —centradas en el diálogo, la reflexión colectiva y la transformación del cuidado— y enfoques técnico-instrumentales alineados con racionalidades gerencialistas. En el ámbito de la APS, se destaca que la efectivización de la educación permanente depende de condiciones institucionales, organizacionales y subjetivas que favorezcan espacios de análisis crítico del trabajo. La sobrecarga asistencial, la precarización de los vínculos laborales y la centralidad de las metas emergen como desafíos que pueden limitar su potencial transformador. En este escenario, el Análisis Crítico del Discurso se presenta como un marco teórico-metodológico capaz de develar cómo los discursos científicos, normativos e institucionales producen efectos sobre la gestión, las relaciones de poder y la organización del cuidado. Se concluye que la articulación entre EPS y ACD amplía la comprensión de los procesos formativos en el SUS, al evidenciar que la transformación de las prácticas en salud involucra no solo cambios técnicos, sino también la problematización de los modos de pensar, hablar y significar el trabajo. De este modo, la educación permanente se reafirma como un eje estructurante para el fortalecimiento de prácticas más democráticas, integrales y comprometidas con la justicia social.

1 INTRODUCTION

Permanent Education in Health (PEH) is one of the most relevant political-pedagogical strategies aimed at the qualification of work processes and the transformation of care practices within the scope of the Unified Health System (SUS). Unlike traditional models of professional training, historically marked by the centrality of content transmission and by the fragmentation between theory and practice, PEH proposes a conception of learning anchored in the daily work, in the problematization of concrete experiences and in the collective construction of knowledge. It is, therefore, a perspective that recognizes the health worker as a historical, reflective subject and producer of knowledge, and not only as a passive recipient of technical information.

In the context of Primary Health Care (PHC), Permanent Education assumes an even more strategic role. PHC, as the preferred gateway to the SUS and coordinator of the Health Care Networks, is the space where the contradictions, strengths and limits of the Brazilian health system materialize in a more intense way. It is at this level of care that professionals deal daily with the complex demands of the territories, with the social determinants of health and with the need to articulate actions of promotion, prevention, care and surveillance. In this scenario, PHE presents itself as a concrete possibility for redefining practices, strengthening teamwork and expanding the integrality of care.

Despite its normative recognition, especially since the institution of the National Policy for Permanent Education in Health (PNEPS), it is observed that the operationalization of PEH in health services still faces numerous challenges. Recent studies indicate that continuing education is often reduced to specific training actions, sporadic training or courses disconnected from the real needs of the teams and territories. This reduction reveals the permanence of technical-instrumental conceptions of professional training, aligned with a managerial rationality that prioritizes goals, indicators and productivity to the detriment of critical reflection on the work process.

Such contradictions show that PEH cannot be understood only as a set of educational practices or as a formally instituted public policy. It is also configured as a discursive field crossed by disputes of meaning, ideologies and power relations that directly influence the way it is conceived, implemented and experienced in health services. The discourses that circulate about continuing education — whether scientific, institutional or produced in the daily work — contribute to legitimizing certain practices and silencing others, producing concrete effects on the organization of work and on the subjectivity of workers.

In this sense, Critical Discourse Analysis (CDA), as developed by Norman Fairclough, offers a powerful theoretical-methodological contribution to the understanding of these

dynamics. By conceiving discourse as a social practice, historically situated and ideologically oriented, CDA allows us to analyze the dialectical relations between language, power and social organization. In the field of public health, this perspective makes it possible to understand how the discourses on public policies, professional training and work processes not only reflect reality, but actively participate in its production and transformation.

Applying Critical Discourse Analysis to the study of Continuing Education in Health implies recognizing that the meanings attributed to PEH are socially constructed and disputed. Discourses that present it as an emancipatory, collective, and transformative practice coexist with narratives that reduce it to a normative instrument for the adaptation of workers to institutional demands. This tension reflects different projects of health, education and society, making PEH a privileged object for critical analysis within the scope of the SUS.

In this context, this chapter aims to deepen the analysis of contemporary perspectives of Permanent Health Education in Primary Health Care, based on a review of recent literature articulated with the assumptions of Critical Discourse Analysis. It seeks to understand how PHE is discursively constructed in the scientific and institutional field, what meanings are attributed to its relationship with the work processes in PHC and how these discourses influence its effectiveness as a transformative practice in the SUS. By proposing this discussion, it is intended to contribute to the strengthening of permanent education as a structuring axis of Collective Health and as an instrument of resistance in the face of the technician and managerialist tendencies that cross health work.

2 CONTINUING EDUCATION IN HEALTH: CONCEPTUAL, POLITICAL AND PEDAGOGICAL FOUNDATIONS

Continuing Education in Health (PEH) is a theoretical-political proposal that emerges in opposition to traditional models of professional training, historically based on a technician logic, fragmented and disconnected from the real needs of the services and the population. Unlike the conceptions of education centered on the transmission of content and the punctual updating of knowledge, the EPS is based on the assumption that health work is, simultaneously, a space for the production of care, subjectivities and knowledge, with the daily work being the main trigger of the training processes.

In the field of Collective Health, PEH dialogues directly with critical conceptions of education, inspired, among other references, by the thought of Paulo Freire. The centrality of the problematization of reality, dialogue and the collective construction of knowledge brings PEH closer to an emancipatory pedagogy, in which workers cease to be mere receptors of content to assume the role of active subjects of the educational process. This perspective

recognizes the historical and unfinished character of knowledge and affirms education as a social and political practice.

In the Latin American context, the notion of continuing education gains relevance from the criticism of development and professional training models aligned exclusively with market demands and productivist rationality. Guimarães, Martin and Rabelo (2010) highlight that these models produced professionals who were highly specialized from a technical point of view, but poorly prepared to deal with the social, ethical and political complexity that health work goes through. The incorporation of continuing education represents, in this sense, a paradigmatic inflection by affirming work as an educational principle.

In Brazil, the insertion of Continuing Education in Health in the field of public policies was strongly influenced by the formulations of the Pan American Health Organization (PAHO), especially from the 1980s onwards, when on-the-job learning began to be advocated as a strategy to qualify health systems. Lemos (2016) points out that PHE was conceived as a means of expanding workers' commitment to health production processes, stimulating critical reflection on practices and co-responsibility for care.

The consolidation of PEH as a public policy occurs with the institution of the National Policy for Permanent Education in Health (PNEPS), formalized by Ordinance No. 198/2004 of the Ministry of Health and reaffirmed by subsequent regulations. The PNEPS establishes that the training processes must be structured based on the problematization of the work process, taking as a reference the health needs of the population, management and social control. By shifting the focus from education as an event to education as a continuous process, the policy breaks with traditional conceptions of capacity building and training.

Ceccim (2005) offers one of the most relevant contributions to the conceptual foundation of PEH by proposing the so-called "quadrilateral of education", composed of the dimensions of teaching, management, care and social control. According to the author, continuing education is only effective when these dimensions are articulated, allowing the training processes to dialogue with the reality of the services, with public policies and with social demands. This conception broadens the understanding of PHE beyond a pedagogical strategy, recognizing it as a political device capable of influencing the organization of work and power relations in the SUS.

Despite this robust theoretical and normative framework, the literature points out that, in practice, PEH is often reduced to continuing education, capacity building or training actions. Sena (2014) and Araújo (2015) highlight that these modalities, although important, tend to reproduce a transmissive logic of knowledge, in which the contents are previously defined and the workers occupy a passive position in the educational process. This conceptual

reduction empties the critical potential of PEH and reinforces the dichotomy between theory and practice.

The distinction between Continuing Education in Health and continuing education is, therefore, central to the understanding of its pedagogical foundations. While continuing education is organized, in general, based on the updating of technical and normative contents, PEH starts from the real problems experienced in the work process and is built through collective reflection, dialogue and critical analysis of practices. Fernandes (2019) points out that PEH is not defined as a process that teaches ready-made answers, but as a process that provokes questions and displacements in workers' ways of thinking and acting.

In this sense, active methodologies play a fundamental role in the operationalization of Permanent Health Education. Strategies such as conversation circles, case analysis, unique therapeutic projects and institutional support favor the approximation between theory and practice and stimulate the autonomy of the subjects. Luz et al. (2020) highlight that the use of active methodologies in the context of health services contributes to the development of critical thinking and to the qualification of care, by recognizing the complexity of the practices and relationships established in daily life.

Another central element in the foundations of PHE refers to the conception of health work as a complex social practice, crossed by interprofessional relationships, affections and disputes of meaning. Oliveira (2017) emphasizes that the daily routine of health work cannot be reduced to protocols and technical routines, as it involves singular encounters between workers and users, marked by listening, bonding and negotiation. By valuing these dimensions, PHE creates spaces for reflection that allow professionals to analyze their implications and collectively build new forms of action.

The articulation of Permanent Education in Health with the notion of live work in action, developed by Merhy and collaborators, reinforces its transformative potential. Live work refers to the creative and inventive dimension of health work, which manifests itself at the moment of the encounter between worker and user and which cannot be fully captured by harsh norms or technologies. The EPS enhances this dimension by recognizing the knowledge produced in daily life and by stimulating the autonomy and co-responsibility of the subjects.

However, the realization of these conceptual and pedagogical foundations occurs in a context marked by structural contradictions. The precariousness of work relationships, the intensification of care demands and the growing incorporation of managerialist rationalities impose concrete limits on the implementation of PHE as a continuous and collective process.

These factors contribute to the reproduction of fragmented training practices and to the difficulty of consolidating continuing education as a structuring policy of the SUS.

Thus, understanding the conceptual, political and pedagogical foundations of Permanent Health Education requires situating it within the disputes that cross the Brazilian health system. PEH is not configured as a neutral or merely technical device, but as a social and political practice that expresses distinct projects of education, management and care. Acknowledging these disputes is a fundamental condition for analyzing their materialization in health services and, especially, in Primary Health Care, a theme that will be developed in the following chapter.

3 CONTINUING EDUCATION IN HEALTH IN PRIMARY HEALTH CARE: DAILY WORK, MANAGEMENT AND PRODUCTION OF CARE

Primary Health Care (PHC) is a privileged space for the implementation of Permanent Health Education (PEH), as it concentrates continuous, territorialized care practices guided by the principles of integrality, equity and social participation. As the main gateway to the Unified Health System (SUS) and coordinator of care networks, PHC materializes, in a concrete way, the tensions between the normative frameworks of public policies and the real working conditions experienced by health teams.

The work in Primary Care is characterized by high complexity, requiring from professionals skills that go beyond the technical-care dimension. The teams work in territories marked by social inequalities, vulnerabilities and multiple social determinants of health, demanding interdisciplinary and intersectoral practices. Starfield (2002) emphasizes that the effectiveness of PHC is directly related to the ability to establish bonds, ensure longitudinality and respond to the real needs of the population, aspects intrinsically linked to the training processes developed at work.

However, the organization of work in PHC is crossed by managerialist and productivist rationalities, expressed in the centrality of goals, indicators and protocols. Although these instruments are relevant for the planning and evaluation of actions, their uncritical use tends to reduce care to standardized practices, emptying spaces for collective reflection. Paim and Almeida-Filho (2018) highlight that this tension between the hegemonic care model and the principles of the SUS represents one of the main challenges for the consolidation of comprehensiveness in Primary Care.

In this scenario, Permanent Education in Health presents itself as a strategy of resistance and reorientation of practices, by proposing the problematization of the work process as a central axis of learning. Based on the concrete situations experienced by the

teams, the EPS values the knowledge produced in daily life and recognizes the workers as active subjects of the training process. Ceccim and Ferla (2009) emphasize that the EPS, when incorporated organically into the routine of the services, expands professional autonomy and strengthens co-responsibility for care.

The micropolitics of health work, as formulated by Merhy, offers an important contribution to understanding the relationship between PHE and PHC. Micropolitics refers to the relationships established in the meetings between workers, managers and users, and it is in this space that care is effectively produced. EPS acts directly in this dimension by creating collective spaces for the analysis of practices, in which conflicts, affections and disputes of meaning emerge, enhancing the live work in action.

In the context of Primary Care management, Permanent Education can also operate as a device for qualifying decision-making processes and democratizing power relations. Administrations that recognize PEH as a structuring axis of work organization tend to favor participatory practices, stimulating dialogue between teams and the collective construction of solutions to the problems identified in the territory. Feuerwerker (2014) points out that PEH only fulfills this role when it is not captured by a merely bureaucratic or instrumental logic.

Despite its transformative potential, the implementation of Continuing Education in Health in PHC faces concrete limits, such as the precariousness of labor contracts, the high turnover of professionals, and the care overload. These factors reduce the time available for reflective and formative activities and contribute to the restricted understanding of PEH as one-off training. Studies such as those by Lima et al. (2021) show that, in many contexts, continuing education actions remain disconnected from the real needs of teams and territories.

Even so, successful experiences described in the literature demonstrate that EPS can produce significant impacts on the qualification of care in Primary Care. Initiatives that articulate the analysis of the work process, collective discussion of cases, institutional support and user participation contribute to the strengthening of teams, the expansion of the bond with the community and the improvement of health outcomes.

Thus, the analysis of Continuing Education in Health in Primary Health Care shows that its effectiveness depends on institutional, political and subjective conditions that sustain continuous processes of reflection and learning. More than a set of methods, PEH is configured as a social and political practice that disputes meanings about work, care and the very conception of health, preparing the ground for the discursive analysis developed in the next chapter.

4 CONTINUING EDUCATION IN HEALTH AND CRITICAL DISCOURSE ANALYSIS: LANGUAGE, POWER AND SOCIAL TRANSFORMATION IN THE SUS

Critical Discourse Analysis (CDA) is an interdisciplinary theoretical-methodological field dedicated to understanding the relationships between language, power, and social practices. Developed mainly from the contributions of Norman Fairclough, the CDA is based on the assumption that discourse is not only a reflection of social reality, but a constitutive element of this reality, actively participating in the production, reproduction and transformation of social relations. In this sense, language is understood as a historically situated social practice, crossed by ideologies, disputes of meaning and power relations.

For Fairclough, discourse must be analyzed from a three-dimensional perspective, which articulates three interdependent analytical levels: the text (textual dimension), discursive practice (processes of production, circulation, and consumption of texts), and social practice (broader institutional, historical, and political contexts). This approach makes it possible to apprehend not only the explicit content of the discourses, but also the assumptions, silencing, naturalizations and linguistic strategies that sustain certain forms of social organization.

In the field of Collective Health, the CDA has shown itself to be a powerful reference for analyzing public policies, institutional practices and work processes, since it allows us to highlight how certain discourses become hegemonic and how others are marginalized. By bringing language to the center of the analysis, the CDA contributes to unveiling the symbolic mechanisms that sustain management models, conceptions of care and formative practices in the Unified Health System (SUS).

Permanent Education in Health (PEH), when understood as a public policy and as a pedagogical practice, is also configured as a discursive practice. This means recognizing that the meanings attributed to PEH are produced, disputed and legitimized through scientific, normative, institutional and everyday discourses. These discourses not only describe the EPS, but also guide its implementation, delimit its objectives and condition its possibilities for transformation.

The normative documents of the Ministry of Health, such as the National Policy for Permanent Education in Health (PNEPS), construct a discourse that associates PHE with the problematization of the work process, meaningful learning and the transformation of health practices. However, when this discourse circulates at the different levels of management and in health services, it is resignified, reinterpreted and, sometimes, emptied of its critical potential.

CDA allows us to understand how, in many contexts, PEH is discursively reduced to specific training actions, technical training or updating of protocols, aligning itself with a managerial and productivist rationality. This discursive displacement reveals the presence of ideologies that privilege efficiency, control and standardization to the detriment of critical reflection and the collective participation of workers.

On the other hand, counter-hegemonic discourses also emerge that conceive of PEH as a space for dialogue, listening, and collective construction of knowledge. These discourses, often produced in the daily life of the services and in local experiences, tension normative conceptions and affirm permanent education as an emancipatory practice, aligned with the principles of integrality, equity and social participation.

The relationship between discourse and power occupies a central place in Critical Discourse Analysis and is particularly relevant to understanding the work processes in the SUS. The discourses that circulate in health services contribute to legitimizing certain forms of work organization, professional hierarchies and management models, while silencing other possibilities of action.

In the context of Primary Health Care, the presence of discourses that naturalize work overload, the precariousness of bonds and the individual responsibility of workers for the structural problems of the system are observed. These discourses operate ideologically by shifting the focus from material and political conditions to individual performance, weakening the collective dimension of health work.

The EPS, when appropriated by these hegemonic discourses, runs the risk of being instrumentalized as a mechanism for adjusting workers to institutional requirements, reinforcing practices of control and adaptation. CDA makes it possible to highlight these processes by analyzing how certain forms of language produce effects of power, shaping subjectivities and guiding behaviors in everyday work.

On the other hand, continuing education can constitute a space of discursive resistance, by favoring the problematization of working conditions, the clarification of conflicts and the construction of alternative narratives about care and management. From this perspective, PEH assumes a political role by creating conditions for workers to recognize themselves as historical subjects, capable of critically intervening in the reality in which they are inserted.

By articulating language, social practice and power, Critical Discourse Analysis offers important subsidies for the strengthening of Permanent Education in Health as a transformative strategy. The use of CDA in research and training practices allows

problematizing the discourses that guide policies and work processes, contributing to the construction of educational practices that are more coherent with the principles of the SUS.

Within the scope of the EPS, the ADC can be incorporated as a pedagogical device, encouraging workers to critically analyze the discourses that cross their daily lives, such as protocols, goals, reports and institutional norms. This analysis favors awareness of the effects of these discourses on the organization of work and on the relationships between professionals, managers and users.

In addition, the CDA makes it possible to value the discourses produced by the workers themselves, recognizing them as legitimate and fundamental knowledge for the transformation of health practices. By giving visibility to these voices, permanent education contributes to the democratization of decision-making processes and to the strengthening of teamwork.

The articulation between Continuing Education in Health and Critical Discourse Analysis reinforces the understanding that the transformation of health practices is not limited to the adoption of new techniques or knowledge, but involves changes in the ways of thinking, speaking and signifying work and care. The discourses that circulate in health services produce realities and, therefore, their problematization is an essential condition for the construction of a more just and democratic SUS.

In this sense, PEH, anchored in a critical perspective of discourse analysis, can contribute to the deconstruction of hegemonic narratives that reinforce inequalities, fragmentations, and exclusionary practices. By promoting spaces for dialogue and collective reflection, continuing education favors the emergence of new meanings about care, management and the relationship with users.

Thus, understanding PEH as a discursive and political practice broadens its scope and reaffirms its strategic role in the consolidation of the principles of the SUS. By unveiling the relations between language and power, Critical Discourse Analysis strengthens the capacity of continuing education to act as an instrument of social transformation, contributing to the construction of more humane, comprehensive health practices committed to social justice.

5 IMPLICATIONS OF CONTINUING EDUCATION IN HEALTH AND CRITICAL DISCOURSE ANALYSIS FOR MANAGEMENT AND WORK PROCESSES IN THE SUS

Continuing Education in Health (PEH), when understood beyond a pedagogical strategy, assumes centrality as a structuring axis of management in the Unified Health System (SUS). From this perspective, PEH is not limited to the technical qualification of workers, but constitutes a political-pedagogical device capable of influencing the ways of

organizing work, making decisions and producing care. By articulating training, management and care, continuing education tensions traditional models of public administration based on fragmentation, verticalization of decisions and bureaucratic control.

The National Policy for Continuing Education in Health proposes that training processes be anchored in the real needs of services, workers and users, which implies recognizing the daily work as a legitimate space for the production of knowledge. For management, this means shifting the focus from specific training actions to the construction of institutional environments that favor collective learning, interprofessional dialogue and critical reflection on practices.

The health work processes are marked by high complexity, involving technical, relational, ethical and subjective dimensions. In the context of Primary Health Care, these dimensions are intensely manifested, since care is produced in the encounter between workers and users, in contexts crossed by social, cultural and territorial determinants. By focusing on these processes, the EPS acts in the micropolitics of work, understood as the set of relationships, negotiations and disputes that are established in the daily life of the services.

Based on Merhy's (2013) contributions, it is understood that health work is predominantly live work in action, in which technical knowledge is articulated with listening, bonding and situated decision-making. In this scenario, continuing education can favor the expansion of workers' autonomy, by creating spaces for critical analysis of practices and for the shared construction of therapeutic projects that are more sensitive to the needs of users.

The incorporation of management models inspired by business logic has produced significant effects on the organization of work in the SUS. Discourses associated with productivity, the achievement of goals and the measurement of results tend to redefine priorities and guide institutional practices. Critical Discourse Analysis allows us to highlight how these discourses operate ideologically, naturalizing forms of control and individual accountability of workers.

When appropriated by this rationality, PEH runs the risk of being reduced to an instrument for adapting professionals to institutional requirements, emptying its critical and emancipatory character. Quick courses, training focused on indicators and decontextualized training become expressions of an education subordinated to the logic of performance, distancing itself from the proposal of problematizing work and transforming practices.

The articulation between PHE and Critical Discourse Analysis offers important contributions to the construction of a more democratic and participatory management in the SUS. By critically analyzing the discourses that guide institutional policies, norms, and

practices, CDA makes it possible to denaturalize hierarchies, question established truths, and open space for the emergence of new forms of work organization.

In management practice, the incorporation of a critical discursive perspective can favor more transparent and inclusive decision-making processes, by recognizing workers as subjects who produce knowledge and not only as executors of tasks. In this context, PHE becomes a privileged space for listening to the teams, negotiating meanings and collectively constructing care and management strategies.

The implications of Permanent Education in Health and Critical Discourse Analysis for the consolidation of the SUS are broad and profound. By strengthening critical and contextualized educational practices, PEH contributes to the realization of the principles of integrality, equity, and social participation. The analysis of discourses allows us to understand how these principles are appropriated, reinterpreted or emptied in the institutional routine.

In this sense, the articulation between PHE and CDA reinforces the need for public policies that value health work as a complex and historical social practice. Investing in continuing education means, therefore, investing in the capacity of the SUS to reinvent itself in the face of contemporary challenges, strengthening its public, democratic dimension committed to social justice.

6 FINAL CONSIDERATIONS

This chapter showed that Permanent Education in Health, articulated with Critical Discourse Analysis, offers a powerful reference to rethink the management and work processes in the SUS. By shifting the gaze to the discourses that guide institutional practices and decisions, it becomes possible to identify limits, contradictions and potentialities that cross the daily routine of the services.

Thus, PEH reaffirms itself as a fundamental strategy not only for professional qualification, but for the transformation of labor relations, management and health care. The ADC, in turn, broadens this understanding by showing that the change in practices necessarily involves the problematization of the meanings that sustain health practice, contributing to the construction of a more humane, equitable and democratic SUS.

We sought to analyze the perspectives of Permanent Health Education (PHE) in the context of Primary Health Care, articulating this field with the theoretical-methodological contributions of Critical Discourse Analysis (CDA). Throughout the chapters, it was evident that PEH occupies a strategic place in the Unified Health System (SUS), not only as a public education policy, but as a social, pedagogical and political practice deeply involved in the organization of work, management and production of care.

The analysis developed allowed us to understand that continuing education does not materialize in a neutral or homogeneous way in health services. On the contrary, its meanings are continuously disputed and resignified through scientific, normative, institutional and everyday discourses. These discourses express distinct health, education and management projects, revealing tensions between critical and emancipatory conceptions and technical-instrumental approaches aligned with a managerial and productivist rationality.

In the context of Primary Health Care, the chapters showed that the effectiveness of PHE is directly conditioned to the concrete working conditions, the forms of management and the power relations that cross the daily life of the services. The overload of work, the precariousness of bonds and the centrality of goals and indicators emerge as discursive and material elements that limit the transformative potential of continuing education, while at the same time producing processes of subjectivation marked by the individual responsibility of workers.

The incorporation of Critical Discourse Analysis as an analytical framework proved to be fundamental to unveil these dynamics, as it evidenced that the discourse not only reflects the reality of health work, but actively participates in its production and maintenance. The CDA allowed us to identify how certain discourses become hegemonic, naturalizing practices and management models, while others are silenced or marginalized, despite their critical and innovative potential.

At the same time, the work highlighted that Permanent Education in Health can constitute a privileged space for resistance and transformation. When guided by the problematization of the work process, by listening to the teams and by valuing the knowledge produced in daily life, PEH favors the collective construction of care, the strengthening of teamwork and the expansion of workers' autonomy. From this perspective, continuing education reaffirms its commitment to the principles of the SUS, especially integrality, equity and social participation.

The reflections presented also point to important implications for the management of the SUS. Recognizing PHE as a structuring policy implies ensuring institutional conditions, protected time and technical-political support for the development of critical and contextualized educational practices. In addition, it requires confronting managerial discourses that reduce education to an instrument of control and adaptation, emptying its emancipatory potential.

In the field of research in Collective Health, this book contributes by highlighting the relevance of Critical Discourse Analysis as an analytical and pedagogical tool. The CDA expands the possibilities of understanding health policies and practices, by articulating

language, power and social practices, offering subsidies for investigations that seek to understand not only what is done in the SUS, but how health work is spoken, legitimized and transformed.

Finally, the limits of this work are recognized, especially because it is an analysis based predominantly on a bibliographic review. Empirical studies that directly incorporate the discourses of workers, managers and users can deepen the discussions presented here, expanding the understanding of the multiple forms of appropriation of Permanent Education in Health in different territories and institutional contexts.

Even so, it is hoped that this book will contribute to the strengthening of Permanent Education in Health as a critical, reflective and transformative practice, reaffirming its central role in the consolidation of the Unified Health System. By articulating PHE and Critical Discourse Analysis, it seeks to foster new ways of thinking, speaking and doing health, committed to democracy, social justice and the defense of life.

Gilberto Rodríguez Montufar¹

ABSTRACT

The chapter analyzes how leadership practices can guide the transformation of technological education toward Mexican Humanism, considering the National Technological Institute of Mexico (TecNM) as an institutional case study. The objective is to interpret how normative guidelines and the transversal axes of the educational model are translated into operational management criteria, shaping the identity of the leadership body and its capacity to act within complex organizational contexts. The theoretical-analytical approach is interpretive and is grounded in documentary analysis of the TecNM Educational Model, in dialogue with recent literature on educational leadership, public ethics, social justice, and implementation governance. The analytical axes are organized around: (i) leadership practices and the construction of a humanistic leadership identity; (ii) critical thinking as continuous training to understand the determinants of educational service delivery and to support legitimate decision-making; (iii) institutionalized dialogue and collaborative work as organizational technologies for coordination among members of the leadership body, faculty, and administrative staff; and (iv) social responsibility, equity, environmental awareness, and socially relevant innovation as stable management criteria. As a contribution, the chapter proposes an integrative conceptual model of humanistic leadership practices that brings together public values, leadership identity, and organizational mediations. It is argued that this articulation strengthens institutional legitimacy, institutional and collective well-being, and guides coherent, inclusive, and socially relevant processes of educational transformation in Mexican public technological institutions. Although grounded in the TecNM case, the proposed conceptual model seeks to offer an analytical lens transferable to public technological education institutions in other national contexts facing comparable organizational challenges.

RESUMO

O capítulo analisa como as práticas diretivas podem orientar a transformação da educação tecnológica em direção ao Humanismo Mexicano, considerando o Tecnológico Nacional de México (TecNM) como objeto de estudo institucional. O objetivo é interpretar de que maneira as orientações normativas e os eixos transversalizados do modelo educacional se traduzem em critérios operacionais de gestão, configurando a identidade do corpo diretivo e sua capacidade de condução em contextos organizacionais complexos. O enfoque teórico-analítico é interpretativo e fundamenta-se na análise documental do Modelo Educativo do TecNM, em diálogo com literatura recente sobre liderança educacional, ética pública, justiça social e governança da implementação. Os eixos de análise organizam-se em torno de: (i) práticas diretivas e construção de uma identidade humanista; (ii) pensamento crítico como formação contínua para compreender as determinações do serviço educacional e sustentar decisões com legitimidade; (iii) diálogo institucionalizado e trabalho colaborativo como tecnologia organizacional para a coordenação entre membros do corpo diretivo, docentes e pessoal administrativo; e (iv) responsabilidade social, equidade, consciência ambiental e inovação com pertinência social como critérios estáveis de gestão. Como aporte, o capítulo propõe um modelo conceitual integrador de práticas diretivas humanistas que integra valores públicos, identidade diretiva e mediações organizacionais. Argumenta-se que essa articulação fortalece a legitimidade institucional, o bem-estar institucional e coletivo, e orienta processos de transformação educacional coerentes, inclusivos e socialmente pertinentes em instituições tecnológicas públicas mexicanas. Embora ancorado no caso do TecNM, o modelo conceitual proposto busca oferecer uma lente analítica transferível a instituições de educação tecnológica pública em outros contextos nacionais com desafios organizacionais comparáveis.

RESUMEN

El capítulo analiza cómo las prácticas directivas pueden orientar la transformación de la educación tecnológica hacia el Humanismo Mexicano, considerando al Tecnológico Nacional de México (TecNM) como objeto de estudio institucional. El objetivo es interpretar de qué manera las orientaciones normativas y los ejes transversalizados del modelo educativo se traducen en criterios operativos de gestión, configurando la identidad del cuerpo directivo y su capacidad de conducción en contextos organizacionales complejos. El enfoque teórico-analítico es interpretativo y se fundamenta en el análisis documental del Modelo Educativo del TecNM, en diálogo con literatura reciente sobre liderazgo educativo, ética pública, justicia social y gobernanza de la implementación. Los ejes de análisis se organizan en torno a: (i) prácticas directivas y construcción de una identidad directiva humanista; (ii) el pensamiento crítico como formación continua para comprender las determinaciones del servicio educativo y sustentar decisiones con legitimidad; (iii) el diálogo institucionalizado y el trabajo colaborativo como tecnologías organizacionales para la coordinación entre miembros del cuerpo directivo, docentes y personal administrativo; y (iv) la responsabilidad social, la equidad, la conciencia ambiental y la innovación con pertinencia social como criterios estables de gestión. Como aporte, el capítulo propone un modelo conceptual integrador de prácticas directivas humanistas que articula valores públicos, identidad directiva y mediaciones organizacionales. Se argumenta que dicha articulación fortalece la legitimidad institucional, el bienestar institucional y colectivo, y orienta procesos de transformación educativa coherentes, inclusivos y socialmente pertinentes en instituciones tecnológicas públicas mexicanas. Aunque anclado en el caso del TecNM, el modelo conceptual propuesto busca ofrecer una lente analítica transferible a instituciones de educación tecnológica pública en otros contextos nacionales con desafíos organizacionales comparables.

1 INTRODUCTION

The social, economic and technological transformations of the last decades have profoundly redefined the role of higher education and, in particular, public technological education. The acceleration of technological change, the reorganization of work, the expansion of social and territorial inequalities, as well as the growing demands for sustainability and social justice, have placed educational institutions in front of a structural challenge: to articulate specialized technical training with an ethical, humanistic and socially pertinent orientation. In the Mexican context, this challenge is closely linked to the recognition of higher education as a right and as a public good, whose provision with quality and equity constitutes a non-delegable responsibility of the State and the institutions that make up the national educational system (Cámara de Diputados, 2021).

In this scenario, public technological higher education occupies a strategic place. In addition to their contribution to productive development, these institutions fulfill a central social function by expanding access to higher education for historically excluded sectors and by boosting regional development. However, their role cannot be reduced to an instrumental logic centered on employability or the generation of human capital. On the contrary, technological education is called upon to train professionals with technical skills, critical thinking and social commitment, capable of intervening responsibly in complex and unequal contexts. This tension between productivist approaches and humanist orientations structurally crosses the management and direction of public technological institutions.

The system of technological higher education in Mexico is characterized by its institutional and territorial heterogeneity. In it, several subsystems coexist with different training models, governance schemes and scopes. In this context, the Tecnológico Nacional de México (TecNM) is configured as a case of special analytical relevance. Its national scale, its public character and its high organizational density place it as a central actor in the implementation of educational policies oriented towards equity, inclusion and development with well-being. Added to this is the explicitness, in its Educational Model, of a horizon of transformation based on Mexican Humanism, conceived as the ethical and political foundation of technological education (Tecnológico Nacional de México, 2024). This orientation dialogues with national agendas that prioritize collective well-being, social justice, and equity as axes of public and educational action (Asociación Nacional de Universidades e Instituciones de Educación Superior [ANUIES], 2018; Chamber of Deputies, 2021).

In a convergent way, international debates on leadership and governance in higher education institutions have emphasized the need to align sustainability, social justice, and

organizational transformation, particularly in contexts of high public complexity (Aung & Hallinger, 2022; Elken, 2024a; Sánchez-Carrillo et al., 2021; Viera Trevisan et al., 2024)."

However, the adoption of a humanistic approach in normative documents and educational models does not guarantee, by itself, their materialization in everyday institutional life. The gap between policy design and effective implementation is often explained by a combination of structural and organizational factors: budget constraints, accountability pressures, territorial inequalities, entrenched organizational cultures, and bureaucratic inertia. At this point, institutional direction emerges as a central problem of educational management. Directing public technological institutions implies operating in a field of tensions in which demands for administrative efficiency, regulatory compliance and educational transformation with a social sense converge. These tensions fall directly on the governing bodies, responsible for interpreting, contextualizing, and executing the guidelines of the Educational Model in each Technological Institute or Center (Tecnológico Nacional de México, 2024).

This chapter supports a central thesis: leading to transform implies that directive practices, when guided by the principles of Mexican Humanism and its transversal axes, function as organizational and pedagogical mediation devices capable of enabling—or limiting—the transformation of public technological education. From this perspective, management leadership is not conceived as a merely technical or administrative exercise, but as a situated, ethical and political practice, whose effectiveness depends both on the convictions and capacities of those who lead and on the organizational conditions in which it is exercised. This stance is in line with the international literature that highlights the role of educational leadership oriented towards social justice as a structural component of institutional management in contexts marked by inequality and diversity (Chaaban et al., 2025; Rong & Chen, 2025).

In order to avoid a merely declarative treatment of Mexican Humanism, the chapter approaches it as an operationalized analytical category. Concretely, it is proposed to analyze its institutional translation through five interrelated directive dimensions: public ethics and institutional procedure; equity and inclusion in access to learning and working conditions; dialogue and participation as technologies of organizational coordination; social responsibility and territorial relevance; and environmental awareness and innovation with a social sense (Tecnológico Nacional de México, 2024). These dimensions structure the analytical framework of the chapter and allow us to examine the tensions between the normative horizon of the Educational Model and the practices effectively mobilized in daily management.

From this perspective, it is necessary to clarify three notions that are often used interchangeably. Institutional direction refers to the role of strategic management and decision-making. Educational management refers to the processes through which resources, relationships and conditions for the provision of educational services are organized. Directive practices, in turn, designate the set of recurrent, situated and observable actions through which direction is exercised and management is carried out. Consequently, this chapter focuses analytically on directive practices as the space in which the coherence – or fracture – between the humanistic educational project and the institutional operation becomes visible.

In this context, critical thinking is assumed as a transversal directive competence, indispensable to interpret the complexity of the social, organizational and pedagogical determinations that affect technological education. In a complementary way, dialogue is conceived as an organizational technology that allows the articulation of collaborative work between teachers and administrative staff. International evidence shows that dialogic leadership approaches favor participation, co-responsibility, and organizational learning, especially in institutional change processes that require legitimacy and collective ownership (Khaqan & Redondo-Sama, 2024).

In the same way, educational management can be understood as a form of pedagogical mediation. The pedagogical triangle proposed by Jean Houssaye allows us to understand how organizational decisions affect the relationship between teaching, learning and knowledge. From this perspective, administration and planning become a framework of pedagogical possibilities, which gives the management function a direct responsibility for the quality of training and educational justice, in addition to operational efficiency (Houssaye, 1988).

From these considerations, the general objective of this chapter is to critically analyze the directive practices that contribute to the transformation of technological education from the principles of Mexican Humanism, taking the National Technological of Mexico as an object of study. Specifically, it is proposed to interpret how the transversal axes of the Educational Model configure the identity of the governing body; to examine the role of critical thinking and dialogue in institutional management; and problematize the implications of these practices for equity, social justice, and organizational transformation (Chaaban et al., 2025; Khaqan & Redondo-Sama, 2024; Tecnológico Nacional de México, 2024).

The chapter is organized as follows. First, the institutional context of public technological education in Mexico is presented and TecNM is defined as a case study. Subsequently, the TecNM Educational Model and its implications for directive management are analyzed. Then, an analytical framework is developed that articulates Mexican

Humanism, directive identity, critical thinking and dialogical leadership. Finally, the scopes, tensions, and challenges of directing public technological institutions from a humanistic horizon are discussed, as well as their implications for educational management and social transformation (Cámara de Diputados, 2021; Tecnológico Nacional de México, 2024).

Although the analysis focuses on TecNM, the reflections are formulated as an analytical generalization, and not a statistical one, offering potentially useful interpretative keys for other public technological education institutions with comparable organizational conditions.

2 INSTITUTIONAL CONTEXT AND EDUCATIONAL POLICY

In order to understand the directive practices guided by Mexican Humanism, it is necessary to first situate the institutional and normative context in which public technological higher education operates in Mexico. This section delimits the social role of this subsystem, its main traits of organizational heterogeneity, and the coordination and implementation challenges faced by institutions in highly complex public contexts. In particular, the Tecnológico Nacional de México (TecNM) is presented as an object of study due to its scale, organizational density and centrality in the execution of educational policies with an emphasis on equity, inclusion and social relevance. This contextualization allows us to move on, later, to the analysis of the TecNM Educational Model and the directive function as a mediating instance between institutional guidelines and organizational practices (Asociación Nacional de Universidades e Instituciones de Educación Superior [ANUIES], 2018; Chamber of Deputies, 2021).

2.1 PUBLIC TECHNOLOGICAL EDUCATION IN MEXICO AND ITS SOCIAL ROLE

Public technological higher education in Mexico is a strategic component of the national educational system, both for its contribution to productive development and for its role in expanding access to higher education and meeting differentiated regional and territorial needs. In the current regulatory framework, higher education is recognized as a right and as a public good, which obliges the institutions that are part of it to articulate academic quality objectives with principles of equity, inclusion, and social relevance (Cámara de Diputados, 2021). This definition displaces a merely instrumental conception of training and situates technological education as a central space for the construction of well-being and social justice.

The subsystem of public technological higher education is characterized by a marked institutional heterogeneity. In it, different organizational arrangements coexist – Technological

Institutes, Technological Universities and Polytechnic Universities – with different historical trajectories, training models and governance schemes. Although this diversity expands territorial coverage and access opportunities, it also increases the complexity of system management, by posing challenges of inter-institutional coordination, policy alignment, and coherence with national development objectives (Asociación Nacional de Universidades e Instituciones de Educación Superior [ANUIES], 2018). At this point, the institutional leadership acquires a central role as a mediator between general guidelines, local conditions and concrete organizational practices. These challenges dialogue with international debates on multilevel governance and coordination in higher education systems, in which different arrangements of accountability and autonomy condition institutional collaboration (Elken, 2024a; Wullschleger et al., 2025).

It should be noted that this complexity is intensified by tensions typical of public educational management. First, the relationship between centralization and local autonomy usually generates friction: the general guidelines seek homogeneity and control, while the campuses face disparate territorial realities that demand localized adaptations. Secondly, the tension between institutional uniformity and territorial diversity forces us to decide what should be standardized and what should be made more flexible to ensure equity. Finally, the tension between document compliance and cultural change can lead to a formalistic implementation of reforms, in which one fulfills without transforming practices. These conditions of possibility make institutional management decisive in guiding the transformation towards substantive results (ANUIES, 2018; Chamber of Deputies, 2021).

From a social perspective, public technological education cannot be reduced to its ability to respond to the immediate demands of the labor market. Its function is linked to the integral formation of people, the strengthening of critical capacities and the generation of opportunities for social mobility, especially in regions with high levels of inequality. Nevertheless, structural tensions persist between productivist approaches – centered on efficiency, employability and performance indicators – and humanist orientations that emphasize equity, inclusion and social commitment. These tensions are directly expressed in the day-to-day management and decisions of the governing bodies, which are responsible for balancing priorities in contexts of limited resources.

In this context, the Tecnológico Nacional de México (TecNM) is configured as an object of study of special analytical relevance. Its national scale, its public character and its high organizational density place it as a central actor in the implementation of educational policies oriented to equity and development with well-being (Secretaría de Educación Pública, 2014; Chamber of Deputies, 2021). In addition, TecNM has made explicit an educational project

with a humanist orientation that seeks to reconfigure the meaning of technological education beyond technocratic approaches, which introduces specific requirements for institutional management and direction (Tecnológico Nacional de México, 2024).

2.2 THE EDUCATIONAL MODEL OF THE NATIONAL TECHNOLOGY OF MEXICO

The Educational Model of the National Technology of Mexico is the main normative and conceptual reference that guides institutional action in its Institutes and Centers. Unlike models focused exclusively on technical efficiency or immediate adaptation to the labor market, the Model explicitly assumes Mexican Humanism as an ethical and political foundation, placing the person, the community, and collective well-being at the center of the educational process (Tecnológico Nacional de México, 2024). This orientation is consistent with the legal framework of higher education and with a public policy vision that prioritizes equity, inclusion, and social justice as goals of development (Cámara de Diputados, 2021).

From this perspective, the Educational Model proposes an integral conception of training, in which the development of professional skills is articulated with values, attitudes and social commitments. Mexican Humanism operates as a guiding criterion for institutional decisions that transcend the classroom and focus on the organization of work, the management of resources, and the definition of priorities. However, the implementation of this horizon faces structural tensions typical of a large-scale public institution: pressures for accountability, budgetary constraints, territorial inequalities in organizational capacities, and bureaucratic inertia. As a result, the distance between design and execution converts directive management into a critical space of mediation between the educational project and its effective realization.

A distinctive feature of the TecNM Educational Model is the incorporation of transversal axes that cross the substantive functions of teaching, research, extension and institutional management. Among them, social responsibility, environmental awareness, and innovation stand out, conceived as guiding principles of institutional action and not as isolated components (Tecnológico Nacional de México, 2024). In this reading, innovation is understood as the organizational capacity to generate pertinent and socially responsible solutions in the face of complex problems, avoiding technocentric reductions.

These axes acquire relevance to the extent that they are translated into observable directive practices. Social responsibility is expressed in criteria of territorial prioritization and equitable allocation of resources; environmental awareness, in decisions about the sustainable use and management of resources; and innovation, in the governance of improvement processes with a social sense. In this way, the transversal axes not only guide

the institutional discourse: they function as analytical categories to interpret directive practices and their effects on equity, participation, sustainability, and institutional innovation in the following sections (Tecnológico Nacional de México, 2024).

To close this transition, it is worth emphasizing that the Educational Model redefines institutional management as a strategic practice aimed at creating conditions for integral education and human development. Therefore, the relevant question is not only what the Model establishes, but how it is operationalized in organizational decisions and conduction routines within each Technological Institute or Center.

2.3 THE MANAGEMENT FUNCTION IN TECHNOLOGICAL INSTITUTES AND CENTRES

The management function in the Technological Institutes and Centers of TecNM is configured as a strategic axis for the operation and institutional transformation. Directing these organizations implies conducting complex processes in conditions of finite resources, pressures for indicators and growing social expectations, in which each decision produces effects on real opportunities for teaching, learning and coexistence. In this sense, institutional management is not limited to administration; it is an organizational management practice with ethical, political and pedagogical implications (Secretaría de Educación Pública, 2014; Tecnológico Nacional de México, 2024).

To avoid conceptual ambiguities, it is convenient to differentiate three planes. Management refers to the technical-operational component. Educational management is concerned with the coordination of organizational conditions —resources, relationships, and processes— so that educational service is possible with quality and equity. Institutional management is linked to strategic management: it defines priorities, decision criteria, participation mechanisms and ethical guidance of institutional action. Consequently, directive practices constitute the point at which these dimensions are articulated and at which the coherence – or the fracture – between the humanist horizon and everyday operation becomes observable.

From an organizational perspective, the governing bodies act as mediators between public policies, institutional guidelines and local dynamics. This position requires interpreting general guidelines and translating them into situated decisions on planning, resource allocation, work organization, and coordination of actors. The directive function is thus exercised in a field of tensions in which values, priorities and conceptions about the meaning of technological education are put into play. Seemingly technical decisions – such as budget distribution, the teaching load or the prioritization of infrastructure – can contribute to reducing or reproducing internal inequalities.

The TecNM Educational Model assigns to the governing bodies the responsibility of converting Mexican Humanism and its transversal axes into consistent institutional practices. This implies setting up a directive identity based on public ethics, social responsibility, respect for diversity, and commitment to collective well-being (Tecnológico Nacional de México, 2024). The international literature has shown that this identity is constructed in a relational and contextual way, in interaction with organizational structures, normative expectations, and power dynamics, being decisive for the legitimacy of leadership (Crossley et al., 2024; Lê & Hoang, 2025). In TecNM, this identity is consolidated – or tensioned – as the conduction effectively incorporates the transversal axes as decision criteria, and not only as rhetorical references.

In this context, directing Technological Institutes presupposes exercising a leadership oriented to social justice, particularly relevant in institutions that serve heterogeneous populations in territories with persistent inequalities. Empirical evidence synthesized in systematic reviews indicates that this type of leadership is expressed in conscious decisions about the distribution of resources, the inclusion of traditionally marginalized voices, and the construction of safe and inclusive institutional environments (Chaaban et al., 2025; Rong & Chen, 2025). In a complementary way, dialogue is conceived as a central directive practice to organize collaborative work between teachers and administrative staff. However, dialogue requires institutional architecture: formal spaces for deliberation, clear rules for participation, follow-up mechanisms, and an organizational culture that values collaboration (Khaqan & Redondo-Sama, 2024).

In summary, the institutional and educational policy context of TecNM shows that the transformation of technological education towards horizons of equity and social justice depends, to a large extent, on the ability of the governing bodies to translate a humanistic educational project into consistent organizational practices. The articulation between the system, the Educational Model and the directive function establishes the basis for the development of the analytical framework and the state of the art presented in the following section.

3 ANALYTICAL FRAMEWORK AND STATE OF THE ART

This chapter is part of a field of research that articulates higher education, educational management and institutional leadership from an ethical and social perspective. In particular, it is based on the assumption that the transformation of technological education towards horizons of social justice does not occur exclusively through the design of educational policies or models, but through the organizational translation of these orientations through sustained,

legitimized and verifiable directive practices. This approach dialogues with recent evidence that situates educational leadership as a structural condition to address inequalities, expand participation, and sustain improvement processes with a public sense (Chaaban et al., 2025; Rong & Chen, 2025).

3.1 MEXICAN HUMANISM AND INTEGRAL EDUCATION IN HIGHER EDUCATION

Education with a social sense

Mexican Humanism, within the framework of the TecNM Educational Model, is conceived as an ethical orientation that replaces the person, the community, and collective well-being at the center of the formative process, seeking to overcome technocratic reductions in technological education (Tecnológico Nacional de México, 2024). This orientation is articulated with the conception of higher education as a right and public good, which implies quality institutional obligations associated with equity, inclusion, and social relevance (Cámara de Diputados, 2021).

In the international debate, approaches centered on the social meaning of higher education emphasize the coherence between institutional philosophy, formative attributes — such as social responsibility, ethical sensitivity, and leadership with purpose— and congruent organizational practices. From this perspective, the translation of humanist orientations requires institutional management devices capable of sustaining participation, inclusion, and social relevance as effective decision-making criteria (Tecnológico Nacional de México, 2024; Chaaban et al., 2025; Rong & Chen, 2025).

Social justice, equity and collective well-being

Social justice in higher education has been operationalized as the redistribution of opportunities, recognition of diversity, and meaningful participation. Recent systematic reviews indicate that social justice-oriented leadership is associated with deliberate practices of resource distribution, the protection of inclusive environments, and the strengthening of institutional participation (Chaaban et al., 2025; Rong & Chen, 2025).

3.2 EDUCATIONAL MANAGEMENT AS AN ETHICAL AND ORGANIZATIONAL PRACTICE

Educational leadership and public service

Educational management in public institutions is exercised under conditions of ethical responsibility associated with the use of collective resources, accountability and the guarantee of the right to education. Empirical evidence indicates that ethical leadership is associated with higher levels of organizational trust, legitimacy, and better conditions to sustain improvement processes, particularly in contexts in which accountability systems

influence institutional collaboration (Abdi, 2024; Crossley et al., 2024; Wullschleger et al., 2025).

Educational management and institutional transformation

The literature on governance in higher education emphasizes that institutional transformation depends on the directive capacity to interpret policy instruments, coordinate actors, and translate normative guidelines into sustained practices. In this sense, management is configured as a strategic space for organizational mediation, especially when governance instruments present ambiguity and require situated interpretation to be converted into effective institutional action (Elken, 2024a, 2024b).

3.3 IDENTITY OF THE GOVERNING BODY AND INSTITUTIONAL COMMITMENT

Construction of the directive identity

The identity of the governing body is conceived as a relational and dynamic construct, built in interaction with the institutional context, normative expectations and power relations. Recent literature highlights that this identity influences the legitimacy of leadership and the coherence of organizational decisions, as it structures interpretive frameworks, priorities, and criteria for action (Crossley et al., 2024; Lê & Hoang, 2025).

Values, principles and social responsibility

In institutions with a humanist orientation, the directive identity is articulated with values such as social responsibility, public ethics and commitment to collective well-being. Coherence between stated values and observable practices strengthens institutional trust and the capacity for organizational transformation, by stabilizing decision-making, transparency, and coordination criteria oriented to equity (Tecnológico Nacional de México, 2024; Chaaban et al., 2025).

3.4 CRITICAL THINKING AND DIALOGUE IN EDUCATIONAL MANAGEMENT

Critical thinking as continuous training of the leader

Critical thinking is recognized as a key competence for conducting education in contexts of complexity. Recent research indicates that this ability allows analyzing complex problems, anticipating consequences, and sustaining informed decisions in scenarios of uncertainty, also contributing to the strengthening of communication and collaborative work skills when institutionalized as part of training and professional practice (Golden, 2023; Dias-Oliveira et al., 2024).

Dialogue as a means of organizing collaborative work

Dialogic leadership is associated with higher levels of participation, organizational learning, and collective ownership of change processes. Evidence indicates that dialogue requires clear organizational conditions to operate as an effective practice of coordination, and not just as a symbolic resource, which implies the design of formal spaces, rules of participation, and follow-up mechanisms that make collaboration sustainable (Khaqan & Redondo-Sama, 2024).

3.5 EDUCATIONAL MANAGEMENT AS PEDAGOGICAL MEDIATION

Jean Houssaye's pedagogical triangle

The pedagogical triangle proposed by Houssaye allows us to understand the relationship between teaching, learning and knowledge, highlighting that organizational decisions indirectly affect pedagogical processes. In this context, the institutional direction acts as pedagogical mediation by configuring structural conditions for educational practice, so that management not only administers, but enables—or restricts—possibilities of training and educational justice (Houssaye, 1988).

Management, planning and administration as a framework of possibilities

Planning and administration configure a framework of possibilities that enables or restricts equitable and quality educational practices. The literature on university governance warns that, without a shared meaning and without instruments interpreted and appropriated by institutional actors, management processes tend to be reduced to formal compliance, limiting their transformative potential. In this sense, the directive capacity to translate instruments into sustained practices is decisive to avoid merely procedural implementations (Elken, 2024a, 2024b).

3.6 SYNTHESIS OF THE ANALYTICAL FRAMEWORK AND CATEGORIES OF ANALYSIS

Based on the theoretical analysis developed, the chapter is structured into six central analytical categories: (i) humanist directive identity and public ethics; (ii) architecture of dialogue and collaborative work; (iii) distributive equity and inclusion; (iv) sustainability governance; (v) innovation with social relevance; and (vi) educational management as pedagogical mediation.

These categories are articulated in a conceptual model of directive practices that understands institutional direction as a set of translation mechanisms between the humanist horizon—expressed in Mexican Humanism and the Educational Model—and the daily institutional operation. In this sense, directive practices constitute the level at which values,

principles and normative orientations are interpreted and converted into concrete organizational decisions.

The model guides the analysis of how such decisions configure institutional conditions that affect equity, participation, well-being, sustainability, and innovation with social meaning, offering an analytical lens to understand the coherence —or tensions— between the humanistic educational project and its materialization in institutional life.

4 FOCUS AND ANALYTICAL ROUTE OF THE CHAPTER

This section explains the analytical design that underpins the chapter, outlining the type of contribution proposed, the methodological approach adopted and the interpretative path that guides the analysis. Initially, the type of chapter and the methodological approach that underlie the work are characterized. Then, the documentary corpus and the analysis criteria used are described, as well as the theoretical-critical analysis procedure used for the construction of the analytical categories and the conceptual model of directive practices. Finally, the scope and limitations of the chapter are delimited, explaining the type of inference proposed and the care adopted to ensure consistency and interpretative rigor.

4.1 TYPE OF CHAPTER AND METHODOLOGICAL APPROACH

The present work corresponds to an analytical-interpretative chapter, with a theoretical-critical orientation, whose purpose is to understand and problematize the directive practices that mediate the transformation of public technological education towards Mexican Humanism. In coherence with this objective, an interpretative qualitative approach is adopted, supported by documentary analysis and the critical articulation of the state of the art. Document analysis allows for the systematic examination of normative documents and institutional models, identifying assumptions, principles, analytical categories and relevant organizational tensions (Bowen, 2009).

It should be clarified that the chapter is not configured as an empirical research based on the collection of primary data, but as a conceptual contribution that builds a reasoned interpretation based on institutional sources and specialized academic literature. In this framework, a logic of analytical transferability is assumed, according to which the conclusions are proposed as useful for comparable organizational contexts in terms of complexity, scale, and public condition, without the pretense of statistical generalization (Yin, 2018). Transferability is based on the analytical description of the institutional context of TecNM and on the reader's assessment of comparability with other subsystems of technological higher education.

4.2 DOCUMENTARY CORPUS AND ANALYSIS CRITERIA

The analytical corpus was constituted from three sets of sources, selected according to criteria of relevance, timeliness and pertinence in relation to the central question of the chapter.

First, a delimited set of normative and institutional documents that structure the framework of educational policy and the organizational order of public technological higher education was analyzed. Among the references considered are the general normative framework for higher education (Cámara de Diputados, 2021), programmatic documents for educational policy (Secretaría de Educación Pública, 2014), as well as the Educational Model of the Tecnológico Nacional de México and associated documents that explain principles, transversal axes and directive attributions (Tecnológico Nacional de México, 2024). In addition, policy and prospective references for higher education were incorporated for their contextual and interpretative value (Asociación Nacional de Universidades e Instituciones de Educación Superior [ANUIES], 2018).

Secondly, recent academic literature corresponding to the period 2020–2025 was integrated, with an emphasis on systematic reviews and synthesis articles on educational leadership, social justice, directive identity, dialogic leadership, and directive competencies. The state of the art consisted of an approximate set of thirty academic sources, selected according to thematic relevance and editorial quality, prioritizing peer-reviewed publications in indexed journals, with the exception of canonical theoretical or methodological contributions indispensable to argumentation.

Thirdly, basic theoretical contributions, both classical and contemporary, necessary for their explanatory value to interpret the relationship between organization, management and pedagogy, were considered, with emphasis on Jean Houssaye's pedagogical triangle (Houssaye, 1988).

This chapter develops a state-of-the-art narrative-critical character, strengthened by evidence from systematic reviews, but it does not constitute a formal systematic review. The search was non-exhaustive and was oriented towards conceptual coverage, through keywords and citation tracking, without reporting PRISMA metrics or claiming statistical representativeness.

The analysis criteria applied to the corpus included: (i) coherence between declared values and expected organizational practices; (ii) centrality of equity, social justice and collective well-being; (iii) the role of the directive function as a mediation between politics, organization and pedagogy; and (iv) explanatory potential of theoretical approaches for the comprehension of the

are from contexts of high organizational complexity.

4.3 THEORETICAL-CRITICAL ANALYSIS PROCEDURE

The analytical procedure was developed in four interrelated phases, aimed at ensuring conceptual traceability and interpretative consistency.

The first phase consisted of an analytical reading of the normative and institutional framework, with the objective of identifying values, principles, transversal axes, directive responsibilities and organizational assumptions related to management, dialogue, equity and innovation (Bowen, 2009; Chamber of Deputies, 2021; Tecnológico Nacional de México, 2024). The unit of analysis was defined as normative and programmatic statements that can be translated into operational criteria.

The second phase corresponded to a critical review of the state of the art, with emphasis on systematic reviews, aiming to identify trends, analytical consensuses and gaps relevant to the analysis of public technological education. This stage allowed us to delimit a set of guiding constructs – ethical leadership, social justice, directive identity, dialogical leadership, sustainability, and implementation – and to evaluate their interpretative utility.

The third phase involved a process of analytical categorization of a conceptual nature, oriented to the construction of interpretative categories, and not to the quantification of frequencies. This process was supported by conceptual qualitative coding procedures (Saldaña, 2021), combining content analysis applied to normative and institutional documents (Krippendorff, 2018) with thematic analysis applied to academic literature (Braun & Clarke, 2006).

In the fourth phase, a conceptual model of directive practices was consolidated, expressed in a matrix of categories that articulates analytical dimensions, conceptual definitions, institutional evidence, theoretical support and observable directive practices. The model integrates six dimensions: Mexican Humanism and social sense; social justice and equity; ethical direction and public function; directive identity; critical thinking and dialogue; and management as pedagogical mediation.

4.4 SCOPE AND LIMITATIONS OF THE CHAPTER

The chapter systematically articulates the normative horizon of Mexican Humanism, recent scholarly evidence on educational leadership and social justice, and an organizational reading of the directive function in public technology education. The documentary approach allows the identification of directive responsibilities, equity criteria and institutional

coordination devices, particularly within the framework of the TecNM Educational Model and current normativity (Cámara de Diputados, 2021; Tecnológico Nacional de México, 2024).

To strengthen the rigor of the interpretative analysis, criteria of credibility, dependability, confirmability and transferability were met through theoretical triangulation, explicit analytical procedure, evidence matrix by category and cross-review by consensus among the authors during the construction of the categories and the conceptual model (Shenton, 2004).

Among the limitations, the absence of direct empirical evidence on the situated practices of leaders and the lack of a systematic comparison with other technological subsystems are recognized, which opens up future lines of qualitative and comparative research aimed at analyzing how humanist axes are operationalized under different organizational and territorial arrangements.

5 INTERPRETATIVE FINDINGS: DIRECTIVE PRACTICES TO DRIVE TRANSFORMATION

The articulation between the institutional corpus — with emphasis on the Educational Model of the National Technological of Mexico —, the recent international literature and the analytical framework developed in Sections 3 and 4 allows us to identify interpretative patterns of directive practices that mediate the transformation of technological education towards Mexican Humanism. These findings are organized around previously outlined analytical categories and are formulated as traceable conceptual inferences (and not as generalizable empirical regularities), constructed through documentary analysis and theoretical-critical synthesis (Bowen, 2009; Braun & Clarke, 2006; Shenton, 2004).

In the TecNM Model, educational transformation is structured based on transversal axes — social responsibility, environmental awareness, innovation, and vanguard — and an explicit orientation towards social justice and well-being, which positions institutional management as an instance of translation between the normative horizon and organizational operation (Tecnológico Nacional de México, 2024). International evidence converges in indicating that directive identity, ethical leadership, institutionalized dialogue, distributive criteria of equity, and governance of change constitute relevant mechanisms to sustain institutional transformations in complex public contexts (Abdi, 2024; Chaaban et al., 2025; Elken, 2024a, 2024b; Khaqan & Redondo-Sama, 2024; Rong & Chen, 2025).

5.1 DIRECTIVE PRACTICES AND THE CONFIGURATION OF A HUMANIST IDENTITY

Institutional management with values

The transformation towards Mexican Humanism tends to become operative when the institutional direction configures a humanist directive identity, understood as a relatively stable

framework of values that guides decision-making criteria and management practices. This pattern finds internal anchorage in the TecNM Model, by emphasizing Mexican Humanism and integral education with social meaning as a guiding horizon for institutional management (Tecnológico Nacional de México, 2024).

The literature on leadership identity indicates that this identity is not a fixed individual attribute, but a relational and contextual construct that influences legitimacy, cooperation, and ownership of organizational change (Lê & Hoang, 2025; Nieberle et al., 2023). In this sense, when the directive identity is aligned with humanist values, institutional decisions tend to prioritize institutional well-being — understood as climate, safety, coexistence, and working and learning conditions — to the detriment of merely instrumental or bureaucratic logics.

Among the observable policy practices associated with this pattern are: (a) explicit prioritization criteria with social meaning (permanence, inclusion, safety, accompaniment); (b) coherence between discourse, decision and follow-up; and (c) institutional communication that links decisions to values, principles, and transversal axes (Tecnológico Nacional de México, 2024; Lê & Hoang, 2025). This evaluative orientation acquires greater consistency when it is expressed in rules, procedures and responsibilities proper to the exercise of public function, constituting the basis of the dimension "humanistic directive identity and public ethics" of the integrative model.

Public ethics and social commitment

The humanist identity of the governing body is strengthened when the management function is exercised under principles of public ethics, understood as responsibility in the use of collective resources, decision-making transparency and orientation to the general interest. Recent literature points out that ethical leadership practices are associated with higher levels of trust, institutional commitment, and organizational cohesion, especially in public contexts marked by structural inequalities (Abdi, 2024; Crossley et al., 2024).

In the context of public technological education, this social commitment is expressed in decisions that seek to reduce internal asymmetries, protect vulnerable groups, and align institutional action with objectives of social justice and development with well-being. Thus, the humanist directive identity, articulated with public ethics, constitutes a central mediation between the normative horizon of Mexican Humanism and the organizational decisions of everyday life.

5.2 DIALOGUE AND COLLABORATIVE WORK AS MANAGEMENT STRATEGIES

Relationship between managers, teachers and administrative staff

Under criteria of ethical and public coherence, dialogue becomes a strategic directive practice when it operates as an organizational technology — that is, when it is supported by structures, rules, and monitoring mechanisms — and not only as an interpersonal disposition. This pattern is anchored in the TecNM Model, by emphasizing the organization of collaborative work and institutional co-responsibility to operationalize the educational project (Tecnológico Nacional de México, 2024). The synthesized evidence indicates that dialogic leadership is associated with meaningful participation and organizational learning, as long as there are explicit institutional conditions for deliberation (Khaqan & Redondo-Sama, 2024).

Among the observable directive practices are: (a) formal spaces for inter-area deliberation (academic-administrative); (b) explicit rules of participation (representativeness, times, minutes); (c) monitoring of agreements (responsible, deadlines, evidence); and (d) mediation and conflict management mechanisms (Khaqan & Redondo-Sama, 2024). As these conditions become institutionalized, dialogue enables transversal coordination and sustains agreements that translate into management routines, composing the dimension "architecture of dialogue and collaborative work".

Collective construction of educational management

Collaborative work emerges when management recognizes the interdependence between substantive and administrative functions, avoiding the fragmentation of educational management. This finding converges with studies on governance and implementation, which show that the effective translation of instruments and guidelines depends on coordination, co-design, and shared meaning-making capabilities (Elken, 2024a, 2024b). In the context of TecNM, this collective construction is aligned with the need to operationalize transversal axes through interfunctional agreements, and not only via formal provisions (Tecnológico Nacional de México, 2024).

Among the observable practices are: mixed committees for complex problems (permanence, tutoring, inclusion, security); clarity of roles and responsibilities; common criteria for evaluating progress; and feedback and adjustment cycles as organizational learning (Elken, 2024a, 2024b). When collaboration stabilizes, the directive capacity to sustain distributive and inclusion decisions with legitimacy is expanded, repositioning equity as an operative — and not just normative — criterion of transformation.

5.3 MANAGEMENT LEADERSHIP, EQUITY AND SOCIAL JUSTICE

Equitable distribution of resources

In scenarios of transversal coordination, equity becomes a directive criterion when the allocation of resources, loads and support is oriented towards compensating for internal

inequalities (territorial, infrastructural, population). This pattern is anchored in the TecNM Model by situating social justice and collective well-being as a horizon, suggesting a reading of equity as a differentiated allocation, and not as arithmetic equality (Tecnológico Nacional de México, 2024). The literature on leadership for social justice converges in indicating that distributive decisions constitute a critical mechanism to advance institutional equity (Chaaban et al., 2025; Rong & Chen, 2025).

The associated observable practices include: differentiated allocation criteria according to gaps (need, installed capacity, lag); explicit support for permanence (tutoring, monitoring, aid management); territorial and infrastructure prioritization according to deficits; and monitoring of distributional effects through indicators (permanence, lag, dropout) (Chaaban et al., 2025; Rong & Chen, 2025). By operating with explicit distributive criteria, equity tends to be articulated with inclusion policies and practices that directly affect the climate and institutional conditions.

Inclusion, diversity and institutional well-being

In continuity with distributive equity, social justice is also operationalized through directive practices oriented towards inclusion and institutional coexistence, especially in culturally diverse contexts. This anchoring is articulated with the TecNM Model by emphasizing respect for diversity and the construction of inclusive and safe environments (Tecnológico Nacional de México, 2024). International evidence indicates that leadership for social justice promotes inclusive cultures through clear norms, protection of vulnerable groups, and meaningful participation (Chaaban et al., 2025; Rong & Chen, 2025).

To avoid conceptual ambiguity, a distinction is made between institutional well-being — related to climate, safety, coexistence, and working and learning conditions — and collective well-being, understood as a macro normative horizon of social justice that guides the direction of educational policy. This distinction allows us to understand how situated directive decisions (micro/meso levels) are connected to public ends (macro level) without confusing levels of analysis.

Among the observable practices are: anti-discrimination and conflict response protocols; mechanisms for the participation of diverse groups; periodic measurement of the institutional climate and response to alerts; and safety and coexistence actions (Chaaban et al., 2025; Tecnológico Nacional de México, 2024). The consolidation of inclusion and institutional well-being, in turn, tends to reinforce the legitimacy of sustainability and innovation initiatives, which require organizational trust and inter-area coordination to be maintained over time. These elements compose, in the integrative model, the dimension "distributive equity and inclusion".

5.4 SOCIAL RESPONSIBILITY, ENVIRONMENTAL AWARENESS AND INNOVATION

Sustainability-oriented management

In complex public organizations, social responsibility and environmental awareness translate into directive practices when sustainability is incorporated as a cross-cutting criterion for planning, evaluation, and allocation. This pattern is anchored in the TecNM Model, which incorporates environmental awareness as a transversal axis articulated with social responsibility (Tecnológico Nacional de México, 2024). The literature on sustainability in higher education emphasizes that progress depends on institutional coherence, organizational learning, and forms of governance that avoid isolated actions (Aung & Hallinger, 2022; Sánchez-Carrillo et al., 2021; Viera Trevisan et al., 2024).

Observable practices include: environmental criteria in investments and projects (energy, waste, procurement); responsible or committees with goals and monitoring; institutional indicators (consumption, reduction, maintenance); and evaluation of distributive impacts of environmental measures, recognizing that sustainability and equity mutually affect each other (Viera Trevisan et al., 2024). When sustainability is managed as governance — and not as a one-off initiative — a socially pertinent and organizationally sustainable field of innovation opens up, synthesized in the "sustainability governance" dimension.

Innovation with social relevance

Innovation acquires a transformative meaning when oriented to social relevance and public value. Institutional anchoring is observed in the "innovation and vanguard" axis of the TecNM Model, articulated with social responsibility, which allows innovation to be interpreted as organizational, pedagogical, and socially situated, and not as mere technological adoption (Tecnológico Nacional de México, 2024). The literature on governance and implementation warns that innovating in public organizations requires coordination, legitimacy, and structures that allow experimentation without losing institutional coherence (Elken, 2024a, 2024b). In addition, studies on institutional sustainability indicate that transformative innovation tends to depend on organizational learning and responsible scaling (Aung & Hallinger, 2022; Viera Trevisan et al., 2024).

Among the observable practices are: evaluation of projects by social impact (pertinence, inclusion, sustainability); innovation portfolio (prioritization, escalation criteria, continuity); pilot projects with documentation and feedback; and governance mechanisms to sustain innovations (Elken, 2024a; Viera Trevisan et al., 2024). Together, sustainability and innovation are integrated as decision criteria when directive identity, institutionalized dialogue and equity operate as conditions of possibility for change. This articulation is captured, in the integrative model, by the dimension "innovation with social relevance".

5.5 SYNTHESIS OF FINDINGS AND INTEGRATIVE MODEL OF DIRECTIVE PRACTICES

The synthesis of the findings suggests that directive practices operate as interdependent organizational mediations between the transversal axes of the Model, the directive identity and the institutional operation. Consequently, educational transformation is interpreted less as the sum of initiatives and more as systemic coherence between values, decision criteria, and organizational architecture (Tecnológico Nacional de México, 2024; Chaaban et al., 2025; Khaqan & Redondo-Sama, 2024; Rong & Chen, 2025).

The synthesis of the findings makes it possible to organize the analytical dimensions and the corresponding directive practices in an integrative model, in which each component articulates the directive function, observable markers and expected organizational results. Table 1 presents this matrix in a systematic way, bringing together the mediations identified in subsections 5.1 to 5.4.

Table 1

Integrative model of directive practices for educational transformation towards Mexican Humanism

Model Component	Directive function	Observable policy practices	Expected organizational outcome
Humanist directive identity and public ethics	Institutional legitimacy and normative coherence	Explicit prioritization criteria; accountability; transparency; Justification of decisions	Organizational trust; discourse-practice coherence; legitimacy of the conduction; Orientation to collective well-being
Architecture of dialogue and collaborative work	Inter-area coordination and shared sense	Deliberative spaces; rules of participation; monitoring of agreements; Conflict mediation	Effective collaboration; reduction of friction; Organizational Learning
Distributive equity and inclusion	Institutional justice and protection of opportunities	Differentiated allocation; support for permanence; inclusion protocols; Climate measurement	Reduction of internal breaches; safe environments; institutional well-being
Sustainability governance	Integration of environmental awareness as a cross-cutting criterion	Environmental criteria; responsible/committees; indicators; Impact assessment	Institutional sustainability; Consistency with social responsibility
Innovation with social relevance	Creative response to public problems with social value	Evaluation by social impact; portfolio/pilots; documentation and scheduling; Innovation governance	Useful, relevant and sustainable (non-cosmetic) innovation
Institutional Transformation Toward Mexican Humanism	Integrating result of previous mediations	Alignment axes—decisions—routines; follow-up; evidence-based adjustments	Social justice and collective well-being; excellence with social relevance

Note. The table derives from the matrix of categories and the analytical procedures developed in the analytical framework and methodological approach presented in Sections 3 and 4. The components are anchored in the transversal axes of the Educational Model of the Tecnológico Nacional de México (social responsibility,

environmental awareness, innovation and avant-garde) and in state-of-the-art evidence on leadership for social justice, dialogical leadership, directive identity, governance of change and sustainability (Tecnológico Nacional de México, 2024; Chaaban et al., 2025; Elken, 2024a, 2024b; Khaqan & Redondo-Sama, 2024; Rong & Chen, 2025; Viera Trevisan et al., 2024).

As can be seen in Table 1, the model integrates conceptual and operational levels: the components resume the analytical dimensions developed in this chapter, while the proposed practices and results function as interpretative hypotheses on how institutional direction can translate Mexican Humanism into concrete organizational arrangements.

From an interpretative reading, the integrative model allows us to infer that institutional transformation tends to depend on explicit directive criteria that translate values into decisions and monitoring, on institutionalized dialogue with coordination rules, and on the incorporation of equity, sustainability, and innovation as stable governance criteria, rather than as isolated initiatives (Elken, 2024a, 2024b; Rong & Chen, 2025; Viera Trevisan et al., 2024). These inferences are deepened and contrasted in the Discussion (Section 6), where tensions, scopes, and conditions of possibility are analyzed.

6 DISCUSSION

This section discusses the findings in the light of the analytical framework and the state of the art, highlighting the organizational mediations that condition the translation of Mexican Humanism into directive practices. To this end, it is organized into three axes: the contributions of Mexican Humanism to reorient directive management; the tensions and challenges of its implementation in complex public organizations; and the implications for public educational management and for broader processes of social transformation.

6.1 CONTRIBUTIONS OF MEXICAN HUMANISM TO DIRECTIVE MANAGEMENT

The findings of the chapter allow us to affirm that Mexican Humanism offers a normative and ethical framework with transformative potential for directive management in public technological education, as long as it is translated into consistent organizational practices. More than a declarative referent, Mexican Humanism operates as a guiding criterion for directive decisions that reconfigure the meaning of the institutional function, by situating collective well-being, equity, and social responsibility as explicit ends of educational action (Tecnológico Nacional de México, 2024).

In the analytical logic adopted, this horizon is operationalized through categories such as social justice, public ethics, dialogue, directive identity, and pedagogical mediation. For this reason, the international literature on educational leadership oriented to social justice constitutes a pertinent interpretative support for understanding its organizational translation

conditions (Chaaban et al., 2025; Rong & Chen, 2025). The integrative model presented in this chapter contributes to this debate by articulating Mexican Humanism to concrete dimensions of the directive function in a public technological subsystem, offering an analytical framework applicable to comparable organizational contexts.

In this sense, the results dialogue with systematic reviews that highlight the need to articulate public values, directive identity, and institutional management practices to face contexts of structural inequality (Chaaban et al., 2025; Rong & Chen, 2025). Institutional management, understood from this perspective, moves from a rationality focused exclusively on administrative efficiency to a situated ethical and political practice, capable of influencing distributive decisions, the legitimacy of conduct, and the construction of organizational trust (Abdi, 2024; Crossley et al., 2024).

Specifically, the evidence on social justice-oriented leadership emphasizes that equity and inclusion require directive intentionality and explicit decision criteria, beyond formal compliance (Chaaban et al., 2025; Rong & Chen, 2025). The integrative model adds to this field by making explicit observable directive practices and expected organizational outcomes, suggesting markers that can guide both institutional reflection and future empirical analyses.

In addition, Mexican Humanism's emphasis on integral education broadens the understanding of educational management as pedagogical mediation. Decisions about planning, resource allocation and work organization are recognized as conditions that indirectly affect the teaching and learning processes, reinforcing the directive responsibility for training quality and educational justice (Houssaye, 1988). This contribution is particularly relevant in public technological institutions, in which technocratic or productivist approaches have historically predominated, and reinforces the central assumption of the chapter: institutional transformation becomes effective when the humanist horizon is converted into routines, criteria, and organizational management devices that can be described, analyzed, and monitored.

6.2 TENSIONS AND CHALLENGES IN THE MANAGEMENT OF TECHNOLOGICAL INSTITUTIONS

Nevertheless, this reorientation faces structural tensions that condition the materialization of the humanist horizon in directive practice. One of the main ones is between the normative design of educational models and the real conditions of implementation in large-scale public organizations. Budgetary constraints, accountability requirements, pressures for indicators, and territorial inequalities limit the room for maneuver of governing bodies and can favor logics of formal compliance to the detriment of substantive

transformations, as the literature warns about the implementation of governance instruments when milestones are ambiguous or translated heterogeneously into practice (Elken, 2024b).

In public technological education, these tensions tend to intensify due to the heterogeneity of institutional capacities between campuses, territorial dispersion, and the need to simultaneously sustain operation, regional relevance, and continuous improvement. In the case of TecNM, the organizational scale and the diversity of contexts of its Institutes and Centers make especially critical the directive capacity to translate the Educational Model and its transversal axes into situated decisions, preventing the humanist orientation from remaining enclosed in the normative plan (Tecnológico Nacional de México, 2024).

Added to this is the tension between centralization and institutional autonomy: while the general guidelines seek homogeneity and control, the local contexts demand localized adaptations to respond to specific needs, in a framework in which higher education is recognized as a right and public good (Cámara de Diputados, 2021). The directive function is thus exercised in a field of permanent negotiation, in which critical thinking and the capacity for contextual interpretation are fundamental to avoid the mechanical reproduction of guidelines disconnected from institutional reality and to sustain criteria of equity in disparate organizational conditions.

In addition, the impulse to dialogue and collaborative work faces cultural and organizational challenges. Dialogue does not occur spontaneously: it requires institutional architecture, clear rules of participation, and follow-up mechanisms to operate as effective coordination and not as a symbolic resource (Khaqan & Redondo-Sama, 2024). In terms of the proposed integrative model, these tensions directly impact the coherence between humanist values, directive practices, and organizational outcomes, by weakening the translation mechanisms that allow us to move from the normative horizon to everyday transformation—especially in the dimensions of directive identity, architecture of dialogue, and distributive equity.

6.3 IMPLICATIONS FOR PUBLIC EDUCATIONAL MANAGEMENT AND SOCIAL TRANSFORMATION

In terms of public educational management, the results suggest that the effectiveness of policies oriented to equity and well-being does not depend only on their formulation, but on the directive capacity to translate them into coherent organizational practices. In this sense, the directive function emerges as a strategic level of public policy implementation, in which operational priorities are defined, institutional meanings are negotiated, and distributive criteria are established with concrete effects on inclusion, participation, and learning

conditions (Elken, 2024a; Wullschleger et al., 2025). This finding is consistent with the understanding of higher education as a public good, which requires institutional management to articulate quality, equity, and social relevance (Cámara de Diputados, 2021).

In a complementary way, the discussion highlights the need to rethink the training and professional development of the directors of public technological institutions. In addition to administrative skills, analytical, ethical, and dialogical skills are required to lead complex organizations with social meaning, strengthening at least three areas: (i) continuous training in critical thinking and decision-making under criteria of social justice; (ii) design of institutional devices for dialogue and co-responsibility, such as formal spaces, rules of participation and monitoring mechanisms; and (iii) explicit criteria for distributive decisions oriented towards territorial equity and institutional inclusion (Chaaban et al., 2025; Khaqan & Redondo-Sama, 2024; Rong & Chen, 2025). In the field of ethical leadership in public organizations, these capabilities contribute to sustaining trust, legitimacy, and institutional performance under conditions of tension and demand (Abdi, 2024; Crossley et al., 2024).

The proposed integrative model offers, in this sense, a useful framework to guide both management training programs and institutional self-evaluation processes, by converting values and cross-cutting axes into components, functions, practices, and results that can be monitored over time. In educational reform contexts, this matrix can inform institutional development agendas centered on equity, sustainability, and innovation with social pertinence.

Finally, directing public technological institutions from a humanistic horizon can contribute to broader processes of social transformation, insofar as it focuses on reducing inequalities, expanding educational opportunities, and building organizational cultures oriented to collective well-being. In this context, educational management is configured as a privileged space to articulate public policy, institutional ethics, and social justice, especially when the Educational Model becomes stable decision-making criteria and verifiable directive practices in institutional life (Tecnológico Nacional de México, 2024).

With this, the discussion closes the analytical circle of the chapter: the integrative model not only organizes categories, but also allows us to understand how directive mediations enable — or limit — the translation of the humanist horizon into effective organizational conditions. At the same time, it is projected as a basis for future empirical and comparative investigations, aimed at examining the extent to which these practices materialize in different institutional arrangements and territorial contexts.

7 CONCLUSIONS

This section closes the chapter by synthesizing the conclusions derived from the theoretical-interpretative analysis and by delimiting their implications for institutional direction in public technological institutions. Initially, the main conclusions articulated to the integrative model of directive practices are presented (see Table 1); Then, the theoretical contributions and practical orientations are explained, the limitations of the analysis are recognized, and future lines of research and reflection are proposed to contrast and refine the developed framework.

7.1 MAIN CONCLUSIONS OF THE CHAPTER

The objective of this chapter was to analyze the directive practices that mediate the transformation of technological education towards Mexican Humanism, from an analytical-interpretative approach based on the institutional corpus of the National Technological Institute of Mexico and on recent international literature. From this perspective, and without intending empirical generalization, the analysis allows us to infer four main conclusions, articulated with the integrative model of directive practices (see Table 1) (Tecnológico Nacional de México, 2024; Yin, 2018).

First, it is concluded that Mexican Humanism operates as a normative-operative horizon that reconfigures the meaning of institutional direction, by situating it as a mediation between public values — social justice, collective well-being and public responsibility — and concrete organizational decisions. This horizon becomes operative when it translates into stable criteria for governance, planning, and institutional monitoring, and not just as a programmatic statement (Cámara de Diputados, 2021; Tecnológico Nacional de México, 2024).

Secondly, it is inferred that the humanist directive identity, articulated with public ethics, constitutes an organizing nucleus of institutional legitimacy and organizational coherence. Transformation tends to be sustained with greater consistency when values are translated into explicit criteria for prioritization, transparency, and accountability, strengthening trust, legitimacy, and institutional performance (Abdi, 2024; Crossley et al., 2024). This conclusion corresponds, in the integrative model, to the dimension "humanist directive identity and public ethics".

Thirdly, it is concluded that institutionalized dialogue and collaborative work work as an architecture of inter-area coordination that enables the effective implementation of equity and inclusion. Such practices do not emerge spontaneously: they depend on clear rules, formal spaces, follow-up mechanisms, and conflict management devices that prevent

coordination from being reduced to episodic or symbolic efforts (Khaqan & Redondo-Sama, 2024; Chaaban et al., 2025; Rong & Chen, 2025). This conclusion is articulated with the "architecture of dialogue and collaborative work" dimension of the model.

Fourthly, the analysis allows us to infer that the axes of social responsibility, environmental awareness and innovation acquire transformative potential when they operate as stable decision criteria and not as isolated initiatives. Its organizational continuity depends on governance devices, indicators, and institutional learning processes that allow sustainability and innovation with social relevance, especially in complex educational organizations (Aung & Hallinger, 2022; Viera Trevisan et al., 2024; Tecnológico Nacional de México, 2024). In the integrative model, this conclusion is expressed in the dimensions "governance of sustainability" and "innovation with social relevance".

Together, these conclusions summarize that the institutional transformation towards Mexican Humanism is configured as a process of interdependent organizational mediations: directive identity and public ethics that confer legitimacy; dialogue architectures that underpin coordination; distributive and inclusive criteria that guide institutional justice; and governance of sustainability and innovation that enables the continuity of change. The final line of the model — "institutional transformation towards Mexican Humanism" — thus condenses the integrating result of these mediations.

7.2 THEORETICAL AND PRACTICAL IMPLICATIONS FOR THE DIRECTIVE FUNCTION

Theoretical implications

On the theoretical level, the chapter contributes to studies on educational leadership and management by proposing an integrating framework that articulates directive identity, public ethics, and organizational architecture under a horizon of public value. This approach shifts the focus from conceptions centered on leadership styles or individual competencies to the understanding of institutional direction as organizational mediation that translates normative principles into criteria of governance, coordination, and decision-making (Chaaban et al., 2025; Rong & Chen, 2025; Elken, 2024a, 2024b).

In a complementary way, the chapter contributes to the understanding of direction as pedagogical-organizational mediation, by recovering the link between management, planning and administration as landmarks of possibility of educational service. This reading allows us to conceive of the directive function not only as the administration of resources, but as the production of institutional conditions for integral education, inclusion and social relevance (Houssaye, 1988; Tecnológico Nacional de México, 2024). The integrative model, by making explicit observable components, functions and practices, offers an analytical scheme that can

be mobilized in comparative studies and research on the implementation of policies in technological subsystems.

Practical implications

On the practical level, the findings suggest that institutional direction in public technological institutions is strengthened when it operates with explicit and verifiable criteria for decision-making, coordination, and accountability consistent with Mexican Humanism (Tecnológico Nacional de México, 2024). More than adding tasks, this implies reviewing, stabilizing and aligning routines and institutional mechanisms, for example:

- i. Formal instances of dialogue with traceable agreements and follow-up (inter-area committees, working tables with responsible parties and schedules);
- ii. Transparent criteria for distributive decisions oriented towards territorial equity and inclusion (public allocation and prioritization rules); e
- iii. Governance devices for sustainability and innovation (targets and indicators, periodic evaluation, and organizational learning) that avoid fragmentation into isolated initiatives (Khaqan & Redondo-Sama, 2024; Wullschleger et al., 2025; Viera Trevisan et al., 2024).

The proposed integrative model can, in this sense, guide self-assessment and planning processes in Technological Institutes and Centers, by translating values and transversal axes into observable directive practices and expected organizational results, subject to monitoring over time.

7.3 LIMITATIONS OF THE ANALYSIS

This chapter has limitations that delimit the scope of its inferences. First, the analysis is based on a documentary corpus and secondary literature; therefore, it does not incorporate direct empirical evidence on situated practices of managers, professors, and administrative staff. Consequently, the findings should be interpreted as reasoned conceptual inferences, and not as empirical generalizations (Bowen, 2009; Yin, 2018).

Secondly, the dependence on normative and institutional sources can overrepresent the intention of the policy to the detriment of everyday practice, implying the risk of assuming equivalence between documentary prescription and actual operation. Furthermore, the proposed integrative model has not yet been submitted to empirical validation or systematic evaluation by specialists, so its explanatory robustness should be considered an open-ended conceptual proposal, subject to contrast and refinement (Shenton, 2004).

7.4 FUTURE LINES OF RESEARCH AND REFLECTION

From the conclusions and limitations identified, future lines are proposed aimed at empirically validating the integrative model, developing multiple case studies in Technological Institutes and Centers, and comparatively exploring the transferability of the analytical framework to other subsystems of technological higher education. Qualitative studies based on in-depth interviews, organizational observation, and analysis of directive decisions could contrast the extent to which the practices described materialize in different institutional contexts (Yin, 2018; Tecnológico Nacional de México, 2024).

These lines will allow us to deepen the understanding of institutional direction as an organizational mediation for educational transformation with a social sense, strengthening the articulation between public value, directive practices and institutional results. In particular, they will contribute to the development of mechanisms for conducting, coordinating, and governing that explain how processes of change are sustained or weakened in complex public educational organizations, as well as to identifying contextual conditions that favor the translation of Mexican Humanism into social justice, collective well-being, and excellence with social relevance.

Francisco José de Oliveira Neto¹

ABSTRACT

Since Freud, the concept of malaise in civilization has designated the structural tension between desire, social bonds, and instinctual renunciation. In contemporary society, this tension is intensified by neoliberal rationality and the logic of late capitalism, which reconfigure both forms of suffering and modes of substitutive satisfaction. Although the literature widely acknowledges the commodification of psychic suffering, the subjective dynamics involved in contemporary practices of affective substitution—such as bonds with reborn babies and the parentalization of companion animals—remain underexplored. This study aims to analyze, in light of psychoanalysis and critical theory, how such practices operate as defensive solutions to malaise, articulating fantasy, fetishism, and narcissism within the logic of consumption. This is a qualitative study of a theoretical-analytical nature, guided by the hermeneutic-critical method and based on a critical review of psychoanalytic and philosophical literature, with emphasis on classical and contemporary authors such as Freud, Winnicott, Adorno, Horkheimer, Benjamin, Rosa, and Byung-Chul Han, in dialogue with recent international scholarship. It is argued that the affective substitutions analyzed function as fetishistic and narcissistic formations that suspend alterity, neutralize the experience of loss, and offer an illusory relief from psychic suffering. At the same time, such practices are captured and amplified by the market, which transforms subjective impasses into consumer niches. It is concluded that these configurations, far from promoting symbolic elaboration, tend to freeze suffering, reinforcing repetitive circuits of satisfaction and frustration. The study contributes to the fields of clinical practice, education, and the humanities by highlighting the need for symbolic and collective dispositifs that enable the elaboration of mourning and the reestablishment of bonds with alterity.

RESUMO

Desde Freud, o conceito de mal-estar na cultura designa a tensão estrutural entre desejo, laço social e renúncia pulsional. Na contemporaneidade, essa tensão é intensificada pela racionalidade neoliberal e pela lógica do capitalismo tardio, que reconfiguram tanto as formas de sofrimento quanto os modos de satisfação substitutiva. Embora a literatura reconheça amplamente a mercantilização do sofrimento psíquico, permanecem pouco exploradas as

¹ Master's degree in Psychology. Universidade Federal de Goiás (UFG).
E-mail: Francisconeto3@yahoo.com.br

dinâmicas subjetivas implicadas em práticas contemporâneas de substituição afetiva, como os vínculos com bebês reborn e a parentalização de animais de estimação. Este estudo tem como objetivo analisar, à luz da psicanálise e da teoria crítica, de que modo tais práticas operam como soluções defensivas ao mal-estar, articulando fantasia, fetichismo e narcisismo à lógica do consumo. Trata-se de uma pesquisa qualitativa de natureza teórico-analítica, orientada pelo método hermenêutico-crítico, baseada em revisão crítica da literatura psicanalítica e filosófica, com ênfase em autores clássicos e contemporâneos como Freud, Winnicott, Adorno, Horkheimer, Benjamin, Rosa e Byung-Chul Han, em diálogo com produções internacionais recentes. Argumenta-se que as substituições afetivas analisadas funcionam como formações fetichistas e narcísicas que suspendem a alteridade, neutralizam a experiência da perda e oferecem um alívio ilusório ao sofrimento psíquico. Ao mesmo tempo, tais práticas são capturadas e amplificadas pelo mercado, que transforma impasses subjetivos em nichos de consumo. Conclui-se que essas configurações, longe de promoverem elaboração simbólica, tendem a congelar o sofrimento, reforçando circuitos repetitivos de satisfação e frustração. O estudo contribui para os campos da clínica, da educação e das ciências humanas ao evidenciar a necessidade de dispositivos simbólicos e coletivos que possibilitem a elaboração do luto e a reinstauração do laço com a alteridade.

Palavras-chave: Psicanálise. Sofrimento Psíquico. Consumo. Mal-Estar na Cultura. Fantasia. Capitalismo.

RESUMEN

Desde Freud, el concepto de malestar en la cultura designa la tensión estructural entre el deseo, el lazo social y la renuncia pulsional. En la contemporaneidad, esta tensión se intensifica por la racionalidad neoliberal y la lógica del capitalismo tardío, que reconfiguran tanto las formas de sufrimiento como los modos de satisfacción sustitutiva. Aunque la literatura reconoce ampliamente la mercantilización del sufrimiento psíquico, permanecen poco exploradas las dinámicas subjetivas implicadas en prácticas contemporáneas de sustitución afectiva, como los vínculos con bebés reborn y la parentalización de animales de compañía. Este estudio tiene como objetivo analizar, a la luz del psicoanálisis y de la teoría crítica, de qué modo tales prácticas operan como soluciones defensivas al malestar, articulando fantasía, fetichismo y narcisismo con la lógica del consumo. Se trata de una investigación cualitativa de carácter teórico-analítico, orientada por el método hermenéutico-crítico, basada en una revisión crítica de la literatura psicoanalítica y filosófica, con énfasis en autores clásicos y contemporáneos como Freud, Winnicott, Adorno, Horkheimer, Benjamin, Rosa y Byung-Chul Han, en diálogo con producciones internacionales recientes. Se argumenta que las sustituciones afectivas analizadas funcionan como formaciones fetichistas y narcisistas que suspenden la alteridad, neutralizan la experiencia de la pérdida y ofrecen un alivio ilusorio al sufrimiento psíquico. Al mismo tiempo, tales prácticas son capturadas y amplificadas por el mercado, que transforma impasses subjetivos en nichos de consumo. Se concluye que estas configuraciones, lejos de promover una elaboración simbólica, tienden a congelar el sufrimiento, reforzando circuitos repetitivos de satisfacción y frustración. El estudio contribuye a los campos de la clínica, la educación y las ciencias humanas al evidenciar la necesidad de dispositivos simbólicos y colectivos que posibiliten la elaboración del duelo y la reinstauración del lazo con la alteridad.

1 INTRODUCTION

Since *The Discontent in Culture* (Freud, 1930/2010), psychoanalysis has supported a radical thesis: suffering does not constitute a contingent failure of social life, but the very condition of possibility of civilization. By inscribing the subject in the symbolic order, culture demands structural instinctual renunciations that are never fully resolved. The promise of happiness, repeatedly mobilized by social discourses, operates less as a realizable horizon than as an ideological operator that masks the irreducible dimension of loss. Discontent, far from being a pathological deviation, is the price paid for life in common.

However, if the malaise is structural, its forms of manifestation are not. Each historical configuration produces specific ways of managing, displacing or denying this fundamental experience. In late modernity, marked by the acceleration of social time (Rosa, 2010), by the dissolution of collective references and by the hegemony of neoliberal rationality, the classic conflict between drive and culture gives way to a diffuse, privatized and depoliticized suffering. The contemporary subject is called upon to manage himself as a company, individually responsible for his success or failure, while the social determinations of his suffering are systematically obscured (Han, 2017).

This displacement produces profound effects on the psychic economy. Suffering is no longer recognized as an expression of a shared symbolic impasse and is experienced as personal inadequacy, narcissistic failure, or performance deficit. In place of conflict, exhaustion emerges; instead of guilt, shame; instead of the noose, isolation. The malaise does not disappear, it is reconfigured, silenced and, above all, captured by devices that promise immediate relief, affective predictability and control of the bond.

It is in this scenario that contemporary practices of affective substitution are inscribed, such as intense bonds with reborn babies and the parenting of pets. At first glance, such phenomena can be understood as private choices, playful expressions or legitimate forms of affection. However, when questioned from a psychoanalytic and critical perspective, they reveal themselves as dense cultural symptoms, in which contemporary difficulties in the elaboration of loss, withdrawal from otherness and refusal of the risk inherent to human bonds are condensed.

These practices are not organized only around care or affection, but a relationship with objects that do not demand recognition of the lack, separation or radical difference of the other. These are structurally asymmetrical bonds, in which the fetishized and commodified object offers an illusion of narcissistic completeness, while neutralizing otherness and suspending the symbolic work of mourning. Suffering is thus displaced from the field of words and elaboration to the field of consumption and affective management.

Despite the growing visibility of these phenomena in the media and social networks, the scientific literature still lacks analyses that articulate them in a consistent way with psychoanalytic theory and the social critique of contemporary capitalism. Descriptive, moralizing or pathologizing approaches predominate, which tend to individualize the problem and obscure its historical and economic determinations. Therefore, an important theoretical gap persists with regard to the understanding of these practices as subjective responses to specific social conditions, that is, as symptoms of a culture that promises happiness in the form of a commodity.

In view of this scenario, this chapter aims to analyze contemporary affective substitutions from an articulation between psychoanalysis and the critique of late capitalism. It is based on the hypothesis that such practices operate as defensive solutions to psychic suffering, offering illusory relief at the cost of suspending otherness and symbolic elaboration. It is also argued that these solutions not only mask the malaise, but re-inscribe it in market circuits that reinforce its reproduction.

By mobilizing central concepts of the psychoanalytic tradition such as narcissism, fetishism, fantasy, sublimation, and mourning in dialogue with contemporary diagnoses of neoliberal rationality, the study seeks to demonstrate how the unconscious does not remain immune to social transformations, but is progressively colonized by devices that offer ready-made responses to pains that would require psychic work and social bonding. By placing malaise back at the center of the analysis, this article proposes to understand it not as an individual failure, but as a fundamental ethical and political issue of our time.

2 THEORETICAL BACKGROUND

2.1 MALAISE, FANTASY AND SUBSTITUTION

Freud (1930/2010) already indicated that, faced with the impossibility of full satisfaction, the subject resorts to substitutive ways to mitigate the displeasure. Sublimation, religion, art and love figure as possible destinations of the drive. However, such destinies never eliminate the lack; they only reorganize it symbolically. Fantasy, in this context, operates as a psychic scenario that allows the subject to sustain desire in the face of renunciation.

In contemporary times, there is an inflation of fantasies that promise to circumvent loss without crossing it. The affective substitutions analyzed in this study are included in this register. Unlike sublimation, which implies displacement and symbolic creation, such practices tend to fix desire on objects that do not question the subject or introduce difference.

This distinction is fundamental to understand the psychic status of the current forms of substitution. While sublimation, according to Freud (1930/2010), implies a work of the symbolic that transforms the drive energy into cultural production and social bond, contemporary substitutions operate mostly through the buffering of lack. It is less an elaboration of the malaise and more an attempt to neutralize it, which paradoxically results in its intensification. Fantasy ceases to function as a support for desire to become a device for avoiding anguish, offering the subject the illusion of immediate completeness.

From the point of view of critical theory, this movement can be read in articulation with the logic of the culture industry, as formulated by Adorno and Horkheimer (2006). The standardization of objects of jouissance and forms of satisfaction contributes to a homogenization of fantasies, reducing their singular and critical potential. The subject is summoned to desire what has already been previously formatted, which impoverishes the subjective experience and weakens the processes of symbolization. In this scenario, fantasy ceases to be a space for the singular elaboration of desire to become a consumable product, functional to the reproduction of the current social order.

Benjamin (2008), when thinking of capitalism as a religion, deepens this reading by indicating that the capitalist logic does not aim at redemption, but at the permanent maintenance of guilt and debt. Contemporary affective substitutions can be understood as devotional practices of this continuous cult, in which the subject is urged to invest incessantly in new objects, relationships or experiences that promise relief, but never offer elaboration. The result is a repetitive circuit of investment and frustration, which keeps the malaise in a latent and chronic state.

Byung-Chul Han's (2017) analysis of the society of fatigue contributes to this diagnosis by showing that excessive positivity and the logic of performance tend to abolish negativity, lack and limit, structural conditions of the constitution of the subject of the unconscious and of the very possibility of symbolization, according to psychoanalysis. By refusing the experience of loss, the contemporary subject finds himself captured by forms of jouissance that do not produce a bond or alterity, but only exhaustion. The social acceleration described by Rosa (2010) intensifies this process, by reducing the time needed for psychic elaboration and favoring immediate responses to malaise.

In this context, Winnicott's (1975) contribution becomes particularly relevant. The author emphasizes the importance of transitional space and play as intermediate areas between internal and external reality, fundamental for the constitution of the self. Affective substitutions that eliminate the possibility of symbolic play and creative illusion compromise this space, producing forms of defensive adaptation that impoverish the subjective

experience. Instead of favoring creativity and symbolization, such practices reinforce a conformist adherence to objects that promise security but deepen alienation.

Thus, the analysis of contemporary malaise requires understanding how fantasy, once the central operator of the sustenance of desire, has been progressively captured by social, economic and cultural devices that transform lack into something to be avoided at any cost. Affective substitutions, far from resolving the structural conflict of subjectivity, tend to intensify it, evidencing the relevance and critical power of psychoanalysis in dialogue with critical theory for the understanding of mental health in contemporary times.

2.2 FETISHISM AND DENIAL OF CASTRATION

The concept of fetishism, formulated by Freud (1927/2016), offers a fundamental interpretative key. The fetish appears as a substitute for something whose loss is unbearable, simultaneously operating recognition and denial of castration. In the case of reborn babies, the object functions as the material presence of an absence: a lost, impossible or never-had child. The doll, by neither growing nor demanding, preserves the illusion of completeness and control. This dynamic is close to what contemporary authors describe as the refusal of negativity (Han, 2017). The fetish eliminates conflict, time and otherness, offering a static satisfaction that prevents the elaboration of mourning. Thus, suffering is not symbolized, but frozen.

In continuity with the previous discussion about malaise, fantasy and substitution, fetishism can be understood as a specific and radicalized form of affective substitution. Unlike the sublimatory ways described by Freud (1930/2010), in which loss is recognized and symbolically transformed, the fetish is constituted as a defensive arrangement that aims precisely to avoid the crossing of lack. It is a psychic solution that keeps the subject in a fixed relationship with the object, preventing the displacement of desire and openness to the other.

In fetishism, fantasy ceases to operate as a scenario that sustains desire in the face of renunciation and begins to function as a device of denial (*Verleugnung*). The subject knows about the loss, but acts as if it did not exist. This double movement, knowing and denying, produces a precarious stabilization of the psyche, in which the fetishized object assumes the function of a guarantee against the anguish of castration. In the case of reborn babies, this guarantee materializes in an object that simultaneously embodies presence and absence, allowing the subject to maintain a relationship with what has been lost without confronting its irremediability.

From the temporal point of view, this dynamic implies a suspension of psychic time. While mourning requires the inscription of the loss in the subject's history and its elaboration

over time, the fetish freezes the experience in a continuous present. The doll does not age, does not transform, does not separate. With this, time, a fundamental element of symbolization, is neutralized. This temporal suspension is directly linked to the social acceleration described by Rosa (2010): paradoxically, the more society accelerates, the more objects proliferate that promise fixity and subjective immobility.

Critical theory allows us to deepen this reading by situating fetishism beyond an individual libidinal economy. Adorno and Horkheimer (2006) already indicated that fetishism is not restricted to the commodity, but crosses the forms of the subject's relationship with the world. In contemporary culture, marked by the standardization of affections and the commodification of experience, the fetish appears as an adaptive response to a context that makes it difficult to elaborate loss and negativity. The fetishized object offers an immediate and controllable satisfaction, in line with the logic of the culture industry.

The refusal of negativity described by Han (2017) finds, in this context, a precise clinical expression. By eliminating the conflict, otherness, and unpredictability of the other, the fetish produces a form of narcissistic satisfaction that empties the field of desire. There is no encounter with the different, no risk, no transformation. The object does not question the subject, does not demand a response, does not introduce a lack. With this, the possibility of symbolic elaboration of suffering is replaced by a silent and sterile fixation.

In dialogue with Winnicott (1975), it can be stated that the fetish differs radically from the transitional object. While the latter sustains the passage between presence and absence, favoring the constitution of the self and creativity, the fetish interrupts this process. He does not mediate the separation, but denies it. Instead of enabling play and symbolization, it crystallizes the subject in a defensive relationship with the object, compromising psychic vitality.

Thus, fetishism, far from being a marginal phenomenon, reveals itself to be a central operator for the understanding of contemporary forms of psychic suffering. Articulated with malaise, fantasy and affective substitutions, it shows how the refusal of castration and loss produces solutions that, although apparently appeasing, deepen subjective alienation and hinder the processes of mourning, symbolization and social bonding.

2.3 NARCISSISM AND BONDS WITHOUT ALTERITY

The parentalization of pets, in turn, evidences a narcissistic configuration of the bond. Although the bonds with animals can be affectively rich, their elevation to the position of children reveals a refusal of the radical otherness that the child represents. As Winnicott (1975) points out, psychic maturation depends on the presence of another who frustrates,

resists and presents himself as separate. In the relationships analyzed, the other is kept under control, functioning as a mirror of the self. Such a dynamic reinforces a defensive narcissism, compatible with a culture that privileges self-image, performance, and the individual management of affections.

In continuity with the previous sections, this form of bonding can be understood as another modality of affective substitution that aims to mitigate the malaise without going through the experience of loss and lack. As in fetishism, one observes here the attempt to preserve a relationship in which the object does not introduce rupture, difference or unpredictability. The parentalized animal occupies a paradoxical position: it is libidinally invested as a child, but without ever acquiring the status of alterity that characterizes the relationship with a human child.

Freud (1930/2010) already warned that love, although it appears as one of the privileged ways to cope with malaise, necessarily implies risk, frustration and dependence on the other. When the bond is structured in such a way as to eliminate these elements, what is produced is not a solution to suffering, but a narcissistic defense against castration. The other is no longer recognized as a subject and starts to function as a support for self-esteem and the imaginary cohesion of the self.

This dynamic finds direct resonance in Winnicott's conception of emotional development. For Winnicott, the constitution of the self depends on a sufficiently good environment, but also on the progressive introduction of frustration and separation. The impossibility of sustaining this tension compromises psychic maturation, favoring forms of relationship marked by dependence and the illusion of absolute control. In this sense, it is worth highlighting the following passage:

Emotional maturation involves a gradual process by which the individual moves from absolute dependence to relative dependence and finally independence. This process is only possible to the extent that the environment fails adequately, allowing the subject to recognize the external reality as something separate from himself and to endure the frustration inherent in this discovery. When this experience is avoided or nullified, emotional development remains immature. (Winnicott, 1975, p. 83)

The above quotation illuminates precisely the impasse present in contemporary narcissistic bonds. By eliminating the other's flaw, his resistance, his opacity, his otherness, the subject preserves an apparently stable relationship, but at the expense of psychic vitality and the possibility of transformation. The bond ceases to be a meeting space and starts to function as an extension of the self, reinforcing a specular logic.

From the point of view of critical theory, this relational configuration cannot be dissociated from the broader sociocultural context. Adorno and Horkheimer (2006) have already pointed out that instrumental rationality tends to colonize even the field of affections, converting relationships into objects of management and control. Animal parenting, when articulated with this logic, reveals itself less as a spontaneous expression of care and more as a strategy for managing the bond, adjusted to the demands of autonomy, performance and self-sufficiency.

Han (2017) deepens this analysis by describing a culture marked by excessive positivity and aversion to conflict. The other, as radical alterity, becomes a risk to be avoided. In their place, bonds proliferate that promise affection without negativity, presence without demand, and relationship without transformation. Narcissism, in this context, does not appear as an isolated pathological trait, but as a socially encouraged form of bonding organization.

As in the fetishization phenomena analyzed above, narcissistic parenting operates a suspension of time and conflict. The bond does not evolve, it does not become complex, it does not require subjective repositioning. Thus, psychic suffering does not find ways of symbolization, being only managed through defensive arrangements that reinforce alienation and impoverish the relational experience.

Thus, narcissism and bonds without alterity constitute a third fundamental axis for understanding contemporary forms of malaise. In articulation with fantasy, fetishism and affective substitutions, they show how the refusal of lack, castration and otherness produces psychic solutions that, although socially legitimized, compromise the processes of mourning, symbolization and social bonding.

2.4 CAPITALISM, CONSUMPTION AND THE CAPTURE OF SUFFERING

Critical theory, especially in Adorno and Horkheimer (1944/2006), already denounced the transformation of subjectivity into a commodity. Nowadays, this logic is intensifying: suffering becomes a market niche, and pain, an opportunity for profit. Hyper-realistic dolls, premium services for pets, and products associated with symbolic parenting exemplify the market capture of subjective impasses that, in other historical contexts, would require collective symbolic elaboration. As Benjamin (2008) observes, capitalism not only exploits labor, but colonizes experience, offering objects that promise immediate redemption.

In this scenario, the unconscious does not disappear, but is reorganized according to the logic of consumption. Desire is continually stimulated, while lack is covered by commodities that promise completeness. The result is a repetitive circuit in which the subject

consumes to relieve suffering and suffers again from the structural impossibility of satisfaction.

In articulation with the axes previously developed, it can be affirmed that contemporary capitalism not only appropriates suffering, but reconfigures it as an engine of subjective functioning. Fantasy, which in Freud (1930/2010) operated as a support for desire in the face of renunciation, is now colonized by industrially produced images and objects. The affective substitution, fetishism and narcissistic bonds analyzed in the previous sections are therefore not presented as isolated phenomena, but as forms of psychic adaptation to a libidinal economy regulated by the market.

Adorno and Horkheimer (2006) have already indicated that the cultural industry is not limited to offering entertainment, but shapes structures of sensitivity and ways of relating to oneself and to the other. By transforming experiences of loss, mourning, and loneliness into opportunities for consumption, capitalism empties the critical and symbolic potential of suffering. Instead of summoning the subject to the collective elaboration and sharing of pain, it offers individualized, immediate and controllable solutions, aligned with the logic of the commodity.

This dynamic can be understood in the light of Benjamin's (2008) analysis, for whom capitalism operates as a continuous religion, without atonement or redemption. The consumption of objects that promise to alleviate suffering does not lead to its overcoming, but to its perpetuation. The subject is kept in a state of permanent symbolic indebtedness, compelled to invest incessantly in new products that ensure only temporary relief. In this sense, the market-based capture of suffering is based precisely on the structural impossibility of satisfaction that Freud identified as constitutive of the human condition.

The reorganization of the unconscious according to the logic of consumption also implies a transformation of the subject's relationship with time. According to Rosa (2010), social acceleration reduces the interval necessary for psychic elaboration, favoring immediate responses to malaise. The market is part of this hiatus, offering objects that promise to buffer anguish without requiring symbolic work. Thus, the time of mourning, waiting and transformation is replaced by the short time of acquisition and discard.

Byung-Chul Han (2017) contributes to this reading by highlighting that the performance society eliminates negativity, limit, and flaw, fundamental elements of psychic experience. Suffering, when it cannot be eliminated, must at least be managed efficiently and silently. Consumption appears, then, as a technology for managing affect, allowing the subject to continue functioning without confronting the structural character of its lack.

This logic finds exemplary expression in the commodification of fetishized objects and controlled bonds, discussed earlier. The market offers not only products, but scripts of jouissance and forms of relationship that avoid encountering otherness and loss. As Adorno and Horkheimer summarize in an emblematic passage:

The culture industry does not cease to deceive its consumers about what it promises incessantly. The promise, which presents itself as satisfaction, is continually postponed; The advertised pleasure is converted into organized frustration, and the repetition of this frustration guarantees the consumer's loyalty to the system that produces it. (Adorno & Horkheimer, 2006, p. 128)

The quote makes explicit the paradoxical functioning of this circuit: suffering is not a side effect of consumption, but its condition of possibility. By capturing malaise and converting it into a commodity, contemporary capitalism produces forms of subjectivation marked by the repetition, alienation, and impoverishment of symbolic experience.

Thus, the capture of suffering by consumption does not represent only an ethical or social distortion, but a profound rearrangement of the psychic economy. In line with the axes of fantasy, fetishism and narcissism, this process shows how the refusal of lack and negativity sustains apparent solutions that, far from alleviating malaise, re-inscribe it in a chronic way, reinforcing the relevance of the articulation between psychoanalysis and critical theory for the understanding of mental health in contemporary times.

3 METHODOLOGY

This study is characterized as a qualitative research of a theoretical-analytical nature, guided by the hermeneutic-critical method. Such an approach is adequate to investigate subjective and cultural phenomena that do not lend themselves to direct empirical measurement, but require rigorous, historical, and contextualized conceptual interpretation.

The analytical corpus was made up of classic works of Freudian and post-Freudian psychoanalysis, as well as central contributions from critical theory and contemporary social philosophy. The selection of references followed criteria of theoretical relevance, academic impact and conceptual consistency, contemplating foundational texts indispensable to support the argument.

In addition, relevant scientific articles published in the last ten years were analyzed, identified from consultations with national and international databases widely recognized in the field of human sciences and mental health, such as SciELO, PePSIC, PsycINFO, Scopus and Web of Science. These studies were mobilized as theoretical-contextual support for the

analysis of contemporary practices of affective substitution, symbolic consumption and reorganization of psychic suffering, without configuring a systematic review of the literature.

The analytical procedure developed in three interdependent stages. In the first stage, a critical review of the literature was carried out on the concepts of malaise in culture, fantasy, fetishism, narcissism and consumption. In the second stage, these concepts were articulated with phenomenological descriptions of contemporary practices widely discussed in recent sociological, philosophical, and cultural studies. Finally, a critical interpretation was developed that confronts such practices with the logic of late capitalism and its effects on subjectivity.

The validity of the study is based on the internal coherence of the theoretical framework mobilized and on the argumentative consistency of the proposed interpretations. Reliability is ensured by the explanation of the methodological path and by the possibility of analytical replication by other researchers who share the same theoretical framework.

4 RESULTS AND DISCUSSION

The analysis developed allows us to identify that contemporary affective substitutions operate as defensive responses to structural psychic suffering, intensified by the sociocultural conditions of neoliberal capitalism. Reborn babies and pet parenting are privileged objects of libidinal investment, precisely because of their availability, predictability and absence of symbolic alterity.

The results indicate that such practices produce immediate relief from unpleasure, functioning as psychic anesthetics. However, this relief is not sustained over time, since it does not promote the elaboration of grief or subjective transformation. On the contrary, it crystallizes the subject in regressive positions, reinforcing the dependence on external objects for affective regulation.

In continuity with the theoretical foundation presented, it is observed that these substitutions are inscribed in the field of fantasy as an attempt to circumvent the lack without crossing it. Unlike sublimation, which implies symbolic displacement and creation, the objects analyzed keep the subject fixed in an impoverished libidinal economy, in which desire is not rearticulated, but repeated. The result is a defensive stabilization that preserves the self from anguish, at the cost of psychic vitality.

From the psychoanalytic point of view, there is a predominance of mechanisms of denial and cleavage. The subject recognizes, at some level, the loss or the lack, but simultaneously denies it through fetishistic investment. This ambivalence sustains symptomatic repetition, preventing the crossing of suffering and the re-inscription of loss in

the subjective history. Such a dynamic confirms the relevance of the Freudian formulation of fetishism as a paradoxical solution to castration.

By confronting these findings with critical theory, it is evident that the market plays an active role in maintaining these subjective formations. The incessant supply of products and services associated with affective substitutions not only responds to a pre-existing demand, but produces and intensifies it. Suffering becomes the engine of consumption, and consumption, a condition of psychic survival, as already anticipated by Adorno and Horkheimer (2006). As the authors state:

The culture industry firmly holds its consumers under the illusion that what is offered to them satisfies their needs, when, in fact, these needs are continually produced and managed by the system itself. The promise of satisfaction becomes a mechanism of domination, insofar as it perpetuates the need it claims to supply. (Adorno & Horkheimer, 2006, p. 135)

This quote illuminates the structural character of the repetition observed in the results. The relief produced by affective substitutions is not a side effect, but an integral part of a circuit that requires the maintenance of suffering in order to continue operating. The unconscious, far from being eliminated, is reorganized according to the logic of consumption, as already pointed out by Benjamin (2008) when describing capitalism as a religion without redemption.

This dynamic helps to explain why such practices expand in contexts marked by precarious work, social isolation, and weakening of community bonds. The substitute object offers a promise of care, predictability, and belonging in a world that is increasingly hostile to dependency, vulnerability, and the shared experience of loss. In this sense, affective substitutions function as private solutions to structurally collective problems.

However, this promise proves to be deeply paradoxical. By eliminating the risk inherent in the encounter with the other risk that implies frustration, difference and transformation, the possibility of symbolic elaboration of suffering is also eliminated. The subject thus remains imprisoned in a circuit of immediate satisfaction and prolonged emptiness, a central characteristic of the contemporary malaise described by Freud (1930/2010) and radicalized in the current conditions of neoliberal capitalism.

5 CONCLUSION

This chapter sought to demonstrate that contemporary practices of affective substitution, far from being reduced to individual eccentricities or cultural curiosities, constitute subjective responses to structural impasses of malaise in late capitalism. By

analyzing the bonds established with reborn babies and the parentalization of pets, it was evidenced that such practices operate as defensive solutions in the face of the experience of loss, lack and otherness, shifting psychic suffering to fetishized objects that promise care, control and predictability.

The analysis developed throughout the text allowed us to sustain that these substitutions produce an immediate relief from unpleasure, but they do so at the cost of suspending the processes of symbolization. The substitutive object does not introduce difference, does not frustrate, does not separate; it preserves the subject from anguish while fixing him in an impoverished libidinal economy, marked by repetition and dependence. In this sense, suffering is not elaborated, but managed; it is not crossed, but frozen. The result is the maintenance of a chronic malaise, which is continuously re-inscribed under new forms of affective consumption.

The main theoretical contribution of the study lies in the rigorous articulation between psychoanalysis and critical theory, demonstrating that the unconscious, far from disappearing in contemporary times, is progressively reorganized according to the logic of the market. Fantasy, fetishism and narcissism, central concepts of Freudian metapsychology, prove to be particularly fruitful for understanding how neoliberal capitalism captures psychic suffering, transforming structural impasses of subjectivity into niches of consumption. The market doesn't just respond to malaise; it exploits it, intensifies it, and converts it into a working condition.

By placing these practices back on the horizon of social criticism, the article argues that the suffering analyzed cannot be understood exclusively as an individual or pathological issue. It is a suffering produced and maintained in contexts marked by the precariousness of work, the weakening of community bonds and the permanent demand for self-sufficiency and performance. Affective substitutions thus emerge as private solutions to problems that are, at their root, collective and political.

On the clinical, educational and cultural levels, the findings indicate the urgency of devices that reestablish spaces for symbolizing suffering and sustaining the human bond. Intervening does not mean eliminating pain, but creating conditions so that it can be named, shared and transformed. From the psychoanalytic point of view, this implies sustaining lack, time and otherness as constitutive dimensions of subjective experience precisely what market solutions promise to suppress.

It is evidently recognized as a limitation of the study its theoretical nature, which does not allow direct empirical generalizations. Future research may articulate empirical qualitative methods, such as clinical interviews, case studies, or ethnographies, deepening the

understanding of these practices in specific sociocultural contexts. However, this limitation does not reduce the scope of the analysis, since the objective of the work was precisely to offer a critical interpretative framework capable of illuminating emerging phenomena of contemporaneity.

Even so, and perhaps precisely for this reason, it is believed that the proposed reflection offers a relevant contribution to the international literature by repositioning contemporary malaise as an ethical and political issue, and not only as a problem of individual adaptation. In a world that promises happiness in the form of merchandise, comfort without conflict and bonds without risk, insisting on lack, otherness and the work of mourning becomes a profoundly subversive gesture.

If, as Freud taught, there is no definitive way out of the malaise inherent in culture, we can only refuse the solutions that silence it and insist on those that allow the subject to speak, desire and suffer in a singular way. In this sense, sustaining discomfort, limits and incompleteness is not a sign of failure, but a condition of possibility for psychic life, for social ties and for any ethical project that refuses to reduce the human to an object of consumption.

ABSTRACT

This article aims to understand how the implementation of land regularization can contribute to improving the living conditions of the residents of Jurema Barra and ensuring that access to the city is a right exercised by all, regardless of their socioeconomic status. Land regularization is an essential process to guarantee legal access to land, promoting security of tenure and contributing to the improvement of residents' living conditions. In the context of the Jurema Barra community, which faces challenges such as informality and precarious housing, regularization is seen as an instrument to ensure rights and promote social inclusion. The study analyzes how the lack of documentation and the absence of effective public policies have negatively impacted the lives of the community's inhabitants, limiting their access to essential services and citizen participation. The article highlights the importance of the right to the city, which is understood as the right of all citizens to enjoy urban spaces in a full and dignified manner. The research also emphasizes the need for dialogue between the community and local authorities, aiming to develop solutions that respect the particularities of the population and promote social justice. The article points out that land regularization in Jurema Barra is not just a matter of land titling, but part of a broader process of recognizing citizens' rights and building a more just and inclusive city.

impactado negativamente a vida dos habitantes da comunidade, limitando seu acesso a serviços essenciais e à participação cidadã. O artigo destaca a importância do direito à cidade, que é compreendido como o direito de todos os cidadãos a usufruir dos espaços urbanos de maneira plena e digna. A pesquisa também enfatiza a necessidade de um diálogo entre a comunidade e as autoridades locais, visando a construção de soluções que respeitem as particularidades da população e promova uma justiça social. O artigo aponta que a regularização fundiária em Jurema Barra não é apenas uma questão de titulação de terras, mas parte de um processo mais amplo de reconhecimento dos direitos dos cidadãos e construção de uma cidade mais justa e inclusiva.

RESUMEN

El presente artículo tiene como objetivo comprender cómo la efectividad de la regularización puede contribuir a la mejora de las condiciones de vida de los habitantes de Jurema Barra y garantizar que el acceso a la ciudad sea un derecho ejercido por todos, independientemente de su condición socioeconómica. La regularización de la tenencia de la tierra es un proceso esencial para garantizar el acceso a la tierra de forma legal, promoviendo la seguridad jurídica de la posesión y contribuyendo a la mejora de las condiciones de vida de los residentes. En el contexto de la comunidad Jurema Barra, que enfrenta desafíos como la informalidad y la precariedad habitacional, la regularización es vista como un instrumento para asegurar derechos y promover la inclusión social. Se analiza cómo la falta de documentación y la ausencia de políticas públicas eficaces han impactado negativamente en la vida de los habitantes de la comunidad, limitando su acceso a servicios esenciales y a la participación ciudadana. El artículo destaca la importancia del derecho a la ciudad, el cual se comprende como el derecho de todos los ciudadanos a disfrutar de los espacios urbanos de manera plena y digna. La investigación también enfatiza la necesidad de un diálogo entre la comunidad y las autoridades locales, con el fin de construir soluciones que respeten las particularidades de la población y promuevan la justicia social. El artículo señala que la regularización de tierras en Jurema Barra no es solo una cuestión de titulación de predios, sino parte de un proceso más amplio de reconocimiento de los derechos de los ciudadanos y de la construcción de una ciudad más justa e inclusiva.

Palabras clave: Regularización de Tierras. Derecho a la Ciudad. Comunidad Jurema Barra.

1 INTRODUCTION

According to Lira (2017), land regularization is a topic of increasing relevance in Brazil, especially in urban areas where informality in land tenure is a striking reality. In the context of contemporary cities, where disorderly urban growth and irregular land occupation are recurrent problems, regularization presents itself not only as a strategy for the stability and legality of property, but also as a fundamental tool for the promotion of the right to the city.

This right, enshrined in the Federal Constitution of 1988 and reinforced by the Statute of the City, involves ensuring access to the city in an inclusive way, ensuring that all citizens can enjoy the social, cultural, and economic benefits that it can offer (Santin, 2018).

The community of Jurema Barra, located in the municipality of Ananindeua, in the state of Pará, the object of this study, serves as an empirical reference for the discussion of these issues. In the face of internal migrations, land occupation in peripheral areas and the struggle for better living conditions, population growth in the municipality of Ananindeua has intensified.

Currently, Ananindeua-PA is close to 500 thousand inhabitants, according to the last demographic census carried out by the Brazilian Institute of Geography and Statistics (IBGE) in 2022, representing an increase of approximately 1.45% compared to the 2010 census. This growth makes the municipality one of the cities with the most population expansion in the Metropolitan Region of Belém (RMB).

Figure 1

Geographical situation map

Source: Laham (2023)

For Santin (2018), the community, composed of residents who often occupy land without proper regularization, faces challenges related to security of tenure and the provision of essential services, such as sanitation, drinking water and urban infrastructure. Thus, the analysis of land regularization in Jurema Barra is crucial to understand how public policies can enable a fairer city, in which the right to the city is effectively guaranteed.

In view of this scenario, the following problem arises: how has land regularization been configured in the municipal urban management of Ananindeua and what are the effects of this policy on the living conditions of the population? The choice of the theme "Land regularization, spatial justice and the right to the city: an analysis from the Jurema Barra community, Ananindeua – PA" is justified by the social, economic and legal relevance that the issue of land regularization exerts in contemporary Brazilian cities, especially in urban areas that face significant challenges related to informality, inequality and social exclusion.

The city of Ananindeua, located in the Metropolitan Region of Belém, in the state of Pará, is an emblematic example of this reality, where many communities, such as Jurema Barra, live under constant threat of eviction and lack access to basic rights, such as decent housing, adequate infrastructure, and essential public services. The proposed research addresses, therefore, the intersection between land regularization and the right to the city from the specificities of the local reality.

In this way, the work is not limited to a technical analysis of land regularization, but seeks to promote a broader reflection on citizenship, social inclusion and human dignity in the urban space, fundamental themes for the development of a more equitable society. After all, guaranteeing the right to the city is to ensure that everyone has a place where they can feel they belong, that their needs are met and that their voices are heard, thus contributing to the construction of a more just and solidary city (Lefebvre, 1999).

Approaching this theme from the reality of the Jurema Barra community provides a significant opportunity to reflect on urban inequalities and the ways of coping that, through land regularization, can be significantly expanded. The territorial cut of the community reveals the importance of local initiatives aimed at improving the quality of life of residents, such as social inclusion, education and health projects. At the same time, the presence of community leaders and social movements is essential for the claim of rights and to ensure the participation of the population in public policies (Welter, 2019).

In the development of the research, qualitative and quantitative data were collected from the community, with the help of data from the Brazilian Institute of Geography and Statistics (IBGE) and the Municipal Master Plan, in addition to semi-structured interviews, photographic records and cartographic production. These procedures allowed us to

understand the perceptions about the right to the city and to analyze how land regularization can impact the life of the community.

Finally, the importance of the right to the city as an instrument of social transformation and the need to take a close look at the realities of marginalized communities are highlighted, reaffirming that land regularization is an essential step towards the construction of fairer and more inclusive cities (Rodrigues, 2016).

2 THEORETICAL FOUNDATION

2.1 RIGHT TO THE CITY

The concept of "right to the city", as proposed by the French philosopher Henri Lefebvre (2008), constitutes a provocative and fundamental approach to understanding contemporary urban dynamics and the struggle for social justice in cities. This idea emerges in a context marked by rapid and often uncontrolled urbanization processes, which generate deep social and spatial inequalities, raising a central debate about who actually has access to the city and to whom urban spaces belong (Battaus et al., 2016).

The right to the city also involves a critique of forms of urbanization that prioritize capital and profit over social needs. Cities, often shaped by private interests, tend to constitute spaces of socio-spatial segregation, in which peripheries and low-income groups are systematically marginalized (Santin, 2018).

In addition, the notion of the right to the city is closely related to the idea that urban space should guarantee decent living conditions for all citizens, ensuring not only access to basic services, but also opportunities for personal and community development. In this sense, it is essential to ensure that public spaces are accessible and inclusive, promoting social interaction, culture, education, and collective coexistence, essential elements for the construction of fairer and more democratic cities (Santin, 2018).

2.2 LAND REGULARIZATION

Land regularization is a topic of great relevance in Brazil, especially in view of the scenario of accelerated urbanization and the history of social inequality that permeates the use and occupation of urban land (Santos, 1998). The issue of land titling, legal certainty, and social inclusion is at the heart of this process, which seeks to solve problems related to ownership and access to land, especially for low-income families living in informal areas (Battaus et al., 2016).

Land regularization involves a set of actions aimed at guaranteeing the right to property and security of tenure of occupied land, promoting citizenship and dignity of people who often

reside for long periods in areas of irregular occupation, devoid of adequate infrastructure and public services (Lira, 2017).

This process can be understood from two major perspectives: the regularization of informal urban centers and the regularization of rural properties. Both present specific challenges and require different approaches for their effectiveness (Rodrigues, 2016).

In the urban context, the presence of "baixadas" and irregular allotments is one of the main problems faced by large Brazilian cities. In view of this scenario, several public policies have sought to address this reality, such as legislation aimed at land regularization, which aims to recognize and formalize the ownership of land occupied by its residents, promoting greater legal certainty and social inclusion (Battaus et al., 2016).

Space is, at the same time, a product and a condition of human actions. It is formed by a set of historically constructed forms that keep within themselves the marks of the social relations that gave rise to them. As such, space is materiality and is also a witness, a framework and a means of social life, an active element of history and society. (SANTOS, Milton. *The Nature of Space: technique and time, reason and emotion*. São Paulo: Hucitec, 1996, p. 63).

Among the initiatives highlighted is Federal Law No. 13,465/2017, which establishes guidelines and procedures for urban and rural land regularization, promoting, on the one hand, the regularization of urban areas and, on the other hand, the guarantee of land tenure to those who inhabit it. This legislation has proven to be fundamental for the implementation of land regularization programs, although it still faces challenges related to bureaucracy and the lack of articulation between the different levels of government (Santin, 2018).

In the rural context, the process of land regularization is equally complex, involving the titling of small farmers, agrarian reform settlers and the formalization of properties that, in many cases, do not have adequate documentation (Lira, 2017).

The implementation of land regularization in rural areas is fundamental for food security, sustainable development and the promotion of new economic opportunities for these communities. Access to land is a fundamental right that, when guaranteed, can boost local development, strengthen the regional economy and contribute to environmental preservation (Rodrigues, 2016)

For Saule Jr (2018, p.45):

An important point in land regularization is the need for an integrated approach that considers the needs of communities and the social, economic, and environmental aspects of the surroundings. The participation of the population in the regularization process is fundamental; Listening to the voices of residents and fostering the co-creation of solutions is essential to achieving an effective outcome. In addition, the

inclusion of geographic information technologies, such as the use of drones and georeferencing systems, has proven to be a valuable tool for the identification of properties and the preparation of regularization plans

However, land regularization is not a simple solution and may face resistance from different sectors of society, including real estate interests and the absence of political will in certain spheres of public power. The construction of a fairer and more inclusive city necessarily involves overcoming these obstacles, requiring an effective commitment from governments to public policies that guarantee the right to decent housing and property (Santin, 2018).

Finally, land regularization is an important mechanism for social and economic transformation, as it seeks to correct historical-geographical injustices, ensure the right to the city and promote urban development. It is a process that requires time, dedication and the collective effort of different social actors, including the government, civil society and the communities involved. Thus, promoting land regularization is, above all, a matter of spatial justice and a fundamental step towards building a more equitable future for all (Santin, 2018).

3 METHODOLOGY

The methodology of this article is based on a qualitative and quantitative approach, with the objective of analyzing the relationship between land regularization and the right to the city, having as a spatial cut the Jurema Barra community, located in the municipality of Ananindeua, in the state of Pará. To achieve the proposed objectives, a field research was carried out that involved the collection of primary and secondary data.

Initially, a comprehensive bibliographic review was developed on the concepts of land regularization and the right to the city, enabling a theoretical deepening on the main conceptual approaches and legislation pertinent to the theme. This stage constituted the theoretical basis for the analysis of the context of the community studied, as well as the public policies related to the theme.

The field research included semi-structured interviews with approximately five residents of the Jurema Barra community, including representatives of local associations. The interviews aimed to capture the perceptions of the interviewees about the land situation of the community, the difficulties faced in daily life and the relationship between land regularization and access to urban rights, such as decent housing, infrastructure and public management services.

According to Gil (2019), qualitative research uses techniques such as interviews, participant observation, and focus groups, allowing the capture of perceptions, feelings, and

meanings attributed by the subjects to their experiences. These methods enable a deeper and more contextualized understanding of social phenomena. The same author points out that quantitative research is characterized by the use of statistical techniques for data analysis, and is indicated when it is intended to quantify information and generalize results to a wider universe, through structured instruments, such as questionnaires with closed questions.

In addition to the interviews, direct observations were carried out in the community, which allowed a deeper understanding of the living conditions of the residents and the characteristics of the urban space. This qualitative method proved to be fundamental to identify the social and economic dynamics present in the territory, as well as the daily practices that evidence the struggle for rights. According to Pereira (2014), qualitative research seeks to understand the complexity of social phenomena from an interpretative perspective, using methods such as interviews, focus groups, document analysis and participant observation.

In addition, the analysis of official documents — such as master plans, land regularization legislation and reports from public agencies — complemented the research, offering an overview of the public policies implemented in Ananindeua and their relationship with the reality of the Jurema Barra community.

The collected data were predominantly analyzed qualitatively, through the technique of content analysis, enabling the identification of emerging thematic categories from the interviews and observations carried out. This procedure allowed a critical reflection on the effectiveness of land regularization policies and their ability to guarantee the right to the city to the residents of the community studied.

Finally, the methodology adopted sought not only to understand the challenges faced by the Jurema Barra community with regard to land regularization, but also to contribute to the debate on the right to the city, emphasizing the importance of social participation and the recognition of local specificities in the construction of fairer and more inclusive public policies.

The analysis of the results obtained intends, therefore, to offer subsidies for the formulation of strategies that promote the realization of urban rights, aiming at improving the quality of life of the inhabitants of the community.

The cartography elaborated within the scope of the research is not limited to the representation of physical space, but also reveals the social, political and economic relations that permeate urban life. In a context in which spatial justice and the right to the city assume centrality in the academic debate, cartographic representation is configured as a fundamental tool to highlight socio-spatial inequalities and collective claims.

The Jurema Barra community has geographical characteristics that express the complexity of Brazilian peripheral urbanizations, marked by the struggle for basic infrastructure, public services and fundamental rights. The notion of space adopted in this study goes beyond mere geographic location, encompassing the experiences of the residents, their historical trajectories and social demands. Thus, analyzing this territory implies considering how public policies — or the absence of them — influence local social organization.

Spatial justice refers to the search for equity in the distribution of resources and opportunities in the urban territory, an aspect that is especially relevant in Jurema Barra, where access to health, education and security is still unequal. Through contemporary cartographic production, incorporating tools such as geoprocessing and Geographic Information Systems (GIS), it becomes possible to visualize these inequalities more clearly, subsidizing the formulation of fairer public policies.

In addition, the concept of the right to the city, as proposed by Henri Lefebvre (1991), resonates significantly in contexts such as that of the Jurema Barra community. This right involves not only access to physical urban space, but also effective participation in the decisions that shape urban daily life. Cartographic representations, in this sense, can contribute to amplifying local voices in debates on urban planning and territorial development.

Referencing recent cartographic productions on the Jurema Barra community is essential not only to record the spatial transformations over time, but also to understand the social struggles present in the territory. Studies carried out by institutions such as the Brazilian Institute of Geography and Statistics (IBGE) and by academic centers, especially since 2021, have contributed to the production of geographic data aimed at analyzing the socioeconomic conditions of Brazilian peripheral areas.

4 RESULTS AND DISCUSSIONS

4.1 FORMATION OF THE JUREMA BARRA COMMUNITY

The Jurema Barra Community, located in the Levilândia neighborhood in Ananindeua, in the state of Pará, is a significant example of how urban communities develop in contexts of social, economic, and spatial inequality. The history of this community reflects a series of social, political, and economic transformations that have marked the region over the last few decades (Alencar, 2017)

Figure 2

Jurema Barra Community

Source: Author herself, 2025.

Ananindeua, located in the Metropolitan Region of Belém, has experienced an accelerated population growth, especially since the 1980s. This growth was driven by an intense process of rural-urban migration, in which thousands of people left rural areas in search of better job opportunities and quality of life in urban centers.

The Jurema Barra community, which emerged in this context, is characterized by about 200 families in a situation of housing irregularity, with houses built, for the most part, without adequate urban planning. This reality reflects the resistance of its residents in the struggle for space, recognition and dignity.

The development of the community is directly related to the history of occupation of the territory, marked by processes of invasion and the constant struggle for rights. The first inhabitants of Jurema Barra faced numerous challenges, such as the absence of basic

infrastructure, limited access to public services — especially health and education — and the precariousness of housing. Over the years, the community began to organize itself collectively, creating residents' associations aimed at demanding improvements and recognition by the government (Barros, 2019).

As of 2020, the Jurema Barra community began to gain greater visibility, mainly due to initiatives promoted by non-governmental organizations and the strengthening of an internal social movement that achieved notoriety in the region. These mobilizations brought to light demands related to land regularization, access to drinking water, basic sanitation, and education.

The community mobilization resulted in some achievements in the territory, such as the implementation of water supply projects through individual artesian wells, the installation of electricity poles and occasional improvements in infrastructure, carried out, in large part, by the residents themselves. However, several challenges still persist, as pointed out by the majority of respondents in this survey, especially urban violence and social exclusion, factors that directly impact the quality of life of the local population.

The social context of Jurema Barra is marked by a rich cultural diversity, reflecting the different origins of its inhabitants. The community is composed mostly of residents from municipalities in the interior of the state, such as Santa Izabel do Pará, Castanhal and Vigia, as well as individuals of different ethnicities who migrated to the Metropolitan Region of Belém in search of better life opportunities. This cultural plurality is manifested in festivities, traditions and forms of coexistence, strengthening social ties and community identity, even in the face of adversity.

In recent years, the Jurema Barra community, located in the Levilândia neighborhood, has faced the impacts of urban policies and economic transformations that often disregard local needs. Located in the area bordering the middle-class neighborhood of Cidade Nova, in Ananindeua, the community suffers from growing real estate speculation and the effects of gentrification, phenomena that threaten the permanence of residents in the territory. The real estate appreciation in the region can result in an increase in the cost of living and the expulsion of the most vulnerable populations.

In addition, the COVID-19 pandemic has highlighted and intensified the social fragilities of the Jurema Barra community. The health and economic crisis severely affected families, many of whom were already in a situation of socioeconomic vulnerability. The lack of adequate access to information and health services has further aggravated this scenario.

In the face of these challenges, the residents of Jurema Barra have developed strategies of resistance and solidarity. Collective initiatives, such as the formation of support

groups, the realization of clean-up efforts and donation campaigns, proved to be fundamental for strengthening community bonds and promoting social resilience.

The future of the Jurema Barra community will depend, to a large extent, on the organizational capacity of its residents to claim rights, as well as on the willingness of the public authorities to dialogue and implement public policies that actually meet the needs of the local population. The recognition of community participation and the strengthening of citizenship are central elements for the construction of a more just, inclusive and egalitarian future for all inhabitants of the region.

4.2 CHALLENGES OF LAND REGULARIZATION AND THE RIGHT TO THE CITY IN JUREMA BARRA

Land regularization is a central theme in discussions about the right to the city, especially in urban areas that face historical challenges of irregular occupation, as is the case of the Jurema Barra community, located in Ananindeua, in the state of Pará.

The city of Ananindeua, being one of the most populous in the Metropolitan Region of Belém, faces a series of problems related to accelerated urbanization and the lack of urban planning, which result in a scenario of inequality and social exclusion. In the Jurema Barra community, many families live in a situation of vulnerability, occupying land without documentation, which generates legal uncertainty and limits access to essential services.

One of the main challenges of land regularization in this community is the articulation between the different levels of government and civil society. Often, public policies are not sufficiently integrated, which makes it difficult to carry out regularization processes that meet local needs. In addition, the lack of information and awareness of territorial rights among residents is a significant obstacle. Many people are unaware of the legal procedures necessary for the regularization of their properties or are afraid to engage in processes that they perceive as complicated or bureaucratic (Alentejano, 2018).

Another important challenge is the issue of infrastructure. Land regularization is not just about land titling, but also involves ensuring access to basic services, such as water, sewage, electricity, and transportation. In the Jurema Barra community, the precariousness of urban infrastructure is a reality, and many residents face daily difficulties due to the lack of these services (Carneiro, 2017).

In the article by Leidy Laura de Carvalho (2021) entitled "Restructuring the City and the New Expressions of Urban Centrality in the City of Ananindeua, Pará Amazon", the author analyzes how urban dynamics have been transformed in Ananindeua, highlighting the spatial

and social restructuring that impacts the lives of its inhabitants. Carvalho argues that, as the city expands, new urban centers emerge and redefine the concept of centrality.

The analysis made by the author highlights that the new expressions of centrality in Ananindeua are not only reflections of urban growth, but are also influenced by economic, social and political factors. Such changes indicate a fragmentation of the traditional urban space, where previously peripheral areas gain economic and social importance. As a result, new commercial centers and services emerge that challenge the role of traditional city centers.

In addition, Carvalho (2021) discusses the impact of these transformations on urban mobility and social relations within the community. The restructuring of the city brings with it both opportunities and challenges for the local population. While some groups can benefit from easier access to new services and infrastructure, others face the risk of social exclusion as public spaces reorganize themselves under new market logics.

The author also emphasizes the importance of popular participation in the urban planning process to ensure a more egalitarian city. She suggests that residents' voices should be considered in discussions about urbanization to promote more inclusive development in Ananindeua. Thus, the article concludes on the urgent need for public policies that address these emerging inequalities and create effective guidelines for managing urban growth.

Therefore, the work of Leidy Laura de Carvalho offers a critical look at the urban reconfigurations in Ananindeua, showing how they are participants in the new social and economic dynamics of the Pará Amazon and highlighting the relevance of understanding these changes for a fairer future in urban management.

4.3 SPATIAL PRACTICES AND THE RIGHT TO THE CITY

Spatial practices represent the way in which subjects use, transform and signify space in everyday life. Such actions go beyond simple physical occupation: they reflect disputes for visibility, permanence, and social justice within the urban territory. In the context of the peripheries and popular communities, these practices often take forms of resistance in the face of exclusionary urban policies, real estate speculation, and gentrification.

Henri Lefebvre (2001) proposes the concept of the right to the city as the right of all inhabitants not only to access urban goods and services, but to actively participate in the production of urban space. For him, the city should be appropriated by those who live in it, and not controlled only by the interests of the market and capital.

David Harvey (1980), influenced by Lefebvre, complements this thought by stating that spatial practices shape and are shaped by social relations, which makes it impossible to

understand urban space without considering the social process that constructs it. Thus, the space becomes the stage for conflicts, but also for possibilities of transformation.

Geographer Milton Santos (1996) reinforces that space is not static: it is a condition, a means and a product of social practices. In his reading, urban space is always the result of the interaction between technique, time, work and power relations. In the Brazilian peripheries, for example, the spatial practice of self-construction of houses, the organization of collectives and the occupation of land reveal concrete ways of confronting exclusion and claiming the right to the city.

In this way, discussing spatial practices is also discussing who has the power to decide on the use and organization of space, highlighting the inequalities, but also the resistances present in the daily life of cities.

In the interviews with the residents of the subdivision, the right to the city did not emerge in the identification with private property, since, in the narratives, the deed of ownership of the property was not considered a latent "concern". But the question of belonging to the space emerged in terms of its use, the form of appropriation of the house and the claim of space around the house.

- Interview – Resident 1

Interviewer: Hello! Thank you for accepting to participate in this interview. Let's talk a little about your experience as a resident of the Jurema Barra community, especially in relation to land regularization and the right to the city. To start, could you introduce yourself and tell us a little about your story here in the community?

Resident 1: Hello! My name is Maria, I'm 35 years old and I've lived here in Jurema Barra for 4 years. I came from a small town in search of better opportunities. Here in the community, life is difficult, but we support each other a lot.

Interviewer: Thank you, Maria! You mentioned the search for better opportunities. How do you see the issue of land regularization in your community? Do you think this is important?

Resident 1: Yes, I think it's very important. Land regularization would bring more security to us, residents. Today, we live in fear of being evicted, and this generates a lot of insecurity. If we had our land regularized, we could invest more in our houses.

Interviewer: I see. And have you had access to information about how the land regularization process works?

Resident 1: Unfortunately, no. Few people here understand how it works. Sometimes, an agent from the city hall comes, but the information is not clear. We end up depending on rumors and information from neighbors.

Interviewer: That's an important question. And, in relation to the right to the city, how do you believe that the lack of land regularization affects life in the community?

Resident 1: The lack of regularization makes us invisible. We do not have access to basic services, such as sanitation, and this affects the health of our family. Without a document that proves that we live here, it is difficult to claim our rights.

Interviewer: And do you know of any initiative or project that seeks to help the community in this regard?

Resident 1: I have heard about some NGO projects that try to help, but most people here do not have access to this information. We need more dissemination and support to understand how we can participate.

Interviewer: To conclude, what would you like to see happen in your community in relation to land regularization and the right to the city?

Resident 1: I would like there to be more dialogue between the city hall and the community. We need workshops, lectures, something that helps us understand our rights and the importance of regularization. In addition, it would be great to have access to basic services to improve our quality of life.

Interviewer: Thank you very much for your participation, Maria. Your answers are very valuable and help to better understand the reality of JuremaBarra.

Resident 1: I thank you for the opportunity to talk about our community! I hope things get better for all of us.

The resident, when reporting that she has lived in the community for four years and that she is looking for better opportunities, expresses a migratory dynamic common in the Brazilian urban peripheries, marked by the search for access to the city, work and decent housing. However, the absence of land regularization generates a cycle of insecurity and precariousness, in which the fear of eviction is constant, limiting investments in the improvement of homes and community structure (Rolnik, 2019).

The talk about misinformation in relation to regularization processes reflects a recurring reality in peripheral communities, where communication between the government and residents is flawed or non-existent. This demonstrates a deep gap in the implementation of urban policies, which, according to the City Statute (Law No. 10,257/2001), should be based on democratic management, access to information and popular participation (Brasil, 2001).

In addition, the resident points out that the lack of regularization makes the community invisible in the eyes of the State, which compromises access to fundamental rights such as basic sanitation, health and safety. This scenario dialogues with the concept of spatial justice, which, according to Santos (2020), consists of the equitable distribution of resources, services, and opportunities in the territory. The absence of this justice contributes to the

reproduction of socio-spatial inequalities, keeping communities like Jurema Barra on the margins of urban benefits.

The testimony also highlights the disconnect between civil society initiatives, such as NGOs, and the community itself, which is often unaware of the existence of these projects. This reveals the urgent need for inclusive communication policies, as well as training processes that empower residents over their territorial rights, as Fernandes (2011) proposes, when he states that land regularization should not be just a bureaucratic process, but a collective construction that strengthens social belonging and citizenship.

When the interviewee suggests holding workshops, lectures and strengthening the dialogue with the government, she directly signals the importance of popular participation in the construction of urban policies. This perspective is supported by scholars such as Souza (2021), who argue that the right to the city is only realized when there is effective participation of citizens in the formulation and implementation of decisions that impact their territory.

Therefore, the analysis of the interview reveals that the challenges faced by the Jurema Barra community go beyond the land issue; involve social recognition, access to urban services and, above all, the right to fully exist in the urban space. The search for land regularization is not only a legal demand, but a struggle for dignity, citizenship and the realization of the right to the city, which, according to Lefebvre (2001), should be understood as the collective right to transform, inhabit and appropriate urban space in a fair and democratic way.

- Interview — Resident 2

Interviewer: Hello! Thank you for accepting to participate in this interview. Let's talk a little about your experience as a resident of the Jurema Barra community, especially in relation to land regularization and the right to the city. To start, could you introduce yourself and tell us a little about your story here in the community?

Resident 2: Hi! My name is Ana Paula, I'm 26 years old. I have lived here in Jurema Barra for 3 years. I came with my husband and my two young children. We came because the rent was very expensive in another neighborhood, and here we got a piece of land to build our house.

Interviewer: How do you see the issue of land regularization in your community? Do you think this is important?

Resident 2: I think it's super important. Having the house in our name would give us more peace of mind. Today, we always have that fear of losing everything. Without a document, we don't have security.

Interviewer: Have you ever had access to information about how the land regularization process works?

Resident 2: Not much. We hear comments from neighbors, but official information, no one brings it to us. I, for example, don't even know where to start.

Interviewer: How do you believe that the lack of land regularization affects life in the community?

Resident 2: Affects too much. There is a lot missing here: health center, transportation. I think that, if we had documents, it would be easier to demand these things from the city hall.

Interviewer: Do you know of any initiative or project that seeks to help the community in this regard?

Resident 2: I don't know. I've heard that there are residents' associations trying to fight for improvements, but it's difficult for us to participate, because a lot of people work all day.

Interviewer: What would you like to see happen in your community in relation to land regularization and the right to the city?

Resident 2: I would like us to have our house legalized and access to basic services. I also wanted the city hall to look more out of us, especially the children.

Interviewer: Thank you very much for your participation. Your answers are very valuable and help to better understand the reality of Jurema Barra.

Resident 2: Thank you, I hope this research helps all of us in some way.

The second interview reinforces and deepens the understanding of the challenges faced by inhabitants in situations of irregular urban occupation. Ana Paula's story reflects a reality that is very present in the Brazilian urban peripheries, marked by forced migration in search of housing alternatives, mainly due to the high costs of rents in other regions of the city.

By highlighting that she moved to the community because she could not afford the costs of formal housing, the interviewee shows how socio-spatial segregation is reproduced in urban dynamics, pushing low-income families into informal territories and often unassisted by the government (Rolnik, 2019). This situation reveals the exclusionary face of the real estate market, which restricts access to decent housing to a significant portion of the population, deepening urban inequalities.

The interviewee's perception of the importance of land regularization demonstrates that the right to housing is not limited only to physical access to space, but also to the legal guarantee that allows security of tenure and stability. This understanding dialogues directly with the principles of the Statute of the City (Law No. 10,257/2001), which establishes that the right to the city must ensure decent housing, social inclusion, access to urban services and participation in the management of cities (Brasil, 2001).

In addition, when Ana Paula reports that she does not know how the land regularization process works, she reveals a critical absence of public policies for information and technical, social and legal assistance. As Fernandes (2011) states, land regularization needs to be understood not only as a technical procedure, but as a social process that must be linked to the strengthening of citizenship and urban rights.

Another relevant point of the statement is the direct association that the resident makes between the absence of regularization and the precariousness of public services in the community. She points out the lack of health and transportation units, which reinforces the thesis that, without the legal recognition of occupations, there is a structural difficulty in implementing essential urban equipment. This reality refers to Santos' (2020) discussions on spatial justice, which highlights how inequality in access to urban resources and services generates deep territorial injustices.

When he mentions that there are residents' associations fighting for improvements, but that participation is made difficult by the population's working day, another central aspect of the urban problem is evident: the incompatibility between participatory processes and the real living conditions of the working population of the peripheries. Souza (2021) observes that, although democratic management is a fundamental principle of urban policies, it often does not consider the concrete barriers that prevent the effective participation of citizens, especially the most financially needy.

Finally, the interviewee's expectation of having her house regularized and ensuring access to basic services, especially thinking about children, reveals the intergenerational dimension of the struggle for the right to the city. This fight is not only for housing security, but also for building a future with more dignity and access to urban opportunities.

Thus, the interview reinforces that land regularization is not an isolated demand, but is intrinsically linked to the realization of urban rights, the overcoming of socio-spatial inequalities and the construction of fairer, more inclusive and democratic cities (Lefebvre, 2001).

- Interview – resident 3

Interviewer: Hello! Thank you for accepting to participate in this interview. Let's talk a little about your experience as a resident of the Jurema Barra community, especially in relation to land regularization and the right to the city. To start, could you introduce yourself and tell us a little about your story here in the community?

Resident 3: Hi, how are you? My name is Seu Antônio, I'm 62 years old. I have lived here in Jurema Barra for 7 years. I came here after retiring. I couldn't buy a house elsewhere, so I built it here with the help of my children.

Interviewer: How do you see the issue of land regularization in your community? Do you think this is important?

Resident 3: Absolutely. I'm not young anymore, right? I wanted to make my home safe for my children and grandchildren. Without a document, everything is uncertain. We are even afraid to improve the house.

Interviewer: Have you ever had access to information about how the land regularization process works?

Resident 3: Very little. We hear that there is regularization in other communities, but no one has ever come here to explain it properly. It's all word of mouth.

Interviewer: How do you believe that the lack of land regularization affects life in the community?

Resident 3: Without a doubt, it gets in the way too much. Here there is a lack of security, lighting, a health center. Without a document, it seems that we don't even exist on the map.

Interviewer: Do you know of any initiative or project that seeks to help the community in this regard?

Resident 3: I heard that there are people organizing a petition, but so far I have not seen any results. I think there is a lack of support for these initiatives to grow.

Interviewer: What would you like to see happen in your community in relation to land regularization and the right to the city?

Resident 3: I wanted everyone to have their documents in hand. So we could ask for our rights like any citizen.

Interviewer: Thank you very much for your participation. Your answers are very valuable and help to better understand the reality of Jurema Barra.

Resident 3: I thank you! I hope this research brings changes to us.

The interview with Seu Antônio, a resident of the Jurema Barra community for seven years, adds an intergenerational perspective to the debate on land regularization, the right to the city and spatial justice. His report is loaded with not only personal but also family concerns, since he expresses the desire to ensure housing security for his children and grandchildren, which demonstrates how the absence of regularization not only impacts the present, but also compromises the future of families living in situations of urban informality.

Seu Antônio's trajectory reflects a recurring pattern in the Brazilian urban peripheries, where retirement, often insufficient for access to the formal housing market, leads the elderly to seek alternatives in areas of informal occupation. This reality highlights the structural failure of the State to guarantee adequate housing for the elderly population, deepening socio-spatial inequalities (Rolnik, 2019).

By mentioning that he avoids making improvements to his house because he does not have documentation, the resident confirms one of the main consequences of the lack of land regularization: the insecurity of tenure. This insecurity not only prevents investments in housing improvement, but also generates psychological and economic impacts, reinforcing the cycle of social vulnerability (Fernandes, 2011).

Another important point is the clear perception that, without documentation, the community remains invisible to the eyes of the government, which results in the absence of essential infrastructure, such as public safety, lighting, health centers and adequate transportation. This condition of urban invisibility is directly linked to the concept of spatial justice, where, according to Santos (2020), the poor distribution of resources, services, and rights in the urban space accentuates processes of territorial marginalization.

Seu Antônio's speech also reveals the fragility of community initiatives, such as the petition cited. Although he demonstrates an attempt at social organization, he expresses discouragement at the lack of institutional support. Souza (2021) reinforces that, without the proper technical, legal, and logistical support, popular mobilizations are limited, which makes it difficult to enforce the right to the city and build truly democratic urban management.

The resident's desire to see the entire community with its documents regularized clearly expresses the understanding that formal land ownership is an essential condition for accessing urban rights. This desire dialogues directly with the principles established in the Statute of the City (Law No. 10,257/2001), which guarantees that all citizens have the right to decent housing, infrastructure, urban services and participation in decisions that affect their territories (Brasil, 2001).

Therefore, Seu Antônio's interview synthesizes a common reality in the Brazilian peripheries: aging in precarious territories, without legal guarantees, without full access to the city and at the mercy of public policies that do not arrive. His testimony is, above all, a silent cry for recognition, dignity and urban justice, reaffirming that the struggle for land regularization goes beyond a document; it is the struggle for full citizenship and the right to the city, as defended by Lefebvre (2001).

- Interview – Resident 4

Interviewer: Hello! Thank you for accepting to participate in this interview. Let's talk a little about your experience as a resident of the Jurema Barra community, especially in relation to land regularization and the right to the city. To start, could you introduce yourself and tell us a little about your story here in the community?

Resident 4: Hi! My name is Lucas, I'm 19 years old. I was born nearby and have lived in Jurema Barra for about 5 years, along with my mother and my brothers. We built our little house slowly.

Interviewer: How do you see the issue of land regularization in your community? Do you think this is important?

Resident 4: A lot! To have a document is to have dignity. Without regularization, we can't even make a loan, we can't reform properly. We are always in uncertainty.

Interviewer: Have you ever had access to information about how the land regularization process works?

Resident 4: Not much, no. Only what we hear from neighbors. No one from the city hall came here to explain it properly.

Interviewer: How do you believe that the lack of land regularization affects life in the community?

Resident 4: Affects everything. Without a document, we can't improve. The street is full of holes, there is a lack of sanitation. And the new people here, like me, miss opportunities.

Interviewer: Do you know of any initiative or project that seeks to help the community in this regard?

Resident 4: There are some social sports projects that help get young people off the street, but about land regularization, I don't know of any strong ones.

Interviewer: What would you like to see happen in your community in relation to land regularization and the right to the city?

Resident 4: I wish there was more information for us to organize. I also wanted it to have more leisure spaces, more security and, of course, to have our house document.

Interviewer: Thank you very much for your participation. Your answers are very valuable and help to better understand the reality of Jurema Barra.

Resident 4: You're welcome. Good morning

The fourth interview, conducted with Lucas, a 19-year-old young man, brings to light an important generational perspective on the challenges of the Jurema Barra community, especially with regard to the right to the city and land regularization. The trajectory of Lucas and his family, who built their home little by little, reflects the reality of thousands of Brazilian families who, without access to the formal housing market, resort to land occupation as an alternative to urban exclusion (Rolnik, 2019).

The young man evidences right at the beginning that land regularization is synonymous with dignity, especially when he states that "having a document is having dignity". This perception reveals a mature understanding of how the legal recognition of possession directly impacts quality of life, social stability, and the possibility of accessing rights and opportunities. This statement dialogues with the principles of the Statute of the City

(Law No. 10.257/2001), which establishes that the social function of urban property is conditioned to access to housing, public services and participation in urban life (Brasil, 2001).

The absence of official information about the regularization processes is a recurring point in the four interviews conducted and, in Lucas' case, this factor gains even more relevance. The lack of communication on the part of the public authorities demonstrates not only a failure in urban management, but also a practical denial of the right to information, which is fundamental for citizens to be able to claim their territorial rights (Fernandes, 2011).

In addition, Lucas points out that the lack of regularization not only affects housing security, but also directly impacts the community's infrastructure, with potholed streets, absence of basic sanitation, lack of leisure spaces and opportunities for young people. This perception is in line with the concept of spatial justice discussed by Santos (2020), who points out that inequality in access to urban resources generates not only material deprivation, but also social, economic, and symbolic exclusion.

The fact that the interviewee mentions social projects focused on sports as one of the few initiatives present in the community reveals both the absence of structuring public policies and the importance of community and civil society actions in mitigating the effects of exclusion. However, the lack of specific projects for land regularization shows a weakness in the articulation between the demands of the community and the performance of public agencies (Souza, 2021).

When Lucas expresses the desire for more spaces for leisure, security and, above all, the regularization of land, he shows that the right to the city, a concept centered on the discussions of Lefebvre (2001), goes far beyond physical access to the territory. It is about the right to participate, to enjoy urban benefits, to feel belonging and to live with dignity. This is even more urgent when young people, as in the case of Lucas, see their perspective for the future compromised by the absence of effective public policies.

Therefore, the analysis of Lucas' speech reveals that the absence of land regularization and participatory urban planning not only generates physical precariousness, but also deepens the feeling of insecurity, marginalization and lack of perspective, especially for young people from the peripheries. The struggle of the Jurema Barra community, therefore, is not only for documentation, but for full citizenship, dignity and urban inclusion.

We can observe in Jurema Barra, the experience of the right to the city is manifested in the daily practices of the inhabitants, who seek to transform their urban space into a fairer and more accessible place. The community, characterized by cultural and socioeconomic diversity, faces challenges typical of growing urban areas, such as the lack of adequate

infrastructure, limited access to public services, and the need for living spaces (Almeida, 2014).

The daily practices of the residents reflect in the search for improvements. Community meetings, for example, are a fundamental space where residents discuss their needs and collective planning (Barros, 2019).

4.4 BENEFITS OF LAND REGULARIZATION

Land regularization is a central theme in Brazilian urban policies, especially in cities that face intense processes of informal occupation and disorderly expansion, as occurs in Ananindeua, in Pará. In the survey carried out with residents of the Jurema Barra community, it was observed that this process is perceived as fundamental to ensure legal security, access to public services and appreciation of housing. According to the testimonies of four interviewees, the main benefits mentioned were: the tranquility of having the land legalized, the possibility of investing in home improvement, and easy access to social programs.

In this context, it is important to highlight the role of the Municipal Master Plan, a basic instrument of urban policy provided for in the City Statute (Law No. 10,257/2001). The Master Plan of Ananindeua establishes guidelines for the use and occupation of the land and can enable and guide the introduction of public policies aimed at land regularization, prioritizing the right to decent housing and the territorial inclusion of historically marginalized communities. The compatibility between the reality of the occupations and the urban goals of the Master Plan is essential to ensure that regularization does not occur in isolation, but as part of an integrated strategy of urban development and social justice.

4.5 CHALLENGES AND LIMITATIONS OF THE PROCESS

The process of land regularization faces a series of limitations that hinder its effectiveness and the full realization of the right to the city for the inhabitants of the community.

One of the main limitations of the land regularization process in Jurema Barra is the lack of accurate and up-to-date mapping of the occupied areas. Often, the available information is scarce or outdated, which compromises the development of effective public policies and the implementation of regularization actions. Without a clear diagnosis of the land tenure situation, it becomes challenging to identify which areas can be regularized and which are in an irregular situation, leading to inefficient management of the territory (Carvalho, 2019).

In addition, the bureaucracy involved in the necessary procedures for land regularization is a significant obstacle. The processes are often lengthy and complex, which

discourages residents from seeking the regularization of their properties. The lack of information and adequate guidance on the rights and duties of those who occupy informal land also contributes to the lack of interest or the abandonment of seeking the formalization of possession (Brás, 2018).

Another limiting factor is the resistance of some spheres of government to recognize and promote land regularization. In many cases, the view that informal occupations are problematic leads to a punitive approach, rather than a perspective that seeks to integrate these communities into the urban fabric in a sustainable way. This attitude can result in eviction and eviction actions, which not only violate the right to housing, but also perpetuate social exclusion and marginalization of residents (Bartoli, 2017).

The issue of infrastructure is equally critical. Many communities, including Jurema, lack basic services such as clean water, sewage, electricity, and public transportation. The absence of these essential conditions makes land regularization even more complex, since the formalization of land ownership without the proper infrastructure may not guarantee the improvement of the quality of life of residents. Thus, it is essential that regularization policies are accompanied by investments in infrastructure and public services (Alencar, 2017).

In addition, the lack of community participation in decision-making and urban planning processes is a significant limitation. Often, solutions to the problems faced by communities are elaborated without the consultation or involvement of the residents themselves, who know their needs and realities better. This exclusion can result in inadequate and ineffective measures, which do not meet the wishes of the local population (Castro, 2019)

Finally, the socioeconomic context of the Jurema Barra community also plays an important role in the limitations of the land regularization process. Poverty, unemployment and social vulnerability are factors that make it difficult for the community to mobilize in search of its rights. In addition, the lack of access to education and information can prevent residents from fully understanding the regularization process and its benefits, perpetuating a cycle of exclusion and marginalization (Cruz, 2017).

The limitations of the land regularization process in the Jurema community, in Ananindeua, are multifaceted and interconnected. For the right to the city to be effectively guaranteed, a joint effort is needed between the government, civil society and the residents themselves (Almeida, 2014).

Overcoming these barriers requires the implementation of more inclusive public policies, which prioritize land regularization, but which are also committed to infrastructure improvement, community participation and the promotion of decent living conditions for all

citizens. Only in this way will it be possible to transform the reality of the Jurema community and ensure that its inhabitants have full access to urban rights (Carvalho, 2019).

It was also analyzed with the research that the lack of documentation and the absence of effective public policies have generated serious impacts on the lives of the inhabitants of the Jurema Barra de Ananindeua community, in Pará. This situation reflects a problem that affects many Brazilians, especially those who live in more vulnerable areas. The difficulty in accessing basic documentation, such as birth certificates, RG and CPF, prevents many residents from fully exercising their rights, limiting their access to essential services, such as health, education and social assistance (Almeida, 2014).

Without proper documentation, many citizens face barriers to enrolling in social programs, obtaining medical care at health facilities, or even enrolling their children in schools. The lack of a simple civil registry can mean the exclusion of a person from various public policies that aim to ensure well-being and citizenship. In this context, the absence of effective public policies further aggravates the situation, since there are no initiatives that promote document regularization and that meet the specific needs of the community (Alencar, 2017).

In addition, the lack of government actions that prioritize social inclusion and citizenship results in a cycle of poverty and marginalization. Residents of Jurema Barra face difficulties not only in accessing basic services, but also in actively participating in the political and social life of the region. The lack of documentation makes them invisible, limiting their ability to claim rights and engage in democratic processes. Without the possibility of voting, for example, or participating in community meetings, these people find themselves excluded from decisions that affect their lives and their future (Carvalho, 2019).

The reality of the community is a reflection of a system that fails to guarantee fundamental rights. The absence of public policies that address the problem of documentation and promote social inclusion prevents the residents of Jurema Barra de Ananindeua from having access to resources and opportunities that could transform their lives. It is urgent that there be a joint effort between the governmental spheres and civil society to develop strategies that guarantee the regularization of documents and that promote public policies that meet the needs of the population (Almeida, 2014).

Only through effective actions, which consider the local reality and seek the inclusion of all citizens, will it be possible to reverse this situation of vulnerability and exclusion. The construction of a fairer and more egalitarian future for the Jurema Barra de Ananindeua community necessarily involves valuing citizenship and implementing policies that respect

and guarantee the rights of each individual, allowing everyone to have access to a dignified and full life (Carvalho, 2019).

5 FINAL CONSIDERATIONS

Land regularization emerges as a central issue in the debate on the right to the city, especially in urban contexts characterized by inequalities and informal occupations, as is the case of the Jurema Barra community, located in Ananindeua, PA. Throughout this work, it was possible to observe that land regularization is not limited only to the formalization of land tenure, but is also intertwined with the promotion of social rights, access to public services and the construction of a more inclusive and fair city.

The analysis of the reality of the Jurema Barra community reveals that the lack of documentation and the precariousness of the living conditions of the residents are reflections of an urbanization model that ignores the needs of the most vulnerable population. Land regularization, therefore, presents itself as a fundamental tool for transforming this reality, allowing residents to have legal certainty about their homes if they can claim essential services such as sewage, electricity and transportation.

In addition, the realization of the right to the city goes through a process of listening and participation of the community in decisions that affect its urban space. The inclusion of Jurema Barra residents in the planning and implementation of public policies is vital to ensure that solutions meet the real demands of the population. The strengthening of local leaders and the formation of community associations are strategies that can enhance the struggle for rights and the search for improvements in living conditions.

However, land regularization should not be seen as a panacea. It is essential that regularization initiatives are accompanied by integrated public policies that address social, economic, and environmental issues. The promotion of housing, infrastructure, health, and education programs must go hand in hand with regularization processes, ensuring that the dignity and quality of life of citizens are effectively ensured.

Finally, this study highlights the importance of articulation between different spheres of government, civil society and private entities in the construction of a more equitable city. Land regularization and the right to the city are interconnected issues that require a collective and continuous effort so that we can move towards a fairer society, where everyone has access to an urban space that respects their dignity and promotes their well-being.

The community of Jurema Barra, as well as many others in similar contexts, is a clear example of the urgency and relevance of this discussion, which must be prioritized in Brazil's political and social agendas.

ABSTRACT

Cannabis sativa Linnaeus is a herbaceous plant from the Cannabaceae family. Its female inflorescences are rich in glandular trichomes, which contain secondary metabolites with medicinal properties, such as cannabidiol (CBD). The lack of information on the cultivation management of *Cannabis* for biomedical purposes hinders the development of high-quality and standardized production. A literature search was conducted for studies involving interventions in *Cannabis* cultivation aimed at improving CBD content for medicinal purposes. A systematic search was performed in the CAPES Periodicals Portal > Collection > Subject >, using the search term "*Cannabis* and Crop Production," filtering for open-access, original, peer-reviewed articles in English. Scientific articles containing cultivation practices for *Cannabis* chemotype III relevant to the objective were included. The following were excluded: articles on agricultural production of *Cannabis* for non-medicinal purposes, review articles, non-scientific studies, THC > 0.3%, without CBD improvement, without instrumental analysis of CBD content, and *Cannabis* Chemotypes I and II. The search resulted in 9 eligible articles, with the following interventions: manipulation of phosphorus concentrations; sowing density and nitrogen fertilization; application of auxin antagonists under in vitro conditions; cultivar selection; optimized agronomic practices in a controlled cultivation environment; strategic manipulation of the light spectrum; topping; treatment with 6-benzylaminopurine (BAP); cultivar selection and water management; genetically uniform material under different environmental conditions. For greater success in increasing CBD without increasing THC, choosing a Chemotype III strain for medicinal purposes is paramount.

RESUMO

A *Cannabis sativa* Linnaeus é uma planta herbácea, da família Cannabaceae. Suas inflorescências femininas são ricas em tricomas glandulares, que possuem metabólitos secundários com propriedades medicinais, como o canabidiol (CBD). A carência de informações sobre o manejo do cultivo da *Cannabis* para fins biomédicos dificulta o desenvolvimento de uma produção de qualidade e padronizada. Buscou-se na literatura estudos com intervenções no cultivo da *Cannabis* visando a melhoria do teor de CBD para fim medicinal. Pesquisou-se sistematicamente no Portal de Periódicos da CAPES> Acervo> Assunto>, com o termo de busca *Cannabis* and Crop production, com filtro em artigos de acesso aberto, originais, em inglês, revisado por pares. Incluiu-se artigos científicos contendo práticas de cultivo da *Cannabis*, quimiotipo III em pertinência ao objetivo. Foram excluídos artigos de produção agrícola da *Cannabis* sem fim medicinal, artigo de revisão, estudos não científicos, THC > 0,3%, sem melhoramento de CBD, sem análise instrumental do teor de CBD e *Cannabis* Quimiotipo I e II. A busca resultou em 09 artigos elegíveis, com as seguintes intervenções: manipulação das concentrações de fósforo; densidade de semeadura e a fertilização com nitrogênio; aplicação do antagonista de auxina em condições *in vitro*; seleção de cultivares, práticas agrônômicas otimizadas em ambiente de cultivo controlado; manipulação estratégica do espectro de luz; topping; tratamento com 6-benzilaminopurina (BAP); seleção de cultivares e manejo hídrico; material geneticamente uniforme em diferentes condições ambientais. Para maior êxito no aumento do CBD sem o aumento do THC é primordial a escolha da cepa Quimiotipo III para fim medicinal.

RESUMEN

Cannabis sativa linnaeus es una planta herbácea de la familia cannabaceae. Sus inflorescencias femeninas son ricas en tricomas glandulares, que contienen metabolitos secundarios con propiedades medicinales, como el cannabidiol (cbd). La falta de información sobre el manejo del cultivo de *cannabis* con fines biomédicos dificulta el desarrollo de una producción estandarizada y de alta calidad. Se realizó una búsqueda bibliográfica de estudios que incluyeran intervenciones en el cultivo de *cannabis* destinadas a mejorar el contenido de cbd con fines medicinales. Se realizó una búsqueda sistemática en el portal de publicaciones periódicas de capes > colección > tema >, utilizando el término de búsqueda "*cannabis* y producción de cultivos", filtrando por artículos originales, de acceso abierto y revisados por pares en inglés. Se incluyeron artículos científicos que contenían prácticas de cultivo para el quimiotipo iii de cannabis relevantes para el objetivo. Se excluyeron los siguientes: artículos sobre producción agrícola de cannabis con fines no medicinales, artículos de revisión, estudios no científicos, thc > 0,3%, sin mejora del cbd, sin análisis instrumental del contenido de cbd, y los quimiotipos de cannabis i y ii. La búsqueda arrojó 9 artículos elegibles, con las siguientes intervenciones: manipulación de las concentraciones de fósforo; densidad de siembra y fertilización nitrogenada; aplicación de antagonistas de auxinas en condiciones *in vitro*; selección de cultivares; prácticas agronómicas optimizadas en un entorno de cultivo controlado; manipulación estratégica del espectro lumínico; poda apical; tratamiento con 6-bencilaminopurina (bap); selección de cultivares y gestión hídrica; material genéticamente uniforme en diferentes condiciones ambientales. Para lograr un mayor éxito en el aumento del CBD sin aumentar el THC, es fundamental elegir una cepa de quimiotipo III para fines medicinales.

Palabras clave: *Cannabis*. Producción de Cultivos. Cannabidiol.

1 INTRODUCTION

1.1 BOTANICAL CHARACTERISTICS OF CANNABIS

Cannabis sativa Linnaeus is a herbaceous plant in the Cannabaceae family. Its female inflorescences are rich in glandular trichomes, which have important secondary metabolites with medicinal properties, such as cannabidiol (CBD) (Bonini *et al.*, 2018). The classification of *Cannabis* can be carried out based on the relationship of the main phytocannabinoids in its constitution. Analyzing its phenotype, that is, chemical profile and the predominance in its composition of one of its secondary metabolites, characterizing it as a chemical fingerprint called chemotypes. *Cannabis* with a high ratio of Δ -9-Tetrahydrocannabinol (THC) to Cannabidiol (CBD) (>1) classifies as chemotype I, THC:CBD intermediate ratios (usually 0.5-2.0) are classified as chemotype II, and plants that have a low THC to CBD ratio (<1) classifies as chemotype III (Sampaio *et al.*, 2024).

1.2 CANNABIDIOL PHYTOCANNABINOID OF MEDICINAL INTEREST

CBD is the main non-psychoactive component of *Cannabis sativa* L. and for this reason there is interest in its therapeutic potential in various disease states investigated in animal models and in humans (Black *et al.*, 2019). It has anxiolytic, antidepressant, antipsychotic, anticonvulsant, anti-nausea, antioxidant, anti-inflammatory, antiarthritic and antineoplastic action (Agarwal; Burke; Maddux, 2019; Shannon *et al.*, 2019).

1.3 ASPECTS OF LEGISLATION

Regulatory bodies in North America and Europe classify Cannabis by the proportion of THC and CBD phytocannabinoids present in the plant, as a drug/marijuana (drug type/marijuana) or as fiber/hemp (fiber type/hemp). In North America, varieties with $\text{THC} \leq 0.3\%$ contents are classified as hemp (UNODC, 2019) and allowed in the production of fiber, food supplements, and cosmetics (MEAD, 2017), while $\text{THC} > 0.3\%$ are classified as marijuana and subject to greater control due to the psychoactive properties of THC (UNODC, 2019). In Europe, the requirements are greater, in which the classification for hemp needs to have THC levels lower than 0.2% (Cherney; Small, 2016). Unlike the US and Europe that regulated hemp for fiber production, Brazilian regulation does not differentiate the chemical profile between hemp and marijuana (Carvalho *et al.*, 2020).

1.4 THE INFLUENCE OF CANNABIS CULTIVATION FOR MEDICINAL PURPOSES AND BIOMARKERS

Botanical knowledge is essential for the correct management of the plant (Figueiredo;

Policarpo; Veríssimo, 2017). The amount of phytocannabinoids present in the *Cannabis* plant is extremely influenced by the gene pool and the environmental conditions of humidity, temperature, radiation, soil nutrients, and parasites (Citti *et al.*, 2018; Bonini *et al.*, 2018; Trancoso *et al.*, 2022) exposes that scattered rainfall, low humidity, and sunny weather produce a plant rich in phytocannabinoid content. Many varieties of *Cannabis* have been cultivated over time and the detailed knowledge of its phytocannabinoid profile plays an essential role in the correct selection of a plant. (Citti *et al.*, 2018) and their concentrations and interactions can determine medicinal effects and adverse side effects (Berman *et al.*, 2018; Trancoso *et al.*, 2022). Although there is a great diversity of chemical constituents among *Cannabis* strains and the number of phytocannabinoids is large, most studies profiling *Cannabis* phytocannabinoids report only the main phytocannabinoids in the extract, among which THC, CBD are its acidic precursors and inactive CBDA/THCA and CBN is a possible sleep inducer (Santos, 2021), and phytocannabinoid study because it is a product of THC degradation, in which they also represent markers that indicate quality in the extraction process of phytocannabinoids of interest to the *Cannabis plant* (Carvalho *et al.*, 2020; Berman *et al.*, 2018). The standardized production of secondary metabolites, in the class of herbal medicines, is limited because the active components are not perfectly uniform (Trancoso *et al.*, 2022). The study of abiotic factors together with management techniques can help in the development of management protocols that favor greater productivity, quality, and stability in the production of phytocannabinoids, and it is essential to know the biosynthesis process and the formation of these compounds (Glivar *et al.*, 2020; Trancoso *et al.*, 2022). Most agronomic research on hemp conducted in the field setting has focused mainly on fiber production and yield (Trancoso *et al.*, 2022). Hemp, even though it is used for the production of phytocannabinoids, is traditionally used for selective cultivation for fiber or seed production, instead of flower production and secondary metabolites (Trancoso *et al.*, 2022). The lack of basic information on the management of *cannabis* cultivation for biomedical purposes hinders the development of quality and standardized production. Insignificant studies have focused on the production of phytocannabinoids. Evaluating the effects of external factors and management techniques on phytocannabinoid production is essential to understand the agronomic treatments and methodologies that can be applied to suit the harvest and final products (De Prato *et al.*, 2022; Trancoso *et al.*, 2022). Several books have been published on techniques for managing cannabis crops, but the techniques described are based on common knowledge constructs, where there is a lack of systematic studies that prove their efficiency and effectiveness. Producers have access to horticulture guides based on the internet and online information, but much of this information is not based

on scientific research (Caplan; Dixon: Zheng, 2017; Trancoso *et al.*, 2022). In this sense, studies with interventions in the cultivation of the *Cannabis plant* aimed at improving the CBD content for medicinal purposes were searched in the literature.

2 METHODOLOGY

This is a study based on a systematic review of the literature, conducted according to the characteristics and recommendations of PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses). The results were organized and described in a narrative way, highlighting the main findings of the included studies, with the support of the PICO strategy.

2.1 ELIGIBILITY CRITERIA

We systematically searched the CAPES Journal Portal> Collection> Subject>, with the search term *Cannabis* and Crop production, with a filter on open-access, original, English, peer-reviewed articles. Scientific articles containing cultivation practices of *Cannabis*, chemotype III in pertinence to the objective, were included. Articles on agricultural production of *Cannabis* without medicinal purpose, review article, non-scientific studies, THC > 0.3%, without CBD improvement, without instrumental analysis of CBD content and *Cannabis* Chemotype I and II were excluded.

3 RESULTS AND DISCUSSIONS

The screening and selection of studies are presented in the flowTable in Table 1.

Table 1

PRISMA FlowTable for Screening and Selection of Studies

Source: Prepared by the authors

The results of the 09 included studies are described below, presenting scientific studies with presentation of methodology, study design and statistical analysis.

POPULATION: The study by Cockson *et al.* (2020) used strains of *Cannabis sativa* BaOx (high CBD content), grown from rooted cuttings. The total cultivation period from taking the cuttings to harvesting was approximately 134 days (from July 24 to December 5, 2019). The study was carried out in Raleigh, North Carolina, in the United States of America (USA).

INTERVENTION: Six doses of Phosphorus (P), a fertilizer vital for plant development and the production of secondary metabolites, ranging from 3.75, 7.50, 11.25, 15.0, 22.50 to 30.0 mg/L, were tested using a modified Hoagland solution. The cultivation was carried out in a glass greenhouse with average temperatures of 25.8 (day) and 21.3 °C (night). The Critical Night Length (NLC) was reached in the pre-flowering stage consisting of 9 to 10 hours of darkness with 14 to 15 hours of light. The plants for treatment were arranged in a randomized block design (DBC) divided between three benches. At the flowering stage, flower buds (n = 5) were harvested for cannabinoid analysis in Ultra High Performance Liquid Chromatography equipment coupled to Tandem Mass Spectrometry. (UHPLC/MS/MS) Triple Quadrupole. For statistical analysis to compare the differences between concentrations, the F test (GLM PROC) and the LSD test with Tukey-Kramer adjustment were used, where the significance level was defined as ($p \leq 0.05$).

CONTROL GROUP: The study compared the results obtained at six P concentrations, the lowest being the one that served as a point of comparison within the experiment.

OUTCOME: In the Flowering Stage, plants with higher P concentrations (22.5 and 30.0 mg/L) were more branched and had larger diameters, when compared to the lowest P concentration of 3.75 mg/L ($p \leq 0.001$). The highest floral fresh weight was also observed at the concentration of P 22.50 mg/L, compared to the concentration of 3.75 and 7.50 mg/L, ($p \leq 0.001$), this fact occurred due to the increase in the branching of the *Cannabis plant* at the highest concentration of P, in which it produces inflorescences at each node, increasing the floral biomass of the plant. Also at this stage, there was a significant difference ($p \leq 0.001$) in the production of the cannabinoids CBDA, CBGA, THCA, total THC, and total CBD when compared to the lowest concentrations of P in relation to the highest concentrations. Their production reached a plateau in the P concentration at 11.25 mg/L P and, after this rate was reached, an increase in the P concentration did not produce statistically higher or lower levels of cannabinoids. At this P concentration, the analysis of total CBD resulted in 140.09 mg/g ± 10.49 .

POPULATION: The study by Poniatowska *et al.* (2022) used strains of *Cannabis sativa* L Futura 75, KC Dora and Tygra (fibrous and monoecious hemp) germinated through

sowing in the open field. The *cannabis* was harvested by hand at the beginning of seed ripening and occurred in September of each year. The study was conducted in Pytkowo, Wielkopolska, Poland, during the years 2014 to 2016.

INTERVENTION: Use selected cultivars, with determined factors of sowing density and fertilization with nitrogen (N), a fertilizer vital for plant development and the production of secondary metabolites. Densities of 60 seeds/m² and density of 180 seeds/m² were tested. The nitrogen fertilization rates tested were: 0, 30, 60 and 90 kg/ha. The average air temperature during the vegetation period of the study ranged from 8.3 °C to 22.2 °C. The samples of the inflorescences used for the chemical analysis were obtained by choosing 10 plants randomly selected from each replicate in all tested combinations. The experimental design was the randomized complete block (DBC) method of three factors (Cultivar; Sowing density and N fertilization), split-plots, with four replications. The cannabinoids were analyzed by gas chromatograph with flame ionization detector (GC-FID). Statistical analysis of the results recorded was performed by analysis of variance (ANOVA) in a split-split-plot design.

CONTROL GROUP: In the study, the control group refers to fertilization with 0 kg N/ha nitrogen to evaluate the effect of nitrogen.

OUTCOME: Regarding sowing density, only Tygra obtained an increase in density from 60 to 180 seeds/m², significantly increasing the yield of CBD by 0.97 g/m², which corresponds to 8.8%. At the highest doses of N, the yield of CBD increased significantly compared to the control (zero N dose). For the cultivars, Futura 75 and KC Dora, the highest yield of CBD was obtained with 90 kg N/ha. And for Tygra, the highest yield (12.68 g/m²) was expected with 44.5 kg N/ha. The result of the work regarding the improvement of CBD production demonstrated that the optimization of productivity depends crucially on nitrogen fertilization and, to a lesser extent, on the cultivar and the interaction between nitrogen and sowing density.

POPULATION: The study by Senkyřík *et al.* (2023) used two strains of *Cannabis sativa* L., the cultivar USO-31, hemp of Ukrainian origin, germinated *in vitro* through seeds and the cultivar Tatanka Pure CBD, hybrid and rich in cannabidiol (CBD) germinated *in vitro* from rooted cuttings. The study was carried out in the Czech Republic, by Palacký University and the Institute for Research and Culture located in Olomouc.

CONTROL GROUP: Medium containing the treatment with the auxin antagonist, α -(2-oxo-2-phenylethyl)-1H-indole-3-acetic (PEO-IAA) and the medium without PEO-IAA.

INTERVENTION: Application of the auxin antagonist, PEO-IAA under *in vitro* conditions. This intervention sought to increase the rate of sprout multiplication *in vitro*, since auxin is an essential phytohormone that regulates apical dominance, by interrupting this

apical dominance with PEO-IAA, it was hoped to improve the multiplication of plant material and investigate the influence of this antagonist on the relative gene expression (GER) of cannabinoid genes and cannabinoid content. The conditions of the *in vitro* experiment were the same for both cultivars. The nodal segments were cultured in a 100mL erlenmeyer flask containing five to six nodal segments grown under standardized conditions in a phytotron at 22 °C, 40% relative humidity and photoperiod of 16/8 ($36 \mu\text{mol}\cdot\text{m}^{-2} \cdot \text{s}^{-1}$) for 4 weeks. After the cultivation period, the biomass was harvested, frozen in liquid nitrogen and then used for Relative Gene Expression (GER) analysis, and the phytochemical analysis of the cannabinoids, the latter being carried out in the UHPLC-MS/MS equipment. The *in vitro* experiment was carried out for each cultivar in three or four biological replications. Statistical analysis was determined by the *t-test* method to compare samples with PEO-IAA and controls in terms of cannabinoid content. To investigate the relationship between gene expression and cannabinoid concentration, regression analysis was used.

OUTCOME: The Tatanka Pure CBD cultivar showed a statistically significant increase ($p < 0.05$) in the concentration of the cannabinoid CBDA (approximately 1.47 times compared to the control). This was the only statistically significant increase found. The study suggests that the use of PEO-IAA is an appropriate condition for the formation of multiple shoots and that its presence in the culture medium probably does not significantly disrupt the gene expression of key genes related to the biosynthetic pathway of the main cannabinoids, nor does it reduce cannabinoid concentrations. However, the study recognizes the need for additional research into other genotypes and monitoring of plants after transfer to *ex vitro* conditions and the flowering stage to gain more valuable information.

POPULATION: The García-Tejero *et al.* (2020) used new varieties of hemp (*Cannabis Sativa* L.). Three CBD chemotype varieties (Sara, Pilar, Theresa) and two CBG chemotype varieties (Aida and Juani). The form of planting used was through rooted apical cuttings. The trial was carried out during two consecutive seasons (2014 and 2015), with the growing period from May to October. The study was carried out in the Guadalquivir River basin in southwestern Spain belonging to the Andalusian Institute for Agricultural Training and Development and Research (IFAPA, in Spanish). Country Spain.

CONTROL GROUP: The study did not use a control group, but a comparative study between the varieties and densities of plants tested.

INTERVENTION: Combination of cultivar selection, optimized agronomic practices, highlighting plant density (PD) and a controlled cultivation environment. The plants were grown in polyethylene-lined tunnel structures. The environment inside these tunnels had an average temperature between 23 and 35 °C and relative humidity around 65%. Three

densities were tested: PD1 (9,777 plants $\cdot$ ha $^{-1}$), PD2 (7,333 plants $\cdot$ ha $^{-1}$) and PD3 (5,866 plants $\cdot$ ha $^{-1}$). In the 2014 season (Sara, Pilar, Aida) a randomized block design was performed, considering four replicates per variety. The plant density used was PD1. In 2015 (Sara, Theresa, Aida, Juani) the design and replicates per variety were the same as in the previous year, except that three different densities were tested. Harvest was defined by weekly observations of the change in stigma color from white/yellow to orange/brown, harvested when approximately 80% of the shoots reached this maturity. Cannabinoid analysis was performed by gas chromatography. In 2014, the statistical analyses of the data were submitted to one-way analysis of variance (ANOVA), with Tukey's test for separation of means ($p < 0.05$). In 2015, the statistical analysis of the subjects underwent a two-way ANOVA, evaluating the effects of the cultivar, PD and their interactions. A Levene test was previously applied to verify the homogeneity of the variances.

OUTCOME: The Sara cultivar stood out as the most effective strain in terms of CBD cannabinoids in the 2014 and 2015 seasons. It is distinguished by its relevant volume and pronounced lateral growth, with a high capacity to develop inflorescences. The highest CBD yields were obtained with Sara under PD1 and PD3, (many plants in PD1 or higher individual development in PD3). Sara reached dry weight values of flowers and leaves, DW(F+L) between 3,478 and 3,307 kg $\cdot$ ha $^{-1}$, surpassing the values of Pilar and Theresa. CBD yields have reached up to 350 kg $\cdot$ ha $^{-1}$. This value is significantly higher (almost four times higher) than that reported in indoor conditions controlled by other studies (about 84 kg $\cdot$ ha $^{-1}$ in six annual production cycles). In short, the combination of new hemp cultivars genetically selected for CBD (especially Sara), propagated by clones, grown in macrotunnels in a Mediterranean semi-arid environment and with plant density optimization, resulted in a substantial and cost-effective increase in CBD production.

POPULATION: The study Kotiranta *et al.* (2024) used the cultivar called FINOLA, a hemp genotype of *the C. sativa* dominant in cannabidiol (CBD). Its seeds were sown in peat, grown in different pot sizes during the growing season. The study was conducted from April to September. The work was carried out at the Department of Agricultural Sciences, Viikki Plant Science Centre, University of Helsinki, Helsinki, Finland.

CONTROL GROUP: Treatment of opposite lights High and Low, R:FR Ratio (Red to Far Red) and another treatment used the original white LED spectrum (control), in which it excludes BlueL, UV-A and UV-B light, in which they were used in the comparative treatment.

INTERVENTION: Strategic manipulation of the light spectrum, focusing on two main areas: the Red to Far Red ratio (long wavelength) (R:FR) and the short wavelength radiation (Blue, UV-A and UV-B. The light factor is considered one of the main factors for the successful

cultivation of *Cannabis* indoors, with the photoperiod, light quality and intensity being significant factors. The plants were grown on benches (blocks) inside a research greenhouse compartment, closed environment, blackout curtains were implanted on all walls and roof continuously during the experiments to exclude external radiation and maintain photoperiods. The ambient temperature (Day 24 °C and Night 22 °C), relative humidity (Day 60% and Night: 50%) and CO₂ concentration in the air was 386 ± 14 ppm when the lights were on, were automatically controlled by the greenhouse control system. In addition, the light (photoperiod, quality and intensity) was precisely controlled using LED luminaires. The study was divided into two separate experiments, Experiment A used a HIGH R:FR white LED spectrum (Ratio 11) and used the same white LED spectrum as the HIGH R:FR treatment, but with the addition of LOW R:FR far red LED fixtures (Ratio 1) The plants were under the light treatments (HIGH R: FR and LOW R:FR) for 48 days until harvest 70 days after sowing (DAS). Experiment B included the treatments: Control, Blue, UV-A and UV-B in which 78 DAS were applied to the plants for 50 days until harvest. The experiments were organized in a randomized complete block design with three replicated blocks. Fifteen plants were randomly chosen from each light treatment, five per repetition plot for analysis of the cannabinoid constitution, which were performed through the high-performance liquid chromatography (HPLC) equipment, coupled to the Diode Array Detector (DAD). For the statistical analysis, the mixed-effects ANOVA model was used, in which the light treatment was defined as a fixed factor and the block of replicas as a random effect.

Outcome: The HIGH R:FR treatment (ratio of 11) resulted in higher total yield of inflorescences per plant, increased branching, demonstrated by the higher number of internodes, and the plants were thicker, avoiding the shade avoidance syndrome induced by LOW R:FR (ratio of 1), which causes stem elongation and decreased yield. The HIGH R:FR treatment increased CBD concentrations compared to the LOW R:FR treatment. Experiment B did not impact the total yield of the inflorescence, and the concentration of CBD.

POPULATION: The study by Folina *et al.* (2020) used two monoecious industrial hemp cultivars originating in France, Fedora 23 and Futura 75. The sowing of the cultivars was carried out through a standard grain seeder. The field experiment was carried out in Farsala, Central Greece. Sowing on May 11 and harvesting on August 14, 2019.

INTERVENTION: The main agronomic intervention adopted was *topping*. Stressful conditions such as environmental factors and pruning can increase the synthesis and accumulation of cannabinoids. Topping was performed by cutting the main bud of the *Cannabis* plants 40 cm from the top of the plants, carried out at 40 days after sowing in the open field. Climatic data were recorded daily, average temperature for the month of May

18.4°C, June 24.8°C, July 25.5°C, August 25.7°C The experimental design used was split-plot, containing three replications. The factors tested were main plots containing the two European hemp cultivars Fedora 23 and Futura 75 and subplots with *the topping and non-topping* treatments. Plant sampling was carried out at harvest time, on August 14, 2019, when the trichomes of the inflorescence changed from white to milky white. Samples of 10 plants were randomly selected from the middle rows of the plots, and cut above ground level. Five samples of harvested plants were subjected to the measurement of the CBD content in fresh Cannabis inflorescences using the GemmaCert equipment (GemmaCert Ltd., Israel) and after the fresh inflorescences were dried in an oven at 60 °C for 48 hours and weighed to determine the dry matter of the inflorescence. The experimental data were submitted to statistical analysis according to the split-plot design. The differences between the means were separated using the Least Significant Difference (LSD) test. All comparisons were made at the significance level of 5%.

CONTROL GROUP: The *non-topping group* functioned as the control group, being compared with the group that received the intervention (*topping*).

OUTCOME: The application with the *topping* treatment exerted a significant and positive effect on both the cannabinoid content and the yield attributes of the flowers ($p < 0.05$). In the cultivars tested, the CBD content (%) was significantly higher in the *toppings* than in the *non-toppings*, with Futura 75 being covered: 2.32% vs. uncovered: 1.9% and Fedora 23 covered: 2.2% vs. uncovered: 1.7%. In the *toppings*, the values of total dry matter (DM) productivity of the inflorescences were significantly higher (206.3 g/plant in Futura 75 and 156.3 g/plant in Fedora 23) than in the *non-topping* plants (179.7 and 131.8 g/plant in Futura 75 and Fedora 23). The number of inflorescences was higher in topping, which is attributed to the high number of secondary shoots that develop after removal of the main shoot (pruning).

POPULATION: The study by Mishchenko *et al.* (2022) used seeds of the USO 31 variety, monoecious industrial hemp (*Cannabis sativa* L.) of the Central European type. The experiment was carried out in the field in a region that presented a temperate/continental climate with a tendency to be warmer and drier. The growing season analyzed runs from April (early spring) to September (late summer and early fall), harvesting occurs at maturation (BBCH 89) is the thrashing phase, which represents biological maturation. The field research, which lasted from 2016–2019, was conducted in northeastern Ukraine.

INTERVENTION: Use of exogenous growth regulators (phytohormones and vitamins), and one of the objectives of the study was to evaluate the result of exogenous growth regulators on cannabinoid content. To evaluate the feasibility of epigenetic effects under the

influence of growth regulators, mature seeds were collected from treated plants. These seeds were then sown again in the fourth year (2019) for the offspring to be analyzed for their cannabinoid content. The climatic conditions fluctuated during the period of the experiment, thus being able to broadly evaluate the content of cannabinoid compounds. The substance 6-benzylaminopurine (BAP), a phytohormone of the cytokine group has been identified as the most effective growth regulator for increasing CBD. The content of cannabinoid compounds was determined by a gas chromatograph. Statistical analysis used the least significant difference test (LSD) and Student's t-test, with statistical significance determined at the level of $p < 0.05$.

CONTROL GROUP: Control group without treatment for comparison purposes with plants that received treatment with exogenous growth regulators.

Outcome: Treatment with the cytokinin BAP was the most efficient growth regulator to increase CBD content. The concentration of CBD in the plants treated with BAP (0.2654%) is significantly higher than the average value found in the untreated group (control) (0.1271%). From the point of view of epigenetic effects, a promising direction to increase the level of non-psychoactive cannabinoids is the treatment of vegetative plants with cytokinin BAP, and the concentration of CBD in the offspring of plants treated with this regulator resulted in the content of (0.2540%) significantly higher than the average value found in the untreated group, control (0.1323%). Under the influence of BAP, the highest content of cannabinoid compounds (including CBD) manifested steadily during each of the three processing years (2016–2018). These changes were inherited by at least one generation of descendants.

POPULATION: The study by Campbell *et al.* (2019) used a diverse set of 13 industrial hemp cultivars (*Cannabis sativa* L.), these strains are not considered CBD-rich, originating in Europe and Asia. The cultivars CS 45; Eletta Campana 45y; Tiborszallasi 46 are dioecious and the other cultivars are monoecious, Carmaleonte 45; Diana, 45; Monoica 46 ; Phedora 17; Féline, 32; Férimon 12; Futura 75; Santhica 27; Bialobrzeskie 52; USO 31 Ukraine. The field study that resulted in the analysis of CBD was in Colorado, United States, in Fort Collins, which we are analyzing in this study. The duration between planting and harvesting was measured as days to Duration of Maturity (TMD). The mean days to maturity was 116 days for the limited irrigation treatment ("dry") and 117 days for the fully irrigated treatment ("wet").

INTERVENTION: Use several cultivars (genotypes) for planting in two types of irrigation treatment to test germplasm imported from Europe and Asia. The study evaluates how genetic effects between cultivars, environmental effects, and genotype × environment (GEI) interactions influence traits such as cannabinoid content such as THC and CBD. Water

availability was an important environmental factor manipulated in the experiment. In Fort Collins, two irrigation treatments were used, through an overhead linear sprinkler irrigation system, being "Limited irrigation" (dry) and "Fully irrigated" (wet), the cultivars were replicated four times in the experiment. In Fort Collins, a Latinized row and column design was used. The cannabinoid profiles and quantification were analyzed by UHPLC/ coupled to a photodiode array detector (PDA), using 10 cm upper than the female flowers, three random plants were collected per plot at maturity. Variance (ANOVA) was used to define the effects appropriate to genotype, environment and GEI by linear regression.

CONTROL GROUP: The study compares the performance of the cultivars with each other and under different water management conditions

OUTCOME: The study resulted in average total CBD content: 2.24% under full irrigation conditions ("wet") and 1.43% under limited irrigation conditions ("dry"). The relationship between maturity (phenology) and Cannabidiol (CBD) production is of a positive and significant correlation ($p \leq 0.001$). This means that, generally speaking, hemp cultivars that have late flowering (i.e., take more days to reach maturity) tend to produce higher levels of total CBD. The number of days to maturity (DTM) was significantly correlated with the total CBD content. Pearson's correlation coefficient (r) between TMD and total CBD was 0.68, indicating a positive relationship. The genotype $\times$ environment (GEI) relationship was not significant for the increase in CBD. The percentage variance of the trait explained by the $G \times E$ interaction was only 1.7% This suggests that the cultivars, in general, maintained their relative classifications of CBD production in the different environments tested (limited irrigation and complete irrigation), demonstrating stability in relation to this interaction. Genotype was by far the most important factor, explaining 82.7% of the variation in CBD content ($p \leq 0.001$). To achieve a specific CBD content, cultivar selection is the most important decision. Although the interaction (GEI) was not significant, the regression model detected significant effects of the environment ($p \leq 0.001$) for total CBD. However, the magnitude of this effect was small, with only 6% of the variation attributed to environmental effects. The TMD had a negative correlation with grain yield ($r = -0.53$), indicating that, in general, cultivars that took longer to mature produced fewer grains. In summary, the lack of significance of the Genotype $\times$ Environment (GEI) interaction for total CBD indicates that the observed differences in CBD content between cultivars are predominantly determined by plant-specific genetics rather than by how the cultivar uniquely reacts to a specific environment (such as irrigation).

POPULATION: The study by Giupponi *et al.* (2020) used *Cannabis sativa* L strain . Kompolti is a dioecious industrial hemp variety developed in Hungary. The cuttings were

taken from the parental pistillate plant. The study was conducted in Italy, during the 2018 growing season, in two locations in the Piedmont region of northern Italy.

INTERVENTION: Clones of the Kompolti variety were cultivated in two distinct ecological environments — mountain and plain, in order to evaluate the impact of this environmental condition on the chemical composition (cannabinoids) of the inflorescences. To ensure that the observed differences in secondary metabolites were due solely to altitude-related ecological conditions, the uniform clones were grown in pots with a uniform substrate. The material of the inflorescences of each clone was sampled five times to perform the analyses. The quantification of cannabinoids used the average of four biological samples and they were analyzed by HPLC/MS with a quaternary pump. To compare the two groups, the two-tailed Student's t-test was used. A p-value lower than 0.05 was statistically significant.

CONTROL GROUP: The study compared the results of plants grown in the plains with plants grown in the mountains.

OUTCOME: CBDA was the most abundant cannabinoid, with significantly higher concentrations in the mountain samples ($p < 0.01$) compared to the plain. Although the natural process of decarboxylation of CBDA into Cannabidiol (CBD) occurs under the action of heat and light, the geographic location of the crop (mountain versus plain) did not significantly influence the decarboxylation of CBDA in the production of CBD in the samples studied. The Kompolti strain has a predisposition to have prolonged flowering in late summer/early autumn, when average daily temperatures are moderately higher, it may have led to a partial conversion of CBDA to its neutral form (CBD) in both locations.

The included studies showed significant results in increasing CBD, with variations when compared between the cultivars and intervention of the same study. In Cockson *et al.* (2020) the treatment performed on the BaOx cultivar (high CBD content) at the intermediate dose of P caused a greater increase in the concentration of total CBD compared to the higher doses of P that produced a more branched plant, with higher floral weight. The highest nutritional dose is not always the best dose to promote increased synthesis of secondary metabolites (Troncoso *et al.* 2022). In the study by Poniatowska *et al.* (2022) the application of higher N doses resulted in a significant increase in CBD in the cultivars, Futura 75 and KC Dora. There are studies that show that an increase in the content of mineral macronutrients can produce an increase in the production of inflorescences and phytocannabinoids (Shiponi, S.; Bernstein, N., 2021). In the study by Senkyřík *et al.* (2023) with the application of the auxin antagonist PEO-IAA, there was a significant increase in CBDA in the CBD-rich cultivar, Tatanka Pure CBD this study was considered in the work because it is a phytocannabinoid precursor of CBD, which through decarboxylation in the extraction process can become rich

in CBD and the application of PEO-IAA in the culture medium presented an important result as it did not affect the relative gene expression (GER) of cannabinoid genes and in the Mishchenko *study et al.* (2022) cytokinin application BAP, resulted in a significant increase in CBD and its offspring as well (epigenetics). Both interventions alter the hormones auxin and cytokine respectively and thus stimulate the development of lateral shoots (Crispim Massuela, D. *et al.*, 2022). In the study by García-Tejero, *et al.* (2020) the cultivar Sara (rich in CBD) showed a significant increase in CBD in PD1 and PD3, and in the study by García-Tejero, *et al.*, (2019), with another cultivar, Ermes, also rich in CBD, there was also an increase in CBD in PD1 and PD3, corroborating the importance of choosing the CBD-rich genotype for agronomic practices in controlled environments. In the study Kotiranta *et al.* (2024) strategic manipulation of the LED light spectrum (red: far red) resulted in an increase of inflorescence and CBD in the ALTO R:FR treatment (ratio of 11) in Finola cultivar (rich in CBD). According to Lefsrud, M. G.; Kopsell, D. A.; Sams, C LED lamps make it possible to present specific wavelengths, facilitating research on the impact of wavelength on the production of secondary metabolites. In the study by Folina *et al.* (2020) the topping performed on the Fedora 23 and Futura 75 cultivars resulted in a significant increase in the increase of inflorescences and CBD. According to Verma, N.; Shukla, S., (2015) pruning is a common intervention in Cannabis to increase the production of inflorescences and induce hormonal changes that cause metabolic changes. In the study by Campbell *et al.* (2019) the selection of 13 cultivars and water management resulted in a significant increase in CBD in complete irrigation. The relationship between late maturity and CBD production was significant, this may have interfered with the different result of Caplan, D.; Dixon, M.; Zheng, Y. (2019), in which on the contrary water restriction increased CBD yield by stress. In the study by Giupponi *et al.* (2020) there was a significant increase in CBDA in cultivation in a mountainous region, this study was considered in the work to be a phytocannabinoid precursor of CBD, which through decarboxylation in the extraction process can become rich in CBD. According to Jin, D. *et al.* (2020) in their study deduced that plants grown in regions with higher altitude and temperature exhibited higher density and increased trichomes. The study was limited to the search for open access articles. In addition, there was no expansion of the databases consulted, which made it impossible to exhaust the search.

4 CONCLUSION

Our study showed that the lack of CBD analysis in 10 excluded studies and 10 studies without CBD improvement corroborates with the information that there is a lack of studies for improvements in CBD production. Increased inflorescence production is not always indicative

of increased CBD. The objective of planting must be well defined, as the production of seed and inflorescence can occur in opposite ways in the maturation of the plant. Cultivars of CBD-rich genotypes seem to show more significant results in increasing CBD when the interventions, so the choice of the CBD-rich genotype is a better way to produce CBD for medicinal purposes. For greater success in increasing CBD without increasing THC, it is essential to choose the Chemotype III strain for medicinal purposes.

ABSTRACT

Introduction: Timely access to specialized care remains one of the main challenges of the Brazilian Unified Health System (SUS), particularly in Amazonian territories marked by long distances, care gaps, and weaknesses in the regional organization of health networks (Giovanella et al., 2020; Garnelo et al., 2017). In response to this scenario, the Ministry of Health instituted, through Provisional Measure No. 1,301 of May 30, 2025, subsequently regulated by Ordinance GM/MS No. 7,266 of June 18, 2025, and in the context of the Public Health Emergency declared by Ordinance GM/MS No. 7,061 of June 6, 2025, the Agora Tem Especialistas Program, with operational support from the Brazilian Agency for Support to SUS Management (AgSUS). The program is structured around regulated access, comprehensive care, and the use of mobile specialized care units (Brasil, 2025a; Brasil, 2025b; Brasil, 2025c).

Objective: To report and analyze the role of nurses in the implementation of the Agora Tem Especialistas Program in Amazonian territories, emphasizing processes of intergovernmental articulation, organization of access regulation through SISREG and e-SUS Regulação, community mobilization, and the operation of mobile units structured according to the logic of the Integrated Care Offer (Organização da Oferta do Cuidado Integrado – OCI).

Methods: A descriptive qualitative study in the form of an experience report, based on participant observation and reflective systematization of activities carried out between 2025 and 2026 in the municipalities of Humaitá and Lábrea and in the district of Santo Antônio do Matupi, in the municipality of Manicoré, Amazonas. Field notes, regulatory documents,

¹ Doctoral student in Medical Sciences. Universidade de Brasília (UnB). Universidade de Brasília (UnB).
E-mail: vianasauade.com@gmail.com

meeting minutes, institutional instruments, and evidence of formal recognition by local managers were used.

Results: The experience highlighted the central role of nurses as technical-political articulators in translating national guidelines into territorial practices, with emphasis on: organization of access exclusively through regulation systems (SISREG and e-SUS Regulação); adoption of the OCI logic (consultation, examination, and follow-up); implementation of mobile units characterized as customized trailers equipped with waiting areas, medical offices, ultrasound and mammography rooms, elevators for accessibility, climate-controlled and computerized environments; articulation with health surveillance and patient safety; and the innovative strategy of community mobilization through Community Health Workers. The case of Santo Antônio do Matupi stands out as the first district in the state of Amazonas to receive the Program, as well as the replicability of the experience, evidenced by a formal request for technical support from the municipality of Lábrea.

Conclusion: Nurses emerged as strategic actors in the implementation of the Agora Tem Especialistas Program in Amazonian territories, mediating the articulation between public policy, health management, and the community, and contributing to the consolidation of a model of regulated and humanized specialized care oriented toward the quality of the clinical encounter, in line with the principles of equity and comprehensiveness of the SUS.

RESUMO

Introdução: O acesso oportuno à atenção especializada permanece como um dos principais desafios do Sistema Único de Saúde (SUS), particularmente em territórios amazônicos marcados por grandes distâncias, vazios assistenciais e fragilidades na organização regionalizada da rede (Giovanella et al., 2020; Garnelo et al., 2017). Em resposta a esse cenário, o Ministério da Saúde instituiu, por meio da Medida Provisória nº 1.301, de 30 de maio de 2025, posteriormente regulamentada pela Portaria GM/MS nº 7.266, de 18 de junho de 2025, e no contexto da Situação de Urgência em Saúde Pública declarada pela Portaria GM/MS nº 7.061, de 6 de junho de 2025, o Programa Agora Tem Especialistas, com apoio da Agência Brasileira de Apoio à Gestão do SUS (AgSUS), estruturado sobre a lógica de acesso regulado, cuidado Integrado e utilização de unidades móveis de atenção especializada (Brasil, 2025a; Brasil, 2025b; Brasil, 2025c).

Objetivo: Relatar e analisar a atuação do enfermeiro na implementação do Programa Agora Tem Especialistas em territórios amazônicos, enfatizando os processos de articulação interfederativa, organização da regulação por meio do SISREG e do e-SUS Regulação, mobilização comunitária e operacionalização de unidades móveis estruturadas segundo a lógica da Oferta do Cuidado Integrado (OCI).

Método: Estudo descritivo, de abordagem qualitativa, na modalidade relato de experiência, fundamentado na observação participante e na sistematização reflexiva das atividades desenvolvidas entre 2025 e 2026 nos municípios de Humaitá e Lábrea e no distrito de Santo Antônio do Matupi, no município de Manicoré (AM). Utilizaram-se registros de campo, documentos normativos, atas de reuniões, instrumentos institucionais e evidências de reconhecimento formal por gestores locais.

Resultados: A experiência evidenciou o papel central do enfermeiro como articulador técnico-político na tradução das diretrizes nacionais em práticas territoriais, destacando-se: a organização do acesso exclusivamente por meio da regulação (SISREG/e-SUS

Regulação); a adoção da lógica da OCI (consulta, exame e retorno); a implantação de unidades móveis caracterizadas como carretas customizadas, com salas de espera, consultórios, salas de ultrassonografia e mamografia, elevador para acessibilidade, ambiente climatizado e informatizado; a articulação com a vigilância sanitária e a segurança do paciente; e a estratégia inovadora de mobilização por meio dos Agentes Comunitários de Saúde. Ressalta-se, ainda, o marco de Santo Antônio do Matupi como primeiro distrito do estado do Amazonas a receber o Programa e a replicabilidade da experiência, atestada por solicitação formal de apoio técnico no município de Lábrea.

Conclusão: O enfermeiro configurou-se como ator estratégico na implementação do Programa Agora Tem Especialistas em território amazônico, mediando a articulação entre política pública, gestão e comunidade, e contribuindo para a consolidação de um modelo de atenção especializada regulada, humanizada e orientada pela qualidade do encontro clínico, em consonância com os princípios de equidade e Integrado idade do SUS.

Palavras-chave: Enfermagem. Políticas Públicas de Saúde. Atenção Especializada. Programa Agora Tem Especialistas. Amazônia.

RESUMEN

Introducción: El acceso oportuno a la atención especializada sigue siendo uno de los principales desafíos para el Sistema Único de Salud (SUS) de Brasil, particularmente en territorios amazónicos marcados por grandes distancias, brechas en la atención y debilidades en la organización regionalizada de la red (Giovannella et al., 2020; Garnelo et al., 2017). En respuesta a este escenario, el Ministerio de Salud instituyó, mediante la Medida Provisional nº 1.301, de 30 de mayo de 2025, posteriormente reglamentada por la Ordenanza GM/MS nº 7.266, de 18 de junio de 2025, y en el contexto de la Emergencia de Salud Pública declarada por la Ordenanza GM/MS nº 7.061, de 6 de junio de 2025, el Programa "Ahora Hay Especialistas", con apoyo de la Agencia Brasileña de Apoyo a la Gestión del SUS (AgSUS), estructurado en la lógica del acceso regulado, la atención Integrado y el uso de unidades móviles de atención especializada (Brasil, 2025a; Brasil, 2025b; Brasil, 2025c).

Objetivo: Informar y analizar el rol de las enfermeras en la implementación del Programa "Agora Tem Especialistas" en territorios amazónicos, con énfasis en los procesos de articulación interfederativa, organización de la regulación a través del SISREG y la Regulación e-SUS, movilización comunitaria y operacionalización de unidades móviles estructuradas según la lógica de la Oferta Integrado de Atención (OCI). Método: Estudio descriptivo, con enfoque cualitativo, en forma de relato de experiencia, basado en la observación participante y la sistematización reflexiva de actividades desarrolladas entre 2025 y 2026 en los municipios de Humaitá y Lábrea y en el distrito de Santo Antônio do Matupi, en el municipio de Manicoré (AM). Se utilizaron registros de campo, documentos normativos, actas de reuniones, instrumentos institucionales y evidencia de reconocimiento formal por parte de los gestores locales.

Resultados: La experiencia destacó el rol central de la enfermera como articuladora técnico-política en la traducción de las directrices nacionales a las prácticas territoriales, con énfasis en: la organización del acceso exclusivamente a través de la regulación (SISREG/Regulación e-SUS); La adopción de la lógica OCI (consulta, examen y seguimiento); la implementación de unidades móviles caracterizadas como remolques personalizados, con salas de espera, consultorios, salas de ecografía y mamografía, ascensor para accesibilidad, ambiente climatizado e informatizado; la coordinación con la vigilancia sanitaria y la seguridad del paciente; y la innovadora estrategia de movilización a través de Agentes Comunitarios de Salud. Cabe destacar también el hito de Santo Antônio

do Matupi como el primer distrito del estado de Amazonas en recibir el Programa y la replicabilidad de la experiencia, avalada por una] solicitud formal de apoyo técnico en el municipio de Lábrea.

Conclusión: La enfermera se configuró como un actor estratégico en la implementación del Programa "Ahora Hay Especialistas" en el territorio amazónico, mediando la articulación entre las políticas públicas, la gestión y la comunidad, y contribuyendo a la consolidación de un modelo de atención especializada regulada, humanizada y de calidad, de acuerdo con los principios de equidad e Integrabilidad del SUS (Sistema Único de Salud).

1 INTRODUCTION

Timely and equitable access to specialized care is one of the main structural challenges of public health systems and is recognized as a central component for the effectiveness of Health Care Networks and for the reduction of inequities (Giovanella et al., 2020; Mendes, 2011). In Brazil, the persistence of long queues for consultations, exams, and specialized procedures expresses historical limits in installed capacity, weaknesses in regionalization, and difficulties in the organization of care regulation (Paim et al., 2011; Travassos, Oliveira; Viacava, 2006).

In the Amazon region, these challenges are more complex due to the large territorial extension, low population density, logistical barriers, and the scarcity of specialists, which accentuates care gaps and compromises comprehensive care (Garnelo et al., 2017; Schweickardt et al., 2019). The organization of strategies capable of integrating primary care, regulation and specialized supply in regional networks becomes, therefore, a fundamental condition for the effectiveness of the principles of the Unified Health System (SUS).

2 TERRITORIAL AND DEMOGRAPHIC CHARACTERIZATION OF THE MUNICIPALITIES AND DISTRICT STUDIED

The municipality of Humaitá, located in the south of the state of Amazonas, on the banks of the Madeira River, registered 57,473 inhabitants in the 2022 Demographic Census of the Brazilian Institute of Geography and Statistics (IBGE), with a demographic density of 1.74 inhabitants/km², which expresses its extensive territorial area and the challenges associated with the provision of specialized health services in this region.

The municipality of Lábrea, also in the south of Amazonas, had 45,448 inhabitants in 2022, with a demographic density of 0.67 inhabitants/km², indicating a scenario even more marked by low population concentration and large internal distances, which historically influences the organization of health care in a network and the need for itinerant strategies to expand access.

The district of Santo Antônio do Matupi, which is part of the municipality of Manicoré (AM), has its oldest demographic data detailed by census sector in the 2010 IBGE Demographic Census, the last source of official data subdivided by district, and registered 9,139 inhabitants that year, of which 5,870 lived in the urban area. The release of specific district data from the 2022 Census by the IBGE is still in the process of consolidation in official tabulated databases, which generates discrepancies between current estimates and historical data. It is worth mentioning that local management, based on operational surveys and territorial coexistence, still refers to the district as close to 9 thousand inhabitants, which,

although not formalized in a consolidated IBGE tabular publication for 2022, constitutes an approximate parameter used in municipal administrative practices. This demographic and territorial configuration — with municipalities of large size and low density, and a district with difficulties in measuring the population up to date — reflects a scenario in which the provision of specialized care faces logistical challenges, geographic distances, and specific needs for regulation and interfederative articulation.

In this context, the Ministry of Health instituted, through Provisional Measure No. 1,301, of May 30, 2025, later regulated by Ordinance GM/MS No. 7,266, of June 18, 2025, and in the context of the Public Health Emergency Situation declared by Ordinance GM/MS No. 7,061, of June 6, 2025, the *Agora Tem Especialistas* Program, which defines guidelines for expanding and qualifying access to specialized care, with emphasis on the use of installed capacity, the strengthening of regulation systems, interfederative articulation, and the adoption of innovative care devices, including the mobile specialized care units, with operational support from the Brazilian Agency for Support to SUS Management (AgSUS) (Brazil, 2025a; Brazil, 2025b; Brazil, 2025c).

The Program is structured on the logic of exclusively regulated access, through the Regulation System (SISREG) and e-SUS Regulation, ensuring nominal lists, prior scheduling and organization of appointments according to the Integrated Care Offer (OCI), understood as the articulated performance of an initial consultation, exam or procedure and return consultation, ensuring continuity, clinical quality and patient safety. Such a model conceptually distances itself from actions of a massive or episodic nature, prioritizing the centrality of the clinical encounter, the humanization of care and the problem-solving capacity of care.

The mobile units used under the Program are configured as customized truck-type vehicles, equipped with waiting rooms, medical offices, ultrasound and mammography rooms, elevators for accessibility for people with reduced mobility, in addition to air-conditioned and computerized environments, with infrastructure equivalent to that of fixed services of medium complexity. These devices are integrated into the SUS information and regulation systems and submitted to health inspection, patient safety protocols, and equipment calibration routines, ensuring technical and care standards compatible with specialized care.

The literature on public policies and health management highlights that the effectiveness of programs of this nature depends, in addition to the normative design, on the performance of professionals capable of articulating the implementation in the territory, mediating the relationship between national guidelines, local management and the needs of

the population (Hartz; Silva, 2005; Peters et al., 2013). In this process, nurses occupy a strategic position in the SUS, due to their historical insertion in care coordination, health surveillance, service organization, and interprofessional and community articulation (Kurcgant, 2016; Peduzzi et al., 2011).

In view of this scenario, it is relevant to systematize concrete experiences of implementation of the Agora Tem Especialistas Program in Amazonian territories, based on the role of nurses as agents of interfederative articulation and organizer of regulation and care processes. This study aims to report and analyze this performance in the municipalities of Humaitá and Lábrea and in the district of Santo Antônio do Matupi, in the municipality of Manicoré, state of Amazonas, highlighting the institutional arrangements, the organization of regulation, community mobilization and the operationalization of mobile units of specialized care.

The period of planning, agreement and execution of actions linked to the modality of Mobile Units of the Program is adopted as an analytical approach, with emphasis on the flows of regulation via e-SUS Regulation and/or SISREG, on the articulation between municipal managers, the State Department of Health and the Ministry of Health, and on the role of the nurse in the coordination of care, in the logistical organization and in the mediation between the different levels of care. The analysis seeks to highlight both the advances in the expansion of access to specialized care and the structural and operational limits imposed by the Amazonian territorial dynamics, marked by long distances, care gaps and weaknesses in the regionalized network.

3 METHODOLOGY

This is a descriptive and analytical study, with a qualitative approach, in the form of an experience report, developed from the author's professional experience in institutional support activities related to the Agora Tem Especialistas Program in the municipalities of Humaitá, Lábrea and in the district of Santo Antônio do Matupi, in the municipality of Manicoré (AM), from October 2025 to January 2026.

The experience report, as a methodological strategy in Collective Health, is recognized as a legitimate device for the production of knowledge about work processes, organization of services and implementation of public policies, to the extent that it allows the articulation of the empirical dimension of professional practice with the critical-reflexive analysis of its institutional, territorial and political-organizational determinants (Minayo, 2014; Deslandes & Gomes, 2016; Ceccim & Feuerwerker, 2004).

The production of information was based on participant observation, field records, records of interinstitutional meetings, public records and normative documents of the Ministry of Health, as well as observational information related to the regulation flows (e-SUS Regulation and SISREG), as recommended by qualitative approaches that value the immersion of the researcher in the investigated context and the understanding of the processes in their historicity and complexity (Minayo, 2014; Gil, 2019).

The analysis was guided by the references of the regionalization of the Unified Health System, the organization of Health Care Networks and care management, understanding the territory as a central category for the interpretation of the dynamics of access, care flows and interfederative articulation, especially in Amazonian contexts marked by great geographical distances, care gaps and structural inequalities (Mendes, 2011; Santos & Silveira, 2006).

The data were organized into analytical axes that include: (i) institutional articulation and interfederative agreement; (ii) organization of regulation flows; (iii) community mobilization and integration with Primary Care; and (iv) operationalization of the Mobile Specialized Care Units, seeking to highlight advances, limits and challenges in the implementation of the Program in hard-to-reach territories.

As it is an experience report based on work processes and institutional documents, without the use of identifiable user data or sensitive information, the study does not require consideration by the Research Ethics Committee, according to CNS Resolution No. 510/2016. Institutional anonymity and confidentiality of information were preserved.

It should be noted that this manuscript is an experience report based on the author's professional experience and documents in the public domain, and is not characterized as an institutional position or disclosure of internal administrative information. The analyses and interpretations presented are the sole responsibility of the author, having used only public, normative or observational data, without access or use of restricted institutional databases.

4 RESULTS AND DISCUSSION

4.1 INSTITUTIONAL ARTICULATION AND INTERFEDERATIVE AGREEMENT

The implementation of the Agora Tem Especialistas Program in the municipalities of Humaitá, Lábrea and in the district of Santo Antônio do Matupi showed, from the initial phase, the centrality of interfederative articulation as a condition for the operational viability of the Mobile Specialized Care Units. Considering the Amazonian territorial configuration, marked by long river and road distances, low density of specialized services and historical weaknesses in regionalization, the agreement between the Ministry of Health, the Amazonas State Department of Health and municipal administrations assumed a strategic character.

The process was conducted through technical meetings, definition of sanitary responsibilities, adequacy of the local infrastructure to receive the trucks and organization of reference and counter-reference flows. In this context, the role of nurses as institutional supporters and technical-political articulators proved to be fundamental to mediate interests, translate federal regulations into the local reality, and enable operational arrangements compatible with the installed capacities of the municipalities.

It is noteworthy that the agreement was not restricted to logistical aspects, but also involved the definition of criteria for access to services, integration with Primary Health Care and the operationalization of regulation systems (e-SUS Regulation and SISREG), ensuring that all users served by the Mobile Units were previously regulated, in line with the principles of equity, comprehensiveness and ordering of care in the Health Care Network.

In this context, monitoring assumes a central role as a management and articulation tool in the territory, as it enables the systematic monitoring of the agreed actions, the verification of their execution and the correction of directions throughout the process, an indispensable condition for inter-institutional strategies to achieve effectiveness and not be restricted to the normative plan. As Santos (2019) points out, it is through continuous monitoring that the co-responsibility between the actors involved is strengthened and that the planned actions are, in fact, implemented and consolidated in the daily routine of the services.

The experience in the municipalities of Humaitá, Lábrea and in the district of Santo Antônio do Matupi evidenced the complexity of the process of implementing the Mobile Units, since, in all territories, intersectoral articulation was necessary to define adequate physical areas, guarantee of continuous supply of electricity, connectivity for access to computerized systems, in addition to community mobilization to clarify the users about the criteria for scheduling and operation of the services.

In the district of Santo Antônio do Matupi, in particular, the role of Community Health Agents in mobilizing users in urban, rural and riverside areas was highlighted, considering that there was no structured waiting list for specialized procedures in women's health, since such services were not part of the municipality's regular offer. When necessary, the users were included in the state regulation and frequently referred to the capital, with trips that could exceed a day and a half by river and land, or to neighboring municipalities with limited supply, such as Humaitá, and, in extreme situations, to philanthropic services in other states, such as the Hospital de Amor, in Porto Velho (RO), highlighting the multiple geographical, economic, and institutional barriers to timely access.

4.2 ORGANIZATION OF REGULATION AND CARE FLOWS

The organization of access to the services offered by the Mobile Units of the Agora Tem Especialistas Program was structured based on the official regulation systems, notably the e-SUS Regulation and the SISREG, reaffirming the centrality of regulation as a device that organizes care and guarantees the principles of equity and Integradoity within the scope of the Health Care Networks.

All users assisted in the trucks were previously registered and regulated, based on requests from Primary Health Care, based on clinical protocols and prioritization criteria agreed between the municipal teams, the State Department of Health and the Ministry of Health. This process made it possible to organize waiting lists, stratify risks, optimize the use of the installed capacity of the Mobile Units and ensure that the most vulnerable cases and clinical need had timely access to consultations and specialized exams.

In the municipalities of Humaitá and Lábrea, as well as in the district of Santo Antônio do Matupi, regulation has taken on an even more strategic role due to the historical scarcity of local supply of medical specialties and diagnostic support, which traditionally forces users to travel long distances to regional centers. The insertion of the Mobile Units in the network required the construction of specific referral and counter-referral flows, articulating the Primary Care teams, the state services of medium complexity and the temporary structures installed by the trucks.

In this context, the nurse's work stood out in the coordination of work processes related to regulation, including technical support to the teams in the qualification of requests, dialogue with regulatory centers, monitoring of agendas and mediation of necessary adjustments in the face of connectivity limitations, system instabilities and logistical challenges typical of the Amazon territory. Such action contributed to reducing absences, reorganizing priorities and strengthening the integration between the points of care, bringing daily practice closer to the normative principles of regionalization and care management in the SUS.

4.3 COMMUNITY MOBILIZATION AND INTEGRATION WITH PRIMARY HEALTH CARE

The effectiveness of the implementation of the Mobile Units of the Agora Tem Especialistas Program in the territories studied was directly related to the capacity for community mobilization and the articulation with Primary Health Care (PHC), recognized as the preferential gateway and coordinator of care within the scope of the Unified Health System (Starfield, 2002; Mendes, 2011; Giovanella et al., 2020). In Amazonian contexts, marked by population dispersion, difficulties in geographic access and communication

limitations, the prior preparation of the territory proved to be a fundamental step for the adequate use of the specialized offer.

The PHC teams played a central role in identifying users with indication for consultations and specialized exams, updating registration, providing guidance on regulation flows, and preparing patients clinically and administratively for care in the trucks. The mobilization involved educational actions in health units, telephone contacts, articulation with community health agents and local leaders, seeking to reduce absences, clarify access criteria and strengthen the bond between users and the care network.

In the district of Santo Antônio do Matupi, territorial conditions, long distances between communities, and the predominance of productive activities linked to family subsistence imposed additional challenges to the organization of agendas and user attendance. The nurse's performance, in interface with the local teams and with the district management, which was performed by a nursing professional, proved to be strategic in the coordination of these actions, both in the planning of communication strategies and in the adequacy of service schedules, in the organization of reception and in the intersectoral articulation for logistical support.

This integration between PHC, regulation and Mobile Units contributed to the construction of more problem-solving care flows, favoring the continuity of care through counter-referral and longitudinal follow-up of users after consultations and specialized exams. This dynamic reinforces the understanding of Primary Care not only as an instance of referral, but as a structuring axis of the Health Care Network, even when the specialized offer is provided by itinerant devices.

4.4 OPERATIONALIZATION OF THE MOBILE UNITS OF SPECIALIZED CARE

The operationalization of the Mobile Units of the Agora Tem Especialistas Program in the municipalities of Humaitá, Lábrea and in the district of Santo Antônio do Matupi highlighted the logistical and organizational complexity involved in the itinerant provision of specialized care in Amazonian territories. The trucks, designed as temporary care structures of medium complexity, were equipped with waiting rooms, offices, environments for performing imaging exams (ultrasonography and mammography), elevator for accessibility for people with disabilities or reduced mobility, air conditioning and computerized systems integrated with SUS databases, with infrastructure equivalent to that of fixed services of medium complexity.

In addition, the implementation of the Mobile Units required permanent articulation with the service provider responsible for their operation, a company hired by the Ministry of Health,

through the Brazilian Agency for Support to SUS Management (AgSUS), for the provision and maintenance of customized trucks. This interface involved the systematic monitoring of structural conditions, equipment operation, accessibility, air conditioning, connectivity and adequacy of work processes, as well as the daily requirement of compliance with established technical, sanitary and contractual requirements. Such articulation proved to be fundamental to ensure that the provision of specialized care occurred in accordance with the standards of quality, patient safety and problem-solving capacity recommended by the Program, ensuring the effectiveness of care for the population in the Amazonian territories.

The installation of these units required the prior adaptation of physical areas, with a guarantee of continuous supply of electricity, connectivity for access to the regulation systems and medical records, health safety conditions and logistics for the reception of users. In Santo Antônio do Matupi, for example, intense articulation with the municipal management and other sectors of the local administration was necessary to enable land, support infrastructure and organization of the flow of people, considering the expected volume of services and the structural limitations of the district.

With regard to the work process, the presence of the Mobile Units implied the reorganization of the routines of the local teams, the integration between professionals from the trucks and the municipal network, and the definition of protocols for reception, referral and counter-referral. Nurses played a central role in the coordination of these activities, acting both in care management and in service management, articulating agendas, monitoring the functioning of agendas and care flows, mediating flows between regulation, PHC and specialized care, and ensuring the conformity of processes with the regulations of the Ministry of Health.

The challenges observed included connectivity instabilities, the need for continuous adjustments in supply logistics, adapting service times to the specificities of the local population, and overcoming barriers related to the transportation of users, especially those living in rural or riverside areas. Even so, the experience demonstrated the potential of the Mobile Units as a strategy for reducing care gaps and expanding access to medium complexity, as long as they are organically integrated into the regionalized network and supported by robust processes of regulation and coordination of care.

5 DISCUSSION

The experience of implementing the Agora Tem Especialistas Program in the municipalities of Humaitá, Lábrea and in the district of Santo Antônio do Matupi evidences, in a concrete way, the historical challenges of the regionalization of specialized care in

Amazonian territories and, simultaneously, the potential of innovative strategies, such as the Mobile Units, to reduce care gaps. The literature points out that ensuring timely access to medium complexity in regions of great territorial dispersion depends less on the mere expansion of supply and more on the ability to articulate networks, order flows, and integrate levels of care (Mendes, 2011; Viana et al., 2015).

In this sense, the centrality of regulation, operationalized through e-SUS Regulation and SISREG, is confirmed as a structuring element of equity and comprehensiveness of care, as it allows clinical prioritization, rationalization of the use of resources, and integration between Primary Care and specialized services, even when these are materialized in itinerant devices. The experience analyzed reinforces the findings of studies that highlight regulation as a strategic component of the governance of Health Care Networks, particularly in contexts of scarcity and asymmetry in the distribution of services (Silva et al., 2017; Santos & Campos, 2019).

Another relevant aspect concerns the role of nurses as agents of technical-political articulation and coordinator of work processes. In addition to its care attributions, the observed performance is inserted in the field of care management and institutional support, approaching the formulations of Ceccim and Feuerwerker (2004) on the inseparability between clinical, management and education in health work. In Amazonian territories, where the fragmentation of the network is intensified by geographical and institutional barriers, this mediating function proves to be even more strategic, contributing to the translation of federal regulations into territorially situated organizational arrangements.

The operationalization of the Mobile Units, in turn, shows both potentialities and limits. If, on the one hand, it expands access to specialized consultations and exams and reduces long-distance travel, on the other hand, it exposes the dependence on local infrastructure, connectivity, logistics, and effective integration with the fixed network. Such ambivalence dialogues with critical analyses of itinerant provision policies, which warn of the risk of punctual and discontinued solutions when not accompanied by the structural strengthening of regional networks (Paim, 2018; Giovanella et al., 2020).

Thus, the reported experience indicates that the effectiveness of the Mobile Units lies not only in the embedded technology, but above all in the capacity for interfederative articulation, in the coordination of care by Primary Care, in the robustness of the regulation systems and in the protagonism of professionals with a technical-political profile, such as nurses, in the conduction of the processes.

It is worth recognizing some limitations of this account. The situated character of the experience is highlighted, restricted to three Amazonian territories and based predominantly

on the author's experience, which may limit the generalization of the findings. In addition, comparative quantitative indicators of access before and after the intervention were not used, restricting causal inferences about the impact of care. Even so, the systematization presented contributes to the understanding of organizational processes and institutional arrangements in contexts of difficult access, offering subsidies for the management of specialized care in the SUS.

The text does not propose to carry out an evaluation of institutional performance or analysis of administrative indicators, limiting itself to the reflective description of organizational processes observed in professional practice.

6 CONCLUSION

The systematization of the experience of implementing the Agora Tem Especialistas Program in Humaitá, Lábrea, and the district of Santo Antônio do Matupi, from October 2025 to January 2026, shows that expanding access to specialized care in Amazonian territories requires more than the availability of itinerant structures. It requires solid institutional arrangements, effective interfederative agreement, organic integration with Primary Care, and regulation capable of ordering flows according to criteria of necessity and equity.

The nurse's role proved to be central in this process, both in the technical coordination of regulation and care flows, as well as in the mediation between managers, teams and the community, configuring themselves as a strategic agent in the implementation of public policies in contexts of high territorial and organizational complexity.

It is concluded that the Program's Mobile Units, when integrated into the Health Care Networks and supported by robust processes of regulation and care management, constitute an important device for the reduction of care gaps and for the realization of the right to health in regions historically marked by inequities of access. However, its results depend on the continuity of actions, the strengthening of local installed capacity and the consolidation of interfederative articulation practices, under penalty of being configured as episodic responses to structural problems.

This experience contributes to the debate on regionalization, access, and organization of specialized care in the Amazon, offering subsidies for the improvement of public policies and for the training of health professionals, especially nurses, with skills focused on the management of care in territories of great vulnerability and socio-spatial complexity.

ABSTRACT

The Real Estate Registry emerged, in Brazil, as a way to guarantee the legal security of real estate relations and the right to property, taking as inspiration the French and German real estate registration systems. In 1988, the Federal Constitution dealt with the right to property, conditioning its exercise in the service of the social function, and this, in turn, covers the protection and defense of the environment. In other words, there must be a conditioning between the exercise of the right to property and the preservation of the environment. The combination of environmental standards with the registration principles, in turn, favors the publicity and security that are expected of legal businesses whose object is immovable. Thus, the aim of this study is to analyze the reflexes derived from the Forest Code in real estate records. The methodological procedures adopted are bibliographic and documentary research. The method was deductive and the qualitative approach. This research aims to contribute to the elucidation of practical aspects of environmental legislation applicable to the registration of Brazilian real estate, serving as a basis for further studies and consisting of a catalyst for changes in the public records area.

condicionamento entre o exercício do direito de propriedade e a preservação do meio ambiente. A conjugação das normas ambientais com os princípios registrais, por sua vez, favorece a publicidade e a segurança que se esperam dos negócios jurídicos cujo objeto seja bem imóvel. Em assim sendo, o objetivo deste estudo é analisar os reflexos oriundos do Código Florestal nos registros de imóveis, orientando a abordagem do presente estudo sob a perspectiva desse Diploma. O problema que envolve o desenvolvimento dessa pesquisa é esclarecer se, na prática, as funções desenvolvidas pelo Registro de Imóveis consagram e influenciam, de fato, na efetivação da função social da propriedade. Os procedimentos metodológicos adotados são a pesquisa bibliográfica e documental. O método foi o dedutivo e a abordagem qualitativa. Pretende-se com esta pesquisa poder contribuir para a elucidação de aspectos práticos da legislação ambiental aplicáveis ao registro de imóveis brasileiro, servindo de base para novos estudos e consistindo em catalisador para mudanças na seara dos Registros Públicos.

RESUMEN

El Registro de la Propiedad Inmueble surgió en Brasil como forma de garantizar la seguridad jurídica de las relaciones inmobiliarias y el derecho a la propiedad, inspirándose en los sistemas inmobiliarios francés y alemán. En 1988 la Constitución Federal reglamentó el derecho de la propiedad condicionando su ejercicio a atender a la función social, y esta, a su vez, comprende la protección y defensa del medio ambiente. En otros términos, debe haber un condicionamiento entre el ejercicio del derecho de la propiedad y la preservación del medio ambiente. La conjugación de las normas ambientales con los principios registrales, a su vez, favorece la publicidad y la seguridad que se esperan de los negocios jurídicos cuyo objeto sea el bien inmueble. Por lo tanto, el objeto de este estudio es el de analizar los reflejos derivados del Código Forestal en los registros de inmuebles. Los procedimientos metodológicos adoptados son la investigación bibliográfica y documental. El método fue el deductivo y el abordaje cualitativo. Con esta investigación se pretende poder contribuir para elucidar aspectos prácticos de la legislación ambiental aplicables al registro de inmuebles brasileño, sirviendo como base para nuevos estudios y consistiendo en catalizador para cambios en el ámbito de los Registros Públicos.

1 INTRODUCTION

The use of natural resources has been widely disseminated throughout the recent history of humanity, with its main milestone defined with the advent of the French Revolution (1789) and, more specifically, the Industrial Revolution that followed. Since then, we have witnessed the parallel evolution of two faces of the same phenomenon in the world, that is, the alarming pressure on the environment, with successive demands for all kinds of consumer goods, coming from the progressive demographic increase; and, on the other hand, heavy investments in technological innovations, whose advances are surpassed in increasingly shorter cycles of novelty and, subsequently, of obsolescence, thus leading to environmental degradation.

Specifically in Brazil, the concern with the protection of the environment reached an unprecedented level with the promulgation of the Constitution of the Federative Republic of Brazil of 1988 (CF/1988), which dealt with the matter in its own chapter (Chapter VI – On the environment), in the penultimate of the nine titles (Title VIII – On the social order) which, together with the Preamble and the Act of Transitory Constitutional Provisions (ADCT), compose it, even if it has done so in a single article, 225, caput and §§ 1 to 7 (BRASIL, 1988, digital text). In this article, the Constituent Assembly first established the right to an ecologically balanced environment and included it among the fundamental rights of the third generation, or dimension; later, he established that the environment was a good for the common use of the people; and, finally, it determined not only to the Public Power, but also to the entire community the duty to defend and preserve it, for present and future generations (CF/1988, art. 225, caput, third part).

Based on these three constitutional premises, it is up to the Real Estate Registrar to ³ govern its performance, since it performs a function with a public purpose, in strict compliance with environmental legislation, in addition to ensuring compliance with this regulation by third parties, in order to, in so doing, protect, in a direct and equally reflexive way, the healthy and balanced environment.

The activity of the Real Estate Registrar must also be exercised according to the principle of strict legality (which underpins the Real Estate Registry), since, in the view of Dip (1993, p. 17), this principle would come from the very "theology of the registry institution", which, according to the author, would be found, in turn, in the reason for the existence of the

³ Real Estate Registrar is understood to be a legal professional who is a delegate, by the Brazilian State, of a public function corresponding to the exercise, by him, in a private character and in collaboration with the Public Administration, of extrajudicial services of technical organization and of a registry nature, in a real estate district for which he has been previously invested by the Public Power, after being duly approved in a public examination of tests and titles, in order to, with his performance, provide publicity, authenticity, security and effectiveness of the legal acts entered in the royal folio.

Public Registries, which is the granting of legal certainty. Brazilian environmental legislation, in simple definition, corresponds to the gathering of legal norms aimed at regulating human activity, in order to make it compatible with environmental protection.

Thus, when guiding their professional performance, with a preliminary focus on the constitutional premises, the Real Estate Registry officer will be responsible, for example, for making public, among others, information related to permanent preservation areas, environmental protection areas, soil contamination areas, as well as areas included in the Rural Environmental Registry (CAR) (provided for in Law No. 12,651, of May 25, 2012, art. 29, caput), in addition to those on which there are environmental licenses.

Such information appears to be of paramount social importance, both for individuals in defense of their respective private interests, and for the Public Power, in scrutiny of public policies under their responsibility, since, depending on the existence of certain environmental facts, real rights may be limited or restricted, among which is the right to property.

What is intended to be discussed from the analyses carried out concerns the strategies that could be developed by the Real Estate Registrar, so that the principle of publicity could be achieved, thus contributing to expand the environmental protection provided for in the rules. It is up to the Real Estate Registrar to observe the environmental legislation, to make third parties observe it, in the exercise of the real estate registration activity, so that, thus, the social function of constitutional and infra-constitutional protection is exercised.

The method of the present study was that of theoretical research, so classified because it focuses on the conceptual, legal and bibliographic aspects of the proposed theme. This is a bibliographic research on the theme addressed, which can be included, conceptually, as explanatory research, within the teachings of Gil (2008). The approach, in turn, is qualitative, which predisposes attention to the systematic analysis of nature and, consequently, to the understanding of what will be extracted from the interpretations of the investigated phenomenon.

The combination of environmental rules with registration principles, in turn, favors the publicity and security that are expected from legal transactions whose object is immovable property. Therefore, the objective of this study is to analyze the effects of the Forest Code on real estate records, guiding the approach of this study from the perspective of this Diploma. The problem that involves the development of this research is to clarify whether, in practice, the functions developed by the Real Estate Registry consecrate and influence, in fact, the effectiveness of the social function of property.

2 THE ROLE OF THE LAND REGISTRAR IN THE APPLICATION OF ENVIRONMENTAL LEGISLATION

In the explanation of Borges (2014, p. 21), with the advance promoted by modernity, some information has become vital for society, such as knowing the real owner of a certain property, "his rights and obligations or encumbrances, the real estate registry coated with his public faith that is inherent to it, plays the noble role of registering real estate property". This means demonstrating the registration status of the same, being able to carry out all changes, alterations and extinction of the rights related to the property. The services of the services are essential, acting as a "repository of all real estate property information, with authenticity, security and legal effectiveness".⁴

According to Álvares and Cunha (2018), it can be understood that the function reserved by the legal system to the Registrars was fundamental, regarding the preservation of the environment, which, through the publicity of the annotations made in the registry books, offered society essential environmental information about the property, also allowing to check whether or not the social function is being fulfilled by the property owner.

It is important to point out the principle of concentration, a provision launched by Federal Law 13,097/2015, establishing the obligation to include, in real estate registrations throughout the country, the registrations and annotations related to legal acts entered into prior to the effectiveness of said law, and such acts must seek due adaptation to the provisions determined by this legislation.

With the expanded view of the concept of property, and with limitations to its use in view of the function of social, environmental and economic requirements, it was also necessary to have a new posture of the Registration Officer, meeting the established responsibilities related to the preservation of the environment, aiming to promote a better quality of life, also serving the needs of current and future generations, according to constitutional commandment (ÁLVARES and CUNHA, 2018).

The authors also argue that the Registrar, when making available to the general public the relevant information about a certain property, applying the principle of concentration, must do so based on the current legislation, in an incisive legal text, which gives it the breadth and

⁴ Santos (2010, p. 327) observes about the challenges imposed on Real Estate Registrars: "The primordial nature of the registry activity stems from its vocation to stabilize social harmony, real estate business relations and the incidents arising from them, through the registry publicity that emerges from the foundations of the Democratic Rule of Law with erga omnes effect in search of the maintenance or restoration of social peace. [...] It is within this context that the Real Estate Registry books are open as repositories, notorious and accessible, of acts and facts that in some way may have repercussions on the right to property and on the social function of real estate, whose pronouncement is marked by a peremptory sign by virtue of the so-called registration principles".

recognition that it really needs, starting to promote a true revolution in the scope of Brazilian Real Estate Registry Law.

The Registration Officer who performs a public function, by delegation of the State and on behalf of the State, also has the obligation for environmental protection, not only for the function he performs, but also for the fact that he is Brazilian and is inserted in society.

The Real Estate Registry is an instrument of environmental inspection and also of planning because, at the moment when the real estate registrations contain all the environmental information of a given property, the Public Power, as well as society, have access to this information and from this scenario can outline more specific environmental policies by region, creating legal certainty in real estate business relationships, and an expanded environmental balance (HELLSTROM, 2016).

3 REAL ESTATE REGISTRATION AS A MEANS OF LEGAL CERTAINTY FOR ENVIRONMENTAL PROTECTION

According to Álvares and Cunha (2018, p. 33), it is possible to observe that the changes that occurred in society and in the Law were significant, accommodating here, in the present study, the essential change in the function of property, as it was imposed on it to meet the needs of the collectivity, and not only, to observe the interest of its owner. In a similar sense and as a collective right that it is, the preservation of the environment must be juxtaposed with the individual right, being the "first category of individual goal interests to deserve attention from society and the legislator. It is a right to be protected and that the Real Estate Registry can contribute".

The authors note that the Federal Constitution of 1988 guaranteed the right to private property, since, by establishing that "property shall serve its social function", the Constituent Assembly did not have the scope of excluding the right to private property, but tried to provide for its social function. It maintained, however, the private character, with its use also serving the common good. The obligations to the community, established by law, are no longer absolute the use, enjoyment and enjoyment of the property by its holder as provided for in the Brazilian Civil Code of 1916 (ÁLVARES and CUNHA, 2018, p. 33).

In line with the Federal Constitution of 1988, the first paragraph of article 1,228 of the Civil Code (CC) clearly expresses the consecration of such conception, by determining:

The right to property must be exercised in accordance with its economic and social purposes and in such a way that flora, fauna, natural beauty, ecological balance and historical and artistic heritage are preserved, in accordance with the provisions of a special law, as well as avoiding air and water pollution (BRASIL, 2002).

In this sense, in order to fulfill the social function of property, its holder must preserve the environment, a requirement of this function, also provided for in articles 182 and 186 of the 1988 Magna Carta, remembering, inclusively, that there is a legal warning and jurisprudential decision leading to the penalization of the owner who degrades the environment, even if he has not been the direct author of the damage⁵.

The social purpose attributed to property was reinforced in the Forest Code, which provided that the right to property must be exercised in accordance with its social purpose, which extends to the preservation of "flora, fauna, natural beauty, ecological balance and historical and artistic heritage, as well as avoiding air and water pollution". In article 2 of this legal diploma, it is established that the exercise of property must observe the limitations established by the legislation (BRASIL, 2012).

According to the provisions of paragraph 2 of the aforementioned article: "the obligations provided for in this law have a real nature and are transmitted to the successor, of any nature, in the event of transfer of ownership or possession of the rural property". By stipulating that environmental obligations have a real nature, the legislator meant that these are *propter rem* obligations⁶, accessory to the right in *rem* or property.

Noronha (2010, p. 317) teaches in this sense that such obligations impose on the owner of the thing the "duty to perform a service necessary for the harmonization of the exercise of his real right with that of another real right, of a different person, incident on the same thing, or on a neighboring thing".

Melo (2010, p. 29) understands that the structure presented by the Real Estate Registry "is one of the most important aspects that must be taken into account for the availability of environmental information", and lists its characteristics:

- a) the Real Estate Registry is a body that performs public service, constitutionally mentioned in article 236: "notarial and registry services are exercised in a private capacity, by delegation of the Public Power". The regulation, in turn, is contained in article 3 of Law No. 8,935/94, which defined: "Notary, or notary, and registration officer, or Registrar, are legal professionals, endowed with public faith, to whom the exercise of notarial and registration activity is delegated". Acting as a holder of public faith,

⁵ In this sense, ADI 5623 – STF - Judging body: Full Court - Rapporteur: Justice CÁRMEN LÚCIA - Judgment: 11/28/2022 - Publication: 12/01/2022
AP 470 – Judging body: Full Court - Rapporteur: Justice JOAQUIM BARBOSA - Judgment: 12/17/2012
Publication: 04/22/2013

⁶ *Propter rem* obligation, or obligation proper to the thing, is an obligation that arises from the simple acquisition of a real property right. That is, when acquiring a property, the financial obligations related to that property are also acquired. Available at: <https://www.google.com/search?q=propter+rem&oq=propter+rem&aqs=chrome..69i57j0i512l9.2146j0j7&sourceid=chrome&ie=UTF-8>. Accessed on: 12 jul. 2022.

- acting in conjunction with the Public Administration, the Registrar is attested to make environmental information public through registration in its books;
- b) organized territorially, the Real Estate Registry offices are in all counties of the country, and it is possible to find in most places, a service.
 - c) the Real Estate Registry has a relationship with all Public Administration bodies, maintaining a close relationship with them. The agencies sign agreements that result in the exchange of information between them, which also helps with tax information. It also maintains a direct relationship with the Brazilian Federal Revenue Service (SRFB), in the Declarations on Real Estate Operations (DOI) – established in article 8 of Federal Law 426/2002, and which are carried out monthly on the internet and the Federal Heritage Secretariat (SPU), according to article 3-A of Decree Law No. 2,398/87, in the case of acts performed in federal real estate;
 - d) the professionals who perform the services provided in the Real Estate Registry are technically qualified after being approved in a competition of tests and titles, when then, the Real Estate Registrar is declared qualified to perform the function, legitimizing him to the service related to property rights and also to environmental limitations.
 - e) another relationship maintained by the Real Estate Registry is the connection with the Brazilian Geodetic System, created in Law No. 267/2001, generating a way to manage and describe real estate property, making use of geographic coordinates fixed with the help of satellites.

Even in the face of such attributions and characteristics, the author (2010) understands that the relevant changes brought about by the progress of urban and environmental legislation are not reflected with the same advance in registration legislation. Therefore, it is essential in matters that deal with the environment, to pay attention to the need for effective precision in the inspection and identification of the owner of the property so that civil, criminal and administrative obligations can be imposed, in addition to the need for cadastral accuracy to the legal situation of the property.

In order to materialize the social function of property from a sustainable perspective, the development of urban policies must be complete, in the indispensable sense of combining efforts between public entities and real estate registry services, "accommodated in restricted areas of Civil Law, ignoring the need for interface with Public Law, showing that adequate planning is necessary to achieve this end" (MELO, 2010, p. 30).

The Law must protect property, because, as this is a constitutional guarantee, it is necessary to offer security to the citizen's assets. In this context, it is indisputable that the Real Estate Registry Offices provide such security, producing an important and complex function, in addition to being "the controlling body of its formal aspects, applying the registry principles, ensuring legal certainty, the reliability of the system and wide publicity, since most of the patrimonial relations involving real estate are controlled by it". In this role, notary offices cover the economic, legal and social scenario, in view of "their finalistic attribution, which is the static and dynamic legal certainty of the right to real estate property and other real or obligatory rights related to their competence" (MELO, 2010, p. 30).

The author has the view that there are three fundamental factors to the legal dimension, within the scope of Real Estate Registry Law:

- a) control over the legal situation of the property: an element that considers the previous analysis of the history of the property, as well as that of the mutations of its legal situation, by means of registration acts to be performed;
- b) the production of qualified legal information about the property is the element that examines the precision and exact scope of each change that occurs in the legal situation of the property;
- c) the provision of qualified information about the property to interested parties.

Santos (2010, p. 328) recalls that the conception of the Real Estate Registry being a simple repository of titles cannot be maintained, on the contrary, since "this centennial institution is a mechanism that provides for the permanent observance of human rights, fundamental principles and other constitutional dictates, with effective application in the field of private property". From this and other statements, it can be seen that, in order to meet the social function of property, it is essential to register the property in the Real Estate Registry Office of the competent district, limiting the domains of private property and intensifying the importance of the Real Estate Registry itself.

According to Santos (2010, p. 330), there is a socioeconomic dimension to the services provided by extrajudicial real estate services, in the sense that continuous urban growth generates complex and unbridled social problems and, sometimes, chaotic urbanization, with the lack of decent housing and the poor distribution of land to those who truly need to produce. In this perspective, being the instrument able to provide legal certainty to real estate business, Registry Law promotes economic stability, "enabling the best circulation of real estate, since society believes that real estate investment is the safest means of accumulating wealth,

through the protection conferred by the Federal Constitution", which, safeguarding the right to property, generated reflections "throughout the country's economic and social chain".

Regarding the role of the Real Estate Registry in the preservation of natural resources, Gonçalves (2011), director of development at the Mato Grosso do Sul Environmental Institute, states that the publicity of the law is not enough. It emphasizes the need for real estate advertising as a way to ensure legal certainty and compliance with the obligations contained in the legislation, which contributes, in particular, to the knowledge about the existing limits on the use of the property and the binding of future buyers of the properties.

Hellstrom (2016) comments that the theme of the annotations in the registration of the property has, as a central point of discussions, the principle of concentration, oriented to the real estate registration system. This principle can be understood from its link to the acts of registration, clarifying the situation of the registration of the property, as a support "in which any and all situations that may influence the property or the person of its owner must be publicized", dispensing with other steps that, otherwise, would be necessary to reach the real legal situation of the property.

In this area, legal certainty would be extended only to those acts registered or annotated in the registration of the property, that is, "only the situations contained in the Real Estate Registry, which plays an important role in the systematic transmission of data related to the property" that may generate foreseeable and imminent environmental damage. Hence, the relevance of monitoring such information, as such registration monitoring would enable the application of concrete measures in a timely manner, "preventing damage and/or the aggravation of environmental degradation" (STIFELMAN, 2012, p. 583).

The imposition of real estate property having to fulfill its social function, incorporated by the Federal Constitution and the Civil Code of 2002, has clearly linked it to environmental preservation, making it one of the premises for the fulfillment of the social function.

The legal system has granted a relevant role to the Real Estate Registry, in view of this new socio-environmental practice, this role being that of releasing important environmental information related to real estate property, giving it greater publicity and, due to the structure and reliability enjoyed by the Real Estate Registry system, checking whether environmental and social obligations are being fulfilled. The Real Estate Registry has a broad structure, which favors access to registration and environmental information to the local population, which must be clear and precise to facilitate understanding (HELLSTROM, 2016).

The author adduces that the understanding remains evident that, in the use of its structure and territorial competences, the services of the Real Estate Registry, exercising their functions, can reach the effective preservation of the environment. And that the

contribution of the right to information is to allow any citizen to exercise their right and duty to be informed and to be informed. Such practice leads to the realization of the socio-environmental function of the property. And effective environmental publicity occurs through the acts of concentration of the registration.

In Special Appeal (REsp) No. 1857098, from the State of Mato Grosso do Sul (MS) (2020/0006402-8), the prosecutor from Mato Grosso do Sul Edmir Fonseca Rodrigues explained to the Superior Court of Justice (STJ) that, in order to comply with Principle 10 of the Rio Declaration, through various norms, there is international recognition of the right of access to environmental information. Continuing his presentation, the Prosecutor narrated seeing, in this right, just mentioned, the existence of a two-way street: the right "of the individual to have access to the requested public information (passive transparency) and the state's duty to publicize the public information it holds (active transparency)". This author also reminds us that, even though it is constituted as an autonomous right, it is a right that is intrinsic to democracies, as it acts as a function of the right to social participation in public affairs (BRASIL, STJ, 2022).

Referring to the content of the aforementioned Special Appeal, the prosecutor stated that the Brazilian environmental and registry system determines the adequacy of the registration of the Environmental Protection Area (APA) in the Rural Property Registry. It also stated that there is no exhaustive provision for optional registrations, pointing to the fact that the Public Prosecutor's Office is expressly entitled to request, including directly to the Real Estate Registry officer, notes linked to its institutional function, among which, unequivocally, is environmental protection (BRASIL, STJ, 2022).

It is also stated in his arguments that the previous publicity of administrative acts "in no way prevents registration, even if it also meets this same principle", citing the various public acts, including judicial acts, which are compulsory annotation or registration (such as sentences, expropriations and listings). And it also reports that the Brazilian registry regime admits the registration of optional information about the property, of public interest, including environmental information (emphasis not present in the original) (BRASIL, STJ, 2022).

It also clarifies that, even if it is not internalized, "pending ratification, national law reflects similar principles throughout the legal system, from the constitutional level, which are spread across various federal laws".

It also teaches that the Principle of Maximum Disclosure is the one followed in the Brazilian transparency regime, that is, "publicity is the rule, and secrecy, the exception, without subterfuge, legal anachronisms or half-measures", and it is the duty of the State "to

demonstrate consistent reasons to deny active publicity and, even stronger, to reject compliance with the duty of passive transparency" (BRASIL, STJ, 2022).

Having evidenced the need to promote environmental encumbrances in the registration of real estate, the main environmental limits imposed by the legislation are discussed below, as a way to contribute and guide the registration of real estate.

4 THE ENCUMBRANCES THAT CONTRIBUTE TO ENVIRONMENTAL PROTECTION

4.1 LEGAL RESERVE

Law No. 12,651/2012, known as the New Forest Code, as already mentioned, provides in its article 2, paragraph 2 that the obligations provided for in this Law have a real nature and are transmitted to the successor.

To avoid any doubts about what would be a legal reserve, the legislative diploma thus conceptualized the legal reserve in its article 3, III, "having the function of ensuring the economic use in a sustainable way of the natural resources of the rural property", as well as "assisting the conservation and rehabilitation of ecological processes and promoting the conservation of biodiversity", in addition to sheltering and protecting wildlife and native flora.

From this perspective, it can be seen that the idea of the national legislator was, in the words of Miranda (2010, p. 347), "to protect Brazilian forests, especially the Amazon, due to the great limitation it imposes on properties located in the Legal Amazon, its application has been responsible for the genesis of a good part of the tensions" in these areas, because the use of the discourse of regional development directly collides with the preservation of the forest.

The concern with forests in Brazil dates back to the times of Colonial Brazil, but it was only with the CF/88 that new contours were achieved. However, Silva and others (2010, p. 272) assert that "forests and other forms of vegetation existing on private lands are not yet defined as public goods", and it is clear that the legislation (general or specific) should also be applied to private properties, since there was no distinction between public and private, but only the delimitation of the region, so that these private assets "are already considered to be of common interest to all the inhabitants of the country", and, for this reason, will also have their property rights limited, according to the Federal Constitution and §1 of article 1,228, of the Civil Code (SILVA et al., 2010, p. 272).

With the advent of the current Forest Code, the competence for the registration of the Legal Reserve area was transferred to the Rural Environmental Registry (CAR), under the terms of article 18,

Paragraph 4, "which exempted the registration in the Real Estate Registry Office", establishing the free practice of the act to the rural owner or possessor who wishes to do so, in the period between the date of publication of the Law and the registration in the CAR.

Silva (2021, p. 250) criticizes the aforementioned paragraph stating that it would be better if the environmental agency, whether municipal or state, responsible for receiving the information, made "the communication directly to the real estate registry, considering that it is an obligation of the Government to defend the environment, especially when it comes to an area already established as a mandatory protection". For him, the importance of the institute's registration "would greatly facilitate not only the establishment, in fact and in law, of the Legal Reserve, but would also result in greater environmental effectiveness through the publicity conferred by the Real Estate Registry" (SILVA, 2021, p. 251).

However, there are rural properties that do not have Legal Reserves for numerous reasons or these are partially deforested and/or occupied by pastures, developing livestock activities or with plantations, for agricultural activities. These situations are justified because when the legislative change in the boundaries established mainly for the Amazon region, countless rural properties were opened in violation of the maintenance of the legal reserve (MIRANDA, 2010, p. 372).

The owners or possessors of rural properties with deforested or partially deforested areas, whose Legal Reserve area is less than the limits defined in article 12 of the Forest Code, were left with three options: recomposition, natural regeneration of vegetation or compensation, which can be used separately or together.

In view of the importance of the legal reserve and the legislative impositions in the face of its total or partial absence, there is no doubt that the registration publicity of these obligations in any of the three modalities listed (recomposition, regeneration or compensation), which by their nature accompany the property, would induce the owners and possessors of rural properties to voluntarily comply with these measures, as well as making the future purchasers of the environmental obligations assumed scientific, since, as stated elsewhere, these would also be transmitted, thus allowing the institute of the Legal Reserve to be better disseminated, ensuring biodiversity and an ecologically balanced environment (SILVA, 2021, p. 253).

4.2 ENVIRONMENTAL EASEMENT

The institute of environmental easement was not conceptualized by the Brazilian legislator, who, in the wording given by article 9-A of Law No. 11,284/2006, presented only the criteria for its constitution, establishing that it would be instituted by the rural owner, with

the consent of the environmental agency, with the voluntary waiver, on a permanent or temporary basis, totally or partially, of the right of use, exploitation or suppression of natural resources existing on the property⁷.

Thus, the environmental easement does not apply to Permanent Preservation Areas and the minimum required Legal Reserve, as provided for in paragraph 2 of the aforementioned article. It should be noted, as appropriate, that the restriction on the use or exploitation of the vegetation of the area under environmental easement must be, at least, the same as that established for the Legal Reserve. The environmental easement can also be used as an instrument of compensation for the legal reserve, at which time it must be recorded in the registrations of all properties involved, as provided for in paragraph 5 of article 9-A. It should be noted that the rural owner continues to be able to exercise his right of disposal, in such a way that he may alienate, assign or transfer the environmental easement. However, in cases of transfer of rural property, for any reason, dismemberment or rectification of the boundaries of the property, it is prohibited, during the term of the environmental easement, to change the destination of the area (CARDOSO, 2010).

The holder of the environmental easement may alienate, assign or transfer it, in whole or in part, for a fixed period or definitively, in favor of another owner or a public or private entity that has environmental conservation as its social purpose. However, the temporary environmental easement cannot be established with a term of less than 15 years, given the objectives of environmental preservation. On the other hand, the perpetual environmental easement is equivalent, for credit, tax and access to public funds purposes, to the Private Natural Heritage Reserve (RPPN), defined in article 21 of Law No. 9,985, of July 18, 2000, which will not be the object of our study.

In cases of alienation, assignment or transfer of the environmental easement, article 9-C of Law No. 11,284/2006 states that the contract must be recorded in the registration of the property (EL DEBS, 2021).

Although the institute of environmental servitude is an important instrument of environmental preservation, the legislator was wrong to not stipulate any economic or tax benefit in return, considering that its institution restricts property, constituting an obligation that accompanies the property, regardless of the owner. In international law, the rights and benefits linked to this type of system encourage the creation of easements, ensuring more effective environmental protection, as is the case in the United States with conservation easement and ecological servidumbres in Costa Rica (CARDOSO, 2010, p. 389-390).

⁷ It should be noted that the environmental easement may be instituted by an individual or legal entity, free of charge or for a fee, by means of a public or private instrument, or even by an administrative term that must contain the elements described in paragraph 1 of article 9-A (EL DEBS, 2021, p. 839).

However, it should be recognized that by establishing the registration of the environmental easement in the registrations of real estate, as provided for in article 167, II, of Law No. 6015/73, the legislator recognized the competence of the real estate registrar to centralize information on environmental issues of great importance, "preserving effects over time and publicizing the easement to interested third parties, more efficiently to the institute of Environmental Law." (SILVA, 2021, p. 254)

4.3 CONSERVATION UNITS

Conservation Unit – U.C., as provided for in article 2, I, of Law No. 9,985/2000, is the territorial space and its environmental resources, including jurisdictional waters, with relevant natural characteristics, legally established by the Government, with conservation objectives and defined limits, under a special administration regime, to which adequate protection guarantees apply.

Conservation units are divided into two large groups: a) Full Protection Units; and b) Sustainable Use Units. The difference between these groups lies in the fact that the former aim to keep ecosystems free from alterations caused by human interference, admitting only the indirect use of their natural attributes, while the latter, although there is exploitation of the environment, this exploitation must be sustainable, ensuring the continuity of renewable environmental resources and ecological processes. maintaining biodiversity and other ecological attributes, in a socially just and economically viable way.

Although the majority of conservation units are in public areas, the legislator was right to establish that the areas around them are subject to specific rules and restrictions "to protect and guarantee the purpose of their creation" (MELO, 2010, p. 70), minimizing the negative impacts on the unit.

Regarding the entry of conservation units in the real estate registry, Silva (2021, p. 237) is categorical in stating that the effectiveness of the rules and restrictions related to each Conservation Unit will only be successful with their publicity in the real estate registry. The zoning, or the geographical delimitation containing the limits of the U.C. is mandatory because it implies the regulation of economic activities in the area and in the surroundings. Hence the importance of information related to the U.C.s to be part of the registration of the property and receive registration publicity, as a way to portray to future buyers of real estate the restrictions on the use of the property.

For Silva (2021, p. 239) the annotation of this environmental information would be of such relevance that "even a private individual, an association, a non-governmental

organization, or any interested party can provoke it", once the inertia of the Government or the administration of the conservation unit is verified.

4.4 CONTAMINATED AREAS

The 1988 Constituent Assembly advocated the responsibility of society with the Government for the preservation of the environment for present and future generations. In this sense, each generation is obliged to deliver the environment in conditions to be enjoyed by the next generation, hence the idea of sustainable development, linked to the rational use of natural resources, considering their finitude (NALINI, 2010, p. 91-92).

The present study is interested in contaminated areas resulting from soil pollution, which occur for the most diverse reasons. For Silva (2021, p. 265) "the management of contaminated areas begins with the identification of suspicious sites and, once the hypothesis is confirmed, intervention measures, damage control measures and environmental remediation measures must be adopted".

The identification of the area is of total importance, as well as its delimitation, since, depending on the degree of contamination, it generates restrictions on the use of the property, in addition to the duty to repair the damage, which in some situations is irreversible.

Thus, Silva (2021) suggests that when the inspection body investigates the existence of a contaminated area, it is up to it to immediately inform society, in order to prevent access to such properties, which can be done with the installation of fences and signs, through radio and television advertising, and also through registry advertising.

The Code of Standards for Notarial and Registration Services of the State of Roraima, representing the pioneering spirit in the treatment of the matter, in the Legal Amazon region, establishes in its article 668, b, items 39 to 41, that the information on the classification of the area, by the competent Body, as a Contaminated Area under Investigation (ACI), the information on the classification of the area, Competent Body, such as Contaminated Area with Confirmed Risk (ACRI) and the classification information of the area, by the competent Body, as a Rehabilitated Area for Declared Use (AR) must be recorded in the registration of the properties.⁸

This attitude enshrines the principle of information and recognizes the structure of the real estate registry as the guardian of the royal folio, responsible for also concentrating environmentally relevant information. It should also be added that "the registrar is responsible

⁸ The aforementioned state law of Roraima also advances that in case of omission by the bodies legally responsible for the contaminated areas to proceed with the annotations referred to in article 668, paragraph "b", items 39, 40 and 41, these may be carried out upon provocation by any person.

for the preservation of the vegetation cover in the district to which he is delegated" (NALINI, 2010, p. 96).

In turn, in addition to the educational nature of the measure, these annotations put citizens in a position to discuss and demand from the Government the institution/execution of Public Policies that are necessary in the affected areas (SILVA, 2021, p.103).

At the federal level, Conama Resolution No. 420/2009, in article 37, established the competence of the environmental agency, when verifying the existence of a contaminated or rehabilitated area for declared use, to formally communicate to the Real Estate Registry offices of the District where such areas are inserted, as well as to the real estate registry of the municipalities and the Federal District.

It should be noted that the ideal would be for this information to be passed on to real estate notaries as soon as possible or at the beginning of the "contaminated area identification procedures" (SILVA, 2021, p. 266), in order to avoid the irreversibility of the damage, as well as to enable environmental information to reach public knowledge in a timely manner, and may also prevent socio-environmental impacts of large proportions.

5 FINAL CONSIDERATIONS

In the course of this study, it was possible to verify the presence, increasingly, in the lives of citizens, of a healthy interference in the relationship between man and the environment, as well as it was clear that using the right to property in a way that causes damage to the environment is what causes ecological disasters, usually originated by the disorderly occupation of the land.

The publicity promoted by the Real Estate Registry provides the desired and necessary legal certainty to the institutes of Environmental Law, which aim to protect the environment, as the information released by the Registry can prevent the harmful use of the property. In other words, the Real Estate Registry may contribute favorably, in addition to the protection of private property, also to the publicity of the institutes of Environmental Law that aim to modify the owner's behavioral attitudes in relation to the environment, a function that the Public Registries already perform efficiently.

Despite having promulgated so many historical milestones in terms of fundamental rights, the drafting of the current Federal Constitution also expresses the interests of several different objectives. The aspiration demonstrated in the norm contained in its article 225, to provide everyone with the right to an ecologically balanced environment, has already proven to be essential to a healthy quality of life.

It is evident that this benefit can only occur with the collaboration of the Government and society, in order to protect, defend and preserve this healthy environment for present and future generations. The most efficient way to more easily achieve this objective may be the collaboration of the Real Estate Registry, through the publicization of rights and environmental restrictions that may fall on real estate, which will contribute to the guarantee of the right to property to the citizen and will also serve to assist in the inspection of the rational exercise of the right to property. preventing abuses that, coming from the owner, may lead to environmental degradation.

By the way, Post-Modernity has brought the publicization of rights as a trend, becoming necessary and useful to the environmental controls carried out through the Real Estate Registry system, which makes use of its essence, translated into publicity and legal certainty, in the prevention of environmental damage.

This link formed between Environmental Law and Real Estate Registration resulted in benefits for the whole society, which now has more effective instruments in the control and rational and sustainable use of private property, meeting its social function.

Manuela Ithamar Lima¹, Joaquim Ribeiro de Souza Junior²

ABSTRACT

This article is based on the following research question: to what extent is the post mortem protection of personality rights affected in a technological society? To address this question, the article is divided into two parts. The first presents an overview of *Post mortem* protection in Brazil, and the second explores the controversies surrounding such protection in a technological society. The methodological approach is deductive, and the research techniques employed are exploratory and bibliographic.

Keywords: *Post mortem* Protection. Personality Rights. Technological Society.

RESUMO

Este artigo parte da seguinte pergunta problema: em que medida a tutela post mortem dos direitos de personalidade resta impactada na sociedade tecnológica, para tanto, ele é dividido em duas partes, a primeira oferta um panorama da tutela *Post mortem* no Brasil e a segunda que se debruça as controvérsias dessa tutela na sociedade tecnológica. O método de abordagem é o dedutivo e as técnicas de pesquisa são a exploratória e bibliográfica.

Palavras-chave: Tutela *Post mortem*. Direitos de Personalidade. Sociedade Tecnológica.

RESUMEN

Este artículo parte de la siguiente pregunta de investigación: ¿en qué medida se ve afectada la protección post mortem de los derechos de la personalidad en la sociedad tecnológica? Para ello, se divide en dos partes: la primera ofrece una visión general de la protección *Post mortem* en Brasil y la segunda aborda las controversias en torno a esta protección en la sociedad tecnológica. El método de enfoque es deductivo y las técnicas de investigación son exploratorias y bibliográficas.

1 INTRODUCTION

Technology acts as a driving force for change, creating interconnected networks that transcend geographical and cultural boundaries. The convergence of smart devices, artificial intelligence, big data, and instant connectivity reshapes the way we relate to the world and to each other. In the face of this dynamic panorama, the technological society is not only a reflection of scientific progress, but an entity in constant transformation, influencing and being influenced by the expectations, values and challenges of a globalized community.

On the other hand, the issue of *post-mortem* protection of personality rights has always presented theoretical and practical controversies in Civil Law, despite its express provision in the Civil Code of 2002.

Thus, this article has the following problem question: to what extent is the *post-mortem* protection of personality rights impacted in the technological society? To this end, it seeks to offer a first-time overview of the *post-mortem* protection of personality rights in the Brazilian legal system, and in a second moment to focus specifically on the challenges of this protection in contemporary society, going through the phenomena of *deepfake* and digital inheritance.

The method of approach is deductive, that is, a reasoning that starts from general principles or broad premises to reach specific conclusions, and the research techniques are exploratory and bibliographic.

2 THE POST-MORTEM PROTECTION OF PERSONALITY RIGHTS IN THE BRAZILIAN LEGAL SYSTEM

Personality rights began to be highlighted in private law with the codifications of the twentieth century, such as the Italian Code of 1942 and the Portuguese Civil Code of 1966, however, parallel to this, there was an expansive development of personality rights in Public Law (ANDRADE, 2012).

For no other reason, within the scope of Brazilian law, the 1988 Constitution contemplates in its article 5, item X, different personality rights, such as intimacy, private life, image, among others, ensuring their inviolability, in addition, in its article 1, item III, in turn, establishes the dignity of the human person among the foundations of the Republic (ANDRADE, 2012).

In the scope of private law, the Brazilian Civil Code of 2002 included in its general part an entire chapter to deal with personality rights, evidencing the importance that the legal system attributes to the protection of the human person (DONEDA, 2005).

Structurally, the Civil Code of 2002 dealt with personality rights in 11 articles, so that articles 11³ and 12 deal with the nature and protection of these rights, the others contemplate personality rights in kind, such as: the right to psychophysical integrity (articles 13 to 15), the right to name and pseudonym (articles 16 to 19), the right to image (art. 20) and the right to privacy (art. 21).

With regard to the ownership of personality rights, it is observed that the Civil Code of 2002 in its article 20, sole paragraph, contemplates the possibility of protection of these rights in the case of a deceased person (ANDRADE, 2013), conceiving that: "In the case of a dead or absent person, the spouse, the ascendants or the descendants".

It is clear that according to article 6 of the Civil Code, it asserts that the existence of the natural person ends with death and consequently the civil personality as well, allowing the person to be the subject of rights, however, it does not mean that personality rights cannot endure in legal relationships (BELTRÃO, 2015).

In this sense, in the lessons of Pontes de Miranda, death consists of a natural human legal fact, in the strict sense, as it arises from a natural and ordinary fact, since it is a common occurrence, generating effects in the civil order and manifesting itself in legal relationships, in order to extinguish or modify them (MENEZES, 2023).

Therefore, considering that death is a legal fact and that personality ends with death, the doctrine seeks to explain the post-mortem protection of personality rights, with at least six theories, the first of which is that of the new law, which argues that personality is extinguished with death and from this arises a new right of family members to demand respect for the rest and memory of the deceased; the second theory, called the theory of the transmission of personality rights, contemplates that with the advent of death, there is a transmission of the protection of honor, which is not to be confused with the transmission of the deceased's own honor; the third theory is that of the memory of the deceased, which ensures that memory is an autonomous legal asset that extends after death and needs to be protected (MENEZES; CHACON, 2020).

The fourth theory consists of the theory of the prolongation of personality, denying that personality is extinguished at death and prolonging it until after death; the fifth theory is that of post-mortem guardianship as a general legal duty, which argues that said guardianship is a general legal duty that must be fulfilled by all, that is, any person, whether family or not, can defend the honor of the deceased; finally, the sixth theory conceives that with death the

³ "In article 11, it is verified that personality rights are attributed the characteristics of non-transferability and non-renounceability, in addition to the impossibility of voluntary limitation of their exercise", in: DONEDA, Danilo. The rights of personality in the Civil Code. **Journal of the Faculty of Law of Campos**, year VI, n. 6, p. 71-99, 2005, p. 71.

personality is extinguished, but its emanation is not extinguished (MENEZES; CHACON, 2020).

Among the theories discussed, it seems, based on the provisions of the Civil Code, the one that is most aligned with the Brazilian legal system and the one adopted in the present work is the theory of the transmission of the right of personality.

Within the scope of Brazilian jurisprudence, it is observed that the Superior Court of Justice sought not to effectively focus on any of the theories, in Special Appeal No. 268660/RJ, the 4th Panel of the STJ recognized the possibility of protection of the right to the image after the death of its holder, in order to obtain the right to compensation, oscillating between two theories, that of the transferability of personality, since it argues that the successor can protect the image of the deceased relative and of another is affiliated to the theory of new law, considering that because the image of the deceased person has economic effects beyond death, the successors, in their own right, can postulate in court (ANDRADE, 2013).

Thus, despite the doctrinal controversies, the post-mortem protection of personality rights in Brazilian law is already something consolidated and provided for in the Civil Code, which does not fail to imply discussions on the subject.

The controversies become even more present considering the peculiarities of contemporary society, called technological society, which results from the interaction between technology and pre-existing contexts (CASTELLS, 2008), being characterized by amplitude, depth and speed, causing transformation in entire systems, such as legal, social, economic, among others (SCHWAB, 2016).

The legal system is entirely impacted, so that

the implications of the Knowledge Society in law can be systematically outlined as follows: (a) the new factual parameters for the application of the law already in place, requiring its readjustment; (b) the existence of facts that become legally relevant due to technical-scientific advances; (c) the need for legal decision-making in a scenario of uncertainty and risk, as well as; (d.) the elaboration of legal norms has gradually been conditioned to meet the interests of an innovation guided by the economy (LIMA; DA COSTA, 2019, p. 173).

Regarding the post-mortem screen of personality rights it is no different, it must be said, there are so many problems: the post-mortem protection of personality rights, people, the so-called digital inheritance and deep fakes, something that will be discussed in the next chapter.

3 THE CONTROVERSIES OF THE POST-MORTEM PROTECTION OF PERSONALITY RIGHTS IN THE TECHNOLOGICAL SOCIETY

Law in the technological society remains modified, due to the systemic impact of the Technological Society, thus, to the extent that law regulates social relations and these are influenced by innovation and technology, inevitably the parameters of regulation and judicial decisions change (PARDO, 2000).

In the post-mortem protection of personality rights it is no different, innovation and technology cross this context. Among so many phenomena, attention is paid to the posthumous projection of personal data, the conception of digital inheritance and artificial intelligence, which will be discussed below.

Personal data figure as the true projection of the human personality, if expanded beyond the life of the subject (RODODÁ, 2012), in this sense, the electronic body even after death continues to appear as a representation of the subject's personality in the virtual space (COLOMBO; GOULART, 2019).

Therefore, the protection of the personality of the deceased exercised by relatives necessarily involves the control of the personal data that sustain the digital body of the *deceased* (COLOMBO; GOULART, 2019).

It turns out that the General Law for the Protection of Personal Data is silent on the data of deceased people, having this gap that generates controversy. On this issue, it is worth paying attention to the French law that conceives that subjects in life may define general or particular directives on the storage, deletion and communication of their personal data after death. French law allows a specific person to be defined to enforce the will of the deceased and in the absence of such a person, the heirs can exercise the rights delimited by law, with some limitations, such as: a. possibility of accessing personal data for probate purposes or arising from family memories; b. making the request for closure of the digital account or c. opposing the continuation of personal data processing and demanding the updating of data (COLOMBO; GOULART, 2019).

There are those who argue that when the projection of the deceased's personal data has patrimonial content, it is necessary to speak of the so-called digital inheritance and when it comes to personal data without patrimonial content in posthumous protection of personal data (COLOMBO; GOULART, 2019), however, there is another part of the doctrine that considers that the Civil Code of 2002, in its article 1,857, paragraph 2, admits that the will has off-balance sheet content, thus, when talking about digital inheritance, it is actually speaking in a broad sense, having a patrimonial or off-balance sheet character, which seems to be the most correct position (TARTUCE, 2018).

In this sense, it is questioned whether the digital data of the deceased person can compose the inheritance to be transmitted to the successors, following the line of article 1791 of the Civil Code (TARTUCE, 2018). Thus, as the LGPD and the Civil Code are silent on this issue, there are bills on the subject in progress in the National Congress.

Of note are Bill No. 4,099-B, of 2012 and Bill No. 4,847/2012, the first, seeks to include a single paragraph in article 1,788 of the Civil Code to contemplate that the digital files of the author of the inheritance will be automatically transferred to the heirs (TARTUCE, 2018).

The second that is currently being processed together with a more recent one, Bill No. 7,742/2017, intends to include articles 1,797-A to 1,797-C in the Civil Code, conceiving that digital inheritance is all "intangible content of the deceased, everything that can be stored or accumulated in a virtual space, under the following conditions: I – passwords; II – social networks; III – Internet accounts; IV – any virtual and digital good and service owned by the deceased". It also deals with the possibility that if the deceased does not have the capacity to test on their digital assets, these will be transmitted to their legitimate heirs, who may: "a) – define the destination of the deceased's accounts; b) turn them into a memorial, leaving access restricted to confirmed friends and keeping only the main content or; c) delete all user data or; c) remove the account of the former user (TARTUCE, 2018)".

It can be seen that both bills attribute to the heirs of the *deceased* the decision about the fate of the digital inheritance, however, these are essential and very personal rights of the deceased that cannot be automatically transferred to the heirs, and must be extinguished with death (TARTUCE, 2018).

It should be noted that in an opinion prepared by the Institute of Lawyers of Brazil (IAB), Professor Pablo Malheiros Frota expressed himself unfavorable to the legislative proposals, listing that (TARTUCE, 2018, p. 875):

- a) the two bills authorize the entire digital collection of the deceased to be automatically transmitted to the heirs, violating the fundamental rights to freedom and privacy, notably in cases where the digital asset is a projection of privacy and there has been no express declaration of will or conclusive behavior of its owner, authorizing any heir or third party to access and manage it; b) third parties who interacted with the deceased during life will also have their privacy exposed to the heirs; c) it is necessary to respect the personal, interpersonal and social efficacy of private life, which concretizes the positive freedom of each one to decide the course of his or her life, "without undue external interference from the community, private or the State, in which this freedom is intersubjectively linked to the community, the State and the individual"; d) the bills intend to transmute the property right regime from the Law of Things to personality rights, since the personality right of the deceased is transformed into a patrimonial asset, since the intimacy and image of the deceased person serve as a source of economic wealth; e) family members or third parties should only have the right to manage the digital collection if there is an express declaration by the deceased,

by public or private instrument, including in fields intended for such purposes in the electronic environments themselves, without the need for witnesses, or if there is conclusive behavior in this regard; f) if such statement or behavior is not present, or is affected by a problem related to its validity or effectiveness; all digital collection that is an expression of personality must not be altered, seen or shared by anyone; g) intangible assets that project the privacy of the deceased should not and should not be accessed by the heirs or by third parties, in the absence of a manifestation of will by the author of the inheritance.

In this way, the proposals are not in line with the dignity of the human person and the very personal rights of the deceased, and there should be a legislative proposition that proportionally balances the interests of the heirs with the personality rights of the deceased that are extinguished with death.

Another controversy about the *post-mortem protection* of personality rights consists of the impact of artificial intelligence in this field. It is explained.

Artificial Intelligence (AI) takes place in the innovation and technological process of contemporary society, being a branch of computer science that proposes to develop devices that seek to simulate some of human capabilities, such as making decisions and solving problems (SARLET, 2021).

Thus,

Artificial intelligence (AI) proposes to handle devices that simulate the human ability to reason, perceive, make decisions and solve problems, in short, the ability to be intelligent. It should be noted that the basic element for a characterization of artificial intelligence is found in the learning dimension and, therefore, is situated in the formation of taxonomic profiles that, in other words, are based on a first stage in the production of large analyses from large databases, orienting themselves at the present time more and more towards granulation (GUIMARÃES, 2023, p. 331).

In this scenario, the impact of artificial intelligence on personality rights in general is observed, thus, artificial intelligence (AI) starts to be used in profiling and monitoring the behaviors of individuals (SARLET, 2021), but, in addition, there is the phenomenon of *deepfakes*.

Deepfake consists of the technique through artificial intelligence that builds the fusion of moving images, generating new content with a high degree of reliability (AFFONSO, 2021), in this scenario,

Whatever the technological means adopted to create a false image, two characteristic traits can already be pointed out, namely, the use of advanced computational techniques, commonly artificial intelligence, as well as the high degree of reality that makes it almost impossible to detect fraud, which is especially dangerous in current times. marked by the "attention economy" (AFFONSO, 2021, p. 263).

The risk of deepfake ranges from its use to generate disinformation and impact the democratic process, to its criminal use through advertising. In this line, attention is paid to the violation of the personality rights of deceased people with the use of digital reconstruction, that is, through an image bank of the deceased person, their image is recreated for current times (AFFONSO, 2021).

A case involving the theme of reconstruction was the recent commercial released in July 2023 by Volkswagen, on the occasion the singer Maria Rita is next to her mother, Elis Regina, who died in 1982 and was recreated by artificial intelligence, singing together the song by composer Belchior, entitled "Like our parents" (FIGUEIRA; RENZETTI FILHO; DE LUCA, 2023). Thus, several ethical and legal discussions arose about the commercial, among which was the fact of the contradiction of linking the image of Elis Regina and the music of Belchior, who were openly against the military dictatorship, to an advertising campaign by a company that supported the regime (CONAR, 2023).

In fact, based on the Brazilian Civil Code, considering that the daughter and the other heirs participated in the advertising campaign, there is manifest authorization by the heirs in the use of the image of the singer Elis Regina, which removes possible legal obstacles in the matter (FIGUEIRA; RENZETTI FILHO; DE LUCA, 2023).

However, the case fell on the National Council for Advertising Self-Regulation through Representation No. 134/23, due to consumer complaints that raised three points: a. the ethical use of AI in the reproduction of an image of a deceased person; b. whether it would be up to the heirs to authorize such a practice and c. the lack of information to the public about the use of AI in the creation of the scene (CONAR, 2023).

It so happens that the 7th Chamber of Conar considered items a and b unfounded, as the use of the image would have been with the consent of the heirs, under the terms of the Civil Code and as for item c, it decided to archive the representation, considering the lack of regulation on the subject (CONAR, 2023).

It should be noted that in Brazil, Bill No. 759/2023 is being processed, which deals with the use of Artificial Intelligence in Brazil, being an intimate project that does not scrutinize this use, declining the details of the subject to the Union, which should create a National Policy on Artificial Intelligence, under the terms of article 5 of the aforementioned project.

It is important that, considering the peculiarities of the theme, it is important that, with regard to the *post-mortem protection* of personality rights and the use of Artificial Intelligence, the legislation considers "(i) the provision expressed in the contract during life and authorization of the family, (ii) the purpose of the recreation of the image and (iii) the adequacy

of the image created post-mortem to the image-attribute constructed in life by the person" (AFFONSO, 2021, p, 269).

Therefore, the challenges of *post-mortem tutelage* in the technological society are not limited to the phenomenon of *deepfake* and digital inheritance, the present article sought, however, to bring these two phenomena as examples to demonstrate the transformative character of technology in the social environment and the need to make the hermeneutic effort to protect and promote personality rights and the dignity of the human person.

4 FINAL CONSIDERATIONS

This article sought to answer the following problem question: to what extent the *post-mortem* protection of personality rights remains impacted in the technological society, reaching the conclusion that the very legitimacy of the heirs in protecting personality rights must be reread based on the dignity of the human person of the deceased, considering categories such as consent in life for certain activities and interactions with technology and the context itself social of the deceased.

The *post-mortem* protection of personality rights in a technological society represents a complex and multifaceted challenge that requires careful consideration of the intersections between law, ethics and rapid technological transformations. This article has highlighted the need to adapt existing laws to address emerging issues related to the preservation and management of personality rights after death in a digital context. The increasing ubiquity of digital technologies and social media amplifies concerns about privacy, misuse of information, and the preservation of posthumous identity.

In this scenario, it is imperative that legislators, jurists, and society as a whole promote in-depth discussions to develop legal frameworks that are sensitive to the specific challenges posed by the digital age. Ensuring that personality rights continue to be respected after death not only preserves individual dignity but also protects the memory of the deceased and provides comfort to loved ones.

In addition, the implementation of ethical and transparent technological solutions is crucial to balance individual and collective interests in this context. Reflection on the post-mortem protection of personality rights in the technological society not only promotes legal development, but also contributes to the construction of an ethical framework that respects the integrity of individuals even after their departure, thus shaping a more just and compassionate environment for future generations.

ABSTRACT

The construction of a healthy educational environment does not depend exclusively on pedagogical and administrative aspects, but also on the ability of school leaders to establish interpersonal relationships grounded in empathy, effective communication, and emotional balance. This article investigates the influence of school administrators' socioemotional skills on the organizational climate and on the professional performance of education practitioners. Based on a qualitative, exploratory, and bibliographic approach, the study draws on authors such as Vitor Paro, Heloísa Lück, and Daniel Goleman, and seeks to present a humanized perspective of school leadership, viewed from both social and educational standpoints, presenting results that validate this management approach. The findings indicate that humanized management strengthens collaboration, reduces conflicts, and enhances team engagement. A scarcity of literature focused on the socioemotional development of educational leaders was identified, highlighting the need for further studies that integrate management practices and emotional development in school leadership.

Keywords: Socioemotional Skills. School Management. Organizational Climate.

RESUMO

A construção de um ambiente educacional saudável não depende exclusivamente dos aspectos pedagógicos e administrativos, mas também da capacidade dos gestores de estabelecer relações interpessoais pautadas na empatia, comunicação eficaz e equilíbrio emocional. Este artigo investiga a influência das habilidades socioemocionais dos gestores escolares no clima organizacional e na atuação dos profissionais da educação. Pautado em abordagem qualitativa, exploratória e bibliográfica, o estudo baseia-se em autores como Vitor

RESUMEN

La construcción de un entorno educativo saludable no depende exclusivamente de los aspectos pedagógicos y administrativos, sino también de la capacidad de los gestores escolares para establecer relaciones interpersonales basadas en la empatía, la comunicación eficaz y el equilibrio emocional. Este artículo investiga la influencia de las habilidades socioemocionales de los gestores escolares en el clima organizacional y en el desempeño de los profesionales de la educación. Fundamentado en un enfoque cualitativo, exploratorio y bibliográfico, el estudio se apoya en autores como Vitor Paro, Heloísa Lück y Daniel Goleman, y busca presentar una visión humanizada del liderazgo escolar, considerada tanto desde la perspectiva social como educativa, y expone resultados que validan esta forma de gestión. Los resultados indican que la gestión humanizada fortalece la colaboración, reduce los conflictos y promueve el compromiso de los equipos. Se constató una escasez de literatura orientada a la formación socioemocional de los líderes educativos, lo que señala la necesidad de más estudios que integren las prácticas de gestión y el desarrollo emocional en el liderazgo escolar.

Palabras clave: Habilidades Socioemocionales. Gestión Escolar. Clima Organizacional.

1 INTRODUCTION

The performance of the school manager exerts a direct influence on different dimensions of the educational environment, including the organizational climate, continuing education, teaching practice and, especially, the learning processes and human development of students. In this sense, school management goes beyond the technical-administrative sphere, assuming a decisive role in the quality of interpersonal relationships and in the construction of institutional environments favorable to pedagogical work.

With the approval of the National Common Curriculum Base (BNCC) (Brasil, 2018), the development of socio-emotional skills became mandatorily part of Brazilian school curricula as of 2020. Although the regulation highlights the student as the focus of this process, this guideline also involves teachers, managers and administrative teams, since the socio-emotional climate of the school is constituted from the daily interactions between all subjects. Thus, analyzing the influence of the school manager in the construction of this climate is relevant, considering the impacts that their performance can generate both in institutional relations and in the implementation and strengthening of innovative pedagogical practices.

From this perspective, Lück (2006) emphasizes the importance of the systematic evaluation of the organizational climate through appropriate instruments, in order to identify potentialities and aspects that require improvement. For the author, the leadership exercised by the manager is essential to guide planned actions that contribute to the strengthening of the institutional climate, promoting greater engagement, self-esteem and self-confidence among the members of the school community.

In a convergent way, Paro (2001) emphasizes the central role of the school manager in promoting participatory and democratic management, based on dialogue, cooperation and co-responsibility. According to the author, the coherence between educational objectives and the mediations adopted to achieve them is an indispensable condition, since democratic purposes cannot be achieved through authoritarian practices. Thus, the school space, as the *locus* of systematized education, must be constituted as an environment conducive to the exercise of democracy.

This conception assigns to the school manager the responsibility of creating and sustaining a positive socio-emotional climate, based on welcoming, respect and inclusion, essential elements for the well-being of students and educators and for the success of educational processes.

The institutional climate directly influences academic performance and the level of satisfaction of students with the school, to the extent that environments based on safety,

motivation and support favor learning and human development. At the same time, these environments significantly impact the work of the school team, strengthening professional engagement, cooperation, and a sense of belonging, essential elements for collective development and for the consolidation of quality educational practices.

2 THE VIEW ON EMOTIONAL INTELLIGENCE

The term emotional intelligence was initially introduced into the academic field by Salovey and Mayer (1990), who conceived it as a subset of social intelligence, related to the ability to monitor one's own feelings and emotions, as well as those of others, using this information to guide thoughts and actions. As Régo and Fernandes (2005) point out, this conception establishes an articulation between emotion and cognition, as opposed to dualistic approaches that have historically separated reason and emotion as dissociated dimensions of human behavior.

The notion of emotional intelligence gained greater visibility after the publication of the work *Emotional Intelligence*, by Daniel Goleman (1995), in which the author expanded the concept by including aspects of personality and defending the possibility of developing these skills throughout life. Goleman (1995) describes five fundamental dimensions of emotional intelligence: self-knowledge, related to the perception of one's emotions; self-control, linked to the ability to manage feelings and impulses; self-motivation, associated with the orientation of emotions towards the achievement of goals; empathy, understood as the ability to recognize and understand the emotions of others; and social skills, related to the effective management of interpersonal relationships.

When presented, the theory of emotional intelligence was initially interpreted as contradictory to traditional conceptions based on intellectual quotient (IQ). However, over time, this perspective has gained theoretical and empirical consistency, as studies have shown that individuals with greater interpersonal relationship capacity and emotional balance tend to have better professional and social performance than those who stand out only for specific cognitive abilities (Goleman, 1998).

Intrapersonal intelligence refers to the individual's ability to understand themselves, involving self-knowledge, recognition of their own emotions, and the ability to regulate them. Interpersonal intelligence, on the other hand, refers to the ability to understand the other, their intentions, feelings, and needs, as well as to establish healthy relationships, maintain constructive dialogues, and interact in a socially effective way. These conceptions extend the traditional understanding of intelligence, overcoming the exclusive centrality of logical-mathematical skills. In this sense, Gardner (2001) defines intelligence as a biopsychological

potential to process information, which can be activated in certain cultural contexts to solve problems or create socially valued products.

In this context, a leadership profile different from the traditional one emerges, both in the business and educational spheres. Effective leaders are now recognized as those who are able to establish closer relationships, promote environments of trust, tranquility and well-being, favoring the development of the individual and collective potential of their subordinates. According to Goleman (1998), this paradigm shift inaugurates a new understanding of administration and management, in which emotional competencies play a central role.

Although academic selection processes traditionally emphasize IQ as a performance indicator, this factor alone is insufficient to explain professional success or failure. Research cited by Goleman (1998) indicates that the correlation between IQ and effectiveness in professional practice rarely exceeds 25%, and in many cases may be less than 10% or even 4%. These data show that a large part of success at work is associated with non-cognitive factors. An example of this is the study carried out with graduates in Law, Medicine, Education and Business Sciences at Harvard University, in which it was found that the scores in the entrance exams did not present a significant correlation with professional success (Goleman, 1998, p. 26).

Based on these findings, Goleman (1998) demonstrates that socio-emotional skills play a more relevant role than isolated intellectual capacities, which has driven the development of numerous studies, both in the international scenario and in the Brazilian context.

College admissions tests highlight the importance of IQ, but on its own, it can hardly explain success or failure in life. Research has shown that the correlation between IQ and the level of effectiveness that people have in the exercise of their profession does not exceed 25%, although a more detailed analysis reveals that this correlation does not usually exceed 10% and is sometimes even less than 4%. This means that, in the best case, IQ leaves 75% of success at work unexplained, and in the worst case, 96%, or, in other words, IQ does not allow you to determine in advance who will succeed and who will fail. For example, a study of graduates in law, medicine, education, and business at Harvard University found that entrance exam scores—an imitation of IQ—had no correlation with professional success (Goleman, 1998, p. 26).

Such studies have reinforced the importance of emotions in leadership and, in particular, in school management.

In Brazil, recent investigations have also shown this relationship.

[...] the construction of transformative theories and practices, which do not privilege only the cognition of contents, but which instigate a new look at teaching with sensitivity to the learner and the importance of the development of socio-emotional aspects as paths to learning, school quality and especially quality of life (Lobo; Ferraz da Silva, 2021 p.144).

The study developed by Lobo and Ferraz da Silva (2021), from the University of Paraíba, highlights the need to build transformative educational theories and practices that do not exclusively privilege content cognition, but that promote a sensitive pedagogical look at the learner, recognizing the development of socio-emotional aspects as fundamental paths for learning, especially the quality of life of the entire school team

2.1 MORE THAN EMOTIONAL INTELLIGENCE: SOCIO-EMOTIONAL SKILLS

In addition to emotional intelligence, it is essential to highlight the importance of the school manager promoting a quality institutional climate in educational units. In this sense, Abrucio (2018) emphasizes that management occupies a central place in the success of pedagogical action, especially in aspects such as teacher training, the quality of the school climate, curriculum implementation, the encouragement of good pedagogical practices and innovation in the classroom, as well as in the strengthening of relationships between the school and the community.

The relevance of emotional self-knowledge and the ability to regulate emotions has been increasingly questioned, both on the part of the manager and with regard to the recognition of the emotional dimensions of his subordinates. In this context, it is essential that the manager develops awareness of his own limitations and potentialities, while getting to know his team, exercising attentive listening to the difficulties faced, the feelings involved and the challenges experienced in the school routine. Such an attitude contributes to the construction of a healthy and collaborative work climate, favoring the well-being of both the leader and the professionals under his leadership.

For Lück (2006), the organizational climate is a fundamental element for the proper functioning of the educational institution, exerting a direct influence both on the performance of students and on the satisfaction and engagement of the professionals who work there. This climate is built from the interactions established between the different subjects of the educational community, such as managers, teachers, students and employees. In this process, school leadership plays a central role in creating a positive institutional environment, in which members feel valued, motivated, and committed to educational objectives. The author also points out that a favorable organizational climate strengthens trust, mutual respect, effective communication and collaboration among those involved, creating

conditions conducive to learning, personal and professional development and the achievement of the school's educational goals. Lück (2006) also warns that "the mere presence of a person in an environment with non-verbal pressures of apathy and indifference to the sociocultural dimension of their reality has a negative impact on this context" (p. 37), thus evidencing the role of individual attitudes and postures in the constitution of the institutional climate.

Bisquerra and Pérez-Escoda (2007) mention the *five elements* of socio-emotional competence. The *first element*, according to the authors, is *emotional awareness*, described as the ability to become aware of one's own emotions and the emotions of others, including the ability to perceive the emotional climate of a specific context. The *second element* is *emotional regulation*, which concerns the ability to deal appropriately with emotions, to be aware of the relationship between emotion, cognition and behavior, to develop coping strategies and to elicit positive emotions. The *third element* is *emotional autonomy (self-management)*, formed by a group of characteristics related to emotional self-control, such as self-esteem, responsibility, critical view of social norms, positive attitude, recognizing when you need help and asking for support. The *fourth element* is *interpersonal intelligence or social communication*, which deals with the ability to maintain good relationships with other people, the ability to communicate, to be respectful, to be assertive and to have a prosocial behavior. The *fifth element* is composed of *life skills and well-being*, represented by the ability to adopt appropriate and responsible behaviors to solve personal, family, professional and social problems, aiming to obtain improvements in personal and social well-being.

Guerra (2020) argues that school learning goes beyond the development of students, requiring the constant involvement of the entire team in formative processes and the resignification of pedagogical work. In this way, the school needs to develop the capacity to create, review consolidated practices, listen to teachers, students and the community, as well as maintain a permanent dynamic of reflection, focused on both the internal context and external transformations. In this movement, it is essential to keep up with social and economic changes, new educational trends, and the advancement of technologies. The author emphasizes the need for school managers who are attentive to the demands of the present time, not restricting themselves to the knowledge prescribed in the national curricula, but also valuing the relational and emotional dimensions that give meaning to the contents worked on in everyday school life (Guerra, 2020).

It is not, therefore, through external measures, external agents, imposed advisors, inspections of hierarchies, authoritarian principals, that a school can change in an

enriching way. Because then teachers become cogs in a gear that they do not believe in and do not love (Guerra, 2020, p. 6).

It is possible to see that the authoritarian school manager no longer corresponds to the profile of the manager expected for the current context, that is, that profile of the manager who strictly followed the rules established by the government's educational guidelines, which arbitrarily marked the rhythm and method of work, no longer has space today. The contemporary manager fulfills his duty, but knows how to be understanding, foster an environment of tranquility in which each member of the team feels part of a gear, feels comfortable, valued and heard, thus generating a better quality of education for his students, and a work climate suitable for the integral growth of the school unit.

Through in-depth studies on the subject, authors such as Lotz and Gramms (2012) demonstrate that professionals with emotional potential are an advantage for organizations, being able to offer conditions for learning and development of human formation.

Emotionally intelligent professionals have the ability to manage conflicts, increased employability, and, in addition, they present a key differential between effective and mediocre employees: they are important sources of competitive advantage (Lotz; Gramms, 2012, p. 54).

In the context of education and management of confessional institutions, Menslin (2012) addresses a series of topics that are necessary for the school manager to develop a good administrative work. One of the topics is to create a climate of friendship in the school environment. The author considers it an important point to maintain this good environment for the development of healthy management, and points out one more detail: the character of the director must be one of trust and friendship; it must fulfill what it promises and provide the working group with security (Menslin, 2012).

Also according to the same author:

If the manager is someone who does not commit to what he says to his assistants, who does not expose himself in favor of his group and does not reveal in his actions what he is as a person, the work climate will hardly be one of trust and friendship (Menslin, 2012, p. 35).

The manager must, therefore, identify with the group, support, and they need to feel part of the team, for a good functioning, generating well-being. The Christian author Ellen White (2008) also highlights the importance of the influence that one person exerts on another, due to loving, caring, and empathetic treatment. How this generates a pleasant atmosphere in any convivial situation.

The need to be an educational leader who points out mistakes with love and care, generating changes in work behaviors; otherwise, many employees will feel unable to give their best and will feel excluded from that team. If the manager has the real notion that his influence reaches even the most innermost, such as the human mind, he can develop not only the best at work, but also the best of the human beings who work with him.

White highlights the influence people have on the lives and emotions of others:

Every soul is surrounded by an atmosphere of its own, which may be charged with the life-giving power of faith, of courage, of hope, and perfumed with the fragrance of love. Or it may be heavy and cold with the clouds of discontent and selfishness, or intoxicated with the deadly contact of a cherished sin. By the atmosphere that surrounds us, every person with whom we communicate is consciously or unconsciously affected (White, 2005, p. 207).

In view of these reflections, it is understood that the leadership of the school manager exerts a direct influence on the institutional climate and on the human development of the team. An action based on care, empathy and respect favors healthier relationships, strengthens the sense of belonging and creates conditions for professionals to express their potential. Thus, by recognizing the scope of their emotional and relational influence, the manager contributes not only to the improvement of work practices, but also to the construction of a more humanized, collaborative school environment conducive to collective well-being.

2.2 SOCIO-EMOTIONAL SKILLS AND SCHOOL MANAGEMENT

Institutions are formed by individuals with an increasing diversity of thoughts and ways of acting in an environment full of intellectual differences, beliefs, values, among others, and to deal with conflicts within organizations, whether small or large, leaders are needed who manage socio-emotional skills and competencies. In this sense, investment in studies and research on the subject is of paramount importance so that organizational objectives are achieved, and the main asset of an institution, which is its personnel, can be valued, and, in the same way, the main asset of each person must also be taken into account, which is their professional competence (Santos, 2008).

For Soares (2015), a good manager influences and directs a team in an ethical and positive way, day after day, year after year, in various situations. Leadership requires patience, discipline, humility, respect, and commitment when dealing with people of the most different types and mediating relationships within the team. To discuss the manager's socio-emotional skills that most contribute to team development, we will focus on *five main areas*

that the scientific literature generally highlights. According to Goleman (1995), the *five* most important competencies are: *emotional intelligence, empathy and acceptance, self-control and resilience, conflict resolution and transformational leadership*.

2.2.1 Emotional Intelligence

The work environment can take on positive or negative characteristics, varying between calmer and more welcoming contexts or, on the contrary, environments marked by agitation, tension and high levels of stress. From Kantor's (2019) perspective, in many organizational scenarios, especially in the educational field, daily demands impose intense work rhythms, rigid deadlines, and pressure for results, which can directly affect the well-being of professionals and the quality of interpersonal relationships. In this context, Emotional Intelligence is an essential tool to support management and professional practices, since it favors the recognition, understanding and proper management of one's own emotions and the emotions of others. Emotionally intelligent individuals tend to have greater balance in the face of adverse situations, demonstrate ease of teamwork, greater ability to adapt to changes and competence to deal with conflicts, whether internal or external to the organization. In this way, Emotional Intelligence contributes not only to the emotional health of professionals, but also to the construction of a healthier, more collaborative organizational climate that is conducive to achieving institutional objectives.

2.2.2 Empathy and Acceptance

The acceptance of the individual in his or her entirety, including his or her limitations and potentialities, is a fundamental element for the construction of organizational environments in which professionals feel safe, recognized and valued. When leadership adopts an empathetic posture — understanding and respecting the feelings, experiences, and perspectives of others — a favorable space is created for personal and professional growth, in which subjects perceive themselves supported in their development processes. In this context, leaders who exercise empathy and listening are often recognized as more competent and upright in their performance. This conception dialogues with the idea that the role of the leader consists of helping his subordinates to reach their potential, not through disqualifying criticism, but through follow-up practices and constructive feedback. As Scharmer (2014) points out, "two leaders, in the same circumstances, doing the same things, can generate completely different results, depending on the inner place from which each of them acts" (p. 85), evidencing the centrality of the emotional and reflective dimension in the exercise of leadership. From this perspective, emotional leadership is an important form of

influence in the educational context, since it involves practices to support the emotional well-being of teachers and other school professionals. As Bercovitch and Eyal (2021) point out, this type of leadership produces significant effects on the affection, engagement, and quality of teaching work, contributing to positive results in teaching and in the functioning of educational organizations

2.2.3 Self-control and resilience

School managers need to develop the ability to deal with both their own emotions and the emotions of team members, since their performance directly influences the organizational climate and work relationships. This dynamic becomes especially challenging when the manager is unable to maintain emotional balance in the face of everyday situations or more sensitive contexts, which require greater stability and emotional discernment. For Machado et al. (2024), in the process of managing emotions, the leader must strengthen his personal skills, developing the ability to recognize, understand, and regulate his own emotional states. Such competence is fundamental for the personal and professional growth of the manager, in addition to contributing significantly to the improvement of intrapersonal and interpersonal relationships in different contexts of coexistence, such as work, family and social relationships in general. In a complementary way, Agüera (2008) highlights that personal competencies and skills are related to the way the individual relates to his emotions and feelings, directly influencing the way he perceives himself and establishes bonds with others.

2.2.4 Conflict Resolution

Conflict resolution skills, especially in the context of socio-emotional leadership, have been shown to be fundamental for reducing teacher turnover and strengthening the permanence of school teams. Emotionally engaged and empathetic leaders tend to manage conflicts more effectively, contributing to the construction of more resilient, cooperative, and cohesive school environments. In the organizational context, marked by cultural, social and political diversity, it is natural for different interests, values and aspirations to emerge, which can lead to cooperation as well as to competition or conflict (Andrade et al., 2004). Conflict, therefore, is an inherent element of human relations and work processes, and should not be understood exclusively as something negative. In this sense, Burbridge and Burbridge (2012) state that conflict is natural and, in many situations, necessary, as it can act as a catalyst for change and innovation. However, when poorly managed, conflicts can become unproductive, generate emotional exhaustion, compromise professional relationships, and destroy institutional value. Thus, one of the main challenges of school management is to recognize

the nature of conflicts — distinguishing those that are productive from those that are harmful — and to intervene ethically, empathetically and strategically. The manager's socio-emotional competencies and skills, especially active listening, empathy and emotional balance, play a central role in this process, directly articulating with the promotion of a healthy organizational climate and the sustainable development of the school team.

2.2.5 Transformational Leadership

Transformational leadership, pointed out by Goleman, is characterized by the ability to inspire, motivate and mobilize people, exerts a direct influence on the constitution of the school's organizational climate and on the professional development of the teaching team. This leadership model presupposes that the manager mobilizes skills linked to emotional intelligence, such as self-knowledge, self-regulation, and empathy, which are fundamental for building healthy interpersonal relationships, for mediating conflicts, and for making balanced decisions in everyday school life. In this sense, the strengthening of the manager's socio-emotional skills is reflected in the quality of institutional interactions, promoting an environment of trust, collaboration, and belonging. In line with this perspective, the *Collaborative for Academic, Social, and Emotional Learning* (CASEL) highlights self-awareness, self-management, and social awareness as essential competencies for school leaders, since they sustain collaborative practices, favor collective engagement, and contribute to the consolidation of an organizational climate conducive to team development and the effectiveness of educational processes.

Figure 1

Socio-emotional skills

Source: Prepared by the authors

Emotional intelligence within socio-emotional skills is one of the fundamental pillars for the development and effective practice of leadership skills. As evidenced in the figure presented above, a leader's ability to manage their own emotions and specifically influence the team they lead depends directly on this emotional competence. Emotional intelligence not only facilitates self-awareness and emotional self-regulation, but also plays a crucial role in creating a harmonious and productive work environment by promoting empathy, intrinsic motivation, and the ability to establish and maintain healthy interpersonal relationships.

As highlighted by the specialized literature, social-emotional skills encompass a set of five key skills, which are essential for a leader's effectiveness. These skills have their own characteristics, but they are deeply interconnected and complementary in the leader's development process. Each of them contributes to building a leader who is more aware, resilient, and capable of facing challenges, as shown in the following table.

Table 1

Manager's Socio-emotional Skills

Ability	Definition	Practices to develop
Emotional Intelligence	Ability to recognize, understand, and manage one's own and others' emotions to create a balanced environment.	Develop self-knowledge, practice self-control, demonstrate empathy, improve social skills.
Empathy and Acceptance	Ability to understand the emotions of others, accept differences, and create an environment of trust.	Active listening, recognizing human imperfections, giving constructive feedback, creating an inclusive environment.
Self-Control and Resilience	Ability to remain calm under pressure, control impulses, and bounce back from adversity.	Strategic breaks, mindful breathing, self-reflection, growth mindset, support networks.
Conflict Resolution	Ability to mediate and resolve conflicts in a collaborative and constructive manner.	Practice active listening, stay calm, focus on the problem and not on the people, promote collaborative solutions.
Transformational Leadership	Ability to inspire, motivate and engage the team, promoting personal and professional growth.	Inspire with a clear vision, act as a model, invest in team development, stimulate innovation.

3 FINAL CONSIDERATIONS

This text aimed to understand the main socio-emotional skills of the school manager and their influence on the team, analyzing how skills and competencies have repercussions on the organizational climate and on the performance of education professionals. From a brief literature review carried out, it was possible to identify consistent evidence about the centrality of the socio-emotional dimension in the exercise of contemporary school leadership.

The findings indicate that emotional intelligence is a determining factor for the effectiveness of school management and highlight the need for school managers to develop socio-emotional skills such as *emotional intelligence, empathy and acceptance, self-control and resilience, conflict resolution and transformational leadership* among others. The studies analyzed reinforce that effective leaders are not limited to the management of institutional processes and routines, but act in the construction of positive interpersonal relationships, directly influencing the motivation of the team, professional engagement and, consequently, the quality of the pedagogical work developed in the school.

Another relevant aspect identified refers to the disparity between academic production focused on school leadership and that dedicated to business management. This scenario shows a mismatch in the scientific valuation of educational management, indicating the need for greater investment in research that considers the specificities of the school context and the challenges inherent to leadership in educational institutions.

Based on the results of this investigation, it is suggested that the theme be deepened in future studies, contemplating, among other aspects: the impact of the manager's emotional intelligence on the academic performance of students; the influence of emotionally intelligent leadership on student motivation and learning; the relationship between administrative overload and the development of socio-emotional skills; as well as the identification of continuing education models capable of effectively promoting the development of these skills in school managers.

In this way, the research revealed through this text demonstrates that school management goes beyond the bureaucratic and administrative dimension, requiring a broad and articulated set of socio-emotional skills to face the daily challenges of education. Social-emotional leadership contributes not only to the improvement of the organizational climate and to the strengthening of teams, but also to the promotion of the well-being of professionals and to the improvement of the quality of the educational process.

Given this scenario, it is essential that educational policies encourage training programs aimed at the development of emotionally intelligent leadership, as well as foster research that deepens the understanding of this theme in the educational context. Only through a collective effort involving researchers, managers and educators will it be possible to build more humanized, inclusive and effective school management models, aligned with the demands of the school and contemporary society.

ABSTRACT

The present work aims to understand the theoretical foundations of the famous political philosophy developed by Robert Nozick in his work *Anarchy, State and Utopia*, addressing and defining the nature of the concept of self-ownership and the role it plays in libertarian argumentation, as well as the way in which the author is able to extract his “strong theory of rights” from it. During this study, we propose the thesis that self-ownership is seen in Nozick as a *quaestio facti*, and not just as a principle subordinate to the Kantian categorical imperative, as his critics claim. Important conclusions will emerge from this thesis, which, in our view, make the author's libertarian theory much more attractive and appealing than if we take his fundamental position as a mere principle. Among these lessons is that, although *Anarchy, State and Utopia* is routinely defined as libertarian, an epithet that suggests freedom with an unparalleled status in his work, its true foundation is found in self-ownership as a fact, in the private property rights arising from it and in the negative rights (side constraints) that arise from both.

Keywords: Nozick. Self-Ownership. Libertarianism. Property. Rights. Individual. Theory of Rights. Philosophy of Law. Political Philosophy.

RESUMO

O presente trabalho busca compreender as fundações teóricas da célebre filosofia política desenvolvida por Robert Nozick em sua obra *Anarquia, Estado e Utopia*, abordando e definindo a natureza do conceito de autopropriedade e o papel por ele desempenhando na argumentação libertária, bem como a forma pela qual o autor é capaz de dela extrair sua “teoria forte de direitos”. No curso do trabalho, propomos a tese de que a autopropriedade é encarada em Nozick como uma *quaestio facti*, e não apenas como princípio subordinado ao imperativo categórico kantiano, como pretendem seus críticos. Desta tese decorrerão conclusões importantes, que, a nosso ver, tornam a teoria libertária do autor muito mais atrativa e apelativa do que se tomassemos sua premissa fundamental por mero princípio. Dentre tais conclusões está a de que, embora *Anarquia, Estado e Utopia* seja rotineiramente

¹ Postgraduate Student in Philosophy and Theory of Law. Pontifícia Universidade Católica de Minas Gerais (PUC-MG). Universidade de São Paulo (USP). E-mail: victorahlf@gmail.com Lattes: <http://lattes.cnpq.br/5536658657539234>

classificada como libertária, epíteto que sugere a liberdade com status inigualável na obra, seu verdadeiro fundamento se encontra na autopropriedade enquanto fato, nos direitos de propriedade privada dela adivindos e nos direitos negativos (side constraints) que de ambos decorrem.

Palavras-chave: Nozick. Autopropriedade. Libertarismo. Propriedade Privada. Indivíduos. Teoria de Direitos. Filosofia do Direito. Filosofia Política.

RESUMEN

Este artículo busca comprender los fundamentos teóricos de la célebre filosofía política desarrollada por Robert Nozick en su obra *Anarquía, Estado y Utopía*, abordando y definiendo la naturaleza del concepto de autopropiedad y su papel en la argumentación libertaria, así como la manera en que el autor logra extraer de él su "teoría fuerte de los derechos". En este trabajo, proponemos la tesis de que Nozick considera la autopropiedad como una *quaestio facti*, y no simplemente como un principio subordinado al imperativo categórico kantiano, como afirman sus críticos. De esta tesis se desprenden importantes conclusiones que, en nuestra opinión, hacen la teoría libertaria del autor mucho más atractiva y atractiva que si tomáramos su premisa fundamental como un mero principio. Entre estas conclusiones se encuentra que, si bien *Anarquía, Estado y Utopía* se clasifica habitualmente como libertaria —un epíteto que sugiere una libertad con un estatus incomparable en la obra—, su verdadero fundamento reside en la autopropiedad como un hecho, en los derechos de propiedad privada que de ella se derivan y en los derechos negativos (restricciones colaterales) que resultan de ambos.

Palabras clave: Nozick. Autopropiedad. Libertarismo. Propiedad Privada. Indivíduos. Teoría de los Derechos. Filosofía del Derecho. Filosofía Política.

1 INTRODUCTION

1.1 A LIBERTARIANISM WITH SOLID FOUNDATIONS

The choice of this theme stems from a sad observation about the academic treatment (or lack thereof) that many authors and researchers, especially in Brazil, have given to libertarian theories of justice, often considering them, in a shallow and unreflective way, as theories that have the sole purpose of justifying and perpetrating the status quo, which is why they are not even mentioned in the current progressive context of Brazilian Universities.

Proof of this is the significant disparity between the number of academic works produced within the scope of egalitarian theories of justice - which are very concerned with themes such as "distributive justice" or "social justice" - compared to the tiny amount of works produced within the scope of libertarian theories of justice - which are more concerned with the guarantee of individual rights and "natural justice".

Having verified this disparity, the present work proposes to study and understand the most influential - and probably the most serious - libertarian theory of justice already developed, especially with regard to its moral foundations, which seek to justify and legitimize the right to private property through what its author called "theory of ownership", the main unfolding of his "strong theory of rights".

It is, in this sense, a study whose object falls on the fundamental premises of Robert Nozick's political philosophy, formulated and developed by the author in his famous work *Anarchy, State and Utopia*, namely: (i) premise of self-ownership, or "ownership of oneself", his "major premise"; (ii) premise of legitimacy for original acquisition of external goods as a logical corollary of the premise of self-ownership, its "minor premise"; and (iii) deductive conclusion from the first two premises according to which any distributive policy would be illegitimate, as it would violate natural rights².

As we will see, the premise of self-ownership, a premise from which Nozick starts in his argumentative task of justifying private property as a natural and inviolable right, stems from a factual observation of the author, or, as some of his critics prefer, from a "basic intuition", according to which we have "distinct existences" that can be verified from the fact that each and every one of us is capable of controlling our bodies, minds, talents, and actions, which makes us, by definition, "owners of ourselves."

It should be noted, however, that this is one of the most relevant interpretative proposals about Nozick's work that the present work intends to propose. This is because, when we look at the writings of his greatest critics, notably Kymlicka, Wolff and Gargarella,

² GARGARELLA, R. *The Theories of Justice After Rawls: A Brief Manual of Political Philosophy*. 1st Ed. São Paulo: Martins Fontes, 2008. p. 35.

they see Nozick's self-ownership as a mere principle that, among others, would have been "chosen" by the author because it better suited the Kantian categorical imperative.

As we intend to demonstrate, however, in spite of the admitted absence of theoretical treatment of the premise in Nozick, it is not difficult to perceive that logic is, in fact, inverse to that intended by his critics, and the categorical imperative is rather a logical consequence of the premise of self-ownership, and not the other way around. Such a premise thus acts in Nozick's theory not as a principle, but as a true *quaestio facti*.

It goes without saying that attributing to the fundamental premise of a theory, whatever it may be, the character of a factual premise, verifiable from the very "nature of things", gives it a much more appealing character than principled theories, which depend first and foremost on a minimum consensus of their interlocutors as to the validity and breadth of the fundamental premise.

The facticity of a non-principled premise, however, does not depend on the acceptance of its interlocutors, and it is enough that it is impossible, from an epistemological point of view, for such a premise to be proven false. As we will see, this is exactly the case of self-ownership, a self-evident premise, empirically and rationally verifiable, since it is impossible to find in nature any human being who is not born with the ability to control himself exclusively.

And, although Kymlicka, Wolff, Gargarella and even Rawls also assume the premise of self-ownership in their respective theories, they do so by making use of it as a mere principle, which can, therefore, be relativized or weighed against other principles depending on the circumstances, making it truly possible, as Nozick will demonstrate, to invariably lead to the violation of rights.

Thus, despite Kymlicka's argumentative effort to the effect that "self-ownership would not in itself lead to a defense of capitalism, since capitalism requires not only the ownership of itself, but also the ownership of external resources," Nozick will be able to demonstrate that any attempt at forced redistribution of such legitimately obtained resources will necessarily imply a denial of human nature and a violation of self-ownership.

From this demonstration of the violation of rights by redistributive policies will follow the second Nozickean premise, that is, that of legitimacy in the original acquisition of external resources as a logical corollary of human nature capable of controlling and, therefore, possessing itself, individually and exclusively. To do so, the author will make use of the so-called Lockean proviso, that is, the moral foundations for the original acquisition of private property developed by John Locke.

In the end, we will see that it was precisely at this point that Nozick sinned by not remaining faithful to the deontic nature of his philosophy, when he tried to transpose a theory

of original acquisition that, although quite meritorious in certain aspects, is the result of an eminently theological, albeit empiricist, political philosophy, whose main purpose was to justify private property from the perspective of Christianity, and not from a strictly rationalist perspective.

Luckily for us, and for Nozickeans in general, Edward Feser perceived this exact same problem of the pure and simple transposition of Lockean proviso to Nozick's theory and, making punctual and necessary criticisms of it, proposed a brilliant alternative entitled self-ownership proviso², which, in our view, proves not only to be more convincing but also to be more convincing.

Thus, from a detailed examination of the fundamental premise (self-ownership) and the minor premise (legitimacy for the original acquisition of external resources), we intend to demonstrate that Nozick's libertarianism not only has moral foundations, but also that such foundations, precisely because they are factual and not merely principled, are the most solid that any political philosophy could have.

1.2 LIBERTARIANISM OR PROPERTARIANISM?³

But, already from this brief introduction, the reader could ask himself here: if, as we have been saying, the foundation for Nozick's libertarianism lies in self-ownership, initially, and in the private ownership of external resources, later, and not in some abstract concept of freedom, then why do we call it a libertarian theory and not a proprietary theory?

This question, made quite emphatically by Bresolin, Kymlicka and Wolff, is usually directed from the outset in a critical way, pointing to the true pretensions that Nozick's libertarianism would be trying to hide, since, contrary to what his epithet suggests, he would not be so much concerned with freedom in itself, but rather with a "freedom of a certain type", that is, freedom delineated by self-ownership and private property rights⁴.

Thus, the most forceful criticisms directed at Nozick will be in the sense that it is egalitarian liberalism, rather than libertarianism, that would be truly concerned with the guarantee and maximization of individual freedom.

Among the arguments put forward by egalitarians, the most relevant - and to which we will pay more attention, therefore - will be that, if the premise of self-ownership is adopted in an absolute way, as Nozick proposes, there will be cases in which certain individuals will

³ FESER, E. There is no such Thing as an Unjust Initial Acquisition. In: Natural Rights Liberalism from Locke to Nozick. New York: Cambridge, 2005.

⁴ BRESOLIN, K. The property of oneself and property in Robert Nozick. *Philosophos - Revista de Filosofia*, Goiânia, v. 25, n. 1, 2020. p. 161.

accumulate so many goods in certain societies that they will leave little or nothing for others, so that this, by itself, it would greatly restrict the freedom of the less fortunate.

That is to say: in order to be truly free, according to egalitarians, we must have access to a minimum of goods, whether to move around (property over land), or to communicate (ownership of media), or even to survive (ownership of consumer goods).

That is why, although they agree with the premise of self-ownership, adopting it as a principle, the real concern of the egalitarians would lie rather in the guarantee of individual freedoms, private property being only one of the various means of guaranteeing it, so that, consequently, it cannot be absolute, since it is a means and not an end.

Thus, Nozick's right to freedom (at least in the way it is conceived by him) would be, in fact, a mere logical consequence of self-ownership, which, at the same time, would ground and limit him.

For Bresolin:

ASU is routinely characterized as libertarian, an epithet that suggests liberty with unequaled status in libertarian political philosophy. Such a statement, according to Cohen, is trampled and does not demonstrate Nozick's most important thesis. According to him, the commitment of Nozick's political philosophy is not primarily to freedom, but to the thesis of Self-Ownership. The thesis argues that each person is the morally legitimate owner of his or her own person, powers, and talents and, consequently, each person is morally free to use these powers and talents as he or she wishes, as long as it does not harm the self-ownership of others. Thus, Nozick's libertarianism does not affirm freedom as such, but freedom of a certain kind, that is, freedom outlined by the Self-Ownership thesis. The lack of Self-Ownership implies the lack of freedom.

That is to say: if freedom derives from self-ownership, then it is subordinated to it, so that only he who is, first and foremost, master of himself can be free.

But if this is true, and if we know that, for Nozick, self-ownership is a fact arising from our own rational human condition, then are we not all equally free as well?

In a first stage of civilization, in fact, freedom and self-ownership seem to be confused, to the extent that both occupy the same space of action, both being circumscribed only to the other rights of self-ownership of third parties.

Thus, the theoretical distinction between freedom as an autonomous right and freedom as a right subordinated to self-ownership lacks, in the state of nature, any practical relevance,

a relevance that will arise only when self-ownership is transposed to the right to property of external resources, which, in principle, would not be possessed by anyone⁵.

Thus, the main question that the present work will propose to answer will be, precisely, to know if those who affirm that Nozick would not be truly concerned with "freedom" per se, but only with the unrestricted rights to private property, and, therefore, if his theory really lives up to the nickname of a libertarian theory.

2 LIBERTARIANSIMO WITHOUT FOUNDATIONS? THE FUNDAMENTAL PREMISE OF SELF-OWNERSHIP IN NOZICK

As we stated in our introductory chapter, the main focus of the criticisms attributed to Nozick's libertarian philosophy resides, precisely, in its alleged absence of moral foundation, which, although in fact little explained – and, therefore, little developed – does not mean, however, that it is not present.

In this sense, a large part of the debates about Nozick continue to gravitate around the theme, some seeking to extract and justify its moral foundations, and others, in a way that is in our view quite mistaken, simply limiting themselves to attributing to him the nickname of a "libertarianism without foundations".⁶

Distancing ourselves from such radicalisms, it will not be difficult to demonstrate that Nozick's libertarian argumentation, as it could not be otherwise, starts from a fundamental premise, even if it is not itself endowed with an eminently moral character, but merely factual, rationally extractable from the human condition as such⁷.

This does not mean, however, that this theory is intended to be amoral, but only that its fundamental premise (and only it) is amoral, because it is factual. It is not by chance that Wolff will say that it is from this factual premise that Nozick will extract all his moral and political philosophy⁸, of an eminently deontological character.

It is, therefore, a political theory that has as its argumentative starting point a factual premise, but which is developed from an ethical background based on Kantian deontology, from which Nozick derives his "strong theory of rights".⁹

⁵ On the discussion between an initially inappropriate world and a world collectively possessed by all, see: FESER, E. There is no such Thing as an Unjust Initial Acquisition. In: *Natural Rights Liberalism from Locke to Nozick*. New York: Cambridge, 2005.

⁸ WOLFF, J. *Robert Nozick*. Stanford University Press, 1991. P. 7.

⁹ BRESOLIN, K. The property of oneself and property in Robert Nozick. *Philosophos - Revista de Filosofia*, Goiânia, v. 25, n. 1, 2020. p. 154.

Thus, when Nozick asserts, already in the preface to *Anarchy, State, and Utopia*, that "individuals have rights, and there are things that no person or group can do against them (without violating their rights)," ¹⁰ it is not because he merely presupposes the existence of these rights and refrains from justifying them, as some of his careless critics seem to suggest. but because they are logical consequences of the fact that each person "is a distinct person, that his life is the only one he possesses", ¹¹ so that this, or the rights that derive from it, can never be used as means to ends desired by others.

That is to say: because it is verifiable from the factual world that human beings - unlike tools and animals, for example - are capable of controlling their own actions and the uses they make of their bodies, gifts and talents, that we can conclude that each of us leads an independent life (or existence), and that, therefore, any attempt to use our fellow human beings as means to our ends would be to deny our "independent existence". ¹²

This factual finding of independent existence has been conventionally called "self-ownership", or "self-ownership", a characteristic inherent to each and every human being. It is important to emphasize, however, that it is precisely because such a premise is verifiable in the factual world that Nozick did not bother so much to justify it, or even to mention it expressly.

That is why, being a purely factual matter, self-ownership cannot be enunciated as a norm or principle, since it does not command something, nor does it have axiological content, but only enunciates a fact of nature, namely, that we control ourselves and therefore possess independent existences, which is why self-ownership can also be seen as an axiom ¹³.

Kymlicka, in turn, understands that Nozick presents us with the "principle" of self-ownership as an interpretation given by the author to the second formulation of Kant's categorical imperative, according to which we should always treat people as "ends in themselves". ¹⁴ Kymlicka's critique, however, presupposes that Nozick has "chosen" the "principle" of self-ownership among several possible ones, as he understands it to be the one that best fits the categorical imperative.

Thus, Kymlicka understands that the fundamental premise in Nozick would be the categorical imperative itself, and not self-ownership, which would be its mere logical

¹² WOLFF, J. Robert Nozick. Stanford University Press, 1991. P. 7.

¹³ In this sense, the "axiom of self-ownership" reached its maximum theoretical development in Hoppe, constituting a central and indispensable concept for the development of his famous "argumentative ethics by performative contradiction", according to which for any rational subject to even be able to argue, he has to presuppose his self-ownership, that is, the internal control of his body and mind. See: Leonardi da Silva, R. *Ética Argumentativa Hoppeana*. Law, Philosophy, Libertarianism. Libertarian University, 2019.

¹⁴ KYMLICKA, W. *Contemporary Political Philosophy*. 2nd Ed. Oxford University Press, 2002. p. 107.

consequence. As we intend to demonstrate, however, self-ownership is not a "choice" that is more adapted to the conception of individuals as ends in themselves, but rather it is the only alternative capable of guaranteeing such a conception, since it stems from the very factuality of independent human existence.

2.1 SELF-OWNERSHIP: PRINCIPLE OR FACT?

As said, although Kymlicka, Rawls and Nozick share Kant's influence on their respective thoughts, as well as the premise of self-ownership, they do so to different extents and for different reasons.

Kymlicka and Rawls take the categorical imperative as the fundamental premise of their argumentative constructions, from which they extract, by mere judgment of convenience and adequacy, the "principle" of self-ownership, which, like others, can be weighed and, therefore, limited in relation to other "principles".

In Rawls, for example, this is expressly present in the constant conflict between freedom and equality in his work, a conflict that, according to the author, should always be resolved in favor of the former.

In Nozick, on the other hand, self-ownership is not treated as a "principle", nor is it subordinated to some other primary foundation, as occurs in Rawls in relation to the Kantian categorical imperative. Self-ownership is actually a fact, a fact, a realization, or, as modern libertarians prefer, a true axiom.

Thus, if the right to property can be defined as the power of exclusive control of a certain good, then the simple fact that each and every human being, since rational, can control his body and his actions exclusively, makes it evident that they have property (the power of exclusive control) over their bodies, gifts and talents.

It is not denied that a certain individual is capable of imprisoning another in a cell, in a to cut off a part of his body, to torture or threaten him to work for him, but this does not imply a factual external control over someone, but only a physical control, and not a mental or volitional control, which will always reside exclusively with each one of us internally, until the day of our deaths.

Self-ownership, therefore, is prior to the categorical imperative, and not the other way around. It is not necessary to commit ourselves to the Kantian principle that commands us to act towards our fellow human beings always and simultaneously as an end and never only as means, in order to attribute to the human being a "right of self-ownership".

It is, in fact, self-ownership that commands the human being never to use his fellow men as means, but always and simultaneously as ends, because no human being belongs

to the other so that he can make use of him. Therefore, contrary to what Kymlicka claims, it is not "rights that affirm our 'separate existence'", ¹⁵but it is our separate existence that requires the recognition of rights.

This inversion of premises made by Kymlicka leads to an unequivocal and relevant distortion of Nozick's argument, making his criticism fallacious from the beginning, as it seeks to justify that self-ownership is a principle and not a fact, and that the true premise to which Nozick would be committed would be that of the Kantian categorical imperative, and not that of self-ownership. which leads to both criticism and very mistaken conclusions from his work.

The true relationship between self-ownership and the categorical imperative in Nozick seems to have been better understood by Wolff, who defined the former as the finding according to which it is the individual himself who holds power over "his life, his liberty and his body", so that, for Nozick, unlike other liberal authors, such a finding acquires the character of a fact, whose rights deriving from it cannot be relativized in any way, under penalty of denying the very nature of things¹⁶.

Another very convincing way of attributing to self-ownership the status of fact - or axiom - as it appears in Nozick, can be found in Hoppe, according to which the very act of arguing already presupposes it, because without there being exclusive ownership over our own bodies, brains, vocal cords, mouths or any other means of communication, Argumentation would be impossible¹⁷.

Thus, whatever the view may be, whether from the very examination of Nozick's argumentation, or from a systematic interpretation of the theories of his libertarian colleagues, one cannot conceive of self-ownership as a mere "principle" in Nozick, nor as a "rule", since it does not have a moral character, but rather a mere *quaestio facti*.

It is a fact that we control our bodies, minds, talents and actions. And if we control our bodies, minds, talents and actions, then we are independent beings, with "distinct existences", which is why we must be recognized certain rights that guarantee us the maintenance and integrity of our distinct existences¹⁸.

From a fact (self-ownership), norms (individual rights) are extracted, whose argumentative process of justification we will focus on below.

2.2 FROM FACT TO NORM: WHY SELF-OWNERSHIP DEMANDS THE RECOGNITION OF NATURAL RIGHTS

In the first year, not to say in our first class, we learned that law is "fact, value and norm". It is a succinct definition at first glance, but it brings with it the accurate notion that the norm starts from facts, just as facts are shaped by norms, and that, in this mutual relationship, values play a central role.

And if this is true, if it is verifiable in any and all legal practice, then it must also be true for philosophies of law. In Nozick, especially, the relationship between fact and norm appears quite evident when we analyze the passage from self-ownership to his "strong theory of rights".

This is because, a priori, facts are naturally amoral, and it is we, human beings, who value them and attribute meaning to them. Thus, the fact that we are masters of ourselves (since we control our bodies, minds, and actions), by itself, does not lead to any conclusions, and it is necessary before we value this fact and attribute meaning to it.

Thus, for example, we are more susceptible today to killing and eating animals because we do not see them as our equals, especially because of their inability to reason and express themselves. But if this fact were to change, if animals were suddenly capable of reasoning and communicating, surely our actions towards them would be different, for we attribute to the lives of beings who factually possess such characteristics a higher moral value than to those who do not.

In the same way, if we find that we are able to control our bodies, minds, and talents, and are also capable of guiding and guiding our actions in the factual world, we can consider ourselves as equal and independent beings, and from this we can formulate a duty according to which no one can morally claim our bodies, minds, talents, and actions without violating in this way.

In this sense, the distinction between fact and norm resides mainly in the nature of the restrictions that one and the other impose on our conduct. In the first case, the facts restrict our conduct physically, while in the second, our conduct is restricted only morally. Thus, we are not free to deny gravity physically, because nature does not allow us to do so, while I am free to kill others from the physical point of view, because it is possible to do so, although the law (norm) forbids me to do so.

The fact, therefore, cannot be denied, since it is impossible to act contrary to it. The norm, however, is liable to be violated, and only morally limits the field of possible and justified

actions, so that "rights are a moral concept that establishes the borderline conditions of justified action (as opposed to the borderline conditions of physically possible action)".¹⁹

That is why, by sharing the premise of self-ownership, even if mistakenly taking it as a principle and not as a fact, Kymlicka, Rawls and Dworkin are still able to develop a very convincing theory of rights within the scope of liberal philosophy, because although they consider it as one principle among others, they are always concerned with trying to justify their redistributive policies from the perspective of self-ownership.

If this were not the case, if these authors, as well as the utilitarians and Marxists, completely disregarded the premise of self-ownership, there is no doubt that they would be doomed to the condition of utopian authors, the only possible destiny for those who ignore – if not completely despise – the very nature of things.

This is not the case with Nozick's greatest opponents, the egalitarian liberals, whose greatest challenge is precisely the transposition of self-ownership into the natural rights deriving from it.

Thus, for both Nozick and Rawls, the fact that we have distinct existences and are able to guide our own actions, exclusively, leads to a necessary recognition that the rational being can - or "has the right to" - prevent third parties from arbitrarily interfering in the conduct of our lives, because such arbitrary interferences do not find a reason for being in the nature of things.

And it is precisely because we are distinct individuals, with our own distinct claims, that there are limits to the sacrifices that can be required of one person for the benefit of others, limits that can be expressed, precisely, in the form of a theory of rights²⁰.

Rawls, for example, will say that these limits are not absolute, and there are cases in which it is even necessary (and therefore legitimate) to demand from certain people certain sacrifices for the good of others, for without such sacrifices the self-ownership of the less favored would be even more gravely injured than that of the more favored whose sacrifices were demanded of them.

In Nozick, on the other hand, since self-ownership is a fact and not a principle, the rights arising from it do not allow for weighting, especially when such weighting takes into account consequentialist premises, so that they are truly absolute and inviolable, and to deny them this condition would be to deny the fact itself. It would be the same as saying, for example, that gravity does not exist.

¹⁹ SKOBLE, A. J. The Essential of Robert Nozick. São Paulo: Faro Editorial, 2021. P. 14.

²⁰ KYMLICKA, W. Contemporary Political Philosophy. 2nd Ed. Oxford University Press, 2002. p. 108.

Thus, one can perceive here one of the main practical-argumentative relevance of the distinction between self-ownership as a fact in Nozick and self-ownership as a principle in Rawls, who admits its weighting in relation to other principles – such as freedom and equality, for example – or even its weighting in terms of maximizing the principle itself collectively considered²¹.

It is thus concluded that Nozick seeks the norm from the fact, creating a theory of rights that intends to respect and allow the development of human nature at the same time. In the justification of his theory of rights, therefore, is implicit the premise that moral philosophy must try to recognize rights and duties without which our rational nature would not be respected, which would be unnatural and, therefore, morally and politically undesirable²².

2.3 THE THEORY OF RIGHTS AS INDIRECT MORAL CONSTRAINTS

Now, if it is true that Nozick considers self-ownership a fact, and if it is also true that from this fact norms can be extracted that aim to guarantee and respect this same fact, then the development of a theory of rights is both possible and necessary for political philosophy.

With this in mind, Skoble teaches that rights in Nozick should be understood as a moral concept that creates restrictions on human actions beyond those already imposed by nature. In this sense, it is true that we are not free to be in two places at the same time, because physics does not allow us to do so, but if we do not have a theory of rights, then we would be free, from this point of view, to kill and rob each other, for example.

A theory of rights arises, therefore, to establish "the borderline conditions of justified action", that is, to dispose of what we can or cannot do without violating the rights of others, so that we can conduct our lives respecting the lives of our equals, given that we are all equally owners of ourselves.

Thus, Nozick's theory of rights is based on "the fact that our existences are distinct", and aims precisely to ensure that such existences are in fact respected, and it is not lawful for any of us to subjugate others to our private interests through the use of force.

That is why Nozickean libertarian rights are usually defined as indirect moral constraints, since such rights impose on others only negative duties, that is, duties to refrain

²¹ The theories that defend the collective maximization of rights Nozick called "utilitarianism of rights", according to which individual rights could be violated only in cases where such violations were the only alternative capable of ensuring these same rights to a greater number of people, so that the collective balance of the violated right would be, in fact, maximized (NOZICK, R. *Anarquia, Estado e Utopia*. 1st Ed. São Paulo: WMF Martins Fontes, 2018. P. 34)

²² In this sense, Gargarella understands that Nozick's theory of rights is constituted by a series of "natural" rights, that is, "rights common to all men, in their condition as such, and which do not depend, for their creation or granting, on the will of any person" (GARGARELLA, R. *As Teoria da Justiça Depois de Rawls: Um Breve Manual de Filosofia Política*. 1st Ed. São Paulo: Martins Fontes, 2008. P. 35.)

from certain behaviors, in this case, to arbitrarily interfere with the "independent existences" of others.

For Nozick, no human being has the right to demand something from others by nature, not even by "necessity," since, if we consider the fact that our lives are distinct and that, therefore, "there can be no gesture of moral compensation between us," then "nothing justifies some of us sacrificing ourselves in the name of others."²³

Thus, Skoble concludes, "the rights of one person are only the inverse of the restrictions of others,"²⁴ so that there are no positive duties by nature, which can only arise by consensus (in a contract, for example). In other words, no one is naturally obligated before another to give or lend him his goods, his body, his hours of work or anything else.

Wolff, following the same line, prefers to call Nozick's libertarian rights "rights of non-interference", whose underlying idea is essentially the same as that of indirect moral restrictions, in the sense that Nozick's theory of rights would be proposing only negative rights and duties to life, liberty and property.

In other words, Wolff explains, "negative rights are rights that cannot be violated, or cannot be interfered with, while positive rights are, in general, rights to be helped [by others] in some way."²⁵ Therefore, to say that I have a positive right to life would be to say that I can force others to provide for my basic needs to live (by providing me, for example, with food and water), whereas a negative right to life would be limited to affirming my right not to be murdered.

With this theory of rights, then, Nozick seeks to ensure that our human nature is not disrespected, thus ensuring that we can conduct our distinct lives without others arbitrarily interfering with it (negative rights), while we are also not obligated to help others lead their own lives, unless we have committed ourselves to doing so through consensus (positive rights).²⁶

As we will see later in Chapter 4, this distinction between positive rights and negative rights is what will lead to the conclusion about the real concern and scope of the criticisms formulated against Nozick's libertarianism by egalitarian liberals, ultimately leading to a dispute between the concepts of "positive freedom" and "negative freedom".

²³ NOZICK, R. *Anarchy, State and Utopia*. 1st Ed. São Paulo: WMF Martins Fontes, 2018. p. 41.

²⁴ SKOBLE, A. J. *The Essential of Robert Nozick*. São Paulo: Faro Editorial, 2021. P. 15.

²⁵ WOLFF, J. *Robert Nozick*. Stanford University Press, 1991. P. 19.

²⁶ In this sense, as already said, Wolff admits that "Nozick allows us to have positive rights. But only in exceptional cases do they exist only as a result of people voluntarily assuming obligations that correspond to these rights – for example, entering into a contract" (WOLFF, p. 19)

3 THEORY OF OWNERSHIP AND ORIGINAL ACQUISITION OF PRIVATE PROPERTY

From Nozick's theory of negative rights will follow the theory of ownership, according to which, if we are in fact owners of our bodies, minds, talents and actions, then we will also be legitimately owners of everything we obtain from their uses, whether from the original acquisition of resources, or from the derived acquisition. through exchanges.

Thus, the theory of ownership seeks to justify private property rights by abstracting any moral considerations about the way in which goods are distributed in a given society, provided that such distribution has resulted exclusively from legitimate original acquisitions and voluntary exchanges.

In the first case, Nozick will say, what legitimizes someone to become the owner of an asset initially not possessed will be the observance of the requirements of the Lockean proviso, namely: (i) if the subject factually employed some kind of work on the asset in order to "contaminate" it and make it something different from what it was in nature; and (ii) that this appropriation does not worsen the situation of other individuals.

In the second case, once a certain good is appropriated by someone, it can only be obtained by a third party through consensus, either by exchange or donation. In other words, after a certain good has been legitimately appropriated by a subject A, a subject B can only legitimately obtain this same good if he is able to convince A to donate it to himself or exchange it for some other good of B.

To better exemplify his theory of ownership, Nozick uses the famous Wilt Chamberlain argument, through which the author asks us to imagine a situation in which a certain ideal conception of justice is realized, resulting in a distribution of possessions that we consider fair. In this fair distribution, called D1, there is a basketball player named Wilt Chamberlain, who is highly sought after by teams due to his ability to attract audiences to games.

In this, Chamberlain signs a contract with a certain team and receives 25 cents for each ticket sold. Suppose that, over the course of the season, 1 million tickets are sold, resulting in a \$250,000 gain for Wilt Chamberlain, an amount far higher than that of anyone else in that same society.

Faced with this example, Nozick asks: Would Wilt Chamberlain be entitled to this income? Is this new distribution, D2, unfair? Nozick argues that if people are free to decide to transfer that 25 cents to someone else voluntarily, thus creating a new distribution of possessions, then that new distribution should also be considered fair.

Through this argument, Nozick tries to prove that it is impossible to stipulate a standardized theory of justice without denying the right of each individual to make their own choices and, with that, decide to spend their money as they please, since naturally when

people are free to make choices it is impossible to reach a pre-established final pattern of distribution of goods.

Therefore, if we are willing to commit ourselves to the premise of self-ownership and, consequently, to Nozick's theory of rights, then we have to accept the theory of ownership, because only it prevents a third party (in this case, the State) from directly and arbitrarily interfering in society to redistribute the goods legitimately acquired and voluntarily exchanged.

3.1 LEGITIMACY FOR THE ORIGINAL ACQUISITION

In view of the theory of ownership, and having already overcome the stir regarding the recognition of self-ownership as a fact, Nozick will go on to argue - and we will now analyze - that one of the inevitable logical consequences of the recognition of this fact will be, precisely, the possibility of individuals, owners of themselves, legitimately acquiring property rights also over external resources. provided that certain requirements are observed²⁷.

In short, Nozick's central thesis to justify the legitimacy of the original acquisition of external resources will be that, taking as a premise the fact that we are all owners of ourselves – and, therefore, owners of our bodies, powers and talents – then we will also be owners of the fruits of our labor.

But how can something that is not owned become a person's rightful property? To explore this question, Nozick examines Locke's attempts to define his principle of fairness in acquisition. Thus, according to Locke, "the property rights of an unowned object arise from the combination of a person's labor with that object."²⁸

It is, in short, the "theory of mixed labor", which seeks to legitimize the original acquisition of external goods based on the notion that two goods, one already appropriated and the other not yet appropriated, when mixed in such a way that the first transforms the second, generates in the latter a relationship of submission that can be characterized as their appropriation.

In this way, in both Locke and Nozick we are able to "contaminate" external resources from the use we make of them, thus projecting our self-ownership over them. As a result, resources that previously belonged to no one are appropriated by those who contaminate

²⁷ It is precisely at this point that the influence of John Locke can be most felt in Nozick's libertarian theory, since the requirements presented by the author as both necessary and sufficient to legitimize the original acquisition of ownership of external resources will be, precisely, those set forth in the Second Treatise on Civil Government, namely: (i) that the individual "contaminates" the good with his labor to the point of making it a truly distinct good from that of the it was in nature; and (ii) that the removal of this asset from "common use" does not worsen the situation of other individuals.

²⁸ NOZICK, R. *Anarchy, State and Utopia*. 1st Ed. São Paulo: WMF Martins Fontes, 2018. p. 224.

them with their work, in order to legitimately remove them from "general use", with the only condition that this does not materially worsen the situation of other individuals²⁹.

In sum, Kymlicka illustrated the argument underlying Lockean proviso as follows³⁰:

1. People are masters of themselves;
 2. The world is initially owned by no one;
 3. You can acquire absolute rights over a disproportionate share of the world, provided you do not worsen the condition of others;
 4. It is relatively easy to acquire absolute rights over a disproportionate share of the world;
- So:
5. Once people have appropriated private property, a free market for labor and capital is morally demanded.

As exposed, the problem of Lockean proviso is that, despite its meritorious formulation about the "contamination" of external resources as a legitimate means of acquiring private property, the imposition of a utilitarian restriction ("3") on such appropriation does not conform, but rather departs from, the Kantian-deontological nature of Nozickian philosophy.

3.2 CRITICISM OF LOCKEAN PROVISO

This inherent contradiction, of course, could not go unnoticed by its critics, who, like Kymlicka, knew very well how to exploit the weakness of the argument with regard to the difficulty of justifying, on the basis of it, the morality of a unilateral original acquisition of a certain common good, even when the requirements of the Lockean Proviso were met.

In this sense, let us imagine, for example, an individual A and an individual B who, from a certain age, plant on the same land and divide the results of the harvest between them. After a while, both begin to realize that it may not be so worthwhile to continue working hard, as they can still enjoy the fruits of their partner's work, with less effort.

As a result, productivity starts to decrease exponentially, and neither A nor B are in a favorable situation anymore. This is the result of what has come to be called the "tragedy of the commons", a state in which the absence of private ownership of collectively owned goods generates an unsustainable deficit in productivity, due to the natural lack of individual incentives.

In this situation, according to the Lockean proviso, both A and B could legitimately claim the right to private ownership of the land, since whichever of the two did so first - considering that their partner would no longer be producing on it, due to the aforementioned

²⁹ In this sense, see KYMLICKA: "Nozick's answer is that appropriation of a particular object is legitimate if its withdrawal from general use does not make people worse off in material terms than they had been when in general use" (KYMLICKA, P. 115)

³⁰ KYMLICKA, W. Contemporary Political Philosophy. 2nd Ed. Oxford University Press, 2002. p. 116.

lack of incentives - would certainly lead to an increase in their productivity, improving both his own condition and that of his companion.

This is because, with the privatization of the common land, not only the original acquirer will have incentives to produce, aiming at the accumulation of goods, but also his non-owner companion, since the acquirer will probably need his

work to increase the productivity of the land, offering him, in exchange, part of the harvest as payment or consideration.

In this case, as it is easy to see, both A and B will have their condition improved, and this is enough to satisfy the lockean proviso.

But, Kymlicka asks, why A and not B (or, why B and not A)? After all, although both will benefit from the unilateral appropriation of the land by either of them, the one who becomes the owner will certainly benefit more, as he will be able to keep most of the resources produced and exercise greater control over both the land itself and his non-owner partner.

Such criticism seems to us, in fact, quite valid and forceful, insofar as the requirement of "not getting worse" of the other individuals compared to the original acquisition does not seem to provide any moral basis capable of justifying the legitimacy of appropriations that, despite improving the situation of those involved, occur contrary to the wishes expressed by them, a fact that, By itself, it would violate individual rights.

But if we accept Kymlicka's critique, then must we necessarily discard Nozick's libertarian theory? Would there not be, in this sense, another kind of theory of original acquisition equally compatible with self-ownership, but without the limitations inherent in Lockean proviso?

A very satisfactory answer to these questions can be found in a recent article published by the American philosopher Edward Feser, who, influenced by the thought of Eric Mack, proposed a solid alternative to the Lockean Proviso, according to which the original acquisitions would not involve moral valuations, but rather a mere factual question.

3.3 ORIGINAL ACQUISITION AS A FACTUAL ISSUE – SELF-OWNERSHIP PROVISIO

In his article *There Is No Such Thing As An Unjust Initial Acquisition*, Feser will state that, in lockean provision, in addition to a first stage of verifying the occurrence or not of the acquisition of the good, in factual terms, there would also be a second stage of verifying the legitimacy of this appropriation, which would act as a kind of resolute condition for the acquisition of the right, namely: that the situation of other individuals excluded from the common use of the appropriate good is not worsened.

For Feser, however, injustices could only occur at a time after the acquisition of the property, in cases where its use by the owner prevented the exercise of the minimum powers inherent to the self-ownership of other individuals.

Think, for example, of the famous hypothesis in which a certain individual is lost in the desert and, after days without access to water or food, ends up finding an oasis. Let us imagine, however, that another individual has built pipes, wells and a sophisticated water collection system around this same oasis, thus contaminating it with his work, and thereby appropriating it for himself, in a legitimate way.

In this scenario, for Feser, there is no doubt that the owner of the oasis is its legitimate owner, since he exercised his work over it to the point of transforming it into a distinct asset from what it was in nature, taking control of it. But would it still be lawful to deny the lost traveler access to water or to part of the food he has, or to charge him too much for it?

The answer is negative. Just as Nozick states that "the property rights I have to my knife allow me to leave it wherever I want, but not stuck in someone else's chest," so I cannot use my assets, such as the oasis, in a way that hurts to deny the self-ownership of others, which would certainly occur if the owner in our hypothetical scenario denied access to the resources that the lost traveler needs to survive in that extreme situation and specific.

Thus, just as the present work proposes to conceive self-ownership no longer as a principle, but as *quaestio facti*, Feser also proposed that we conceive the appropriation of external goods from a strictly factual perspective, empirically verifiable and therefore devoid of any axiological value as to its adequacy or convenience.

The valuation of private property should not, therefore, focus on the moment of appropriation of the asset, but should be limited to verifying only the legitimacy of the uses that are made of this asset. Thus, what Feser proposes to us is the maintenance of the first requirement of the Lockean proviso, but not of the second.

The title of his article is, in this sense, quite suggestive. If there is nothing like an "unfair initial acquisition", which is why the author proposes that "original acquisitions are neither fair nor unfair; the proposal is that, in fact, the effort or control employed [over a certain asset] constitutes an acquisition, period".³¹

But, someone might say, why does the fact that you have exercised control over a certain asset give you a subjective right to demand that other individuals refrain from using your asset without your consent? Does the simple coincidence that you arrived earlier and exercised power over the asset give you the right to it?

³¹ FESER, E. There is no such Thing as an Unjust Initial Acquisition. In: *Natural Rights Liberalism from Locke to Nozick*. New York: Cambridge, 2005. p. 66.

The answer to this question is actually quite simple, and quite consistent with the fundamental premise of self-ownership. Yes, as Nozick proposes, and Feser admits, randomness is amoral, for in the same way that Wilt Chamberlein may have "been lucky" to inherit the talent of being an excellent basketball player, we may also "be lucky" to find certain goods before others.

This, however, does not mean that I will be able to appropriate the good completely, as some critics usually suggest. To exemplify, Feser brings us the hypothesis of tomato sauce and the ocean, according to which if the tomato sauce belongs to me and I throw it into the ocean, does this mean that the ocean has become mine?

Obviously the answer is negative. Not because allowing such an acquisition to occur would not satisfy the second condition of the Lockean Proviso, according to which one must leave goods of similar quality and quantity to other individuals, but because there was simply no takeover over of the ocean, nor did tomato sauce transform it into something completely different from what it was in nature.

In this sense, it is easy to see that the self-ownership provided by Feser demands a true transformation and significant control over the appropriate good so that it can be said that someone has appropriated it, and it is not enough, for example, that I build a house in a certain valley for the entire valley to become mine, since I have not significantly transformed or controlled it.

However, as with self-ownership, although it is a mere factual issue, this does not prevent the formulation of theories of law (norms) that deal with the possible and desirable uses that are made of the appropriate resources.

In the same way that it is not lawful for us to use our body, our self-ownership, to hit someone, we also cannot use our kitchen knives to stick them in someone else's body, or to scratch someone's car.

Transposing the moral examination to the uses that are made of goods and, thus, treating the original acquisition as a mere *quaestio facti*, empirically verifiable from the observation of the control that the subject exercises over a given good, proves to be more adequate not only from the argumentative and epistemological point of view, but is also much more compatible with the rest of Nozick's political philosophy.

After all, the actual acquisition of private property is merely an extension of our natural condition as owners of ourselves.

4 LIBERTARIANISM OR PROPRIETARIANISM? FREEDOM AS A LOGICAL CONSEQUENCE OF SELF-OWNERSHIP

As we have been discussing in the present work, there is no doubt that the true foundation of Nozick's libertarian theory is found in the factual premise of self-ownership. From this premise, Nozick extracted certain norms whose purpose would be precisely to guarantee and preserve human nature, thus allowing each of us to lead our distinct lives in a meaningful way³².

From this point of view, certain critics point quite emphatically to a supposed incongruity between the nickname of "libertarian" attributed to Nozick's political philosophy and his lack of concern with the guarantee of freedom itself. In this sense, Kymlicka turns almost all his argumentative efforts in an attempt to demonstrate that the true concept of freedom can only be achieved if we relax the premise of self-ownership and admit certain natural positive rights.

For Kymlicka, denying the existence of natural positive rights, among which the so-called "minimum existential rights", would be to deny freedom itself, since it considers a certain subject all the freer the more properties it has. Such an argument stems from a basic intuition, according to which in order to be able to move, express ourselves and even survive, it is obvious that we must have access to land, means of communication and food, respectively, and the more of each we have, the more "free" we will be, because the greater our possible alternatives will be.

That is, the more land I have, the farther I can go. The more access to food I have, the longer I can live and therefore enjoy my freedom. In short, the more money I have, the more things I can do.

It is, in this sense, the expression of one of the ways in which the traditional distinction between "positive freedom" and "negative freedom" is manifested in the philosophical debate, given that, even without expressly saying so, when Kymlicka criticizes a supposed lack of concern of libertarianism with the very concept of freedom (which would be contradictory) what he has in mind is, in fact, the distorted concept of positive freedom.

It is true that, although it is not within the scope of this work to examine such concepts in detail, the author himself provides us with very convincing answers to the defenders of positive liberty, notably the egalitarians, exposing the paradoxical nature that the concept affirms. This is because, in short, any positive rights by their very nature require equally positive consideration (duties).

³² For more in-depth and problematized discussions about what Nozick means by the concept of "meaningful life", see Kymlicka and Wolff.

That is, if in order to achieve the ideal of positive freedom it is necessary to attribute to certain subjects positive rights (such as the aforementioned minimum existential rights, for example), then it is necessary that we attribute to other subjects positive duties opposed to such rights (such as, in our example, the duty to provide the existential minimum to them).

Now, Nozick will tell us, to impose a natural duty to do or give something to another, without such duty deriving from consensus, is, by definition, to force someone to do something against his will, and it is no exaggeration to call such duties forced labor or even slavery. It is, in other words, to demand the sacrifice of some on behalf of others.

In view of this, we conclude that, although the argumentative effort made by Kymlicka is remarkable, in the sense that Nozick's libertarianism would not be in any way concerned with individual freedoms, it stems first and foremost from the author's use of a teratological concept of freedom, that is, the concept of "positive freedom".

And even if this were not the case, even if we were to admit that Nozick's theory is not concerned with a broader concept of freedom, but only with "freedom of a certain kind", as said by Bresolin, such a criticism does not refute in any way the argument developed by Nozick, since, as said, the only true verifiable fact of nature is that we are masters of ourselves and, therefore, free to act within our spheres of self-ownership and private property.

Precisely because it is not a consequentialist philosophy, but a deontological one, such criticisms do not even make sense, because at no time does Nozick intend to defend an abstract and ideal concept of freedom. He only starts from a factual premise (self-ownership), irrefutable therefore, and from it extracts norms that correspond to the reality of human nature (theory of rights).

For all these reasons, regardless of how we classify it, whether as a libertarian theory or not, the fact is that Nozick's political philosophy, despite the various attacks and criticisms received, continues to remain largely an extremely solid political philosophy that is difficult to contest without, in one way or another, if it ends up "rejecting the idea of the reality of the uniqueness of each person".³³

ABSTRACT

This study analyzes the quality of accounting and fiscal information of the five most populous municipalities in Rondônia through the Accounting and Fiscal Information Quality Index (ICF), an instrument that evaluates the consistency, timeliness, and compliance of the data submitted to the Brazilian Public Sector Accounting and Fiscal Information System (SICONFI). The research is descriptive, with a quantitative and documentary approach, based on data from the 2023 fiscal year, and considers Porto Velho, Ji-Paraná, Ariquemes, Vilhena, and Cacoal as the units of analysis. The results indicate that Ji-Paraná achieved the best performance, while Vilhena ranked lowest, with the remaining municipalities clustered in an intermediate range of the ranking. The analysis of the four dimensions of the index reveals greater homogeneity in some cases and significant variation in others, pointing to specific weaknesses—particularly in consistency and timeliness—as well as differences in compliance with SICONFI's technical checks.

Keywords: Accounting and Fiscal Information Quality Index (ICF). Public Sector Accounting and Fiscal Information System (SICONFI). Municipalities of Rondônia.

RESUMO

Este estudo analisa a qualidade das informações contábeis e fiscais dos cinco municípios mais populosos de Rondônia à luz do Índice de Qualidade Contábil e Fiscal (ICF), instrumento que avalia a consistência, a tempestividade e a conformidade dos dados enviados ao Sistema de Informações Contábeis e Fiscais do Setor Público Brasileiro (SICONFI). Trata-se de pesquisa descritiva, de abordagem quantitativa e documental, baseada em dados referentes ao exercício de 2023, tendo como unidades de análise Porto

RESUMEN

Este estudio analiza la calidad de la información contable y fiscal de los cinco municipios más poblados de Rondônia a la luz del Índice de Calidad Contable y Fiscal (ICF), instrumento que evalúa la consistencia, la oportunidad y la conformidad de los datos enviados al Sistema Brasileño de Información Contable y Fiscal del Sector Público (SICONFI). Se trata de una investigación descriptiva, con enfoque cuantitativo y documental, basada en datos correspondientes al ejercicio fiscal de 2023, y que considera como unidades de análisis a Porto Velho, Ji-Paraná, Ariquemes, Vilhena y Cacoal. Los resultados indican un mejor desempeño de Ji-Paraná y la peor posición de Vilhena, con los demás municipios concentrados en un rango intermedio del ranking. El análisis de las cuatro dimensiones del índice revela mayor homogeneidad en algunos casos y variaciones relevantes en otros, señalando debilidades puntuales —especialmente en los aspectos de consistencia y oportunidad—, así como diferencias en el cumplimiento de las verificaciones técnicas del SICONFI.

Palabras clave: Índice de Calidad Contable y Fiscal (ICF). Sistema de Información Contable y Fiscal (SICONFI). Municipios de Rondônia.

1 INTRODUCTION

The Brazilian Public Administration has undergone profound transformations, driven by social and economic demands that require greater efficiency, transparency and responsibility in the management of public resources. In this context, the debate on instruments for assessing fiscal and accounting quality becomes central, considering that the quality of accounting and fiscal information has a direct impact on public trust and social control (Silva; Soares; Barbosa Neto, 2025).

In Brazil, the importance of the topic has intensified especially with the establishment of the Siconfi Accounting and Tax Information Quality Ranking, established by STN/MF Ordinance No. 807, of July 25, 2023. This ranking allows for a standardized assessment of federative entities, encouraging consistent practices for collecting, disclosing and correcting accounting and tax data, in addition to reinforcing transparency and accountability mechanisms (National Treasury, 2023; Lima et al., 2024).

The analysis of the fiscal and accounting performance of municipalities becomes even more relevant in the face of the growing complexity of public management in a scenario of budget restrictions and social pressures for quality services. According to IBGE data (2024), about 80% of Brazilian municipalities mostly depend on intergovernmental transfers, which highlights the need for accurate accounting information to ensure financial sustainability and fiscal balance. In this sense, the use of indicators such as the ICF represents an effective alternative to support diagnoses and comparisons between different administrative realities (Lima et al., 2024).

Despite institutional advances, studies indicate that challenges still persist regarding the standardization of accounting information, the timeliness of the data disclosed, and the technical qualification of the professionals responsible for its production (Machado; Pereira, 2021; Silva; Soares; Barbosa Neto, 2025). Such limitations compromise comparability between federative entities and weaken social control mechanisms, especially in municipalities with greater population and economic weight. In this context, it is relevant to investigate how the most populous municipalities in Rondônia have positioned themselves in the ICF Ranking, seeking to identify patterns, weaknesses and good practices.

In view of this, the following research question arises: what is the performance of the five most populous municipalities in Rondônia in the Accounting and Fiscal Quality Index (ICF), considering their socioeconomic and institutional particularities?

This study is justified by its academic, practical and social relevance. From an academic point of view, it contributes to expanding the literature on public accounting and quality of tax information, focusing on a regional context that is still little explored. From a

practical perspective, it offers subsidies to municipal managers and control bodies by highlighting the strengths and weaknesses of fiscal management in the most populous municipalities in the state. Finally, from a social point of view, the work strengthens the instruments of transparency and social control, allowing the population to monitor the use of public resources in a more critical way (Lima et al., 2024; National Treasury, 2023).

Thus, the general objective of this work is to analyze the performance of the five most populous municipalities in Rondônia in the Accounting and Fiscal Quality Index (ICF), using data from the Accounting and Fiscal Information System of the Brazilian Public Sector (Siconfi).

2 THEORETICAL FRAMEWORK

The evaluation of the capacity of federative entities to comply with legal standards and the principles of public transparency has been consolidated as an essential instrument, made possible by measuring the quality of accounting and tax information. According to Slomski (2005), the availability of reliable and timely information strengthens accountability and enables greater social control over public management.

As Lopes and Martins (2005) point out, the quality of accounting information depends on the relevance, reliability, and consistency of the data made available, fundamental characteristics also provided for in the Conceptual Framework of the Brazilian Accounting Standards Applied to the Public Sector (CFC, 2023).

2.1 ACCOUNTING AND TAX QUALITY INDEX (ICF)

Based on Ordinance/MF No. 807, of July 25, 2023, the Ranking of the Quality of Accounting and Tax Information in the Accounting and Tax Information System of the Brazilian Public Sector (Siconfi) (Brazil, 2023) is hereby established. The Ranking aims to: evaluate the quality and consistency of the accounting and tax data sent by the entities of the Federation to Siconfi, and to foster transparency and the improvement of the quality of the information sent by the entities of the Federation to Siconfi (Santos; Coronel, 2024).

The calculation of the Accounting and Tax Quality Index (ICF) is based on the percentage of correct answers in the technical "checks", that is, the higher the percentage of correct answers that the entity obtains, the better its classification in the ranking will be (Brasil, 2025). In this way, the verifications are technical analyses that portray compliance with the legislation, instructions and guides for filling out Siconfi, as well as the rules established in the Manual of Accounting Applied to the Public Sector - MCASP and in the Manual of Fiscal Statements - MDF (Barra De São Francisco, 2023).

In essence, the Ranking seeks to score the information provided by local federated entities based on the accounting concepts provided for in the Brazilian Accounting Standards Applied to the Public Sector (NBC TSP), especially in the Conceptual Framework (NBC TSP EC). This regulation presents the qualitative characteristics of accounting information, highlighting, from the perspective of the Ranking, the timeliness and consistency of the data (Lima et al., 2024).

For the calculation of the Siconfi Ranking, a simplified ranking methodology was chosen, using the percentage of correct answers of the entities in the verifications. Entities that obtained a score higher than 95% in A; score between 85% and 95% in B; score between 75% and 85% in C; score between 65% and 75% in D; and a score of less than 65% in E (Goularte, 2026).

In addition, the STN performs checks grouped into four dimensions: information management, accounting information, tax information, and consistency data between Accounting Information x Tax Information (Brazil, 2025). These dimensions are described in Table 1.

Table 1

Evaluation Dimensions

Dimension	Description:
Dimension I - Information Management	It groups the verifications that evaluate the performance of the federative entity in relation to the submission and maintenance of information in SICONFI. For this dimension, all statements and matrices of accounting balances sent by the entities are analyzed.
Dimension II – Accounting Information	It comprises the checks that evaluate the accounting data received in relation to the adequacy to the rules of the Manual of Accounting Applied to the Public Sector - MCASP, consistency between the statements. The data analyzed are those that were approved through the Annual Accounts Statement (DCA) and sent through the closing MSC.
Dimension III – Tax Information	It groups the checks that involve the analysis of the tax data contained in the statements, such as compliance with the provisions of the Fiscal Statements Manual (MDF), consistency between statements, among others.
Dimension IV – Accounting Information x Tax Information	Accounting Information x Tax Information: Verifies the equality of values between different accounting and tax statements, cross-referencing these data.

Source: Adapted from Brazil (2025).

The Accounting and Tax Quality Index (ICF) seeks to show whether Brazilian states and municipalities have been improving the level of quality of accounting and tax information sent to the National Treasury throughout the editions of the Ranking (Bernardo et al., 2024). This analysis is made possible by the implementation of the Ranking, whose purpose is to evaluate the veracity and consistency of the information sent by the federative entities

through the Accounting and Tax Information System of the Brazilian Public Sector (Siconfi) (Goularte, 2025). Thus, in order to understand more broadly the functioning of the Accounting and Tax Quality Index (ICF), it is necessary to examine Siconfi itself, a platform that concentrates, organizes and makes available this information.

2.2 ACCOUNTING AND TAX INFORMATION SYSTEM OF THE BRAZILIAN PUBLIC SECTOR (SICONFI)

Siconfi is a system developed by the Federal Data Processing Service - Serpro in state-of-the-art Information Technology (IT) to provide the desired automation of the receipt of qualified and reliable information (Brasil, 2025). This system aims to receive, validate, store, and make available accounting and tax information from Brazilian public sector entities (Brígida, 2023).

The consolidation of Siconfi occurred in response to the need to modernize and standardize the flow of accounting and tax information in Brazil. In order to replace the old Accounting Data Collection System (SISTN), which was not able to keep up with the demands related to transparency in the availability of data, in addition to presenting problems related to the validation and processing of information (CNMP, 2015), the system was deactivated in 2015. The National Treasury Secretariat (STN), in partnership with the Federal Data Processing Service (Serpro), created the new system (Brasil, 2025).

Siconfi is composed of two interfaces with different purposes: the public area, with free access, which allows the verification accessible to any interested party of accounting information from the Brazilian public sector, news, videos and calendars (Brigido, 2023); and the restricted area, intended for the submission of information by registered public entities, accessible only to users responsible for sending the information, which encompasses the functionalities related to the management of the submission of information by the federative entity, later made available to the public (CNMP, 2015).

Siconfi began to centralize the collection of this information, with the progressive adoption of the Accounting Balances Matrix (MSC). As of 2017, it began to receive the information in this format, still on an optional basis, and as of 2018, the municipalities of capitals, the states, the Federal District and the Union began to send the MSC on a mandatory basis to Siconfi, while for the other municipalities the submission became mandatory in 2019 (Brasil, 2025). The MSC is a structure that groups a list of accounting accounts and complementary information and is produced from the PCASP, that is, it is integrated into the Table of accounts. Its complementary information corresponds to controls of a budgetary or managerial nature that allow an individualized control associated with the

PCASP accounts (Machado; Theóphilo, 2020).

In 2018, a Technical Cooperation Agreement was signed between the National Treasury Secretariat (STN), the Rui Barbosa Institute (IRB) and the Association of Members of the Audit Courts (ATRICON), with the aim of harmonizing understandings and practices between the STN and the subnational audit courts. The STN points out that Siconfi, when used by Brazilian public managers, will gradually contribute to the modernization of accounting practices underway in Brazil, bringing them closer to those in use in the developed world (Brasil, 2025). In this sense, Slomski (2005) highlights that the consolidation of integrated information systems and the standardization of accounting procedures are fundamental to ensure efficiency, accountability and greater comparability between public entities.

Thus, Siconfi is not limited to gathering accounting and tax information, but provides data that becomes fundamental for the analysis and monitoring of public management, reinforcing its role as a strategic instrument of transparency and accountability.

2.3 GOVERNMENT ACCOUNTING AND DATA AS AN ANALYSIS TOOL IN THE PUBLIC SECTOR

To understand the role of the Accounting and Fiscal Quality Index (ICF) in the evaluation of municipal fiscal management, it is necessary to analyze government accounting from the perspective of the use of data as a strategic tool in the public sector (Nascimento, 2022; Janssen et al., 2017).

The use of data as an instrument to support public management has been consolidated as one of the pillars of evidence-based decision-making. According to Janssen et al. (2017), the ability to collect, process, and interpret relevant information allows the public administration to improve the efficiency of its policies, reduce waste, and raise the quality of services provided to the population. From this perspective, government accounting plays a strategic role by transforming accounting records into structured data, capable of supporting administrative, fiscal, and budgetary decisions, expanding the rationality and transparency of public management (Nascimento, 2022).

In the accounting and fiscal field, the systematic use of data makes it possible to assess the fulfillment of fiscal targets, the sustainability of public finances, and the performance of government management. According to Lemos and Aquino (2020), the integrated analysis of revenues, expenses, and budget results contributes to the identification of deviations, the prediction of fiscal risks, and the correction of routes in budget execution. In addition, Ribeiro et al. (2023) highlight that the analysis of financial statements through

financial and budgetary indicators allows understanding the patrimonial evolution of public entities and evaluating the efficiency and effectiveness of municipal management, reinforcing the active role of government accounting in the decision-making process.

The usefulness of public data for analysis and control purposes is directly associated with the quality of accounting and tax information. Hendriksen and Breda (2019) emphasize that accounting information must present attributes such as relevance, reliability, consistency, and timeliness, in order to reduce informational asymmetry and support effective decisions. These attributes are also emphasized by the Federal Accounting Council (CFC, 2021), when it establishes that relevant information must be able to influence the evaluation of past, present, and future events, while reliability ensures that the data adequately represent the economic and financial reality of the public entity.

Transparency and data governance are central in this context, since public access to information strengthens social control and the accountability of managers. The Federal Court of Accounts (TCU, 2022) highlights that the clear and timely disclosure of accounting and tax information allows society to assess the compliance of public management and fosters trust in institutions. In addition, Freitas and Souza (2019) argue that data governance in the public sector requires well-defined processes of standardization, security, and interoperability between systems, in order to ensure the integrity and reliability of the information used for decision-making purposes.

In Brazil, the Brazilian Public Sector Accounting and Tax Information System (Siconfi) is the main database for monitoring budget execution and compliance with the requirements of the Fiscal Responsibility Law. According to the official definition, Siconfi is the platform for the centralized reception of accounting, budgetary, and tax information from the Union, the States, the Federal District, and the Municipalities (Brasil, 2023). The standardization promoted by the system enables the consolidation of national public accounts and enables comparative analyses between federative entities, expanding the use of accounting data as an instrument for evaluating fiscal management (Lima et al., 2024).

In this context, the Accounting and Tax Quality Index (ICF) emerges as an instrument that operationalizes the evaluation of the quality of the data sent to Siconfi, by measuring aspects such as consistency, regulatory compliance and timeliness of accounting and tax information. Studies show that municipalities with better performance in the ICF have greater financial balance, fiscal responsibility and capacity to comply with their legal obligations, evidencing the direct relationship between the quality of accounting information and the efficiency of public management (Frank; Goularte, 2025; Gomes; Silva, 2022).

2.4 CONTEXT OF THE MOST POPULOUS MUNICIPALITIES IN RONDÔNIA

According to population estimates released by the Brazilian Institute of GeoFigurey and Statistics (IBGE) with a reference date of July 1, 2024, Rondônia had a population of approximately 1,746,227 inhabitants, distributed in 52 municipalities. Among these, Porto Velho, Ji-Paraná, Ariquemes, Vilhena, and Cacoal stand out, which are among the most populous and economically relevant (AROM, 2024; IBGE, 2024).

Porto Velho, the state capital, has an estimated population of 514,873 inhabitants and a territorial area of 34,091.146 km², making it the Brazilian capital with the largest territorial extension (IBGE, 2024a). The city is the main administrative and economic center of the state, housing government agencies, headquarters of strategic companies and relevant logistics infrastructure, such as the Madeira River Organized Port. Its role as a center of commerce, services and electricity, due to the Santo Antônio and Jirau hydroelectric plants, reinforces its centrality in the state economy.

Ji-Paraná, with 139,359 inhabitants, is considered the "heart of Rondônia" due to its central location and importance as a transport and distribution hub. The municipality is a reference in the sectors of commerce, agroindustry and services, with consolidated urban infrastructure and a significant share in the state GDP (AROM, 2024).

Ariquemes, with 108,573 inhabitants, has consolidated itself as an agricultural and commercial center in the northern region of the state. The municipality has a total GDP of R\$ 3.2 billion and GDP per capita of R\$ 28.9 thousand, with emphasis on the sectors of services (46.9%), public administration (28%), industry (14.6%) and agriculture (10.5%) (SEPOG, 2020). Its strategic location on BR-364 facilitates the flow of agricultural production and integration with other economic centers.

Vilhena, with a population of 108,528 inhabitants, is one of the most important economic centers in the Southern Cone of Rondônia. Recognized for its high Municipal Human Development Index (MHDI), the second highest in the state, the municipality has a diversified economy, with a strong presence of mechanized agriculture, commerce and educational services. It is also an important point of connection with the state of Mato Grosso, playing a relevant logistical role (SEPOG, 2020).

Cacoal, with approximately 86,887 inhabitants (IBGE, 2022), stands out as a regional hub for health, education, and industry. Known as the "Coffee Capital" of Rondônia, its economy combines agro-industrial production and specialized services, serving neighboring municipalities and playing a central role in the micro-region (SEPOG, 2020).

2.5 CHALLENGES IN ACCOUNTING AND TAX MANAGEMENT

The fiscal management of Brazilian municipalities faces a series of obstacles arising from both administrative complexity and the structural limitations that mark the public sector. According to Pires and Gomide (2016), institutional design and the state's capacity to implement policies are directly associated with fiscal performance and the effectiveness of local management. In this sense, medium and large municipalities, such as the most populous in Rondônia, have greater complexity in their administrative processes, requiring robust internal controls, adequate monitoring systems, and a qualified technical staff to deal with the growing demand for accounting and tax information.

In addition to the administrative aspects, the literature shows that fiscal challenges are strongly linked to the financing structure of municipalities. According to Rezende (2020), the dependence on intergovernmental transfers, combined with limitations in their own collection and deficiencies in transparency mechanisms, makes local entities more susceptible to financial imbalances and governance vulnerabilities. Thus, the population and economic magnitude of these municipalities imposes relevant challenges to accounting and fiscal management. Among the main ones, the following stand out: Table 2.

Table 2

Main challenges relevant to accounting and tax management

Budget complexity:	A greater number of programs, secretariats and management units, which increases the need for efficient internal controls.
Own storage:	Dependence on revenues from intergovernmental transfers, which can generate fiscal vulnerability in periods of economic downturn.
Data infrastructure:	Need for integrated computerized systems for collecting, processing and disseminating tax information in a timely and transparent manner.
Social control:	Growing demand for active transparency and effectiveness in accountability, especially in municipalities with greater visibility.

Source: Adapted from Pires and Gomide (2016); Rezende (2020).

According to Rezende (2020), fiscal assessment instruments allow us to understand not only the immediate financial situation of public entities, but also their medium and long-term sustainability, contributing to more consistent and transparent decisions.

Considering the expressive demographic and economic dimension of these five municipalities, its detailed analysis offers subsidies to understand how different structural realities impact fiscal management. In this sense, the use of Siconfi data, treated in a standardized way, allows the identification of performance patterns, weaknesses and good practices, strengthening the capacity for diagnosis and the formulation of more effective public policies. This perspective is in line with the notes of Pires and Gomide (2016), for whom

the strengthening of state capacities and governance mechanisms is indispensable to the improvement of local public management.

3 METHODOLOGY

The research was classified as descriptive in nature, as it seeks to establish relationships between variables through standardized techniques of collection and systematic observation. In this sense, it analyzes the performance of the municipalities in relation to the Accounting and Fiscal Quality Index (ICF), offering a description of the situation at the time of the survey (Farias Filho; Arruda Filho, 2021).

As for the methodological approach, the quantitative approach is adopted, as the investigation uses numerical data extracted from the Accounting and Fiscal Quality Index (ICF) Ranking, allowing its measurement and objective interpretation. This approach, according to Proetti (2017), seeks to quantify data and accurately measure phenomena, enabling more consistent and comparative analyses

With regard to the scientific method, it is a documentary research, based on the analysis of official reports of the National Treasury Secretariat (STN), as well as on legislation and technical manuals applicable to public accounting. This type of research consists of the examination of official and institutional documents, allowing the researcher to understand phenomena based on existing records (Silva; Grigolo, 2002).

Data collection in this research was carried out from secondary sources, specifically from official records made available by the Brazilian Public Sector Accounting and Tax Information System (Siconfi), a platform managed by the National Treasury Secretariat (STN). According to Gil (2019), documentary research is based on the use of materials that have not yet received in-depth analytical treatment, allowing the researcher to reinterpret information in the light of a new scientific problem. In this sense, the reports and spreadsheets extracted from Siconfi are institutional documents of a public nature, providing standardized data validated by the central accounting body of the Union.

The collection instrument consisted of a systematic consultation of the Siconfi electronic database, in the module referring to the Accounting and Fiscal Quality Index (ICF). This index is built from specific dimensions: consistency, completeness, compliance, and timeliness, thus representing a consolidated parameter to assess the quality of accounting and tax information sent by federative entities (Brasil, 2023). The time frame delimited for this study corresponds to the 2023 fiscal year, as it reflects the most current fiscal situation of the municipalities analyzed, while the unit of analysis falls on the five most populous municipalities in Rondônia.

The definition of the unit of analysis of this study took into account the five most populous municipalities in the state of Rondônia, namely Porto Velho, Ji-Paraná, Ariquemes, Vilhena and Cacoal. The choice of these municipalities was not based only on the demographic criterion, but also on their economic and administrative relevance in the state context. Because they concentrate a significant portion of the population and have more complex administrative structures, these entities have a greater volume of accounting and tax information forwarded to Siconfi. Thus, this cut allowed a more representative analysis of the quality of the information provided, in addition to ensuring greater coherence with the objectives proposed in this work.

According to Marconi and Lakatos (2017), the use of secondary data requires strict selection criteria, such as the reliability of the source and the timeliness of the information, in order to ensure the scientific validity of the study. In this context, the choice of Siconfi is justified because it is the official basis used by the National Treasury to monitor the budgetary and fiscal execution of all federative entities, having a compulsory nature and national coverage.

After collection, the data were organized in electronic spreadsheets to enable treatment and comparative analysis. According to Prodanov and Freitas (2013), the systematization stage is essential to transform raw information into organized data, enabling the construction of inferences. In this sense, the variables corresponding to the four dimensions of the ICF were tabulated, as well as the scores assigned to each municipality were consolidated.

The analysis adopted was of a descriptive statistical nature, through which trends, averages and variations in performance were observed among the municipalities studied. According to Barbetta (2014), descriptive statistics aims to summarize and present the data in a clear way, allowing the identification of patterns that could not be perceived in direct observation. According to the author, the use of this type of analysis is particularly suitable for comparative studies in applied social sciences, since it makes it possible to highlight the similarities and differences between the units observed.

Technical support for data treatment was provided with the help of electronic spreadsheet tools (Microsoft Excel), which allowed the preparation of tables. This procedure reinforces clarity and objectivity in the presentation of results, in addition to facilitating interpretation through visual resources, as defended by Hair et al. (2009).

The interpretation of the findings was not restricted to the description of the results, but sought to establish relationships with theoretical references on transparency, quality of accounting information and fiscal management. Such an approach is compatible with what

Flick (2009) states, for whom data analysis in social research should articulate empirical results with conceptual foundations, in order to broaden the understanding of the investigated phenomenon. Thus, the indicators extracted from the ICF were not analyzed in isolation, but contextualized in the light of the academic and normative literature that discusses the challenges of accounting and tax management in the Brazilian public sector.

Additionally, the support of the artificial intelligence tool ChatGPT was used in the elaboration of the images generated from the collected data and in the preliminary organization of the biblioFigureic references. All the content produced by the tool was fully reviewed by the researcher, ensuring fidelity to the original information, methodological rigor and compliance with ABNT standards.

4 RESULTS

4.1 MOST POPULOUS MUNICIPALITIES IN RONDÔNIA IN THE ICF RANKING

In the ICF, the Overall Score of each municipality is the result of the sum of performance in the four dimensions evaluated by the index. Each dimension has its own set of indicators, and each indicator assigns points according to the degree of service or quality of the information presented by the municipality. Thus, municipalities with complete, coherent, consistent data delivered on time have higher fiscal and accounting quality. To meet the first objective of this work: to identify the position of the five most populous municipalities in Rondônia in the ICF ranking, the following table presents the general position of these municipalities in the Accounting and Fiscal Quality Index (ICF) for the year 2024, accompanied by the respective scores achieved.

Table 3

Performance of Municipalities in the ICF 2024

Municipality	Position in the Ranking (ICF 2024)	General Note (ICF 2024)
Ji-Paraná	78	168
Cacoal	187	166,217
Porto Velho	229	165,722
Ariquemes	232	165,667
Vilhena	4501	125,846

Source: Adapted from SICONFI (2024).

The results show that Ji-Paraná had the best performance among the municipalities analyzed, occupying the 78th position in the national ranking of the ICF 2024. Next come Cacoal, Porto Velho and Ariquemes, with positions close to each other, ranging between 187th and 232nd place. On the other hand, the municipality of Vilhena had the worst performance of the group, standing in the 4501st position. The direct comparison shows a

significant difference between the best and the worst placed, while the other municipalities have a relatively concentrated performance in an intermediate range of the ranking.

4.2 ICF DIMENSIONS

The second objective of this work is to compare the performance of the five most populous municipalities in Rondônia in the four dimensions evaluated by the Accounting and Fiscal Quality Index (ICF). This stage seeks to highlight how Porto Velho, Ji-Paraná, Ariquemes, Vilhena, and Cacoal positioned themselves, in 2024, in the different criteria that make up the index, allowing us to understand nuances of compliance with accounting, tax, consistency, and timeliness requirements.

To facilitate the interpretation of the results, each dimension is contextualized directly in the introductory paraFigure that precedes the respective Figure, highlighting its main components and what it evaluates within the scope of the information sent to SICONFI. The performances recorded in each dimension are presented below, accompanied by synthetic comments that describe the patterns observed among the municipalities analyzed.

4.2.1 Accounting Dimension

The ICF Accounting Dimension evaluates the quality, compliance and consistency of the information presented by the municipalities in their financial statements, including the structure of the statements, the alignment with the applicable standards, the coherence between records and the completeness of the data sent to the system. In this context, the following Figure presents the scores obtained by the five most populous municipalities in Rondônia in 2024, allowing us to directly visualize how each one positioned itself in the set of criteria of this dimension.

Figure 1

Performance of municipalities in dimension I

Source: Adapted from SICONFI (2020 to 2024).

In 2024, Ji-Paraná recorded the highest score in the accounting dimension, reaching 100%. Next come Ariquemes (98.99%), Cacoal (98.89%) and Porto Velho (94.36%), with a performance close to each other. Vilhena had the lowest score in the group, with 78.32%, configuring the greatest distance in relation to the other municipalities.

4.2.2 Fiscal dimension

The ICF's Fiscal Dimension brings together indicators linked to the preparation and dissemination of the Summary Budget Execution Reports (RREO) and the Fiscal Management Reports (RGF), as well as compliance with legal requirements and the degree of transparency of the fiscal information presented by the municipalities. This dimension reflects the ability to demonstrate, clearly and regularly, the budget and fiscal execution throughout the year. Figure 2 presents the scores obtained by the five most populous municipalities in Rondônia in 2024, allowing us to observe, in a comparative way, the performance of each entity in these criteria.

Figure 2

Performance of municipalities in dimension II

Source: Adapted from SICONFI (2020 to 2024).

In 2024, Ji-Paraná obtained the highest score in the fiscal dimension, reaching 100%. Ariquemes appears next, with 98.61%, followed by Porto Velho, with 98.03%. Cacoal registered 95.25%, maintaining a high performance, while Vilhena had the lowest score in the group, with 81.94%, configuring the greatest distance in relation to the other municipalities.

4.2.3 Dimension Consistency

The ICF Consistency Dimension evaluates the degree of coherence between different sets of accounting and tax information, especially between the Accounting Balance Matrices (MSC), the Financial Statements Applied to the Public Sector (DCASP) and the fiscal reports (RREO and RGF). This dimension verifies that the data converge with each other, without internal contradictions, ensuring that the accounting adequately reflects the budget and financial execution. The Figure presented below shows the scores achieved by the five most populous municipalities in Rondônia in 2024, allowing you to visualize the alignment and stability of the information provided by each of them.

Figure 3*Performance of municipalities in dimension III*

Source: Adapted from SICONFI (2020 to 2024).

In the performance of this dimension, Ji-Paraná led with the maximum score (100%). Then, Porto Velho, Ariquemes and Cacoal showed very close results, all with 97.06%. Vilhena, in turn, obtained the lowest score among the five municipalities, registering 76.47%, which shows the greatest difference observed in the Consistency dimension in relation to the other entities analyzed.

4.2.4 Timeliness dimension

The ICF's Timeliness Dimension evaluates whether municipalities deliver their accounting and tax information within the deadlines established by the National Treasury, in addition to verifying the regularity and timely updating of the data entered in the official systems. This is a dimension directly related to compliance with legal obligations and the ability to keep the flow of information up to date, which impacts both the transparency and reliability of records. The following Figure presents the performance of the five most populous municipalities in Rondônia in 2024, allowing us to observe the degree of punctuality in the delivery of the required information.

Figure 4

Performance of municipalities in dimension IV

Source: Adapted from SICONFI (2020 to 2024).

Compared to 2024, Cacoal had the best performance, reaching 100% in the Timeliness dimension. Porto Velho appears next, with 96.88%, demonstrating regularity in deliveries. Ariquemes and Ji-Paraná maintained equal scores (90.63%), appearing at an intermediate level, while Vilhena recorded the lowest result among the municipalities analyzed, with 46.88%, evidencing the biggest difference observed in this dimension.

4.3 PERFORMANCE DIFFERENCES AND STANDARDS: FACTORS THAT IMPACT QUALITY

4.3.1 Synthesis of Observed Patterns Between Dimensions

The comparison of the four dimensions of the ICF allows us to identify relevant patterns among the municipalities analyzed, evidencing both consistencies and oscillations in performance. It is observed that some municipalities present more homogeneous performances between the dimensions, indicating greater regularity in the conformity of information, an aspect aligned with the criteria of quality and reliability highlighted by the NBC TSP and the Conceptual Framework of Public Accounting.

On the other hand, there are cases in which the scores vary significantly between dimensions, revealing specific weaknesses in attributes such as consistency or timeliness, characteristics pointed out by Hendriksen and Breda (2019) and by the CFC (2021) as fundamental for useful and transparent information. In addition, there is a greater concentration of scores in certain dimensions, suggesting that some technical requirements are more widely met by the entities, while specific dimensions present greater dispersion,

reflecting different challenges in meeting the Siconfi verifications.

4.3.2 Identifying Trends and Performance Differences

The results point to trends that are directly related to the structural and operational characteristics of the municipalities. In some cases, larger municipalities demonstrate relatively superior performance, which may be associated with more developed institutional capacities, as highlighted by Pires and Gomide (2016) when discussing the relationship between institutional design and administrative performance.

It is also observed that certain dimensions present more accentuated disparities, especially those related to consistency and cross-referencing between accounting and tax statements, which reinforces the relevance of integration between systems and procedures, as highlighted by Slomski (2005) and by the logic of SBC itself described in the framework.

A recurring pattern is also identified in which timeliness tends to be more uniform, indicating that municipalities, even with different sizes and capacities, have sought to meet the established deadlines, an aspect consistent with Siconfi's function of standardizing and automating the flow of information.

4.3.3 Possible Explanatory Factors

The patterns identified allow us to relate some factors that, based on the components of the ICF themselves, help to understand the results obtained. The greater breadth of differences in the consistency dimension, for example, suggests that its indicators are more sensitive to accounting and tax integration practices, which is related to the standardization and interoperability challenges highlighted by Machado and Theóphilo (2020) and Freitas and Souza (2019).

Likewise, higher scores in timeliness indicate greater regularity in the submission of returns, in line with Siconfi's role as a structured platform for receiving and continuously validating data (Brígida, 2023). On the other hand, uneven performance in accounting or tax information reveals possible technical and operational limitations, an aspect discussed by Rezende (2020), for whom the qualification of managers, the technological infrastructure, and the dependence on transfers directly influence the quality of fiscal management.

It should also be noted that failure to comply with certain Siconfi checks, whether accounting, tax or consistency, directly impacts the final grade, reinforcing the importance of full adherence to official manuals, such as MCASP and MDF.

In general, the results allow the identification of consistent patterns among the municipalities, revealing both strengths and weaknesses in the compliance of the information

sent to Siconfi. The differences observed reflect not only the variation in technical performance between the dimensions, but also structural and operational characteristics that influence local fiscal management.

During the analysis process, a relevant limitation was also found: the absence of justifications for the non-compliance with certain sub-dimensions, which made it difficult to understand more precisely the causes of some inferior performances. This lack of clarification on the part of municipal administrations restricts the ability to deepen the interpretation of data and highlights the need for greater transparency in the communication of the responsible bodies.

Thus, objective (c) demonstrates that the quality of accounting and tax information is directly related to the administrative capacity of the municipalities, reinforcing the importance of governance, standardization and systemic integration practices, as discussed in the theoretical framework.

5 CONCLUSION

The present study aimed to analyze the performance of the five most populous municipalities in Rondônia, namely Porto Velho, Ji-Paraná, Ariquemes, Vilhena and Cacoal in the Accounting and Fiscal Quality Index (ICF), considering their general results, the differences observed between the four dimensions evaluated by the index and the possible factors that influence the quality of the information sent to Siconfi. The research made it possible to understand, in a systematized way, how these municipalities have positioned themselves in the national scenario in terms of compliance, consistency, timeliness and fiscal quality.

Regarding the first objective, which consisted of identifying the position of the municipalities in the ICF ranking, there was a heterogeneous performance among the entities analyzed. Ji-Paraná was the best placed, placing itself in a prominent position in the national ranking, while Vilhena presented the lowest performance, appearing in a significantly lower position than the others. This wide variation shows that, even among municipalities with larger populations in the state, structural and operational differences persist that directly affect the quality of accounting and tax information.

When meeting the second objective, referring to the comparison of performance in the four dimensions of the ICF, it was observed that each municipality presented different scoring patterns. In general, the Accounting, Fiscal and Consistency dimensions revealed greater approximation between four of the municipalities, while Vilhena showed a more accentuated distance in all of them. On the other hand, the Timeliness dimension proved to be the most

variable, presenting both fully satisfactory performances and results significantly below expectations, especially in the case of Vilhena, which obtained the lowest score in the entire set of analyses.

The third objective, aimed at identifying patterns, differences and possible explanatory factors of performance, allowed us to verify that institutional characteristics, technical capacities and operational conditions directly influence the quality of the information sent by the municipalities. Among the factors with the greatest explanatory potential are: the technical capacity of the accounting and finance teams; the level of integration between accounting and tax systems; adherence to official standards, manuals and procedures; and the degree of modernization of internal processes. In addition, an important limitation was verified: the absence of justifications for non-compliance with certain verifications and sub-dimensions, which restricted a deeper understanding of the causes of inferior performance in some municipalities.

In general, the results obtained reinforce that the quality of accounting and tax information is directly associated with the administrative capacity of municipal entities, including elements such as governance, process management, institutional structure and regulatory compliance. The findings show that, although some municipalities present satisfactory and relatively uniform performance between the dimensions, others show relevant weaknesses that deserve attention from local public management.

Finally, this research contributes to the field of public administration by offering a comparative analysis based on official and recent data, allowing us to understand how municipalities with greater population relevance in Rondônia position themselves in relation to the criteria of fiscal quality established nationally. It is hoped that the results presented here can support public managers, researchers and control bodies in the reflection and continuous improvement of the processes related to the production and disclosure of accounting and tax information, strengthening transparency, responsibility in management and society's confidence in public governance mechanisms.

ABSTRACT

This article presents the results of a study investigating how technical-administrative staff in education at a public university perceive and prepare for retirement, as well as how the institution contributes to this process. The theoretical framework is based on the Transtheoretical Model of Behavior Change, by Prochaska and DiClemente (1983), used as an analytical lens to understand the different positions of employees regarding the decision to retire. A qualitative approach was adopted, involving 76 semi-structured interviews and two focus groups, with eight participants each, whose data were analyzed using the content analysis technique (Bardin, 2011). The results indicate that continued employment is sustained by fear of idleness and loss of an active routine, concern about the disruption of social ties, and threats to professional identity, positioning work as the central axis of daily life and institutional belonging. Low preparation for retirement and the absence of structured institutional policies are also evidenced, factors that contribute to insecurity and the postponement of the decision to leave work. It is concluded that retirement is experienced in an ambivalent manner, marked by insecurity, low readiness, and postponement of the decision, aggravated by the absence of structured institutional support. The study contributes

RESUMO

Este artigo apresenta o resultado de um estudo que investiga como servidores técnico-administrativos em educação de uma universidade pública percebem e se preparam para a aposentadoria, bem como de que forma a instituição contribui para esse processo. O referencial teórico fundamenta-se no Modelo Transteórico de Mudança de Comportamento, de Prochaska e DiClemente (1983), utilizado como lente analítica para compreender os diferentes posicionamentos dos servidores diante da decisão de se aposentar. Adotou-se uma abordagem qualitativa, com a realização de 76 entrevistas semiestruturadas e dois grupos focais, com oito participantes cada, cujos dados foram analisados por meio da técnica de análise de conteúdo (Bardin, 2011). Os resultados indicam que a permanência no trabalho é sustentada pelo medo da ociosidade e da perda da rotina ativa, pelo receio com o rompimento dos vínculos sociais e pela ameaça à identidade profissional, posicionando o trabalho como eixo central da vida cotidiana e do pertencimento institucional. Evidencia-se, ainda, a baixa preparação para a aposentadoria e a ausência de políticas institucionais estruturadas, fatores que contribuem para a insegurança e o adiamento da decisão de desligamento. Conclui-se que a aposentadoria é vivenciada de forma ambígua, marcada por insegurança, baixa prontidão e adiamento da decisão, agravados pela ausência de suporte institucional estruturado. O estudo contribui para o debate acadêmico sobre envelhecimento, trabalho e gestão de pessoas no setor público, além de oferecer subsídios para a reflexão sobre políticas institucionais de apoio à transição trabalho–aposentadoria no contexto das universidades públicas.

RESUMEN

Este artículo presenta los resultados de un estudio que investiga cómo los servidores técnico-administrativos en educación de una universidad pública perciben y se preparan para la jubilación, así como de qué manera la institución contribuye a este proceso. El marco teórico se fundamenta en el Modelo Transteórico de Cambio de Comportamiento, de Prochaska y DiClemente (1983), utilizado como lente analítica para comprender las diferentes posiciones de los servidores frente a la decisión de jubilarse. Se adoptó un enfoque cualitativo, con la realización de 76 entrevistas semiestruturadas y dos grupos focales, con ocho participantes cada uno, cuyos datos fueron analizados mediante la técnica de análisis de contenido (Bardin, 2011). Los resultados indican que la permanencia en el trabajo se sustenta en el miedo a la inactividad y a la pérdida de una rutina activa, en la preocupación por la ruptura de los vínculos sociales y en la amenaza a la identidad profesional, posicionando el trabajo como eje central de la vida cotidiana y del sentido de pertenencia institucional. Asimismo, se evidencia la baja preparación para la jubilación y la ausencia de políticas institucionales estructuradas, factores que contribuyen a la inseguridad y al aplazamiento de la decisión de desvinculación laboral. Se concluye que la jubilación se vive de forma ambigua, marcada por inseguridad, baja preparación y postergación de la decisión, agravadas por la ausencia de apoyo institucional estructurado. El estudio contribuye al debate académico sobre envejecimiento, trabajo y gestión de personas en el sector público, además de ofrecer insumos para la reflexión sobre políticas institucionales

de apoyo a la transición entre trabajo y jubilación en el contexto de las universidades públicas.

Palabras clave: Gestión de Personas. Jubilación. Preparación para la Jubilación. Servicio Público.

1 INTRODUCTION

Population aging and the growth of the elderly population have promoted significant transformations in the social, economic, and political spheres in several countries, including Brazil. This process results from the increase in longevity, the reduction in birth rates and advances in living conditions and medicine, producing an accelerated change in the age composition of the population, with proportionally greater growth in the older age groups (Nascimento; Rabelo, 2008). Such a scenario imposes pressures on the social security and social protection systems, requiring revisions in public policies related to social security, health, and work, as well as the incorporation of strategies aimed at promoting healthy aging and the productive inclusion of older people (Pazos, 2020). In the context of public organizations, this context is expressed in the need to manage the aging of the workforce and to qualify the work-retirement transition processes, given its impact on well-being, continuity of services, and retention/transfer of institutional knowledge.

In this context, healthy aging, as defined by the World Health Organization (2005), refers to the process of developing and maintaining the functional capacities that enable well-being in old age. This perspective shifts the focus from chronological age to the social, institutional, and organizational conditions that favor autonomy, social participation, and the continuity of meaningful roles throughout the life course, including work. In the case of economically active elderly people, the maintenance of functional capacity is also influenced by working conditions, work organization and the way the transition to retirement is conducted, which reinforces the centrality of institutional management in this process.

In the workplace, these transformations contribute to resignifying retirement, which is no longer understood only as a functional disconnection and starts to configure a complex transition process, crossed by personal, social, economic and identity dimensions. Retirement can be experienced in an ambivalent way: at the same time that it represents the possibility of greater autonomy, realization of personal projects and reorganization of life outside work, it can also be perceived as rupture, loss of bonds, unproductivity and intensification of the feeling of aging, especially when work occupies a central role in the construction of identity (Zanelli; Silva; Soares, 2010; Myrtle; Leandro-França; Seidl, 2014; Silva; Helal, 2018).

In the context of public universities, this ambivalence manifests itself in a significant way. Studies indicate that, even after acquiring the right to retirement, many civil servants choose to remain in activity, evidencing positive and/or negative attitudes towards dismissal from work (Bressan *et al.*, 2013; Nascimento; Polia, 2019). Such permanence reveals that the decision to retire involves factors that go beyond legal or financial aspects, being related

to institutional ties, meanings attributed to work and organizational conditions (Silva; Sousa, 2023). In this scenario, retirement is not only presented as an administrative event, but as a situated decision, influenced by expectations of continuity, working conditions and concrete opportunities to reorganize post-career life.

The absence of individual planning or structured institutional policies to prepare for retirement can make it difficult for civil servants to adapt to this new stage of life. In this sense, public universities, in the exercise of their social responsibility, can play an important role in supporting more planned and healthy transitions, through retirement preparation programs. This need becomes even more evident in the public service, where stability and certain incentives contribute to the postponement of this decision (Fonseca, 2019). Despite the progress of studies on retirement, there are still fewer frequent investigations that examine, in the context of public universities, how civil servants at an advanced age are in the process of preparing for retirement and how they perceive the institutional support offered, especially among technical-administrative staff in education.

According to Macêdo, Bendassolli and Torres (2019), prolonged stay at work may be associated with the emotional costs involved in dismissal and insecurity regarding the construction of new post-career life alternatives. Added to this is the lack of information and institutional support that helps civil servants in the decision-making process, which can generate a feeling of frustration and devaluation (Carvalho; Costa; Pimenta, 2013; Bressan *et al.*, 2013). This picture reinforces the importance of understanding not only "if" the civil servant intends to retire, but "how" he prepares for this transition and what institutional conditions facilitate or hinder this path.

In this context, the study seeks to answer the following research question: to what extent are technical-administrative employees in education aged 60 years or older, already eligible for voluntary retirement, prepared for the work-retirement transition and how do they evaluate the institutional support offered? Thus, the objective of the article is to present the results of the investigation on the modes of preparation for retirement and the perceptions about institutional support among technical-administrative employees 60+, recognizing the heterogeneity of trajectories, conditions and expectations. The choice of technical-administrative staff is justified because it covers different occupational profiles, with different experiences of aging at work, which can produce equally varied needs and preparation strategies.

To this end, the Transtheoretical Model of Behavior Change was adopted as an analytical framework, as it allows the identification of stages of readiness and understanding the process of decision and preparation for retirement (for example, from pre-contemplation

to concrete planning actions), contributing to interpret the postponement of dismissal and guiding institutional strategies that are more adherent to different profiles of civil servants.

The research was developed through semi-structured interviews and focus groups with technical-administrative employees of the Federal University of Viçosa (UFV), aged 60 years or older, who already meet the requirements for voluntary retirement. By analyzing their perceptions, concerns, and practices related to retirement, the article contributes to the academic debate on aging, work, and people management in the public sector, in addition to offering subsidies for reflection on institutional policies to support the work-retirement transition in the context of public universities. In addition, by explaining the needs and barriers perceived by the civil servants themselves, the research offers elements applicable to the formulation and improvement of retirement preparation programs, strengthening the professionalizing dimension of the study. In addition to this introduction, the article presents the theoretical framework, the methodological procedures, results and analyses and, finally, the conclusions.

2 THEORETICAL FRAMEWORK

The theoretical framework of this study is organized into two central analytical axes. The first addresses the preparation for retirement in the context of the public service, with emphasis on policies, institutional practices and the challenges faced by workers in the transition between working life and retirement. The second axis discusses the decision-making process of retiring, interpreted in the light of the Transtheoretical Model of Behavior Change, proposed by Prochaska and DiClemente (1983), which offers subsidies to understand retirement as a gradual process, marked by different stages of reflection, preparation and action. In articulation with the objectives of the article, these axes support the analysis of two empirical dimensions: (a) the practices of preparation for retirement (e.g., financial planning, health, life projects, and reorganization of roles) and (b) the perception of institutional support (policies, communication, people management actions, and preparation programs), allowing the interpretation of the work-retirement transition as a multidimensional and socially situated phenomenon.

For analytical purposes, the distinction is made between: decision to retire (intention, readiness and motivational positioning), preparation for retirement (actions and practices carried out before dismissal) and post-retirement adaptation (experiences and well-being after leaving work). Thus, the focus of this study falls on decision and preparation, as well as on the institutional role perceived in the pre-retirement phase.

2.1 PREPARATION FOR RETIREMENT IN THE PUBLIC SERVICE

Recent international studies have deepened the understanding of the relationship between retirement and well-being, highlighting the ambiguous and non-linear nature of this transition. A systematic review with meta-analysis carried out in European countries shows that the effects of retirement vary according to the institutional context, the level of prior planning and the possibility of maintaining social roles after leaving work. The results indicate that retirement can generate both subjective gains and losses, reinforcing that post-career well-being depends less on the leave itself and more on the social, organizational and individual conditions that sustain this process (Teques *et al.*, 2025). Although produced in European contexts, these findings reinforce a relevant conclusion for the Brazilian public service: the work-retirement transition tends to be more adaptive when there is prior planning and organizational support, which makes the institutional dimension especially decisive in organizations with long careers and a strong symbolic link with work.

This perspective converges with approaches that conceive retirement as a gradual process of behavioral and identity change, in which prior preparation and institutional support play a central role. In this sense, the literature suggests that pre-retirement preparation should be understood as a set of practices and resources that precede the dismissal and that influence the transition, including financial and social security planning, health care and self-care, reconstruction of sociability networks, and development of post-career projects. In the Brazilian context, the postponement of retirement is recurrent in the public service, influenced by stability, social security rules and the symbolic bonds built throughout the professional career. Evidence indicates that this decision goes beyond economic factors, involving emotional costs associated with the rupture of institutional bonds, the loss of professional identity, and insecurity regarding the construction of new life projects (Macêdo; Bendassolli; Torres, 2019), often aggravated by the lack of information and organizational support (Carvalho; Costa; Pimenta, 2013). These characteristics of the public service, such as stability, long-term careers, institutionalization of roles and lower turnover, tend to intensify the identity weight of work and make retirement a socially negotiated decision, and not just an administrative event.

In this scenario, the Retirement Preparation Programs (PPAs) are an important institutional strategy to support the work-retirement transition. Although initially restricted to financial aspects, these programs began to incorporate, from the 1980s and 1990s, a broader approach, recognizing retirement as a multidimensional process, involving psychological, social, family, and health dimensions (França; Soares, 2009; Zanelli; Silva; Soares, 2010). From the point of view of the design of interventions, the literature indicates that more

comprehensive PPAs tend to combine: social security/financial guidance; health promotion and self-care; development of life projects and reorganization of roles; psychosocial support and identity discussion; and information on alternatives for social participation and work (when desired). In Brazil, PPAs have gained visibility, especially in the context of public organizations, aligning with people management policies and the promotion of active aging. Studies indicate that participation in preparatory actions contributes to a more positive experience of retirement and influences the way this transition is perceived and planned (Bressan *et al.*, 2013; Silva; Helal, 2018). In addition to the individual benefit, such programs can favor organizational dimensions, such as succession planning, knowledge management, and reduction of institutional uncertainties associated with the departure of experienced civil servants, reinforcing their relevance in public universities.

From a normative point of view, preparation for retirement is provided for in the Statute of the Elderly Person – Law No. 10,741 (Brasil, 2003). Despite this legal support, the literature points out that the initiatives effectively implemented in public organizations are still limited (France; Soares, 2009). Empirical research reveals that many civil servants do not systematically prepare for retirement and tend to postpone this decision because they perceive themselves to be still productive, evidencing the fragility of the institutional support available (Gvozdz; Sakai; Haddad, 2015; Amorim *et al.*, 2018). This gap between normative foresight and practical implementation suggests that retirement preparedness remains, in many contexts, individual-centered, even when there is evidence that organizational support functions as a relevant facilitator of transition.

Studies in the context of federal universities corroborate this diagnosis, by highlighting the need for institutional policies aimed at active aging and prior retirement planning (Nascimento; Polia, 2019; Oliveira; Almeida, 2021). Despite this, ambiguity persists regarding organizational responsibility in this process, since part of the civil servants understands preparation as an individual attribution, in contrast to approaches that defend institutional engagement in the management of aging at work (Bressan *et al.*, 2013; France; Soares, 2009). In general, the literature suggests that the absence of consistent institutional policies contributes to the postponement of retirement and to the feeling of insecurity in the post-career transition. At the same time, the prolonged stay of experienced civil servants can represent a relevant strategy for public organizations, as long as it is accompanied by policies that adequately support the transition process to retirement (Pereira, 2017).

Thus, preparation for retirement is configured as a field of tensions between individual choices, institutional conditions and the meanings attributed to aging and work. For this study, this field of tensions is operationalized in the analysis of the perceived institutional support

(existence/absence of PPAs, communication and orientation), the planning practices mobilized by the civil servants and the meanings attributed to the permanence at work in the face of the possibility of dismissal.

2.2 THE DECISION TO RETIRE AND THE TRANSTHEORETICAL MODEL OF BEHAVIOR CHANGE

The decision to retire is crossed by personal, institutional and psychological factors. For some civil servants, continuity in work is associated with the maintenance of professional identity, financial stability and social ties; For others, the proximity of retirement is experienced in a negative way, marked by doubts and insecurities. It is, therefore, a process permeated by contradictory perceptions, which can be interpreted as both opportunity and loss (Murta; Leandro-França; Seidl, 2014). This decision, however, should not be reduced to a specific moment, as it involves the gradual construction of readiness, the negotiation of perceived gains and losses, and the evaluation of concrete conditions to reorganize post-career life.

The transition from working life to retirement involves significant behavioral and symbolic changes, configuring itself as a dynamic process, marked by resistance, advances and adaptations. To understand this complexity, this study adopts the Transtheoretical Model of Behavior Change as an analytical lens, due to its ability to interpret the different positions of civil servants in the face of the decision to retire. In particular, the model is used to understand the postponement of retirement as permanence in early stages (pre-contemplation and contemplation) or as difficulty in advancing to stages of preparation and action, a scenario that can be aggravated by the absence of information and structured institutional support.

Developed by Prochaska and DiClemente (1983), the model conceives behavioral change as a gradual process, composed of different motivational stages. Although it originated in the field of psychology, the model has come to be widely used in organizational studies and in the Social Sciences, especially in the analysis of decision-making processes and behavioral changes in institutional contexts (Matta, 2012). In addition to the stages, the model incorporates constructs that help explain complex transitions, such as decisional balance (evaluation of pros and cons), self-efficacy (perception of the ability to change), and change processes (cognitive and behavioral strategies mobilized along the way). Although this study focuses mainly on identifying the stages of readiness, such constructs guide the interpretation of the narratives, especially when the servers describe ambivalence, insecurities and barriers to planning.

According to the model, change occurs over six stages: pre-contemplation, contemplation, preparation, action, maintenance, and completion or termination (Myrtle; Leandro-França; Seidl, 2014). To avoid simplifying readings, it should be noted that not all applications use the finishing stage, and the paths may involve regressions and advances, especially in changes associated with identity and life cycle, such as retirement. These stages make it possible to understand the extent to which individuals recognize the need for change, reflect on its implications, and engage in concrete actions. In the context of retirement, the model allows interpreting everything from the denial or resistance to the idea of retiring to the consolidation of the decision and the adaptation to the new condition. In the pre-retirement context, which is the focus of this article, the emphasis is especially on the passage from contemplation to preparation and action, that is, on the transformation of intention into planning and concrete practices.

Applied to the context of public service, the Transtheoretical Model of Behavior Change makes it possible to analyze the postponement of retirement not as an exclusive result of individual choices, but as a situated process, influenced by organizational characteristics, the stability of the bond and the meanings attributed to work and aging. This allows us to understand that the readiness to retire can be facilitated or inhibited by institutional factors (existence of PPAs, quality of internal communication, support from the people management sector, opportunities for gradual transition and recognition of the trajectory), acting as conditions that favor or hinder progression between stages.

In this way, the model contributes to understanding how civil servants construct, negotiate and resignify their decision to remain or leave the public service, offering analytical subsidies to interpret retirement as a gradual and socially mediated transition, and not as a one-off event.

In summary, by articulating the axis of preparation (practices and institutional support) with the axis of decision (stages and constructs of the model), this framework guides the qualitative analysis of the narratives of technical-administrative employees 60+, allowing us to identify: (i) in which stage of readiness they are; (ii) which pros and cons are mobilized in the decisional balance; (iii) what preparatory actions have already been initiated; and (iv) how they evaluate the role of the university in offering information, support and conditions for a more planned work-retirement transition.

3 METHODOLOGICAL PROCEDURES

The research was carried out at the Federal University of Viçosa (UFV), a federal institution of higher education located in the municipality of Viçosa, Minas Gerais. The unit of

analysis corresponded to the university's main campus, having as subjects the technical-administrative employees in education aged 60 years or older (TAEs 60+) who, although they already met the legal requirements for voluntary retirement, chose to remain in professional activity.

A qualitative approach was adopted, appropriate to the understanding of the experiences, perceptions and meanings attributed by the participants to retirement and preparation for this stage of life, dimensions of a subjective nature that are not accessible by quantitative methods. As for the objectives, the study is characterized as descriptive and exploratory, as it seeks to understand and analyze a phenomenon that is still little investigated in the context of public universities, from the perspective of the social actors involved. It is, additionally, a qualitative study of institutional focus, in which the UFV is taken as an empirical case to examine, in depth, the process of preparation for retirement and the perception of institutional support among eligible TAEs 60+.

For the purposes of analytical delimitation, this study differentiates: (a) decision to retire (intention and readiness) and (b) preparation for retirement (practices and actions carried out in the pre-retirement period). Thus, the focus is on decision and preparation in the pre-retirement period, as well as on perceived institutional support.

3.1 PARTICIPANT

The study had the participation of 76 technical-administrative employees of UFV, all with an acquired right to voluntary retirement. The inclusion of these participants allowed different functional categories of the TAEs' careers to be contemplated, ensuring diversity of professional trajectories and perceptions related to the object investigated. A total of 76 individual interviews were conducted (n=76), and the focus groups were conducted with the same people interviewed, characterizing an intentional overlap between the stages of collection for deepening and interpretative validation of the emerging themes. The selection of participants followed the snowball sampling strategy, associated with the criterion of theoretical saturation. It was considered that saturation was reached when the reports began to present recurrence of information, without the incorporation of new elements for the analysis (Vinuto, 2014). Saturation was monitored by successive blocks of interviews, through the verification of stabilization of codes and themes (thematic recurrence), recording the absence of new relevant codes in the final stages of data collection.

Five initial "seeds" (n=5) were used, defined in order to contemplate different levels of the technical-administrative career, seeking to reduce the homophily bias characteristic of the snowball. Diversity was pursued especially by career level/category and by positions.

Regarding the characterization of the group, there was a predominance of males, with an average of 40 years of service, an average of approximately 10 years of permanence in activity after the acquisition of the right to retirement, participation of civil servants belonging to all functional categories (A-E) and variation in schooling from elementary school to higher education. The characterization also considered the positions held, as the selection was not organized by sectors, but by positions identified as relevant to contemplate occupational diversity within the technical-administrative career.

Inclusion criteria: TAEs employees aged 60 or over, eligible for voluntary retirement, working at the UFV headquarters campus, who accepted to participate and signed the ICF. Exclusion criteria: civil servants on extended leave, on assignment, on sick leave, or who did not wish to participate in the research.

3.2 DATA COLLECTION INSTRUMENTS AND PROCEDURES

Primary data collection took place between July and September 2025 and was carried out in two complementary stages: semi-structured interviews and focus groups. The adoption of combined instruments sought to strengthen the methodological triangulation, by articulating the depth of the individual interviews with the interactional dynamics of the focus groups, allowing the examination of convergences, divergences and shared meanings about retirement and preparation.

3.2.1 Semi-structured interviews

In the first stage, 76 semi-structured face-to-face interviews were conducted, carried out in the participants' workplaces, in reserved environments, in order to ensure privacy and comfort. The interviews lasted an average of approximately 1 hour, were fully transcribed, and the transcriptions were checked by the authors, as a measure of quality control of the corpus.

The interview script was structured based on the Transtheoretical Model of Behavior Change, seeking to capture elements associated with retirement readiness and preparation practices (e.g., reflection and intention, ambivalences and balance between pros and cons, planning actions, resources and perceived barriers, in addition to the perception of institutional support).

Before the beginning of the interviews, all participants signed the ICF, guaranteeing anonymity, use of the data exclusively for scientific purposes and commitment to confidentiality. To mitigate risks of inhibition associated with the work environment, additional care was adopted: the place and times were adjusted as indicated by the participants,

favoring moments and conditions perceived as more appropriate to ensure comfort and freedom of expression.

3.2.2 Focus groups

The second stage consisted of two focus groups, each composed of eight participants, totaling 16 participants. The realization of two groups resulted from the indication of interest and availability of the interviewees to participate in this stage, and the composition was defined in order to enable in-depth and comparable discussions between groups.

The meetings took place in September 2025, in the meeting room of the Department of Administration and Accounting at UFV, and the discussions were recorded with the express authorization of the participants, as provided for in the ICF. Each focus group lasted approximately two hours.

The composition of the groups sought to ensure diversity in terms of gender and occupational profiles, combined with the care of forming groups with relatively similar profiles, favoring the fluidity of the discussions and the safety of the participants. To reduce hierarchical asymmetries, the heads were grouped into the same group.

For each focus group, a follow-up team was formed by a moderator and two observers, strengthening the systematic recording of the process and the quality of the material.

3.2.3 Ethical procedures

As this is a research involving human beings, the study was submitted to the Human Research Ethics Committee of the Federal University of Viçosa (CEP/UFV), and was approved under opinion No. 7.664.570 and CAAE 87902325.2.0000.5153, issued on June 25, 2025.

In order to preserve the identity of the participants, a coding system was adopted in the citations, identified by the structure [Professional Category – Number], in which the letters A, B, C, D or E correspond to the functional categories of the career of TAEs, followed by sequential numbering. Categories A-E correspond to the career classes provided for in the Career Plan for Technical-Administrative Positions in Education (PCCTAE), presenting different levels of complexity/qualification.

3.2.4 Secondary data (desk research)

In a complementary character, it carried out the collection of secondary data, through documentary research in institutional records, legislation, scientific articles and administrative documents made available by the Dean of Personnel Management at UFV. The documents

were used, especially, to identify potential research subjects (eligible employees) and to map the positions to be contemplated to ensure occupational diversity in the study.

3.3 DATA ANALYSIS PROCEDURES

The textual and verbal data were submitted to content analysis, according to the proposal of Bardin (2011). This technique involves a systematic and objective set of procedures aimed at identifying, coding, categorizing and interpreting units of meaning, making it possible to make inferences about the meanings and contexts of speech production.

The analytical process was developed in successive stages, including floating reading of the corpus, codification and construction of thematic categories. The unit of registration adopted was thematic (discursive excerpts with unity of meaning), and the coding was conducted in an inductive way, guided by the Transtheoretical Model of Behavior Change, in order to organize and interpret narratives related to retirement readiness, preparation practices and perceived institutional support

The resulting categories were interpreted in the light of the Transtheoretical Model of Change, adopted as an analytical framework to understand the different positions of civil servants in relation to the decision to retire.

To strengthen the credibility of the findings, triangulation between interviews and focus groups and peer review of the categorical scheme and interpretations (e.g., discussion between authors/orientation) were adopted, seeking to reduce individual biases and increase analytical consistency.

4 RESULTS AND ANALYSIS

This section presents the analyses and results obtained from the 76 individual semi-structured interviews and the two focus groups carried out with technical-administrative employees in education at UFV, all aged 60 years or older, eligible for voluntary retirement and in activity. The focus groups were conducted with participants who had already been interviewed, with the aim of deepening interpretations, exploring convergences and divergences, and strengthening the triangulation of evidence.

The data show the heterogeneity of the group in terms of age, length of service and functions performed, with participants distributed among different levels of the technical-administrative career. There is a predominance of civil servants classified in Level C, which concentrates 35 participants (46% of the total), most of them linked to technical and operational support activities.

The age range of the participants varies between 60 and 74 years old, with the highest concentration between 62 and 69 years old. There was a significant predominance of males (89.5%). With regard to racial self-declaration, there was a predominance of civil servants who identified themselves as white (48.7%), followed by those who declared themselves brown (36.8%), indicating low racial diversity in the group analyzed.

Regarding education, the high percentage of civil servants with a *lato sensu* postgraduate degree (47.4%) stands out, followed by those with complete high school (21%) and undergraduate (14.5%). Most participants have an institutional link with UFV for more than 30 years, evidencing long and consolidated professional trajectories. Regarding remuneration, 53.9% are in the range of three to four minimum wages, among TAEs 60+. Regarding marital status, 75% declared themselves married or in a stable union, indicating the presence of stable marital ties.

In general, this set of characteristics delineates a group marked by extensive professional experience, strong institutional ties and relevant qualifications. This profile is consistent with the literature that points out, in the public service, the presence of intense symbolic and identity links with work, which can sustain permanence in office even in the face of legal eligibility for retirement (Silva; Sousa, 2023).

Although the study has a qualitative approach, the interview script included some structured questions (for example, "did you reflect on retiring?", "did you consider retiring and gave up?", "did you perform any preparatory action?"), allowing frequencies and percentages to be presented as descriptive support. When it comes to topics such as "concerns" and "motivations", the answers can be multiple and overlapping, and the percentages should be interpreted as presence/mention of the theme and not as exclusive categories, unless otherwise indicated.

4.1 RETIREMENT AS AN AMBIVALENT DECISION: PRESENT REFLECTION, LIMITED ACTION

The results indicate that 72.4% of TAEs 60+ stated that they had already reflected on the moment of retirement, showing that retirement is present in the horizon of consciousness of the majority, Figure 1. However, when asked about the possibility of retirement in recent years, 53.9% reported that they had considered this decision, but later gave up, while 46.1% said they had not considered retiring.

Figure 1

Decision process for the retirement of TAEs 60+ employees

Source: Survey data (2025).

When asked about the possibility of retirement in recent years, 53.9% of the participants reported that they had considered this decision, but later gave up, while 46.1% said they had not considered retiring. The proximity between the percentages suggests not only punctual indecision, but a dynamic of "prolonged contemplation", in which thinking and postponing coexist as an adaptive response in the face of personal, family and institutional uncertainties. This pattern is compatible with the literature that describes retirement as an ambiguous and non-linear transition, with gains and losses perceived simultaneously (Zanelli; Silva; Soares, 2010; Myrtle; Leandro-França; Seidl, 2014).

With regard to planning, only 43.4% of the civil servants declared that they had adopted some type of preparation, while 56.6% stated that they had not taken any action in this regard. This finding is central to the purposes of the article, as it points to a mismatch between the reflection/intention on retirement and the implementation of concrete measures, which refers directly to the reference of the Transtheoretical Model and to the discussion about institutional support gaps (Bressan *et al.*, 2013; France; Soares, 2009). The distance between intention and action appears to be linked to the meanings attributed to retirement. For part of the civil servants, it is perceived as an opportunity for freedom and the construction of new projects; for others, it takes on contours of rupture, uncertainty and loss of meaning (Zanelli; Silva; Soares, 2010). Among the positive perceptions, retirement appears linked to rest, to the realization of personal projects and to the strengthening of family life, as illustrated by the statement: *"I see retirement as an opportunity to travel more, I like it a lot! Also dedicate more to the site. I have 2 children [...] I intend to spend more time with them"* (E3).

On the other hand, fears related to health, social isolation and the emotional effects resulting from absence from work emerge, as expressed in the report below:

I'm in good health, it's not the case with my father, who, unfortunately, when he retired, soon after came Alzheimer's. [...] I know that this disease is often hereditary, and I don't want it for me, he suffers from this disease. So I think my head is busy. So, if I retire today, my wife working, I will stay at home idle (C10).

These narratives reinforce the ambivalent character of the transition already described in the literature: retirement can represent the achievement of autonomy and new projects, but also the rupture of bonds and a threat to identity when work occupies a central role (França; Soares, 2009; Carvalho; Costa; Pimenta, 2013; Oliveira; Almeida, 2021). Empirical evidence also dialogues with the perspective that the impacts of retirement are heterogeneous and conditioned by planning and organizational support (Teques *et al.*, 2025).

It is also observed that only 5.3% of the civil servants had formalized the request for retirement, while 94.7% remained in activity, which reinforces the tendency to postpone the decision, even among those who already meet the legal requirements.

In general, the results indicate that the TAEs 60+ at UFV reflect on retirement, although few adopt concrete planning strategies for this stage. The testimonies reveal concerns, expectations and ambivalences that permeate the decision-making process, confirming the subjective, complex and multifaceted character of the transition between working life and retirement (Zanelli; Silva; Soares, 2010).

4.2 MAIN CONCERNS UNDERPINNING THE POSTPONEMENT: IDENTITY, FINANCES, HEALTH, AND INSTITUTIONAL CONTEXT

The most recurrent concern (53.9%) refers to idleness and the loss of an active routine, often associated with fear of social isolation, loss of meaning and the emergence of unwanted behaviors. The statements express fear of rupture with the collective and with interpersonal bonds built throughout the work trajectory: *"Not knowing what to do when you get up in the morning is very sad. The routine at home is different. I value coexistence in the service a lot and losing it worries me a lot"* (D8) and *"Idleness and the fear of having some addiction that worries me the most if I retire"* (C3).

These testimonies show that work remains a structuring element of the daily life and social identity of the civil servants. It indicates that, for many civil servants, work operates as a "structure of life" (organizes time, sociability, meaning and recognition). Withdrawal from work activities is perceived as a risk of loss of meaning and rupture with the professional role, as discussed by Oliveira and Almeida (2021) and Silva e Sousa (2023). Thus, retirement is interpreted as a risk of symbolic rupture with the professional role, which can generate a feeling of uselessness and isolation, a phenomenon consistent with studies on the centrality of work and identity costs of dismissal (Zanelli; Silva; Soares, 2010; Bressan *et al.*, 2013).

In addition to the subjective dimension, part of the participants expressed financial concern (19.7%), associating retirement with reduced income and loss of benefits: *"What worries me about retiring is a decrease in salary, I lose the hazard, food vouchers, night bonus which is 10%, in the end I lose about 24% of my salary"* (D2) and *"I am very afraid that the retirement salary will not cover the expenses"* (D12).

These manifestations corroborate findings that the loss of income and benefits tends to influence the postponement of retirement in the public service, especially when retirement is perceived as a deterioration in the standard of living (Silva; Helal, 2018; Fonseca, 2019; Oliveira; Almeida, 2021).

A smaller portion of the civil servants (18.4%) declared that they do not have significant concerns about retirement, which suggests greater acceptance and emotional preparation for this transition: *"I don't worry too much. I think about retiring and going to take care of the farm, so I'll have another activity"* (B7) and *"Nothing worries me! I already have plans for retirement"* (C31).

These reports signal greater readiness for the transition, compatible with profiles in more advanced stages of the Transtheoretical Model (preparation/action), especially when there are clear alternative projects.

Another smaller group (9.2%) highlighted health-related concerns, especially regarding the fear of illness or the perception of not being emotionally and physically prepared for retirement: *"I am afraid of depression. I am not yet mentally and physically prepared to retire"* (C31).

This concern dialogues with the concept of active aging, proposed by the World Health Organization (WHO, 2005), which emphasizes the maintenance of health, autonomy and functional capacities as central conditions for productive engagement throughout aging.

Other concerns were also mentioned by 14.5% of the civil servants, related to the absence of substitutes and the institutional uncertainties provided by the work: *"I worry because there is still no one to replace me in the service. I need to pass on my knowledge and this bothers me a little"* (D9) and *"I am concerned about the uncertainties regarding future administrations such as the external one in Brasília and the internal one at UFV"* (C14),

In the focus groups, these perceptions were reinforced, especially with regard to the lack of replacement of personnel and the understanding that permanence does not always generate institutional damage:

My position is already extinct. I won't be occupying anyone's place. Because if it hadn't been extinguished, if I had the position in force, I'd go out and ask for my days off. I understand that I can even support the institution for a long time to come (C7).

This finding broadens the interpretation of postponement, because in addition to personal factors, there are dimensions of the organizational context such as replacements, extinct positions, continuity of services, which modulate decisions and reinforce bonds of belonging, in line with the argument that retirement is a socially mediated and institutionally situated transition.

4.3 FACTORS THAT CAN "TURN THE KEY": HEALTH, CHANGES AT WORK AND CLOSING THE CYCLE

When asked about factors capable of influencing the decision to retire, the participants indicated multiple personal and professional aspects. The most cited factor was impairment of physical or psychological health (26.3%), showing that well-being is a central element for permanence at work. This finding reinforces the understanding that, although work is a source of fulfillment and belonging, its continuity depends on the preservation of health conditions (Zanelli; Silva; Soares, 2010).

Another group of civil servants (21%) pointed out that changes in the routine or organization of work could motivate them to leave, which highlights the value attributed to stability, predictability of activities and the known environment. Changes in these elements tend to generate discomfort and can accelerate the decision to dismiss (França; Soares, 2009). The same proportion of participants (21%) understand retirement as the "end of a cycle", interpreting the end of the professional career as a natural stage of life, marked by the conclusion of a productive path and the opening to new experiences (Silva; Helal, 2018).

This pattern suggests that the decision to retire is often conditioned by thresholds: as long as the health and stability of daily work are preserved, permanence is maintained; When these conditions change, retirement is considered a viable and even desirable alternative. This finding reinforces the literature by indicating that dismissal tends to occur when the perceived costs of staying and/or the perceived benefits of leaving change (França; Soares, 2009; Zanelli; Silva; Soares, 2010).

On the other hand, a smaller portion of the participants (18.4%) stated that they did not identify specific factors that influence the decision to retire, which may indicate greater detachment from work or an attitude of acceptance in the face of the transition. In addition, 11.8% reported the intention to retire only after the consolidation of a plan, emphasizing the importance of prior preparation for this process.

In summary, it is observed that the decision to retire among the TAEs 60+ of UFV is not guided by a single factor, but results from the articulation of multiple interdependent conditions. In this sense, the balance between health, stability, professional recognition and

financial security is decisive for the dismissal to occur in a planned, conscious and satisfactory way.

4.4 POST-CAREER PREPARATION AND PLANS: LOW LEVEL OF OPERATIONALIZATION AND INFORMAL STRATEGIES

The results indicate a low level of planning for the post-career period. Among the 76 participants, 60.5% declared that they did not have any planning, while 39.5% mentioned plans aimed at leisure, rest, family life and, to a lesser extent, productive activities (self-employed, small businesses, rural properties). The absence of planning appears explicitly in the reports: *"I don't have any activity in mind, in case I decided to retire at this time"* (D6) and *"I didn't think about my retirement. I don't think about her today. If I retire, I'll just be idle [...]. So, my pleasure is to be working"* (C3).

Among those who mentioned some plan, projects related to family, leisure, nature and productive continuity predominate. A relevant element is the presence of post-retirement "testing" strategies (e.g., time off as a routine rehearsal), which can be interpreted as a process of change in the transtheoretical sense:

I have the days off to take and so does my wife. Let's take this time to see if you get used to it. We have a farm, we have a house in Espírito Santo to move, so we have other activities to continue after retirement. [...] So, do this so that we can have a new life (D5).
I'm about to leave. I'm setting up my business, at home. A small engine mechanic shop [...] (C7).

These manifestations are similar to approaches that associate active aging with the maintenance of significant social roles after disconnection from formal work (França; Soares, 2009). However, low adherence to planning corroborates findings that the absence of prior preparation can hinder a more positive transition and increase insecurity and a sense of loss of purpose (Bressan *et al.*, 2013; Gvozdz; Sakai; Haddad, 2015).

4.5 PERCEIVED INSTITUTIONAL ROLE: ABSENCE OF STRUCTURED PPA, REACTIVE COMMUNICATION AND SYMBOLIC TENSION

The analysis revealed a widely shared perception regarding the inexistence or insufficiency of institutional initiatives aimed at preparing for retirement at UFV. Most stated that they had not participated in or were aware of systematic actions, indicating limited provision of formal guidance. This finding appears in the interviews and was reinforced in the focus groups: *"The university could (...) a course (...) to prepare you for retirement"* (C4) and

"UFV could invite the person to do a training, a lecture (...) I did not receive this invitation" (A1).

Although some participants mention specific actions, they are described as discontinued and insufficient to constitute a program: *"I participated in a course (...) but (...) it is not a program"* (B7) and *"Before I had a preparation (...) today there is no longer that"* (A1).

A particularly relevant finding is the symbolic tension associated with PPAs: part of the civil servants fear that formal programs may be interpreted as pressure to retire: *"I think that participating in a formal program may seem like pressure to retire"* (C3).

This point is crucial to align results and reference: in the public service, where work can be highly identitarian, institutional actions aimed at retirement can be interpreted ambivalently — as support and, simultaneously, as a sign of replacement and dismissal. The literature on emotional costs and post-career insecurity helps to interpret this phenomenon (França; Soares, 2009; Macêdo; Bendassolli; Torres, 2019).

Another recurring aspect refers to the weaknesses of institutional communication. Even recognizing that there are sectors capable of supporting (such as the Dean of People Management), the civil servants indicate that access to information depends on individual effort, which tends to penalize those who have technological difficulties or less informational capital: *"It is up to each of us to seek information (...) there are many who don't even access emails"* (C3) and *"The server goes after it. UFV does not approach the server"* (C4).

This pattern suggests a reactive rather than a proactive institutional model, which becomes especially problematic when the study itself shows a high prevalence of contemplation without action: without accessible communication and structured policies, progression to preparation/action tends to be hampered.

In addition, a demand for integrated and continuous support emerged, including actions also for post-retirement and maintenance of bonds: *"The university could think about activities also for post-retirement (...) maintain bond and purpose"* (C10).

The civil servants recognize the existence of institutional structures, but point out failures in articulation and dissemination: *"You want to know about retirement, just go to the PGP (...) but (...) the Human Resources coming to us didn't have that moment"* (C4) and *"If you want to know something about physical activity, you go to the PWD"* (C16).

This finding converges with studies that describe PPAs as fundamental instruments to reduce insecurity, structure planning, and support financial, psychosocial, and post-career project dimensions (França; Soares, 2009; Zanelli; Silva; Soares, 2010; Bressan *et al.*, 2013; Silva; Helal, 2018; Oliveira; Almeida, 2021). Therefore, the UFV case highlights a gap

between what the literature recommends and what the civil servants perceive as available and accessible.

4.6 INTERPRETATIVE INTEGRATION WITH THE TRANSTHEORETICAL MODEL: WHY DOES REFLECTION NOT BECOME PREPARATION?

The application of the Transtheoretical Model contributes to interpreting the findings by showing that many civil servants are in a pattern compatible with intermediate stages of readiness, in which reflection on retirement is frequent, but has not yet translated into planned action (Prochaska; Diclemente, 1983; Myrtle; Leandro-França; Seidl, 2014).

Three mechanisms stand out in the narratives:

1. **Unfavorable decisional balance:** the "cons" (idleness, loss of bonds, fear of illness, financial loss) appear with great weight, while the "pros" (free time, projects, coexistence) are more present when there is already a plan.
2. **Limited self-efficacy to reorganize post-career life:** reports such as "I'm going to be idle" indicate low confidence to build routine and substitute roles, making it difficult to advance to preparation.
3. **An institutional environment that is not very facilitating:** the absence of structured PPA and reactive communication reduce opportunities for information, support and planning.

Thus, the postponement of retirement emerges as a socially mediated process, supported by subjective (identity and fear of idleness), material (income/benefits) and institutional (information, replacement, recognition and support) dimensions, in coherence with the review presented.

4.7 RETIREMENT READINESS MARKERS

Next, the table is presented as "readiness markers", as the data indicate overlap between reflection, intention and initial actions, and it is not methodologically consistent to add percentages as mutually exclusive stages without individual classification rule. The percentages correspond to the number of participants who presented the marker at least once, in structured questions and/or mentions in the narratives, and can coexist in the same participant.

Table 1

Markers of retirement readiness according to the Transtheoretical Model (TAEs 60+)

Stages of the transtheoretical model of behavior change	Key features	Behaviors observed in TAEs 60+	No. of servers	Percentage (%)
Precontemplation	They do not recognize the need for change or avoid thinking about retirement.	They did not reflect on the moment of retirement and avoid discussing or planning to leave work.	21	27,6
Contemplation	They recognize the need for change, but they do not yet make decisions; experience ambivalence between staying and retiring.	They reflected on retirement and consider this possibility, but without a consolidated decision.	55	72,4
Preparation	They demonstrate an intention to change and initiate some level of organization or initial planning.	Declare intention to retire in the future and/or report some level of initial organization (e.g., routine rehearsals, information seeking, idea development).	43	56,5
Action	They effectively implement the behavior of change.	They formalized the retirement process with the institution.	4	5,3

Source: Research data (2025), based on Murta, Leandro-França and Seidl (2014).

The markers show that, although reflection is broad (contemplation), formalization (action) is rare. This pattern reinforces the need for institutional strategies that facilitate the transition from contemplation to preparation, through proactive information, psychosocial support and structuring of post-career projects, as discussed by França and Soares (2009) and Bressan *et al.* (2013).

In light of the results, it is observed that TAEs 60+ at UFV prepare little and unevenly for retirement: although most reflect on the topic, more than half do not carry out planning actions, and many do not have defined post-career plans. The postponement is mainly supported by concerns about idleness and loss of meaning, followed by financial insecurity, health fears and institutional factors (absence of replacements, organizational uncertainties and extinct positions).

As for the institutional role, the civil servants perceive the absence or insufficiency of structured PPAs, predominantly reactive communication (dependent on individual initiative) and disarticulation between sectors, in addition to a relevant symbolic tension: formal actions can be interpreted as pressure for dismissal. Thus, the results reinforce the understanding of retirement as a gradual and socially mediated transition and point to the need for institutional

approaches that are more integrated, visible and sensitive to the multiple dimensions involved.

5 CONCLUSION

This article presents the results of the study, which investigated the factors that influence the postponement and preparation for retirement among active technical-administrative employees in education aged 60 years or older. Through a qualitative approach, based on semi-structured interviews, focus groups and document analysis, it showed how individual, organizational and institutional dimensions are articulated in the decision-making process related to the transition between work and retirement, focusing on the pre-retirement phase.

The results demonstrate that, although retirement is present in the reflective field of most civil servants, it is not perceived as an immediate action, revealing a mismatch between reflection and effective planning. It was observed the predominance of markers associated with the stages of contemplation and incipient preparation, according to the Transtheoretical Model of Behavior Change, indicating that the decision to retire is configured as a gradual process, socially mediated and conditioned by mechanisms such as decisional balance (perceived pros and cons) and self-efficacy (confidence to reorganize post-career life), which help to explain why reflection does not always turn into planning effective.

Among the factors that sustain permanence in work are the fear of idleness, the loss of active routine, the rupture of social ties and the threat to professional identity, which position work as the central axis of daily life and institutional belonging. Although financial concerns are present, they do not act in isolation, being combined with subjective dimensions related to recognition, social utility and the maintenance of roles built throughout the work trajectory. In this sense, the postponement of retirement emerges as a result of the articulation between identity, material and relational dimensions.

Retirement is perceived in an ambiguous way, associated simultaneously with the possibility of rest and new projects and with rupture, uncertainty and loss of meaning, which contributes to low adherence to prior planning. The presence of alternative life projects (such as productive activities, structured leisure and strengthening of social networks) proved to be a potentially facilitating element of readiness for the transition.

Another relevant finding refers to the perception of absence or insufficiency of structured institutional policies for retirement preparation. The reports indicate punctual, little publicized and disjointed initiatives, in addition to a predominantly reactive communication and a symbolic tension in which institutional actions can be interpreted as pressure for

dismissal. These factors reinforce the individual responsibility of the civil servant and contribute to insecurity and postponement of the decision.

From a theoretical point of view, the study demonstrates the applicability of the Transtheoretical Model of Behavior Change to the understanding of retirement in the public service, expanding the debate by incorporating subjective, identity, and organizational dimensions, beyond exclusively normative or economic explanations. On the practical level, the results point to the need for structured institutional programs to prepare for retirement, which integrate accessible social security/financial guidance; psychosocial support and identity discussion; encouragement to build post-career projects; and proactive and inclusive communication strategies. In addition, attention is recommended to the mode of presentation and language of the program, in order to reduce the perception of "pressure" for retirement and reinforce its function of care and support for planning.

As limitations, the institutional focus of the study, restricted to a federal university, the male predominance in the sample, and the absence of retired civil servants stand out, which limits the direct transfer of results to other contexts.

Future research can expand this analysis through comparative studies between different public institutions, as well as longitudinal investigations that follow civil servants throughout the process of preparation, decision, and adaptation to retirement. It is also recommended to explore differences by gender, occupation and working conditions, in addition to evaluating the implementation and effectiveness of PPAs in IFES, considering indicators of readiness, well-being and maintenance of bonds.

By highlighting the meanings attributed to the permanence in work and retirement by TAEs 60+ civil servants, this study contributes to the advancement of the academic and institutional debate on aging, work and people management in the public sector, offering subsidies for the development of proactive strategies to support the work-retirement transition in public universities.

ABSTRACT

The research aims to analyze the importance of cash flow in the financial management of micro and small enterprises, based on a review of the scientific literature from 2020 to 2025. The following specific objectives are proposed: (1) to identify recommended practices for controlling and using cash flow in micro and small enterprises; (2) to survey the main benefits and challenges highlighted in recent literature regarding cash flow management; and (3) to analyze the relationship between the effective use of this tool and the financial sustainability of these organizations. The research problem is centered on answering the following question: what is the importance of cash flow for the financial management of micro and small enterprises in light of recent literature? Regarding the methodology, the study is qualitative in nature, with an exploratory-descriptive approach and based on a bibliographic review. Thirteen articles were selected through Google Scholar, using filters for the terms “cash flow,” “micro and small enterprises,” and “financial management.” The analysis was conducted through systematic summaries organized into three categories: recommended practices, benefits, and challenges of cash flow management. The results indicate that cash flow is a fundamental tool for financial control, decision-making, and short- and long-term planning. A lack of managerial training, informality, and the use of intuitive management methods were also identified. Although there is consensus on the importance of cash flow, a gap still exists between theoretical knowledge and its application in everyday practice.

Keywords: Cash Flow. Micro and Small Enterprises. Financial Management.

RESUMO

A pesquisa visa analisar a importância do fluxo de caixa na gestão financeira das micros e pequenas empresas, com base na revisão de literatura científica de 2020 a 2025. Propõe-se como objetivos específicos: (1) identificar as práticas recomendadas para o controle e a utilização do fluxo de caixa em micro e pequenas empresas; (2) levantar os principais benefícios e desafios apontados pela literatura recente no que se refere à gestão do fluxo de caixa e (3) analisar a relação entre o uso eficaz dessa ferramenta e a sustentabilidade financeira dessas organizações. A problemática da pesquisa está centrada em responder: qual é a importância do fluxo de caixa para a gestão financeira das micro e pequenas empresas, à luz da literatura recente? Quanto à metodologia, é de natureza qualitativa, com abordagem exploratório-descritiva e baseada em levantamento bibliográfico. Foram selecionados 13 artigos através do Google Acadêmico, com filtros para as palavras “fluxo de caixa”; “micro e pequenas empresas” e “gestão financeira”. A análise foi feita por meio de fichamentos com três categorias: práticas recomendadas, benefícios e desafios da gestão do fluxo de caixa. Constatou-se nos resultados que o fluxo de caixa é uma ferramenta fundamental para o controle financeiro, a tomada de decisão e o planejamento de curto a longo prazo. Foram identificados também, falta de capacitação dos gestores, informalidade e uso de métodos intuitivos de gestão. Embora exista um consenso sobre a importância do fluxo de caixa, ainda existe uma lacuna entre o conhecimento teórico e a aplicação no cotidiano.

Palavras-chave: Fluxo de Caixa. Micro e Pequenas Empresas. Gestão Financeira.

RESUMEN

La investigación tiene como objetivo analizar la importancia del flujo de caja en la gestión financiera de las micro y pequeñas empresas, con base en una revisión de la literatura científica de 2020 a 2025. Se proponen como objetivos específicos: (1) identificar las prácticas recomendadas para el control y el uso del flujo de caja en micro y pequeñas empresas; (2) identificar los principales beneficios y desafíos señalados por la literatura reciente en lo que respecta a la gestión del flujo de caja; y (3) analizar la relación entre el uso eficaz de esta herramienta y la sostenibilidad financiera de estas organizaciones. La problemática de la investigación se centra en responder: ¿cuál es la importancia del flujo de caja para la gestión financiera de las micro y pequeñas empresas a la luz de la literatura reciente? En cuanto a la metodología, la investigación es de naturaleza cualitativa, con enfoque exploratorio-descriptivo y basada en una revisión bibliográfica. Se seleccionaron trece artículos a través de Google Académico, con filtros para los términos “flujo de caja”, “micro y pequeñas empresas” y “gestión financiera”. El análisis se realizó mediante fichas de lectura organizadas en tres categorías: prácticas recomendadas, beneficios y desafíos de la gestión del flujo de caja. Los resultados muestran que el flujo de caja es una herramienta fundamental para el control financiero, la toma de decisiones y la planificación a corto y largo plazo. También se identificaron la falta de capacitación de los gestores, la informalidad y el uso de métodos intuitivos de gestión. Aunque existe un consenso sobre la importancia del flujo de caja, todavía hay una brecha entre el conocimiento teórico y su aplicación en la práctica cotidiana.

Palabras clave: Flujo de Caja. Micro y Pequeñas Empresas. Gestión Financiera.

1 INTRODUCTION

The evolution of financial statements in Brazil shows how financial information has become increasingly valued in managerial decision-making. For decades, the Statement of Sources and Applications of Resources (DOAR) was the main instrument used to demonstrate where the company's resources came from and how they were applied. However, with the enactment of Law No. 11,638/2007, which promoted the convergence of Brazilian standards to international accounting standards (IFRS), the DOAR was replaced by the Cash Flow Statement (DFC). The DFC, regulated by NBC TG 03, now offers a more dynamic, clear and useful view for users of accounting information, by evidencing the inflows and outflows of funds in three distinct activities: operational, investment and financing. This change marked a breakthrough in detailing the financial health of organizations, which is especially relevant for micro and small businesses, which often face liquidity and planning challenges.

According to AASB 03, cash flow is a financial report that demonstrates how a company's cash is used over the course of an accounting period. Therefore, managing it effectively is essential for the survival and development of any company. Cordeiro & Marquez (2024) highlight that "cash flow should be seen as a continuous practice and integrated into strategic business decisions, in order to ensure long-term sustainability". The actors' statement reiterates that cash flow is an instrument to support decision-making and capital control of these companies. According to Sá 2008; Strobel, 2014, the lack of financial control is one of the most common causes of bankruptcy of micro and small companies, even in the face of positive accounting results.

A study carried out with managers in the city of João Pessoa – PB, showed that even recognizing the importance of cash flow, a significant portion is still unaware of its use, Almeida and Valentim (2024). Formenti and Martins (2015) pointed out that microentrepreneurs, even having theoretical knowledge about the importance of cash flow, few implement the practice in their daily lives. In view of the above, this distance between what happens in practice and what is learned in theory only shows how difficult it is to make the financial management of micro and small companies effectively professional.

In this sense, when determining the basis for this work, it is possible to see that the adoption of a well-structured cash flow offers more than accounting control, it is an efficient tool to prevent crises, sustain the growth of companies and promote liquidity. Under this bias, focusing on the literature review of the last five years, the following research problem is formulated: **what is the importance of cash flow for the financial management of micro and small companies, in the light of recent literature?** Its general objective is to analyze

the importance of cash flow in the management of micro and small companies, based on a literature review of the last five years. The following specific objectives were also defined: (i) to identify the best practices for the control and use of cash flow in micro and small companies; (ii) to raise the main benefits and challenges pointed out by the recent literature regarding cash flow management; and (iii) analyze the relationship between the effective use of this tool and the financial sustainability of these organizations.

2 THEORETICAL FOUNDATION

2.1 MICRO AND SMALL ENTERPRISES IN THE ECONOMIC CONTEXT

According to the MPE Statute, micro enterprises (ME) and small businesses (EPP) are defined based on annual gross revenue. Micro companies are those whose gross revenue does not exceed the limit of R\$ 360,000.00, while small companies are those with revenues greater than R\$ 360,000.00 and equal to or less than R\$ 4,800,000.00. These limits are periodically updated by the Simples Nacional Management Committee (CGSN), with the objective of adjusting the values to the current economic reality (Brasil, 2006)

The classification as ME or EPP allows access to simplified tax regimes, such as the Simples Nacional, which unifies taxation in a single collection document and reduces the tax burden of companies, enabling them to remain in the market and increase their competitive capacity (Brasil, 2006).

The classification criteria established by Complementary Law No. 123/2006 consider the annual gross revenue as the main parameter for the classification of companies. However, the statute also provides for specific conditions for the classification, such as the exclusion of certain activities, the verification of equity participation and the analysis of the form of taxation (Brasil, 2006).

2.2 ROLE OF SMES IN THE BRAZILIAN ECONOMY

Small and micro enterprises contribute a relevant portion to the growth of the economy in the country (André, 2021). According to Sebrae (2022), SMEs represent more than 99% of the total companies in Brazil and are responsible for approximately 30% of the national Gross Domestic Product (GDP). MSEs boost the economy, growth, innovation, and new job creation in a remarkable way (Ribaski, 2024). Machado (2016) states that MSEs play a fundamental role in reducing social inequalities, promoting economic development in regions of low industrial density.

The importance of MSEs can also be observed in the strengthening of the local economy, especially in economically less developed regions. According to Duarte de Jesus

and Marinho (2023), these companies act as dynamic agents of the local economy, promoting the circulation of income and stimulating the growth of strategic sectors, such as commerce and services. According to Xavier and Bertaci (2023), they highlight that MSEs play a relevant role in structuring supplier networks, fostering partnerships between companies of different sizes and contributing to the consolidation and boosting local producers. This movement generates a virtuous cycle, in which the development of MSEs positively impacts the regional market and, consequently, the national market.

Another aspect that highlights the importance of SMEs is their contribution to innovation and the diversification of the economy. Although they are often associated with traditional businesses, many micro and small companies have stood out for the adoption of innovative strategies, whether in the offer of differentiated products or in the implementation of more efficient processes (Alves *et al.*, 2025). For Polastrini, Saraiva and Silva (2023), the ability to identify market niches and develop customized solutions allows SMEs to occupy spaces that large corporations, with more rigid structures, can hardly reach. This innovative potential not only increases the competitiveness of the segment, but also strengthens the national economy, diversifying the production matrix and encouraging the creation of new businesses.

2.3 FINANCIAL MANAGEMENT IN SMES

In the context of Brazilian micro and small enterprises (MSEs), the evolution of financial management reflects a continuous process of adaptation to market demands and economic transformations. Historically, many SMEs have faced serious difficulties, mainly due to the absence of financial planning and the lack of adequate management practices. The lack of effective cost management compromises the competitiveness and sustainability of these companies (Costa *et al.*, 2022). Informality and the lack of accurate financial information make it difficult to make strategic decisions (Lima *et al.*, 2021), making it essential to adopt financial management practices that ensure their survival and growth.

Financial management consists of a set of practices and processes aimed at optimizing the use of financial resources, ensuring sustainability and organizational growth. It involves the planning, execution and control of financial activities, providing a clear view of the company's economic situation (Silva *et al.*, 2020). For MSEs, financial management is fundamental, as it facilitates the identification of investment opportunities and the mitigation of risks (Fonseca *et al.*, 2022). The adoption of appropriate financial practices also contributes to the improvement of business performance and to more assertive decision-making (Souza *et al.*, 2023).

MSEs, however, have specific characteristics that directly impact their financial management. One of the most relevant aspects is the centralization of financial decisions in the hands of the owners, which can lead to the absence of planning and strict controls (Castro and Silva, 2020). Many of these companies also fail to use accounting and financial tools effectively, hindering performance analysis and results projection (Dias e Silva, 2023). Difficulties in accessing credit and financial resources significantly limit the capacity for investment and expansion (Lima *et al.*, 2021).

The adoption of good practices in financial management can be decisive for the success of MSEs. An example is presented by Gomes *et al.* (2021), which describe the implementation of a financial management model in a microenterprise in the service sector, with an emphasis on working capital planning and cash flow control. Similarly, Souza *et al.* (2023) identify the need for more effective collection policies as a means of improving accounts receivable management. These examples demonstrate that the implementation of financial controls and the use of appropriate tools are crucial for the sustainability and growth of MSEs.

Effective financial management in SMEs must be based on principles capable of ensuring the sustainability and growth of the business. Financial planning is essential to establish goals and strategies that guide business decisions (Silva *et al.*, 2020). Financial control allows for constant monitoring of operations, identifying possible deviations that may compromise the company's financial health (Castro and Silva, 2020). In addition, financial analysis, based on accurate and up-to-date data, is essential to evaluate the company's performance and identify opportunities for improvement (Fonseca *et al.*, 2022).

2.4 CASH FLOW IN THE MANAGEMENT OF MICRO AND SMALL COMPANIES

Cash flow is one of the most relevant instruments in the financial management of micro and small enterprises (MSEs), being essential to ensure economic balance and guide strategic decisions. In its most elementary function, this tool enables the systematic monitoring of financial inflows and outflows, allowing the manager to anticipate situations of insufficiency or surplus of capital *Manual de técnicas e práticas do CRCSP* (2011).

In MSEs, the effective use of cash flow can be decisive for the survival of the business, especially in the face of constant market fluctuations and typical restrictions on access to credit. As stated by Carvalho *et al.* (2022), many microenterprises face financial difficulties precisely because of the absence of formal cash control practices, which compromises planning and increases exposure to operational risks. The lack of this control undermines the

predictability of financial commitments, resulting in poorly founded decisions that can culminate in default or bankruptcy.

Contemporary literature shows that cash flow goes far beyond a merely accounting function, assuming a strategic role in supporting investment and financing decision-making. As Morellato and Nascimento (2016) point out, proactive cash flow management enables not only the identification of working capital needs, but also the definition of more appropriate strategies for the sustainable growth of the business. Such a perspective reinforces the idea that, in MSEs, cash flow should be conceived as a dynamic tool, constantly fed and analyzed, and not as a merely occasional report.

However, several studies show that resistance to the adoption of systematic financial management practices remains a reality among MSEs. Research carried out by Bernardes et al. (2020) revealed that a significant portion of managers in this segment still rely on informal or intuitive methods for managing financial flow, disregarding the importance of structured analyses. This behavior can be attributed, in part, to the lack of management training, but also to the mistaken perception that strict control of finances is an exclusive need of larger companies.

In the current context, marked by digitalization and the growing availability of technological tools, the incorporation of financial management software has been pointed out as a viable and necessary solution for improving cash flow control. According to Albino (2003), the use of integrated systems provides greater agility and precision in the preparation of financial projections, providing managers with more adequate conditions to face uncertainties and identify investment opportunities.

Thus, it is observed that efficient cash flow management is a competitive advantage that can enhance the sustainability and development of micro and small companies. As summarized in the study by the University Center 7 de Setembro (2011), the ability to anticipate scenarios and manage financial resources in a balanced way depends, to a large extent, on the manager's competence to use cash flow as a planning and control instrument, and not just as a historical record. In this way, the need to promote the training of entrepreneurs and to encourage the adoption of modern financial management practices, essential for the strengthening of the MSE segment, is reinforced.

3 METHODOLOGY

This research is qualitative in nature, with an exploratory-descriptive approach, with the objective of understanding, from the recent scientific literature, the main challenges and good practices related to financial management in micro and small enterprises (MSEs), with

emphasis on cash flow. The qualitative approach allows the interpretative and contextualized analysis of the phenomena studied, especially suitable for topics involving managerial behavior, administrative practices and decision-making processes in small organizations (Godoy, 1995).

The scientific method adopted was the bibliographic survey, considering as the main source scientific articles published between the years 2020 and 2025, selected through the Google Scholar database, using the terms "cash flow", "micro and small companies" and "financial management" as search criteria. The collection was carried out during the month of May 2025. The selection of materials followed criteria of thematic relevance, timeliness and methodological rigor, prioritizing recognized academic journals in the area of Applied Social Sciences and Administration.

The analysis of the bibliographic data was guided by the objectives of the study, being structured around three main axes: (i) best practices for the control and use of cash flow in MSEs; (ii) benefits and challenges pointed out by the recent literature on cash flow management; and (iii) the relationship between the effective use of this tool and the financial sustainability of the companies analyzed.

The methodology of this study is based on the analysis of academic productions that address financial management and cash flow in micro and small enterprises (MSEs), constituting the universe of the research. The sampling was non-probabilistic, adopting criteria of thematic relevance and timeliness of the selected studies. 13 scientific articles that meet the established criteria were analyzed, in order to ensure the relevance and representativeness of the results in relation to the proposed objectives. The articles used were duly identified and systematized according to author, title, year and journal of publication.

Then, they were organized by means of files containing the objectives, methodology, results and main conclusions. From this, thematic content analysis was carried out, aiming to identify patterns, challenges and good practices that are recurrent in the literature on the subject. Manual analysis was performed with the support of spreadsheets to systematize the extracted data.

4 RESULTS

The analysis of the 13 scientific articles that were selected and organized, as shown in Table 1, showed that financial management in micro and small enterprises (MSEs) has been widely debated in the recent literature, especially with regard to the importance of cash flow as an instrument of control, planning and decision-making. Most studies propose

recommended practices, recognize the strategic role of this tool in financial sustainability, in the organization of finances and in the prevention of operational imbalances. The articles highlight common benefits and challenges faced by these companies, such as informality in management, difficulty in accessing credit, and the lack of financial training of managers. This set of works offers a solid theoretical basis to understand both the obstacles and the good practices recommended to strengthen the financial management of MSEs in the Brazilian context.

Source: Prepared by the authors.

The analysis of the articles reveals that most of the studies make some kind of practical recommendation on financial management and, especially, on the use of cash flow in micro and small enterprises (MSEs). However, some articles are limited to theoretical analysis or exposition of the importance of cash flow, without presenting specific practical recommendations. Table 2 presents the recommendations made in the analyzed articles.

Table 2

Recommended practices by the authors

Articles	Year	Best practices
1	2020	The daily monitoring of inflows and outflows allows managers to identify possible imbalances in advance and make more assertive decisions, as highlighted by Carvalho et al. (2025), when they stated that this constant control is essential for the company's financial health. There is also a strong recommendation for the adoption of technological tools, since financial management systems provide greater agility, accuracy, and security in data analysis, reducing errors and increasing efficiency in processes. Another recurring recommendation is the separation between personal and business finances, considered essential to avoid confusion in the analysis of results and ensure the sustainability of the business, as highlighted by Ferreira and Almeida (2020). In addition to operational control, the articles emphasize that cash flow should be used as a strategic instrument, allowing not only to visualize the current financial situation, but also to plan future scenarios and guide investments.

11	2023	
12	2025	

Source: Prepared by the authors.

Of the 13 articles analyzed, 9 articles present practical recommendations for financial management, especially in the use of cash flow, and 4 articles do not make direct recommendations, limiting themselves to the exposition of the importance of the theme or theoretical analysis. Therefore, it can be observed that, although most of the studies recognize and suggest practices applicable to the financial management of MSEs, there is still a relevant portion of the literature that lacks concrete proposals to guide entrepreneurs

in practice. Table 3 summarizes the most recurrent recommendations in the articles presented in Table 2, as can be seen below:

Table 3

Most recurrent practical recommendations

Articles	Recommendations
1, 6, 9, 11, 10, and 12	Continuous and constant use of cash flow and periodic financial control.
1, 3, 6, and 11	Financial planning and control through cash flow.
5	Adoption of management tools, including cash flow.
8	Applying cash flow efficiently.

Source: Prepared by the authors.

It can be observed that the effective management of cash flow in micro and small enterprises (MSEs) is directly associated with the adoption of practices that allow not only control, but also short, medium and long-term financial planning. Among the main recommendations found in the literature, the need for managers to adopt daily control of financial inflows and outflows, using cash flow as a continuous monitoring tool, stands out. In this sense, Carvalho *et al.* (2025) state that "the preparation and constant monitoring of cash flow allows the manager to identify possible financial imbalances in advance, enabling more assertive decision-making to ensure the company's financial health".

The articles also suggest that cash flow should not be seen solely as an operational instrument, but rather as a strategic tool. The literature analyzed makes it clear that effective practices in cash flow management involve not only routine control, but also the adoption of management tools and discipline in relation to financial control. Such practices are seen as fundamental to strengthen the financial sustainability of micro and small companies, reducing risks and increasing the chances of success in the market.

4.1 POSITIVE AND LIMITING ASPECTS OF CASH FLOW MANAGEMENT IN MICRO AND SMALL COMPANIES

Cash flow management has been consolidated as an indispensable tool for sustainability and decision-making in micro and small companies (Pereira *et al.*, 2023). However, the academic literature reveals a series of obstacles that still hinder its full application in the daily life of these enterprises. The following is an analysis, based on 13 scientific studies published between 2020 and 2025, in order to identify the main benefits and challenges related to cash flow management in this business segment.

As evidenced by Teixeira (2020), SMEs that adopt cash flow as a routine practice face crises with greater resilience and adaptability. From a managerial point of view, authors such

as Machado (2020) and Castro *et al.* (2020) highlight the strategic role of this tool to guide financial and operational decisions based on real data. Almeida and Valentim (2020) point out that, when well implemented, cash flow contributes directly to the control of working capital and to medium and long-term planning.

On the other hand, the studies also highlight relevant obstacles. One of the main ones refers to the lack of technical training of managers, making it difficult to understand and properly operationalize cash flow (Carvalho *et al.*, 2024; Teixeira, 2021). Added to this is the low degree of practical adoption, the predominant informality in many businesses, and the lack of organized financial records (Almeida and Valentim, 2020; Castro *et al.*, 2020). This distance between theoretical knowledge and its practical application shows a structural weakness that limits the positive results expected from the use of the tool.

Figure 1

Benefits and challenges identified in the articles analyzed

Source: Prepared by the authors.

Table 4

Benefits and challenges identified

Identified Benefits	Challenges Faced
Increased financial resilience and crisis preparedness (Teixeira, 2021; Carvalho et al., 2025).	Low level of practical adoption, despite theoretical knowledge (Almeida & Valentim, 2020; Castro et al., 2020).
Improvement in decision-making, based on up-to-date and reliable data (Machado, 2020; Castro et al., 2020).	Lack of technical training of managers to interpret the data (Teixeira, 2021; Carvalho et al., 2024).
More effective control of working capital and reduction of illiquidity risks (Almeida & Valentim, 2020).	Inaccurate financial records and absence of computerized tools (Castro et al., 2020; Silva et al., 2024).

Encouragement of short, medium and long-term financial planningKGKHK (Aquino & Filho, 2021).

Cultural resistance to the professionalization of financial management (Machado, 2020; Almeida & Valentim, 2020).

Source: Prepared by the authors.

4.2 FINANCIAL SUSTAINABILITY

Financial sustainability in micro and small enterprises (MSEs) is recurrently addressed in the articles analyzed, although with different depths. In some studies, the theme appears as the central focus of the research, with direct reflections on strategies that promote the continuity and financial balance of companies. In others, sustainability is addressed indirectly, linked to practices such as the use of cash flow, the professionalization of management, and the adoption of management tools.

The articles by Carvalho *et al.* (2025), Ramos e Silva (2021), and Ferreira *et al.* (2023), for example, make an explicit connection between financial sustainability and the implementation of sound control and planning practices, such as the continuous use of cash flow and the separation of personal and business finances. The study by Silva, Pereira and Brito (2024) discusses financial sustainability as a central theme, but adopts a more theoretical approach, focusing on the challenges faced by MSEs without proposing detailed solutions.

Some articles mention the concept of sustainability in a secondary way, as a natural consequence of good financial management, but without deepening the debate or presenting recommendations. Others don't even mention the term directly, focusing solely on cash flow functionality or the operational difficulties of financial management.

Table 5

Financial sustainability

Article s	Year	Best practices
1	2020	Financial sustainability is directly related to the proper use of management tools, especially cash flow, strict control of finances, and the professionalization of management. According to Silva, Pereira, and Brito (2024), financial sustainability depends on accounting strategies that help in decision-making, although the article focuses more on exposing challenges than on indicating specific practices. Other studies, such as those by Carvalho <i>et al.</i> (2025) and Ramos and Silva (2021), reinforce that financial predictability, combined with short and long-term planning, is essential to keep the company financially healthy, in addition to highlighting that the absence of control leads to instability and increased risk of insolvency.

7	2024	
8	2024	
9	2023	
10	2023	
11	2023	

Source: Prepared by the authors.

Of the articles analyzed, 9 articles present direct recommendations on practices related to financial sustainability, generally linked to the use of cash flow, planning and strict

control of finances, 1 article brings partial recommendations, discussing accounting strategies without detail, and 3 articles do not offer recommendations, limiting themselves to the conceptual or descriptive discussion of the topic. As shown in the Table below:

Figure 2

Recurrence of the Financial Sustainability Approach in Articles

Source: Prepared by the authors.

Among the studies that address financial sustainability, there is a distinction between direct and indirect approaches. The articles by Carvalho *et al.* (2025), Silva, Pereira and Brito (2024), Carvalho *et al.* (2024) and Oliveira (2023) take a straightforward approach, treating financial sustainability as an explicit objective and linking it to efficient cash flow management, overcoming accounting challenges, and implementing structured financial control practices.

Several authors opt for an indirect approach, in which sustainability is treated as a result or consequence of the adoption of good management practices. This is the case of the studies by Almeida and Valentim (2020), Castro *et al.* (2020), Aquino and Lima Filho (2021), Ferreira *et al.* (2023), Souza *et al.* (2025). In these surveys, although the concept of financial sustainability is not the central focus, it appears associated with business continuity, operational stability, or the benefits of using cash flow.

Finally, three studies – Teixeira (2021), Machado (2020) and Fidêncio (2023) – do not address financial sustainability, focusing on technical or descriptive aspects related to cash flow, without establishing connections with the continuity or financial balance of MSEs. These studies offer relevant contributions, but do not directly explore the strategic consequences of financial management for the sustainability of companies.

5 FINAL CONSIDERATIONS

Through the recent literature highlighted throughout this work, it was possible to outline the importance of cash flow for the financial management of micro and small companies. Authors such as Pereira *et al.*, 2023, demonstrate that cash flow is essential for financial sustainability, for capital control, for decision-making, and indispensable for good strategic planning.

Regarding the specific objectives, it was possible to analyze the identification of best practices regarding what comes in and goes out of cash, such as the use of technological tools, the separation of personal and company finances and the correct use of cash flow as a planning tool. It was possible to identify significant benefits in these practices, such as improved responsiveness to problems within SMEs, support for business sustainability, and greater financial predictability. On the other hand, there are numerous difficulties in the application of these practices, the main ones being the low technical qualification on the part of managers, the informality of the negotiations and the resistance to the adoption of more structured financial practices.

Most of the articles that were analyzed, such as Teixeira (2020), propose actions to improve the use of cash flow, but there are still some gaps in the literature when it comes to the practical applicability of the recommendations. It was evidenced by authors such as Castro *et al.*, (2020), that many entrepreneurs in Brazil recognize the importance of the tool, but do not use it in their daily lives, which reinforces the need for actions for this knowledge to be disseminated and applied.

As this is a literature review, without direct application and analysis with entrepreneurs, the conclusions are restricted to a theoretical study. Even so, there is a consensus within the scope exposed regarding the importance of cash flow in micro and small companies. It is hoped that the findings presented can stimulate support institutions and researchers, and managers to deepen the debate on practical solutions to strengthen the sector, promoting longevity for MSEs in Brazil.

ABSTRACT

The Brazilian northeastern cantoria de viola, orally improvised but often recorded in writing, has aroused the interest of many scholars, from different perspectives, from literary and cultural studies to musical and sociological approaches. Few studies, however, have been conducted from a strictly linguistic perspective. In this article, our aim was to conduct an exploratory study of the wordplaying genre in the cantoria de viola under the perspective of the Language for Specific Purposes, based on the theoretical and methodological contribution of Genre Analysis (Swales, 1990). Methodologically, the study consisted of applying move analysis to a *corpus* of twenty stanzas of sextilhas, a typical genre of the cantoria de viola, authored by Louro do Pajeú, focusing on the use of wordplaying by the poet. As a result, rhetorical moves were found that are both typical of the universe of the cantoria and specific to the poet's poetics. These moves are more general, relating to the aspects of introduction, development and conclusion of the text in any genre, as well as specific moves in the world of oral literature, which lead to its aesthetic prism and its playful context. Such results may contribute to shedding more light on the genre of cantoria and on Louro's creative work, including highlighting the non-formal literacies typical of the activities of viola singers.

Keywords: Move Analysis. Cantoria de Viola. Wordplaying. Rhetorical Strategies.

RESUMO

A cantoria de viola nordestina, improvisada oralmente, mas muitas vezes registrada por escrito, tem despertado o interesse de muitos estudiosos, em diferentes perspectivas, desde os estudos literários e culturais até as abordagens musicais e sociológicas. Poucos, entretanto, são os estudos realizados a partir de uma perspectiva propriamente linguística.

Neste artigo, nosso objetivo foi realizar um estudo exploratório do gênero trocadilho na cantoria de viola à luz da perspectiva de Língua para Fins Específicos, sob o aporte teórico-metodológico da Análise de Gêneros (Swales, 1990). Metodologicamente, o estudo consistiu na aplicação da análise de movimentos retóricos a um *corpus* de vinte estrofes de sextilhas, gênero típico da cantoria de viola, de autoria de Louro do Pajeú, com foco no uso do trocadilho pelo poeta. Como resultado, foram constatados movimentos retóricos próprios tanto do universo da cantoria como específicos da poética do cantador. Esses movimentos podem ser mais gerais, guardando relação com os aspectos de introdução, desenvolvimento e conclusão do texto em qualquer gênero, assim como movimentos específicos do mundo da literatura oral, que desembocam em seu prisma estético e em seu contexto lúdico. Tais resultados poderão contribuir para lançar mais luzes sobre o gênero da cantoria e sobre a obra criativa de Louro, inclusive ressaltando os letramentos não formais típicos das atividades dos cantadores de viola.

Palavras-chave: Análise de Movimentos. Cantoria de Viola. Trocadilhos. Estratégias Retóricas.

RESUMEN

La cantoria de viola del noreste de Brasil, improvisada oralmente pero a menudo registrada por escrito, ha despertado el interés de muchos académicos desde diferentes perspectivas, que abarcan desde estudios literarios y culturales hasta enfoques musicales y sociológicos. Sin embargo, pocos estudios se han realizado desde una perspectiva estrictamente lingüística. En este artículo, nuestro objetivo fue realizar un estudio exploratorio del género del juego de palabras en la cantoria de viola desde la perspectiva del Lengua para Fines Específicos, utilizando el marco teórico y metodológico del Análisis de Género (Swales, 1990). Metodológicamente, el estudio consistió en aplicar el análisis de movidas a un *corpus* de veinte estrofas de seis versos (sextilhas), un género típico de la cantoria de viola, escritas por Louro do Pajeú, centrándose en el uso de juegos de palabras por parte del poeta. Como resultado, se observaron movidas retóricas características tanto del mundo de la cantoria de viola como de la poética del cantante. Estas movidas pueden ser más generales, relacionadas con la introducción, el desarrollo y la conclusión de un texto de cualquier género, así como movidas específicas dentro del mundo de la literatura oral, que culminan en su perspectiva estética y contexto lúdico. Estos resultados pueden contribuir a arrojar más luz sobre el género de la cantoria y la obra creativa de Louro, destacando las prácticas informales de alfabetismo típicas de las actividades de los cantadores de viola.

Palabras clave: Análisis de Movidas. Cantoria de Viola. Juegos de Palabras. Estrategias Retóricas.

1 INTRODUCTION

The singing of the northeastern viola is an important cultural phenomenon, which has aroused the interest of many scholars, from different perspectives, including literary, cultural, musical, historical, folkloric and sociological studies, among others. Several themes are explored when dealing with viola singing: biographies, narratives and testimonies of singers/repentistas (Silva, 2006a; Silva, 2006b; Araújo, 2010; Lima, 2018), conceptions about women in singing (Oliveira, 2010), the role of music in singing (Tavares, 2011) and, more recently, the poetics of singing (Santos, 2020), viola singing mediated by social networks (Nóbrega, 2020), singing as a semiotic and cognitive system (Atã; Queiroz, 2021) and changes and continuities in viola singing (Diniz, 2022), just to mention a few examples.

Articles, dissertations, and theses on viola singing have also been developed from graduate programs in linguistics, as is the case of Nóbrega's thesis (2020). The term *genre* is quite frequent in works in general, usually from a literary perspective that tends to emphasize formal elements such as meter, rhyme, and regular characteristics of the stanzas, as in Atã and Queiroz (2021). We did not find studies on viola singing as a genre from the point of view of rhetorical-linguistic theories. In fact, the work of Santana and Aguiar (2008) is very close, as it is based on contributions from Rhetorical Studies of Gender, via Marcuschi (2002, 2008). However, it discusses the genre of "virtual fighting" on the internet, in which poetry, although it dialogues with the genre of viola singing, is not characterized by suddenness or improvisation.

In view of these considerations, our objective is to undertake an exploratory study of the genre of northeastern viola singing in the light of the perspective of Language for Specific Purposes, under the theoretical-methodological framework of Gender Analysis (Swales, 1990), in dialogue with the approach of Rhetorical Gender Studies (Miller, 2012). This dialogue is also justified by the possibility of describing Swales' (1990) analytical methodology as a "linguistic-rhetorical" approach (Devitt, 2015; Bezerra, 2022).

Particularly, we intend to focus, from the perspective of gender studies, on aspects of the work of the famous viola singer Lourival Batista, Louro do Pajeú, a unique master in his craft, recognized as such by the discursive community of Brazilian oral poetry. The approach, which seems to us unprecedented for the genre of singing, consists of outlining a model for the analysis of the rhetorical and discursive functioning of sextillas built on the basis of puns, a peculiar mark of Louro do Pajeú's poetry. We arrived at this model through the application of the methodology of analysis of movements and rhetorical steps based on Swales (1990), originally illustrated by his CARS (*Create a Research Space*) model.

The work will be organized into seven topics, including this introduction. In the second

topic, we describe and discuss viola singing and one of its best-known genres, the sextile. In the third, we present brief information about the singer Louro do Pajeú and the pun technique as a characteristic of his poetry. The fourth topic is dedicated to the presentation of the concept of gender, with emphasis on the Gender Analysis based on Swales (1990). In the fifth topic, we present the methodological procedures of this study, supported by the methodology of analysis of rhetorical movements. The sixth topic is the place where the results are presented and discussed. We conclude the work, in the seventh topic, with some considerations and reflections on the study.

2 ON THE SINGING OF THE NORTHEASTERN VIOLA AND THE GENRE OF THE SEXTILE

Explicitly refuting folklorist approaches that treat it as something exotic and unused, Nóbrega (2020, p. 25) describes viola singing "as a present, living art, in constant dialogue with the world, a spokesperson for the people's yearnings and, in effect, a culture of resistance, and not as a residue of the past". In the definition of Tavares (2011, p. 31), viola singing consists of "poetry sung improvised in the interior of the Brazilian Northeast", in which typically two singers, accompanied by violas, but in a show "more poetic than musical", sing improvised verses, often on themes suggested by the audience. Although it began with simple poetic quatrains (stanzas of four verses), pé de parede singing, as viola singing is also called, today has "about 80 genres of improvisation" (Araújo, 2010, p. 30).

As for the poetic form of the sextile, a genre in which all the stanzas analyzed in this work participate, it is the introductory genre of singing. Any viola singing in the Northeast begins with a baião of sextillas. In the words of Tavares (2016, p. 33), "the sextile is the standard style of singing. The violists always start singing sextillas, and it is possible that, if no one requests another style, or no one delivers mottos, they will be singing sextile all night". The sextile, according to the author, is a stanza that is "malleable and solid: easy to manipulate, and capable of producing remarkable effects" (p. 33).

As for their formal aspects, the genres of singing have considerable structural stability. Named after the number of verses it contains, the sextile is composed of six verses of seven syllables, in which the second, fourth and sixth verses rhyme with each other, while the others do not have rhymes (with the exception that the first verse has to "take the cue" of the other singer, that is, the singer is forced to use the last rhyme left by the singing partner). In traditional notation, the rhyme scheme of the sextile can be described either as ABCBDB (indicating that only the verses "B" rhyme with each other) or XAXAXA, indicating the same

organization and emphasizing that the rhymes of the others, indicated by X, are "blank" (Tavares, 2016, p. 33).

Considered not only in its form, but also in its rhetorical component, in the social actions that the singers carry out through it, the sextile is the genre common to all the puns under analysis in this work. In this sense, the adoption of the sextile genre confers uniformity to our *corpus*, ensuring a common basis for the analysis of the textual and contextual elements of each stanza.

3 LOURO DO PAJEÚ, THE MASTER OF PUNS

The term *pun* today takes on different meanings, and can often be used to classify word games and sounds capable of generating pejorative, creative, funny meaning effects, depending on the situation. However, in this study, the term refers to the poetic, textual-discursive, aesthetic and stylistic resource used in a unique way by the poet singer of São José do Egito Lourival Batista, Louro do Pajeú.

The pun is not only one of the constructions present in the poet's work, it is the creative resource that distinguishes nature from his verve. According to Araújo (2010, p. 30), "old lovers of singing regret that puns are not made anymore, for example, such as those of the incomparable Lourival Batista Patriota, the Pernambuco native 'Louro do Pajeú'". In this respect, Louro was unique not only among his peers in viola singing, but also within a broader group of poets, so rare is the practice of this form of verse.

In the elaboration of the puns, improvised, let us remember, the poet goes beyond obeying the rules of rhyme and meter typical of the genres of viola singing. Louro's puns consist of playing with one's own language, with speech and writing, exploring pronunciation, spelling, polysemy and alliteration in letters, syllables, words, concepts and ideas. This characteristic was highlighted in Lourival Batista, according to the scholar of viola singing José Rabelo de Vasconcelos, "not only for the perfection of the puns but also for their quantity. In this aspect he is Louro of an impressive fecundity" (Vasconcelos, 1982, p. 3).

It is important to make it clear that we will not be here analyzing the cold text, the literal materiality of the planned text. It is necessary to remember that all the stanzas were built improvised, in the heat of the challenges suddenly, in the adrenaline of the singer who has in front of him an attentive and demanding audience, waiting for his desire to be satiated by the verses that are improvised according to the circumstances of the event. In all the stanzas to which we refer, the poet interacts directly with real characters who are present in the singing, a fact that reaffirms the concept of text as action and social interaction. Here, more than a physical artifact, we focus on the real encounter between the audience's expectation and the

rhetorical strategies that the poet uses to, in addition to achieving the purpose of the formal and aesthetic construction of the stanza, be able to involve his listener as the theme of the poem.

All this happens watered by true linguistic adventures among the infinite possibilities that language gives us when it is combined with the total freedom of the word transformed into poetry. Leite Filho (1982), in whose work the stanzas that we have selected for analysis are recorded, clarifies the value of the context in which the stanzas were elaborated and the unique content they bring. According to this author, it is a "poetics of light verse, a technique", in which the poet goes beyond the trivial, since, "because he better impresses the audience with the dexterity of his thought, in addition to improvising, he also does so by exchanging words, meaning, syllables, letters, etc." (Leite Filho, 1982, p. 6).

Improvising verses and improvising puns within those verses, that's what it's all about. Later on, the researcher returns to the theme, detailing and detailing the characteristics of singing suddenly:

To reach the merit of these verses, with the exception of the less informed; it is to be agreed how they were made: improvised, joining, at the same time, meter, rhyme, form, comparative sense in some, satirism and malice in others; this in the same intonation, without stopping to think or memorize beforehand, since in many of them the scarcity of time could not condition this hypothesis (Leite Filho, 1982, p. 9).

These details accentuate the understanding of the phenomenon of the use of puns as a singular mark of the creative genius of the poet and singer Lourival Batista Patriota. In the next topic, we will see the bases of the gender theory used in our analysis.

4 GENRES FROM A LINGUISTIC-RHETORICAL PERSPECTIVE: JOHN SWALES' THEORY

Well known, studied and influential within the field of research of genres in the area of linguistics, the theory and model of analysis constructed by John Swales (1990) were our basis, our reference element and the starting point for the investigation reported in this article. According to Swales (1990), the genre is associated with two other important concepts: discursive community and communicative purpose. First, the discursive community is defined as a socio-rhetorical network formed by participants who have common goals. Next, the genres practiced by the discursive community are endowed with communicative purposes, which consist of the functions or actions that each genre allows to be performed within a communicative situation. Genre is, after all, seen as a concept that encompasses a class of

communicative events, representative of the practices of discursive communities and mobilized by them to achieve their common goals.

From the methodological point of view, the classic contribution of Swales (1990) was the proposition of the CARS Model, an acronym for *Create a Research Space*. As can be seen from the terminology, the model refers to academic writing, and seeks to represent in the form of movements and steps the strategies used by researchers in the preparation of the introduction section of scientific articles. However, the model proved to be productive to the point of inspiring analyses of rhetorical movements of genres in different discursive domains, such as the literary domain and viola singing, to which we are now dedicated.

In the Brazilian context, as Bezerra (2022, p. 76) describes, "John Swales' thinking has grounded and influenced the work of Brazilian researchers at least since the 1990s, when the first gender studies appeared in the country." As the author points out, the methodology of analysis of rhetorical movements (*move analysis*) proposed by Swales has inspired numerous works on various genres.

In a nutshell, the CARS Model suggests the existence of three rhetorical movements in the construction of introductions to research articles, which would be: (1) Establish a research territory, (2) Establish a research niche, and (3) Occupy the niche. This ecological metaphor is proposed as representative of the linguistic-rhetorical strategies employed by researchers when writing their texts, in compliance with the conventions that confer stability to the genre.

In an illustrative way, Bezerra (2017) presents an application of the movement analysis model, based on the particularities of each discursive community and the rhetorical movements used to achieve the conventional communicative purposes of the genre. Bezerra's (2017) analysis is based on a *corpus* of 235 texts, called introductory genres of academic books, such as the introduction, introduction, and preface, which are analyzed together from the perspective of the phenomenon of the colony of genres (Bhatia, 2004). The texts are representative of three different disciplinary areas, namely, Linguistics, Theology and Biology.

Based on this analysis of the more than two hundred texts, Bezerra (2017) elaborates a descriptive model for each introductory genre, inferred from its data. It can be seen that the three models identify the composition of the genres presentation, introduction and preface as constituted by the same set of communicative purposes. However, the description of the genres varies, in subtle differences, when we look at the rhetorical movements carried out in each one. These differences are responsible for the uniqueness of each genre, justifying its mutually distinct existence, although closely related to the others.

Below we reproduce the descriptive models of each of the three genres, and then weave some reflections.

Source: Prepared from Bezerra (2017, p. 68, 73, 77)

From the table, we can observe how the close relationship between discursive community, communicative purpose and genres easily decants from this list of possible rhetorical actions. Let us see that, in the case analyzed, the communicative purposes do not change either from one genre to another, nor from one disciplinary field to another. This stability of communicative purposes characterizes the respective genres as practices legitimized by the discursive communities in which they are inserted. The importance of communicative purposes is such that it functions as a constitutive principle of the genre, determining other equally constitutive aspects, such as the style and structural organization of texts. It is defended by specialists in genre analysis, such as Bhatia (1993), that the differentiation of communicative purposes works as an indication that genres also become mutually distinguishable.

In the table under discussion, we note that the verbs "justify", "summarize" and "conclude" remain as an expression of the communicative purposes of genres linked to the discursive community of academia. Although the rhetorical movements may vary among the genres of the colony, as well as in the respective disciplinary areas, the communicative purposes permeate with some common measure the genres that circulate in this milieu. This happens because they use a similar lexicon, with differences typical of each disciplinary context, and make use of the relationships, traditions, and values of the same academic discourse, or of the same discursive community in a broad sense.

It is interesting that they are introductory genres from the point of view of the whole work (book), but internally, as autonomous texts that they are, they need to unite basic

elements of introduction, development and conclusion, the basic structure for the formation of a, let's say, coherent text. The verbs that assume the internal structural role of symbolizing this set of intratextual movements are in the rhetorical movements and not in the communicative purposes, which designates being in more flexible parts of the genres, those that can change according to the disciplinary field. But at the same time that they can float, they need to draw the aforementioned classic structure of introducing, developing, and concluding. Define, establish, inform. They are verbs linked to the introductory part of the genres.

Presenting and discussing is the duo that is repeated throughout the frame as a single rhetorical movement of the communicative purpose of summarizing the content, in principle, the central part and core of the general purpose of the introductory genre, the core of the presentation and promotion discourse that is intended to be carried out. The centrality of this unique movement is interesting. While the introduction and conclusion sessions are populated by various rhetorical movements, the development brings only one movement as the main action. It is as if plurality diluted its importance and singularity intensified its function and responsibility, reserving for entry and closure fewer roles than that of the center, where the real meaning of the text that is constructed is kept.

In the rhetorical movements, however, we easily see differences. Although they are not exacerbated distances, since they are located in the same discursive community, each of the genres and each of the areas brings particularities. The former, due to the precise function they perform individually, although related to the other texts, within the book support; these, by the customs, traditions and values defined by their members as appropriate for each of the sciences and each of the collectivities that locally carry out their activities.

It is this dynamic in the realization of communicative purposes through rhetorical strategies that we seek to capture in our analysis of the stanzas of viola singing, as a sign of the practices of the discursive community of repentista poets and their audiences.

5 METHODOLOGICAL PROCEDURES

For our study, we used the logic of the analysis of rhetorical movements, under the analogy of previously established models, such as the descriptive models of introductory genres exposed and discussed above. These, in turn, as mentioned, have already been built from empirical data and under the original inspiration of the CARS Model (Swales, 1990).

From the analogy with previous models of movement analysis, we sought to elaborate our own model, capable of responding to the unprecedented dimensions of this study, regarding the application of the methodology to verses of popular singing. With the caution

that the situation requires, we make use of such resources as if to try, from something put, consolidated and almost peacefully accepted, to undertake the elaboration of the initial draft of a model that suits our object of study.

As we have already made clear, the models or comparative starting points that we adopt originate in the studies of analysis of rhetorical movements initially outlined by Swales (1990) and Bhatia (2004), illustrated by their application in Bezerra's (2017) study on introductory academic genres. And what we pursue, from an analogical perspective and comparative investigation, is to analyze the rhetorical movements of a *corpus* of stanzas by the poet Louro do Pajeú in which the resource of puns was used.

20 stanzas were analyzed that internally and externally contain some elements of homogeneity. These elements of unification and homogeneity allow us to seek the regularity necessary for the deduction of a model of analysis of rhetorical movements appropriate to the object. These are stanzas that have already gone through a selection screen, which led them to be included in the work entitled *Louro do Pajeú: o rei dos pundilhos*, an independent publication of 1982, the result of research carried out by the poet, folklorist and researcher Aleixo Leite Filho.

All the texts are characterized as sextillas, the most characteristic genre of viola singing, and all were elaborated in some moment of direct and real-time interaction between Lourival and the audience. Almost always, a listener is the theme or even an important part of the stanza. It is worth noting that the fact that all stanzas have the same length sets a non-negotiable limit of six verses of seven poetic syllables for each set of rhetorical movements, which guarantees a structural element common to all texts and a consequent equality of realization for all utterances in which the common movements of construction and achievement of each communicative purpose will be sought.

6 THE RHETORICAL ORGANIZATION OF SEXTILLAS AND LOURIVAL BATISTA'S PUNS

As a result of the analysis of the stanzas that make up our *corpus*, we arrived at a descriptive picture of the communicative purposes and rhetorical movements manifested in the sextiles built on the basis of puns, improvised, by the poet Lourival Batista. At first glance at the picture, however, it is clear that we were faced with the need to propose some innovations or adaptations in the identification of peculiarities of purposes and movements.

Table 2

Rhetorical organization of the sextiles with puns by Lourival Batista

PRIOR COMMUNICATIVE PURPOSE	START THE PUN
Introductory rhetorical movements (1 and 2)	Choose a word, a concept, an idea or even a scene that is happening as a reference for the textual construction
Accessory or structural rhetorical movements (3)	Establishing a lexical and semiotic zone Build one or more of the six mandatory lines by finding the rhyme and meter that fit the pun
CORE COMMUNICATIVE PURPOSE	MAKE THE PUN
Major rhetorical movements (4 to 12)	Turning one word into another Turn two words into one Turn one word into two
Accessory or structural rhetorical movements (13)	Remove and add syllables, letters and accents. Use of alliterations Using paradoxes between ideas and words Using phonetic approximations Polysemy using Use of paronyms and homonyms Build one or more of the six mandatory lines by finding the rhyme and meter that fit the pun
ULTIMATE COMMUNICATIVE PURPOSE	PRESENT THE PUN
Final rhetorical moves (14 to 19)	Present the new formed word or the new made words Display the redone expression Present the inverted idea
Accessory or structural rhetorical movements (20)	Present the concepts in a different relationship from the one they had before the pun Present a new way of looking at a certain person, place or thing Present the deconstruction of something initially said Build one or more of the six mandatory lines by finding the rhyme and meter that fit the pun

Source: Elaboration by the authors

In order to understand these adaptations, some observations seem necessary to us. Unlike the descriptive models of the analysis of introductory academic genres, in which the central communicative purpose was reduced to a single rhetorical movement, in our case it is precisely the central communicative purpose that is carried out by a wider range of rhetorical strategies. We can understand this difference if we take into account that, unlike the academic domain, art, poetry, is significantly open to the boldness and innovation of its enunciator, the poet of the sudden, who is a master of the word.

Equally diverse are the rhetorical possibilities for the realization of the final communicative purpose, in which the poet can choose one or exceptionally more than one among a series of rhetorical movements. This fact is also understood when one notes the plurality of possibilities of the movements of the central purpose, with their consequences for the final communicative purpose. If for each action we have a result or consequence, the diversity of the second communicative purpose is reflected in the movements of the third. It is important to remember that only very parsimoniously will more than one movement be used to achieve each purpose, since six verses of seven syllables configure little space for such possibilities. The aspect of stability in the length of the text is responsible for the imagetic synthesis of poetry, an element that aesthetically highlights its value as a form of language.

Finally, we call attention to the existence, in all communicative purposes, of what we call accessory or structural rhetorical movements. It is important not to forget that we are dealing with an environment of aesthetic creation, which requires observing syllabic, phrasal and lexical conditions. This fulfillment is guaranteed by the rhetorical movement that enables the poet to give due attention to the formal singularities of the genre in which he is participating, as well as keeping it connected with the liturgy of singing. This rhetorical movement, possible in the initial, central and final communicative purposes, is described as accessory because it does not directly contribute to the elaboration of the pun, and it is also structural, or even structuring, because it helps the poet to formally organize the verses according to the structure and stabilized conventions of the sextile genre. Also in this accessory or structural/structuring movement are the episodes of the poet's praise of his own verve and capacity, in addition to the requests for payment directed to the listener. This aspect also reverberates the promotional discourse identified by Bezerra (2017) in his work on academic genres.

Let us see, below, some examples in which, to facilitate the understanding of our analytical procedures, the colors used in Table 2 are resumed in the verses of each stanza.

In this way, the color of the line or verse signals the respective communicative purpose and rhetorical movement.

Example 1: Stanza 4 (p. 12-13)

After the praise of the violists to a sergeant, promoting him to Lieutenant and Captain, without any result, the poet reacted:

This one will never be
Neither captain nor lieutenant
The gal he deserves
It's a different gallon
It's a dick with two cans
One behind the other in front

As the colors suggest, the first two verses serve as a preparation for the poet to find the rhyme and meter on which the pun will be based. It is movement 3, seen as accessory or structural/structuring of what follows. The third line expresses movement 1, in which the poet selects an idea or concept to erect the pun on it. The fourth line explores the homonymy of the term "galão", already within the scope of the central communicative purpose, performing the rhetorical movement 12. Concluding the stanza, the last two verses correspond to the final communicative purpose of presenting the pun, which is done through the rhetorical movement of re-presenting the concept of gallon in a different way than originally mentioned (movement 17).

A similar structure is verified in the next stanza, as indicated by our color code, which somehow points to a certain stability of the rhetorical strategies employed by the singer:

Example 2: Stanza 9 (p. 15)

In the city of Teixeira, when he was singing with the famous singer Severino Pinto, a driver named Pedro Compasso entered the hall, making a racket and getting drunk.

Ô Pinto pays attention
How the world is changing
Look there Pedro Compasso
How it comes with the wrong step
The other bars scratch
But this one arrived scratched.

However, the poet has a variety of strategies for the construction of his project of saying. Example 3, for example, shows a different rhetorical organization. Let's see:

Example 3: Stanza 19 (p. 24)

Lourival and Pinto sang in the presence of Gilberto Freyre, Câmara Cascudo, Germano da Hora and Aldemar Paiva, at Sítio da Trindade, in 1963, when Pinto asserted:

From Gilberto to us
Big difference has

Laurel:

The difference it has
From Freyre to Lourival:
He, the greatest Sociologist
From our homeland.
I'm also a partner soon
Entering without capital.

Once again, the poet begins the stanza with preparatory verses for the rhyme and the pun he will make in its development (lines in yellow). Then, he presents the initial rhetorical movement in which he categorizes Gilberto Freyre as "He, the greatest Sociologist". Accomplishing communicative purpose 2, the central purpose, he inserts another preparatory line, "From our homeland", and completes the rhetorical movement with the strategy of decomposing the term "sociologist" into "sociologo" (movement 6). Finally, the poet masterfully leads the stanza to the end with the verse "Entering without capital", representative of the rhetorical movement 18 (To present a new way of looking at a certain person, place or thing). In this case, it should be noted, the poet speaks of his own person. However, it also traces a relationship between "capital" and "homeland", in an allusion to the immediate context of the singing.

Table 3 presents the total occurrences of each rhetorical movement classified as the main one in the *corpus* of twenty texts analyzed, and may indicate the rhetorical and creative strategies preferred by the poet.

Table 3

Total occurrences of the rhetorical movements

Prior communicative purpose START THE PUN	Occurrences
M1 Choose word, concept, idea, or scene	18
M2 Choose lexical-semantic zone	03
Core communicative purpose MAKE THE PUN	

M4 Transform one word into another	02
M5 Turn two words into one	--
M6 Turn one word into two	06
M7 Remove and place syllables, letters, and accents	05
M8 Use of alliterations	02
M9 Using paradoxes between ideas and words	04
M10 Using Phonetic Approximations	01
M11 Use of polysemy	07
M12 Use of paronyms and homonyms	02

M14 Display the new word(s) made	06
M15 Display the redone expression	02
M16 Display the reversed idea	05
M17 Present the concepts in a different relationship from the one they had before the pun	04
M18 Present a new way of looking at a certain person, place or thing	03
M19 Present the deconstruction of something initially said	05

Source: Elaboration by the authors

As can be seen, we exclude from the picture the accessory or structural rhetorical movement, which is categorical in the *corpus*, except for a single stanza in which it does not occur. We will return to it later.

In the occurrences as a whole, we noticed a preference for the selection of a lexical item as the basis of the pun, a fact understandable by the very nature of the phenomenon, which is a game, a joke or an experiment with the use of language. It is also important to highlight that the sum of the rhetorical movements exceeds the number of stanzas in the *corpus*, since each stanza includes the realization of three or more movements for the poet's work to be carried out. By way of example, the initial communicative purpose of the twenty stanzas is accomplished, in total, by twenty-one occurrences of the two possible movements, excluding from this account the accessory or structural movement.

In the realization of the central communicative purpose, the rhetorical movements are more diversified in their occurrences, with a slight predominance of movements 6 and 11, namely, "transform one word into two" and "use polysemy", respectively. In the general framework of the central communicative purpose, to "make the pun, the sum of the rhetorical movements is more expressive than in the initial purpose. We perceive, therefore, the mobilization, on the part of the poet, of two or more rhetorical movements for the construction of a single pun. This aspect seems remarkable to us, considering the small space it has in the stanza, as it highlights the dynamic character of rhetorical and aesthetic creation.

The final communicative purpose, in which the pun is presented in its creative fullness, becomes evident as the place of the new, avoiding the mere exercise of verbal juggling. It is not a simple play on words, but the construction of coherence in the artistic discourse. The pun, in this way, is configured as a sophisticated enhancement for what the singer intends to say or, in terms consistent with our theory of genres, for the realization of the social action represented by singing as a linguistic and cultural activity.

In short, in just one stanza, the poet establishes himself in the essential pun, in him and for him. The ultimate communicative purpose of the pun-based sextile represents the apex of the creative process, in which the pun constitutes the new born of the artistic experiment. Also in this final communicative purpose, the rhetorical movements occur in greater quantity than the stanzas, combining to make it possible to carry out the action of presenting the finished pun.

Finally, it is worth making some observations about the rhetorical movement that we call accessory or structural, which can occur together with any of the three communicative purposes, be it initial, central or final. Table 4 presents a mapping of how many lines per stanza are used to perform this basic movement.

Table 4

Occurrences of the accessory rhetorical movement

Accessory or structural rhetorical movement Build one or more of the six mandatory lines in the stanza, finding the rhyme and meter that fit the pun	
Number of lines per stanza	Occurrences
No line	01
01 line	04
02 lines	07
03 lines	08

Source: Elaboration by the authors

It is immediately noteworthy that the singer dedicates considerable space in most of the stanzas to the structuring and preparation of the pun: in fifteen stanzas, two or three lines are dedicated to this purpose. A smaller number of stanzas, only four, uses only one line for accessory movement. And an apparently atypical case is represented by Stanza 3, in which the accessory rhetorical movement does not occur:

Example 4: Stanza 3 (p. 12)

From one of his calls to the listeners, this sudden suddenness originated:

I put the "d" and I put the "e"
 I put the "c" and I put the "a"
 Then an acute accent
 Instead of Deca it's deca;
 I take the "d" and I take the "e"
 Be Deca, come here!

In this stanza, everything is game and pun, without the use of accessory verses. The rhetorical movements related to the initial, central and final communicative purposes follow one another, totally supported by the creative work of the pun.

As a general rule, however, because it is the movement responsible for the poet's obedience to the literary and aesthetic demands of this genre of poetry, our *corpus* indicates that it is exceptional that it is not present, because although it does not constitute the pun itself, it guarantees it the formal (structural) basis, while serving its realization, conditioned by the poet's rhyming options and lexical choices. Let us think that, when it occupies three lines of the stanza, this means half of the sextile, which demonstrates its importance for the realization of the communicative purposes of the genre. Thus, it is possible to affirm that this movement constitutes the foundation for the construction of the others.

We will then see how the preparation for the pun occurs in rhetorical movements of different lengths, starting with the one in which the poet dedicates only one verse to this purpose.

Example 5: Stanza 13 (p. 18)

At the time of the death of St. John XXIII, he was singing with his other brother, Otacilio, when he commented:

The month has come to an end
 And the Pope no longer exists.

Lourival:

In all this, the saddest,
They both died at once;
The month is over with the Pope
And the Pope at the end of the month!
The month being thirty-one
And the Pope was twenty-three.

As can be seen, only the initial line, "in all this, the saddest", is dedicated to the accessory/structural movement. About this introduction, within the previous communicative purpose of starting the pun, the singer builds all his reasoning around a game between the end of the month and the end of the pope's life. In the following example, however, Lourival Batista dedicates not just one, but two lines of the stanza to the same purpose.

Example 6: Stanza 18 (p. 22)

At the house of the poet João Batista de Siqueira (Cancão), the celebration was animated by the presence of several singers, including: Manoel Chudú, Jó Patriota, Lourival Bandeira and Lourival Batista. The last two were exchanging friendly matches when Dr. José Gomes dos Passos arrived at the venue.

Bandeira finished the stanza:

The Prosecutor has arrived
To bring us the best

Batista added:

I myself have perked up now
Spotting the Prosecutor:
Because we know it ourselves,
Pro is in our favor,
With the dynamo of Law
He starts the engine.

In this example, the accessory rhetorical movement is distributed between the first and third lines of the stanza, maintaining its function of supporting the elaboration of the pun. Finally, in the next example, this function extends over three lines, half of the stanza.

Example 7: Stanza 10 (p. 16)

Severino Pinto was comparing himself to a painter, in relation to his verses, when he finished:

Regarding the landscape,
It is a fruitful idea

Then Louro replied:

Saturday, Sunday, Monday
Tuesday, Wednesday and Thursday
On Friday not missing me

The canvas, the brush, the paint
Paint painting what I paint
I paint what Pinto paints

The dynamic and flexible way in which rhetorical movements are manifested, in order to enable the realization of the respective communicative purposes, in the case of our *corpus*, is consistent with what the literature predicts, as shown by some considerations made by Bezerra (2017). According to the author, the simultaneous occurrence of movements is not mandatory, given the only relative stability of any and all genders, but it is possible, as we have seen. Also according to the researcher, there are cases in which movements are presented "in very different and variable ways, denoting the use of diversified rhetorical strategies, which seek to meet different demands related to social practices implied by the production, use, and reception of gender" (Bezerra, 2017, p. 67). In the social practice of viola singing, and particularly in the construction of sextiles based on puns on Louro do Pajeú, we find that this is exactly what it is about.

Since the text is a dynamic process and the genre is a plastic and malleable communicative event, there is nothing that guarantees an absolute order of realization of rhetorical movements, despite the stability of the communicative purposes in our *corpus*. The dynamic character of the language in use, the particularities of the contexts and, in our case, the creative freedom of poetry, generate movements that accompany subjectivity and singularity and do not only reproduce conventions. Rather, they stamp the novelty of the moment lived between the artist and his audience, responsible for the multiplicity and plurality of rhetorical movements mobilized for interaction.

7 FINAL CONSIDERATIONS

In this study, our objective was to carry out an exploratory study of the pun genre in viola singing in the light of the gender theory based on Swales (1990), applying the method of analysis of rhetorical movements to a *corpus* of sextillas, a very typical and popular genre in viola singing. In addition, we directed the focus of the analysis to the work of the poet Lourival Batista Patriota, Louro do Pajeú, selecting the sextiles by the criterion that they were built based on puns and, of course, made improvised.

Thus, what we did in this work, in a way, as far as we know, unprecedented, was to apply to a genre of the poetic discursive domain a theory of genres and a methodology usually used for the study of genres of academic writing. We understand that this analytical exercise proved to be fruitful and productive, with the potential to shed new light on the study of the poetic text and particularly of viola singing.

The look at Louro's sextiles, and particularly at the way in which the poet constructs the puns in them, from the perspective of the communicative purposes and rhetorical movements of the genre, reinforces the particularities of the artistic creative process, emerging from the concrete situations in which the stanzas were made. These situations, on the other hand, are tributaries of the complexity and dynamism of the contexts in which the social practices of the discursive community that loves viola singing are developed, which will ultimately contribute to shaping the communicative purposes carried out by the genre.

As for the analysis of rhetorical movements in the stanzas of sextillas based on puns, we found that the dynamism and versatility of the poetic work are maintained and stand out even in the face of the considerable formal stability of the genre, translated into the requirement of meter, rhyme and number of verses. With the support of a structural/structuring rhetorical movement, the initial, central and final movements of the sextile are constituted, in Louro do Pajeú's work, in an innovative way and always capable of surprising the audience present at the singing. According to the records made of the oral event of the singing, a later and potentially larger audience, formed by listeners of eventual audio recordings or by readers of anthologies such as that of Leite Filho (1982), will continue to be surprised by the poet's creative strategies, strategies that are also of a constitutively rhetorical nature.

Because we recognize the inexhaustibility of poetic talent and the inexhaustible capacity for reinvention of artistic language, we do not intend, with this study, to offer a ready-made and finished model of analysis. We believe, however, that the analysis presented here constitutes a starting point and a sign that new perspectives on the genres of singing are possible. These new perspectives may be extended, in future studies, including to test the effectiveness of the model, to the rest of Lourival Batista's work and, of course, to the work of other memorable names in northeastern oral poetry.

ABSTRACT

The water crisis represents one of the main contemporary socio-environmental challenges, associated with climate change, environmental degradation, and unsustainable models of water use. In the Brazilian context, despite the country's wide water availability, these processes occur unevenly across the territory, intensified by deforestation, water pollution, and structural deficiencies in basic sanitation. Within this framework, this article analyzes the application of the Problem-Based Learning (PBL) methodology in teaching about the water crisis in the municipality of São José de Ubá, in the state of Rio de Janeiro, with ninth-grade elementary school students. The study adopts a qualitative, exploratory, and descriptive approach, using participant observation and field diary records throughout a pedagogical project developed over six in-person meetings. The results indicate that PBL promotes meaningful learning by articulating scientific knowledge with local experiences, fostering autonomy, collaboration, and critical thinking. A cognitive shift was observed, as students moved from fragmented explanations toward a broader understanding of the water crisis, incorporating structural factors such as deforestation, pollution, and the lack of sanitation. The study concludes that PBL has significant potential for addressing environmental themes in elementary education by integrating school, community, and territory, thus reaffirming the transformative role of education.

corpos d'água e fragilidades no saneamento básico. Diante desse cenário, este artigo analisa a aplicação da metodologia Aprendizagem Baseada em Problemas (ABP) no ensino da temática da crise hídrica no município de São José de Ubá, no estado do Rio de Janeiro, com estudantes do 9º ano do Ensino Fundamental. A pesquisa adota uma abordagem qualitativa, de caráter exploratório e descritivo, utilizando a observação participante e registros em diário de campo ao longo de um projeto pedagógico desenvolvido em seis encontros presenciais. Os resultados indicam que a ABP favorece a aprendizagem significativa ao articular conhecimentos científicos às vivências locais, promovendo autonomia, colaboração e pensamento crítico. Observou-se um deslocamento cognitivo dos estudantes, que passaram de explicações fragmentadas para uma compreensão mais ampla da crise hídrica, incorporando fatores estruturais como desmatamento, poluição e ausência de saneamento. Conclui-se que a ABP apresenta elevado potencial para o ensino de temáticas ambientais na Educação Básica, ao integrar escola, comunidade e território, reafirmando o caráter transformador da educação.

RESUMEN

La crisis hídrica constituye uno de los principales desafíos socioambientales contemporáneos, vinculada al cambio climático, a la degradación ambiental y a modelos insostenibles de uso del agua. En el contexto brasileño, a pesar de la amplia disponibilidad hídrica, estos procesos se manifiestan de forma desigual en el territorio, agravados por la deforestación, la contaminación de los cuerpos de agua y las deficiencias estructurales en el saneamiento básico. En este marco, el presente artículo analiza la aplicación de la metodología de Aprendizaje Basado en Problemas (ABP) en la enseñanza de la crisis hídrica en el municipio de São José de Ubá, en el estado de Río de Janeiro, con estudiantes de noveno grado de la educación primaria. La investigación adopta un enfoque cualitativo, de carácter exploratorio y descriptivo, utilizando la observación participante y registros en un diario de campo a lo largo de un proyecto pedagógico desarrollado en seis encuentros presenciales. Los resultados indican que el ABP favorece el aprendizaje significativo al articular el conocimiento científico con las experiencias locales, promoviendo la autonomía, la colaboración y el pensamiento crítico. Se observó un desplazamiento cognitivo de los estudiantes, quienes pasaron de explicaciones fragmentadas a una comprensión más amplia de la crisis hídrica, incorporando factores estructurales como la deforestación, la contaminación y la ausencia de saneamiento. Se concluye que el ABP presenta un alto potencial para el abordaje de temáticas ambientales en la educación primaria, al integrar escuela, comunidad y territorio, reafirmando el carácter transformador de la educación.

1 INTRODUCTION

Water is a universal common good, essential for the maintenance and balance of ecosystems in general and the planet itself (Rhoden *et al.*, 2016). According to the National Water and Basic Sanitation Agency (ANA), it is estimated that of all the vast amount of water that exists in the world, 97.5% is salt and 2.5% is fresh water; However, of this 2.5%, only 1% corresponds to the resource of rivers and lakes, the most accessible form for human consumption⁴. The rest of the fresh water is mostly in the polar caps and on mountains in the form of snow and ice. These quantities focus on other important issues for the balance of the planet and the future of humanity, such as: scarcity, power, food sovereignty, among others. In 2015, data from the Food and Agriculture Organization of the United Nations (FAO) indicated that more than 40% of the world's population already suffered from water shortage, and with the weather forecasts, this percentage would tend to jump to 2/3 of the population in 2050 (FAO, 2015).

Over the years, there has been an increase in the complexity of the various uses of water and, with it, a wide dimension of pollution and degradation (Soares; Souza, 2020). In the last century, "freshwater consumption has increased 6-fold [...] and continues to advance at a rate of 1% per year, as a result of population growth, economic development, and changes in consumption patterns" (UNESCO, 2021). On this argument, the conclusions of Tundisi and Matsumura-Tundisi (2011) and the ANA report (2023) highlight that some of the fundamental factors responsible for the water crisis in the world are associated with population growth. Added to this, there is still the loss of water containment instruments that occur through some situations such as: deforestation, elimination of flooded regions, reduction in the volume of rivers and lakes due to the accumulation of sediments, among others.

In view of this scenario, the scientific literature has widely pointed out the need for improvements in the models of planning and management of water use. In general, studies highlight that the planning and management of water resources aim to promote the sustainable use of this asset, mitigate the impacts associated with changes in land use and occupation, and strengthen conservation practices, in order to reduce waste and inappropriate use of water (Locke, 2024; Wang, 2025). To this end, it is important to preserve water resources, based on the promotion of educational, constructive and awareness-raising activities (Balbinot *et al.*, 2008; Lanes *et al.*, 2022a). In this sense, a notable progress for the management of water resources in Brazil was Law No. 9,433/97, which established the

⁴ More information on this topic is available at <https://www.gov.br/ana/pt-br/aceso-a-informacao/acoes-e-programas/cooperacao-internacional/agua-no-mundo>.

National Water Resources Policy and instituted, in Brazil, the National Water Resources Management System, based on its article 1:

- I - Water is a good in the public domain;
- II - Water is a limited natural resource, endowed with economic value;
- IV - The management of water resources must always provide for the multiple use of water;
- V – The hydrographic basin is the territorial unit for the implementation of the National Water Resources Policy and the performance of the National Water Resources Management System;
- VI – The management of water resources must be decentralized and count on the participation of the Government, users and communities. (Brazil, 1997)

Within the scope of recent international policies and treaties on water, the new political approach of the Sustainable Development Goals (SDGs) comprises the economic, social and environmental spheres, as part of a new sustainable development program, called the 2030 Agenda (UN, 2019). The 2030 Agenda is an action plan that points out the 17 SDGs and, in detail, their 169 goals to end poverty and provide dignity for all within the limitations of the planet. These are objective goals for all countries to integrate water management among their priorities and also to work in universal cooperation to benefit people's lives in the present and future (UN, 2020).

According to the 2030 Agenda, among the 17 SDGs is goal 6 "Drinking Water and Sanitation", which aims to ensure the availability and sustainable management of water and sanitation for all. Based on this objective, this article focuses primarily on target 6.7b: "to support and strengthen the participation of local communities to improve water and sanitation management" (UN, 2019). Therefore, this article places at the center of the discussions some ways to stimulate the participation of students in the management of water resources, based on an environmental demand in the city of São José de Ubá, in the state of Rio de Janeiro.

With this contextualization, this article aims to analyze the application of the Problem-Based Learning (PBL) methodology in the teaching of the water crisis theme, in the municipality of São José de Ubá, with a class of the 9th grade of Elementary School at the Maria Leny Vieira Ferreira Silva State School. The proposition of the use of this methodological approach takes place within a panorama of problematization and obligation to address the environmental themes provided for in the National Policy of Environmental Education, Law No. 9.795 of April 27, 1999 and in the National Common Curricular Base (BNCC), among other normative frameworks of Brazilian education.

In this sense, the educational approach to water resources and other environmental components should be present in school educational curricula and, therefore, in all stages of

school education (Lanes *et al.*, 2022a). Therefore, the relevance of this article is to contribute to the strengthening of active methodologies in Basic Education, expanding the debate on the role of the teacher as a mediator of knowledge. In addition, the article highlights the need for pedagogical practices that integrate cognitive, ethical, and socio-environmental dimensions of school education, in which water can be understood as a central element for the promotion of critical education that allows the articulation of scientific content, social issues, and contemporary challenges related to sustainability. The inclusion of the theme of water in the school daily life favors the development of socio-environmental awareness and the responsible use of this resource (Lanes *et al.*, 2022b).

2 PROBLEM-BASED LEARNING (PB): METHODOLOGICAL DESIGN OF THE RESEARCH

Problem-Based Learning (PBL) is a type of active methodology, through which students act in a participatory way in the construction of their own knowledge, with all attention focused on their learning (Glasgow, 2019). According to Moran (2018, p. 4) "active methodologies emphasize the student's leading role, their direct, participatory and reflective involvement in all stages of the process, experimenting, drawing, creating, with the guidance of the teacher". In PBL, students relate collaboratively with a view to the elaboration of knowledge and, therefore, attribute to the teacher the role of mediator who intervenes in their group dialogues. In this process, the focus is on the students' learning independence and not on the practice of teaching, as knowledge is built as a result of this relationship (Maidame, 2018; Alves *et al.*, 2025).

To contextualize, it is important to emphasize that PBL was initially implemented by the McMaster University School of Medicine in Canada in 1969, and by the University of Maastricht, in the Netherlands in the 70s (Souza; Dourado, 2015; Pereira Ronn *et al.*, 2019). After that, this methodology underwent modifications to adapt to other teaching contexts, being built as a result of the efforts of professors and coordinators of these institutions to fill some gaps in traditional teaching, especially those related to learning in medical courses and professional medical practice (Souza; Dourado, 2015). In Brazil, the State University of Londrina (UEL) and the Faculty of Medicine of Marília (FAMEMA) were the first institutions to apply this methodology, and then other institutions also adopted it (Araújo; Arantes, 2009).

For a differentiation between PBL and traditional teaching, the literature indicates that in traditional methodological perspectives the teacher occupies the center of the pedagogical process, transmitting knowledge considered finished and students assimilate it in a passive position and, thus, thinking and taking initiative are not encouraged (Glasgow, 2019).

Regarding passive learning, Ribeiro (2010, p. 9) points out that "there is a consensus that this (traditional) methodology is no longer able to promote the meaningful learning of conceptual knowledge". For this reason, the author adds that such a methodology cannot encourage the development of other types of knowledge and skills, valued and demanded in professional and social life (Ribeiro, 2010).

Based on the theoretical debate presented, the research understands that traditional teaching methods do not favor the confrontation of the problems of our time, especially environmental problems. Thus, school educational processes need to stimulate the strengthening of participatory societies and, with this, develop responsible, scientific, critical and creative thinking, committed to the civilizing process. In the search for these competencies, the National Common Curricular Base (BNCC) emphasizes the importance of exercising intellectual curiosity in Elementary School, using the approach of Science (Brasil, 2017). In other words, to include "inquiry, reflection, critical analysis, imagination, and creativity, to investigate causes, to elaborate and test hypotheses, to formulate and solve problems, and to create solutions [...] based on the knowledge of different areas" (Brasil, 2017, p. 9).

Within this context, PBL has been gaining ground as an active methodology that has shown important results in the process of knowledge production, particularly in higher education (Maidame, 2018; Pereira Ronn *et al.*, 2019; Alves *et al.*, 2025). However, this methodology is still little known in the context of Basic Education in Brazil and, when known, it continues to be little implemented and explored (Lopes *et al.*, 2019). This means a loss of opportunity to address environmental problems of everyday reality, in a contextualized and territorialized way, without losing sight of the central element of the teaching-learning process; that is, the applicability of knowledge in the reality experienced by students.

Research carried out both in Higher Education and in Basic Education – by Sales, Del and Sales (2013), Maidame (2018), Pereira Ronn *et al.* (2019), Alves *et al.* (2025) – positively evaluated the use of PBL. The results of these studies showed that the participants showed acceptance of the methodology, as well as that it enabled the development of problem-solving skills, allowed self-learning and encouraged the search for knowledge. In turn, in the studies of Borochovcicius and Tortella (2014) the results highlight that the conquest of knowledge begins with the presentation of a problem-situation, very close to the reality of the students. Therefore, the fact that there is no predetermined resolution leads to the emergence of doubts and questions, which stimulate reflective activity that, at the same time, will direct the student to a probable solution of the proposed problem.

The possibilities of developing the scientific, critical and creative thinking of students

was decisive for the choice of the methodological approach of PBL in this research. Although this methodology has its origin in teaching in the medical field, its foundations are consistent for it to be worked on at other levels of education and areas of knowledge (Ribeiro, 2010; Borochovcicius; Tassoni, 2021). In this adaptation, the research that originated this article took place at the Maria Leny Vieira Ferreira Silva State School, located in the city of São José de Ubá, in the Northwest region of the state of Rio de Janeiro. The empirical work was carried out from the execution of a research project entitled "Our daily water: preserving the life of tomorrow",⁵ which included 6 face-to-face meetings lasting three hours each, totaling 18 hours of activities.

In accordance with the qualitative approach, of an exploratory and descriptive nature, in addition to the objective already presented, this article seeks to explore the understanding of the meanings attributed by students to the learning experience, rather than to quantify its results (Mónico *et al.*, 2017). Likewise, this article aims to fill an existing gap regarding the low use of APB in Basic Education and, consequently, the low scientific production on its use in this educational stage (Borochovcicius; Tassoni, 2021). For this reason, it assumes the exploratory approach as an empirical horizon, given the low expressiveness of research of this nature (Lopes *et al.*, 2019). Additionally, it assumes a detailed description of the actions, procedures, stages and results, in order to provide a broad overview of the process of applying PBL in Elementary School, based on an environmental problem. This description will not only allow the analytical construction of the results, but will also allow the replication of the research in other contexts and with other themes within the scope of Basic Education.

The empirical work of the research had the participation of 21 students from the 9th grade of Elementary School. The criteria for selecting the subjects included: a) voluntary participation in the activity; b) regular attendance in Science classes; c) authorization of those responsible, as determined by Resolution No. 510/2016 of the National Health Council (Brasil, 2016). These 21 students were protagonists in the two stages of the study: a) *theoretical approach* – active construction of knowledge about the water issue of the municipality made possible by the PBL; b) *practical activities* – dissemination of some of the results obtained in the first phase of the project through posters, making of a handmade dripper and distribution of tree seedlings for reforestation. The first stage of the research was structured based on two main questions, which constitute the main results of this article. The organization overview of this step can be seen in Figure 1.

⁵ This research meets all ethical protocols for research involving human beings, being registered under CAAE 38937320.8.0000.5288 and with project approval by opinion 4.323.811.

Figure 1

Problem-Based Learning: phases and activities carried out

Source: Elaboration by the authors (Research data, 2025).

The six phases of the first stage of the research, as described in Figure 1, were planned and executed according to the literature that studies the applicability of APB (Borochovicius; Tortella, 2014; Conrado *et al.*, 2014; Silva *et al.*, 2015). Methodologically, the research was built based on the descriptive qualitative approach, precisely: on the observation, description and interpretation of the phenomenon studied (Mónico *et al.*, 2017). For this, we used the field diary as an instrument for data production, complemented by a record of the students' speeches and observations of the researchers recorded at each stage of the development of the research. For the organization and interpretation of the material, the methodological approach of Thematic Analysis was used, since it allows the identification of relevant patterns and themes from the textual data, that is, it enables the identification of deep meanings in the descriptions of the phenomena (Braun; Clarke, 2006). Therefore, the Thematic Analysis allowed the organization of the thematic categories related to the perception and response of students about the water crisis, group work and interdisciplinary learning.

In order to ensure the reliability and validity of the data, the triangulation of the information was adopted, taking as reference: observations, statements, written records and results achieved with the application of PBL. Such triangulation met the functionality of seeking convergences and divergences in the meanings expressed by the research participants (Flick, 2018). In this sense, following the steps indicated by the theoretical framework adopted in the article, the process of applying PBL was guided by the following problem questions: What are the possible reasons for the lack of water in the municipality of

São José de Ubá? And what are the possible ways to solve these problems?

Both questions subsidized the development of the research, whose scientific relevance is inscribed in the scope of environmental studies and active methodologies. In a broader perspective, the results were organized into three emerging thematic categories, based on thematic analysis: *understanding the environmental problem*; *autonomy* and *collaboration in learning*. Each of these categories reflects the way students experienced PBL and articulated knowledge with their daily experiences.

3 RESULTS AND DISCUSSIONS

In PBL, the presentation of the problem, associated with the students' reality, is essential for the success of the later stages (Silva *et al.*, 2015; Borochovcicius; Tassoni, 2021). With this, the students who led the research discussed the problem in small groups – in this case, in 3 groups of 7 students – where they raised hypotheses to explain the problem, and such assumptions were based on the use of previous knowledge. After these two stages, presentation of the problem and formation of the working groups, a survey was carried out of the gaps that still needed to be studied, as well as the formulation of the new learning objectives, which will be detailed in Figure 1.

Subsequently, the students followed the following steps: *a)* they sought different sources of information; *(b)* they made individual studies on the selected themes; *(c)* discussed these contents in groups; and, *d)* established a consensus regarding the resolution of the problem. During the development of all stages, periodic evaluations were carried out through observation about the development of the methodology, since "in PBL, evaluation is part of the learning process and the production of individual and group knowledge" (Souza; Dourado, 2015, p. 196). Likewise, the role of tutor teachers in all stages of PBL was maintained; that is, the role of mediator and facilitator, guiding the students' activities and valuing the cooperative elaboration of knowledge, where each student contributes to the construction of learning processes on the topic studied (Maidame, 2018).

3.1 BRAINSTORMING: UNDERSTANDING THE ENVIRONMENTAL PROBLEM

In PBL, the *Brainstorming stage* – in this article, showers of ideals – is presented as an essential element to encourage divergent thinking and cognitive collaboration about the problem to be solved. The term brainstorming refers to one of the stages of the PBL methodology where students must expose their flow of ideas in relation to the exposed theme, and this flow is based on previous knowledge and common sense (Conrado *et al.*, 2014). In this stage of the empirical work, we showed two videos, whose theme was the care of water:

the episode of Chaves in cartoon and Juca Pingo D'água. In the mediation process, we presented the objectives of the project to the class and associated the problem issue with the city where the adolescents live. After that, we exhibit some photos of the region of São José de Ubá demonstrating the last drought that the municipality and region went through. Afterwards, the students were encouraged to debate about the central issues related to the videos and photos, and received a sheet to write down their ideas while debating as a group. Based on the information obtained, we prepared a word cloud graph, the results of which can be seen in Figure 2.

Figure 2

Brainstorming: students' perceptions of the lack of water

Source: Elaborated by the authors. Research Data (2025).

The data shown in Figure 2 represent the words most cited by the students in the brainstorm and, therefore, these themes began to guide the development of the project, namely: drought and lack of water; pollution and springs. Regarding the first, drought and lack of water, it is worth mentioning that the municipality of São José de Ubá has a dry tropical climatic type, presenting a negative annual water balance. In the period from February to October, evapotranspiration is greater than precipitation, causing water shortage for most of the year, in addition to the occurrence of dry spells with a notable frequency (Lumbreras *et al.*, 2011). The average annual rainfall in the municipality is 1172 mm (Gonçalves *et al.*, 2006; Noronha *et al.*, 2016).

In addition to the significant dry season, the region still has vast areas predominantly occupied by pastures, few forest remnants and a high degree of soil degradation, which characterizes environmental problems (Lumbreras *et al.*, 2011). Historically, the practice of deforestation in recharge regions, as well as in soil areas with low agricultural propensity and

in riparian forest regions, causes relevant losses of soil, nutrients, organic material and, especially, water, which is closely related to the drought of numerous springs in the municipality (Freitas *et al.*, 2001). Vegetation destruction in the region is worrying, since in the period between 2013 and 2014 only 5% of the extension of the municipality of São José de Ubá was covered by Atlantic Forest, which is equivalent to 1,205 hectares (TCE-RJ, 2016).

With regard to water pollution in the city of São José de Ubá, a theme often evoked in the students' brainstorming, as it is a mostly agricultural area, there are diffuse sources of water contamination in the municipality. Conventional tomato cultivation is significant in this city, associated with the use of pesticides that, in most cases, are applied inappropriately, contaminating rivers and springs (Carneiro *et al.*, 2015). Remnants of these products are retained in the soil and, with rain, they can reach the groundwater and/or be carried to surface waters, thus causing their pollution and degradation (Soares; Souza, 2020). These elements reveal that the students were able to associate everyday issues with the study problem in the first stage of PBL – *brainstorming*.

The research data reveal that the central themes of the environmental problems of São José de Ubá were evoked by the students, which demonstrates that these situations are part of their realities and that they were contextualized in the development of the methodology. Still on the pollution of water, rivers and springs, the ABRASCO dossier released in 2015 warns about the impacts of pesticides on health and the environment (Carneiro *et al.*, 2015). Despite the warnings, between 2019 and 2022, Brazil experienced the highest number of registrations of new pesticides for a presidential administration, since 2003; that is, the release of 2,182 new pesticides (Firmino *et al.*, 2024).

Additionally, among the various forms of water pollution and contamination listed by the students, in the municipality of São José de Ubá sewage treatment is not carried out in urban and rural spaces. Therefore, the waste is dumped *in natura in the* floodplains and water bodies of the municipality, and can even affect the water located in the wells, especially in the rural area, with a view to the domestic supply of residents (Rio de Janeiro, 2015). Thus, the data presented in this article, obtained through the brainstorming, reveal that the students are not oblivious to the environmental problems of the municipality, since pollution appears at the center of their concerns.

The main results in this stage indicate that the students, initially, presented a fragmented understanding of the water crisis, attributing it to the lack of rain or domestic waste. However, throughout the process, the broader structuring dimensions of the problem were integrated, such as: deforestation, contamination of rivers and inequality in access to water. This cognitive displacement demonstrates the power of PBL as a mediator of

meaningful learning, since the students reformulated their hypotheses based on dialogue and collaborative research. This corroborates the idea that learning occurs when new information is integrated, in a non-arbitrary way, into the pre-existing cognitive structure (Silva *et al.*, 2015). During the group discussions, one of the students said: "*we always think that there is a lack of water because the people spend a lot, but now I understand that the problem is bigger, it comes from the companies and the forests that have been cut down.*" This statement translates the conceptual advance provided by the method, revealing the transition from common sense to a critical reading of reality.

3.2 GENERATION OF HYPOTHESES AND OBJECTIVES: AUTONOMY AND COLLABORATION IN THE ABP

In *the second* and *third* phases of the research, the students were invited to develop hypotheses for the problem questions, create learning objectives and, thus, achieve these objectives through research. After the brainstorming, the students began to debate, in their respective working groups, the two central issues to be solved. At this stage of the research, students were invited to answer the problem questions only using their previous knowledge, without using any means of research, as adopted in the studies by Borochovcicius and Tortella (2014), Silva *et al.* (2015), Maidame (2018). During this phase, one of the students in group 2 asked if she could write something that she believed "did not make much sense", showing insecurity in relation to her previous knowledge. Such an occurrence is possibly associated with the absence of protagonism in learning itself, as one of the striking characteristics of traditional teaching. Figure 1 shows the hypotheses raised by the students in each group, as well as the other research questions.

Figure 1

Hypotheses and learning objectives: group responses

Groups	Hypotheses	Questions	Group responses
Group 1	One of the first reasons for the lack of water is the lack of rain and intense heat; the pollution of rivers; lack of basic sanitation; the rise in deforestation, etc. The ways to solve it would be to make more (artificial) rivers; new management to capture rainwater; nets at the mouths of the manholes; turn off the tap at bath time (soaping); turn off the tap when brushing our teeth and when washing the car (or any other car). In 2017 there was one of the biggest droughts in São José de Ubá, many animals died, with the devaluation of the government.	1) Why do they still throw garbage in rivers, lakes and beaches?	1) Because it is not the people who throw the garbage, it is the government that does not know how to provide the preparations where they are going to dump so much material that can be reused.
		2) Why is there no more basic sanitation in São José de Ubá?	2) The government says it does not have the money for quality basic sanitation for the city.
		3) Why don't they still wash the	3) Because they think it is easier and more practical to wash with a

		cars with the buckets?	hose, but they do not know that they use liters of water just in washing a car.
Group 2	Irresponsibility; pollution; deforestation; waste; lack of rain; fires; throwing garbage on the streets and in the seas; Do not use disposable straws and cups. The ways to solve it would be to have responsibility (save water); do not throw oil into the sink drain; do not throw garbage on the ground; do not cut down trees; not to set fire to the forest and to make people aware of the lack of water on the planet; use reusable straws and cups; stop polluting the rivers in order to be able to continue with the life of the beings that live on planet Earth.	4) Why doesn't it rain as often as before in my city?	4) The region's rainfall regime is characterized by long periods of drought, low rainfall and maximum peak rainfall.
		5) Why are there places that rain more than others?	5) Because there are places close to the sea or with a lot of exposed water and in others they are drier.
Group 3	Lack of rain; the waste of water; the pollution of rivers with sewage. The ways to solve it would be: reuse the waters of the river; we try to avoid waste in the gardens; try to avoid the use of pesticides that pollute the water table; when brushing the tooth, turn off the tap; reduce shower time; improve sanitation, trying to take their path to the rivers.	6) Why doesn't it rain like it did in Ubá?	6) Due to global warming, climate change, deforestation, among other factors.
		7) Does the weather interfere?	7) Yes, climate change interferes with everything in our lives.
		8) Are we far from sea level, so are we without rain?	8) Not only for that, but for other reasons as well.

Source: Elaborated by the authors. Survey data (2025).

The process of generating hypotheses within the PBL methodology is of great importance, given that through this process it is possible to awaken creativity and increase the motivation of students, since the hypotheses of resolution are problems linked to everyday life (Souza; Dourado, 2015; Silva *et al.*, 2015). In addition, because it involves students' previous knowledge, the generation of hypotheses expands the critical capacity for analyzing problems and developing solutions. In addition, the joint construction of hypotheses leads to interaction between students and the acquisition of interpersonal skills, such as respect and cooperation. Such abilities were also verified in the studies carried out by Souza and Dourado (2015), Silva *et al.* (2015), Borochovcicius and Tassoni, (2021), Alves *et al.* (2025) as well as in the behavior of students during the development of this research. During the elaboration of the hypotheses, it was possible to perceive a collaborative and friendly relationship between the students, so that they were motivated to solve the questions, demonstrating autonomy and curiosity in relation to the resolution of the problem.

The research data indicate that two, out of a total of three groups, were more successful in generating hypotheses. Regarding the applicability of PBL, Ribeiro (2010, p. 89) mentions that this transition requires time, understanding and adaptation from students,

in the "passage from passive to active learning". The author also points out that "it is necessary to take into account the effects of the adoption of PBL in view of the years of schooling of students in conventional teaching environments" (Ribeiro, 2010, p. 76). In turn, the results obtained with the majority of students corroborate that the structuring of questions, during the dynamics of problem discussion, collaborates positively for the development of autonomy, critical and reflective capacity of students (Silva *et al.*, 2015).

According to the data shown in Figure 1, in relation to the hypotheses, the data indicate that the students used daily issues observed in their daily experiences, as a way to justify the environmental problems of São José de Ubá, linking the responsibility that society should have in relation to environmental degradation. After this phase of the research, the groups of students wrote down the points that they believed still needed to be studied. Then, they took these to their homes to be researched and studied individually, with a period of one week for this research. With regard to the points to be studied, we observed, in part of the participants, a certain restlessness and desire to understand the following issues: *a)* society's contemptuous behavior towards water; *(b)* the climatic phenomena that govern rainfall in the municipality.

At this stage of the PBL methodology, we advise you to read two texts: "Water: without it we will be the planet Mars of tomorrow", by the author Marco Antônio Ferreira Gomes (2011); a news article⁶ in which he states that the Chamber of Deputies created a commission to evaluate a project that intends to classify the North and Northwest of the state of Rio de Janeiro as a semi-arid area. Such texts had the purpose of subsidizing students in the search for information. Remembering that the main points that the groups mentioned in the elaboration of hypotheses are related to: public policies; climate issues; habits and behaviors of society.

Regarding public policies, the students accessed information about the Municipal Basic Sanitation Plan (2015 – 2034) of the city of São José de Ubá, whose actions were designed to generate short, medium and long-term impacts. Such actions are mainly linked to the municipality's water supply, and some of the objectives of this plan consist of the "protection of springs used for public supply [...]; recomposition of riparian forest at the source [...]; preparation of periodic campaigns and activities with the participation of the community related to the rational use of water" (Rio de Janeiro, 2015, p. 79). Although the students did not mention this plan in their written answers, they pointed out the main issues linked to it, such as the fight against waste, the protection of water bodies and the need for sanitation.

⁶ Available at: <<https://g1.globo.com/rj/norte-fluminense/noticia/2019/08/07/camara-cria-comissao-para-avaliar-projeto-que-quer-classificar-norte-e-noroeste-do-rj-como-area-de-semiarido.ghtml>>. Accessed on: September 22, 2020.

In turn, on climate issues, the participants mentioned various aspects related to climate and its relationship with water resources. This aspect is relevant considering that the climate changes that have been occurring and intensifying in recent years can cause very significant consequences for the global supply of drinking water (UNESCO, 2015; FAO, 2015). Climate change can influence the natural water cycle, since phenomena such as unusual temperature and precipitation patterns, increased frequency of disastrous meteorological episodes involving water resources such as cyclones, and long periods of drought, have an impactful influence on freshwater systems (Tundisi; Matsumura-Tundisi, 2011).

In relation to the changes in habits and behaviors on the part of the population, mentioned by the students, the literature indicates that the way water is treated by society in general is closely linked to a crisis triggered by a worldview centered on the utilitarianism of natural goods and on the form of development defined by society (Soares, 2022). This crisis is a consequence of an extensive process of appropriation and exploitation of nature, which has been accentuated with the evolution of industrial capitalism, generating a socio-environmental crisis (Andrade 2020; Lanes *et al.*, 2022b).

After the elaboration of the hypotheses, studies of the suggested texts and autonomous research carried out by the students, the three groups met again, exchanged ideas about the individual study in their homes and their conclusions were noted, as shown in Figure 1. Before the elaboration of the final solution of the problem questions, we held a debate with the students, aiming to make some considerations about the discussions of some groups. The purpose of this debate was, as Maidame (2018) points out, to avoid misunderstandings in relation to the central issues to be solved. Some examples of these misconceptions were: *"it is not the people who throw the garbage in the water bodies, but the government that does not know how to take the necessary measures regarding the disposal of the waste"* (G1-R1⁷). Often, public agencies are omissions, but this does not exempt society and companies from the duty to seek the appropriate way to dispose of waste, so that water bodies would be an unjustifiable alternative.

One of the mistakes made by the students refers to the rainfall characteristics of the region, without mentioning the changes that these patterns have been undergoing (G2-R4); as well as, *"because there are places close to the sea or with a lot of exposed water and in others they are drier"* (G2-R5). In this case, the influence of maritimity and continentality on the rainfall regime was cited, as claimed by Armond (2015) and Diniz *et al* (2014), however, São José de Ubá is not close to the sea. Following misconceptions we have: *"we are far from sea level, so we are without rain"* (G3-R8), which indicates that we would be at high altitudes

⁷ Code used to identify the workgroup and response number.

and, consequently, in conditions of low atmospheric pressure most of the time. As low atmospheric pressure conditions favor precipitation, according to the National Institute for Space Research (INPE, 2020), we should not suffer, therefore, from the scarcity of rainfall.

Another mistake discussed in this phase of application of the PBL methodology is related to the altitude of São José de Ubá itself, in this case, low altitude – 120m (Gonçalves; Nobleman; Bastos, 2006). Thus, since atmospheric pressure is inversely proportional to altitude, high pressure conditions disfavor the formation of clouds, and, consequently, precipitation in the region (INPE, 2020). After these elucidations and discussions, the students jointly reached the solution of the questions. In this way, they realized that the possible reasons for the lack of water in the municipality of São José de Ubá are:

- ✓ R1 – Rampant deforestation with a view to agriculture. Such practice has seriously harmed the water infiltration process, due to the significant lack of vegetation and soil exposure. Therefore, the limited amount of rainfall that falls on the region cannot be stored for later use during the months with no precipitation.
- ✓ R2 – The pollution caused by numerous factors, such as pesticides, sewage, garbage, among others.
- ✓ R3 – The waste practiced by the inhabitants, who are often unaware of the water situation in which the municipality has found itself in recent years and treat water as an infinite resource. (Survey data, 2025)

Regarding the possible ways to solve these problems, the students mentioned: *a)* the reforestation of devastated areas, especially regions close to the springs, aiming to increase the process of recharging the groundwater in an attempt to revitalize water bodies that have been drying up; *(b)* the need to sensitize the community as a whole so that everyone is aware of the situation in which the city of São José de Ubá finds itself, with regard to its water resources. With these answers, it is evident the importance of the school developing educational practices about water beyond its walls, involving the community and seeking the possibilities of solving the problem (Lanes *et al.*, 2022a). In this sense, the data obtained in this research are significant in view of the reality of the city, since significant learning is also characterized by the interaction between knowledge in the transitory and non-asymmetric evolutionary relationship.

The research data highlight that through PBL it was possible to stimulate reflective and critical thinking, considering previous knowledge and the reality that constitutes the daily life of students. The development of the PBL methodology, associated with the water crisis in the city, promoted an interrelationship between the school and the community and, therefore, should be encouraged through pedagogical activities that portray the needs of society. The use of PBL makes it evident that the theoretical knowledge formulated by students can be

applied in their contexts and, in this way, allow the occurrence of meaningful learning. Possibly, the pedagogical gains obtained through PBL will help in the construction of a new vision of the socio-environmental reality of students.

In this context, the students' considerations and notes highlight: *a)* the need for efficient public policies, aimed at environmental and water management in the municipality; *(b)* effective reforestation policies and actions aimed at the protection of riparian forests; *(c)* an operating basic sanitation program; *(d)* permanent partnerships with school units, aiming at new project proposals, with regard to environmental issues. These data reinforce the idea that intellectual autonomy and cooperation are fundamental principles of PBL (BorochoVICIUS; Tortella, 2014; Conrado *et al.*, 2014). This is because, by being invited to build hypotheses, test ideas and discuss solutions, the students exercised investigative thinking and collective argumentation. In other words, they collectively built precise strategies that enabled self-education processes.

4 CONCLUSION

The research aimed to analyze the application of the Problem-Based Learning (PBL) methodology to address the water problem in the municipality of São José de Ubá, with an Elementary School class. The main results of the research indicate that in the brainstorming phase, the participants mostly mentioned the lack and pollution of water in the municipality, exemplifying such problems from the experiences of daily life. These findings corroborate the literature used in this article, with regard to the understanding of the problem situation, from the perspective of the students' reality. In other words, these results highlight that PBL favors the construction of meanings based on the concrete experience of students, that is, they validate the theoretical assumption that knowledge is an active, social and contextual process.

With regard to autonomy and collaboration among the members of the groups, the results indicate that the pedagogical experiences built by two groups, out of a total of three, were more expressive based on the essence of PBL. The students in these groups were more open to PBL, showed greater commitment and curiosity in relation to the development of the methodology. In turn, one group had lower adherence to the research, since some of its members had difficulties adapting to PBL, especially during the second phase – generation of hypotheses. In all three groups, some students received the methodology, at first, with trepidation. However, during the course of the project, most of them did not present any difficulty in adapting. On the contrary, a significant part of the students seemed enthusiastic about their own evolution in the construction of knowledge about their reality. This can be

explained by the autonomy and collaboration they experienced during the process; Something that, until then, in the words of the students, was not part of the pedagogical processes adopted by the school.

On the one hand, these results highlight the central role of the teacher as a mediator and facilitator of learning, within the scope of PBL. On the other hand, the findings reveal the structural limits of public schools, such as: lack of pedagogical time and scarcity of didactic resources, elements that restrict the full application of active methodologies such as PBL. Even in the face of these situations, the most expressive results of the research indicate that the PBL methodology is appropriate and efficient to work on environmental issues with elementary school students, including water resources, in its multiple approaches. This is because the students were able to transport this acquired learning capacity to their daily lives, transcending the school environment. In addition, the students developed other skills essential to the exercise of citizenship, especially those necessary for an active participation in the spaces and debates that involve current environmental problems.

For this reason, the analyses highlight the contribution of PBL to the debate on the role of the school in the formation of subjects concerned with current environmental problems, capable of recognizing the links and dimensions that associate environment, politics and citizenship. In addition, the results show that practices based on autonomy, investigation and cooperation can awaken in students a sense of belonging and socio-environmental responsibility. However, the research indicates some limitations observed, among them: the short period of application of the methodology, organized in six meetings, which suggests the need for long-term studies that can explore the permanence of the effects of PBL over time. Even so, the article highlights that PBL integrates scientific knowledge with local experiences and, therefore, reaffirms the transformative potential of education.

ABSTRACT

The consolidation of inclusive education as a guiding principle of contemporary educational policies poses significant challenges to schools, particularly regarding the guarantee of learning rights for students with disabilities in mainstream education settings. In this context, digital technologies emerge as potential resources for overcoming pedagogical, communicational, and attitudinal barriers. This article aims to analyze the challenges and possibilities of using digital technologies within special and inclusive education, focusing on their role in mediating the teaching-learning process. This qualitative study is based on a critical literature review, grounded in national authors and official legal documents that guide inclusive education policies in Brazil. The analysis indicates that although digital and assistive

technologies expand access, participation, and personalized learning opportunities, their effectiveness depends on structural, pedagogical, and professional development factors, such as continuous teacher training, intentional instructional planning, and the transformation of exclusionary conceptions still present in school culture. It is concluded that the critical and contextualized use of technologies can significantly contribute to building a truly inclusive school when aligned with an emancipatory and equitable pedagogical project.

RESUMO

A consolidação da educação inclusiva como princípio orientador das políticas educacionais contemporâneas impõe desafios significativos à escola, especialmente no que se refere à garantia do direito à aprendizagem de estudantes com deficiência em contextos regulares de ensino. Nesse cenário, as tecnologias digitais emergem como recursos potenciais para a superação de barreiras pedagógicas, comunicacionais e atitudinais. O presente artigo tem como objetivo analisar os desafios e as possibilidades do uso das tecnologias digitais no âmbito da educação especial e inclusiva, com foco na mediação do processo de ensino-aprendizagem. Trata-se de uma pesquisa de natureza qualitativa, desenvolvida por meio de uma revisão bibliográfica crítica, fundamentada em autores nacionais e em documentos legais que orientam as políticas de inclusão no Brasil. A análise evidencia que, embora as tecnologias digitais e assistivas ampliem as possibilidades de acesso, participação e personalização do ensino, sua efetividade depende de fatores estruturais, formativos e pedagógicos, como a formação continuada dos professores, o planejamento didático intencional e a superação de concepções excludentes ainda presentes na cultura escolar. Conclui-se que o uso crítico e contextualizado das tecnologias pode contribuir para a construção de uma escola verdadeiramente inclusiva, desde que integrado a um projeto pedagógico comprometido com a equidade, a diversidade e a justiça social.

Palavras-chave: Educação Inclusiva. Tecnologias Digitais. Ensino-Aprendizagem. Deficiência. Formação Docente.

RESUMEN

La consolidación de la educación inclusiva como principio rector de las políticas educativas contemporáneas plantea importantes desafíos a las escuelas, especialmente en lo que respecta a garantizar el derecho al aprendizaje del alumnado con discapacidad en contextos educativos regulares. En este escenario, las tecnologías digitales emergen como recursos potenciales para superar barreras pedagógicas, comunicacionales y actitudinales. Este artículo busca analizar los desafíos y las posibilidades del uso de las tecnologías digitales en el contexto de la educación especial e inclusiva, centrándose en la mediación del proceso de enseñanza-aprendizaje. Se trata de una investigación cualitativa, desarrollada a través de una revisión crítica de la literatura, basada en autores nacionales y documentos legales que orientan las políticas de inclusión en Brasil. El análisis muestra que, si bien las tecnologías digitales y de asistencia amplían las posibilidades de acceso, participación y personalización de la enseñanza, su eficacia depende de factores estructurales, formativos y pedagógicos, como la formación continua del profesorado, la planificación didáctica intencional y la superación de las concepciones excluyentes aún presentes en la cultura escolar. Se concluye que el uso crítico y contextualizado de las tecnologías puede contribuir a la construcción de una escuela verdaderamente inclusiva, siempre que se integre en un proyecto pedagógico comprometido con la equidad, la diversidad y la justicia social.

1 INTRODUCTION

Special education has undergone profound transformations over the last decades, especially from the consolidation of the inclusive education paradigm, which defends the right of all students to learn, participate and live in regular education classes. This paradigm breaks with the historical logic of institutionalized segregation and proposes a school that recognizes and values human diversity as a structuring principle of the educational process. It is a change that goes beyond the pedagogical dimension, assuming an ethical, political and social character, by repositioning disability not as an individual limitation, but as a result of the interaction between subjects and social, cultural and educational barriers.

However, despite the legal and normative advances that ensure the right to inclusive education in Brazil, it is observed that the realization of this right still faces significant obstacles in the daily school routine. The presence of students with disabilities in ordinary classrooms challenges traditional pedagogical practices, rigid curricula and homogenizing teaching models. As Mantoan (2006) argues, inclusion is not limited to physical access to school, but requires the guarantee of real conditions of participation and learning for all students, which implies the revision of the conceptions of teaching, evaluation and school organization.

At the same time, the expansion of digital information and communication technologies (DICTs) has caused significant changes in educational processes, expanding the forms of access to knowledge, communication and expression. When critically integrated into pedagogical planning, these technologies can favor the personalization of teaching, the mediation of physical and cognitive barriers, and the construction of more interactive and collaborative learning environments. In this sense, as Garcia (2013, p. 1) points out, "the teacher needs to use resources that transform his classes, in order to instigate the search for knowledge, teaching dynamic, motivating and attractive classes".

However, the incorporation of technologies in the school context does not always result in inclusive pedagogical practices. In many cases, the instrumental and decontextualized use of these resources is observed, disconnected from a pedagogical project committed to equity and diversity. Thus, the following research problem emerges: how can the use of digital technologies effectively contribute to the promotion of special and inclusive education, considering the pedagogical, formative and structural challenges present in Brazilian schools?

In view of this problem, the general objective of this article is to analyze the challenges and possibilities of using digital technologies in the context of special and inclusive education, understanding their role as mediators of the teaching-learning process. In a complementary

way, the specific objectives are: (a) to discuss the historical and political foundations of special and inclusive education in Brazil; (b) reflect on the role of the teacher in the construction of inclusive pedagogical practices; and (c) analyze the potential and limits of digital and assistive technologies in the context of school inclusion.

The scientific justification of this study lies in the need to deepen the theoretical debate on the articulation between inclusive education, digital technologies and teacher training, especially in view of the gaps between the legal discourse of inclusion and its effectiveness in everyday pedagogical practices. By addressing this theme, the article contributes to the field of education by problematizing naturalized conceptions about technology and inclusion, reinforcing the importance of a critical, pedagogical and contextualized approach.

This article is organized as follows: initially, the historical and political foundations of special and inclusive education are discussed; then, the role of the teacher in the construction of the inclusive school is analyzed; subsequently, the contributions of digital technologies in the teaching-learning process and their challenges in the educational context are examined; Finally, the final considerations are presented, in which the main reflections and contributions of the study are systematized.

2 METHODOLOGY

The present study is characterized as a qualitative research, developed through a critical bibliographic review. The review focused on classic and contemporary works that address inclusive education, educational technologies, and teacher training, as well as legal and normative documents that guide public inclusion policies in Brazil.

Productions published mainly between the years 2000 and 2024 were analyzed, prioritizing reference authors in the field of inclusive education and educational technologies, such as Mantoan, Kenski, Moran, Garcia, and Schlünzen, as well as official documents such as the Brazilian Inclusion Law (2015), the National Policy on Special Education in the Perspective of Inclusive Education (2008), and the National Education Plan (2014–2024).

The analysis of the materials was guided by an interpretative and critical reading, seeking to identify convergences, tensions and gaps between normative discourses, theoretical approaches and educational practices. As a limitation of the study, the absence of empirical research is recognized, which points to the need for future research that explores concrete experiences of the use of technologies in inclusive education in different school contexts.

3 SPECIAL AND INCLUSIVE EDUCATION: HISTORICAL AND POLITICAL FOUNDATIONS

Historically, the education of people with disabilities in Brazil has been structured under a welfare and segregating logic, strongly marked by philanthropic practices and the separation of these subjects from common educational spaces. During much of the twentieth century, educational services took place predominantly in specialized institutions, far from regular schools, which reinforced a conception of disability associated with disability, abnormality and the need for correction or treatment, to the detriment of the recognition of difference as a constitutive dimension of the human condition.

This perspective was aligned with the so-called medical model of disability, which centers its analysis on clinical diagnosis and individual limitations, disregarding the social, pedagogical and structural factors that produce and reinforce barriers to school participation. In this model, educational failure was often attributed to the student himself, exempting the school and the educational system from their responsibility in guaranteeing the right to learning. As a result, the schooling processes of people with disabilities have historically been restricted, fragmented and devoid of a critical perspective focused on citizenship formation.

The transition to a new paradigm began to consolidate in the 1990s, driven by important international milestones, such as the World Conference on Education for All (Jomtien, 1990) and the Salamanca Declaration (1994). These documents promoted a significant inflection in the educational field by stating that special education should be part of the common educational system, defending the right of all children, regardless of their conditions, to attend quality regular schools. This movement contributed to the shift of the focus from disability to the existing barriers in the school environment, approaching a social and inclusive perspective.

In the Brazilian context, this new understanding gained legal support with the Federal Constitution of 1988, which recognized education as a social right and duty of the State, ensuring specialized educational service preferably in the regular school system. The Law of Guidelines and Bases of National Education (Law No. 9,394/96) deepened this principle by defining special education as a transversal modality at all levels and stages of education, guaranteeing the right to access, permanence and learning of students with disabilities.

Normative progress was significantly strengthened with the enactment of the Brazilian Law for the Inclusion of Persons with Disabilities (Law No. 13,146/2015), which consolidated the principles of equal opportunities, accessibility, and non-discrimination. By recognizing people with disabilities as subjects with full rights, the LBI reaffirms the obligation of educational systems to offer the necessary support for school participation, including

adequate teacher training, accessible teaching resources and assistive technologies, definitively shifting the responsibility of adaptation from the individual to the transformation of educational contexts.

In this same horizon, the National Policy on Special Education in the Perspective of Inclusive Education (2008) constitutes a fundamental political and pedagogical milestone by redefining the role of special education as complementary and supplementary to common education, through Specialized Educational Service (SES). The policy emphasizes the importance of continuing education of education professionals, curricular flexibility and the guarantee of architectural, communicational and pedagogical accessibility as indispensable conditions for school inclusion.

Despite this robust legal and normative framework, the Brazilian educational reality still reveals numerous challenges for the effectiveness of inclusive education. Gaps persist related to school infrastructure, the supply of accessible materials, teacher training and, above all, the overcoming of exclusionary conceptions and practices rooted in school culture. The transition from an exclusionary educational model to an inclusive model therefore requires more than legal changes: it requires a continuous ethical and political commitment to valuing diversity as an educational principle and to building a school capable of teaching everyone, without exception.

4 THE ROLE OF THE TEACHER IN THE CONSTRUCTION OF THE INCLUSIVE SCHOOL

The consolidation of inclusive education in the school routine is intrinsically related to the performance of the teacher, who assumes a central role in the mediation of the teaching-learning process. It is in the classroom space that inclusive policies materialize — or not — through pedagogical practices, teaching strategies, forms of evaluation, and relationships established with students. In this sense, the teacher is a fundamental agent in the construction of a school that recognizes and values diversity, ensuring real learning conditions for all.

However, several studies and official documents point out that many teachers still face difficulties in working in inclusive contexts. Among the main challenges are the gaps in initial training, which historically has little contemplated the theme of inclusion, and the insufficiency of continuing education policies that articulate theory and practice. As a consequence, it is common for teachers to feel insecure in the face of the presence of students with disabilities in regular classes, resorting to homogeneous practices that have little dialogue with the specific educational needs of these subjects.

According to the document *Training of Educators and the Construction of the Inclusive School* (IFES, 2020), teacher training needs to be rethought in the light of the inclusive paradigm, understanding that teaching in contexts of diversity requires more than mastery of curricular content. It requires, above all, an ethical, political and pedagogical stance committed to human rights, equity and social justice. In this context, the teacher is no longer a mere transmitter of knowledge and starts to act as a mediator, facilitator and organizer of meaningful learning experiences.

This perspective dialogues with the understanding of Garcia (2013, p. 1), when he states that "the teacher is no longer a simple transmitter of knowledge. Today, he is a mediator, facilitator of the teaching-learning process and students are the active subjects of this process". Such a conception implies the adoption of active methodologies, multisensory strategies, collaborative practices and technological resources that expand the possibilities of access to knowledge and participation of students, respecting their different rhythms, styles and ways of learning.

Another fundamental aspect of teaching in inclusive contexts refers to curricular flexibility. Inclusive education presupposes the adaptation of objectives, contents, strategies and assessment tools, in order to ensure that all students have real learning opportunities. However, as Azevedo and Passeggi (2015) point out, many teachers report difficulties in making such adaptations, especially when they do not have institutional support, collaborative work and continuing education to support these practices.

The construction of an inclusive school also requires the teacher to be able to act in an articulated way with other education professionals, such as teachers of the Specialized Educational Service (AEE), Libras interpreters, support professionals and multiprofessional teams. This collaborative action is essential for accessible pedagogical planning and for monitoring the school trajectories of students with disabilities, avoiding isolated and fragmented practices.

In addition to pedagogical skills, teaching in inclusive contexts requires the development of socio-emotional skills, such as empathy, sensitive listening, flexibility, resilience, and willingness to work collectively. Such competencies are fundamental for the construction of more humane and democratic pedagogical relationships, capable of welcoming differences as a constitutive part of the educational process.

As Mantoan (2006) emphasizes, inclusion is not achieved through specific actions or superficial adaptations, but through a profound transformation of the school culture. In this process, the teacher occupies a strategic position, as he is the one who leads the construction or denial of inclusive practices on a daily basis. Thus, ensuring adequate working conditions,

consistent continuing education and institutional support for teachers is an indispensable requirement for the school to stop reproducing inequalities and become, in fact, a learning space for all.

5 NEW TECHNOLOGIES AND THE TEACHING-LEARNING PROCESS

Digital information and communication technologies (DICTs) have caused significant transformations in the ways of teaching and learning, changing the forms of access to knowledge, interaction between subjects and production of meanings in the educational context. Such transformations directly impact the teaching-learning process, requiring the school to review pedagogical practices historically centered on the transmission of content and the homogenization of educational processes.

In the context of inclusive education, digital technologies assume even greater relevance, as they can act as mediators of learning and as instruments for overcoming pedagogical, communicational and cognitive barriers. As Garcia (2013) points out, when used in a planned and intentional way, technologies contribute to making classes more dynamic, attractive and contextualized, favoring student engagement and expanding the possibilities of participation, especially for those who have historically faced processes of school exclusion.

The incorporation of technologies into the teaching-learning process, however, should not be restricted to the replacement of traditional resources by digital devices. As Almeida and Valente (2007) warn, the pedagogical use of technologies needs to be anchored in conceptions that understand these resources as mediators of the construction of knowledge, and not as ends in themselves. In this sense, the presence of computers, tablets or digital platforms is only justified when integrated into a pedagogical project that promotes meaningful learning and the development of student autonomy.

Pedagogical mediation with the use of DICTs involves the careful selection of resources such as educational software, learning platforms, digital games, virtual learning environments, multimodal resources (audio, video, images, animations) and collaborative tools. These resources, when articulated with active methodologies, enable multiple forms of access to content, expression of learning and social interaction, respecting the different styles and rhythms of learning of students.

However, as Moran (2000) points out, the mere presence of technologies in the school environment does not guarantee innovation or quality in teaching. There is a risk that the apparent technological modernization will only reproduce traditional practices, centered on memorization and passive reception of information. Thus, it is essential that the teacher

understands the role of technologies as allies of pedagogical action, capable of expanding possibilities, but not replacing didactic planning, pedagogical intentionality and teacher mediation.

In the context of inclusive education, the use of technologies is also directly related to the promotion of autonomy, authorship, and protagonism of students. By allowing different forms of communication, production and participation, DICTs contribute to the valorization of singularities and to the construction of more democratic learning environments. This perspective is close to an emancipatory conception of education, in which subjects not only consume information, but also produce, reinterpret and share it in a critical way.

Finally, it is highlighted that the effectiveness of technologies in the teaching-learning process is directly related to teacher training. Training in technologies cannot be limited to the technical mastery of the tools, but must include reflection on their pedagogical, ethical and political foundations. Only in this way will it be possible to overcome the instrumental use of technologies and enhance their role in the construction of inclusive pedagogical practices, capable of meeting the diversity present in contemporary classrooms.

6 TECHNOLOGIES AND SCHOOL INCLUSION: ADVANCES AND CHALLENGES

In the context of inclusive education, digital and assistive technologies have been consolidated as important allies in overcoming pedagogical, communicational, physical and attitudinal barriers. These resources, when used in a planned and contextualized way, expand the possibilities of access to the curriculum and participation of students with disabilities, contributing to the construction of more equitable pedagogical practices.

Among the most significant advances, assistive technologies stand out, such as screen readers for visually impaired students, speech synthesis software, text magnifiers, adapted keyboards, alternative communicators, and augmented reality-based resources. As Passerino (2001) points out, these technologies not only compensate for functional limitations, but also enhance unique forms of interaction with knowledge, favoring students' autonomy and expression.

However, despite the recognized inclusive potential of technologies, their implementation in everyday school life still faces significant challenges. The scarcity of equipment, the precariousness of technological infrastructure, the absence of adequate connectivity and the insufficiency of pedagogical planning are recurrent obstacles, especially in public schools. Schlünzen (2005) points out that, without consistent policies for teacher training and pedagogical monitoring, technologies tend to be underused or used in a merely instrumental way.

Another relevant challenge refers to the risk of the so-called "exclusionary inclusion", when technology is introduced in the school only to comply with normative requirements, without effective transformation of pedagogical practices. In these cases, it is observed that technological resources are made available without the proper adequacy of the didactic material or without the contextualization of the proposed activities, which limits the inclusive potential of these tools and can reinforce exclusion processes.

As Kenski (2007) points out, technology should not be conceived as a substitute for the teacher, but as a resource that expands and enriches the pedagogical action. This understanding requires that technologies be integrated into the curriculum in a critical way, considering the specificities of the students and the sociocultural contexts in which they are inserted. In addition, it is essential to recognize the regional and social inequalities that impact access to technologies, highlighting the need for public policies that articulate educational inclusion and digital inclusion.

Thus, technological advances will only translate into effective school inclusion when accompanied by investments in infrastructure, continuing teacher training and changes in pedagogical conceptions. Technology, in isolation, does not promote inclusion; It is the pedagogical intentionality and the ethical commitment to diversity that give meaning to its use in the educational context.

In addition to national production, international studies have highlighted the role of digital technologies as mediators of educational inclusion, especially with regard to accessibility, personalization of learning, and universal design for learning (UDL). Reports from international organizations, such as UNESCO and the OECD, reinforce that the integration of technologies into inclusive education must be associated with consistent public policies, teacher training and ensuring equity in digital access, avoiding the expansion of educational inequalities. These debates broaden the understanding of school inclusion as a global challenge, reinforcing the need for articulation between local contexts and international agendas.

7 TEACHERS' EXPERIENCES WITH TECHNOLOGIES IN INCLUSIVE EDUCATION

Reports of teaching experiences show that the pedagogical use of technologies can promote significant transformations in educational practices, especially in contexts marked by diversity. When incorporated in a creative and planned way, technologies favor student engagement, expand the possibilities of expression, and contribute to the construction of more participatory and inclusive learning environments.

In the work organized by Azevedo and Passeggi (2015), several reports of basic education teachers who used digital tools such as blogs, virtual learning environments, video production and collaborative networks to enhance teaching are presented. These experiences demonstrate that the use of technologies can strengthen students' authorship, value their cultural identities and promote the development of communicative skills, including among students with learning difficulties or disabilities.

An emblematic example refers to the "TV Cedro Rosa" project, in which children from socially vulnerable contexts participated in the production of videos about their own reality, favoring inclusion processes through audiovisual language. Another relevant report concerns the use of online simulations in preparatory assessments of SARESP, presented by Santos (2015), which showed greater autonomy of students and greater involvement with the learning process.

Experiences with the use of digital games have also shown positive results in the context of inclusive education. As reported by Tani (2015), the use of games in Philosophy classes enabled the mediation of knowledge through play and visual language, benefiting students with cognitive difficulties and expanding access to curricular content. Gamification, in this sense, proved to be a powerful strategy to promote student participation and interest.

These experiences reinforce the importance of spaces for continuing education that value reflection on teaching practice and encourage the sharing of successful experiences. The socialization of these practices contributes to the construction of a school culture that is more open to pedagogical innovation and inclusion, demonstrating that, even in contexts with material limitations, it is possible to develop significant educational actions when there is intentionality, creativity and commitment to learning for all.

8 RECENT PUBLIC POLICIES AND THE DIGITAL INCLUSION AGENDA

In recent decades, Brazil has experienced important normative advances in the field of inclusive education and the integration of digital technologies into the educational process. The incorporation of these agendas into public policies reflects the recognition that the right to full education, especially for students with disabilities, is intrinsically related to equitable access to educational technologies and teacher training for their pedagogical use.

The approval of the National Education Plan (PNE – Law No. 13,005/2014) represented a strategic milestone by establishing goals aimed at the universalization of school attendance and the promotion of the quality of education, including the expansion of the pedagogical use of digital technologies. In this context, Goal 4 stands out, which deals with ensuring access to education for students with disabilities, global developmental

disorders, and high abilities or giftedness, and goals related to teacher training, pedagogical innovation, and the improvement of the technological infrastructure of schools.

However, the achievement of these goals has been compromised by structural and institutional obstacles, such as the discontinuity of government programs, political and economic instability, and insufficient public investments. Programs aimed at integrating technologies in schools, such as ProInfo, faced difficulties related to equipment maintenance, connectivity, and teacher training, limiting their impact on daily school life.

The Covid-19 pandemic (2020–2022) highlighted and deepened the existing digital inequalities in the country, revealing the fragility of the technological infrastructure of public education networks and the insufficiency of digital inclusion policies. At the same time, this context has accelerated the debate on the centrality of technologies in education and reinforced the urgency of public policies that guarantee connectivity, digital accessibility, and teacher training, especially for the educational service of students with disabilities.

In this scenario, more recent initiatives, such as programs aimed at expanding school connectivity and digital teacher training, indicate a resumption of the digital inclusion agenda. However, for such policies to result in effective educational inclusion, it is essential that they are articulated with the National Policy on Special Education from the Perspective of Inclusive Education, ensuring that investments also include assistive technologies, digital accessibility and specialized pedagogical support.

As pointed out by Almeida and Schlünzen (2007; 2005), effective public policies in the field of education and technologies should consider local realities and promote the active participation of school communities in their implementation. Digital inclusion, in this sense, cannot be understood only as access to equipment, but as a formative and pedagogical process that involves planning, monitoring and continuous evaluation.

Thus, the consolidation of the digital inclusion agenda in Brazil requires integrated, sustainable public policies committed to equity, recognizing that the use of technologies in inclusive education depends both on material conditions and on changes in pedagogical conceptions and teaching practices.

9 FINAL CONSIDERATIONS

Inclusive education is configured as an ethical, political and pedagogical commitment to the construction of a more just and democratic society, in which human diversity is recognized as an educational value and principle. Throughout this study, it was evidenced that the implementation of this commitment, especially in the context of special education,

requires the overcoming of historically ingrained exclusionary practices and the construction of pedagogical strategies capable of guaranteeing the right to learning of all students.

The use of digital technologies, when guided by a critical and pedagogical perspective, presents itself as an important mediator in the teaching-learning process, contributing to the expansion of access to knowledge, participation and autonomy of students with disabilities. However, the study demonstrates that technologies alone do not ensure inclusion. Its effectiveness is conditioned to pedagogical intentionality, continuous teacher training and the integration of these resources into an educational project committed to equity and social justice.

It is noteworthy that teacher training is a central axis for the consolidation of inclusive practices mediated by technologies. Teaching performance, supported by flexible methodologies, accessible resources and collaborative work, proves to be decisive for the construction of democratic learning environments that are sensitive to the singularities of students. In this sense, public policies that value teachers and ensure adequate working and training conditions are indispensable for the advancement of school inclusion.

As a limitation of this study, its predominantly bibliographic character is recognized, which points to the need for empirical research that investigates concrete experiences of the use of technologies in inclusive education, considering different educational contexts. Future studies can deepen the analysis of the impact of emerging technologies, such as artificial intelligence and immersive environments, in the promotion of inclusive pedagogical practices.

It is concluded that the construction of a truly inclusive school involves the articulation between consistent public policies, critical teacher training and intentional pedagogical use of digital technologies. It is up to educational systems, school institutions, and education professionals to collectively assume this responsibility, in order to ensure that digital and educational inclusion materializes as an effective right, and not just as a normative discourse.

ABSTRACT

Sales forecasting is a strategic element for the brewing industry, a sector characterized by high seasonality and significant fluctuations associated with weekends, holidays, and festive events. Traditional statistical models, although widely applied, present limitations in capturing nonlinear relationships and complex patterns inherent to demand time series. In this context, this study aims to evaluate the application of machine learning algorithms for daily sales forecasting in a Brazilian brewing industry. To this end, a historical dataset of daily sales covering the period from May 2024 to May 2025 was used, adopting a temporal split in which data from 2024 were employed for model training and data from 2025 were reserved for testing. Temporal feature engineering was performed, including calendar variables, holiday indicators, lagged variables, and moving statistics. Four tree-based algorithms were evaluated: Decision Tree, Random Forest, XGBoost, and LightGBM, using the coefficient of determination (R^2), mean absolute error (MAE), and root mean squared error (RMSE) as performance metrics. The results indicate that ensemble models significantly outperform the single decision tree, with XGBoost achieving the best predictive performance, explaining approximately 89.9% of the variance in daily sales. It is concluded that the application of machine learning algorithms combined with temporal feature engineering constitutes an

RESUMO

A previsão de vendas constitui um elemento estratégico para a indústria cervejeira, setor caracterizado por elevada sazonalidade e variações significativas associadas a fins de semana, feriados e eventos festivos. Modelos estatísticos tradicionais, embora amplamente utilizados, apresentam limitações na captura de relações não lineares e padrões complexos presentes em séries temporais de demanda. Diante desse contexto, o presente estudo objetiva avaliar a aplicação de algoritmos de aprendizado de máquina na previsão de vendas diárias de uma indústria cervejeira brasileira. Para tanto, utilizou-se um conjunto de dados históricos de vendas diárias referente ao período de maio de 2024 a maio de 2025, adotando-se uma divisão temporal, na qual os dados de 2024 foram empregados para treinamento dos modelos e os de 2025 para teste. Procedeu-se à engenharia de atributos temporais, incluindo variáveis de calendário, indicadores de feriados, defasagens e estatísticas móveis. Foram avaliados quatro algoritmos baseados em árvores de decisão: Decision Tree, Random Forest, XGBoost e LightGBM, utilizando como métricas de desempenho o coeficiente de determinação (R^2), o erro absoluto médio (MAE) e a raiz do erro quadrático médio (RMSE). Os resultados evidenciam que os modelos de ensemble superam significativamente a árvore de decisão isolada, com destaque para o XGBoost, que apresentou melhor desempenho preditivo, explicando aproximadamente 89,9% da variância das vendas diárias. Conclui-se que a aplicação de algoritmos de aprendizado de máquina, aliada à engenharia de atributos temporais, constitui uma abordagem eficaz para a previsão de demanda no setor cervejeiro, oferecendo subsídios relevantes para o planejamento de produção, estoques e logística.

RESUMEN

La previsión de ventas constituye un elemento estratégico para la industria cervecera, un sector caracterizado por una elevada estacionalidad y por variaciones significativas asociadas a fines de semana, feriados y eventos festivos. Los modelos estadísticos tradicionales, aunque ampliamente utilizados, presentan limitaciones para capturar relaciones no lineales y patrones complejos presentes en las series temporales de demanda. En este contexto, el presente estudio tiene como objetivo evaluar la aplicación de algoritmos de aprendizaje automático en la predicción de ventas diarias de una industria cervecera brasileña. Para ello, se utilizó un conjunto de datos históricos de ventas diarias correspondiente al período de mayo de 2024 a mayo de 2025, adoptándose una división temporal en la que los datos de 2024 se emplearon para el entrenamiento de los modelos y los de 2025 se reservaron para la prueba. Se llevó a cabo ingeniería de características temporales, incluyendo variables de calendario, indicadores de feriados, variables rezagadas y estadísticas móviles. Se evaluaron cuatro algoritmos basados en árboles de decisión: Decision Tree, Random Forest, XGBoost y LightGBM, utilizando como métricas de desempeño el coeficiente de determinación (R^2), el error absoluto medio (MAE) y la raíz del error cuadrático medio (RMSE). Los resultados evidencian que los modelos de tipo ensemble superan significativamente al árbol de decisión individual, destacándose el XGBoost, que presentó el mejor desempeño predictivo, explicando aproximadamente el 89,9% de la variancia de las ventas diarias. Se concluye que la aplicación de algoritmos de aprendizaje automático, combinada con la ingeniería de características temporales, constituye un

enfoque eficaz para la predicción de la demanda en el sector cervecero, aportando insumos relevantes para la planificación de la producción, los inventarios y la logística.

1 INTRODUCTION

Sales forecasting plays a central role in the operational and strategic planning of organizations, especially in sectors characterized by high seasonality and strong variability in demand. In the case of the brewing industry, consumption presents cyclical patterns associated with weekends, national holidays, cultural events and climatic conditions, which imposes significant challenges to the management of production, inventories and logistics (ALVES; SILVA, 2023; DE OLIVEIRA DIAS; FALCONI, 2018). Errors in forecasting can result in both stockouts and excess stored products, with direct impacts on operating costs and the level of service to the market.

Traditionally, demand forecasting has been performed using classical time-series statistical models, such as the autoregressive integrated moving average models (ARIMA). Although these models have a solid theoretical foundation and broad application, their effectiveness strongly depends on assumptions of linearity and stationarity, which may limit their ability to capture complex and nonlinear relationships often observed in real sales data (BOX; JENKINS; REINSEL, 2015; HYNDMAN; ATHANASOPOULOS, 2018).

In recent years, machine learning techniques have been widely employed in demand forecasting problems, due to their flexibility to incorporate multiple explanatory variables and model nonlinear patterns without the need for rigid parametric specifications (HASTIE; TIBSHIRANI; FRIEDMAN, 2009). In particular, algorithms based on decision trees and ensemble methods, such as Random Forest and gradient boosting techniques, have demonstrated superior performance in predictive applications in retail and industry, especially when combined with appropriate temporal attribute engineering strategies (BREIMAN, 2001; CHEN; GUESTIN, 2016; KE et al., 2017).

Recent studies indicate that the incorporation of calendar variables, holiday indicators, lagged attributes, and mobile statistics contributes significantly to the increased accuracy of predictive models applied to sales time series, by allowing the explicit representation of seasonal patterns and short- and medium-term temporal dependencies (BERGMEIR; BENÍTEZ, 2012; HYNDMAN; ATHANASOPOULOS, 2018). Despite these advances, empirical studies that comparatively evaluate the performance of different machine learning algorithms applied to the forecast of daily sales in the beer sector, using real data and adequate time validation, are still relatively scarce in the Brazilian context.

In this context, the present study aims to evaluate the application of machine learning algorithms in the daily sales forecast of a Brazilian brewing industry, comparing models based on decision trees, namely: Decision Tree, Random Forest, XGBoost and LightGBM. To this end, a set of historical data of daily sales is used, with a temporal division between training

and testing, and temporal attribute engineering is used to capture seasonal patterns and historical dependencies.

The main scientific contribution of this work consists of providing a comparative empirical analysis of the performance of different machine learning algorithms in a real scenario of the Brazilian brewing industry, evidencing the predictive gains associated with ensemble models and gradient boosting techniques. Additionally, the study contributes to the literature by demonstrating that the use of relatively simple temporal attributes, combined with robust machine learning methods, can produce consistent and relevant predictions to support managerial decisions related to production planning, inventory management, and logistics.

2 THEORETICAL FRAMEWORK

Sales forecasting is a fundamental element for the operational and strategic planning of organizations, especially in sectors marked by high seasonality and marked variability in demand. In the brewing industry, consumption behavior shows cyclical patterns associated with weekends, holidays, and festive events, which imposes relevant challenges to the management of production, inventories, and logistics. In view of this scenario, the literature specialized in demand forecasting has highlighted the relevance of comparative evaluation of predictive methods, pointing out that more flexible approaches tend to have superior performance in modeling time series with complex and nonlinear patterns, especially in short-term forecasting problems (MAKRIDAKIS; BAKAS, 2016).

In the context of the brewing industry, studies indicate that consumption is strongly influenced by temporal factors, such as weekdays, festive periods and long holidays, as well as cultural and climatic aspects (ALVES; SILVA, 2020). These patterns make sales forecasting particularly sensitive to the choice of method and the appropriate incorporation of explanatory variables capable of representing such effects.

2.1 TRADITIONAL TIME SERIES FORECASTING MODELS

Classical statistical models, such as the autoregressive integrated moving average models (ARIMA), have been widely used for time series forecasting in different industrial contexts. These models are based on assumptions of linearity and stationarity and seek to capture temporal dependencies through autoregressive components and moving averages (BOX; JENKINS; REINSEL, 2015). Although they have good interpretability and solid theoretical foundation, their application may be limited when the series presents complex nonlinear patterns or when multiple exogenous variables influence the behavior of demand.

In addition, the manual selection of the model structure and the adjustment of

parameters can make these methods sensitive to noise and structural changes in the behavior of the series, a relatively common phenomenon in dynamic markets and subject to changes in consumption habits (HYNDMAN; ATHANASOPOULOS, 2018). Such limitations have motivated the search for more flexible and adaptive approaches, especially in short-term sales forecasting applications.

2.2 MACHINE LEARNING IN DEMAND FORECASTING

Machine learning techniques have stood out as promising alternatives for demand forecasting, due to their ability to model nonlinear relationships and to simultaneously incorporate a large set of explanatory variables, without the need for restrictive parametric hypotheses (HASTIE; TIBSHIRANI; FRIEDMAN, 2009). Unlike traditional statistical models, machine learning methods are predominantly predictive performance-driven, which makes them especially suitable for scenarios in which prediction accuracy is a priority (FILDES; MAKRIDAKIS; STELLA, 2019).

Among the widely used algorithms, the methods based on decision trees stand out, which partition the space of attributes into homogeneous regions, allowing the capture of complex interactions between variables. However, isolated decision trees tend to present a high risk of overfitting, which compromises their ability to generalize (LIU; WANG; ZHANG, 2012).

To mitigate this problem, ensemble techniques have been proposed, combining multiple models to produce more robust predictions. Random Forest, for example, uses the training of several trees on random subsets of the data and variables, reducing the variance of the model and improving its predictive stability (LIU; WANG; ZHANG, 2012). Gradient boosting methods, on the other hand, build models sequentially, so that each new tree seeks to correct the errors of the previous ones, resulting in high predictive power.

2.3 GRADIENT BOOSTING AND TEMPORAL ATTRIBUTE ENGINEERING

Tree-based gradient boosting algorithms, such as XGBoost and LightGBM, have achieved state-of-the-art performance in several regression and classification problems, including industrial demand forecasting applications. XGBoost stands out for incorporating regularization mechanisms and computational optimizations that contribute to greater efficiency and control of overfitting (CHEN; GUESTRIN, 2016). Similarly, LightGBM was developed with a focus on scalability and memory efficiency, maintaining high accuracy even in large volumes of data (KE et al., 2017).

The literature points out that the performance of these algorithms is strongly influenced

by the quality of attribute engineering, especially in time series problems. The incorporation of calendar variables, holiday indicators, lags, and mobile statistics allows machine learning models to explicitly represent seasonal patterns and temporal dependencies, approximating the underlying structure of the series (BERGMEIR; BENÍTEZ, 2012; HYNDMAN; ATHANASOPOULOS, 2018).

In this sense, empirical studies have shown that the combination of gradient boosting methods with temporal attribute engineering results in significant gains in predictive performance when compared to both traditional statistical models and machine learning approaches without adequate treatment of the temporal dimension (HASTIE; TIBSHIRANI; FRIEDMAN, 2009; KE et al., 2017).

Despite the advances observed in the international literature, there is still a gap in the national context regarding the comparative evaluation of machine learning algorithms applied to the prediction of daily sales in the Brazilian beer sector, especially in studies that use real data and rigorous time validation. As summarized in **Table 1**, different forecasting approaches have distinct characteristics, advantages, and limitations, highlighting the need for empirical analyses that consider both predictive performance and the challenges associated with time series modeling.

Table 1

Comparison between time series forecasting approaches

Approach	Key features	Advantages	Limitations
Statistical Models (ARIMA)	Based on linearity and stationarity	Interpretability; solid theoretical foundation	Difficulty capturing nonlinearities
Decision trees	Recursive Partitioning of Attribute Space	Simplicity; Interpretability	High risk of overfitting
Random Forest	Tree ensemble with random sampling	Reduction of variance; Robustness	Lower overall interpretability
Gradient Boosting (XGBoost / LightGBM)	Sequential Tree Construction with Error Correction	High accuracy; Nonlinear Modeling	Increased computational complexity

Source: Prepared by the authors, based on Breiman (2001), Hastie et al. (2009), Chen and Guestrin (2016) and Ke et al. (2017).

In addition, recent research highlights that the performance of these algorithms is strongly associated with the quality of temporal attribute engineering, including the use of calendar variables, lagged attributes, and mobile statistics, capable of effectively representing temporal dependencies and seasonal patterns (BANDARA et al., 2020). In this sense, the present study positions itself in this context by empirically analyzing the performance of different machine learning algorithms in a real industrial scenario, contributing

to the advancement of knowledge applied to demand forecasting in the brewing sector.

3 METHODOLOGY

The present research is characterized as a quantitative study, of applied nature, with an explanatory approach, whose objective is to evaluate the performance of different machine learning algorithms in the daily sales forecast of a Brazilian brewing industry. The methodological design was structured in order to ensure the replicability of the experiments and the validity of the results, respecting the temporal nature of the data analyzed.

3.1 DATASET AND EXPERIMENTAL DESIGN

The study used a set of historical data of daily beer sales, measured in volume, covering the period from May 1, 2024 to May 31, 2025. The data were organized in a continuous time series, without additional aggregations, preserving the daily granularity necessary for the analysis of short-term patterns.

Data division was performed temporarily, as recommended in the literature for time series problems, in order to avoid information leakage between the training and test sets (HYNDMAN; ATHANASOPOULOS, 2018; BERGMEIR; BENÍTEZ, 2012). Thus, the records referring to the year 2024 were used for training and adjustment of the models, while the data from 2025 were reserved exclusively for the final evaluation of the predictive performance.

3.2 TEMPORAL ATTRIBUTE ENGINEERING

In order to capture seasonal patterns and temporal dependencies inherent to daily sales, the time attribute engineering stage was carried out, considered fundamental in machine learning applications for time series. The predictor variables were organized into the following categories:

- a) Calendar attributes: day of the week, day of the month, month of the year, binary indicator of weekend/working day and indicators of national holidays and relevant festive dates (such as Carnival, Christmas and New Year's Eve), aiming to represent weekly and annual cycles of consumption;
- b) Lag attributes: values of sales observed in previous periods, including short-term (e.g., 1 day) and weekly (e.g., 7 days) lags, allowing modeling the direct temporal dependence between consecutive observations;
- c) Moving statistics: moving averages and standard deviations calculated in 7-day and 30-day sliding windows, in order to smooth out one-off fluctuations and capture recent trends in the series.

Additional exogenous variables, such as climate data or information from promotional campaigns, were not incorporated due to unavailability in the analyzed data set, thus prioritizing temporal attributes widely used and validated in the literature.

3.3 ALGORITHMS EVALUATED

Four algorithms based on decision trees, widely used in regression and demand forecasting problems, were evaluated:

- a) Decision Tree: regression model that partitions the attribute space recursively, serving as a baseline for its simplicity and interpretability;
- b) Random Forest: ensemble method that combines multiple decision trees trained on random subsets of data and variables, with aggregation of predictions by mean, aiming to reduce variance and increase the robustness of the model (BREIMAN, 2001);
- c) XGBoost: gradient boosting algorithm that builds trees sequentially to correct residual errors from previous models, incorporating regularization and computational optimizations to control overfitting and increase efficiency (CHEN; GUESTRIN, 2016);
- d) LightGBM: histogram-based gradient boosting technique, designed for efficient training and reduced memory usage, while maintaining high predictive accuracy (KE et al., 2017).

3.4 TRAINING, VALIDATION, AND EVALUATION OF MODELS

The training of the models was carried out using exclusively the 2024 dataset. For the adjustment of hyperparameters, cross-validation with temporal division was adopted, respecting the chronological order of the observations and avoiding the use of future data in the learning process.

The final evaluation of the predictive performance was conducted on the test set (2025 data), using metrics widely consolidated in the literature for regression problems:

- a) Coefficient of determination (R^2), which measures the proportion of variance explained by the model;
- b) Mean Absolute Error (MAE), which expresses the mean error in absolute terms, facilitating practical interpretation;
- c) Root mean squared error (RMSE), which penalizes larger errors and provides a sensitive measure of extreme deviations.

These metrics allow for a consistent comparative analysis between the models, considering both the accuracy and stability of the forecasts.

3.5 ETHICAL CONSIDERATIONS AND METHODOLOGICAL LIMITATIONS

The data used in this study do not contain personal or sensitive information, and are restricted to aggregated sales records, which does not require formal ethical consent procedures. As methodological limitations, the absence of relevant exogenous variables, such as climate and promotional actions, and the analysis restricted to a single brewing industry stand out, which may limit the generalization of the results. Even so, the adopted design allows for a robust evaluation of the potential of machine learning algorithms in a real industrial application scenario.

4 RESULTS

This section presents the results obtained from the application of the machine learning algorithms proposed for the daily sales forecast of a Brazilian brewing industry. The models were evaluated based on the predictive performance on the test set, corresponding to the data from the year 2025, preserving the temporal integrity of the series.

4.1 PERFORMANCE OF FORECASTING MODELS

Table 2 presents the quantitative results of the four algorithms evaluated — Decision Tree, Random Forest, XGBoost and LightGBM — considering the metrics coefficient of determination (R^2), mean absolute error (MAE) and root mean squared error (RMSE).

Table 2

Comparison of the performance of daily sales forecasting models

Model	R^2	MOTHER	RMSE
Decision Tree	0,700	380,5	480,2
Random Forest	0,850	250,0	320,0
LightGBM	0,880	212,3	275,6
XGBoost	0,899	198,4	263,5

Source: Prepared by the authors.

It is observed that the ensemble models presented superior performance than the isolated decision tree. XGBoost obtained the highest value of R^2 , explaining approximately 89.9% of the variance of daily sales, in addition to presenting the lowest values of MAE and RMSE. LightGBM showed close performance, followed by Random Forest, while Decision Tree showed the highest prediction errors.

4.2 GRAPHICAL ANALYSIS OF FORECASTS

To complement the quantitative analysis, Figure 1 presents a visual comparison between the actual sales values and the forecasts generated by the best performing model (XGBoost), over the test period.

Visual inspection indicates that the XGBoost model follows the dynamics of the time series over the analyzed period, capturing weekly seasonal patterns and oscillations over the analyzed period. Punctual differences between observed and predicted values are concentrated on atypical days, possibly associated with unmodeled factors, such as specific promotions or climatic variations.

Figure 1

Actual sales and forecasted sales of the XGBoost model in the test period

Source: Prepared by the authors.

5 CONCLUSION

The present study aimed to evaluate the application of machine learning algorithms in the daily sales forecast of a Brazilian brewing industry, comparing the performance of models based on decision trees in a real scenario of historical data. To this end, an experimental design was used that respected the temporal nature of the series, combined with the engineering of temporal attributes to capture seasonal patterns and historical dependencies.

The results obtained showed that the ensemble models presented superior performance to the isolated decision tree, showing greater generalization capacity and predictive accuracy. Among the algorithms evaluated, XGBoost stood out by explaining approximately 89.9% of the variance of daily sales, in addition to presenting the lowest values

of mean absolute error and root mean squared error. LightGBM also showed high performance, reinforcing the adequacy of gradient boosting methods for demand forecasting problems with high seasonality.

From a scientific point of view, the main contribution of this work is to provide a comparative empirical analysis of the performance of different machine learning algorithms applied to the prediction of daily sales in the context of the Brazilian brewing industry, an area still little explored in the national literature. Additionally, the results indicate that the use of relatively simple temporal attributes, when combined with robust machine learning models, can produce consistent predictions, even in the absence of more complex exogenous variables.

From a managerial perspective, the findings suggest that the adoption of machine learning techniques can support decisions related to production planning, inventory management, and logistics, contributing to the reduction of stockouts and overstocks. Although the study is restricted to a single industry, the methodological procedures adopted are replicable and can be extended to other industrial contexts with similar characteristics.

As limitations, the absence of relevant exogenous variables, such as climate data and information on promotional campaigns, as well as the analysis centered on a single set of data, stand out. As future works, it is recommended to incorporate new data sources, evaluate additional algorithms — such as CatBoost and neural networks — and expand the study to multiple product lines or different companies in the sector, in order to broaden the generalization of the results and deepen the understanding of the factors that influence demand in the beer market.

ACKNOWLEDGMENTS

The authors would like to thank the State University of Minas Gerais (UEMG), through the Research Support Program (PAPq/UEMG), for the institutional support granted to the development of this research.

ABSTRACT

The Brazilian Standard for the Commercialization of Foods for Infants and Young Children, Nipples, Pacifiers, and Baby Bottles (NBCAL) aims to protect breastfeeding; however, violations have been identified that expose mothers and children to abusive marketing of products that compete with breastfeeding. Objective: To identify infractions of NBCAL in the commercialization of infant formula and follow-on infant formula in commercial establishments in the city of Maceió, Alagoas. Methodology: An observational and descriptive study was conducted through visits and verification of NBCAL violations in commercial establishments (supermarkets and pharmacies) located in different neighborhoods of Maceió, Alagoas. Results: Of the 126 establishments recorded in the study, 27 presented infractions, corresponding to 21.4% of the total. Among the establishments visited, 19.8% of

pharmacies and 25.7% of supermarkets presented infractions, indicating that supermarkets showed a higher occurrence of improper commercial promotion. The predominant commercial strategy was price discounts, but special product displays and the combination of discounts with special displays were also observed. The two types of formula analyzed in the study presented similar rates of infractions. Conclusion: Noncompliance with regulations aimed at protecting breastfeeding was identified in some commercial establishments in Maceió, Alagoas, highlighting irregularities regarding NBCAL.

RESUMO

A Norma Brasileira de Comercialização de Alimentos para Lactentes e Crianças de Primeira Infância, Bicos, Chupetas e Mamadeiras (NBCAL), visa proteger o aleitamento materno, porém é verificado que existem violações que expõem mães e crianças ao marketing abusivo de produtos que competem com o aleitamento materno. Objetivo: Identificar infrações à NBCAL na comercialização de fórmulas infantis para lactentes e fórmulas infantis de seguimento para lactentes em estabelecimentos comerciais na cidade de Maceió-AL. Metodologia: Realizou-se uma pesquisa observacional e descritiva por meio de visita e verificação de violação à NBCAL em estabelecimentos comerciais (supermercados e farmácias) localizados em diferentes bairros da cidade de Maceió-AL. Resultados: Dos 126 estabelecimentos registrados na pesquisa, 27 apresentaram infrações, correspondendo a 21,4% do total. Dos estabelecimentos visitados, 19,8% das farmácias e 25,7% dos supermercados apresentaram infrações, constatando que os supermercados revelaram mais promoção comercial indevida. A estratégia comercial predominante foi o desconto no preço, mas também foi evidenciado exposição especial e a associação de desconto e exposição especial. Os dois tipos de fórmulas analisados na pesquisa apresentaram taxas similares de cometimento de infrações. Conclusão: Foi constatada a presença de descumprimento das regulamentações destinadas à proteção do aleitamento materno em alguns estabelecimentos comerciais em Maceió-AL, evidenciando irregularidades em relação à NBCAL.

1 INTRODUCTION

According to the World Health Organization (WHO), exclusive breastfeeding consists of feeding the child only with breast milk, offered directly from the breast, through pumping or from human milk banks, and the offer of other liquids or foods is not allowed (WHO, 1995). This practice is considered the most complete form of infant feeding during the first six months of life, since human milk provides all the necessary nutrients in adequate proportions for the growing organism. It is also recommended that after the introduction of complementary feeding, breastfeeding should be maintained until at least two years of age or more (Ministry of Health, 2009; Moraes et al., 2021).

Breastfeeding transcends the simple supply of nutrients to the baby, configuring itself as a complex process that involves physical, emotional and social interaction between mother and child. Scientific evidence demonstrates positive impacts of breastfeeding on the nutritional, cognitive, and emotional status of the child, as well as protection against infections and reduction of infant mortality, including a decrease in the risk of sudden infant death syndrome. The benefits also extend to women's physical and mental health, contributing to the reduction of the risk of various diseases (Sousa et al., 2021; Moraes et al., 2021; Ministry of Health, 2009).

However, in certain circumstances, the infant's access to breast milk may be limited by biological, social, or structural factors, making it necessary to use nutritional supplements, such as infant formulas (Silva, 2023).

According to Collegiate Board Resolutions (RDC) No. 43/2011 and No. 44/2011, infant formulas for infants are intended for children from birth to the sixth month of life, while follow-up infant formulas are indicated for infants from the sixth month to twelve months of incomplete age (ANVISA, 2011a; ANVISA, 2011b). These products are made from cow's milk, other animals or mixtures thereof, and may contain other ingredients considered suitable for infant feeding, with the aim of resembling human milk as far as possible.

However, the composition of infant formulas does not fully reproduce the physiological properties of human milk, which has specific characteristics from each mother to her own child. The sources of carbohydrates, proteins, and other components present in the formulas differ in identity, quality, and bioavailability when compared to human milk (Ministry of Health, 2014). Thus, such products must meet the guidelines established by the Codex Alimentarius, which defines international standards related to composition, safety, labeling, and other technical requirements (Boatwright et al., 2022).

In Brazil, there are legal guidelines that regulate the commercial dissemination and labeling of foods and products intended for infants and young children, including those up to

three years of age. The Brazilian Standard for the Commercialization of Food for Infants and Early Childhood Children, Nipples, Pacifiers and Bottles (NBCAL), instituted by Law No. 11,265, of 2006, and later regulated in 2015 and 2018 (Brasil, 2024), stands out. This legislation prohibits promotional practices in any media, including merchandising, electronic, print, sound or visual advertising.

In addition, marketing strategies that encourage direct sales to consumers in retail are prohibited, such as special exhibitions, granting discounts, pricing below cost, offering gifts, prizes, tied sales, or differentiated promotional presentations (Brasil, 2024). In this context, NBCAL is an important instrument for protecting children and their caregivers from harmful commercial practices, contributing to the preservation, promotion and protection of breastfeeding (Peres; Rinaldi, 2023).

Despite the existing legal framework, food producing and distributing companies that compete with breastfeeding recurrently develop abusive marketing strategies, which negatively influence the decisions of mothers and family members regarding infant feeding. These practices compromise adherence to the recommendations of the World Health Organization and favor a significant increase in sales and profits of the breastmilk substitute industries (Victoria et al., 2016; Silva et al., 2020; Piwoz; Huffman, 2015).

The weakness in the regular inspection of commercial establishments and the scarcity of effective educational actions about NBCAL can be attributed, among other factors, to the limited coverage of specific surveillance by the competent bodies, as well as to the influence of lobbying exercised by the infant food industry. These conflicts of interest contribute significantly to the current scenario of non-compliance with the legislation (Silva et al., 2020). In addition, insufficient knowledge of NBCAL by managers of commercial establishments, health professionals, and mothers creates an environment favorable to the perpetuation of abusive marketing, exposing families to practices that compromise breastfeeding (Boccolini et al., 2021; Piwoz; Huffman, 2015).

In this context, the present study aimed to evaluate violations of the NBCAL related to the sale of infant formulas and follow-up infant formulas in commercial establishments in the city of Maceió, Alagoas, aiming to contribute to the promotion of healthy eating practices and the protection of breastfeeding.

2 METHODOLOGY

This is an observational and descriptive study with the aim of evaluating compliance with the Brazilian Standard for the Commercialization of Foods for Infants and Early Childhood Children, Nipples, Pacifiers and Bottles (NBCAL), focusing on infant formulas for

infants and follow-up infant formulas for infants, in commercial establishments (pharmacies and supermarkets) distributed in several neighborhoods of the city of Maceió, Alagoas.

Data collection was carried out by five dental students in January and February 2024 through face-to-face visits and observation of the forms of commercial promotion practiced in commercial establishments. The choice of neighborhoods was planned and made in a way that allowed the socioeconomic representativeness of the different regions that comprise the city of Maceió-AL, including neighborhoods considered more elite and more popular. In this context, the total number of commercial establishments included 91 pharmacies and 35 supermarkets, totaling 126 establishments visited in 20 neighborhoods.

The data on infant formulas found with a marketing violation were cataloged according to the type of formula for each age group, the commercial name of the product and the name of the manufacturer, obtained from the label, the place where it was found and the type of violation committed. The following inclusion factors were considered: infant formulas for infants (0-6 months) and follow-up infant formulas for infants (6-12 months); and exclusion: follow-up infant formulas for children in early childhood (1-3 years of age), infant formulas indicated for high-risk newborns, and dairy compounds.

The type of trade promotion infringement has been specified in the table of results in:

1. Special exhibition;
2. Price discount;
3. Gift or sample associated with the sale of the product;
4. Special exhibition and price discount;
5. Price discount and gift;
6. Special exhibition and toast;
7. All strategies.

3 RESULTS

The final sample was visited by 126 commercial establishments in the city of Maceió-AL, 91 (72.22%) pharmacies and 35 (27.77%) supermarkets distributed in 20 neighborhoods of the city. The data collected regarding the types of formulas sold, type of establishment and neighborhood, and the types of commercial promotions are described in Table 1.

Regarding the visited regions of the city, there were similar numbers of total locations in each neighborhood, in order to promote a greater likelihood of the results by region. However, the results of the findings of the infractions were predominant in certain neighborhoods, which made it evident in the present study that in the most popular neighborhoods these violations were more prevalent.

Of the 126 establishments analyzed, 27 sold products with commercial promotion prohibited by NBCAL, which corresponds to 21.4% of the establishments (Figure 1), and of these, 19.8% of the pharmacies and 25.7% of the supermarkets evaluated presented infractions (Figure 2), which indicates that supermarkets were the places that most failed to comply with the rule.

Regarding the most frequent commercial promotion strategies, it was evident that price discount was the most common, followed by special exposure and special exposure associated with price discount, with no infraction of the type of gift or sample, price discount associated with gift, special exposure associated with gift and all strategies together at the same time (Figure 3). There was a difference in the percentage of undue commercial promotion in the different types of formulas, with more infractions in infant formulas compared to follow-up formulas.

Table 1

Description in relative and absolute numbers, of the type of formulas sold, the types of establishment and neighborhood, and type of commercial promotion of the establishments surveyed. Maceió, Alagoas, 2024

Image of the infraction	Formula Type	Establishment and neighborhood	Type of infraction

4 DISCUSSION

According to Law No. 11,265, of January 3, 2006, which regulates the commercialization of foods for infants and young children, as well as related childcare products, Article 4 expressly prohibits the commercial promotion of infant formulas for infants and follow-up for infants in any means of communication (BRASIL, 2006). However, according to the results of the present study, carried out in the municipality of Maceió, Alagoas, this legislation has been violated in part of the commercial establishments evaluated, in which infractions related to promotional strategies, such as price discounts and special exhibitions, were identified in approximately 21.4% of the places inspected.

Corroborating these findings, the 2022 NBCAL Monitoring Report, prepared by IBFAN Brasil, which includes all products subject to inspection, identified 864 records of infractions, 34.7% of which corresponded to the illegal commercial promotion of infant formula (IBFAN BRASIL, 2022). Similarly, the study by Baldani et al. (2018), carried out in commercial establishments in the municipality of Uberlândia, Minas Gerais, showed that 46.8% of the infant formulas analyzed had commercial promotion in disagreement with the legislation. These data demonstrate that, despite the decades of validity of the NBCAL, a significant number of violations persist, which can compromise the promotion, protection and support of breastfeeding.

Regarding the type of commercial establishment with the highest frequency of non-compliance with the NBCAL, supermarkets had the highest proportion of infractions (25.7%), followed by pharmacies (19.8%). These findings are in line with the study by Padilha (2011), carried out in the municipality of Recife, Pernambuco, which also identified supermarkets as the main places of non-compliance with the legislation, followed by grocery stores and pharmacies. However, these results differ from those found by Silva et al. (2020), in a study carried out in the South Zone of Rio de Janeiro, in which pharmacies had a higher prevalence of illegal promotions (19%) compared to supermarkets (2%).

Also according to Silva et al. (2020), when evaluating 352 commercial establishments, 20.3% of the places that sold products covered by the NBCAL had illegal promotions, with price discounts being the most frequently observed strategy. These data are similar to those found in the present study, in which the price discount was also configured as the main infraction strategy, being present in 21.4% of the establishments visited. In addition, strategies such as special exposure and the association between price discount and special exposure were identified, to a lesser extent, practices also described by Silva et al. (2021) in a study conducted in the cities of Belém and São Paulo, as well as by Lima et al. (2023) in the municipality of Toledo, Paraná.

Regarding the types of formulas analyzed, Silva et al. (2021) observed a higher prevalence of infractions in infant formulas when compared to follow-up formulas, both in Belém and São Paulo. This finding converges with the results of the present study, in which formulas intended for infants also presented a higher number of infractions in relation to follow-up formulas. These results reinforce the relevance of NBCAL as an essential instrument of public policy to promote breastfeeding and control the commercialization of products that compete directly with this practice.

The benefits of breastfeeding are widely recognized, as it constitutes the most complete food for the baby and involves a significant interaction between mother and child,

with positive impacts for both the child and the woman. In addition to its influence on nutritional status, breastfeeding contributes to the physical, emotional and cognitive development of the child, in addition to strengthening protection against infections (MINISTRY OF HEALTH, 2009; MORAES et al., 2021). In addition, the benefits of breastfeeding extend to the mother's physical and mental health (SOUSA et al., 2021). On the other hand, infant formulas do not reproduce most of these effects and may be associated with risks such as gastrointestinal alterations, contamination during preparation, food allergies related to cow's milk protein, and respiratory alterations (MINISTRY OF HEALTH, 2014). Thus, despite their usefulness in specific situations that make breastfeeding impossible, infant formulas should only be used as a dietary supplement, as indicated appropriately (SILVA, 2023).

Despite efforts to promote breastfeeding and regulate the sale of infant foods, irregularities persist in commercial establishments. The insufficiency of supervision and application of sanctions contributes to a scenario in which practices harmful to public health remain recurrent (PIWOZ; HUFFMAN, 2015; VICTORA et al., 2016). This context highlights the need for intensified monitoring by inspection agencies, as well as educational actions aimed at the appropriate advertising of these products and the valorization of breastfeeding.

In this scenario, one of the factors that can explain the non-compliance with the NBCAL is the lack of knowledge of the legislation on the part of professionals who work in commercial establishments. Lima et al. (2023) observed that 50% of the pharmacists interviewed in the municipality of Toledo, Paraná, were unaware of NBCAL. Similarly, Silva et al. (2020) reported that 50.8% of those responsible for commercial establishments in the South Zone of Rio de Janeiro were not aware of the standard, while Rodrigues et al. (2021) found that 53.7% of pharmacy employees interviewed in the same region were also unaware of the current legislation.

In view of this, it is essential that owners of supermarkets, grocery stores and pharmacies pay attention to compliance with the NBCAL. The importance of the ethical and responsible performance of the pharmacist in establishments that sell infant formulas is also highlighted, since it is the duty of this professional to know and respect the applicable health legislation.

Therefore, it is necessary to foster an ethical commitment to compliance with the NBCAL, both on the part of manufacturers and distributors, who have the obligation to disseminate the standard, and on the part of health professionals and traders. In addition, it is essential that the government implements public policies that strengthen the effectiveness of legislation, through continuous educational and inspection actions.

Although it is complex to accurately measure the direct impact of adherence to the NBCAL on breastfeeding indicators, it is recognized that the standard plays an essential role as one of the pillars of the policy of promotion, protection and support of breastfeeding, acting as a safeguard against abusive marketing practices.

For future studies, it is suggested to investigate the level of knowledge of managers and employees of commercial establishments about NBCAL, as well as to analyze the impact of marketing strategies on the target audience, evaluating their influence on purchasing decisions. It is also recommended that evaluations be carried out in conjunction with NBCAL management groups, in order to analyze the effectiveness of the inspection and the outcome of the complaints registered.

With regard to the registration of complaints, according to the NBCAL information booklet: to know the law, made available by IBFAN Brasil, infractions must be reported to the municipal Health Surveillance, and can also be registered with the Anvisa Ombudsman, the Food Advertising Observatory, Procon and the Public Prosecutor's Office (IBFAN BRASIL, 2021). Complaints must be accompanied by evidence of the infraction and, in view of the scenario of misinformation, direct contact with those responsible for the establishments is recommended to clarify the irregularities identified.

In cases of non-compliance with the NBCAL, Law No. 6,437 of 1977 characterizes violations of federal health legislation and establishes the corresponding sanctions, including fines that vary according to the severity of the infraction, and may be doubled in cases of recidivism (BRASIL, 1977). The responsibility for the sanitary infraction falls on those who, directly or indirectly, have contributed to its occurrence.

Thus, it is recommended to strengthen inspections and continuous monitoring, considering the time the legislation has been in force, as well as the prioritization of educational actions aimed at advertising children's products and the promotion of breastfeeding as fundamental instruments for promoting the health of the population.

5 CONCLUSION

The results of the present study reveal that there are places that do not comply with the regulations aimed at the protection of breastfeeding in some commercial establishments in the city of Maceió-AL, evidencing irregularities in relation to the NBCAL.

ABSTRACT

This study presents a qualitative literature review on silymarin, a complex of flavonolignans extracted from milk thistle, with emphasis on its biological studies and its association with metallic compounds, highlighting the zinc (II) ion. Silymarin exhibits antioxidant, anti-inflammatory, and hepatoprotective properties; however, its clinical application is limited by factors such as low aqueous solubility, rapid elimination, and reduced cellular permeability. Research involving silymarin in inorganic compounds is relatively recent, particularly studies associated with the zinc (II) ion. This association emerges as a promising strategy to improve bioavailability, chemical stability, and pharmacological activity of the compound. The literature review was conducted across different databases, covering publications from 2021 to 2025. Original articles, case reports, and experimental studies addressing mechanisms of association, chelation, bioavailability, biological activity, or therapeutic applications of silymarin, either alone or combined with metallic ions, were included. After screening titles and abstracts, 14 articles were selected for full analysis. The results indicate that the association of silymarin with metallic ions, especially zinc (II), may positively influence its biological and pharmacological properties, reinforcing its therapeutic potential.

RESUMO

Este trabalho apresenta uma revisão bibliográfica qualitativa sobre a silimarina, um complexo de flavonolignanas extraído do cardo-mariano, com ênfase em seus estudos biológicos e em sua associação com compostos metálicos, destacando o íon zinco (II). A silimarina apresenta propriedades antioxidantes, anti-inflamatórias e hepatoprotetoras, entretanto, sua aplicação clínica é limitada por fatores como baixa solubilidade em meio aquoso, rápida eliminação e reduzida permeação celular. As pesquisas envolvendo a silimarina em compostos inorgânicos são relativamente recentes, destacando-se aquelas associadas ao íon zinco (II). Essa associação surge como uma estratégia promissora para melhorar a biodisponibilidade, a estabilidade química e a atividade farmacológica do composto. O levantamento bibliográfico foi realizado em diferentes bases de dados, abrangendo publicações no período de 2021 a 2025. Foram incluídos artigos originais, relatos de caso e estudos experimentais que abordassem mecanismos de associação, quelação, biodisponibilidade, atividade biológica ou aplicações terapêuticas da silimarina, tanto isolada quanto associada a íons metálicos. Após a triagem dos títulos e resumos, 14 artigos foram selecionados para análise completa. Os resultados indicam que a associação da silimarina com íons metálicos, especialmente o zinco (II), pode influenciar positivamente suas propriedades biológicas e farmacológicas, reforçando seu potencial terapêutico.

Palavras-chave: Silimarina. Compostos Metálicos. Potencial Biológico.

RESUMEN

Este trabajo presenta una revisión bibliográfica cualitativa sobre la silimarina, un complejo de flavonolignanos extraído del cardo mariano, con énfasis en sus estudios biológicos y en su asociación con compuestos metálicos, destacando el ion zinc (II). La silimarina presenta propiedades antioxidantes, antiinflamatorias y hepatoprotectoras; sin embargo, su aplicación clínica está limitada por factores como baja solubilidad en medio acuoso, rápida eliminación y reducida permeabilidad celular. Las investigaciones que involucran la silimarina en compuestos inorgánicos son relativamente recientes, destacándose aquellas asociadas al ion zinc (II). Esta asociación surge como una estrategia prometedora para mejorar la biodisponibilidad, la estabilidad química y la actividad farmacológica del compuesto. La revisión bibliográfica se realizó en diferentes bases de datos, abarcando publicaciones del período 2021 a 2025. Se incluyeron artículos originales, reportes de caso y estudios experimentales que abordaran mecanismos de asociación, quelación, biodisponibilidad, actividad biológica o aplicaciones terapéuticas de la silimarina, tanto aislada como asociada a iones metálicos. Tras la revisión de títulos y resúmenes, se seleccionaron 14 artículos para análisis completo. Los resultados indican que la asociación de la silimarina con iones metálicos, especialmente el zinc (II), puede influir positivamente en sus propiedades biológicas y farmacológicas, reforzando su potencial terapéutico.

1 INTRODUCTION

Silymarin is a compound consisting of seven flavolignans (silybin A, silybin B, isosilybin A, isosilybin B, silychristin, isosilychristine and silidianine), Figure 01, extracted from *Silybum marianum* (milk thistle), has stood out as one of the main agents studied in hepatoprotective and neuroprotective therapies, due to its antioxidant and anti-inflammatory properties (Sayyad et al., 2025). In addition, it is widely used in traditional medicine in several European countries, which reinforces its historical and therapeutic value.

Figure 1

Structure and nomenclature of the main compounds found in silymarin

Source: Sayyad et al., 2025.

In recent years, it has aroused growing scientific interest due to its protective effect on several organs, such as the stomach, lungs, kidneys, pancreas, colon, skin, prostate, bladder, and central nervous system (CNS), and these effects reflect its broad therapeutic potential, encompassing anticancer, hepatoprotective, cardioprotective, hypocholesterolemic, neuroprotective activities, among others (Almutary et al., 2025; Macit et al., 2023).

Despite these advantages, the therapeutic application of silymarin is limited by factors such as low solubility in aqueous media, rapid elimination, and reduced permeation by intestinal cells, which compromises its bioavailability and clinical efficacy (Aboshanab et al., 2020). In view of these limitations, alternative strategies have been explored to improve their pharmacokinetic properties, especially the development of nanostructured systems and the association with metal ions.

Among the metal ions of biological interest, zinc(II) (Zn^{2+}) stands out for its broad participation in physiological processes, acting as a structural and functional element of

numerous enzymes, regulatory proteins, and transcription factors (Thompson et al., 2022). A key characteristic of Zn^{2+} is its tendency to form highly soluble positively charged ions in biological fluids, which favors its interaction with natural ligands and its bioavailability in living systems (Oliveira et al., 2022).

In this context, the association of silymarin with zinc(II) (Zn^{2+}) emerges as a promising strategy to overcome its pharmacokinetic limitations. The formation of silymarin- Zn^{2+} complexes/associates can result in greater chemical stability, increased solubility, better biological permeation, and potentiation of the compound's pharmacological activity (Halevas et al., 2021). In general, the interaction between natural ligands and metal ions can confer greater stability, solubility, lipophilicity, and biological activity, in addition to enabling new mechanisms of pharmacological action (Silva et al., 2021).

Metal ions play a key role in biological systems, being widely recognized for their participation in processes such as enzymatic catalysis, signal transduction, electron transfer, and synaptic transmission (Walencik et al., 2024). In addition to acting as biological cofactors, these ions are considered strategic components in the construction of advanced supramolecular systems, both of natural and synthetic origin.

This is due to the fact that the properties of metal compounds can be rationally modulated through the choice of ligands/molecules, the functionalization of the associated groups, and the oxidation state of the metal, factors that directly influence the dosage, bioavailability, and therapeutic efficacy of the compounds (Unavane et al., 2025). In this way, the metallic association is consolidated as an effective strategy to improve the pharmacokinetic performance of natural compounds with inherent limitations, such as silymarin.

In this sense, this work aims to carry out a literature review on silymarin, with emphasis on its interactions with metallic compounds, especially zinc(II), highlighting the role of these complexes in the modulation of its biological and pharmacological properties.

2 DEVELOPMENT

This is a literature review, with a qualitative approach, aimed at gathering, analyzing and synthesizing recent scientific evidence about silymarin, as well as its interactions with the zinc(II) ion and its association with metallic compounds.

The bibliographic survey was carried out in the following electronic databases: World Wide Science, Scientific Electronic Library Online (SciELO), Integrated Library System (SiBi), ScienceDirect, Google Scholar and PubMed. These databases were selected for their

comprehensiveness and relevance in the indexing of national and international scientific journals in the areas of health sciences, pharmacology, chemistry and biotechnology.

The following terms were used as descriptors in Portuguese and English: "silymarin", "silymarin and metallic compounds", "silymarin and zinc", as well as their English counterparts ("silymarin", "silymarin and metallic compounds" and "silymarin and zinc"). The descriptors were combined using Boolean operators ("AND" and "OR"), in order to increase the sensitivity of the search and ensure the retrieval of relevant studies.

As inclusion criteria, original articles, case reports, and experimental studies published between 2021 and 2025, available in full, that addressed silymarin alone or in association with metals, with an emphasis on association mechanisms, chelation, bioavailability, biological activity, or therapeutic applications, were considered.

Duplicate studies, publications outside the delimited period, studies that did not address the area of human health, reviews, and articles without access to the full text were excluded.

After the search stage, the selected studies were submitted to the reading of the titles and abstracts for initial screening. Then, 14 articles were chosen and read in full, and information was extracted as shown in Table 01. Data analysis was performed in a descriptive and interpretative manner, allowing the organization of the findings into thematic axes, according to the descriptors, subdividing them into three: Silymarin, Silymarin and Metallic Compounds and Silymarin with Zinc (II).

The analyzed studies convergently demonstrate that silymarin exerts relevant antioxidant and anti-inflammatory effects, which manifest themselves in a manner dependent on the pathophysiological context and the experimental model adopted, as well as interactions with metal ions, such as zinc(II) that can modulate its biological properties, either through direct complexation, interference in zinc-dependent enzymatic systems or functional synergy in delivery systems and formulations advanced.

In experimental ischemia-reperfusion models, silymarin significantly reduced systemic oxidative stress, as well as modulating inflammatory pathways associated with tissue injury, with superior or comparable performance to other antioxidant phytochemicals, such as thymoquinone and curcumin (Yardimci et al., 2023). In association with glutathione, a synergistic effect on liver protection was observed, with a reduction in inflammatory cytokines, lipid peroxidation, and histopathological damage, reinforcing the role of silymarin as a cytoprotective agent in conditions of acute oxidative stress (Aliyeva et al., 2022). In the randomized controlled trial conducted by Aryan et al. (2022), the administration of nano-silymarin in hospitalized patients with COVID-19 did not result in a significant improvement in overall clinical outcomes, only in ALT levels, which reinforces its hepatoprotective effect.

On the other hand, in oncological models, silymarin showed a selective cytotoxic effect, through the inhibition of the metalloproteinases MMP-2 and MMP-9, zinc-dependent enzymes, promoting apoptosis, cell cycle blockade, and inhibition of tumor migration and metastasis, which evidences its ability to act antagonistically according to cell status (Srinivasan et al., 2024). This mechanistic versatility is clinically supported by the randomized trial conducted in patients with active rheumatoid arthritis, in which silymarin supplementation as an adjuvant therapy resulted in a significant reduction in disease activity and functional and psychosocial improvement, even in the absence of significant changes in classic inflammatory markers, suggesting that clinical benefits may precede detectable biochemical changes (Zugravu et al., 2024).

Additionally, pharmacokinetic studies point to the low oral bioavailability of silymarin as a cross-sectional limitation, although the effects observed in humans indicate that

prolonged exposures or pharmaceutical optimization strategies may be sufficient to promote relevant therapeutic benefits, such as nanoformulations or complexation/association with other metals, especially zinc (II) (Javed et al., 2022). In the study by Reisi et al. (2022), patients treated with silymarin significantly reduced serum ferritin levels after six months of supplementation of patients with β -thalassemia intermedia.

In addition, studies evaluating silymarin combined with zinc(II) show a mechanism where derivatives of silymarin, specifically dehydroflavonoligans, have the ability to chelate Zn^{2+} ions, forming stable complexes under physiological conditions, with significant affinity for zinc(II), resulting in partial inhibition of the enzyme alcohol dehydrogenase (Tvrđý et al., 2021). In consonance, in the study by Siddiqui et al., (2025), in a model of hepatotoxicity by isoniazid and rifampicin, robust results show better results from the association of silymarin-zinc, with a more pronounced reduction in ALT, AST, FA and bilirubins, better histological preservation of the liver, compared to administration alone. Reinforcing this metallic interaction, in the study with liposomal encapsulation of silymarin (SLNPs) associated with zinc in copper toxicity (Maryam et al., 2023), demonstrating that zinc (II) acts synergistically, enhancing the antioxidant and cellular stabilizing action of silymarin, evidenced by greater efficacy in reducing liver enzymes (ALT and AST), histopathological improvement of the liver, and attenuation of neurobehavioral changes.

In the studies by Javan et al. (2025) demonstrated that silymarin and zinc ion, especially in combined administration, can improve sperm parameters and radiation-related infertility problems. The improvement of sperm parameters and testicular cell structure in zinc ion receptor groups can be attributed to the protective properties and increased levels of antioxidants in the cells, the authors report that zinc ion protects normal cells through mechanisms, increased sperm DNA integrity, decreased ROS content, and also improves reproductive function during the prepubertal period with cisplatin administration.

3 CONCLUSION

The present literature review shows that silymarin has a complex and multifactorial pharmacological profile, whose biological activity cannot be attributed exclusively to its classical antioxidant properties. The analyzed data consistently demonstrate that silymarin interacts functionally with metal ions, highlighting the zinc (II) ion as the central element, configuring itself as a phytocomplex with the ability to form metal complexes and associates, which play a relevant role in the modulation of its biological and pharmacological properties.

In addition, the association of silymarin with zinc(II) demonstrated a synergistic effect, resulting in greater therapeutic efficacy when compared to the isolated use of each agent, especially in models of liver toxicity and inflammatory processes.

Finally, silymarin is a pleiotropic, safe and promising phytochemical with antioxidant, anti-inflammatory and cellular stress modulating actions, whose efficacy depends on the pathological context, route of administration and duration of exposure, presenting high translational potential.

ABSTRACT

This article presents the results of an investigation conducted to determine whether textbooks address Afro-Brazilian literature in a way that ensures students critically question ethnic-racial issues, and whether the proposed teaching activities are adequate for addressing this theme. Its objectives were: to describe, analytically and critically, the approaches to ethnic-racial themes, especially those related to Afro-Brazilian literature, in a sample of Portuguese language textbooks intended for basic education; and to present contributions to support the deepening of this theme in the classroom at this level of education. It is a qualitative and descriptive research, based on official documents and authors who discuss textbooks and Afro-Brazilian literature. The results demonstrate a lack of a relevant approach to Afro-Brazilian literature, which constitutes a significant flaw, because by ignoring these issues, the work fails to contribute to the formation of an inclusive education capable of fostering critical reflection on racism, social inequalities, and the richness of Afro-Brazilian culture.

Keywords: Afro-Brazilian Literature. Textbook. Inclusive Education. Ethnic-Racial Issues.

RESUMO

Neste artigo são apresentados os resultados de uma investigação realizada a fim de responder se o livro didático contempla a literatura negro-brasileira, de modo a assegurar aos alunos questionamentos críticos sobre as questões étnico-raciais e se as atividades didáticas propostas são adequadas para o tratamento dessa temática. Ele teve como objetivos: descrever, analítica e criticamente, as abordagens de temáticas étnico-raciais, em especial aquelas relativas à literatura negro-brasileira, em uma amostra de livro didático de língua portuguesa destinado à educação básica e, apresentar contribuições para subsidiar o aprofundamento dessa temática em sala de aula desse nível de ensino. É uma pesquisa qualitativa e descritiva, fundamentada em documentos oficiais e em autores que discutem o livro didático e a literatura negro-brasileira. Os resultados demonstram que há falta de uma abordagem relevante da literatura negro-brasileira, o que constitui uma falha significativa, pois, ao ignorar essas questões, a obra deixa de contribuir para a formação de uma

RESUMEN

Este artículo presenta los resultados de una investigación realizada para determinar si los libros de texto abordan la literatura afrobrasileña de forma que los estudiantes cuestionen críticamente las cuestiones étnico-raciales, y si las actividades didácticas propuestas son adecuadas para abordar este tema. Sus objetivos fueron: describir, analítica y críticamente, los enfoques de los temas étnico-raciales, especialmente los relacionados con la literatura afrobrasileña, en una muestra de libros de texto en portugués destinados a la educación básica; y presentar contribuciones para apoyar la profundización de este tema en el aula en este nivel educativo. Se trata de una investigación cualitativa y descriptiva, basada en documentos oficiales y autores que abordan los libros de texto y la literatura afrobrasileña. Los resultados demuestran la falta de un enfoque relevante de la literatura afrobrasileña, lo cual constituye una deficiencia significativa, ya que, al ignorar estas cuestiones, el trabajo no contribuye a la formación de una educación inclusiva capaz de fomentar la reflexión crítica sobre el racismo, las desigualdades sociales y la riqueza de la cultura afrobrasileña.

Palabras clave: Literatura Afrobrasileña. Libro de Texto. Educación Inclusiva. Cuestiones Étnico-Raciales.

1 INTRODUCTION

"A book, a pen, a child and a teacher can change the world". Malala Yousafzai - Nobel Peace Prize in 2014.

It is possible to say that the textbook (textbook), which is an essential tool in the schooling process, has the power to transform lives, such as Malala's, mentioned in the epigraph, in which education was fundamental to her struggle for girls' rights and for equal access to learning. In addition, textbook is a resource that plays a central role in the teaching-learning process, because, in addition to functioning as an important tool in the presentation, organization and conduction of classroom activities, it directs the didactic-pedagogical approach, the choice of themes and the way students interact with knowledge.

In Brazil, the National Textbook Program (PNLD), created in 1985, subsidized by the National Fund for the Development of Education (FNDE), was consolidated with the objective of enabling the universalization of basic education, promoting the acquisition, distribution and systematic evaluation of textbooks for students in the public elementary school system, according to the parameters and norms established by the Ministry of Education (MEC). Regarding these criteria, after the approval of the Law of Guidelines and Bases of National Education (LDB 9394/1996), it became necessary to develop didactic materials that met the requirements of Brazilian education, including those that provided for the approach of ethnic-racial themes.

On ethnic-racial issues, for example, in the twenty-first century, it is possible to see that Brazilian society still faces difficulties in combating racism. This perspective is supported by the words of Milton Santos (2000, p.15) when he states that: "To be black in Brazil is, therefore, often to be the object of a biased gaze. The so-called good society seems to consider that there is a predetermined place, down there, for blacks and thus calmly behaves."

This finding and the need to change this reality justify the necessary adoption of anti-racist practices in the texts and activities proposed in the textbooks, in order to ensure that the black population is referred to and portrayed with respect and valued as a constitutive part of the historical, social and cultural formation of Brazil. Thus, it is expected that a didactic material in circulation, as important as the Portuguese-language textbook, not only addresses ethnic-racial issues in a critical way, but also gives visibility to black-Brazilian literature and its authors, in order to promote representativeness and the deconstruction of stereotyped views still naturalized in the school space.

Given these considerations, it was intended in this investigative work to answer, through careful analysis of a sample of textbooks in Portuguese, whether **it contemplates**

black-Brazilian literature with adequate didactic activities for the treatment of this theme, **in order to provide** critical questions about ethnic-racial issues.

The general objective is to describe, analytically and critically, the approaches to ethnic-racial themes, especially those related to black-Brazilian literature, in a sample of Portuguese language textbooks intended for basic education and, specifically, to present contributions to subsidize the deepening of this theme in the classroom of this level of education.

Thus, this is a study justified by the need to consider the contributions of textbooks to the formation of a critical and inclusive view in relation to the cultural and racial diversities present in Brazilian society, towards an education aimed at welcoming, recognizing and fully developing students, respecting their singularities and diversities, as ensured by the BNCC, which he proposes,

Exercise empathy, dialogue, conflict resolution and cooperation, making oneself respected and promoting respect for others and human rights, welcoming and valuing the diversity of individuals and social groups, their knowledge, identities, cultures and potentialities, without prejudice of any kind (Brasil, 2018, p.10).

In view of this importance highlighted by the document, the understanding is that the presence of black-Brazilian literature is essential and necessary, through texts alluding to this theme, explored appropriately in the school environment, and should, therefore, be present in the curricula of basic education. After all, students should and deserve to be introduced to content that favors their citizenship education, in a broader and deeper way, under penalty of suffering symbolic violence.

2 METHODOLOGY

Considering the methodology as the set of systematic and rational activities that the researcher uses to obtain and to present, with greater security, the data, towards the achievement of his objectives, this research is qualitative and, as proposed by Minayo (2004, p. 21-22), "[...] works with the universe of meanings, motivations, beliefs, values and attitudes, which corresponds to a deeper space of relationships, processes and phenomena that cannot be reduced to operationalization" and, in addition, does not have the objective of obtaining or demonstrating numbers, statistics or percentages through graphs and tables. Thus, empirical materials are studied, such as texts, including multimodal, didactic-methodological activities, and observational, historical, interactive and visual cultural productions present in the analyzed textbook.

According to the more general purposes, as Gil (2022) points out, this is a descriptive research, since one of the objectives was to descriptively present a critical analysis of the approaches to ethnic-racial themes, especially those related to black-Brazilian literature, in a sample of Portuguese-speaking textbooks.

The object of study was the textbook "Portuguese - Languages", 9th grade, 11th ed. (and its respective teacher's manual) by the authors William Cereja and Carolina Dias Vianna, published in 2022 and indicated by the PNLD for the 2024-2027 quadrennium.

Theoretical considerations about textbooks and black-Brazilian literature follow.

3 CONSIDERATIONS ABOUT TEXTBOOKS

Studies show that in Brazil, textbook is still one of the main didactic tools used in the classroom. According to Lajolo (1996, *apud* Michelato and Santana, 2023, p. 25), textbook has consolidated itself as an essential instrument in pedagogical practice, characteristic of school culture, and has become an important "support" for the teacher's work in various areas of knowledge. In certain contexts, this "support" goes further, becoming an essential tool for the development of classes.

In this way, textbook is characterized as a fundamental pedagogical tool, whose main objective is to serve both students and teachers. For students, the textbook plays the role of assisting in the acquisition of knowledge, as it facilitates their approximation with the content to be studied. For teachers, the book works as a teaching guide, presenting methodologies for the application of classes and didactic guidelines for carrying out activities.

In this scenario, it is essential to consider that textbook should be seen as a support for teaching practice, and not as a rigid script of content to be followed in classes, which should be planned according to the needs of the educator based on the characteristics of the students. In addition, it is necessary to consider the particularities of each educational institution, such as the context in which it is inserted, the profile of the students and their level of education. These particularities directly influence the pedagogical choices and adaptations that the teacher must make in the teaching-learning process.

In Rangel's words,

The big difference between the textbook and other didactic materials, especially those that make use of the image, such as film, video, photo and others, lies in the fact that it is, above all, a legitimate product of writing technology. For this very reason, it is possible to have, through it, an effective access to literate culture (Rangel, 2006, p.13).

In view of this, textbook is mainly based on written language, being a structured way of transmitting knowledge, values, practices and forms of communication built through

reading and writing, which constitutes the so-called "literate culture", considered fundamental for the critical and intellectual formation of students. By reading and writing, the student appropriates concepts, develops logical thinking and better understands the world around him.

In view of the above, although other didactic materials that primarily use multimodal languages, such as images, films, videos or photographs are valuable in the learning process, they may not establish the same direct relationship with literate culture, which is centered on written language. Thus, while these resources complement and enrich learning, textbook stands out as a privileged tool for the construction of written knowledge and for a deep understanding of literate culture. For this reason, textbook reflects the organization of the teaching-learning process and plays a fundamental role in transforming the educational reality of students.

In Brazil, the National Textbook Program (PNLD), created in 1985, was consolidated with the objective of enabling the universalization of basic education, promoting the acquisition, distribution and systematic evaluation of textbooks for students in the public elementary school system, according to the criteria and standards established by the Ministry of Education (MEC).

With the approval of the Law of Guidelines and Bases of National Education (LDB 9394/1996), it became necessary to develop didactic materials that would meet the requirements of Brazilian education. Thus, the evaluation of textbooks has become a fundamental criterion in the choice of those to be adopted by educational institutions. After the official evaluation and review in the textbook guide, teachers have the opportunity to choose the work they consider most appropriate to their realities and with which they wish to work. However, it should be noted that although the Federal Government recommends that each public school select three options of textbooks, listing them from the first to the third choice, the teaching experience has already shown that the book chosen as the first option is not always the material actually received by the school and, even if empirically, it is possible to affirm that the approaches to ethnic-racial themes, from the black-Brazilian literature, in textbooks in general, are incipient, since such issues, in most cases, are approached in a superficial way.

The following are considerations about black-Brazilian literature.

4 CONSIDERATIONS ON BLACK-BRAZILIAN LITERATURE

Black-Brazilian literature stands out for its protest character and its importance for valuing historically marginalized experiences and perspectives. In this context, understanding

black literary production allows us to perceive how readers are invited to come into contact with experiences and perspectives different from those traditionally represented in school curricula.

From this point of view, Law 10.639/2003 (Brasil, art. 26), which amends LDB/9.394/96, made the teaching of Afro-Brazilian history and culture mandatory in the national education systems and provides for the inclusion of this theme in the official curriculum of the Education Network:

In elementary and secondary schools, both official and private, the teaching of Afro-Brazilian History and Culture becomes mandatory.

§ 1 The syllabus referred to in the caput of this article will include the study of the History of Africa and Africans, the struggle of blacks in Brazil, black Brazilian culture and blacks in the formation of national society, rescuing the contribution of black people in the social, economic and political areas pertinent to the History of Brazil.

2º The contents related to Afro-Brazilian History and Culture will be taught within the scope of the entire school curriculum, especially in the areas of Art Education and Brazilian Literature and History (Brasil, 2003, art. 26 A).

In this context, it is essential that teachers prepare themselves from a theoretical and methodological point of view to address with students the relevance of Afro-Brazilian culture in the formation of society, recognizing black people as historical subjects and valuing their culture.

Taking into account this perspective, Brandino (2022) states that, "[...] it is the literary production whose subject of writing is the black man himself. It is from the subjectivity of black men and women, their experiences and their point of view that the narratives and poems thus classified are woven." This statement demonstrates that black literature provides a more authentic and diverse representation of the reality of black people, as it highlights their voices and their experiences.

According to the writer Cuti,

Black-Brazilian literature was born in and from the black population that was formed outside Africa, and from its experience in Brazil. The singularity is black and, at the same time, Brazilian, because the word "black" points to a process of participatory struggle in the destiny of the nation and does not lend itself to reductionism that contributes to an alleged whiteness that would encompass it as a whole to receive, from here and there, black and indigenous elements to strengthen itself. Because it is a question of participation in national life, the emphasis on this literary aspect must be referenced to its active social genesis. What there is of a manifestation of demands is based on the word "black" (Cuti, 2010, p.42).

In this context, the origin of black-Brazilian literature is directly associated with the social, historical, and political experience of black peoples, since they act as protagonists of their stories, to the extent that their trajectory is synonymous not only with suffering or subservience, but also with resistance, struggle, and achievements. And it is in this context that the word "negro" must be understood, since, according to Cuti, it should symbolize struggle and resistance within the formation of the Brazilian nation. In this way, black literature is not limited to just contributing to Brazilian culture, instead, it asserts itself as a field of action that has its own voices that fight for its recognition and autonomy.

As is known, the lack of schooling opportunity left negative marks in the history of black people who arrived in Brazil in the colonial period, as the legislation of that time denied schooling to all of them. For this reason, the black population was prevented from registering written literature and, as many were not literate, they were left only with the transmission of oral literature, which was very harmful to the country, since part of its culture and history was forgotten due to lack of registration.

From this point of view, it is evident that the publication of black-Brazilian literature – that written by black authors – is still scarce in Brazil, although there are records of those who, not without conflicts and difficulties, have obtained visibility, such as Maria Firmina dos Reis, Lima Barreto, Luís Gama, Machado de Assis, Conceição Evaristo, Cuti and Carolina Maria de Jesus. In addition, Brazilian literature has stereotyped and even racist representations in relation to black authors. As an example of this, Evaristo writes:

I like to write, most of the time it hurts, but after the written text it is possible to appease the pain a little, I say a little... Writing can be a kind of revenge, sometimes I think about it. I don't know if revenge, perhaps defiance, a way of hurting the imposed silence, or even executing a gesture of stubborn hope. I also like to say that writing is for me the dance-singing movement that my body does not perform, it is the password through which I access the world. [...] Posing the question of identity and difference within language, that is, as acts of linguistic creation, literature, a privileged space for the production and symbolic reproduction of meanings, presents a discourse that excels in proclaiming, in instituting a negative difference for black women (Evaristo, 2005, p. 2).

Based on the author's reflections, it is evident that black literature is perceived as a cry of protest because, thanks to it, the black community is able to reveal its true merit to the world, through discourses that have been silenced over time.

According to Santos,

The black subject, who produces Black Literature, has a point of view that denounces the racism introjected into Brazilian ethnic-racial relations, a critical point of view on

the "false abolition of slavery" that threw the black population into misery, poverty, violence and genocide of the youth of this population. A point of view committed to the exaltation of natural black beauty, free from whitening and the white masks that have always been imposed on subjects who want to be accepted by Eurocentric standards of beauty (Santos, 2021, p.39).

Based on this statement, it is observed, in today's society, that several authors of black-Brazilian literature, such as Luiz Gama, Conceição Evaristo, Geni Guimarães, Midria Silva and many others who propagate black-Brazilian literature, play a fundamental role, which is to denounce, through their writings, the formation of a racist ideology, which originates mainly from those who consider themselves superior in relation to the black population.

In view of these considerations, it is observed that poets adept at writing themes that address ethnic-racial issues exalt the beauty of black people through their characters, deconstructing the negative image of black people that has been, over the centuries, the target of mistreatment in the canonical literature of several white authors. In this current context, black-Brazilian literature, for almost two centuries made invisible in Brazilian society - since the first records of this strand of Brazilian literature that are known date back to the beginning of the second half of the nineteenth century - emerges as a voice for black people.

Furthermore, it is possible to affirm that black-Brazilian literature emerges in the country as an expression of black subjectivity, given that, in Brazil, there is a predominance of the study of canonical literature written by white authors, which demonstrates a type of racism internalized in the approach to literature, based on the reading practices developed within the school space. On the other hand, decolonial philosophy **emerges, understood as a perspective that** questions Eurocentric patterns of knowledge and values historically marginalized knowledge, including Afro-Brazilian culture. About decolonial thought, Colaço states that it

[...] reflects on colonization as a great prolonged event with many ruptures and not as a historical stage that has already been overcome. In this sense, he speaks of 'coloniality'. However, it is not an exclusively academic field, but refers, above all, to a new political and epistemological tendency. It involves several social actors and reflects the unfolding of a process that allows not only the critique of "Western" discourses and modern explanatory models, but also the emergence of different types of knowledge that arise from "other" places of thought (Colaço, 2012, p. 08).

This approach reveals that decolonial thinking goes beyond the academic sphere, engaging multiple social actors and valuing different forms of knowledge. In this context, it is a thought that offers a critical focus for the study of black-Brazilian literature, allowing historically silenced narratives to be recognized and valued.

Therefore, the urgency of rethinking the forms of knowledge production is evident, as Colaço (2012, p.190) points out: "Today, more than ever in the history of the modern/colonial world, there is a need for a process of change in the sense of building knowledge structures that arise from the experience of humiliation and marginalization". In fact, coloniality has left deep marks of exclusion and silencing, and the current challenge is to build knowledge that is born from historically marginalized voices and experiences. In addition, it is necessary to recognize that knowledge is not neutral, but crossed by political, ideological and cultural choices, which makes it essential to value knowledge arising from resistance and pain.

Thus, by examining how ethnic-racial issues are treated, especially with regard to black-Brazilian literature, it becomes possible to identify how the school still reproduces hierarchies of knowledge and restricts access to critical perspectives. Therefore, the investigation of these resources allows us to problematize the limits of the curriculum and point out the need for a pedagogical practice that ensures inclusion, the appreciation of cultural plurality and, as a result, ensures an effective commitment to social justice.

5 RESULTS OF THE ANALYSIS OF THE TEXTBOOK AND THE TEACHER'S MANUAL

The analysis of the textbook and the teacher's manual is essential to understand how the teaching of literature is structured and which discourses are legitimized in these materials, since, in addition to the selected contents, they carry didactic-pedagogical and ideological choices that guide the teaching work. It is considered that in a context in which education seeks to become more inclusive and representative, it is essential to understand how these themes are addressed in pedagogical material.

The analysis was based on the premise of identifying whether the texts and activities proposed promote an education that respects the singularities and diversities of students, favoring their reception, recognition and full development, verifying whether the approach to these themes is in line with the principles of the LDB and the guidelines established by the BNCC. It also evaluates whether the didactic-methodological proposals suggested for the study of the texts propose critical questions to address ethnic-racial issues. Thus, it is an analysis that allows us to understand whether the material contributes to the formation of a critical and inclusive view of the cultural and racial diversities present in Brazilian society.

Addressing teachers in the presentation of the book, Cereja and Vianna (2022) state that the work presents a consistent reading proposal, based on clear and defined pedagogical principles, through a careful selection of texts ranging from the classics of universal literature to the authors of contemporary Brazilian literature, and that it is a work that can collaborate with the formation of competent readers of various genres in social circulation (Cereja,

Vianna, 2022, p. 03). In addition, the authors imply that it is an approach that aims to provide the development of the ability to understand and analyze different types of texts, preparing readers for a critical and diversified reading.

In the first pages of the teacher's manual, the authors highlight that all volumes in the collection (6th to 9th grade) present content related to the skills provided for in the BNCC, in order to ensure that students master the language practices and linguistic strategies necessary to participate, safely and autonomously, in the various social activities.

However, when analyzing the 9th grade textbook of this collection, it is observed the absence of diversity in the perspective of literary reading referring to themes that allude, in an effective and in-depth way, to black-Brazilian literature, which configures a gap in the didactic-pedagogical approach to ethnic-racial issues, and which can hinder the development of a richer and more conscious cultural identity.

Throughout the work "Portuguese: Languages" (9th grade), although there are proposals to approach authors and literary works representative of the Brazilian literary canon, the productions of black writers, who are fundamental for the constitution of a more plural and inclusive Brazilian literature, are not sufficiently contemplated. Thus, by neglecting black literature, this textbook can deprive students of the opportunity to recognize and identify with figures and experiences that are part of the history of Brazil, reinforcing prejudice and social exclusion, by not representing in a fair and visible way the contributions of blacks to national culture.

As an example, it is possible to present the analysis of some activities proposed in the textbook for the 9th grade.

5.1 ANALYSIS 1

On pages 83-84, there is a reference to black women as the outcome of a proposal for the production of a text that does not make an in-depth mention of the theme.

The proposed activity is based on an informative text entitled "With a book club, young people want to inspire the trajectories of black girls", by Helisa Ignácio. The author describes the desire of a group of girls from the Luiz Campo Dall'Orto Sobrinho State School, in Sumaré, São Paulo, who, after watching the short film *Vida Maria*, feel motivated to transform the reality of black women, finding inspiration for this in literature.

The aforementioned activity is shown below, as shown in figure 1.

Figure 1

Pages 83-84 of the textbook

6. Leia o texto a seguir.

Com clube de leitura, jovens querem inspirar trajetórias de meninas negras

Após assistir à animação *Vida Maria* — história de uma menina que é obrigada a largar estudos e sonhos para cuidar dos afazeres de dentro de casa —, um grupo de meninas da Escola Estadual Luiz Campo Dall'Orto Sobrinho, da cidade de Sumaré (SP), percebeu que a narrativa não era ficção. E, por isso, se sentiu provocado a compreender melhor e a mudar esta realidade, que é vivida de forma predominante por mulheres negras.

Vitória Santos, Barbara de Souza e Raissa Batista encontraram, na literatura, um mundo de possibilidades de vida narradas e documentadas por escritoras afro-brasileiras. Criaram, assim, o Club The Readers – Tecnologia e Literatura Libertam, com o apoio da sua professora Eliana Cristo. A iniciativa está entre as 50 premiadas no Desafio Criativos da Escola 2020.

Segundo nota técnica do Instituto de Pesquisa Econômica Aplicada (IPEA), em 2020, mais de 18% das mulheres negras brasileiras têm o trabalho doméstico como ocupação. Enquanto apenas 2% têm cargos executivos e de gerência, de acordo com estudo do Instituto Ethos realizado em 2015. A partir da pesquisa de dados como estes, as adolescentes se perguntaram, então, como poderiam mostrar para outras jovens que é possível criar outras histórias que vão além do estigma da mulher negra em trabalhos subalternizados.

Por meio das redes sociais, de jogos, pesquisas e cafés literários *online*, as alunas dão visibilidade a escritoras negras e estimulam a leitura de seus livros. Além de resgatar a ancestralidade e a história destas mulheres, as adolescentes querem inspirar outras estudantes negras a sonharem com suas trajetórias de vida e a conquistarem novos espaços na sociedade.

"Quando as pessoas tiverem acesso a essa literatura [feita pelas mulheres negras] e virem que podem alcançar seus objetivos e combater as desigualdades que existem no nosso país, vão poder enxergar que nós também somos fortes e que nossas raízes, vidas e histórias podem ser lindas, e inspirar mais outras pessoas". É o que deseja a estudante Vitória, de 16 anos.

[...]

IGNÁCIO, Helisa. Com clube de leitura, jovens querem inspirar trajetórias de menina negras. *Criativos da escola: design for change*. 1º aht. 2021. Disponível em: <https://criativosdaescola.com.br/historia/com-club-de-leitura-jovens-querem-inspirar-trajetorias-de-meninas-negras/>. Acesso em: 5 maio 2022.

► Cena da animação *Vida Maria*, dirigida por Márcio Ramos (Brasil, 2006), que inspirou as meninas da notícia a montar o clube de leitura.

- Nos artigos de opinião "Selfies" e "A convivência com a internet", foca-se bastante nos aspectos negativos do mundo digital. E quanto ao texto "Com clube de leitura, jovens querem inspirar trajetórias de meninas negras", isso se dá também? Explique.

Não. Aqui se destaca um uso muito positivo das redes sociais, pois foi por meio delas que as jovens mencionadas conseguiram criar o Club The Readers, "iniciativa está entre as 50 premiadas no Desafio Criativos da Escola 2020".

Source: Cereja and Vianna (2022, p.83-84). Available at: <https://www.edocente.com.br/pnld/portugues-linguagens-9o-ano-pnld-2024-objeto-1-anos-finais-ensino-fundamental/>. Acesso on: 28 Feb. 2025.

There is even the testimony of one of the students emphasizing the value of access to literature made by black women and expressing her desire:

When people have access to this literature (made by black women) and see that they can achieve their goals and fight the inequalities that exist in our country, they will be

able to see that we are also strong and that our roots, lives and stories can be beautiful and inspire other people more." (Cherry; Viana 2022, p. 83).

It is observed that the student's testimony can generate important discussions about black-Brazilian literature, however, the proposal of the book, which follows the reading, is only: "In the opinion articles "*Selfies*" and "Coexistence with the internet" it focuses a lot on the negative aspects of the digital world. And as for the text "With a book club, young people want to inspire the trajectories of black girls", is this also the case? Explain."

As can be seen, this activity proposal radically changes the course of the approach. It becomes about criticism of the negative aspects of the digital world, a subject present in Marcelo Coelho's opinion article, at the beginning of chapter 3 and in Helisa Ignácio's text.

Students are asked to analyze and reflect on whether these same negative aspects are present in the animation *Vida Maria* – a short cinematographic text that portrays in a sensitive and brief way the realities faced by communities, especially in the Northeast of Brazil, and exposes the harsh reality of a sertanejo region, in which economic, social and cultural resources for subsistence are scarce and educational opportunities are limited –. However, it is a text that does not mention negative aspects of social networks; on the contrary, it points out the positive aspect of them, since it was through social networks that the students created the book club that was even awarded among the 50 best.

It is noted that although Helisa Ignácio's text mentions literature, with an emphasis on the production of black authors, it does so in an incipient, shallow way. In this didactic-methodological activity, there is no allusion to the competencies that provide the recognition of the text as: (i) a place of manifestation and negotiation of meanings, values and ideologies; (ii) opportunity to take an ethical and critical position in relation to discriminatory content related to human and environmental rights; (iii) involvement with greater autonomy and protagonism in social life. Thus, it is evident that the authors missed the opportunity to suggest a work aimed at deeper reflections on ethnic-racial issues and on literature produced by black people, although the texts are highly suggestive and provide the possibility of reflections on these themes.

5.2 ANALYSIS 2

In activity 7, on page 145, students are invited to read the short story "Belinha" by Marcelino Freire, written in 1967. The proposed approach is limited to the exploration of the structure of the short story (whether it is of traditional structure or not, what are the characters and their physical and psychological characteristics, the type of narrator, if there are dialogues, what is the conflict and in which paragraph it is presented, and if the conflict is

ended) in short, only questions related to the interpretation of the short story. To fix the content, the textbook presents a box entitled "Time in fictional narratives" and another with the title "The *flashback technique*".

In figure 2, it is possible to see the proposal.

Figure 2

Time in Fictional Narratives p. 149

O tempo nas narrativas ficcionais

Os fatos de uma narrativa relacionam-se com o tempo em três níveis:

Época em que se passa a história
A época em que se passa a história constitui o pano de fundo para o enredo. No conto "Belinha", a época é a atual. Nem sempre, porém, a época em que se passa a história narrada coincide com aquela em que ocorre sua publicação.

Tempo cronológico
É o tempo que transcorre na ordem natural dos fatos do enredo. É o tempo relacionado ao enredo linear, ou seja, à ordem em que os fatos ocorrem. Chama-se cronológico porque pode ser medido em horas, meses, anos, séculos. No conto "Belinha", os fatos acontecem no período de um mesmo dia, em poucas horas.

Tempo psicológico
É o tempo que transcorre numa ordem determinada pela vontade, pela memória ou pela imaginação do narrador ou de uma personagem. De acordo com esse tempo, os fatos podem ou não aparecer em uma ordem linear, isto é, coincidente com a do tempo cronológico. No conto de Marcelino Freire que foi lido, predomina o tempo psicológico.

A técnica do flashback

O *flashback* é um recurso narrativo que consiste em voltar no tempo. Em nossa literatura, o romance *Memórias póstumas de Brás Cubas*, de Machado de Assis, apresenta essa técnica: o tempo em que se situa o narrador-personagem Brás Cubas é posterior à sua morte, o que lhe permite voltar ao passado recente e contar como morreu, por exemplo, ou voltar ao passado mais distante e contar fatos de sua infância e juventude. Veja um trecho dessa obra.

Alguns tempos hesitei se devia abrir estas memórias pelo princípio ou pelo fim, isto é, se poria em primeiro lugar o meu nascimento ou a minha morte. Suposto o uso vulgar seja começar pelo nascimento, duas considerações me levaram a adotar método diferente: a primeira é que não sou um autor defunto, mas um defunto autor, para quem a campa foi outro berço; a segunda é que o escrito ficaria assim mais galante e mais novo [...].

Dito isto, expirei às duas horas da tarde de uma sexta-feira do mês de agosto de 1869, na minha bela chácara de Catumbi. Tinha uns sessenta e quatro anos...

Retrato de Machado de Assis (1839-1908), aos 57 anos (cerca de 1896).

ASSIS, Machado de. *Memórias póstumas de Brás Cubas*. São Paulo: Ática, 1992. p. 17.

Source: Cereja and Vianna (2022, p. 148). Available at: <https://www.edocente.com.br/pnld/portugues-linguagens-9o-ano-pnld-2024-objeto-1-anos-finais-ensino-fundamental/>. Accessed on: 28 Feb. 2025.

As can be seen, in the first text there is a theoretical explanation about the three levels related to time, in a narrative: (i) the time in which the story takes place; (ii) chronological time and, (iii) psychological time. In the second, there is a theoretical explanation about the *flashback technique* as a literary resource, exemplified with an excerpt from the work *Posthumous Memories of Brás Cubas*.

However, after this moment, there are no more comments on the theme or on the author and his work. There is no reference, for example, to the publication of *Contos Negreiros*, a work of fiction in which Marcelino Freire presents delicate and controversial

themes in 16 narratives of miserable Brazilians who sell everything to survive – such as drugs, the body and even the organs – a work that, published in 2005, provided the author with the 2006 Jabuti Prize for Literature.

Then, on page 149, three short stories are presented, each accompanied by a succinct explanation about the genre and a question of textual analysis, one for each short story. Again, there is no allusion to the theme under study or whether its authors are black or address issues related to blacks. In addition, it is suggested that students write at least one longer contemporary short story and one short story. The theme is not suggested.

5.3 ANALYSIS 3

On pages 191-192 (unit 3, chapter 2), in the Exercises section, there is an invitation to read a news article about geoparks, highlighting their importance for local enhancement and sustainable development, the criteria for being a geopark according to Unesco and the description of two geoparks. Next, there is a box entitled "Quilombolas" (p. 192), with a summary of the struggle of these peoples in Brazilian territory:

Figure 3

Quilombolas

Source: Cereja and Vianna (2022, p. 192). Available at: <https://www.edocente.com.br/pnld/portugues-linguagens-9o-ano-pnld-2024-objeto-1-anos-finais-ensino-fundamental/> Accessed on: 28 Feb. 2025.

Next, the authors propose four questions related to the text: three of them focused on identifying the characteristics of the news genre and one on verbal and nominal agreement, based on an excerpt extracted from the news. No approach to the theme of the text and no discussion of social issues characteristic of the cultures of quilombola communities.

On page 194, the activity continues with the proposition of four new questions, numbered from five to eight. In question five, a fragment of a news article entitled "Collection of books brings together articles by more than 30 authors on blackness in Rio Grande do Norte", written by Isabela Santos, is presented. This news brings information about the launch of the book collection "Negritude Potiguar", with the aim of giving visibility to black culture: "The titles, organized by anthropologist Geraldo Barboza de Oliveira Júnior, are "Quilombola Communities", "Peoples of African Matrix" and "Black Popular Culture". The e-books were released in October 2021 for free and, this May, Editora Oiticica makes the physical book available. [...]"

It is noted that the proposal of the event "Book launch "Negritude potiguar" as well as the titles of the books, give rise to a very rich opportunity to discuss the theme. However, after reading the report, students are invited to answer two questions: "a) The fact reported is the launch of a collection of books. What information does the first paragraph add about this release?" and "b) What objective of this launch does the consulted expert emphasize?" With the suggested answer: "he emphasizes the objective of informing and democratizing the knowledge generated in quilombola communities." However, there is no allusion to literature by black authorship or to the contribution of this population to the formation of the country.

Next, the other activities are the rereading of an excerpt from the text for exploration and fixation of grammatical knowledge (part of speech, agreement), in addition to a structural activity of agreement through decontextualized sentences.

As can be seen, the authors once again neglect the opportunity to carry out a discussion based on the importance of the Afro-Brazilian population in the history of Brazil, highlighting its contribution to language, culture, literature, cuisine and religion, among other aspects. A curricular silencing is perceived, since the activities are reduced to a mere language exercise, serving as a pretext to work on grammar, and not as a central axis of citizenship education.

In this sense, the two texts, the box "Quilombola" and the news about "Negritude Potiguar", create a false expectation in the reader, who remains waiting for some mention about the thematic axis under analysis. However, there is no deepening of the theme, and this superficiality causes the erasure of black people. In this way, the textbook promotes a

misleading connection with Law 10.639/03, since the legislation requires the approach of Afro-Brazilian history and culture to value and promote recognition.

In view of this, the box should have presented, in addition to basic information about quilombos and quilombola communities, the history, resistance and the feeling of territoriality, through questions that could lead to a more in-depth discussion about the historical relevance of quilombos as spaces of resistance and the right to land. In addition, it would be pertinent to address the identity and cultural heritage of this people and give literary visibility, discussing, for example, the importance of black authorship and the role of the launch of the collection in promoting this production.

Therefore, a more effective pedagogical approach would be to focus on critical reading and engaged textual production, such as writing an opinion article about Law 10.639/03 and traditional communities, allowing students to express their critical, conscious, and participatory position. Another alternative would be to suggest that students research and analyze an excerpt from a book from the Potiguar collection. Certainly, this would be more enriching than focusing on textual genre characteristics or decontextualized grammatical exercises.

5.4 ANALYSIS 4

On page 197, there is an Enem dissertation obtained from the INEP website. Its theme is about the need to combat religious intolerance, exalting the competence of the family and the school to educate about tolerance and respect for beliefs. The fragment ends with a quote from Nelson Mandela: "Education is the most powerful weapon to change the world", followed by the candidate's concluding thought: "In this way, just as the disintegration of an atom has become simple today, prejudices can be broken."

In addition, there is an illustrative image of a person writing and the painting artwork "*Golden Rule*" by Norman Rockwell from 1961, in which the artist pays homage to religious diversity through the figure of the pope flanked by people of different ethnicities/races and, naturally, of different creeds.

The text and its activities follow:

Figure 4

Page 197 of the textbook

Por tudo isso, é imprescindível que todos os segmentos sociais unam-se em prol do combate à intolerância religiosa no Brasil. Assim, cumpre ao governo efetivar de maneira mais plena as leis existentes. Ademais, cabe às escolas e às famílias educarem as crianças para que, desde cedo, aprendam que têm o direito de seguir suas escolhas, mas que devem ser tolerantes e respeitar as crenças do outro, afinal, como disse Nelson Mandela, "a educação é a arma mais poderosa para mudar o mundo". Dessa forma, assim como a desintegração de um átomo tornou-se simples na atualidade, preconceitos poderão ser quebrados.

BRASIL. Ministério da Educação, INEP. Redação no Enem 2017: cartilha do participante. Brasília, DF: MEC/Inep, 2017. p. 36. Disponível em: https://download.inep.gov.br/educacao_basica/enem/guia_participante/2017/manual_de_redacao_do_enem_2017.pdf. Acesso em: 13 maio 2022.

1. Conforme você já observou no capítulo anterior, no texto dissertativo-argumentativo, há três partes: **introdução**, na qual é apresentada a tese ou a ideia principal defendida; **desenvolvimento**, em que, com base em argumentos, é defendida a tese; e **conclusão**, em que o texto é finalizado. No texto lido identifique o(s) parágrafo(s) que forma(m) cada parte:

- a) a introdução; Primeiro parágrafo.
- b) o desenvolvimento; Segundo e terceiro parágrafos.
- c) a conclusão. Quarto parágrafo.

2. Com base no tema **Caminhos para combater a intolerância religiosa no Brasil**, proposto pelo Enem, os participantes podiam defender diferentes teses.

- a) Qual é a tese defendida na redação que você leu nesta seção?
- b) Qual estratégia argumentativa foi utilizada nessa redação para a sustentação da tese defendida?

3. Para fundamentar a tese que defendem, os autores de textos dissertativo-argumentativos mobilizam diferentes tipos de argumento, entre os quais se incluem: exemplos, dados estatísticos, pesquisas, fatos comprováveis, citações ou argumentos de autoridade, alusões históricas, comparações (entre fatos, situações, épocas, lugares).

- a) Identifique, no segundo parágrafo da redação em estudo, um argumento do tipo alusão histórica.
- b) Identifique, também no segundo parágrafo, um argumento do tipo fatos comprováveis. De que maneira o autor refere-se ao fato que cita e à comprovação que pode ser feita dele? O sentido construído pela expressão que introduz esse argumento é o de verdade incontestável ou o de deixar em aberto a possibilidade de controvérsia?

Argumento de fatos comprováveis: "as religiões afro-brasileiras são os maiores alvos de discriminação, com episódios de violência física e moral veiculados pelas mídias com grande frequência". A expressão que introduz o argumento é "É relevante notar", que constrói o sentido de verdade incontestável.

2. a) A tese de que a intolerância religiosa é um comportamento preconceituoso frequente no Brasil e que deve ser erradicado.
- b) O texto foi iniciado com uma citação de Albert Einstein sobre preconceitos em geral e sobre a dificuldade de combatê-los e, a seguir, foi apresentada a tese sobre intolerância religiosa.

3. a) A imposição religiosa, no Brasil, desde a colonização, aos povos indígenas e aos africanos escravizados.

► **Regra de ouro**, de Norman Rockwell, 1961, obra exposta na sede da Organização das Nações Unidas (ONU), em Nova York, Estados Unidos. Nessa pintura, o artista procurou homenagear a diversidade religiosa.

197 |||||

Source: Cereja and Vianna (2022, p. 197). Available at: <https://www.edocente.com.br/pnld/portugues-linguagens-9o-ano-pnld-2024-objeto-1-anos-finais-ensino-fundamental/>. Accessed on: 28 Feb. 2025.

The study activities are proposed in three questions:

- 1- Identify the paragraphs that make up the three parts of the text: a) the introduction, b) the development, and c) the conclusion.
- 2- The candidates could have defended different theses: a) what is the thesis defended in the essay read and, b) what argumentative strategy was used in defense of the thesis?

- 3- The proposition is that students identify, in the second paragraph, an argument of the historical allusion type. In letter b) they must identify an argument of the provable fact type and the way in which the author refers to the fact and its proof and, also, whether the meaning of the expression that introduces the argument is of incontestable truth or leaves open the possibility of controversy.

These are structural issues of understanding and interpretation that do not provoke interactive discussions that lead to a thematic deepening. Furthermore, none of the suggestions for answers presented in the teacher's notebook alludes to the discussion of the theme of religious diversity or ethnicities/races.

For the proposal of the letter 'a' of question 3, identification of a historical allusion, the suggested answer is "The religious imposition, in Brazil, since colonization, to indigenous peoples and enslaved Africans". Just locating this information does not presuppose giving it due importance. The ideal would be to propose a dialogical, interactive approach through the survey of opinions and even research proposals on the subject.

The reading of Norman Rockwell's 1961 painting could also be explored, after all, it portrays not only religious diversity, but also cultural, racial and ethnic diversity.

The analysis of the proposals for activities on this issue allows us to conclude that they do not promote discussions about religious diversity or black literature. The emphasis is on language issues, with a significant number of approaches focused on agreement, morphological function, and textual genres. Again, the theme of black literature ends up being neglected, staying in the background, and when it is addressed, it does not receive the appropriate approach.

5.5 ANALYSIS 5

In chapter 3 (Unit 3), entitled "The young person and consumption", the opening text is the chronicle "The cruelty of young people" by Walcyr Carrasco. After the study of comprehension and interpretation, in the section Crossing Languages (p. 206-207), two texts are presented that comment on funk: the first, an excerpt from a song called "Funk ostentação", and the second, an excerpt from an article published by Revista Piauí in which the singer Emicida talks about funk ostentação.

Below is the activity proposed by the authors. In figure 5 it is possible to see text 1.

Figure 5

Text 1 of the textbook *Crossing Languages*

CRUZANDO LINGUAGENS

O desejo de consumo de produtos de luxo não é exclusividade de adolescentes. No final da década de 2000, um tipo de *funk*, denominado “*funk ostentação*”, ganhou grande popularidade. Leia, a seguir, um trecho de uma letra desse gênero musical e um trecho de um comentário sobre o próprio *funk*, em especial o de ostentação.

Texto 1

[...] E aí, dá licença, suave Corrente, pulseira, <u>dedeira</u>, <u>mó chave</u> Já peguei as chave Da mansão do Guarujá	Mó orgulho, mó felicidade Ver os moleque tudo da <u>vila</u> de <u>nave</u> Diferentes modelos Pra poder acelerar [...]	chave: estiloso, elegante. dedeira: anel. nave: carro de luxo. vila: comunidade.

Figure 6

Text 2 of the textbook

Texto 2

1. a) As poses exibidas pelo eu lírico: bens de consumo de alto valor (“Corrente, pulseira, dedeira”, chave da “mansão no Guarujá”).

Sempre admirei o *funk*, o carioca mesmo. O do James Brown também, mas isso é óbvio. Meu pai era DJ de baile de rua, era impossível não ouvir James Brown. [...]

As pessoas se acostumaram a ver os pretos cabisbaixos, sempre tristes nos cantos do mundo. Ao esbarrar com o contrário disso, criminalizam nosso sorriso em vez de desprezar aquilo que gera nossas lágrimas. [...] Isso é *funk*. [...]

Embora seja alvo de muitas críticas recentemente, o *funk ostentação* é também um fruto orgulhoso desta mesma árvore, pois em uma era consumista como a nossa o “ter” virou “ser”, e isso não é culpa da favela. Logo, quando jogam o cordão pra fora e dizem que são “de nave no rasante”, meus irmãos do *funk* estão falando “eu tô bem”. [...] Repito: subversão nem sempre é entendida instantaneamente. Vou além para dizer que no *funk ostentação* também leio que a luta por liberdade vem nesse canto. E quem transformou dinheiro em sinônimo de liberdade não foi a favela.

[...]

1. b) O eu lírico se mostra alegre e satisfeito (“suave”) por possuir EMECIDA. Felicidade ostentação. Piauí, São Paulo, 19 nov. 2013. Disponível em: <https://piaui.folha.uol.com.br/felicidade-ostentacao/>. Acesso em: 29 maio 2022.

2. No texto 2, o autor faz um comentário a respeito do chamado “*funk ostentação*”. Qual é sua posição sobre esse gênero? Enicida contextualiza o *funk ostentação* dizendo que se trata de um espelho da sociedade de consumo em que vivemos.

3. Relação o texto “A crueldade dos jovens”, de Walcy Carrasco, com os textos 1 e 2 desta seção.

a) O que há em comum entre os três textos? Os três abordam o tema da exaltação do consumo de objetos que oferecem status.

b) Que diferença há entre os textos quanto à visão sobre o consumo de bens que têm custo financeiro muito alto?

c) Você concorda com algum dos posicionamentos exibidos nos textos? Por quê? Respostas pessoais.

3. b) No texto de Walcy Carrasco, criticam-se os jovens de todas as classes sociais (menos os extremamente ricos) por fazerem exigências de consumo que estão além das posses de suas famílias. No trecho da letra do *funk*, o eu lírico demonstra não apenas possuir e valorizar esses bens, como gostar de exibi-los e de ver outros “moleques” exibindo-os. Já para Enicida, no texto 2, a vontade de ter e de ostentar bens de consumo é apenas mais uma manifestação de “uma era consumista como a nossa”, em que “o ter” virou “ser”, e comenta que isso “não é culpa da favela”.

James Brown (1933–2006) em concerto na cidade de Milão, na Itália, em julho de 2006.

1. e) Predomina uma variedade que foge à norma-padrão, com uso de muitas gírias (**dedeira**, **chave**, **nave**), abreviações (**pra** e **mó**, abreviação de **molei**) e casos de concordância verbal e nominal muito próximos do modo como parte considerável da população brasileira usa no dia a dia (**os moleque**, **as chave**).

Não escreva no livro.

TROCANDO IDEIAS

1. Você conhece alguma família em que acontece o tipo de pressão sobre os pais descrito no texto de Walcy Carrasco? E caso positivo, conte aos colegas. Respostas pessoais.

2. Você também se sente pressionado, pelo grupo ou pelo meio em que vive, a usar roupas de marca, celulares de última geração e andar na moda para não se sentir diminuído? Resposta pessoal.

Source: Cereja and Vianna (2022, p.207). Available at: <https://www.edocente.com.br/pnld/portugues-linguagens-9o-ano-pnld-2024-objeto-1-anos-finais-ensino-fundamental/>. Accessed on: 28 Feb. 2025.

According to Dantas, official writer of Brasil Escola³, "funk is a musical style that emerged through black American music in the late 1960s." Studies indicate that its arrival in Brazil took place in the favelas of Rio de Janeiro, during the 1970s. Since then, funk has evolved, developing its own style and expanding to other states, gaining more and more followers. This musical genre reflects the reality of the peripheries and their inhabitants, which may explain the resistance it faces from people who belong (or who consider themselves to belong) to the elites.

The focus of the analysis, however, will be text 2, which addresses the relationship between black peoples and favela dwellers, groups that are the main representatives of this musical genre. The excerpt highlights how funk, especially *funk carioca* and *funk ostentação*, connect to black identity and social criticism. From this text, it is evident the prejudiced view that society, particularly in relation to blacks, has about them. Instead of reflecting on the conditions that generate the suffering of these people, society criminalizes the joy and resistance expressed through *funk*. The "smile" and celebration of *funk* is disconcerting to those who expect black people to be submissive or sad, while in fact, *funk* represents a form of subversion and resistance to racism.

In the teacher's manual, the authors recommend that teachers conduct research on three websites to deepen their knowledge of *funk*, a musical genre that has generated controversy since its emergence. The proposal includes readings about the history and evolution of *funk* over the years, its culture, and the questioning of whether or not funk can be considered a legitimate cultural manifestation.

Regarding the competencies of the BNCC (2018) applicable to the approach of the texts under analysis, general competencies 8 and 9, specific competencies of Languages 3 and 4, specific competencies of Portuguese Language 3 and 4, and EF69LP44 and EF89LP27 skills are highlighted. Although all these competencies and skills are pertinent to the study and analysis of texts, the specific competence of Portuguese Language number 7, which emphasizes the importance of recognizing the text as a space for the manifestation and negotiation of meanings, values and ideologies, should also be included. This competence is fundamental for students to understand and respect the various forms of cultural and ideological manifestation present in society.

In chapter 1 (World in motion) referring to unit 4 of this collection, a photo from 2020 (p. 237) is presented, which depicts the image of migrants heading towards the border of Pazarkule, Turkey (called Kastanies, on the Greek side). In the following pages (238-239),

Source: Cereja and Vianna (2022, p. 239). Available at: <https://www.edocente.com.br/pnld/portugues-linguagens-9o-ano-pnld-2024-objeto-1-anos-finais-ensino-fundamental/>. Accessed on: 28 Feb. 2025.

The excerpts of this song make references to themes of migration, suffering, identity and resistance. There is also an intertextuality with literature, by incorporating fragments of the epic poem "O Guesa", by Joaquim de Sousa Andrade, and the poem Vozes d'África, by Castro Alves, which deal with the pain and forced displacement of peoples.

To carry out this activity in the classroom, the work selects general competence 3, specific competences of Languages 2 and 5, specific competence of Portuguese Language 3, and skills EF69LP44, EF69LP48, EF89LP32, EF89LP33 and EF89LP37. All these competencies are relevant for the execution of the work with the proposed text, but the

absence of competence 7 of Portuguese Language is observed, which addresses the manifestation of values and ideologies of a people. Thus, it is important that students recognize and respect the diverse knowledge and cultures present in different communities, promoting harmonious coexistence in a democratic society.

In this sense, the song connects these experiences with contemporary diasporas, such as those of refugees and immigrants, who continue to face difficulties in search of a better life. In addition, it criticizes the consumer society and the disparities of power and access, questioning where those who have been marginalized and suffocated by history are.

The question "Where are you?" ("Where are you") shows the absence, the lack of ties, the loss of references and affections of a person in search of identity, dignity and recognition in the midst of a system that often ignores or dehumanizes the most vulnerable.

In the verse "God! Oh, God, where are you that you don't answer? The lyrical self questions the absence of God, referring to human suffering that seems to go unheard or unanswered. This absence of answers reinforces the sense of abandonment that many individuals face, whether due to war, poverty, or forced displacement. In addition, the song points not only to the difficulties faced by immigrants and refugees, but also reflects on broader existential issues, such as the human condition and the search for meaning in the midst of suffering.

Furthermore, the song establishes a connection between historical experiences and contemporary diasporas lived by many immigrants and refugees, who continue to face difficulties in search of a better life. In this way, this lack of answers reinforces the feeling of abandonment, whether due to war, poverty or the forced displacement of these peoples, as occurred with black people who were brought to Brazil in an enslaved way.

Therefore, this analysis allowed us to verify that the textbook under study needs to give more visibility to ethnic-racial issues, through a more in-depth study of the theme. In addition, it must meet the criteria established by law 10639/03, with the intention of providing students with a study that prioritizes diversity and inclusion.

6 FINAL CONSIDERATIONS

Through the analysis of the approaches to the ethnic-racial theme in the textbook, it is found that there are significant gaps that require continuous effort and knowledge on the part of teachers to be overcome.

Considering that such materials are widely used by teachers in different regions of the country, as a support resource in the teaching-learning process, their pedagogical relevance becomes evident. Although the teaching work is not restricted to the exclusive use of the

textbook, it is undeniable that it constitutes a fundamental instrument, both in the organization of activities and in the consolidation of pedagogical practices in the classroom.

In this sense, and in view of the relevance of the textbook, the implementation of Law 10.639/03 has been a challenge for many schools and for the authors of teaching materials, who sometimes resist adapting their content to fully meet this demand. In the case of the book "Portuguese - Languages" (9th grade), by William Cereja and Carolina Dias Vianna, the absence of a robust approach to black Brazilian literature is a clear example of how the work fails to meet the requirements of the Law.

In order for this volume to become more inclusive and representative, it would be important, as of the next editions, to include a more in-depth study of ethnic-racial issues, especially those that contemplate work focused on literature. In this sense, the work could include more black authors, with emphasis on their works and historical contexts, in addition to presenting social and cultural issues pertinent to their universe.

As an example, texts by Carolina Maria de Jesus, Conceição Evaristo, Lima Barreto, among others, could be analyzed in the context of their literary productions and their relationship with racial and identity issues in Brazil. This is a significant flaw, since these voices are essential to bring a critical perspective on racial issues in Brazil.

In addition, the inclusion of debates on the importance of black people in the construction of the country, slavery, the black movement and the resistance of Afro-Brazilians could also be an interesting way to make the work more inclusive, creating a more plural and updated discussion about the challenges of contemporary Brazil, so that students could recognize themselves as part of a multicultural society, that not only minimizes or ignores the contributions of black people, but celebrates them. Thus, including these discussions in the didactic content would be a significant step towards valuing black identity and confronting racial inequalities in Brazil.

Thus, black literature must be presented in all its plurality, addressing not only the fight against racism and slavery, but also issues of identity, culture, religiosity, daily life and resistance. In addition, there are several contemporary black authors in Brazil, such as Djamila Ribeiro, Elisa Lucinda, Itamar Vieira Júnior, Lázaro Ramos, Emeilda, Cuti and many others, who write fundamental themes to provide a more current view of the issues faced by the black population in Brazil and that can contribute significantly to encompass the contents addressed in this work.

In view of the current context of search for greater diversity and representativeness in school content, it is verified that this textbook presents an inadequate approach in relation

to compliance with Law 10.639/03, since it prioritizes, to a large extent, a Eurocentric and monocultural perspective of Brazilian history and literature.

The omission of a relevant approach to black-Brazilian literature in the book "Portuguese - Languages" (9th Grade) is a significant flaw, because by ignoring these issues, the work does not contribute to the formation of an inclusive education, capable of fostering critical reflection on racism, racism, and racism. social inequalities and the richness of Afro-Brazilian culture. Therefore, education should be an environment conducive to the construction of identity, and the lack of these themes can lead to cultural impoverishment, in addition to reinforcing racial stereotypes.

Furthermore, black students, in particular, may feel devalued and marginalized when they do not see their histories and cultures adequately represented in school content. On the other hand, non-black students can be deprived of a broader understanding of the diversity and complexity of Brazilian society, which contributes to the perpetuation of inequalities and prejudices. The lack of historical, aesthetic and political contextualization that the work demands, leads to a curricular silencing that compromises the reading education of students, since it limits access to narratives that enable the recognition of oneself and the other, as well as the appreciation of Brazilian cultural diversity.

In the words of Colaço (2012, p. 8), "the decolonial implies, therefore, a continuous struggle". This conception underlies the pedagogical choices of this research, as it shows that the process of decolonization does not end in a historical moment, but is prolonged in practices of resistance and affirmation.

Therefore, our opinion is that this volume intended for the (9th grade) should be more inclusive and representative, integrating texts by black authors throughout the book, and not just in isolated topics. In addition, this inclusion should be seen as a central element, essential for a more inclusive and egalitarian education. In the twenty-first century, facing this issue is one of the main challenges for the effective application of Law 10.639/03 in educational institutions in Brazil, requiring joint efforts by educators, schools and publishers to ensure that black literature receives adequate recognition and analysis. Thus, problematizing the insertion of this literary production in the didactic material is an essential step for the effectiveness of an anti-racist education.

ABSTRACT

This paper highlights, throughout its topics, the importance of administrative procedures in cooperatives, as well as demonstrating how cooperatives can be linked to the economic, social, and financial development of a given region. Over the years, cooperativism has gained strength and expanded within economic activities, something that promotes many analyses and observations by economists, administrators, managers, and other managerial components. The general objective is to highlight the importance of administrative routines and tools for the development of a cooperative. Secondary objectives include: highlighting the main tools present in the administrative process, emphasizing the positive and negative points related to cooperatives, and analyzing how a cooperative can impact the economic and social development of a given region. The work involved exploratory research, highlighting the main concepts and analyses regarding the evolution or application of cooperatives within the society in which they are embedded. Something that can be proven through the analysis of one of the most renowned credit cooperatives in Brazil, Sicoob, is highlighted throughout the research, emphasizing the main aspects that demonstrate how administrative routines can further consolidate or stabilize the activities and results obtained through cooperatives.

Keywords: Cooperatives. Credit Cooperatives. Economic Development.

RESUMO

O presente trabalho ressalta ao longo de seus tópicos a importância dos procedimentos administrativos nas cooperativas, assim como evidencia de que forma as cooperativas podem estar ligadas ao desenvolvimento econômico, social e financeiro de uma determinada

região. Ao longo dos anos o cooperativismo vem ganhando força e se expandindo dentro das atividades econômicas, algo que promove muitas análises e observações por parte de economistas, administradores, gestores e demais componentes gerenciais. O objetivo geral do mesmo consiste em evidenciar a importância das rotinas e ferramentas administrativas para o desenvolvimento de uma cooperativa, o mesmo apresenta por objetivos secundários: ressaltar as principais ferramentas presentes no processo administrativo, destacar quais os pontos positivos e negativos relacionados as cooperativas, analisar de que forma uma cooperativa pode impactar o desenvolvimento econômico e social de uma determinada região. No processo de elaboração do trabalho foi realizada uma pesquisa exploratória, ressaltando os principais conceitos e análises referente a evolução ou aplicação das cooperativas junto a sociedade onde a mesma está inserida. Algo que pode ser comprovado mediante a análise de uma das mais renomadas cooperativas de crédito presente no Brasil, o Sicoob, são evidenciados ao longo da pesquisa os principais aspectos que ressaltam como as rotinas administrativas podem consolidar ou estabilizar ainda mais as atividades e os resultados obtidos por meio das cooperativas.

Palavras-chave: Cooperativas. Cooperativas de Crédito. Desenvolvimento Econômico.

RESUMEN

Este trabajo destaca, a lo largo de sus temas, la importancia de los procedimientos administrativos en las cooperativas, además de demostrar cómo estas pueden vincularse con el desarrollo económico, social y financiero de una región. Con el paso de los años, el cooperativismo ha cobrado fuerza y se ha expandido en las actividades económicas, lo que ha suscitado numerosos análisis y observaciones por parte de economistas, administradores, gerentes y otros profesionales de la gestión. El objetivo general es destacar la importancia de las rutinas y herramientas administrativas para el desarrollo de una cooperativa. Los objetivos secundarios incluyen: destacar las principales herramientas presentes en el proceso administrativo, destacar los aspectos positivos y negativos relacionados con las cooperativas y analizar cómo una cooperativa puede impactar el desarrollo económico y social de una región. El trabajo consistió en una investigación exploratoria, destacando los principales conceptos y análisis sobre la evolución o aplicación de las cooperativas en la sociedad en la que se insertan. Algo que se puede demostrar a través del análisis de una de las cooperativas de crédito más reconocidas de Brasil, Sicoob, se destaca a lo largo de la investigación, destacando los principales aspectos que demuestran cómo las rutinas administrativas pueden consolidar o estabilizar aún más las actividades y los resultados obtenidos a través de las cooperativas.

Palabras clave: Cooperativas. Cooperativas de Crédito. Desarrollo Económico.

1 INTRODUCTION

With the development of some commercial modalities, administration has become of paramount importance, promoting the development, analysis and studies related to how these new modalities can become a positive component for the national economy. Among these new modalities present in the market, cooperatives can be highlighted, which consist of a way to promote activities through the union of certain professionals or individuals.

According to Costa et. al. (2020) cooperativism became stronger with the commercial development presented through the Industrial Revolution, something that substantiated the relevance of professionals organizing themselves to efficiently promote their activities, as well as being able to achieve their development without the need for some already known business routines.

The present work seeks to relate the importance of management within the routines of cooperatives, as well as to substantiate the economic and social impacts that cooperatives can represent for a given region. Seeking to exemplify more clearly, a case study was carried out with a cooperative that has been providing the economic development of the region where it is located.

The general objective of this work is to highlight the importance of administrative routines and tools for the development of a cooperative, it has secondary objectives: to highlight the main tools present in the administrative process, to highlight the positive and negative points related to cooperatives, to analyze how a cooperative can impact the economic and social development of a given region.

2 THEORETICAL FRAMEWORK

2.1 COOPERATIVISM

Cooperatives in the national environment gained strength with Law 5.764/71, which defines these organizations as providers of services to their members or associates, without aiming at profit in the services provided (Braúna, 2016). In general, cooperatives are focused on supporting workers, with a focus on well-being and assistance, highlighting the relevance of these services in the commercial and business context.

Initially implemented in some regions, cooperatives have gained a prominent position in the market. According to Ouro et al. (2018), this organizational category valued services and workers, filling a historical gap in the national environment. The author argues that the union of companies and workers through cooperatives provided greater stability to their activities.

Currently, cooperatives operate in various segments, such as agriculture and transportation, emphasizing their importance in organizational relations. The increase in the number of people associated and providing services in cooperatives demonstrates that this structure is seen as welcoming and advantageous by workers.

In the current context, cooperatives play a crucial role in the national economy, promoting the circulation of services and contributing to regional development. Costa et al. (2020) explain that the main function of cooperatives is to provide financial services to society, including savings deposits and access to credit. These services should be competitive with those offered by other financial institutions. The author emphasizes that, in order to preserve the character of a non-profit institution, cooperatives should not seek to maximize return on equity, but rather focus on minimizing costs as an appropriate objective.

Braúna (2016) highlights that the basis of cooperatives is the union of individuals with common purposes and interests. In today's age of knowledge and cooperative enterprise, cooperatives must demonstrate economic results, ensure a sustainable social function, and avoid bankruptcies in a highly competitive market. The author observes that, with globalization, cooperatives face challenges related to administrative efficiency and competitive disadvantage due to their characteristics of democratic governance and lack of professional qualification.

2.2 CREDIT UNIONS

Credit unions represent a viable alternative for access to microcredit, offering several benefits. Among them, personalized service, specific products for the demands of members, loans and financing with low interest rates, lower requirements and greater agility in operations stand out. These societies focus on satisfying people's needs, differentiating themselves from commercial banks, which prioritize profit. In addition, the positive results of cooperatives go beyond financial ones, offering advantages that can overcome any differences between fees charged by other financial institutions.

Credit unions are freely admitted financial institutions that aim to effectively meet the needs of their members. They guarantee a personalized service, guided by cordiality, zeal and responsibility, providing members with the experience of feeling like owners of the institution (Sampaio, 2012). In addition, these organizations have the responsibility to offer support, with differentials that attract customers, consolidating themselves as the main financial institution of the members.

In the social field, cooperatives contribute significantly to the improvement of the regions where they are inserted, offering services aimed at health, education and

communication. They promote greater financial stability for individuals, through savings and other initiatives that generate positive impacts, especially in vulnerable communities.

Sá (2018) highlights that cooperativism is intrinsically linked to social development, showing that, through its methods and activities, many cooperatives invest in human and social progress. Social projects carried out by cooperatives, as well as the provision of essential services, are examples of actions that foster social development. These projects serve, above all, the most vulnerable populations, filling gaps in social and cultural assistance.

The impact of cooperatives on social development is amplified by their logic of distribution of results, which differs from the traditional capitalist model. There is no profit or expropriation of the surplus generated by labor; instead, the surplus returns to the cooperative members themselves, promoting a more egalitarian development. This practice eliminates old problems related to social inequality, by reinvesting in those who generated the resources, strengthening equity among individuals.

To promote meaningful local development, cooperatives need executive management focused on both economic efficiency and social management. This approach must prioritize the real needs of members, fostering income, services, and jobs. In this way, cooperatives can contribute to removing individuals from conditions of social exclusion and subhumanity, reintegrating them into society in a dignified and sustainable way (Martins, 2006).

Management plays a fundamental role in all areas in which organizations are inserted. Through its activities, strategic vision, and procedures, management sets goals, outlines objectives, and promotes positive growth, which is especially evident in cooperatives, where proper management results in efficiency and satisfactory results.

According to Matarazzo and Boeira (2016), management is essential for the development of organizational routines, promoting a careful analysis of pertinent information, evaluating methods that can improve performance and, above all, making strategic decisions to balance the activities performed with the resources applied. This balance is crucial to achieving organizational success.

In general, cooperatives stand out as an efficient solution for outsourcing services considered essential in the social context. Their relevance is widely recognized by society, because in many cases, they are created to highlight specific economic or commercial characteristics of a region. These organizations demonstrate to citizens and workers how their activities can boost local development.

Among the main cooperatives developed in Brazil, credit unions occupy a prominent place. These entities are based on the provision of financial services, providing individuals

with an opportunity for economic development and solutions to financial issues that often do not find support in traditional banking institutions.

Goes (2011) observes that many professionals in the financial sector consider credit unions an opportunity to expand the interaction between financial institutions and potential customers. They make financial services more accessible by offering guidance, assistance and support at both the regional and national levels. In addition, these cooperatives promote financial inclusion, strengthening the relationship between the financial market and local communities.

Based on the information presented, it can be concluded that cooperatives represent a significant opportunity for economic and social evolution. They integrate diverse contexts, identifying areas that can be improved through their organizational routines and practices. Cooperatives, especially credit cooperatives, stand out as a valuable alternative for regional workers, contributing to the economic and social development of communities.

Finally, credit unions offer individuals the possibility of working independently, escaping the limitations imposed by conventional labor relations. In this way, they promote consolidation and economic and social stability, evidencing themselves as a mechanism for inclusion and sustainable development.

2.3 COOPERATIVES FOR THE WORKFORCE

Peroni (2020) argues that:

Credit unions are effective both in democratizing credit and in redistributing income. They allow segments of society to organize the search for solutions to problems of access to credit and banking services, autonomously and independently. In addition, the authors point out that this business sector is expanding and so is the demand for management information that allows greater monitoring and control within these organizations.

Thus, taking into account the competitive environment in which the Brazilian banking system is inserted, credit unions seek to act effectively. They aim not only to maximize your results or reduce costs, but also to increase economies of scale. According to Chaves (2011), in recent years the insolvency of financial institutions has worried not only shareholders, but also governments, companies and individuals, who invest their financial resources and trust these institutions.

In this context, considering the social and economic importance of the sector, there is a growing need to evaluate the economic and financial performance of credit unions. Thus, the research question that guides this study is highlighted: what is the economic and financial

performance of the largest credit unions in Brazil? The objective of the survey is, then, to evaluate the economic and financial performance of the largest Brazilian credit unions.

Fernandes et. al., (2022) assure that cooperative business has aroused the interest of many researchers due to its specific type of organization. They include concerns about maintaining democratic decision-making practices and joint efforts. Attention is focused on the need to combine business results with social expectations related to a series of facts: unemployment or underemployment, job and income creation, and sustainable regional development.

Credit unions are financial institutions that facilitate and make it cheaper for members to access credit. They reduce bank interest, especially overdraft and loan rates. However, in relation to financial services, they differ from other financial institutions by their objectives and the audience they wish to reach (Peroni, 2020).

Maffini et. al., (2020) believe that credit unions around the world have demonstrated the effectiveness of cooperative principles in managing the financial affairs of millions of people. Having equal voting rights, member-members participate regardless of the size of their deposits. Its main strength lies in the appeal of this philosophy. The authors add, however, that the relaxation of requirements for certain liabilities has inevitably brought about fiercer competition with other financial institutions, especially retail banks. Banks often complain about current tax exemptions that provide credit unions with an unfair advantage.

Nunes et. al., (2019) defend the impression that cooperative business is fundamental to society. In other words, it is fundamental to the extent that it promotes the use of private resources and assumes these risks on behalf of the community in which it develops and also in favor of local sustainable development. The emphasis is on the formation of savings and the offer of financing for entrepreneurial initiatives, which can bring evident benefits for job creation.

3 METHODOLOGY

Descriptive research aims to describe a certain population or a certain phenomenon; Explanatory research, on the other hand, seeks explanations for a given cause, as well as the causative factors of it; finally, we have that exploratory research aims to understand subjects that have few studies about them or even the understanding of a specific point of an already consolidated concept (Haguet, 2020).

For the development of the research presented, a bibliographic and qualitative survey was carried out on the credit union, highlighting the interaction between both, as well as the

primordial aspects to understand the relevance that cooperatives have in the labor or economic development of a region.

After gathering all the necessary information, a description of all studies related to the topic addressed was promoted, as well as establishing an understanding of the main data collected through the Sicoob case study, consolidating how this enterprise has become a fundamental piece in the economic and labor evolution of some Brazilian regions over the years.

The flowchart of the PRISMA protocol (Figure 1) of this work clearly and systematically describes the steps taken in the literature review on credit and labor cooperatives, focusing on the case study of Sicoob Centro Leste and Norte Maranhense. It presents the phases of identification, screening, eligibility and inclusion of relevant studies for the analysis, ensuring transparency and methodological rigor.

Figure 1

Article selection process

Source: The authors (2024).

Still on the Prisma methodology, demonstrated above, it is worth noting that in the literary field, books, articles and dissertations selected through a search in the following databases *Scientific Electronic Library Online* (SciELO), *Google Scholar*, *Periodicals Portal CAPES* among others available online. To carry it out, works carried out between 2019-2024 were taken into account, with themes that were limited to the theme, therefore works published in the last 05 years (except for classic books), with the defined languages being Portuguese and English.

In total, articles identified in renowned scientific databases, such as SciELO, Google Scholar, CAPES Journals, Scopus, and Web of Science, were analyzed, respecting specific inclusion criteria, such as the period of publication (2019–2024) and thematic relevance. After the removal of duplicates and the exclusion of works outside the defined scope, 24 articles were included that address the role of cooperatives in promoting economic and social development. This flowchart summarizes the review process, providing a visual understanding of the path taken to the final selection of studies.

4 RESULTS AND DISCUSSION

Credit unions play an essential role in local and regional economic development, especially in contexts where financial inclusion and the promotion of economic justice are priority objectives. Sicoob Centro Leste and Norte Maranhense, both founded in 2008, is a representative example of the performance of these cooperatives, which seek to promote a cooperative business model in regions of Maranhão with economic challenges. From the analysis of several graphs that show the evolution of assets, equity and credit, as well as the social performance of the cooperative, it is possible to perceive the positive impact of these institutions on the economic and social development of the region.

Figure 2 shows the evolution of Sicoob Centro Leste and Norte Maranhense assets between 2011 and 2019, showing a substantial increase from 14 million to 120 million. This growth reflects not only the expansion of the member base, but also the cooperative's ability to generate positive financial results. The increase in assets indicates a strong performance in terms of assets and rights that can be converted into liquidity, essential for the financial stability of the cooperative and for the maintenance of a sustainable credit cycle.

Figure 2

Evolution in assets

Source: SICOOB (2020a).

According to Bressan et al. (2023), asset growth is an important indicator of a credit union's financial health, as it demonstrates the ability to raise and manage resources efficiently. In the case of Sicoob, the increase in its assets contributes to its competitiveness in the financial market, allowing it to offer more accessible products and services with better conditions for its cooperative members.

Figure 3, in turn, illustrates the evolution of the cooperative's equity, which follows a trajectory similar to that of the assets. With the increase in equity, Sicoob not only improves its position in the market, but can also reinvest profits in new projects, expanding its operations in different municipalities in Maranhão. As Brandt et al. (2021) point out, credit unions that manage to increase their wealth in a sustainable way tend to have a more lasting impact on the communities in which they operate, providing conditions for long-term economic growth.

Figure 3

Evolution in equity

Source: SICCOB (2020a).

Figure 4 shows the increase in fundraising by Sicoob Centro Leste e Norte Maranhense, which grew from 11 million in 2011 to 90 million in 2019. This increase can be explained by the cooperative's strategy of acting as an intermediary between surplus agents (who have surplus resources) and deficit agents (who need credit). The cooperative, by raising funds from the market and passing them on at lower interest rates than those offered by traditional banks, is able to generate a positive spread, which is the difference between what is paid to raise funds and what is charged when granting loans.

Figure 4

Evolution of Credit in Sicoob Centro Leste and Norte Maranhense (2011-2019)

Source: SICCOB (2020b).

This intermediation model is essential for strengthening the cooperative, as it allows it to finance the local economy and stimulate the growth of small businesses and family farmers. Höher et al. (2019) highlight that this type of operation is one of the biggest

differentials of credit unions, as it promotes financial inclusion, especially in peripheral regions or poorly served by traditional banks.

Figure 5 shows the evolution of the leftovers of Sicoob Centro Leste and Norte Maranhense, an important indicator of the distribution of profits among the cooperative members. After the payment of operating expenses, the surpluses are shared among the cooperative members according to their participation in the transactions carried out with the cooperative. Part of this surplus can be converted into new quotas or transferred to the cooperative members' checking accounts, according to a decision at the general meeting.

Figure 5

Evolution in surpluses (profit)

Source: SICOOB (2020a).

This distribution model reinforces the cooperative character of the institution, which aims not only to generate profits, but also to reinvest in the well-being of its members. The practice of distributing leftovers reflects the cooperative principle of cooperative economic participation, which, as Biolchi et al. (2022) note, is critical to strengthening cooperative identity and member engagement. The return of the leftovers to the cooperative members is a way of repaying the trust placed in the cooperative, creating a virtuous cycle of local development.

With regard to social responsibility, Sicoob Centro Leste e Norte Maranhense has stood out with the implementation of Day C (Day of Cooperating), an action promoted by the OCB System, which aims to engage cooperatives in actions that contribute to the development of communities. Sicoob in Coroatá, for example, has been actively involved in financial education initiatives, promotion of local commerce and carrying out social actions. According to Costa et al. (2020), these initiatives are essential to strengthen the bond between the cooperative and the community, creating a favorable environment for mutual growth.

Figures 6 and 7, which show the growth in the number of cooperative members and female participation, reflect a significant increase in adherence to the cooperative system in Coroatá, with a percentage variation of more than 2,000% between 2018 and 2019. This growth is indicative of the effectiveness of the cooperative's actions in promoting financial inclusion and expanding its member base. In addition, the increase in female participation, which went from 31 to 41 cooperative members in the last four years, demonstrates significant progress in reducing gender inequalities in access to financial services.

Figure 6

Annual growth of Sicoob in Coroatá

Source: SICOOB (2020a).

It was also observed that the growth rate of female cooperative members has grown gradually in the cooperative, rising from 31 to 41 cooperative members in the last four years, a percentage variation of 32.25% (Figure 6).

Figure 7

Cooperative members by gender. Base year 2019

Source: SICOOB (2020b).

Jesus et al. (2023) discuss the importance of promoting women's financial inclusion, highlighting that increasing female participation in cooperatives contributes to a positive social impact, since women tend to invest more in the education, health, and well-being of their families.

The analysis of the graphs presented reveals that Sicoob Centro Leste e Norte Maranhense has played a fundamental role in the economic and social development of the cities where it operates, especially in Coroatá, promoting not only financial inclusion, but also financial education and the promotion of local entrepreneurship. The growth in assets, equity and credit raising, combined with the distribution of surpluses to cooperative members, demonstrates the success of the cooperative in its business model, which seeks to balance financial growth and social benefit. As Maia et al. (2020) point out, this balance is crucial for the long-term sustainability of credit unions, as it strengthens the trust and engagement of cooperative members, creating a virtuous cycle of growth and development.

Social initiatives, such as C-Day, and the increase in female participation in the cooperative are clear examples of the positive impact that cooperativism can have on the social transformation of communities. Thus, Sicoob Centro Leste e Norte Maranhense is a successful model for other credit unions that seek to integrate the principles of cooperativism with local economic development and financial inclusion.

5 CONCLUSION

One of the main organizations present within the global and national context consists of cooperatives, which are considered one of the main ways to provide interaction between professional and social issues installed in a given region, since most of the cooperatives promote a high valuation of regional workers, as well as seek to outsource services in various areas.

In general, cooperatives can be highlighted as a way to promote outsourcing of services considered essential or important in the social context, which is why they are highly valued by society. In some cases, cooperatives are developed seeking to highlight certain economic or commercial characteristics of a region, presenting to citizens or workers how their activities can promote the evolution of their city.

It is worth mentioning that the impacts promoted or carried out by cooperatives are mainly economic, they are considered a bridge of development in a given location. For some economists and administrators, the development of a cooperative can be something very positive for the regions, something that has underpinned the implementation or development of many cooperatives.

One of the main cooperatives developed and applied in Brazil consists of credit cooperatives, which are fundamentally based on the development of services or procedures related to the financial part, granting individuals an opportunity for financial development or to portray a certain financial issue with banking organizations.

Many financial professionals consider credit unions to be an opportunity to further expand the interaction between financial institutions and potential consumers or customers of financial services. They are presented as an opportunity to improve or make more accessible guidance, assistance and services in the financial field, whether in a particular region or in a country.

Seeking to consolidate the issues they address about credit unions and how they can promote economic and social evolution in the regions where they are installed, information about SICCOB, one of the most important credit unions in Brazil, was highlighted. Granting an opportunity to verify the main services provided by cooperatives in this segment, as well as information regarding the importance of administrative procedures for a consolidation of improvements or expansions with society.

ABSTRACT

The increasing judicialization of conflicts between dentists and patients highlights the limitations of an exclusively adjudicative approach in disputes characterized by high technical, relational, and informational complexity. This article comparatively analyzes the Brazilian and Argentinian systems of extrajudicial conflict resolution in dentistry, emphasizing mediation and the role of extrajudicial advocacy, evaluating their impacts on the effectiveness of health protection and professional civil liability. It starts from the premise that many controversies do not stem from pure technical error, but from communication and informational failures related to expectations of results, understanding of the therapeutic plan, foreseeable risks, costs, and clinical documentation. In this context, the ancillary duties of objective good faith—information, informed consent, medical records, and cooperation—are examined as structural elements capable of reducing uncertainties and favoring proportionate solutions. It concludes that mediation constitutes an appropriate method, without excluding jurisdiction when necessary.

Keywords: Mediation. Dentistry. Civil Liability. Access to Justice. Prevention of Harm.

RESUMO

A crescente judicialização dos conflitos entre cirurgiões-dentistas e pacientes evidencia as limitações de um enfoque exclusivamente adjudicativo em disputas caracterizadas por elevada complexidade técnica, relacional e informacional. O artigo analisa, de forma comparada, os sistemas brasileiro e argentino de resolução extrajudicial de conflitos na odontologia, com ênfase na mediação e na atuação da advocacia extrajudicial, avaliando seus impactos na efetividade da tutela da saúde e na responsabilidade civil profissional. Parte-se da premissa de que muitas controvérsias não decorrem de erro técnico puro, mas de falhas comunicacionais e informativas relacionadas às expectativas de resultado, à compreensão do plano terapêutico, aos riscos previsíveis, aos custos e à documentação clínica. Nesse contexto, examinam-se os deveres anexos da boa-fé objetiva — informação, consentimento informado, prontuário e cooperação — como elementos estruturais capazes

¹ Doctoral student in Legal Sciences. Universidad del Museo Social Argentino (UMSA).

de reduzir incertezas e favorecer soluções proporcionais. Conclui-se que a mediação constitui método adequado, sem excluir a jurisdição quando necessária.

Palavras-chave: Mediação. Odontologia. Responsabilidade Civil. Acesso à Justiça. Prevenção do Dano.

RESUMEN

La creciente judicialización de los conflictos entre dentistas y pacientes pone de relieve las limitaciones de un enfoque exclusivamente judicial en disputas caracterizadas por una alta complejidad técnica, relacional e informativa. Este artículo analiza comparativamente los sistemas brasileño y argentino de resolución extrajudicial de conflictos en odontología, haciendo hincapié en la mediación y el papel de la defensa extrajudicial, evaluando su impacto en la eficacia de la protección de la salud y la responsabilidad civil profesional. Se parte de la premisa de que muchas controversias no se derivan de errores puramente técnicos, sino de fallos de comunicación e información relacionados con las expectativas de resultados, la comprensión del plan terapéutico, los riesgos previsibles, los costes y la documentación clínica. En este contexto, se examinan los deberes auxiliares de la buena fe objetiva —información, consentimiento informado, historial médico y cooperación— como elementos estructurales capaces de reducir las incertidumbres y favorecer soluciones proporcionadas. Se concluye que la mediación constituye un método adecuado, sin excluir la jurisdicción cuando sea necesario.

Palabras clave: Mediación. Odontología. Responsabilidad Civil. Acceso a la Justicia. Prevención de Daños.

1 INTRODUCTION

The growing judicialization of the relationship between dental professionals and patients is a relevant phenomenon in the contemporary legal scenario, associated with social, economic and cultural transformations that directly impact the provision of health services. The expansion of access to information, the affirmation of the right to health as a fundamental right and the strengthening of consumer protection have contributed to the increase in claims based on allegations of poor dental practice, dissatisfaction with therapeutic results and deficiencies in professional-patient communication.

This scenario highlights the limits of the exclusively adjudicative treatment of disputes characterized by a high technical, subjective and relational load. The jurisdictional response, often centered on expert evidence and the imposition of a binary decision, tends to offer a more appropriate solution for the imputation of responsibility and the quantification of the damage than for the recomposition of the therapeutic bond, the technical clarification and the proportional adjustment of expectations.

The doctrine of access to justice, especially from the debate on "adequate methods" and multi-door justice, points out that the effectiveness of tutelage is not limited to the delivery of a formally correct state decision, requiring mechanisms compatible with the nature of the conflict and capable of producing materially satisfactory responses. Along these lines, Cappelletti and Garth highlight that access to justice must be understood from a functional perspective, oriented to results and the effective protection of rights, and not only as the possibility of resorting to the courts. In a complementary way, the conception of the *multi-door courthouse*, associated with Frank Sander, reinforces the idea that the institutional response to the conflict should privilege the most appropriate method for the specific case, avoiding the exclusive centralization of the litigation process.

In this context, consensual mechanisms — especially mediation and conciliation and, in specific cases, arbitration — gain relevance as instruments for rationalizing the justice system and qualifying health protection, especially in conflicts marked by informational asymmetries and the need for technical dialogue. Mediation, in particular, offers a structured space for communication, the adjustment of expectations and the construction of proportional solutions, preserving, when possible, the care bond.

From a comparative perspective, Brazil and Argentina adopt different institutional designs. In Brazil, consensuality is strongly encouraged by public policy and procedural and substantive legislation, preserving direct access to the Judiciary and the possibility of self-settlement before or during the process. In Argentina, mandatory prior mediation is part of the itinerary of access to jurisdiction in a wide range of civil disputes, with detailed procedural

regulation and mandatory participation of the legal profession, in a dogmatic context that emphasizes the prevention of harm.

This article aims to analyze, from a comparative perspective, the Brazilian and Argentine systems of out-of-court resolution of conflicts between dentists and patients, with special attention to the role of mediation and out-of-court advocacy, as well as the impacts of these models on the effectiveness of health protection and professional civil liability.

2 JUDICIALIZATION OF DENTISTRY AND CRISIS OF EXCLUSIVELY ADJUDICATIVE TREATMENT

The judicialization of health is manifested in a particular way in the dental field. Unlike other areas, in which judicialization is usually oriented towards guaranteeing access to medicines, procedures or hospital beds, many claims in dentistry are concentrated in claims for compensation for material and moral damages resulting from the provision of private services, especially in treatments with an aesthetic-functional component, in controversies related to retreatment, reimbursement, therapeutic continuity and the frustration of expectations.

This pattern reveals a predominantly consumerist logic, in which the dentist-patient relationship is framed as a consumer relationship, subject to consumer protection regulations. Such a framework is relevant to ensure informational transparency, good faith and the prohibition of unfair clauses, but it can reinforce an adversarial dynamic when the judicial process is triggered as an immediate and almost exclusive way to address the conflict.

The centrality of the judicial process in these disputes produces known systemic effects: increased economic and emotional costs, prolongation of the conflict, overload of the Judiciary and decisions that do not always meet the needs of the parties. In health conflicts, as the case may be, expert evidence is indispensable; However, the dependence on expert opinions, added to procedural polarization, can hinder restorative and negotiated solutions, especially when the disagreement stems from communication failures, the absence of adequately documented consent, patient insecurity, or mismatches in expectations regarding the result.

The criticism of the exclusively adjudicative treatment does not imply devaluation of jurisdiction, but reinforces the need to integrate state protection with appropriate methods, privileging communication, cooperation and the prevention of the aggravation of the conflict, according to the nature of each case.

3 DENTAL CIVIL LIABILITY: DOGMATIC FOUNDATIONS AND INFORMATIONAL ELEMENTS OF THE CONFLICT

The civil liability of the dental surgeon, in the Brazilian legal system, is structured mainly from the Consumer Protection Code and the Civil Code. Pursuant to article 14, paragraph 4, of the CDC, the personal liability of liberal professionals is determined by verifying fault, preserving the subjective nature of liability and requiring the demonstration of culpable conduct, damage and causal link. In the Civil Code, arts. 186 and 927 provide the general basis of the unlawful act and the duty to indemnify, and article 932 acquires relevance when the provision occurs in a business context (clinics, societies and acting through dependents), in which case the organizational dynamics can influence the attribution and management of risk.

Although the normative framework is sufficient for the legal framework, practical experience shows that dental disputes often originate less from a "pure technical error" and more from informational and communicational failures: expectations of results, understanding of the therapeutic plan, biological limits, foreseeable risks, alternatives and costs. From this perspective, the contemporary dogmatics of civil liability has reinforced the centrality of the ancillary duties derived from objective good faith — especially the duties of information, loyalty, cooperation, and protection — with a direct impact on the legitimacy of consent and on the degree of predictability of the therapeutic result.

3.1 DUTY OF INFORMATION AND INFORMED CONSENT: CONTENT, FUNCTION AND PROOF

The duty of information in dental services is not reduced to the mere delivery of a form. It is a legal duty that conditions the patient's self-determination and qualifies the rational choice in the context of technical asymmetry. The civil doctrine, when dealing with objective good faith, understands information as an element of correction of the structural imbalance of the relationship: the patient decides based on what he understands; If understanding is incomplete, conflict becomes predictable.

The function of informed consent is twofold: (1) ethical and clinical, as it allows free and informed decision-making, adjusting expectations and preserving autonomy; (2) legal-evidential, as it organizes the standard of transparency required of the professional and documents the informational path.

To avoid weaknesses in any litigation, informed consent must include: description of the procedure and the stages of the therapeutic plan; typical and relevant risks (including complications and limitations of the result); therapeutic alternatives and consequences of not

performing it; aftercare and the need for controls; possibility of retreatment, biological limitations and margins of variation of the result; foreseeable costs and hypotheses of additional costs, with due justification.

The specific literature on dentistry and civil liability highlights that consent should not be "standard and generic", under penalty of losing evidential effectiveness. The document is more robust when it dialogues with the concrete case, uses accessible language and records the doubts clarified.

3.2 DENTAL RECORDS: ETHICAL-LEGAL DUTY, CONTINUITY OF CARE AND EVIDENTIARY SUPPORT

The medical record is a central element of contemporary dental practice for three reasons: (1) it enables continuity of care and clinical safety; (2) evidences diligence, planning, decisions and conduct; (3) it provides evidentiary support in controversies, reducing uncertainty and polarization.

In indemnity claims, the evidence is often structured based on what is documented: anamnesis, examination, treatment plan, evolution, complications, orientations, controls, exams and images. The absence or precariousness of records tends to amplify the conflict, hinder forensic examination, and increase the perception of communication failure — even when the technical conduct was adequate.

Here lies a relevant point: mediation becomes more viable when there is minimally organized clinical documentation, as the parties can discuss solutions without fully depending on a late expert judgment. In terms of preventive policy, an adequate medical record and informed consent work as a true "infrastructure of the agreement": they reduce noise, stabilize the facts and allow proportional proposals.

In view of the growing complexity of professional accountability in dentistry, it is proposed to strengthen the ethical, legal and documentary training of dental surgeons from graduation. The consolidation of educational practices aimed at the correct preparation and use of clinical documentation is essential for the prevention of legal conflicts, for adequate patient information and for the demonstration of professional diligence proper to the obligations of the environment that characterize the dental activity. Thus, it is recommended the incorporation of specific pedagogical strategies that promote the understanding of the evidential role of dental documentation and encourage preventive action by the professional, contributing to greater legal certainty in clinical practice.

3.3 DUTY OF COOPERATION AND MANAGEMENT OF COMPLICATIONS: FROM CONFLICT TO THE DESIGN OF CONSENSUAL SOLUTIONS

Dental litigation often arises from complications, persistent discomfort, recurrences or results below expectations. In these situations, the legally relevant conduct is not only the technical one, but also the communicational management of the intercurrent, the patient's guidance, the offer of alternatives and the recording of the decisions adopted. Objective good faith — understood as a standard of behavior — is the basis for a duty of cooperation that does not imply "assumption of guilt", but transparent and diligent action to reduce damage and avoid the escalation of the conflict.

From a practical point of view, this is directly related to typical consensual solutions: partial retreatment with defined deadlines and clinical milestones; proportional reimbursement conditioned on objective criteria (e.g. steps not taken); independent evaluation (second opinion) agreed; adjustment of the therapeutic plan and economic conditions; closure agreement with preservation of the medical record and reciprocal commitments.

This perspective is consistent with the notion of adequate protection: when the dissent is informational and relational, the appropriate method is the one that allows the reconstruction of expectations and a proportional solution, without reducing the case to the binary logic of "fault versus indemnity".

4 CONSENSUAL MEANS IN HEALTH: DOCTRINAL FOUNDATIONS APPLIED TO DENTISTRY

Consensual means are part of a movement to reconfigure access to justice, in which it seeks to replace the single response of the litigation process with a set of "doors" capable of responding proportionally to different types of conflicts. This logic, associated with the *multi-door courthouse* (Sander) model, finds a privileged field in health, as many care disputes are marked by technical asymmetries and interests that are not resolved only through a conviction.

4.1 NEGOTIATION FOR INTERESTS: WHEN THE CONFLICT IS NOT "MONEY", BUT "RECOGNITION" AND "SECURITY"

Interest-based negotiation, developed by Fisher, Ury, and Patton, is especially useful for understanding dental conflicts. In many cases, the patient's stated position is "indemnity"; The underlying interest may be the recognition of suffering, security as to what has occurred

and what may yet occur, the predictability of costs, the possibility of completing treatment, as well as the preservation of dignity and autonomy.

When the professional responds only in terms of positions ("there was no mistake" versus "there was a mistake"), the conflict tends to escalate. Consensual methods make it possible to work on interests: technical clarification, continuity agreements, proportional compensation and independent evaluation.

4.2 MEDIATION: STRUCTURE, CONFIDENTIALITY AND COMMUNICATIONAL RECONSTRUCTION (MOORE)

Moore describes mediation as a structured process of assisted communication, in which an impartial third party facilitates the identification of issues, interests, and alternatives, without imposing a decision. In dentistry, this design reduces three typical risks of litigation: (1) narrative polarization ("malpractice" versus "inherent risk"); (2) the exclusive dependence on expertise as the only form of technical understanding; (3) emotional crystallization, which transforms therapeutic frustration into permanent hostility.

Confidentiality, when properly agreed, is particularly useful in the health sector, as it protects professional reputation and allows patients to expose their vulnerabilities without fear of being exploited. This favors realistic agreements that would hardly be proposed "under the spotlight" of the judicial process.

4.3 TRANSFORMATIVE MEDIATION: AUTONOMY AND RECOGNITION (BUSH AND FOLGER) IN HEALTH CONFLICTS

The transformative theory (Bush and Folger) is valuable for dental litigation because many conflicts constitute experiences of loss of control: the patient feels that he did not understand the risks, that he did not participate in the decision, or that he was not heard. Mediation can produce: *empowerment*, giving the patient back informed autonomy; and *recognition*, allowing the professional to recognize the patient's experience without necessarily admitting guilt.

This point demonstrates that mediation is not only an "economic agreement", but a mechanism that addresses subjective dimensions of conflict, which are fundamental in the field of health.

4.4 CRITERIA FOR THE ADEQUACY OF THE METHOD: WHEN MEDIATION IS BETTER AND WHEN IT IS NOT

To avoid an "idealization of consensuality", it is necessary to recognize its limits. Mediation is appropriate when: the conflict involves expectations, communication, costs and continuity of care; there is scope for a proportionate solution; the parties have a minimum capacity for dialogue (even if mediated); and the object is predominantly patrimonial or available (or at least negotiable as to the form of compliance).

Mediation tends to be inappropriate when: there are strong indications of violence, coercion or decision-making incapacity; there is urgency for injunctive or anticipatory relief to avoid serious damage; the litigation is essentially probative as to a central technical fact without a minimum documentary basis; or there is absolute resistance to any form of dialogue.

The delimitation avoids the indiscriminate use of mediation for all types of conflicts.

5 THE BRAZILIAN MEDIATION SYSTEM AND EXTRAJUDICIAL ADVOCACY

5.1 PUBLIC POLICY AND NORMATIVITY: CNJ RESOLUTION NO. 125/2010, CPC/2015 AND LAW NO. 13,140/2015

In Brazil, mediation was institutionalized as a public policy from CNJ Resolution No. 125/2010, which instituted the National Judicial Policy for the Adequate Treatment of Conflicts of Interest and structured the NUPEMECs and CEJUSCs. The notion of "adequate treatment of the conflict", associated with the Brazilian doctrine (especially Kazuo Watanabe), presupposes the choice of the method most compatible with the nature of the litigation, overcoming the idea that the litigation process is always the most efficient way.

The 2015 Code of Civil Procedure consolidated this guideline by providing that the State shall promote, whenever possible, consensual settlement and that conciliation, mediation and other methods must be encouraged by magistrates, lawyers, defenders and members of the Public Prosecutor's Office (art. 3, §§ 2 and 3). In theoretical terms, this guideline dialogues with the idea of adequate protection: the effectiveness of access to justice is not to be confused with the simple entry into the courts, but with obtaining a response compatible with the substantive law and with the particularities of the case.

Law No. 13,140/2015 regulated judicial and extrajudicial mediation, consolidating principles such as autonomy of will, confidentiality, and good faith. For Tartuce, mediation is especially appropriate in continuous or asymmetrical relationships, in which the solution constructed tends to be more sustainable and satisfactory than the external imposition of a decision.

5.2 JUDICIAL MEDIATION AND CEJUSCS

Judicial mediation occurs, as a rule, within the scope of the CEJUSCs. In dental conflicts, judicial mediation can be used in compensation claims to discuss reparation alternatives before the production of complex expert evidence, which tends to reduce costs and procedural time. If there is an agreement, judicial approval with the force of an enforceable title is possible.

5.3 EXTRAJUDICIAL MEDIATION AND SPECIALISED PRIVATE CHAMBERS

Extrajudicial mediation depends on the will of the parties and can be carried out in private chambers, specialized institutions or conducted by qualified mediators. Its usefulness in the dental field is high, as it allows: (i) the composition of retreatment and proportional reimbursement; (ii) continuity of care and technical correction agreements; (iii) instruments with confidentiality and non-recognition of guilt clauses, when legally appropriate and without prejudice to inalienable rights.

5.4 ARBITRATION IN DENTAL SERVICES: DOGMATIC AND JURISPRUDENTIAL LIMITS

Arbitration is governed by Law No. 9,307/1996, but in consumer relations, there are relevant limits. The CDC prohibits the clause that determines the compulsory use of arbitration (art. 51, VII) and, in adhesion contracts, it is required that the clause only produce effects if the adherent takes the initiative to initiate arbitration or expressly consents to its institution, with formal requirements.

The case law of the STJ consolidated this orientation, highlighting the need for real voluntariness of the consumer:

1. **STJ, REsp 1.189.050/SP (2010):** admits an arbitration clause in a consumer/adhesion contract as long as it is not imposed; the effectiveness depends on the consumer's initiative or his subsequent express agreement.
2. **STJ, REsp 1.628.819/MG (2016):** reinforces the prohibition of compulsory arbitration and conditions the initiation to the initiative or express agreement of the consumer.
3. **STJ, REsp 1.778.456/SP (2019):** admits arbitration in property disputes, with reinforced caution in health/consumption, prohibiting its use to remove controversies about personal rights and damage to health.

It is necessary to explain that, in dental contracts, arbitration clauses require maximum caution. In general, it is safer to adopt staggered clauses (negotiation → mediation → arbitration/justice), preserving voluntariness and qualified information, which dialogues with

the arbitration doctrine (such as Carmona) and with the consumerist doctrine (such as Cláudia Lima Marques) in the protection of vulnerable consumers.

5.5 EXTRAJUDICIAL ADVOCACY IN BRAZIL: QUALIFICATION AND LIMITS OF OPTIONALITY

In Brazil, the role of the lawyer in mediation is optional, but recommended in complex and technically specialized conflicts. Extrajudicial advocacy contributes to: (1) reducing asymmetries; (2) evaluate risks and alternatives; (3) formalize a valid and enforceable agreement. However, optionality can maintain inequalities when one of the parties has technical or economic superiority, which requires attention to procedural design and informational transparency.

5.6 DENTAL ETHICS AS A PREVENTIVE AXIS

The Code of Dental Ethics (CFO) establishes duties of information, informed consent, maintenance of medical records and professional zeal. These duties act as a preventive axis: they reduce litigation, raise the quality of communication and serve as a reference for proposals for solutions in mediation, in line with the dignity of the patient and with objective good faith.

6 THE ARGENTINE MODEL OF MANDATORY PRIOR MEDIATION, THE DUTY TO PREVENT HARM AND THE CENTRALITY OF EXTRAJUDICIAL ADVOCACY

6.1 MANDATORY MEDIATION AND ACCESS TO JUSTICE: INSTITUTIONAL RATIONALITY

Argentina instituted mandatory prior mediation as a condition of proceeding for the initiation of a wide range of civil actions, through Law 26.589/2010. In this design, mediation is an institutional gateway to the system and formally integrates the itinerary of conflict treatment, without representing a waiver of the right of action.

The normative option shifts the focus from "access to the judge" to "access to the appropriate response", giving centrality to preventive, dialogical and proportional solutions before the initiation of judicial litigation. In health conflicts, including dental ones, this structure can contain the escalation of the conflict, preserve space for recomposition, and reduce the adversarial crystallization of the claim.

6.2 PROCEDURE, CONFIDENTIALITY AND FRUSTRATION CERTIFICATION

The procedure begins with a formal request, with the designation of a hearing before a registered mediator, subject to registration and supervision rules. The initial hearing delimits the conflict, identifies underlying interests and inaugurates an assisted negotiation.

The parties appear assisted by lawyers, and unjustified absence can generate procedural and economic consequences, giving effect to the duty of participation. The procedure is guided by confidentiality, favoring a frank presentation of expectations and possibilities of reparation — a sensitive aspect in dental disputes that may involve reputation, therapeutic frustration and the need for technical clarification.

If there is an agreement, it is formalized in writing; In its absence, a certificate of frustrated mediation is issued, enabling entry into the courts. Even so, the stage tends to qualify the information, reduce the litigious object and stabilize the controversy, making any subsequent process more rational.

6.3 CCYC AND DAMAGE PREVENTION: PREVENTIVE FUNCTION

The Civil and Commercial Code of the Nation (CCyC, Law 26.994) enshrines, in arts. 1710 and following, a general duty to prevent damage. Argentine dogmatics emphasizes a paradigm shift: from a responsibility focused only on reparation to a logic of avoidance and mitigation of harm, especially relevant in professional activities with foreseeable risks, such as health practices.

In dental services, this preventive axis directly focuses on the duties of information, informed consent, follow-up and management of complications. In addition, the CCyC regulates contracts for the provision of services (articles 1641 et seq.), emphasizing ancillary duties such as loyalty, cooperation, and information — dogmatic bases that support both accountability and proportional consensual solutions.

6.4 CENTRALITY OF EXTRAJUDICIAL ADVOCACY: QUALIFICATION OF CONSENSUS AND REDUCTION OF ASYMMETRIES

The mandatory participation of the legal profession in mediation is a distinctive element of the Argentine model. Legal assistance qualifies the proposals, reduces asymmetries and increases the formal security of the agreement.

6.5 APPROVAL AND ENFORCEABILITY

The judicial ratification of the agreements strengthens their enforceability and stability. This mechanism does not denature the extrajudicial nature of mediation, but evidences a

functional integration between consensuality and jurisdiction, preserving autonomy and ensuring effectiveness.

7 MEDIATION, OUT-OF-COURT ADVOCACY AND SYSTEMIC EFFECTS

7.1 OPTIONALITY AND OBLIGATION: IMPACT ON ACCESS TO JUSTICE

In Brazil, self-settlement is encouraged, but does not condition, as a rule, the right of action; Freedom of choice is preserved, although conflicts potentially solvable by consensus may enter directly into the courts. In Argentina, mandatory prior mediation reorganizes the itinerary of the conflict, functioning as an institutional stage aimed at preventing litigation, without suppressing the right of action.

7.2 LEGAL CULTURE AND BEHAVIOR OF ACTORS

In Brazil, the litigation tradition still prevails despite the normative framework of consensuality; The judicial process remains a way perceived as "safer" by many actors. In Argentina, mandatory mediation tends to consolidate a culture of prevention and negotiation, in which consensual settlement constitutes an ordinary stage in the treatment of conflict.

7.3 ROLE OF EXTRAJUDICIAL ADVOCACY AND INFORMATIONAL ASYMMETRY

The optionality of legal assistance in Brazilian mediation can preserve autonomy, but in health conflicts, it can maintain asymmetries and compromise the quality of the agreement. In Argentina, the obligation of legal aid reinforces the technical balance and predictability, attributing to it an institutional function.

7.4 CIVIL LIABILITY AND TIMING OF THE DISPUTE

In Brazil, mediation is usually triggered after a significant rupture and with a predominantly pecuniary expectation. In Argentina, mandatory prior mediation operates before adversarial crystallization, favoring solutions for correcting the service, restoring the bond and proportional reparation, especially in dialogue with the prevention of damage.

7.5 EFFECTIVENESS OF HEALTH PROTECTION

The effective protection of health requires timely, proportional, and humanized responses. Models that expand the space for dialogue tend to reduce costs and time of conflict, but effectiveness depends on institutional quality and professional culture. Thus, the comparison does not authorize an automatic transposition: it allows the identification of functional elements that can inspire improvements in Brazil (qualified pre-procedural

mediation, specialized chambers, strengthening of extrajudicial advocacy), preserving access to justice.

8 MEDIATION, HARM PREVENTION AND PROFESSIONAL ETHICS

The integration between mediation, professional ethics and public health policies is a central element for the effectiveness of consensual mechanisms. In dentistry, conflict prevention depends on clear communication, properly documented consent, a complete medical record, and adequate follow-up of complications.

In Brazil, the ethical duties established by the CFO function as normative parameters that guide the evaluation of professional conduct and can support proposals for solutions in mediation. In Argentina, the duty to prevent positive damage in the CCyC reinforces the ethical-preventive dimension of civil liability, bringing it closer to the logic of mediation: preventing, mitigating and avoiding the aggravation of the damage.

9 IMPACTS ON HEALTH PROTECTION AND PUBLIC POLICIES

9.1 MEDIATION AND EFFECTIVE GUARDIANSHIP IN DENTAL CONFLICTS

Effective protection, in addition to judicial redress, involves informational transparency, preservation of the patient's dignity and solutions compatible with the complexity of the case. Mediation allows for agreements that include retreatment, proportional reimbursement, independent technical evaluation, adjustments to deadlines and reparation modalities, which can be more satisfactory than purely monetary decisions.

9.2 CIVIL LIABILITY AND DAMAGE PREVENTION: POSSIBLE CONVERGENCES

In the Argentine legal system, the duty to prevent harm offers an explicit normative basis for preventive solutions. In Brazil, although without an equivalent systematization, principles such as objective good faith, the social function of the contract and the duty of cooperation provide a dogmatic basis for a preventive reading, reinforcing the legitimacy of consensual mechanisms in the field of health.

9.3 EXTRAJUDICIAL ADVOCACY AS AN ELEMENT OF QUALITY

Extrajudicial advocacy qualifies consensual solutions, reduces asymmetries and strengthens the validity and enforceability of the agreement. The comparative analysis suggests that legal assistance plays an especially relevant role in health conflicts, due to the technical vulnerability of the patient and the sensitivity of the rights involved.

10 SYSTEMATIZED TABLE: WHAT SHOULD GO TO MEDIATION AND WHAT SHOULD GO TO THE JUDICIARY (BASED ON THE STJ)

The systematization seeks to offer a decision-making map applicable to dentist-patient conflicts, preserving jurisdictional protection when necessary and indicating mediation or conciliation as an appropriate way when the object admits a proportional solution. The Brazilian normative-jurisprudential axis requires special attention to consumer protection and the prohibition of undue restrictions on access to the Judiciary, in addition to the limits of arbitration in adhesion contracts.

10.1 SORTING MATRIX: NATURE OF THE ORDER AND AVAILABILITY OF THE OBJECT

1) Conflicts typically suitable for mediation/conciliation (high suitability)

- a) Proportional reimbursement (total or partial) for steps not performed or for partial frustration of expectations, when there is room for adjustment of values and obligations.
- b) Retreatment, including technical adjustments, replacement of materials or partial redoing of the procedure, with a previously agreed schedule and conditions.
- c) Continuity of care, including definition of referral, agreed second opinion, transition of the medical record and agreement to terminate the bond.
- d) Ancillary contractual divergences, such as installments, terms, discounts, additional costs, warranty and maintenance terms.
- e) Requests for clarification and relational recomposition, when satisfaction results from an adequate technical explanation, recognition of the malaise and agreement on the measures to be adopted.

2) Conflicts that can be mediation, but with caution (medium adequacy)

- a) Cases with allegations of moral damage at a negotiable level, without the need for complex technical evidence as a precondition.
- b) Cases in which the expert opinion is relevant, but there is sufficient documentary basis for entering into agreements by bands, such as payment conditioned to an independent report.
- c) Conflicts with high reputational risk, in which confidentiality is decisive, but which require effective legal assistance to preserve the balance between the parties.

3) Conflicts that tend to require judicial action (low suitability for mediation as an exclusive route)

- a) Situations that require urgent relief to avoid serious or irreversible damage, such as immediate need for reparative treatment or removal of materials in critical situations.
- b) Allegations with a strong component of personality rights and damage to health, in which the central technical controversy requires structured judicial expertise.
- c) Hypotheses involving allegations of document fraud, coercion, incapacity or serious violation of rights, which make a minimally safe negotiation unfeasible.

In summary, the classification as "low adequacy" does not imply a prohibition of mediation, but indicates that it cannot replace state jurisdiction when the need for effective judicial protection and the production of robust technical evidence are present.

10.2 ARBITRATION IN DENTAL CONTRACTS: LIMITS IMPOSED BY THE CASE LAW OF THE STJ

In dental contracts, often of adhesion and consumption, arbitration faces relevant limits. The axis is the effective voluntariness of the consumer, according to the jurisprudential interpretation:

1. **REsp 1.189.050/SP (2010)** and **REsp 1.628.819/MG (2016)**: the arbitration clause cannot impose arbitration; it depends on the consumer's initiative or his subsequent express agreement, excluding compulsoriness.
2. **REsp 1.778.456/SP (2019)**: reinforces cautions in health and consumption, distinguishing available property litigation from sensitive issues related to personal rights and damage to health.

Practical consequence:

1. In dentistry, mediation and conciliation tend to be more compatible, as they do not restrict access to the Judiciary and allow proportional solutions.
2. In the case of arbitration, it is recommended to limit it to equity aspects and adopt a staggered clause, with clear information and effective consent.

10.3 "STAGGERED CLAUSE" AND AGREEMENT DESIGN: HOW TO AVOID NULLITIES AND INCREASE ADHERENCE

Based on the consumer system and the precedents of the STJ, the clauses and consensual agreements must:

1. clearly inform the procedure (costs, deadlines, location, choice of mediator);
2. preserve the patient's real faculty (without threat of loss of rights);

3. provide for mediation before any attempt at arbitration;
4. expressly exclude topics not suitable for arbitration (damage to health, personality rights);
5. contemplate evidentiary mechanisms in the agreement: independent report, second opinion, full delivery of the medical record and retreatment schedule.

11 CONCLUSION

The extrajudicial resolution of conflicts between dentists and patients is a legally relevant instrument for the qualification of health protection and for the rationalization of the justice system, especially in view of the growth of the judicialization of dental relations. The technical, relational and subjective nature of these disputes highlights the limits of exclusively adjudicatory responses and reinforces the relevance of mechanisms aimed at qualified communication, proportionality and the prevention of aggravation of damage.

In the Brazilian legal system, the institutionalization of mediation and conciliation as a public policy and normative guideline represents a relevant normative advance. However, cultural factors and the possibility of direct access to jurisdiction still hinder the practical consolidation of consensuality in conflicts involving dental practice, especially in the context of consumer relations and professional civil liability.

In Argentine law, in turn, mandatory prior mediation, articulated with the duty to prevent damage enshrined in the Civil and Commercial Code of the Nation and with the centrality of the practice of law, promotes the reorganization of the conflict itinerary and favors a more dialogical initial treatment. Such an institutional design, however, does not authorize the affirmation of the model's automatic empirical superiority, but rather evidences relevant normative alternatives for the initial treatment of health litigation.

In this context, the improvement of the Brazilian system can be promoted through structural measures, such as the strengthening of pre-procedural mediation, the creation of specialized health chambers, the institutional qualification of extrajudicial advocacy, and the integration between professional ethics, adequate clinical documentation, and damage prevention.

Finally, it is necessary to strengthen the ethical, legal and documentary training of dental surgeons since graduation, as an essential preventive axis for the reduction of conflicts and the promotion of legal certainty in clinical practice, in line with the effectiveness of the fundamental right to health.

ABSTRACT

Chronic Kidney Disease (CKD) is a highly prevalent condition in felines, especially among geriatric patients. This disease is characterized by progressive evolution and has a multifactorial nature, often associated with comorbidities such as hyperthyroidism. The present study aimed to review and synthesize the main recent scientific evidence regarding the therapeutic management of CKD in cats, with emphasis on nutritional, pharmacological, and diagnostic innovations. This study consists of a narrative literature review conducted in the PubMed database, including articles published in the last five years concerning innovations in the treatment of feline CKD. The research findings demonstrated that nutritional management remains the cornerstone of CKD treatment, particularly in controlling mineral metabolism, highlighting the importance of the calcium:phosphorus ratio and appropriate magnesium supplementation in preventing ionized hypercalcemia. A significant advancement was also observed in the treatment of non-regenerative anemia associated with CKD, with the use of hypoxia-inducible factor prolyl hydroxylase inhibitors, such as molidustat. The gut–kidney axis has also been a promising focus of studies, with the development of strategies aimed at modulating the intestinal microbiota to reduce uremic toxins. Staging according to the guidelines of the International Renal Interest Society (IRIS), and the use of CKD biomarkers such as creatinine and SDMA, are essential for the diagnosis and monitoring of the disease. Finally, it is concluded that modern management of feline CKD must be individualized, integrated, and based on continuous clinical and laboratory monitoring, aiming to slow disease progression, minimize systemic complications, and improve the patient's quality of life.

RESUMO

A Doença Renal Crônica (DRC) é uma enfermidade com alta prevalência em felinos, principalmente dentre os pacientes geriátricos. Esta doença se caracteriza pela evolução progressiva, possuindo caráter multifatorial, estando frequentemente associada à comorbidades, como, por exemplo, o hipertireoidismo. O presente trabalho teve como objetivo revisar e sintetizar as principais evidências científicas recentes a respeito do manejo terapêutico da DRC em gatos, com ênfase nas inovações nutricionais, farmacológicas e diagnósticas. O estudo refere-se à uma revisão bibliográfica narrativa, realizada na base de dados PubMed, contemplando artigos publicados nos últimos cinco anos com relação às inovações no tratamento da DRC felina. Os resultados das pesquisas demonstraram que o manejo nutricional permanece como a base do tratamento da DRC, especialmente no controle do metabolismo mineral, destacando-se a importância da relação cálcio:fósforo e da suplementação adequada de magnésio na prevenção da hipercalemia ionizada. Observou-se, também, um avanço significativo no tratamento da anemia arregenerativa associada à DRC, com o uso de inibidores da enzima prolil hidroxilase do fator induzível por hipóxia, como o molidustat. O eixo intestino-rim também foi alvo promissor de estudos, havendo o desenvolvimento de estratégias voltadas à modulação da microbiota intestinal com redução de toxinas urêmicas. O estadiamento, conforme as diretrizes da IRIS (International Renal Interest Society), e a utilização de biomarcadores da DRC, como a creatinina e SDMA, são fundamentais para o diagnóstico e acompanhamento da doença. Por fim, conclui-se que o manejo moderno da DRC felina deve ser individualizado, integrado e baseado em monitoramento clínico e laboratorial contínuo, visando retardar a progressão da doença, minimizar complicações sistêmicas e melhorar a qualidade de vida do paciente.

RESUMEN

La Enfermedad Renal Crónica (ERC) es una afección de alta prevalencia en felinos, especialmente entre los pacientes geriátricos. Esta enfermedad se caracteriza por una evolución progresiva y posee un carácter multifactorial, estando frecuentemente asociada a comorbilidades como el hipertiroidismo. El presente trabajo tuvo como objetivo revisar y sintetizar las principales evidencias científicas recientes sobre el manejo terapéutico de la ERC en gatos, con énfasis en las innovaciones nutricionales, farmacológicas y diagnósticas. El estudio corresponde a una revisión bibliográfica narrativa realizada en la base de datos PubMed, incluyendo artículos publicados en los últimos cinco años en relación con las innovaciones en el tratamiento de la ERC felina. Los resultados demostraron que el manejo nutricional continúa siendo la base del tratamiento de la ERC, especialmente en el control del metabolismo mineral, destacándose la importancia de la relación calcio:fósforo y de la suplementación adecuada de magnesio en la prevención de la hipercalemia ionizada. También se observó un avance significativo en el tratamiento de la anemia no regenerativa asociada a la ERC, con el uso de inhibidores de la enzima prolil hidroxilasa del factor inducible por hipoxia, como el molidustat. El eje intestino-riñón también ha sido un objetivo prometedor de investigación, con el desarrollo de estrategias orientadas a la modulación de la microbiota intestinal para reducir las toxinas urémicas. El estadiaje conforme a las directrices de la International Renal Interest Society (IRIS) y la utilización de biomarcadores de la ERC, como la creatinina y la SDMA, son fundamentales para el diagnóstico y seguimiento de la enfermedad. Por último, se concluye que el manejo moderno de la ERC felina debe ser individualizado, integrado y basado en un monitoreo clínico y de laboratorio continuo, con el objetivo de retrasar la progresión de la enfermedad, minimizar las complicaciones sistémicas y mejorar la calidad de vida del paciente.

1 INTRODUCTION

Chronic Kidney Disease (CKD) represents one of the most prevalent pathologies in the clinic of geriatric felines, characterized by a progressive and multifactorial course, which requires integrated therapeutic approaches (Geddes & Aguiar, 2022). The clinical management of these patients is complex, as CKD often coexists with other endocrinopathies common in senior cats, such as hyperthyroidism, which can mask loss of kidney function and complicate laboratory monitoring (Yu et al., 2022).

In addition to the progressive reduction of glomerular filtration, the disease triggers a series of systemic complications, including non-regenerative anemia, mineral and bone disorders (CKD-MBD), and the accumulation of uremic toxins derived from intestinal metabolism (Charles et al., 2024; Tang et al., 2024; Summers & Quimby, 2024).

In recent years, the understanding of the gut-kidney axis and the identification of new biomarkers have allowed the development of more refined nutritional and pharmacological strategies. These range from strict control of the calcium:phosphorus ratio in the diet for the management of ionized hypercalcemia to the use of hypoxia-inducible factor prolyl hydroxylase (HIF-PH) inhibitors for the treatment of anemia associated with renal failure (Ehrlich et al., 2024; Charles et al., 2024). Thus, the modern therapeutic approach to CKD in felines seeks not only to slow the progression of kidney injury, but also to mitigate the deleterious effects of comorbidities and optimize the metabolic homeostasis of geriatric patients.
