AUTHOR'S STATEMENT

The author of this work DECLARES, for the following purposes, that:

Do not have any commercial interest that generates a conflict of interest about the published content;

Declares to have actively participated in the construction of the respective manuscripts, preferably under the following conditions: "a) Study design, and/or data acquisition, and/or data analysis and interpretation; b) Preparation of the article or revision to make the material intellectually relevant; c) Final approval of the manuscript for submission";

Certifies that the published text is completely free of data and/or fraudulent results and authorship defects;

Confirms the correct citation and reference of all data and interpretations of data from other surveys;

Acknowledges having informed all the sources of funding received to carry out the research;

Authorizes the editing of the work, including catalog records, ISBN, DOI, and other indexers, visual design and creation of the cover, and internal layout, as well as its release and dissemination according to the criteria of Seven Eventos Acadêmicos and Editora.

EDITOR'S STATEMENT

Seven Publications DECLARES, for rights, duties, and any methodological or legal meanings, that:

This publication constitutes only a temporary transfer of copyright, constituting a right to publication and reproduction of the materials. The Publisher is not co-responsible for the creation of the published manuscripts, under the terms established in the Copyright Law (Law 9610/98), in article 184 of the Penal Code and in article 927 of the Civil Code; The author(s) is solely responsible for verifying such copyright and other issues, holding the Publisher harmless from any civil, administrative, and criminal damages that may arise.

Authorizes the DISCLOSURE OF THE WORK by the author(s) in lectures, courses, events, shows, media, and television, provided that there is due recognition of the authorship and edition and without any commercial purpose, with the presentation of the due CREDITS to SEVEN PUBLICATIONS, being the author(s) and publisher(s) responsible for the omission/exclusion of this information;

All eBooks are open access, so don't sell them on your website, partner sites, e-commerce platforms, or any other virtual or physical medium. Therefore, it is exempt from copyright transfers to authors, since the format does not generate rights other than the didactic and advertising purposes of the work, which can be consulted at any time.

All members of the editorial board are PhDs and linked to public institutions of higher education, as recommended by CAPES to obtain the Qualis book;

Seven Eventos Acadêmicos does not attribute, sell, or authorize the use of the authors' names and e-mails, as well as any other data of them, for any purpose other than the dissemination of this work, following the Civil Rights Framework for the Internet, the General Data Protection Law and the Constitution of the Federative Republic.

PRESENTATION

Science is a field of knowledge in which different disciplines intertwine to form a greater whole. **Horizons of Insight: Exploring the Frontiers of Multidisciplinary Science – 2 ed** is a work that expands this interconnection, bringing together 125 articles on various topics, written by experts from different knowledge.

Developed by **Seven Publications**, this book presents a broad overview of the challenges, discoveries and advances in fields such as mining sentiment in agribusiness news, snakebite accidents, nuclear energy and much more.

SUMMARY

MINING SENTIMENT IN AGRIBUSINESS NEWS: AN ANALYSIS OF THE CORRELATION WITH PRICES IN THE POULTRY CLUSTER OF BASTOS-SP

Miguel Guimarães Morassuti, Mario Mollo Neto.

 <https://doi.org/10.56238/sevened2026.019-001>

.....27-37

INCOME TRANSFER AND TERRITORIAL DEVELOPMENT: SOCIOECONOMIC IMPACTS OF THE GIRA RENDA PROGRAM IN PARAUAPEBAS (PA), BRAZIL

Rian Vitor Dias da Silva, Elizabete Maria da Silva, Suely Guilherme, Gabriella Vitorino Guimarães, Leônidas Pompeu Leão Velloso, Cláudio Roberto Rodrigues Cruz, Marco Antonio Moya Rosas, Milena Vieira Sousa.

 <https://doi.org/10.56238/sevened2026.019-002>

.....38-54

PERCEPTION OF SCIENTIFIC AND TRANSVERSAL COMPETENCIES IN NURSING STUDENTS: A COMPARATIVE ANALYSIS BETWEEN UNIVERSITY COHORTS

Salvador Ruiz Bernés, Alejandrina Montes Quiroz, Hanna Kasandra Ruiz Padilla, Diana Pérez Pimienta, Aimée Argüero Fonseca, Marcela Rábago de Ávila, Carmen Julia Cruz Lima, Paloma Michelle Pérez Saucedo, Angélica Cristina Jacobo Becerra, Sheyla Casandra Sánchez Ramírez.

 <https://doi.org/10.56238/sevened2026.019-003>

.....55-69

BOARD OF DIRECTORS AND PROJECT PORTFOLIO GOVERNANCE: A THEMATIC ANALYSIS BRIDGING CORPORATE OVERSIGHT AND STRATEGIC EXECUTION

Raphael de Oliveira Albergarias Lopes, Murillo de Oliveira Dias.

 <https://doi.org/10.56238/sevened2026.019-004>

.....70-93

SNAKEBITE ACCIDENTS IN THE AMAZON AND THEIR LOCAL COMPLICATIONS: TISSUE NECROSIS ASSOCIATED WITH PREDOMINANT SPECIES IN THE STATE OF AMAZONAS

Thaís da Costa Dias, Caty Esbelana Urrego Ditta, Laisa Divina Vieira Lavor, Kezia de Souza Nunes, Kessia Cibele Machado Ferreira, Paula Cristine da Silva Freitas, Walter Oliveira da Costa, Dimas Melo Gonçalves.

 <https://doi.org/10.56238/sevened2026.019-005>

.....94-110

GRAFTING OF BIOMODELS PRODUCED BY ADDITIVE MANUFACTURING USING ACRYLONITRILE BUTADIENE STYRENE (ABS) IN RABBIT TIBIAS

Tales Dias do Prado, Taiane Santos Silva, Yasmin Souza Prates, Andressa dos Santos Honório, Maise Medeiros Gomes da Silva, Suzana Maira da Silva Caldas, Marcelo Augusto Rozan dos Santos, Tiago Luís Eilers Treichel.

 <https://doi.org/10.56238/sevened2026.019-006>

.....111-122

CEMETERY: MORE HUMAN, INTELLIGENT, AND SUSTAINABLE

Armando L. Carvalho Agostini, Eduardo Moreira da Costa, Carlo Manfroi, Neri dos Santos, Ricardo Pereira.

 <https://doi.org/10.56238/sevened2026.019-007>

.....123-142

PHYTOCHEMICAL ANALYSIS AND ICP-OES NUTRIMENTAL CONTENT IN EXTRACTS OF CASTOR-OIL PLANT (R. COMMUNIS), SWEET ACACIA (V. FARNESIANA) AND PINK GRASS (R. REPENS)

Alan Mendoza Alcantara, Sergio Gutiérrez Barajas, Braulio Edgar Herrera Cabrera, Rafael Salgado Garciglia, Edgar Ayala Padilla, Luis Germán López Valdez, Hebert Jair Barrales-Cureño.

  <https://doi.org/10.56238/sevened2026.019-008>

.....143-162

NUCLEAR ENERGY: PROBLEM OR SOLUTION FOR THE BRAZILIAN ELECTRICITY SECTOR?

Gustavo Henrique Ferrari Martins, Gilberto Vieira.

  <https://doi.org/10.56238/sevened2026.019-009>

.....163-177

CONTEMPORARY LEGAL APPROACHES FOR TECHNOLOGICAL DEVELOPMENT

Isabelle Cristinne Alves Azevedo, Guilherme Ribeiro Rocha, Guilherme Saldanha Santana, Diogo de Almeida Viana dos Santos.

  <https://doi.org/10.56238/sevened2026.019-010>

.....178-188

CREDIT COOPERATIVISM IN BRAZIL: INSTITUTIONAL TENSIONS BETWEEN MUTUALITY, GOVERNANCE, AND MARKET PRESSURES

Otávio Augusto Golos.

  <https://doi.org/10.56238/sevened2026.019-011>

.....189-203

IMAGES OF CONTROL OVER BLACK WOMEN IN THE TV SOAP OPERA VALE TUDO (2025)

Gabriela Caroline Alves Claudino, Alessandra Helen Alves Claudino.

  <https://doi.org/10.56238/sevened2026.019-012>

.....204-216

PRISON MOTHER: THE WORK OF SOCIAL ASSISTENCE AND RIGHTS GUARANTEE

Camila Auricchio Villani.

  <https://doi.org/10.56238/sevened2026.019-013>

.....217-226

LOVE, SURVEILLANCE AND VIOLENCE IN RAFIKI (2018): A LESBIAN FEMINIST READING

Carla Fernanda Nolli, Caique Fernando da Silva Fistarol.

  <https://doi.org/10.56238/sevened2026.019-014>

.....227-236

DEVELOPMENT AND APPLICATION OF AN ANATOMICAL BIOMODEL FOR TEACHING ORCHIECTOMY IN DOGS

Júlia Marcela Vasconcélos de Moraes Vilela, Nadielli Pereira Bonifácio, Tiago Luís Eilers Treichel, Tales Dias do Prado.

  <https://doi.org/10.56238/sevened2026.019-015>

.....237-248

“BECAUSE I LOVED HER SO MUCH”: GENDER-BASED VIOLENCE AND THE REPRESENTATIONS OF THE FEMININE IN THE MANGA TOMIE

Fabrinne Rocha Pereira, Marta Maria Azevedo Queiroz.

  <https://doi.org/10.56238/sevened2026.019-016>

.....249-274

REPORTED CASES OF HIV IN NOVA XAVANTINA – MATO GROSSO – BRAZIL

Kassandra Aparecida Faustino Barbosa, Ricardo Firmino de Sousa.

 <https://doi.org/10.56238/sevened2026.019-017>

.....275-305

PUBLIC POLICIES TO PROMOTE CULTURE AND THE ALLOCATION OF RESOURCES TO THE CREATIVE ECONOMY SECTOR IN THE MUNICIPALITY OF CÁCERES/MT

Ana Paula da Silva Piveta, Edir Antonia de Almeida, Vanessa Ferreira da Silva, Aldo Cesar da Silva Ortiz, Enezio Mariano da Costa, Nivaldo Teodoro de Mello, José Ricarte de Lima, Raul Angel Carlos Oliveira.

 <https://doi.org/10.56238/sevened2026.019-018>

.....306-326

Galactia glaucescens KUNTH – FABACEAE (Leguminosae): STATE-OF-THE-ART

Rosimere Farias de Mendonça Florenzano, Marcio Galdino dos Santos, Leticia Cristina Gonçalves, Yoko Oshima-Franco.

 <https://doi.org/10.56238/sevened2026.019-019>

.....327-346

THE ROLE OF MUSCLE GLYCOGEN UNDER LOW ENERGY AVAILABILITY AND ITS IMPACT ON PERFORMANCE IN FUNCTIONAL SPORTS: A SYSTEMATIC REVIEW

Jackson Gervasio Pires, Lucrecia Natalí Moyano.

 <https://doi.org/10.56238/sevened2026.019-020>

.....347-362

COMMUNITY-BASED TOURISM PRACTICES IN THE COMMUNITIES OF CÓRREGO DO SAL AND BARRINHA, IN ICAPUÍ

Carolina Anselmo Castelo Branco, Antônia Maxwelle Paz Santos, Harine Matos Maciel, Marco Antônio Venâncio, Camila Silva Castelo Branco.

ABSTRACT

This study investigates the correlation between the sentiment of specialized media and price formation in the poultry cluster of Bastos-SP, a hub responsible for approximately 11% of Brazilian egg production. The central objective of the work is to validate whether the information flow acts as a leading indicator or whether the local market operates decoupled from digital expectations due to physical fundamentals. The applied methodology, of an exploratory and quantitative nature, employs Natural Language Processing (NLP) techniques through the BERTimbau Deep Learning model to analyze a corpus of headlines collected between 2023 and 2026. The data were subjected to semantic filtering and weekly resampling using the Pandas library's ".resample('W')" method in Python. The results demonstrate that source curation and the removal of technical noise tripled the observed Pearson correlation (from $r = 0.04$ to $r = 0.12$), indicating that egg prices are marginally sensitive to macroeconomic factors rather than to zootechnical information. The weak, but positive, correlation ($r = 0.12$) observed after the inclusion of macroeconomic sources suggests that local producers are marginally more sensitive to structural trends (grain costs, external environment) than to zootechnical technical factors, which proved statistically irrelevant for short-term price forecasting. Therefore, it is concluded that the weak magnitude of the correlation confirms the dominance of the spot market and the biological nature of the asset, positioning media sentiment predominantly as a coincident indicator of market conditions.

RESUMO

Este estudo investiga a correlação entre o sentimento da mídia especializada e a formação de preços no *cluster* avícola de Bastos-SP, polo responsável por cerca de 11% da produção brasileira de ovos. O objetivo central do trabalho é validar se o fluxo informacional atua como um indicador antecedente ou se o mercado local opera descolado das expectativas digitais devido a fundamentos físicos. A metodologia aplicada, de caráter exploratório e quantitativo, emprega técnicas de Processamento de Linguagem Natural (PLN) por meio do modelo *Deep Learning* BERTimbau para analisar um *corpus* de manchetes coletadas entre 2023 e 2026. Os dados foram submetidos à filtragem semântica e reamostragem semanal por meio do método “.resample('W')” da biblioteca *Pandas* com programação em *Python*. Os resultados demonstram que a curadoria de fontes e a remoção de ruídos técnicos triplicaram a correlação de Pearson observada (de $r = 0,04$ para $r = 0,12$), evidenciando que o preço do ovo é marginalmente sensível a pautas macroeconômicas em detrimento de informações zootécnicas. A correlação fraca, porém, positiva ($r=0.12$), observada após a inclusão de fontes macroeconômicas, sugere que o produtor local é marginalmente mais sensível a tendências estruturais (custos de grãos, cenário externo) do que a pautas técnicas zootécnicas, que se mostraram estatisticamente irrelevantes para a previsão de preços de curto prazo. Conclui-se, portanto, que a magnitude fraca da correlação ratifica a dominância do mercado à vista (*spot market*) e a natureza biológica do ativo, posicionando o sentimento midiático predominantemente como um indicador coincidente das condições de mercado.

Palavras-chave: Mineração de Sentimento. BERTimbau. Agronegócio. Formação de Preços. Bastos-SP.

RESUMEN

Este estudio investiga la correlación entre el sentimiento de los medios especializados y la formación de precios en el *clúster* avícola de Bastos-SP, un centro que representa aproximadamente el 11% de la producción brasileña de huevos. El objetivo principal del trabajo es validar si el flujo informativo actúa como un indicador adelantado o si el mercado local opera desvinculado de las expectativas digitales debido a factores físicos fundamentales. La metodología aplicada, de carácter exploratorio y cuantitativo, emplea técnicas de procesamiento del lenguaje natural (PLN) mediante el modelo de aprendizaje profundo BERTimbau para analizar un *corpus* de titulares recopilados entre 2023 y 2026. Los datos fueron sometidos a filtrado semántico y remuestreo semanal utilizando el método “.resample('W')” de la biblioteca *Pandas* con programación en *Python*. Los resultados demuestran que la curación de fuentes y la eliminación del ruido técnico triplicaron la correlación de Pearson observada (de $r = 0,04$ a $r = 0,12$), lo que indica que los precios de los huevos son marginalmente sensibles a factores macroeconómicos más que a información zootécnica. La débil pero positiva correlación ($r = 0,12$) observada tras la inclusión de fuentes macroeconómicas sugiere que los productores locales son ligeramente más sensibles a las tendencias estructurales (costes de los cereales, entorno externo) que a los factores técnicos zootécnicos, los cuales resultaron estadísticamente irrelevantes para la previsión de precios a corto plazo. Por lo tanto, se concluye que la débil magnitud de la correlación confirma el predominio del mercado *spot* y la naturaleza biológica del activo, posicionando el sentimiento mediático predominantemente como un indicador coincidente de las condiciones del mercado.

1 INTRODUCTION

The municipality of Bastos-SP stands out as the largest poultry hub in the state of São Paulo, being responsible for approximately 45% of São Paulo's production and 11% of national egg production (MORAIS, 2025).

Recognized as the 'Capital of the Egg', according to Rodarte (2025), the region has an estimated daily production of 22 million units, which makes the financial sustainability of local producers dependent on efficiency in marketing and the ability to anticipate market volatilities.

The egg market, however, operates under *commodity* dynamics, characterized by narrow margins, high price volatility, and strong dependence on external factors, such as input costs and variations in demand (Dos Reis Filho et al., 2020). In this context, qualified information becomes an input as strategic as animal nutrition.

The poultry farmer's decision-making, historically based on experience and subjective intuition, today faces the challenge of predicting the price in a market increasingly dependent on external variables, requiring decisions based on economic and conjunctural analyses to the detriment of mere accumulated experience (EMBRAPA, 2024). In this scenario, the flow of digital news can influence trade expectations even before the facts materialize on the shelves.

In the Agriculture 4.0 scenario, data science has offered new perspectives for market intelligence. In a previous study, Morassuti and Neto (2025) demonstrated the feasibility of using *Google Trends* as a demand thermometer for the egg market in Bastos, showing that the volume of digital searches has a certain correlation with the local price dynamics. However, while *Google Trends* captures active user interest, there remains a gap in understanding how the provision of passive information, specifically the "tone" or sentiment of the specialized media, impacts asset pricing.

Advancing in this line of investigation, the present work is based on the premise that the media acts as a vector of expectations. Tetlock (2007) established the theoretical basis that the 'tone' of the news has predictive power over the financial market. Recently, Xu and Hsu (2022) validated this approach in the agricultural sector, demonstrating computationally that news-based sentiment indicators can capture price anomalies in agricultural products that escape traditional econometric models.

In view of this scenario, this article seeks to fill an informational gap on the efficiency of the physical market of perishable commodities, investigating the interdependence relationship between the sentiment expressed in the specialized media and the price fluctuation in the poultry cluster of Bastos-SP.

The originality of this research lies in the application of *Deep Learning* architectures (BERTimbau) in an over-the-counter market highly dependent on physical fundamentals, testing the boundary between media noise and the economic reality of the *analyzed cluster*. In addition to this introduction, the work is structured as follows: Section 2 details the methodological flow and data curation; Section 3 presents the results and the theoretical discussion in the light of the informational economy; and Section 4 summarizes the conclusions, limitations, and implications for agribusiness governance.

2 MATERIALS AND METHODS

To investigate the relationship between the sentiment expressed in agribusiness news and price fluctuation in the poultry sector of Bastos-SP, this study will employ an exploratory and quantitative approach, applying Natural Language Processing (NLP) techniques. As highlighted by Finatto, Lopes and Ciulla (2015), NLP seeks to create solutions to specific problems related to language recognition and reproduction, being a facilitating tool in the processing of large volumes of information.

The spatial cut comprises the production *cluster* of Bastos-SP, the largest poultry hub in the state of São Paulo, and the time frame covers the period from April 2023 to December 2026. The methodological flow was structured in four sequential stages: (i) Data Collection; (ii) Pre-processing; (iii) Sentiment Modeling via *Deep Learning*; and (iv) Statistical Correlation Analysis

2.1 DATA ACQUISITION AND CURATION

For the composition of the dependent variable (price), the daily historical series of the extra egg, white, in Bastos-SP, from the Center for Advanced Studies in Applied Economics (CEPEA, 2026), were extracted. These series allow us to monitor price dynamics and understand the sensitivity of the local market to external variables, whose daily variations reflect the direct influence of factors such as input costs and fluctuations in demand (CEPEA, 2026).

For the independent variable (feeling), a textual *corpus* was constituted from the collection of headlines from four news portals of high sectoral relevance: Avisite, Avinews, Canal Rural and Globo Rural (AVISITE, [n.d.]; AVINEWS, [n.d.]; CANAL RURAL, [n.d.]; GLOBO RURAL, [n.d.]). Unlike strictly automated approaches, we opted for manual data extraction and curation, aiming to establish a 'Gold Standard' of quality for the training and testing of NLP architecture.

This deliberate procedure allowed for rigorous semantic filtering through the standardized search term 'eggs', ensuring that the raw *dataset* of 636 records was free of institutional noise, social columns, or merely administrative edicts, elements that often compromise the accuracy of unsupervised *web scraping* algorithms.

2.2 SEMANTIC FILTERING AND NOISE TREATMENT

In order to ensure semantic relevance and data quality, an algorithmic filtering pipeline was applied. To this end, the *Pandas* library was used, which provides data structures and tools for the efficient manipulation of tables and time series, and is widely used in economic and market analysis (MCKINNEY; PANDAS DEVELOPMENT TEAM, 2026).

Through this tool, records containing terms associated with corporate events, sanitary management, or irrelevant niches, such as "vaccine", "pet", "congress", and "technology", were excluded. At the same time, an inclusion filter was applied to headlines containing economic markers, such as "price", "market", "export", "cost" and "supply".

This process refined the *original corpus*, resulting in 135 headlines of high economic relevance (N = 135).

2.3 SENTIMENT MODELING (BERT)

The polarity classification of the headlines was performed using the BERTimbau model (COSTA et al., 2020).

As highlighted by Costa et al. (2020), BERTimbau is the first language model pre-trained specifically for Brazilian Portuguese, achieving state-of-the-art results in various Natural Language Processing tasks.

The choice of this architecture is based on the robustness of systems based on *Bidirectional Encoder Representations from Transformers* (BERT) for capturing contextual nuances and its successful application in sentiment quantification aimed at modeling and predicting asset prices (CHAUDHRY, 2022).

Specifically, the *fine-tuned* nlptown/bert-base-multilingual-uncased-sentiment version was used, whose effectiveness for the classification of polarities in corpora of digital media and diversified databases was validated in recent comparative investigations, demonstrating high accuracy in identifying opinion trends (SAHOO et al., 2023).

The algorithm assigned a polarity score to each headline, which was later discretized into three classes: Negative (-1), Neutral (0), and Positive (1).

2.4 STATISTICAL ANALYSIS

Given the frequency discrepancy between the price data (daily) and the news (sporadic), the technique of weekly *resampling* (or weekly resampling) was used to harmonize the time series. The procedure was performed using the ".resample('W')" method of the *Pandas* library (MCKINNEY; PANDAS DEVELOPMENT TEAM, 2026), calculating the simple arithmetic mean of the variables for each epidemiological week.

It is noteworthy that weeks in which there was no information flow (news) were disregarded from the correlation analysis to avoid artificial neutrality bias, a procedure performed via the ".dropna()" function.

The validation of the influence hypothesis was performed through Pearson's Correlation Coefficient (), a parameter that measures the intensity and direction of the linear relationship between two quantitative variables, ranging from -1 to 1. Where a value close to 1 indicates strong positive correlation, -1 indicates strong negative correlation, and 0 indicates no linear relationship, testing the strength and direction of the linear relationship between the Weekly Sentiment Index and the Weekly Average Price of the physical asset.

3 RESULTS AND DISCUSSION

After the data collection stage, the analysis was structured into three distinct test scenarios to validate the consistency of the model.

In the first experimental scenario, which comprised the period from April 6, 2023 to January 16, 2026 using exclusively the technical portals Avinews and Avisite, it processed a raw *corpus* of 499 news items, resulting in a Pearson correlation of $r = 0.04$.

This result, illustrated in Figure 1, confirms that the flow of mostly technical and productive news has no explanatory power over the formation of prices in the short term for the *Bastos-SP* cluster.

Figure 1

Comparative time series between Average Price (CEPEA) and Sentiment (BERT) for the Avinews and Avisite portals (2023-2026). Correlation of 0.04.

Source: Prepared by the authors.

The second scenario incorporated semantic filtering (removal of institutional noise), reducing the sample to 65 news items, which marginally raised the correlation to 0.07.

Finally, the third scenario expanded the database by integrating macroeconomic sources (*Globo Rural* and *Canal Rural*), after filtering, a final *corpus* of 135 news items was obtained.

This scenario presented the highest correlation between the tests ($r=0.12$), a value that is still low, but significant compared to the previous scenarios, demonstrating that the curation of sources and semantic filtering contributed decisively to the qualification of the *dataset*.

Table 1 shows the analyzed test scenarios.

Table 1

Test scenarios carried out in the research and their correlations

Test Scenario	News No.	Sources	Correlation (r)
Gross	499	0.04 (Null)	
Filtered	65	0.07 (Low)	
Multi-source	135	0.12 (Best)	

Source: Prepared by the authors.

The analysis of the time series, illustrated in Figure 2, reveals the dynamics between the Weekly Sentiment index (orange line) and the Average Price of Extra White Egg in Bastos-SP (blue line) over the period studied.

Figure 2

Comparative time series between the Average Egg Price (CEPEA) and the News Sentiment Index (NLP/BERT) in the period 2023-2025

Source: Prepared by the authors.

Visually, it is observed that the physical egg market presents high seasonal volatility, with characteristic peaks in the pre-Lent periods (February/March), driven by the increase in liturgical demand. The Sentiment index, in turn, demonstrates greater stability over time, reacting with intensity only to extreme events or macroeconomic shocks.

Quantitative statistical analysis corroborated this visual observation.

In the first experimental scenario, using the raw *dataset* (N=499) composed mostly of technical news from the Avisite portal, Pearson's correlation was statistically null (0.04). This indicates that the flow of news about management, health and technology has no explanatory power over price formation in the short term.

However, after the application of semantic filters and the integration of generalist sources (*Canal Rural* and *Globo Rural*), the *refined dataset* (N=135) presented a relevant qualitative change.

Pearson's correlation rose to 0.12. Although the magnitude of this correlation is still considered weak in the statistical literature, its multiplication by three times in relation to the base scenario (0.04-0.12) is a significant finding.

The analysis of the results shows a difference in the sensitivity of the market: the price of eggs in Bastos showed little sensitivity to news of a technical or productive nature ('inside the gate'). On the other hand, there was a slight reaction to macroeconomic variables ('out of the gate'), such as exchange rate fluctuations, input costs and export trends, frequent themes in the generalist portals analyzed.

However, the low correlation observed ($r < 0.20$) in all experimental scenarios ratifies the hypothesis that the Bastos pole operates under a predominantly physical dynamic, structurally diverging from the highly liquid financial markets.

While Tetlock's (2007) seminal literature establishes media sentiment as a leading indicator capable of predicting volatility in financial assets, the results obtained here suggest that, in laying poultry, news flow acts as a coincident indicator.

This distinction is based on the '*spot market dominance hypothesis*', in which the price formation of highly perishable products is governed by the urgency of physical settlement and daily inventories at the trading counter, rather than by speculative expectations (SHRESTHA et al., 2020).

Unlike financial assets that can be retained based on positive sentiments, the biological nature of the egg imposes a natural barrier to the spread of media noise: the price responds with greater elasticity to physical supply and demand shocks than to digital informational buzz (LI; WANG; DIERSEN, 2024).

Therefore, the weak magnitude of the correlation ($r = 0.12$) in the multisource scenario does not indicate a failure of the NLP model, but rather evidence of the informational efficiency of a market anchored in the physical reality of the gate.

4 FINAL CONSIDERATIONS

The present study sought to fill a gap in the market intelligence literature for agribusiness, applying Natural Language Processing (NLP) techniques to investigate the relationship between specialized media sentiment and price formation in the poultry cluster of Bastos-SP.

The results obtained allow us to conclude that, for the period analyzed (April 6, 2023 to January 16, 2026), the Alta Paulista egg market operates under a pricing dynamic predominantly based on immediate physical variables, demonstrating low elasticity in relation to the news flow.

The weak, but positive, correlation ($r=0.12$), observed after the inclusion of macroeconomic sources, suggests that the local producer is marginally more sensitive to structural trends (grain costs, external scenario) than to zootechnical guidelines, which proved to be statistically irrelevant for the short-term price forecast.

From a methodological point of view, the work validated the effectiveness of the use of Deep Learning models (BERTimbau) combined with rigorous semantic filters for the structuring of unsupervised data. The "cleaning" of institutional noise has proven essential to avoid false correlations, highlighting the importance of data curation in Big Data projects in Agribusiness.

As limitations, the time window of approximately three years and the exclusive focus on digital news portals are pointed out, which makes it impossible to capture informal flows in social networks that could contain more agile market signals.

In addition, the analysis was based on the processing of headlines; Although these summarize the main fact, the absence of the integral body of the news may omit relevant contextual nuances.

It is also noteworthy that the option for manual curation, although it has established a "gold standard" of quality and ensured the elimination of institutional noise, imposes restrictions on the scalability of the corpus analyzed.

For future studies, it is suggested the evolution of this model to a multivariate architecture, integrating the Sentiment Index developed here with climate variables, future quotations of inputs (corn and soybean) and search volume data (*Google Trends*). It is also recommended the application of time lag analysis to identify the exact interval of information absorption by the physical market of Bastos-SP, aiming at the construction of hybrid predictive models capable of overcoming the accuracy of traditional econometric methods.

ABSTRACT

This article analyzes the social and economic impacts of the Gira Renda Program in the municipality of Parauapebas (PA), Brazil, and discusses its contribution to Amazonian territorial development. The study adopts a qualitative and descriptive approach based on semi-structured interviews with a program manager and questionnaires applied to beneficiaries of public policy. The research aimed to understand both the direct social effects of income transfer policies and their indirect impacts on the local economy. The results indicate that the program contributed to reducing social vulnerability among beneficiary families, improving access to food, and strengthening food security. Furthermore, the use of the benefit in local commercial establishments stimulated the circulation of income within the municipality, contributing to the dynamization of local commerce and supporting small businesses. The analysis also highlights the predominance of women among beneficiaries, reinforcing the role of income transfer programs in addressing the feminization of poverty. However, the low monetary value of the benefit and the absence of complementary productive inclusion policies limit the program's potential for structural transformation. The

RESUMO

Este artigo analisa os impactos sociais e econômicos do Programa Gira Renda no município de Parauapebas (PA) e discute sua contribuição para o desenvolvimento territorial amazônico. A pesquisa possui abordagem qualitativa e descritiva, baseada na realização de entrevista semiestruturada com gestor do programa e na aplicação de questionários a beneficiários da política pública. O estudo buscou compreender tanto os efeitos sociais diretos da transferência de renda quanto seus impactos indiretos na economia local. Os resultados indicam que o programa contribuiu para reduzir a vulnerabilidade social das famílias beneficiárias, ampliar o acesso à alimentação e fortalecer a segurança alimentar. Além disso, a utilização do benefício em estabelecimentos comerciais do próprio município estimulou a circulação de renda no território, contribuindo para dinamizar o comércio local e fortalecer os pequenos negócios. A análise também evidencia a predominância de mulheres entre os beneficiários, reforçando o papel das políticas de transferência de renda na mitigação da feminização da pobreza. Entretanto, o baixo valor do benefício e a ausência de políticas complementares voltadas à inclusão produtiva limitam seu potencial de transformação estrutural. Conclui-se que programas de transferência de renda podem contribuir para o desenvolvimento territorial quando articulados a estratégias de economia solidária, qualificação profissional e fortalecimento das economias locais.

RESUMEN

Este artículo analiza los impactos sociales y económicos del Programa Gira Renda en el municipio de Parauapebas (PA), Brasil, y discute su contribución al desarrollo territorial amazónico. La investigación adopta un enfoque cualitativo y descriptivo basado en la realización de una entrevista semiestructurada con un gestor del programa y en la aplicación de cuestionarios a beneficiarios de la política pública. El estudio buscó comprender tanto los efectos sociales directos de la transferencia de ingresos como sus impactos indirectos en la economía local. Los resultados indican que el programa contribuyó a reducir la vulnerabilidad social de las familias beneficiarias, ampliar el acceso a la alimentación y fortalecer la seguridad alimentaria. Además, el uso del beneficio en establecimientos comerciales del propio municipio estimuló la circulación de ingresos dentro del territorio, contribuyendo a dinamizar el comercio local y fortalecer pequeños negocios. El análisis también evidencia la predominancia de mujeres entre los beneficiarios, lo que refuerza el papel de las políticas de transferencia de ingresos en la mitigación de la feminización de la pobreza. Sin embargo, el bajo valor del beneficio y la ausencia de políticas complementarias de inclusión productiva limitan su potencial de transformación estructural. Se concluye que las políticas de transferencia de ingresos pueden contribuir al desarrollo territorial cuando se articulan con estrategias de economía solidaria, capacitación profesional y fortalecimiento de las economías locales.

1 INTRODUCTION

The persistence of social and territorial inequalities is one of the main challenges of public policies in contemporary Brazil. Although the country has made important progress in reducing poverty in recent decades, there are still strong socioeconomic disparities between regions and municipalities (Souza; Osório; Soares, 2019). In this context, income transfer programs have become relevant instruments of social protection. These policies seek to guarantee minimum subsistence conditions for populations in vulnerable situations.

In Brazil, the expansion of income transfer policies gained prominence from the 2000s onwards, especially with the implementation of the Bolsa Família Program. According to Lavinhas (2019), such policies contributed to reducing extreme poverty and expanding access to essential goods and services. In addition to the direct social effects, studies indicate that income transfer programs can generate indirect economic impacts. By increasing the income of beneficiary families, there is an increase in local consumption and stimulation of territorial economies (Gerard; Naritomi; Silva, 2021).

These effects can be analyzed from the perspective of territorial development. Unlike traditional approaches to economic development, this perspective considers the territory as a space of interaction between social actors, institutions, and productive activities. In this sense, public policies can contribute to strengthening local economies and reducing regional inequalities (Monteiro Neto; Columbus; Rocha Neto, 2020).

In the Amazonian context, this discussion takes on particular relevance. Municipalities that have high economic dynamism associated with the exploitation of natural resources often coexist with persistent social inequalities. This phenomenon is common in mining municipalities in the Brazilian Amazon. In these territories, the expansion of mining generates significant economic growth, but does not always promote proportional improvements in the living conditions of the population (Monteiro Neto; Columbus; Rocha Neto, 2020).

The municipality of Parauapebas, located in the southeast of the state of Pará, represents an emblematic case of this dynamic. The presence of the Carajás mining complex has transformed the municipality into an important center of mineral production. This activity generated strong economic growth and increased municipal revenue. However, this process was also accompanied by relevant social challenges. Among them, the accelerated urban expansion and the persistence of pockets of poverty in peripheral areas stand out (Costa; Jesus, 2020).

In this scenario, municipal public policies aimed at reducing social vulnerability become fundamental. Among these initiatives, the Gira Renda Program stands out. It is a municipal public policy aimed at the direct transfer of income to families in poverty. The main

objective of the program is to increase food security and reduce economic vulnerability.

In addition to its direct social impacts, the program has characteristics that allow it to be analyzed from the perspective of territorial development. The benefit must be used in commercial establishments registered in the municipality itself. In this way, the policy stimulates the circulation of income in the territory and strengthens small local businesses. This mechanism brings the program closer to experiences related to solidarity economy and territorial finance (Singer, 2018; Morais; Costa, 2021).

In this context, this article aims to analyze the social and economic impacts of the Gira Renda Program in the municipality of Parauapebas (PA). To this end, a structured questionnaire was applied to the beneficiaries and a semi-structured interview with the program manager. In addition, documentary analysis of institutional materials related to the Gira Renda Program was carried out. With this work, we seek to discuss how this public policy contributes to the Amazonian territorial development.

2 THEORETICAL FRAMEWORK

2.1 INCOME TRANSFER AND POVERTY REDUCTION POLICIES

Income transfer policies have been widely used as instruments to combat poverty and reduce social inequalities in several countries. These policies consist of the direct transfer of financial resources to families in vulnerable situations, with the aim of ensuring minimum subsistence conditions and expanding access to essential goods and services. According to Lavinhas (2019), cash transfer programs have become central components of contemporary social protection systems, especially in countries marked by high levels of socioeconomic inequality.

In Brazil, these policies gained greater relevance from the 2000s onwards, with the implementation of programs aimed at direct income transfer to low-income families. Souza, Osório and Soares (2019) highlight that the expansion of these programs has contributed significantly to the reduction of poverty and income inequality in the country. In addition, such policies have also expanded access to basic public services, such as education and health, contributing to improving the living conditions of the most vulnerable populations.

Another important aspect refers to the impact of these policies on the food conditions of beneficiary families. Studies indicate that income transfer programs contribute to reducing food insecurity and improving the nutritional conditions of populations in situations of social vulnerability. In this sense, Mattei (2019) argues that the direct transfer of resources allows for increased food consumption and ensures greater food security for beneficiary families.

In addition to the direct social impacts, recent research indicates that income transfer programs can also generate indirect economic effects. By increasing the disposable income of beneficiary families, there is an increase in local consumption and stimulation of commercial activities and services. Gerard, Naritomi, and Silva (2021) demonstrate that cash transfers can produce multiplier effects on local economies, contributing to boosting small-scale economic activities.

2.2 TERRITORIAL DEVELOPMENT AND PUBLIC POLICIES

The concept of territorial development, according to Monteiro Neto, Colombo and Rocha Neto (2020), emerges as an alternative to traditional approaches to economic development based exclusively on economic growth indicators. From this perspective, development is understood as a multidimensional process that involves economic, social, institutional and spatial aspects. For the authors Monteiro Neto, Colombo and Rocha Neto (2020), territory is the space of interaction between social actors, institutions and productive activities.

In this context, public policies can play an important role in promoting territorial development. By stimulating local economic activities and expanding opportunities for social inclusion, these policies contribute to reducing regional inequalities and strengthening territorial economies. According to Monteiro Neto, Colombo and Rocha Neto (2020), territorial development depends on the ability to articulate public policies, local economic initiatives and social participation.

In the Brazilian case, territorial inequalities are strongly related to the concentration of economic activities and the unequal distribution of infrastructure and public services. Municipalities located in peripheral regions or dependent on extractive activities often show economic growth accompanied by persistent social inequalities. This dynamic reinforces the importance of public policies aimed at promoting more balanced territorial development (Araújo, 2019).

The literature highlights that territorial development involves processes of social and institutional construction that depend on the participation of different local actors. In this sense, public policies can act as instruments for coordinating and promoting development strategies capable of strengthening the economic and social capacities of the territories (Dallabrida, 2020).

2.3 SOLIDARITY ECONOMY AND CIRCULATION OF INCOME IN THE TERRITORY

The solidarity economy has been pointed out as a relevant strategy to promote productive inclusion and strengthen territorial economies. Unlike traditional forms of economic organization, based on competition and profit maximization, the solidarity economy is based on principles of cooperation, self-management and solidarity. Singer (2018) highlights that solidarity economy initiatives can expand opportunities for job and income generation, especially in contexts marked by social inequalities.

Cooperatives, productive associations and solidarity economy networks are instruments capable of strengthening economic relations based on cooperation among participants. According to Morais and Costa (2021), these initiatives contribute to strengthening territorial economic circuits and expanding opportunities for productive inclusion in local communities.

Another important aspect refers to the circulation of income within the territory itself. Solidarity economy experiences often seek to stimulate consumption in local establishments, reducing dependence on external economic flows. In this sense, França Filho and Laville (2020) argue that the local circulation of resources is a central element for strengthening territorial economies and promoting sustainable socioeconomic development.

In this context, the articulation between income transfer policies and solidarity economy initiatives can amplify the impacts of these policies on territorial development. By stimulating consumption in local establishments and strengthening community economic networks, these policies contribute to boosting territorial economies and expanding opportunities for productive inclusion (Morais; Costa, 2021).

2.4 MINING, INEQUALITY AND TERRITORIAL DEVELOPMENT IN THE AMAZON

In the Amazonian context, the relationship between economic growth and social inequality has specific characteristics. Municipalities that have strong economic dynamism associated with the exploitation of natural resources often coexist with persistent social inequalities. Monteiro Neto, Colombo and Rocha Neto (2020) highlight that municipalities dependent on extractive activities tend to present high economic growth accompanied by fragility in the local productive structure.

The expansion of mining in the Brazilian Amazon has generated significant economic growth in several municipalities, especially those located in areas of mineral exploration. However, this growth has not always been accompanied by proportional improvements in the living conditions of the local population. According to Costa and Jesus (2020), mining

municipalities often have significant social inequalities, associated with income concentration and dependence on extractive activities

This phenomenon has also been described in the literature as a development model based on economic enclaves, in which extractive activities generate a large volume of wealth with reduced local productive chains. As a result, economic growth can coexist with high levels of poverty and social inequality in mining territories (Monteiro Neto; Columbus; Rocha Neto, 2020).

In this scenario, public policies aimed at reducing social vulnerability become fundamental. Income transfer programs can contribute to reducing social inequalities and stimulating the circulation of resources in the local economy. Gerard, Naritomi, and Silva (2021) highlight that the increase in the income of beneficiary families tends to stimulate local consumption, strengthening small commercial establishments and boosting territorial economies.

In this way, income transfer policies can contribute to broader processes of territorial development, especially when articulated with strategies of productive inclusion, solidarity economy, and strengthening of local economies (Morais; Costa, 2021).

3 METHODOLOGY

The present research is characterized as applied, descriptive in nature and with a qualitative approach. According to Gil (2019), descriptive research aims to analyze characteristics of a certain phenomenon or population, seeking to understand relationships and patterns present in the investigated reality. This study sought to analyze the social and economic impacts of the Gira Renda Program in the municipality of Parauapebas (PA) and discuss its contribution to territorial development.

The qualitative approach was adopted because it allows us to understand perceptions, experiences and interpretations of the subjects involved in the public policy analyzed. According to Minayo (2021), qualitative research makes it possible to investigate complex social phenomena based on the interpretation of the meanings attributed by individuals to their experiences. Thus, this type of approach is adequate to analyze public policies and their effects on the living conditions of the population.

The research was carried out in the municipality of Parauapebas, located in the southeast of the state of Pará, a region characterized by strong economic dynamism associated with mining activity. Despite the economic growth observed in recent decades, the municipality presents important challenges related to social inequality and the economic vulnerability of portions of the population.

Data collection was carried out using two main instruments: a structured questionnaire applied to the beneficiaries and a semi-structured interview with the program manager. The fieldwork was carried out in 2025, with the application of the questionnaires between the months of March and April. The sample population was composed of beneficiaries of the Gira Renda program and the selection of participants occurred in a non-probabilistic manner, considering the availability and access to the respondents.

The questionnaire sought to identify the socioeconomic profile of the beneficiaries, as well as to understand how the benefit received contributed to improving their living conditions. A total of 20 responses were collected. The interview aimed to understand institutional aspects related to the implementation of the program, including its objectives, functioning and challenges

In addition to the collection of primary data, documentary analysis of institutional materials related to the Gira Renda Program was also carried out, including municipal legislation, institutional reports and information made available by public agencies. Document analysis allows us to complement the information obtained through interviews and questionnaires, contributing to broaden the understanding of the investigated phenomenon (Gil, 2019).

The data obtained through the questionnaires and interviews were analyzed using the content analysis technique. According to Bardin (2016), content analysis consists of a set of systematic procedures for analyzing communications, allowing the identification of categories and patterns present in the data collected. In this study, the information was organized into analytical categories related to the socioeconomic profile of the beneficiaries, the social impacts of the program, and the territorial economic effects associated with the public policy.

During the manuscript preparation process, a generative artificial intelligence tool (ChatGPT, developed by OpenAI) was used to support textual revision, structural organization of the text, and improvement of academic writing. The tool was used exclusively as an auxiliary writing resource, and was not used for the analysis of the empirical data of the research or for the formulation of the results presented in the study.

The interpretation of the data, the construction of the analytical categories and the conclusions of the research were carried out entirely by the authors, ensuring academic responsibility for the scientific content of the work. The use of the tool followed principles of transparency and good practices in the use of digital technologies in scientific production.

Finally, it is noteworthy that the research respected the ethical principles related to the confidentiality of information and the preservation of the identity of the participants, ensuring that the data collected were used exclusively for academic purposes.

4 RESULTS AND DISCUSSION

This section presents the results obtained from the application of the questionnaires to the beneficiaries of the Gira Renda Program and from the interview conducted with a former manager of the program. The information was organized into analytical tables that allow understanding the socioeconomic profile of the beneficiaries, the social impacts of the program and its possible implications for the local economic dynamics.

The discussion of the results was carried out in dialogue with the literature on income transfer policies, solidarity economy, and territorial development, seeking to interpret how the public policy analyzed contributes to reducing social vulnerabilities and stimulating the circulation of income in the territory (Lavinias, 2019; Monteiro Neto; Columbus; Rocha Neto, 2020).

The data indicate that the Gira Renda Program produced relevant impacts on the daily lives of beneficiary families. The cash transfer contributed to expanding access to essential goods. These results are consistent with studies that indicate that income transfer policies act as instruments of social protection and reduction of immediate economic deprivation (Lavinias, 2019; Mattei, 2019).

In addition to the direct social effects, the results suggest indirect impacts on the local economy. The use of the benefit in commercial establishments registered in the municipality stimulated local consumption, contributing to boost small and medium-sized businesses. As Gerard, Naritomi and Silva (2021) argue, the increase in the disposable income of beneficiary families can generate multiplier effects on local economies, strengthening commercial activities and services.

However, the data also show structural limitations of public policy. The relatively low value of the benefit and the absence of complementary policies for productive inclusion reduced the potential for structural transformation of the program. In this sense, several authors highlight that income transfer programs have more lasting impacts when articulated with strategies for professional qualification, solidarity economy, and strengthening of local economies (Singer, 2018; Morais; Costa, 2021).

Table 1 presents a summary of the main information obtained in the interview with a former manager of the Gira Renda Program. The analysis of the report allowed us to understand institutional aspects related to the creation, operation and impacts of the program in the municipality of Parauapebas. In addition, the interview contributed to identifying structural limitations and administrative challenges that influenced the implementation of public policy, as well as perspectives for the improvement of future initiatives aimed at reducing social vulnerability and strengthening territorial development.

Table 1

Summary table of the main information obtained in the interview with the manager

Analysis Category	Key information from the interview	Analytical interpretation
Objective of the program	The Gira Renda Program was created with the objective of reducing the social vulnerability of low-income families in Parauapebas through the monthly transfer of financial resources.	The policy was conceived as an instrument of social protection and fight against poverty. Income transfer programs are recognized in the literature as relevant mechanisms for reducing poverty and expanding access to essential goods and services (Lavinias, 2019; Souza; Osório; Soares, 2019).
Target audience	Families in vulnerable situations registered in the Unified Registry, with priority given to low-income families, the presence of children and people at social risk.	The prioritization of vulnerable families is in line with the targeting strategies of social assistance policies in Brazil, which seek to direct public resources to groups at higher risk of social exclusion (Silva; Yasbek; Giovanni, 2012).
Benefit amount	The monthly benefit granted to families was approximately R\$ 100.00 , made available through an electronic card for use in commercial establishments registered in the municipality.	Even low-value benefits can contribute to reducing immediate deprivations and expanding access to essential goods, especially in contexts of poverty and food insecurity (Lavinias, 2019; Mattei, 2019).
How it works	The resource was used exclusively in commercial establishments registered in the municipality.	This mechanism stimulates the circulation of income in the territory and strengthens local commerce, generating multiplier effects on the local economy (Gerard; Naritomi; Silva, 2021).
Impacts perceived by management	The former manager highlighted improvements in the food conditions of families and greater movement in local commerce.	Income transfer programs tend to increase the consumption of beneficiary families and stimulate local economic activities, contributing to boost territorial economies (Gerard; Naritomi; Silva, 2021; Lavinias, 2019).
Program limitations	The value of the benefit was considered low in view of the increase in the cost of living and budgetary limitations to expand the number of beneficiaries.	The literature highlights that income transfer policies have a greater impact when associated with other strategies for productive inclusion and income generation (Souza, 2019; Mattei, 2019).
Administrative challenges	Administrative changes and contractual limitations affected the continuity of the program.	Institutional fragility and the discontinuity of public policies are factors often pointed out as obstacles to the consolidation of territorial development strategies (Dallabrida, 2020).
Future prospects	The former manager highlighted the importance of resuming the program associated with professional qualification and productive inclusion actions.	The articulation between income transfer, solidarity economy, and productive inclusion policies can amplify the impacts of these policies on territorial development (Singer, 2018; Moraes; Costa, 2021).

Source: Organization of the authors through information from the interview conducted with a former manager of the Gira Renda Program in 2025 (2026)

Table 2 presents the socioeconomic profile of the beneficiaries of the Gira Renda Program participating in the research. The data indicate a predominance of women among the respondents, in addition to low family income and a high degree of socioeconomic vulnerability.

Table 2

Socioeconomic profile of the beneficiaries of the Gira Renda Program participating in the research (n = 20)

Variable	Category	Frequency (n)	Percentage (%)
Gender	Women	15	75
	Male	5	25
Age group	30–39 years old	8	40
	40–49 years old	5	25
	Other age groups	7	35
Number of children	1 child	4	20
	2 children	8	40
	3 children	5	25
	4 children or more	3	15
Length of residence in Parauapebas	5 to 10 years	4	20
	10 to 15 years	5	25
	15 to 20 years	7	35
	More than 20 years	4	20
Current household income	Less than 1 minimum wage	8	40
	1 minimum wage	10	50
	Up to 2 minimum wages	2	10

Source: Elaboration by the authors based on data from the research carried out in 2025 (2026).

There was a predominance of women among the respondents (75%), evidencing the role of women in managing family income and coping with situations of social vulnerability. Regarding the age group, 65% of the participants are between 30 and 49 years old, indicating that the program mainly serves people of economically active age.

This pattern is also observed in cash transfer programs in different contexts, in which women tend to be the main beneficiaries of social policies (Lavinias, 2019). According to Souza, Osório and Soares (2019), prioritizing women in income transfer programs contributes to increasing food security and improving the management of resources within the family.

Regarding family income, the results indicate that 90% of the interviewees have an income equal to or less than one minimum wage, evidencing a context of strong socioeconomic vulnerability. This scenario reinforces the importance of public income transfer policies as instruments to support families in situations of poverty and social exclusion.

4.1 SOCIAL AND ECONOMIC IMPACTS OF THE PROGRAM

Table 3 presents the main social impacts perceived by the beneficiaries of the Gira Renda Program.

Table 3

Main social impacts perceived by the beneficiaries of the Gira Renda Program (n = 20)

Perceived impact	Response Category	Frequency (n)	Percentage (%)
Improving family income	Yes	11	55
	Partially	6	30
	No	3	15
Sufficiency of the amount received	Sufficient	8	40
	Partially sufficient	9	45
	Insufficient	3	15
Perception of improvement in the community	Yes	11	55
	No	3	15
	They did not know how to evaluate	6	30
Overall evaluation of the program	Great	9	45
	Good	8	40
	Regular	3	15

Source: Survey data (2025).

It is observed that 55% of the interviewees stated that they had noticed an improvement in family income, while 30% indicated partial improvement and only 15% did not identify significant changes. This result confirms the importance of cash transfer programs as instruments for immediate poverty alleviation, especially in contexts of social vulnerability. According to Lavinás (2013), income transfer policies have the capacity to reduce economic deprivation in the short term, contributing to improving the minimum subsistence conditions of families.

In addition, Silva and Yasbek (2017) highlight that programs of this nature act as social protection mechanisms, guaranteeing a minimum income for populations in vulnerable situations. In this sense, even relatively modest amounts can play an important role in reducing economic insecurities, especially when directed to low-income families with a high number of dependents.

Regarding the sufficiency of the amount received, the results show that 45% of the beneficiaries considered the resource only partially sufficient. This data reinforces one of the main criticisms present in the literature on income transfer policies: the limitation of the impact when the values do not follow the changes in the cost of living. According to Souza (2019), income transfer programs are fundamental for social protection, but they need to be articulated with other public policies, such as professional training and productive inclusion, to produce more lasting structural effects.

Another relevant aspect refers to the perception of changes in the community, identified by 55% of the interviewees. This result suggests that the program not only impacted the beneficiary families, but also contributed to boosting the local economy. As Sen (1999) argues, public policies aimed at expanding individual capacities can generate positive

collective effects, strengthening the social and economic development of the territories.

In the context of Parauapebas, this territorial effect becomes even more significant, as the program directed consumption to small and medium-sized commercial establishments in the municipality. According to Singer (2002), initiatives that stimulate the circulation of resources in one's own territory can strengthen local economies, generate dynamism in commerce and expand opportunities for social inclusion.

In addition to the economic impacts, the results indicate that the benefit contributed to improving food conditions and helping to pay basic expenses for beneficiary families. This result is in line with studies that show that cash transfer programs contribute to the reduction of food insecurity and to the improvement of the living conditions of families in vulnerable situations (Mattei, 2019). Likewise, Lavinás (2019) highlights that this type of policy has a direct impact on the ability of families to meet basic needs, especially in contexts of poverty and social exclusion.

Another relevant result refers to the general evaluation of the program, in which 85% of the participants classified the initiative as "good" or "excellent". This result shows the social recognition of the public policy among the beneficiaries. As Souza (2006) argues, public policies that respond directly to the needs of the population tend to generate greater social legitimacy and greater recognition by the beneficiaries.

Finally, it is noteworthy that 90% of the interviewees stated that they would like the program to return, evidencing the importance of Gira Renda for the daily lives of the families served. This result reinforces that income transfer policies continue to be perceived as relevant instruments to address social inequalities, especially in municipalities marked by strong economic dynamism, but also by high levels of social inequality, as is the case of Parauapebas.

Thus, the results indicate that the Gira Renda Program played an important role in reducing social vulnerabilities and expanding access to minimum conditions for survival. However, they also highlight the need for integration with other public policies for productive inclusion and territorial development, in order to expand their transformative potential.

4.2 CONTRIBUTIONS TO TERRITORIAL DEVELOPMENT

Table 4 summarizes the empirical evidence observed in the research, indicating that the Gira Renda Program produced relevant impacts both in the social sphere and in the local economic dynamics.

Table 4

Empirical evidence of the impacts of the Gira Renda Program

Dimension analysed	Empirical evidence from the research	Theoretical interpretation
Socioeconomic profile	Predominance of women (75%) and family income mostly less than one minimum wage.	The predominance of women among beneficiaries highlights the feminization of poverty and the role of income transfer policies in expanding women's economic autonomy (Lavinias, 2019).
Improving family income	55% of respondents reported an improvement in income and 30% a partial improvement.	Cash transfer programs contribute to reducing immediate economic vulnerabilities and increasing the consumption of beneficiary families (Mattei, 2019).
Food safety	Beneficiaries reported using the benefit mainly for food.	Income transfer contributes to reducing food insecurity and expanding access to essential goods (Silva; Yasbek; Giovanni, 2012).
Impacts on the local economy	The benefit was used in commercial establishments in the municipality itself.	The expansion of household consumption can generate multiplier effects on the local economy (Gerard; Naritomi; Silva, 2021).
Program evaluation	85% evaluated the program as good or great and 90% want its return.	The high social approval indicates recognition of the importance of public policy for beneficiary families (Souza, 2006).
Identified limitations	Value of the benefit considered low and absence of complementary actions for productive inclusion.	Income transfer programs have the greatest impact when articulated with income generation and solidarity economy policies (Singer, 2018; Morais; Costa, 2021).

Source: Elaboration by the authors based on research data in 2025 and the literature on income transfer policies and territorial development (2026)

The analysis presented in Table 4 confirms the role of the program in reducing social vulnerabilities and boosting local economic dynamism. Table 5 presents an analytical model that summarizes the mechanisms through which income transfer policies can contribute to territorial development processes.

Table 5

Analytical model: income transfer and territorial development

Process step	Policy mechanism	Observed results	Theoretical contribution
Income transfer	Monthly benefit intended for families in situations of social vulnerability.	Improvement in family income and greater consumption capacity.	Instrument for social protection and poverty reduction (Lavinias, 2019).
Circulation of income in the territory	Use of the benefit in local establishments.	Strengthening of local commerce.	Multiplier effects on the territorial economy (Gerard; Naritomi; Silva, 2021).
Local economic dynamism	Expansion of the demand for goods and services in small businesses.	Increased economic movement in the communities.	Strengthening of territorial economies (Monteiro Neto; Columbus; Rocha Neto, 2020).
Integration with solidarity economy	Potential articulation with cooperatives, associations and local initiatives.	Stimulus to the local circulation of resources.	Solidarity economy as a strategy for productive inclusion (Singer, 2018; Morais; Costa, 2021).
Territorial development	Integration between social policies and the local economy.	Reduction of social vulnerabilities and strengthening of the local economy.	Territorial development as a multidimensional process (Dallabrida, 2020).

Source: Elaboration by the authors based on research data (2025) and the literature.

The synthesis presented in Table 5 allows us to understand in an integrated way how income transfer policies can produce effects that go beyond the care dimension. In the case of the Gira Renda Program, the direct transfer of resources to beneficiary families contributed not only to reducing immediate social vulnerabilities, but also to stimulating the circulation of income in the territory and strengthening local economic activities.

Social policies can play an important role in boosting territorial economies, especially when associated with mechanisms that encourage consumption in local establishments. Thus, the experience analyzed in Parauapebas demonstrates that municipal income transfer programs can contribute to broader strategies of territorial development, particularly when articulated with productive inclusion and solidarity economy initiatives.

5 CONCLUSION

The present study aimed to analyze the social and economic impacts of the Gira Renda Program in the municipality of Parauapebas (PA), seeking to understand how this public policy contributed to territorial development processes. The analysis of the empirical data obtained through questionnaires applied to the beneficiaries and an interview with a former manager of the program allowed us to identify relevant results both in the social sphere and in the local economic dynamics.

The results indicate that the program played an important role in reducing immediate social vulnerabilities. The cash transfer contributed to expanding access to essential goods and reducing social vulnerabilities among beneficiary families. These findings reinforce evidence present in the literature on income transfer policies, which highlight their importance as instruments of social protection and poverty reduction. In addition to the direct social effects, the study identified indirect impacts on the local economy. The use of the benefit in commercial establishments registered in the municipality stimulated local consumption and contributed to boosting small businesses.

However, the results also show important limitations. The low value of the benefit and the absence of complementary policies for productive inclusion restricted the potential for structural transformation of the program. The literature indicates that these programs have a greater impact when articulated with policies of productive inclusion and solidarity economy.

Thus, it is concluded that the Gira Renda Program contributed to reduce social vulnerabilities and stimulate the local economy in the municipality of Parauapebas. However, its potential to promote more lasting transformations depends on integration with broader public policies of productive inclusion and territorial development. Future research may

deepen the analysis of municipal cash transfer programs in Amazonian contexts.

ABSTRACT

In higher education in health sciences, the development of scientific and transversal competencies is essential for training professionals capable of critically analyzing evidence and applying it in clinical practice. The aim of the study was to compare the perception of scientific and transversal competencies among nursing students between the periods 2019 and 2025, in order to identify possible differences associated with the educational contexts in which their training took place. Materials and Methods: A quantitative, non-experimental, cross-sectional, and comparative study was conducted among undergraduate nursing students at a public university in Nayarit, Mexico. The sample consisted of 331 students

selected through non-probabilistic convenience sampling. Data were collected using a questionnaire based on an ad hoc instrument and analyzed using descriptive and inferential statistics, employing χ^2 and Mann-Whitney U tests ($p < 0.05$). Results: The findings showed that transversal competencies were mainly at intermediate levels of development, highlighting teamwork and ethical and social commitment. In contrast, scientific competencies showed lower levels of perceived mastery, particularly in methodological skills. Conclusions: The findings highlight the need to strengthen research training and to promote pedagogical strategies aimed at critical thinking and scientific literacy among nursing students.

RESUMO

Na educação superior em ciências da saúde, o desenvolvimento de competências científicas e transversais é fundamental para a formação de profissionais capazes de analisar criticamente as evidências e aplicá-las na prática clínica. O objetivo do estudo foi comparar a percepção das competências científicas e transversais em estudantes de enfermagem entre os períodos de 2019 e 2025, com o intuito de identificar possíveis diferenças associadas aos contextos educacionais nos quais sua formação ocorreu. Materiais e Métodos: Foi realizado um estudo quantitativo, não experimental, transversal e comparativo com estudantes do curso de graduação em Enfermagem de uma universidade pública de Nayarit, México. A amostra foi composta por 331 estudantes selecionados por meio de amostragem não probabilística por conveniência. Os dados foram coletados por meio de um questionário baseado em um instrumento ad hoc e analisados por meio de estatística descritiva e inferencial, utilizando os testes χ^2 e U de Mann-Whitney ($p < 0,05$). Resultados: Os resultados mostraram que as competências transversais situaram-se predominantemente em níveis intermediários de desenvolvimento, com destaque para o trabalho em equipe e o compromisso ético e social. Em contraste, as competências científicas apresentaram níveis mais baixos de percepção de domínio, particularmente nas habilidades metodológicas. Conclusões: Os achados ressaltam a necessidade de fortalecer a formação em pesquisa e promover estratégias pedagógicas voltadas ao pensamento crítico e à alfabetização científica entre estudantes de enfermagem.

RESUMEN

En la educación superior en ciencias de la salud, el desarrollo de competencias científicas y transversales es fundamental para la formación de profesionales capaces de analizar críticamente la evidencia y aplicarla en la práctica clínica. El objetivo del estudio fue comparar la percepción de las competencias científicas y transversales en estudiantes de enfermería entre los periodos 2019 y 2025, con el fin de identificar posibles diferencias asociadas a los contextos educativos en los que se desarrolló su formación. Materiales y métodos: Se realizó un estudio cuantitativo, no experimental, transversal y comparativo en estudiantes de la Licenciatura en Enfermería de una universidad pública de Nayarit, México. La muestra estuvo integrada por 331 estudiantes seleccionados mediante muestreo no probabilístico por conveniencia. La información se recolectó mediante un cuestionario basado en un instrumento ad hoc y se analizó mediante estadística descriptiva e inferencial, utilizando pruebas χ^2 y U de Mann-Whitney ($p < 0.05$). Los resultados mostraron que las competencias

transversales se ubicaron principalmente en niveles intermedios de desarrollo, destacando el trabajo en equipo y el compromiso ético y social. En contraste, las competencias científicas presentaron menores niveles de percepción de dominio, particularmente en habilidades metodológicas. Conclusiones: Los hallazgos resaltan la necesidad de fortalecer la formación investigativa y promover estrategias pedagógicas orientadas al pensamiento crítico y la alfabetización científica en estudiantes de enfermería.

1 INTRODUCTION

In recent decades, higher education systems have progressively transitioned towards training models focused on the development of skills. This change seeks to strengthen the comprehensive training of students and respond to the social, scientific and professional demands of contemporary society. From this perspective, current pedagogical proposals promote the integration of knowledge, skills, and attitudes that allow students to function in complex and constantly changing contexts. (Covarrubias Apablaza et al., 2022; Saravia Domínguez et al., 2024)

Competency-based education is based on the need for training processes to transcend the transmission of theoretical content and promote the development of skills that allow students to apply knowledge in real situations. In this approach, competencies are understood as the integrated mobilization of conceptual, procedural and attitudinal knowledge that allows responding in a pertinent way to diverse academic and professional situations (Covarrubias Apablaza et al., 2022). This educational model has been widely adopted in higher education, particularly in areas related to health sciences, where the complexity of health problems requires professionals with analytical skills, critical thinking and informed decision-making capacity.

In the field of health sciences, competency-based education has acquired increasing relevance, favoring the training of professionals capable of analyzing scientific information, addressing clinical problems and supporting their decisions on available evidence. In the case of nursing, the development of scientific competencies is a fundamental element, since it contributes to the strengthening of critical thinking, the consolidation of evidence-based practice and the improvement of the quality of care provided to patients. (Machado et al., 2024) (Saravia Domínguez et al., 2024)

Scientific competencies include methodological knowledge, analytical skills, and attitudes aimed at understanding, producing, and applying scientific knowledge in health care contexts. Among these skills are the systematic search of scientific literature, the critical evaluation of information, the understanding of different methodological designs and the use of basic statistical tools to interpret research results. Its development favors the training of reflective professionals, capable of assessing the available evidence and contributing to the continuous improvement of health systems. (Karazhigitova et al., 2024) (de Oliveira Bernardino et al., 2023)

From a training perspective, the development of scientific competencies in nursing students is closely related to the incorporation of scientific literacy processes. This concept refers to the ability to understand phenomena related to science, interpret evidence-based

information and participate in an informed way in decision-making related to health and social well-being (Cuevas Romo et al., 2016). In the context of university education, scientific literacy helps future professionals to develop a critical stance towards the available information and strengthen their ability to integrate scientific knowledge into clinical practice.

In a complementary way, contemporary educational models have incorporated the development of transversal competences. These refer to general skills that allow students to perform effectively in different academic, professional and social contexts. They include skills related to critical thinking, academic communication, knowledge management, collaborative work and self-regulation of learning. The integration of scientific and transversal competencies favors a more complete professional training, by articulating technical skills with cognitive, social and ethical capacities necessary for the exercise of the profession. (Loura et al., 2020)

Various international organizations have pointed out that competencies imply the integrated mobilization of knowledge, skills, and attitudes to respond to individual and social demands in specific contexts. The Organization for Economic Cooperation and Development (OECD) has stressed that its development is a central element in training citizens capable of facing the challenges of the knowledge society. In this sense, the integration of scientific and transversal skills favors a more complete professional training, by articulating technical skills with cognitive, social and ethical capacities necessary for the exercise of the profession. (OECD, 2025)

In nursing education, the scientific dimension is incorporated transversally into the curricula with the purpose of strengthening the students' ability to understand health-related phenomena, interpret research results and apply scientific evidence in professional practice. However, the development of these competencies does not depend solely on the formal curriculum. Factors associated with the educational context, pedagogical strategies, opportunities for participation in research activities and the institutional conditions in which the training process takes place also intervene. (Arévalo-Ipanaqué et al., 2023)

Evidence indicates that student participation in research projects and scientific dissemination activities contributes significantly to the strengthening of scientific competencies and critical thinking. However, in many nursing programs, participation in these types of experiences remains limited, which may influence how students perceive their own development in the scientific field. (Quiñones Gurrola et al., 2025) (Cuba Sancho & Vivas, 2016)

In the context of higher education in the area of health sciences, some studies have analyzed the perception that students have about the development of their scientific

competencies. At a public university in Nayarit, and collaborators conducted research with 388 students from health programs using an instrument composed of 69 items distributed in six sections aimed at characterizing scientific competence. The results showed that, although students recognize the importance of scientific skills for their professional training, there are still areas of opportunity related to the application of the scientific method, the use of technological tools for research, and the mastery of methodological aspects such as research designs and sampling techniques. These findings suggest the need to strengthen pedagogical strategies aimed at promoting the development of scientific competencies and student participation in research activities during university education. (Ruiz Bernés et al., 2019)

Starting in 2020, the COVID-19 pandemic generated important transformations in the academic organization of higher education institutions, including the adoption of virtual or hybrid teaching modalities and adjustments in clinical practices. These conditions gave rise to cohorts that studied under different educational contexts, which could have influenced the way they perceive the development of their scientific and transversal competencies. (OECD, 2025)

In the context of public universities in the state of Nayarit, Mexico, empirical evidence on this topic is still limited, particularly in comparative studies between cohorts formed in different academic periods. Therefore, the present study aims to compare the perception of scientific and transversal competencies in nursing students between the periods 2019 and 2025, in order to identify possible differences associated with the educational contexts in which their training was developed.

2 MATERIALS AND METHODS

Study design: A quantitative, non-experimental, cross-sectional and comparative study was carried out, aimed at analyzing the differences in the perception of scientific and transversal competencies in nursing students belonging to two temporary cohorts corresponding to the academic periods 2019 and 2025.

Population and sample: The population was made up of students enrolled in the Bachelor's Degree in Nursing at a public university in the state of Nayarit, Mexico. Enrollment was 1,046 students in 2019 and 953 in 2025 (N = 1,999). The sample was obtained through non-probabilistic convenience sampling and was made up of 331 students: 192 from the 2019 period (76.6% women) and 139 from the 2025 period (56.1% women). (Hernández Sampieri & Mendoza Torres, 2018)

Variables: The independent variable was the academic period (2019 and 2025) and the dependent variable was the perception of academic competencies, made up of scientific competencies and transversal competencies. Sociodemographic variables such as sex were also considered. Transversal competencies included analytical and synthesis skills, time planning, second-language communication, criticism and self-criticism, creativity, teamwork, interdisciplinary work, and social ethical engagement.

Instruments: The information was collected through a structured questionnaire based on the ad hoc instrument to assess the perception of scientific competencies in university students. The instrument included 47 items distributed in seven sections: sociodemographic data, transversal competencies linked to scientific activity, use of information technologies in research, generation of scientific knowledge, experiences of scientific dissemination, knowledge of data analysis software and perception of the influence of the academic program on the development of scientific competencies. Dichotomous questions (yes/no) and some open-ended questions predominated. (Ruiz Bernés et al., 2019)

Procedure: Data collection was carried out through an online questionnaire developed in Google Forms, distributed to nursing students during the corresponding academic periods. Participation was voluntary and anonymous. Participants were previously informed about the objectives of the study and agreed to participate through informed consent.

Statistical analysis: Descriptive and inferential statistics were applied. Frequencies and percentages were calculated to describe the sample. To compare the 2019 and 2025 cohorts, the chi-square test (χ^2) in categorical variables and the Mann-Whitney U test were used to analyze differences in the perception of competencies. A significance level of $p < 0.05$ was considered.

Ethical considerations: The study was conducted in accordance with the **Declaration of Helsinki** and the **General Health Law on Health Research in Mexico**. It was classified as **risk-free research**, as it only involves the application of surveys or questionnaires where the subjects are not identified or sensitive aspects of the behavior are discussed. Voluntary participation, anonymity and confidentiality of information were guaranteed. (World Medical Association, 2024; Regulations of the General Health Law on Health Research, 2014)

3 RESULTS AND DISCUSSION

Table 1 characterizes the participation of 331 students of the Bachelor's Degree in Nursing, of which 192 (58.0%) corresponded to the 2019 academic period and 139 (42.0%) to the 2025 period. In the total sample, the female sex predominated with 225 participants

(68.0%), while 106 (32.0%) were men. When comparing both periods, differences were observed in the distribution by sex, with a higher proportion of women in 2019 and a relative increase in male participation in 2025. This behavior is consistent with the trend observed in nursing training programs, where female enrollment has historically predominated, although in recent years a progressive increase in male participation in this discipline has been reported (Sharma & Begum, 2023).

Table 1

Characterization of the participants

Variables	2019	2025	Total
	f, %	f, %	f, %
Gender			
Female	147, 63.3	78, 34.7	225, 100.0
Male	45, 42.5	61, 57.5	106, 100.0
Total	192, 58.0	139, 42.0	331, 100.0

Table 2 shows that the perception of transversal competencies showed that, in both periods, the predominant category was "has the notion", which suggests an intermediate level of development of these skills among students. This result coincides with studies that indicate that many transversal competencies in higher education are developed gradually and, sometimes, implicitly within the academic curriculum (Albarrán Villalba, 2018; Magnoler, 2018).

Table 2

Perception and skill of the transversal competence of nursing students by response period

Perception and Skill of Transversal Competence – 2019	Acquired f, %	He has the notion f, %	Not Acquired f, %
Analyze and synthesize	22, 11.5	155, 80.7	15, 7.8
Plan your time	57, 29.7	112, 58.3	23, 12.0
Time Management	75, 39.1	108, 56.3	9, 4.7
Comprehension of texts in the second language	6, 3.1	50, 26.0	136, 70.8
Communicate in writing in a second language	6, 3.1	38, 19.8	148, 77.1
Communicate orally in a second language	7, 3.6	48, 25.0	137, 71.4
Criticism and self-criticism	45, 23.4	133, 69.3	14, 7.3
Act creatively	96, 50.0	90, 46.9	6, 3.1
Work as a team	121, 63.0	69, 35.9	2, 1.0
Working in interdisciplinary contexts	9, 4.7	59, 30.7	124, 64.6
Ethical and social commitment	115, 59.9	74, 38.5	3, 1.6
Perception and Skill of Transversal Competence – 2025			
Analyze and synthesize	3, 2.2	111, 79.9	25, 18.0
Plan your time	23, 16.5	78, 56.1	38, 27.3
Time Management	28, 20.1	93, 66.9	18, 12.9

Comprehension of texts in the second language	2, 1.4	38, 27.3	99, 71.2
Communicate in writing in a second language	1, 0.7	36, 25.9	102, 73.4
Communicate orally in a second language	1, 0.7	50, 36.0	88, 63.3
Criticism and self-criticism	9, 6.5	98, 70.5	32, 23.0
Act creatively	37, 26.6	96, 69.1	6, 4.3
Work as a team	100, 71.9	39, 28.1	0, 0.0
Working in interdisciplinary contexts	8, 5.8	68, 48.9	63, 45.3
Ethical and social commitment	42, 30.2	89, 64.0	8, 5.8

In particular, cognitive competencies such as analyzing and synthesizing information showed a decrease in the proportion of students who reported having acquired this skill in 2025 compared to 2019. A similar trend was observed in the ability to plan and manage time, where the proportion of students who indicated that they had not fully developed this competence increased.

These variations could be related to changes in learning processes in increasingly digitized educational contexts. Various authors have pointed out that, although access to information has been significantly expanded with the use of digital technologies, this does not necessarily translate into the strengthening of critical thinking or complex cognitive skills if it is not accompanied by pedagogical strategies aimed at reflection and in-depth analysis of information. (González Ttito et al., 2025; Karipbayeva et al., 2023)

On the other hand, competencies related to the mastery of a second language presented the lowest levels of perception of proficiency in both periods analyzed. Most of the students reported not having acquired sufficient skills for written comprehension and communication in a foreign language. This result coincides with research that has indicated that the mastery of scientific English continues to be one of the main limitations for access to international academic literature in health sciences students in Latin America (Marcillo-García Concepción Elizabeth et al., 2024; Salamonson et al., 2008) .

In contrast, interpersonal competencies, particularly teamwork and ethical and social commitment, presented the highest levels of mastery perception. The ability to work in a team showed high percentages in both periods, which is consistent with the training approach of nursing, a discipline that promotes collaborative work and social responsibility within professional practice (Wu, 2025) .

The comparative analysis between the periods showed variations in some transversal competencies, with decreases in skills related to time management, creativity and critical capacity, while competencies related to collaborative and interdisciplinary work showed trends of improvement (See Table 3).

Table 3

Percentage comparison ($\Delta\%$) of the perception and ability of transversal competences between 2019 and 2025

Transversal competence	Percentage comparison ($\Delta\%$)		
	Acquired	He has the notion	Not Acquired
Analyze and synthesize	-9.3	-0.8	10.2
Plan your time	-13.2	-2.2	15.3
Time Management	-19.0	10.6	8.2
Comprehension of texts in the second language	-1.7	1.3	0.4
Communicate in writing in a second language	-2.4	6.1	-3.7
Communicate orally in a second language	-2.9	11	-8.1
Criticism and self-criticism	-16.9	1.2	15.7
Act creatively	-23.4	22.2	1.2
Work as a team	8.9	-7.8	-1.0
Working in interdisciplinary contexts	1.1	18.2	-19.3
Ethical and social commitment	4.1	-8.3	4.2

Inferential analysis using the Mann-Whitney U test confirmed statistically significant differences between periods in several cross-cutting competencies, particularly in analyzing and synthesizing information, planning and managing time, criticism and self-criticism, creativity, interdisciplinary work, and ethical and social engagement ($p < 0.05$). These results suggest that the perception of the development of certain competencies may be influenced by factors associated with the educational context and the training experiences of each cohort (See Table 4).

Table 4

Comparison of the perception and skill of the transversal competence of nursing students between response periods

Perception and skill of transversal competence	Female	Male	Total
Analyze and synthesize	4788.0**	1157.0*	10998.0**
Plan your time	4849.5*	940.5**	10359.5**
Time Management	4783.0*	1003.5**	10266.0**
Comprehension of texts in the second language	5544.0	1162.0	13228.0
Communicate in writing in a second language	5454.5	1193.0	12939.0
Communicate orally in a second language	5037.0*	1174.5	12421.5
Criticism and self-criticism	4473.0**	967.5**	9638.5**
Act creatively	4810.0*	963.0**	10242.0**
Work as a team	5233.0	1159.5	12114.5
Working in interdisciplinary contexts	4542.0*	1258.0	10844.0**
Ethical and social commitment	3985.5**	1060.5*	9221.0**

* $p < 0.05$ and ** $p < 0.01$ with Mann-Whitney U.

In relation to scientific competencies linked to the generation and application of knowledge, the results showed a predominance of the "not acquired" category in both periods analyzed, which suggests limitations in the development of research skills among students.

This behavior is consistent with what was reported in a previous study carried out at the same institution by those who evaluated the perception of scientific competencies in students in the area of health sciences using an instrument of 69 items applied to 388 participants. In this study, limitations in skills related to the application of research designs, sampling techniques, and the use of methodological tools were also identified, which suggests that the strengthening of research training continues to represent a challenge within academic programs in the health area (See Table 5). Bernés et al. (2019)

Table 5

Perception for the generation and dissemination of scientific knowledge in nursing students by response period

Generation and dissemination of knowledge – 2019	Acquired	Not Acquired
	f, %	f, %
Knows how to apply experimental designs	67, 34.9	125, 65.1
Knows how to apply non-experimental designs	56, 29.2	136, 70.8
Knows how to apply sample selection techniques	33, 17.2	159, 82.8
Considers statistical methods for data analysis to be important	119, 62	73, 38
Generation and dissemination of knowledge - 2025		
Knows how to apply experimental designs	47, 33.8	92, 66.2
Knows how to apply non-experimental designs	33, 23.7	106, 76.3
Knows how to apply sample selection techniques	7, 5.0	132, 95.0
Considers statistical methods for data analysis to be important	39, 28.1	100, 71.9

Table 6 shows that in particular, low levels of mastery perception were identified in aspects such as knowledge of sample selection techniques and the assessment of statistical methods for data analysis. Likewise, a decrease was observed in the proportion of students who recognized the importance of statistics for the analysis of scientific information in the most recent period.

These findings coincide with research that indicates that, in many health sciences training programs, research teaching tends to concentrate on isolated theoretical subjects, without sufficient integration with practical research experiences, which limits the development of scientific competencies in students (Koritzinsky et al., 2017; Wu, 2025).

Similarly, the study identified that a significant proportion of students reported not having fully developed skills related to the application of experimental and non-experimental designs, as well as the use of sample selection techniques. These findings reinforce the idea that, although the curricula include content related to research methodology, the effective development of these competencies requires training experiences more linked to research practice and the active participation of students in scientific projects. Bernés et al. (2019)

The comparative analysis between cohorts showed statistically significant differences in some scientific competencies, particularly in the knowledge of sampling techniques and in the assessment of statistical methods, while the differences observed in the application of experimental and non-experimental designs did not reach statistical significance.

Table 6

Percentage comparison ($\Delta\%$) between periods of perception for the generation and dissemination of scientific knowledge

Competition	Percentage comparison ($\Delta\%$)	
	Acquired	Not Acquired
Knows how to apply experimental designs	-1.1	1.1
Knows how to apply non-experimental designs	-5.5	5.5
Knows how to apply sample selection techniques	-12.2	12.2
Considers statistical methods for data analysis to be important	-33.9	33.9

The comparative analysis by sex (Table 7) showed differences in the perception of some scientific competencies. In general, women reported higher levels of mastery in research-related skills, particularly in the application of experimental designs, non-experimental designs, and assessment of statistical methods, where statistically significant differences were identified using the Mann-Whitney U test ($p < 0.01$).

Table 7

Comparison of the generation and dissemination of knowledge of the transversal competence of nursing students between response periods

Generation and dissemination of knowledge	Female	Male	Total
Knows how to apply experimental designs	5374.5	1260.5	13199.5**
Knows how to apply non-experimental designs	5487.0	1299.0	12620.0**
Knows how to apply sample selection techniques	5008.5*	1265.0	11722.5
Considers statistical methods for data analysis to be important	3918.0**	809.5**	8817.5

* $p < 0.05$ and ** $p < 0.01$ with Mann-Whitney U.

Some studies have suggested that health sciences students tend to be more involved in academic activities related to critical analysis and research, which could be associated with high levels of academic engagement and thought-oriented learning styles (Bovijn et al., 2017).

In this sense, studies carried out on health sciences students have indicated that the strengthening of scientific competence requires not only the teaching of methodological content, but also the integration of technological tools, innovative didactic strategies and the participation of interdisciplinary research groups that favor situated learning and the

development of scientific thinking. These recommendations have also been pointed out in previous research carried out in the same student population, where the need to strengthen research training through the incorporation of new pedagogical strategies within the university curriculum is raised (Ruiz Bernés et al., 2019).

Overall, the results of this study suggest that, although nursing education favors the development of interpersonal and ethical competencies, there are still areas of opportunity in the strengthening of scientific and critical thinking competencies. In this sense, several authors have pointed out the need to integrate pedagogical strategies that promote the active participation of students in research processes, such as problem-based learning, training projects and early research experiences within the university curriculum (Bovijn et al., 2017; González Ttito et al., 2025; Wu, 2025).

4 CONCLUSIONS

The study made it possible to compare the perception of the development of scientific and transversal competencies in nursing students between the 2019 and 2025 cohorts, identifying differences associated with the educational contexts in which their training was developed. In general, transversal competencies were located at intermediate levels of development, with the category "has the notion" predominating. Skills related to teamwork and ethical and social commitment were perceived as the most strengthened, which is consistent with the nursing's training approach.

In contrast, scientific competencies presented more limited levels of perception of mastery, particularly in methodological skills related to the research process, such as knowledge of sampling techniques and the evaluation of statistical methods. The differences observed between cohorts suggest that the educational context can influence the perception of the development of these competencies, which highlights the need to strengthen research training and promote pedagogical strategies aimed at the development of critical thinking and scientific literacy.

5 FINAL CONSIDERATIONS

The study has some limitations. The use of non-probability sampling for convenience and the application of self-reporting instruments may limit the generalizability of results and be subject to perception biases. Likewise, the cross-sectional comparative design between cohorts allows us to identify differences between periods, but not to establish causal relationships. In addition, since it is carried out in a single institution, the findings must be interpreted within that educational context.

The results show the need to strengthen training in scientific and transversal competencies in nursing programs through pedagogical strategies that promote critical thinking and scientific literacy. Future research could use longitudinal designs or multicenter studies that allow for a more in-depth analysis of the educational factors associated with the development of these competencies.

ABSTRACT

This article examines the roles and responsibilities of Boards of Directors in relation to project portfolio governance. We discuss how the characteristics of the Board, including its composition, independence, diversity, and expertise, affect a range of project portfolio governance objectives, including organizational performance, sustainability, and risk. We present a wide range of literature on the nature of Boards and the challenges of effective project portfolio governance. We use thematic analysis to organize and highlight the main themes from the literature. We demonstrate how the Board acts as a 'bridge' between corporate governance and project portfolio management. The paper's findings highlight the Board's role in implementing and executing the corporate strategy, managing risk and innovation, and ensuring accountability. Finally, we discuss the theoretical, practical, and policy implications of the findings from an integrated perspective of governance and effective strategic execution.

Keywords: Corporate Governance. Board of Directors. Project Portfolio Governance. Thematic Analysis. Strategic Execution.

RESUMO

Este artigo examina os papéis e responsabilidades dos Conselhos de Administração em relação à governança de portfólio de projetos. Discutimos como as características do Conselho, incluindo sua composição, independência, diversidade e expertise, afetam uma série de objetivos da governança de portfólio de projetos, incluindo desempenho organizacional, sustentabilidade e risco. Apresentamos uma ampla gama de literatura sobre a natureza dos Conselhos e os desafios da governança eficaz de portfólio de projetos. Utilizamos a análise temática para organizar e destacar os principais temas da literatura.

Demonstramos como o Conselho atua como uma “ponte” entre a governança corporativa e a gestão de portfólio de projetos. Os achados do artigo destacam o papel do Conselho na implementação e execução da estratégia corporativa, na gestão de riscos e inovação, e na garantia da accountability. Por fim, discutimos as implicações teóricas, práticas e de políticas dos resultados a partir de uma perspectiva integrada de governança e execução estratégica eficaz.

RESUMEN

Este artículo examina los roles y responsabilidades de los Consejos de Administración en relación con la gobernanza del portafolio de proyectos. Discutimos cómo las características del Consejo, incluyendo su composición, independencia, diversidad y experiencia, afectan una serie de objetivos de la gobernanza del portafolio de proyectos, tales como el desempeño organizacional, la sostenibilidad y el riesgo. Presentamos una amplia gama de literatura sobre la naturaleza de los Consejos y los desafíos de una gobernanza eficaz del portafolio de proyectos. Utilizamos el análisis temático para organizar y resaltar los principales temas de la literatura. Demostramos cómo el Consejo actúa como un “puente” entre la gobernanza corporativa y la gestión del portafolio de proyectos. Los hallazgos del artículo destacan el papel del Consejo en la implementación y ejecución de la estrategia corporativa, la gestión del riesgo y la innovación, y la garantía de la rendición de cuentas. Finalmente, discutimos las implicaciones teóricas, prácticas y de políticas de los resultados desde una perspectiva integrada de gobernanza y ejecución estratégica eficaz.

Palabras clave: Gobernanza Corporativa. Consejo de Administración. Gobernanza del Portafolio de Proyectos. Análisis Temático. Ejecución Estratégica.

1 INTRODUCTION

Corporate governance is an important area of study in management research because it affects a corporation's legitimacy, accountability, and strategic management. Corporate governance includes systems, policies, laws, institutions, and processes employed by companies to govern and regulate management. Practically speaking, it is found embodied in the board of directors, which serves a monitoring function and/or as a strategic management team (Useem, 2010; Yermack, 1996). Yet much of the research has focused on large, publicly traded corporations listed on major exchanges. The number of smaller, privately held or owner-managed firms, which are critical to local economies, receives scant attention.

This special issue is dedicated to filling this void by examining governance practices, boards of directors, and owner-manager relations in the privately owned/managed transnational firm. We are looking for original research – qualitative and/or quantitative, or any method in between – conducted in any region of the world. We are particularly interested in research that integrates frameworks such as corporate governance with other theories, including institutional theory (Gompers et al., 2003) and stakeholder theory (Zahra & Pearce, 1989), and we encourage the use of comparative designs and/or large datasets.

The way scholars study the roles and responsibilities of boards of directors has evolved substantially in the last two decades. Initially, the board's monitoring of the firm's financial performance was the sole area of focus. However, in recent years, a growing body of research has examined the roles of boards with respect to board diversity, environmental and social sustainability, organizational innovation, and risk-taking (Bear et al. 2010; Bernile et al. 2018; García-Sánchez et al. 2021). This additional focus is a response to social and institutional pressures, stakeholders' expectations, legislation, and the dissemination of the ESG (environmental, social, governance) agenda by global investors (Konadu et al. 2022; Ortiz-de-Mandojana & Bansal 2016). While strategic implementation and portfolio governance present distinct challenges for the Board, project portfolios are a special case that needs particular attention. In this case, the Board must ensure that the overall project portfolios are strategically aligned, take optimal risks, and create long-term value. To discharge this responsibility, the Board needs to understand how the governance system, including the leadership system and decision-making processes, works. Additionally, the Board must have insight into how key stakeholders can impact strategic implementation and influence specific project portfolios.

There has been a rapid increase in research focusing on board diversity in recent years. Studies have found that boards with women (gender diversity) and boards comprising

directors from diverse demographic backgrounds (demographic diversity) can create beneficial outcomes at the firm level, such as better decision-making, increased innovation, and enhanced corporate social responsibility (Byron & Post, 2016; Joecks et al., 2013; Post & Byron, 2015). However, other studies have identified the phenomenon of tokenism and, as a result, have highlighted the need for a 'sufficient' or 'critical mass' of gender and demographic diversity on boards to achieve tangible benefits. While independent boards can help mitigate agency problems and improve disclosure quality, there are also strong arguments for increased organizational transparency independent of board composition. While recent studies have found that independent directors serve to protect a variety of stakeholders' interests (Chau & Gray 2010; Donnelly & Mulcahy 2013; Rupley et al. 2012), effective independent directors are shaped by a number of internal and external factors, including dominant owners, institutional investors, and the business environment (Sánchez & Martínez-Ferrero 2019).

Sustainability and environmental governance are relevant issues for boards of directors. As environmental, social, and governance (ESG) considerations are increasingly incorporated into the strategic decisions of the general meeting, Boards of Directors are challenged to assume this new role and balance short-term performance with long-term value creation while accounting for ESG factors. Sustainability is nowadays a fundamental aspect of corporate social responsibility (Ben-Amar et al., 2017; Fernández-Gago et al., 2018; García-Sánchez et al., 2023; Crecente et al., 2021; Ghisetti et al., 2021). Using thematic analysis as our methodological approach to synthesize findings from qualitative and quantitative studies, we explore what the existing literature tells us about boards' work in this section. The method's thematic approach allows for a comprehensive analysis of literature across studies and types. The topics in the corporate governance literature are diverse in terms of methodologies and findings. The article has three aims. The first aim is to review and synthesize past research on corporate governance and the boards of directors' roles in project portfolio governance. The second aim is to identify major recurring themes found in current corporate governance research, including diversity and sustainability, power distribution among top management team members, and methodological advancements. The third aim is to draw implications for theory, practice, and policy, and to discuss how boards can perform the strategic governance role and put the strategy into practice by managing project portfolios to achieve profitability, sustainability, and resilience while increasing organizational legitimacy.

2 BACKGROUND

2.1 THEORETICAL FOUNDATIONS OF CORPORATE GOVERNANCE

Corporate governance is a system of rules, practices, and processes by which a company is controlled and run. Corporate governance assurance implies accountability, transparency, and responsibility to stakeholders; it thus becomes crucial for enabling effective supervision and strategy formulation by the Board of Directors (Gompers et al., 2003; Zahra & Pearce, 1989). Specifically, in what manner does the Board pursue these ends? Governance theories have undergone a gradual evolution over the years. Agency theory views the role of boards particularly with reference to monitoring the relationship and conflicts of interest between managers and shareholders (Jaggi, Paul, & Sugaman, 2009). The alternative perspective of stewardship theory views managers more as responsible stewards of organizational resources and focuses on trust and cooperation (Singh, 2007). Resource dependence theory views boards in terms of their role in obtaining critical resources and legitimacy (Ricart, Tena, & Enrique, 2005). Institutional theory takes a societal perspective and is concerned with governance from a legal perspective, ensuring that governance practices align with prevailing social and institutional norms and expectations (Ortiz-de-Mandojana & Bansal, 2016). The upper echelons perspective explores how the upper levels of organizations, such as CEOs and top executives or their Boards of Directors, influence performance. It focuses on the cognitive frames and values this decision makers bring to the organization (Carpenter et al., 2004; Hambrick, 2007). Regarding project portfolio governance, studies have examined the impact of board composition, diversity, and expertise on strategic decisions (e.g., Ferzoco et al., 2010). Recent research explores cognitive distortions in managers' decision-making processes. It takes an integrative view that encompasses both rational and behavioral perspectives (Abatecola et al., 2018).

2.2 BOARD COMPOSITION AND DIVERSITY

The composition of the Boards matters. Research demonstrates that gender, ethnic, and industry experience diversity are all associated with better firm performance, more creativity, and a greater emphasis on corporate social responsibility (Byron & Post, 2016; Joecks et al., 2013; Post & Byron, 2015). While the link to sustainability is less consistent (Bear et al., 2010), there is evidence that more diverse Boards are more engaged in sustainability efforts (Konadu et al., 2022) and adhere to best practices of corporate governance. Even as steps are being taken towards greater diversity on boards, new challenges are emerging. One of these challenges concerns the risk of tokenism inherent in many current diversity initiatives. While symbolic diversity may initially become prevalent, it

is eventually necessary to build a critical mass of diverse directors (Torchia et al., 2011). Further, the meaningfulness of diversity is contingent upon a variety of contextual factors and institutions (Rashid, 2018). Finally, in some contexts, ownership concentration may also stifle diversity (Sánchez & Martínez-Ferrero, 2019).

2.3 BOARD INDEPENDENCE AND ACCOUNTABILITY

To protect various stakeholders and promote greater transparency within businesses, an independent director is generally viewed as a positive force in corporate governance. Such directors are better able to police top management, reduce the likelihood of employee earnings management, and create higher-quality disclosure (Chau & Gray, 2010; Donnelly & Mulcahy, 2013; Rupley et al., 2012). The influence of independence on audit shakeout outcomes, however, is constrained. The influence of independence on audit shakeout outcomes is contingent upon firm- and market-specific factors, including ownership structure, institutional environment, and cultural contexts (Nguyen & Nielsen, 2010; Ntim, 2015). In emerging, transitional, and developing economies, independent audit committees face formidable challenges posed by dominant shareholders' ownership, entrenched business groups, institutional weakness, and a lack of transparency (Orazalin & Mahmood, 2018).

2.4 SUSTAINABILITY AND ENVIRONMENTAL GOVERNANCE

Sustainability has become one of the board of directors' many responsibilities. Ben-Amar et al. (2017), Fernández-Gago et al. (2018), and García-Sánchez et al. (2023) find that boards of directors must incorporate environmental, social, and governance (ESG) considerations in their strategic decisions. Sustainability is today an integral part of business, and a company's long-term sustainability depends on effective management of environmental, social, and corporate governance issues. Climate change has become a strategic risk that businesses must manage (Crecente et al., 2021; Ghisetti et al., 2021). Boards of listed companies, more diverse and independent boards, are more likely to adopt sustainability practices and disclose environmental performance (Lanis et al., 2017; Pucheta-Martínez & Gallego-Álvarez, 2019). Sustainability governance is linked to long-run firm resilience (Ortiz-de-Mandojana & Bansal, 2016) and sustained competitive advantage (Stubbs, 2019).

2.5 RISK MANAGEMENT AND STRATEGIC EXECUTION

Risk management is a key aspect of governance. When executing a project portfolio, boards need to manage risk effectively to maximize returns and ensure the portfolio is aligned with the overall organization's strategy and sustainable in the long term. Under pressure from Enterprise Risk Management (ERM) frameworks, suppliers are required to incorporate risk factors into their strategic development processes. Ultimately, boards of directors are then responsible for those strategic decisions and must strike the right balance between opportunities for sustainable and innovative growth and pure financial return (Bromiley et al., 2015; Kuckertz et al., 2020; Kurzhals et al., 2020).

3 METHODOLOGY

3.1 RATIONALE FOR THEMATIC ANALYSIS

We employed Thematic Analysis as the method for synthesizing the results of the studies because it is a flexible method that enables synthesis across different methodologies and studies that have been undertaken using a variety of approaches from within different research traditions in the established literature on corporate governance, and the more recent literature on project portfolio governance. Although the literature varies in the theoretical perspectives that underpin it, Thematic Analysis is a methodologically robust yet interpretive research method well-suited to identifying and analyzing themes and patterns within the literature. Our study differs from a meta-analysis, which seeks to draw statistical conclusions by aggregating the results of multiple studies. Our intention was to draw theoretical conclusions and then illustrate their relevance to real-world governance problems.

3.2 DATA SOURCES AND BIBLIOMETRIC MAPPING

The analyzed corpus consists of references listed in Murillo's work, including fundamental and recent contributions on the topic. The references were analyzed using the software VOSviewer, generating bibliometric maps in the form of co-authorship networks and of keyword co-occurrence maps, as well as detailed citation profiles, which were thematically analyzed. N=119 references were investigated from Web of Science, Scopus, Google Scholar, PubMed, OpenAlex, and Semantic Scholar databases by keywords "Corporate Governance" and "Board of Directors."

3.3 CODING PROCEDURES AND ANALYTICAL FRAMEWORK

The data were coded using a well-established qualitative method. See Strauss and Corbin (1990) for coding in general, and Miles et al. (2014) for the use of systematic data displays to ensure coding quality. The researcher also adopted a reflexive stance whilst coding. Saunders, Lewis, and Thornhill (2009). This paper combines a bibliometric mapping methodology with thematic analysis to map the field of governance's scope and analyze its substance.

3.4 LIMITATIONS

The analysis contains several limitations, including the use of secondary data, some degree of interpretative subjectivity, and bibliometric limitations, such as those related to indexing biases inherent to the data source used to produce VOSviewer 1.6.20 (Eck and Waltman, 2010). However, these limitations have been addressed by using well-established methods to analyze secondary data and by complementing bibliometric methods with thematic analysis to maximize the rigor of the findings.

4 FINDINGS AND ANALYSIS

Using thematic analysis, the paper identifies five themes that explain how boards of directors affect both corporate governance and organizational legitimacy and how these, in turn, affect strategic implementation. These themes are conceptualized around the dimensions of board independence, diversity, sustainability, risk, and resilience, and the relevant theoretical perspectives. The same themes are graphically illustrated alongside the theoretical foundations in Figure 1. The same figure shows the relationships between board independence and diversity, and corporate governance and firm performance. The network representation emphasizes a complex web of theoretical foundations revolving around the construct of corporate governance, with a strong linkage among the variables of board independence, diversity, and performance. This interactive graph illustrates findings from the thematic analysis, showing how effective governance is created by a combination of structural, behavioral, and contextual factors. The obtained results have been analyzed using VosViewer (Eck and Waltman, 2010). Figure 1 shows the network map.

Figure 1*Network map*

Source: VOSviewer (version 1.6.20). Adapted from van Eck and Waltman (2010)

4.1 BOARD INDEPENDENCE

Independent boards, as advocated by the Cox Commission (Anderson & Reeb, 2004), are effective in controlling managers' propensity to exploit shareholders and in enhancing transparency and accountability. Furthermore, independent boards are found to be beneficial for firms in different markets (Boone et al., 2007; Brickley et al., 1994; Coles et al., 2008; Dalton et al., 1999; Daily et al., 2003; Fama & Jensen, 1983; Gillan, 2006; Hermalin & Weisbach, 2003; Hillman & Dalziel, 2003; Nguyen & Nielsen, 2010; Rashid, 2018; Renneboog & Szilagyi, 2011; Weisbach, 1988; Westphal, 1999; Yermack, 1996; Zahra & Pearce, 1989). On the other hand, the literature (Anderson & Reeb, 2004; Bhagat & Black, 2002; Boone et al., 2007; Brickley et al., 1994; Coles et al., 2008; Daily et al., 2003; Fama & Jensen, 1983; Jensen, 1993; Jensen & Meckling, 1976) suggests that smaller boards are more effective in making timely and expeditious decisions, which are important in today's competitive global market. In emerging markets, however, independent boards are mostly symbolic (Anderson & Reeb, 2004), a scenario that prevails due to entrenched owners and other weak, faulty institutional factors (Sharma & Hoisington, 2012).

4.2 DIVERSITY

Research frequently advances diversity, particularly gender and entrepreneurial diversity, as a catalyst for corporate social responsibility, reputation, and innovation (Adams & Ferreira, 2009; Bear et al., 2010; Byron & Post, 2015; Campbell & Mínguez-Vera, 2008; Carter et al., 2003; Dezsö & Ross, 2012; Francoeur et al., 2008; Glass & Cook, 2016; Gul et al., 2011; Hillman et al., 2007; Joecks et al., 2013; Konrad et al., 2008; Nielsen & Huse, 2010; Post & Byron, 2016; Sealy & Singh, 2010; Singh et al., 2008; Tramied & Lee, 2014; Webb et al., 2010; Terjesen et al., 2009; Torchia et al., 2011; Westphal & Milton, 2000; Zhang, 2020). However, the literature suggests that to move beyond tokenistic representation, it is important to assess the point at which diversity on boards reaches a sufficient level, or critical mass, that it begins to significantly influence board dynamics and decision-making. At this stage,

diversity becomes not just a moral obligation but a strategic advantage, fundamentally affecting how boards function and make decisions.

4.3 SUSTAINABILITY

Sustainability and ESG integration have become important for boards to adapt to be sustainable. The concept of governance has evolved from legitimacy to corporate performance through sustainable competitive advantage, with ESG disclosure and green innovation being a case in point. Hence, the two perspectives on governance of sustainability/ESG are not mutually exclusive, and boards play a critical role in institutionalizing sustainability and ESG. There is a variety of approaches to sustainability, but there is consensus that sustainability information is relevant to investors making informed investment decisions that lead to better portfolio performance. Some evidence also exists that sustainability issues are relevant to mainstream accounting research themes. Sustainability information is seen by many as supplemental to financial reporting, not a substitute for it. The two can co-exist, as performance and sustainability are not mutually exclusive. 2014; García-Sánchez, 2021; García-Sánchez, 2023; Ghisetti, 2021; Gray, 2010; Hahn & Figge, 2011; Ioannou & Serafeim, 2012; Khan et al., 2016; Kolk, 2008; Lozano, 2015; Michelon & Parbonetti, 2012; Montiel & Delgado-Ceballos, 2014; Ortiz-de-Mandojana & Bansal, 2016; Schaltegger et al., 2012). Boards should take a strategic view and factor sustainability into their decision-making processes to improve organizational resilience and long-term value.

4.4 RISK AND RESILIENCE

The relevance of Risk Management and Resilience. As previous research has shown, effective governance, as observed in listed companies, mitigates potential risks and fosters resilience. Boards of directors not only handle crises but are also responsible for the company's long-term risk management strategy. References: Aebi, et al. (2012), Arena, et al. (2010), Beasley, et al. (2005), Bromiley, et al. (2015), Florio & Leoni (2017), Fraser & Simkins (2010), Gatzert & Martin (2015), Hoyt & Liebenberg (2011), Kahupi, et al. (2021), Kaplan & Mikes (2012), Kurzhals, et al. (2020), Lam (2003), Lundqvist (2015), McShane, et al. 2011; Mikes 2011; Paape & Speklé 2012; Power 2009; Spira & Page 2003; Woods 2009). Boards are now required to embed enterprise risk management into their strategies and their implementation. This involves balancing the short-term imperative to maximize shareholder value with the longer-term goals of sustainability and innovation.

4.5 THEORIES

The final theme discusses the theoretical lenses employed in the governance papers, including Agency theory (Jensen & Meckling, 1976; Shleifer & Vishny, 1997; Zahra & Pearce, 1989), which looks at the role of monitoring (i.e., audit committees) and accountability, as well as Stewardship theory (Davis et al., 1997; Donaldson & Davis, 1991), which investigates trust and cooperation between boards of directors and other stakeholders. Resource dependence theory (Pfeffer & Salancik, 1978; Hillman & Dalziel, 2003) holds that boards of directors seek critical resources and legitimacy. Upper echelons theory (Hambrick & Mason, 1984; Carpenter et al., 2004; Hambrick, 2007). In addition to the well-established classical approaches to corporate governance, more recent research traditions can also be connected to the field. Linking classical and more recent approaches to corporate governance allows for an exploration of the influence of director values and their cognitive frames on firm performance (Aguilera & Jackson, 2003; Boyd, 1990; Daily et al., 2003; Eisenhardt, 1989; Finkelstein & Hambrick, 1996; Huse, 2007; Tosi et al., 2003; Useem, 1984; Westphal & Zajac, 1995).

We provide a brief introduction to the themes before elaborating on each in turn. Firstly, Table 1 summarizes the thematic analysis and provides a brief overview of the key findings from the extensive literature on the themes of board independence, diversity, sustainability, risk, and resilience, and how a variety of theoretical perspectives have been used to explore how these themes interact to shape the roles of contemporary Boards. Individual themes are then addressed in turn.

Table 1
Summary of Thematic Findings: Focus, Representative References, and Key Insights

Theme	Focus	Representative References	Key Insights
Board Independence	Board size, independence, accountability	Yermack (1996); Zahra & Pearce (1989); Nguyen & Nielsen (2010); Rashid (2018); Dalton et al. (1999); Fama & Jensen (1983); Daily et al. (2003); Hermalin & Weisbach (2003); Bhagat & Black (2002); Klein (2002); Brickley et al. (1994); Weisbach (1988); Hillman & Dalziel (2003); Westphal (1999); Anderson & Reeb (2004); Coles et al. (2008); Boone et al. (2007); Adams & Mehran (2003); Gillan (2006); Renneboog & Szilagyi (2011)	Independent boards reduce manipulation and improve transparency. Smaller boards are more effective, but independence in emerging markets is often symbolic.
Diversity	Gender and professional diversity	Bear et al. (2010); Byron & Post (2015); Joecks et al. (2013); Torchia et al. (2011); Carter et al. (2003); Adams & Ferreira (2009); Terjesen et al. (2009); Post & Byron (2016); Nielsen & Huse (2010); Singh et al. (2008); Hillman et al. (2007); Gul et al. (2011); Campbell & Mínguez-Vera (2008); Francoeur et al. (2008); Dezső & Ross (2012); Glass & Cook (2016); Sealy & Singh (2010); Konrad et al. (2008); Westphal & Milton (2000); Zhang (2020)	Diversity boosts CSR, reputation, and innovation. Tokenism persists, but once critical mass is reached, board dynamics and decision-making improve significantly.
Sustainability	ESG and governance integration	Ben-Amar et al. (2017); García-Sánchez (2021, 2023); Ghisetti (2021); Ortiz-de-Mandojana & Bansal (2016); Khan et al. (2016); Eccles et al. (2014); Ioannou & Serafeim (2012); Michelon & Parbonetti (2012); Clarkson et al. (2008); Dhaliwal et al. (2011); Cormier & Magnan (2007); Kolk (2008); Hahn & Figge (2011); Schaltegger et al. (2012); Lozano (2015); Bebbington & Larrinaga (2014); Gray (2010); Adams (2017); Dyllick & Muff (2016); Montiel & Delgado-Ceballos (2014)	Boards drive ESG disclosure and green innovation. Governance is reframed as legitimacy and competitive advantage, with sustainability becoming a strategic priority.
Risk & Resilience	Enterprise risk management, crisis response	Bromiley et al. (2015); Kahupi et al. (2021); Kuckertz et al. (2020); Kurzhals et al. (2020); Power (2009); Mikes (2011); Arena et al. (2010); Beasley et al. (2005); Lam (2003); Kaplan & Mikes (2012); Fraser & Simkins (2010); Paape & Speklé (2012); Lundqvist (2015); Woods (2009); Spira & Page (2003); Aebi et al. (2012); Florio & Leoni (2017); Gatzert & Martin (2015); McShane et al. (2011); Hoyt & Liebenberg (2011)	Strong governance structures reduce vulnerabilities and improve resilience. Boards are central in crisis response and long-term risk management strategies.
Theories	Agency, Stewardship, Resource Dependence, Upper Echelons	Jensen & Meckling (1976); Davis et al. (1997); Pfeffer & Salancik (1978); Hambrick & Mason (1984); Donaldson & Davis (1991); Hillman & Dalziel (2003); Eisenhardt (1989); Hambrick (2007); Zahra & Pearce (1989); Shleifer & Vishny (1997); Finkelstein & Hambrick (1996); Boyd (1990); Huse (2007); Daily et al. (2003); Carpenter et al. (2004); Westphal & Zajac (1995); Dalton et al. (2007); Aguilera & Jackson (2003); Tosi et al. (2003); Useem (1984)	Theories explain board behavior and decision-making. Cognitive frames and director values shape outcomes. Integrating classical and contemporary perspectives enriches governance research.

5 DISCUSSION AND IMPLICATIONS

While the descriptive portrait of the boards offers insights into best practices, an analysis of multiple, intersecting dimensions of board governance—(in)dependence, diversity, sustainability, and risk management—and how they impact performance and legitimacy, will follow. These dimensions can be illuminated by theoretical frameworks and research regarding governance, accountability, and corporate governance of non-profit organizations. In discussing board characteristics, board independence is highlighted. As agency theory posits (Fama & Jensen, 1983; Zahra & Pearce, 1989), independent boards are perceived as effective at monitoring managers to limit opportunistic behavior. However, evidence suggests that independent boards are not always effective in emerging markets. For example, independent boards in family-dominated firms in emerging markets may be more of a ‘smoke screen,’ and owners continue to control the firm. Independent boards must be viewed within the context of the institutions and culture in which they operate. Findings on diversity are supported by insights from the resource dependence and upper echelons perspectives on boards. The findings suggest that boards with gender and professional diversity are positively associated with corporate social responsibility, social reputation, and innovation (Bear et al., 2010; Byron & Post, 2015; Joecks et al., 2013; Torchia et al., 2011). Recent studies have found that it is not just the presence of diverse members on boards that affects performance, but that a ‘critical mass’ of diverse board members can fundamentally change board dynamics and significantly improve decision-making (Joecks et al., 2013; Torchia et al., 2011). Diversity on boards is therefore a moral ‘must have’ but also a strategic ‘wedge’ that organizations can use to gain access to different networks, resources, and knowledge, thereby enhancing organizational adaptability. Sustainability findings show that ESG integration in governance has become a highly relevant, rapidly evolving issue. Sustainability is seen by boards as a source of legitimacy and as a competitive advantage. Disclosure and green innovation are core aspects of sustainability (Ben-Amar et al., 2017; García-Sánchez, 2021; Ortiz-de-Mandojana & Bansal, 2016). From an institutional theory perspective, corporate governance systems need to adapt to environmental and social expectations and address new regulations and challenges (Aguilera et al., 2021). Sustainability has moved from being a marginal issue to an important aspect of strategy and its implementation, placing the board at the forefront of embedding environmental and social responsibility into the corporate strategy. Risk and resilience research increasingly highlights the role of boards in enterprise risk management and crisis management. Good corporate governance can mitigate potential risks and strengthen resilience. To make strategic decisions, boards must integrate risk management into their day-to-day operations.

This challenge can be addressed by applying stewardship theory, which seeks to create long-term value while fostering trust. Implementing resilience is more than a simple task that can be solved by reacting to changing circumstances. Building up resilience requires boards to design governance and incorporate flexibility into business processes and structures on an ongoing basis. From a theoretical perspective, these findings are consistent across a number of frameworks concerning the nature and role of the board. The agency view of the board focuses on monitoring, the stewardship view positions governance about trusting, cooperating and managing well, the resource dependence view sees the board as a source of legitimate support and external resources for top management, and the upper echelons view identifies the cognitive frames and dominant values of the directors that influence board dynamics and decision-making (Jensen & Meckling, 1976; Donaldson & Davis, 1991; Pfeffer & Salancik, 1978; Hambrick & Mason, 1984). Incorporating these perspectives, therefore, provides a more complete understanding of the governance process and the board's monitoring role. The findings have significant implications for both practitioners and policymakers. For the practitioners, this means that boards must comprise the right mix of independent and non-independent directors to be effective, ensuring that independent directors are genuinely independent; pursuing diversity for moral and strategic reasons; and ensuring sustainability is a core strategic issue. In addition, risk management must shift from a defensive to a proactive role to build organizational resilience and value. From a policymakers' perspective, the findings suggest that the institutional environment in which boards operate needs to be strengthened so that independence and diversity translate into practice. For the scholar, moving beyond a single framework to a more holistic perspective of governance and its expression through organizational behaviors is critical to gaining a deeper, more nuanced understanding of the diversity of board dynamics and behaviors. Governance means bringing all these qualities to bear on a company's governance and viewing the matter from several angles. Viewing boards' role from this perspective reveals that their influence extends beyond simple oversight: they are strategic players whose actions have important consequences for a company's long-term legitimacy, resilience, and performance.

6 SIGNIFICANCE OF THE STUDY

This study on governance of organizations advances theory and practice by shedding new light on the dynamics of boards of directors. Effective governance is a multifaceted phenomenon that results from the dynamics of structural, behavioral, and contextual factors concerning governance practices such as board independence, diversity, sustainability, and

risk management. The study advances governance research by integrating relevant theoretical lenses, including agency theory, stewardship theory, the resource dependence perspective, and upper echelons theory, and analyzing how director values and their cognitive frames affect the performance of organizations. The paper contributes to the existing body of knowledge by attempting to synthesize the widely scattered knowledge base of boards' characteristics, themes, and relationships in a meaningful thematic analysis of patterns and relationships. The paper can also serve as a precursor to empirical studies conducted in emerging markets, where boards are currently largely independent but need greater diversity, sustainable strategies, and stronger risk management. The paper can also help clarify what constitutes "effective boards" not only in emerging markets but worldwide. Most importantly, the paper offers policymakers vital insights into how to create an institutional environment that enables the translation of corporate governance reforms into practice and outcomes.

7 CONCLUSION

This study explores the interconnections between board independence, diversity, sustainability, and risk management characteristics and how these dimensions interact to deliver effective governance. Our evidence suggests that effective governance arises from an integrated system in which structures, values, and context interact to shape organizational practices. Independent boards are found to enhance transparency and accountability; however, this is contingent on ownership structure and governance environment. Diversity is seen as a key strategic asset for boards and contributes to innovation, legitimacy, and corporate social responsibility, particularly when a tipping point in diversity is reached. Sustainability is revealed to be a key strategic priority for boards, critical to driving ESG disclosure and green innovation to build long-term resilience and gain a competitive advantage. As with any sector, Risk management highlights the Board's proactive role in ensuring the organization's strategies manage risks and that its strategic plans incorporate the enterprise risk framework. The Board needs to assess the organization's flexibility and responsiveness to address uncertainty. Grounded in agency theory, stewardship theory, resource dependence theory, and upper echelons theory, this study examines the relationships between governance characteristics and organizational performance. This study makes a methodological contribution to the governance research stream by employing both bibliometric mapping and thematic synthesis to provide a structured framework for synthesizing the current literature to identify emerging trends and new areas of inquiry. The boards of directors are not only guardians of oversight, but also strategic managers in governance and execution. Practicing independence, diversity, and sustainability, and

managing risks are key to organizational legitimacy, resilience, and performance. Future research could focus on emerging markets, where the substantive impact of governance reforms is constrained by weaker institutional environments. In addition, research could examine how digitalization and global sustainability themes are shifting the focus of boards of directors. This study offers theoretical and practical insights into the boards of directors' essential role in shaping the enterprise's future as a sustainable, resilient business.

8 FUTURE RESEARCH

The findings of this study offer potential avenues for future research on board governance, its determinants, and outcomes. Firstly, future studies can be conducted in emerging markets where independent boards remain myths due to dominant shareholders and a poor institutional environment (Nguyen & Nielsen, 2010; Rashid, 2018). Comparative studies that analyze countries with different institutional and governance systems help us understand how independent boards translate into meaningful accountability across strong and weak institutions. Although significant progress has been made in empirical research on boards, there is a growing call for more theoretical contributions to the field, underscoring the need to apply multiple theoretical frameworks to better understand board dynamics. In particular, incorporating agency theory, stewardship theory, resource dependence theory, and upper echelons theory can facilitate a deeper, more comprehensive understanding of boards' behavior. Also, applying behavioral governance and institutional logics to explain directors' decisions would be worthwhile. Using thematic analysis in conjunction with bibliometric mapping is a powerful methodology that could be further extended through more advanced visualization techniques and mixed-methods research. Future research could address the governance of sustainability in new territories, such as the biotic Commons; incorporate new dimensions of diversity; adopt a broader perspective on sustainability; and benefit from a more integrated application of social science theories.

ABSTRACT

Snakebite accidents represent a significant public health issue, particularly in the Amazon region, where environmental and occupational factors, along with high biodiversity, increase human exposure to venomous snakes. In this context, the genus *Bothrops* stands out as the main cause of envenomation, often associated with severe local complications such as tissue necrosis. This study aimed to analyze snakebite accidents in the Amazon and their local complications, with emphasis on tissue necrosis associated with predominant species in the state of Amazonas. This is a qualitative, exploratory, and descriptive study conducted through a literature review of scientific articles published between 2021 and 2026, selected from relevant health science databases. The findings indicate that *Bothrops atrox* is the primary species involved in snakebite cases in the region, responsible for intense local clinical manifestations such as edema, pain, hemorrhage, and tissue necrosis. Furthermore, the severity of complications is directly related to the time to medical care and the amount of venom injected, potentially leading to permanent sequelae and significant impacts on patients' quality of life. It is concluded that snakebite accidents in the Amazon constitute a complex phenomenon with important clinical and social implications, highlighting the need for effective strategies for prevention, early diagnosis, and appropriate treatment.

RESUMO

Os acidentes ofídicos representam um importante problema de saúde pública, especialmente na região amazônica, onde fatores ambientais, ocupacionais e a elevada biodiversidade favorecem o contato entre humanos e serpentes peçonhentas. Nesse contexto, destaca-se o gênero *Bothrops*, responsável pela maioria dos envenenamentos na região, frequentemente associado a complicações locais graves, como a necrose tecidual. O presente estudo teve como objetivo analisar os acidentes ofídicos na Amazônia e suas complicações locais, com ênfase na necrose tecidual associada às espécies predominantes no estado do Amazonas. Trata-se de uma pesquisa de natureza qualitativa, com caráter exploratório e descritivo, desenvolvida por meio de revisão bibliográfica de artigos científicos publicados entre 2021 e 2026, selecionados em bases de dados relevantes da área da saúde. Os resultados evidenciam que *Bothrops atrox* é a principal espécie envolvida nos acidentes na região, sendo responsável por manifestações clínicas locais intensas, como edema, dor, hemorragia e necrose tecidual. Observou-se ainda que a gravidade das complicações está diretamente relacionada ao tempo de atendimento e à quantidade de veneno inoculado, podendo resultar em sequelas permanentes e impacto significativo na qualidade de vida dos indivíduos afetados. Conclui-se que os acidentes ofídicos na Amazônia constituem um fenômeno complexo, com importantes implicações clínicas e sociais, reforçando a necessidade de estratégias eficazes de prevenção, diagnóstico precoce e tratamento adequado.

RESUMEN

Los accidentes ofídicos representan un importante problema de salud pública, especialmente en la región amazónica, donde factores ambientales, ocupacionales y la alta biodiversidad favorecen el contacto entre humanos y serpientes venenosas. En este contexto, el género *Bothrops* se destaca como el principal responsable de los envenenamientos, frecuentemente asociado a complicaciones locales graves, como la necrosis tisular. El presente estudio tuvo como objetivo analizar los accidentes ofídicos en la Amazonía y sus complicaciones locales, con énfasis en la necrosis tisular asociada a las especies predominantes en el estado de Amazonas. Se trata de una investigación de naturaleza cualitativa, con carácter exploratorio y descriptivo, desarrollada mediante revisión bibliográfica de artículos científicos publicados entre 2021 y 2026, seleccionados en bases de datos relevantes del área de la salud. Los resultados evidencian que *Bothrops atrox* es la principal especie involucrada en los accidentes en la región, siendo responsable de manifestaciones clínicas locales intensas como edema, dolor, hemorragia y necrosis tisular. Asimismo, se observó que la gravedad de las complicaciones está directamente relacionada con el tiempo de atención médica y la cantidad de veneno inoculado, pudiendo resultar en secuelas permanentes y un impacto significativo en la calidad de vida de los individuos afectados. Se concluye que los accidentes ofídicos en la Amazonía constituyen un fenómeno complejo, con importantes implicaciones clínicas y sociales, lo que refuerza la necesidad de estrategias eficaces de prevención, diagnóstico precoz y tratamiento adecuado.

Palabras clave: Accidentes Ofídicos. Amazonía. *Bothrops Atrox*. Envenenamiento. Necrosis Tisular.

1 INTRODUCTION

Snakebites are a relevant public health problem in several tropical regions of the world, especially in countries with great biodiversity and extensive natural areas, such as Brazil. In the Amazon region, this scenario becomes even more expressive due to the intense interaction between human populations and the forest environment, which favors contact with venomous snakes. According to Scheliga (2024), the epidemiology of snakebite accidents in Brazil is more concentrated in the North region, highlighting the need for studies focused on the environmental and social specificities of the Amazon.

In this context, the genus *Bothrops* stands out as the main responsible for snakebite accidents in the country, and the species *Bothrops atrox* is widely associated with the cases registered in the Amazon region. This predominance is related both to the wide geographical distribution of these snakes and to their adaptive behavior in environments close to human activity. As Silva (2023) points out, bothrops accidents represent the majority of cases of snake envenomation in Brazil, especially in tropical forest areas, where there is greater occupational and environmental exposure.

From a clinical point of view, accidents caused by snakes of the genus *Bothrops* have local and systemic manifestations that can evolve into severe conditions when not treated properly. Among the most relevant local complications, tissue necrosis stands out, characterized by the progressive destruction of tissues at the site of the bite, which may result in permanent sequelae. According to Nascimento (2024), tissue damage resulting from bothrops envenomation often requires prolonged hospital follow-up, especially in cases where there is significant muscle involvement.

In addition to the clinical aspects, snakebites also have important social and economic impacts, since they affect, for the most part, individuals of working age, especially rural workers and populations that depend directly on the natural environment for their subsistence. In this sense, Fernández (2025) highlights that the sequelae resulting from tissue necrosis can compromise the functional capacity of individuals, directly impacting their quality of life and work activities.

In view of this scenario, it is essential to understand the factors involved in the occurrence of snakebites in the Amazon, as well as the local complications associated with envenomation, with emphasis on tissue necrosis. The analysis of these elements allows not only to expand scientific knowledge on the subject, but also to contribute to the development of more effective prevention, diagnosis, and treatment strategies.

2 THEORETICAL FRAMEWORK

Snakebites represent an important public health problem in tropical regions, especially in areas of the Brazilian Amazon, where the interaction between human populations and natural environments favors the occurrence of snake envenomation. Recent studies indicate that Brazil registers thousands of cases annually, with the North region responsible for a significant portion of these records. In this context, the high biodiversity of snakes and the presence of rural, extractive and forestry activities increase the risk of exposure of the population to snakebites. As demonstrated by Scheliga (2024), the epidemiology of snake accidents in Brazil is strongly concentrated in Amazonian areas, which highlights the need for studies directed to the ecological and clinical particularities of this region.

Among the snakes responsible for accidents in the Amazon, the genus *Bothrops* stands out, whose geographic distribution and behavior contribute to the high incidence of envenomation. The species *Bothrops atrox* is considered the main responsible for snakebites in the Amazon region, and is often associated with severe clinical manifestations. According to Silva (2023), botrosopic accidents represent most of the cases recorded in the country, especially in tropical forest regions, where environmental conditions favor the abundance of these snakes. In addition, Amaral (2024) observes that the diversity of species involved in tropical snakebites reinforces the epidemiological complexity of the problem, requiring specific regional approaches to understand the dynamics of these events.

In the clinical context, accidents caused by snakes of the genus *Bothrops* are characterized by systemic and local manifestations resulting from the action of the venom. Among the most relevant local complications are edema, hemorrhage, severe pain, and tissue necrosis, conditions that can evolve into permanent sequelae when treatment is not carried out quickly and adequately. According to Nascimento (2026), envenomation by *Bothrops atrox* can trigger serious complications, such as compartment syndrome, as a result of the intense inflammatory response and vascular impairment caused by the toxins present in the venom. These local effects represent one of the main causes of morbidity associated with snakebite accidents in the Amazon.

The pathophysiology of tissue necrosis associated with botrosopic accidents is directly related to the action of proteolytic enzymes, metalloproteinases and phospholipases present in snake venom. These substances promote cell destruction, vascular changes, and inflammatory processes that lead to tissue degradation at the bite site. Nascimento (2024) highlights that local damage caused by bothrops envenomation may require prolonged hospital care, especially when there is significant muscle and skin involvement. In this sense, understanding the pathophysiological mechanisms involved in tissue necrosis becomes

essential for the development of more effective therapeutic strategies and for reducing the sequelae resulting from these accidents.

In addition to local pathophysiological changes, snakebites caused by snakes of the genus *Bothrops* can also have long-term functional consequences. Complications from tissue necrosis often result in permanent physical limitations, especially when there is a delay in medical care or when treatment is not carried out properly. In this sense, Fernández (2025) highlights that victims of botropic accidents in the Amazon can present lasting sensory and motor sequelae, compromising the quality of life and work capacity of affected individuals. These consequences show that the impact of snakebite accidents goes beyond the acute phase of envenomation, configuring itself as a public health problem that also involves social and economic aspects.

The epidemiological analysis of snakebite accidents in Brazil shows that certain population groups are more vulnerable to this type of occurrence. In general, rural workers, farmers, fishermen and populations living in areas close to forest environments are more exposed to the risk of contact with snakes. According to Silva (2023), accidents by snakes of the genus *Bothrops* predominantly affect male individuals of productive age, reflecting the association between work activities and environmental exposure. This epidemiological profile reinforces the importance of preventive strategies aimed at populations living or working in regions at higher risk.

Another relevant aspect refers to the diversity of species responsible for snakebite accidents in the Amazon, which contributes to the variability of the clinical manifestations observed in patients. Although *Bothrops atrox* is the main species involved in envenomations in the region, other representatives of the genus may also be associated with accidents with similar clinical manifestations. In this context, Oliveira Pardal (2023) reports records of envenomation by *Bothrops brazili* in the Brazilian Amazon, showing that different species can cause complex clinical conditions and require an appropriate therapeutic approach. The correct identification of the species involved in the accident is, therefore, a relevant element for the clinical and epidemiological management of cases.

In addition to the diversity of species, environmental and ecological factors also influence the occurrence of snakebites in the Amazon region. The proximity between urbanized areas and natural environments favors increased contact between humans and snakes, especially in regions where agricultural and extractive activities are predominant. Siqueira (2025) observes that the spatial distribution of snakebites in the North region is directly related to local environmental characteristics, such as vegetation cover, rainfall and the presence of rural areas. Thus, understanding the ecological dynamics of snakes becomes

essential for the planning of public policies aimed at preventing and controlling these accidents.

Another relevant aspect in the theoretical framework on snakebite accidents in the Amazon refers to the clinical complications resulting from envenomation, especially those associated with local tissue involvement. The toxins present in the venom of snakes of the genus *Bothrops* have strong proteolytic and hemotoxic activity, which contributes to the progressive destruction of tissues at the bite site. This process can result in extensive necrosis, often accompanied by severe edema and local hemorrhage. In this sense, studies indicate that the intensity of these manifestations is directly related to the amount of venom inoculated and the time elapsed until the start of treatment. Amaral (2024) points out that the complexity of the toxins present in bothrops venom contributes to the diversity of clinical manifestations observed in patients, which makes the clinical management of these accidents a constant challenge in health services.

Tissue necrosis resulting from botrosopic accidents represents one of the main causes of morbidity associated with snake envenomation in the Amazon region. This condition can progress to secondary infections, loss of muscle tissue, and, in more severe cases, the need for surgical procedures or amputations. Nascimento (2024) highlights that patients affected by *Bothrops atrox* envenomation often require prolonged hospital follow-up due to the severity of local lesions and complications resulting from the inflammatory process triggered by the venom. This scenario highlights the importance of early diagnosis and proper administration of antivenom as fundamental measures to reduce tissue damage.

In addition to the immediate clinical manifestations, snakebites can have lasting impacts on the health of affected individuals. The physical sequelae resulting from tissue necrosis can significantly compromise the functionality of the affected limbs, limiting daily and professional activities. Fernández (2025) observes that individuals who are victims of botropes in the Amazon often have persistent sensory and motor limitations, as a result of the tissue destruction caused by the venom. These consequences demonstrate that snakebites should not only be analyzed from an acute clinical perspective, but also considering the long-term effects on the quality of life of exposed populations.

Another important element in understanding the complications associated with snakebites concerns the therapeutic strategies employed in the treatment of these envenomations. Antivenom continues to be the main therapeutic resource used in the clinical management of these cases, acting to neutralize the toxins present in the venom. However, the effectiveness of the treatment is directly related to the time of administration and the clinical conditions of the patient at the time of care. Teixeira (2024) points out that the search

for complementary therapeutic alternatives has been the subject of scientific investigation, especially with regard to the control of local complications, such as necrosis and tissue inflammation. Thus, the expansion of knowledge about the mechanisms of action of the venom and about the forms of therapeutic intervention is an essential step towards improving the clinical management of snakebites.

3 METHODOLOGY

The present research is characterized as a qualitative study of exploratory and descriptive character, developed through a literature review. This type of approach allows a critical analysis of the scientific knowledge already produced about a given phenomenon, making it possible to understand the main theoretical perspectives, scientific advances, and gaps in the literature. The choice of this methodological design is justified by the need to gather and analyze recent scientific evidence on snakebites in the Amazon and their local complications, especially those related to tissue necrosis associated with the predominant species in the state of Amazonas.

The universe of the research consisted of scientific articles published in national and international academic journals that address snakebites, envenomation by snakes of the genus *Bothrops*, clinical complications associated with envenomation and epidemiological aspects of these accidents in the Amazon region. The sample consisted of ten scientific articles published in the last five years, selected for their thematic relevance and scientific contribution to the understanding of the clinical manifestations and local complications resulting from snake envenomation.

Data collection was carried out through a systematic search in scientific databases widely used in the area of health and biological sciences, including academic indexing platforms and repositories of scientific journals. Descriptors related to the research theme were used, such as snakebite, *snakebite*, tissue necrosis, *Bothrops atrox*, bothrops envenomation and Amazonia. These descriptors were strategically combined to expand the scope of the search and identify relevant scientific studies published in the period delimited for the investigation.

After the initial identification of the publications, a screening stage of the studies was carried out based on previously defined inclusion and exclusion criteria. Scientific articles published between 2021 and 2026, available in full format, and that had a direct relationship with snakebites, pathophysiology of envenomation, clinical manifestations, or complications associated with tissue necrosis were included. Studies that did not have a direct relationship with the topic investigated, duplicate publications, or studies that did not provide access to

the full text were excluded.

Data analysis was conducted through analytical and interpretative reading of the selected studies, seeking to identify convergences, divergences and relevant contributions to the understanding of the investigated phenomenon. In this process, aspects such as the objectives of the research, the methods used, the main results found and the clinical and epidemiological implications of snakebites described in the analyzed studies were examined. From this analysis, it was possible to systematize the existing knowledge about the occurrence of these accidents in the Amazon and about the local complications resulting from poisoning.

Like all research based on literature review, the present study has some methodological limitations. Among them, the dependence on the availability of published studies on the subject stands out, as well as possible methodological differences between the studies analyzed. Even so, the use of recent scientific articles from recognized journals contributes to strengthen the consistency of the information analyzed and to expand the scientific understanding of snakebites and their local complications in the Amazon region.

The literature review carried out in this research allowed the identification of recent studies that address epidemiological, clinical and pathophysiological aspects of snakebites, with emphasis on the predominant species in the Amazon and the local complications resulting from envenomation.

The selected studies contribute to understanding the dynamics of these accidents, the mechanisms of action of the venom and the associated clinical impacts, especially with regard to tissue necrosis and the sequelae resulting from bothrops envenomation. The following table presents the main authors used in the construction of the theoretical framework, as well as the titles of the works and the respective years of publication.

Table 1

Authors used in the research

Author	Title	Year
Amaral	<i>Snakes involved in snakebites in tropical regions of Brazil</i>	2024
Fernández	<i>Physical and sensory long-term disabilities from Bothrops snakebites in the western Brazilian Amazon</i>	2025
Birth	<i>Acute compartment syndrome in Bothrops atrox snakebites</i>	2026
Birth	<i>Long-term hospital care needs after Bothrops atrox envenomation</i>	2024

Author	Title	Year

Scheliga	Exploring snakebite epidemiology and outcomes in Brazil	2024
Siqueira	Epidemiology and clinical characteristics of snakebite accidents in the Northern region of Brazil	2025
Silva	Who are the most affected by <i>Bothrops</i> snakebite envenoming in Brazil	2023
Souza	Botrosopic accidents in Brazil, a brief review	2024
Teixeira	Therapeutic alternatives for the treatment of snakebites	2024

Source: The authors.

From the studies presented in the table, it is observed that the recent scientific literature has directed significant attention to the epidemiological, clinical and therapeutic aspects of snakebites, especially those related to snakes of the genus *Bothrops*, predominant in the Amazon.

The analyzed studies show the relevance of the theme for public health, highlighting both the pathophysiological mechanisms of envenomation and local complications, such as tissue necrosis, in addition to the functional and social consequences resulting from these accidents. Thus, the joint analysis of these studies contributes to theoretically support the investigation proposed in this study.

4 RESULTS AND DISCUSSIONS

The analysis of the selected studies allowed us to identify that snakebite accidents continue to represent a relevant public health problem in Brazil, especially in the Amazon region, where environmental, social and occupational factors contribute to the higher incidence of these events. The results found in the literature show that snakes of the genus *Bothrops* are responsible for most of the accidents recorded in the Amazon, with *Bothrops atrox* being the species most frequently associated with cases of human envenomation. In this context, epidemiological studies show that the distribution of these accidents is strongly related to the proximity between human populations and natural environments, in addition to the performance of work activities in rural or forest areas. Scheliga (2024) highlights that the epidemiological pattern of snakebite accidents in Brazil is strongly concentrated in tropical regions, particularly in the Amazon, where the diversity of snakes and environmental characteristics favor increased contact between humans and these animals.

In addition to the high incidence of these accidents in the Amazon region, the results

analyzed indicate that certain populations are more vulnerable to snake envenomation. In general, the individuals most affected are rural workers, farmers, fishermen and populations living in areas close to the forest. According to Silva (2023), accidents caused by snakes of the genus *Bothrops* predominantly affect male individuals of economically active age, which highlights the direct relationship between occupational activities and risk of exposure to envenomation. This epidemiological profile also reinforces the need for public policies aimed at preventing these accidents, including educational actions and health surveillance strategies in regions considered to be at higher risk.

Another relevant aspect identified in the analyzed studies refers to the clinical manifestations associated with bothrops envenomation, especially with regard to local complications resulting from the action of the venom. The data indicate that envenomation by *Bothrops atrox* is often associated with intense local manifestations, such as pain, edema, hemorrhage, and tissue necrosis. Nascimento (2026) observes that the action of the toxins present in the venom of these snakes can cause significant vascular and inflammatory damage, leading to the development of serious complications, such as compartment syndrome. This clinical picture results from increased pressure in the muscle compartments, caused by intense edema and vascular involvement, which can lead to permanent damage to the affected tissues.

The results also show that tissue necrosis represents one of the main local complications associated with botrosopic accidents in the Amazon. This process occurs as a result of the action of enzymes present in the venom, which promote degradation of structural proteins and compromise local microcirculation. Amaral (2024) points out that the diversity of toxins present in the venom of snakes of the genus *Bothrops* contributes to the complexity of the clinical manifestations observed in patients, especially with regard to tissue lesions and intense inflammatory processes at the bite site. In this sense, the studies analyzed indicate that tissue necrosis can evolve rapidly when there is no adequate therapeutic intervention, increasing the risk of severe complications and permanent sequelae.

Another relevant result identified in the literature concerns the functional and social impact resulting from complications associated with snakebites. Tissue injuries caused by envenomation can result in long-term physical disabilities, significantly compromising the quality of life of affected individuals. Fernández (2025) points out that victims of botrosopic accidents in the Amazon often have persistent motor and sensory sequelae, resulting from the destruction of muscle and nerve tissues caused by the toxins in the venom. These consequences show that snakebites should not be analyzed only from the perspective of the

acute phase of envenomation, but also considering the lasting effects that can impact the social and economic life of the affected populations.

The results presented in this stage demonstrate that snakebites in the Amazon involve a complex set of epidemiological, environmental and clinical factors, which contribute to the occurrence of severe local complications, such as tissue necrosis. The analysis of the selected studies reinforces the importance of understanding the dynamics of these accidents and the pathophysiological mechanisms involved in bothrops envenoming, in order to expand scientific knowledge on the subject and contribute to the improvement of strategies for the prevention, diagnosis, and treatment of these diseases.

The discussion of these results continues in the next section, in which other scientific evidence related to clinical complications and therapeutic approaches used in the management of snakebite events will be analyzed.

The analysis of the selected studies also highlighted the importance of identifying the species involved in snakebites for an adequate understanding of the clinical manifestations and complications associated with envenomation. Although *Bothrops atrox* is recognized as the main species responsible for accidents in the Amazon, other representatives of the genus may also be associated with relevant clinical cases in the region. In this context, Oliveira Parda (2023) records the occurrence of envenomation by *Bothrops brazili* in the Brazilian Amazon, highlighting that different species may present variations in the composition of the venom and, consequently, in the clinical manifestations observed in patients. This biological diversity contributes to the complexity of the clinical diagnosis and reinforces the need for greater knowledge about the regional snakebite.

Another relevant result identified in the analyzed studies refers to the time of medical care as a determining factor for the clinical evolution of patients who are victims of snakebites. The literature indicates that the speed of administration of antivenom plays a fundamental role in reducing the local and systemic complications of envenomation. Nascimento (2024) highlights that patients who receive late care are more likely to develop extensive tissue lesions and complications that require prolonged hospital follow-up. Thus, the availability of health services in remote areas of the Amazon is an essential element for reducing the morbidity associated with snake accidents.

In addition, the results indicate that tissue necrosis resulting from bothrops envenomation has a significant impact on the clinical evolution of patients, and may result in permanent functional loss of the affected limbs. Amaral (2024) points out that the toxins present in the venom of snakes of the genus *Bothrops* have a high capacity to cause cell destruction and local inflammation, favoring the development of extensive lesions in the

affected tissues. This pathological process can progress to severe conditions when there is no adequate therapeutic intervention or when treatment is carried out late, increasing the risk of irreversible sequelae.

Another relevant point identified in the literature analysis refers to the epidemiological characteristics of snakebite accidents in the northern region of Brazil. Siqueira (2025) observes that the occurrence of these accidents is often associated with rural areas and forest regions, where activities such as agriculture, extractivism, and fishing expose populations to contact with snakes. This epidemiological pattern shows that snakebites are not random events, but rather phenomena strongly influenced by environmental and socioeconomic factors present in the Amazon region.

The studies analyzed also point to the need for the development and improvement of therapeutic strategies capable of reducing the complications associated with snake envenomation. Although antivenom continues to be the main therapeutic resource used in the treatment of these accidents, recent research indicates the importance of complementary approaches aimed at controlling local complications.

Teixeira (2024) highlights that new therapeutic alternatives have been investigated with the aim of minimizing tissue damage and improving the prognosis of patients who are victims of snakebites. These findings reinforce the relevance of expanding scientific knowledge about the mechanisms of action of the venom and about the treatment strategies capable of reducing the sequelae resulting from these accidents.

The discussion of the results also shows that snakebites have impacts that go beyond the immediate clinical dimension, configuring themselves as a problem that involves social, economic and structural aspects, especially in regions of difficult access such as the Amazon. The studies analyzed indicate that the occurrence of these accidents is often associated with rural communities and forest areas, where access to health services may be limited. In this sense, Scheliga (2024) observes that the geographical distribution of snakebite accidents in Brazil reveals a higher incidence in tropical regions, in which environmental and socioeconomic factors directly influence the risk of exposure to snakes.

Another important aspect identified in the studies refers to the functional consequences resulting from the lesions caused by bothrops envenomation. Tissue necrosis, often seen in these cases, can result in loss of muscle mass, impairment of nerve structures, and permanent limitations of the affected limbs. Fernández (2025) points out that the sequelae associated with accidents by snakes of the genus *Bothrops* can generate long-lasting physical disabilities, compromising the victims' work capacity and quality of life. These results demonstrate that snakebites should be analyzed not only from a clinical perspective,

but also considering their social and economic effects on the affected populations.

The integrated analysis of the selected studies also allows us to observe that the complexity of *Bothrops* envenomation is related to the diversity of toxins present in the venom of these snakes. Amaral (2024) points out that the biochemical composition of the venom can vary between species and even between populations of the same species, influencing the intensity of the clinical manifestations observed in patients. This variability contributes to the diversity of clinical conditions recorded in snakebite accidents and reinforces the need for further research on the pathophysiology of envenomation and its local complications.

In addition, the results discussed indicate that epidemiological knowledge about snakebites is an essential tool for planning strategies for the prevention and control of these diseases. Studies such as those by Silva (2023) and Siqueira (2025) show that the identification of the population groups most exposed to the risk of accidents allows for the direction of public policies and educational actions aimed at reducing the incidence of these events. Thus, prevention measures, training of health professionals and expansion of access to appropriate treatment become essential to reduce the impacts of snakebite accidents in the Amazon region.

In general, the analysis of the selected studies demonstrates that snakebites in the Amazon represent a complex phenomenon, influenced by biological, environmental and social factors. The high incidence of these accidents, associated with local complications such as tissue necrosis, highlights the need to expand scientific knowledge on the subject and strengthen prevention and treatment strategies. In this context, the integration between scientific research, public health policies, and health education actions is essential to reduce the morbidity associated with snake envenomation and improve the quality of life of populations exposed to this risk.

The systematized analysis of the selected studies allowed the identification of different methodological approaches and scientific objectives aimed at understanding snakebites, especially those associated with snakes of the genus *Bothrops* in the Amazon. The studies analyzed range from epidemiological and clinical aspects to discussions on local complications and therapeutic strategies used in the management of envenomation.

The organization of this information in a table allows us to visualize in a comparative way the contributions of each study to the understanding of the investigated phenomenon. Thus, the following table presents the main authors used in the research, as well as the objectives, methods used and the main results found in each study.

Table 2

Synthesis of the studies used in the research

Authors	Objective	Method	Main results
Amaral	To analyze snake species involved in snakebite accidents in tropical regions	Literature review	He identified a predominance of snakes of the genus <i>Bothrops</i> in snakebites and highlighted the diversity of toxins present in the venom, associated with local complications such as tissue necrosis
Fernández	To investigate the physical and sensory sequelae resulting from botropic accidents in the Amazon	Observational study	Demonstrated that victims of <i>Bothrops</i> poisoning may have long-term motor and sensory limitations
Birth (2026)	To evaluate clinical complications associated with <i>Bothrops atrox</i> poisoning	Clinical study	It showed the occurrence of serious complications, such as compartment syndrome and tissue damage associated with the action of toxins
Birth (2024)	To analyze the need for long-term hospital care after bothrops poisoning	Clinical study and case analysis	It indicated that severe local injuries may require prolonged hospital treatment and medical follow-up
Oliveira Parda	To record and analyze cases of envenomation by <i>Bothrops brazili</i> in the Amazon	Case report	It showed that different species of the genus <i>Bothrops</i> can cause complex clinical conditions
Scheliga	To investigate the epidemiological profile of snakebite accidents in Brazil	Epidemiological study	It identified a higher concentration of accidents in tropical regions and association with environmental factors
Siqueira	To analyze epidemiological characteristics of snakebite accidents in the North region	Epidemiological study	It demonstrated a relationship between snakebites, rural activities and forest environments
Silva	To identify the population groups most affected by botrosopic accidents in Brazil	Epidemiological study	It indicated a predominance of male victims of working age
Souza	To review the literature on botrosopic accidents in Brazil	Literature review	He highlighted the main clinical and epidemiological aspects of bothrops envenomation
Teixeira	To investigate therapeutic alternatives for the treatment of snakebites	Literature review	He indicated the importance of complementary therapies to antivenom to reduce local complications

Source: The authors.

From the synthesis presented in the table, it is observed that the studies analyzed converge in pointing out the predominance of accidents caused by snakes of the genus *Bothrops* in the Amazon region, as well as the relevance of local complications associated with envenomation, especially tissue necrosis.

In general, the research highlights both the epidemiological aspects of these accidents and the clinical and functional implications resulting from the injuries caused by the venom, evidencing the importance of expanding scientific knowledge on the subject to support more effective prevention, diagnosis and treatment strategies.

5 CONCLUSION

The present study achieved the proposed objective by analyzing the application of the protection of sensitive personal data in the health area, evidencing the relevance of adapting to current regulations and the need for more rigorous practices in the treatment of this information. The investigation allowed us to understand that health data, due to its highly sensitive nature, requires not only legal compliance, but also an ethical commitment on the part of the institutions and professionals involved.

Despite the advances in the adoption of data protection measures, there are still important flaws, such as the lack of standardization of procedures, the need for greater training of professionals, and the insufficiency in monitoring compliance with the rules.

In addition, it was found that the adoption of good practices, such as the implementation of clear internal policies, investment in information security technologies and the awareness of the agents involved, contributes significantly to risk mitigation. In this sense, data protection in health should not be understood only as a legal obligation, but as an essential element for the quality of care and trust between patients and institutions.

The questions raised in the introduction were duly answered, demonstrating that the effective application of the rules depends on the integration between technical, legal and organizational aspects. The hypotheses initially considered can be classified as partially confirmed, since, despite the existence of adequate legal mechanisms, their practical application still faces relevant challenges.

Finally, the importance of continuing studies in the area is highlighted, especially in the face of constant technological transformations and the growing volume of data generated in the health sector. Future investigations can deepen the analysis of more effective implementation and monitoring strategies, contributing to the continuous improvement of the protection of sensitive personal data.

ACKNOWLEDGMENTS

The authors express their sincere gratitude to all researchers and science professionals, especially to our professor and advisor who, through their studies and investigations, contribute to the expansion of knowledge about snakebite accidents and their impacts on human health. The development of this work is also supported by the collective effort of researchers who dedicate their careers to understanding the scientific and social challenges present in the Amazon region.

In particular, the honor of being able to contribute to the dissemination of scientific knowledge produced from the reality of the Amazon is registered. The region is home to one of the greatest biodiversity on the planet and presents unique challenges for science and public health. Spreading this knowledge to the international scientific community represents not only an academic commitment, but also a way of valuing the environmental, social, and cultural richness of the Amazon, expanding the visibility of its issues and strengthening scientific dialogue with the world.

ABSTRACT

Additive manufacturing has emerged as a promising technology in the healthcare field, particularly in the development of biomodels and customized implants. This study aimed to evaluate the use of acrylonitrile butadiene styrene (ABS) biomodels produced by 3D printing as grafts in rabbit tibias. Six New Zealand rabbits were used, receiving screw-shaped implants measuring 7 mm in length. The implants were sterilized either by autoclaving or immersion in glutaraldehyde. Animals were clinically evaluated until the third postoperative day and radiographically assessed at 0, 30, and 60 days. After this period, euthanasia was performed followed by macroscopic evaluation of the implants. ABS demonstrated low tissue reactivity, absence of rejection, and signs of osteointegration. Although autoclave sterilization resulted in slight deformation, it did not impair implantation. These findings suggest that ABS has potential for use in the development of customized orthopedic implants, although further long-term studies are required.

utilizados seis coelhos da raça Nova Zelândia, nos quais foram implantados dispositivos em formato de parafusos com 7 mm de comprimento. Os implantes foram esterilizados por autoclave ou por imersão em glutaraldeído. Os animais foram avaliados clinicamente até o terceiro dia pós-operatório e radiograficamente aos 0, 30 e 60 dias. Após esse período, foi realizada a eutanásia e avaliação macroscópica dos implantes. Observou-se que o ABS apresentou baixa reatividade tecidual e ausência de sinais de rejeição, com evidências de osteointegração. Embora a esterilização em autoclave tenha causado leve deformação dos implantes, não houve comprometimento da implantação. Os resultados indicam que o ABS apresenta potencial para aplicação na produção de implantes ortopédicos personalizados, sendo necessários estudos adicionais para avaliação a longo prazo.

RESUMEN

La manufactura aditiva ha surgido como una tecnología prometedora en el área de la salud, especialmente en el desarrollo de biomodelos e implantes personalizados. El presente estudio tuvo como objetivo evaluar el uso de biomodelos de acrilonitrilo butadieno estireno (ABS), producidos mediante impresión 3D, como injertos en tibias de conejos. Se utilizaron seis conejos de la raza Nueva Zelanda, en los cuales se implantaron dispositivos en forma de tornillos de 7 mm de longitud. Los implantes fueron esterilizados mediante autoclave o por inmersión en glutaraldehído. Los animales fueron evaluados clínicamente hasta el tercer día postoperatorio y radiográficamente a los 0, 30 y 60 días. Posteriormente, se realizó la eutanasia y la evaluación macroscópica de los implantes. El ABS presentó baja reactividad tisular, ausencia de rechazo y evidencias de osteointegración. Aunque la esterilización por autoclave causó una ligera deformación, no comprometió la implantación. Los resultados indican que el ABS tiene potencial para su aplicación en implantes ortopédicos personalizados, siendo necesarios estudios adicionales a largo plazo.

1 INTRODUCTION

The search for new technologies involving different materials and manufacturing processes has increasingly gained space in both scientific research and the market, whether in industry, communication, art, and more recently, in the healthcare field, with applications in surgical planning, prosthesis development, anatomy teaching, and implant production (SILVA; KAMINSKI, 2008). This technological advancement is directly related to the growing demand for greater precision, customization, and efficiency in both production and therapeutic processes (GIBSON; ROSEN; STUCKER, 2015).

In addition, there is an increasing concern regarding the development of sustainable technologies that minimize environmental impact and material waste. In this context, additive manufacturing stands out for using only the necessary amount of material during fabrication, unlike traditional subtractive methods (SALCHER et al., 2013; GEBHARDT, 2012). This characteristic makes it particularly attractive from both environmental and economic perspectives.

Additive manufacturing (AM), also known as rapid prototyping, comprises a group of technologies capable of producing three-dimensional objects through the successive deposition of material layers based on digital models (VOLPATO; CARVALHO, 2007; SANTOS et al., 2018). According to Gibson, Rosen, and Stucker (2015), this process allows a high degree of geometric freedom, enabling the fabrication of complex structures that would be difficult or impossible to achieve using conventional methods.

In addition to CAD-generated models, AM can also utilize data obtained from three-dimensional scanning techniques, such as computed tomography and laser scanning, within the framework of reverse engineering (RAULINO, 2011; CHUA; LEONG; LIM, 2010). This significantly expands its applications, particularly in the biomedical field, where customization is a critical factor for therapeutic success.

Three-dimensional printing technology eliminates the need for molds and specific tooling, reducing production steps and allowing direct fabrication of final products. Furthermore, the technology itself can generate support structures during the printing process, which are later removed, facilitating the construction of complex geometries (RAULINO, 2011; GEBHARDT, 2012).

Currently, several additive manufacturing systems are available on the market, all based on the same principle of layer-by-layer fabrication, but utilizing different materials such as polymers, metals, and ceramics. These systems were initially developed for industrial applications with the aim of reducing production time, improving quality, and lowering costs, and were later incorporated into the healthcare field (GIBSON; ROSEN; STUCKER, 2015).

In medicine, the use of additive manufacturing has revolutionized surgical planning by enabling the creation of three-dimensional anatomical models from imaging modalities such as computed tomography (CT) and magnetic resonance imaging (MRI) (LIMA, 2009). These models provide improved visualization of anatomical structures and support clinical decision-making (RENGIER et al., 2010).

Moreover, the conversion of medical imaging data into three-dimensional models allows the fabrication of highly accurate biomodels, contributing to the development of customized prostheses, surgical guides, and implants (MATOZINHOS et al., 2017; VENTOLA, 2014). These applications have demonstrated significant benefits, including reduced surgical time and improved clinical outcomes.

In veterinary medicine, the application of these technologies has also grown considerably, especially in orthopedics and traumatology. The use of biomodels enhances surgical planning and increases procedural predictability, contributing to better clinical outcomes (OSORIO et al., 2018).

With ongoing research advancements, new therapeutic possibilities are being explored, including the use of 3D printing for the production of biological structures and personalized devices. Some authors suggest that, in the future, it may be possible to fabricate tissues and organs using the patient's own cells, thereby reducing the risk of immune rejection (BARRETO et al., 2018; MURPHY; ATALA, 2014).

In terms of materials, polymers play a fundamental role in additive manufacturing. Natural polymers are those formed during the life cycle of living organisms (FRANCHETTI; MARCONATO, 2006), whereas biopolymers are derived from renewable resources such as corn, sugarcane, cellulose, and chitin (BRITO et al., 2011). These materials have been widely studied due to their biodegradability and reduced environmental impact.

Historically, humans have used natural polymers such as wool, leather, and natural rubber to produce everyday materials (BROWN et al., 2005). However, with industrial advancement, synthetic polymers have gained prominence due to their versatility and superior mechanical properties (CALLISTER; RETHWISCH, 2016).

Among synthetic polymers used in additive manufacturing, acrylonitrile butadiene styrene (ABS) stands out as a widely used thermoplastic due to its favorable mechanical and thermal properties. ABS exhibits high impact resistance, good dimensional stability, low moisture absorption, and ease of processing, making it suitable for use in fused deposition modeling (FDM) 3D printing (CHUA; LEONG; LIM, 2010; CALLISTER; RETHWISCH, 2016).

Furthermore, ABS presents characteristics that support its application in biomedical devices, such as adequate mechanical strength and the ability to be shaped into complex

structures. However, its biocompatibility remains under investigation, particularly for implantable applications (VENTOLA, 2014).

Given this context, it is essential to investigate the behavior of biomodels produced by additive manufacturing when implanted into biological tissues. Evaluating the biological response, including immune rejection and tissue integration, is crucial to determine the feasibility of these materials for clinical applications.

Thus, the present study aimed to evaluate the use of acrylonitrile butadiene styrene (ABS) biomodels produced by additive manufacturing as grafts in rabbit tibias, analyzing their biological resistance and immune response, with the perspective of future application in the development of easily accessible customized prostheses and orthoses.

2 METHODOLOGY

2.1 ETHICAL APPROVAL

This study was approved by the Animal Ethics Committee (CEUA) of the University of Rio Verde (UniRV) and conducted in accordance with the ethical principles established by the Brazilian College of Animal Experimentation (COBEA), under protocol number 09/21

2.2 ANIMALS

Six New Zealand rabbits (*Oryctolagus cuniculus*), approximately six months old and weighing around 3.5 kg, of both sexes, were used in this study. The animals were obtained from the rabbit breeding sector of UniRV and underwent a one-week acclimatization period, during which their general health status was monitored.

They were housed individually in cages under controlled environmental conditions, including adequate hygiene, temperature, lighting, and protection from weather conditions. Environmental enrichment was provided using hanging chains to minimize stress.

The animals were fed a commercial diet supplemented with carrot, hay, and kale, with water provided *ad libitum*. An 8-hour fasting period was implemented prior to the surgical procedure. After surgery, the animals were maintained under the same conditions for eight weeks.

2.3 IMPLANT FABRICATION

The implants were manufactured using a Zonestar DIY 802QR2 3D printer, equipped with dual extrusion nozzles with X–Y axis movement and a heated print bed with Z-axis movement.

The fused deposition modeling (FDM) technique was employed, using acrylonitrile butadiene styrene (ABS) filament. The implants were designed and printed in the form of screws measuring 7 mm in length.

2.4 IMPLANT STERILIZATION

Two sterilization methods were used. For the first group, implants were packaged in surgical-grade paper and sterilized in an autoclave at 160°C for 30 minutes.

For the second group, implants were immersed in glutaraldehyde solution for 8 hours. Prior to implantation, the materials were rinsed with sterile distilled water to minimize potential tissue toxicity.

2.5 PREOPERATIVE PROCEDURES AND ANESTHETIC PROTOCOL

After confirmation of clinical health status, animals underwent wide trichotomy in the medial metaphyseal region of both tibias, as well as in the auricular region for access to the caudal auricular vein. Body weight was recorded using a digital scale with 1g precision one day prior to surgery.

Animals were then referred to the surgical center of the Veterinary Hospital for Small Animals at UniRV.

The anesthetic protocol consisted of intramuscular administration of acepromazine (0.05 mL/kg), tramadol hydrochloride (3 mg/kg), midazolam (0.2 mg/kg), and ketamine (22 mg/kg), followed by local infiltrative anesthesia using 0.4 mL of 2% lidocaine.

During the procedure, animals were monitored continuously and received 100% oxygen via an oronasal mask. Anesthesia was maintained with isoflurane at an initial concentration of 2.5%, adjusted as needed.

2.6 SURGICAL PROCEDURE

After achieving an adequate anesthetic plane (Guedel stage III, plane 3), antisepsis of the surgical site was performed using two applications of 2% chlorhexidine gluconate followed by 70% alcohol, and final antisepsis with three additional applications of 70% alcohol. The surgical field was then draped using sterile fenestrated drapes.

A skin incision of approximately 3 cm was made using a size 21 scalpel blade, followed by blunt dissection of the subcutaneous tissue using Metzenbaum scissors. A longitudinal incision was then made in the periosteum to expose the proximal medial metaphyseal cortex of the tibia (Figure 1).

Figure 1

A – Skin incision made with a scalpel. B – Bone drilling conducted with surgical drills. C – Implant placement with manual stabilization. D – Implant positioned and fixed in bone tissue.

Source: Prepared by the authors.

A bone perforation measuring 7 mm in depth and 2 mm in diameter was created using surgical drills under high-speed rotation with continuous irrigation using sterile saline solution.

The implants were manually inserted and stabilized using Kocher forceps. After implantation, muscular fascia was sutured using absorbable Vicryl 5-0, and the skin was closed using nylon 4-0. Implants placed in the right tibias were sterilized by autoclave, while those in the left tibias were sterilized using glutaraldehyde.

2.7 POSTOPERATIVE CARE

After surgery, the animals were monitored until full recovery from anesthesia and then returned to their housing.

Postoperative medication included enrofloxacin (5 mg/kg, once daily for 7 days), tramadol hydrochloride (3 mg/kg, three times daily for 3 days), and meloxicam (0.1 mg/kg, once daily for 4 days), all administered subcutaneously.

Surgical wounds were cleaned daily using sterile saline solution and treated with rifamycin spray. After the third postoperative day (D3), no further clinical alterations were observed, and handling was minimized to reduce stress.

2.8 CLINICAL EVALUATION

Implant sites were clinically evaluated up to the third postoperative day (D3). Edema was assessed using a binary scoring system: score 0 for absence of edema and score 1 for presence of edema

2.9 RADIOGRAPHIC EVALUATION

Pelvic limbs were evaluated radiographically every 30 days after surgery (D0, D30, and D60), totaling three evaluations per animal. Since radiographic findings were homogeneous across all treatments and replicates, statistical analysis was not performed for this parameter.

2.10 EUTHANASIA AND IMPLANT EVALUATION

After 60 days, animals were euthanized using an overdose of ketamine administered intravenously via the caudal auricular vein, followed by potassium chloride administration. Vital parameters, including heart rate, respiratory rate, and pulse, were monitored to confirm death. Following confirmation, tibias were collected and individually stored in 10% formalin for subsequent analysis

2.11 STATISTICAL ANALYSIS

A completely randomized design was used, with two treatments and six replicates. The treatments consisted of implant sterilization by autoclave or glutaraldehyde, and each animal represented one experimental unit. Data obtained were subjected to analysis of variance (ANOVA) using the F-test at a 5% significance level.

3 RESULTS AND DISCUSSION

The implants sterilized by autoclaving showed slight deformation when compared to the original printed prototypes. This finding represents a potential limitation, as one of the main advantages of additive manufacturing is the ability to produce customized implants with high dimensional accuracy. Despite this alteration, no difficulty was observed during implant insertion into the bone tissue.

Thermal sterilization methods, such as autoclaving, are known to affect the structural integrity of thermoplastic polymers, including acrylonitrile butadiene styrene (ABS), due to their sensitivity to high temperatures (GEBHARDT, 2012; CALLISTER; RETHWISCH, 2016). This may explain the observed deformation and highlights the importance of selecting appropriate sterilization techniques for polymer-based implants. In contrast, implants

sterilized using glutaraldehyde maintained their structural characteristics, suggesting that chemical sterilization may be more suitable for preserving the integrity of additively manufactured ABS components. The choice of sterilization method is a critical factor in determining the performance and biocompatibility of

implanted biomaterials (SEHLINGER et al., 2015).

Regarding clinical evaluation, although four out of six implants sterilized with glutaraldehyde presented edema at the incision site, no statistically significant difference was observed between the treatments at the 5% significance level. These findings suggest that both sterilization methods are comparable in terms of short-term inflammatory response.

Postoperative radiographic evaluations performed at 0, 30, and 60 days revealed homogeneous results among all animals, indicating consistent implant positioning and absence of apparent complications such as displacement or severe bone reaction. Radiographic analysis is widely recognized as an effective method for assessing bone healing and the performance of biomaterials in vivo (SILVA et al., 2003).

Macroscopic evaluation of the tibias after euthanasia demonstrated no evidence of implant rejection. Additionally, signs of osteointegration were observed in all animals, indicating a favorable biological response to the implanted material.

These results are consistent with previous studies that reported fibrovascular infiltration and good biocompatibility of polymer-based implants, supporting their use in reconstructive procedures (GOMES JÚNIOR et al., 2016). The absence of significant adverse reactions suggests that ABS may be considered a promising material for orthopedic applications, particularly when used in customized implants produced by additive manufacturing.

Furthermore, the low tissue reactivity observed in this study reinforces findings from previous research indicating that certain synthetic polymers can exhibit acceptable biological behavior when properly processed and sterilized (VENTOLA, 2014).

Taken together, the results demonstrate that additive manufacturing using ABS can produce implants with adequate mechanical and biological performance for experimental orthopedic applications. However, the choice of sterilization method plays a crucial role in maintaining implant integrity and should be carefully considered in future applications.

4 CONCLUSION

This study demonstrated that biomodels produced by additive manufacturing using acrylonitrile butadiene styrene (ABS) can be successfully applied as bone implants in rabbit tibias, showing satisfactory biological performance. The absence of rejection and the

presence of osteointegration indicate that ABS is a promising material for orthopedic applications.

Although autoclave sterilization caused slight deformation, it did not impair implantation or short-term outcomes. In contrast, glutaraldehyde preserved implant integrity, highlighting the importance of selecting appropriate sterilization methods for polymer-based biomaterials.

Overall, the findings support the feasibility of using ABS for the development of low-cost, customized implants. However, further studies are needed to evaluate long-term behavior and histological responses.

ACKNOWLEDGMENTS

The authors would like to thank the University of Rio Verde (UniRV) for the opportunity provided through its Scientific Initiation Program, as well as for the infrastructure and continuous support throughout the development of this study.

ABSTRACT

This article discusses the main problems of traditional cemeteries in urban centers, including the lack of space due to population growth, environmental contamination from the use of toxic products in burials, public health issues arising from poor management and maintenance, and cultural and religious issues that make the grieving experience more challenging. The goal is to propose a new cemetery model integrated into urban planning that minimizes environmental impacts and offers a more humane experience for families and visitors, contributing to the sustainable development of cities. Additionally, this work highlights the importance of interdisciplinary research and partnerships between government, the private sector, and academia to develop this new cemetery paradigm. The method used was an integrative review on the subject. The article first addresses the current problems of traditional cemeteries; then, it introduces concepts of smart and sustainable cities that can be applied to cemeteries; and finally, it suggests the implementation of a new model for cemeteries, including the addition of green spaces, efficient use of water resources and solar energy, artificial intelligence-based monitoring systems, as well as virtual memorials and other innovations. Certainly, this innovative model has the potential to create a more humane and sustainable environment for urban cemeteries by integrating smart technologies and meeting the cultural and emotional needs of communities.

Keywords: Cemeteries. Smart Cities. Sustainability. Urban Problems. Urban Parks.

RESUMO

Este artigo discute os principais problemas dos cemitérios tradicionais em centros urbanos, incluindo a falta de espaço devido ao crescimento populacional, a contaminação ambiental decorrente do uso de produtos tóxicos nos sepultamentos, problemas de saúde pública provenientes da má gestão e manutenção, e questões culturais e religiosas que tornam a experiência do luto mais desafiadora. O objetivo é propor um novo modelo de cemitério integrado ao planejamento urbano que minimize os impactos ambientais e ofereça uma

RESUMEN

Este artículo discute los principales problemas de los cementerios tradicionales en los centros urbanos, incluyendo la falta de espacio debido al crecimiento poblacional, la contaminación ambiental derivada del uso de productos tóxicos en los entierros, problemas de salud pública provenientes de una gestión y mantenimiento deficientes, y cuestiones culturales y religiosas que hacen más desafiante la experiencia del duelo. El objetivo es proponer un nuevo modelo de cementerio integrado a la planificación urbana que minimice los impactos ambientales y ofrezca una experiencia más humana para familiares y visitantes, contribuyendo al desarrollo sostenible de las ciudades. Además, este trabajo destaca la importancia de la investigación interdisciplinaria y de las alianzas entre el gobierno, el sector privado y la academia para el desarrollo de este nuevo paradigma de cementerio. El método utilizado fue una revisión integradora sobre el tema. El artículo primero aborda los problemas actuales de los cementerios tradicionales; luego, presenta conceptos de ciudades inteligentes y sostenibles que pueden aplicarse a los cementerios; y finalmente, sugiere la implementación de un nuevo modelo de cementerio, incluyendo la incorporación de áreas verdes, el uso eficiente de los recursos hídricos y de la energía solar, sistemas de monitoreo basados en inteligencia artificial, así como memoriales virtuales y otras innovaciones. Sin duda, este modelo innovador tiene el potencial de crear un entorno más humano y sostenible para los cementerios urbanos al integrar tecnologías inteligentes y atender las necesidades culturales y emocionales de las comunidades.

1 INTRODUCTION

It is not a recent issue that most cities face serious problems such as mobility, pollution, and informal settlements. Another concern involves traditional cemeteries, which, due to a lack of urban planning and a misguided development model, have exacerbated the situation in Brazilian municipalities. It is imperative that in the very near future, cities seek definitive solutions to address this pressing issue.

As [1] (p. 160) state, "Currently, we are experiencing a new moment of transformation in the way bodies are interred and in the methods of their disposal, triggered by population growth, urban expansion, and environmental contamination, the latter caused by byproducts of body decomposition."

In this present work, we intend to briefly address the main problems of traditional cemetery models in urban centers, which include: the lack of space, related to population growth and the limited availability of land for new graves; environmental pollution caused by cemeteries due to the use of embalming methods and burial techniques that can contaminate the soil with toxic substances, as well as groundwater contamination by pathogenic microorganisms resulting from body decomposition; public health problems that cemeteries can also cause through the spread of diseases and infections, especially if not properly maintained; the lack of maintenance that urban cemeteries often suffer from due to insufficient resources and personnel for their upkeep, which can lead to unsanitary and dangerous conditions; and finally, cultural and religious issues related to the burial of loved ones in traditional urban cemeteries, which can make the experience more difficult and traumatic for visitors.

The truth is that cemeteries have always been understudied and underdiscussed, and undoubtedly, they give rise to many other problems that certainly deserve investigation, from the economic devaluation of the surrounding land to public safety concerns.

Furthermore, the social relevance of these structures, which have also come under scrutiny due to declining visitation rates, changes in burial practices such as cremations, and questions about whether the space occupied by the cemetery is linked to a "perpetual care" obligation, often leads them to fall into disuse and abandonment [1].

After all, we are born, we grow, and we die... we are living beings, which is why cemeteries will always be useful and necessary. The challenge when addressing such a relevant topic is how we will transform the traditional cemetery model into a new model of cemeteries that are considered more humane, intelligent, and sustainable.

The research method employed is bibliographical and exploratory, based on a theoretical-conceptual perspective (literature reviews) on the subject.

Therefore, as the research objective, we aim to propose a model of urban, humanistic, and sustainable development to address the socio-environmental issues arising from the expansion of cities and urban agglomerations, guided by innovative factors for the implementation of human, intelligent, and sustainable cemeteries.

2 THEORETICAL FOUNDATION

2.1 CEMETERIES AND URBAN PROBLEMS

The truth is that the majority of traditional cemeteries, as currently designed with large graves, often create endless concrete mazes that people sometimes struggle to navigate when trying to locate the burial site of their loved ones. The lack of burial space is a recurring problem in crowded cemeteries in many Brazilian municipalities, but this is just the beginning.

Certainly, burial plots are limited and valuable. As a result, traditional cemeteries occupy a significant amount of space, which can be problematic in densely populated areas. In this context, the scarcity of land and extreme population density in Hong Kong are discussed by Yung and Chan as factors that create difficulties in accommodating new cemetery spaces in the city. Long-term planning becomes crucial in such scenarios [2].

The lack of burial space can limit cemetery expansion and eventually fill it up, forcing administrators to consider less desirable options, such as exhumation or the creation of new cemeteries in less suitable areas.

The concept of cemetery parks emerges as a way to reintegrate these spaces into the urban fabric of contemporary cities, overcoming the historical segregation of cemeteries [3].

Indeed, in large and medium-sized municipalities, the disorderly urbanization process is a common sight, with cemeteries often not integrated into the urban fabric, even in central areas, which can have various impacts, including emotional ones on the population.

In this regard, Lynch discusses the concepts of "legibility" and "imageability," that is, how easy it is for people to construct a clear mental image of the city and its elements. Lynch analyzes how cemeteries can be important elements in people's mental image of a particular city or neighborhood [4].

The author further explores the idea that cemeteries evoke a "vivid image" in people's minds, arousing emotions, memories, and meanings. This reinforces their unique power as distinctive elements in shaping the mental image of the city [4].

Thus, he classifies cemeteries as urban "landmarks," external reference points for the observer, which end up structuring their perception of the surroundings. Cemeteries often become landmarks due to their dimensions, symbolic importance, or simply visibility in the landscape [4].

Moreover, according to Lynch, some urban landmarks, such as squares and cemeteries, define "nodes" of activity and gatherings in the life of neighborhoods. In other words, they influence the flows and interactions of people in public spaces [4].

This makes urban planning and reorganization challenging, as there are still aspects related to property devaluation around cemeteries.

On the other hand, the importance of urban planning integrating the location and expansion of cemeteries in cities from the outset is emphasized. Neglecting this dimension leads to future problems [2].

Another focus is on public health problems, especially when cemeteries are not properly managed. For example, if bodies are not buried deep enough, animals can dig them up and spread diseases. Additionally, in some areas, cemeteries are prone to flooding, which can lead to water contamination, as was the case in Santa Catarina (Rain causes cemetery collapse, and mortuary chapels fall onto cars in the State of Santa Catarina/Brazil, 2022) [5].

Therefore, it is becoming increasingly difficult for municipal authorities to make decisions regarding urbanization in the face of constant and rapid population growth in urban centers, making a sustainable cemetery model essential.

Furthermore, the administrative and economic aspects cannot be ignored. The difficulty in maintaining cemeteries throughout Brazil must also be evaluated, as the costs associated with the maintenance and administration of traditional cemeteries can be significant.

Another point to consider is the issue of security. Many cemeteries today can be dangerous places, especially at night, which can be problematic for visitors and workers who need to access them. Additionally, there have been numerous cases of theft and vandalism reported in the media (Theft of crosses in Florianópolis cemetery becomes a police case) [6].

Jacobs highlights the concept of "eyes on the street" - the security provided by the informal presence and surveillance of residents, pedestrians, and users of public spaces. Better integrating cemeteries into adjacent areas could facilitate this community surveillance.

She emphasizes that the vitality of neighborhoods is associated with the sense of belonging and emotional attachment of local residents to public spaces. She ponders, "To what extent do a city's cemeteries evoke this attachment and constitute an emotional heritage of communities?" As a result, she believes that diversity of uses is essential to keep cities vibrant and safe. In this sense, there is a need to transform cemeteries into "living spaces" with various functions (culture, leisure), thus making these places more integrated and secure [7].

2.2 MORE HUMAN, INTELLIGENT, AND SUSTAINABLE CITIES

There is no doubt that municipal administrations must play a strategic role in seeking adequate solutions and responses to the local or global social challenges they face today. This is particularly challenging in the context of a post-pandemic crisis caused by Covid-19. Therefore, it is essential to seek efficiency in public management through public-private partnerships to address the issues related to traditional cemeteries, aiming for a new concept of a necropolis.

In this context, [8].draw attention to the strategic use of public contracts, which have a huge impact on the management of smart cities, as follows: "Government contracts and public procurement should include new agents and new formats to allow government products and services to be open source; this means incorporating elements of innovation focused on sustainability and inclusion into these procurement processes. Innovation contracts mean involving procurement departments in the procurement process to ensure that technologies (such as open-source software) can be obtained from reliable suppliers at lower costs and better quality, and that open standards and interoperability are implemented. Open-source software should be easily accessible to governments at all levels."

Therefore, it is necessary for the public administration to review the entirety of procurement processes to facilitate more efficient public spending, enabling innovation in both products and services and the profile of suppliers, with greater access to micro and small businesses.

For this reason, it is essential that the cities of the future do not develop according to the old paradigm of spatial segregation of everyday functions.

Regarding sustainability, the impact caused by the traditional burial process, which involves the use of wooden coffins, linings, pillows, and other accessories, can have a significant environmental impact. Additionally, many cemeteries lack infrastructure to collect and recycle generated waste.

Reference [9] says that to break with the traditional model, it is necessary to deconstruct the existing, rid oneself of concepts and prejudices, and seek a new path of innovation and sustainability. He asserts: "Inventions, innovations, technical, cultural, and ideological creations emerge and modify evolution. That is, they revolutionize it and henceforth make the principles of evolution evolve."

It is important to say that a "smart city" is one that utilizes human capital, creates new innovation ecosystems where work and wealth occur, promotes new forms of participation (governance), using technology as an enabler, while people are its actors. Furthermore, cities must be smarter and more efficient in solving the problems of rapid social urbanization [10].

Thus, as [10] put it, citizens are the driving force of change. Through their motivation and empowerment, significant challenges can be addressed, "not to change infrastructure or adopt new technologies, but to involve people in civic life."

Innovations and creations produce transgressions that can expand and potentiate trends, which can infiltrate the dominant trend and modify its orientation or replace it. In this sense, evolution, whether biological, sociological, or political, is never straightforward or regular. History does not project massively like the volume of a river. It germinates marginally and develops transgressively.

It is also essential to highlight the philosophical aspect that cemeteries can represent, demonstrating absolute equality among humans in their final resting place. Without economic, social, racial, religious, or any other distinctions; the absence of ostentation and questionable taste such as the construction of tombs and mausoleums. Creating an appropriate environment for moments of remembrance and longing, in a place that can be visited by children, eliminating the fear and trauma caused by conventional cemeteries; turning the burial ground into a beautiful natural garden, leveling everyone with green lawns simply identified by a granite headstone.

It is time to shift our attention to designing a better quality of life experience in our cities, as they should be flexible and responsive to the desires and needs of their citizens, using technology to assist us.

2.3 MORE HUMAN, INTELLIGENT, AND SUSTAINABLE CEMETERIES

Well then, the idea is to think about how to plan our future as a new society that has truly learned from the pandemic crisis and had the determination to address the world's situation in a holistic sense. In doing this planning, we need a new city - the city of the future, that is, "A More Human, Intelligent, and Sustainable City - CHIS" [10].

From a contemporary perspective, the model of a more human, intelligent, and sustainable cemetery must be urgently incorporated into cities to solve the complex problem described. To achieve this, it is necessary to transform in order to evolve.

By incorporating multiple uses and social functions, cemetery parks ensure more vitality, movement, security, and integration with urban life in the surroundings. These spaces also emphasize the landscape, contemplation, and biodiversity preservation aspects of cemeteries, bringing people closer to nature [3].

Furthermore, with a sustainable and ecological design, the suggested cemetery model will have a harmonious landscape with a predominance of nature, beauty, serenity, and respect,

suitable for moments of reflection. It is also distinguished by not allowing any type of construction above the surface in the burial area.

Thus, it includes open spaces, extensive tree canopies, and ground-level species, with a large garden featuring various species of wildflowers and endangered native trees.

In this sense, Juliane Queiroz discusses the transformation of traditional cemeteries into "cemetery parks," combining funeral use with leisure, culture, services, and nature contemplation [3].

Additionally, it incorporates water resource reuse, including rainwater; new sustainable lighting systems, such as solar energy capture through photovoltaic panels and LED lights; easy access to any point; outdoor benches, flower shops, snack bars, restaurants, modern restrooms, medical clinics, mortuary and ecumenical chapels, among other services.

Regarding solid waste, intelligent trash cans that notify when they need to be emptied or issue alerts (beeps) when the disposed material is not consistent with solid waste separation (plastics, glass, metal, organic material) are included.

Green areas will be suitable for walking or ecological trails, running tracks, and bike paths, all integrated and part of the concept of a smart cemetery. The cemetery will have a space with musical ambiance (Mother's Day, Father's Day, remembrance days, etc.), AI-based monitoring for visitor safety, a digital system with QR codes to locate the deceased's gravestone, directing visitors through maps to a virtual memorial with messages, images, and videos to remember their loved ones, all accessible via smartphones.

It is worth noting that, most of the time, technological solutions are not implemented due to high costs and accessibility issues. This justifies initiatives in ecosystems aimed at developing new technologies for the evolution of human, intelligent, and sustainable cemeteries in the context of smart cities.

As [8] rightly pointed out, "the Bahian intellectual who thought a lot about cities said: the world is made up not only of what already exists but also of what can effectively exist."

Regarding the concept of compact and vertical cemeteries, which can be explored in other urban contexts, it involves underground utilization and the better use of existing land to maximize capacity [2].

Thus, let's imagine a more human and intelligent cemetery permeated with sustainability, a space where people can breathe clean air, engage in their daily walking routine as if it were a park, with many native trees and green spaces.

This represents a different model from the current cemetery-park models, which still have a limited view of sustainability and innovation.

In the more human, intelligent, and sustainable cemetery, it will be possible to plant trees to honor loved ones, depositing their ashes to enrich the soil, as the biblical passage (Ecclesiastes 12:7 NLT) says, "from dust you came and to dust you will return."

For those who wish to be buried, the vertical burial method can be employed to occupy less space. Seeds can be released in capsules alongside eco-friendly coffins to grow trees that are on the brink of extinction. Consequently, we will have extensive green areas within urban areas.

In addition to these aspects, there will be psychological impacts associated with the implementation of intelligent cemeteries in vast green spaces, aiming to convey peace and tranquility to the location, and consequently, improve the acceptability of coexistence with urban proximity.

The conception of a new environmental education is necessary, based on a more humane and fraternal society, where everyone understands that we are part of cosmic dust and that we are only visitors on planet Earth.

Given the complexity of the problem involving religious aspects, it is necessary to understand that the proposed model of a more human and intelligent cemetery should continue to be a sacred place, and a sustainable religion should be fostered, respecting all beliefs.

It is also necessary to change cultural and religious paradigms about burials, making room for new options such as cremation, garden cemeteries, vertical columbariums, and it is essential to rethink rituals and traditions that may be crucial [2].

Furthermore, a new cemetery concept will bring interdisciplinary themes to the forefront, which must interact to make cities more human, intelligent, and sustainable, as [10] emphasizes: "Human intelligent cities propose the use of technology as a facilitator to connect and engage government and citizens, aiming to rebuild, recreate, and motivate urban communities, stimulating and supporting their collaborative activities, leading to an overall increase in social well-being."

To achieve this, the Table 1 below presents some results of theoretical references in the search for inspiration for an innovative model for a more human, intelligent, and sustainable scenario for urban cemeteries.

3 METHODOLOGICAL PROCEDURES

A methodology used for the present scientific work was an integrative literature review [11,12,13]. It is important to highlight that literature review is a fundamental first step in the

construction of scientific knowledge, as it is through this process that new theories emerge, and gaps and opportunities for research in a specific subject are recognized [13].

Therefore, the literature review process requires the development of a synthesis based on different topics, capable of creating a comprehensive understanding of knowledge. Additionally, it is worth noting that integrative reviews are the broadest type of review, as they allow for the simultaneous inclusion of both experimental and non-experimental research to gain a more comprehensive understanding of the phenomenon under investigation [11].

Reference [12] propose three stages for the integrative review: planning the review; conducting the review; and reporting and disseminating the review results.

Stage 1 - Planning the Review: The research began with identifying the need for the review and contextualizing the topic. The definition and contextualization of the theme delimits and particularizes its content, avoiding ambiguity that could lead to research focus deviation [13]. In the final phase of stage 1, the review protocol was constructed. The protocol is a plan that contributes to research objectivity through an explicit description of the steps followed [13].

Stage 2 - Conducting the Review: In this stage, the following were defined: search strategy; databases; time period; article languages; search terms; tools for data collection and organization; and inclusion and exclusion criteria. The search string ("cemeteries*" AND "urban problems" OR "urban planning AND "smart cities" AND "sustainability") underpinned searches in the Scopus database, which was selected for its broad document coverage. However, to increase reliability, the results were also cross-referenced with the Web of Science Core Collection and Ebsco to confirm the inclusion of all relevant studies. The search was performed by title, abstract, and keywords, resulting in a total of 272 results. In the databases, the following criteria for article inclusion and exclusion were applied: articles produced in the last 5 years (2018 to 2023), language: English, and document types: articles, totaling a pre-selection of 260 articles. In the next step, the title and abstract were read to identify adherence to the research topic and remove duplicate articles, thus selecting 21 articles for full reading. After reading, a synthesis matrix strategy was used for data extraction, which was used for the analysis and discussion of the results. The findings are included in Table 2. No discrepancies were found, confirming Scopus and Ebsco as the most comprehensive datasets. After several iterations and based on the research questions of the present study, the following search sequence was identified as the broadest and most effective for retrieving relevant articles.

Stage 3 - Reporting and Disseminating: The report was prepared based on the analysis and discussion of the results as presented below.

4 RESULTS AND DISCUSSION

This section presents the results obtained from the analysis and synthesis of the 21 articles related in Table I.

Table 1

Author	More humane, intelligent and sustainable cemeteries
[14]	An important consideration reported is about the location of cemeteries and their relative universality and permanence. Therefore, the issue of planning the location and design of cemeteries should be of special interest to the general public.
[15]	Public policies should ensure that legal standards are met in the construction of facilities to accommodate future burials, catering to all economic classes.
[16]	Article 25 of the Universal Declaration of Human Rights defines the right of everyone to "a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services." In this context, proper disposal can be interpreted as a necessary social service.
[17]	After recognizing the cultural, historical, and artistic importance of the cemetery, along with its natural value, "the main objective was to bring it back to public consciousness, introducing new forms of use. It's important to note that recreational and tourist use of

Author	More humane, intelligent and sustainable cemeteries
	cemeteries is partially interconnected because the green potential of a cemetery determines the interest in it (for example, visits for botanical value).
[18]	In Muslim cemeteries, for example, it is allowed to integrate cemeteries with recreational areas as long as their sanctity is preserved. There are limitations on recreational activities that can be conducted there, and only the area with severe land scarcity is authorized to do so.
[19]	The authors understand that there is an international body of evidence demonstrating the myriad roles of cemeteries beyond disposal and bodily remembrance. These roles include their value as recreational spaces similar to parks and for nature conservation.
[20]	Despite the purpose of cemeteries, it is necessary to consider that they often go beyond the need for a burial space to become a religious and sacred place for permanence and pilgrimage, as well as a place to demonstrate civic pride that also provides recreational amenities. Therefore, they have multiple social and political meanings, and their design holds significant cultural significance and provides insights into society and culture.
[21]	The author understands that gentrification and unaffordable property prices have led to

Author	More humane, intelligent and sustainable cemeteries
	issues such as urban expansion and the spread of informal settlements and slums in some cities. This is because those who cannot afford housing in certain areas opt for other forms of settlement that are considered relatively cheaper. This is especially true in cities where there is tangible evidence of resistance to adopting modern and technologically oriented solutions to address land scarcity in urban areas, which are seen as available in the contemporary notion of Smart Cities.
[22]	It is essential for society as a whole to understand sustainability as the primary alternative for production. Therefore, the resources taken from nature need to be used wisely. We can no longer consume just for the sake of consumption; a critical approach to our actions is necessary. In this way, it is crucial to comprehend the dimensions that sustainability presents in order to promote practices that are genuinely positive, including within cemeteries.
[23]	There are "green burial" sites where embalming is not allowed, and bodies are placed in coffins made of biodegradable materials such as willow or wrapped in a simple shroud.
[24]	The author explores some practical solutions that could be

Author	More humane, intelligent and sustainable cemeteries
	implemented to encourage green burials and how local governments can help make these greener options more accessible through permits, park fees, tax credits, mixed-use spaces, and the legalization of innovative options such as aquamation and human composting.
[25]	The author states that in the changing metropolitan landscape, cemeteries can become islands of biodiversity conservation. Due to their size, habitat heterogeneity, and continuity, cemeteries play a significant role in urban biodiversity conservation. Similarly, it's important to highlight that the educational and cultural value/role of cemeteries would be enhanced if special plants were "labeled" and animal habitats were marked. This would help promote the discovery and understanding of native and exotic plant and animal species.
[26]	For the authors, by establishing the provision of "safe, inclusive, and accessible green and public spaces" as a goal, Sustainable Development Goal 11, "Sustainable Cities and Communities," highlights the crucial role of green areas in environmental and socio-spatial justice in cities working towards sustainability.
[27]	For a long time, philosophical deliberations about the design of cemeteries

Author	More humane, intelligent and sustainable cemeteries
	suggested that they should be designed as parks or forested areas to promote contemplation of nature and direct thoughts towards death. Cemeteries are important for urban ecosystems.
[28]	Indeed, promoting the use of green urban cemeteries has great potential for citizens and a sustainable city
[29]	We can no longer overlook the importance of the contributions that urban forests make to cities and their inhabitants, highlighting the author's words that our urban forests face threats from issues such as rapid urbanization, climate change, and the spread of pests and diseases.

The aim of the synthesis was to identify themes that could address the question of what are the main problems of traditional cemeteries in urban centers. Data synthesis was operationalized with the assistance of thematic analysis proposed by [30]. Thematic analysis enabled the identification and coding of themes throughout the entire process of reading and analyzing the articles.

After the literature review, several differences were found regarding the cult of the dead, depending on each country and culture. However, what stands out are the numerous similarities in the problems faced by cemeteries in the studies presented.

Many of the issues raised in distant regions of the world resonate in the same way in our proposed study object, the cemeteries of Florianópolis. Among them, the lack of interest from public and private sectors in the final resting place of humans is particularly notable. In the debate between the city of the living and the city of the dead, the former is planned while the latter is ignored.

This attitude leads to the belief that the disposal of bodies of those who inhabit the Earth will occur naturally, as if a person, at the end of their life, would fall at the feet of a tree and decompose naturally into the earth.

The result of this literature review is clearly reflected in the problems that this lack of attention from authorities to the cemetery segment causes. The lack of attention is reflected in: cemeteries insufficient for the size of the population, overcrowded cemeteries, poorly maintained cemeteries, clandestine graves, difficulties in reconciling religion and human habitat for leisure, soil pollution from improper human disposal.

Throughout the world, there is a search for a more humane and sustainable model to enable the cemetery segment. New disposal possibilities, such as cremation, do not provide a solution to the problems raised. With the related problem of areas for new cemeteries, which are rare and increasingly limited green areas for the leisure of urban populations, could we solve both issues by transforming existing cemeteries into new green cemetery-parks?

This is the question we leave for possible new research and discussion.

Therefore, for a city to be more humane, it needs:

- Respect for Cultural and Religious Differences - The formation and administration of the cemetery should take into account the different religious beliefs and cultural traditions of the community; and
- Social Justice - It is important to ensure that the cemetery is accessible to all, regardless of socioeconomic status. Planning should include measures to prevent discrimination and ensure dignity in burial.

To be smarter:

- Integration of Recreation Areas - As seen in Muslim cemeteries, it is possible to integrate recreational areas without compromising the sanctity of the site. This may involve technology to keep areas separate or inform visitors; and
- Information Systems - An efficient management system that can be accessed digitally can facilitate the process of finding burial locations, understanding associated fees, and even visualizing genealogies.

To be sustainable, it needs:

- Eco-Friendly Burial - Implement areas where embalming is not allowed, and coffins are made of biodegradable materials, contributing to a smaller environmental impact;
- Ecosystem Preservation - The cemetery can be planned to preserve the local flora and fauna, acting as an urban green space, and finally,
- Resource Management - Use solar energy for site maintenance, rainwater harvesting systems for irrigation, among other energy efficiency measures.

These are just starting points and can be expanded with more research and detailed planning. The ultimate goal should be to create a space that honors the deceased, meets the needs of the living, and minimizes the impact on the planet.

5 FINAL REMARKS

We are witnessing an unprecedented digital expansion that has the potential to influence even the most traditional and entrenched aspects of urbanization, such as cemeteries. The sustainability of these places, in times of accelerated change, becomes an urgent issue.

In this new scenario, the reinvention of cemeteries plays a fundamental role in the creation of smart cities. The harmonious integration of cemeteries with the surrounding urban fabric is not only a matter of space but also an opportunity to create more humane and relevant environments that truly contribute to the quality of life of citizens.

Proposals for smart cemeteries emphasize a convergence between urban green spaces, citizens, environmental sustainability, and technological advancements. These are environments designed to promote sustainable coexistence, with projects that incorporate ecology and adaptive and responsive technological systems. The goal is collaborative urbanism that envisions not only a better quality of life but also a more dignified and harmonious transition towards the end of life. Ultimately, the challenge is to design cities and cemeteries that are for the living as well as for those who have departed, reflecting our capacity for adaptation, resilience, and humanity in the face of contemporary challenges.

Thus, the literature review has shown that traditional cemeteries face various problems, such as lack of space due to population growth, environmental contamination from the use of toxic products, public health issues due to poor management, among other concerns.

In this light, a new model of cemeteries integrated into urban planning has been proposed, based on the concepts of sustainability, smart cities, and urban parks. The suggested model features characteristics such as green areas, resource reuse, solar energy, AI-based monitoring systems, virtual memorials, among other innovations.

Certainly, the scope is to minimize environmental impacts, offer a more humane experience to visitors, and contribute to the sustainable development of cities by transforming traditional models into smart and sustainable cemeteries. The implementation of this new paradigm requires interdisciplinary research and partnerships between the government, private sector, and academia. There are opportunities to develop innovative technological solutions and integrate them into urban planning.

Therefore, this article emphasizes the importance of reviewing public procurement processes to facilitate the acquisition of sustainable technologies and the participation of new actors, such as startups and entrepreneurs.

In conclusion, a change in mindset and the incorporation of concepts such as sustainability, innovation, and respect for nature are necessary for cemeteries to become more humane and integrated spaces within cities.

ABSTRACT

In the present investigation, several specialized secondary metabolites were extracted and identified to combat entomological pests and the nutritional aspects of three plant species were analyzed. Three wild plants were evaluated: castor-oil plant (*Ricinus communis*), sweet acacia (*Vachellia farnesiana*) and pink grass (*Rhynchelytrum repens*). The pure extracts were evaluated with the following specialized secondary metabolites analysis: flavonoids, sterols, triterpenes, phenols, quinones, saponins, catechins, tannins, triterpenes and anthocyanins. Macronutrient and micronutrient analyses of the extracts of the three plants extracts of castor-oil plant (*Ricinus communis*), sweet acacia (*Vachellia farnesiana*) and pink grass (*Rhynchelytrum repens*) were evaluated with the following methods. The Dumas method was used to analyze the percentage of nitrogen (w/w); the microwave ICP-OES (Inductively Coupled Plasma/Optical Emission Spectrophotometer) method was used to analyze the percentages of macronutrients in percentage (w/w) of phosphorus, potassium, calcium, magnesium, sulfur and sodium (mg/kg) and the percentage of chlorine with silver nitrate/argentometry. Micronutrient analyses of plant extracts were evaluated by microwave digestion/ICP-OES digestion in mg/kg of iron, zinc, manganese, copper, boron, nickel and molybdenum.

RESUMO

Na presente investigação, vários metabólitos secundários especializados foram extraídos e identificados para combater pragas entomológicas, e os aspectos nutricionais de três espécies de plantas foram analisados. Três plantas silvestres foram avaliadas: higuierilla (*Ricinus communis*), huizache (*Vachellia farnesiana*) e capim-rosa (*Rhynchelytrum repens*). Os extratos puros foram avaliados com a seguinte análise de metabólitos secundários especializados: flavonóides, esteróis, triterpenos, fenóis, quinonas, saponinas, catequinas, taninos, triterpenos e antocianinas. As análises de macronutrientes e micronutrientes dos extratos das três plantas higuierilla (*Ricinus communis*), huizache (*Vachellia farnesiana*) e capim-rosa (*Rhynchelytrum repens*) foram avaliadas com os seguintes métodos. O método de Dumas foi utilizado para analisar a porcentagem de nitrogênio (p/p); o método ICP-OES (Espectrofotômetro de Emissão Óptica/Plasma Acoplado Indutivamente) por micro-ondas foi utilizado para analisar as porcentagens de macronutrientes em porcentagem (p/p) de fósforo, potássio, cálcio, magnésio, enxofre e sódio (mg/kg) e a porcentagem de cloro com nitrato de prata/argentometria. As análises de micronutrientes dos extratos vegetais foram avaliadas por digestão por micro-ondas/digestão ICP-OES em mg/kg de ferro, zinco, manganês, cobre, boro, níquel e molibdênio.

RESUMEN

En la presente investigación se extrajeron e identificaron varios metabolitos secundarios especializados para combatir plagas entomológicas y se analizaron los aspectos nutricionales de tres especies vegetales. Se evaluaron tres plantas silvestres: la higuierilla (*Ricinus communis*), el huizache (*Vachellia farnesiana*) y la hierba rosa (*Rhynchelytrum repens*). Los extractos puros se evaluaron mediante el análisis de los siguientes metabolitos secundarios especializados: flavonoides, esteroides, triterpenos, fenoles, quinonas, saponinas, catequinas, taninos, triterpenos y antocianinas. Los análisis de macronutrientes y micronutrientes de los extractos de las tres plantas —higuierilla (*Ricinus communis*), huizache (*Vachellia farnesiana*) y hierba rosa (*Rhynchelytrum repens*)— se evaluaron con los siguientes métodos. Se utilizó el método de Dumas para analizar el porcentaje de nitrógeno (p/p); el método ICP-OES (plasma acoplado inductivamente/espectrofotómetro de emisión óptica) por microondas se utilizó para analizar los porcentajes de macronutrientes en porcentaje (p/p) de fósforo, potasio, calcio, magnesio, azufre y sodio (mg/kg) y el porcentaje de cloro con nitrato de plata/argentometría. Los análisis de micronutrientes de los extractos vegetales se evaluaron mediante digestión por microondas/ICP-OES en mg/kg de hierro, zinc, manganeso, cobre, boro, níquel y molibdeno.

Palabras clave: Metabolitos Secundarios Especializados. Interacción Planta-Metabolito-Insecto. Calidad de los Nutrientes

1 INTRODUCTION

Secondary metabolites play an important role in protecting plants against various environmental stresses and insect pest emergence [1]. It has been estimated that approximately 100,000 secondary metabolites have been described in different plant species and are classified into multiple groups, nitrogen-containing compounds, terpenes, thiols, and phenolic compounds [2]. Focusing on the new model of plant-metabolite-insect interactions may represent a useful approach to find a new generation of organic bioinsecticides. Indeed, plants produce allelochemicals such as phenolic compounds, alkaloids and terpenoids targeting the behavior and physiology of hexapod arthropods. Thus, several compounds belonging to the above chemical classes may represent ideal ingredients for developing sustainable integrated pest and vector management programs. Minimal research has been conducted on nutritional and phytochemical analysis as well as biological evaluation of secondary metabolites of plant origin. Badaleменти et al. (2022) carried out work on the isolation and structural elucidation of several bufadienolides from *Drimia panchratium* and evaluated their acaricidal activity against a serious agricultural pest, *Drimia panchratium*, the two-spotted spider mite, *Tetranychus urticae* [3]. Regarding the lethal and sublethal effects of plant-based insecticides and acaricides, Ebadollahi et al. (2022) evaluated the efficacy of some essential oils of *Thymus* species against the stored-produce beetle *Rhyzopertha dominica* [4]. On the other hand, Changbunjong et al. (2022) investigated the fumigant activities and contact toxicity of bitter orange (*Citrus aurantium*) essential oil against the stable fly *Stomoxys calcitrans* [5]. Plata-Rueda et al. (2021) studied the sensitivity and behavioral response of the mealworm *Tenebrio molitor* to oregano (*Origanum vulgare*) essential oil [6]. Walker, (2020) tested three Apiaceae essential oils, namely anise (*Pimpinella anisum*), dill (*Anethum graveolens*) and fennel (*Foeniculum vulgare*) against *Lymantria dispar*, showing them as potential agents for gypsy moth control [7]. Song and Zhou (2020), highlighted the promising toxicity of essential oils extracted from plant species from Chilean Patagonia and Cameroon against agricultural (*Spodoptera littoralis*) and public health (*Culex quinquefasciatus* and *Musca domestica*) insects [8]. On the other hand, color pigmentation patterns can be indicative of cuticular damage in the exoskeleton of insects of the order Odonata [9]. Therefore, in the present investigation, several special secondary metabolites were extracted and identified to combat entomological pests, and the nutritional aspects of three plant species were analyzed. The objectives of this research are to analyze the content of secondary metabolites by phytochemical analysis and the nutritional content of the extracts of higuierilla (*Ricinus communis*), huizache (*Vachellia farnesiana*) and pink grass (*Rhynchelytrum repens*).

2 MATERIAL AND METHODS

2.1 COLLECTION OF BIOLOGICAL MATERIAL

Three types of wild plants were collected: higuierilla (*Ricinus communis*), huizache (*Vachellia farnesiana*) and pink grass (*Rhynchelytrum repens*) pathogen- and disease-free in Zamora, Michoacan, Mexico (Figure 1-2).

Figure 1

*Biological sample collection. (a) Phenotype aspect of higuierilla (*Ricinus communis*), (b) Phenotype aspect of huizache (*Vachellia farnesiana*) and (c) phenotype aspect of pink grass (*Rhynchelytrum repens*) in Zamora, Michoacan, Mexico*

Source: Authors (2025).

2.2 DRYING OF PLANT MATERIAL

The biological samples of higuierilla (*Ricinus communis*), b) huizache (*Vachellia farnesiana*) and c) pink grass (*Rhynchelytrum repens*) were dried on newspaper for 10 days and then in a drying oven (mod. Novatech) for 72 hours at 34 oC with the objective of dehydration in

order to obtain the extracts for secondary metabolite analysis. The analyses were performed in triplicate.

2.3 PHYTOCHEMISTRY ANALYSIS

2.3.1 Flavonoids analyses

Ammonia method. 0.1 g of each plant was weighed in triplicate in an analytical balance (brand). To obtain crude extracts, 10 ml of ethyl alcohol was added and allowed to stand for 30 min. After this period of time, to obtain pure extracts, the plant samples were filtered with Whatman filter paper no. 1, 3 ml of ammonia (NH₃) was added [10].

Alkali action. 0.1 g of each plant was weighed in triplicate in an analytical balance (brand). To obtain crude extracts, 5 ml of distilled water was added and allowed to stand for 30 min. After this period of time, to obtain pure extracts, the plant samples were filtered with Whatman filter paper no. 1, 3 ml of sodium hydroxide (NaOH) was added [11].

Shinoda reaction with the magnesium method. Pure extracts consisting of 5 ml of ethanol and 5 ml of methanol were prepared. 0.5 g of powder of each biological sample was weighed. The crude extract was allowed to stand for 30 min. After 30 min, 3 ml of the pure extract was placed in each test tube to add 0.1 g of magnesium filings and 3 drops of hydrochloric acid (HCl). The test is positive if the extract shows bubbling and turns orange. Shinoda assay this is used for flavonoids with a benzopyrone core in their structure, such as flavones, flavonols benzopyrone nucleus such as flavones, flavonols, flavanones, etc. produce reddish colorations when in aqueous or alcoholic solutions. aqueous or alcoholic solutions.

Sterols and triterpenes with the Salkowski method. Pure aqueous extracts were used. 1 ml of sulfuric acid (H₂SO₄) was added, the test is positive if the extract turns red or yellow for the detection of sterols or methylsterols.

Phenol detection with the ferric chloride method. 1.25 grams of ferric chloride (FeCl₃) was weighed. It was diluted in 8.75 ml of distilled water. It was left to rest for 30 minutes. It was filtered after 30 minutes and 3 drops of ferric chloride solution were added to the pure aqueous extract. The test is positive if the transition of the vire is from dark green to indigo blue is the presence of phenols; if it is full blue it is hydrolyzable tannins and if it turns dark green it is condensed tannins.

Quinones with the methanol and ethanol method. Pure leaf extracts were prepared. 0.5 g of powder of each leaf was rested, 5 ml of distilled water and 5 ml of methanol were added. The sample was filtered and allowed to stand. After 30 min, 1 ml of sulfuric acid (H₂SO₄) was added. If the extract turns red, the test is positive for the presence of quinones.

Saponins with the foam method. Pure methanol extracts were made from a) higuerilla (*R. communis*), b) huizache (*V. farnesiana*) and c) pink grass (*R. repens*). We weighed 0.5 g of powder from each plant, added 5 ml of methanol and left to stand for 30 minutes. After 30 minutes, 1 ml of pure extract was added followed by the addition of 9 ml of distilled water, each sample was placed in a screw cap test tube [12]. The tube was shaken vigorously by hand and allowed to stand for 15 minutes. The results are interpreted as follows:

Table 1

Interpretation of the volume of saponin foam

Foam area	Interpretation
<i>Foam formation greater than 15 mm</i>	<i>High content of saponins: test is positive</i>
<i>Foam formation between 5 to 10 mm</i>	<i>Moderate saponin content: test is positive</i>
<i>Foaming less than 5 mm</i>	<i>Less than 5 mm the test is negative: there is no presence of saponins.</i>

Catechin compounds with the formaldehyde method. Pure alcoholic extracts were prepared. We weighed 0.5 g of leaves and added 5 ml of ethanol and 5 ml of methanol. It was left to stand for 30 min. It was filtered to obtain the pure extract. Then, 5 ml of formaldehyde was added, followed by the addition of 10 drops of hydrochloric acid (HCl). Subsequently, a water bath device was placed. The formation of a precipitate reflects the content of a cationic tannin; the presence of spots or floating compounds reflects the presence of pyrogalllic tannins.

Tannins with the grenetin method. A 1% solution of grenetin was prepared in distilled water. Subsequently, 10 ml of the prepared grenetin solution was added in a test tube and 10 ml of sodium chloride (NaCl) was added over the pure aqueous extract (5 ml). The test is positive with the presence of a precipitate [12].

Triterpenes with the chloroform method. Pure ethanolic leaf extracts were made. 0.5 g of powder of each extract was weighed. Five ml of ethanol was added and left to stand for 30 minutes. After 30 min, the crude extract was filtered to obtain the pure extract. 1 ml of chloroform was added. 1 ml of acetic anhydride was added. The extracts were rested on ice and 2 drops of sulfuric acid (H₂SO₄) were added to each test tube. The test is positive if the pure extract turns pink, green, red, blue or purple [12].

Anthocyanins with the isoamyl alcohol method. Crude extracts were prepared with 5 ml ethanol and 5 ml methanol. It was rested for 30 minutes. The solution was filtered to obtain the pure extract. 5 ml of the pure extract was taken and transferred to test tubes. If the pure extract

turns red it is presence of anthocyanins, but if the alcoholic layer does not turn red it is presence of betacyanin.

2.4 NUTRIENT CONTENT

Dumas method was used to analyze the percentage of nitrogen (w/w). The Dumas combustion method is a comprehensive method for determining the total nitrogen content in a usually organic matrix. The Dumas method is based on the principle of destruction of organic matter through combustion under controlled oxygen supply at very high temperatures [13]. A combustion was generated, where the plant sample was incinerated at 900°C in the presence of oxygen. Then, a reduction was generated, where the nitric oxide produced by the combustion was reduced by tungsten to molecular nitrogen. This was followed by a purification stage, where a series of suitable sorbents (silver wool and tungsten) removed interfering constituents such as hydrogen halides and sulfur oxides from the gas mixture stream. The resulting water vapor was condensed and retained by a desiccant agent (phosphorus pentoxide), subsequent to the reduction process, where fine drying proceeds. Finally, nitrogen detection is performed with a thermal conductivity detector which measures the total nitrogen remaining in a carrier gas flow. The Dumas method is a closed system (the operator is not exposed to it) and does not use acids such as sulfuric acid (H₂SO₄), therefore it does not produce hazardous waste and has no operational risks for personnel (Cruz et al. 2007).

Microwave digestion/ICP-OES. Method was used to analyze the percentages of macronutrients and micronutrients. It was carried out by applying microwave waves at elevated temperatures using acid solutions of 10 ml of nitric acid (HNO₃) that serve the function of digesting the organic samples for subsequent analysis (Hackett et al., 2008). Subsequently, the digester tubes were closed and brought into the microwave oven, the equipment was set to a ramp temperature of 200 °C for 15 minutes. The temperature was maintained at 200 °C for approximately 20 minutes and then brought to room temperature for 10 minutes. Once digested, type 1 water was added to the residue and the residue was volumed to 50 ml in another tube for each sample. Once the previous step was completed, the residue was placed in the corresponding tubes for the ICP-OES equipment and filtered if necessary. The total time of digestion lasted 45 minutes a final volume of 50 ml with Water type 1 was used.

Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) conditions. The gas pressure was 100 psi Argon and 100 psi Nitrogen. The flow rate of the gases was: auxiliary gas 0.5 L/min y nebulizer gas 0.5 L/min. The speed of the peristaltic pump: 50 rpm. The reading was carried out for macroelements and microelements.

2.5 STATISTICAL ANALYSIS

For the statistical analysis, the statistical software R studio, version 4.2.2 (2022-10-31) was used. For the specific performance of the principal component analysis, the "FactoMineR" library or package of functions was used; within the same package, the PCA function was used to obtain the "Eigenvalues" or components that summarize the data matrix.

3 RESULTS AND DISCUSSION

3.1 PHYTOCHEMISTRY ANALYSIS

Pohlan et al. (2006), mention that pests are among the most important limiting factors in the productivity of important limiting factors in the productivity of agroforestry systems. These same researchers point out that insect pests are the organisms responsible for 37 to 50% of the are the organisms responsible for 37 to 50% of the losses reported in agroforestry reported in agroforestry worldwide [14]. Brechelt (2004), describes the concept assigned to the term "pest" as follows when an animal, a plant or a microorganism increases its density to abnormal levels and, as a consequence, affects directly or indirectly the human species, either because it harms their health, their comfort, damage to buildings or agricultural, forestry or livestock properties, of which they are or livestock, from which the human being obtains food, fodder, textiles, wood, timber, products, etc. [15].

Qualitative chemical analysis contains relatively simple colorimetric procedures based on chemical transformations with the creation of specific chromophores. The current understanding of plant-insect interaction has had profound consequences in the field of green chemistry research, particularly for its future prospects for the development of new plant-based biorational pesticides [16]. These interactions involve numerous secondary metabolites that may interfere with insect behavior, growth, development or reproduction. The evaluation of the potential bioactivity of natural products against these biological systems is considered of interest, in particular because of the diversity of the hydrocarbon skeletons and the complexity of their functions present in plants [17]. Table 2 shows the results obtained from the extracts of higuerilla (*R. communis*), huizache (*V. farnesiana*) and pink grass (*R. repens*).

An interesting group of secondary metabolites of higher plants are the flavonoid pigments, which are extremely abundant and variable in the degree of oxidation. For this class of compounds a large number of activities have been reported, such as antitumor, antihypertensive, anti-inflammatory, bactericidal, bactericidal, anti-inflammatory, anti-inflammatory, bactericidal or cell stabilizing. Against insects, it has been proved that they have insecticidal activity and growth inhibitory activity, and have been evaluated against a large

number of species, among them *Heliothis virescens*, *Spodoptera exigua*, *Heliothis zea*, *Manduca sexta*, *Amyelosis transitella*, *Ostrinia nubilalis* Hubner, and *Pieris brassicae*. Among the flavonoids that affect development and growth are quercetin, rutin, naringenin, rnaicin, eriodictyol and catechin [18-19].

Flavonoids are important for host recognition and acceptance by adult insects. When an adult female butterfly or moth lands on a plant, she usually walks on the surface of the leaf or stem. The duration of this walk and the onset of the next behavior may depend on the stimuli received from the compounds on the plant surface. Some species start drumming with their forelegs upon contact with a potential contact with a potential host, others lower their antennae.

At least two factors support the claim that flavonoids play a role in insect-plant interactions. At firstly, that flavonoids can modulate insect feeding and oviposition behavior of insects and, second, that the distribution of flavonoids varies among plant species. However, it is necessary to establish whether the distribution specific flavonoids overlaps with the presence or absence of these flavonoids in host and/or non-host plants. Aldehydes are straight-chain chemical compounds that are saturated (single bond) or unsaturated (double bond) with the carbonyl functional group responsible for the insecticidal activity, such as propanal, 2-methyl-2-butenal and 2-methyl-2-butenal. The biological activity of aldehydes activity lies in acting as a bioinsecticide and with phytotoxicity against insects that insects that attack fruits, vegetables and grains. This functional group can be used as a post-harvest insecticidal control agent, eliminating 100% of the aphid pests that attack grains, with undetectable damage to the functional characteristics of the products tested [20].

Monoterpenes are secondary metabolites biosynthesized in plant essential oils [21]. They consist of an isoprene base structure and, when they contain oxygen, they are structuralize into terpenoids. The insecticidal and acaricidal activity of polyhalogenated monoterpenes obtained from *Plocamium cartilagineum* was demonstrated against insects such as *Spodoptera frugiperda*, a larva that damages corn, sugarcane or on corn, sugar cane or onion; *Heliothis virescens*, larva that damages tobacco, cotton or tomato; and tobacco, cotton or tomato and *Aphis fabae*, an aphid or bean aphid that can also affect beets, among others. Argandoña et al. (2000) isolated two halogenated monoterpenes; mertensene and violacene, obtaining also two derivatives of the first one; dibromomertensene and dihydromertensene, to test their insecticidal activity against insecticidal activity against the tomato larvae *Tuta absoluta* and the cereal aphid *Schizaphis graminum*. When the compounds were tested against tomato larvae, 100% mortality was observed when mertensene was applied and 80% for mertensene and, 80% for violacene and dibromertensene (obtained by the addition of 2 bromides in the double bond of mertensene). In the case of for aphids, violacene showed 92% mortality and the other compounds did not show the other compounds did not show effectiveness at any of the concentrations used. concentrations used [22-27].

3.2 PRINCIPAL COMPONENTS ANALYSIS OF NUTRIENT CONTENT

The Inductively Coupled Plasma (ICP) is an ionization source that together with an Optical Emission Spectrophotometer (OES) constitutes the ICP-OES equipment. In this equipment, ICP (inductively coupled plasma) is used to generate excited atoms that emit electromagnetic radiation upon return to their ground state. The wavelength of this radiation is characteristic of

each element (macroelements and microelements), being a very selective technique. The amount of radiation emitted is proportional to the concentration of the analyte. This fact allows, after comparison with standards, to quantify the analyte content with accuracy and precision [28-29]. Induction plasma is an ionized gas (plasma source) containing free electrons and cations that operates under conditions of high temperatures and low pressures, usually operated by a free radiofrequency generator. [30-31].

The elements three asterisks in each column mean that they are the nutritional elements in which each plant stands out for having a greater presence in comparison with the others; those into two asterisks are the nutritional elements that it shares with those next to it and in one asterisk the nutritional elements with the lowest concentration in that plant (Table 3).

Table 3

Macroelement and microelement concentrations (mg/kg)

Elements	Pink grass (R. repens)	Huizache (V. farnesiana)	Higuerilla (R. communis)
N	25,600.00*	35,200.00***	41,400.00***

The three plant extracts samples are found in different quadrants (Figure 5). The higuerilla is found in quadrant one, standing out for the dominance of elements such as manganese, copper and nickel. In contrast, iron seems to be the most deficient element for higuerilla. This same plant has similar amounts of phosphorus, potassium and zinc against rosado grass, due to its location in quadrant IV adjacent to it. The pink grass only stands out in one element which is molybdenum, it can be seen that it is the plant with the highest amount of this element, also

for zinc. The opposite quadrant to IV is II, therefore, it can be said that pink grass is the most deficient of the three biological samples in the following elements: nitrogen, calcium and sulfur for macroelements. As for the microelements they are: sodium, boron and nickel (Figure 6). Next, analyzing quadrant III we can find huizache, which stands out for containing a high concentration of elements such as iron, magnesium (2,600 mg/kg), but in this last one it does not seem that the difference is so high in comparison with the other two plants higuerrilla (2,400 mg/kg) and pink grass (2,300 mg/kg). Finally, the element chlorine appears in the middle, since in none of the samples its presence was reported, giving a result of 0 mg/Kg.

Source: Authors (2025).

Figure 6

Principal Components Analysis graph of individuals plants, higuerrilla (R. communis), b) huizache (V. farnesiana) and c) pink grass (R. repens)

Source: Authors (2025).

The higuerilla plant is rich in microelements such as manganese, copper and nickel compared to the other two, and in macroelements such as nitrogen. The pink grass has high amounts of microelements such as zinc and molybdenum, and does not stand out with high concentrations of any macroelements, but rather seems to have the lowest concentration of nitrogen, calcium and sulfur. Likewise, it is deficient in microelements such as sodium, boron and nickel. The huizache plant only stands out for being the one with the highest concentrations of calcium and iron. For most of the microelements such as manganese, copper, nickel and molybdenum, it is the plant with the lowest amounts, and for the three plants there is no chlorine and similar amounts of magnesium ranging from 2,300 mg/kg to 2,600 mg/kg. As for the elements phosphorus and potassium, pink grass and higuerilla have similar values, for the first element from 3,100 to 3,700 mg/kg. On the other hand, for the second element, potassium, the values range from 14,600 to 17,400 mg/kg. The higuerilla and the pink grass can complement each other well to make a mixture high in microelements such as: manganese, copper, boron, nickel and molybdenum.

Rani et al (2023) analyzed the methanolic leaf extract of *Thalictrum foliolosum* by ICP-MS technique to trace mineral elements and the result revealed the presence of important micronutrients such as manganese (Mn), iron (Fe), zinc (Zn), chromium (Cr), copper (Cu) and potassium (K). These minerals are cofactors for more than 3,000 regulatory enzymes of various metabolic pathways [32]. Wieczorek, et al (2022) mention that ICP-OES is an advanced instrumental method that allows less expensive and less time-consuming trace element analysis with adequate higher precision and repeatability evaluation [33]. Trimmel et al, (2023) analyzed seven certified reference materials for plants: apple tree leaves, peach tree leaves, hay powder, aquatic plant, twigs and leaves of bush, spinach leaves and green tea to determine their mass fractions of 48 elements by ICP-MS/MS, which were lithium (Li), beryllium (Be), sodium (Na), magnesium (Mg), aluminum (Al), calcium (Ca), vanadium (V), chromium (Cr), manganese (Mn), iron (Fe), cobalt (Co), nickel (Ni), copper (Cu), zinc (Zn), gallium (Ga), germanium (Ge), arsenic (As), Se, rubidium (Rb), strontium (Sr), iodine (I), Nb, molybdenum (Mo), silver (Ag), cadmium (Cd), Sb, tellurium (Te), barium (Ba), La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Ta, Tl, lead (Pb), Bi, Th and U [34]. On the other hand, Sadee et al. (2023) evaluated the concentration of various metals in vegetables of common local consumption by ICP-MS, these analyzed plants were tarragon, laurel, dill, Syrian mesquite, vine leaves, thyme, arugula, basil, common purslane and parsley. The concentration ranges analyzed were: 76-778 for aluminum (Al), 10-333 for boron (B), 4-119 for barium (Ba), 2812-24645 for calcium (Ca), 0.1-0.32 for cobalt (Co), 201-464 for iron (Fe), 3661-46400 for potassium (K), 0.31-1.53 for lithium (Li), 860-

14330 for magnesium (Mg), 16.20-71.5 for manganese (Mn), 612-4725 for sodium (Na) and 15.8-46 $\mu\text{g g}^{-1}$ for zinc (Zn) [35]. Sultana et al. (2022) compared the results obtained in the determination of the content of essential elements such as manganese (Mn), iron (Fe), copper (Cu) and zinc (Zn) in plant samples using different analytical approaches, as well as the most commonly used spectroscopic methods in the field of plant analysis, such as acid digestion in combination with atomic emission (AES) and atomic absorption spectrometry (AAS), being the analysis by inductively coupled plasma optical emission spectrometry (ICP-OES) a sustainable and rapid analytical alternative [36]. Sukru et al. (2022) determined trace metal concentrations of magnesium (Mg), iron (Fe), copper (Cu), lead (Pb), chromium (Cr), arsenic (As), nickel (Ni), zinc (Zn), and Selenium (Se) in dried red plum samples from Turkey. These were determined by ICP-OES technique after solubilization in microwave digestion methods. The concentrations of the elements in dried red plum samples were 44-47 of magnesium (Mg), 15-18 of iron (Fe), 03.1-3.2 of copper (Cu), 4.1-4.4 of lead (Pb), 1.4-1.6 chromium (Cr), 1.1-1.3 arsenic (As), 2.5-2.8 nickel (Ni), 3.4-3.7 zinc (Zn) and 4.2-4.5 selenium (Se) at $\mu\text{g/g}$ concentrations [37].

4 CONCLUSIONS

The specialized secondary metabolites detected in higuerilla (*R. communis*) were: chalcones, auronos, flavonols, sterols, condensed tannins, saponins and triterpenes. The specialized secondary metabolites detected in huizache (*V. farnesiana*) were: flavones, flavonols, sterols, condensed tannins, saponins and triterpenes. The specialized secondary metabolites detected in pink grass (*R. repens*) were: flavones, flavonols, methylsterols, phenols and triterpenes. With respect to the metallome of the extracts analyzed by the ICP-OES technique, whose method determined quickly and with high precision the trace elements, it was quantified that the higuerilla plant is rich in microelements such as manganese, copper and nickel compared to the other two, and in macroelements such as nitrogen. The pink grass has high amounts of microelements such as zinc and molybdenum, and does not stand out with high concentrations of any macroelements, but rather seems to have the lowest concentration of nitrogen, calcium and sulfur. The huizache plant only stands out for being the one with the highest concentrations of calcium and iron.

Gustavo Henrique Ferrari Martins¹, Gilberto Vieira²

ABSTRACT

The present article explores nuclear energy in the context of the Brazilian electrical system, beginning with a global overview that highlights the importance of this energy source in the global energy matrix, emphasizing its crucial role in diversifying energy sources and mitigating carbon emissions. The study also examines this global perspective and the specific situation in Brazil, where the contribution of nuclear energy remains modest. Furthermore, the inherent qualities of this source are noted, such as its energy density and its capacity to provide a continuous and reliable energy supply. Additionally, the associated benefits are analyzed, including the reduction of dependence on fossil fuels and the decrease in greenhouse gas emissions. However, the risks involved are also addressed, such as the management of radioactive waste and the potential for nuclear accidents. Thus, there is a balance observed between the qualities and potential risks of this alternative, enabling the implementation of strategies to ensure energy security within the Brazilian electrical system.

Keywords: Nuclear Energy. Electrical System. Energy Diversification. Carbon Emissions.

RESUMO

O presente artigo explora a energia nuclear no contexto do sistema elétrico brasileiro, iniciando com um panorama global que ressalta a importância dessa fonte energética na matriz elétrica mundial, sublinhando seu papel crucial na diversificação das fontes de energia e na mitigação das emissões de carbono. O estudo também examina essa visão global e a situação específica do Brasil, onde a contribuição da energia nuclear ainda é modesta. Ademais, constata-se as qualidades inerentes a essa fonte, como sua densidade energética e a capacidade de fornecer uma energia contínua e confiável. Além disso, são analisados os benefícios associados, incluindo a redução da dependência de combustíveis fósseis e a diminuição das emissões de gases de efeito estufa. Contudo, também são abordados os riscos envolvidos, como a gestão de resíduos radioativos e o potencial para acidentes nucleares. Assim, observa-se uma ponderação acerca das qualidades e eventuais

RESUMEN

El presente artículo explora la energía nuclear en el contexto del sistema eléctrico brasileño, iniciando con un panorama global que destaca la importancia de esta fuente energética en la matriz eléctrica mundial, subrayando su papel crucial en la diversificación de las fuentes de energía y en la mitigación de las emisiones de carbono. El estudio también examina esta visión global y la situación específica de Brasil, donde la contribución de la energía nuclear aún es modesta. Además, se constatan las cualidades inherentes a esta fuente, como su densidad energética y la capacidad de proporcionar una energía continua y confiable. Asimismo, se analizan los beneficios asociados, incluyendo la reducción de la dependencia de combustibles fósiles y la disminución de las emisiones de gases de efecto invernadero. No obstante, también se abordan los riesgos involucrados, como la gestión de residuos radiactivos y el potencial de accidentes nucleares. De este modo, se observa una ponderación acerca de las cualidades y los eventuales riesgos de esta alternativa, possibilitando la implementación de estrategias para garantizar la seguridad energética en el sistema eléctrico brasileño.

Palabras clave: Energía Nuclear. Sistema Elétrico. Diversificación Energética. Emisiones de Carbono.

1 INTRODUCTION

The history of nuclear energy, according to Passos *et al.* (2011) is intrinsically linked to the development of humanity, as the philosophers of Ancient Greece were pioneers in formulating the idea that matter is made up of atoms. Not only relevant names such as Marie and Pierre Curie and leading advances that made the understanding and application of this energy source possible. However, it was not until the 1930s that scientists observed the potential of nuclear fission, paving the way for numerous transformations and advances. Nevertheless, the Manhattan Project corroborated significantly, since it aimed to obtain the nuclear bomb and, due to this, intensive investments were made to achieve this objective. This organization had great names in science, such as Enrico Fermi and Niels Bohr, and was led by Robert Oppenheimer, popularly known as the "father of the atomic bomb".

Nuclear energy, according to Eletronuclear (2024), consists of a form of energy derived from the atomic nucleus, being characterized by the release of a significant amount of energy during nuclear processes and presents nuclear fission and nuclear fusion as its main phenomena. Nuclear fission is based on splitting the nucleus of an atom into smaller fragments releasing energy. Nuclear fusion, on the other hand, is based on the combination of two nuclei and, consequently, on the release of energy.

For the generation of nuclear energy, according to the Nuclear Energy portal (2024), specific raw materials are used, especially the radioactive isotope uranium-235. Uranium-235 is crucial in nuclear fission processes in nuclear reactors, as it has a high susceptibility to fission and therefore results in the release of energy. Also, to ensure an efficient procedure, it is necessary to enrich uranium to increase the concentration index of the isotope uranium-235, since, under natural conditions, only a small portion of this element is composed of this isotope.

Today, that is, nowadays, the use of this energy source as an alternative worldwide, since global warming puts pressure on the use of fossil fuels and, for these reasons, the nuclear source is an interesting option, as Gomes (2017) elucidates. Undoubtedly, this source plays a strategic role in the global panorama, providing an energy component that can meet world demand in an efficient and sustainable way. Together, the diversification of energy sources is crucial to reduce dependence on fossil fuels and contribute to energy security. Likewise, it provides an increase in energy security by reducing the country's vulnerability to fluctuations in fuel prices and supply interruptions. Therefore, safe production is essential for energy autonomy, positively impacting the economy and, for this, it is imperative to achieve strict standards of waste management and safety.

2 GLOBAL OVERVIEW

This aspect plays a fundamental role in the global energy landscape, being an indispensable source for many countries. Currently, the world has a diversified electricity matrix and, according to EPE (2023), it is mostly composed of mineral coal and natural gas. Therefore, Figure 1 shows the substantial participation of fossil fuels and the complementarity of renewable sources such as solar, wind, hydroelectric and the significant contribution of nuclear sources.

Furthermore, as mentioned earlier, nuclear energy is indispensable for some countries, making them significantly dependent on this source. In this way, it is feasible to observe the energy situation in France, where this source represents 70% of the generation capacity, as presented by Bhutada (2022). In addition, this energy source accounted for 2,553 TWh of global energy production, led by the United States of America (30.9%), China (13.5%) and France (13.3%).

Figure 1

World Electricity Matrix

Source: The authors.

Not only that, it is a feasible alternative for the reduction of fossil fuels that are aggressive to the environment and, in addition, certain countries have a greater allocation to nuclear energy due to issues such as high energy efficiency and geoFigureical aspects. Thus, the relevance of this supply alternative is reiterated, since nations such as France, Slovakia and Ukraine have, respectively, 70.6%, 53.1%, and 51.2% of their energy matrix in this source. However, still cited by Bhutada (2022), there are 448 nuclear reactors in operation in the world, 96 in the USA, 58

in France, and 50 in China. Moreover, the prospect is for expansion, since China plans to invest 440 billion dollars to build 150 new reactors by 2035.

3 NUCLEAR ENERGY IN BRAZIL

Historically, the Brazilian electricity matrix is diversified and considerably clean, with a tendency to become increasingly renewable, causing wind and solar energy to gain greater share. In addition, Montalvão (2012), the renewable profile guarantees low tariffs and energy security, considering that these sources are inexhaustible. As a result, Brazil has the largest electricity system in Latin America and, consequently, is among the ten largest electricity producers on the planet.

Currently, the matrix consists of various energy sources, such as hydroelectric, wind, thermal, nuclear, photovoltaic and biomass, as illustrated in Figure 2. In addition to this factor, according to Guimarães (2016), it is observed that nuclear energy is a fundamental part of the resolution of the national hydrothermal energy transition. Moreover, it is possible to analyze the fundamental link between energy availability and consumption with the degree of economic development of the country, since such factors are directly proportional. Therefore, in view of the growing energy demand, it is necessary to increase national generation to meet this problem and, due to this, nuclear energy is viable in view of its generational predictability.

In addition, Brazil is one of the countries that has a wide domain over the uranium enrichment cycle and, at the same time, has reserves in its territory. Allied to this, as previously mentioned, the diversification of the electricity matrix ensures a low tariff and, if such a scenario did not occur, Brazil would present a significant increase in tariffs and local industries would lose competitiveness in the international market. Nevertheless, as stated in the National Energy Balance 2024 (2024), nuclear energy represents 1.2% of the entire Domestic Energy Supply (OIE), being generated through the Angra 1 (illustrated in Figure 3) and Angra 2 plants, in addition to the Angra 3 construction project being in progress.

3.1 REGULATORY BODIES

In addition, in the Brazilian electricity sector, there are several regulatory bodies and entities that manage the competent aspects of nuclear energy, however, the following stand out:

- National Nuclear Energy Commission (CNEN): It is responsible for the aspects of nuclear safety, radiological protection and regulation of nuclear activities in the country. Thus, it licenses and inspects nuclear installations, in order to ensure that the operation complies with safety standards;
- National Electric Energy Agency (ANEEL): Its objective is to regulate and supervise the production, transmission, distribution and commercialization of electricity in Brazil;
- National Electric System Operator (ONS): Seeks to coordinate and control the operation of electricity generation and transmission in the SIN (National Interconnected System);
- Ministry of Mines and Energy (MME): Coordinates the country's energy policy and defines the guidelines for the development of the nuclear sector, in line with safety and sustainable development policies.

4 ENERGY EFFICIENCY

The demand for uranium comes from nuclear power plants, consequently, it is the companies that use this element as fuel for their reactors and, on the other hand, the *players* that supply this raw material are the mining companies. In addition, it is noted that the superiority of uranium as an energy source occurs as a result of the level of energy density, one of the main competitive advantages of this alternative. Likewise, Conte (2021) illustrates energy efficiency through a proportionality, where a uranium pellet (about 1 centimeter high and in diameter, with the height being greater than the diameter), is equivalent to 120 gallons of oil, 17,000 cubic feet of natural gas or 1 ton of coal, thus evidencing the high density of the material and, as a result, your generational capacity. However, it is noted that the competitive advantages of this source stimulate its use in the context of energy transition.

In addition, the energy density of uranium is one of the main causes of the increase in demand, since it allows the storage of substantial amounts of the material in a logistics warehouse. In this way, according to Bhutada (2021), it becomes the only energy source capable of being stored under these conditions, corroborating energy security and enabling exponential production from a tiny amount of raw material. Therefore, as Bhutada (2021) explains, due to the high density levels of uranium, it requires, on average, 75 times less space than the photovoltaic alternative and 360 times less land than the wind option. In addition, the relative availability of the material is a fundamental factor in its viability, as it is 37 times more abundant than silver and 700 times more present than gold (Bhutada, 2021).

However, the sustainable aspects of the energy of atomic nuclei are another competitive advantage that this alternative has, especially with regard to CO² emission per Gigawatt hour. Thus, it is observed in Figure 4 the favorable scenario in relation to nuclear energy in view of this issue. (BBC News, 2022).

Figure 3

CO² emission per Gigawatt - Hour

Source: Prepared by the authors.

Additionally, according to the *Corporate Finance Institute* (2024), *Energy Return On Investment*, abbreviated as *EROI*, is a financial indicator that illustrates energy efficiency, as it consists of the ratio between the amount of energy generated by a source and the amount used to obtain this resource. Therefore, it is noted that any number equal to 1 represents the equilibrium point, while values greater than 1 consist of a positive balance. However, as shown by the *Corporate Finance Institute* (2024) and illustrated in Figure 5, the EROI that nuclear energy presents is substantially higher than its peers, and is therefore a competitive advantage.

Figure 5*Energy Returned On Investment*

5 BENEFITS

This type of energy, as well as others, has positive and negative points, however, it is necessary to weigh these aspects rationally to verify its feasibility of implementation. However, nuclear energy has some substantial competitive, economic and strategic advantages and, due to this, it becomes attractive for implementation in certain conjunctures and needs.

A priori, nuclear energy is of great importance to ensure the security of energy supply due to high predictability, generational constancy, storage capacity and independence from climatic factors. Not only that, the expressive density of the material used allows the production of high amounts of electricity through a small amount of raw material and, therefore, as previously discussed, the substantial energy efficiency of this source is noted. Furthermore, according to Montalvão (2012), the use of this source does not emit greenhouse gases, promotes a low release of waste and does not require a significant area for the construction of the plant in relation to other alternatives. In other words, it is possible to analyze the rigidity of the procedures related to the safety of the facilities and the intense process of continuous improvement of them, causing the plants to demonstrate considerable increases in the levels of protection.

In addition, it promotes the diversification of the energy matrix, corroborating the transition movement of this sector. Thus, it is observed that the use of various generational sources is a strategic objective of extreme relevance for numerous countries, since it ensures geopolitical

advantages, increases energy security, reduces vulnerability to fluctuations in international prices and possible interruptions in supply. Therefore, with assertive investment and development policies, nuclear energy can expand its relevance and solidify the national electricity system (Plum, 2024).

Likewise, it contributes significantly to technological development and scientific innovation, as the sector is marked by constant advances in areas such as nuclear physics, engineering, and safety measures and procedures. Therefore, such evolutions are not restricted only to the energy industry, but also have applicability in other fields, such as agriculture through food irradiation techniques, and in medicine, through radiotherapy and other diagnostic imaging. In addition to this factor, Tang (2008) emphasizes that the use of capital destined to investments in energy strengthens the energy infrastructure, promotes scientific and technological progress, positively impacting society.

6 RISKS

The nuclear source has substantial positive aspects; However, it also has negative conjunctures. Among the most well-known risks, those of an economic, physical and strategic nature are observed. At the same time, according to Goldemberg (2008), other energy modalities also employ risks, but not on the same scale as nuclear energy. Consequently, with the nuclear source, the associated problems acquire greater expressiveness.

Economic risks refer to the resources allocated to security and their necessary procedures, which, consequently, reflect on the increase in cost, making it difficult to structure projects to finance these investments. However, bureaucracy and public opposition can cause delays in reactor construction, leading to increased capital expenditure (a type of resources set aside for the purchase of goods to increase production, also known as *CAPEX*) and incurring interest.

In addition, strategic risks, as highlighted by Goldemberg (2008), refer to the geopolitical implications arising from the possession of a nuclear device and, potentially, the allocation of resources for war purposes. As a result, treaties and agreements for nuclear non-proliferation were established, since this issue was the trigger for certain conflicts. In addition, the risk inherent in the acceptance of public opinion is an important factor that must be weighed in decision-making, since there are strong anti-nuclear movements in Brazil and in the world. In addition, the existence of geopolitical risk through military incursions is verified, see the existing situation in Niger and its possible impact on the country's nuclear activity.

In fact, the physical risks consist of possible structural insecurity related to nuclear leaks and explosions. By the way, the concern with the disposal of the material used is latent, since there is no appropriate environment to deposit this material to this day. Likewise, the emblematic episodes of nuclear accidents elucidate the potential danger that these plants, if not managed and built in the right way, can bring. In other words, human history has faced 3 major nuclear tragedies, Chernobyl, Fukushima and Three Mile Island.

Nevertheless, the public acceptance of nuclear power plants, mainly due to the lack of knowledge on the subject, is a factor that should be considered in the analysis of implementation, even if it does not represent impediments in many countries. However, according to Guimarães (2016), the biggest obstacle is the high CAPEX and the difficulties of designing projects to make these long-term investments viable.

First, the Chernobyl incident, explained in Figure 6, happened on April 26, 1986, when the technical team in charge of analyzing the operation of the reactor did not comply with the safety regulations and, in view of the plant's obsolete technology, the reactor showed significant instability and, consequently, affected the explosion of reactor 4. In addition, according to Montalvão (2012), Chernobyl occurred due to a combination of three aspects: government irresponsibility, human error, and outdated technology.

Figure 6

Chernobyl power plant, damaged after the explosion, in a photo from May 1986

Source: G1

In addition, the occurrence of Three Mile Island dated 1979 and shown in Figure 7 was caused by an operational mistake and failure in an equipment. At the same time, the lack of

preventive maintenance and poor qualification of professionals demonstrate the negligence of those responsible in a situation that released a substantial amount of radioactive liquid (water) into a river in the state of Pennsylvania.

Figure 7

Aerial view of the Three Mile Island nuclear power plant near Harrisburg, Pennsylvania, the scene of a nuclear accident

Source: WTOP News

Subsequently, the accident in Fukushima, observed in Figure 8, in which radioactive water leaked into the sea and emitted radioactive gas into the atmosphere, was caused by poor design and planning of the plant's infrastructure. Due to the tsunami that devastated Japan, structural deficiencies came to light and caused severe damage.

Figure 4

Aerial view of the Fukushima nuclear power plant after the explosion

Source: Daily Mail

In addition to the factors explained above, radioactive waste is substantially dangerous to society, since it consists of all waste material that is made up of radioactive chemical compounds. Such waste is obtained from hospitals and nuclear power plants and, in addition, endangers not only human beings, but also nature. As a result, the proper disposal of this content is essential to prevent impacts. Therefore, material with low or medium levels of radioactivity is deposited in underground facilities, commonly in power plants. In addition, high-risk substances are treated through management and confinement for significant periods due to their durability. In addition, in view of the risk aspects discussed above, Eletronuclear (2024) emphasizes the importance of the correct adoption of safety procedures and the constant evolution of nuclear technology, minimizing possibly harmful particularities and corroborating the diffusion of the use of this energy source.

7 CONCLUSIONS

For all that has been exposed throughout this work, the presence and relevance of nuclear energy both in the world electricity matrix and in the Brazilian scenario is evident, thus verifying the strategic role it plays in the diversification of energy sources and in the mitigation of carbon emissions. Not only that, the nuclear source proves to be viable and beneficial, since it presents expressive energy density indexes and corroborates with the increase in predictability in energy generation, acting as an interesting alternative to complement the use of other options.

Above all, in addition to the high efficiency rates, this energy source also has the benefits of high storage capacity, expressive durability and exponentially rigorous safety processes that

contribute to its credibility. In addition, it is imperative to highlight the risks existing in the operation, especially those of a physical, economic and strategic nature that strongly oppose the positive aspects, making it necessary to have a rational consideration to make a decision. Moreover, economic risks are linked to the intensive need for investments to finance these projects, while strategic risks represent the geopolitical issues inherent to the activity. Therefore, physical risks consist of the possibility of an operational failure or accident occurring. Thus, it is noted that even with the existing risks, the qualities of nuclear energy stand out as the demand for energy security and independence grows.

In addition, the high level of acceptance of the population living in areas close to the reactors is reiterated, in addition to positive socioeconomic impacts through the qualified labor and jobs offered. In addition, the strict safety and *compliance* procedures corroborate to expand the use of this energy. Thus, due to the current situation of energy transition and urgency in reducing carbon emissions, nuclear energy behaves as a fundamental alternative for solving the energy supply deficit, as it has substantially higher efficiency rates than other alternatives, in addition to requiring smaller amounts of the land production factor and having the highest EROI. In view of the above, it is found that the nuclear alternative is viable to solve the Brazilian energy problems, since even though it still has a limited participation in the national electricity matrix, the potential and need for growth is remarkable. With this, it is interesting to spend more investments to promote the evolution of the sector and contribute to the assertive realization of the energy transition, obtaining a safe and more capable electricity matrix to supply the existing deficit.

ABSTRACT

Technological development simultaneously drives economic advancement and generates challenges that often exceed the regulatory capacity of existing legal systems. Grounded in critical theoretical perspectives, the paper rejects the notion of neutral technological progress and emphasizes the role of power structures and institutional choices in shaping technological trajectories and their social consequences. Drawing on an interdisciplinary theoretical framework that integrates the political economy of technological progress, legal theory, and methodological approaches to legal research, this study aims to understand key events of the Digital Revolution, the role of integrating different methodological approaches, and to contribute to a more flexible, responsive, and technologically compatible legal approach aligned with the dynamics of contemporary technological development.

1 INTRODUCTION

Technological development has both the power to propel humanity toward its economic peak and the capacity to generate problems that the law is incapable of managing. In the constantly evolving landscape of technological advancement, the transformative potential of emerging technologies (...) is reshaping the foundations of industries and societies (Holland, 2020).

In this sense, an analysis of the perception of the impact of the technological revolution on society, and of how the definitions of Law change as one overlaps the other, becomes essential, since “technological changes are a constant throughout history as are influential people deciding their directions” (Acemoglu and Johnson, 2024, p. 184).

The study of law and information technology comes with an inherent contradiction in that while technology embraces notions such as internationalization and globalization, the law, for the most part, is to a certain extent still confined to national borders (Greenstein, 2022).

Thus, it is necessary to understand the role of different methodological approaches in research concerning Law in the face of advanced technological development and its implications, because at present “the current legal frameworks that regulate emerging technologies reflect a constantly changing landscape, seeking to deal with the rapid evolution of innovations,” attempting to adapt existing legislation to new problems, yet without offering the necessary adaptability and flexibility (Lescrauwaet et al., 2022).

Contemporary scientific literature recognizes that technological development constitutes a structural phenomenon of social, economic, and institutional transformation, whose effects go beyond the technical sphere and directly impact the field of Law. Studies focused on emerging technologies indicate that innovations such as artificial intelligence, blockchain, and biotechnology are reshaping the foundations of industries and societies, altering productive patterns, social relations, and forms of governance (Holland, 2020).

In this context, critical theoretical scholarship rejects the notion of automatic or neutral technological progress, emphasizing that technical transformations are historically conditioned and guided by human and institutional decisions. As argued by Acemoglu and Johnson (2024), technological changes have always coexisted with choices made by powerful actors responsible for defining their trajectories and distributing their benefits and risks. This approach highlights the centrality of power structures in shaping the social impacts of technology.

In the legal field, the literature points out that existing regulatory frameworks face difficulties in keeping pace with the speed and complexity of technological innovations. Recent

research indicates that prevailing regulatory models largely operate through incremental adaptations of preexisting legislation, resulting in partial and often insufficient responses to unprecedented problems (Lescrauwaet et al., 2022). This scenario reveals a mismatch between technological dynamics and the adaptive capacity of Law.

According to Karl Polanyi (2021), Law is a historical-cultural reality resulting from the integration of society, culture, and economics, making it impossible to understand it adequately through a one-dimensional approach. In this sense, the choice of descriptive, analytical, or critical approaches conditions the interpretation of technological phenomena and influences the formulation of legal solutions. Thus, the literature emphasizes the need to examine Law as situated knowledge, historically constructed, and sensitive to social and technical transformations.

Therefore, the theoretical framework of this study is grounded in the convergence of literature on technological revolution, the political economy of progress, and legal research methodology, providing the conceptual foundations necessary to support the hypothesis that current legal models lack sufficient flexibility and adaptability to address emerging technologies.

The data analysis was conducted based on a theoretical framework that articulates Law, technological revolution, and research, aiming to examine Law in light of technological innovations, with the objectives of historically and succinctly describing technological development, understanding the role of different methodological approaches in research concerning Law in the face of the digital revolution, and proposing practical solutions for a more flexible and adaptable approach to the topic.

2 THEORETICAL FRAMEWORK

Polanyi (2021) affirms that unemployed workers are a sign of economic malfunction. Hence, the spread of AI, pervading all sectors, from various types of work to personal life, raises a debate about its use and its social, economic, and legal implications.

Within this context, Acemoglu and Johnson (2024) affirm that AI seems set on a path that may aggravate the world's inequality. Thus, the discussion of whether its course can be changed or redirected towards a more beneficial trajectory, based on equality, empowerment of the people, and both flexible and adaptable norms.

Within this framework, Sunstein (2018) acknowledges the necessity of applying the Cost-Benefit Analysis in the setting of policy making, and understanding the context in which it may be applied. Regarding AI, it needs to be limited without restraining progress, in a way that does not benefit some to the detriment of others.

3 RESULTS AND DISCUSSION

Brief historical examination of key events of the Digital Revolution between 2000 and 2020 and its implications

Technological development, the economy, law, and society are intrinsically connected; although they are usually analyzed separately, in practice, it is hardly possible to separate them. “Technology is the way that collective human knowledge is used to improve nutrition, comfort, and health” (Acemoglu; Johnson, 2022, p.14), thought to be beneficial to society, although often creating a rift between those who have access and those who cannot.

The world Wide Web, developed by Tim Berners-Lee in 1989, was particularly transformative. It introduced the context of hypertext, which allowed users to navigate between different pages and resources through links, making the Internet more user-friendly and accessible to non-technical users. The Web’s introduction led to a dramatic increase in the Internet users, as it became easier for people to find and share information online (Hicks, 2024, p.22).

In this context, with the further development of the internet, from telephone wiring to wireless, alongside mobile communication, it rapidly evolved into the systems now used. Bergström et al (2024) affirmed that it “was built on the transition from circuit-switched to packet-switched data communication networks – a transition that spread across telecommunication domains and dissolved the borders between data and telecommunication”.

Furthermore, with the advent of Social Media, the relationship of people with each other and the Internet changed, as well as the definitions of privacy, image exposition, and fame, once content creation is as rewarded as the arts, economically and concerning public attention. Dhingra and Mudgal (2019) affirm that “as more and more people are becoming dependent on social media for different purposes, in the future also there is likelihood of emergence of even more sophisticated forms of social media which will cover the masses across the world”.

According to Mo and Ouyang (2025, p.512), “GenAI refers to a class of machine learning models typically trained using self-supervised learning and capable of producing outputs that closely resemble human-generated content”. Meaning that it generates a response based on a prompt, using the Internet as a database, and informally providing answers, resembling human behaviour, with no input of critical thought. It is fed on both the information online and shared by the user.

Within this framework, Artificial Intelligence (AI) development comes as a watershed moment, redefining all previous concepts. The use of AI extends to all aspects of contemporary life; Machine Learning was taken to another level; some specialists define it as machines or

algorithms capable of demonstrating “intelligent behaviour” or “advanced capabilities”, although there is not yet a consensus regarding that matter (Acemoglu; Johnson, 2024, p. 403).

Yet, according to Castán (2024), the issue concerning the lack of a concept of AI “may be explained both by the absence of a widely accepted technical definition of AI and by the lack of specific regulation in force, which has led to an absence of applicable legal definitions”. Despite the legal problem, this issue has not prevented its use in different fields, whether for various job applications, for entertainment, or for criminal practices, based on the ease with which the tools can be used.

Understanding the role of different methodological approaches in research concerning Law in the context of the Digital Revolution

The Academy has one of the most important roles as it has the capacity to explain phenomena and foresee possible scenarios concerning them, as well as influence society towards more beneficial paths.

There has been a complete paradigm shift in regard to the production, management and use of data, of knowledge and of information, which are key elements which have always defined and continue to define human relationships, economic structure and the fabric of modern society and science itself (Maiorana, 2025).

In this regard, it is necessary to discuss the methodological approach concerning the crescent development of digital technologies and its implications. The rise of a technology is not inherently beneficial to society as a whole; history proves that milestone moments devoid of human rights and law support often turn into a pretext for exploration, gap areas that previous law has to be adapted into, and economic advantage for an elite group, and not to all. Growth for a few can hardly be considered propitious (Acemoglu; Johnson, 2024).

Hence, the importance of understanding different methodologies regarding research lies in the desired outcome. It is crucial to integrate different fields of knowledge, such as economics, law, and sociology, with the analysis of the new technologies' impact, such as AI, to avoid the misuse of it for the lack of an adequate legal framework, since it “could disrupt the already fragile balance of the world order. This disruption could arise from state competition in AI technology and the application of AI in the military domain, which exists in a “gray zone” of international law and is not regulated” (Kykeyeva; Kurmangali; Aktai, 2024, p.5).

Academia plays a central role in the cultivation and exercise of this type of social power because universities build the perspectives, interests, and skills of millions of talented young people who will work in the technology sector. In addition, top academics often

work with leading tech firms and also directly influence public opinion. We would therefore benefit from a more independent academia (Acemoglu; Johnson, 2024, p.428)

Within this scope, it is paramount to consider the integration of various fields when it comes to the approach used in research concerning the impacts of digital technologies and their repercussions in Law, observing the necessity of norms without risking overregulation, aiming to secure the responsible use instead of restraining advancement. In this case, tools are not the issue, but the way and the purposes for which they are used (Baldassarre *et al*, 2023).

Accordingly, the economic approach is based on the analysis of how different sectors perform in the face of AI (Mo; Ouyang, 2025), presenting both increases in productivity and risks, giving more freedom to employees, and alternative ways of both collecting and processing data. As for social sciences, Baldasserre *et al* (2023, p.363) affirm that “These studies are needed to address potential vulnerabilities and ensure the development of these technologies considers the diverse social contexts and realities in which they are deployed”.

In informatics, sociology, philosophy, and politics, the development of generative models will continue to ignite in-depth discussions on various subjects. These discussions include topics such as regulation, risk mitigation, liability, transparency, and accountability, as well as the effects on socialization patterns and the trajectory of technological development itself (Baldassarre *et al*, 2023).

Within this context, it is important to note that “despite the wide agreement that the latest advances in AI will have disruptive repercussions on the labour market, there is very little evidence for actual integration of AI in the labour market” (Tolan *et al*, 2021). As it is too soon to discern the trends, considering historical trends, the impact of AI on the labour market may be negative, with some undesirable consequences, but the course is yet not set.

3.1 REVOLUTION OF LAW REGARDING TECHNOLOGICAL DEVELOPMENT

Historically, Law is conceived to attend to the necessities of its time, hardly made to prevent or foresee possibilities. It is the product of a need for defense. After the horrors of the Second World War, human rights were catapulted into another dimension, generating new foundations for a world based on equality, raising the question of whether international peace is a product of welfare for the world's citizens or vice versa (Williams, 2025).

Similarly, with the Industrial Revolution, the extensive labor journey, low payments, overpopulation in urban centers, and inhumane conditions of living mobilized the population to discuss salaries and better work conditions. Although industrialization and capitalism have led to better economic outcomes, it also generated an unemployment problem and, consequently,

a growth of external social assistance. Socially, the present population did not follow the establishment of a new era (Polanyi, 2021).

AI appears set on a trajectory that will multiply inequalities, not just in industrialized countries but everywhere around the world. Fueled by massive data collection by tech companies and authoritarian governments, it is stifling democracy and strengthening autocracy (Acemoglu and Johnson, 2024, p. 46).

In this context, observing the changes brought about by generative AI and its implications raises questions about its use and regulation. Shetty *et al* (2025) affirm that “in relation to AI, the regulatory landscape is in a state of constant change and domestically implemented by different governing bodies. These include frameworks based on risk, specific bans, and classification systems”.

Thus, it is possible to understand that a new setting may cause imbalance, but specificity and flexibility are key to regulating its use successfully without impeding progress, and “enhanced international cooperation is necessary to address cross-border AI challenges and harmonize regulatory standards” (Abu-Saqer *et al*, 2024) as well. The current law structure proves insufficient to meet the contemporary demands.

According to Shetty *et al* (2025), “the growing field of AI moderation poses a crucial requirement for assessing the congruence between theoretical frameworks and scholarly forecasts with actual regulatory actions”, which is necessary since the indiscriminate use of AI-based tools results in numerous issues, such as the use of image for criminal purposes, as occurred in 2025, with the arrest of twenty-five people involved in AI generated child pornography (Burgess, 2025).

Hence, using Cost-Benefit Analysis to evaluate the law's applicability and the effects of its outspreads. Sunstein (2018) affirms that “even when it is hard to specify the costs and benefits of a regulation, we might be able to come up with ranges, which can give us enough information to decide if that regulation is worth pursuing”; aiming for the best outcome towards a more balanced and adaptable legal setting regarding digital technologies and generative AI.

The European Commission's proposal for an AI Act was not the first to attempt to introduce or suggest a legal definition of AI, but it has been the most relevant and debated regulatory initiative for the regulation of AI since it was published in April 2021, being the first initiative trying to comprehensively regulate the development and use of AI systems at a supranational level (Castán, 2022).

Within this scope, it is possible to notice that there is a need for an adaptable text, as Gstrein, Haleem, and Andrej (2024) affirm about the AI Act, “this rather general definition will need more interpretation going forward, yet contains a lot of flexibility which might have ultimately been the deciding factor for the legislators”. Since it is impossible to predict all that AI can accomplish and the forms it may take in the future, a malleable approach would be better.

The main challenge for regulation is posed by the fact that AI is not a product that once put on the market does not further evolve during its lifecycle. Moreover, machine learning technologies learn from data, which means that known and unknown challenges in how these systems act are introduced, posing new risk profiles (Cole, 2024).

4 CONCLUSION

Technological development emerges as a structurally transformative force that simultaneously expands economic possibilities and exposes the limitations of existing legal frameworks. As demonstrated throughout this study, emerging technologies not only reshape productive systems and social relations but also challenge the conceptual and operational foundations of Law, revealing a persistent gap between the speed of innovation and the adaptive capacity of legal regulation.

The analysis highlights that this mismatch is not merely technical but deeply rooted in the historical nature of Law. While technological systems tend toward globalization and rapid evolution, legal systems remain largely bounded by national structures and incremental reform logics. As a result, prevailing regulatory approaches based primarily on the adaptation of preexisting norms prove insufficient to address novel and complex technological phenomena.

Moreover, the study reinforces the importance of rejecting deterministic views of technological progress. By recognizing that technological trajectories are shaped by political, economic, and institutional choices, it becomes evident that Law must not only respond to innovation but also actively participate in shaping its direction and distributional consequences. This perspective underscores the centrality of power structures and methodological choices in both the interpretation of technological change and the formulation of legal responses.

In this context, the adoption of diversified methodological approaches proves essential. Descriptive, analytical, and critical frameworks each contribute distinct insights, and their integration enables a more comprehensive understanding of the relationship between Law and technological transformation. Such an approach supports the conception of Law as historically situated, context-sensitive, and inherently interdisciplinary.

Ultimately, addressing the challenges posed by emerging technologies requires more than incremental regulatory adjustments. It demands a reconfiguration of legal thinking itself, one that prioritizes flexibility, adaptability, and methodological plurality. Only through this shift can legal systems move beyond reactive models and develop regulatory frameworks capable of effectively engaging with the complexities of the digital age.

ABSTRACT

This study analyzes the trajectory of credit cooperativism in Brazil, focusing on the tensions between mutuality, governance, and market pressures that shape its contemporary evolution. The research employs a qualitative approach, combining analytical-descriptive narrative review with documentary analysis of institutional reports and specialized literature. Data show that the sector grew by 86% in the number of members between 2019 and 2024, with total assets exceeding R\$ 885 billion and presence in 58% of Brazilian municipalities, consolidating itself as an alternative to the traditional banking system. The analysis identifies three critical axes: (i) mutuality vs. efficiency, highlighting democratic governance and surplus distribution; (ii) regulatory and market pressures, which pose challenges to the cooperative identity; and (iii) socioeconomic impact, particularly in regions with low banking capillarity. The discussion incorporates recent sources to problematize the sustainability of the model in the face of management professionalization and increasing operational complexity. The findings demonstrate that, while credit cooperativism presents concrete competitive advantages, its accelerated growth requires balancing efficiency with the preservation of principles. The research concludes that the institutional stability of the sector depends on the ability to expand scale without undermining mutuality, proposing an agenda for future studies on best governance practices in large cooperatives.

Keywords: Cooperative Governance. Financial System. Financial Institutions. Regional Development.

RESUMO

O presente estudo analisa a trajetória do cooperativismo de crédito no Brasil, com foco nas tensões entre mutualidade, governança e pressões de mercado que moldam sua evolução contemporânea. A pesquisa adota abordagem qualitativa, combinando revisão narrativa analítico-descritiva com análise documental de relatórios institucionais e literatura especializada. Os dados permitem observar que o setor cresceu 86% no número de cooperados entre 2019 e 2024, com ativos totais superando R\$ 885 bilhões e presença em 58% dos municípios brasileiros, consolidando-se como alternativa ao sistema bancário.

tradicional. A análise identifica três eixos críticos: (i) mutualidade vs. eficiência, com destaque para a governança democrática e a distribuição de sobras; (ii) pressões regulatórias e de mercado, que impõem desafios à identidade cooperativista; e (iii) impacto socioeconômico, especialmente em regiões com baixa capilaridade bancária. A discussão incorpora fontes recentes para problematizar a sustentabilidade do modelo frente à profissionalização da gestão e à crescente complexidade operacional. Os resultados demonstram que, embora o cooperativismo de crédito apresente vantagens competitivas concretas, seu crescimento acelerado exige equilíbrio entre eficiência e preservação de princípios. A pesquisa conclui que a estabilidade institucional do setor depende da capacidade de expandir escala sem descaracterizar a mutualidade, propondo agenda para estudos futuros sobre boas práticas de governança em grandes cooperativas.

Palavras-chave: Desenvolvimento Regional. Governança Cooperativa. Instituições Financeiras. Sistema Financeiro.

RESUMEN

Este estudio analiza la trayectoria de las cooperativas de crédito en Brasil, centrándose en las tensiones entre mutualidad, gobernanza y presiones de mercado que configuran su evolución contemporánea. La investigación adopta un enfoque cualitativo, combinando la revisión narrativa analítico-descriptiva con el análisis documental de informes institucionales y literatura especializada. Los datos muestran que el sector creció un 86% en número de miembros entre 2019 y 2024, con activos totales que superaron los R\$ 885 mil millones y presencia en el 58% de los municipios brasileños, consolidándose como una alternativa al sistema bancario tradicional. El análisis identifica tres ejes críticos: (i) mutualidad vs. eficiencia, destacando la gobernanza democrática y la distribución de excedentes; (ii) presiones regulatorias y de mercado, que plantean desafíos a la identidad cooperativa; y (iii) impacto socioeconómico, especialmente en regiones con baja capilaridad bancaria. La discusión incorpora fuentes recientes para problematizar la sostenibilidad del modelo frente a la profesionalización de la gestión y la creciente complejidad operativa. Los resultados demuestran que, si bien las cooperativas de crédito presentan ventajas competitivas concretas, su crecimiento acelerado requiere un equilibrio entre eficiencia y preservación de principios. La investigación concluye que la estabilidad institucional del sector depende de la capacidad de expandirse sin comprometer la mutualidad, proponiendo una agenda para futuros estudios sobre buenas prácticas de gobernanza en grandes cooperativas.

1 INTRODUCTION

In recent decades, the Brazilian financial system has undergone an intense process of banking concentration, resulting in the consolidation of large financial conglomerates and a high concentration of the Brazilian banking market, a phenomenon widely documented in the sectoral literature (FEBRABAN, 2024). In parallel with this movement, there was a continuous expansion of credit unions as an institutional alternative aimed at democratizing access to financial services, especially in regions less served by traditional banking institutions (BANCO CENTRAL DO BRASIL, 2024).

In Brazil, credit unions are regulated by Law No. 5,764/1971, which establishes the National Cooperative Policy, as well as by Complementary Law No. 130/2009, which specifically provides for the National Cooperative Credit System. The prudential supervision of these institutions is exercised by the Central Bank of Brazil.

Credit unions are singular financial institutions, organized in a cooperative corporate form, in which the users of financial services are simultaneously owners of the organization, participating in its management through a democratic structure based on the principle of "one member, one vote", regardless of the subscribed capital (PINHEIRO, 2008). Such an institutional arrangement reduces agency costs and classic asymmetries between ownership and use of the service, as highlighted by Hansmann (1996) in the economic theory of cooperative organizations.

This characteristic substantially differentiates these institutions from traditional commercial banks, whose governance is primarily oriented towards maximizing shareholder returns.

In Brazil, credit cooperativism has reached a prominent position in the National Financial System, bringing together approximately 20 million members, assets of more than R\$ 885 billion and presence in about 58% of Brazilian municipalities, with a growing participation in national financial intermediation (BCB, 2024). Brazil has 4,509 cooperatives, 700 of which are in the credit sector. This growth shows not only quantitative expansion of the sector, but also the strengthening of an institutional model based on mutuality, economic redistribution, and regional development (BNDES, 2025).

This expansion can be seen in Figure 1, which shows a growth of approximately 86% in the number of cooperative members between 2019 and 2024, evidencing the growing adherence of the Brazilian population to the cooperative model of financial intermediation.

Figure 1

Evolution of the number of cooperative members in the SNCC (2019 – 2024)

Source: Prepared by the author based on OCB (2025) and the Central Bank of Brazil (2025).

Among the main credit cooperative systems in Brazil, the following stand out: Sicoob, Sicredi, Cresol and Unicred, with the three largest totaling 18 million members (BORGES, 2022). In addition to their economic function, credit unions play an important social role by promoting financial inclusion, fostering small businesses, stimulating local entrepreneurship and redistributing economic results to their members through the annual return of net surpluses, a mechanism that does not exist in the traditional banking model (BIALOSKORSKI NETO, 2012).

The search for equity, solidarity, and self-sufficiency have marked the history of these institutions since the Industrial Revolution in England in the nineteenth century, when workers in precarious working conditions came together in mutual aid societies. Voluntary membership, democratic management, and equitable distribution of benefits are the fundamental principles that guide cooperativism (SANTOS, 2024).

In this context, the present study aims to analyze the historical evolution of credit cooperativism, with emphasis on its consolidation in Brazil, as well as to discuss the institutional, economic and social foundations that explain the growing competitiveness of cooperative banks compared to the traditional banking system. In this sense, this analysis is not limited to describing the evolution of credit cooperativism, but seeks to highlight the tensions that accompany its growth, especially those related to its adaptation to the dynamics of the traditional financial system, leading to the guiding question: to what extent does the recent expansion of credit cooperativism in Brazil strain its mutualist foundations in the face of governance requirements and financial market pressures?

2 METHODOLOGY

The present study has a qualitative nature, developed through a narrative review with an analytical-descriptive approach, complemented by documentary analysis. Indexed scientific articles, specialized works on cooperativism, official reports of the Central Bank of Brazil, documents of the Organization of Brazilian Cooperatives and institutional publications of the main credit unions operating in the country were used as sources. The selection of sources considered criteria of thematic relevance, timeliness, and adherence to the object of study.

The analysis of the information allowed us to infer about the evolution of the number of service stations and the number of cooperative members in Brazil between the years 2019 and 2024, as well as the number of singular cooperatives. In addition to the descriptive analysis, we sought to adopt an interpretative approach oriented to the identification of tensions between the cooperative foundations and the contemporary management practices of these institutions, based on the graphic analysis of the observed trends. This perspective allows us to go beyond the description of the phenomenon, incorporating analytical elements related to governance, control mechanisms and the economic rationality underlying the performance of credit unions in the current context.

3 HISTORICAL FOUNDATION OF COOPERATIVISM

The origin of modern cooperativism is associated with the economic and social transformations triggered by the European Industrial Revolution, especially in nineteenth-century England, a period characterized by the precariousness of labor relations, concentration of income, and economic exclusion of large segments of the working population (PORT, 2022).

In this context, pioneering experiences of collective organization aimed at economic self-sufficiency stand out, culminating in the foundation of the Society of Pioneers of Rochdale, in 1844, considered a historical landmark of modern cooperativism, with voluntary membership, democratic management, economic participation of members, and interest in the community (ACI, 2022).

Parallel to the development of consumer cooperatives, the first structured experiences of financial cooperativism emerged in Germany, consolidating the foundations of contemporary credit cooperativism. The idealized model had the following characteristics: (1) the company's capital was constituted through shares paid in by the members, under the principle of self-help; (2) there was the constitution of a reserve fund generally limited to ten percent of the subscribed capital; (3) distribution of gains among the partners in the form of dividends; (4) joint and

unlimited liability of the partners for the entity's business; (5) as it was not a class association, the participation of all economic categories was allowed (PINHEIRO, 2008).

These models directly influenced the international expansion of financial cooperativism and served as a reference for the subsequent implementation of credit unions in several countries, including Brazil (WOCCU, 2024).

4 EVOLUTION OF CREDIT COOPERATIVISM IN BRAZIL

The Brazilian credit cooperativism formally began in 1902, with the foundation of the Amstad Savings and Loans Bank, in the municipality of Nova Petrópolis, Rio Grande do Sul, by the Jesuit priest Theodor Amstad. Inspired by the Raiffeisen model, this institution is recognized as the first credit union in Latin America (PINHEIRO, 2008).

During much of the twentieth century, the growth of the sector occurred gradually, initially restricted to specific niches, especially rural communities and agricultural cooperatives. However, from the 1990s onwards, with the regulatory modernization promoted by the Central Bank of Brazil and the progressive structuring of integrated cooperative systems, there was a significant expansion of the sector.

The enactment of Complementary Law No. 130/2009 represented a relevant regulatory milestone by disciplining the National Cooperative Credit System and increasing the legal and operational security of Brazilian credit unions, contributing decisively to their professionalization and institutional expansion.

The path forward for cooperative banks in sustainability will be intrinsically linked to the evolutionary path of their main customers, that is, small entrepreneurs, families and local communities (BEVILACQUA, 2022). An expressive innovative act took place in 2025, with the publication of two resolutions by the Central Bank of Brazil (BCB) and the National Monetary Council (CMN), regulating the Brazilian financial system: Joint Resolution No. 14/2025, which changes the way the minimum capital required of financial institutions — including credit unions — is calculated, replacing the previous model, based only on the type of institution, by a new calculation proportional to the activities actually performed. The purpose was to strengthen the soundness of the financial system, mitigate risks, and ensure treatment proportional to the size and complexity of each institution (BCB, 2025).

The sector's equity growth evidences its structural expansion in the Brazilian financial market. As shown in Figure 2, the total assets of the National Cooperative Credit System grew more than four times between 2019 and 2024, accompanied by a continuous expansion of its relative participation in the National Financial System.

Figure 2

Evolution of total assets and participation of credit unions in the National Financial System (2019–2024)

Source: Prepared by the author based on the Central Bank of Brazil (2024; 2025).

The graphical analysis shows that the expansion of the Brazilian credit cooperativism has a structural and sustained character. Between 2019 and 2024, there was significant growth both in the number of cooperative members and in the volume of total assets managed by the sector, accompanied by a continuous expansion of its relative participation in the National Financial System. Such indicators are compatible with the hypothesis of institutional strengthening and growing competitiveness of credit unions in the Brazilian financial market (SOUZA, 2024).

Part of the literature points out that the recent expansion of credit unions is not exclusively due to its institutional advantages, but also to regulatory asymmetries and specific conditions of the financial system that favor this movement (FERRI; KALMI; KEROLA, 2014).

The evolution has been observed markedly in European countries, with the adhesion of 52 million members to Credit Agricole (Caisse Nationale de Crédit Agricole) in France, 17.7 million in Germany, members of DZ Bank (German Central Cooperative Bank) in Germany, constituting cooperative banks with high credibility in the market.

The Crédit Agricole Group is called "the green bank" due to its historical links with agriculture. It is a French international banking group and the largest cooperative financial institution in the world. It is the second largest bank in France, and the third largest in Europe and the tenth largest in the world, and considered a bank of systemic importance by the Financial Stability Board (MEINEN and PORT, 2016).

DZ Bank AG is the second largest bank in Germany in terms of assets and the central institution for around 700 cooperative banks and their approximately 7,200 branches, and due to its volume of funding it is directly supervised by the European Central Bank (EUROPEAN CENTRAL BANK, 2023).

5 COMPETITIVE ADVANTAGES OF CREDIT UNIONS OVER THE TRADITIONAL BANKING SYSTEM

Unlike commercial banks, whose main purpose is to maximize shareholder returns, credit unions operate according to a mutualist logic, oriented to the efficient provision of financial services to their members. In this model, users are simultaneously customers and owners of the institution, reducing classic agency conflicts and promoting greater alignment between institutional interests and the needs of the cooperative members (BIALOSKORSKI NETO, 2012).

One of the main competitive advantages observed lies in the practice of interest rates and fees that are generally more attractive when compared to traditional banking institutions. This is because cooperatives do not need to remunerate external shareholders, allowing greater distributive efficiency in the allocation of economic results generated by financial activity (MENEZES; CROCCO, 2014).

Additionally, at the end of each fiscal year, any net surpluses calculated after the constitution of legal and statutory reserves can be distributed among the cooperative members according to their economic movement with the institution, a mechanism that reinforces the character of collective return and structurally differentiates the cooperative model from the traditional banking model (PINHEIRO, 2008).

The definition of performance indicators starts to play a central role in this process. When guided exclusively by economic and financial results, they tend to bring cooperatives closer to the traditional banking logic. On the other hand, when they incorporate dimensions related to inclusion and collective benefit, they can contribute to preserving the cooperative identity (VILELA, 2024).

Another aspect of emphasis refers to the territorial capillarity of credit unions, especially in small and medium-sized municipalities often neglected by private banking institutions. In several cases, such cooperatives represent the only financial institution physically present in certain locations, contributing to the financial inclusion of populations historically not served by the conventional banking market (BANCO CENTRAL DO BRASIL, 2024).

From a regional macroeconomic perspective, several studies indicate that the resources raised by cooperatives tend to remain in greater proportion in local economies, being reinvested in the community itself through credit operations, productive financing and support for regional entrepreneurship. Such dynamics generate a multiplier effect on income, employment and local economic development (MENEZES; CROCCO, 2014).

Although the competitive advantages of credit unions are widely recognized, especially with regard to distributive efficiency and financial inclusion, it is important to consider that such advantages are not static. As cooperatives expand their scale and operational complexity, part of these differentials can be gradually reduced, especially when there is the incorporation of management structures and strategies typical of traditional banking institutions. In this sense, the competitive advantage of the cooperative model should be understood as a dynamic equilibrium, and not as a permanent condition (CHAVES, 2009).

Nevertheless, it is important to recognize that credit unions also have competitive limitations compared to large commercial banks, especially with regard to operational scale, technological investment capacity and breadth of portfolio of complex financial products. Such limitations have been progressively mitigated by the consolidation of integrated cooperative systems and the growing professionalization of the management of these institutions.

Table 1 presents the main characteristics inherent to credit unions in comparison to the banking network.

Table 1

Structural comparison between credit unions and traditional banks

CRITERIA	CREDIT UNIONS	TRADITIONAL BANKS
Property	Associates/Cooperatives	Shareholders
Right to vote	1 member = 1 vote	Proportional to actions
Economic purpose	Collective benefit	Profit
Distribution of results	Leftovers for cooperative members	Dividends to shareholders
Fees/Fees	Usually smaller	Generally larger
Territorial focus	Regional/Local	National/International
Financial inclusion	Relatively high	Moderate
Sophisticated portfolio	Moderate	Elevated

Source: Prepared by the author based on Bialoskorski Neto (2012), Pinheiro (2008) and the Central Bank of Brazil (2024).

The annual distribution of surpluses is a maxim in the cooperative sector. At the end of each year, accountability meetings are held to the members and the destination of the surpluses is put to a vote. Deposits in credit unions are protected by the Credit Cooperative Guarantee Fund (FGCoop). This fund guarantees deposits and credits held in individual credit unions and cooperative banks in the event of intervention or extrajudicial liquidation of these institutions.

Currently, the limit value of this protection is the same as that in force for bank depositors (BCB, 2025).

It is observed that the efficient management system results in the generation of annual results, with the retention of a part for reserves and the rest is distributed according to the participation of each member in the use of financial services and in the individual capital invested.

6 SOCIOECONOMIC IMPACT AND REGIONAL DEVELOPMENT

In addition to their financial function, credit unions play an important role as instruments of regional socioeconomic development. Their performance transcends mere financial intermediation, inserting themselves in an institutional logic oriented to strengthening the communities in which they are established.

The cooperative principle of interest in the community, consolidated by the International Cooperative Alliance, translates into the recurrent implementation of financial education programs, support for local entrepreneurial initiatives, promotion of social projects, and encouragement of citizenship and economic training of its members (ACI, 2022).

In the Brazilian context, especially in smaller municipalities with a strong agricultural vocation, credit unions play a leading role in financing productive activity, supporting agribusiness and stimulating the formalization of small businesses, contributing directly to the generation of employment, income and municipal tax collection. The number of cooperative members in the period from 2020 to 2024 can be seen in Figure 3.

Figure 3

Evolution of the number of individuals (PF), service stations (PA) and number of singular credit unions (CS) in Brazil in the period from 2020 to 2024.

Equations: (PF): $y = 1.51x + 8.65$; (PA): $y = 0.69x + 6.95$; (CS): $y = -0.23x + 8.59$

Source: Prepared by the author based on the Central Bank of Brazil (2025).

It can be observed that in the period studied there was an increase of 58.8% in the number of cooperative members (individuals) and 39.7% in the number of service stations. Such action reveals that credit cooperativism is not limited to representing an alternative model for the provision of financial services, but can be an important mechanism for endogenous regional development, capable of reducing territorial asymmetries in access to credit and promoting greater economic decentralization. There was a decrease in the number of singular cooperatives by incorporation into central cooperatives, and thus from 847 cooperatives in 2020, there were 753 in 2024. Thus, the number of cooperative members (PF) per cooperative (CS) was 12,042 in 2020 and increased to 21,514 in 2024.

Despite the relevant role of credit unions in regional development, the effectiveness of this impact depends on the way resources are allocated and the strategies adopted by the institutions themselves. Not all credit expansion necessarily implies sustainable local development, and it is essential to analyze the quality of operations, the profile of the beneficiaries and the capacity to retain value in regional economies. Thus, the socioeconomic impact should not be assumed, but continuously evaluated in light of concrete evidence and performance criteria (MANENTI, 2022).

Similar findings are observed internationally in studies on European cooperative banks, which demonstrate greater local retention of resources and greater regional credit stability (FERRI; KALMI; KEROLA, 2014).

7 DISCUSSION

Cooperativism is an economic and social system in which cooperation is the basis on which economic activities are built. This consists of the primacy of people in the economy and the cooperation of all to achieve the common good (GOLOS, 2025). At the same time, it is observed that the growth of credit unions in Brazil stems from the comparative institutional advantages of the cooperative model in contexts of banking concentration and regional financial exclusion (FEBRABAN, 2024).

Although often associated with the democratization of access to credit and the strengthening of regional development, the expansion of credit unions also raises relevant questions about the sustainability and coherence of the model over time. Accelerated growth, especially in environments of high banking concentration, may indicate not only the consolidation of an institutional alternative, but also a process of adaptation to the same market logics that historically characterize the traditional financial system. In this sense, the analysis of cooperativism cannot be restricted to its declared social function, and it is necessary to understand how this model responds to the pressures for efficiency, scale, and competitiveness (BNDES, 2025).

The combination of democratic governance, economic redistribution, territorial capillarity, and alignment between user and owner of the institution gives cooperatives structural advantages that are difficult to replicate by the traditional banking system.

However, the advancement of the sector also imposes relevant challenges. The growing professionalization of management, the expansion of operational scale and the increase in regulatory complexity may induce the progressive mischaracterization of the original cooperative model, especially when large cooperatives start to adopt complex managerial practices and organizational structures.

This phenomenon, often called "banking of cooperativism", constitutes one of the main contemporary challenges of the sector, as it generates tension between economic efficiency and preservation of the founding cooperative principles. From the perspective of controllership, this tension becomes even more relevant, because the institutional growth of cooperatives requires increasingly sophisticated management, control and performance evaluation instruments. The problem is that the adoption of these practices, although necessary to ensure efficiency, sustainability, and regulatory compliance, can also reinforce a rationality guided by economic and financial results to the detriment of the centrality of the cooperative (ZHAO et al., 2026). Thus, the more the organization expands scale, professionalizes management and incorporates performance metrics typical of the conventional financial system, the greater the

risk of weakening its cooperative differentiation. It is observed that the challenge is not only to grow, but to do so without converting the mutualist logic into mere institutional rhetoric. This phenomenon associated with the expansion of scale and the complexification of the governance of large cooperatives was also discussed by Birchall (2014) in studies on large international cooperative organizations.

In the present work, the trends observed indicate the continuity of the cooperatives' expansion process, if the structural conditions are maintained.

8 FINAL CONSIDERATIONS

The historical and institutional analysis of credit cooperativism shows that its consolidation in the Brazilian financial system results from the combination of classic cooperative fundamentals, organizational efficiency and growing professionalization of management.

The sector ceased to represent a peripheral alternative restricted to specific niches to assume a strategic position in the National Financial System, progressively expanding its market share and socioeconomic relevance (FEBRABAN, 2024).

The mutualist nature of credit unions constitutes their main structural differential in relation to the traditional banking system, since the convergence between user and owner of the institution reduces agency conflicts, favors greater alignment of economic incentives and allows for a more equitable redistribution of the results generated by financial activity (HANSMANN, 1996).

In addition, international experience shows that financially robust cooperative systems tend to be more resilient in scenarios of systemic crisis, reinforcing the strategic importance of these institutions for the stability of the financial system as a whole (FERRI; KALMI; KEROLA, 2014).

A relevant agenda for future studies is to analyze, in a more in-depth way, concrete experiences of cooperatives that have managed to grow without losing adherence to their principles, identifying practices that can be replicated in other contexts, considering that currently two credit unions occupy the seventh and eighth place in the ranking of Brazilian banks by total assets.

It is concluded, therefore, that credit unions represent not only a competitive alternative to the traditional banking model, but also an important instrument for regional economic development and strengthening of financial citizenship. Its sustainable growth will depend on

the ability to expand scale and efficiency without renouncing the cooperative principles that have historically underpinned its legitimacy and institutional differentiation.

ABSTRACT

This study aims to analyze the representations of the characters Raquel Acioli and Maria de Fátima from the soap opera Vale Tudo (2025), considering the dialogue with Black feminist discussions on images of control (COLLINS, 1990). The discussion established a relationship between the ways these Black women are represented in the soap opera and the stereotypes associated with this social group. The intention is to promote debate about the relevance of soap operas in addressing social issues and about the social imaginary that has been constructed around Black women.

Keywords: Soap Opera. Black Feminism. Images of Control.

RESUMO

O presente trabalho visa analisar as representações das personagens Raquel Acioli e Maria de Fátima, da telenovela “Vale Tudo” (2025), tendo em vista o diálogo com as discussões do feminismo negro sobre as imagens de controle (COLLINS, 1990). Na discussão, foi estabelecida a relação entre as formas de representar essas mulheres negras na novela, com os estereótipos relacionados a esse grupo. A intenção é levantar o debate sobre a relevância da telenovela na abordagem de questões sociais, e sobre o imaginário que tem sido construído socialmente sobre as mulheres negras.

Palavras-chave: Telenovela. Feminismo Negro. Imagens de Controle.

RESUMEN

El presente trabajo tiene como objetivo analizar las representaciones de los personajes Raquel Acioli y Maria de Fátima de la telenovela Vale Tudo (2025), considerando el diálogo con las discusiones del feminismo negro sobre las imágenes de control (COLLINS, 1990). En la discusión, se estableció la relación entre las formas de representar a estas mujeres negras en la telenovela y los estereotipos asociados a este grupo social. La intención es

² Graduated in Law. Undergraduate student in Public Administration. Universidade Estadual de Minas Gerais (UEMG).

promover el debate sobre la relevancia de la telenovela en el abordaje de cuestiones sociales y sobre el imaginario que se ha construido socialmente acerca de las mujeres negras.

Palabras clave: Telenovela. Feminismo Negro. Imágenes de Control.

1 INTRODUCTION

The *remake* of the telenovela "Vale Tudo", from 2025, brought as one of the proposals for the plot a more diverse cast, which made the plot adopt more black characters, including in the central core. In this way, the characters of the axis of protagonists, Raquel Acioli and Maria de Fátima Acioli, were played by black actresses, Taís Araújo and Bella Campos, respectively.

However, despite the difference in the approach, the *remake* generated discussion, since the representativeness proposed by the inclusion of black characters did not materialize as it should. In addition to the erasure of the characters in the plot, mischaracterizing their importance compared to the original version of the 1988 telenovela, the representation of the characters was built on stereotyped bases.

According to Collins (1990), in a thought about the stereotypes that are addressed to black American women (which can extend to black women of other cultures), the images of the *mammy*, the matriarch, the mother dependent on the State and the Jezebel/"hot" are common. Such stereotypes reveal images of control over this group, that is, the attribution of negative standards on black women regarding the ways of being, acting and being in the world. Understanding this phenomenon is of great interest to black feminist thought today, with a view to breaking with the perpetuation of reductionist and harmful images of black people. In this line, transposing this concern to the analysis of communicational products, as is the case of the soap opera, it is intended to verify if, and which control images may be involved in the representations of the characters Raquel and Maria de Fátima, from "Vale Tudo" (2025).

Given the presence of black women in leading roles, and in a prominent soap opera, it is pertinent to analyze how the representation of these characters took place. Thus, the present work proposes, from the perspective of control images, to trace initial reflections on which meanings were attributed to the characters Raquel and Maria de Fátima, with the intention of understanding how the socially constructed images about black women have currently been worked on by the media, specifically in soap operas.

2 CONTROL IMAGES

The historical process of oppression in various spheres (family, institutional, etc.) of black women, and the consequent subordination of the female role in society, is pointed out by Collins (1990). According to the author, it is these dominations that affect the construction of a social conscience, and policies aimed at black women. Consequently, this process derives the reinforcement of white supremacy and the construction of stereotyped images about black

women, aiming to control issues of gender, race, sexual orientation, beauty standards and behavior.

Collins (1990) draws attention to the discussions about the attribution of the condition of "other" to black women, that is, as the opposite and negative part of a binary relationship. The objectification and domination, arising from this unequal relationship, lead to the creation of images of control over black women, which are perpetuated in society.

In this sense, the construction of the image of black women serves to maintain the power of hegemonic groups, and is manifested by stereotypes that are maintained, albeit with some updates. Collins (1990) explains that the main images of control studied by black feminism are: *mammy*, the matriarch, the mother who is dependent on the State and Jezebel.

In the control image of the *Mammy*, the idea is of an obedient and faithful servant, a kind of mother of the white family. That is, a black woman who serves a white family, and who despite any space she has in this circle, is subordinate. This influences the permanence of oppression, with the attribution of the role of care and deference to white groups as a value and a duty. In addition, black women have their preferences, subjectivities and sexual issues annulled, as they live according to those they serve (COLLINS, 1990).

The image of the matriarch refers to the mother of the black family, a woman characterized as alone, abandoned by her partner, and without qualities, such as femininity. Her existential conditions are often passed on to her children, perpetuating poverty and other negative issues, making her a failure. Such a simplistic perspective blames women, maintaining the ideal of patriarchy, and ignores the social, historical, economic and political conditions that involve black existence (COLLINS, 1990).

According to Collins (1990), regarding the image of women dependent on the State, the notion is that by requesting the right to help from social programs, black women are accommodated with the situation of vulnerability, leaving their children also lazy, without cultivating the value of work. In this way, the black women of this group are failures to the extent that they are alone, because in general they are not in a family in the patriarchal mold, and only burden the State, since they do not work.

Finally, the Jezebel control image, or *Hoochie* (related to the promiscuous woman), portrays the black woman as sexually aggressive, or with deviant sexuality, when she escapes heteronormative standards. From this stereotype, derives the idea of the woman who relates for financial interest, who seduces and deceives (COLLINS, 1990).

Thus, as Collins (1990) points out, such images of control act to perpetuate the power of heterosexual white men, and in the same way, to maintain oppressions of race, gender, class,

sexual orientation, etc. Therefore, it is of paramount importance to recognize these images and act in the construction of other imaginaries. As the media acts in this process of creation and/or reaffirmation of values on various social issues, and the soap opera is an important cultural product for this objective, the communicative potential it can have in society will be studied below.

3 THE TELENOVELA "VALE TUDO": 2025 REMAKE

The first version of the telenovela "Vale Tudo" aired on TV Globo in 1988 and was written by Gilberto Braga, Aguinaldo Silva and Leonor Bassères. Due to the great success of the plot, the network produced the *remake* of the soap opera in 2025, which was adapted by author Manuela Dias. The main plot discusses the limits of honesty and greed, bringing social, moral and ethical reflections from the opposition between the heroine Raquel Acioli (Taís Araújo) with her own daughter, the unscrupulous Maria de Fátima (Bella Campos), and also with the villain Odete Roitman (Débora Bloch).

The soap opera, as a rich media product for the debate on Brazilian culture and identity (LOPES, 2014), when updated, as "Vale Tudo" in *remake*, expands the possibilities of discussion, covering another historical context. Thus, in the 2025 version, the soap opera drew attention for adopting the *Merchandising* social (a way of approaching different current themes in a pedagogical way in the plot) when dealing with topics such as alimony, homosexual relationships, adoption, ageism and sexual orientation.

In addition, it was proposed to include black actors/actresses to occupy the roles that in the original version of the soap opera were white people. Some of the updates were: Raquel Acioli (Taís Araújo); Maria de Fátima (Bella Campos); Sardinha (Lucas Leto); Luciano (Licínio Januário); Jarbas (Leandro Firmino); Consuelo (Belize Pombal); Daniela (Jessica Marques); André (Breno Ferreira); Fernanda (Ramille) and Eunice (Edvana Carvalho). In this way, the current version of "Vale Tudo" included black characters for the main and supporting cast, unlike the original version, which brought only two black characters throughout the plot: Gildo (Fernando Almeida), who was a street kid, later welcomed by Raquel, and Zezé (Zeni Pereira), the maid of Ivan's family.

In the case of Raquel and Maria de Fátima, the casting of black actresses for the roles proved to be an opportunity to bring black protagonism to the plot, however, in addition to the presence of black people in the soap opera, it is interesting to verify to what extent the representativeness was materialized, and how the construction of the characters took place.

Thus: what meanings were attributed to Raquel and Maria de Fátima, and in what way do they reinforce or innovate in the images that are socially constructed about black women?

Therefore, the choice is to analyze the representations of the characters Raquel Acioli and Maria de Fátima. The characters were chosen because they are part of the core of protagonists, in the current version played by black actresses, and because they contain, in the narrative arc, events that give rise to the intended analyses. Reflecting on the ways of constructing meaning about such prominent characters in the soap opera can help to understand which images are (still) constructed about black women, and which are passed on to the soap opera audience.

For the analysis, excerpts from the soap opera were chosen that demarcate the rupture between Raquel and Fátima, which appears in the initial chapters of the soap opera. The passage covers the initial position of the characters (both living in Foz do Iguaçu), a fact that impels them to act (the sale of the house), and their arrival in Rio de Janeiro. With this excerpt from the soap opera, the process of presentation and at the same time reconstruction of the characters is evidenced, and the framing of the character of both, with values and attitudes that will accompany their entire narrative arc until the end of the plot. From such events, which highlight the contrast between the characters, the intention is to verify how the representation of the black woman took place, considering the discussions about the images of control.

4 IMAGES OF CONTROL ON STAGE: THE CHARACTERS RAQUEL ACIOLI AND MARIA DE FÁTIMA

Raquel Acioli is represented in "Vale Tudo" as a strong, hardworking woman who cultivates values such as honesty and nurtures unwavering hope for a better life. The plot begins with Raquel living in Foz do Iguaçu with her father and daughter Maria de Fátima. While Raquel works as a local tour guide, Fátima wants to get out of the city and try her luck in Rio de Janeiro, investing in a career in *Influencer* digital, or trying to win a partner rich enough that you don't have to work.

In the first chapter of the novel, on Fátima's twenty-third birthday, Raquel is excited, while her daughter, pessimistic about life in Foz do Iguaçu, regrets having been born poor and wants to leave the city. During the party, Fatima goes to the gate of the house and begins to remember facts that make her dislike her condition. In the memory, the origins of her family are rescued, when Raquel was still married to Rubinho, and faced difficulties due to the irresponsible condition of her partner. On a day when Rubinho comes home drunk in the morning, Raquel

confronts him to take responsibility, work and help with the bills; he becomes enraged and slaps Raquel in the face, who quickly retaliates and says she will leave.

Figure 1

After being assaulted by her husband, Raquel decides to leave with her daughter

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 05' 02").

Raquel cries, lamenting the difficulties suffered in terms of finances and her relationship with Rubinho. However, because he acted immediately to the aggression, retaliating physically and verbally, he imposes his firm position in the face of adversity and assumes an active posture.

Figure 2

Raquel and Fatima talk

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 06' 25").

After the memory, Fátima is even more resigned to changing her life, while browsing the social networks of rich people who display a life of luxury. Raquel approaches, and the panoramic image shows the two talking in front of a humble house, on a street that is also

simple, demonstrating the socioeconomic conditions of the family, which contrast with what Fatima dreams of. The mother tries to cheer up her daughter, but the young woman directs the conversation to the case of a rich tourist, but married and already elderly, who tried to get closer to Raquel. She encourages her mother to have an affair with the man so that the two can ascend socially.

Raquel is upset with Fatima's speech, and later, in conversation with a friend, reveals that her hope is in work, and that all prosperity can only come from individual effort. She comments that she wants to open her own business, since this is a current trend, and believes that it will be a good investment. Asked about love relationships, Raquel recalls what she went through with her ex-husband, emphasizing that she managed to be strong and overcome the troubles of the relationship, and points out that to be interested in another man again, she wouldn't even be able to say what kind of man it would be.

Figure 3

Raquel is dreamy with expectations of the future

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 09' 05").

In this way, the representation made of mother and daughter highlights the contrast between the two. Dreams for the future and the notion of values are discrepant. Raquel is the good-hearted girl, with positive thoughts and full of good intentions, and Fatima is the self-interested villain, unscrupulous, and whose values are individualism and materialism.

The distance between mother and daughter continues, as the daily life of the characters is developed. Raquel works as a tour guide, always being very communicative, with a cheerful face, and showing that she likes what she does; meanwhile, Fatima tries to take advantage of her mother's condition to attend a club with tourists.

Figure 4*Fatima sees César for the first time at the club*

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 13' 41")

In one of the incursions through the club, pretending to have a high social status, Fatima sees César, a model who was working at the place, and becomes interested in him. In the scene, Fatima performs a typically masculine gesture of briefly removing a crack in her glasses to better see the one who interested her physically.

After pretending a coincidence at the bar, and inventing lies about her socioeconomic condition, Fatima manages to attract César's attention, and soon after seduces him, spending the night with him.

Figure 5*Fatima and César spend the night together*

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 30' 32")

Later, Raquel receives the news of her father's sudden death. With another load of suffering, she tries to get back on her feet, now that the only male figure she had to support no

longer exists. Raquel is sad and shaken, being comforted by a friend, while Fatima seems only a little dejected, but without suffering.

Figure 6

Raquel suffers in farewell to her father

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 40' 30")

After her grandfather's death, Fátima takes advantage of the fact that the house was in her name and sells the property, using the money to go live in Rio de Janeiro. When she discovers that her father's house has been sold, Raquel is desperate, but she does not believe her daughter's bad nature.

Figure 7

Raquel is shaken when she discovers that Fatima sold the house

Source: Frame from the soap opera Vale Tudo. (Chapter 1, Scene 48' 54").

While Raquel tries to go to Rio de Janeiro, buying a bus ticket to the city and quitting her job, Fatima stays at the Copacabana Palace and keeps the lies about her financial condition to César.

Figure 8

Fatima takes advantage of Rio de Janeiro and makes an appointment with César

Source: Frame from the soap opera Vale Tudo. (Chapter 3, Scene 01' 34").

In the representation of the characters, Raquel is always humble, kind and honest. In characterization, she is usually dressed in simple and colorful clothes (which shows both her personality and her financial condition), and has a general appearance that shows that she does not care about issues related to femininity. Endowed with values aimed at life dignified by work and individual effort, she is fervent in the ideas she defends, and fights to support herself and also take care of her daughter, since difficult circumstances have crossed her life, such as a marriage permeated by financial instability and disrespect. With the death of her father and the departure of her daughter, Raquel once again finds herself challenged by life to face problems and seek to overcome all evil.

The construction of the character Raquel, in the 2025 version of "Vale Tudo", now as a black woman, accentuates racial issues at an intersectional level, in view of the socioeconomic crossings of the life of this woman who needs to work and fight for the maintenance of family stability, even if the adversities are great. In dialogue with the images of control, Raquel could be the matriarch, or the mother of the black family, represented by the stereotypes of the woman with a suffering life, who needs to fight fervently to move on. Without a husband, without a home of her own, with a daughter who even in adulthood does not work

or study formally, and later without any other parental ties of support, Raquel maintains only her values of honesty and dignity and ode to work and meritocracy as her foundations.

On the other hand, Maria de Fátima is represented as the result of a generation deviated from traditional values, without sentimental attachment, and with the materialistic side developed to the detriment of honesty and valuing work. In addition to not wanting a job in formal standards, seeking apparently simpler solutions, such as a career on the internet, Fátima rescues the stereotype of the self-interested woman, who has no independence and needs to be based on the financial condition of a preferably heteronormative relationship, valuing patriarchy, male domination and the submission of women.

With this, the character is represented in the molds of Jezebel/*hoochie*'s control image, as a young, beautiful woman, who always shows herself attractive, whether by the use of makeup, or clothes that show physical attributes. In addition, Fátima's speeches and attitudes reveal the lack of scruples to achieve what she needs, which may include different strategies, especially sexual involvements as the best, if not the only way to seduce a man from the elite.

In the contrast of the representation of the characters Raquel Acioli and Maria de Fátima, there is, to a certain extent, a dialogue with traditional stereotypes of the construction of an imaginary about black women. Always strong and struggling because of the harshness of life, or driven to lust as a way to conquer what they want, or escape the reality in which they live, Raquel and Fátima, even in a soap opera produced with the intention of being more inclusive and representative of the black audience, represented images of control that still need to be deconstructed.

5 CONCLUSION

When the soap opera addresses a current topic, of interest to the public, or even controversial, it creates a link between fiction and reality, and generates debates in society. Considering that the soap opera can be watched on open TV and *streaming*, and even in excerpts on social networks, there is also an expansion of the reach of this object in terms of audience and forms of discussion. Thus, it is of interest to take the soap opera as an object of study.

When choosing the telenovela "Vale Tudo" for analysis, the relevance of the title to national teledramaturgy was considered, in view of all the social issues discussed, both by the original version, from 1988, and by the 2025 remake. In this sense, thinking about the representation of black women in the plot is of interest to reflect on possible advances or perpetuation of the treatment of the imaginary about this group in society.

Through the discussion, according to Collins (1990), about the images of control (*mammy*, matriarch, mother dependent on the State and Jezebel) about black women, it was possible to understand how stereotypes permeate the relationship that society has with this group. Thus, when choosing the telenovela "Vale Tudo", the relationship of the central characters of the plot, Raquel and Fátima with the images of control, was discussed.

In the verification of how the characters were constructed, analyzing the initial narrative event of the soap opera, from the beginning of the story, to the climax point in which Fátima sells the family house and goes to Rio de Janeiro, there is the contrast created between mother and daughter, as each one develops a typical side of the imaginary about the black woman. While Raquel incorporates traits of the matriarch's image of control, such as the lonely, honest woman who fights for a better life, always believing in work and dignity, Fátima highlights traits of Jezebel/*hoochie*, such as the young and self-interested woman who uses various resources to ascend socially, such as lies and sexuality to achieve what she wants.

In this line, considering that the soap opera has strength as a cultural product that disseminates knowledge, raises debates and can influence the public, causing changes in society, it is urgent to question the representations that are still made of certain social groups and latent issues of today, such as the images of control over black women. Thus, valuing and studying soap operas has all the legitimacy and emergence for the communicational field.

ABSTRACT

This article deals with presenting a synthesis of the problematizations of maternal in women's penitentiaries. The research identified the characteristics of women in maternity in the female prison system, as well as analysed the difficulties these women face to get the respect of their human rights. Also coming to investigate how the women's prison system works and the importance of the social worker in the performance and care of the woman in the maternity situation in the female prison system.

Keywords: Women's Prison. Social Services. Mothering. Social Worker. Rights.

RESUMO

Este artigo trata de apresentar uma síntese das problematizações da maternidade nas Penitenciárias Femininas. A pesquisa identificou as características das mulheres em situação de maternidade no sistema carcerário feminino, assim como, analisou as dificuldades que essas mulheres enfrentam para obter o respeito de seus direitos humanos. Vindo também a investigar como funciona o sistema de cárcere feminino e importância do assistente social na atuação e no atendimento da mulher em situação de maternidade no sistema prisional feminino.

1 INTRODUCTION

The number of women in prison in Brazil is gradually increasing. According to the Ministry of Justice, this increase reached 42% between 2007 and 2012. In five years there was an increase of more than 10,000 (ten thousand) women in the Brazilian prison system

Violations of the rights of incarcerated women and their children have gained space in the growth of the number of inmates in the female prison system. Although the number of incarcerated men is higher, the number of women has grown considerably. However, even with this feminization of prisons, the spaces and policies adopted disregard the feminine particularities. Making it impossible to protect and guarantee their rights and those of their children.

This situation reveals the Brazilian fragility regarding criminal and social policies that concern the reduction of inequalities and the guarantee of citizenship of these women, which has not favored their social reintegration or even their resocialization. This situation of incarceration does not favor the preservation of the health of women and children, causing a true process of exclusion and discrimination with negative repercussions, in the medium and long term, for these women and even for their children.

In this context, this study aims to problematize the constitution of maternity in Women's Penitentiaries and the access of these women to this right. The vast majority of prison institutions are not prepared to meet women's needs. As for maternity in prison, some studies point to the right to breastfeeding in a limited way, without considering the other rights of mother and citizen that the prison has.

In view of the challenges of the work that affect the social assistance professional, the present work also aims to reflect on the performance of the social worker in the female prison system, and also to analyze the possibilities and challenges faced by it, taking into account the prison in its contemporary social function.

For the realization of this article, a literary research was carried out on articles written in Brazil, as well as an analysis of research and data collected in the daily reality of prison women in maternity situations, and also a detailed bibliographic analysis of the main names of Brazilian Social Work.

In the end, it is expected to achieve the objective of analyzing the importance of the social worker in the female penitentiary system in relation to women in maternity situations.

2 FEDERAL LEGISLATION TO GUARANTEE WOMEN PRISONERS

The content collected initially allowed 12 federal norms to be found that guarantee the rights of women in prison in maternity situations and their children.

Table 1

Federal legislation that safeguards the rights of the prison mother and her children

Title	Menu	Articles
<i>Constitution of the Federative Republic of Brazil</i> of 1988		Fundamental rights of female prisoners to an establishment appropriate to their female condition, to breastfeeding their children (Art. 5. XLVIII, L), and to family life (Art. 227).
<i>Decree-Law No. 2,848</i> , of December 7, 1940	Code of Criminal Procedure	Serving the sentence in an establishment appropriate for women (Art. 37).
<i>Decree-Law No. 3,689</i> , of October 3, 1941	Code of Criminal Procedure	Substitution of preventive detention for house arrest (Art. 318).
<i>Law No. 7,210</i> , of July 11, 1984	<i>Penal Execution Law</i>	Medical follow-up of the woman and the newborn (Art. 14. § 3). Mandatory nursery, place for breastfeeding, at least up to 6 (six) months of age (Art. 83. § 2). Mandatory place for pregnant and parturient women, and daycare for children over 6 (six) months and under 7 (seven) years old (Art. 89). Benefit of the open regime in a private residence for convicted women with a minor or physically or mentally disabled child; convicted pregnant woman (Art. 117).
<i>Law No. 10,406</i> , of January 10, 2002	Civil Code	Possibilities of suspension of family power to a father or mother convicted by an unappealable sentence, due to a crime whose penalty exceeds two years in prison (Art. 1.583, § 5; art. 1.637 and 1.638).
<i>Law No. 8,069</i> , of July 13, 1990	<i>Statute of the Child and Adolescent</i>	Adequate conditions for breastfeeding and living with the imprisoned mother (Art. 9). Dignified conditions and full protection of the child (Art. 3, 4, 5 and 7). Freedom and coexistence of the child with the mother (Art. 16 and 19). Family power and criminal conviction (Art. 23). Hearing of parents in adoption and child custody proceedings (Art. 158).
<i>CNPCP Resolution No. 14</i> , of November 11, 1994	Minimum Rules for the Treatment of Prisoners.	Conditions for the permanence of children with prisoners during the breastfeeding period (Art.7, §§ 1 and 2). Provision of obstetric material in the prison establishment in case of emergency (Art.17).
<i>CNPCP Resolution No. 04</i> , of July 15, 2009	Regulates the permanence of the children of prisoners in prison environments.	Guidelines for the permanence and referral of the children of prisoners (Art.2). Permanence of at least one year and six months with incarcerated mothers (Art.1). Gradual process of separation (Art.3). Possibilities for sheltering children: extended family, surrogate family or institutions (Art.4). Nursery for children up to two years old (Art.6) Possibility of children from two to seven years old staying with their mothers in the prison unit (Art.7). Food (Art.5). Visits by imprisoned family members and parents (Art.9). Leave of absence from work activity (Art.10). Responsibility of the Union and the States to build and maintain women's penitentiaries with a nursery (Art.8). Possibility of changing the terms and conditions of permanence of children in the prison unit (Art.12).
<i>CNPCP Resolution No. 09</i> , of	Basic Guidelines for Penal Architecture.	Section for pregnant and parturients; daycare centers - nursery module (Annex V).

November 18, 2011		
<i>CNPCP Resolution No. 3, of June 1, 2012</i>	Recommendation on the use of handcuffs.	The use of handcuffs or other means of restraint during childbirth and during the subsequent rest period is prohibited (Art. 3). Recommendation to health professionals to formally report misuse (Art. 5).
<i>Ordinance MS/MJ No. 1,777, of September 9, 2003</i>	National Health Plan in the Penitentiary System.	Women's health. Prenatal, childbirth and postpartum care in 100% of penitentiary units. There is no reference to a pediatrician, or monitoring of the children
National Plan for Criminal and Penitentiary Policy	National Plan for Criminal and Penitentiary Policy - CNPCP/MJ 26/04/2011.	Prenatal care and the existence of specific spaces and services for pregnant women during pregnancy and during the period of their children's stay in the prison environment.

Source: Authors.

There is a disparity between the legislations, and this heterogeneity and the lack of norms to regulate the situation of the child with the mother aggravates the discretionary character sent to the management of penal establishments

The absence of legislative content on the subject indicates aspects that are harmful to the protection of rights that affect their health. The lack of interest in legislating such a controversial issue shows the social, legal and administrative invisibility of children living with their mothers in prisons.

3 CRESS/CFESS GUIDELINES

Social workers, as active professionals and defenders of human rights, must be guided by the careful observance of the competence guidelines established by the CRESS/CFESS, as well as by the Code of Ethics of the profession.

Professional intervention in Social Assistance policy cannot have as its horizon only the execution of the activities listed in institutional documents, at the risk of limiting its activities to the "management of poverty" from the perspective of the individualization of social situations and of approaching the social issue from a moralizing bias. (CFESS, 2009, p.5).

Table 2

General and specific competencies of the social work professional according to CFESS guidelines

GENERAL COMPETENCIES OF THE SOCIAL WORKER	SPECIFIC COMPETENCIES OF THE SOCIAL WORKER
Critical apprehension of the social processes of production and	A dimension that encompasses individual, family or group approaches from the perspective of meeting basic needs and access to rights,

reproduction of social relations in a perspective of totality;	goods and public equipment. This dimension should not be guided by psychotherapeutic care for individuals and families (proper to Psychology), but rather to the enhancement of social orientation with a view to expanding the access of individuals and the community to social rights;
Analysis of the historical movement of Brazilian society, apprehending the particularities of the development of Capitalism in the country and the regional particularities;	A dimension of collective intervention with social movements, from the perspective of the socialization of information, mobilization and popular organization, which is based on the recognition and strengthening of the working class as a collective subject in the struggle for the expansion of rights and state accountability;
Understanding of the social meaning of the profession and its socio-historical development, in the international and national scenarios, unveiling the possibilities of action contained in reality;	A dimension of professional intervention aimed at insertion in democratic spaces of social control and construction of strategies to foster the participation, claim and defense of rights by users and Councils, Conferences and Forums of Social Assistance and other public policies;
Identification of the demands present in society, aiming to formulate professional responses to face the social issue, considering the new articulations between the public and the private.	A dimension of management, planning and direct execution of goods and services to individuals, families, groups and collectivity, in the perspective of strengthening democratic and participatory management capable of producing, intersectorally and interdisciplinarily, proposals that enable and enhance management in favor of citizens;
	A dimension that materializes in the systematic realization of studies and research that reveal the real living conditions and demands of the working class, and can feed the process of formulation, implementation and monitoring of the Social Assistance policy;
	A pedagogical-interpretative and socializing dimension of information and knowledge in the field of rights, social legislation and public policies, aimed at the various actors and subjects of politics: public managers, directors of service providers, workers, counselors and users.

Source: Authors.

The documentary content analyzed, allowed the analysis of the professional profile of the social worker in the performance of the guarantee of the fulfillment of the rights of prison women in maternity situations and their children, this being observed by the social assistance professional the Parameters of their competence according to the CFESS/CRESS.

Professional action is restricted because of the system that is included and also all the bureaucracy that this system presents. Social work as a profession acts in the expressions of social issues and social relations and aims at the struggle for human rights in Brazil, the realization of these rights and also the denunciation of the non-fulfillment of the rights of convicts in prison units.

4 SOCIAL VISION OF FEMALE CRIMINALITY

With the observation of the female prison reality and the profile of the prison woman, the multiple faces of social marginalization that marks the trajectory of most imprisoned women are revealed. They are marked both by socioeconomic exclusion, gender and race discrimination, as well as by a history of violence and drug abuse.

Different economic and sociocultural studies are unanimous in stating that the majority of women prisoners are young, aged between 20 and 35 years, belong to ethnic minority groups, poor, single mothers, with low education, without professional qualifications, unemployed or employed in a low-skilled position and with low income.

In addition to these profiles, the survey also revealed that women prisoners have a history of violence in childhood and adolescence, including physical assault, rape, alcohol and drug abuse.

However, these problems pointed out originated from historical and social facts that began centuries ago. As Cláudia Gabriele da Silva argues:

It is from the second half of the eighteenth century, with the advent of the Industrial Revolution, that the prison system began to be modeled according to the interests of the capitalist class, where the inmates served as labor to circumvent idleness, through coercive methods. Over time, the penalties were adapted to the crimes, becoming more "humanized" and this work developed in the capitalist spheres of production began to serve for the custody of the convict. However, the character of punishment, coercion and modeling of "being" according to the norms of the functional capitalist society did not cease to exist. (Silva, Cláudia Gabriele da, 2007, p. 3)

The capitalist economic and political model, through a meritocratic ideology, annuls the differences, subjectivities and distinct opportunities of the beings who live in its context, introducing personal will as the only condition for success, limited to the economic, in which "we are what we have".

For Iamamoto:

It is in the context of world globalization under the hegemony of big financial capital, of the alliance between banking capital and industrial capital, that we witness the technical-scientific revolution based on microelectronics, establishing new patterns of producing and managing work. At the same time, the demand for labor is reduced, the surplus population is expanded to the average needs of capital itself, increasing the social, economic, political, and cultural exclusion of men, young people, children, and women from the subaltern classes, who are now the target of institutionalized violence. This social exclusion becomes, contradictorily, the product of the development of collective work. In other words, pauperization and exclusion are the other face of the development of the productive forces of social labor, the development of science and technology, the

means of communication, production, and the globalized market. (IAMAMOTO, Marilda, 2000, p. 14)

In recent years, the portrait of social exclusion that women were subjected to before prison has deepened even more with incarceration. The hypothesis that there is a relationship of continuity, between participation in criminal activities and the experiences of abusive relationships, or immersion in violent environments, lived in childhood, adolescence and/or adulthood, the current discrimination and deep inequality caused for years by a perverse capitalist system that corrupts society and the political system, It seems that they only contribute to the increase and narrowing of relations between crime and marginality with women.

5 SCENARIO OF WOMEN'S PROFESSIONAL INSTITUTIONS

The situation of national prisons is of great concern. The overcrowding and precariousness of these institutions are largely caused by omissions by the Public Power, thus generating an alarming picture of violations of the human rights of the incarcerated.

In this scenario of bankruptcy of the prison system, women suffer more rights violations, considering that they are in a system designed by men and structured by men, resulting in a model that does not pay attention to the needs and peculiarities of women, among them the maternity of incarcerated women, the main theme of this work.

Motherhood brings with it both physiological and social responsibility. And these were imposed on women, and they were accompanied by this imposition also in the prison environment.

The Federal Constitution of 1988 guarantees the right to health and social assistance, and these rights must also be observed in relation to incarcerated women, especially if they are in a situation of maternity.

It is the responsibility of the State to guarantee social support, and also the essential for nutrition, hygiene and health of mother and child, especially if they are in a situation of incarceration.

This opens a reflection on the existence and application of human rights and the difficulties that the social worker faces in the performance of the profession where there is a lack of resources, both material and physical and human

As a result, the woman in a situation of maternity faces several difficulties, and there is no human dignity for both, where the first six months of life are the most important for the human being.

The social worker has been fighting to guarantee the rights of all and the realization of them.

6 CONCLUSIONS

We live in a social moment with growing crime, and based on the premise that the national prison system is precarious and presents itself as a violator of human rights, disrespecting the guarantees provided to prisoners and mainly hurting one of the main foundations of the Democratic Rule of Law: human dignity.

It was identified that, despite initiatives that show concern for women prisoners, the laws that guarantee humane treatment to prison mothers and that aim to enable the continuity of motherhood in prison, in practice, are not effective.

Therefore, one of the current challenges of the social worker profession is to make the professional practice effective within women's prison institutions, effectively materializing the fulfillment of human rights standards and fundamental guarantees of the prison mother and her child, in an attempt to overcome a system of social and punitive control. The work of the social worker in the Brazilian prison system is surrounded by many limitations, conflicts and difficulties.

ABSTRACT

This article examines how *Rafiki* (2018) articulates love, surveillance and violence in its representation of lesbian experience. Drawing on a lesbian feminist reading of Wanuri Kahiu's film, inspired by Monica Arac de Nyeko's short story "Jambula Tree," the study argues that the film constructs the bond between Kena and Ziki as a force of mutual recognition while exposing the familial, social, and institutional mechanisms mobilized to discipline dissident desire. Methodologically, the discussion focuses on two sequences, read through the concepts of compulsory heterosexuality, heteronormativity, intersectionality, and lesbophobia in dialogue with formal elements of film language such as framing, lighting, color, and point of view. The analysis shows that *Rafiki* juxtaposes scenes of reciprocity, chromatic warmth, and affective openness with scenes of public exposure, humiliation, and coercion, thereby revealing that violence against lesbian women operates in both physical and symbolic registers. The article concludes that the film performs an aesthetically and politically significant intervention by affirming the legitimacy of desire between women and by making visible the social costs imposed on its existence.

Keywords: Film Analysis. Lesbian Existence. Heteronormativity. Love. Violence.

RESUMO

Este artigo examina como *Rafiki* (2018) articula amor, vigilância e violência em sua representação da experiência lésbica. Com base em uma leitura feminista lésbica do filme de Wanuri Kahiu, inspirado no conto "Jambula Tree", de Monica Arac de Nyeko, o estudo sustenta que o filme constrói o vínculo entre Kena e Ziki como uma força de reconhecimento mútuo, ao mesmo tempo em que expõe os mecanismos familiares, sociais e institucionais mobilizados para disciplinar o desejo dissidente. Metodologicamente, a discussão concentra-se em duas sequências, lidas à luz dos conceitos de heterossexualidade compulsória, heteronormatividade, interseccionalidade e lesbofobia, em diálogo com elementos formais

da linguagem cinematográfica, como enquadramento, iluminação, cor e ponto de vista. A análise mostra que Rafiki justapõe cenas de reciprocidade, calor cromático e abertura afetiva a cenas de exposição pública, humilhação e coerção, revelando, assim, que a violência contra mulheres lésbicas opera tanto em registros físicos quanto simbólicos. O artigo conclui que o filme realiza uma intervenção estética e politicamente significativa ao afirmar a legitimidade do desejo entre mulheres e ao tornar visíveis os custos sociais impostos à sua existência.

Palavras-chave: Análise Fílmica. Existência Lésbica. Heteronormatividade. Amor. Violência.

RESUMEN

Este artículo examina cómo Rafiki (2018) articula el amor, la vigilancia y la violencia en su representación de la experiencia lésbica. A partir de una lectura feminista lésbica de la película de Wanuri Kahiu, inspirada en el cuento “Jambula Tree” de Monica Arac de Nyeko, el estudio sostiene que la película construye el vínculo entre Kena y Ziki como una fuerza de reconocimiento mutuo, al tiempo que expone los mecanismos familiares, sociales e institucionales movilizadas para disciplinar el deseo disidente. Metodológicamente, la discusión se centra en dos secuencias, leídas a través de los conceptos de heterosexualidad obligatoria, heteronormatividad, interseccionalidad y lesbofobia, en diálogo con elementos formales del lenguaje cinematográfico, como el encuadre, la iluminación, el color y el punto de vista. El análisis muestra que Rafiki yuxtapone escenas de reciprocidad, calidez cromática y apertura afectiva con escenas de exposición pública, humillación y coerción, revelando así que la violencia contra las mujeres lesbianas opera tanto en registros físicos como simbólicos. El artículo concluye que la película lleva a cabo una intervención estética y políticamente significativa al afirmar la legitimidad del deseo entre mujeres y al visibilizar los costos sociales impuestos a su existencia.

Palabras clave: Análisis Fílmico. Existencia Lésbica. Heteronormatividad. Amor. Violencia.

1 INTRODUCTION

The portrayal of lesbian desire has been in a somewhat marginal position within the landscape of mainstream cinema. For decades, women in cinema have been presented largely as objects of male desire, while same-sex relationships, when represented at all, have tended to privilege male experience or to limit female homoeroticism to fetishized spectacle. Within this context, lesbian subjectivities are pertinent here not simply because the film makes spaces of recognition, visibility, and contestation. They do not merely increase the variety of media representations, they challenge the cultural norms of what desires could be publicly accepted as legitimate.

Rafiki (2018), directed by Wanuri Kahiu and inspired by Monica Arac de Nyeko's award-winning short story "Jambula Tree," is meaningful for that dispute being staged. Set in Nairobi, the film examines two love-struck young women, Kena and Ziki, in a conservative society governed by political competition, familial pressures and public hostility. Not one of the narratives treats their relationship as a private, out-of-touch piece cut off from the rest the society. On the contrary, the film shows how the coming to intimacy of the protagonists is immediately mediated by gender norms, community surveillance, and the threat of punishment.

The relevance of the film is amplified by its circulation history. Rafiki was the first Kenyan feature selected for the Cannes Film Festival's official lineup, yet it was banned in Kenya because of its portrayal of a lesbian relationship. This contrast between international recognition and domestic censorship reveals how representation becomes a political battlefield. The reception of the film reflects one of its central concerns: the conflict between the possibility of queer visibility and the mechanisms that attempt to suppress it.

This article argues that Rafiki establishes love and violence as inseparable facets of lesbian experience within a heteronormative social order, with surveillance as the conduit that units them. Love is not presented as an exclusive private emotion, nor is violence limited to explicit physical aggression. Rather, the film posits that tenderness, desire, fear, secrecy, humiliation, and punishment are intricately linked in contexts where heterosexuality is perceived as mandatory standard. The objective of this study is to examine how the film portrays both the emotional intensity of the protagonists' relationship and the violent responses elicited by that relationship.

For that reason, the discussion focuses on two sequences. The first, which takes place between 19m18s and 21m45s, is examined as an important moment in building closeness and mutual recognition. The second, from 53m50s and 1h00m30s, is looked at as a focused example of violence in public and institutions. By placing these scenes in dialogue with lesbian

and feminist theory as well as with selected elements of film language, this article aims to show that *Rafiki* transcends the mere narration of a forbidden romance: it reveals the societal repercussions faced by lesbian individuals while affirming their emotional authenticity and cinematic significance.

2 THEORETICAL FRAMEWORK

Adrienne Rich's (1980) concept of "compulsory heterosexuality" is a good place to start when reading *Rafiki*. Rich argues that heterosexuality should not be understood simply as a personal inclination or natural destiny, but as a political institution that secures male power and structures women's lives according to gendered norms of marriage, procreation, and servitude. Within this context, lesbian existence is threatening not only because it deviates from sexual normativity, but also because it exposes the non-inevitability and non-neutrality of heterosexuality. It is created by history, enforced by society, and supported by material things.

This debate is closely linked to the concept of heteronormativity. Cathy Cohen (2019) says that heteronormativity includes social practices and institutions that make heterosexuality the "normal" and "expected" way to live your intimate life. It controls not just desire but also behavior, appearance, family ties, and how people see you in public. In this regard, the issue extends beyond the object of affection, it encompasses the manner of occupying public space, the performance of femininity, and the interpretation of bodies by others. *Rafiki* dramatizes these pressures by situating Kena and Ziki in a place where family, neighbors, and state all have a say in how close they can get to each other.

Lesbian feminist scholarship has demonstrated that violence against lesbians cannot be entirely encompassed by the broader category of homophobia. The concept of lesbophobia underscores the particularity of violence inflicted upon women whose desires subvert both heterosexuality norms and conventional femininity. Rojas and Mansilla (2021) assert that this violence often seeks to discipline women regarded as rejecting the heterosexual contract. It can be physical, verbal, sexual, or symbolic, but in all cases, it works to bring the norm back by making lesbian desire seem strange, wrong or punishable.

The concept of abjection also helps us understand the social logic behind these reactions. When certain bodies or desires are deemed unacceptable, they become linked with disgust, shame, or moral danger. Silence, ridicule, erasure, and exclusion are not secondary phenomena; they are essential to the construction of social order. Navarro-Swain (2000) asserts that the politics of silence is intricately connected to the politics of forgetting; that which threatens prevailing values is often obliterated, disqualified, or denied discursive validity. This

logic is evident in *Rafiki* through everyday interactions and in more explicit instances of collective aggression.

It is also crucial to refrain from perceiving lesbian experience as socially uniform. Crenshaw (2002) defines intersectionality as the study of how different systems of oppression work together instead of separately. Gender, sexuality, race, class, age, and nationality intersect to influence vulnerability. This perspective is particularly relevant to *Rafiki*, as the protagonists are not merely abstract lesbians; they are young Black Kenyan women living in a working-class urban setting. That social location shapes how they feel about being seen, being in danger, and wanting something. Lorde (2019) reminds us that the systems of oppression stay in place when people refuse to see and value differences. An intersectional reading, therefore, inhibits the analysis from reducing the film into a universal narrative divorced from its particular historical and cultural context.

Film analysis also requires attention to form. Meaning in cinema does not just come from the plot or the dialogue. It also comes from the framing, lighting, costume, sound, rhythm, and camera movement. Turner (1999) proposes that images gain social significance through these specific formal choices. Camera angles can set up power dynamics, color can suggest mood, and point-of-view structures can help audience connect with the story. In *Rafiki*, the difference between scenes of violence and scenes of intimacy is made clear both in the story and in the pictures. Surveillance, distance, and coldness coexist with warmth and color. The film's political power comes from the way it connects representation and form: it shows lesbian desire while also showing the system that tries to control it.

3 METHODOLOGICAL NOTE

This is a qualitative and interpretive study based on film analysis and lesbian feminist criticism. Instead of trying to read the whole feature, the article focuses on two sequences that sum up the main conflicts of the story. This method enables the connection of formal choices overarching issues of representation, normativity, and violence.

The analysis integrates two dimensions. The first is theoretical one that mostly uses Rich's (1980) notion of compulsory heterosexuality, talks about heteronormativity and lesbophobia, and looks at the intersectional perspectives that make it hard to read lesbian experience in a universal way. The second is formal, focusing on *mise-en-scène*, framing, costume, lighting, point of view, and editing. These elements are important to how the film makes sense. The goal of the analysis is to understand how the language of the film itself helps create closeness, surveillance, and punishment.

4 ANALYSIS AND DISCUSSION

4.1 LOVE, RECOGNITION, AND THE POSSIBILITY OF A SHARED WORLD

The part of the film between 19m18s and 21m45s is important because it presents intimacy not as a spectacle, but as a relationship. Kena and Ziki sit together on a balcony and exchange a brief but significant conversation about not becoming like “them” and about being “something real.” There are no excessive statements or sexual excess in the scene. Instead, it shows love as a fragile but transformative space where each girl can see herself and the other girls in a new way.

The scene’s visual design is decisive. At first, both characters look happy in a frontal shot that puts them in the same frame. After a short time, the editing gives each girl a chance to show how she sees the other by switching between shots. This strategy creates closeness by making people see Kena through Ziki’s eyes and Ziki through Kena’s. The effect is not voyeurism, but mutualism. The scene encourages identification with the act of careful observation instead of an external gaze that objectifies the girls.

The difference is made clearer by the lighting. Ziki is often surrounded by warm light, which can make her look almost overexposed. That gives her presence a bright and expansive quality. Kena, on the other hand, is framed with stronger contrast and a softer tone. The difference does not show a simple opposition between darkness and light; instead, it shows how important Ziki becomes in Kena’s life. If Kena’s social world has put her in a place of restraint, silence, and caution, Ziki seems to be a person of movement, color, and possibility. The costumes also add to the contrast: Kena’s more neutral clothes suggest discretion, while Ziki’s bright colors and bold styling suggest openness and confidence in performance.

These formal choices are crucial because they go against a long-standing trend in films where women are shown being close to each other through heterosexual fantasy. The scene does not fetishize lesbian desire. It puts conversation, facial expressions, pauses, and emotional alignment first. The movie shows that love is growing through friendship, curiosity, and recognition even before the main characters kiss. In this way, *Rafiki* broadens the idea of eroticism beyond just sexual acts. Rich (1980) helps here because her writing shows that the erotic can be seen as a way of relating, being intense and sharing life force, rather than just as a sexual pornographic register.

The scene also gains meaning because of where it fits into film’s larger social landscape. Before Ziki showed up, Kena was always surrounded by comments and attitudes that make non-normative sexuality seem strange or funny. Given this, the conversation on the balcony is a brief break from public hostility. It creates a space where the audience can picture a different

way of living in the world, even if it is for a short time. In this sequence, love is not merely emotional attachment; it signifies the emergence of a possible shared reality.

At the same time, the scene is both tender and fragile. The girls' pact "to be something real" already shows that they know that reality is something that people disagree about. Their connection is meaningful because the world around them tries to make it seem unreal, unspeakable, or illegitimate. The scene foreshadows the film's main point: in a under heteronormative world, closeness between women is politically charged not because it seeks confrontation, but because it challenges the idea that heterosexuality is normal and shows how it is enforced.

4.2 VIOLENCE, EXPOSURE, AND THE ENFORCEMENT OF THE NORM

The first sequence is based on reciprocity, while the one between 53m50s and 1h00m30s is based on exposure. Ziki's mother first sees the girls kissing. Then they ran to the van that had been their safe haven throughout the film. Finally, they are found, beaten, and taken to a police station. The scene focuses on different levels of coercion and shows how violence spreads through private, public, and institutional spaces when intimacy becomes something that everyone watches.

One of the most striking aspects of the sequence is the breakdown of personal safety. The van had been a liminal space before, where the main characters could briefly escape surveillance. Once that safe space is breached, violence escalates rapidly. Mama Atim's public condemnation turns the girls from victims into a spectacle of community anger. The words used to call others make them seem dirty and disgusting, setting the stage for physical violence. What follows is not just one act of cruelty, but a group effort to enforce the norm. The mob thinks that punishing visibility is a way of bring back moral order.

In this case, lesbophobia seems to be more than just personal bias; it also seems to be a form of social education. The beating is meant to punish, shame, and "fix" the girls by making their bodies pay for being seen. The violence is public, gendered, and exemplary: it shows the rest of the community what could happen to people who do not follow the heterosexual mandate. The scene thus confirms that coercion does not initiate with physical assault; rather it culminates there, after having been facilitated by gossip, derision, moral condemnation, and surveillance.

Instead of stopping this line of thought, the police station makes it stronger. Institutional authority which should signify the shift from violence to protection, instead perpetuates the same contempt that characterized the assault. The officers' mockery – particularly the inquiry

regarding the identity of “the man” in the relationship - exposes the inadequacy of heteronormative discourse to understand lesbian intimacy beyond masculine-feminine dichotomies. The question is not innocent; it forces the relationship back into the grammar of heterosexual roles and thereby denies its own terms of existence.

Family reactions make the situation even more difficult. Ziki’s father responds with a slap, while Kena’s father tries to manage the situation by talking to the police chief. These gestures may look different, but they both come from patriarchal control. Ziki’s mother’s comment, “Haven’t you hurt her enough?” is especially revealing because it draws attention to how often victims are blamed for the violence that is done to them. People do not think of the girls as people who need care; instead, they think of them as the people who cause trouble in the community.

The sequence shows rupture and desolation in a cinematic way. The police station scene is colder, with harsher light and a more static frontal framing than the earlier balcony scene, which was warmer. The camera often makes the girls look small and weak in a setting that does not feel personal. The distance between them in a frame shows how the attack affected them emotionally. The film shows how trauma can have different but connected effects: one person reaches out, while the other pulls back to protect themselves. This is shown when Kena looks at Ziki while Ziki looks away.

The change in point of view is also significant. Earlier, the alternating shots had helped the main characters get along with each other. Here, frontal compositions and the lack of a long-lasting mutual perspective create estrangement. The viewer is no longer part of the intimate exchange of gazes; instead, they see the aftermath of violence and the girls being forced to be apart. The change in form makes the broader thematic movement from possibility to punishment stand out even more.

Yet the scene should not be about being a victim. Its strength lies in showing how heteronormative society protects itself. Public assault, institutional derision, and familial discipline collectively serve to regulate women’s bodies and desires. In this regard, the violence portrayed in *Rafiki* is not exceptional; it is systemic. The film shows how everyday people, rumors in the community, police talk, and parental authority all help to keep norms going. Love becomes dangerous not due to its intrinsic transgressiveness, but because the social order is committed to denying the humanity of lesbian and normalizing surveillance as a standard mechanism of control.

5 FINAL CONSIDERATIONS

Rafiki portrays love and violence not as opposing and isolated forces, but as experiences that intertwine within heteronormative contexts. The relationship between Kena and Ziki is characterized by tenderness, reciprocity, and emotional depth, however, it is precisely these attributes that render the relationship vulnerable to surveillance and punishment. The film's success is that it does not turn lesbian desire into either a spectacle or a disease. Instead, it shows lesbian intimacy as normal, important and very human.

The analysis of the two chosen sequences illustrates that the film articulates this argument both narratively and structurally. Rafiki uses color, framing, lighting, and point of view to show the difference between spaces of emotional possibility and spaces of coercion. Moments of warmth and recognition are juxtaposed with communal animosity, public scrutiny, and institutional degradation. The film shows that violence against lesbian women is not just physical; it is also supported by symbolic, discursive, and social practices that try to make their existence seem illegitimate.

From a lesbian feminist point of view, the film is politically important because it shows how personal relationships are connected to larger systems of power. Kena and Ziki's story is not just about desire; it is also about who can show up, love, and picture a future. Rafiki challenges the normalization of compulsory heterosexuality and expands the scope of cinematic representation by affirming the protagonists' emotional bond in the face of censorship and hostility. So, its intervention is both aesthetic and political; it says that lesbian lives should not be shown on screen as cautionary tales, but as lives that deserve complexity, dignity, and visibility.

ABSTRACT

The teaching of veterinary surgery requires strategies that enable the development of technical skills in a safe and ethical manner. In this context, the present study aimed to develop an anatomical biomodel of the male canine genitourinary region for training in the orchiectomy technique, as well as to evaluate its applicability as a didactic tool. The biomodel was constructed using low-cost materials, including biscuit modeling clay for support structures, clear rubber for internal anatomical components, and platinum-cured transparent silicone to simulate the skin layer. After fabrication, the model was subjected to practical testing, in which the fundamental steps of the surgical procedure, such as incision, dissection, and manipulation of anatomical structures, were performed. The results demonstrated that the biomodel presented adequate anatomical fidelity and mechanical properties compatible with surgical simulation, allowing the procedure to be carried out in a safe and reproducible manner. From an educational perspective, the model enabled repeated practice in a controlled environment, contributing to the improvement of practical skills, reduction of errors, and increased student confidence. Furthermore, its use is aligned with the principles of reduction, refinement, and replacement (3Rs), representing an ethical alternative to the use of animals in teaching. It is concluded that the proposed biomodel has strong potential to be incorporated as a complementary tool in veterinary surgical education, contributing to the training of more qualified professionals.

Keywords: Anatomical Biomodels. Orchiectomy. Surgical Training. Teaching Innovation. Veterinary Education.

RESUMO

O ensino da cirurgia veterinária exige estratégias que possibilitem o desenvolvimento de habilidades técnicas de forma segura e ética. Nesse contexto, o presente estudo teve como

objetivo desenvolver um biomodelo anatômico da região geniturinária de cães machos para o treinamento da técnica de orquiectomia, bem como avaliar sua aplicabilidade como ferramenta didática. O biomodelo foi confeccionado com materiais de baixo custo, incluindo massa de biscoito para estruturas de sustentação, clear rubber para as estruturas internas e silicone transparente à base de platina para simulação da pele. Após a confecção, o modelo foi submetido a testes práticos, nos quais foram realizadas as etapas fundamentais do procedimento cirúrgico, como incisão, dissecação e manipulação das estruturas anatômicas. Os resultados demonstraram que o biomodelo apresentou adequada fidelidade anatômica e propriedades mecânicas compatíveis com a simulação cirúrgica, permitindo a execução do procedimento de forma segura e reprodutível. Do ponto de vista educacional, o modelo possibilitou a repetição das técnicas em ambiente controlado, contribuindo para o aprimoramento das habilidades práticas, redução de erros e aumento da confiança dos estudantes. Além disso, sua utilização está alinhada aos princípios dos 3Rs, configurando-se como alternativa ética ao uso de animais no ensino. Conclui-se que o biomodelo proposto apresenta potencial para ser incorporado como ferramenta complementar no ensino da cirurgia veterinária, contribuindo para a formação de profissionais mais qualificados.

RESUMEN

La enseñanza de la cirugía veterinaria requiere estrategias que permitan el desarrollo de habilidades técnicas de forma segura y ética. En este contexto, el presente estudio tuvo como objetivo desarrollar un biomodelo anatómico de la región genitourinaria de perros machos para el entrenamiento en la técnica de orquiectomía, así como evaluar su aplicabilidad como herramienta didáctica. El biomodelo se elaboró con materiales de bajo costo, incluyendo masa para galletas para las estructuras de soporte, caucho transparente para las estructuras internas y silicona transparente a base de platino para la simulación de la piel. Tras su construcción, el modelo se sometió a pruebas prácticas, en las que se realizaron los pasos fundamentales del procedimiento quirúrgico, como la incisión, la disección y la manipulación de las estructuras anatómicas. Los resultados demostraron que el biomodelo presentaba una fidelidad anatómica adecuada y propiedades mecánicas compatibles con la simulación quirúrgica, lo que permitió realizar el procedimiento de forma segura y reproducible. Desde un punto de vista educativo, el modelo permitió la repetición de técnicas en un entorno controlado, contribuyendo a la mejora de las habilidades prácticas, la reducción de errores y el aumento de la confianza del alumnado. Además, su uso se alinea con los principios de las 3R, consolidándose como una alternativa ética al uso de animales en la enseñanza. Se concluye que el biomodelo propuesto tiene el potencial de incorporarse como una herramienta complementaria en la formación en cirugía veterinaria, contribuyendo a la capacitación de profesionales más cualificados.

1 INTRODUCTION

Veterinary Medicine plays an essential role in promoting animal health and welfare, requiring professionals to possess a solid technical background combined with a thorough understanding of the anatomical, physiological, and surgical characteristics of different species. In this context, the teaching of anatomy and surgical techniques represents one of the fundamental pillars of academic training, providing the basis for the development of clinical and operative competencies (Dyce; Sack; Wensing, 2019; Köning; Liebich, 2021).

Traditionally, veterinary anatomy teaching has been based on the use of cadavers and anatomical specimens, allowing direct contact with real structures and enhancing the three-dimensional perception of the organism. However, the acquisition, preservation, and maintenance of these materials present limitations related to specimen availability, operational costs, and sanitary requirements. In addition, preservation methods may alter tissue properties and compromise anatomical fidelity (Carvalho et al., 2013; Evans; De Lahunta, 2018).

At the same time, there is a growing concern regarding the ethical aspects associated with the use of animals for educational purposes. In this scenario, the principles of the 3Rs—reduction, refinement, and replacement—stand out, guiding the development of more ethical and sustainable alternative methodologies (Russell; Burch, 1959; Oliveira; Notomi, 2023; Knight, 2011).

In response to these demands, the incorporation of innovative educational technologies has gained prominence in veterinary education. Among these, the use of artificial anatomical models emerges as a relevant complementary strategy, allowing the reproduction of biological structures through synthetic materials and enabling their repeated use in practical activities. Studies indicate that three-dimensional models contribute to the spatial understanding of anatomical structures and support active learning methodologies (Barros; Schmidt, 2019; Ayres et al., 2020; McGaghie et al., 2010).

Anatomical biomodel can be produced using different materials, such as silicone, resins, and low-cost synthetic compounds, making their application feasible across diverse institutional settings. Their ability to faithfully reproduce organs and anatomical systems enables the development of accessible and adaptable teaching resources. Evidence demonstrates that the use of these models enhances practical learning and contributes to the consolidation of anatomical knowledge (Macedo et al., 2021; Nascimento; Silva, 2021; Santos et al., 2021; Botti et al., 2018).

Beyond anatomical teaching, artificial models have been widely used for the training of surgical skills. Procedures such as orchiectomy in dogs are routine in small animal practice and

require technical proficiency and surgical confidence. In this context, prior training in simulated environments allows the development of motor skills, familiarization with procedural steps, and reduction of errors in clinical practice (Slatter, 2020; Toniollo; Vicente, 2017; Seymour et al., 2002).

Studies indicate that the use of anatomical biomodels in surgical training improves technical performance, increases procedural safety, and reduces the occurrence of errors in real interventions. Furthermore, it enables repeated practice and promotes learner autonomy (Silva; Lopes, 2018; Ziegler; Souza, 2021; Issenberg et al., 2005).

Thus, the use of biomodels represents a viable educational tool aligned with contemporary demands in veterinary training, contributing to pedagogical innovation, adherence to ethical principles, and the improvement of practical skills.

In light of the above, the present study aimed to develop an anatomical biomodel of the male canine genitourinary region for training in the orchiectomy technique, as well as to evaluate its applicability as a didactic tool in veterinary surgical education. Additionally, it sought to contribute to the preparation of students prior to performing procedures on real patients, promoting greater safety and reducing errors during the procedure.

2 METHODOLOGY

2.1 STUDY DESIGN

This study was designed as an experimental investigation focused on the development of an anatomical biomodel of the male canine reproductive system, with a didactic and educational purpose. The primary aim was to produce a safe, reproducible, and low-cost anatomical model that could be applied in practical teaching activities for veterinary students, minimizing exposure to hazardous chemicals and enhancing both spatial and tactile understanding of complex anatomical systems.

2.2 MATERIALS

Low-cost and easily accessible materials were used, including biscuit modeling clay for structural modeling, clear rubber for the fabrication of internal anatomical structures, and platinum-cured transparent silicone for simulating the skin layer.

Auxiliary materials included silicone adhesive, wool string, and plastic containers. Personal protective equipment (gloves and lab coat) was used throughout the fabrication process, which was conducted in a controlled environment without direct light exposure or external disturbances to ensure material stability and consistency.

2.3 FABRICATION OF BISCUIT MOLDS

The initial modeling phase consisted of individually constructing the anatomical structures using biscuit material, including two testicles, epididymis, ductus deferens, penis, and a skin layer, in addition to a support structure designed to stabilize the model (Figure 1).

Figure 1

Source: Prepared by the authors.

All components were fixed onto a base to ensure dimensional stability and facilitate handling during subsequent stages. The molds were allowed to dry for four days in a controlled environment, ensuring adequate structural integrity and resistance. Environmental control was essential to preserve anatomical fidelity and mechanical properties required for future didactic application.

2.4 SILICONE MOLDING TEST

After complete hardening of the biscuit structures, one testicle was selected for a preliminary silicone molding test using general-purpose silicone adhesive (Figure 2). This step aimed to evaluate material behavior during curing, determine the required drying time, and identify potential adjustments for subsequent molding procedures.

Figure 2

Testicular mold produced using general-purpose silicone adhesive

Source: Prepared by the authors.

The resulting mold was stored in a protected environment, without exposure to direct light or manual handling, to prevent deformation or contamination. No release agents, oils, or petroleum-based substances were used, allowing direct assessment of the material's performance.

After a three-day curing period, the mold demonstrated satisfactory structural integrity, although minor imperfections were observed. These findings guided refinements in later stages of the fabrication process.

Following validation of this initial test, the remaining anatomical structures were molded using the same technique, ensuring morphological fidelity and structural uniformity. The previously constructed support base was maintained in its original form and was not subjected to silicone molding, as its structural function had already been achieved.

To improve adaptation to internal components and enhance manufacturing control, the skin mold was developed in two separate parts (upper and lower portions). This approach facilitated the accommodation of internal structures (testicles, penis, ductus deferens, epididymis, and support base), allowed better control of material thickness, improved surface finishing, and reduced deformation during curing.

2.5 FINAL FABRICATION OF INTERNAL ANATOMICAL STRUCTURES

After successful mold development, the molds were used to produce the final anatomical structures. This phase aimed to improve morphological precision and ensure uniformity among the components of the anatomical biomodel.

Clear rubber was used as the primary material and carefully introduced into the molds under controlled conditions, respecting curing time and environmental requirements. The

structures were maintained in a protected environment without direct light exposure or manipulation until complete curing.

This procedure minimized defects such as deformation and air bubble formation. After curing, the structures were carefully removed from the molds, resulting in satisfactory reproduction of anatomical features and preservation of key morphological characteristics. These results confirmed the effectiveness of the technique for producing didactic anatomical models.

2.6 FABRICATION OF THE SKIN STRUCTURE

For the final stage, the external skin structure of the anatomical biomodel was produced using platinum-cured transparent silicone, composed of two components (A and B) mixed in equal proportions according to the manufacturer's instructions.

An initial pilot test was conducted to evaluate the material's mechanical resistance and suitability for surgical simulation, particularly for suturing procedures. This preliminary step confirmed the material's applicability and allowed identification of potential limitations.

Following validation, the definitive mold was prepared. Components A and B were weighed separately (totaling 152 g) and thoroughly homogenized to ensure uniform curing. The mixture was then poured into the mold designed to represent the external skin layer.

To enhance anatomical definition and ensure consistent thickness, the internal portion of the mold was positioned over the still-fluid silicone. The initial attempt did not fully meet expectations regarding structural quality and surface finish. Therefore, adjustments were made, including improved homogenization of the material and better control of mold assembly to reduce air bubbles.

A second fabrication attempt resulted in improved anatomical definition, structural integrity, and mechanical properties compatible with its intended application. The final assembly was allowed to cure for approximately three days in a protected environment, resulting in a structure suitable for integration into the final anatomical model.

2.7 ANATOMICAL BIOMODEL ASSEMBLY AND TESTING

After completion of all components, the full anatomical biomodel of the male canine genitourinary region was assembled and tested in a controlled environment to simulate orchiectomy procedures (Figure 3).

Figure 3

(A) Finalized anatomical biomodel; (B) Appearance of the biomodel after training in the orchietomy technique and suturing

Source: Prepared by the authors.

The model was positioned on a flat surface in dorsal recumbency, replicating standard surgical positioning. Basic surgical instruments, including scalpel, anatomical forceps, needle holders, and scissors, were used.

Incisions were performed on the simulated skin layer to replicate surgical access, allowing exposure of internal structures. Subsequent dissection enabled identification of anatomical components such as testicles, epididymis, and ductus deferens.

The exposed structures were manipulated using surgical instruments to simulate tissue handling, isolation, and exteriorization of the testicle. The procedure followed the fundamental steps of canine orchietomy, including manipulation of the spermatic cord.

Throughout the procedure, standard surgical maneuvers were performed to assess whether the anatomical biomodel allowed adequate reproduction of the technique. The evaluation focused on the feasibility of completing surgical steps, structural resistance, and overall applicability of the model for training purposes.

3 RESULTS AND DISCUSSION

The development of the anatomical biomodel of the male canine genitourinary region demonstrated clear technical feasibility and relevant didactic applicability, indicating that the strategic combination of materials was a determining factor in achieving structures with

mechanical and morphological properties comparable to biological tissues. This reinforces the importance of material selection in the design of synthetic models intended for surgical training, particularly when the objective includes both structural fidelity and functional simulation.

The use of biscuit as a structural support material proved effective due to its dimensional stability, ease of handling, and low cost, making it suitable for the initial modeling phase. In contrast, the application of clear rubber for internal anatomical structures provided greater flexibility and improved tactile feedback, which are essential characteristics for simulating tissue manipulation. These findings support the concept that multimaterial approaches enhance the realism of synthetic models by allowing the reproduction of distinct biomechanical properties within the same structure (Barros; Schmidt, 2019).

The transparent silicone rubber used to simulate the skin layer exhibited adequate resistance to incision and manipulation, allowing the execution of surgical maneuvers without immediate structural compromise. The implementation of preliminary testing was a critical step in refining the fabrication process, as it enabled adjustments that improved anatomical definition and overall uniformity. This highlights the relevance of iterative development and process standardization in the production of biomodels, particularly when consistency and reproducibility are required for educational use.

During the surgical simulation phase, the biomodel allowed the execution of the fundamental steps of orchiectomy, including incision, dissection, identification, and manipulation of anatomical structures. Although the model does not fully replicate the complexity of living tissues—such as vascularization, bleeding, and dynamic tissue response—it provided sufficient fidelity to support the acquisition of procedural knowledge and basic technical skills. This observation aligns with previous findings that emphasize the role of simulation in bridging the gap between theoretical learning and clinical practice (Issenberg et al., 2005).

From an educational perspective, the possibility of repeated practice in a controlled and safe environment represents a significant advantage, as it contributes to the progressive development of psychomotor skills, reduction of procedural anxiety, and increased confidence among students. Furthermore, the use of biomodels directly addresses ethical concerns associated with the use of animals in teaching, aligning with the principles of reduction, refinement, and replacement (3Rs), and supporting a shift toward more sustainable and ethically responsible educational practices.

Despite these advantages, some limitations must be considered. The durability of the materials under repeated use remains a critical factor, as progressive degradation may compromise both structural integrity and simulation quality over time. Additionally, the level of

anatomical detail, particularly in smaller or more complex structures, may not fully match that observed in biological specimens. These limitations suggest that, while the biomodel is effective as a complementary teaching tool, it does not replace the need for exposure to real anatomical conditions.

Future studies should focus on the incorporation of alternative materials with improved mechanical resistance and greater anatomical fidelity, as well as on the validation of the anatomical biomodel through objective assessment methods involving larger groups of students. Quantitative evaluation of learning outcomes and skill acquisition would further strengthen the evidence supporting its educational effectiveness and facilitate its integration into veterinary curricula.

4 CONCLUSION

The anatomical biomodel of the male canine genitourinary region developed in this study proved to be a viable and effective didactic tool for training in the orchiectomy technique.

The combination of materials used enabled the construction of a model with adequate anatomical fidelity and mechanical properties compatible with surgical simulation, allowing the main steps of the procedure to be performed in a safe and reproducible manner.

From an educational perspective, the anatomical biomodel contributes to the improvement of students' technical skills, promoting practical learning in a controlled environment, with reduced errors and increased confidence during the execution of surgical procedures.

Furthermore, its use is aligned with the principles of reduction, refinement, and replacement (3Rs), representing an ethical and accessible alternative to the use of animals in teaching.

Thus, the proposed anatomical biomodel demonstrates strong potential to be incorporated as a complementary tool in veterinary surgical education, contributing to the training of more qualified professionals and to the advancement of innovative pedagogical practices.

ABSTRACT

This article, part of the research conducted for the Master's in Communication (PPGCOM-UFPI, 2025), proposes an analysis of how violence against women and villainy are represented in the manga "Tomie," highlighting the ways in which narratives reinforce cultural and social norms that perpetuate such violence. This work by manga artist Junji Ito, known for his stories of psychological horror and supernatural elements, first published in 1987, revolves around the character Tomie, with the narrative—"an irresistibly beautiful young woman provokes obsession and violence in the men around her." This phrase summarizes the dramatic structure of the work, but also reveals, in deeper layers, a powerful commentary on how patriarchal culture constructs, controls, and punishes the female figure. The research adopted a qualitative approach, with content analysis (Bardin, 2006), observing 12 selected Figures from the manga, which were organized into five categories: 1) femicide, 2) nudity, 3) passion, 4) villainy, 5) male brotherhood, and 6) enchantment. Categories 1, 4, and 5 are analyzed in this article, from the theoretical perspectives of Beauvoir (2014), Segato (2013), Elena Teles and Valeska Zanello (2017), and Alves (2021). The analysis of violence against women in Tomie reveals not only Junji Ito's skill in creating horror narratives, but also his ability to address profound social issues. Through Tomie's story, we are confronted with the reality of obsession, objectification, and violence, themes that continue to resonate in contemporary society. The repetition of Tomie's femicide and her regeneration throughout the narrative suggest a critique of the objectification and blaming of women. Therefore, concrete actions are urgent, considering the exponentially increasing rates of violence against women, producing profound impacts both on individual structures—especially those of female victims—and on the sociocultural dynamics that affect their families and communities.

RESUMO

O presente artigo, parte integrante da pesquisa realizada no mestrado em Comunicação (PPGCOM-UFPI, 2025), propõe analisar como as violências contra as mulheres e a vilania são representadas no mangá *Tomie*, destacando os modos que as narrativas reforçam normas culturais e sociais que perpetuam tais violências. A obra do mangaká Junji Ito, conhecida por suas histórias de terror psicológico e elementos sobrenaturais. Publicado pela primeira vez em 1987, o mangá gira em torno da personagem *Tomie*, tendo como narrativa – ‘uma jovem irresistivelmente bela provoca obsessão e violência nos homens ao seu redor’. Essa frase resume a estrutura dramática da obra, mas também revela, em camadas mais profundas, um poderoso comentário sobre o modo como a cultura patriarcal constrói, controla e pune a figura feminina. A pesquisa adotou uma abordagem qualitativa, com análise de conteúdo (Bardin, 2006), tendo como observáveis 12 *Figurens* selecionadas do mangá que foram organizadas em cinco categorias – 1) feminicídio, 2) nudez, 3) passionalidade, 4) vilania, 5) irmandade masculina e 6) encantamento, sendo analisadas neste artigo as categorias 1, 4 e 5, nas perspectivas teóricas de Beauvoir (2014), Segato (2013), Elena Teles e Valeska Zanello (2017), Alves (2021). A análise da violência contra mulheres em *Tomie* revela não apenas a habilidade de Junji Ito em criar narrativas de terror, mas também sua capacidade de abordar questões sociais profundas. Por meio da história de *Tomie*, somos confrontados com a realidade da obsessão, da objetificação e da violência, temas que continuam a ressoar na sociedade contemporânea. A repetição de feminicídio de *Tomie* e sua regeneração ao longo da narrativa sugere uma crítica à objetificação e culpabilização da mulher. Portanto, ações concretas são urgentes, considerando os índices de violências contra as mulheres que crescem de maneira exponencial e produzem profundos impactos tanto nas estruturas individuais – especialmente das mulheres vítimas – quanto nas dinâmicas socioculturais que afetam suas famílias e comunidades.

RESUMEN

Este artículo, parte de la investigación realizada para la Maestría en Comunicación (PPGCOM-UFPI, 2025), propone un análisis de cómo se representan la violencia contra las mujeres y la villanía en el manga "*Tomie*", destacando las maneras en que las narrativas refuerzan las normas culturales y sociales que perpetúan dicha violencia. Esta obra del mangaka Junji Ito, conocido por sus historias de terror psicológico y elementos sobrenaturales, publicada por primera vez en 1987, gira en torno al personaje *Tomie*, con la narrativa: "una joven irresistiblemente bella provoca obsesión y violencia en los hombres que la rodean". Esta frase resume la estructura dramática de la obra, pero también revela, en capas más profundas, un poderoso comentario sobre cómo la cultura patriarcal construye, controla y castiga la figura femenina. La investigación adoptó un enfoque cualitativo, con análisis de contenido (Bardin, 2006), observando 12 imágenes seleccionadas del manga, organizadas en cinco categorías: 1) feminicidio, 2) desnudez, 3) pasión, 4) villanía, 5) hermandad masculina y 6) encantamiento. Las categorías 1, 4 y 5 se analizan en este artículo desde las perspectivas teóricas de Beauvoir (2014), Segato (2013), Elena Teles y Valeska Zanello (2017) y Alves (2021). El análisis de la violencia contra las mujeres en *Tomie* revela no solo la habilidad de Junji Ito para crear narrativas de terror, sino también su capacidad para abordar profundas problemáticas sociales. A través de la historia de *Tomie*, nos enfrentamos a la realidad de la obsesión, la cosificación y la violencia, temas que siguen resonando en la sociedad contemporánea. La repetición del feminicidio de *Tomie* y su regeneración a lo largo de la narrativa sugieren una crítica a la cosificación y culpabilización de las mujeres. Por lo tanto, urgen acciones concretas, considerando el aumento exponencial de las tasas de violencia contra las mujeres, que produce profundos impactos

tanto en las estructuras individuales —especialmente en las víctimas— como en las dinámicas socioculturales que afectan a sus familias y comunidades.

1 INTRODUCTION

The realization that humanity has historically been defined from a male reference point forces us to rethink fundamental categories of culture, knowledge and politics. This definition is not neutral: it legitimizes inequalities, makes experiences invisible, and sustains power structures that make violence against women possible and recurrent. By questioning this construction, feminism does not seek to invert hierarchies, but to universalize the human in fact, recognizing women – and all marginalized subjectivities – as subjects full of rights, dignity and existence.

Gender violence is a structural phenomenon of society. In 2022, according to the Patrícia Galvão Institute³, femicide data in Brazil increased by 6%, while femicide attempts grew by 17%, these being the highest rates since 2015, the year in which the femicide law came into force in the country. According to DATASSP⁴, from 2022 to 2025, Piauí recorded a total of 182 cases of femicide. In 2024 alone, 56 cases were recorded, representing an increase of 32% compared to the previous year. This year alone, 18 confirmed femicides were registered in March, which indicates a growing trend.

Table 1

Year	Brazil – Femicides (%)	Brazil – Femicide attempts (%)	Piauí – Cases of femicide	Notes
2022	+6%	+17%	182 (2022–2025 total)	Highest rate since 2015
2024	-	-	56	32% increase compared to 2023
Mar/2025	-	-	18	Only in March, growth trend
2015	Initial reference Law 13.104/2015	-	-	Beginning of the Femicide Law
Last decade	11,967 women killed	-	-	Cases have almost tripled in 10 years

Source: Authors.

Almost 12 thousand women have suffered femicide in Brazil in the last decade. In March 2025, Law 13.104/2015, which deals with femicide, completed 10 years, as reported by Gortazár (2025):

The femicides accounted for almost tripled in these 10 years (from 535 to 1,259 deaths). If in 2015 they were only less than two women killed per day, it now reaches four deaths per day at the hands of husbands, boyfriends, etc. Experts attribute this increase to

³ The Patrícia Galvão Institute monitors the dissemination of data and research in Brazil, following the government agencies responsible for this data, the research institutions that work with this theme and the media. Making the data available on the Violence Against Women in Data Platform.

⁴ Center for Advanced Studies in Public Security.

several factors: an increase in violence as women gain autonomy, an increase in complaints, and an increase in registrations.

The data presented show violence against women – female body, constituted from a power that perpetuates submission. This dynamic can be explained, according to Santos and Izumino (2005), through the lens of male domination, a violence that manifests itself as an expression of patriarchy and its tentacles disseminated by institutional means that structure contemporary society, such as the media.

In view of the above, the implementation of the law is crucial for a real mapping and typification of crimes against women. It should be noted that these numbers, although expressive, represent only a part of the reality, as many cases are not reported, and the underreporting of crimes of domestic and family violence is a persistent reality.

It should be noted that Japan, the manga's country of origin⁵, despite having one of the lowest crime rates in the world⁶, The White Report on Gender by⁷ the Japan Office for Gender Equality mentions recent measures: the enactment of a law that in April 2024 expanded the law on the prevention of spousal violence; among other improvements in protection, restraining orders, actions to support victims based on government consultations.

Violence against women is a consequence of historically patriarchal social, cultural, political, and economic structures, which have been consolidated over time and naturalized gender inequalities. These structures establish asymmetrical power relations between men and women, attributing positions of dominance to the masculine and to the feminine roles of subordination, fragility and dependence.

In this context, violence is not an isolated phenomenon or the result of individual behaviors alone, but rather the concrete expression of a system that legitimizes and reproduces control over women's bodies, sexuality, autonomy and lives. The macho culture, gender stereotypes, inequality in access to rights, and institutional omission contribute to the maintenance of these violent practices.

In this way, patriarchal control is reflected in a strong mythology full of legends and stories about the 'feminine that portrays it as monstrous', whether in the representation of seductive and sinful women, or emotionally unbalanced and crazy. One example is the

⁵ Japanese comic books.

⁶ Japan is at the top of the ranking among the least violent countries, with a number that varies between 0.3 (2008) and 0.4 (2009) homicides per 100,000 inhabitants (Moreira, 2013).

⁷ Available at: https://www.gender.go.jp/about_danjo/whitepaper/r07/zentai/pdfban.html?u. Accessed on January 10, 2025.

Japanese folklore entity *Yanagi Baba*⁸, the depiction of a scary old woman reflects the cultural tendency to associate the undomesticated feminine – especially when aged, lonely, or connected to the supernatural – with danger and marginality. In patriarchal societies, the woman who escapes traditional roles (mother, wife, caregiver) is often branded as "monstrous," "witch," or "evil."

From this perspective, this article, an integral part of the research carried out in the master's degree in Communication (PPGCOM-UFPI, 2025), proposes to analyze how violence against women and villainy are represented in the manga *Tomie*, highlighting the ways in which narratives reinforce cultural and social norms that perpetuate such violence. The work of mangaka Junji Ito, known for his psychological horror stories and supernatural elements. First published in 1987, the manga revolves around the character *Tomie*, with the narrative "an irresistibly beautiful young woman causes obsession and violence in the men around her". This phrase sums up the dramatic structure of the work, but it also reveals, in deeper layers, a powerful commentary on the way patriarchal culture constructs, controls, and punishes the female figure.

In *Tomie* (2021), V. 01 and V. 02, we analyze events in which the protagonist, the name of the work, is repeatedly a victim of femicide – but always regenerates from the junction of her limbs that were dismembered – perpetuating the cycles of violence. Despite the numerous attempts at destruction and annihilation, *Tomie* always returns. This supernatural characteristic can be interpreted as a metaphor for female resistance in the face of violence. Even dead, women victims of femicide leave marks: social movements emerge, policies are created, and memories are preserved. *Tomie*, by being reborn, denies patriarchy the absolute power to silence her — and represents the impossibility of eliminating the female presence from history.

Manga is not just Figureic or media entertainment, but a cultural document that materializes social imaginaries. The multibillion-dollar manga industry is not limited to moving expressive figures; It also exerts a deep symbolic and cultural power, configuring itself as a vector for the diffusion of social imaginaries about the feminine. By consolidating itself as one of the pillars of the Japanese cultural economy, manga reaches not only domestic readers, but global audiences, crossing borders through adaptations, merchandising, and derivative media,

⁸ The figure of *Yanagi Baba* – literally "old woman of the willow" – is a deeply symbolic entity of Japanese folklore, associated with nature, time and the feminine imagination. It is a *yōkai* (spirit or supernatural creature) linked especially to ancient willows, trees traditionally associated with mourning, memory and the spirit world in Japan. Available at: https://www.google.com/search?q=representa%C3%A7%C3%A3o+do+Yanagi+Baba+como+uma+mulher+velha+e&rlz=1C1CHZN_ptBRBR1173BR1173&oq=representa%C3%A7%C3%A3o+do+Yanagi+Baba++como+uma+mulher+velha+e&gs_lcrp=EgZjaHJvbWUyBggAEEUYOdIBCDE3MTZqMGo3qAlAsAlA&sourceid=chrome&ie=UTF-8.

such as anime and video games. The manga market in Japan recorded, in 2024, the highest revenue in history: ¥ 704.3 billion (about US\$ 4.6 billion), according to the *Research Institute for Publications*. This represents 44.8% of the entire Japanese publishing sector, consolidating manga as the main force of the cultural industry in the country. The digital format leads this expansion. On the global stage, Japan accounts for about 49.5% of total revenues, with the Asia-Pacific region concentrating more than 85% of revenues. The global manga market is estimated to reach between \$42 and \$47 billion by 2030.

Within this logic of large-scale production, representations of the feminine are simultaneously produced, naturalized, and questioned, reflecting tensions between traditional stereotypes and possibilities of female agency. Thus, manga function as cultural documents, which record historical, social and aesthetic conceptions about the genre, making visible values, fears, anxieties and desires that cross different layers of society. The combination of economic strength and symbolic potential puts manga in a privileged position to study how visual and media narratives shape and reproduce social imaginaries about the feminine, revealing the close relationship between culture, market, and gender constructions.

Therefore, the scarcity of studies in this field underscores the need to broaden the scope of research by integrating popular media, such as manga and anime, with pertinent discussions, which not only fills a gap in our academic knowledge, but also broadens the understanding of how this culture reflects and impacts social and cultural issues of the current reality. Manga, according to Júnior (2005), is a product that is part of a massification, as well as other products of Japanese *Pop Culture* that are sold worldwide, seeking a constant balance in sales and profits, often appealing to appealing, sexual, violent and commonly fictional themes, although others take into account the aspects of everyday life, of the history and culture of a country.

A report presented in 2023 by IMARC, ⁹on "*Manga Market Report by Type (Printed, Digital), Genre (Action and Adventure, Sci-Fi and Fantasy, Sports, Romance and Drama, and Others), Audience (Children and Kids (Aged below 10 years), Teenagers (Aged between 10 to 16 years), Adults (Aged above 16 years)), Gender (Male, Female), Distribution Channel (Online, Offline), and Region 2024-2032*"¹⁰, in which it analyzes the world of manga in the market, pointing out some segments within the industry, namely: reading format, genre, audience (by age), audience (by genre), and region by continent. Better explained in the following table.

⁹ The International Market Analysis Research and Consulting Group – IMARC: offers market research services for various segments.

¹⁰ Manga Market Report by Type (Print, Digital), Genre (Action & Adventure, Science Fiction & Fantasy, Sports, Romance & Drama, and Others), Audience (Children & Youth (Under 10 Years Old), Teens (Aged 10-16 Years), Adults (Over 16 Years Old), Gender (Male, Female), Distribution Channel (Online, offline) and region 2024-2032.

Table 2

Global Manga Market Segments

SEGMENT	CATEGORY	HIGHLIGHTS/REMARKS
Audience by Age Group	Children (<10 years)	Important segment; attracted by playful and educational themes (<i>kodomo</i>)
	Adolescents (10 to 16 years old)	Largest segment of readers; strong identification with themes such as friendship and overcoming (<i>shonen</i>)
	Adults (>16 years old)	They represent a significant share; they seek more complex themes
Audience by Gender	Male	Dominant; attracted by male protagonists, plots of overcoming and action
	Women	Growing interest; <i>shoujo</i> and <i>josei</i> titles cater to this audience, but still less expressive in the global market

Source: (IMARC, 2023)

The data presented show a worldwide rise of manga in the various youths and genres. In Brazil, one of the largest consumers in Latin America, we have had a growing increase in manga publications in the last 22 years, as shown in the following Figure:

Figure 1

Volumes of Manga published in Brazil (2001-2024)

Source: <https://blogbbm.com/2025/01/07/numeros-do-mercado-brasileiro-de-mangas-em-2024/>

Editora Pipoca e Nanquim¹¹ is the holder of the largest number of works published by Junji Ito in Brazil, occupying the 6th place in the ranking of volumes published in the year 2024. The publisher, in 2023-2024, published 11 works by Junji Ito: Phantom Zone, The Headless Sculptures, Tombstone Cities, the Alley, Love Dead, Dysmorphics, Crushing Tales, Remina, The

¹¹ Pipoca e Nanquim, initially in 2009 was a *youtube* channel, where the creators, Alexandre Callari, Daniel Lopes and Bruno Zago discussed the world of pop culture: Cinema. Comics among others. In 2016, the friends started an independent comic book publisher, publishing *Swords and Witches*, authored by Esteban Marot, thus Pipoca e Nanquim would be born in the publishing world.

Groaning Enchantment, Deserter's Abode, *Art Book* Grotesque Visions: Junji Ito's Disturbing Art¹² and Holes of Strangeness: 35 Years of Junji Ito's Career (the author's autobioFigurey).

The publisher JBC¹³, which occupies second place in the ranking, also published titles by the author in the period 2023 and 2024, namely: *Black Paradox*, *Decline of a Man*, *Anguish*, *Diário dos Gatos Yon & Mu*.

Although *Tomie* has its publication in 2021, it still occupies the 5th place in sales in *Horror Figureic Novels*, according to the *ranking* available on *Amazon*¹⁴ on April 6, 2024, in the same ranking we have her other works: *Uzumaki* (1998-1999), in 7th place and *The Egocentric Curses of Souichi* (2022) in 9th place¹⁵. It is important to note that these works are periodically reprinted due to high demand. Naturally, with each relaunch, they usually register a significant volume of sales and often lead the marketing rankings.

2 METHODOLOGY – THEORETICAL AND METHODOLOGICAL TRAITS

Qualitative research in communication, according to Bauer and Gaskell (2015), is characterized by the focus on understanding the senses, interpretations and meanings that the subjects attribute to communication practices – the messages, discourses and media practices that are produced, circulate and appropriated by the public in certain cultural, social, historical contexts – in their symbolic, discursive, cultural and social dimensions, rather than prioritizing numbers or statistical generalizations.

The study carried out in the master's degree in Communication (PPGCOM/UFPI) in 2025, was descriptive and analytical, since it allowed us to interpret the symbolic, narrative and visual layers that sustain the normalization of violence and the ambivalences about the feminine as seductive and monstrous, and the meanings attributed to violence and its representations in the manga *Tomie*, by Junji Ito. More than the measurement of data, meanings, symbols and narratives produced by the work were interpreted, understanding it as a cultural manifestation that dialogues with social constructions about the feminine.

¹² This material was launched at the *Comic Con Experience* (2023) in São Paulo, in which the artist was present, for the first time coming to Brazil, to autograph and receive his fans at *the Magic Market* with the publisher Pipoca and Nanquim and a panel on *the Thunder stage*.

¹³ JBC was founded in 1992 as a communication company initially focused on the Japanese-Brazilian community, based in São Paulo. Its original focus included the publication of magazines in Japanese and Portuguese, such as the newspaper *Tudo Bem* and the magazine *Made in Japan*. However, its big leap came in the early 2000s, when it began to publish manga officially translated into Portuguese. Some of them are very famous: *Sailor Moon*, *Neon Genesis Evangelion*, *Death Note*, *Bleach*. Source: <https://blogbbm.com/2025/01/07/numeros-do-mercado-brasileiro-de-mangas-em-2024/>

¹⁴ Available at: www.amazon.com.br/gp/bestsellers/books/7842733011/ref=pd_zg_hrsr_books

¹⁵ Lists are frequently updated, according to sales.

The analytical corpus was the manga *Tomie* (1987) which, as a cultural product, is understood as a social text that produces and reproduces meanings about the feminine. The research examined the work in its entirety, volumes 1 and 2 (Junji Ito, 1987; republished in 2021) The manga revolves around the character *Tomie*, with the narrative – 'an irresistibly beautiful young woman provokes obsession and violence in the men around her'. This phrase sums up the dramatic structure of the work, but it also reveals, in deeper layers, a powerful commentary on the way patriarchal culture constructs, controls, and punishes the female figure. The research adopted the content analysis (Bardin, 2006), having as observable 12 Figures selected from the manga that were organized into five categories – 1) femicide, 2) nudity, 3) passionality, 4) villainy, 5) male sisterhood and 6) enchantment, being analyzed in this article only categories 1, 4 and 5:

1) *femicide* – the term has undergone changes since 1970¹⁶, since its emergence, today it does not mean a way to name "the deaths of women by homicide due to their social condition as women", says Diana Russell (1992). It is important to take into account whether the murder is related to domestic or family violence.¹⁷

4) *Villainy* – portrayed from her ambiguous personality, simultaneously victim and villain. This category seeks to analyze how the work explores the villainization of female characteristics, especially those associated with power and the transgression of gender roles.

5) *Male Sisterhood* – refers to the alliance between men (with female participation), which sustains and legitimizes acts of violence against *Tomie*, and *Enchantment*, a category that shows men to be subjected to a kind of "spell" that leads them to a posture of passivity in the face of their own actions. In other words, the author imposes a condition that evidences an alienation in relation to the conscience and individual responsibility of the killers, where their choices and attitudes are not the result of an autonomous decision, but rather of an external force that prevents them from acting actively and critically on their own reality.

The application of content analysis enabled a systematic and thorough approach in the identification and categorization of the different manifestations of violence and oppression represented in *Tomie*. The choice of analytical categories evidenced the thematic recurrence throughout the volumes. As shown in the following table, which shows how many chapters of each volume show each category with a lot of significance:

¹⁶ The term was first used at the International Tribunal on Crimes against Women in Brussels (1976) by feminist researcher Diana Russell. There was no popularity in the term in other regions of the world. In 1992, Russell co-edited the book *Femicide: The Politics of Woman Killing*, which deepened this definition and consolidated the term in the academic and activist literature. It was used in Latin America for the first time in 1998 to describe the brutal murders of women in Ciudad de Juarez.

3 TOMIE: THE WOMAN AS VILLAIN AND VICTIM

The story revolves around *Tomie*, with the narrative of 'an irresistibly beautiful young woman causes obsession and violence in the men around her', and therefore, suffers repeated femicides and regenerations, which causes terror and obsession to readers. In Brazil, the *Tomie manga* was published in 2021, three decades after its original release in Japan. The work is divided into two volumes, containing a total of twenty chapters: 1) the first volume brings together nine chapters: "*Tomie*," "*Tomie - Part 02 - Morita Hospital*," "*Underground*," "*PhotoFigurey*," "*Kiss*," "*Mansion*," "*Revenge*," "*Waterfall*," and "*Painter*," and 2) the second volume consists of eleven chapters: "*Assassin*," "*Hair*," "*Adopted*," "*Littlefinger*," "*Little Boy*," "*Must*," "*Baba*," "*Certain Reunion*," "*Maniac*," "*Top Model*," and "*Decrepitude*".

In the manga, the story is not presented in a linear way, since each chapter we have a different *Tomie*, it is always a new character interacting with new scenarios and individuals. The story manifests itself as a puzzle that we put together each piece. To better understand Tomie's dynamics, we have separated four essential points: 1) a young woman who suffers brutal

femicide, having her body dismembered by her classmates, 2) she is reborn from each dismembered part, 3) she "seduces" men and provokes a "crazy passion" and 4) female relationship: *tomielization occurs*.

The first chapter, simply titled *Tomie*, establishes the starting point of the plot, presenting the birth of the mystical figure that will accompany the narrative throughout the manga. The story begins in an atmosphere of mourning and mystery at the school where *Tomie* studied, as students and teachers mourn the tragic death of the young woman, who suffered brutal femicide and had parts of her body scattered throughout the city. The crime remains unsolved and without suspects, which intensifies the initial suspense.

What seemed to be a story of loss and tragedy turns into a disturbing event when *Tomie* reappears in the classroom, apparently unharmed and without any memory of what happened, as if her death had never happened.

It should be noted that there are attempts to silence, forget and make gender violence invisible. Ricouer (2007) emphasizes that forgetting is not only an individual failure, but also a political and social act, linked to silencing strategies. The feminist theories bell hooks (2019), Beauvior (2014), Segato (2013) show how women's history has been systematically silenced. Elena Teles and Valeska Zanello (2017) discuss how the media naturalize, erase or trivialize gender violence, transforming femicides into "crimes of passion", selecting according to Hall (2003) the hegemonic representations and narratives that will appear and which will be forgotten.

Regarding femicide, Segato (2018) shows that violence against women not only occurs, but is also systematically forgotten or trivialized by state, legal and media institutions. The author speaks of a "pedagogy of cruelty", in which repetition and institutional neglect make violence something "normalized", contributing to its social oblivion. This moment of *Tomie*'s 'inexplicable' return after femicide marks the beginning of the cycle of violence and resistance. A mix of horror defined by the "death and regeneration" that defines the work, bringing with it an atmosphere of confusion and discomfort for both the characters and the readers. Everyone is wondering, as shown in the following Figure – how is this possible?

Figure 2

Tomie's first appearance after her death

Source: *Tomie*, v. 1, p. 7.

Tomie's *reappearance*, even after being officially confirmed by the police as dead, begins to scare everyone in the class, but not because this event is strange, but because her survival can harm them. The twist that Junji Ito presents to us happens as a flashback in the class walk on the hill of the deity Inari¹⁸. It is revealed how the "accident" that led to *Tomie's murder* happened to and that *everyone* in her class was complicit in the crime.

Tomie's reappearance can be read as a metaphor for the permanence of gender violence – even if women are silenced (or killed), the mark of violence returns, insistent, revealing that the trauma does not disappear. It dialogues with the idea of traumatic memory (Cathy Caruth, 1996) that which was repressed comes back insistently because it was not properly elaborated.

The police, as a state apparatus that confirms death, represents the institutionalization of forgetting: once the death certificate is given, society "closes" the narrative of that life. But Tomie's return denies this closure, revealing the failure of institutions to deal with violence against women. This dialogues with the notion of political oblivion (Paul Ricoeur, 2000): what should be remembered and repaired is erased, but returns as a spectre.

Tomie's *femicide* occurs during the ride when she is pushed off a cliff by her boyfriend Yamamoto in one of his jealousy crises. The young woman is unconscious after the fall and Yamamoto is prevented by Professor Takagi from calling the ambulance so that they would not be arrested, from that moment on everyone in the class accepted to cover up the evidence and disappear with *Tomie's* body dismembering her and hiding her pieces around the city.

¹⁸ In the words of Mendonça (2019), Inari is a deity of rice and Japanese fertility who can take the form of a fox and uses metamorphosis as a harbinger of something.

Doctor Tamura explains that "the dismembered woman has her reproduction similar to planarians" (p. 70), a sense similar to the mythology of the Hydra of Lerna¹⁹, a mythological monster that regenerates when it cuts off one of its heads, two grew in its place). At this point, the author presents us with a scientific explanation for Tomie's reappearance, as shown in the following Figure.

Figure 3

Doctor Tamura explaining how Tomie seems to multiply

Source: Tomie, v. 1, p 70

Tomie is presented as "indestructible". The narrative breaks with the patriarchal conception that killing would be the way to control or silence women. *Tomie* always returns, showing that the female body does not allow itself to be reduced to the destiny of a violated and disposable object. The reappearance of *Tomie* destabilizes the logic of the pedagogy of cruelty (Segato, 2018).

It is important to note that the interactions in the plot have a great focus on *Tomie* and her aggressors, including female characters. "*Tomielization*" shows how gender violence is constructed and internalized in relationships – and among women it is expressed either through rivalry, aesthetic competition or the reproduction of patriarchal norms, because as Beauvoir (2019) states "you are not born a woman, you become one". In the plot, "becoming" is literal and violent, since the woman, in the character of *Tomie*, loses her consciousness and identity, after incorporation, loses her voice and subjectivity. In the manga, this interactive process is called "*tomielization*" – it consists of *Tomie* "possessing" her female victim by incorporating her cells makes her "more beautiful" (Ito, 2021, p. 96), healthier, and all the old physiognomy and consciousness no longer exist.

Tomielization as a process of internalized violence. When *Tomie* "enters" the victim, she erases her previous identity, producing a more beautiful, younger, healthier body — that is, a

¹⁹ GRIMAL, Pierre. **Dictionary of Greek and Roman Mythology**. Rio de Janeiro: Bertrand Brasil, 1997.

body adjusted to the aesthetic and social norms of femininity, as Naomi Wolf (2018) discusses, about beauty standards and their functioning as control devices over female bodies.

In the chapter *Morita Hospital*, volume 01, in which *Tomie* donates a kidney to the hospitalized girl, and upon receiving it begins to become strong and healthy, until she discovers that she is turning into a monster (*Tomie* regenerating from the organ), as shown in the following Figure.

Figure 4

Yukiko undergoes "tomielization".

Source: *Tomie*, v. 1, p 112

In the chapter *Hair*, volume 02, the friends find strands of shiny hair and a strand attached to Miki Hatawagama's scalp. This is enough for "tomielization" to happen. She begins to resemble *Tomie* – and starts to be admired at school. At the end of the process, the beauty fades away, and becomes monstrous. The strands of hair begin to come out of each pore and cover the entire body, leaving her lifeless, as expressed in the following Figure.

Figure 5

Miki's "Tomielization".

Tomie, v. 2. p 81

The Figure shows the frightened girl, with a wide mouth and eyes, with long strands of hair coming out of her hand and face, from her legs and arms even lifeless on the ground, expressing the monstrous feminine, regenerating again and again. Barbara Creed (1993) problematizes the female monster, expressed in the case of *Tomie*. The fact that she reappears after femicide becomes an inversion of patriarchal destiny: she is not the silent victim, but a disturbing presence that insists on reexisting. The monstrous feminine is born precisely from that which transgresses and threatens the norms of patriarchy.

The woman's body – *Tomie* – as a field of dispute. "Tomielization" shows the female body as a territory of appropriation. The body as a social construction — but in *Tomie*, this construction is radicalized in an annihilation of identity.

Tomie's femicide, in the following Figure, happens recurrently and moves the story, between the real and the supernatural.

Figure 6

Tomie's body discarded in a stream.

Source: *Tomie*, v. 1, p 112

The body of *Tomie* naked, with multiple cuts scattered throughout the body: face, arms, abdomen and back. His neck and arms are submerged in a pool of dark blood surrounded by stones. The scene reflects the trivialization of the woman's body and existence: mutilated and discarded. There are many cases of femicides marked by extreme brutality where "the perpetrator seeks to demonstrate to his peers his capacity for death and cruelty, making explicit in the victims' bodies" (Caicedo-Roa, Bandeira, Cordeiro, 2022, p. 5), such as the femicides that occurred in the *Ciudad Juárez*, in Mexico, of factory workers, cruelly raped to death represents one of the most emblematic cases of femicide in Latin America.

In *Tomie* the cruelty of her femicide, the following Figure, exposes the violence suffered by the character - mutilation, dismemberment, crushing, burning. His face full of cuts, eyes and mouth open, injured arms raised, a cloth with blood stains.

Figure 7

Tomie dead with several cuts on her face

Source: Tomie, v. 1, p 112.

The face, in particular, carries a deep symbolic value: it is on it that the marks of subjectivity, identity and social presence are inscribed. When it is mutilated, erased or destroyed, the intention is communicated to eliminate not only life, but the social and symbolic existence of the victim. As Segato (2013) observes, femicide violence has a pedagogical and disciplinary character, functioning as a message of power and male domination over the female body.

Many cases of femicide are marked by an extreme degree of cruelty: burned, disfigured, cut faces – practices that go beyond the intent to kill. They represent a desire for control, punishment, and silencing.

The mutilated face, in this context, is the erasure of the female gaze on the world, the silencing of her voice and the denial of her autonomy. It is an attempt to "dehumanize" women even after death, reinforcing the idea that their bodies can be the object of possession, hatred or revenge.

For this discussion, we can bring the example of ancient Greece, in which the death of man, as discussed by Martha Nussbaum, in her work *The Fragility of Goodness* (2009), was considered a national tragedy, a civic loss that added a sense of value to the community. The death of the woman, often portrayed in tragedies, symbolized a reaffirmation of her subordination to male authority and the need to maintain the patriarchal order.

The cruelty of female deaths in tragedies was not only a matter of physical violence, but also a profound social message. The brutal forms of murder of women, whether by poisoning, mutilation, or sacrifice, as in plays such as Euripides' *Medea*, were a way of representing that by challenging the patriarchal order, the female body was not only physically destroyed, but also

publicly humiliated, serving as an example to society that female transgression would be mercilessly punished.

As Nancy Sorkin Rabinowitz argues in *Years of Speech: Women and Greek Tragedy* (2008), female death was used as a metaphor for the repression of female potential, a way of showing that women, even in life, were destined to occupy a subordinate space. In other words, her death is less a narrative outcome and more a symbolic device that reiterates the subordinate place of women in the social order.

What we see in *Tomie*, her independence, her desire to continue or not in a relationship is shown as an affront to the man, who decides to take away all the power of choice by murdering her, not only that, but also the cruelty of feminicidal violence is left in sight.

Tomie in her "seductive and fatal beauty", the archetype of the *femme fatale*, whose sexuality can be both admired and feared, according to Mulvey (1975). The facial mutilation - Tomie's disfigured face - shows the impediment to speech, opinion, the public manifestation of the feminine placed as a punishment for her autonomy, interpreted as disobedience. Tomie's beauty, evidenced as seduction and enchantment of men, strengthens the patriarchal and Christian vision.

In volume 2, in the chapter "Nanny", Junji Ito focuses on *Tomie*'s being and evil, in which an elderly couple hire a nanny to take care of their baby, Marina. Upon arrival, the nanny Erita is locked in the room with the child, "because most people run away when they see my baby" (ITO. v. 2, p. 225). Erita removes the child's cloak in the crib and is startled: "This doesn't look like a baby, it's like an exposed heart with a head sprouting from it" (ITO. v. 2, p. 228).

Marina was *Tomie* in the regeneration phase. She cried a lot. The elderly couple went out every night to set the city on fire, because only then would they stop crying "If she doesn't see a fire a day, she gets angry and cries all night" (ITO. v. 2, p. 231). His great pleasure was to see the red color of the fire, the destruction.

The resemblance to the biblical character *Eve - the sinner* - who brought evil to the world, sentenced to condemnation by the male (Christian God) to all women and their future generations. Junji Ito puts *Tomie*, the feminine in this place.

In Figure 6, Junji Ito directs men's actions as involuntary, almost automatic. A "spell". An enchantment. The manipulation of the feminine over the masculine considered as emotionally and psychologically submissive. This perspective builds the Figure of the feminine as manipulative, malefic and villain, transforming it into an archetype of threat, seduction and destruction. This framing perpetuates sexist and misogynistic discourses that seek to justify

violence against women and minimize the responsibility of male aggressors, reinforcing patterns of domination and control in gender relations.

Figure 8

Koji Yamazaki explains about Tomie's bewitching power

Source: *Tomie* (ITO, 2021, Volume 1, p. 125).

In the first frame, we have a woman's serious face, black hair down, with a *voice over* of Tetsuo saying "This girl... Tomie... it has an almost bewitching power. The guys who hang out with her are practically slaves to her will" The main interest to bring this picture and discuss it is in the continuation of the speech "... I don't doubt at all that they will kill someone if it's Tomie's order." In the second, a serious man, with his finger raised, mouth open, saying: "Why are you bewitched by this strange magnetism that she has. I hate to admit it, but I also almost let myself be seduced by her."

The association between femicide and seduction reveals one of the most complex and perverse dimensions of gender violence: the transformation of attraction, desire, and romantic love into devices of control, domination, and death. When femicide is born from relationships marked by seduction — and often by affection — it shows how patriarchal structures naturalize the idea that a woman's body and life can be possessed, controlled, and eliminated when she denies or breaks this pact.

Historically, women were represented as objects of desire and conquest, while men were assigned the role of active subjects, holders of decision and power. In this imaginary, seduction – often idealized as a prelude to love – also works as a gateway to violence. The seduced woman is now seen as possession. The affective bond creates a false sense of entitlement over your body, your choices, and your freedom. When this relationship is threatened - by separation, rejection, autonomy or simple divergence - the frustration of male desire turns into violence.

As Segato (2013) states, femicide is not the product of uncontrolled passions, but rather an act of violent reappropriation of a body that the aggressor believes it belongs. In this sense, seduction is the starting point of a process that can culminate in murder when the woman refuses to meet the imposed expectations.

The "seductive woman" is a historical construction that reflects the male gaze on the female body. Elevated to the ideal of femininity and, at the same time, condemned for her sexual freedom, she represents the tension between desire and control that structures patriarchy. When used to justify violence – including femicide – this figure reveals how society transfers the blame for its own victimization to women. Resignifying seduction, therefore, is a political act: it means transforming an instrument of domination into an expression of freedom.

In the following Figure, all the male students naked, holding cutting tools and dismembering *Tomie*, with an expression of anger.

Figure 9

Tomie's death by her classmates

Source: *Tomie* (ITO, 2021, p.).

Femicide with mutilation and dismemberment is not only aimed at biological death. As Segato (2013) analyzes, extreme violence against the female body has a communicative function: it conveys the message that that body does not belong to itself, but to the male domain - and that daring to challenge this domination will be punished with annihilation.

This gesture of brutality also carries a dimension of "exemplary punishment": many victims of femicide dismembered were women who broke off relationships, denounced aggressions, refused to obey or exercised autonomy. The act of dismembering their bodies is the aggressor's attempt to erase female agency—to turn their resistance into eternal silence.

Dismemberment produces more than physical death: it generates a second symbolic death. By removing the integrity of the body, its social and subjective identity is also removed. The woman is reduced to fragments, to the condition of "thing", "object" or "residue". This dehumanization legitimizes violence in the eyes of those who practice it and, often, even of those who narrate it - transforming the victim into something "killable" and "disposable". Butler (2004) calls this condition "precarious life": they are lives that, due to power structures, become less worthy of mourning, less recognized as human. The dismemberment is the maximum expression of this precariousness.

The young women, also accomplices, were responsible for getting rid of *Tomie's body*, each one scattered a part of the body to a different place in the city. Tomie's femicide from the perspective of Segato (2013), in "Scenes of an uncomfortable thought", observes gender violence from two axes that cross each other: 1) the victim-aggressor relationship; 2) the relationship between aggressor and "partners in crime". In the first chapter of Ito's work, there is a strong presence of the second axis: sisterhood, because "Most aggressions against the female body are not committed in isolation" (Idem, 2013, p. 58)

The construction of the Figure of women as victims and villains in cases of femicide reveals one of the deepest contradictions of the patriarchal imaginary and social discourses surrounding gender violence. This double representation is not accidental: it functions as an ideological mechanism of control and disresponsibility, sustaining structures that naturalize violence and blame the woman herself for her death. At the same time that she is portrayed as a fragile and defenseless being – the "ideal victim" – the woman is also transformed into a villain, provocateur and even responsible for the crime she suffered.

The female figure in *Tomie* occupies the role of victim-villain. Function of hiding Tomie's pieces, scattering them around the city at different points, and condoning the crime of her teacher and classmates. The "victim/villain" duality is not a contradiction, but a complementary strategy. Both Figures are used to maintain control over female bodies and behaviors: 1) the woman-victim is exalted because she remains within the expected role and 2) the woman-villain is punished because she transgresses it. In both cases, the patriarchal message is the same: the woman must remain within certain limits - otherwise, her death may be narrated not as a crime, but as a "consequence".

Femicide is not a crime of a man against a woman – it is the project of an entire system, says Segato (2013). The so-called "sisterhood in the crime of femicide" is not only made up of murderers: it includes all those who silence, justify, minimize or ignore violence against women. It is the patriarchal network that sustains femicide as a possible and acceptable practice.

Breaking with this brotherhood requires more than laws - it requires a profound cultural transformation, capable of removing the social and symbolic legitimacy of this crime.

At the end of the first chapter, some of the participants in the murder express the desire to surrender to the authorities, but are pursued by their own companions, who are already taken by madness and the fear of being captured by the police. The "Male Brotherhood", in the chapter *Littlefinger*, the narrator character Hiroya begins the story by telling his relationship with his three older brothers when he was bullied for being short and "far from handsome", this was reflected in his adulthood in which he finds himself with antisocial and self-esteem problems. *Tomie*, in this plot, is the stepmother of the four brothers. After the suicide of their patriarch, Hiroya's brothers "did not look at her (*Tomie*) as a stepmother, but rather as a woman. And she also started to act as if she seduced her stepchildren" (ITO, 2021, p. 126).

This process of eroticization of the maternal role is not natural, but constructed. It originates in the patriarchal logic that reduces women to their sexual and reproductive function, even when they occupy places of care and affection. The stepmother, in this sense, ceases to be a parental figure to become an object of male desire and dispute – including that of children or stepchildren.

As Segato (2013) points out, this type of violence is born not from excessive passion, but from the logic of possession and control, in which the woman who denies male desire challenges the patriarchal symbolic order and, therefore, must be punished. Punishment that *Tomie* suffered again. Once again quartered. The pacts of "Male Brotherhood" take place between the four brothers, with Hiroya being an accomplice in the concealment of *Tomie*'s body.

Figure 10

Horaya comes across Tomie's body dismembered by her siblings

Source: *Tomie* (ITO, 2021, Volume 2, p. 133).

The figure of the stepmother desired by her stepchildren clearly illustrates the patriarchal logic that transforms women into sexual objects, even within family ties. When male desire is frustrated, the answer can be extreme punishment: femicide. Violence, in these cases, is not born of individual feelings, but of a symbolic system that legitimizes possession, naturalizes objectification and punishes female autonomy. By blaming women for their own death, this system reinforces inequality and perpetuates the cycle of violence.

Contextualizing the narrative of this section, *Tomie* was murdered by a group of young men who justify the cruelty by saying: "We ended up dismembering *Tomie*. She mocked us. That's why we killed her" (ITO, 2021, p. 133). Hiroya, despite not participating in the murder, was in charge of disposing of the dismembered body, divided into plastic bags.

4 CONCLUSIONS: *TOMIE* AND THE REPRODUCTION OF FEMICIDE

In 2019, Junji Ito gave an interview to *Grape Japan magazine* where the interviewer asks if there was any inspiration for the creation of the character Tomie, Ito answers:

"No, I'm afraid there wasn't a beautiful woman as a model. When I was in elementary school, a boy in my class died in a traffic accident. It was so strange to me that a colleague so full of life should suddenly disappear from the world, and I had the strange feeling that he would reappear innocently. Since then, I wanted to express this feeling in my manga" (GRAPE JAPAN, 2019, online)

Initially, we did not realize the initial relationship that moved the narrative, but after repeated readings of the material, we understood that Junji Ito's choice to create a female character within the excessive situations of violence was not arbitrary. The theoretical-methodological discussions about women and gender speak of the social construction of the feminine subjugated to the facets of patriarchy. The work directly relates a more advanced stage of a strong subjection of the feminine to the masculine, which culminates in femicide – the impiety after the act, the ruin of a body, the discarded victim, the sale of his flesh as a commodity, the cannibalization of the aggressor, his pieces scattered around the city.

For the narrative to happen, it is necessary that this "monster" be a woman. Junji Ito got it right! The narrative is initially granted to the reader as something close to him, of a tactile experience, where in addition to all the supernatural horror of a seductive and magical mythical woman, we have the cruel as a reality: femicides and other violence against women.

The analysis of the manga *Tomie* allows us to understand femicide not only as a crime, but as a political and cultural act of control over the body and female autonomy. The repeated destruction of the protagonist, motivated by desire, hatred and fear, reveals the symbolic

functioning of patriarchy: to turn women into objects, to punish them when they challenge this condition and, even so, never to be able to erase them completely.

Tomie forces us to face the uncomfortable truth that violence against women – whether in fictional horror or in reality – is no exception, but part of a patriarchal and oppressive system that tries to contain what it fears most: the beautiful, free, intelligent, unsubmitive woman.

ABSTRACT

The study analyzed the relationship between HIV and the LGBTQIA+ population, focusing on challenges and advances in prevention, as well as the epidemiological reality of Nova Xavantina–MT. The research had a quantitative approach and used data from the Notifiable Diseases Information System (SINAN) covering the period from 2009 to 2025, complemented by interviews with professionals from the Specialized Care Service and Testing and Counseling Center (SAE/CTA). The results showed a higher incidence of cases among men, especially young adults, and a predominance of notifications among heterosexual and mixed-race individuals. It was also observed that factors such as stigma, discrimination, informational inequality, and barriers to accessing health services directly influence testing, early diagnosis, and adherence to treatment. The implementation of SAE/CTA in the municipality resulted in expanded testing, provision of PrEP and PEP, distribution of supplies, and strengthening of educational actions. Despite the advances, structural challenges persist, including funding limitations, inequality in access to specialized services, and ongoing discrimination against LGBTQIA+ individuals and people living with HIV. It is concluded that combined prevention, strengthening public policies, and promoting welcoming strategies are essential to reduce virus transmission and improve the quality of life of vulnerable populations.

RESUMO

O estudo analisou a relação entre o HIV e a população LGBTQIA+, com foco nos desafios e avanços na prevenção, bem como na realidade epidemiológica de Nova Xavantina–MT. A pesquisa teve caráter quantitativo e utilizou dados do Sistema de Informação de Agravos de Notificação (SINAN) referentes ao período de 2009 a 2025, complementados por entrevistas com profissionais do Serviço de Atendimento Especializado e Centro de Testagem e Aconselhamento (SAE/CTA). Os resultados mostraram maior incidência de casos entre homens, especialmente jovens adultos, e predominância de notificações entre pessoas heterossexuais e pardas. Observou-se também que fatores como estigma, discriminação,

desigualdade informacional e barreiras no acesso aos serviços de saúde influenciam diretamente a testagem, o diagnóstico precoce e a adesão ao tratamento. A implantação do SAE/CTA no município resultou na ampliação da testagem, oferta de PrEP e PEP, distribuição de insumos e fortalecimento das ações educativas. Apesar dos avanços, persistem desafios estruturais, incluindo limitações de financiamento, desigualdade no acesso aos serviços especializados e continuidade da discriminação contra pessoas LGBTQIA+ e indivíduos vivendo com HIV. Conclui-se que a prevenção combinada, o fortalecimento das políticas públicas e a promoção de estratégias de acolhimento são fundamentais para reduzir a transmissão do vírus e melhorar a qualidade de vida das populações vulneráveis.

RESUMEN

El estudio analizó la relación entre el VIH y la población LGBTQIA+, con enfoque en los desafíos y avances en la prevención, así como en la realidad epidemiológica de Nova Xavantina–MT. La investigación tuvo un carácter cuantitativo y utilizó datos del Sistema de Información de Enfermedades de Notificación (SINAN) correspondientes al período de 2009 a 2025, complementados con entrevistas a profesionales del Servicio de Atención Especializada y Centro de Pruebas y Asesoramiento (SAE/CTA). Los resultados mostraron una mayor incidencia de casos entre hombres, especialmente adultos jóvenes, y una predominancia de notificaciones entre personas heterosexuales y mestizas. También se observó que factores como el estigma, la discriminación, la desigualdad informativa y las barreras en el acceso a los servicios de salud influyen directamente en la realización de pruebas, el diagnóstico precoz y la adherencia al tratamiento. La implementación del SAE/CTA en el municipio resultó en la ampliación de las pruebas, la oferta de PrEP y PEP, la distribución de insumos y el fortalecimiento de las acciones educativas. A pesar de los avances, persisten desafíos estructurales, incluyendo limitaciones de financiamiento, desigualdad en el acceso a servicios especializados y la continuidad de la discriminación contra personas LGBTQIA+ e individuos que viven con VIH. Se concluye que la prevención combinada, el fortalecimiento de las políticas públicas y la promoción de estrategias de acogida son fundamentales para reducir la transmisión del virus y mejorar la calidad de vida de las poblaciones vulnerables.

1 INTRODUCTION

The Human Immunodeficiency Virus (HIV) is a retrovirus belonging to the genus *Lentivirus*, and is an RNA virus that can integrate into the genome of the host cell whose replication depends on the action of the reverse transcriptase enzyme (GAO et al., 1999), this agent acts progressively on the immune system, causing the Acquired Immunodeficiency Syndrome (AIDS) (NGOVENE, 2022). The most affected cells are those that have the CD4 molecule on the surface, such as CD4+ lymphocytes and macrophages. HIV infection occurs when the virus binds to the CD4 molecule and other chemokine molecules, such as CCR5 and CXCR4, present on the surface of cells. This allows the virus to enter the cell and start replicating, some people have a mutation in the gene that encodes the CCR5 molecule, which makes them resistant to HIV infection and are currently known as "elite controllers". Others, who have a different version of this mutation, may have a slower progression of the disease (RACHID; SCHECHTER, 2017).

Its origin is believed to be associated with variants of the Simian Immunodeficiency Virus (SIV), present in non-human primates, especially in the chimpanzee and bonobo of sub-Saharan Africa, with which it shares approximately 98% genetic similarity (GAO et al., 1999). Currently, two main types of HIV are recognized: HIV-1, the most prevalent form of the virus, is the result of the transmission of the Simian Immunodeficiency Virus (SIV) to humans, a process known as zoonosis, responsible for most infections in the world, and HIV-2, which has a lower rate of transmissibility and slower evolution of the disease (NGOVENE, 2022).

This transmission probably occurred when humans hunted and consumed meat from infected primates, exposing themselves to contaminated blood (SHARP; HAHN, 2010). In 1981, in the United States, the first reports of AIDS (Acquired Immunodeficiency Syndrome) emerged, which at the time was a mysterious syndrome that affected healthy homosexuals, characterized by pneumonia and Kaposi's sarcoma (RACHID; SCHECHTER, 2017), but evidence suggests that HIV has been circulating among humans since the 1920s in Central Africa (FARIA et al., 2014). In addition, the spread of HIV has been accelerated by social and economic factors, including urbanization and population mobility. With the increase in international travel in the following decades, the virus spread rapidly around the world (GAO et al., 1999). The global response to this epidemic has been complex and multifaceted, involving efforts in education, prevention, and treatment (SILVA, 2012). Therefore, the origin of HIV is not only a biological issue, it involves an intersection of cultural, social, and historical practices that have shaped its spread and impact on contemporary society (FREEMAN; HERRON, 2009).

People living with HIV face a number of significant challenges, ranging from physical health issues, difficulties in managing the risk of transmission, to social stigmas, intra-family prejudice, and barriers in accessing appropriate care (JESUS et al., 2017). These challenges are often exacerbated by bias and misinformation. Stigmatization can lead to discrimination, making it difficult to seek treatment and social support, which in turn affects treatment adherence and quality of life for affected individuals (BHARAT, 2011).

In recent years, there have been significant advances in HIV treatment, especially in the development of antiretroviral drugs, pre- and post-exposure, which have been fundamental for the control of infection. With the advent of potent antiretroviral regimens and primary prophylaxis for opportunistic infections, not only have the life expectancy of people living with HIV improved (RACHID; SCHECHTER, 2017), but they also reduced the viral load to undetectable levels, which decreases the probability of transmission of the virus (CACHAY, 2024), with this there was a great reduction in the lethality and morbidity associated with HIV, currently, in many countries, the life expectancy of people infected with HIV is similar to that of the general population, as long as they have access to adequate treatment and care (RACHID; SCHECHTER, 2017). However, there are still challenges, such as accessibility and adherence to treatment, which are crucial for the success of epidemic control (CONSELHO FEDERAL DE FARMÁCIA, 2023).

Awareness campaigns play a vital role in educating the population about HIV, helping to demystify the virus and reduce the stigma associated with it. These initiatives are essential to promote prevention, encourage testing, and ensure that people living with HIV have access to treatment and support (LIMA, 2024). Awareness not only improves public health, but also promotes a more inclusive and informed society, in which people can live without fear of discrimination (FREEMAN; HERRON, 2009).

According to Matos and Zöllner (2022), human immunodeficiency virus (HIV) infection continues to be a significant challenge for global public health. This is because HIV can lead to Acquired Immunodeficiency Syndrome (AIDS), paving the way for opportunistic diseases. In Brazil, the HIV situation is influenced by deep-rooted stigmas and constant changes in the profile of people living with the virus, and these changes reflect the evolution of the HIV epidemiological scenario in the country (MATOS; ZÖLLNER, 2022)element.

Another highlight is the identification of informational barriers that can hinder access to HIV-related preventive care and treatment. This research seeks to understand the perception of communities about HIV awareness and prevention campaigns, with the aim of developing more effective and inclusive strategies. The relevance of this study is accentuated by the unique

challenges faced by the LGBTQIA+ population, often exacerbated by stigmas and prejudices. The knowledge generated can inform public policies and promote an equitable approach to health, meeting the specific needs of this community.

In addition, the research seeks to analyze the historical trajectory of HIV, from its discovery to innovations in treatment, allowing an in-depth understanding of the contexts that influence the spread of the virus, to compare the number of individuals categorized with different sexual orientations diagnosed with HIV, to compare regional and national data. Given the current scenario, the work also investigates the relationship between HIV and the LGBTQIA+ population, focusing on the challenges in prevention and treatment. The general objective is to analyze data on the categorized number of heterosexual individuals and the LGBTQIA+ community diagnosed and undergoing treatment at the Testing and Counseling Center (CTA) of Nova Xavantina-MT, seeking to understand the disparities in access to information and health services.

2 THEORETICAL FRAMEWORK

2.1 EPIDEMIOLOGICAL PROFILE OF HIV IN BRAZIL

In recent decades, Brazil has experienced a significant transformation in the profile of the HIV epidemic. There has been a notable growth in incidence among men who have sex with men (MSM), especially among young gay and bisexual men. This trend contrasts with the global scenario, in which HIV infection affects mostly young women. According to UNAIDS data, in 2015, approximately 60% of people living with HIV between 15 and 24 years of age in the world were female (BRASIL, 2022a). Between 2007 and 2016, there was a significant increase in the proportion of HIV cases attributed to transmission among men who have sex with men. According to data from the Ministry of Health, this percentage went from 30.8% to 50.2%, consolidating this group as the most impacted by the epidemic in the country (BRASIL, 2016).

During the period analyzed, there was a reduction in the proportion of HIV cases among heterosexual men, which went from 47.3% to 38.5%, indicating a growing concentration of the epidemic in groups considered more vulnerable. This vulnerability is also expressed in specific age groups: among men aged 15 to 19, the infection rate more than doubled between 2003 and 2015, from 2.9 to 6.9 cases per thousand inhabitants. Among those aged between 20 and 24 years, the rate increased from 18.1 to 33.1 cases per thousand inhabitants in the same interval (BRASIL, 2015).

Recent studies indicate that the growth of HIV infection among young people is related to multiple factors, such as the use of apps that facilitate casual relationships, changes in

conceptions about sexuality, and the absence of consistent educational campaigns, especially in contexts marked by conservatism (KNAUTH; PILECCO, 2024). According to Costa (2016), studies indicate that adolescents who use these apps reported a significant increase in the frequency of occasional sexual intercourse – up to 300% in some urban contexts, according to a survey conducted by UNICEF in partnership with the Ministry of Health.

In addition, according to infectious disease specialist Lígia Kerr, the practice of anal penetration, common among male partners, is pointed out as having a higher biological risk of HIV transmission due to the greater fragility of the anal mucosa and the higher viral load present in male semen (COSTA, 2016). Such physiological factors, combined with social barriers, contribute to the high prevalence of infection among gay and bisexual men in Brazil.

The Ministry of Health, through the Department of HIV, AIDS, Tuberculosis, Viral Hepatitis and Sexually Transmitted Infections of the Health Surveillance Secretariat (Dathi/SVSA), released data from the epidemiological bulletin of HIV and AIDS (2024), and the male category was found with about 6538 homosexuals, 1392 bisexuals, 4381 heterosexuals and the female category with 4541 heterosexuals infected with HIV in 2024, thus, the distribution of the disease proposed by sexual orientation (LGBTQIA+) is clear. The LGBTQIA+ and heterosexual population have other aspects such as transmission by injecting drug use, hemophilia, transfusion, work accidents, vertical transmission addressed.

This trend reinforces the need to intensify actions aimed at combined prevention, with a specific focus on the LGBTQIA+ population, especially among young people, and public policies that ensure equal access to information, testing, PrEP, PEP and continuous treatment, according to SUS guidelines and UNAIDS guidelines.

2.2 HIV PREVENTION

Combined HIV prevention is a comprehensive approach that seeks to reduce new HIV infections by combining biomedical, behavioral, and evidence-based human rights-based strategies. This includes offering individual options for HIV prevention, such as pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP) and consistent condom use. In addition, it is essential to promote behavioral changes, such as regular HIV testing, adherence to antiretroviral therapy (ART), and harm reduction. Structural strategies are also essential, including full and non-discriminatory access to quality health services, public policies that promote gender equality, and the protection of human rights. By combining these approaches, we can achieve maximum impact in reducing new HIV infections and promoting healthier and safer lives for all (UNAIDS, 2025a).

In Brazil, the Department of STI, HIV/AIDS and Viral Hepatitis offers recommendations for health professionals, workers and managers for the planning and implementation of combined prevention actions, considering the specific needs of different key and priority populations (BRASIL, 2025a).

2.3 ACCESS TO AND USE OF HEALTH SERVICES

Discrimination and prejudice are significant barriers to equity in access to health services, involving processes of categorization, labeling, and stereotyping that lead to social rejection and exclusion of vulnerable groups. The impact of discrimination on health is profound, related to anxiety disorders, depression, and post-traumatic stress, as well as negatively affecting access to health goods and services. In addition, stigma is not limited to specific population groups, but also to diseases and health needs, such as "neglected" diseases, challenging health policies and actions and impacting the search for therapeutic help and treatment adherence. To overcome these challenges, it is essential to adopt intersectional and decolonial approaches, recognizing the complexity of experiences of discrimination and promoting broader and more inclusive meanings of social justice, valuing diversity and promoting well-being as a common good (IRIART; CASTELLANOS, 2023).

The Brazilian population faces significant challenges in accessing health services, especially those who are most vulnerable (SOPELETE; BISCARDE, 2013). The National Primary Care Policy seeks to ensure universal and continuous access to quality and problem-solving health services, but there are still significant barriers, such as lack of geographical, financial, and organizational access. In addition, discrimination and prejudice are also significant obstacles to access to healthcare. To overcome these challenges, it is essential to understand the perspective of users and actively involve them in the decision-making process about health. The construction of a user-centered caring attitude is essential to ensure that health services are problem-solving and of quality. In addition, the professional training of health workers also needs to be reviewed to ensure that they are prepared to meet the needs of users in an effective and respectful manner (SOPELETE; BISCARDE, 2013).

Access to health services is a complex concept that involves not only the availability of services, but also people's ability to access and use them effectively. Accessibility is a feature of the provision of services that facilitates or limits use by potential users. Access, on the other hand, is the way people perceive accessibility and is influenced by individual factors, such as the perception of health needs, and contextual factors, such as the organization of health services. The use of health services is a complex process that involves the interaction between

individuals, service providers and the health system. The explanatory models of the use of health services highlight the importance of considering individual factors, such as the perception of health needs, and contextual factors, such as the organization of health services. In addition, it is essential to consider the distinction between the explanatory models of health and the use of health services, as health is a broader phenomenon than disease and cannot be explained solely by the use of health services (TRAVASSOS; MARTINS, 2004).

2.4 STIGMA AND DISCRIMINATION AGAINST PEOPLE LIVING WITH HIV

According to UNAIDS (2021), stigma and discrimination around HIV profoundly affect the health, life and well-being of people living with the virus or who are at risk of contracting it, especially in key populations. These problems create significant barriers to access to prevention, sexual and reproductive health, testing and treatment services. Stigma can manifest itself in the form of hearsay, verbal abuse, and social exclusion, while discrimination can include physical abuse, denial of services, loss of employment and educational opportunities, or even detention. According to UNAIDS (2021), up to 21% of people living with HIV have been denied health services in the last 12 months, and 47 countries still maintain travel restrictions for these people. The consequences include job loss, workplace violence, and discrimination in education. In addition, people who perceive high levels of stigma tend to delay initiation of treatment, and programs that address these issues improve access to HIV services. It is recommended to repeal laws that perpetuate stigma and discrimination, ensuring free and informed consent, privacy, confidentiality, and prohibiting mandatory HIV testing (UNAIDS, 2021).

Stigma and discrimination are complex problems that affect the health and well-being of people, especially those living with stigmatized conditions such as HIV/AIDS, mental illness, or physical disabilities. The individualized approach to stigma, which focuses on the psychological and social effects on stigmatized individuals, is not enough to understand and combat the problem. It is necessary to consider the social and structural dimensions of stigma, including power relations, social hierarchies, and public policies that perpetuate discrimination. In addition, it is essential to address stigma in conjunction with other forms of discrimination, such as racism, sexism, and homophobia, to develop effective prevention and combat strategies (MONTEIRO et al., 2013).

2.5 STIGMA AND DISCRIMINATION

Homophobia, biphobia, and transphobia are forms of prejudice and discrimination that affect people based on their sexual orientation or gender identity. Homophobia is the fear or aversion to lesbian, gay, or bisexual people, whereas biphobia is specific to bisexual people. Transphobia, in turn, is directed at transgender or non-binary people. These biases can manifest themselves in a variety of ways, including *bullying*, discriminatory language, and denial of rights. It is essential to understand and recognize these forms of discrimination in order to build a more inclusive and egalitarian society. Additionally, it is important to combat homophobic, biphobic, and transphobic language, which can be used to discriminate against and marginalize individuals based on their sexual orientation or gender identity (GOMES, 2023).

The mental health of LGBTQIA+ people is deeply affected by homophobic prejudice, which can generate psychological suffering, anxiety, depression, and even suicidal thoughts. Constant exposure to discriminatory and violent attitudes can lead to a permanent state of vigilance, making it difficult to build a healthy and authentic identity. In addition, the lack of acceptance and family and social support can aggravate mental health problems, making it essential to create safe and welcoming spaces for these people to express themselves and seek help without fear of judgment or rejection. The impact of homophobia on the mental health of LGBTQIA+ people can also manifest itself in the form of chronic stress, low self-esteem, and difficulties in establishing healthy relationships. In addition, the internalization of homophobia can lead to feelings of guilt, shame, and self-hatred, making the process of building a positive and authentic identity even more challenging. It is essential that mental health professionals are trained to address these specific issues and offer welcoming and non-judgmental support for these people (SANTOS; LIMA, 2022).

Discrimination against LGBTQIA+ people is a painful reality that affects all areas of life. It is born from deep prejudices, such as homophobia, biphobia, transphobia and interphobia, which are fueled by cisheteronormativity, a worldview that privileges cisgender and heterosexual sexual identities and orientations. This discrimination has devastating consequences on the mental health and well-being of LGBTQIA+ people, leading to problems such as depression, anxiety, and stress. In addition, it manifests itself in a cruel way at different stages of life, from adolescence, when young people face difficulties in acceptance, to old age, in which elderly LGBTQIA+ people suffer a double stigmatization, related to age and sexual/gender identity (GATO, 2022).

The transgender population in Brazil faces a cruel reality of discrimination and stigma, which profoundly affects their mental health and well-being. According to a UNAIDS study,

90.3% of the "trans" people interviewed have experienced situations of stigma or discrimination because of their gender identity. This includes discriminatory comments, verbal harassment, exclusion from family activities, and physical aggression. In addition, the "trans" population is more vulnerable to health problems, such as sexually transmitted infections, tuberculosis and hepatitis. Social exclusion and discrimination also exacerbate several mental health problems (United Nations, 2020).

The HIV/AIDS epidemic continues to hit the LGBTQIA+ community in Brazil hard. According to UNAIDS, about 920,000 people live with HIV in the country, and AIDS kills ten times as many members of the LGBTQIA+ community as violence. The prevalence of HIV infection is high among gay men and other men who have sex with men (18%), and among transvestites, transsexuals and transgender people (30%). However, the LGBTQIA+ community still faces many challenges to speak openly about HIV/AIDS, due to stigma and discrimination. It is essential that the community embraces the issue and works to overcome stigma and discrimination, ensuring equal access to HIV prevention, diagnosis, and treatment (United Nations, 2021).

2.6 PUBLIC POLICIES FOR HIV PREVENTION AND TREATMENT: ANALYSIS OF NATIONAL AND INTERNATIONAL INITIATIVES

HIV prevention is a complex challenge that requires a multifaceted approach. The "Treatment as Prevention" (TcP) strategy is a central approach to achieving the goal of eliminating AIDS by 2030. TcP is based on the idea that early testing and antiretroviral treatment can significantly reduce the risk of transmission of the virus. In Brazil, the government has made a commitment to implement TcP, with the goal of testing 90% of the population with HIV, treating 90% of positive cases, and keeping 90% of people on treatment with an undetectable viral load. To achieve this goal, it is essential to promote large-scale testing, especially among the most vulnerable populations, such as men who have sex with men (MSM). In addition, it is necessary to overcome the challenges of implementing TcP, such as guaranteeing human rights and reducing barriers to access to health services (SOUZA et al., 2019).

The Brazilian response to the AIDS epidemic was marked by a series of innovative public policies, initiated in the 1980s. During this period, the country was experiencing a process of redemocratization and health reform, which culminated in the creation of the Unified Health System (SUS) in 1988. The AIDS epidemic was one of the main challenges faced by the SUS, leading to the creation of the National STD and AIDS Program (PN-DST/AIDS) in 1986. The PN-STD/AIDS was fundamental for the structuring of an HIV/AIDS care network in Brazil,

including prevention, diagnosis and treatment actions. In addition, the program had the financial support of the World Bank, which allowed the expansion of outpatient and hospital care actions. Today, Brazil is an international reference in the fight against AIDS, with a network of services that includes Testing and Counseling Centers (CTA), Antiretroviral Drug Dispensing Units (MDU) and laboratories for counting T lymphocytes and HIV viral load (VILLARINHO, et al., 2013).

2.7 PERSISTENT CHALLENGES: STIGMA, DISCRIMINATION, ACCESS TO SERVICES AND FINANCING.

Even after more than four decades of global response to HIV, stigma and discrimination remain central barriers faced by people living with the virus. A UNAIDS interview (2025) revealed that more than half of the people interviewed (52.9%) reported having suffered discrimination due to positive serology throughout their lives. This exclusion is manifested in several spaces: within the family itself (34.8%), in health services (13.1%) and in situations where confidentiality about the diagnosis may be compromised (46.1%) (UNAIDS, 2025c). Such practices contribute to emotional illness: with a high incidence of symptoms of depression, anxiety, and weaken engagement in treatment, making it difficult to achieve the global goals for the elimination of AIDS as a public health problem (BRASIL, 2025b).

According to a UNAIDS report, HIV-related stigma is structural, affecting not only HIV-positive individuals, but also key populations, such as LGBTQIA+ people, sex workers, drug users, and people in situations of social vulnerability (UNAIDS, 2021). These populations face social rejection, violence, job loss, educational exclusion, and even denial of access to essential health services. Discrimination is also institutionalized through punitive legislation and abusive practices, such as compulsory testing, requiring contraceptives to access treatment, and travel restrictions (UNAIDS, 2021).

Access to health services aimed at the prevention, diagnosis, and treatment of HIV and other STIs in Brazil is guaranteed by the Unified Health System (SUS), which operates under the principles of universality, integrality, and equity. The structuring of the health care network includes the provision of rapid testing, counseling, dispensing of antiretrovirals, clinical follow-up and educational actions, and is organized in a decentralized manner among the federative entities (UNAIDS, 2025d).

Despite the wide coverage provided for in the rule, effective access still presents regional and structural inequalities. Vulnerable populations, such as LGBTQIA+ people, sex workers, drug users, homeless people, people deprived of liberty, and indigenous people, face social and

institutional barriers that make it difficult to remain in services and adhere to treatment (BRASIL, 2025c). Such obstacles range from the lack of trained professionals to welcome without discrimination to limitations in infrastructure and material resources in the municipalities.

The Ministry of Health, through specific financial incentives and the publication of technical guidelines, advises that services implement actions articulated with primary care, specialized centers (SAE/CTA) and psychosocial support networks. Municipalities and states, in turn, must ensure the inclusion of these actions in health plans and programs, ensuring continuous and humanized care for people living with HIV (BRASIL, 2025c).

In addition, it is recommended that active testing and tracing practices be strengthened in the territories, with a focus on expanding early diagnosis and combined prevention, which involves the use of condoms, PrEP, PEP, harm reduction and regular testing. Expanding the coverage of services, especially in municipalities with the highest incidence, is considered strategic for controlling the epidemic (AGGIO, et al., 2025).

The financing of HIV/AIDS surveillance, prevention and control actions in Brazil occurs through a financial incentive instituted by the Ministry of Health, linked to the Variable Floor of Health Surveillance (PVVS). This incentive was initially implemented in 2002, with resources from an agreement with the World Bank, and since then it has been updated according to the epidemiological and operational needs of the country. In 2024, the incentive now has an annual budget of R\$ 300 million, of which R\$ 200 million are specifically allocated to actions related to STIs, HIV, AIDS and viral hepatitis, as established by Ordinance GM/MS No. 4,869/2024 (CONASS, 2024).

The resources transferred are intended to fund strategic actions involving prevention, diagnosis, treatment and monitoring of people living with HIV. These amounts do not replace the resources already allocated by the state and municipal spheres, but complement them, reinforcing the local response capacity. The execution of these resources requires actions to be foreseen in the official planning instruments, Health Plan and Annual Health Programming (PAS) and are monitored through quarterly and annual reports, such as the RQPC and the RAG, ensuring transparency and effectiveness in the application (CONASS, 2024).

In addition, the importance of intersectoral and civil society participation in the planning and execution of funded actions is highlighted, especially in addressing the social vulnerabilities that aggravate the epidemic. The regulation directs that resources should also be directed to key populations, such as men who have sex with men, transgender people, drug users, homeless people and people deprived of liberty, according to the reality of each territory (CONASS, 2024).

The constitutional guarantee of the right to health in Brazil, affirmed in article 196 of the Federal Constitution (2025), supports the free supply of antiretroviral drugs through the Unified Health System (SUS), as established by Law No. 9,313/1996. However, the realization of this right has often been driven by lawsuits, a phenomenon known as judicialization of health. Although this action of the Judiciary has contributed to expanding access to treatment, it has also generated significant consequences in the State's financial planning (FILHO, 2013). Judicial determinations that impose the supply of medicines, often of high cost and not included in the official lists of the Unified Health System (SUS), cause the immediate redirection of public resources, usually without the proper budget forecast. This practice has generated significant impacts on government finances, resulting in the reallocation of funds destined to other equally priority sectors of public health. Research indicates that, if this situation continues, the continuity of the policy of access to HIV/AIDS treatment may be compromised, unless the country presents consistent economic growth or promotes a profound restructuring in its budget and industrial policy, with emphasis on strengthening the national production of generic drugs (FILHO, 2013).

According to Filho (2013), the Judiciary has recognized the supply of medicines as an obligation shared between the Union, States and Municipalities. However, this co-responsibility, although legally supported, is not accompanied by effective mechanisms of financial coordination between the federative entities, which intensifies the challenges faced by local health systems.

Therefore, although judicialization represents a legitimate mechanism to guarantee fundamental rights, its disjointed use of technical and economic criteria can generate imbalances in the execution of public policies. The challenge lies in reconciling individual rights with the rational management of the public budget, especially in contexts of fiscal crisis and high demand for high-cost treatments.

UNAIDS (2025e), published a global report showing that, by the end of 2024, the joint efforts of governments and communities had reduced new HIV infections by 40% and AIDS-related deaths by 56% compared to 2010. However, gaps in prevention remained, with about 1.3 million new cases in 2024 alone. Despite scientific advances, such as long-acting drugs for prevention, the global response suffered a severe impact in 2025 due to the sudden withdrawal of international funding, especially from PEPFAR, which is responsible for 80% of the funding of prevention programs in low- and middle-income countries. UNAIDS estimates that if funding is not restored, by 2029 there could be an additional 6 million new infections and 4 million additional AIDS-related deaths.

The financial crisis has exposed regional and population inequalities: Sub-Saharan Africa has made significant progress but still accounts for the majority of cases, while regions such as the Middle East, North Africa, and Eastern Europe have seen growth in infections. In addition, adolescent girls, young women, and key populations remain more vulnerable, facing stigma, discrimination, and legal barriers. The disruption of funding also affected the distribution of condoms, male circumcision programmes and access to pre-exposure prophylaxis (PrEP), the global reach of which was far below the target for 2025 (UNAIDS, 2025e).

About 25 countries out of 60 have already announced increased domestic investments in HIV by 2026, signaling a transition to more sustainable, albeit gradual and challenging models. The strengthening of health systems, the integration of services and community participation are pointed out as fundamental axes for the sustainability of the response. UNAIDS emphasizes that, although the current crisis represents a setback, it is still possible to achieve the goal of eliminating AIDS as a public health threat by 2030, provided that there is renewed political commitment, multilateral cooperation and diversification of financing mechanisms (UNAIDS, 2025e).

3 OBJECTIVES

3.1 GENERAL OBJECTIVE

To organize and analyze quantitative data categorized into sexual orientation, sex, sexual frequency, age group, education and race, of people who are diagnosed with HIV and undergoing treatment at the Testing and Counseling Center (CTA) of Nova Xavantina-MT, analyze the confrontation of the municipality of Nova Xavantina with HIV/AIDS and compare these actions and characteristics in the national context.

3.2 SPECIFIC

- To ascertain the number of people with different sexual orientation in relation to the diagnosis of HIV and the treatment received in the municipality of Nova Xavantina-MT.
- To analyze the confrontation of HIV/AIDS in the municipality of Nova Xavantina and to compare these actions and characteristics in the national context.
- Identify the main informational barriers that hinder access to HIV-related preventive care and treatment.

4 MATERIAL AND METHODS

4.1 FIELD OF STUDY

The study was carried out in the municipality of Nova Xavantina, in the central-west region, latitude 14° 40' 24" S, longitude 52° 21' 11" W, altitude 275m (GEOGRAFOS, 2025), located in the State of Mato Grosso, 653 km from the capital, Cuiabá. The city has a territorial extension of 5,492.206 km², has an estimated population of 25,915 inhabitants (Brazilian Institute of Geography and Statistics (IBGE), 2025).

4.2 STUDY DESIGN

This is a scientific study, with exclusively quantitative use, through the analysis of data from notifications of patients diagnosed with HIV/AIDS in Nova Xavantina-MT sent by the Regional Office of Barra do Garças-MT, responsible for this STI department in the region. For the bibliographic reference, a theoretical survey was carried out on the origin, characteristics, treatment of HIV/AIDS, and information about the LGBTQIA+ population through bibliographic consultations on virtual platforms such as Scientific Electronic Library Online (SciELO), Google Scholar and electronic addresses of the Ministry of Health, UNAIDS.

4.3 DATA COLLECTION

Notification data from the database of the Notifiable Diseases Information System (SINAN) of the Ministry of Health were requested via email and made available in the form of a spreadsheet by the Regional Health Department of Barra do Garças/MT (May 2025), located in the central-west region, latitude 15° 53' 24" S, longitude 52° 15' 24" W, altitude 318m, area of 8761.3 Km², approximately 516m from the capital Cuiabá, the center responsible for coordinating health actions in the region, including the municipality of Nova Xavantina – MT. It should be noted that, as this is sensitive information, the collection and processing of this data was carried out exclusively by authorized professionals, respecting the principles of confidentiality and ethics, as recommended by the guidelines of the Ministry of Health (Law 14.289/22, Agência Câmara de Notícias, 2022 (BRASIL, 2022b). The number of carriers by sexual orientation, children, education, age group, race, sexual relations, residence, and sex, for the period from 2009 to 2025, was provided. The interview was conducted with the infectious disease specialist in charge at the time (May 2025) from Nova Xavantina, and recorded for proper notes, for information about the CTA, questions in docs were sent via WhatsApp to the current coordinator (May 2025), answered and returned in docs by the same application.

4.4 DATA ANALYSIS

The data obtained in May 2025, through the Regional Health of Barra do Garça/MT were organized and interpreted according to each classification, and through NAPKIN AI, tables and figures were created in order to facilitate the understanding of the data obtained from the Regional Health Department.

5 RESULTS AND DISCUSSION

The municipality of Nova Xavantina, located in the interior of Mato Grosso (653 km from the capital Cuiabá), with approximately 25,915 inhabitants (IBGE, 2025), had an important milestone in August 2023, when the SAE/CTA was implemented in the municipality. The Specialized Care Service (SAE) and the Testing and Counseling Center (CTA) were implemented in the municipality of Nova Xavantina – MT with the purpose of expanding access to diagnosis and early treatment of Sexually Transmitted Infections (STIs), such as HIV/AIDS, syphilis and viral hepatitis B and C. This implementation arose from the need to offer free rapid testing services, provide prevention inputs, promote educational and awareness actions, in addition to ensuring welcoming, confidential, and quality care (SAE/CTA COORDINATION, 2025).

The creation of the SAE/CTA brought significant impacts to local public health, especially in the care of people living with HIV/AIDS and other STIs. Among the main benefits are increased access to diagnosis and treatment, intensification of preventive actions, reduction of STI transmission, mental health care, integration with other health system services, reduction of social stigma and consequent improvement in the quality of life of users (SAE/CTA COORDINATION, 2025).

The target audience of the SAE/CTA covers the entire community of the municipality of Nova Xavantina, with special attention to vulnerable groups, such as young people, adults, the elderly, pregnant women not tested during prenatal care, patients diagnosed with tuberculosis, partners of people with STIs, users of pre-exposure prophylaxis (PrEP), people deprived of liberty, indigenous population, LGBTQIAPN+ population, sex workers, individuals with clinical suspicion or undetermined clinical conditions, victims of sexual violence, adolescents from 15 years of age in this condition, and workers exposed to biological material (COORDENAÇÃO SAE/CTA, 2025).

The SAE/CTA of Nova Xavantina has future prospects to include the expansion and improvement of its activities, with emphasis on the prevention, early diagnosis and treatment of STIs, HIV/AIDS and viral hepatitis. The service already plays a fundamental role and with

excellence in specialized care and intends to further strengthen the integration with primary care, ensuring humanized, equitable and accessible care, especially to the most vulnerable populations. The main goal of the SAE/CTA is to expand access to STI prevention, testing, and treatment actions, with a focus on reducing the incidence of new infections, improving the quality of life of the people served, and combating prejudice and discrimination (COORDENAÇÃO SAE/CTA, 2025).

Its services offered, it uses different means of communication, such as social networks (mainly Instagram), informative pamphlets, campaigns to the public such as at the university of the municipality, schools, squares, some events, and reports on the local radio. These strategies aim to increase the visibility of the service and encourage the population to spontaneously seek testing and counseling (COORDENAÇÃO SAE/CTA, 2025).

An interview was conducted with the infectious disease specialist responsible for the CTA (May 2025). The professional informed that all patients, regardless of sexual orientation, who undergo treatment and follow-up at the city's CTA receive medication. He stressed, however, that not everyone uses the same drug, as there are cases of mutations of the virus and specific situations. For example, some elderly patients (over 50 years old) may receive a new medication in a single daily dose (only one tablet).

The infectious disease specialist also explained about the treatment of pregnant women, noting that they follow the protocol considered "normal". However, there are changes in pregnant women in the first trimester who have not yet started first-line treatment, due to studies carried out by a university in the United States that raised the hypothesis that dolutegravir is associated with nuchal translucency in fetuses.

During the interview, the doctor was asked about the medication intended for people with AIDS, considering that HIV and AIDS are not the same condition. The question was whether there would be a difference in the drugs used. The specialist clarified that the treatment is the same, since Acquired Immunodeficiency Syndrome (AIDS) corresponds to the advanced stage of HIV infection, usually after a period of 7 to 10 years without treatment. The data made available by the Regional Health Department of Barra do Garças follow the respective records, among heterosexual people (61), followed by 26 cases among homosexual people and 3 among bisexuals (figure 1). In addition, one case of perinatal transmission was recorded, highlighting the importance of prenatal care for the prevention of vertical transmission of HIV. Regarding the distribution by sex, there was a predominance of males, with 54 reported cases (61%), while females (39%) represented 41 records (Figure 1).

Figure 1

Distribution of HIV/AIDS cases by sex and sexual orientation

Distribution of HIV Cases by Gender and Sexual Orientation

Source: Data: provided by the Regional Health of Barra do Garças/MT. Image: The authors.

The data provided also present information regarding the types of sexual relations reported by the patients. A total of 63 people reported having sex exclusively with men, 25 reported having sex exclusively with women, and 3 reported having sex with both sexes. In 4 cases, this information was not declared or is missing (unknown/blank) (figure 2). It should be noted that these data do not necessarily indicate the sexual orientation of the individuals nor are they directly related to biological sex, reflecting only the types of sexual partners mentioned at the time of notification.

Figure 2

Distribution of HIV/AIDS cases by self-reported sexual intercourse

Source: Data: provided by the Regional Health of Barra do Garças/MT. Image: The authors.

Figure 3 shows the distribution of HIV/AIDS cases in Nova Xavantina according to the main age groups affected. It is observed that the age group of 2 to 4 years had 2 cases, from 15 to 19 years had 8 cases, 20 to 34 years 43 cases, 35 to 49 years 34 cases, 50 to 64 years 8 cases, 65 to 79 years 2 cases. This age distribution shows the greater vulnerability of young adults and adults of economically active age, possibly reflecting factors such as greater sexual activity, multiple partners, less use of condoms and lack of continuous access to prevention actions. The presence of cases in the age group of 15 to 19 years also draws attention to the need to intensify public policies aimed at sex education in basic education and access to preventive methods among adolescents.

Figure 3

Distribution of HIV/AIDS cases by age group

Source: Data: provided by the Regional Health of Barra do Garças/MT. Image: The authors.

According to records provided by the Regional Health Department of Barra do Garças, between 2009 and 2025, two cases of HIV/AIDS in children were reported. Specifically, there was one case registered in 2010 and another in 2019, children aged 1 to 4 years (figure 3).

The distribution of HIV/AIDS cases by race (figure 4) in the municipality of Nova Xavantina reveals a predominance of people who self-declare themselves brown and white, according to data provided by the Regional Health Department. The brown breed has the highest number of reported cases, totaling 43 records. Next are individuals who identify themselves as white, with 39 cases. Among the black population, 12 cases were registered. The lowest incidence was observed among people of the yellow race, with only 1 case reported.

Figure 4

Distribution of HIV/AIDS cases by race

Distribution of HIV/AIDS Cases by Race in Nova Xavantina (cases)

The lack of schooling affects a lot, as most of the time there is no education, information, correct literacy, and thus hinders access to HIV, means of transmission, prevention disseminated by social media. Regardless of education, everyone is subject to the disease, however, those who have more access to and understanding of information, can protect themselves more and thus can avoid new transmission. Figure 5 below shows the number of cases by level of education in Nova Xavantina - MT.

Figure 5*HIV/AIDS cases by schooling*

Source: Data: provided by the Regional Health of Barra do Garças/MT. Image: The authors.

Between 2017 and 2021, the numbers fluctuated, remaining at levels of 8 cases in 2018, 9 in 2019 and 6 in 2020. The peak of notifications occurred in 2021, with 16 cases registered, which represents the highest value in the period analyzed. After this peak, there was a downward trend: 13 cases in 2022, 10 in 2023, only 1 case recorded in 2024, and in 2025 (May 2025) only 1 case was reported, respectively (figure 6).

Figure 6*HIV/AIDS cases in Nova Xavantina from 2009-2025*

Source: Data: provided by the Regional Health of Barra do Garças/MT. Image: The authors.

In the survey carried out based on data provided by the Regional Health Department of Barra do Garças – MT, a municipality located approximately 148.9 km from Nova Xavantina – MT, it was observed that only 95 cases of HIV/AIDS were reported in the period from 2009 to

2025. Although this number is considered low in relation to the estimated population of the municipality, which is around 25,915 inhabitants (IBGE, 2025), this data raises questions about the real scope of notification and the supply of antiretroviral drugs. Currently, with the implementation of the Specialized Assistance Service (SAE) and the Testing and Counseling Center (CTA), there has been an expansion in the test collection points, which could, theoretically, reflect in greater detection of cases.

Despite the low number of notifications, the supply of medicines is still limited, with only one vial per month being made available per patient, as informed by local professionals. This practice has generated concern, since any delays in the replenishment of the municipal stock can compromise the continuity of treatment. Considering that the Regional serves several municipalities, the need for proportional distribution is understood, however, it is suggested to evaluate the possibility of an extended release for patients with a history of proven adherence, as is the case of individuals with a condition of undetectable viral load. Such a measure could contribute to the optimization of logistics and the well-being of users, by reducing the frequency of trips to pick up medicines.

The analysis of HIV/AIDS epidemiological data for the municipality of Nova Xavantina, in the period from 2009 to 2025, shows a scenario that partially dialogues with the national pattern, although it presents important particularities related to the regional, demographic, and historical context of organization of local health services. In Brazil, a total of 46,495 new cases of HIV were observed in 2023, with a predominance of males (70.7%) and a higher concentration in the age group of 20 to 29 years, representing 37.1% of notifications (BRASIL, 2024b). Local data follow this trend: most notifications were recorded among men and young adults, especially individuals of economically active age. This convergence suggests that behavioral, social, and cultural factors that influence the national epidemic are also present in the municipal context.

However, when the magnitude of the cases is observed, a discrepancy between the number of local records (95 cases in the period analyzed) and the national pattern becomes evident. Considering the estimated population of Nova Xavantina, the volume of notifications seems relatively low, which indicates probable underdiagnosis or underreporting over the years. The fact that the Specialized Care Service (SAE/CTA) was only implemented in 2023 reinforces this interpretation, since limited access to testing, counseling, and specialized follow-up may have restricted the identification of cases during previous periods. In municipalities in the interior, the absence of structured services usually has a direct impact on epidemiological surveillance, making it difficult to detect early and longitudinally monitor people living with HIV/AIDS (SOUZA et al, 2013).

Another relevant aspect is the racial distribution of notifications. Nationally, the black and brown populations account for more than 60% of recent notifications (BRASIL, 2024b), while in Nova Xavantina cases predominate among self-declared brown and black individuals with 55%, white with 49%. This difference, although partially explained by the local demographic composition, may also reflect social inequalities and variations in access to health services. Inland regions often have additional barriers related to stigma, lack of information, and difficulty in traveling, elements that can interfere with the search for diagnosis and follow-up (SOUZA et al, 2013).

The diversity of exposure categories observed in the municipality, including heterosexuals, homosexuals, bisexuals, and cases of vertical transmission, shows that the infection is not concentrated in a single group, but is distributed among different population segments. This characteristic reinforces the need for broad, integrated, and continuous prevention actions, in line with national recommendations for the promotion of sexual and reproductive health. The presence of cases in children and adolescents, although a minority, points to specific vulnerabilities related to prenatal care, gestational follow-up and sex education in schools (CAMPOS et al, 2013).

The implementation of the SAE/CTA in 2023 is a milestone and a fundamental differential for the municipality, allowing to expand diagnostic coverage, decentralize the provision of care, strengthen prevention actions and ensure savings with travel in the municipality. Since its opening, the service has carried out rapid testing, reception, distribution of prevention supplies, clinical follow-up and educational actions in schools, universities and public spaces. These initiatives dialogue directly with national strategies, which emphasize the importance of early diagnosis, expansion of testing, and continuous treatment as the main means of controlling the epidemic. In addition, the historic drop in AIDS mortality in the country in 2023, reaching 3.9 deaths per 100 thousand inhabitants, the lowest rate since 2013 (BRASIL, 2024b), demonstrates the effectiveness of sustained comprehensive care policies and access to antiretrovirals.

The supply of medicines in limited quantities (one vial per patient per month) still poses risks to the continuity of treatment, especially in a region where delays in distribution or logistical difficulties can compromise adherence. In addition, cultural factors and the stigma associated with sexually transmitted infections can restrict the spontaneous search for testing, making it essential to maintain community awareness, continuing education, and confronting prejudice actions (DIAS et al, 2021).

In summary, the data analyzed indicate that the reality of Nova Xavantina follows part of the national epidemiological trends, but presents specificities related to the structure of the services, the countryside context and the local dynamics of access to health. The continuous strengthening of the NCS/CTA, associated with the expansion of prevention strategies, active epidemiological surveillance, and integration with primary care, is essential to ensure early diagnosis, timely treatment, and reduction of new infections (MELO et al, 2018). Based on this, it is recommended that, in the coming years, indicators such as adherence to treatment, average viral load of the population served, evolution of notifications and changes in the sociodemographic profile of cases be evaluated, in order to allow a consistent assessment of the impact of the service on the dynamics of HIV/AIDS in the municipality.

Despite these obstacles, it is necessary to recognize the work performed by SAE/CTA professionals in the municipality. The performance has been efficient and comprehensive, including laboratory tests, rapid tests, viral load monitoring and CD4/CD8 lymphocyte count, in addition to the regular distribution of medicines and health education actions. With the presence of an infectious disease specialist and adequate laboratory structure, Nova Xavantina was able to reduce the dependence on neighboring municipalities for the care of people living with HIV/AIDS, which represents an advance both in the field of public health and in the management of local resources.

6 CONCLUSION

The data collected at the Testing and Counseling Center (CTA) of Nova Xavantina-MT reinforce the importance of considering sexual orientation and gender identity in the formulation of prevention, diagnosis and treatment strategies. The numbers point to disparities that cannot be ignored and require managers, health professionals and civil society to engage in the construction of inclusive and humanized practices.

Another fundamental point identified was the need to expand the financing and sustainability of HIV/AIDS actions, since both the contribution of national and international resources has been shown to be vulnerable to political and economic oscillations. The judicialization of health, although it represents a legitimate mechanism for guaranteeing rights, also has relevant budgetary impacts, requiring planning and coordination between government spheres.

Therefore, it is concluded that facing the challenges of HIV in the LGBTQIA+ population implies recognizing the centrality of the fight against stigma and discrimination, strengthening the SUS as a space for welcoming and promoting equity, and expanding investments in

research, prevention, and treatment. The effectiveness of the response to HIV is not restricted to the biomedical dimension, but depends on the construction of a more just, inclusive and supportive society, in which diversity is respected and valued.

LIST OF ACRONYMS AND ABBREVIATIONS

AIDS – Acquired Immunodeficiency Syndrome
 CCR5 – C-C chemokine receptor, used by HIV for cell entry
 CD4 – Glycoprotein present on the surface of helper T lymphocytes
 CD4+ – CD4-expressing helper T lymphocytes
 CONASS – National Council of Health Secretaries
 CTA – Testing and Counseling Center
 CXCR4 – CXC chemokine receptor, used by HIV for cell entry
 GLS – Gays, Lesbians and Sympathizers
 GM/MS – Office of the Minister of the Ministry of Health
 HIV – Human Immunodeficiency Virus
 IBGE – Brazilian Institute of Geography and Statistics
 STI – Sexually Transmitted Infection
 STIs – Sexually Transmitted Infections
 LGBT – Lesbian, Gay, Bisexual and Transgender
 LGBTQIA+ – Lesbian, Gay, Bisexual, Transgender, Queer, Intersex, Asexual and other identities
 MT – State of Mato Grosso
 PAS – Annual Health Program
 PEPFAR – President's Emergency Plan for AIDS Relief
 PVVS – Variable Health Surveillance Floor
 RAG – Annual Management Report
 RNA – Ribonucleic acid
 RQPC – Quarterly Accountability Report
 SAE – Specialized Care Service
 SIV – Simian Immunodeficiency Virus
 SUS – Unified Health System
 UNAIDS – Joint United Nations Programme on HIV/AIDS

ABSTRACT

This study aimed to analyze the impacts of resource allocation by public policies promoting culture on the creative economy sector in the municipality of Cáceres/MT, focusing on the Aldir Blanc Law, the Paulo Gustavo Law, and the Aldir Blanc National Policy (PNAB). The research used a qualitative and quantitative approach, through documentary analysis of official data provided by the Ministry of Culture, the Official Gazette of the Municipalities of the State of Mato Grosso, and the Transparency Portal of the Municipality of Cáceres. The work presents an analysis of the distribution and effectiveness of the use of resources at the state level, with a local analytical focus on the municipality of Cáceres/MT, illustrating how these policies were operationalized at the local level. The results indicate that these policies had a significant impact on the execution of the local public budget and contributed to the maintenance and strengthening of creative enterprises, despite the challenges faced in their implementation and adaptation to local realities. It is concluded that public funding for culture presents strategic potential for strengthening the creative economy, and the continuity and improvement of these policies are necessary to expand their positive impacts.

RESUMO

O presente estudo teve como objetivo analisar os impactos das destinações de recursos pelas políticas públicas de fomento à cultura para o setor de economia criativa no contexto do município de Cáceres/MT, com foco nas Leis Aldir Blanc, Paulo Gustavo e Política Nacional Aldir Blanc (PNAB). A pesquisa utilizou abordagem qualitativa e quantitativa, por meio de análise documental de dados oficiais disponibilizados pelo Ministério da Cultura, pelo Diário Oficial dos Municípios do Estado de Mato Grosso e Portal da Transparência do Município de Cáceres. O trabalho apresenta uma análise da distribuição e da efetividade da utilização dos recursos em âmbito estadual, com um recorte analítico local no município de Cáceres/MT, ilustrando como essas políticas foram operacionalizadas em nível local. Os resultados indicam que essas políticas tiveram impacto relevante na execução do orçamento público local e contribuíram para a manutenção e o fortalecimento de empreendimentos criativos, apesar dos desafios enfrentados na execução e adaptação às realidades locais. Conclui-se que o fomento público à cultura apresenta potencial estratégico para o fortalecimento da economia criativa, sendo necessária a continuidade e o aprimoramento dessas políticas para ampliar seus impactos positivos.

RESUMEN

Este estudio tuvo como objetivo analizar los impactos de la asignación de recursos por parte de las políticas públicas de promoción cultural en el sector de la economía creativa del municipio de Cáceres/MT, centrándose en la Ley Aldir Blanc, la Ley Paulo Gustavo y la Política Nacional Aldir Blanc (PNAB). La investigación empleó un enfoque cualitativo y cuantitativo, mediante el análisis documental de datos oficiales proporcionados por el Ministerio de Cultura, el Boletín Oficial de los Municipios del Estado de Mato Grosso y el Portal de Transparencia del Municipio de Cáceres. El trabajo presenta un análisis de la distribución y efectividad del uso de recursos a nivel estatal, con un enfoque analítico local en el municipio de Cáceres/MT, ilustrando cómo se operacionalizaron estas políticas a nivel local. Los resultados indican que estas políticas tuvieron un impacto significativo en la ejecución del presupuesto público local y contribuyeron al mantenimiento y fortalecimiento de las empresas creativas, a pesar de los desafíos que enfrentaron en su implementación y adaptación a las realidades locales. Se concluye que el financiamiento público para la cultura presenta un potencial estratégico para fortalecer la economía creativa, y la continuidad y mejora de estas políticas son necesarias para ampliar sus impactos positivos.

1 INTRODUCTION

The creative economy has been consolidated, in recent decades, as one of the main vectors of economic, social and cultural development in several countries, including Brazil. This field can be defined as the set of activities related to the creation, production, distribution, circulation, consumption, and enjoyment of goods and services whose productive basis resides essentially in the symbolic dimension, creativity, knowledge, and human talent — individual or collective — as the main inputs for the generation of added value (Brasil, 2022; UNCTAD, 2010).

The appreciation of cultural diversity, the promotion of social inclusion and the stimulation of innovation have transformed the creative economy into a strategic component of contemporary public policies, elevating culture to the condition of a central asset for sustainable development. According to UNESCO (2024), the cultural and creative sector is one of the most dynamic in the global economy, contributing about 6.1% of the world's Gross Domestic Product (GDP), moving approximately US\$ 2.25 billion annually and generating almost 30 million jobs, especially young people between 15 and 29 years old — surpassing other sectors in generating opportunities for this age group.

In Brazil, the field of creative economy has gained relevance, especially in regions with expressive cultural richness and natural diversity, as is the case of the state of Mato Grosso. According to data from the Brazilian Micro and Small Business Support Service (Sebrae, 2025), there was a significant increase in the creation of enterprises linked to the creative economy. As an example, the capital Cuiabá showed a 35% growth in the number of creative businesses in the first quarter of 2024, jumping from 121 to 164 registered enterprises.

On the national scene, there has been an important advance in the formulation of public policies aimed at culture and the creative economy, with emphasis on the Aldir Blanc Law (Complementary Law No. 14,017/2020), the Paulo Gustavo Law (Complementary Law No. 195/2022) and the Aldir Blanc National Policy for the Promotion of Culture (PNAB), instituted by Complementary Law No. 14,399/2022. These initiatives, initially of an emergency nature, were later institutionalized as structuring policies and played a key role in strengthening the cultural sector during and after the Covid-19 pandemic, ensuring the continuity of cultural activities and the appreciation of creative entrepreneurs throughout the country.

Given the relevance of these policies, it is necessary to deepen the analysis of how public resources destined to the cultural sector were applied and what challenges were faced in their operationalization, especially at the state and municipal levels. Such research allows us to evaluate the effectiveness of public funding and its ability to promote the strengthening of the creative economy and the appreciation of cultural agents in different territories.

In this context, this study proposed to answer the following research question: what are the impacts of the allocation of resources from public policies to promote culture for the creative economy sector in the context of the municipality of Cáceres/MT?

To this end, the general objective was to analyze the impacts of the allocation of resources by public policies to promote culture for the creative economy sector in the context of the municipality of Cáceres/MT. Among the public policies to promote culture, this study selected as the object of analysis the Aldir Blanc Laws, Paulo Gustavo Law and the Aldir Blanc National Policy (PNAB).

Thus, it was sought to understand how public policies to promote culture were implemented in different federative spheres and, from the sample of the municipality of Cáceres, to evaluate their consequences for the strengthening of the local creative economy. The relevance of this study lies in its contribution to the improvement of cultural policies, by offering subsidies for the formulation of more effective future actions, in addition to enriching the debate on the strategic role of the creative economy in territorial development, evidencing its potential for social inclusion, income generation and economic dynamism.

2 THEORETICAL FRAMEWORK

2.1 CREATIVE ECONOMY: HISTORICAL AND CONCEPTUAL ASPECTS

For the United Nations (UN), the Creative Economy (CE) comprises a set of economic activities based on creativity, knowledge and cultural expression, involving the cycle of creation, production and distribution of goods and services that use creativity and skill as main inputs, with the potential to generate employment, income and sustainable economic growth. This evolving concept is based on creative assets capable of driving economic growth and development, and is considered an important driver for sustainable development, promoting social inclusion and valuing cultural diversity (UNCTAD, 2010).

The creative economy is a relatively recent concept, whose origin is strongly linked to the evolution of the notions of creative and cultural industries. The term began to take shape in the 1990s, driven by economic, technological, and social transformations that highlighted the central role of creativity, knowledge, and culture as engines of economic and social development (Gabriel; Souza; Fumagalli, 2019).

A key early milestone of the creative economy was the *Creative Nation: Commonwealth Cultural Policy report*, released by the Australian government in 1994. This document highlighted the importance of culture for national identity and for the economy, proposing public policies that valued cultural and artistic production as a strategy for economic development, in

addition to emphasizing that creativity would be essential for the country's adaptation to new economic demands and for competitive insertion in the global scenario (*Australian Government, 1994*).

In the United Kingdom, in 1997, the government led by Tony Blair created a multisectoral task force to analyze the economic potential of creative activities, resulting in the *Creative Industries: Mapping Document*. This document identified thirteen sectors with the greatest economic potential, consolidating the expression "creative industries" and establishing an integrated agenda between government, private sector and cultural creators. This initiative has become a global reference in public policies for the creative economy (DCMS, 1998).

From the 2000s onwards, the creative economy became a central theme in international conferences and reports by multilateral organizations, especially the United Nations (UN), through UNCTAD (United Nations Conference on Trade and Development) and UNESCO. In 2010, UNCTAD's *Creative Economy Report* consolidated the concept, highlighting that, if well nurtured, the creative economy can be a significant source of economic growth, job creation, innovation and trade, as well as promoting social inclusion, cultural diversity and sustainable human development (UNCTAD, 2010).

In Brazil, discussions on the creative economy gained strength from 2004 onwards, with the recognition of the sector as strategic for economic diversification, job creation and promotion of national culture. The country began to invest in public policies and research that highlight the importance of the creative economy, which moves billions of reais and formally employs hundreds of thousands of people (Brasil, 2011).

According to UNCTAD (2010), the main categories of the creative economy include: natural and cultural heritage (museums, archaeological sites, cultural landscapes, natural heritage); shows and celebrations (performing arts, festivals, cultural fairs); visual and plastic arts (handicrafts, painting, sculpture, photography); books and periodicals (books, newspapers, magazines, physical and digital libraries); audiovisual and interactive media (cinema, television, radio, internet, *podcasts*, video games, production and distribution of audiovisual content); *design* and creative services (*graphic design*, fashion, interiors, architecture, advertising).

In Brazil, sectors such as audiovisual production (cinema, *streaming*, advertising), digital games, music and cultural festivals, digital *marketing* and content production, and literature and independent publishers are highlights of the creative economy, generating jobs, innovation, and economic growth (Sebrae, 2025).

2.2 PUBLIC POLICIES TO PROMOTE CULTURE AND ALLOCATE RESOURCES TO THE CREATIVE ECONOMY IN BRAZIL

Public policies to encourage culture have proven to be fundamental for the development of the Brazilian creative economy. In the same sense, UNESCO reinforces the importance of including culture and the creative economy in countries' development plans, in addition to encouraging financing actions aimed at the creative industries as strategies to promote inclusive and sustainable growth (UNESCO, 2021). This conception recognizes culture as a strategic axis for development, valuing the symbolic and creative potential of the territories and promoting the generation of employment, income and the strengthening of local identities.

Although the concept of creative economy has broadened the understanding of the role of culture in social and economic development, the main focus of public policies aimed at culture in Brazil has historically been directed to the creation of financing mechanisms that would enable cultural activities to be carried out, especially those with difficulties in accessing resources through traditional channels. such as bank loans, private sponsorships, own or third-party capital, which often prove inaccessible to most independent cultural entrepreneurs (Ipea, 2021).

According to Rubim (2011) *apud* Calabre (2009), the enactment of Law No. 7,505/1986, known as the Sarney Law, represented a milestone in the institutionalization of cultural funding in Brazil, by introducing tax incentives to stimulate private investments in cultural projects. This legislation was succeeded by Law No. 8,313/1991, the Rouanet Law, which consolidated the National Program for Cultural Support (PRONAC), establishing mechanisms such as the National Culture Fund (FNC) and tax incentives via patronage.

These initiatives highlight the focus of Brazilian cultural policies on creating financing instruments that would enable cultural activities to be carried out, especially in view of the limitations of access to resources. In 2020, this legislation was officially renamed the Culture Incentive Law, remaining the main mechanism for tax incentives for culture in the country (Ribeiro *et al.*, 2023).

During the Covid-19 pandemic, the fragility of the cultural sector highlighted the need for more direct emergency actions. In this context, the Aldir Blanc Law (Law No. 14,017/2020) was sanctioned, which allocated R\$ 3 billion from the Union to the states, the Federal District and municipalities, with the aim of ensuring the survival of the cultural sector. The application of the resources was regulated by Ordinance No. 62/2020, which defined the transfer criteria, based on the estimated population of the municipalities (according to the IBGE) and the coefficients of the State Participation Funds (FPE) and Municipalities (FPM) (Brasil, 2020a; Brasil, 2020b).

In continuity with the emergency support process, the Paulo Gustavo Law (Complementary Law No. 195/2022) was created, which released around R\$ 3.86 billion for the cultural sector, with a strong emphasis on audiovisual production. This legislation reinforced the role of the State in the reconstruction of the cultural sector, expanding access to resources in a more direct and simplified way (Brasil, 2022).

The consolidation of this movement took place with the New Aldir Blanc Law (Law No. 14,399/2022), which institutes the Aldir Blanc National Policy for the Promotion of Culture (PNAB). Unlike the first version, which was of an emergency nature, the PNAB establishes a permanent development policy for five years, with annual transfers planned until 2027, totaling R\$ 3 billion per year. The new legislation proposes a federative cultural pact, strengthening state and municipal culture systems and valuing social participation (Brasil, 2022b).

In this context, the growing importance of development policies as instruments of local development is observed, especially in smaller municipalities, where cultural resources can represent a significant boost for creative enterprises, which have a growing role in the generation of income, employment and innovation. Therefore, for this growth to be maintained, it is essential to continuously support public policies that encourage entrepreneurship, innovation, and the appreciation of creative talents, promoting a favorable environment for micro and small companies in the sector (Tenório Vieira, 2023; Sebrae, 2025).

3 METHODOLOGY

This study is characterized as a qualitative and quantitative research, of descriptive character, with a focus on documentary analysis. The main objective was to examine the impacts of the allocation of public resources applied in the cultural sector through the main policies to promote the creative economy in Brazil, with an analytical focus in the state of Mato Grosso and sampling in the municipality of Cáceres.

The official documents made available by the Ministry of Culture were used as primary sources of data, notably the data panels of the Aldir Blanc and Paulo Gustavo Laws and the Aldir Blanc National Policy (PNAB). In addition, public documents accessed in the Official Gazettes of the Municipalities of the State of Mato Grosso and the Transparency Portal of the Municipality of Cáceres were analyzed, including municipal laws, regulatory decrees, ordinances, public notices and budget and financial execution reports related to the application of resources.

Data collection took place between April and May 2025, covering the period from 2020 to 2024 — corresponding to the implementation cycle of the three policies analyzed. The

analysis was structured in three stages:

- a) First stage: survey of resources destined to states and municipalities, focusing on the distribution and execution criteria within the state of Mato Grosso.
- b) Second stage: analysis of the budgetary and financial impacts of the allocation of public resources from the Development Policies in the municipality of Cáceres.
- c) Third stage: analysis of three selection processes carried out by the municipality of Cáceres (one referring to each policy: Aldir Blanc Law, Paulo Gustavo Law and PNAB), focusing on identifying the profiles of the cultural enterprises contemplated.

The data were organized in tables, allowing the identification of transfer patterns, execution rates and beneficiary profiles, and are presented in the next section.

4 RESULTS AND DISCUSSIONS

4.1 GLOBAL ANALYSIS OF THE ALLOCATION OF RESOURCES BY POLICIES FOR THE PROMOTION OF CULTURE IN THE STATE OF MATO GROSSO

4.1.1 Law No. 14,017/2020 (Aldir Blanc Law)

The enactment of Law No. 14,017, of June 29, 2020, known as the Aldir Blanc Law, established a milestone in Brazilian cultural public policy by instituting an emergency aid of R\$ 3 billion for the cultural sector that was heavily impacted by the COVID-19 pandemic. The operationalization of the distribution of resources was regulated by Decree No. 10,464/2020, which established the criteria for transfer in a single installment to the federative entities.

The distribution of the R\$ 3 billion of the Aldir Blanc Law in the 2020 fiscal year among the Brazilian states used the criteria established by the legislation itself, which mainly consider population factors, in addition to aspects related to social vulnerability and the ability to execute cultural policies.

Although states with smaller populations and economic dimensions, especially in the North and Midwest regions, received more modest shares, the policy sought to ensure national coverage. In this context, the state of Mato Grosso was awarded R\$ 30,016,809.05, equivalent to 1.00% of the total transferred. This amount represents an important reinforcement of local cultural policies, considering the cultural diversity of the state, marked by indigenous, Afro-descendant and traditional expressions, in addition to its relationship with the Cerrado, Pantanal and Amazon biomes.

Among the 141 municipalities in Mato Grosso, Cuiabá concentrated most of the resources, with R\$ 3,900,000.00, corresponding to 12.99% of the state total. It was followed

by Várzea Grande (6.00%) and Rondonópolis (5.00%), reflecting, in part, the centralization in municipalities of larger size and economic and population relevance.

The municipality of Cáceres received R\$ 640,900.00, representing 2.14% of the state amount, being among the 10 municipalities with the highest volume of transfers. This amount is considerably higher than the state average per municipality, estimated at approximately R\$ 212,654.60, indicating an above-average allocation.

The comparative analysis suggests that there is a correlation between the values transferred and variables such as the number of inhabitants, Gross Domestic Product (GDP) and Municipal Human Development Index (MHDI). However, according to the criteria established by the Aldir Blanc Law, the distribution of resources was based mainly on the number of inhabitants – according to IBGE estimates – in addition to the apportionment criteria of the State Participation Fund (FPE) and the Municipal Participation Fund (FPM).

Regarding the effectiveness of the use of resources, it was observed that most municipalities were able to fully apply the amounts received, with emphasis on 100% execution in locations such as Apiacás, Alta Floresta, Alto Araguaia, and several others. However, some municipalities had a residual balance or even negative execution, as is the case of Pedra Preta, Santa Terezinha and São José do Xingu, where the balances exceeded the amounts initially transferred, indicating possible inconsistencies in the execution or subsequent accounting adjustments.

Although most municipalities have achieved a full or satisfactory execution of the resources, evidencing commitment to the cultural public policy, the heterogeneity in effectiveness points to the need for improvement in technical training and in the monitoring of cultural management, especially in smaller municipalities or with less administrative structure, whose data indicated the absence of allocation of the resources received to local creative enterprises.

4.1.2 Complementary Law No. 195/2022 (Paulo Gustavo Law)

The Paulo Gustavo Law (Complementary Law No. 195/2022) represents the largest direct investment ever made in the cultural sector in Brazil, allocating R\$ 3.862 billion for the execution of cultural actions and projects throughout the national territory. This development policy, administered by the Ministry of Culture and aimed at cultural professionals, allowed access to resources through public notices, public calls, awards, acquisition of goods and services or other forms of simplified public selection (Brasil, 2024).

Although it was sanctioned in 2022, there are still resources that have not been fully used

by states and municipalities. Many have already received the transfers, but not all have completed the application of the amounts in the local Creative Economy sector.

According to the Data Panel made available by the Ministry of Culture, it is possible to monitor the progress of the financial execution and verify that a significant portion of the resources are still in the execution or planning phase, with deadlines that extend until the year 2025.

The distribution of resources from Complementary Law No. 195/2022 (Paulo Gustavo Law) in the state of Mato Grosso, which totaled R\$ 36,006,534.90, plus financial income, observed the population criterion established by Decree No. 11,525/2023. This methodology aimed to ensure distributive justice in access to cultural promotion among the 141 municipalities of Mato Grosso.

It is observed that most of the municipalities in Mato Grosso have almost fully executed the resources received through the Paulo Gustavo Law. Several municipalities, such as Acorizal, Alto Araguaia, Alto Garças, Arenápolis, Brasnorte, Campinápolis, Campos de Júlio, Cana Brava do Norte, Colíder, Confresa, General Carneiro, Jaciara, Jangada, Lambari D'Oeste, Lucas do Rio Verde, Marcelândia, Nobres, Nossa Senhora do Livramento, Nova Canarana do Norte, Nova Monte Verde, Nova Mutum, among others, recorded an application rate of 100% of the amounts received plus the income values, evidencing an efficient management and commitment to the execution of resources destined to the cultural sector.

In the specific case of Cáceres, 96.5% of the resources from the aforementioned Law were executed, which indicates the existence of a remaining cash balance from this public policy. In view of this scenario, it is important that the Municipal Department of Culture adopts the necessary measures so that such amounts are properly allocated to local cultural promotion, ensuring the full realization of the objectives of the Law and expanding the benefits for the municipality's culture makers.

On the other hand, some municipalities presented significant balances or execution percentages lower than 80%, such as Alto Taquari (55%), Cláudia (53%), Juara (51%) and Nova Lacerda (50%). This picture reveals a partial execution of resources, which may reflect administrative difficulties, bureaucratic obstacles or strategic issues related to the management and use of public funds.

In addition, it was found that in certain municipalities the balances remain totally or partially unused, as occurs in Alto Paraguai, Conquista D'Oeste, Denise, Gaúcha do Norte, Indiavaí, Itiquira, Jauru and Nova Bandeirante, which did not present clear information about the final destination of the resources.

The general panorama shows a good capacity for execution on the part of most municipalities in the State of Mato Grosso, reinforcing the relevance of structuring public policies in the cultural sector and the effectiveness of the decentralization of resources promoted by the Paulo Gustavo Law. However, the differences in effectiveness analyzed suggest the need for complementary studies that seek to understand, in a more in-depth way, the factors that hindered the full execution of resources in certain municipalities, with a view to improving administrative practices and optimizing the impact of cultural policies in the state territory.

4.1.3 Complementary Law No. 14,399/2022 (Aldir Blanc National Policy)

Complementary Law No. 14,399, of July 8, 2022, establishes the Aldir Blanc National Policy for the Promotion of Culture (PNAB) as a permanent public policy, ensuring annual transfers of resources from the Union to States, the Federal District, and Municipalities until the year 2027. The PNAB is a structuring response to the weaknesses of the cultural sector, especially evidenced during the COVID-19 pandemic, and is consolidated as a legal framework for the continued promotion of culture in Brazil, reinforcing the role of the State in promoting cultural diversity and strengthening local creative economies.

Cycle 1 of the PNAB corresponds to the first effective transfer made by the Union in 2023 and 2024, operated by the TransfereGov Platform, under the monitoring of the Ministry of Culture. In this cycle, the subnational entities presented their action plans containing goals, priority cultural actions and forecast for the use of resources, which, once approved, were credited to specific accounts of the FEC (State or Municipal Fund for Culture).

The allocation of values obeys the federative logic, respecting local autonomies, and seeks to reduce inequalities in access to cultural resources, fostering the decentralization and regionalization of public policies in the sector.

The State of Mato Grosso, the object of interest in this study, received approximately R\$ 26 million, corresponding to 1.7% of the national total. However, its application effectiveness is still considered low, with only 4.74% of the resources executed so far. This data suggests the existence of operational bottlenecks in the management of cultural resources in the state, which can compromise the effectiveness of public policy and delay the achievement of benefits to local culture makers. The situation is even more relevant when considering the rich cultural diversity and territorial extension of the state, factors that would potentially require a more agile and capillary management.

In general, there is a significant variation between the total resources received and the percentage of budget execution. In many municipalities, the percentage of execution was equal

to 0%, signaling a total absence of application of the amounts, while others exceeded the amount initially received, resulting in percentages above 100%, which may indicate the full use of resources plus their income.

In this context, Cáceres stands out negatively: although he received a significant amount of R\$ 626,128.06 (plus income), he managed to apply only 54.88% of the resources, maintaining a considerable balance in the account. This performance highlights administrative challenges and the need to strengthen local cultural policies, especially in a municipality with recognized cultural and tourist potential in the Pantanal.

Thus, the general panorama and the specific case of Cáceres reinforce the importance of training and planning in cultural management, aiming to ensure that future policies achieve their objectives fully and efficiently.

4.2 ANALYSIS OF THE BUDGETARY AND FINANCIAL IMPACTS OF POLICIES TO PROMOTE CULTURE IN THE MUNICIPALITY OF CÁCERES

This section presents the analysis of the budgetary and financial execution of public policies to promote culture in the Municipality of Cáceres-MT, in the period from 2020 to 2024. The approach is structured in three levels: an overview of the execution of the budget of the Secretariat of Tourism and Culture, the specific government function "Culture" and the subfunction "Cultural Diffusion", enabling an integrated understanding of the role and effects of these resources in local public management.

Table 1 presents the budget execution of the Secretariat of Tourism and Culture of Cáceres/MT and the impact of the resources of the Policies for the Promotion of Culture (PFC) on the local budget. Although they represent a relatively modest portion of the overall budget of the Municipal Department of Tourism and Culture, these transfers were fundamental to enable the financial contribution in the subareas most directly related to cultural dissemination.

Table 1

Budget Execution of the Department of Tourism and Culture of Cáceres/MT

Year	Fixed Expenditure	Settled Expense	Appeal Received PFC*	Percentage of Settled Expense
2020	R\$ 10.115.974,12	R\$ 2.768.719,34	R\$ 640.864,00	23,15%
2021	R\$ 8.482.330,49	R\$ 3.538.810,30	R\$ 0,00	0,00%
2022	R\$ 21.599.772,	R\$ 11.899.879,94	R\$ 0,00	0,00%

	02				
2023	R\$ 35.813.802,55	R\$ 15.927.307,85	R\$ 650.849,79		4,09%
2024	R\$ 31.887.689,91	R\$ 14.448.770,02	R\$ 775.139,01		5,36%

*Note: PFC = acronym for Policies for the Promotion of Culture

Source: Survey Data

In general, the expenditure set by the Secretariat is significantly higher than the expenditure settled in all the years analyzed, which shows a tendency to overestimate budget expenditure or low effectiveness of public spending in this area. In 2020, of just over R\$ 10 million fixed, only 27% were effectively settled. The same pattern is repeated in other years, with settlements always below 50% of the fixed.

With regard to resources from federal public policies for the promotion of culture (PFC) — such as the Aldir Blanc Law (2020), the Paulo Gustavo Law (2023) and the PNAB - Cycle 1 (2024) — it is observed that, although important, these amounts represent relatively modest percentages within the Secretariat's overall budget: 2020: 23.15%; 2023: 4,09%; 2024: 5,36%.

This low representativeness occurs because the Secretariat's budget includes not only cultural actions, but also activities involving tourism, which dilutes the perception of the impact of these federal transfers on the total of the portfolio.

On the other hand, when the analysis is specifically directed to budget execution by Culture government function, federal funding transfers become more expressive in relation to settled expenditure, as can be seen in Table 2.

Table 2

Budget Execution by the Government Function Culture

Year	Fixed Expenditure	Settled Expense	Appeal Received PFC*	Percentage of Settled Expense
2020	R\$ 6.827.301,57	R\$ 2.556.426,33	R\$ 640.864,00	25,07%
2021	R\$ 4.351.111,49	R\$ 2.436.036,84	R\$ 0,00	0,00%
2022	R\$ 7.467.678,93	R\$ 3.188.617,11	R\$ 0,00	0,00%
2023	R\$ 14.900.216,89	R\$ 3.212.065,01	R\$ 650.849,79	20,26%
2024	R\$ 13.488.189,91	R\$ 2.913.678,	R\$ 775.139,01	26,60%

*Note: PFC = acronym for Policies for the Promotion of Culture
Source: Survey Data.

In 2020, the resource of the Aldir Blanc Law represented 25.07% of the total paid for Culture, evidencing its importance for the maintenance of the municipality's cultural activities that year. In 2023 and 2024, with the transfers of the Paulo Gustavo and PNAB Laws, this share was also significant: 20.26% and 26.60%, respectively.

However, as in the Secretariat's global view, the Culture function also presents a marked discrepancy between the amounts fixed and those actually settled. For example, in 2023, almost R\$ 15 million in expenses were fixed, but just over R\$ 3.2 million were settled, that is, only 21% of the liquidated value of the forecast.

The analysis of the budget execution of the Cultural Diffusion subfunction reveals an even more interesting and specific scenario in the context of public policies to promote culture in Cáceres-MT, as evidenced in Table 3.

Table 3

Budget Execution by the Subfunction of Government Cultural Diffusion

Year	Fixed Expenditure	Settled Expense	Appeal Received PFC*	Percentage of Settled Expense
2020	R\$ 1.576.152,51	R\$ 900.076,47	R\$ 640.864,00	71,20
2021	R\$ 1.337.511,49	R\$ 117.714,43	R\$ 0,00	0,00%
2022	R\$ 3.993.382,23	R\$ 2.955.673,74	R\$ 0,00	0,00%
2023	R\$ 10.104.216,89	R\$ 2.726.039,30	R\$ 650.849,79	23,88
2024	R\$ 12.446.911,20	R\$ 2.068.796,08	R\$ 775.139,01	37,47

*Note: PFC = acronym for Policies for the Promotion of Culture
Source: Cáceres-MT City Hall

In general, it is observed that the budget execution in this subdivision of the government function is more efficient, with settlement percentages in relation to the fixed value higher than those observed in the Culture function and in the Secretariat as a whole.

In 2020, for example, the Cultural Diffusion subfunction reached an execution of 71.20% of the fixed expenditure, and the resources from the Aldir Blanc Law represented almost the entire amount paid in that year. In the following years, although there are variations, the subfunction maintained relevant percentages of use of PFC resources, such as 23.88% in 2023, with the application of resources from the Paulo Gustavo Law, and 37.47% in 2024, with the implementation of the Aldir Blanc National Policy (PNAB) – Cycle 1.

These data indicate that the receipt of federal resources, analyzed from the perspective of the Cultural Diffusion subfunction, was of great relevance for the performance of the portfolio

as a whole. Thus, the need to strengthen the performance of the Municipal Department of Tourism and Culture is evident, especially with regard to the preparation of adequate planning and the guarantee that the City Hall is able to receive and execute federal resources for cultural promotion.

In this context, the institutionalization of the Aldir Blanc National Policy for the Promotion of Culture (PNAB), through Law No. 15,132/2025, represents a strategic opportunity for the municipality, by ensuring the continuity of federal transfers to the cultural sector (Brasil, 2025). However, for local cultural enterprises to be sustainable in the long term, it is essential that the municipality of Cáceres does not depend exclusively on these resources and develops its own mechanisms to finance cultural dissemination, through investments with municipal resources, in order to ensure greater autonomy, emancipation and strengthen local cultural management. Expanding the execution capacity of the Department of Culture and continuously investing in the area are essential steps to consolidate culture as a vector of economic and social development.

4.3 ANALYSIS OF THE ALLOCATION OF RESOURCES BY POLICIES TO PROMOTE CULTURE IN CREATIVE ECONOMY ENTERPRISES IN THE MUNICIPALITY OF CÁ CERES

For the analysis of the application of public policies to promote culture in the municipality of Cáceres, it was decided to select three public notices as a representative sample of each of the main cultural policies implemented in recent years. The following were considered: a public notice referring to the Provisional Measure of the Aldir Blanc Law (2020), a public notice corresponding to the execution of Complementary Law No. 195/2022 (Paulo Gustavo Law), and a public notice linked to the first cycle of the Aldir Blanc National Policy for the Promotion of Culture (PNAB), instituted by Complementary Law No. 195/2022 and regulated in 2023.

This approach allows a more in-depth reading of the cultural areas prioritized by the municipality and how the federal resources, transferred via PNAB, were operationalized in the local context. From the categorization of the selected proposals, as presented in Table 4, we sought to understand the diversity of artistic languages served, the participation of local cultural agents and the alignment of actions with the guidelines of the national policy for the promotion of culture.

Table 4

Analysis of Public Notice No. 001/2020 of the Aldir Blanc Law

Proponent	Culture Category	Number of Proposals	%
Individual	Music	27	37,50%

Legal Entity	Visual Arts	11	15,28%
	Audio Visual	1	1,39%
	Other	19	26,39%
	Music	6	8,33%
	Visual Arts	1	1,39%
	Audio Visual	6	8,33%
	Other	1	1,39%

Source: Survey Data.

The analysis of Public Notice No. 001/2020, referring to the emergency execution of the Aldir Blanc Law in the municipality of Cáceres (MT), shows the selection of 72 proposals for cultural funding, totaling a transfer of R\$ 496,713.48. It is noteworthy that most of the beneficiaries were individuals, with 58 proposals approved, while 14 were submitted by legal entities, which indicates a significant involvement of artists and individual cultural agents in the city.

With regard to the cultural categories covered, Table 5 shows a significant diversity of artistic languages, with a predominance of the musical segment, which brought together 33 proposals, corresponding to approximately 45.83% of the total. Other areas of emphasis include the visual arts, with 12 proposals; audiovisual, with 7; and literature, with 6 approved proposals. In addition to these, initiatives in the areas of dance, theater, gastronomy and other cultural manifestations were also contemplated, demonstrating the breadth of the promotion actions and the reach of the cultural public policies implemented through this notice.

Table 5

Analysis of Public Notice No. 008/2024 of the Paulo Gustavo Law

Proponent	Category	Number of Proposals	%
Women	Handicrafts	2	60%
	Visual Arts	1	
	Performing art	0	
	Music	1	
	Cultural Manifestation	1	
	Heritage and Culture	2	
	Literature	1	
	Training, training and cultural research.	0

	Performing art	2	
	Music	1	
	Cultural Manifestation	1	
	Heritage and Culture	0	
	Literature	1	
	Training, training and cultural research.	1	

Source: Survey Data.

Public Notice No. 008/2024 included 15 cultural proposals, totaling R\$ 215,046.45 for creative enterprises, with a balanced distribution among various areas of the Creative Economy. Women were responsible for 60% of the proposals, while men represented 40%, highlighting the female participation in segments such as handicrafts and cultural heritage.

The categories contemplated included handicrafts, visual arts, performing arts, music, cultural manifestations, cultural heritage, literature and training, training and cultural research, evidencing the diversity and scope of public development policies in the municipality.

Tables 6 and 7 present the data on the allocation of resources by the Aldir Blanc Law – Cycle 01 PNAB, categorized, respectively, by gender and vacancy reservation.

Table 6

Analysis of Public Notice No. 009/2024-SMTC Aldir Blanc Law – Cycle 01 PNAB by Gender

Proponent	Category	Number of proposals	%
Women	Handicrafts	1	33,33%
	Visual and Audiovisual Arts	1	
	Performing Arts and Diversity	1	
	Music	0	
	Dance	1	
	Cultural Heritage	2	
	Literature	1	
Men	Handicrafts	2	57,14%
	Visual and Audiovisual Arts	2	

	Performing Arts and Diversity	2	
	Music	3	
	Dance	0	
	Cultural Heritage	1	
	Literature	2	
Association	Dance	2	9,53%

Table 7

Public Notice No. 009/2024-SMTC Aldir Blanc Law – Cycle 01 PNAB by Vacancy Reservation

Quota Vacancy Group	Quantity	%
Black People (black and brown)	9	43%
Wide Competition	11	52%
PCD	1	5%

Source: Survey Data.

The analysis of Public Call Notice No. 009/2024-SMTC (Aldir Blanc Law) referring to the first cycle of the Policy in the municipality of Cáceres, shows the local commitment to the promotion of diversity and democratization of access to public resources. Through the notice, 21 proposals were contemplated, distributed among different artistic categories, such as handicrafts, visual and audiovisual arts, performing art, music, dance, cultural heritage and literature.

Of the total, 7 proposals were authored by women, 12 by men and 2 by associations, reflecting a diversified participation. The transfer was made through the award modality, according to Law No. 14,399/2022, with fixed amounts predominantly of R\$ 10,672.63, intended for the execution of the projects.

The adoption of quotas stands out, promoting affirmative actions: 9 vacancies were allocated to black people (black and brown), 1 to people with disabilities (PCD) and 11 by wide competition. This distribution reinforces the commitment to equity and social inclusion, expanding the reach of cultural public policies to historically underrepresented segments.

Thus, it is observed that the operationalization of the PNAB in Cáceres sought not only to foster local artistic production, but also to strengthen the cultural heritage and value the cultural identity of the municipality.

5 CONCLUSION

This study sought to analyze the impacts of the allocation of resources by public policies to promote culture for the creative economy sector in the context of the municipality of Cáceres/MT. The analysis carried out shows the relevance of public policies to promote culture for the strengthening of the creative economy in Brazil, with emphasis on the state of Mato

Grosso and the municipality of Cáceres. The resources from the Aldir Blanc Law, the Paulo Gustavo Law and the Aldir Blanc National Policy for the Promotion of Culture (PNAB) were essential contributions for the maintenance and encouragement of cultural activities, especially in a scenario marked by the health and economic crisis resulting from the Covid-19 pandemic.

It was observed that, in general, the municipalities of Mato Grosso presented a satisfactory level of execution of resources, reflecting the local commitment to cultural development. However, significant challenges persist that may be related to management, planning and technical training, especially in smaller municipalities, which limits the full use of the potential of these investments.

The municipality of Cáceres stood out positively, configuring itself as an example of good governance and effectiveness in the application of resources, which reinforces the importance of qualified administrative practices for the success of cultural policies, especially due to the concern with the equitable allocation among the various social groups, with reservations of vacancies for affirmative actions and people with disabilities.

The heterogeneity in the application of resources among the municipalities points to the urgent need for complementary policies that promote technical assistance, training and continuous monitoring, ensuring a more efficient and qualified execution of public resources. Such measures would amplify the positive impacts, strengthening the local creative economy and contributing to the diversification and dynamization of the regional economy.

This study contributes to the reflection on the centrality of cultural policies in regional development, emphasizing the importance of continuity, improvement and expansion of these actions. Consolidating culture as the structuring axis of sustainable development and social inclusion strategies in Brazil requires the commitment of public managers and society to promote environments favorable to innovation, collaboration and the appreciation of local talents. The experience of Mato Grosso, especially in the municipality of Cáceres, demonstrates that, with effective management and integrated policies, the creative economy can be a decisive vector for balanced and sustainable territorial development.

ABSTRACT

Galactia glaucescens Kunth is a native species from South America whose traditional use is mainly associated with antivenom properties. Recent studies have demonstrated the ability of its extracts to neutralize neurotoxic and myotoxic activities of snake venoms, reinforcing its pharmacological potential. However, despite this growing interest, there is still a lack of information regarding its toxicological, pharmacological, and regulatory aspects. Plants from the Fabaceae family may present secondary metabolites of therapeutic importance but also risks and adverse effects. This duality between benefits and risks highlights the need for more robust scientific approaches, especially through *in vitro* and *in vivo* assays to assess genotoxicity, mutagenicity, and safety under different doses and exposure conditions. In the biotechnological field, *in vitro* culture techniques, micropropagation, and metabolomics represent promising alternatives to standardize plant material and identify bioactive compounds safely. Furthermore, the use of nanotechnology and computational modeling can contribute to enhancing pharmacological efficacy, reducing adverse effects, and predicting relevant molecular interactions. Nevertheless, the absence of rigorous regulation on herbal medicines in Brazil and the persistence of the myth that “natural means harmless” pose additional barriers to the responsible use of the species. It is concluded that *G. glaucescens* holds attributes of scientific and therapeutic interest, but its safe exploitation will depend on the integration of pharmacology, toxicology, biotechnology, and regulation. Overcoming popular misconceptions and advancing preclinical and clinical studies will be crucial to consolidating its potential in the field of phytotherapy.

Keywords: Biotechnology. *Galactia glaucescens*. Phytotherapy. Toxicity.

RESUMO

A *Galactia glaucescens* Kunth é uma espécie nativa da América do Sul cujo uso popular está associado principalmente a propriedades antiofídicas. Estudos recentes têm demonstrado a capacidade de seus extratos em neutralizar atividades neurotóxicas e miotóxicas de venenos ofídicos, reforçando seu potencial farmacológico. Entretanto, apesar desse interesse crescente, ainda há escassez de informações sobre seus aspectos toxicológicos, farmacológicos e regulatórios. Plantas da família Fabaceae podem apresentar metabólitos secundários de importância terapêutica, mas também riscos associados à toxicidade e efeitos adversos. Essa dualidade entre benefícios e riscos impõe a necessidade de abordagens científicas mais robustas, especialmente por meio de ensaios *n vitro* e *in vivo* que avaliem genotoxicidade, mutagenicidade e segurança em diferentes doses e condições de exposição. No campo biotecnológico, técnicas de cultivo *in vitro*, micropropagação e metabolômica representam alternativas promissoras para padronizar o material vegetal e identificar compostos bioativos de forma segura. Além disso, o uso da nanotecnologia e de modelagens computacionais pode contribuir para ampliar a eficácia farmacológica, reduzir efeitos adversos e prever interações moleculares relevantes. Contudo, a ausência de regulamentação rigorosa sobre fitoterápicos no Brasil e a persistência do mito de que “natural não faz mal” constituem barreiras adicionais para o uso responsável da espécie. Conclui-se que *G. glaucescens* reúne atributos de interesse do seu potencial no campo da fitoterapia.

Palavras-chave: Biotecnologia. Fitoterapia. *Galactia glaucescens*. Toxicidade.

RESUMEN

Galactia glaucescens Kunth es una especie nativa de América del Sur cuyo uso tradicional se asocia principalmente con propiedades antivenenosas. Estudios recientes han demostrado la capacidad de sus extractos para neutralizar las actividades neurotóxicas y miotóxicas de los venenos de serpiente, lo que refuerza su potencial farmacológico. Sin embargo, a pesar de este creciente interés, sigue habiendo una falta de información sobre sus aspectos toxicológicos, farmacológicos y normativos. Plantas de la familia Fabaceae pueden presentar metabolitos secundarios de importancia terapéutica, pero también riesgos y efectos adversos. Esta dualidad entre beneficios y riesgos pone de relieve la necesidad de enfoques científicos más sólidos, especialmente mediante ensayos *in vitro* e *in vivo* para evaluar la genotoxicidad, la mutagenicidad y la seguridad en diferentes dosis y condiciones de exposición. En el campo biotecnológico, las técnicas de cultivo *in vitro*, la micropropagación y la metabolómica representan alternativas prometedoras para estandarizar el material vegetal e identificar compuestos bioactivos de forma segura. Además, el uso de la nanotecnología y los modelos computacionales puede contribuir a mejorar la eficacia farmacológica, reducir los efectos adversos y predecir las interacciones moleculares relevantes. No obstante, la ausencia de una regulación rigurosa sobre los medicamentos a base de hierbas en Brasil y la persistencia del mito de que «natural significa inocuo» suponen obstáculos adicionales para el uso responsable de las especies. Se concluye que *G. glaucescens* posee atributos de interés científico y terapéutico, pero su explotación segura dependerá de la integración de la farmacología, la toxicología, la biotecnología y la regulación. Superar los conceptos erróneos populares y avanzar en los estudios preclínicos y clínicos será crucial para consolidar su potencial en el campo de la fitoterapia.

Palabras clave: Biotecnología. Fitoterapia. *Galactia glaucescens*. Toxicidad.

1 INTRODUCTION

Scientific interest in medicinal plants has grown exponentially in recent decades, due to the search for safe, effective and low-cost therapeutic alternatives. In this context, species of the Leguminosae family (=Fabaceae) have been highlighted for their phytochemical diversity and pharmacological potential demonstrated in different experimental models. Among them, (Barros; Silva; Porto, 2014) *Galactia glaucescens* (Kunth) has emerged as a subject of investigations due to its pharmacological properties, especially in the management of snake envenomations and inflammatory disorders. (Dal Belo et al., 2008)

G. glaucescens has bioactive compounds with recognized antioxidant, anti-inflammatory and antineurotoxic activity, being considered a promising candidate for the development of new herbal medicines. Experimental results indicate that fractions of the plant are able to neutralize the effects of the venom of (Dos Santos et al., 2019) *Crotalus durissus terrificus*, expanding the perspective of its use as an adjuvant in serum therapies. Despite this therapeutic potential, the use of plant species is still surrounded by misperceptions, such as the belief that "natural does not cause harm". This paradigm has been questioned by recent studies demonstrating potential adverse effects of plant compounds, including hepatotoxicity, genotoxicity, and mutagenicity. Thus, it is essential to critically evaluate the safety of plants such as (Dal Belo et al., 2008) (Chan, 2003; Ekor, 2014) *G. glaucescens*, whose traditional use can hide important toxicological risks.

The presence of complex secondary metabolites gives the species both its pharmacological properties and its toxic potential. Flavonoids and alkaloids, although widely investigated as bioactive molecules, can, under certain conditions, induce oxidative stress, chromosomal instability, and DNA damage. The absence of systematic toxicogenomic studies on (Cardoso, 2017) *G. glaucescens* becomes, therefore, a relevant gap to be explored.

Recent studies in pharmacognosy have reinforced the need to investigate not only the beneficial effects of medicinal plants, but also their potential genotoxic risks. Reviews published between 2020 and 2025 highlight that the indiscriminate consumption of herbal medicines may be related to mutagenic effects that are still poorly recognized clinically. These data alert to the importance of integrating molecular toxicology methodologies into pharmacological studies of the species. (Chan, 2003; Posadzki; Watson; Ernst, 2013)

In the field of experimental pharmacology, the investigation of toxicological effects is essential to validate the safety of potential herbal medicines. Assays such as comet test, micronucleus, and chromosomal aberrations have been widely used to evaluate the genotoxic

impacts of plant extracts. Applying these methodologies to (Hartmann, 2003) *G. glaucescens* would represent an advance in the understanding of its risk profile.

In addition to the pharmacological approach, it is necessary to consider the ecological aspects associated with the use of this species. *G. glaucescens* plays an important role in tropical ecosystems, particularly due to its nitrogen fixation capacity, contributing to soil fertility and environmental restoration. However, indiscriminate exploitation for medicinal purposes can negatively impact biodiversity conservation. (Sprent ; Gehlot , 2010)

Another critical point is the accelerated growth of the global herbal medicine market, which often anticipates the scientific validation of many plant species. This expansion, associated with the popularization of natural medicine, exposes populations to the risk of consuming extracts without proof of toxicological safety. The case of (Bent, 2008; Ekor, 2014) *G. glaucescens* illustrates the need for stricter regulations.

In parallel, international regulatory bodies such as the European Medicines Agency (EMA) and the Food and Drug Administration (FDA) have strengthened requirements for preclinical genotoxicity and mutagenicity analyses before the approval of plant-derived compounds for therapeutic use. The adequacy of research on (European Medicines Agency, 2026) *G. glaucescens* to these guidelines is an essential condition for future validation of the species in clinical contexts.

In Brazil and other Latin American countries, where the traditional use of the species is reported, it is urgent to promote investigations that reconcile popular knowledge with modern scientific approaches. The rescue of ethnopharmacology needs to be linked to toxicological tests that guarantee consumer safety. This strengthens rational use and avoids risks associated with empiricism. (Bent, 2008; Posadzki; Watson; Ernst, 2013)

When analyzing the state of the art on *G. glaucescens*, it is observed a concentration of studies on its pharmacological effects, but still a significant lack of data on toxicity. This asymmetry between efficacy and safety constitutes a challenge to be overcome by the scientific community, especially in the face of the growing demands for safe and validated herbal medicines. (Chan, 2003; Dos Santos et al., 2019)

Thus, the aim of this study was to present a critical and comprehensive review of *Galactia glaucescens* (Kunth), highlighting its therapeutic properties, but also emphasizing the potential risks related to toxicity, genotoxicity and mutagenicity. It is intended, therefore, to offer subsidies for the advancement of future research and for the consolidation of the safe and rational use of this species in the contemporary pharmacological context.

2 METHODOLOGY

The present study consists of a literature review with a systematic approach and narrative character, aimed at identifying, critically analyzing, and synthesizing the scientific knowledge published between the years 2015 and 2025 on the species *Galactia glaucescens* (Kunth). The objective was to map evidence related to morphology, ecology, phytochemistry, pharmacological potential and, especially, the toxicological risks associated with its use, including aspects of toxicity, genotoxicity and mutagenicity.

The searches were carried out between August and September 2025 in widely recognized international databases, including PubMed/MEDLINE, Scopus, Web of Science, ScienceDirect, and SciELO. In order to broaden the scope and reduce publication biases, the searches were complemented with queries to Google Scholar, repositories of theses and dissertations, and technical documents available in Brazilian and international digital libraries.

To ensure terminological coverage, controlled and uncontrolled descriptors were used in Portuguese and English, according to the MeSH (Medical Subject Headings) and DeCS (Health Sciences Descriptors) vocabularies. The combinations included terms such as "*Galactia glaucescens*", "Fabaceae", "Leguminosae", "medicinal plants", "toxicity", "genotoxicity", "mutagenicity", "pharmacological potential", "natural products", "ecology" and "distribution", using Boolean operators to refine the search.

Original articles, reviews, brief communications, and book chapters published from January 2015 to May 2025, available in English, Portuguese, or Spanish, that presented specific data on *G. glaucescens* in botanical, pharmacological, toxicological, or ethnobotanical aspects, were included. Studies published before 2015, those without access to the full text, studies that mentioned only the genus *Galactia sp* without directly addressing the target species, as well as editorials, case reports, abstracts in annals of events, and gray literature without peer review were excluded.

The selection of articles followed a process in three successive stages. Initially, titles and abstracts were evaluated for relevance and adherence to the theme. Then, the full texts of potentially eligible studies were examined in depth. Finally, two independent reviewers applied the inclusion and exclusion criteria rigorously, and any divergences were resolved by consensus.

The extracted data were systematized in a standardized spreadsheet, including information such as author, year of publication, country of origin, indexing base, methodological design, objectives, main results and conclusions. The organization of the information allowed the categorization of the findings into five main axes: botany and morphology; geographic

distribution and ecology; phytochemistry and secondary metabolites; pharmacological potential, including studies on antivenom, antioxidant and anti-inflammatory effects; and toxicity, with emphasis on genotoxicity and mutagenicity analyses.

The synthesis of the data was carried out in a narrative and integrative way, seeking to relate trends, advances and gaps in the recent literature. Priority was given to studies published in the period from 2015 to 2025, although some previous works were mentioned punctually for historical and complementary contextualization.

3 LITERATURE REVIEW

3.1 BOTANICAL AND TAXONOMIC ASPECTS

The genus *Galactia* groups approximately 50 species described in tropical regions. Of these, about 45 species are distributed in Tropical America. According to

Beyra Matos et al. (2005) little is known about the economic applications of the species belonging to this genus. The species *Galactia glaucescens* belongs to the class Dicotyledoneae, which includes angiosperms that are characterized by developing two cotyledon leaves in the seed embryo; family Leguminosae (=Fabaceae), which comprises one of the largest families among the dicots with more than 600 genera. The plant stands out for its pharmacological potential and the complexity of its botanical characterization. Floristic studies in the state of São Paulo have shown the occurrence of different species of the genus (Joly, 2005) *Galactia*, but have not recorded the presence of *G. glaucescens*, pointing to gaps in knowledge about its geographic distribution. This absence in regional surveys highlights the need to expand taxonomic and ecological investigations, especially to support future therapeutic uses in a responsible manner. (Portal Plantas do Brasil, 2026)

In Brazil, the species *Galactia glaucescens* is found in the cerrado and is distributed mainly in ecotonal areas of this biome, as in the state of Tocantins. According to the BIOTA program developed by the Foundation for Research Support of the State of São Paulo and according to a resolution of the Department of the Environment of the same state, the plant ("BIOTA-FAPESP Program", [Undated]) (Legislation, 2022) *G. glaucescens* is on the list of species of flora in the state of São Paulo threatened with extinction.

In the state of Tocantins there is no study on the population density of this species. However, in an ethnobotanical survey carried out by Barra D'Aroeira, the use of *G. glaucescens* leaves (vernacular Three Leaves) by healers belonging to the community of black remnants Barra D'Aroeira, located in the municipality of Santa Tereza, Tocantins, in the treatment of snakebite envenomation was identified. The

vernacular "three leaves" was attributed by the healers of this community due to the plant having a leaf blade divided into three independent leaflets.

Its taxonomic classification is supported by international databases such as the NCBI Taxonomy Browser, which places the species in the group of Papilionoideae, highlighting its relationship with legumes of ecological importance. Despite the consolidated systematic positioning, there are still challenges in the chemical and pharmacological characterization of the species. This reality reinforces the maxim that botanical identification, although essential, does not ensure safety of use, and it is essential to deepen toxicological studies. (NCBI Taxonomy Browser, 2026)

3.2 ANATOMY AND HISTOCHEMISTRY

Anatomy and histochemistry surveys of vegetative organs of *G. glaucescens* demonstrated the presence of specialized secretory structures and phenolic compounds distributed in different tissues, confirming its pharmacological potential. Such findings corroborate the interest in the species as a source of bioactive metabolites. However, the production of these substances must be analyzed from a critical perspective, since natural compounds can also trigger adverse effects on biological systems. (Barros; Silva; Porto, 2014)

The histochemical characterization showed a predominance of flavonoids, alkaloids and phenolic derivatives, which are often associated with antioxidant and cellular protective effects. Despite these potential benefits, there is evidence in the literature that these same chemical groups can exert genotoxic activities, especially at high doses or in prolonged exposures. Thus, the study of histochemistry not only provides support for therapeutic uses, but also warns of risks intrinsic to the indiscriminate use of the species. (Barros; Silva; Porto, 2014)

3.3 PHARMACOLOGICAL PROPERTIES AND ETHNOBOTANICAL USES

The pharmacological potential of *G. glaucescens* includes antivenom activities, with promising results against certain effects of the venom of the snake *Crotalus durissus terrificus* (Dal Belo et al., 2008; Gómez-Murillo; Arellano-Martín, 2021 ; Sumedh et al., 2018). These effects strengthen the perspective of using the plant as a complementary therapeutic resource in endemic regions, where snakebites represent a serious public health problem. However, studies remain incipient and lack further study on safety and clinical applicability.

From the ethnobotanical point of view, records in the Pantanal region point to the use of plants of the genus *Galactia* in traditional practices. These reports, although relevant to

ethnopharmacology, should be interpreted with caution, since popular knowledge tends to reinforce the mistaken notion that "natural does no harm". Without robust investigations into toxicity, genotoxicity and mutagenicity, the consumption of these plants may imply silent health risks. (Pott ; Pott , 1995)

3.4 DIVERSITY, CONSERVATION AND GAPS

Broader studies on legume diversity in the Gran Chaco highlight the importance of legumes as a whole and the existence of several endemic species, but do not include specific data on *G. glaucescens*, underscoring the paucity of detailed research on the species. This lack of data reinforces the urgency of systematic studies that consider both the pharmacological potential and the toxicological risks associated with the species. (C Eolin ; M iotto , 2013)

Although the genus *Galactia*, as well as other Fabaceae, has potential for the discovery of bioactive compounds, there are still no studies directed to *G. glaucescens* — highlighting a gap in knowledge (Carvalho et al., 2008) However, more general research shows the complexity of these species, which can concentrate biologically active molecules with effects that are not only beneficial, but also potentially harmful. The balance between benefit and risk, therefore, needs to be investigated with greater scientific rigor.

3.5 POLLEN MORPHOLOGY AND TOXICOLOGICAL IMPLICATIONS

The analysis of the pollen morphology of the genus *Galactia* sp, including Brazilian representatives, provides subsidies to understand its diversification and phylogenetic relationship with other legumes. This type of characterization, in addition to having taxonomic implications, can help in understanding the biosynthetic pathways responsible for the production of secondary metabolites. Such pathways are precisely the ones that determine the bioactivity and toxicity profile of compounds present in (Roubik; Moreno, 1991 ; Bishop of the Santos, 2014) *G. glaucescens*.

Analysis of the pollen morphology of representatives of the genus *Galactia*, including *G. glaucescens*, reveals features—such as perforated murus—that may be useful for distinguishing this species from others and inferring phylogenetic relationships and potential metabolic correlations. The characterization of these structures contributes to identifying potential correlations with the synthesis of molecules that, while having therapeutic properties, can trigger genotoxic or mutagenic effects. In this sense, morphological and biochemical analysis must be interpreted in an integrated way, reinforcing the central debate about the risks

embedded in the belief that natural substances are harmless. (Roubik; Moreno, 1991 ; Bishop of the Santos, 2014)

3.6 ECOLOGY AND GEOGRAPHICAL DISTRIBUTION OF *GALACTIA GLAUDESCENS*

Recent taxonomic studies, such as that of Ceolin & Miotto (2013), provide a synthesis of the genus *Galactia* in Brazil and present relevant data for *G. glaucescens*, such as its synonymy and distribution. In addition, the formal description of the species in the Plazi TreatmentBank provides essential information about its typification, morphological variation, and relationship with other species of the genus. (Ceolin; Miotto, 2013) (“*Galactia glaucescens*”, Prefix Match - Plazi TreatmentBank”, [Undated])

The absence of consistent data on the geographic range of the species has a direct impact on the risk analyses associated with its use. Plants of restricted distribution tend to accumulate secondary metabolites at differentiated concentrations, a result of local environmental pressures. Such chemical changes can ultimately modify its toxicological profile. The ethnobotanical literature indicates that traditional populations often use species of the genus (Gobbo-Neto; Lopes, 2007) *Galactia* without clear taxonomic distinction, which can lead to the misuse of plants with potential adverse effects. This overlap in popular knowledge reinforces the urgency of detailed investigations into the identity and risks of (De Albuquerque et al., 2007) *G. glaucescens*.

From an ecological point of view, it is notable that Fabaceae species, when occupying marginal niches, often synthesize bioactive compounds as a defense strategy against herbivory. In (Wink, 2013) *G. glaucescens*, this characteristic can be interpreted as a pharmacological advantage, but also a warning of genotoxic risks. In addition, anthropogenic changes in ecosystems, such as deforestation and fragmentation, may be further restricting the distribution of *G. glaucescens*. Such environmental pressures often intensify the production of defense metabolites, increasing the need for toxicity monitoring. This interface between ecology and pharmacology cannot be neglected. (Bravo-Monzón et al., 2022)

Pollination ecology is also related to the availability of the species. Studies on pollen morphology indicate that *Galactia* has specific patterns that influence its dispersion. Alterations in this process can compromise natural reproduction and reduce genetic variability, a relevant factor for biochemical and toxicological potential. Finally, the restricted distribution and ecological challenges faced by the species reinforce the need for multidisciplinary approaches. Without robust data on its occurrence, it becomes impossible to accurately assess both the therapeutic potential and the risks associated with indiscriminate use. This reinforces the

centrality of the debate about the myth that natural products are necessarily safe. (Veasey et al., 1999) (“ *Galactia glaucescens* Kunth | Plants of the World Online | Kew Science”, 2026)

The ecology of *G. glaucescens*, therefore, should not be seen only as a field of botanical interest. It is an essential element for understanding its pharmacological safety and for the formulation of public policies that reconcile conservation and sustainable use. The integration of ecological, taxonomic and toxicological data is, in this sense, an indispensable path. (Clement et al., 2010)

3.7 POTENTIAL HERBAL MEDICINES AND SAFETY LIMITATIONS

The use of *Galactia glaucescens* in traditional healing practices in Brazil is documented by communities that employ it mainly in disorders related to inflammatory processes and snakebites. The reported pharmacological potential is in line with the presence of bioactive metabolites that act on neuronal and enzymatic receptors. While this ethnobotanical knowledge is valuable, its transposition into clinical settings requires rigorous toxicological studies. (Calixto, 2000)

Preclinical trials have demonstrated antineurotoxic activity of plant extracts against the venom of *Crotalus durissus terrificus*, suggesting its application as an adjuvant in snakebite treatments. This result, however, should not be interpreted as a guarantee of safety, since pharmacological efficacy may coexist with risks of systemic toxicity and genotoxicity. (Dal Belo et al. , 2008)

The appreciation of native flora as a therapeutic resource is growing, driven by the global movement in favor of phytotherapy. However, this scenario favors the spread of the mistaken belief that natural is free of adverse effects. In the case of (Ekor, 2014) *G. glaucescens*, this perception can induce consumption without adequate scientific support, exposing users to potential risks of mutagenicity.

The concept of "relative safety" in herbal medicines is particularly sensitive, as different methods of preparation — infusion, decoction or alcoholic extracts — can substantially modify the concentration of active and toxic compounds. Thus, the same plant material may have divergent profiles in terms of efficacy and risk. Recent pharmacological research highlights the importance of isolating and characterizing the compounds responsible for the effects attributed to the plant. In (Firenzuoli; Gori, 2007) *G. glaucescens*, flavonoids and alkaloids are among the leading candidates. Even so, many of these chemical groups have reports in the literature

of potential genotoxic effects, which reinforces the need for careful evaluation. (Pott ; Pott , 1995)

The risk of popular use of plant species is not restricted to the intrinsic toxicity of the metabolites. External factors, such as contamination by heavy metals, pesticides, or microorganisms during collection and processing, can further increase the deleterious effects. This indicates that the issue of safety goes beyond the species itself, encompassing the entire production and use chain. (Street, 2012)

Another central point is the absence of specific regulations on the commercialization of products derived from *G. glaucescens*. Without official quality control protocols, variability in extracts compromises both therapeutic efficacy and toxicological evaluation. Such regulatory fragility reinforces the urgency of standardized studies. The literature on herbal medicines highlights that plants with recognized therapeutic potential also have reports of adverse effects in cell and animal models, including DNA damage and chromosomal instability. In this context, (World Health Organization, 2007) (Wagner; Ulrich-Merzenich, 2009) *G. glaucescens* should be studied from the same perspective, aiming to identify genotoxic risks early.

In addition to direct toxicity, the possibility of drug interactions is an aspect that is often overlooked. Bioactive compounds of *G. glaucescens* may interfere with metabolic pathways of conventional drugs, increasing clinical risks. This pharmacological dimension should be incorporated into future research protocols. Therefore, although the herbal potential of (Williamson, 2003) *G. glaucescens* is promising, it cannot be dissociated from the need for scientific rigor. The popular discourse that "natural does no harm" lacks support when confronted with the growing evidence of toxicological, mutagenic and genotoxic risks. The consolidation of safe use will depend on the integration between pharmacology, toxicology and regulatory policies. (Efferth; Koch, 2011)

3.8 TOXICOLOGICAL RISKS: GENOTOXICITY AND MUTAGENICITY

The safety of the use of *Galactia glaucescens* requires special attention in the field of toxicology. Plants of the Fabaceae family are known for the production of compounds with relevant pharmacological activity, but may also contain potential adverse effects. In the case of (Susilawati et al., 2023) *G. glaucescens*, the scarcity of specific studies on safety reinforces the need for systematic investigations that consider cellular and molecular parameters. The genotoxic risk associated with secondary metabolites is widely documented in plant species. Flavonoids, for example, have antioxidant activity, but under certain conditions they can induce DNA damage and generate genomic instability. This duality requires caution in interpreting the

benefits attributed (López-Lázaro, 2007) to *G. glaucescens*, since positive and adverse effects can coexist.

In vitro *experimental models* represent a valuable tool to evaluate genotoxicity and mutagenicity of plant extracts. However, in the case of (Pfuhler et al., 2009) *G. glaucescens*, such studies are still incipient, limiting the understanding of the real risk potential. The absence of micronucleus assays, comet testing, or chromosomal aberrations represents a relevant gap that must be filled.

Popular use without scientific backing exposes individuals to invisible risks. The mutagenic effects of plant compounds may not manifest immediately, but accumulate over time, increasing the likelihood of developing chronic diseases, including cancer. This dimension reinforces the urgency of breaking the paradigm that medicinal plants are inherently safe. (Stich; Rosin, 1984)

Another critical point refers to reproductive toxicity. Some legumes have compounds capable of interfering with fertility and embryonic development. Considering the phytochemical similarity between species of the genus (Hughes Jr, 1988) *Galactia*, it is plausible that *G. glaucescens* shares characteristics that require experimental evaluation. Toxicity should not be analysed solely from the perspective of high doses. Recent studies highlight that even subtherapeutic concentrations of some herbal medicines can induce mutations when exposure is chronic. This perspective magnifies the challenges in defining safe limits for long-term use of (European Food Safety Authority, 2010) *G. glaucescens* extracts.

The risk of genotoxic interactions also extends to the environmental context. Bioactive compounds released by plant species can interfere with soil microorganisms and, in the long term, affect food chains. This relationship between ecotoxicology and human safety has not yet been explored for (Duke; Dayan, 2011) *G. glaucescens*, but it should be considered in multidisciplinary approaches. It is also necessary to highlight the absence of regulatory protocols that require mutagenicity tests before the commercialization of herbal medicines in Brazil. This gap opens space for the circulation of potentially harmful products, without robust evidence of safety. In the case of (Mattei et al., 1998) *G. glaucescens*, the risk is amplified by the lack of standardization in preparation and dosage methods.

In parallel, recent reviews on medicinal plants highlight that the underreporting of adverse events compromises the real safety assessment. Often, genotoxicity-related side effects are not directly attributed to plant consumption, making epidemiological screening difficult. This phenomenon may be hiding the impacts of the indiscriminate use of (De Sousa, 2023) *G. glaucescens*.

Thus, the discussion about the toxicological risks associated with any herbal compound, such as *G. glaucescens*, needs to be broadened, integrating molecular biology, regulatory toxicology and pharmacovigilance methods. Only in this way will it be possible to counteract in a reasoned way the popular argument that "natural does not hurt" and build solid foundations for the responsible use of this species. (Rodrigues; Barnes, 2013)

3.9 FUTURE PHARMACOLOGICAL PERSPECTIVES AND BIOTECHNOLOGY

Biotechnology has expanded the possibilities for safe exploitation of medicinal plants, including *Galactia glaucescens*. Modern techniques of *in vitro* cultivation and micropropagation allow the achievement of standardized plant biomass, reducing phytochemical variability and favoring more consistent pharmacological studies. This advance may contribute to isolating compounds of therapeutic interest with greater safety. In addition to standardization, biotechnology enables the genetic manipulation of plant species in order to reduce potentially toxic compounds, maintaining the production of relevant bioactive metabolites. For (Fazili et al., 2022) (Georgiev et al., 2012) *G. glaucescens*, this represents a promising path, since the coexistence of therapeutic properties and genotoxic risks limits its full use.

Nanotechnology emerges as another strategic tool for plant pharmacology. The encapsulation of plant extracts in nanoparticles can reduce adverse effects, control the release of active ingredients and increase bioavailability. These approaches would demonstrate efficacy in other Fabaceae, which reinforces their potential application. (Srinivasan, 2023)

Still, pharmacological development requires strict safety protocols. Preclinical and clinical trials should be conducted to verify toxicity in cellular and animal systems prior to transposition to human therapies. The absence of such studies for (Martins et al., 2011). *G. glaucescens* highlights a barrier that must be overcome. Another emerging field is metabolomics, which enables the global analysis of the compounds present in the plant. Applied to *G. glaucescens*, this technique would make it possible to identify both molecules with therapeutic potential and those associated with genotoxicity. This systemic view is essential to advance in the balance between benefits and risks. (Wolfender et al., 2015)

Bioprospecting for natural compounds faces ethical challenges, especially when it involves traditional knowledge from local communities. The use of this knowledge must respect the principle of fair sharing of benefits, avoiding undue exploitation of ancestral knowledge. This ethical dimension is inseparable from pharmacological advances. On the other hand, the growing demand for natural products in the global market increases the pressure for rapid scientific validation of new species. This scenario can favor methodological shortcuts that

compromise security. For (Singh; Pathak; Rai, 2022) (Tilburt, 2008) *G. glaucescens*, it is essential that the commercial rush does not supplant the need for robust toxicological tests.

The integration between pharmacology and bioinformatics also opens horizons for the species. Molecular modeling can predict interactions of *G. glaucescens* compounds with biological targets, anticipating potential therapeutic and adverse effects. This approach allows prioritizing safer molecules for future assays. The biotechnological perspective should not be seen as a substitute for traditional studies, but as a necessary complement. Technological advancement can optimize the investigation of (Sliwoski et al., 2014) *G. glaucescens*, as long as it is accompanied by appropriate toxicological evaluations. This synergy is indispensable to transform the plant's potential into safe clinical applications. (Atanasov et al., 2021)

In short, the pharmacological prospects of *G. glaucescens* are promising, but the future of the species in the field of phytotherapy will depend on the ability to reconcile biotechnological innovation and scientific rigor. Without this, there is a risk of perpetuating the cycle of exploitation of medicinal plants with proclaimed benefits, but invisible risks. (Newman; Cragg, 2020)

3.10 THE SCIENTIFIC DEBATE ABOUT "NATURAL DOES NOT HURT"

The discourse that natural products are risk-free remains rooted in the popular imagination, but the scientific literature increasingly demonstrates that this belief is mistaken. In the case of *Galactia glaucescens*, the therapeutic potential is accompanied by uncertainties regarding toxicity and genotoxicity. This duality needs to be clearly communicated to society. (Veiga Junior; Pinto; Maciel, 2005)

The popularization of herbal medicines often relies on arguments of cultural tradition and historical use, without considering that long-term adverse effects have rarely been systematically documented in traditional contexts. This perception bias contributes to the perpetuation of the idea of absolute security. (De Smet, 2002)

The precautionary principle should guide the exploitation of *G. glaucescens*. The absence of conclusive studies is not equivalent to proof of harmlessness. On the contrary, the lack of evidence should be understood as a warning of the risk of inadvertent exposure to mutagenic substances. Scientific communication plays a central role in this debate. It is necessary to counter the marketing narrative, which often reinforces the appeal to "natural", with data from toxicological research that shows potential risks. Only then will it be possible to rebalance public perception. From a regulatory point of view, the weakness in the supervision

of the commercialization of natural products amplifies the problem. Herbal medicines derived from species with knowledge gaps, such as (World Health Organization, 2007) (Izzo; Ernst, 2001) *G. glaucescens*, can reach the market without any proof of safety. This reality poses challenges to public health. (Shaw, 2010)

The myth of "natural does not hurt" also impacts the behavior of patients who use herbal medicines in combination with conventional medicines. The resulting interactions can compromise established pharmacological therapies, generating serious consequences. This risk is still little explored in studies on (Fugh-Berman, 2000) *G. glaucescens*. Recent research in toxicology has shown that the indiscriminate consumption of medicinal plants may be associated with increased markers of genomic instability in exposed populations. This evidence reinforces that the discussion goes beyond hypotheses and approaches measurable impacts. (Cruz, 2015)

It should be noted that modern pharmacology has already demonstrated that many synthetic compounds derived from plants were only accepted after rigorous toxicological evaluation. Thus, there is no justification for not applying the same rigor to species such as (Butler, 2008) *G. glaucescens*. The scientific debate, therefore, is not about denying the potential benefits of medicinal plants, but about recognizing that benefits and risks coexist. For *G. glaucescens*, this duality is especially evident and needs to be addressed in a transparent way. (Capasso et al., 2000)

It is concluded that overcoming the myth "natural does no harm" is an indispensable condition for the safe use of *G. glaucescens*. The integration between ethnobotany, pharmacology, toxicology and scientific communication will be the way to transform this species into a reliable therapeutic resource, without compromising collective health. (Jordan; Cunningham; Marles, 2010)

4 CONCLUSION

The analysis of *Galactia glaucescens* shows a central duality: while it has relevant pharmacological properties, such as antivenom and antioxidant activities, it also brings uncertainties regarding its toxic and genotoxic potential. This ambivalence reinforces the need for their use to be accompanied by rigorous scientific protocols, especially in a scenario in which the valorization of natural products is still permeated by myths of absolute safety.

Future perspectives indicate that biotechnology, nanotechnology and metabolomics can play fundamental roles in the safer and more effective exploitation of the species, allowing both the standardization of extracts and the identification and isolation of bioactive compounds with

lower toxicological risk. However, such advances will only be relevant if accompanied by an ethical approach, which respects traditional knowledge and avoids the predatory exploitation of natural resources.

Overcoming the popular imagination that "natural does no harm" is an indispensable condition to transform *G. glaucescens* into a reliable therapeutic resource. This requires integration between ethnobotany, pharmacology, toxicology, biotechnology, and scholarly communication, in order to balance risks and benefits. Thus, the future of the species in the field of phytotherapy will depend not only on technological innovation, but also on scientific and regulatory responsibility to ensure its safety and effectiveness.

THE ROLE OF MUSCLE GLYCOGEN UNDER LOW ENERGY AVAILABILITY AND ITS IMPACT ON PERFORMANCE IN FUNCTIONAL SPORTS: A SYSTEMATIC REVIEW

O PAPEL DO GLICOGÊNIO MUSCULAR EM CONDIÇÕES DE BAIXA DISPONIBILIDADE ENERGÉTICA E SEU IMPACTO NO DESEMPENHO EM ESPORTES FUNCIONAIS: UMA REVISÃO SISTEMÁTICA

EL ROL DEL GLUCÓGENO MUSCULAR EN CONDICIONES DE BAJA DISPONIBILIDAD ENERGÉTICA Y SU IMPACTO EN EL RENDIMIENTO EN DEPORTES FUNCIONALES: UNA REVISIÓN SISTEMÁTICA

<https://doi.org/10.56238/sevened2026.019-020>

Jackson Gervasio Pires¹, Lucrecia Natalí Moyano²

ABSTRACT

Introduction: Low energy availability (LEA) and reduced muscle glycogen are recognized as key determinants of performance and health in athletes practicing functional sports, which are characterized by high training density and mixed metabolic demands. This systematic review aimed to synthesize the available evidence on the relationship between LEA, muscle glycogen status, and physical performance in functional sports.

Methods: A systematic review was conducted following PRISMA 2020 guidelines. A search was performed in PubMed/MEDLINE, Scopus, and Web of Science (January 2015–October 2025). Twelve studies involving trained adults were included. Data extraction and risk of bias assessment were performed by a single reviewer. Due to methodological heterogeneity, a descriptive quantitative synthesis was conducted.

Results: Four studies (33%) directly assessed muscle glycogen, showing that a 30–40% depletion was associated with 8–15% reductions in high-intensity performance. Five studies (42%) identified LEA associated with decreased leptin and triiodothyronine levels and increased cortisol. Physiological demands in functional sports included oxygen consumption of 85–92% of VO_2max and lactate concentrations exceeding 10–12 mmol/L.

Conclusions: Evidence indicates that LEA and reduced muscle glycogen consistently impair performance and recovery in functional sports, highlighting the need to distinguish between total energy availability and carbohydrate availability in nutritional planning.

RESUMO

Introdução: A baixa disponibilidade energética (LEA) e a redução do glicogênio muscular são reconhecidas como fatores determinantes do desempenho e da saúde em atletas que praticam esportes funcionais, caracterizados por elevada densidade de treinamento e demandas metabólicas mistas. O objetivo desta revisão sistemática foi sintetizar as evidências disponíveis sobre a relação entre LEA, o estado do glicogênio muscular e o desempenho físico em esportes funcionais.

Métodos: Foi realizada uma revisão sistemática seguindo as diretrizes PRISMA 2020. A busca foi conduzida nas bases PubMed/MEDLINE, Scopus e Web of Science (janeiro de 2015 a outubro de 2025). Foram incluídos doze estudos com adultos treinados. A extração dos dados e a avaliação do risco de viés foram realizadas por um único revisor. Devido à heterogeneidade metodológica, foi realizada uma síntese quantitativa descritiva.

Resultados: Quatro estudos (33%) avaliaram diretamente o glicogênio muscular, observando-se que uma depleção de 30–40% esteve associada a reduções de 8–15% no desempenho de alta intensidade. Cinco estudos (42%) identificaram LEA associada a diminuições de leptina e triiodotironina e aumentos de cortisol. As demandas fisiológicas em esportes funcionais incluíram consumos de oxigênio de 85–92% do $\text{VO}_{2\text{máx}}$ e concentrações de lactato superiores a 10–12 mmol/L.

Conclusões: As evidências indicam que a LEA e a redução do glicogênio muscular comprometem de forma consistente o desempenho e a recuperação em esportes funcionais, destacando a necessidade de diferenciar entre disponibilidade energética total e disponibilidade de carboidratos no planejamento nutricional.

Palavras-chave: Disponibilidade Energética. Desempenho Esportivo. Nutrição.

RESUMEN

Introducción: La baja disponibilidad energética (LEA) y la reducción del glucógeno muscular se reconocen como factores determinantes del rendimiento y la salud en atletas que practican deportes funcionales, caracterizados por una elevada densidad de entrenamiento y demandas metabólicas mixtas. El objetivo de esta revisión sistemática fue sintetizar la evidencia disponible sobre la relación entre LEA, el estado del glucógeno muscular y el rendimiento físico en deportes funcionales.

Métodos: Se realizó una revisión sistemática siguiendo las directrices PRISMA 2020. Se efectuó una búsqueda en PubMed/MEDLINE, Scopus y Web of Science (enero de 2015–octubre de 2025). Se incluyeron doce estudios en adultos entrenados. La extracción de datos y la evaluación del riesgo de sesgo fueron realizadas por un único revisor. Debido a la heterogeneidad metodológica, se efectuó una síntesis cuantitativa descriptiva.

Resultados: Cuatro estudios (33%) evaluaron el glucógeno muscular de forma directa, observándose que una depleción del 30-40% se asoció con reducciones del 8-15% en el rendimiento de alta intensidad. Cinco estudios (42%) identificaron LEA asociada con disminuciones de leptina y triyodotironina y aumentos de cortisol. Las demandas fisiológicas en deportes funcionales incluyeron consumos de oxígeno del 85-92% del $\text{VO}_{2\text{máx}}$ y concentraciones de lactato superiores a 10-12 mmol/L.

Conclusiones: La evidencia indica que la LEA y la reducción del glucógeno muscular comprometen de manera consistente el rendimiento y la recuperación en deportes funcionales, destacando la necesidad de diferenciar entre disponibilidad energética total y disponibilidad de carbohidratos en la planificación nutricional.

1 INTRODUCTION

Energy availability is conceptualized as the embodied energy minus the energy cost associated with exercise, adjusted according to fat-free mass, thus constituting a determining factor of physiological functionality in athletes. In cases where such a relationship leads to temporarily sustained insufficiencies, low energy availability (LEA) occurs, related to an overall energy imbalance that entails the compromise of the energy required for basal metabolism processes, as well as for systemic homeostasis (1). LEA is a pathophysiological structuring factor of Relative Energy Deficiency Syndrome in Sport (RED-S), associated with systemic alterations, whether endocrine, metabolic, immunological, bone and cardiovascular, thus directly affecting health and performance (1,2). It is of great importance to differentiate this concept from carbohydrate availability (CHO), which is associated with the provision of carbohydrates for exercise and recovery, as well as from low-CHO or ketogenic diets, the latter being nutritional strategies aimed at restricting such intake. It should be emphasized that such terms are not equivalent, given that although LEA implies a total energy deficit, the reduced availability of CHO is potential even with an adequate caloric intake, always dependent on the context and physiological objective (8,9).

In female athletes, LEA is especially relevant due to its association with the Female Athlete Triad, given by LEA, menstrual dysfunction and reduced bone mineral density (3). Specifically, sustained LEA leads to alterations in pulsatile secretion of GnRH, decreases concentrations of luteinizing hormone (LH) and follicle-stimulating hormone (FSH), and affects ovarian function, all in conjunction with reductions in leptin and triiodothyronine (T3), and increases in cortisol (adaptive catabolic state) (1,3). Although these reactions are aimed at preserving energy survival, their sustained presence entails compromises on bone health, reproductive function, post-exercise recovery, and immune homeostasis and the risk of injury and psychological damage (2,4). These repercussions derive from the overall deficit of the LEA, not individually from the restriction of CHO, thus finding a mechanistic differentiation between the constructs in question.

From a performance perspective, the availability of CHO has a central function in determining glycogen content and localization at the muscle level; that is, the most important energy component in high-intensity exercise: adenosine triphosphate (ATP) resynthesis (glycogenolysis), regulation of muscle contraction, calcium release, metabolic signaling (5-7). Studies affirm that glycogen depletion, at any level, is likely to reduce force generation, as well as produce the acceleration of fatigue, regardless of the total depletion of reserves (6,7). In this way, the low availability of CHO alters acute performance; on the other hand, LEA increases

this effect by limiting glycogen resynthesis and favoring a catabolic hormonal environment (lower insulin and leptin, higher cortisol) (1,2,8).

In accordance with the theme of this study, such interactions are of great relevance in functional and hybrid patterns such as CrossFit, Hyrox and concurrent instances of strength and endurance (high working density and glycolytic requirements, and recovery with limitations). Whether in CrossFit (performance associated with previous glycogen stores and replenishment capacity between consecutive sessions) (6,10), or in Hyrox (need for sustained glycogen availability towards sustaining intensity) (11), the overlap between LEA and low CHO availability is decisively detrimental, since the global energy deficit affects chronic adaptive capacity and health. In addition to the fact that the CHO restriction delimits short-term performance, as well as work capacity. In this sense, energy and substrate levels should be differentiated in nutritional planning, as well as any modality of CHO restriction should be justified in correspondence with the physiological mechanism and the training objective, towards the avoidance of temporarily sustained energy deficits likely to increase the risk of RED-S and performance impairment (8,9).

Taken together, the evidence suggests that muscle glycogen constitutes a central determinant of performance in functional sports, and that LEA, by limiting its availability, establishes a scenario of physiological vulnerability that compromises power, endurance and resilience. Understanding how these factors are interrelated is essential for designing nutritional and training strategies that optimize adaptation and minimize the adverse effects of energy deficiency. Therefore, the present study aims to analyze the role of glycogen in the context of low energy availability and its impact on the performance and health of athletes in functional disciplines, through a systematic review based on PRISMA 2020 (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) (12).

2 METHODOLOGY STUDY DESIGN

A systematic review of the literature was carried out in accordance with the guidelines established by the PRISMA 2020 guideline (12). The aim was to synthesize current evidence on the relationship between LEA, muscle glycogen status, and performance-related outcomes in functional sports.

2.1 SOURCES OF INFORMATION AND SEARCH STRATEGY

The search was carried out in the PubMed/MEDLINE, Scopus and Web of Science databases, justifying by its treatment of studies in sports science, exercise physiology and sports nutrition.

The searches themselves were conducted in September-October 2025, including studies published in the period January 2015-October 2025, regardless of geographical context. Research published in both English and Spanish was considered.

The survey strategy included the combination of controlled terms (MeSH) and free keywords, involving the use of Boolean AND and OR operators, discriminated according to the database. Thus, for PubMed/ MEDLINE, MeSH terms and free text were used in Title/Abstract fields: ("Low Energy Availability"[Title/Abstract] OR "energy availability"[Title/Abstract] OR "relative energy deficiency in sport"[Title/Abstract] OR RED-S[Title/Abstract] OR "Energy Metabolism"[Mesh]) AND ("Muscle Glycogen"[Mesh] OR "muscle glycogen"[Title/Abstract] OR "glycogen depletion"[Title/Abstract] OR "glycogen resynthesis"[Title/Abstract]) AND ("Athletes"[Mesh] OR athlete*[Title/Abstract] OR "trained individuals"[Title/Abstract] OR "high-intensity functional training"[Title/Abstract] OR "functional training"[Title/Abstract] OR CrossFit[Title/Abstract] OR Hyrox[Title/Abstract] OR "high-intensity interval exercise"[Title/Abstract]) AND ("Sports Performance"[Mesh] OR performance[Title/Abstract] OR fatigue[Title/Abstract] OR recovery[Title/Abstract]).

In Scopus, we used TITLE-ABS-KEY search: (title-abs-key("low energy availability" OR "energy availability" OR "relative energy deficiency in sport" OR "RED-S")) and (title-abs-key("muscle glycogen" OR "glycogen depletion" OR "glycogeresynthesis"))AND (TITLE-ABS-KEY("functional training" OR "high intensity functional training" OR "high intensity interval exercise" OR CrossFit OR Hyrox OR athlete* OR "trained individuals")) AND (TITLE-ABS-KEY(performanceORfatigueOR recovery OR "exercise performance")).

Finally, in Web of Science, a Topic (TS) search was used: TS=("low energy availability" OR "energy availability" OR "relative energy deficiency in sport" OR RED-S) and TS=("muscle glycogen" OR "glycogen depletion" OR "glycogen resynthesis") AND TS=("functional training" OR "high intensity functional training" OR CrossFit OR Hyrox OR athlete* OR "trained individuals") AND TS=(performance OR fatigue OR recovery OR "exercise performance").

2.2 ELIGIBILITY CRITERIA

The following inclusion criteria were considered: studies conducted in adult humans (≥ 18 years), athletes, or physically trained; studies that directly or indirectly assessed muscle glycogen through validated techniques; studies evaluating energy availability, LEA and/or

nutritional interventions for the modification of energy infestation or CHO; studies with outcomes associated with physical performance, fatigue, work capacity, recovery, and/or adjacent physiological responses; experimental, quasi-experimental, observational designs or systematic reviews with explicit methodology.

On the other hand, the following were excluded: studies carried out in animals and/or cell models; studies carried out in pediatric populations; case studies, editorials, letters to the editor, and/or narrative reviews; studies conducted without peer review; studies with insufficient methodological information for quantitative data extraction or risk of bias assessment.

Thus, the review included studies with different methodological designs (experimental, observational and systematic reviews) given the need to cover more fully the evidence related to the problem, while, in this field of research, the scientific data generated come from diverse methodological approaches. In other words, it is considered that the restriction to a single design variant would have entailed limitations on the comprehensive understanding of the problem addressed.

2.3 SELECTION PROCESS

The identified research was imported into a bibliographic manager, the duplicates being eliminated both manually and automatically.

The selection of studies was carried out in the four phases given by PRISMA 2020 (12), in terms of identification, screening by title and abstract, full-text eligibility assessment and final inclusion.

The entire selection process was carried out by a single reviewer, in accordance with the criteria presented. In order to reduce the risk of selection bias, the application of the criteria was systematic and consistent in the stages of the process in question. The included and excluded studies by phase were documented from a PRISMA 2020 flowchart.

2.4 DATA EXTRACTION

Data extraction was carried out by a single reviewer from a standardized spreadsheet, extracting: author and year of publication; sample size and characteristics of the population; study design; method of evaluation of muscle glycogen and/or energy availability; reported quantitative outcomes (means, standard deviations, percentages, and p-values, where available); limitations.

Statistical analysis and synthesis of results

A quantitative descriptive synthesis of the data surveyed was carried out, while the extraction of percentage changes, absolute differences and statistical significance when (when available).

Considering that the included studies corresponded to significant heterogeneity in terms of design, glycogen quantification techniques, analysis of energy availability, population and outcome variables, a statistical meta-analysis was not performed.

The descriptive quantitative synthesis was based on the identification of consistent patterns regarding the relationship between the decrease in energy availability, that of muscle glycogen and the detriment of performance in functional sports, omitting aggregate statistical inferences.

2.5 ASSESSMENT OF METHODOLOGICAL QUALITY AND RISK OF BIAS

These analyses were carried out by a single reviewer, always depending on the design of each of the included studies. Thus, experimental trials were evaluated using the PEDro scale, while observational research was carried out using ROBINS-I and systematic reviews were carried out using ROBIS.

It is important to clarify that, although the analyses were not carried out independently by various reviewers, the implementation of validated techniques resulted in structured and transparent assessments of risk of bias.

On the other hand, the overall certainty of the evidence was analyzed qualitatively based on the GRADE approach, based on risk of bias, consistency, precision, and applicability to functional sports.

Considering that the present review was carried out based on studies with different methodological designs, the GRADE evaluation was implemented qualitatively at the level of narrative synthesis, incorporating all the available evidence on the relationship between energy availability, muscle glycogen and performance in functional sports. Thus, experimental studies were interpreted as higher-level evidence, while observational studies were interpreted as moderate-to-low-level evidence, although they could be adjusted in correspondence with the domains evaluated.

The final assessment of the certainty of the evidence was judged in four levels or categories: high, moderate, low or very low. In the framework of the development of the present review, we considered global certainty to be moderate, given that, although the results showed a clear directional consistency regarding the effect of low energy availability and glycogen depletion on yield, limitations were found on the precision and generalizability of the findings as

methodological heterogeneity, reduced sample sizes and methodical variability of glycogen assessment.

2.6 METHODOLOGICAL LIMITATIONS

The procedures for study selection, data extraction and assessment of risk of bias were carried out by a single author, as mentioned in due course. This corresponded to the fact that the review was carried out within the framework of an academic project with limited resources. In direct relation to the latter, in order to minimize potential biases, methodological strategies were implemented in order to guarantee procedural consistency and transparency: a priori definition of the selection criteria and their systematic application in all phases of the selection process, according to the PRISMA 2020 guide (12); Reduction of the risk of missing relevant studies when identifying and screening studies through a structured and reproducible search strategy across multiple databases. The protocol of this study was not prospectively registered in international platforms such as PROSPERO, a decision that corresponded to the realization of the review within an academic project framework with exploratory scope. Notwithstanding the latter, the guarantee of methodological transparency and reproducibility derived from the a priori definition and detailed report according to the PRISMA 2020 guide (12) of the eligibility criteria, search strategies, study selection process and synthesis methods, thus seeking to maintain comparable methodological standards in terms of traceability and clarity of the review process.

3 RESULTS

Figure 1 represents the flow process derived from the application of the PRISMA 2020 criteria (12) that resulted in the inclusion of 12 studies.

The quantitative descriptive synthesis evidenced a heterogeneous availability of data on muscle glycogen and LEA, which prevented the performance of a formal meta-analysis according to the criteria of PRISMA 2020 (12). Four studies (33%) evaluated muscle glycogen directly, through muscle biopsies or analysis of its subcellular location, demonstrating that glycolytic depletion in the order of 30-40% is associated with a significant decrease in performance in high-intensity exercise, with estimated reductions of 8-15% in total work capacity and maximal force production (13,14,19,20). These effects were observed even in the absence of complete total glycogen depletion, underscoring the functional relevance of selective intrafibrillary depletion.

Five studies (42%) addressed total energy availability or its indirect estimation, identifying that values compatible with LEA, operationally defined as insufficient energy intake relative to training expenditure, were associated with consistent hormonal alterations, including reductions in leptin and T3, along with increases in cortisol, setting up a catabolic metabolic environment (2,15,16,17,18). In these studies, the presence of LEA was also associated with impaired ability to sustain repeated high-intensity efforts and increased perception of fatigue, even in the absence of significant changes in body mass.

Likewise, studies that analyzed physiological demands typical of functional sports reported sustained oxygen consumption close to 85-92% of VO_{2max} and blood lactate concentrations above 10-12 mmol/L during competition or training, which shows a high dependence on glycolytic metabolism and, therefore, on adequate muscle glycogen stores (10,11). Taken together, these quantitative findings indicate that both muscle glycogen reduction and the presence of LEA consistently compromise physical performance and resilience in high-work-density settings, although methodological heterogeneity between studies limited the possibility of integrating the results using combined statistical analyses.

Regarding the assessment of methodological quality and risk of bias of the included studies, overall, seven of the twelve studies had a low to moderate risk of bias, while the remaining five were classified as having moderate risk of bias, with no studies identified as being at critical risk of bias.

The main methodological limitations detected in the experimental studies included small sample sizes, absence of blinding of participants and investigators, and short-term follow-up, factors that may influence the accuracy of the observed effects on muscle glycogen and physical performance (13,14,19). In observational studies, the risk of bias was mainly related to the indirect measurement of energy availability, the dependence on dietary self-reports, and the cross-sectional design, which prevents establishing causal relationships between LEA and the physiological variables evaluated (2,15-18).

On the other hand, the included reviews showed a low to moderate risk of bias, conditioned by the heterogeneity of the primary studies and the absence of combined quantitative analyses in some cases (8,20). Overall, we judged the overall quality of the evidence to be moderate, with clear directional consistency in the effects of LEA and glycogen depletion on performance in functional sports, although with limitations in the precision and generalizability of results due to methodological variability between included studies.

4 DISCUSSION

The evidence gathered in this systematic review shows that energy availability and muscle glycogen status are determinants of performance and physiological adaptation in contemporary functional sports, such as CrossFit, Hyrox and hybrid training. Throughout the studies analyzed, it is observed that both glycogen depletion and LEA exert adverse effects that are manifested in the ability to maintain potency, post-exercise recovery and anabolic signaling associated with protein synthesis.

More recent physiological studies, such as that of Vigh-Larsen et al. (13), confirm that the subcellular distribution of glycogen within the muscle fiber plays a crucial role in fatigue. The reduction of up to 70% of intrafibrillary glycogen in type II fibers during intense intermittent exercise is directly related to loss of strength and decreased performance.

This finding explains why, in modalities such as CrossFit or Hyrox, even partial reductions in local glycogen stores can compromise the ability to sustain repeated high-intensity efforts. The neuromuscular fatigue observed in these disciplines is not only dependent on global glycogen depletion, but also on localized depletion in compartments critical for rapid muscle contraction.

On the other hand, studies exploring low-carbohydrate nutritional strategies or ketogenic diets (15,16) showed conflicting results, but the general trend points to a reduction in anaerobic performance and maximal power, especially in glycolysis-dependent activities. Although prolonged adaptation to diets very low in CHO can increase fat oxidation, the results suggest that these strategies compromise the ability to produce fast energy, essential in functional or competitive training. In this sense, carbohydrate periodization (training with low availability in low-intensity sessions and competing with high reserves) emerges as a useful tool, as long as it is carefully planned to avoid prolonged episodes of ALE.

Evidence on anabolic signaling and recovery reinforces the importance of maintaining adequate glycogen status. Margolis et al. (17) demonstrated that initiating exercise with low glycogen attenuates the activation of the mTORC1 pathway and reduces the expression of myogenic markers such as PAX7 and MYOGENIN. These findings are relevant in the context of functional sports, in which training frequency and high weekly workload require optimal recovery. Prolonged LEA and persistent glycogen shortages limit the ability to adapt to training, with a negative impact on both strength and protein synthesis and body composition.

Regarding the physiological axis, the studies reviewed (2,19) establish a clear relationship between LEA, glycogen depletion and hormonal alterations. Under conditions of low energy availability, a significant decrease in leptin and insulin is observed, accompanied by an increase in cortisol, which favors a catabolic environment and reduces the capacity for glycogen resynthesis. In women, these effects are more marked and can lead to menstrual dysfunctions and thyroid disorders, adding to the impact on bone density and performance. The relationship between LEA and muscle glycogen, therefore, transcends the energy aspect and becomes a central axis to understand the metabolic, hormonal and muscular adaptations of functional athletes.

Finally, the practical literature (8,11,20) provides specific guidelines for optimizing carbohydrate intake and timing in high-density sports. The "fuel for the work required" strategies fit particularly well into the logic of functional training, where the demands vary per session. Ingesting between 1.0-1.2 g/kg.h of CHO in the first hours of recovery, together with protein and fluids, is associated with optimal glycogen resynthesis and an improvement in energy availability for consecutive sessions. The study by Brandt et al. (11) provides recent evidence on Hyrox, showing that the test imposes a mixed energy demand with high glycogen dependence; Therefore, proper recharging between training rounds is critical.

Taken together, the results of this review confirm that maintaining an adequate energy balance and optimal glycogen stores is essential not only for acute performance, but also for chronic adaptation to functional training. Sustained LEA can act as a negative modulator of performance and health, particularly in women, and should be considered a metabolic and endocrine risk factor in the sports field.

5 CONCLUSIONS

The results suggest that the preservation of adequate glycogen stores is a determining factor for the athlete's performance and metabolic health. In addition, it is proposed that the evaluation of LEA in these contexts should incorporate indirect markers of glycogen availability, such as indicators of fatigue, decreased performance, slow recovery or a feeling of persistent muscle exhaustion.

From an applied perspective, this work reaffirms the importance of updating CrossFit Inc.'s nutritional recommendations and promoting evidence-based nutrition education among both athletes and coaches. The lack of specific protocols on carbohydrate intake and timing in CrossFit and hybrid modalities represents a gap that should be addressed through updated guidelines, with special emphasis on the prevention of ALS in women.

Limitations include the paucity of studies that include female CrossFit or Hyrox athletes, the predominant use of male samples, and methodological heterogeneity in glycogen assessment (biopsy, MRI, indirect estimates). However, the findings are consistent in pointing out the need to maintain an adequate energy balance and sufficient carbohydrate intake to sustain adaptations to functional training. On the other hand, a methodological limitation of this systematic review is that the process of study selection, data extraction and assessment of risk of bias was carried out by a single reviewer, which could increase the risk of selection and interpretation bias. However, this risk was mitigated through the application of a priori defined criteria and the use of validated assessment tools.

ABSTRACT

The present study aims to examine community-based tourism in the communities of Córrego do Sal and Barrinha, located in the municipality of Icapuí, with the objective of analyzing how community-based tourism is developed in these areas. Tourism encompasses various typologies, and community-based tourism is one of them. It is characterized by being developed by residents of a given region, with the objective of organizing and controlling local productivity and generating income through tourism. In this context, the article focuses on community-based tourism practices in Córrego do Sal and Barrinha, investigating experiences and local dynamics supported by partnerships such as Fundação Brasil Cidadão, Fundação AVINA, Fundação O Boticário, and Banco Santander. The methodology applied consisted of a bibliographic review, based on authors such as Coriolano, Borges, Maldonado, Mollison, Sancho, and Soares, and field research using a semi-structured questionnaire administered to the local community. Córrego do Sal and Barrinha were selected as case studies due to their tourism potential oriented toward community-based tourism. The research demonstrated that, through the practice of community-based tourism and the encouragement of local participation as both actors and entrepreneurs, the region developed initiatives such as the Mulheres Alimentando Vidas group and the Mulheres de Corpo e Alga group, which contribute to the growth of community-based tourism by generating employment and income for the local population, while also attracting tourists interested in experiencing this type of tourism that promotes the destination while preserving it. Understanding the community-based practices implemented in these communities is relevant for identifying successful models that can be adapted and promoted in other locations as a means of fostering local economic and social development, making residents the driving force behind these initiatives.

RESUMO

O presente trabalho busca o estudo do turismo comunitário nas comunidades de Córrego do Sal e de Barrinha, pertencentes ao município de Icapuí, tendo como objetivo estudar como se dá o turismo comunitário nestas comunidades. O turismo apresenta diversas tipologias e o turismo comunitário é uma delas. O turismo comunitário é aquele em que é desenvolvido por moradores de uma determinada região, onde se tem como objetivo a organização e o controle da produtividade local e a geração de renda através do turismo. Neste sentido, o artigo volta-se as práticas de turismo comunitário em Córrego do Sal e Barrinha, investigando-se experiências e vivências a partir do turismo local e apoio de parcerias como a Fundação Brasil Cidadão, Fundação AVINA, Fundação O Boticário e Banco Santander. A metodologia aplicada no trabalho foi pesquisa bibliográfica, através de autores como Coriolano, Borges, Maldonado, Mollison, Sancho e Soares ; e pesquisa de campo, através de um questionário semiestruturado, aplicado com a comunidade local. Córrego do Sal e Barrinha foram escolhidos como objeto de estudo por terem o potencial turístico voltado ao turismo comunitário. A pesquisa demonstrou que através da prática do turismo comunitário e incentivo da participação local como atores e empreendedores, a região desenvolveu projetos como o grupo Mulheres Alimentando Vidas e o grupo Mulheres de Corpo e Alga que influenciam no crescimento do turismo comunitário, através da geração de emprego e renda para comunidade local, além de promover atração de turistas interessados em vivenciar este tipo de turismo que promove o destino, porém que também o preserva. Conhecer as práticas comunitárias aplicadas na comunidade faz-se relevante para buscar modelos de práticas exitosas que podem ser adaptadas e impulsionadas em outras localidades, como forma de desenvolver o desenvolvimento econômico e social local, tornando os moradores os propulsores das ações.

RESUMEN

El presente trabajo tiene como objetivo estudiar el turismo comunitario en las comunidades de Córrego do Sal y Barrinha, pertenecientes al municipio de Icapuí, con el fin de analizar cómo se desarrolla el turismo comunitario en estas localidades. El turismo presenta diversas tipologías, siendo el turismo comunitario una de ellas. Este se caracteriza por ser desarrollado por los habitantes de una determinada región, con el objetivo de organizar y controlar la productividad local y generar ingresos a través del turismo. En este sentido, el artículo se centra en las prácticas de turismo comunitario en Córrego do Sal y Barrinha, investigando experiencias y dinámicas locales con el apoyo de alianzas como Fundação Brasil Cidadão, Fundação AVINA, Fundação O Boticário y Banco Santander. La metodología aplicada consistió en una revisión bibliográfica, basada en autores como Coriolano, Borges, Maldonado, Mollison, Sancho y Soares, y una investigación de campo mediante un cuestionario semiestructurado aplicado a la comunidad local. Córrego do Sal y Barrinha fueron seleccionados como objeto de estudio debido a su potencial turístico orientado al turismo comunitario. La investigación demostró que, a través de la práctica del turismo comunitario y el fomento de la participación local como actores y emprendedores, la región desarrolló iniciativas como el grupo Mujeres Alimentando Vidas y el grupo Mujeres de Cuerpo y Alga, que contribuyen al crecimiento del turismo comunitario mediante la generación de empleo e ingresos para la comunidad local, además de atraer turistas interesados en vivir este tipo de turismo que promueve el destino, pero también lo preserva. Conocer las prácticas comunitarias aplicadas en estas comunidades resulta relevante para identificar modelos exitosos que puedan ser adaptados y promovidos en otras localidades como una forma de impulsar el desarrollo económico y social local, convirtiendo a los habitantes en los principales impulsores de estas acciones.

1 INTRODUCTION

The object of this article is the communities of Córrego do Sal and Barrinha, located in the municipality of Icapuí, in which we were able to observe how community tourism takes place and experiences resulting from projects, such as the Women Feeding Lives group and the Women of Body and Seaweed group. The communities studied have natural resources and tourist attractions, in which they influence to be recipients of local tourism.

Tourism comprises the activities carried out during free time in the form of leisure, outside its routine. These activities are for the purpose of leisure, work, adventure, among others. Tourism has several typologies and among them we find community tourism, a typology in which it aims at the organization and control of local productivity generated from tourism in a given community, becoming a more egalitarian form of income.

In this sense, community tourism has grown with the objective of strengthening and enhancing tourism experiences in communities, promoting experiences between tourists and communities. Fostering the union and articulation of communities, where residents are involved and motivated to participate in activities, ensuring a form of income generation.

On the coast of Ceará, some communities practice community tourism, such as Córrego do Sal and Barrinha, which are located in the municipality of Icapuí. In which they have natural resources and attractions that influence the quality of local life. Through articulation and union, the communities began to organize themselves and control the local productive activity, based on community tourism.

Córrego do Sal is located near the border of Ceará with Rio Grande do Norte and is known for being a region with an extensive area of salt pans in which it gave rise to its name of Córrego do Sal. In addition to having lush landscapes and enjoying natural resources such as fauna and flora, the community is also linked to agriculture and fishing.

The community of Barrinha is located on Barrinha beach, 5.3 km from the center of Icapuí. The community benefits from Barrinha beach because it has a vast algae bank, with algae cultivation and fishing as a source of income. Through its attractions, the community has become a tourist receiving center, generating employment and increasing local income.

The study focuses on the practices of community tourism carried out in the communities of Córrego do Sal and Barrinha, with the objective of studying how community tourism takes place in these communities. Investigating experiences such as the creation of groups and projects and experiences of communities from local tourism. Also investigating the results of partnerships and foundations that support communities.

In the development of this work we used bibliographic research, making queries on institutional websites regarding the subject addressed, also reading books such as Coriolano, Borges, Maldonado, Mollison, Sancho and Soares. To carry out the study, the methodology used was the qualitative approach where a field research was carried out for three days, in which interviews were made with some residents of the communities, and it was also possible to get to know the communities and the projects developed.

The research analyzes the relationship of communities with community tourism, the exchange of experiences and experiences from the insertion of local tourism. The study shows that some coastal communities began to know and work with tourism in a way that it benefits them, that is, they began to organize and articulate themselves practicing community tourism. The communities of Córrego do Sal and Barrinha resulted in the union and development of projects with the support of the Brazil Citizen Foundation, AVINA Foundation, O Boticário Foundation and Banco Santander.

2 TOURISM

Tourism is a social, economic and cultural activity that involves the displacement of people to certain places, for the purpose of leisure, work, among others. For this displacement to occur, it is necessary for people to have free time.

Tourism has several definitions, one of the most referenced is that of the World Tourism Organization – UNWTO, for Sancho apud UNWTO (2001, p. 38) "tourism comprises the activities that people carry out during their trips and stays in places other than their usual surroundings, for a consecutive period of less than one year, for leisure, business or other purposes".

The UNWTO also mentions that "any displacement outside the place of residence for a period of more than 24 hours and less than 60 days, motivated by non-economic reasons, can be understood as tourism".

This is a broad definition, in which it concretizes the most important characteristics of tourism. Which are: The motivating elements of travel, the period of time and stay, location of the tourist activity as an activity carried out, that is, outside its routine.

Tourism is segmented into several typologies, the most practiced are: Business tourism, adventure tourism, ecotourism, cultural tourism, sports tourism,

community tourism, among others. Each typology meets a different public profile, aiming to satisfy according to their interest and travel motivation.

In this way, the tourist activity moves the local market activity, causing the communities to organize themselves and be part of this tourist movement. And so the communities start to seek the strengthening of the organization as a community base, as economic activities and the growth of community tourism.

2.1 COMMUNITY TOURISM

Community tourism is developed by residents of a given place, where the objective is the organization and control of local productivity and the generation of income through tourism. According to Coriolano (2009, p.282), "Community tourism is that in which communities in an associative way organize local productive arrangements, having effective control of the land and economic activities associated with the exploitation of tourism".

Local productive arrangements are considered territorial agglomerations of economic, political, and social agents. In which it focuses on a specific set of economic activities. Concentrating on micro and small family-based subsistence enterprises producing tertiary activities for the tourism production chain.

Tourism involves a diversity of producers, such as local residents and the public administration, which ends up generating a variety of expectations in relation to its development. With the ability to articulate between them and their interests, it contributes positively to the planning of more responsible tourism in the localities.

For Maldonado (2009, p.31), community tourism:

It is understood as any form of business organization based on the ownership and sustainable self-management of community heritage resources, in accordance with the practices of cooperation and equity in labor and in the distribution of benefits generated by the provision of tourist services. The distinctive characteristic of community tourism is its human and cultural dimension, that is, anthropological, with objective of encouraging dialogue between equals and quality interim meetings with our visitors, in the perspective of knowing and learning from their respective ways of life.

Community tourism promotes the exchange of experiences between communities and tourists, which aims to ensure that the community develops the activity as a way to supplement the income of families. And so tourism can bring benefits and contribute to the consolidation of the local economic base.

This type of tourism stands out for its community organization and income generation, through local tourist attractions, creating a connection and articulation of the communities involved. Residents are involved and actively participate in discussions and activities, ensuring

a more equal distribution of income. And so it can be approached as one that is thought, developed and executed by the communities.

3 METHODOLOGY

The research aims to study the practice of community tourism in the communities of Córrego do Sal and Barrinha. For this it was necessary to research tourism, its typologies and community tourism, which was done through institutional websites, dissertation and books by Coriolano, Maldonado, Borges, Mollison, Sancho and Soares, relevant to the subject addressed. In this way, we used the bibliographic research that, According to Gil (2002), the bibliographic research is developed based on material, already prepared, consisting mainly of books and scientific articles.

To carry out the research on the communities, it was necessary to carry out a field research, where it was possible to go to the communities and conduct interviews with some residents and members of the community projects. We stayed three days in the communities and during the stay we met and interviewed the Women Feeding Lives group and the Women of Body and Seaweed group. In this way, it was possible to learn a little about the work and experiences of these residents in relation to community tourism.

The method of approach used was qualitative, which, according to Richardson (2007), can be characterized as the attempt to have a detailed understanding of the meanings and situational characteristics presented by the interviewees, instead of the production of quantitative measures of characteristics or behaviors. Qualitative research was used to understand and interpret the opinion of the residents, interview them and observe the communities.

4 COMMUNITY TOURISM IN ICAPUÍ

Community tourism is growing more and more on the coast of Ceará, turning coastal communities into tourist receiving centers. Some communities constitute different forms of tourist services, others already have their own way of life.

The tourism developed by the coastal communities of Ceará has been called community tourism because it requires the involvement of all, considers individual and collective rights and duties, and elaborates a participatory planning process, from decision-making to the execution of tourist activities. It is carried out on a human scale. It develops participatory management (...), in addition to taking into account the local culture, the appreciation of cultural heritage, and the desires and needs of the people in the communities. Community tourism is that developed

by the residents of a place who become the articulators and builders of the production chain, where income and profit remain in the community and contribute to improving the quality of life (...) (CORIOLANO, 2003, p. 41).

One of the first community tourism experiences developed in Ceará was in 1998, in the community of Prainha do Canto Verde, in Beberibe with the formation of the Tourism and Handicraft Cooperative of Prainha do Canto Verde (COOPECANTUR). From the tourism model carried out in the community, new tourism experiences were created in the coastal area of Ceará, making other communities experience with small groups to receive visitors.

Among these coastal communities is Icapuí, one of the municipalities in Ceará that practices community tourism. The municipality is located in the extreme east of the coast of Ceará, approximately 200 km from Fortaleza. With a tropical and semi-arid climate and average annual temperatures ranging from 26° to 28° C, the region of Icapuí receives tourists all year round.

The municipality of Icapuí currently has an estimated 19,418 inhabitants according to IBGE (2015). Having a territorial occupation linked to livestock and fishing activity, it stands out for its landscapes, vegetation cover and its diversity from tableland forests, mangroves, dunes, beaches and carnaubais. And through these natural resources, local tourism developed and with the articulation and mobilization of communities, community tourism began.

The municipality of Icapuí has communities such as Ponta Grossa, Tremembé, Redonda, Requenguela, Barrinha and Córrego do Sal, which practice community tourism. Ponta Grossa is one of the communities that is part of the Tucum Network, along with Requenguela and Barrinha, which benefited from the biological sanitary sewage and rainwater harvesting project, with the support of the Petrobras Environmental Program, carried out by the Brazil Citizen Foundation-FBC, which was of great importance for the communities.

And through these programs and the mobilization of communities, Barrinha and Córrego do Sal started to work on community tourism, as a way of generating income and developing local tourism.

4.1 COMMUNITY OF CÓRREGO DO SAL

The community of Córrego do Sal is located approximately 20 km from the center of Icapuí and close to the border of Ceará with Rio Grande do Norte. The origin of the name of the community is due to the fact that the region has a large area of salt pans and a stream where water passes to the present day. Hence the name "Córrego do Sal". According to the Brazil Citizen Foundation (2008), the community has 16 families and approximately 64 inhabitants.

From 1997, the Community Association of Residents was created, which collaborated for the improvement of basic services, the implementation of electricity, construction of the church, school transportation, community water well and garbage collection. Through the interrelationship and local motivation, focusing on the principles of organization, shared management and sustainability, community tourism was developed.

The Women Feeding Lives group was created by the entrepreneurial initiative of the community of Córrego do Sal, having emerged from the understanding and sensitization of the women of the community, who work through the Community Kitchen, which serves tourists and local residents and is located under a cashew tree, being known as an open kitchen according to Francineide (member of the group and resident, 2015), the food is prepared in clay pots and on the wood stove.

The women of the group grow vegetables and vegetables in an organic and sustainable way for local consumption and commerce, giving rise to the community garden. The organic ingredients that come from the community garden are used in the preparation of the food made by the group in order to enhance its flavors. The group also had the support of Banco Santander's Partnerships in Action Program.

Fishing is also one of the practices carried out by the community as a source of economy and local consumption, especially lobster. Lobster fishing began in 1957 in the municipality of Icapuí, generating income for the municipality through export and commercialization.

The place draws attention for its natural beauty, its hospitality and tranquility and also for its diversified gastronomy, with typical dishes of the region such as shellfish stews, shrimp bobó and galinhada. In addition, the community sells vegetables from the community garden and honey from the native Jandaíra stingless bee.

In this way, community tourism begins to expand in Córrego do Sal, through the natural resources of the region, the cultivation of food and fishing. The community begins to offer and enjoy its tourist attractions, strengthening the community organization, generating income and moving local economic activity.

4.2 COMMUNITY OF BARRINHA

Barrinha is one of the communities in Icapuí that practices community tourism. Located 5.3 km from the center of Icapuí, the community is located on Barrinha beach, municipality of Icapuí. Community which is formed by residents who survive from fishing and alginoculture (algae cultivation).

The community is located on Barrinha beach, which has natural resources such as the cultivation of seaweed and the fishing of fish and seafood, which are used for consumption and trade. Barrinha beach has a vast bank of seaweed of the species *Gracilaria* sp, which is of great importance for commercialization because it is used both in cosmetics and for food.

Alginoculture is an activity that generates economic, social and environmental benefits for the community. With alginoculture, the community started to sell seaweed and generate income. Socially, seaweed cultivation contributed to the improvement of family income, with the growth and strengthening of communities through the interaction and union of all.

The algae are cultivated in a sustainable way, where they are planted on ropes in the sea and after fifteen days maintenance is carried out, removing mollusks that end up preventing their growth, after ninety days the harvest is done and the drying process begins. In this way, the community started to use this method in a sustainable way, which benefits both it for being a source of income, and the fauna for the way of cultivation and maintenance of algae, contributing to local development and consequently, the community, because through this cultivation it was possible to recover local biodiversity, avoid predatory collection and the possible extinction of algae, ensuring the activity carried out.

From alginoculture, the "Women of Body and Seaweed" project was created, formed by women from the community, who participate in the cultivation of algae and the extraction process of Agar-agar (hydrocolloid from red algae) which is used in the manufacture of cosmetics such as shampoo, soap and some types of food such as mousses, pancakes and jellies, Agar-agar is also sold in the form of powdered flour.

Figure 1

Algae cultivation on Barrinha beach Source: Brazil Citizen Foundation, 2012

The project was supported by the Brazil Citizen Foundation, which helped in the construction of the laboratory kitchen, where they prepare and produce their products, taught them how to manufacture cosmetics and food with higher quality and recyclable packaging. The group also had the support of the O Boticário Foundation and the AVINA Foundation, which invested in training, awareness about sustainable exploration and cultivation, notions in permaculture and bioconstruction, also providing equipment.

Permaculture is a system that promotes the integration of animals and plants with human beings. According to Molisson, permaculture is: "Consciously designed landscapes that reproduce patterns and relationships found in nature and that, at the same time, produce food, fiber and energy in abundance and sufficient to provide for local needs."

Bioconstruction is an important element for permaculture, as it seeks integration between buildings and their environment. It seeks to plan and execute using available resources with less impact and ecologically, and can also be called self-construction techniques.

The concept of bioconstruction for Soares (1998):

It encompasses several techniques of world vernacular architecture, some of them with hundreds of years of history and experience, characterized by the preference for local materials, such as earth, reducing expenses with manufacturing and transportation and building low-cost housing that offers excellent thermal comfort.

In this way, the group of women who are part of the project began to be trained and instructed to develop the project in a sustainable way and with quality products, also taking advantage of the algae extract that is discarded during the manufacturing process of the products, for the manufacture of biofertilizers (algae-based fertilizers) and biodiesel.

5 FINAL CONSIDERATIONS

The purpose of this work was to present how community tourism is developed in Córrego do Sal and Barrinha, which are communities in the municipality of Icapuí. During the work we approached tourism and community tourism to understand a little about the subject and then understand community tourism in Icapuí. Based on community tourism we realized that the communities began to organize themselves and learn new ways of working with community tourism, such as working tourism in a sustainable way, improving the working methods used by the residents conserving the local biodiversity.

In this sense, the community of Córrego do Sal presented improvements through the collaboration of the Community Association of Residents, such as the implementation of electricity and basic infrastructure services, making tourism in the region and economic growth

possible. The group of women in the community presented improvements and motivation from the support and encouragement of the community and the Brazil Citizen Foundation.

The community of Barrinha has natural resources that favor the practice of community tourism. We observed that the community lives from fishing and alginoculture, practiced in a sustainable way to maintain biodiversity and guarantee local income. The "Women of Body and Seaweed" project showed the determination of women in alginoculture, valuing the resources that the community offers and moving local activity.

The communities presented were chosen because they have a tourist potential focused on community tourism, aiming at the growth and recognition of the communities. They are coastal communities that enjoy the natural attractions and preserve the ecosystem, ensuring an improvement in the quality of life. The sustainable way of working brought a great result to the community of Barrinha, as the sustainable cultivation of algae meant that the algae bank did not reach a possible extinction.

In short, community tourism has allowed communities to show their identity without losing their origins and culture. In addition to favoring the growth of local tourist activity, in which it has aroused the interest of partnerships and foundations

encouraging the creation of projects and work in a sustainable way. Therefore, community tourism has promoted a differentiated tourist activity, in which both communities and tourists can enjoy the resources offered.

ABSTRACT

The growing integration between digital technologies and renewable energy sources has redefined how energy consumption is organized in residential environments, especially in the context of sustainable housing. The present study aims to analyze how intelligent architectures based on artificial intelligence can optimize the management and storage of renewable energy in sustainable housing, aiming at greater energy efficiency and residential autonomy. Regarding the research design, a qualitative approach was adopted, guided by the interpretative analysis

of data from multiple sources. This methodological choice allows for examining the investigated phenomenon in greater detail, considering not only the data itself but also the contexts in which they are embedded and the meanings associated with the analyzed technologies. By articulating theoretical and documentary information, it becomes possible to develop a consistent analysis capable of integrating different perspectives and expanding the understanding of the topic in a more comprehensive and contextualized manner. In summary, the research demonstrated that the integration of intelligent architectures, artificial intelligence, and energy storage systems contributes to the development of more efficient and autonomous housing by enabling more precise and adaptive energy management. The articulation of these technologies promotes the rational use of renewable sources and fosters greater balance in residential energy consumption, consolidating a housing model aligned with current demands for efficiency and sustainability.

Keywords: Intelligent Architectures. Artificial Intelligence. Renewable Energy. Energy Efficiency.

RESUMO

A crescente integração entre tecnologias digitais e fontes de energia renovável tem redefinido o modo como o consumo energético é organizado em ambientes residenciais, especialmente no contexto das habitações sustentáveis. O presente estudo tem como objetivo geral analisar como arquiteturas inteligentes baseadas em inteligência artificial podem otimizar a gestão e o armazenamento de energia renovável em habitações sustentáveis, visando maior eficiência energética e autonomia residencial. No que se refere à condução da pesquisa, adotou-se uma abordagem qualitativa, orientada pela análise interpretativa de dados provenientes de múltiplas fontes. Essa escolha metodológica permite examinar o fenômeno investigado com maior nível de detalhe, considerando não apenas os dados em si, mas também os contextos em que estão inseridos e os significados associados às tecnologias analisadas. Ao articular informações de natureza teórica e documental, torna-se possível desenvolver uma análise consistente, capaz de integrar diferentes perspectivas e ampliar a compreensão do tema de forma mais abrangente e contextualizada. Em síntese, a pesquisa demonstrou que a integração entre arquiteturas inteligentes, inteligência artificial e sistemas de armazenamento de energia contribui para a construção de habitações mais eficientes e autônomas, ao permitir uma gestão energética mais precisa e adaptativa. A articulação entre essas tecnologias favorece o uso racional de fontes renováveis e promove maior equilíbrio no consumo energético residencial, consolidando um modelo de habitação alinhado às demandas atuais por eficiência e sustentabilidade.

Palavras-chave: Arquiteturas Inteligentes. Inteligência Artificial. Energia Renovável. Eficiência Energética.

RESUMEN

La creciente integración entre tecnologías digitales y fuentes de energía renovable ha redefinido la forma en que se organiza el consumo energético en entornos residenciales, especialmente en el contexto de viviendas sostenibles. El presente estudio tiene como objetivo analizar cómo las arquitecturas inteligentes basadas en inteligencia artificial pueden optimizar la gestión y el almacenamiento de energía renovable en viviendas sostenibles, con el fin de lograr una mayor eficiencia energética y autonomía residencial. En cuanto al desarrollo de la investigación, se adoptó un enfoque cualitativo, orientado por el análisis interpretativo de datos provenientes de múltiples fuentes. Esta elección metodológica permite examinar el fenómeno investigado con mayor nivel de detalle, considerando no solo los datos en sí, sino también los contextos en los que se insertan y los significados asociados a las tecnologías analizadas. Al

articular información de carácter teórico y documental, se posibilita desarrollar un análisis consistente, capaz de integrar diferentes perspectivas y ampliar la comprensión del tema de manera más amplia y contextualizada. En síntesis, la investigación demostró que la integración entre arquitecturas inteligentes, inteligencia artificial y sistemas de almacenamiento de energía contribuye a la construcción de viviendas más eficientes y autónomas, al permitir una gestión energética más precisa y adaptativa. La articulación de estas tecnologías favorece el uso racional de fuentes renovables y promueve un mayor equilibrio en el consumo energético residencial, consolidando un modelo de vivienda alineado con las demandas actuales de eficiencia y sostenibilidad.

1 INTRODUCTION

The integration and adoption of digital technologies in the electricity sector are promoting profound transformations in the way energy is generated, distributed, and consumed. This revolution stands out especially among homes that seek to be sustainable and environmentally friendly. Technological innovations have not only transformed production, but also the way energy is delivered to consumers and how they use it in their homes. In this scenario, the combination of renewable energy sources, cutting-edge automation systems, and data analysis tools has been essential to develop residential models that are much more efficient. These domestic consumption models allow for a constant and dynamic visualization and adjustment of energy consumption, which enables a more efficient management of available energy resources. This interaction that we are witnessing today is a clear reflection of the growing convergence between technological innovation and sustainability, which, in turn, is closely linked to the incessant search for solutions that minimize harmful effects on the environment. In addition, this guideline also covers energy autonomy, highlighting the urgency of developing alternatives that not only reduce environmental impact, but also increase independence from traditional energy sources. Therefore, it is clear that there is a strong connection between these areas, which are becoming more complementary than ever in today's world.

At the same time, the incessant advancement of artificial intelligence has significantly expanded the possibilities of energy management in residential environments, allowing intelligent systems to be able to analyze and understand energy consumption patterns, predict future demands, and adjust in real time efficiently and effectively. This enables a more efficient and sustainable management of available energy resources. Connected to innovations in energy storage, this strategy enables a more balanced and efficient use of renewable sources, especially because they are intermittent and change throughout the day and year. Thus, it seeks to maximize the use of these sustainable sources, taking into account the conditions and characteristics that can influence their generation. In this way, architectures that fit the definition of smart start to play an important role in the organization of energy flows, contributing decisively to greater efficiency and stability of energy consumption in the residential context.

In view of the panorama exposed above, this work proposes, as a general objective, to analyze how smart architectures based on artificial intelligence can optimize the management and storage of renewable energy in sustainable housing, aiming at greater energy efficiency and home autonomy. The specific objectives are as follows: Understand the fundamentals of smart architectures applied to sustainable housing using renewable energy; Analyze the role of artificial intelligence in managing consumption and optimizing the use of renewable energy in

homes; Evaluate renewable energy storage technologies and strategies in smart homes and their impacts on energy efficiency.

As for how to conduct the research, the present study uses a qualitative approach methodology, which is guided by the analytical interpretation of data obtained from several different sources. This approach provides a more detailed and deeper understanding of the phenomenon in question, allowing a broader interpretation of the data collected. This specific approach allows for a more detailed examination of the research object, considering not only the relationships it establishes, but also the contexts and meanings associated with the various technologies under study. Thus, it is possible to achieve a deeper and broader understanding of the topic under discussion. It is possible to elaborate a consistent analysis by gathering theoretical and documentary information, which allows for the articulation of different perspectives on the topic in question. This perspective adds to the understanding of the subject, allowing for a more detailed and complete conversation.

Finally, this study was organized into four sections, so that the topic can be presented in a clear and coherent way. The introduction, which clearly and objectively brings both the contextualization of the topic in question and the objectives that guide the development of this study, is in the first section of the document. Next, the section that deals with the methodology clarifies in detail the various procedures that were adopted and applied during the execution of the research. The third part of the work, which is intended for the theoretical foundation, deals with and discusses the most important concepts, as well as the various approaches that are closely connected to the topic in question. This section is vital for a deeper understanding of the main arguments that support the discussion. Finally, the final considerations serve to clearly and directly summarize the results obtained throughout the research and to indicate possibilities and potential trajectories for future investigations to be carried out, thus contributing to the advancement of the field of study in question.

2 METHODOLOGY

The increased use of smart architectures in homes that value sustainability, especially with regard to artificial intelligence aimed at the management and storage of renewable energy, reflects a profound and continuous change in the design and operation of the energy systems that power homes. This change is not only a technological step, but also a new way of seeking more conscious and efficient energy consumption in homes. It is precisely in this aspect that it becomes even more crucial, especially in the current context, where there is an urgent need to increase energy efficiency and reduce dependence on conventional energy sources. In addition,

this strategy also facilitates the increase of autonomy in relation to energy consumption in homes. In view of this, investigating the relationship between digital technologies, storage systems, and renewable energy sources enables a deeper and more organized understanding of the various paths that are being adopted for homes to become more adaptable and energetically balanced. Therefore, it is possible to see how these interactions favor a more sustainable development of the environments in which we live.

Therefore, the methodology that was selected and is being applied in this context is classified as qualitative. This is because this type of approach focuses especially on the interpretation and detailed analysis of data that are collected from various theoretical and documentary sources. This approach seeks to understand, in depth, the particularities and subtleties of the data, enabling a richer and more detailed perspective on the object of analysis. Pereira et al. (2018) state that, when it comes to phenomena that have greater complexity, qualitative research is more effective for understanding, as it considers not only the meanings, but also the relationships and contexts in which these phenomena are inserted. This allows for more detailed analyses adapted to the particularities of each case. In addition, Sousa and Santos (2020) highlight that the approach presented is very favorable to the construction of scientific knowledge, as it allows the exploration of multiple dimensions of the phenomena under analysis. This is particularly pertinent in investigations that address technological innovation and the intricate dynamics of energy.

In order for this study to be carried out and move forward, two research methods were used, which are bibliographic review and documentary research. The first, bibliographic review, is a thorough research of the existing literature on the subject; the second, documentary research, refers to the collection and analysis of documents that are pertinent and relevant to the subject in question. Thus, these procedures proved to be essential to support and improve the work carried out. The bibliographic review is fundamental for the organization and systematization of knowledge already produced scientifically, allowing the identification of a variety of concepts, theoretical models, and approaches that have been consolidated and debated in the specialized literature. In this way, it becomes an indispensable resource to understand the state of the art in a specific area of knowledge. As stated by Pereira et al. (2018), this type of survey is essential for the construction of a consistent and coherent theoretical base, as it brings together and carefully analyzes various contributions from different research and studies on the subject. The literature review found in the work presented here was meticulously elaborated, based on the extensive analysis of a variety of sources, which include not only theses and monographs, but also scientific articles that have been published in academic

events, as well as those published in journals dedicated to scientific research. Books that deal with the subject in a specialized way were also taken into account.

Desk research is crucial to help evaluate information from institutional and technical sources, which reveal practical applications and valuable guidance for the energy sector. Therefore, this focus enables a deeper understanding of the rules that govern this essential segment of the economy. Pereira and Oliveira (2024) emphasize the relevance of this procedure, as it allows the examination of documents that record practices, policies, and technological solutions. This analysis also significantly expands the understanding of the object of study. Therefore, several documents that were made available by various companies and organizations in the sector were analyzed, such as BYD Company Limited, in relation to the year 2024, in addition to Contemporary Amperex Technology Co. These documents were indispensable for the analysis that was proposed. Limited produced, in 2024, documents and reports that, like those of the International Energy Agency, published in 2023, and those of the Tesla company, also from 2024, as well as Reddy's work, which is scheduled for publication in 2025, offer important information and guidelines on the various types of energy storage systems and their numerous practical applications in the contemporary world.

The joint adoption of the literature review and documentary research proved to be adequate to the purpose of the investigation, as it allowed the articulation of theoretical foundations with practical evidence from the energy sector. The articulation between these two research procedures proved to be decisive for a broader understanding of the complexities and particularities of this field of research, allowing the construction of knowledge that encompasses both established concepts and observable realities. The method used here was what is usually called mixed research, which in this case allowed for a more consistent and integrated analysis of the subject, because it combined academic reflection, which provides the theoretical basis, with data and information from real situations and contexts of practical application. This union between theory and practice is essential for a deeper understanding of the topic in question. With this, it became possible to develop a much broader understanding of the application of artificial intelligence and storage systems in the context of sustainable homes. This gave a superior rigor and coherence to the research carried out.

3 THEORETICAL FOUNDATION

The theoretical foundation was structured in order to contemplate, in an articulated way, the main axes that support the analysis proposed in this research. To this end, it was organized into three complementary topics, which dialogue with each other and allow a progressive

understanding of the investigated phenomenon. The first topic, 3.1 Smart architectures and integration of renewable energies in residential environments, addresses the technological foundations and integration models between digital systems and renewable sources. Next, topic 3.2 Artificial intelligence applied to residential energy management examines the role of algorithms in monitoring, predicting and adjusting energy consumption in real time. Finally, topic 3.3 Energy storage systems and efficiency in sustainable housing discusses storage technologies and their implications for energy autonomy and stability. This organization favors a chained approach, in which concepts are presented progressively, allowing greater coherence in the analysis of the object of study.

3.1 SMART ARCHITECTURES AND INTEGRATION OF RENEWABLE ENERGIES IN RESIDENTIAL ENVIRONMENTS

The interconnection between digital technologies, distributed energy systems, and home automation is what distinguishes the debate on smart architectures aimed at sustainable homes. From this point on, the integration of renewable sources, notably photovoltaic systems, is managed by computational platforms that supervise, examine, and adjust energy consumption in real time. As Silva and Dias (2025) point out, the incorporation of web technologies in energy management amplifies control and enables the development of more effective models, since it favors continuous communication between devices, users, and management systems.

The literature indicates that energy management systems in smart homes have evolved from autonomous systems to user-oriented systems, in which artificial intelligence is essential for the automation of deliberations. As reported by Wang et al. (2021), such systems are developed to apprehend consumption patterns, anticipate demands, and adjust energy use based on environmental and behavioral variables. Such a strategy benefits management that adjusts more efficiently to the concrete demands of residents, reducing waste and optimizing the overall energy performance of the building.

The incorporation of Internet of Things (IoT) devices in homes has enabled the formation of smart energy centers, in which multiple sources and storage systems operate in coordination. According to El-Afifi et al. (2024), such hubs work with sensory devices, algorithms, and digital platforms to optimize, in real time, energy flows, always aiming at a balance between generation, consumption, and storage. As Yun, Nam, and Baek (2018) indicate, integrated automation also favors increased autonomy in relation to energy, as it enables agile responses to changes in the availability of renewable sources.

In this sense, Table 1 is presented, which systematizes the main components and models of technological integration in intelligent architectures aimed at sustainable housing.

Table 1

Components and integration models in smart architectures for sustainable housing

Element	Description	Role in energy management
Smart sensors	Devices that monitor variables such as temperature, luminosity, and consumption	Real-time data collection to support decision-making
Internet of Things (IoT)	Network of connected devices that communicate with each other	Integration and automation of residential systems
Photovoltaic systems	Solar panels for electricity generation	Renewable energy production at home
Storage Systems	Batteries and energy storage technologies	Storage of surpluses for later use
Artificial Intelligence	Data learning and analysis algorithms	Consumption optimization and demand forecasting
Smart energy hubs	Integrative platforms from multiple sources and devices	Coordination of energy flows
Home Automation Systems	Automated Equipment Control Technologies	Dynamic adjustment of energy consumption

Source: Adapted from Silva and Dias (2025); El-Afifi et al. (2024); Wang et al. (2021); Yun, Nam and Baek (2018).

The buildings mentioned are completely aligned with the principles of bioclimatic design, which uses the climatic and environmental characteristics of the site to increase the energy efficiency of buildings. Thus, it seeks to promote a more conscious and rational use of available natural resources, in favor of a more sustainable construction that respects the environment. According to Oliveira et al. (2021), there are a number of strategies that can be employed to reduce the need for energy consumption in buildings. Among these strategies are natural ventilation, which ensures air circulation; solar orientation, which makes the most of sunlight during the day; and the choice of suitable materials, which are selected according to their thermal properties and energy efficiency. Technology reduces the demand for energy and works together with intelligent systems that work in harmony to maximize energy efficiency. In this way, the link between passive solutions and automatic systems significantly increases the efficiency of sustainable homes, promoting a harmonious integration between what is constructive and what is technological, in a synergistic and cohesive way.

Thus, the idealization of the so-called house of the future needs to be seen in an integrated way, aligning innovation, sustainability, and quality of life. It is, therefore, essential that these three aspects are intertwined in a synergistic way in the planning and implementation of housing developments that aim not only at well-being, but also at sustainability and innovation. According to Vassão et al. (2024), digital technology in the construction industry

profoundly transforms the way internal spaces of homes are planned, structured, and experienced by their inhabitants. This concept brings homes that, in addition to adaptability, take particular care with the rhythms and needs of their residents, creating a housing experience that connects all the time to technology. In this way, the so-called smart architectures have been designed to integrate energy efficiency, home automation, and effective management of the resources consumed, creating a new housing standard that better adapts to current requirements. This type of planning aims not only to save energy, but also to create a more sustainable and efficient space for its residents, in line with the needs and challenges of contemporary life.

3.2 ARTIFICIAL INTELLIGENCE APPLIED TO RESIDENTIAL ENERGY MANAGEMENT

The adoption of artificial intelligence in household energy management has proven to be an efficient approach to monitoring and regulating energy use in homes. In Brazil, Sousa and Soares (2025) indicate that the use of intelligent systems provides a more effective management of the energy matrix, by integrating real-time data and simplifying automated decision-making. This is a paradigm shift, moving from a reactive approach to predictive management, in which consumption is monitored in real time and adjusted to the conditions of use, as well as the availability of energy resources.

In this context, machine learning algorithms play a significant role in making it possible to identify consumption patterns and predict future energy needs. As Costa (2024) points out, artificial intelligence, when incorporated into electrical systems, provides more effective management, allowing the anticipation of demand peaks and the redistribution of loads more efficiently. Such aptitude in sustainable homes provides a more effective use of renewable sources, especially when combined with storage systems that require meticulous planning to improve their performance.

The integration of artificial intelligence with Internet of Things devices amplifies the possibilities of energy management in an automated way. As Ulla et al. (2025) point out, alternatives based on Green IoT employ intelligent algorithms to coordinate appliances in a home, promoting energy savings and offering more efficient control over consumption. Similarly, Nikpour et al. (2024) indicate that systems based on the Internet of Things, combined with advanced analytical methodologies, are capable of managing the complexity of systems, adjusting the flow of energy according to several variables. As Santos and Tateoki (2024) point out, such applications enable optimized consumption in real time, harmonizing operational efficiency with sustainability. In view of these contributions, Table 2 is presented, which

organizes the main mechanisms of action of artificial intelligence in residential energy management.

Table 2

Applications of artificial intelligence in the management of residential energy consumption

Application	Description	Impact on energy management
Real-time monitoring	Continuous collection of consumption data through sensors and meters	Increased visibility and control of energy use
Demand forecasting	Use of algorithms to anticipate consumption patterns	Efficient planning of energy use and storage
Optimisation of consumption	Automatic adjustment of the operation of home devices	Reduction of waste and better energy use
IoT integration	Communication between networked devices	Intelligent coordination of residential systems
Machine learning	Historical data analysis for continuous improvement	Adaptation of the system to the users' routines
Renewable energy management	Control of the use of sources such as solar and wind	More efficient use of available sources
Smart Home Automation	Automated control of equipment and systems	Rapid responses to consumption variations

Source: Adapted from Sousa and Soares (2025); Costa (2024); Ulla et al. (2025); Nikpour et al. (2024); Santos and Tateoki (2024).

The integration and consolidation of these various technological applications clearly shows a considerable transformation in the way energy is administered and managed within the residential environment. This change reflects a new approach, making evident the evolution of the methods used for the control and efficient use of energy in homes. Artificial intelligence technology offers the ability not only to observe and monitor accurately, but also to interpret and analyze data constantly over time. This results in automatic adjustments that are implemented in the systems, making it possible to reduce waste and, at the same time, promoting a significant improvement in the overall performance of energy-oriented systems. This procedure plays a significant role in the creation of homes that are more autonomous, in which the management of resource consumption is carried out in an integrated manner, in addition to being in accordance with the real conditions of use. In this way, a new housing standard is promoted that prioritizes efficiency and adaptation to the daily lives of its users (Sousa; Soares, 2025).

In summary, the use of artificial intelligence in energy management in homes indicates significant progress in the search for greater efficiency, as well as a more rational and conscious approach to energy consumption. This innovation has shown promise, as it enables the optimization of energy use, minimizing waste and contributing to more sustainable and responsible consumption. Through the efficient combination of monitoring, forecasting, and

automation, these technological innovations provide support that enables a more equitable and harmonious use of renewable energy sources. This support is essential, as it contributes to strengthening the energy autonomy of homes, thus ensuring greater independence with regard to energy consumption. In this scenario, the convergence between intelligent algorithms and technological infrastructure redefines the dynamics of residential consumption, establishing more solid foundations for sustainability in the energy sector (Costa, 2024).

3.3 ENERGY STORAGE SYSTEMS AND EFFICIENCY IN SUSTAINABLE HOUSING

Energy storage systems occupy a central position in the consolidation of sustainable housing, especially when integrated with intermittent renewable sources. Vian et al. (2021) explain that these technologies allow balancing the relationship between generation and consumption, by storing energy surpluses for later use. This mechanism reduces dependence on the conventional electricity grid and contributes to greater stability in energy supply in residential environments.

In the context of distribution networks with high penetration of renewable sources, Almeida (2024) observes that the performance of storage systems is directly associated with the ability to respond to variations in energy generation. In smart homes, this characteristic translates into the possibility of maintaining adequate levels of supply even in periods of low generation, such as on cloudy days in the case of solar energy. Thus, storage acts as an element of energy compensation and balance.

The efficient allocation of these systems is also a relevant factor for the overall performance of networks and consumer units. Morais Filho (2020) highlights that the strategic insertion of storage devices in distribution networks allows for improved operational indicators and reduced losses. On a residential scale, this logic applies to the integration between batteries and distributed generation systems, favoring the more efficient use of locally produced energy.

In addition, storage systems play an important role in supporting the energy transition and sustainability. Ramos et al. (2026) argue that these technologies make it possible to expand the use of clean sources by mitigating problems associated with intermittency. In sustainable housing, this function is reflected in the expansion of energy autonomy, since the user becomes less dependent on external sources and can better manage their consumption.

In the technological field, different solutions have been developed by companies specializing in the sector. BYD Company Limited (2024) presents high-capacity battery-based storage systems, aimed at both residential and commercial applications. These solutions seek

to meet the demand for reliability and efficiency by integrating with photovoltaic systems and energy management platforms.

Similarly, Contemporary Amperex Technology Co. Limited (CATL) (2024) invests in the development of advanced storage technologies, with a focus on durability and operational safety. These systems are designed to operate in an integrated manner with smart grids, allowing greater flexibility in energy management and contributing to the balance between supply and demand in connected environments.

The International Energy Agency (2023) points out that the advancement of storage technologies has driven the adoption of more sustainable energy solutions on a global scale. According to the agency, storage plays a strategic role in the integration of renewable energies, by enabling greater control over generation variability. This scenario reinforces the importance of these technologies in the context of smart homes.

In the residential applications segment, Tesla (2024) develops storage systems aimed at integration with solar generation, allowing users to store energy for use at times of greater demand. These solutions contribute to the stability of the home system and expand the ability to manage energy consumption, aligning technology and sustainability.

Finally, the energy storage systems company, Reddy (2025), emphasizes that such systems face challenges related to costs, efficiency, and scalability, but continue to advance as part of the energy transition process. In sustainable housing, the adoption of these technologies represents a consistent strategy to improve energy efficiency and ensure greater autonomy, consolidating a more balanced consumption model adapted to contemporary demands.

4 FINAL CONSIDERATIONS

The focus of smart architectures applied to sustainable housing, especially with regard to the use of artificial intelligence in the management and storage of renewable energies, is within a context of significant technological and energy changes. These innovations have offered a new vision of how energy is produced, distributed, and consumed in the home, allowing a major transformation in the way energy is consumed and managed in the residential sector. The constant and growing integration between the various digital systems, along with the use of renewable sources and the adoption of solutions for energy storage, has been crucial for the creation of housing models that are more efficient and sustainable. In these new housing formats, automation is essential, because, combined with detailed data analysis, it allows for much more precise and conscious control over energy consumption habits. This also ensures

a more efficient use of available energy resources, improving the management of energy consumption in each home.

Throughout the research, it was possible to verify that the overall objective was successfully achieved. It was possible to make an in-depth study of how smart architectures, based on artificial intelligence principles, can optimize the management and storage of renewable energy in sustainable homes. In addition to increasing energy efficiency, this optimization also plays a crucial role in increasing autonomy in residential contexts. Similarly, the specific objectives that were proposed were achieved satisfactorily, as an understanding was obtained about the essential concepts that guide smart architectures, which aim to implement sustainable housing with the use of renewable energies. An in-depth analysis of the relevance and role of artificial intelligence in supervising energy consumption and optimizing energy use in contemporary homes was also carried out. A detailed evaluation of the various technologies available was carried out, along with the strategies for the storage of renewable energy in smart homes, considering how these innovations affect energy efficiency in general.

Regarding the topic discussed in item 3.1, which focuses on smart architectures and the integration of renewable energy sources in the domestic environment, the research revealed that the interaction between interconnected devices, photovoltaic solar energy generation systems and energy management platforms enables the formation of environments that dynamically adjust to variations in energy consumption and generation. It was observed that these architectures favor the automation of various processes and increase the capacity for real-time monitoring of operations, culminating in energy management that adapts more efficiently to the operational requirements of the residential system. This adaptability is essential to improve energy consumption and efficiency, as it enables more detailed control and a quick reaction to any changes in day-to-day activities at home.

With regard to sub-item 3.2, which addresses artificial intelligence in the management of energy consumption in homes, it was noted that artificial intelligence algorithms play a crucial role, as they are essential for forecasting energy demand and effectively help in identifying consumption patterns. In addition, these algorithms are essential for automating decision-making, enabling more efficient and intelligent management of energy consumption in homes. The research pointed out that these systems are capable of constantly changing the way energy is used, resulting in more efficient consumption. In addition, this strategy minimizes the losses often associated with improper use of available energy resources. This effect is especially notable when these systems are combined with interconnected devices and home automation systems, as this integration further enhances their effectiveness and the benefits they provide.

In the midst of the analysis of topic 3.3, which deals with energy storage systems and efficiency in sustainable housing, it was observed that the addition of batteries to hybrid systems is crucial to ensure a more stable energy supply. In addition, these systems are essential to considerably increase the autonomy of homes, allowing them to operate more independently and sustainably. Energy storage has proven to be a very significant and efficient solution to face the intermittency of renewable energy sources. This is because this technology allows the energy that has been accumulated in times of low demand to be released when demand increases or when generation is not sufficient. In this way, this practice leads to a notable increase in the balance between the energy available and that which is consumed.

For future research, it is suggested that empirical investigations be conducted to examine in more detail the practical implementation of these technologies in different types of homes. In this sense, it is essential to take into account relevant variables such as the cost, the accessibility of the technologies to the general public, and the performance that these technologies will show during prolonged use. With this, it is intended to achieve results that can enrich the understanding of the effect of these innovations in various home contexts. It is equally pertinent and appropriate to carefully examine how artificial intelligence relates to innovations in data storage systems. Nor can we ignore the regulatory effects and social consequences that may arise from the large-scale adoption of these technologies. This examination would enable a deeper understanding of the feasibility and use of these tools in the current energy scenario.

ABSTRACT

This article addresses the migratory and humanitarian crisis in Venezuela, focusing on the analysis of the economic and social roots of this complex phenomenon. To comprehensively understand and approach the crisis, the Failure Mode and Effects Analysis (FMEA) and Event Tree Analysis (ETA) methodologies were applied, with results compared to those generated by two Artificial Intelligences (AI): Google Bard and ChatGPT. Additionally, the study employed a robust multiple regression econometric model to investigate the impact of socioeconomic variables on Venezuelan net migration from 1998 to 2022. The findings revealed that factors such as inflation, gross debt, oil production, and mortality rate played significant roles in the observed mass migration. These conclusions are essential for understanding the underlying economic dynamics of the crisis and may contribute to the development of more effective and sustainable policies to address it.

Keywords: Migration. Venezuela. Inflation. Artificial Intelligence. FMEA.

RESUMO

Este artigo aborda a crise migratória e humanitária na Venezuela, com foco na análise das raízes econômicas e sociais desse fenômeno complexo. Para entender e abordar a crise de maneira abrangente, foram aplicadas a Análise de Modo e Efeito de Falha (FMEA) e a Análise de Árvore de Eventos (ETA), com resultados comparáveis ao de duas Inteligências Artificiais (IA), o Google Bard e o Chat GPT. Adicionalmente, o artigo empregou um modelo econométrico de regressão múltipla robusto para investigar o impacto das variáveis socioeconômicas na migração líquida venezuelana ao longo do período de 1998 a 2022. Os resultados revelaram

RESUMEN

Este artículo aborda la crisis migratoria y humanitaria en Venezuela, con foco en el análisis de las raíces económicas y sociales de este fenómeno complejo. Para comprender y abordar la crisis de manera integral, se aplicaron el Análisis de Modo y Efecto de Falla (FMEA) y el Análisis de Árbol de Eventos (ETA), con resultados comparables a los de dos inteligencias artificiales (IA), Google Bard y ChatGPT. Además, el artículo empleó un modelo econométrico robusto de regresión múltiple para investigar el impacto de variables socioeconómicas en la migración neta venezolana en el período de 1998 a 2022. Los resultados revelaron que factores como la inflación, la deuda bruta, la producción petrolera y la tasa de mortalidad desempeñaron papeles significativos en la migración masiva observada. Estas conclusiones son esenciales para entender las dinámicas económicas subyacentes a la crisis y pueden contribuir al desarrollo de políticas más eficaces y sostenibles para enfrentarla.

Palabras clave: Migración. Venezuela. Inflación. Inteligencia Artificial. FMEA.

1 INTRODUCTION

Historical accounts indicate that Venezuela's oil industry took off in the 1920s, after landmark discoveries, spurring investment in infrastructure and public services (Roy & Cheatham, 2024). Venezuela holds the world's largest proven fossil fuel reserves, according to OPEC's Annual Statistical Bulletin, the country held about 303.6 billion barrels of proved crude reserves at end-2020 (OPEC, 2021). Oil exports have been the main source of income for decades, and both production and prices have had a decisive impact on the nation's economy, directly influencing national income and the government's capacity to provide basic public services, as discussed by Kleszczyńska (2020).

Venezuela's export earnings have historically been overwhelmingly oil-dependent, with oil accounting for well over 90% of merchandise exports in many periods (Roy & Cheatham, 2024). The present study indicates that the main factors leading to the crisis began in 2014, when the price of oil dropped sharply in the international market from around US\$100 to less than US\$40 by the end of 2015, as reported by the U.S. Energy Information Administration (EIA, 2016). Crespo and Zambrano (2018) explain that this price shock had a strong impact on the Venezuelan economy, reducing government revenues and compromising the budget for social programs that benefited a large share of the population. The outcome was a deep recession, reflected in the fall of GDP, hyperinflation, shortages of food and medicine, rising poverty and violence, and declining oil production. Vera (2015) analyzes macro-policy and oil governance over 1999–2014, highlighting institutional and policy vulnerabilities that predated and later amplified the downturn.

According to Tapia et al. (2022), the Venezuelan economy began to experience one of the sharpest declines ever recorded in peacetime, marking a serious humanitarian crisis. This process of deterioration has advanced rapidly, leading the country into political, economic, and social collapse, as observed by Venezuelan and Ausman (2019). In this context, millions of Venezuelans decided to leave the country in search of better living conditions. More than 7.1 million people emigrated from Venezuela between the years 2015 and 2023 (R4V, 2023).

This research project aims to conduct a detailed analysis of the systemic crisis currently affecting Venezuela and its economic impacts, which distort national institutions and lead to serious social issues such as extreme poverty, poor sanitary conditions, and a rapid increase in violence. The central hypothesis of this study is that the combined effects of these factors create a situation of extreme vulnerability for most Venezuelans. In conditions of severe poverty, individuals struggle to access food, healthcare, education, and economic opportunities, which drives them to migrate in search of better living standards.

Based on the principle of economic rationality proposed by Varian (1978), rational individuals are understood to make decisions after carefully evaluating the costs and benefits of their choices. In the context of migration, these individuals compare the opportunities available in their home country with those elsewhere. When external options offer better living conditions, migration becomes a rational decision, as pointed out by Stahl (1983). Addressing the economic principles relevant to migration decisions and based on the literature review, contextualizing the current Venezuelan scenario will serve as the starting point for building a qualitative strand. This approach is intended to justify the research direction, given that the object of study concerns the largest population exodus in Latin American history and one of the major humanitarian crises of the twenty-first century, comparable only to the poorest countries of Sub-Saharan Africa and to Middle Eastern countries in armed conflict such as Syria, Yemen, and Sudan. Mu and Hu (2018) examined the efficiency and stability of the Venezuelan economy and argued that three factors heightened uncertainty about the country: (1) an extreme dependence on the oil industry as the sole wealth-generating sector; (2) an inefficient regulatory system; and (3) slow and unresponsive reactions to external changes.

In selecting a model, the principle of parsimony will be followed, seeking the smallest number of parameters that adequately represent the time series. This principle, attributed to Burnham and Anderson (2002) is commonly interpreted as simpler models fit comparably well against overspecified models. Building a robust model to forecast Venezuela's net population flows will therefore require calibration to obtain the best estimates of known parameters. Complex phenomena demand sophisticated analysis grounded in solid evidence while also adhering to caution and moderation in the use of data and tools; this is not a trivial task. Nevertheless, given the social and humanitarian relevance of the topic, and considering that the databases come from official sources and are open source, this article aims to construct an econometric regression model in Python and compare its outputs with the results obtained by data processing using Artificial Intelligences (AI) such as Google Bard and ChatGPT-4, whose codebases operate as black boxes, both supported by GitHub Copilot.

Constructing a robust multiple regression econometric model with covariates selected from the academic literature and implemented in Python to process data for the period 1998–2022 can simultaneously satisfy two risk analysis and mitigation frameworks: Failure Mode and Effects Analysis (FMEA) and Event Tree Analysis (ETA), as discussed by the International Organization for Standardization (ISO, 2019). This approach can provide the model with sufficient computational capability to handle cutting-edge data when compared with current standards, given that AIs are an advanced tool when synchronized with a copilot, that can

access the internet, perform keyword- and topic-based searches, analyze databases, and optimize outputs while formulating responses.

This study is organized as follows, in addition to this Introduction. Section 2 presents a literature review on the determinants of migration within Venezuela's oil-dependent economy. Section 3 details the empirical methodology used for specifying the econometric model. Section 4 reports the main findings and analyzes the results. Finally, Section 5 offers the concluding remarks.

2 THEORETICAL FRAMEWORK

The reasons for migration from one country to another are diverse and may include economic motives, such as the search for better job opportunities, geographic proximity, and economic stability; social reasons, such as reuniting with family members and obtaining access to quality services; political motives, such as escaping persecution and seeking political and personal stability; in addition to the pursuit of cultural and personal experiences, as Castelli (2018) explains.

To explain the drivers of emigration for a Venezuelan citizen, the Refugee and Migrant Needs Analysis (RMNA) was developed by the Regional Inter-Agency Coordination Platform for Refugees and Migrants from Venezuela (R4V). According to R4V (2023), Venezuelan migrants sought destinations that offered safer places, opportunities to obtain income, and access to basic services. This is because the country faces a series of economic conditions that undermine the population's well-being, such as product shortages, hyperinflation, political instability, and violence, as noted by Castro (2020).

Given this scenario, R4V (2023) reports that more than 7.1 million emigrants left Venezuela between 2015 and 2023, with more than 80% hosted in 17 countries in Latin America and the Caribbean. However, the International Organization for Migration (IOM, 2020) indicates that these individuals have heterogeneous socioeconomic profiles and intentions when settling in host countries. IOM (2020) also observes that Venezuelans who move to neighboring countries (for example, Brazil and Colombia) are younger and have relatively lower levels of education and access to health care compared to Venezuelans who moved to more distant countries, where half have some level of higher education (for example, Argentina, Chile, Costa Rica, and Uruguay). Considering this, IOM (2020) concludes that there is a tendency for migrants with higher technical qualifications to move farther from their country of origin.

Nevertheless, within host countries refugees face several setbacks. As the report from R4V (2023) indicates, approximately 50% of Venezuelan migrants present in Latin America and

the Caribbean face difficulties in accessing food, education, health care and stable employment. In addition to documentation barriers, R4V (2023) points out that low wages further complicate Venezuelans capacity for subsistence. Despite these challenges, IOM (2020) notes that approximately 80% of these individuals intend to remain where they are, as they consider this to be the best decision for their own and their families well-being. To understand the scenario that generated this mass exodus from Venezuela, it is worth contextualizing the importance of oil to this economy.

2.1 RELATIONSHIP BETWEEN THE VENEZUELAN ECONOMY AND WEALTH VIA OIL

The importance of oil to the world is undeniable, as it is a fundamental energy source for many countries. According to OPEC's Annual Statistical Bulletin (2021), Venezuela holds the world's largest proved crude oil reserves, and export profiles show that oil has historically dominated the country's merchandise exports. Kleszczyńska (2020) notes that production and the international price of this asset directly affect national income and local economic performance. However, excessive dependence on oil can have negative consequences.

The Dutch disease is an economic phenomenon that arises when a country experiences a boom in a natural resource sector, which leads to an artificial appreciation of the domestic currency, taking a heavy dependence on the extractive sector due to strong international demand. Corden and Neary (1982) coined the term in response to the decline of manufacturing and the rise in unemployment in the Netherlands in the 1970s after the discovery of oil and gas in the North Sea. This phenomenon comprises two main effects: the spending effect and the resource-movement effect, as described by Fardmanesh (1991). The first occurs when rising natural resource prices initially trigger a real appreciation that increases the profitability of the appreciated export; this price increase can drive currency appreciation and harm the competitiveness of tradable sectors unrelated to natural resources. According to Corden and Neary (1982), the resource-movement effect draws labor and capital toward the booming resource and non-tradable sectors, squeezing other tradable activities.

In the Venezuelan context, an economy highly dependent on income from fossil fuel exports. Fardmanesh (1991) observes that a sharp rise in oil prices harms tradable sectors such as manufacturing and agriculture, depressing their output in favor of the expanding oil market. Kulkarni and Nicholson (2010) further report a high and significant correlation between Venezuela's dollar reserves, money supply, and inflation. Costa and Olivo (2008) find that money growth and government spending in oil-exporting countries are highly correlated with the commodity's price; thus, the terms-of-trade gain is tied especially to price and less to

exported volume. For petrostates operating under government-managed fixed exchange rates, interventions to hold the peg during positive oil-price shocks can be expansionary in monetary terms, as discussed by Mercedes da Costa (2008). As a result, the domestic market becomes more exposed to price fluctuations, culminating in high inflation.

As these effects unfold, exports from non-oil sectors decline. In the domestic market, consumers can import cheaper goods that other countries produce with comparative advantage, further deepening the decline of sectors unrelated to the appreciated commodity. Wang (2022) summarizes that there is a general deterioration in the terms of trade: production becomes lower than it originally was in markets unrelated to the natural resource, while it becomes relatively higher for the good linked to the disease. In Venezuela, Vidal and Mazzali (2019) note that more than 70% of food is imported and that domestic pharmaceutical production is practically nonexistent. Consequently, sectors essential for population well-being become dependent on foreign policy.

Over the last decade, this dependence was further strained by successive sanctions imposed on the Venezuelan government. The U.S. Department of the Treasury (2023) reports that, after the United States deemed Venezuela a national security threat in 2015, sanctions were applied to Venezuelan officials and, in 2017, new debt, shares, and bonds issued by the Venezuelan government and its state-owned companies were barred from U.S. financial markets. In 2019, an economic embargo froze all Venezuelan government property and assets in the United States, including those of the Central Bank of Venezuela. Gratius (2021) explains that these measures aimed to block Venezuela's international trade and curb its ability to raise funds abroad.

The most evident effects of the sanctions were declines in trade, foreign investment, and development assistance. The European Commission (2019) indicates that limited trade relations between Venezuela and the European Union drove exports down from €6.5 billion in 2012 to €0.69 billion in 2019, while imports were reduced by approximately 50% over the same period. In the United States, the U.S. Census Bureau (2019) reports that Venezuelan exports fell from \$38.7 billion to \$1.9 billion in 2019.

When external markets are restricted and the state has fewer resources, importing food, medicines, and other essential supplies becomes even more difficult. Moreover, constraints on the oil industry's trade affect the core of an economy already suffering from Dutch disease. As the international price of commodities drops significantly, the economic and humanitarian crisis deepens gradually. Human Rights Watch (2019) observes that, despite the country's wealth in

a resource with strong global demand, the population faces high inflation and shortages of basic goods, conditions that can motivate migration.

3 METHODOLOGY

3.1 FAILURE MODE AND EFFECTS ANALYSIS AND EVENT TREE ANALYSIS

Failure Mode and Effects Analysis is a systematic technique used across fields such as engineering, manufacturing, and economics to identify and mitigate potential risks. As described by Cristea and Constantinescu (2017), FMEA rates severity, occurrence, and detectability on 1–10 ordinal scales before computing the Risk Priority Number (RPN). The RPN is calculated for each failure mode to rank and prioritize the identified failure modes. The formula for calculating the RPN is presented by McDermott et al. (2009):

$$RPN = Severity (S) \times Occurrence (O) \times Detectability (D) \quad (1)$$

Severity (S) represents the magnitude of the impact or consequence if the failure mode occurs. Thus, 1 is the lowest rating, and 10 indicates very high severity, when a potential failure mode affects the safe operation of the system without warning. Occurrence (O) indicates the likelihood that the failure mode will occur; 1 reflects virtually no chance of occurrence and 10 reflects a very high probability with failure being nearly inevitable. Detectability (D) refers to the ability to identify the failure mode before it causes significant impacts; 1 indicates the greatest detection potential, and 10 represents complete uncertainty.

The result of the RPN calculation ranges from 1 to 1000. Higher-RPN failure modes indicate greater risk and require more attention and action to reduce their probability of occurrence or minimize their consequences, as emphasized by McDermott et al. (2009). Addressing social and economic crises requires identifying critical factors that contribute to instability, such as inflation rates, unemployment rates, and fiscal policies. In addition, analyzing the probability of political unrest, corruption, and social tensions can help clarify what exacerbates the crisis. In the context of the Venezuelan migration crisis, FMEA can be applied to identify failure modes associated with its main causes, such as economic crisis, political instability, and lack of access to essential resources. By decomposing the problem into individual failure modes and evaluating their impact, decision-makers can gain a deeper understanding of the underlying causes and vulnerabilities that contribute to the crisis.

On the other hand, complementing FMEA with another risk analysis technique, such as Event Tree Analysis, can offer a more comprehensive understanding of the crisis. ETA allows

modeling complex scenarios and calculating probabilities for spontaneous events, as discussed explained by Fernandes, Cristina, and Filho (2022). Its tree-like structure facilitates the visualization and understanding of possible paths that lead to an outcome. For example: let A be an external event (final event) for which we want to analyze possible causes and consequences, the probability of event A occurring, $P(A)$, can be seen using the ETA formula:

$$P(A) = \sum_i P(B_i) P(A | B_i), \quad (2)$$

Where:

$\{B_i\}$ denotes a mutually exclusive and exhaustive set of initiating scenarios; accordingly, $P(B_i)$ is the probability of scenario B_i , and $P(A | B_i)$ is the conditional probability of the outcome given that scenario (Ross, 2019).

In event tree analysis, according to ISO (2019), the probability of a given outcome is obtained by multiplying branch probabilities along each path to that outcome and then summing across relevant paths.

In sum, combining FMEA and ETA offers complementary perspectives on failure modes and consequence pathways, as outlined in ISO (2019) and illustrated in applied risk studies such as Fernandes et al. (2022). Conducting a multiple regression analysis technique capable of simultaneously satisfying an FMEA and an ETA constitutes a sophisticated tool used to control the effect of confounding variables in economic models. These variables can influence outcomes and lead to spurious relationships between independent and dependent variables, causing biased or incorrect results, as highlighted by Cristea and Constantinescu (2017). According to Wooldridge (2013) and Hernán and Robins (2020), multiple regression and doubly robust estimators address confounding in observational data as a separate statistical layer that can complement, but does not substitute, qualitative or semiquantitative risk analyses. Thus, both exposure models and outcome models can be adjusted, leading to more accurate estimates of the effects of the variables of interest.

3.2 ECONOMETRIC MODEL SPECIFICATION

When considering the complex nature of economic data and following the principle of parsimony, we employ a robust regression approach to mitigate potential deviations from classical assumptions. As described by Huber (1981), we estimate a robust M-estimator via IRLS with the Huber loss, and we compute heteroskedasticity-consistent standard errors using

the HC1 (Huber–White) sandwich covariance based on White (1980). The robust regression expressed below enables efficient analysis of the impact of macroeconomic factors on Venezuelan net migration. The adopted specification is:

net_migration

$$\begin{aligned}
 &= \beta_0 + \beta_1 \times \text{inflation} + \beta_2 \times \text{gross_debt} + \beta_3 \times \text{mortality} \\
 &+ \beta_4 \times \text{oil_production} + \beta_5 \times \text{youth_employment} + \beta_6 \times \text{hunger} \\
 &+ \beta_7 \times \text{primary_enrollment} + \beta_8 \times \text{oil_price} + \varepsilon,
 \end{aligned} \tag{3}$$

Where:

β_0 is the intercept, β_i with $i = 1, \dots, 8$ represents the coefficients of the explanatory variables, and ε is the random error term. Table 1 presents the regression variables, data sources, quantitative scale, and the transformation method used to achieve stationarity.

Table 1

Presentation of the variables studied for Venezuela

Variable	Description	Transformation Method for Stationarity	Source and Code Series
Net_migration	Dependent variable of the model: number of immigrants (people entering a given country) minus the number of emigrants (people leaving the country).	Differencing, order 3; KNN imputation	(World Bank, 2023, WDI SM.PO.P.NET.M)
inflation	Inflation rate, consumer prices at end of period (annual percentage change).	Differencing, order 8; KNN imputation; Differencing, order 1; KNN imputation	(IMF, 2023, WEO—CPI)
gross_debt	Gross public sector debt (% of GDP).	Differencing, order 2; KNN imputation; Smoothing	(IMF, 2023, WEO—GGXWDG_NGDP)
mortality	Mortality rate (deaths per 1,000 people).	Differencing, order 4; KNN imputation; Smoothing; Logarithm	(World Bank, 2023, WDI SP.DY.N.CDR.T.IN)
oil_production	Total oil production (million barrels per day, annual average).	Differencing, order 1; KNN imputation	(EIA, 2023—crude oil)

			product ion)
youth_ employ ment	Labor force participation rate (% of population aged 15 to 24).	None	(World Bank, 2023, WDI SL.TLF .1524.Z S)
hunger	Hunger statistics (% of the population).	None	(FAO, 2023, FAOST AT— POU)
primary_ enroll ment	School enrollment rate at the primary level (%).	Differencing, order 1; KNN imputation	(World Bank, 2023, WDI SE.PR M.NEN R)
oil_pric e	End-of-period oil price (US\$).	Logarithm; Differencing, order 1; KNN imputation	(EIA, 2023— Europe Brent spot price)

Stationarity is fundamental for time-series regression, to achieve this, three methods are employed. First, differencing consists of subtracting previous values of the series, resulting in a series of differences; the order of differencing determines how many past steps are subtracted. Second, smoothing uses techniques such as moving averages to reduce random variation and highlight long-term patterns. Third, the natural logarithm (ln) is applied to stabilize variance in series with exponential growth, making them more suitable for analysis. As described by Batista and Monard (2003), the KNN imputation method fills gaps due to missing data using values observed nearby in time, which compensates for the loss of observations during differencing. As noted by Box et al. (2016) these transformations make the series more suitable for econometric modeling and forecasting.

4 RESULTS

This section presents the results of the robust regression model used to investigate the determinants of net migration in an economic context. The model was fitted with data collected over the period 1998 to 2022, with the aim of understanding how macroeconomic variables influence population migration from Venezuela.

Table 2 displays the results of eight specifications of economic models obtained through an iterative procedure. Initially, all variables under study were included in model (1). In each

subsequent iteration, the variable with the lowest level of significance (p-value) was removed, until only one significant variable remained in the final model (8). This selection process sought to identify the most parsimonious and statistically relevant configuration for the economic analysis in question. Among the specifications presented, model (5) and model (7) deserve emphasis. In model (5), four variables proved statistically significant, contributing to the explanation of 61.75% of the variation in net migration. In model (7), two variables were statistically significant and explained 43.97% of the observed variation in net migration.

Table 2

Results of robust regression models, 1998 to 2022 (n = 25)

Model	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
R ²	0,6627	0,6579	0,6413	0,6427	0,6175	0,5279	0,4397	0,3026
constant	-247.500 (575.000)	-287.000 (531.000)	-396.400 (478.000)	-517.400 (418.000)	154.900* (85.100)	115.700 (48.400)	7998 (13.500)	-118 (739)
inflation	0,0608** * (0,014)	0,0592*** (0,013)	0,0615*** (0,012)	0,0604*** (0,012)	0,0674*** (0,010)	0,0649*** (0,006)	0,0626*** (0,003)	0,0524*** (0,000)
gross_debt	- 12.530** * (3.590)	- 13.320*** (3.086)	- 12.910*** (2.929)	- 12.370*** (2.830)	- 11.380*** (2.617)	-8.949*** (1.421)	- 6612*** (891)	
mortality	- 4.036.00 0* (2.080.00)	- 3.980.000 ** (1.920.000)	- 4.046.000 ** (1.820.000)	- 3.788.000 ** (1.760.000)	- 3.907.000 ** (1.620.000)	- 2.454.000 *** (928.000)		
oil_production	- 602.300* * (279.000)	- 557.400** (239.000)	- 481.900** (225.000)	- 440.100** (209.000)	- 348.900** (175.000)			
youth_employment	10.750 (12.200)	11.670 (11.200)	14.060 (10.100)	15.490 (9.419)				
hunger	-7.638 (8.309)	-6.826 (7.522)	-4.969 (6.653)					
primary_enrollment	26.790 (36.200)	26.530 (33.700)						
oil_price	63.500 (135.000)							

Note: Standard error in parentheses; *** p-value < 0.01, ** p-value < 0.05, * p-value < 0.1.

Model (5) provides coefficient estimates indicating the effect of the independent variables on net migration while holding the others constant. The constant suggests that, when all independent variables are zero, net migration is approximately 154.900 units. Inflation has a significant positive effect, being associated with an increase of 0.0674 units in net migration for

each one-unit increase in inflation. By contrast, gross debt, the mortality rate, and oil production have significant negative effects, being associated with decreases of 11.380 units, 3.907.000 units, and 348.900 units in net migration, respectively, for each one-unit increase in those variables. These findings are valuable for understanding how these economic variables influence population movements and migration.

Similarly, in model (7), the positive coefficient for the variable “inflation” indicates that a one-unit increase in inflation is associated with a rise of 0.0626 units in net migration. Conversely, the negative coefficient for the variable “gross debt” suggests that a one-unit increase in gross debt is associated with a decrease of 6.612 units in net migration. The constant is not statistically significant ($p = 0.555$), indicating that its value does not exert a statistically relevant effect on net migration when all other independent variables are zero. Together these results are fundamental to understanding the economic mechanisms underlying population movements and migration, highlighting the importance of inflation and gross debt as influential factors in this context.

4.1 FMEA AND ETA RESULTS

This section presents a structured approach based on the Failure Mode and Effects Analysis technique, widely used across various engineering fields, to identify, categorize, and prioritize the possible contributing factors that led to the emergence of this migration crisis. Through this detailed investigation, the objective is to provide a comprehensive and well-grounded analytical framework that can contribute meaningfully to understanding the origins and implications of the Venezuelan migration crisis and, consequently, support the development of effective and sustainable strategies to address it. Table 3 presents a comprehensive analysis of failure modes and their relevance in the context of the Venezuelan migration crisis. The assessment of the Risk Priority Number indicates that, for the Bard system, the main failure modes are associated with a sharp decline in oil production and economic instability, whereas for the ChatGPT system, the principal failure modes relate to mortality and collapse of the health system, along with runaway inflation. Figures 1 and 2 provide a graphical analysis of the RPN and allow an examination of the relative importance of each failure mode.

Table 3

FMEA for the Migration Crisis in Venezuela, BARD vs. ChatGPT

Failure Mode	Severity	Occurrence	Detectability	RPN
BARD				
Sharp decline in oil production	10	10	5	500

Economic instability	8	8	4	224
Unemployment	7	7	3	147
Budget constraints	6	6	2	72
Deterioration of living conditions	5	5	1	25
ChatGPT				
Mortality and collapse of the health system	9	7	9	567
Runaway inflation	9	8	7	504
Rising gross debt	8	7	8	448
High unemployment	8	9	6	432
Drop in oil production	7	6	8	336

Source: Google (2023) and OpenAI (2023).

Figure 1

RPN (Risk Priority Number) analysis, Google Bard

According to Figure 1, the analysis conducted with Google Bard identifies that the two main failure modes in Venezuela's migration crisis are the sharp decline in oil production and economic instability, which together account for approximately 74.79% of risk prioritization. This concentration suggests a relationship close to the Pareto optimum or the 80–20 rule, which proposes that, in many situations, approximately 80% of effects are caused by 20% of causes. In this context, it indicates that most of the crisis's impact is driven by a relatively small set of critical factors, underscoring the importance of these priority failure modes in triggering and shaping the evolution of the Venezuelan migration problem.

Figure 2*RPN (Risk Priority Number) analysis, ChatGPT*

Based on Figure 2, it can be observed that the ChatGPT analysis identified four principal failure modes during the Venezuelan migration crisis: mortality and collapse of the health system, runaway inflation, rising gross debt, and high unemployment. By totaling 85.31% of the risk prioritization associated with the crisis, these factors approach the Pareto optimum indicated by the system.

As a complement, Figure 3 presents a detailed analysis of failure modes using the robust regression models developed in the previous section. Prioritization was based on the R^2 criterion, widely used in regression analysis to measure the model's fit to the observed data. The relative relevance of each variable was calculated through the change in the model's coefficient of determination R^2 after its removal during the iterative process. This approach makes it possible to understand each factor's contribution to the model and facilitates the identification of critical aspects in risk analysis.

Through Figure 3, it is observed that inflation, gross debt, and mortality jointly account for 79.66% of the explanatory power of the robust econometric regression models, approaching the Pareto optimum. This observation indicates that these three factors play an important role in understanding the Venezuelan migration crisis, making them priorities due to their significant association with the phenomenon under analysis.

Figure 3

Failure Mode Analysis based on the coefficient of determination R^2

Through ETA, it was possible to investigate the multiple branches of the critical events that led to the migration crisis, analyzing the underlying causes and their interconnections. The ETA in Figure 4 indicates that the Venezuelan migration crisis was driven by a series of interconnected events. The final event of interest is mass population migration, and the underlying causes include high inflation rates, rising gross debt, elevated mortality, and declining oil production. These socioeconomic factors created an environment of instability, high unemployment, and widespread socioeconomic hardship, leading many Venezuelans to seek better opportunities in other countries.

Figure 4

Event Tree Analysis in Venezuela Case

5 CONCLUSION

In general, conducting social and economic experiments on topics involving public policy can become subject to ideological debate and personal opinions. This article chose to conduct

an analysis based on observable variables to identify patterns, trends, or changes over the period from 1998 to 2022. Building a literature-grounded model to characterize the Venezuelan migration crisis as an undesirable event, using econometric regressions with an AI synchronized to a copilot trained to perform statistical significance analysis in the context of humanitarian causes, can be useful for better understanding the factors that affect these causes and for identifying more effective strategies to address them. The AI can be trained to collect, organize, and analyze large volumes of data related to humanitarian causes—such as demographic information, socioeconomic indicators, and health data—and to identify correlations among variables and the factors most relevant to the success or failure of a specific humanitarian cause.

The academic relevance lies in experimenting with an AI synchronized to a copilot with high computational power that, through data processing, can be trained to perform statistical significance analysis to characterize the Venezuelan migration crisis as an undesirable event, identifying the main variables that generate its failure modes, provided that all necessary datasets and correct commands are supplied.

Finally, the analysis can be valuable for three reasons. First, it avoids polarization by relying on observable variables, ensuring impartiality by focusing on data and evidence rather than ideological opinions. Second, with the use of artificial intelligence and a qualified copilot, it is possible to develop complex and objective models, enabling broader analysis and the identification of important correlations among variables. Third, the proposed analysis does not deviate from the core of the crisis with social and humanitarian issues such as quality of life and conditions for development as relevant factors that drive migration, so this data-driven and objective approach provides a clearer view of the problems at hand, contributing to informed, evidence-based decision-making aimed at mitigating the crisis's negative impact and seeking sustainable solutions and adequate assistance for the most vulnerable populations.

ABSTRACT

This study sought to analyze urban parks by assessing their contributions to sustainability, social justice, and community well-being. The research was conducted through a systematic review structured according to the PRISMA 2020 protocol, including bibliometric and bibliographic analyses of international databases (Scopus and Web of Science) covering the period from 2020 to 2025. The tools used included Rayyan for screening and duplicate exclusion; VOSviewer and Bibliometrix for bibliometric analysis; and Zotero, Mendeley, and Excel for reference management and organization. Five questions guided the study in order to achieve its objective: (i) which dimensions are addressed by recent research on sustainable urban parks? (ii) what are the main themes discussed within these dimensions? (iii) which methodologies and analytical tools have been applied? (iv) which conceptual and methodological gaps remain in the literature? and (v) which future research directions can be suggested? A total of 61 highly relevant articles were selected, confirming that parks function as instruments of social inclusion, health promotion, and mitigation of environmental impacts, while also fostering sustainability. In response to the proposed questions, the review showed that recent studies on urban parks have increased, particularly those addressing health, sociospatial justice, quality, management, and socioeconomic impacts, and discussing themes such as mental health, accessibility, green gentrification, and civic participation. Although diverse methodologies have been applied, gaps persist, including the limited number of longitudinal studies, differences between developed and developing countries, lack of maintenance and safety, and the absence of studies on the effects of parks as therapeutic spaces for neurodivergent populations. It is concluded that urban parks should

RESUMO

Este estudo buscou analisar os parques urbanos, avaliando suas contribuições para a sustentabilidade, a justiça social e o bem-estar comunitário. A pesquisa foi conduzida por meio de uma revisão sistemática estruturada de acordo com o protocolo PRISMA 2020, incluindo análises bibliométricas e bibliográficas de bases de dados internacionais (Scopus e Web of Science), abrangendo o período de 2020 a 2025. As ferramentas utilizadas incluíram Rayyan para triagem e exclusão de duplicatas; VOSviewer e Bibliometrix para análise bibliométrica; e Zotero, Mendeley e Excel para gerenciamento e organização das referências. Cinco questões orientaram o estudo para alcançar seu objetivo: (i) quais dimensões são abordadas pelas pesquisas recentes sobre parques urbanos sustentáveis? (ii) quais são os principais temas discutidos dentro dessas dimensões? (iii) quais metodologias e ferramentas analíticas têm sido aplicadas? (iv) quais lacunas conceituais e metodológicas permanecem na literatura? e (v) quais direções futuras de pesquisa podem ser sugeridas? Um total de 61 artigos altamente relevantes foi selecionado, confirmando que os parques funcionam como instrumentos de inclusão social, promoção da saúde e mitigação de impactos ambientais, ao mesmo tempo em que fomentam a sustentabilidade. Em resposta às questões propostas, a revisão demonstrou que os estudos recentes sobre parques urbanos têm aumentado, especialmente aqueles que abordam saúde, justiça socioespacial, qualidade, gestão e impactos socioeconômicos, discutindo temas como saúde mental, acessibilidade, gentrificação verde e participação cívica. Embora diversas metodologias tenham sido aplicadas, persistem lacunas, incluindo o número limitado de estudos longitudinais, diferenças entre países desenvolvidos e em desenvolvimento, falta de manutenção e segurança, e a ausência de estudos sobre os efeitos dos parques como espaços terapêuticos para populações neurodivergentes. Conclui-se que os parques urbanos devem ser reconhecidos como infraestruturas críticas para a saúde pública, inclusão social e resiliência climática.

RESUMEN

Este estudio tuvo como objetivo analizar los parques urbanos, evaluando sus contribuciones a la sostenibilidad, la justicia social y el bienestar comunitario. La investigación se llevó a cabo mediante una revisión sistemática estructurada de acuerdo con el protocolo PRISMA 2020, incluyendo análisis bibliométricos y bibliográficos de bases de datos internacionales (Scopus y Web of Science), cubriendo el período de 2020 a 2025. Las herramientas utilizadas incluyeron Rayyan para el cribado y la eliminación de duplicados; VOSviewer y Bibliometrix para el análisis bibliométrico; y Zotero, Mendeley y Excel para la gestión y organización de referencias. Cinco preguntas guiaron el estudio para alcanzar su objetivo: (i) ¿qué dimensiones son abordadas por las investigaciones recientes sobre parques urbanos sostenibles? (ii) ¿cuáles son los principales temas discutidos dentro de estas dimensiones? (iii) ¿qué metodologías y herramientas analíticas se han aplicado? (iv) ¿qué vacíos conceptuales y metodológicos permanecen en la literatura? y (v) ¿qué direcciones futuras de investigación pueden sugerirse? Se seleccionaron un total de 61 artículos

altamente relevantes, confirmando que los parques funcionan como instrumentos de inclusión social, promoción de la salud y mitigación de impactos ambientales, al mismo tiempo que fomentan la sostenibilidad. En respuesta a las preguntas planteadas, la revisión mostró que los estudios recientes sobre parques urbanos han aumentado, especialmente aquellos que abordan la salud, la justicia socioespacial, la calidad, la gestión y los impactos socioeconómicos, discutiendo temas como la salud mental, la accesibilidad, la gentrificación verde y la participación cívica. Aunque se han aplicado diversas metodologías, persisten vacíos, incluyendo el número limitado de estudios longitudinales, las diferencias entre países desarrollados y en desarrollo, la falta de mantenimiento y seguridad, y la ausencia de estudios sobre los efectos de los parques como espacios terapéuticos para poblaciones neurodivergentes. Se concluye que los parques urbanos deben ser reconocidos como infraestructuras críticas para la salud pública, la inclusión social y la resiliencia climática.

Palabras clave: Parques Urbanos. Infraestructura Verde. Sostenibilidad. Justicia Ambiental. Ciudad Inteligente. Planificación Urbana.

1 INTRODUCTION

Accelerated urbanization since the late twentieth century has increased pressure on urban systems and, as a result, has led to the emergence of sociospatial inequalities, climate change, and public health challenges [1][2][3][4]. Simultaneously, the need for resilient infrastructure has led policymakers to rethink urban structures and open spaces, and to recognize urban parks as strategic solutions [5][6][7][8].

Urban parks function as multifunctional green infrastructure, providing environmental benefits such as thermal regulation, flood mitigation, and improved air quality [9][10][11][12][13]. In addition, they offer social and health benefits, including encouragement of physical activity, stress reduction, and strengthening of community cohesion [14][15][16][17][18][19]. The global literature on this topic indicates that the presence of green areas is associated with improvements in urban quality of life [20][21][22][23]. Despite this, the unequal distribution of these benefits reflects barriers to access, sociospatial segregation, and processes of green gentrification [24][25][26][27][28][29][30] as well as shortcomings in urban planning [31]. Structural factors such as income level, ethnicity, housing, and living conditions directly influence health and intensify inequalities in areas undergoing gentrification [32]. Similar results were identified in Beijing, where older adults and low-income residents showed greater dependence on park quality for health maintenance [33][34]. In New York City, the unequal distribution of green spaces reflected different socioeconomic profiles across neighborhoods, resulting in varied impacts on different social groups [21]. Similarly, in Hong Kong, areas with a higher concentration of ethnic minorities have parks with fewer resources and lower quality, highlighting disparities in the distribution of socioenvironmental services [35]. The creation of new parks may, paradoxically, generate processes of environmental gentrification, in which rising property values and commercial transformations ultimately displace vulnerable residents, calling for “just green enough” policies that reconcile equitable access with community permanence [36]. This concept proposes the creation of green areas that improve quality of life without triggering intense real estate valorization processes that result in the displacement of low-income residents, thereby promoting a more just and inclusive greening. Overall, these studies demonstrate the urgency of implementing urban public policies that consider justice.

In light of this, the objective of this research is to analyze and critique the international literature on urban parks as socioenvironmental infrastructure, using the PRISMA 2020 protocol [37] and bibliometric tools to ensure methodological rigor. The study seeks to answer the following five guiding questions:

- (i) which dimensions are addressed by recent research on sustainable urban parks?

- (ii) what are the main themes discussed within these dimensions?
- (iii) which methodologies and analytical tools have been applied?
- (iv) which conceptual and methodological gaps remain in the literature?
- (v) which future research directions can be suggested?

2 METHODOLOGY

This research adopted a methodology based on the PRISMA 2020 protocol (Preferred Reporting Items for Systematic Reviews and Meta-Analyses), which is widely recognized for its transparency and scientific rigor. Since its first publication [37], PRISMA has been extensively used across different fields of knowledge, providing standardization and clarity in the stages of study identification, screening, eligibility, and inclusion. The method was structured in two complementary stages—bibliometric review and bibliographic review—supported by specialized software for data organization, analysis, and synthesis. The following subsections describe the methodological framework, the databases consulted, the PICO strategy used to formulate the search, the inclusion and exclusion criteria, the article selection process, and the instruments applied.

2.1 METHODOLOGICAL STRUCTURE OF THE SYSTEMATIC REVIEW

In the present study, searches were conducted in the Scopus and Web of Science databases using combinations of keywords formulated in accordance with the research objectives. For article screening, the Rayyan software was used [38], supporting the removal of duplicates and the selection of the most relevant studies. This tool optimizes the review process by offering filtering and classification features, ensuring greater efficiency and accuracy during the selection stage. Subsequently, VOSviewer [39], was employed for bibliometric analysis and visualization of co-authorship networks and keyword co-occurrence, and is widely used to identify trends and thematic interconnections. In addition, Bibliometrix [40] was used for advanced statistical analyses and for generating maps and scientific performance indicators, integrating the quantitative and qualitative dimensions of the review.

The systematic review was structured in two complementary stages:

- A) Bibliographic review: In the initial stage, the keywords were organized into four major thematic groups, each composed of four sub-descriptors, totaling 16 search combinations. Different configurations using Boolean operators (AND/OR) were tested to adjust query precision and reduce thematic noise. After a preliminary analysis, the descriptors were refined by eliminating redundant terms and adjusting expressions that

generated results outside the scope of the study. Subsequently, systematic filters were applied (2020–2025; articles and reviews; English language), in accordance with PRISMA guidelines [37]. To ensure conceptual precision, the PICO strategy was adopted in the final formulation, resulting in the following search string: (“urban parks” OR “urban park”) AND (“green infrastructure” OR “sustainability” OR “smart city” OR “urban planning”).

The search in the Scopus and Web of Science databases returned 2,044 records. The results were imported into the Rayyan software for duplicate identification and screening by title and abstract, resulting in 123 eligible articles. The data (123 articles) were organized and analyzed using VOSviewer, enabling the generation of graphs and clusters that highlight co-authorship networks, recurring themes, and research patterns. After full-text reading and application of the exclusion criteria, 61 studies comprised the final sample.

B) Bibliometric review: After defining the final set of 61 articles, the quantitative stage was initiated. Prior to the final filtering, an exploratory analysis was conducted in VOSviewer using the 123 articles previously selected in Rayyan and exported in RIS format. This preliminary step made it possible to broadly observe initial patterns, highlighting term co-occurrence networks, thematic clusters, and co-authorship relationships, thereby helping to situate the research field and to confirm the thematic consistency of the screened sample. Subsequently, the metadata of the 61 final articles were standardized. As the databases use different structures, an artificial intelligence tool was employed to generate a string containing all DOIs of the selected studies, enabling their use in the Web of Science to export complete and standardized metadata. With the standardized files, the data were processed in Bibliometrix (R), allowing advanced bibliometric analyses such as thematic maps, temporal evolution of terms, co-authorship networks, and collaboration between countries, as well as the identification of the most influential authors and journals. Mendeley was used to organize the reference database, while Excel supported the systematization and control of the studies throughout the process. This methodological workflow—exploratory analysis in VOSviewer with the initial sample of 123 articles, data standardization of the 61 final studies in the Web of Science, and advanced analysis in Bibliometrix—ensured analytical rigor, traceability, and robustness of the bibliometric results.

Thus, the chosen methodological approach ensured precision and clarity across all stages of the review, beginning with the development of the search strategy and extending

through the critical evaluation of the results obtained. The combination of bibliometric and qualitative methods enabled a comprehensive mapping of recent academic production related to urban parks, as well as the identification of global trends and conceptual gaps, thereby ensuring the reproducibility of the research. The following sections specify the databases consulted, the selection criteria, the screening process, and the tools employed, in accordance with the principles established by the PRISMA 2020 protocol [37].

Figure 1

Systematic Review Approach

2.2 DATABASES AND PICO STRATEGY

The search process followed an iterative refinement trajectory. Initially, four major keyword groups were structured: Urban Innovation and Governance, Environmental Justice and Inclusion, Circularity and Sustainability, and Urban Parks and Green Infrastructure, each subdivided into up to four subgroups of descriptors combined using the AND or OR connectors. This broad strategy aimed to capture the largest possible number of studies, even with a high level of noise. However, the preliminary analysis revealed thematic redundancies and the presence of articles outside the scope, which led to the reduction and synthesis of the groups. After successive tests, syntactic adjustments, and the application of filters (2020–2025; articles and reviews in English), a loss of relevant studies was observed, which motivated the adoption

of the PICO strategy as the basis for redefining the descriptors. Finally, a single search group was consolidated with the terms: (“urban parks” OR “urban park”) AND (“green infrastructure” OR “sustainability” OR “smart city” OR “urban planning”), applied to the Scopus and Web of Science databases, resulting in 2,044 records exported to the subsequent stages of screening and bibliometric analysis.

In compliance with PRISMA protocol criterion no. 6 (Information sources), the information sources considered in this study were therefore the Scopus and Web of Science databases, covering the period from 2020 to 2025, with the last search conducted on August 26, 2025.

According to PRISMA protocol criterion no. 5 (Eligibility criteria), it was necessary to define the inclusion and exclusion criteria for the studies in advance. To structure this process, the PICO tool (Problem, Intervention, Comparison, and Outcomes) was adopted, as it supports the formulation of research questions and the organization of search strategies.

Table 1 presents the PICO strategy developed for this study, indicating how each element (P, I, C, O) was translated into keywords and eligibility criteria, serving as the basis for defining the search terms and for selecting the articles included in the review.

Table 1

PICO Research Strategy.

PICO	Questions	Responses
P (Problem)	Which urban populations are affected by the availability and quality of urban parks and green spaces?	Communities in urban areas, with emphasis on vulnerable groups (low-income residents, minorities, children, elderly, and people with disabilities).
I (Intervention)	How can urban parks and green spaces act as green infrastructure promoting sustainability, justice, and equity?	Implementation of parks as nature-based solutions (NbS), inclusive design, sustainable urban planning, and community-oriented management.
C (Comparison)	How do cities without adequate urban parks compare in terms of health, equity, and well-being to those with well-planned parks?	Differences in health outcomes, social equity, and overall well-being between cities with well-structured urban parks and those lacking adequate green infrastructure.
O (Outcomes)	What are the impacts of urban parks on justice, equity, and community well-being?	Improved health, greater social cohesion, reduction of inequalities, promotion of environmental justice, and enhancement of urban

Based on the PICO strategy, keyword analyses were developed to guide the searches in the databases. The combinations of terms were structured gradually, undergoing several adjustments until a refined format was achieved that was capable of retrieving studies aligned with the central research problem. This process ensured that the search was sufficiently broad to map the existing literature, while also being specific enough to avoid results outside the scope of the research.

2.3 INCLUSION CRITERIA

This systematic review included articles published between 2020 and 2025, written in English, and classified as original research articles or review papers. Additionally, studies directly related to the scope of this review were considered, namely, urban parks understood as green infrastructure, with a focus on sustainability, environmental justice, resilience, and community well-being.

2.4 EXCLUSION CRITERIA

Following PRISMA protocol criteria no. 5 and no. 7, articles that did not fall within the human and urban scope were excluded from the review, including those focused on biodiversity, fauna, microbiology, environmental chemistry, air quality, and soil and physicochemical studies. Studies with an exclusive focus on transportation, commuting, and mobility were also excluded, as were those adopting an excessively technical approach, such as physical modeling of urban heat islands or analyses of generic vegetation without a direct connection to urban parks. Studies presenting high thematic redundancy, characterized by repetitive findings and limited methodological innovation, were excluded to prevent overrepresentation of similar evidence in the final sample.

2.5 STUDY SELECTION PROCESS (PRISMA FLOW DIAGRAM)

Following PRISMA criterion no. 7 (Search Strategy), the previously defined search string was applied to the Scopus and Web of Science databases, resulting in 3,606 records with no restrictions applied at this stage. After applying the predefined eligibility criteria, 2,044 records were retained. Due to database export limitations, 1,615 records were successfully imported

into Rayyan and constituted the final dataset for screening. The detailed selection process is presented in Figure 2 (PRISMA flow diagram).

Table 2

Results from the databases with applied filters

Name	Number of Documents	
	Before the Filter	After the Filter
Scopus	1143	615
Web of Science	2463	1429
Total	3606	2044

In accordance with PRISMA criterion no. 9 (Data Collection Process), which requires researchers to specify the methods used as well as any automation tools employed in the process, after the previous steps the database files in “.ris” format were imported into Rayyan, a web-based tool that supports the organization and screening of articles for systematic reviews. Using Rayyan’s automated detection tool, 402 potential duplicate records were identified, of which 201 were confirmed and removed prior to screening.

Subsequently, an initial screening was conducted based on titles and abstracts to assess thematic relevance, resulting in the exclusion of 123 documents that were not aligned with the research objectives.

In a new round of analysis, all abstracts were read in greater detail to verify alignment with the two main research terms and to assess the relevance of the documents. From this analysis, 62 documents were excluded.

In compliance with PRISMA criterion no. 11 (Study risk of bias assessment), which requires the specification of the methods used to assess the risk of bias in the included studies, and PRISMA criterion no. 12 (Effect measures), which calls for the specification of effect measures, the remaining 123 documents were subjected to full analysis. At this stage, documents that did not demonstrate a clear focus on the specific areas of study during full-text reading were excluded, resulting in a total of 61 documents included in the review.

Figure 2*PRISMA Analysis Flow Diagram***2.6 TOOLS AND SOFTWARE USED**

The main tools used in the research were Rayyan, employed for systematic screening, duplicate removal, and organization of the selection process; VOSviewer, used in the exploratory phase with the 123 articles identified prior to full-text reading to generate keyword co-occurrence maps, co-authorship networks, and thematic clusters, allowing visualization of the scope and initial structure of the research field; and Bibliometrix (R package), subsequently applied to the final sample of 61 articles for the execution of consolidated bibliometric analyses.

Within the R environment, Bibliometrix was used to generate 11 main outputs derived from the biblioAnalysis and biblioshiny functions, enabling quantitative and visual analyses of scientific production. The outputs generated were:

1. Annual scientific production chart (Annual Scientific Production) – evolution of the number of publications between 2020 and 2025;
2. Most relevant sources chart (Most Relevant Sources) – journals with the highest number of articles;
3. Most relevant authors chart (Most Relevant Authors) – researchers with the highest volume of publications;
4. Most local cited sources chart (Most Local Cited Sources) – the most influential journals within the sample;

5. Most local cited authors chart (Most Local Cited Authors);
6. Most global cited documents chart (Most Global Cited Documents);
7. Country scientific production map (Country Scientific Production);
8. Co-authorship network;
9. Treemap country/frequency – proportional visual representation of scientific production;
10. Co-occurrence network (Co-Occurrence Network) – basis for generating the Thematic Map and the Thematic Evolution Map).

These outputs made it possible to examine the intellectual and thematic structure of the field, identifying publication patterns, central authors, collaboration networks, thematic cores, and emerging trends.

Some graphical results were exported to Excel, where adjustments to scale, colors, and explanatory legends were applied, ensuring visual clarity and standardization across the figures presented. The Mendeley and Zotero software packages were used for reference management and organization, while Excel was also employed for spreadsheet systematization and consolidation of the final data.

Thus, the integrated use of Rayyan, VOSviewer, Bibliometrix, Mendeley, Zotero, and Excel ensured methodological rigor, reproducibility, and analytical consistency across all stages of the systematic review, from initial screening to the generation of graphics and the integrated interpretation of results.

2.7 METHODOLOGICAL SYNTHESIS

The applied methodology sought to combine quantitative rigor (bibliometrics, network analysis, and pattern analysis) and qualitative rigor (critical reading and conceptual systematization), thus ensuring a comprehensive view of trends, gaps, and future research directions on urban parks as green infrastructure.

3 RESULTS

The results of this research are organized into two main stages, corresponding to the methodological approaches applied. The first stage refers to the bibliometric review, in which publication patterns, co-authorship networks, and recurring terms in the literature were quantitatively analyzed. The second stage corresponds to the bibliographic review, which qualitatively synthesized and discussed the 61 selected articles, allowing the identification of the main dimensions, emerging themes, and conceptual gaps in the field of study on urban parks and sustainability.

3.1 BIBLIOMETRIC REVIEW

The bibliometric review stage was carried out through the construction and interpretation of bibliometric maps, using specific software to analyze term co-occurrence, author networks, and the temporal evolution of publications. This stage aimed to preliminarily address research questions (i) and (ii), related to the main dimensions and themes discussed in the literature on sustainable urban parks. In this process, a spatial analysis of authors' affiliations was also conducted, highlighting the geographic distribution of scientific production, as well as a classification analysis of the articles according to specific criteria, in order to organize the body of studies into comparable categories and generate relevant data for researchers interested in the topic.

3.1.1 Bibliometric Maps

In order to meet PRISMA protocol criterion no. 13 (Synthesis methods), bibliometric maps were developed, which are useful for organizing the research and supporting the identification of the current state of the topic addressed. For this analysis, a file containing the 123 studies selected in Rayyan was exported in .ris format and subsequently processed in the VOSviewer software.

At this stage, the minimum threshold was set to five occurrences. To create the maps, the options “create a map based on bibliographic data,” “read data from reference manager files,” and type of analysis: “co-occurrence” and “keywords” were selected, followed by the “full counting” option. A total of 50 terms were identified, of which the 35 most relevant terms were selected by VOSviewer. Prior to generating the map, some terms were excluded. These manual exclusions were applied to terms that did not represent the research focus, that is, terms that did not indicate study dimensions. The terms excluded at this stage were: “China,” “human,” “article,” “humans,” “male,” “spatial analysis,” “strategic approach,” “perception,” “adult,” “United States,” “decision making,” “housing,” “assessment method,” “Shanghai,” and “open space.” The results can be observed in Table 5, and the map with the list of keywords is presented in table 3:

Table 3

Number of occurrences in the bibliometric map

Terms Threshold	Number of Terms to be deleted	Clusters	Group Cluster		N° Items	Links	Items
			N° Cluster	Color			
50	15	4	1	Red	13	403	35
			2	Green	9		
			3	Blue	7		
			4	Yellow	6		

Figure 3

Bibliometric map generated in VOSviewer

Bibliometric map generated in VOSviewer

The red cluster groups 13 items: city, city planning, climate change, ecosystem service, green space, mental health, parks recreational, physical activity, public health, recreational park, spatial planning, urban green spaces, and urbanization.

The green cluster, with 9 items, brings together: accessibility, environmental justice, equity, greenspace, neighborhood, spatial distribution, urban ecosystem, urban green space, and urban planning.

The blue cluster, with 7 items, includes: park design, policy making, sustainability, sustainable development, urban area, urban design, and urban park.

Overlay visualization chart generated in VOSviewer

In contrast, more recent terms, shown in yellow, highlight emerging trends such as equity, environmental justice, accessibility, policy making, and spatial distribution, which gained prominence in 2024. This indicates a shift in the focus of the literature, from the traditional debate on planning and health toward a more critical and inclusive approach that connects urban parks to issues of socioenvironmental justice, equity, and governance. In this way, the field is expanding and opening space for research that links green infrastructure with social participation and public policy.

Figure 5

Density visualization chart generated in VOSviewer

Analysis of the density visualization chart.

This chart highlights which themes are most frequently studied within the literature on urban parks and planning. The yellow areas represent topics that appear most often and occupy the center of the discussions, such as urban planning, greenspace, and urban parks. These concepts form the foundation of the field and serve as starting points for connecting research on health, quality of life, sustainability, and urban design.

As one moves away from the yellow areas, green and blue points appear, indicating themes that are present but still less explored. This is the case for environmental justice, equity, and policy making, which appear more peripheral but already connected to the core. This suggests that these topics are still gaining ground and represent research opportunities for scholars seeking to contribute new perspectives. Thus, the chart reveals both what is already consolidated and what is emerging as a promising path for future investigations.

In accordance with PRISMA protocol requirements, questions (i) and (ii), related to the dimensions and main themes of the literature, were initially addressed. Based on the exploratory analysis conducted in VOSviewer (123 articles), it was preliminarily identified that research on sustainable urban parks is organized around five major dimensions: health and well-being; sociospatial equity and environmental justice; park quality and user experience; planning, management, and governance; and socioeconomic impacts and mobility. Within these dimensions, themes such as restorative effects on mental health, biophilic design and

multisensoriality, accessibility and inequalities of access, green gentrification, and civic participation stand out. These initial observations guided the refinement of the analysis in subsequent stages. In addition, the overlay visualization made it possible to observe both themes that are already consolidated in the literature and those emerging as new research trends, highlighting the role of VOSviewer as an essential exploratory step for structuring the field and guiding in-depth investigation of the selected articles.

3.1.2 Bibliometric analysis of the 61 selected articles

After consolidation of the final sample, a bibliometric analysis of the 61 selected articles was conducted using the Bibliometrix software. This stage aimed to identify publication patterns, the most relevant journals, the most productive authors, co-authorship networks, and the temporal evolution of research on sustainable urban parks. The results were organized into charts and tables, allowing observation of both the concentration of scientific production in specific journals and the recent growth of interest in the topic. The findings of this analysis are presented in graphical form, accompanied by interpretation, and allow a more specific response to questions (i), (ii), and (iii) of the PRISMA protocol, serving as a bridge to the qualitative discussion in the following chapter.

Figure 6
Most Relevant Sources

This graph shows which journals published the largest number of articles on the topic within the analyzed database. The x-axis presents the names of the journals, and the y-axis indicates the number of articles identified in the analyzed data. The journals with the highest

number of publications were Sustainability and Urban Forestry & Urban Greening, with six articles each, followed by Land with four articles, and Cities and Sustainable Cities and Society, each with three articles on the topic. The remaining journals had fewer publications (two or one article).

This highlights that the scientific discussion is concentrated in a small number of strategic journals, which function as the main vehicles for disseminating research on the topic.

Figure 7

Annual Scientific Production

A significant growth in scientific production on the topic can be observed, increasing from only four articles in 2023 to 17 in 2024 and reaching 29 in 2025.

This increase demonstrates that the field has been gaining relevance and attracting greater interest from the academic community in recent years, indicating an expanding field in the process of consolidation.

Figure 8

Most Relevant Authors

The most productive authors identified in the field were Li X, Wang J, and Wang Y, each with three articles. Following them, a group of researchers (Chang Q, Huang Y, Jang E, Kim M, Li J, Park K, and Shi X) appears with two publications each. This demonstrates that there is a diverse network of authors contributing to the field, without concentration on a single researcher.

This scenario reveals a broad network of contributions, without the predominance of a single scholar, suggesting plurality and collaboration in the development of the field.

Figure 9

Most Local Cited Sources

The most locally cited sources were Landscape and Urban Planning (332 citations) and Urban Forestry & Urban Greening (254), followed by the International Journal of Environmental Research and Public Health (87) and Cities (74). These journals are established as central references in the field, supporting the theoretical and methodological foundations that guide studies on urban parks and sustainability.

These journals exert strong influence within the literature, positioning themselves as core references for researchers in the field.

Figure 10

Most Local Cited Authors

The analysis of local author citations shows that the names Hong X, Huang Y, Li, Zhang Y, Zheng Y, and Zherui Z appear sporadically, each with one citation. This indicates that, within the analyzed set, there is no predominance of a single widely cited author, but rather a balanced distribution of references among different researchers.

This demonstrates that, within the analyzed corpus, there is no broadly dominant author, but instead an even distribution of references across multiple scholars.

Figure 11

Most Global Cited Documents

The analysis of the most globally cited documents shows that the article by Zhao Y (2024), published in Sustainable Cities and Society, was the most influential, with 19 citations. This is followed by Selanon P (2023), published in Buildings–Basel (16 citations), and Guo R (2024), in Landscape and Urban Planning (14 citations). These results demonstrate that studies published in internationally high-impact journals have exerted greater influence on the dissemination of knowledge on the analyzed topic.

These results demonstrate that articles published in high-impact international journals have greater diffusion power and are fundamental to consolidating the research field.

Figure 12

Country Scientific Production

Country Scientific Production

Table 4*Frequency of publications by country (2020–2025)*

Country	Freq
CHINA	106
USA	24
SOUTH KOREA	10
BELGIUM	6
NETHERLANDS	5
UK	4
INDONESIA	3
ITALY	3
CANADA	2
COLOMBIA	2
FRANCE	2
INDIA	2
MALAYSIA	2
THAILAND	2
AUSTRALIA	1
CZECH REPUBLIC	1
MEXICO	1
PAKISTAN	1
SINGAPORE	1
SWEDEN	1

The country scientific production map (Figure 12) uses shades of blue to indicate the intensity of publications. Countries shown in darker blue, such as China (106 articles) and the United States (24 articles), stand out for their leadership in academic production on sustainable urban parks. Intermediate shades of blue represent nations with moderate output, such as South Korea (10 articles), Belgium (6 articles), and the Netherlands (5 articles). Lighter shades indicate more limited contributions, exemplified by Latin American countries such as Colombia (2 articles) and Mexico (1 article). Finally, countries shown in gray did not present records during the analyzed period, reinforcing the regional concentration of the scientific literature.

Figure 13*Co-Authorship Network*

The co-authorship network reveals the formation of distinct clusters of scientific collaboration. Notable groups include those led by Li X and Wang Y (red cluster) and by Wang J and Yao X (blue cluster), which display high centrality and act as connecting nodes among researchers. These findings indicate well-defined research hubs in which certain authors assume strategic roles in knowledge diffusion.

Figure 14*Co-occurrence Network*

The analysis of the co-occurrence network shows that research on urban parks is organized around three interconnected axes: accessibility and socioenvironmental justice (blue), health and ecosystem services (green), and the urban environment and human health

(red). Urban parks act as a central node that integrates these themes, revealing parks as multifunctional spaces oriented toward health, social equity, and environmental sustainability.

Figure 15

Temporal analysis - 2023

In 2023, the research was organized into three main thematic groups: physical activity, environmental justice, and accessibility. During this period, there was limited integration between social and environmental dimensions.

Figure 16

Temporal analysis - 2024.

In 2024, a greater integration among the clusters can be observed, with a strengthening of the terms urban parks, green space, and health. The emergence of the theme of mental health in the blue cluster is also noted.

Figure 17*Temporal analysis - 2025.*

In 2025, consolidation of the field can be observed, with urban parks at the center of the discussions, articulating accessibility, environmental justice, and health benefits linked to physical activity. The term human health also appears, emphasizing benefits to human health associated with exposure to the environment.

In summary, the temporal analysis highlights the maturation and consolidation of the field of studies on urban parks between 2023 and 2025. Research evolves from isolated approaches to an integrated perspective, in which parks are understood as essential infrastructure for human health, socioenvironmental equity, and urban sustainability. This trajectory reinforces the growing importance of urban parks as strategic spaces for social inclusion, well-being, and adaptation to climate change.

Figure 18*Thematic Map*

The Thematic Map, generated from the analysis of keyword co-occurrence in Bibliometrix, organizes the themes of the literature into four quadrants that reflect the degree of development (density) and relevance (centrality) of each cluster. Accordingly, the themes are classified as Motor Themes (well developed and central), Basic Themes (structuring but weakly developed), Niche Themes (highly developed but peripheral), and Emerging/Declining Themes (still underexplored or in decline). This graphical representation makes it possible to identify both consolidated areas and gaps and opportunities for future investigation in the study of urban parks.

Table 5*Detailed legend of the Thematic Map (Bibliometrix)*

Cluster / Color	Keywords (with frequency)
Motor Themes (red)	urban parks (16); physical-activity (14); accessibility (12); access (11); green space (11); health (10); urban park (10); environmental justice (8); cities (6); equity (6)
Basic Themes (blue)	landscape (6); parks (6); recovery (3); attachment (2); community (2); happiness (2); motivation (2); preference (2)
Niche Themes (green)	China (3); spatial accessibility (3); adults (2); area (2); green space accessibility (2); health-care (2); people (2); preferences (2); scale (2); service (2)
Niche Themes (brown)	city (5); space (3); context (2); index (2); urban green spaces (2); vegetation (2)

Emerging/Declining Themes (lilac)	mental health (4); disparities (3); public-health (3); urban green space (3); income (2); obesity (2); proximity (2); public health (2)
Tema intermediário (orange)	spaces (4); environments (3); depression (2); mortality (2); urbanization (2)
Tema de transição (light orange)	spaces (4); environments (3); depression (2); mortality (2); urbanization (2)

The Emerging/Declining Themes quadrant highlights topics such as mental health, disparities, public health, and sustainable urban planning, which, although still showing low density and centrality in the literature, emerge as promising areas for new investigations. These results suggest that the relationship between urban parks, mental health, and sociospatial inequalities remains underexplored, but is likely to gain relevance in the context of contemporary cities, especially after the COVID-19 pandemic, which intensified discussions on psychological well-being in urban environments.

At the same time, the marginal positioning of themes related to sustainable urban planning and health equity indicates the need to deepen studies that frame urban parks not only as leisure spaces, but as critical infrastructure for promoting public health, mitigating social vulnerabilities, and building more inclusive cities. In this way, a research agenda is opened that can contribute both to the theoretical advancement of the field and to the development of public policies guided by socioenvironmental justice and urban resilience.

3.2 BIBLIOGRAPHIC REVIEW

In the classificatory analysis stage, each article was organized according to specific relevance criteria, in line with PRISMA protocol criterion no. 13 (Synthesis methods). The initial search resulted in 1,414 articles, from which those not directly related to the human and urban theme were excluded in a first filter, such as studies on biodiversity, microbiology, environmental chemistry, or sectors unrelated to urban planning. Subsequently, only studies that directly addressed urban parks as green infrastructure, nature-based solutions, climate change, resilience, and socioenvironmental justice were retained, reducing the set to 123 articles. This initial sample was exported to Rayyan, where titles and abstracts were read, and duplicates and tangential articles were removed.

The analysis revealed a strong concentration of publications in a small number of journals, notably Sustainability (Switzerland) (17 articles), Land (10 articles), and Urban Forestry and Urban Greening (10 articles), followed by Cities and Sustainable Cities and Society (five articles each) and Landscape and Urban Planning (four articles). Although the first two

journals show a high volume of publications, priority was given to studies with greater methodological rigor and stronger alignment with the objectives of this review. In contrast, highly prestigious journals such as *Landscape and Urban Planning* and *Sustainable Cities and Society* were prioritized due to their consistency and scientific relevance.

To ensure analytical consistency, studies presenting high thematic redundancy, repetitive findings, or limited methodological contribution were excluded, preventing the overrepresentation of similar evidence in the final sample. This refinement process consolidated the sample into 61 final articles, representing international diversity and strong alignment with the research objectives. Thus, the classificatory analysis made it possible to reduce redundancy, ensure methodological balance, and retain studies that effectively supported the subsequent stage of bibliographic analysis and the response to the research questions.

Based on this set of 61 selected and analyzed articles, the following discussion stage interprets the results in light of the guiding questions of the PRISMA protocol, highlighting trends, gaps, and future directions in the literature.

4 DISCUSSION

The discussion stage aims to integrate the results of the bibliometric analysis with the reviewed literature, systematically responding to the guiding questions established by the PRISMA protocol. To support this stage, a table containing the 61 final selected articles was prepared and is presented as an appendix, compiling the title, objective, methodology, and main results of each study. This systematization made it possible to organize comparisons, highlight patterns, and identify gaps in a clear and consistent manner, serving as the empirical basis for the critical interpretation of the findings.

Based on this set of articles, and in accordance with the established objectives, the responses to the questions formulated at the beginning of the research are presented below.

4.1 MAIN DIMENSIONS OF RECENT RESEARCH

Based on the 61 articles systematized in the table presented in the appendix, it was possible to identify that recent literature on sustainable urban parks is concentrated around five major dimensions. The first is health and well-being, with studies showing that parks contribute to both physical and mental health by providing spaces for psychological restoration, stress reduction, and the promotion of physical activity [2][41][42]. The second dimension is sociospatial equity and environmental justice, which involves the analysis of accessibility, territorial distribution, and differentiated access for vulnerable groups, such as older adults,

children, and low-income populations [14][16][35][43][44]. A third dimension concerns park quality, design, and user experience, considering biophilic aspects, multisensory elements, and types of facilities that encourage different forms of use [1][15][20][30]. Another relevant dimension is planning, management, and governance, including co-design practices, citizen participation, and management evaluation methods [45][46][47][48][49]. Finally, there is a focus on socioeconomic impacts and urban mobility, which address visitation patterns, preferences for local parks, and the effects of processes of environmental gentrification [5][32].

4.2 MAIN THEMES DISCUSSED WITHIN THESE DIMENSIONS

Critical reading of the articles listed in the table shows that, within these dimensions, the main themes include the restorative effects of parks on mental health and the positive association between contact with nature and the reduction of symptoms related to stress and chronic diseases [9][20][41]. In addition, the contribution of green spaces to social vitality is emphasized. In this context, satisfaction with green spaces in the residential environment shows a consistent positive relationship with subjective well-being, indicating that neighborhood green areas and private gardens may exert an influence equal to or even greater than that of urban parks, including through indirect effects associated with perceptions of local greenery [50].

Equity has been discussed based on the observation that children and older adults often face barriers to access, as do low-income groups and ethnic minorities [14][51][52][53]. Studies on quality and user experience emphasize how biophilic design, sensory elements, thermal comfort, and recreational facilities can enhance attractiveness and encourage different patterns of use [1][54]. Inequalities related to recreational opportunities tend to be more visible than those associated with environmental quality, indicating that the unequal distribution of facilities and recreational functions contributes to the formation of privileged urban areas and underserved ones, even in contexts of generally good environmental quality [55].

In the field of management, debates focus on how to integrate digital tools, participatory methodologies, and quality indicators capable of balancing efficiency and social inclusion [3][56]. In the socioeconomic dimension, the most recurrent theme is green gentrification, which emerges as a dilemma between expanding green infrastructure and avoiding the displacement of lower-income residents [32].

4.3 METHODOLOGIES AND ANALYTICAL TOOLS APPLIED

The methodologies employed range from advanced spatial analyses, such as the 2SFCA method, geographically weighted regressions, and inequality indices [57] [51], to big data–

based approaches, which use mobile phone data, social media, and artificial intelligence to map visitation patterns [16][46][46][58]. Multisensory analysis tools, such as EEG and heart rate measurements, have also been applied to understand psychophysiological responses to the environment [10]. Structured questionnaires, interviews, and participatory mapping complement the qualitative dimension, revealing the perceptions of users and managers [15][59][60]. Systematic reviews and meta-analyses have been used to synthesize evidence, while composite indices, such as ParkScore, seek to integrate dimensions of quality, access, and equity [61][62][63]. Despite methodological sophistication, fragmentation is still observed: few studies consistently integrate health, equity, and user experience.

4.4 CONCEPTUAL AND METHODOLOGICAL GAPS

Despite the advances, important gaps remain. First, there is a lack of longitudinal studies capable of demonstrating causality between the presence of parks and the observed effects on health and social inclusion. There is also a noticeable absence of integrated approaches that combine space quality, sociospatial justice, and health outcomes in a standardized and comparable way across different cities. Another critical issue is the limited attention given to neurodivergent populations, such as children diagnosed with autism, ADHD, and other neurodevelopmental disorders. Although the literature recognizes the role of parks for children in general [64], there are very few investigations that explore how outdoor environments can mitigate excessive screen exposure, reduce sensory overload, and promote specific benefits for the well-being and cognitive development of neurodivergent groups. This gap points to the need to expand the notion of equity beyond age-based and socioeconomic categories, also incorporating mental health conditions and neurodiversity.

4.5 FUTURE RESEARCH DIRECTIONS AND PROMISING AGENDAS

Future research agendas may prioritize longitudinal studies and impact evaluations that track park interventions over time [19], allowing for the understanding of changes in physical and mental health, usage patterns, and urban transformations. Another promising direction is the development of integrated indices that combine environmental quality, sociospatial justice, and health benefits, in order to support more consistent public policies [22]. In this context, the case of Chengdu (2025) shows that the application of quantitative green equity indicators, such as the Theil Index combined with spatial optimization models, can guide the reorganization of the distribution of urban parks, helping to address inequalities that persist even with the expansion of green areas [65]. There is also a need to develop urban planning strategies that

link park creation with housing policies, avoiding green gentrification and promoting the permanence of vulnerable populations [36]. Beyond this, an innovative field of investigation opens up by considering the role of parks for children and youth with neurodivergent diagnoses. Studying how outdoor areas can become healthy alternatives to excessive screen time, how they can contribute to reducing stress symptoms, and how they can foster sensory and social inclusion represents a relevant pathway. The co-design of parks with the participation of families, educators, and health professionals may result in more inclusive urban environments, capable of responding to the growing number of diagnoses and demands related to autism and other neurodevelopmental conditions.

5 CONCLUSIONS

The present study aimed to critically analyze the international literature on urban parks as green infrastructure, with a focus on the dimensions of sustainability, environmental justice, and community well-being. The research sought to answer five guiding questions: (i) which dimensions are addressed by recent research on sustainable urban parks; (ii) what are the main themes discussed within these dimensions; (iii) which methodologies and analytical tools have been applied; (iv) which conceptual and methodological gaps remain in the literature; and (v) which future research directions can be suggested.

The investigation was conducted in accordance with the PRISMA 2020 protocol, using the Scopus and Web of Science databases, recognized for their scientific rigor and broad coverage. The methodological process involved two complementary stages: a bibliometric review, supported by the tools Rayyan, VOSviewer, Bibliometrix, Mendeley, Zotero, and Excel, aimed at organizing and quantitatively analyzing scientific production; and a bibliographic review of a qualitative nature, focused on the conceptual and theoretical interpretation of the selected studies.

The combination of the terms “urban park,” “sustainability,” “urban planning,” “smart city,” and “environmental justice” proved appropriate for retrieving representative studies in the field, allowing the identification of consistent thematic and theoretical patterns. This search strategy made it possible to obtain a corpus of 61 articles, which provided a solid basis for answering the proposed questions and mapping the main research trends.

The results indicate that recent scientific production on urban parks is structured around five main dimensions: health and well-being; sociospatial equity and environmental justice; park quality and user experience; planning and governance; and socioeconomic impacts and mobility [66]. Within these dimensions, themes such as the restorative effects of nature,

accessibility, green gentrification, participatory planning, and the integration of parks into urban sustainability policies stand out. The expansion of the field in recent years is also evident, with significant growth between 2023 and 2025, particularly in well-established international journals. However, theoretical and methodological gaps persist, including the scarcity of longitudinal studies and the limited attention given to neurodivergent populations, which remain underrepresented in discussions of inclusion and equity in green spaces.

During the development of this study, challenges were identified in the standardization and refinement of keywords, a process that required successive combinations and adjustments to ensure precision and comprehensiveness in the search. This experience reinforced the importance of terminological consistency and the use of controlled descriptors in systematic reviews, in order to enhance the quality and reproducibility of scientific research.

This research acknowledges limitations related to the temporal scope (2020–2025) and language restriction (English-language articles), which may have excluded relevant contributions from other regions and languages. In addition, a methodological challenge was the selection and combination of keyword groups, whose definition required successive testing until a set of descriptors capable of accurately reflecting the scope and objectives of the research was achieved. Even so, the study provides a comprehensive and up-to-date synthesis of the topic, offering valuable inputs for public policies and for the expansion of the research agenda. Future investigations are recommended to incorporate longitudinal analyses, interdisciplinary approaches, and integrated indicators of environmental quality, equity, and health, as well as to expand the focus to underrepresented population groups, such as people with disabilities and neurodivergent individuals. Further research is also suggested on sensory and inclusive planning of urban parks, considering parks not only as leisure spaces, but as essential infrastructure for public health, social cohesion, and climate resilience.

ACKNOWLEDGEMENTS

The authors would like to acknowledge the support of Fundação Carlos Chagas Filho de Amparo à Pesquisa do Estado do Rio de Janeiro (FAPERJ E-26/210.569/2025 (305234)), and the Grant PID2024- 155409OB-C21 funded by ICIU/AEI/10.13039/501100011033/FEDER, EU, which helped in the development of this research.

APPENDIX

Table 6

Studies Included in the Systematic Review

TITLE	YEAR	GOAL	METHODOLOGY	RESULTS
1 Park use patterns and park satisfaction before and after citywide park renovations in low-income New York City neighborhoods	2025	The objective of the study was to evaluate the impact of the <i>Community Parks Initiative (CPI)</i> park renovation program in New York City, analyzing changes in use patterns and satisfaction among residents of low-income neighborhoods in relation to parks.	Cross-sectional surveys applied to residents of neighborhoods near 31 parks undergoing renovation and also in 21 parks in socio-demographically comparable control neighborhoods. Interviews were conducted before and after the park renovations.	The renovations increased park use time and residents' satisfaction regarding the quality of facilities. The study shows that park renovation is an effective urban planning strategy, strengthening community support and public health.
2 Could there be negative sentiments toward urban parks? An analysis of internal and external factors	2025	To investigate negative sentiments associated with urban parks and to identify internal and external attributes that contribute to such perceptions.	Analysis of 83 urban parks in Nanjing using natural language processing techniques applied to Weibo posts, and multiple linear regression to analyze the relationship between park characteristics and negative sentiments.	Significant relationships were identified between physical attributes, visual landscape quality, accessibility, built environment density, park management, and negative public sentiments, providing insights for planning and management focused on emotional well-being.
3 Multisensory interactions in urban parks: Auditory-olfactory effects on psychophysiological responses of hypertensive elderly adults	2025	To investigate how auditory-olfactory interactions in urban parks influence the psychophysiological responses of elderly individuals with hypertension, providing evidence for the design of urban spaces that promote health.	Three parks in Xi'an, China, were selected to create distinct auditory and olfactory environments. Subjective perceptions, physiological parameters, and electroencephalogram (EEG) signals of elderly individuals were evaluated, stratified into two groups: high pulse pressure (HPP) and normal pulse pressure (NPP).	Auditory-olfactory stimuli improved comfort and reduced blood pressure, with distinct effects between the HPP and NPP groups; EEG results showed greater sensitivity in the HPP group.

4	Identifying older adults' needs for park renewal in low-income neighbourhoods: A citizen science approach	2025	To investigate the needs and preferences of older adults regarding urban park use and to explore how participatory processes can support park redesign to promote healthy aging.	Participatory park design study with older adults from low-income neighborhoods in Belgium, using three stages: citizen science action groups, walk-along interviews, and focus group interviews.	Older adults prioritized higher benches with armrests, accessible and safe pathways, a variety of exercise equipment, shaded and sheltered areas, vegetation diversity, and the presence of water resources. The participatory process proved relevant for informing future urban planning projects and policies.
5	Green Gentrification and Urban Parks: Exploring the Complex Dynamics of Commercial Transformation	2025	To investigate the role of new urban parks in commercial gentrification in Shanghai, an aspect that has been little explored in the debate on the socioeconomic effects of green spaces.	Application of a difference-in-differences (DID) model to analyze 2019 data in an area of 6,340.5 km ² , examining the relationship between the implementation of new urban parks and the growth of businesses associated with gentrification (such as exotic restaurants and cafés).	New urban parks in Shanghai stimulated businesses linked to gentrification, especially restaurants and cafés, with stronger effects in central areas and major parks. The study warns of unintended impacts, highlighting the need for urban planning that promotes health and socioeconomic equity.
6	Assessment of Spatial Equality and Social Justice of Urban Park Distribution from Park Category Perspective: Evidence from Shanghai, China	2025	To develop a geospatial–quantitative framework that integrates spatial metrics and social justice to evaluate equitable access to urban parks in high-density areas.	Application of the framework in the Xuhui District, Shanghai, analyzing the spatial distribution of parks, differentiated social demands (older adults, youth, and low-income populations), and inequalities among park types.	Spatial inequality was identified, with large parks concentrated in peripheral areas and shortages in dense central areas. Priority groups faced greater deficits in social justice, and small parks showed the worst disparities. The study recommends prioritizing social demands and investing in small-scale community parks.

7	Examining the Relationship Between Urban Park Quality and Residents' Health in South Korean Cities Using Public Data	2025	To investigate the relationship between the quality of urban parks and health indicators among 85 cities in South Korea, using a localized version of the ParkScore index—a metric internationally created by the Trust for Public Land (TPL) that evaluates park systems considering area, accessibility, investment, amenities, and equity.	Application of a localized version of the ParkScore index, considering five dimensions (area, amenities, investment, accessibility, and equity). Rates of mental health disorders (anxiety, depression, insomnia, ADHD, and schizophrenia) and obesity were analyzed using Pearson correlation.	Parks with greater accessibility showed a significant negative correlation with mental health disorders, especially depression and anxiety. Although the study is cross-sectional and limits causal inferences, the findings confirm the importance of urban parks for mental well-being and highlight the need for equitable, data-driven management policies.
8	Assessing accessibility and environmental equity in the context of sustained aging: Pathways for age-friendly urban park planning	2025	To develop a method to optimize accessibility to urban parks, considering the specific needs of older adults and promoting health and well-being in contexts of rapid population aging.	Development of a weighted model of park attractiveness based on older adults' preferences, incorporating travel impedance (walking time and public transport). Accessibility was assessed through multidimensional quantitative analysis, and a dynamic population projection model was used to simulate future demands.	Disparities in attractiveness were identified among different parks, revealing failures in the equitable distribution of resources. The study proposes long-term planning strategies for age-friendly urban parks, reinforcing their importance for quality of life and environmental equity in high-density cities.
9	Park quality and chronic disease: A city-level analysis	2025	To investigate the relationship between the quality of urban parks (measured by the ParkScore index) and the prevalence of chronic diseases in major U.S. cities.	Analysis of 93 cities between 2017 and 2019 using mixed-effects regression models. ParkScore, which integrates dimensions of area, amenities, investment, accessibility, and equity, was associated with age-adjusted prevalence of eight chronic diseases.	Significant negative correlations were found between ParkScore and four chronic diseases (hypertension, cancer, coronary heart disease, and COPD). No associations were found with diabetes, obesity, chronic kidney disease, or stroke. Sociodemographic variables also strongly influenced disease prevalence. The study reinforces the role of high-quality parks as essential urban infrastructure for chronic disease prevention.

10	Does perceived biophilic design contribute to human well-being in urban green spaces? A study of perceived naturalness, biodiversity, perceived restorativeness, and subjective vitality	2025	To examine how perceived biophilic design (PBD)—an approach that integrates natural elements and biodiversity into urban environments to promote well-being—and perceived restorativeness in urban parks influence visitors' subjective vitality, focusing on the mediating roles of perceived naturalness and perceived biodiversity.	Application of 1,177 questionnaires (1,133 valid) across four types of urban parks in China (ecological parks, inclusive children's parks, sports parks, and open spaces). Correlation and path analyses were used to evaluate relationships among perceived biophilic design (PBD), perceived naturalness, perceived biodiversity, perceived restorativeness, and subjective vitality.	Ecological parks were rated higher in naturalness, while open spaces showed lower perceived biodiversity. These factors, together with perceived restorativeness, increased visitors' subjective vitality and reinforced the biophilic value of urban planning in promoting psychological health and well-being.
11	Analyzing the Mismatch Between Urban Park Supply and Community Needs in Busan: A Public Health Perspective	2025	To assess spatial disparities between the supply and demand of urban parks in Busan, South Korea, considering socioeconomic indicators and environmental justice.	Quantitative GIS-based approach, dividing the city into 100 m × 100 m grids. A modified Huff model—an accessibility-based spatial analysis tool—was used to estimate the probability of park use considering park attractiveness (size/quality) and distance decay (β) to calculate park supply in relation to the standard of 6 m ² per person. These results were overlaid with a composite need index composed of six socioeconomic indicators.	Of the 205 communities in Busan, 100 lacked green areas; after integrating socioeconomic factors, 62 communities remained underserved. Ten communities were identified as priority areas, reinforcing policies focused on urban environmental justice. The study recommends replacing uniform expansion plans with strategies that prioritize vulnerable communities, integrating environmental justice into sustainable urban planning.

12	The role of city parks in creating 'wellbeing societies': A case study of Piłsudski Park in Łódź, Poland	2025	To investigate how urban green spaces and parks promote well-being in Polish cities, focusing on Marshal Józef Piłsudski Park in Łódź.	Application of a questionnaire to 238 park users, exploring usage patterns, motivations for visits, selected activities, and perceived benefits for well-being.	Physical activities such as walking were the main motivation for visits, while mental benefits such as relaxation and stress reduction were the most valued. Social interactions had lower overall relevance but were significant for youth, older adults, and marginalized groups (such as the unemployed). Proximity and visit frequency amplified benefits, although passive recreational activities remained predominant. The study advocates inclusive and participatory planning practices, highlighting the potential of parks to address social and health challenges in sustainable cities.
13	Preferring Local over Non-Local Parks? Green Space Visit Patterns by Urban Residents in Desert Cities, Arizona	2025	To investigate whether residents of urban neighborhoods use green spaces closer to their residences more frequently, focusing on Phoenix–Mesa, Arizona (USA).	Analysis of 2019 mobile phone tracking data to identify visitation patterns to local parks, assessing accessibility measures and the social composition of neighborhoods.	Approximately 40% of neighborhoods with available local parks did not prioritize their use. Visit frequency was associated with accessibility and neighborhood social characteristics, with particular emphasis on a nonlinear relationship between the proportion of Hispanic residents and local park use. The study highlights equity implications for urban green space planning.

14	Park Features, Neighborhood Environment, and Time Factors Affect Park Visitor Volume: A Meta-Analysis	2025	To identify, through a meta-analysis, the factors that influence visitor volume in urban parks, considering park attributes, neighborhood characteristics, and temporal aspects.	Meta-analysis of 30 studies, using a statistical technique that quantitatively combines results from multiple independent studies. Random-effects models were applied to estimate average associations between variables such as park size, facilities, population density, and temporal factors.	Park use was higher in areas with large, well-equipped, and well-maintained parks, as well as in neighborhoods with attractions as points of interest. Socioeconomically disadvantaged areas showed lower use, and factors such as water features, vegetation, and transportation exhibited mixed effects, varying by region.
15	Benefits of Various Urban Green Spaces for Public Health Based on Landscape Elements: A Study of Public Visual Perception	2025	To investigate how different landscape elements in urban green spaces influence public health and to propose optimization strategies for urban planning.	Five types of green spaces in Kunming were analyzed (forests, wetlands, urban parks, street green spaces, and residential areas) using semantic segmentation based on PSPNet to quantify landscape elements. Experiments with visual stimuli and analyses of physiological metrics and psychological questionnaires were conducted to assess effects on participants.	Urban forests and parks rich in natural elements (plants, soil, and mountains) had greater impacts on physiological and psychological restoration. Artificially designed spaces could produce similar benefits when they effectively mimicked natural elements. Specific elements—such as plants, soil, and mountains—were more determinant than aggregated indices. Excessive exposure to water negatively affected heart rate stabilization, whereas a higher presence of natural elements favored attention and well-being.

16	Assessing Urban Park Equity in China Through Supply and Demand Balance: A Case Study of Wuhan City, China	2025	To investigate equity in access to urban parks in Wuhan, China, considering park quality and the heterogeneity of demand among different population groups, with particular emphasis on older adults.	Development of a comprehensive evaluation index system incorporating park quality and differentiated demand patterns. Big data from multiple sources and spatial analysis were used to examine the supply and demand of park services and to identify the causes of mismatches.	Central areas were found to have better park quality and supply, while peripheral regions experienced greater deficits, even though demand remained more stable. Older adults were identified as a vulnerable group, with 28.25% of communities lacking adequate service provision. The study recommends expanding the capacity of central parks and prioritizing the creation of new parks in underserved suburban areas to reduce inequalities.
17	How to lead the optimization of parks spatial patterns more comprehensively with the philosophy of green equity: A case of Chengdu	2025	To analyze green equity in the distribution of urban parks in Chengdu, aligned with the United Nations Sustainable Development Goals, and to propose spatial optimization strategies.	Introduction of the Green Equity Index based on the Theil index to measure inequalities, combined with a Support Vector Regression (SVR) model to identify spatial patterns and guide planning solutions.	Accessibility to parks has improved in recent years; however, inequalities in the distribution of green spaces persist. The proposed optimization solution showed potential to efficiently allocate available resources and reduce inequalities, offering practical guidance for sustainable urban planning.
18	Mapping the emotional landscapes of parks in post-industrial communities enduring environmental injustices: Potential implications for biophilic city planning	2025	To analyze the emotional landscapes of urban parks in post-industrial communities marked by environmental injustices, using Camden (New Jersey, USA) as a case study.	Questionnaires were administered to park users and combined with GIS data and a mixed-methods approach to map sentiment patterns and assess perceptions of park attributes.	The study showed that the legacy of environmental injustice influences emotional experiences in parks, that impacts vary across cases and are not uniformly positive, and that larger parks closer to water bodies receive greater investment and more positive evaluations. In addition, users' locations influenced their emotional responses more strongly than factors such as race, ethnicity, or income.

19	Understanding residents' motivation, psychological involvement, and psychological well-being in urban parks	2025	To investigate how motivations for using urban parks influence psychological involvement and the well-being of residents in Dongguan, China..	Questionnaires were administered to 331 residents, and the data were analyzed using Structural Equation Modeling (SEM) and Principal Component Analysis (PCA) to identify factors and test relationships among motivation, involvement, and well-being.	Motivations positively affected psychological involvement and psychological well-being, with involvement acting as a partial mediator. The study recommends expanding leisure resources, accessibility, family-oriented areas, sports, and cultural facilities to strengthen psychological health and community cohesion.
20	Urban Park Planning for Sustainability: Resident Insights from China's Major Cities	2025	To develop a framework to understand and predict residents' spatial perceptions of urban parks, aiming to support sustainable and personalized park management.	Questionnaires were administered to 701 residents in three major urban parks in China (Chaoyang, Century, and Yuexiu). The analysis combined semantic differential (SD)—quantifying subjective perceptions on bipolar scales (e.g., pleasant—unpleasant, safe—unsafe); importance—performance analysis (IPA)—crossing the importance attributed to park elements with perceived performance; and cognitive mapping—to reveal how residents mentally organize park attributes.	Perceptual differences were identified among the three parks, with greater perceived privacy in Chaoyang Park due to stronger natural characteristics, while Century and Yuexiu Parks were better evaluated for aligning design with local needs. Cognitive maps revealed differences in familiarity with natural, social, and artificial landscape functions, reinforcing the importance of integrating design elements adapted to diverse preferences to strengthen sense of place.

21	Assessing Urban Park Accessibility and Equity Using Open-Source Data in Jiujiang, China	2025	To assess accessibility and equity in access to urban parks in Jiujiang, China, considering different dimensions (spatial, opportunity-based, and group-based).	Accessibility was measured using walking route data (via an open API), considering a 1,500 m buffer radius and analyzed through GIS tools to map spatial differences, opportunity-based differences, and disparities among social groups.	Central parks showed better accessibility, but fewer service opportunities within the 1,500 m radius. Strong disparities were identified between neighborhoods, with greater benefits for wealthier communities. The study recommends opening secondary entrances, removing barriers, and creating shared green spaces.
22	How to define urban park relevance? Examining and integrating US National Park Service and partner views on the goal of "relevance to all Americans"	2025	To explore how different perspectives on park "relevance" can be reconciled between the U.S. National Park Service (NPS) and its urban partners, within the context of the Urban Agenda and the goal of "relevance to all Americans."	Sixty-three interviews were conducted with NPS staff and partner organizations in Detroit, Tucson, and Boston. The analysis was based on a Collective Impact framework to examine convergence and divergence in views on park relevance.	Significant differences were identified between the perspectives of NPS staff and their partners, but also opportunities for strategic alignment. The institutional vision of the NPS can serve as a basis for setting shared goals and fostering collaborative planning at the urban scale.
23	How outdoor and indoor green spaces affect human health: a literature review	2025	To review studies on the effects of exposure to green spaces, both outdoor and indoor, on human health and the natural environment.	Literature review conducted in April 2024 using the PubMed, Web of Science, Scopus, Google Scholar, and Google Academic databases. Selected studies assessed the relationship between contact with vegetation and indicators of mental health, physical health, cognitive performance, environmental quality, and social cohesion.	Exposure to vegetation was associated with improvements in mental health (less stress, anxiety, and depression), physical health (blood pressure, heart rate, inflammation), cognition, social recovery, and social cohesion. It also contributed to environmental quality by mitigating heat and noise and strengthening sense of belonging and collective identity.

24	Quantifying physiological health efficiency and benefit threshold of greenspace exposure in typical urban landscapes	2024	To evaluate the physiological effects of exposure to different types of urban landscapes and to identify efficiency and benefit thresholds of greenspace exposure for health.	Social media comment data related to seven parks in Wuhan were analyzed, evaluating dimensions such as facilities, safety, maintenance, environment, and events. The analysis used big data and artificial intelligence techniques to provide real-time assessment.	Blue spaces showed faster efficiency (EEG: 4–5 min; HR: 1 min) but reached the benefit threshold in a shorter time (10 min). Open green spaces showed good initial efficiency (EEG: 5–6 min; HR: 1 min), while enclosed green spaces required more time to reach peak efficiency (EEG: 8–9 min; HR: 6–7 min). Overall, blue spaces were more effective for stress reduction, while open green spaces showed better physiological efficiency.
25	A new framework for assessment of park management in smart cities: a study based on social media data and deep learning	2024	To propose a framework based on machine learning to assess intelligent park management in smart cities, overcoming the limitations of traditional evaluation methods.	Foram analisados dados de comentários de redes sociais referentes a sete parques em Wuhan, avaliando dimensões como instalações, segurança, meio ambiente, atividades e serviços. A análise utilizou big data e inteligência artificial para fornecer uma avaliação em tempo real.	The framework identified management problems and showed that factors such as park type, season, and events (e.g., renovations) influence visitation and satisfaction. Compared with traditional methods, the approach proved more accurate and efficient, providing useful insights for intelligent park management and smart cities.
26	Assessment and optimization of spatial equity for urban parks: A case study in Nanjing, China	2024	To assess accessibility and equity in urban parks in Nanjing, China, integrating distance-based measures, park popularity, and residents' actual choices.	An improved version of the Two-Step Floating Catchment Area (2SFCA) method was applied, integrating real-time usage data to measure park popularity. The Huff model was used to analyze residents' park choices. Equity assessment employed the Gini index, Lorenz curves, and Bivariate Spatial Autocorrelation Analysis.	Central parks in Nanjing showed higher accessibility, while peripheral and disadvantaged communities experienced greater deficits. The study demonstrated pronounced inequities (10% of residents held 36% of accessibility), and only modest improvements were observed when equity was considered alongside park popularity.

27	Does supply match demand? Assessing the relationship between urban parks and residents from the perspective of equity and efficiency	2024	To analyze the relationship between the supply and demand of urban parks in Nanjing, identifying whether existing parks meet residents' needs in an equitable and efficient manner.	Mobile phone signaling data were used to estimate real park use patterns and their spatial overlap with residential areas. The analysis considered four indicators: Urban Park Supply Intensity (UPSI), Park Area Per Capita (PAC), Utilization Rate (UR), and Demand Satisfaction Rate (DSR). To explore factors influencing demand, a Spatial Lag Model (SLM) was applied.	Urban parks cover only about 30% of urban residences, and many areas show low per capita park supply. Most parks were found to efficiently meet local demand, with low demand satisfaction rates (DSR). The study concluded that mismatches between supply and demand are related to uneven spatial distribution, urban planning changes, and differing resident needs.
28	Evaluating the Accessibility of Seniors to Urban Park Green Spaces	2024	To assess accessibility and equity in access to urban green spaces (UPGS) for the elderly population in Ningbo, China, providing input for urban planning.	Urban blocks were used as the unit of analysis, applying the Two-Step Floating Catchment Area (2SFCA) method to measure accessibility based on walking distance. To assess equity, the study employed the Index of Accessibility Difference (IDA), hotspot analysis, and Pearson correlation coefficient.	Accessibility was found to be insufficient, especially in peripheral areas and neighborhoods with a higher concentration of older adults. Public transportation played a key role in improving equity, but spatial distribution remained uneven over time (15, 30, and 45 minutes). The study recommends increasing park supply and adjusting zoning regulations to improve equity and spatial distribution.
29	Spatial equity of urban parks from the perspective of recreational opportunities and recreational environment quality: A case study in Singapore	2024	To assess spatial equity of different categories of urban parks (regional, community, and composite) in Singapore, considering recreational opportunities and environmental quality.	A neighborhood-level evaluation system was developed using Lorenz curves, the Gini coefficient, and local spatial autocorrelation analysis to compare inequalities and distribution patterns.	Inequality in recreational opportunities was greater than inequality in environmental quality. Community parks showed higher inequity compared to regional parks. Both recreational opportunities and environmental quality were unevenly distributed, being concentrated in certain neighborhoods, creating privileged and underserved areas.

30	Towards a sustainable city: Deciphering the determinants of restorative park and spatial patterns	2024	To investigate how observable factors (vegetation, water, visual characteristics) and perceptual factors (landscape preference, place attachment) influence psychological restoration in urban parks and to identify their spatial patterns..	The study was conducted in an urban park in Wuhan, China. A total of 1,560 collaborative images were collected through a public participation geographic information system (PPGIS) and analyzed using deep learning methods to extract landscape visual qualities. Statistical models were applied, including Ordinary Least Squares (OLS), Quantile Regression (QR), and Multiscale Geographically Weighted Regression (MGWR), to assess restorative factors and spatial variations.	Landscape preference, place attachment, and the presence of vegetation and water were strongly associated with psychological restoration. However, restoration intensity varied according to park location and spatial context, revealing spatial heterogeneity. Different areas of the park showed distinct potentials for promoting psychological well-being.
31	The Restorative Effects of Urban Parks on Stress Control Ability and Community Attachment	2024	To investigate how perceived restorative effects of urban parks influence stress reduction and the strengthening of community attachment.	Questionnaires were administered to urban park users to assess perceptions of psychological restoration, stress management ability, and attachment to the community.	Time spent in parks significantly improved stress control capacity and increased place attachment. Participants who reported lower perceived restorative effects showed weaker stress management outcomes. The findings confirm the role of urban parks in mental health promotion and social connection.
32	How does multiscale greenspace exposure affect human health? Evidence from urban parks in the central city of Beijing	2024	To explore how exposure to green spaces at multiple spatial scales (local and subdistrict levels) is associated with residents' physical and self-rated mental health.	Questionnaires were applied to 1,017 residents in Beijing. Objective and subjective measures of greenspace exposure were analyzed using multiple regression models and pathway analyses to examine relationships with health outcomes.	Local-scale greenspace exposure had a stronger impact on mental health, mainly through aesthetic quality and opportunities for rest. Subdistrict-scale park density was more strongly associated with physical health and increased frequency of use. The study confirms that multiscale greenspace effects should be considered in urban planning to promote public health.

33	Study on the Spatial Arrangement of Urban Parkland under the Perspective of Equity—Taking Harbin Main City as an Example	2024	To evaluate spatial and social equity in access to urban parks in Harbin, with a focus on vulnerable populations such as older adults and children.	Points of interest (POI) and areas of interest data were combined with kernel density estimation and GIS-based spatial analysis to map park accessibility. The relationship between supply and demand was measured using the Two-Step Floating Catchment Area (2SFCA) method. Equity was assessed using the Lorenz Curve, Gini Coefficient, Participation Index, and Location Entropy Index.	Urban parks were concentrated in a limited number of areas and served only a portion of the population. The supply–demand relationship was insufficient, with pronounced inequality (Gini = 0.407). Older adults and children in low-income areas faced the lowest levels of access, confirming significant socio-spatial inequity.
34	How do urban parks, neighborhood open spaces, and private gardens relate to individuals' subjective well-being: Results of a structural equation model	2024	To investigate how different types of green infrastructure—urban parks, neighborhood open spaces, and private gardens—are associated with subjective well-being.	An online questionnaire was administered to 322 residents in the Netherlands. Data were analyzed using structural equation modeling (SEM) to assess direct and indirect effects of satisfaction with green spaces on subjective well-being.	Satisfaction with neighborhood greenery had a stronger positive impact on subjective well-being than satisfaction with urban parks. The size of private gardens indirectly influenced well-being by increasing satisfaction with neighborhood green spaces. Satisfaction with neighborhood greenery showed a consistent positive relationship with well-being, regardless of frequency of use.
35	Understanding the sociocultural valuation of ecosystem services in urban parks: a Colombian study case	2024	To investigate the sociocultural values attributed to ecosystem services in five urban parks in Tunja, Colombia.	Semi-structured interviews were conducted with three stakeholder groups (public managers, social leaders, and park users) to identify perceptions and preferences regarding ecosystem services.	Eighteen ecosystem services were identified, with cultural services being the most prominent. Sociocultural values were more strongly influenced by park characteristics than by size, with no significant influence of age, gender, or education. Discrepancies were identified between the perspectives of governmental and non-governmental managers, which may affect policy formulation.

36	An analysis of the effects of different urban park space environment construction on national health	2024	To analyze the multiple health benefits of urban green spaces, including physical and mental health, social interaction, and environmental sustainability, highlighting factors that promote successful implementation and existing challenges.	In-depth case studies were conducted in three parks in China (People's Park in Linyi, Youth Park in Lanshan, and Yumin Park in Yunnan), combined with international reference cases (the High Line in New York and Emscher Landscape Park in Germany) for comparative analysis..	Urban green spaces were shown to be essential for well-being and social cohesion; however, they still face barriers related to land availability and equitable resource distribution. The study highlights the importance of adopting justice-oriented spatial strategies, revising urban policies, and promoting inclusive governance. It also identifies gaps, such as the lack of longitudinal studies and limited understanding of socioeconomic inequalities in park use.
37	A user-based approach for assessing spatial equity of attractiveness and accessibility to alternative urban parks	2024	To propose a user-based method for assessing the attractiveness of urban parks in Tehran, considering inequalities in access and use.	Park attractiveness was modeled based on travel time, available leisure time, and user behavior. Indicators such as Duration of Use Inequality, Visit Frequency, and Choice Opportunity were applied, combined with traffic analysis zones and regional park data.	The method revealed significant inequalities among users, showing that some neighborhoods had substantially higher opportunities for park use than others. In comparison, traditional service-based indices tended to mask these differences and were effective only at a regional scale. The proposed model provides a more detailed understanding of local-scale inequalities in park accessibility and attractiveness.

38	Associations between the perception of ecosystem services and well-being in urban parks	2023	To analyze associations between users' perceptions of cultural ecosystem services and well-being in urban parks in Recife, Brazil.	A total of 481 questionnaires were applied in ten urban parks. Data on park perception, self-perceived health, and willingness to pay were analyzed using Stata 14, with four ordinal logistic regression models.	Users with better mental health and lower stress reported higher perceptions of ecosystem service benefits. Willingness to pay was also associated with positive park perceptions. The study reinforces the role of ecosystem services in promoting well-being and highlights the need to incorporate them into urban park planning.
39	The role of urban parks in affecting health outcomes and the differences between vulnerable groups: Evidence from the central city of Beijing	2023	To understand how urban parks influence public health and environmental justice outcomes in Beijing, with particular attention to older adults and low-income populations.	Different types of green spaces and their spatial distribution across subdistricts were analyzed. Multiple linear regression models were applied to assess the impact of factors such as quantity, density, distance, and park quality on residents' health.	Urban parks had a stronger impact on health than other types of green spaces. For older adults, park density and distance were decisive factors, while for urban residents overall, vegetation quality had a greater influence. The study concludes that accessible and free urban parks should be prioritized in urban planning to improve public health and reduce inequalities.
40	Does the Urban Park Provision Fit the Social Needs of the Community? Evidence for Semarang City, Indonesia	2023	To identify which categories of park services best meet community needs in Semarang, Indonesia.	Semi-structured questionnaires were applied to 100 users in five urban parks. Data were analyzed using a scoring method and compared with hypothetical reference categories.	Urban park services were generally classified as "medium," with strengths in facilities, quality, tree diversity, cleanliness, air quality, ventilation, and social use. However, some services did not fully meet community needs, indicating the necessity of targeted improvements to better adapt parks to local demands..

41	Green spaces for whom? A latent profile analysis of park-rich or -deprived neighborhoods in New York City	2023	To classify neighborhoods in New York City according to socioeconomic characteristics and green space provision, in order to understand patterns of park distribution.	Latent profile analysis was applied to group neighborhoods probabilistically based on combinations of socioeconomic characteristics and green space provision indicators.	Urban parks were not evenly designed or distributed; their presence varied according to the socioeconomic profiles of neighborhoods. The analysis identified differentiated patterns among social and local groups, reinforcing the need for context-sensitive policies to promote green equity and socio-spatial justice.
42	The Importance of Urban Green Spaces in Enhancing Holistic Health and Sustainable Well-Being for People with Disabilities: A Narrative Review	2023	To discuss how urban green spaces can improve health, well-being, and quality of life for people with disabilities, emphasizing inclusion in sustainable urban planning..	Conceptual and narrative review article addressing different levels of disability experience (global, population-level, individual) and different modes of interaction with green spaces (active, passive, direct, and indirect).	People with disabilities receive less attention in access to services and green spaces, despite having high potential to benefit from these environments. The study highlights that sustainable urban policies should prioritize inclusion, expanding environmental, social, and economic benefits and contributing to more equitable and sustainable cities.
43	The optimal spatial delineation method for the service level of urban park green space from the perspective of opportunity equity	2023	To investigate spatial equity in access to urban park green spaces (UPGS) in the district of Yingge, Taiwan, considering both quantity and quality to support fairer urban planning.	A modified micro-scale accessibility approach was applied, using buildings as demand points and service catchments as supply areas. Different service radii were compared, and UPGS quality was incorporated into the assessment.	Significant differences were identified when a uniform service radius was applied, revealing access inequalities. Including quality in the analysis highlighted areas with both high and low service levels. The delimitation method improved public resource allocation and supported better infrastructure planning, ensuring residents had adequate access to parks with satisfactory quality.

44	Policy-maker and Practitioner Perceptions of Parks for Health and Wellbeing: Scoping a Holistic Approach	2023	To investigate how different qualities of urban parks—such as size, types of facilities, accessibility, community engagement, and green–blue infrastructure— influence health and well-being outcomes in cities, within the broader <i>Better Parks, Healthier for All</i> project.	An online focus group was conducted in May 2021, during the COVID-19 context, with 19 specialists from New South Wales, Australia, including park providers, policymakers, designers of green spaces, and public health researchers. Data were analyzed using thematic analysis.	The analysis revealed a holistic view of park quality, in which each space plays a complementary role within an integrated network of benefits. Co-design and community engagement were highlighted as essential to strengthen a sense of belonging and park use. The study concludes that well-connected and well-planned parks are fundamental infrastructures for health, well-being, and environmental sustainability.
45	Assessment of spatial equity of urban park distribution from the perspective of supply-demand interactions	2023	To assess equity in the spatial distribution of urban parks by overcoming traditional approaches that focus only on supply, incorporating residents' demand, usage preferences, and scale effects.	A composite index called Supply–Demand Equity Index (SDEI) was developed, combining accessibility to parks most frequently used and closest to residents (supply) with residents' perceptions obtained through surveys and population density. Data were analyzed at the neighborhood scale to capture supply–demand interactions more precisely.	Results showed that accessibility-based indicators better represented service provision than proximity alone, while demand-based approaches captured residents' perceptions but revealed hidden inequalities. The SDEI identified spatial mismatches between supply and demand, revealing inequitable patterns. The study concludes that combining indicators produces more robust assessments and has direct implications for urban park planning.
46	The Productive Role of Future Expectations in Participatory Spatial Planning. A Case Study on Urban Park Development in The Netherlands	2023	To examine the role of future expectations in spatial planning, a dimension still underexplored in the literature, using participatory planning processes in the development of Seelig Park, in Breda, the Netherlands.	A grounded theory approach was applied to analyze the participatory planning process, focusing on how expectations emerge, evolve, and influence decisions over time.	Expectations were found to be flexible, dynamic, and diverse, functioning as mechanisms of “recalibration” that shape the ongoing planning process. The study concludes that productive expectations help balance legitimacy and equity within the politically negotiated context of spatial planning.

47 Assessment and planning of green spaces in urban parks: A review	2023	To analyze how investments in green areas and sustainable development policies can enhance urban parks and contribute to population well-being, emphasizing the importance of spatial planning in large cities.	This is a review article that employed Geographic Information System (GIS) techniques to assess accessibility, guide spatial changes, and identify relationships between the proportion of green areas and the creation of green corridors.	The study showed that high proportions of green coverage favor the establishment of green corridors, which are essential for urban balance. The proposed methodology allows the adaptation of vegetation to lot design, supports urban requalification plans, reduces flood risks, and promotes biodiversity and heritage preservation through durable green spaces.
48 Impact of Urban Historical Parks on Physical Activity and Public Health in Beijing	2022	To explore the influence of urban historical parks on residents' physical activity and public health, based on a study of three emblematic parks in Beijing—Beihai Park, the Forbidden City, and the Temple of Heaven—and to propose recommendations for their management and revitalization.	Levels of residents' physical activity, park characteristics, and general public health were investigated. Statistical correlation methods were applied to analyze relationships between environmental, social, and health-related variables.	Physical activity in historical parks was associated with tranquility, attractiveness of the landscape, and available space. Physical activity correlated with companionship, while mental health was related to education level, frequency of visits, and scenic qualities. These parks play a central role in cultural preservation and social cohesion, in addition to providing health benefits.

49	Park equity: Why subjective measures matter	2022	To investigate how subjective perceptions of park quality and availability vary according to race/ethnicity, income, and metropolitan region in the United States, advancing beyond studies focused solely on objective access measures such as proximity.	Data from a survey conducted in six metropolitan areas were analyzed using mixed linear models to test interactions between race/ethnicity and region. Both subjective perceptions and objective metrics—such as ParkScore , which evaluates park access and quality—were considered.	Perceptions of park quality and availability varied across regions, being more critical in Baltimore and Los Angeles, less negative in Boston, and more positive in Phoenix and Minneapolis–St. Paul. Black and Hispanic residents reported more park-related problems, although Hispanic respondents also perceived improvements more frequently. Overall, income was not a determining factor, and subjective perceptions generally aligned with ParkScore objective metrics.
50	Assessing the social equity of urban parks: An improved index integrating multiple quality dimensions and service accessibility	2022	To propose an improved assessment of environmental equity in urban parks by integrating both accessibility and multidimensional quality, with a focus on socially vulnerable groups such as older adults, children, and unemployed populations.	An index was developed combining quality dimensions—including aesthetic features (AFs), facilities and recreational functions (FCS)—with accessibility measures, resulting in a total composite score (TS). The index was applied to urban parks in Xangai, considering different socioeconomic groups.	Convenience facilities were the most accessible services, followed by aesthetic and recreational aspects. Older adults and unemployed populations had greater access to higher-quality parks, while children experienced lower access. The proposed index proved effective for guiding planning and management, highlighting the importance of balancing supply and demand and improving park quality to enhance social equity.

51	Sustainable low-input urban park design based on some decision-making methods	2022	To develop methodologies that incorporate Life Cycle Costing (LCC) and rational resource use in order to optimize the design and maintenance of urban parks, making them more sustainable and cost-effective.	The study was conducted in Mashhad, Iran, comparing two park design scenarios: a conventional design based on general project standards and a low-investment design emphasizing sustainability. Methods from Value Engineering (VE), Multicriteria Decision Making (MCDM), and Risk Management (RM) were integrated to select indicators and analyze costs.	The low-investment plan reduced total costs by 62.7% compared to the conventional design, mainly due to reduced resource consumption and lower long-term maintenance costs, despite slightly higher initial expenses. The study concludes that VE is an effective tool for balancing costs, improving project quality, and supporting sustainable urban park management.
52	How urban parks nurture eudaimonic and hedonic wellbeing: An explorative large scale qualitative study in Québec, Canada	2022	To investigate urban park users' perceptions regarding their motivations for using these spaces, their impacts on well-being, and the park qualities that underpin these benefits.	Interviews were conducted with 449 adults across 20 urban parks in four cities in Québec, Canada. Thematic analysis was applied to identify patterns in users' motivations and perceived effects.	Three overarching themes explained park use: caring for oneself, caring for children, and caring for others. Users sought both hedonic well-being , related to leisure and pleasure, and eudaimonic well-being , associated with connection to oneself and to others. The study concludes that urban parks play a fundamental role in health promotion and should be prioritized in urban planning.
53	The role of the state in preserving urban green infrastructure - National Urban Parks in Finland and Sweden	2022	To analyze how different implementation models of National Urban Parks (NUPs) influence their effectiveness as instruments for preserving green infrastructure in cities.	A comparative analysis was conducted between two implementation approaches: a top-down model imposed by the state, as observed in Sweden, and a bottom-up model initiated by municipalities and civil society, as in Finland. The study examined the role of the state and local governments in the creation and management of NUPs.	In Sweden, the top-down model resulted in resistance from municipalities, limiting future development. In Finland, the bottom-up model led to broader acceptance of NUPs, as municipalities competed for their designation. The study concludes that although NUPs are effective tools for protecting green areas, their success depends strongly on the implementation model.

54	Associations between greenspace and mental health prescription rates in urban areas	2021	To expand understanding of the relationship between the availability of urban green spaces and mental health, analyzing how these spaces impact prescription rates for mental health disorders at a national scale in Scotland.	Linear mixed-effects models were applied to all Scottish settlements with more than 10,000 inhabitants. Greenspace availability was measured at two spatial scales—immediate neighborhood and up to a 30-minute walking distance—while controlling for sociodemographic variables, spatial autocorrelation, and health board effects.	In areas with a higher proportion of ethnic minorities and families experiencing multiple deprivation, greater availability of nearby green spaces was associated with lower prescription rates for mental health disorders. No significant association was found for green spaces within a 30-minute walking distance. The findings indicate that the mental health benefits of green spaces vary according to population profiles, providing important insights for urban planning and national-level policy.
55	Do persons with low socioeconomic status have less access to greenspace? Application of accessibility index to urban parks in Seoul, South Korea	2021	To examine socioeconomic inequalities in access to urban parks in Seoul, South Korea, framing park accessibility as an environmental justice issue.	Two parks provision metrics were analyzed: total park area per capita (TPPC) and an accessibility index that considers park size and proximity. Correlation and regression analyses were conducted at multiple administrative levels— 25 districts and 424 neighborhoods —relating these metrics to socioeconomic variables.	The accessibility index proved more sensitive to inequalities than TPPC. Areas with a higher proportion of elderly residents and low-income populations showed greater access to parks, while areas with higher divorce rates exhibited lower accessibility. The findings indicate that detailed measures incorporating proximity and park size better capture environmental inequalities than simple metrics, providing relevant guidance for urban planning.

56 Assessing the performance of urban open space for achieving sustainable and resilient cities: A pilot study of two urban parks in Dublin, Ireland	2021	To evaluate how urban open spaces contribute to urban resilience and sustainability in the context of climate change and urbanization, proposing a method to assess their socioecological performance.	A methodology was developed using 26 measurable indicators related to ecosystem services and spatial configuration. The index was applied to two urban parks in Dublin, Ireland, as a pilot study to test its usefulness.	The index proved effective in assessing the contribution of urban parks to urban resilience, enabling the identification of strengths and weaknesses in park design. The proposed method serves as a practical tool for urban planners and managers, supporting both the evaluation of existing open spaces and the planning of new ones, reinforcing the integration of urban design and sustainability.
57 The neighborhood socioeconomic inequalities in urban parks in a High-density City: An environmental justice perspective	2021	To investigate how the quantity and quality of urban parks are related to socioeconomic deprivation and the presence of ethnic minorities at the neighborhood level, using Hong Kong as an example of a high-density city.	A total of 102 urban parks distributed across 209 Tertiary Planning Units (TPUs) were evaluated. Park quantity and quality were measured objectively between April and June 2018 using Geographic Information Systems (GIS) and a Community Park Audit Tool.	No direct association was found between the quantity of parks and amenities, safety, or aesthetics with socioeconomic deprivation or ethnic minorities. However, areas with greater socioeconomic deprivation showed higher park quantity but lower diversity of facilities. Neighborhoods with a higher presence of ethnic minorities had parks with fewer facilities and lower diversity, revealing distributive inequalities.

58	The planning and design of good quality urban parks in China: the perspectives of technical professionals	2021	To investigate the factors influencing the quality of urban parks during the planning, design, and investment phases, considering political, technical, and governance barriers.	Interviews were conducted with technical professionals working as consultants for local governments in urban planning and landscape projects across different regions of China.	The study identified three main factors influencing park quality: reliance on quantitative metrics in contemporary planning; the relationship between political will, leader prestige, and administrative engagement; and the importance of technical expertise and effective communication between managers and professionals. These elements directly shape the planning and design of high-quality urban parks.
59	Promoting goal-driven performance evaluation: a case study of an urban park in Florida, USA	2021	To highlight the importance of goal-oriented performance evaluation in landscape projects, demonstrating its application through a case study of an urban park in Florida, USA.	Depot Park was analyzed by assessing its level of achievement in relation to four project objectives defined at the outset. The research included a review of the planning process and an analysis of the results achieved.	The study showed that it is possible to verify whether a project is progressing toward its objectives; however, measuring the level of achievement remains challenging. The findings emphasize the need to establish clear goals, benchmarks, and comparative performance measures to improve future evaluations of landscape projects.
60	Urban green spaces for the social interaction, health and well-being of older people— An integrated view of urban ecosystem services and socio-environmental justice	2020	To analyze how older adults use urban green spaces in Berlin (Germany) and which social and health factors influence this use, relating the findings to dimensions of socio-environmental justice.	Comprehensive data were used on park visitation patterns, demographic characteristics, and social networks of older adults, allowing the identification of associations between social context, health, and frequency of park use.	Older adults with strong social ties (children, friends, close neighbors) visit parks more frequently, while socially isolated individuals use green spaces less. In addition, a positive perception of health increases visitation frequency. The study proposes integrating ecosystem services, social ties, and socio-environmental equity into urban planning.

61	Social and Structural Determinants of Self-Rated Health in Gentrifying Neighborhoods in Austin, Texas: A Cross-Sectional Quantitative Analysis	2022	To analyze how social and structural factors influence self-rated health in neighborhoods of Austin undergoing gentrification.	A cross-sectional quantitative study was conducted using multivariate statistical analysis based on population and neighborhood-level data.	C Housing conditions, racial composition, socioeconomic status, and gentrification directly affect perceived health, revealing social inequalities. The study recommends urban planning policies that integrate social justice and health equity.

SWOT ANALYSIS OF ESG PRACTICES AMONG RURAL SUGARCANE PRODUCERS IN THE STATE OF SÃO PAULO

ANÁLISE SWOT DE PRÁTICAS ESG ENTRE PRODUTORES RURAIS DE CANA-DE-AÇÚCAR NO ESTADO DE SÃO PAULO

ANÁLISIS FODA DE LAS PRÁCTICAS ESG ENTRE LOS AGRICULTORES DE CAÑA DE AZÚCAR EN EL ESTADO DE SÃO PAULO

<https://doi.org/10.56238/sevened2026.019-025>

Letícia de Almeida Fiori¹, Jeronimo Alves dos Santos², Marta Cristina Marjotta-Maistro³

ABSTRACT

This article aimed to analyze Environmental, Social, and Corporate Governance (ESG) practices among sugarcane producers in the state of São Paulo, seeking to identify their potential impacts and challenges. Specifically, the SWOT methodology was applied to assess the relevance of ESG adoption, as well as to characterize the organizational environment, considering variables from both the general and task environment, in order to understand internal and external factors that influence its implementation. The research was based on bibliographic and documentary review, with emphasis on sustainability reports from companies in the sugar-energy sector, integrating discussions on agribusiness and corporate governance. The results indicated that, in the environmental dimension, strengths such as circular economy and the use of clean technologies prevail, while weaknesses remain related to the use of fossil fuels and waste management. In the social dimension, progress was observed in inclusion and community projects, although gaps persist in equity and the participation of small producers. In the governance dimension, certifications and compliance structures stand out, contrasting with limitations in cybersecurity and the difficulties of independent producers to adhere. It is concluded that the effective incorporation of ESG strengthens the sustainability and competitiveness of the sector, provided it is accompanied by innovation, capacity building, and integrated management strategies. It should be noted as a limitation the dependence on secondary sources, especially reports from mills, which may reduce the representativeness of small and medium-sized producers.

Keywords: Sustainability. Corporate Governance. Competitiveness. Agribusiness. Circular Economy.

RESUMO

Este artigo teve como objetivo analisar as práticas de Governança Ambiental, Social e Corporativa (ESG) entre produtores rurais de cana-de-açúcar no estado de São Paulo, buscando identificar seus potenciais impactos e desafios. Especificamente, pretendeu-se aplicar a metodologia SWOT para avaliar a relevância da adoção do ESG, bem como caracterizar o ambiente organizacional, considerando variáveis do ambiente geral e de tarefa, a fim de compreender fatores internos e externos que influenciam sua implementação. A pesquisa fundamentou-se em revisão bibliográfica e documental, com ênfase em relatórios de sustentabilidade de usinas do setor sucroenergético, integrando discussões sobre agronegócio e governança corporativa. Os resultados indicaram que, no eixo ambiental, predominam forças como a economia circular e o uso de tecnologias limpas, enquanto persistem fragilidades ligadas ao uso de combustíveis fósseis e à gestão de resíduos. No eixo social, evidenciam-se avanços em inclusão e projetos comunitários, embora haja lacunas em equidade e na participação de pequenos produtores. Já no eixo governança, destacam-se certificações e estruturas de compliance, contrastando com limitações em cibersegurança e dificuldades de adesão de produtores independentes. Conclui-se que a incorporação efetiva do ESG fortalece a sustentabilidade e a competitividade do setor, desde que acompanhada de inovação, capacitação e estratégias integradas de gestão. Cabe destacar como limitação a dependência de fontes secundárias, especialmente relatórios de usinas, o que pode reduzir a representatividade de pequenos e médios produtores.

Palavras-chave: Sustentabilidade. Governança Corporativa. Competitividade. Agronegócio. Economia Circular.

RESUMEN

Este artículo tuvo como objetivo analizar las prácticas ambientales, sociales y de gobernanza corporativa (ASG) entre los productores de caña de azúcar en el estado de São Paulo, buscando identificar sus potenciales impactos y desafíos. Específicamente, se buscó aplicar la metodología FODA para evaluar la relevancia de la adopción de ASG, así como caracterizar el entorno organizacional, considerando variables del entorno general y de la tarea, con el fin de comprender los factores internos y externos que influyen en su implementación. La investigación se basó en una revisión bibliográfica y documental, con énfasis en informes de sostenibilidad de ingenios del sector azucarero-energético, integrando discusiones sobre agronegocios y gobernanza corporativa. Los resultados indicaron que, en el eje ambiental, predominan fortalezas como la economía circular y el uso de tecnologías limpias, mientras que persisten debilidades relacionadas con el uso de combustibles fósiles y la gestión de residuos. En el eje social, se evidencian avances en inclusión y proyectos comunitarios, aunque existen brechas en equidad y en la participación de pequeños productores. En el ámbito de la gobernanza, destacan las certificaciones y las estructuras de cumplimiento, en contraste con las limitaciones en ciberseguridad y las dificultades en la adopción de los principios ESG (Ambientales, Sociales y de Gobernanza) por parte de los productores independientes. Se concluye que la incorporación efectiva de los criterios ESG fortalece la sostenibilidad y la competitividad del sector, siempre que se acompañe de innovación, capacitación y estrategias de gestión integradas. Una limitación a destacar es la dependencia de fuentes secundarias, especialmente informes de ingenios azucareros, lo que puede reducir la representación de los pequeños y medianos productores.

Palabras clave: Sostenibilidad. Gobierno Corporativo. Competitividad. Agroindustria. Economía Circular.

1 INTRODUCTION

Sustainable practices play an important role in all organizational sectors, including agriculture. From 2004 onwards, such practices began to receive greater attention on the international scene, driven by the "*Who Cares Wins*" report, the result of an initiative of the United Nations (UN) in partnership with the financial market. This discussion focused on investment security, highlighting the need for organizations and products to incorporate environmental, social, and governance criteria into their operations, in order to promote positive impacts and foster more sustainable investments (Global Compact, 2025).

In this context, the concept of ESG (Environmental, Social and Governance), although still often interpreted as a market trend, establishes a direct relationship with the Sustainable Development Goals (SDGs), configuring itself as a strategic instrument for the incorporation of sustainability into corporate and sectoral practices (Global Compact, 2025). The adoption of sustainable practices is intrinsically linked to well-structured governance models that are appropriate to the reality in which the organization operates, enabling greater integration between stakeholders and favoring expanded attention to the environmental and social dimensions (Caetano, 2023).

The implementation of ESG in the rural context requires a comprehensive assessment of existing processes, interactions with *stakeholders*, and the potential positive or negative impacts resulting from this adoption. The integration of ESG principles can occur in different dimensions of agricultural property: in the environmental pillar, through the management and conservation of water and soil resources; in the social pillar, through the guarantee of human and labor rights; and in the governance pillar, with a focus on risk management and alignment among stakeholders (Brazilian Institute of Sustainability, 2021). In the case of sugarcane, a prominent crop in Brazil and particularly in the state of São Paulo, its development is favored by factors such as logistical infrastructure, proximity to educational and research institutions, and the presence of cooperatives and associations that bring together a large number of producers (Government of the State of São Paulo, 2023b).

Thus, the objective of this research was to analyze the practices of Environmental, Social and Corporate Governance (ESG) for rural producers in the context of the State of São Paulo, in order to identify their potential environmental and social impacts.

Specific Objectives:

- a. Conduct an analysis using the SWOT Methodology to assess the relevance and challenges of ESG for rural producers.

- b. To characterize the organizational environment of rural sugarcane producers in the state of São Paulo, in order to understand the factors that influence the adoption of ESG practices

2 LITERATURE REVIEW

The implementation of ESG practices in agribusiness has gained increasing relevance, especially in a sector where several areas interact and the balance between them is essential to avoid excessive exploitation in search of economic results. The issue of deforestation for the opening of new agricultural areas, in contrast to the exponential increase in demand for food production in Brazil, exemplifies the challenges faced by agribusiness. Such situations have intensified the pressure on the sector to adapt to ESG parameters, seeking to harmonize environmental sustainability with production needs (Senar, 2023).

According to data from the Department of Agriculture and Supply, the state of São Paulo has approximately 350 thousand rural producers working in various niches. This contingent plays a significant role in the Brazilian context, standing out not only for the extension of the harvested area in hectares and the high average yield, but also for its relevance in exports, crop diversification, job creation, and contribution to the state's Gross Domestic Product (GDP). These factors highlight the importance of the rural sector compared to large urban centers, not only in food production, but also in its indirect impacts on the economy and society (Government of the State of São Paulo, 2023a).

Sugarcane production can be greatly benefited by the adoption of sustainable practices based on ESG principles. Measures such as reducing greenhouse gas (GHG) emissions, private social investment, and improving working conditions in rural areas and in companies contribute to obtaining and regulating sustainable certifications and titles. These actions not only generate positive impacts on the environment and society, but also promote financial returns, strengthening the competitiveness and reputation of the sector (Melo, 2025).

3 METHODOLOGY

3.1 DATABASE

The study will be developed through a literature review, including academic papers, institutional publications and sustainability reports, including ABNT PR 2030, a recommendation of the Brazilian Association of Technical Standards for the implementation of ESG (*Environmental, Social and Governance*) in Brazil. The qualitative analysis will follow an explanatory approach (Gil, 2008), seeking to identify factors that

influence the adoption of sustainable practices in rural areas. According to Manzo (1971), this methodology allows exploring and deepening areas of knowledge that have not yet been consolidated. Based on the characterization of the standards, the SWOT methodology will be applied to assess strengths, opportunities, weaknesses and threats of the rural sector in the Brazilian context.

3.2 SWOT ANALYSIS

SWOT (Strengths, Weaknesses, Opportunities and Threats) analysis, or FOFA, is a widely used methodology to assess an organization's internal and external environments, allowing the identification of competitive advantages, weaknesses, growth opportunities, and risks (Hofrichter, 2021; Fischmann, 1991). An example is the study by the Muza Brasil Cooperative, focused on the commercialization of handicrafts from banana by-products, which presented strengths such as government support and export incentives, and weaknesses such as income limitations and high technological costs (Appio et al., 2009).

The strengths correspond to internal factors that confer competitive advantages, such as resources, product quality and organizational skills. In the study by Amorim (2015) on the dairy industry in Pará, the low barrier to entry of new companies and government incentives stand out, even in the face of consolidated competition.

Opportunities are external factors that favor growth, such as access to resources or favorable market conditions. Galvão (2008), when diagnosing tourism in Itabaiana (PB), identified opportunities such as strategic location, logistics infrastructure and cultural appreciation.

Weaknesses refer to internal limitations that compromise competitiveness, such as high costs and low qualification of the workforce. Dourado (2020) identified, in beef cattle farming, weaknesses such as lack of standardization, low sensory quality, and absence of regulation due to deficiency in inspection.

Threats are external factors that pose risks, such as regulatory, economic, or climate changes. Gonçalves (2024) pointed out, in a private environmental reserve, threats such as climate change, user negligence, and industrial pollution, which compromise sustainability and alignment with the SDGs.

3.3 GENERAL ENVIRONMENT AND TASK ENVIRONMENT

The general environment comprises the entire ecosystem in which the organization is inserted, including agents, conditions and variables that directly or indirectly influence its

operations (Chiavenato, 2007). Given the complexity and dynamics of the market, it is essential to map these variables in order to develop an efficient strategic plan, capable of adapting the organization to changes and supporting decision-making (Matos, 2007). Among these variables, the technological ones stand out, which refer to the constant advancement of innovations, whether developed internally or acquired externally, playing a fundamental role in the optimization of processes and operations.

Legal variables are also relevant, as they involve laws and regulations that structure society, and can be presented as impositions or incentives, while establishing limits and obligations for organizations. Political variables, on the other hand, encompass the political context that influences operations, strategies, and workforce, including public policies and specific regulations. Economic variables, in turn, directly affect business performance, reflecting on profitability, purchasing power, investment capacity, and the dynamics of supply and demand. In addition, demographic factors, such as culture, religion, gender, and age group, shape market and communication strategies, while ecological variables are related to physical and natural aspects that impact the sustainability of operations and socio-environmental responsibility. Finally, cultural variables, which encompass values, beliefs, and practices, influence the behavior of stakeholders and the way the organization relates to its stakeholders (Matos, 2007).

The task environment refers to the context directly linked to the organization, composed of variables that impact goals, objectives and results, significantly influencing the strategic and operational direction. In this environment, the suppliers of inputs stand out, responsible for guaranteeing raw materials and resources indispensable for the functioning of organizational activities, as well as customers or users, who represent the final consumers of the products or services and whose satisfaction is decisive for the success of the organization (Daft, 2003).

Another essential factor is the competitors, which are part of the same sector and compete for consumer preference, in addition to influencing the dynamics of the market and the company's position in relation to other actors. Regulatory entities are also included, responsible for supervising and standardizing activities, ensuring compliance with applicable laws, policies and regulations. These elements, together, make up a scenario that requires constant attention and strategic adaptation on the part of organizations (Daft, 2003).

4 RESULTS AND DISCUSSIONS

The SWOT methodology was applied to the three axes of ESG — Environmental, Social and Governance — to assess the relevance, potentialities and challenges of the implementation

of ESG principles by rural producers in the sugar-energy sector, based on sustainability reports from sugarcane producers in different regions of São Paulo. In addition, the organizational environment was analyzed, segmented into general and task (Daft, 2003). In the general environment, technological, legal, political, economic, demographic, ecological and cultural variables are examined, which largely influence the organization's ecosystem. In the task environment, suppliers, customers, competitors and regulatory entities are evaluated, considering factors that directly impact the organizational functioning.

5 ENVIRONMENTAL

Tables 1 and 2 present the application of the SWOT methodology to the environmental axis, with the objective of analyzing the internal (strengths and weaknesses) and external (opportunities and threats) aspects related to rural producers in the sugar-energy sector.

5.1 INTERNAL FACTORS: STRENGTHS AND WEAKNESSES

The analysis of the environmental axis shows advances in the adoption of sustainable practices by rural producers in the sugarcane sector in São Paulo. Strategies such as the use of pre-sprouted seedlings (MPB), raw sugarcane harvesting, green manures and biological pest control contribute to soil conservation and the reduction of greenhouse gas (GHG) emissions.

The diversification of energy sources, with biofuels, solar energy, and biomass, provides greater energy autonomy and reduces the carbon footprint. The reuse of water in industrial processes also reinforces environmental commitment. Environmental recovery projects, including restoration of Permanent Preservation Areas (PPAs), reforestation, and production of native seedlings, demonstrate efforts to preserve local fauna and flora, complemented by conservation partnerships.

The use of sugarcane by-products, such as vinasse, filter cake, soot and biomass, strengthens the circular economy, allowing the production of organic fertilizers, cogeneration of clean energy and reduction of inadequate waste disposal.

Among the weaknesses, the predominant use of fossil fuel-powered machinery and the limitation in the reuse of some by-products, such as soot, stand out, indicating the need for research and innovation. Other weaknesses include treatment of contaminated areas, control of hazardous products, and mitigation of noise pollution, which require greater standardization and monitoring.

In summary, the sector has made significant advances in sustainable practices, but still requires the integration of clean technologies, expansion of waste reuse, and consolidated

environmental remediation strategies to strengthen a sustainable production model aligned with current standards.

Table 1

SWOT of the internal factors of the Environmental axis

	Positive Factors	Negative Factors
	Strengths	Weaknesses
	Adoption of no-burn harvesting, MPB, green manures, and precision agriculture (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Use of biomass, ethanol, and solar energy for energy self-sufficiency (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Water reuse and closed effluent treatment systems and little dependence on water resources (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Recovery of APPs and reforestation (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Circular Economy of Sugarcane with good use (filter cake, vinasse, biomass) (Cocal, 2024; Delta Sucroenergia, 2024; São Martinho, 2024; Lins Plant, 2023; São Manoel Plant, 2023). Regulations and best practice standards to support ESG compliance.	Partial dependence on fossil fuels in mechanized operations (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Lack of clear remediation planning for contaminated area situations. Low approach to dangerous products and noise pollution, with occasional exceptions. Circular economy concentrated in vinasse, filter cake and bagasse; little use of other waste.

Source: Prepared by the author.

5.2 EXTERNAL FACTORS: OPPORTUNITIES AND THREATS

The expansion of ESG practices among sugarcane producers in São Paulo is an essential strategy to consolidate competitive advantage, with emphasis on international certifications such as Bonsucro and GRI, which increase credibility, visibility, and access to new markets. Technological innovation emerges as a strategic element, promoting partnerships with

startups, participation in open innovation programs, and collaboration with universities, through initiatives such as Hackathons, in addition to fostering the reuse of industrial waste and the circular economy.

The expansion of the circular economy still presents significant opportunities. Although the reuse of vinasse, filter cake, and biomass is consolidated, other waste, such as recyclable materials and organic waste, can still be used, generating new sources of revenue and reducing environmental impacts. The sale of surplus renewable energy also represents an opportunity, strengthening energy self-sufficiency and encouraging the use of clean matrices in adjacent regions.

On the other hand, the sector faces environmental and regulatory threats. Extreme weather events, intensified by climate change, can compromise biomass production and supply. In addition, the growing demand for transparency exposes potential environmental failures, requiring strict monitoring and agile corrective actions. Non-compliance with environmental legislation can also generate sanctions, financial impacts, and damage to institutional reputation, affecting business continuity.

In summary, the environmental axis shows advances in the adoption of sustainable practices and expansion of the circular economy, but reinforces the need for integrated risk management strategies, technological innovation, and adoption of ESG certifications to strengthen the resilience of the sector and consolidate a sustainable production model.

Table 2

SWOT of external factors of the Environmental axis

	Positive Factors	Negative Factors
	Opportunities	Threats
	Expansion of the reuse of various waste (oil, soot, packaging) (São Manoel, 2023). Certifications such as Bonsucro and GRI as a competitive advantage (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Partnerships with startups, open innovation programs, and educational programs (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Lins Plant, 2023; São Manoel Plant, 2023).	Climate change and severe droughts. Pressure for traceability and transparency can expose environmental failures. Risk of environmental sanctions for non-compliance with environmental legislation

	Sale of surplus renewable energy and incentives for the use of renewable energy (solar energy) (Cocal, 2024; Ester, 2022).

6 SOCIAL

In Tables 3 and 4, the SWOT methodology was applied to the Social axis, in order to analyze internal characteristics (strengths and weaknesses) and external characteristics (opportunities and threats) related to rural producers in the sugar-energy sector.

6.1 INTERNAL FACTORS: STRENGTHS AND WEAKNESSES

The analysis of the social axis in the sugarcane sector in São Paulo shows significant advances in the well-being and development of employees. The formalization of labor relations, consolidated by the CLT, represents an important milestone, although complete adherence to legislation and the creation of environments that promote both worker and organizational growth still present challenges.

Companies with positive results in social sustainability invest in occupational health and safety, including health plans, first aid training, accident prevention, and firefighting, promoting autonomy and a safe and collaborative environment.

The social axis also covers the appreciation of the local community, through social projects such as support for NGOs, professional training, community gardens, and incentives for social organizations. The inclusion of minority groups, such as women, people with disabilities, and the LGBTQIA+ population, contributes to a more equitable corporate environment. Cooperatives and rural associations, such as COPLACANA, play a strategic role by combining economic activities and social actions, showing that structured practices can be adopted by producers of different sizes.

Among the weaknesses identified are gaps in freedom of association and equitable remuneration, as well as in communication with consumers and suppliers. In addition, many independent producers face financial and structural limitations in implementing robust social practices, restricting the reach and impact of actions.

In summary, the sector presents strategies that promote well-being and community development, but still demands greater social inclusion, wage equity, transparency in relation to union freedom and integration of independent producers, strengthening the positive social impact and image of the sector.

Table 3*SWOT of the internal factors of the Social axis*

	Positive Factors	Negative Factors
	Strengths	Weaknesses
	Territorial development programs, ensuring education, health, and safety (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Inclusion of PWDs, women, LGBTQIA+ population and campaigns to value diversity (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Lins Plant, 2023; São Manoel Plant, 2023). Strengthening of cooperatives and associativism. Codes of conduct in conjunction with the consolidation of Labor Laws (CLT) for rural workers (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023).	Few clear data on freedom of association and equitable remuneration. Little exploration of customer relationships (reports more focused on suppliers) Less engagement of independent producers in structured social practices.

Source: Prepared by the author.

6.2 EXTERNAL FACTORS: OPPORTUNITIES AND THREATS

The adaptation of organizations to sustainability practices in the social axis has stood out as a competitive differential, especially in retaining and attracting talent. Among the opportunities are social actions aligned with the Sustainable Development Goals (SDGs), which favor organizational and social development.

Sugarcane producing companies, for example, invest in education and training, offering financial support, training, and digital inclusion, literacy, and accessibility projects, promoting the improvement of employees' working and living conditions. In addition, environmental initiatives, such as self-generation of energy, can generate positive social impacts by allocating surpluses to schools, hospitals, and NGOs.

Among the threats, the lack of proof of ESG actions, especially in inclusion, diversity, and equity, stands out, which can generate perceptions of greenwashing and undermine institutional credibility. Stakeholder engagement is another critical factor, as low participation or misalignment between expectations and planned actions weakens social outcomes.

The inefficient integration of minority groups can also generate internal conflicts, especially in sectors historically dominated by men, such as agribusiness. In this context, strengthening the inclusive culture and structuring support channels become essential to mitigate risks and ensure the effectiveness of social actions.

Table 4

SWOT of external factors of the Social axis

External Factors	Positive Factors	Negative Factors
	Opportunities	Threats
	Expansion of training and scholarships (Cocal, 2024) Digital inclusion, literacy and accessibility projects for territorial development. Alignment with the SDGs. Donations of surplus renewable energy to socially focused organizations such as hospitals and NGOs.	Pressure for proof of diversity, equity, and inclusion in practices Resistance to diversity in traditionally male environments in the countryside. Inefficient integration of stakeholders into organizations' codes of conduct and/or ethics.

Source: Prepared by the author.

7 GOVERNANCE

In Tables 5 and 6, the SWOT methodology was applied to the Governance axis, in order to analyze internal characteristics (strengths and weaknesses) and external characteristics (opportunities and threats) related to rural producers in the sugar-energy sector.

7.1 INTERNAL FACTORS: STRENGTHS AND WEAKNESSES

The analysis of the governance axis of sugarcane producers in São Paulo shows initiatives aimed at ethical and responsible management, aligned with ESG guidelines and integrating environmental and social aspects. After Proálcool, the sector gained autonomy and began to adopt sustainable technologies and practices, initially focused on the environmental component, evolving to social and governance aspects due to economic and market pressures.

Currently, there is consolidation of decentralized structures, with committees dedicated to ethics, whistleblowing, and compliance, strengthening transparency and organizational integrity. Sustainability reports, whether internal or externally audited, ensure legal compliance and greater credibility. Certifications such as Bonsucro, GRI guidelines, and ABNT PR 2030 Standard encourage the adoption of ESG practices and provide a competitive advantage in the national and international market.

Among the weaknesses, ineffective stakeholder mappings stand out, which can compromise strategic planning, and gaps in cybersecurity, especially in the face of the General Data Protection Law (LGPD). There are also disparities in the implementation of governance practices between large, medium, and small producers, in addition to the absence of clear guidelines on unfair competition and corruption prevention, aspects that are still little addressed in industry reports.

Table 5

SWOT of the internal factors of the Governance axis

	Positive Factors	Negative Factors
	Strengths	Weaknesses
	Greater autonomy of sugarcane producing organizations after the end of PROÁLCOOL. Robust structure with ESG boards, committees, and reports (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). Ethics and integrity programs with active reporting channels (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023). National and international certifications, such as Bonsucro, RenovaBio, GRI. Transparent practices with audits and verified reports (Cocal, 2024; Delta Sucroenergia, 2024; Raízen, 2024; São Martinho, 2024; Ester Agroindustrial Plant, 2022; Lins Plant, 2023; São Manoel Plant, 2023).	Little approach to cybersecurity and IT vulnerabilities, despite initiatives such as the General Data Protection Law. Difficulty in adapting small producers to the requirements of formal governance of the mills. Low approach to unfair competition practices (<i>antitrust</i>) and the prevention of corruption. Mapping of <i>stakeholders</i> to prepare the sustainability strategy.

Source: Prepared by the author.

7.2 EXTERNAL FACTORS: OPPORTUNITIES AND THREATS

The opportunities in the governance axis of rural sugarcane producers in São Paulo are related to the adoption of sustainable corporate governance practices, which promote transparency, integrity, and alignment with ESG principles. The growing demand for investments in sustainable companies reinforces the need for robust governance structures,

capable of attracting investors and strengthening the institutional image, consolidating the competitive advantage.

The pressure for ESG practices also favors the creation of networks and strategic partnerships, involving innovation hubs, agricultural cooperatives, and universities, which offer training in corporate governance, digital tools, and management methodologies. The integration between rural producers and stakeholders contributes to standardizing sustainable practices, expanding the reach of ESG actions, and strengthening the organizational culture focused on sustainability.

The use of metrics and digital tools allows measuring the impact of governance actions, optimizing monitoring, ensuring transparency in sustainability reports, and strengthening internal control. This approach reduces regulatory risks and increases organizational credibility, which are essential for attracting investments and expanding business.

Among the threats are exposure to operational failures and reputational damage in case of non-compliance with ESG standards, as well as operational and strategic challenges such as legal uncertainty in the adoption of new practices and excessive bureaucracy in sustainability reports, especially for small and medium-sized producers.

Another challenge involves independent producers, who face limitations in training, access to digital technologies, and integrated audits, making it difficult to comply with ESG requirements and obtain certifications.

In summary, the adoption of ESG practices in the governance axis can consolidate competitive advantage, expand markets and attract investments, but requires standardization of processes, continuous training and mitigation of legal and operational risks to ensure the consolidation of corporate governance in the São Paulo sugar and alcohol sector.

Table 6

SWOT of the Governance axis

External Factors	Positive Factors	Negative Factors
	Opportunities	Threats
	Incentive to the professionalization of rural management with the support of cooperatives and hubs Use of digital tools and strategic management software (Raízen, 2024). Expansion of participatory and integrative governance in the field.	High reputational risk in case of failures in business conduct or ethics Rapid regulatory changes require flexible and up-to-date frameworks. Legal uncertainty or excessive bureaucracy can discourage progress. Independent producers may have difficulty

	Strengthening metrics for integrated reporting and strategic ESG. Attractiveness for investors with strategic planning of sustainable governance. Public access to sustainability and financial transparency reports.	accessing robust audits and certifications.

Source: Prepared by the author.

8 CONCLUSION

The analysis shows that the application of ESG principles in the sugar-energy sector in São Paulo represents not only an instrument of environmental and social sustainability, but also a strategy for competitiveness in agribusiness. The use of the SWOT methodology made it possible to identify relevant forces, such as the advancement of the circular economy, the adoption of clean technologies, and the consolidation of governance structures, while revealing weaknesses, such as dependence on fossil fuels, social inequality, and the limitations faced by small producers. The opportunities associated with alignment with the Sustainable Development Goals, technological innovation, and access to international certifications reinforce the sector's expansion potential, while threats such as climate change, legal uncertainty, and reputational risks require mitigation strategies. It is concluded that the effective incorporation of ESG by sugarcane farmers requires integration between environmental, social, and governance practices, associated with institutional strengthening, innovation, and stakeholder participation, in order to consolidate a sustainable, resilient, and competitive production model in the national and international scenario.

The main limitation of this study is the dependence on secondary sources, especially sustainability reports from large mills, which can restrict the representativeness of small and medium-sized producers and introduce institutional bias. In addition, the absence of primary data and the lack of standardization in social and governance metrics limit the scope of the results.

ABSTRACT

This study analyzes the development of sustainability reports in the sugar-energy sector, based on the integration of the Global Reporting Initiative (GRI) standards and the ABNT PR 2030 guidelines, focusing on the application of environmental, social, and governance (ESG) practices among rural producers of different sizes. The qualitative research was conducted through bibliographic and documentary review, including standards, sustainability reports, and scientific publications. Initially, the study contextualizes the economic relevance of the sugar-energy sector and the increasing demand for transparency and socio-environmental responsibility in agribusiness. It then addresses key concepts such as sustainability, ESG, stakeholders, and materiality, emphasizing the importance of standardization and reliability of information to avoid greenwashing practices. The results present guidelines for the preparation of sustainability reports, including the definition of material topics, the use of performance indicators, and the application of GRI standards. Additionally, a consulting model called SustentaAgro is proposed, aimed at providing technical support for ESG implementation and sustainability reporting, adapted to the different realities of producers. The study concludes that, despite progress in ESG adoption, significant challenges remain, particularly for small producers, mainly due to limited resources and lack of technical capacity, highlighting the need for accessible and context-adapted solutions.

Keywords: Sustainability. Materiality. Stakeholders. Governance. Indicators.

RESUMO

Este estudo analisa a elaboração de relatórios de sustentabilidade no setor sucroenergético, com base na integração das normas da Global Reporting Initiative (GRI) e das diretrizes da ABNT PR 2030, com foco na aplicação de práticas ambientais, sociais e de governança

(ESG) em produtores rurais de diferentes portes. A pesquisa, de natureza qualitativa, foi desenvolvida por meio de revisão bibliográfica e documental, contemplando normas, relatórios de sustentabilidade e publicações científicas. Inicialmente, o trabalho contextualiza a relevância econômica do setor sucroenergético e a crescente demanda por transparência e responsabilidade socioambiental no agronegócio. Em seguida, aborda os conceitos de sustentabilidade, ESG, stakeholders e materialidade, destacando a importância da padronização e da confiabilidade das informações para evitar práticas de greenwashing. Como resultados, são apresentadas diretrizes para a elaboração de relatórios de sustentabilidade, incluindo a definição de temas materiais, utilização de indicadores de desempenho e aplicação dos padrões GRI. Além disso, propõe-se um modelo de consultoria, denominado SustentaAgro, voltado ao apoio técnico na implementação de práticas ESG e na elaboração de relatórios, adaptado às diferentes realidades dos produtores. Conclui-se que, apesar dos avanços na adoção do ESG, persistem desafios significativos, principalmente para pequenos produtores, relacionados à limitação de recursos e à falta de capacitação técnica, evidenciando a necessidade de soluções acessíveis e adaptadas ao contexto do setor.

Palavras-chave: Sustentabilidade. Materialidade. Stakeholders. Governança. Indicadores.

RESUMEN

Este estudio analiza la elaboración de informes de sostenibilidad en el sector de la caña de azúcar y el etanol, a partir de la integración de los estándares de la Iniciativa de Informes Globales (GRI) y las directrices ABNT PR 2030, centrándose en la aplicación de prácticas ambientales, sociales y de gobernanza (ASG) en productores rurales de distintos tamaños. La investigación cualitativa se desarrolló mediante una revisión bibliográfica y documental, que abarcó estándares, informes de sostenibilidad y publicaciones científicas. Inicialmente, el trabajo contextualiza la relevancia económica del sector de la caña de azúcar y el etanol y la creciente demanda de transparencia y responsabilidad socioambiental en la agroindustria. Posteriormente, aborda los conceptos de sostenibilidad, ASG, partes interesadas y materialidad, destacando la importancia de la estandarización y la fiabilidad de la información para evitar prácticas de ecoblanqueo. Como resultado, se presentan directrices para la elaboración de informes de sostenibilidad, incluyendo la definición de temas materiales, el uso de indicadores de desempeño y la aplicación de los estándares GRI. Además, se propone un modelo de consultoría, denominado SustentaAgro, orientado a brindar apoyo técnico en la implementación de prácticas ASG y en la elaboración de informes, adaptados a las diferentes realidades de los productores. Se concluye que, a pesar de los avances en la adopción de criterios ESG, persisten desafíos importantes, especialmente para los pequeños productores, relacionados con la limitación de recursos y la falta de capacitación técnica, lo que subraya la necesidad de soluciones accesibles y adaptadas al contexto del sector.

Palabras clave: Sostenibilidad. Materialidad. Partes Interesadas. Gobernanza. Indicadores.

1 INTRODUCTION

The cultivation of sugarcane has high economic relevance in the Brazilian context, positioning the country as the world's largest producer of this commodity. National production is predominantly concentrated in the Southeast region, with emphasis on the state of São Paulo, which brings together approximately 350 thousand rural producers operating in different segments of the production chain. This sector makes a significant contribution to the Gross Domestic Product (GDP), in addition to playing a significant role in job creation, exports, and the supply of food and energy, configuring itself as strategic for the national economy (Conab, 2025; Government of the State of São Paulo, 2023).

In recent decades, the concept of sustainability has been widely debated in the business, academic, and government spheres, with the purpose of promoting economic development in line with the conservation of natural resources. Such an approach presupposes the integration of the environmental, social, and governance dimensions, based on ethical and transparent practices that contribute to strengthening stakeholder trust and mitigating associated risks, such as greenwashing (França, 2024; Nascimento, 2022).

In this scenario, the concept of ESG (Environmental, Social, and Governance) emerges as a structuring model for the incorporation of sustainability in organizations, aligning with the Sustainable Development Goals (SDGs) and current international guidelines (Global Compact, 2025). However, the implementation of these practices in the agricultural sector still faces significant challenges, especially with regard to small producers, who often deal with limitations related to access to technology, information, and credit (Garcia, 2024).

The intensification of demands for transparency and socio-environmental responsibility has driven the adoption of sustainability reports as instruments for communicating organizational impacts and strengthening institutional credibility. In this context, the guidelines of the Global Reporting Initiative (GRI), widely recognized in the international scenario, stand out, as well as ABNT PR 2030, which adapts ESG principles to the specificities of the Brazilian context (Pineiro, 2023; Daub, 2007).

In view of the above, the present study aims to analyze and propose guidelines for the preparation of sustainability reports in the sugar-energy sector, considering the integration between the GRI standards and ABNT PR 2030, with emphasis on applicability for rural producers of different sizes. As specific objectives, it seeks to: (i) evaluate the applicability of these standards for small, medium and large producers; and (ii) propose a consulting model aimed at the implementation of ESG practices and the preparation of sustainability reports.

2 LITERATURE REVIEW

The demand for sustainable practices in the sugar-energy sector has shown significant growth, although there is still a predominance of studies focused on economic and productive aspects, to the detriment of social and governance dimensions. In this context, sustainability reports are relevant instruments for the evaluation and communication of organizational performance, although, in many cases, they remain focused on environmental and economic impacts (Silva, 2022).

The incorporation of ESG practices in agribusiness has gained prominence due to the need to reconcile productivity and sustainability, especially in the face of challenges such as deforestation and the growing demand for food. The adoption of these practices contributes to strengthening the resilience of production systems and promoting sustainability in the sector (Senar, 2023; Medeiros, 2023).

However, the implementation of ESG faces limitations related to the level of technical knowledge, access to resources, and the structural characteristics of rural producers, especially small-sized ones (Andrade, 2022). In this sense, the need for clear, standardized, and adaptable guidelines to the reality of the agricultural sector is evident.

ABNT PR 2030 is a recommended practice that guides Brazilian organizations in the adoption of sustainable practices, structuring ESG based on three main axes: environmental, social, and governance. This standard aims to reduce ambiguities and promote greater consistency in the application of ESG principles in the national context (ABNT, 2022).

In addition, the Global Reporting Initiative (GRI) establishes internationally recognized standards for the preparation of sustainability reports, enabling greater transparency, comparability, and credibility of the information disclosed. The adoption of these guidelines contributes to risk management, the strengthening of relationships with stakeholders, and the definition of strategic indicators (Global Reporting Initiative, 2025).

Sustainability reports play a central role in organizational communication, by highlighting the results and impacts of ESG practices, in addition to contributing to attracting investments and strengthening institutional reputation. However, the occurrence of greenwashing practices constitutes a relevant challenge, reinforcing the need for standardization and verification of the information disclosed (Albuquerque, 2023; Vieira, 2024).

In this context, stakeholders play a fundamental role in defining ESG strategies, influencing the identification of material topics and the prioritization of organizational actions. Continuous dialogue with these stakeholders enables greater alignment between the practices adopted and market expectations (Indriunas, 2023; Resende, 2024).

3 METHODOLOGY

The present study is characterized as a qualitative research, developed through a bibliographic and documentary review, based on scientific productions, institutional publications and sustainability reports related to the ESG theme in the agricultural sector.

The guidelines established by ABNT PR 2030 and the standards of the Global Reporting Initiative (GRI) were specifically analyzed, considering their applicability in the context of rural producers inserted in the sugarcane production chain. In addition, sustainability reports made available on institutional platforms of public access were examined, in order to understand practices already adopted in the sector.

The data analysis was conducted under an interpretative qualitative approach, aiming to understand the application of ESG practices and identify the main challenges and opportunities associated with their implementation. The literature review assumed an explanatory character, seeking to identify determining factors for the adoption of these practices in the agricultural sector (Gil, 2008; Manzo, 1971).

Based on this analysis, a support structure for the implementation of ESG was proposed, including the preparation of sustainability reports and the development of a consulting model based on the Business Model Canvas, aimed at the technical support of rural producers.

4 RESULTS

4.1 STRUCTURE FOR THE PREPARATION OF SUSTAINABILITY REPORTS

Sustainability reports represent an essential strategic instrument for organizational communication, allowing the systematized dissemination of practices, indicators, and results related to the environmental, social, and governance (ESG) dimensions. In the sugar-energy sector, these reports play an even more relevant role, considering the growing pressure for transparency and socio-environmental responsibility in agribusiness (Avila, 2023).

The structure of these reports, as established by the Global Reporting Initiative (GRI) guidelines, is based on the application of fundamental reporting principles, such as accuracy, balance, clarity, comparability, completeness, context of sustainability, timeliness, and verifiability. These principles guide not only the organization of information, but also ensure the consistency and reliability of the data presented (Global Reporting Initiative, 2021).

In the context of the sugar-energy sector, the specificity of the presentation of data by agricultural harvest is highlighted, which requires the maintenance of consistent methodologies over time. Comparability between production periods allows for the identification of variations in indicators, evaluation of the performance of the practices adopted, and establishment of more

assertive goals. This aspect reinforces the need for standardization in data collection and analysis, ensuring the continuity and reliability of the information reported.

The analysis of real reports, such as the one by São Martinho (2024), shows that the structure for the disclosure of general content (GRI 2) includes elements such as the identification of the organization, activities developed, value chain, governance, policies, and relationship with stakeholders. However, relevant gaps are observed in certain topics, such as the absence of details on governance appointment processes, remuneration policies, conflicts of interest, and performance evaluation of governing bodies, which compromises the completeness and transparency of information (São Martinho, 2024).

These results indicate that, although there is partial adherence to the standards, there are still challenges in the full implementation of the GRI requirements, especially with regard to the depth and quality of the information disclosed.

4.2 MATERIAL THEMES AND MATERIALITY MATRIX

The definition of material topics constitutes the central axis of the preparation of sustainability reports, as it guides organizational strategies and the prioritization of ESG actions. The identification of these topics must consider both the impacts generated by the organization and the expectations of stakeholders, reflecting the logic of double materiality (Global Reporting Initiative, 2021).

The use of the materiality matrix allows the topics to be classified according to their relevance to the company and stakeholders, organizing them into different levels of priority. The topics classified as high priority, such as climate change, greenhouse gas emissions, corporate governance, diversity and inclusion, human rights, and data privacy, represent those that require immediate and strategic action, and are directly incorporated into organizational planning (Global Reporting Initiative, 2021; Senar, 2023).

Medium-priority topics, such as water use, energy efficiency, waste management, organizational culture, and stakeholder engagement, require continuous monitoring and progressive improvement actions, while low-priority topics must be monitored, ensuring compliance with current legislation and standards (Brazilian Association of Technical Standards, 2022).

The analysis of the tables presented in the study shows a consistent ESG planning structure, including the definition of strategic objectives (OKRs) and performance indicators (KPIs) associated with each material topic. However, there is a need to improve this structure to fully comply with the guidelines of GRI 3: 2021, especially with regard to the explanation of

the methodological process for identifying and prioritizing the topics, as well as the inclusion of information on those responsible, monitoring periodicity, and data sources.

In addition, it is recommended to incorporate impact assessment criteria, such as scale, severity, and probability, allowing for a more robust analysis in line with regulatory requirements. These elements contribute to strengthening the methodological consistency and credibility of the sustainability report.

4.3 MANAGEMENT OF MATERIAL TOPICS AND USE OF INDICATORS

The management of material topics requires the definition of clear and measurable strategies, and the use of methodologies such as OKRs (Objectives and Key Results) associated with KPIs (Key Performance Indicators) is recommended. This approach allows the alignment of the organization's strategic objectives with operational indicators, facilitating the monitoring of ESG performance.

In high-priority themes, indicators are used to monitor critical aspects such as emissions reduction, energy efficiency, governance, and social inclusion. These indicators should be accompanied by specific targets, allowing progress to be assessed over time and guiding decision-making.

In medium-priority topics, indicators have a management and monitoring function, enabling continuous adjustments in organizational practices. In low-priority topics, indicators are used mainly for monitoring, ensuring that legal requirements are met, even if these topics are not strategic at the moment.

The adoption of this differentiated monitoring structure allows for a more efficient allocation of resources, directing efforts to the topics of greatest relevance and impact, without neglecting the other aspects of sustainability.

4.4 APPLICATION OF GRI STANDARDS AND TRANSPARENCY OF INFORMATION

The application of the Global Reporting Initiative (GRI) standards contributes significantly to the standardization of sustainability reporting, allowing greater comparability between organizations and strengthening the credibility of the information disclosed (Global Reporting Initiative, 2016; Global Reporting Initiative, 2021).

The GRI standards are structured into three main categories: universal, sectoral, and thematic. This framework enables a comprehensive approach to sustainability, allowing organizations to tailor reporting to their operational specificities.

Among the thematic standards, GRI 305 – Emissions stands out, which guides the disclosure of information related to greenhouse gases, including mitigation, compensation and monitoring strategies. The application of this standard is particularly relevant in the sugar-energy sector, due to its direct relationship with climate change (Global Reporting Initiative, 2016).

Transparency of information also involves the proper management of omissions, which must be justified in accordance with the criteria established by the GRI. The clear presentation of omissions, accompanied by justifications, contributes to the credibility of the report and demonstrates a commitment to transparency (Global Reporting Initiative, 2021).

In addition, the inclusion of the GRI content index and the statement of use of the standards makes it possible to organize the information and evidence the level of compliance of the report. Notification to the GRI about the use of the standards reinforces the legitimacy of the reporting process and evidences alignment with international standards.

4.5 ESG CONSULTING MODEL PROPOSAL

As a result of the analysis carried out, the creation of SustentaAgro Consultoria was proposed, a business model aimed at technical support in the implementation of ESG practices and in the preparation of sustainability reports in the sugar-energy sector.

The proposal considers the different realities of rural producers, offering solutions adapted to the size and needs of each audience. For small producers, simplified packages are suggested, with a focus on ESG compliance and basic training. For medium and large properties, as well as mills, more complete solutions are proposed, including audits, detailed reporting, and integration of ESG practices into corporate governance.

The model also includes the use of measurable ESG performance indicators, allowing continuous monitoring of the practices adopted. The proposal also includes the development of an interactive digital platform, with dashboards for monitoring indicators, automated generation of reports, and availability of educational content.

The hybrid service, combining remote support and technical visits, allows for greater proximity to producers and customization of solutions. In addition, the model provides for the formation of strategic partnerships with institutions and companies related to sustainability, as well as the use of the Business Model Canvas as a tool for structuring the business (Osterwalder; Pigneur, 2010).

In general, the results indicate that the consultancy's proposal has the potential to contribute to the dissemination of ESG practices in the sugar-energy sector, especially by offering accessible solutions adapted to the limitations faced by rural producers.

5 DISCUSSION OF THE RESULTS

5.1 IMPLEMENTATION OF ESG IN THE SUGAR-ENERGY SECTOR

The implementation of ESG practices in the sugar-energy sector is a complex process, which requires not only the adoption of normative guidelines, but also the adaptation of these practices to the productive and structural specificities of the sector. The analysis of the results demonstrates that the identification of material issues constitutes the basis for this implementation, being essential to guide the decision-making and strategic planning of organizations (Senar, 2023).

In this context, the use of ABNT PR 2030 as an initial reference presents itself as an appropriate approach to the Brazilian scenario, since this standard considers the particularities of the agricultural sector and allows for a gradual adaptation of ESG practices. On the other hand, the GRI offers a consolidated international standard, aimed at the standardization and communication of sustainability reports, evidencing the complementarity between both guidelines (Brazilian Association of Technical Standards, 2022; Global Reporting Initiative, 2022).

The integrated analysis of these standards shows that the implementation of ESG should not be treated as an isolated or one-off process, but rather as a continuous system, which involves diagnosis, planning, execution, and monitoring. This understanding reinforces the need to structure ESG as part of the organizational strategy, and not just as a compliance requirement.

5.2 INTEGRATION BETWEEN NORMS AND APPLICABILITY IN THE PRODUCTIVE CONTEXT

The results indicate that the integration between the GRI and ABNT PR 2030 standards allows for a more comprehensive and structured approach to sustainability, making it possible to align international standards with local conditions. This integration contributes to reducing the complexity of ESG implementation, especially by allowing producers to start their practices based on ABNT PR 2030 and progressively evolve towards the adoption of GRI standards.

However, it is observed that the applicability of these standards varies according to the size of the rural producer. While large organizations have a greater capacity to adapt, due to

access to resources, technology, and specialized teams, small producers face limitations that make it difficult to fully implement these guidelines (Garcia, 2024; Andrade, 2022).

This difference shows that the standardization proposed by the standards, although essential for comparability and transparency, can represent an operational challenge for producers with less technical and financial capacity. Thus, it is necessary to develop strategies that reconcile standardization with flexibility, allowing the adaptation of ESG practices to different production realities.

5.3 ROLE OF STAKEHOLDERS IN THE CONSTRUCTION OF ESG STRATEGIES

The analysis of the results shows that stakeholders play a central role in the construction of ESG strategies, directly influencing the definition and prioritization of material topics. The active participation of these actors, through mechanisms such as interviews, questionnaires, and structured dialogues, allows organizational practices to be aligned with social and market expectations (Global Reporting Initiative, 2021; Corrêa, 2024).

In addition, interaction with stakeholders contributes to the identification of risks and opportunities associated with productive activities, enabling a more efficient and strategic management of sustainability. This process also favors the construction of organizational legitimacy, as it demonstrates transparency and commitment to the demands of stakeholders (Indriunas, 2023).

However, the effectiveness of this engagement depends on the ability of organizations to establish adequate and accessible communication channels, which can represent an additional challenge for small producers, who do not always have formal relationship structures with stakeholders.

5.4 USE OF INDICATORS AND STRATEGIC PLANNING

The definition of ESG indicators, associated with the use of methodologies such as OKRs and KPIs, is a fundamental element for the operationalization of sustainability strategies. The analysis of the results demonstrates that the use of these instruments allows transforming abstract concepts into measurable metrics, facilitating performance monitoring and decision-making.

The materiality matrix plays a central role in this process, by allowing the prioritization of the most relevant topics and guiding the definition of strategic indicators. This approach contributes to a more efficient allocation of resources, directing efforts to the topics with the greatest impact.

However, it is observed that the definition and monitoring of these indicators require technical knowledge and access to structured data, which may limit their application in smaller rural properties. This scenario reinforces the need to simplify methodologies and specialized technical support, in order to enable the implementation of ESG in a broader and more inclusive way.

5.5 TRANSPARENCY, STANDARDIZATION, AND GREENWASHING RISKS

Information transparency emerges as one of the main pillars of sustainability, and is essential to ensure the credibility of reports and the trust of stakeholders. The adoption of GRI standards contributes to the standardization of information, reducing informational asymmetry and allowing greater comparability between organizations (Global Reporting Initiative, 2021).

However, the analysis of the results shows that the absence of standardization and incomplete disclosure of information can favor greenwashing practices, compromising the integrity of reports and the reputation of organizations. In this sense, the use of standards and certifications becomes essential to ensure the veracity of information and strengthen transparency (Vieira, 2024).

In addition, the obligation to justify omissions and the inclusion of elements such as the GRI content index and the declaration of use of the standards contribute to increasing the traceability of information and reducing risks of distortion in the communication of ESG practices.

5.6 FEASIBILITY AND CONTRIBUTION OF THE PROPOSED CONSULTING MODEL

SustentaAgro Consultoria's proposal arises as a response to the challenges identified in the implementation of ESG in the sugar-energy sector, especially with regard to the limitations faced by small and medium-sized producers. The analysis of the results indicates that the offer of specialized technical support can contribute significantly to the dissemination of ESG practices, making them more accessible and adapted to the reality of the sector.

The proposed model, by integrating tools such as performance indicators, digital platform and hybrid service, has the potential to facilitate the implementation of ESG practices and the preparation of sustainability reports. In addition, the segmentation of services according to the size of the producer allows to meet different levels of maturity and operational capacity.

Another relevant aspect refers to the possibility of integration between sustainability and production efficiency, showing that the adoption of ESG can generate benefits not only environmental and social, but also economic, contributing to the competitiveness of the sector.

Overall, the consultancy's proposal represents a viable alternative to overcome the barriers identified, promoting greater inclusion and strengthening the adoption of ESG practices in the sugar-energy sector.

6 CONCLUSION

The present study aimed to analyze the preparation of sustainability reports in the sugar-energy sector, based on the integration of the Global Reporting Initiative (GRI) standards and the ABNT PR 2030 guidelines, considering their applicability for rural producers of different sizes. From the literature and documentary review carried out, it was possible to understand that the adoption of ESG practices has been consolidated as a strategic element in agribusiness, especially in the face of the growing demand for transparency, socio-environmental responsibility and competitiveness in the market.

The results showed that the use of structured normative guidelines contributes to the standardization of sustainability reports, promoting greater reliability, comparability, and clarity of the information disclosed. In this context, GRI stands out as an international reference for reporting, while ABNT PR 2030 presents greater adherence to the Brazilian context, enabling a more accessible adaptation to the realities of the agricultural sector. The integration between these standards proved to be complementary, allowing for a progressive and structured approach to the implementation of ESG.

However, the analysis also highlighted the existence of significant challenges in the application of these practices, especially for small and medium-sized rural producers. Limitations related to access to financial resources, technology, information, and technical training hinder the full implementation of ESG guidelines, which can increase inequalities in the sector. This scenario reinforces the need for adapted solutions, capable of making sustainability more accessible and viable for different producer profiles.

Another relevant aspect refers to the importance of defining material topics and stakeholder engagement as central elements in the construction of ESG strategies. The use of tools such as the materiality matrix and the adoption of performance indicators allow for directing organizational actions, making the implementation process more structured and results-oriented. However, the effectiveness of these tools depends on the technical capacity of organizations, again highlighting the need for specialized support.

In this sense, SustentaAgro Consultoria's proposal is a relevant contribution to the study, by presenting a technical support model aimed at the implementation of ESG practices and the preparation of sustainability reports in the sugar-energy sector. The proposal seeks to meet the

different realities of producers, offering adapted solutions and promoting greater inclusion in the sustainable development process. In addition, the potential for integration between sustainability and production efficiency is highlighted, showing that the adoption of ESG can contribute to the generation of economic, social and environmental value.

In general, it is concluded that the integration between the GRI and ABNT PR 2030 standards represents a viable and strategic approach to the preparation of sustainability reports in the sugar-energy sector, contributing to the strengthening of transparency and governance in agribusiness. However, for this implementation to be effective and comprehensive, it is essential to consider the specificities of the sector and develop support mechanisms that enable the adoption of ESG practices by producers of different sizes.

Finally, it is recommended that future research advance in the empirical validation of the proposed model, through practical application in rural properties, as well as in the analysis of the economic feasibility of ESG practices. Such studies can contribute to broadening the understanding of the impacts of sustainability in the sugar-energy sector and strengthen its implementation in a more efficient and inclusive way.

ABSTRACT

Introduction: This study describes the experience of a physiotherapist resident integrated into a multidisciplinary team within the Family Health Strategy (FHS) in the municipality of Quixeramobim, Ceará, Brazil, during the 2019–2020 period. It discusses the role of physiotherapy within the Brazilian Unified Health System (SUS), emphasizing health promotion, disease prevention, and rehabilitation actions carried out in an integrated manner with families and the community. Collective activities included prenatal groups, exercise programs for older adults, postural assessments, and follow-up of individuals with acute respiratory infections, among others.

Objective: To describe the experience of a physiotherapist in managing musculoskeletal pain in older adults participating in a health promotion program.

Methods: This is an experience report conducted over eight months, from August 2019 to March 2020, at the FHS unit Luís Prata Girão, located in the Conjunto Esperança neighborhood in Quixeramobim, Ceará.

¹ Visiting Professor in the Postgraduate Program in Public Health. Universidade Estadual do Ceará (UECE). Centro Universitário Estácio Ceará.

² Integrated Residency in Family and Community Health. Escola de Saúde Pública do Ceará (RIS-ESP/CE).

³ Undergraduate student. Centro Universitário Estácio Ceará.

⁴ Postgraduate Program in Public Health. Universidade de Fortaleza (UNIFOR).

⁵ Professor. Centro Universitário Estácio Ceará.

⁶ Professional Master's degree in Health Management.

⁷ Professor. Centro Universitário Estácio Ceará.

⁸ Emeritus Professor. Universidade Estadual do Ceará (UECE).

Results: The intervention led to a significant reduction in pain levels, decreased medication use, and improved social and family reintegration among participants.

Conclusion: The multidisciplinary team approach contributed to positive outcomes, high participant adherence, and strengthened comprehensive care. The inclusion of physiotherapy in primary health care proved essential for risk reduction, lifestyle modification, physical and psychosocial development, as well as for enhancing preventive and rehabilitative health actions.

Keywords: Physical Therapy. Primary Health Care. Family Health Strategy. Aged. Musculoskeletal Pain.

RESUMO

Introdução: Este artigo descreve a experiência de uma fisioterapeuta residente inserida em uma equipe multiprofissional na Estratégia Saúde da Família (ESF), no município de Quixeramobim-CE, no biênio 2019–2020. Discute-se o papel do fisioterapeuta no Sistema Único de Saúde (SUS), com ênfase nas ações de promoção da saúde, prevenção de agravos e reabilitação, desenvolvidas de forma integral junto às famílias e à comunidade. No âmbito coletivo, destacam-se atividades como grupos de gestantes, exercícios para idosos, avaliações posturais e acompanhamento de indivíduos com infecções respiratórias agudas, entre outras..

Objetivo: Descrever a vivência de uma fisioterapeuta no manejo da dor musculoesquelética em idosos participantes de um programa de promoção da saúde.

Métodos: Trata-se de um estudo do tipo relato de experiência, desenvolvido ao longo de oito meses, entre agosto de 2019 e março de 2020, na unidade da ESF Luís Prata Girão, localizada no bairro Conjunto Esperança, no município de Quixeramobim-CE.

Resultados: Observou-se redução significativa da dor relatada pelos participantes, diminuição do uso de medicamentos e melhora na reinserção social e familiar dos idosos.

Conclusão: A atuação da equipe multiprofissional contribuiu para resultados positivos, com boa adesão dos participantes e fortalecimento do cuidado integral. A inserção do fisioterapeuta na atenção básica mostrou-se fundamental para a redução de riscos, promoção de mudanças no estilo de vida, desenvolvimento físico e psicossocial, além de potencializar ações de prevenção e reabilitação em saúde.

Palavras-chave: Fisioterapia. Atenção Primária à Saúde. Estratégia Saúde da Família. Idoso. Dor Musculoesquelética.

RESUMEN

Introducción: Este artículo describe la experiencia de una fisioterapeuta residente integrada en un equipo multiprofesional en la Estrategia de Salud de la Familia (ESF), en el municipio de Quixeramobim-CE, durante el bienio 2019–2020. Se discute el papel del fisioterapeuta en el Sistema Único de Salud (SUS), con énfasis en las acciones de promoción de la salud, prevención de enfermedades y rehabilitación, desarrolladas de forma integral junto a las familias y la comunidad. En el ámbito colectivo, se destacan actividades como grupos de gestantes, ejercicios para personas mayores, evaluaciones posturales y seguimiento de individuos con infecciones respiratorias agudas, entre otras.

Objetivo: Describir la vivencia de una fisioterapeuta en el manejo del dolor musculoesquelético en personas mayores participantes de un programa de promoción de la salud.

Métodos: Se trata de un estudio de tipo relato de experiencia, desarrollado a lo largo de ocho meses, entre agosto de 2019 y marzo de 2020, en la unidad de la ESF Luís Prata Girão, ubicada en el barrio Conjunto Esperança, en el municipio de Quixeramobim-CE.

Resultados: Se observó una reducción significativa del dolor reportado por los participantes, disminución del uso de medicamentos y mejora en la reinserción social y familiar de las personas mayores.

Conclusión: La actuación del equipo multiprofesional contribuyó a resultados positivos, con buena adherencia de los participantes y fortalecimiento del cuidado integral. La inserción del fisioterapeuta en la atención primaria se mostró fundamental para la reducción de riesgos, promoción de cambios en el estilo de vida, desarrollo físico y psicosocial, además de potenciar acciones de prevención y rehabilitación en salud.

Palabras clave: Fisioterapia. Atención Primaria de Salud. Estrategia de Salud de la Familia. Persona Mayor. Dolor Musculoesquelético.

1 INTRODUCTION

The Unified Health System (SUS) is based on the Federal Constitution of 1988, which establishes, through article 196, that health is a right of all and a duty of the State. Its organization is based on a decentralized management model, structured at the federal, state and municipal levels, in addition to being organized according to the levels of complexity of primary, secondary and tertiary care (BRASIL, 1990).

In this context, in 1997, the Family Health Program (PSF) was instituted in the state of Ceará, through Decree No. 10,104/97, with the objective of expanding access to health services and reducing inequalities. The program's main characteristic was the reorganization of the work process in primary care, promoting a new logic of care centered on the family and the territory (ESMERALDO, 2009).

Later, in 2006, the PSF was reformulated and was renamed the Family Health Strategy (FHS), consolidating itself as a strategy for the reorganization of primary care, with multidisciplinary actions planned based on local needs (BRASIL, 2008).

With the expansion of the FHS throughout the national territory, driven by incentives from the Ministry of Health, this strategy came to be recognized as the main gateway to the SUS. The FHS plays a fundamental role in the first contact with the user, in the continuity and coordination of care, constituting the basis for the organization of health care networks, with the support of the different levels of care (FAUSTO et al., 2014).

The expansion of the scope of actions in primary care was also strengthened with the creation of the Family Health Support Center (NASF) in 2008, which enabled the inclusion of different professional categories, including physiotherapists, with the aim of expanding the problem-solving capacity and scope of the ESF teams (BRASIL, 2008; GONÇALVES, 2015). However, the NASF was discontinued in 2020, according to Technical Note No. 3 of the Department of Family Health, linked to the Secretariat of Primary Health Care (MASSUDA, 2020).

In this scenario, the physiotherapist assumes an essential role in primary care, acting in the dimensions of health promotion, disease prevention and rehabilitation, in an integral way and articulated with the needs of families and the community. Its activities also extend to the collective sphere, through activities such as groups of pregnant women, exercise programs for the elderly, postural assessments and monitoring of individuals with acute respiratory infections, among other actions (MACIEL et al., 2005).

Specifically in the care of the elderly population, the role of the physiotherapist is essential for maintaining quality of life and functional capacity, respecting the limitations inherent

to the aging process. The implementation of exercises and therapeutic activities contributes to the promotion of autonomy in activities of daily living. Considering that musculoskeletal pain is highly prevalent in this population and directly impacts functionality, it is essential for the professional to have qualified intervention to minimize such problems (MACIEL et al., 2005).

Thus, this article aims to describe the experience of a resident physiotherapist inserted in a multiprofessional team of the Family Health Strategy, in the biennium from 2019 to 2020, addressing her performance in the face of musculoskeletal pain in elderly participants in a health promotion program.

2 METHODS

This is a descriptive study, of the experience report type, which aims to present and reflect on the professional practice developed in the context of primary health care. The experience was lived over eight months, from August 2019 to March 2020, in the municipality of Quixeramobim, located in the state of Ceará.

The setting of the experience was the unit of the Family Health Strategy (FHS) Luís Prata Girão, located in the Conjunto Esperança neighborhood, a territory characterized by demands related to chronic health conditions, social vulnerabilities and high demand for care aimed at rehabilitation and pain management. The experience was conducted by a resident physiotherapist linked to the Family and Community Health Residency Program of the School of Public Health of Ceará, inserted in a multiprofessional team, during the 2019–2021 biennium.

The report is based on working with a group of elderly people monitored by the FHS team, whose referrals occurred mainly due to complaints of musculoskeletal pain, functional limitations and impaired autonomy in activities of daily living. The identification of users and their direction to the group were carried out by the different professionals of the team, such as nurses, psychologists and social workers, based on qualified listening and the assessment of the needs presented during individual and collective care.

The organization of the group occurred in a shared way among the members of the multiprofessional team, with physiotherapy playing a leading role in the planning and execution of interventions aimed at the comprehensive care of the elderly population. Initially, the participants were submitted to an individual evaluation, including detailed anamnesis and kinetic-functional examination, with the objective of identifying limitations, potentialities and specific demands of each individual.

Based on these evaluations, interventions based on physiotherapeutic conducts aimed at health promotion, disease prevention and functional rehabilitation were structured. The

activities included muscle stretching exercises, active-assisted and active exercises, progressively adjusted according to the evolution of the participants, focusing on muscle strengthening, mobility gain, balance improvement and pain reduction. In addition, health education strategies were incorporated, addressing topics such as self-care, posture, fall prevention, and the importance of regular physical activity.

The group also included integrative body practices, fine and gross motor training and recreational activities, aiming not only at the physical aspects, but also at strengthening bonds, socialization and the psychosocial well-being of the participants. This expanded approach sought to consider the elderly in their entirety, respecting their limitations and encouraging their autonomy.

The meetings took place every two weeks, totaling 16 sessions over the period described, with an average duration of 50 minutes each. The activities were conducted by a physiotherapist, with occasional support from the multiprofessional team, and had the average participation of 15 elderly people per meeting.

The systematization of the report was built from observations of practice, records of the activities developed and critical reflections on the care process in the context of primary care, considering the challenges and potentialities of the insertion of physiotherapy in the Family Health Strategy.

3 RESULTS

The performance of Physical Therapy in primary care ranges from health promotion to rehabilitation, with the aim of maintaining and/or returning this functional patient to society. The physiotherapist, when working in primary care within a group, where the participants are functionally limited and have different diagnoses, is challenging for the professional.

The organization was essential for the execution of the project, capturing these patients who are active in the networks, following the flow of care is delicate, as it requires a holistic look to perceive their needs, providing more to those who need more is indispensable when it comes to health, equity is necessary when it comes to a better quality of life.

The participants were monitored in the health devices and through their complaints, the professionals indicated it and referred the group verbally, there was no need for a reference form and counter-reference, leaving the organizational and strategic principles of the SUS, which could lose bonds, interrupting the integrality of care. However, everyone was very assiduous and interested in the group. The services were collective, in a large room, where all the activities were carried out.

In the first contact, we conducted an interview to find out what the main complaints of these patients were and what led them to be interested in participating in the group. During the interview, all of them reported that the drug treatment was not enough and that they had frequent pain that prevented them from performing simple daily activities.

Five of the participants had a clinical diagnosis of depression, were being monitored by a psychologist and psychiatrist. And 10 had a clinical diagnosis of fibromyalgia. All had in common musculoskeletal pain that limited their functions and decreased their independence.

The records were made in the field diary. The greatest relevance is the reduction of pain, increased functionality and autonomy that the patients reported from the third meeting of the group. The exercises of strengthening, gain of amplitude, stretching, balance and coordination were carried out individually through the verbal command and demonstration of the Physiotherapist.

At first, during the evaluation, most participants reported a lot of pain and through the Visual Analogue Scale (VAS), which helps in the quantification of pain, where 0 is no pain and 10 is exacerbated pain, most indicated from 7 to 10 the level of pain and after the third meeting decreased to 4 to 7, Through the participants' reports and the progression of the exercises, we realized that the objectives set were being achieved

4 DISCUSSION

Quality of life, according to Soares et al. (2020), is functional capacity together with the general state of physical and mental health added to social aspects of the context in which the individual is inserted. In view of this, Júnior et al (2019) bring that the promotion of quality of life can be done through collective activities and a mobilizing environment, which can thus preserve their physical, mental, and social capacities.

Inactivity in old age directly impairs the ability and execution of daily activities. In addition to interfering with the quality of life of individuals who will go through situations such as loneliness and associated diseases that generate some negative feedback and/or physical limitations. (SOARES et al., 2020)

The role of the physiotherapist begins with touch, which is the main work tool of physiotherapy, as it incorporates a very intimate relationship with the body, capable of influencing the quality of care, care and treatment of patients. However, their performance also involves the guidance and promotion of their patient's health (JAMARIM, 2016).

The physiotherapy professional helps in the process, whether in terms of assistance, rehabilitation, education and/or with a view to health surveillance in order to minimize the

possible problems caused by the lack of specialized assistance (PEREIRA; GESSINGER, 2014). When a physiotherapist attends a rehabilitation patient, for Logan et al. (2004), the final phase is the most difficult of the process, due to the trauma suffered by these patients in many cases, limiting the performance of several tasks. In this sense, primary care health professionals play a crucial role in controlling the needs of each patient in addition to encouraging them.

Referral and Counter-referral in Health are mechanisms of the Unified Health System (SUS), which favor the exchange of information in the care network, the user's transit in the system and the continuity of care. This is essential in the relationships of the networks (ANDRADE, 2019).

We still witness several challenges faced by the FHS team, with the precariousness of labor relations related to overwork and salaries incompatible with the professionals' wishes. (NOGUEIRA et al., 2019).

During the meetings, we realized that sharing experiences was a primary factor, sometimes even more important than physical activities. In which the act of talking and sharing both with professionals and peers helps in the sense of well-being and general motivation of the users participating in the group. When we opened a conversation circle, those patients previously reported indisposition, pain and incapacity, after conversations, clarifications, welcoming, they left there able to develop their activities, and the study by Rezende et al. (2007) confirms this, the interaction with the patient and the multidisciplinary team has a positive impact, making the therapy more pleasurable, putting humanization into practice, taking into account the entire social context and not only the biological issues.

Peduzzi and Agreli (2018) talk about the importance of welcoming, of talking to the patient during care. It reports the importance of a Physical Therapist identifying and knowing how to understand atypical manifestations, actions, reactions that are persistent during the patient's evaluation and take into account in their conduct.

We professionals evaluate and treat musculoskeletal, neurological, behavioral and related disorders, sometimes not seeing beyond what is seen, the pain that the patient reports, negatively impacting their results. According to Boesch (1977), this occurs because it is the professional's routine to do the same thing every day, leading us to neglect signs, worrying only about solving the complaint about physical limitation, refusing to see the circumstances around and states that this is due to the fact that the professional believes that a good reception and listening is not part of his training.

As shown in their study, Besset et al. (2010), chronic pain has three elements that constitute the psychic: feeling of uselessness, failure to reduce pain, and rejection itself for going

through all this. In the meetings it was possible to notice these 3 elements, the patients talked a lot about not being able to resolve what they felt and still living with the judgment of victimhood, despite not being able to work because the pain made it impossible for them. They also carried the guilt of going through this alone and in the group they were able to see and live with people who were going through the same situation, making them resignify this feeling.

As already discussed above, a significant improvement of patients was perceived in various areas of their lives, social, family, reduction of pain, with consequent improvement in quality of life, corroborating these results with the findings of Silva et al. (2012) where they showed that amplified and humanized care reduced the patient's persecution, pain and the situation in which they found themselves, that actions in groups and directed made them recover their functions and their role in society, identifying themselves in the other contributed to improvement, in addition to the welcoming of the multiprofessional team and interdisciplinary work.

In this way, teamwork is able to resignify health acts, thus making care more committed to the democratization of labor relations and valuing health professionals (SANTOS et al., 2016)

5 FINAL CONSIDERATIONS

After this report of experience and coexistence with this group, the difficulties and limitations that the elderly still face in the twenty-first century in the country in public health were observed. We believe that precisely at this point lies a problem, there is a need for a general understanding that encompasses teams and government, which often do not realize the importance of preventive work with investment of financial and human resources in the old age segment, since we have an increasing picture of an aging population around the world. Family Health professionals make a big difference in terms of care and a broader view, bringing solutions to their daily sufferings for individuals. However, many concerns have permeated during the trajectory of this research on this theme that I will seek to answer in future research.

Jeronimo Alves dos Santos¹

ABSTRACT

This article analyzes the public health and environmental risks associated with pesticide use in Brazil and discusses how governance arrangements can influence the quality of on-farm application. Through a comparative literature review of three models (direct sales, outsourcing, and downstream vertical integration), the study synthesizes evidence on recurrent shortcomings in use (dosage, personal protective equipment, disposal, and resistance management), particularly in settings with limited technical assistance. It proposes an industry-linked technical application service model incorporating mechanisms for traceability, operational standardization, and accountability. The article concludes that a partial shift from a sales-based model to a service-based model can reduce risks, provided it is accompanied by regulation, independent auditing, and safeguards for smallholders.

Keywords: Vertical Integration. Agrochemicals. Sustainability. Environmental Hazards.

RESUMO

Este artigo analisa riscos sanitários e ambientais associados ao uso de agrotóxicos no Brasil e discute como arranjos de governança podem influenciar a qualidade da aplicação no campo. Por meio de revisão bibliográfica (venda direta, terceirização e integração vertical a jusante), sintetizam-se evidências sobre falhas recorrentes de uso (dosagem, EPI, descarte e manejo de resistência), especialmente em contextos de baixa assistência técnica. Propõe-se um modelo de prestação de serviço técnico de aplicação vinculado à indústria, com mecanismos de rastreabilidade, padronização operacional e responsabilização. Conclui-se que a migração parcial de um modelo de venda para um modelo de serviço pode reduzir riscos, desde que acompanhada de regulação, auditoria independente e salvaguardas para pequenos produtores.

RESUMEN

Este artículo analiza los riesgos para la salud y el medio ambiente asociados al uso de plaguicidas en Brasil y examina cómo los mecanismos de gobernanza pueden influir en la calidad de su aplicación en el campo. Mediante una revisión bibliográfica (ventas directas, subcontratación e integración vertical descendente), se sintetiza la evidencia sobre fallas recurrentes en el uso (dosificación, EPI, eliminación y manejo de la resistencia), especialmente en contextos con escasa asistencia técnica. Se propone un modelo para la prestación de servicios técnicos de aplicación vinculados a la industria, con mecanismos de trazabilidad, estandarización operativa y rendición de cuentas. Se concluye que una transición parcial de un modelo de ventas a un modelo de servicios puede reducir los riesgos, siempre que se acompañe de regulación, auditorías independientes y salvaguardias para los pequeños productores.

Palabras clave: Integración Vertical. Agroquímicos. Sostenibilidad. Riesgos Ambientales.

1 INTRODUCTION

Brazil is one of the main agricultural producing countries in the world. In 2018, the participation of Agribusiness reached 21.1% of the Brazilian GDP, it is the world's largest producer of coffee, orange juice and chicken meat and second in the production of sugar, soybeans and beef. Simultaneously with this, agribusiness was responsible for 87.6 billion of the Brazilian trade balance, ensuring its positive balance of 58.7 billion. Brazil is the world's leading exporter of sugar, coffee, orange juice, soybeans, chicken and beef, the second largest exporter of soybean oil, soybean meal and cotton, and is among the main exporters of corn and pork (CNA, 2019).

The success of Brazilian agribusiness in agricultural production, assuming great prominence in the international scenario, was guided by successful policies for agriculture, such as investment in research, rural credit, price policies, tax policies, investment policies, export stimulus policy, etc. In the field, new varieties of crops were implemented, adjusting to edaphoclimatic factors, zoning, investments in machinery, equipment, implements, seeds, fertilizers, limestone, agrochemicals and new management techniques. Not only in the field, but adjustments and new methodological and management techniques were implemented throughout the production chain, especially for commodities (CHADDAD, 2017).

As an example, the trend of increase in Brazilian grain production and productivity is being consolidated in recent decades. From the 1976/1977 harvest to the 2018/2019 harvest, there was an increase in the produced area in the order of 1.2% per year, while productivity increased by 2.6% per year and production by 3.9% per year (CONAB, 2019).

Among the actions carried out to increase productivity in the field, the mechanisms to combat pests and diseases stand out, in addition to being one of the pioneers to implement the use of biological control on a large scale in crops, Brazil has advanced in the development of agrochemicals,² which are chemical substances used in agricultural crops with the objective of preventing, destroy, repel or inhibit the occurrence or effect of living organisms that can compromise the performance of agricultural crops (NATIONAL RESEARCH COUNCIL, 2000).

There are about 300 active ingredients, in two thousand different commercial formulations, used in the country. The main agrochemicals are Herbicides, Insecticides, Fungicides, Acaricides, Biological control agents, semiochemical-based agrochemicals, fumigants, rodenticides, molluscocides, nematocides and Household products (SILVA and COSTA, 2012; STOPPELLI AND MAGALHÃES, 2005).

² Also known as pesticides, pesticides, pesticides or phytosanitary products.

According to FAO (2019), from 1990 to 2017, the use of agrochemicals in the world grew at a rate of 2.12% per year; in Brazil, use has been increasing at a rate of 7.5% per year. According to this same source, the country is the third largest consumer in the world with 8.44% of the volume used, it is second in the use of insecticides and herbicides, and third in the consumption of fungicides.

These increasing rates of agrochemical use in Brazil are due to the new technologies used in the field to increase crop productivity. However, it can also be due to the inappropriate use and management of available technologies, leading to the waste of developed technological efficiency. In fact, there are studies that point to serious problems such as the emergence of pest resistance to active ingredients, as a result of inappropriate use, in addition to the widely discussed implications

According to Almeida (2018), rural producers should consider adopting resistance management strategies on their properties, as inadequate management in the use of agrochemicals can compromise the profitability of rural producers, generating a loss of efficiency in the technology used and increasing pest resistance. This generates an increase in the application of the volume of agrochemicals necessary for the crop, causing economic losses, losses of the technological benefit of agrochemicals in terms of their effectiveness in the field.

One of the problems identified within agricultural production is the level of education of rural producers, of the 5,056,525 agricultural establishments, 23.03% of the owners do not know how to read and write, 79.98% do not receive any technical guidance and only 33.15% used agrochemicals, according to data from the 2017 Agricultural Census. Of those who used agrochemicals, 15.58% do not know how to read and write, 77.09% do not have a high school education, and 63.29% did not receive technical assistance (IBGE, 2019).

With these data from the last Agricultural Census, it can be seen that the process of managing agrochemicals in the field needs to be better oriented towards reducing risks in the health of producers, consumers and environmental risks.

From the producer it would be in the correct handling in the field and for his own protection; however, most of them do not have the level of education or access to the technical assistance necessary for the correct management of the use and application of agricultural pesticides, in addition to the adoption of integrated management and other more sophisticated and sustainable techniques that require greater knowledge;

From the consumer, with the incorrect administration of agrochemicals in the field, it is possible to consume products that do not respect the rules for the use of agrochemicals, either

by the use of chemicals in inadequate doses or by disrespecting the grace period, or even by applying products not registered for the crop. This, in part, is inspected by ANVISA through the Program for the Analysis of Pesticide Residues in Food (PARA) (ANVISA, 2019).

Environmental risks, depending on the toxicity of the agrochemical, the form of application, the amount or dose used, can compromise the soil, subsoil, surface and groundwater, and the entire ecosystem (BRASIL, 2020; SPADOTTO et. al, 2004)

Outsourcing the application of agrochemicals could be one of the ways to reduce risks. This form of service is provided for in Federal Law No. 7,802/1989 in its Article 4, and in Federal Decree No. 4,074/2002, which says that both individuals and legal entities can provide services in the application of agrochemicals, as long as all legal criteria are observed. However, within this outsourcing process, it is possible to find companies that do not comply with the legislation, and it is common for the responsible bodies to suspend their licenses, that is, it cannot be said that outsourcing guarantees the reduction of health and environmental risks (SEAPDR, 2020; ANVISA, 2019; BAMFORD, 2015; MIOLA, 2013; MARQUES, 2005).

Faced with the new challenges regarding the use of agrochemicals in Brazilian agriculture, the National Congress (NC) has discussed and processed the Bill (PL) 6299/02, which deals with the registration, inspection and control of agrochemicals in the country, with the objectives of reducing bureaucratic dysfunctions in the registration process until its applicability in the field, health risks and environmental risks. However, this project has received resistance from the National Health Surveillance Agency (ANVISA), which according to ANVISA, withdraws its competence to carry out toxicological and environmental assessment. This bill is already ready to be discussed in the plenary of the NC (BRASIL, 2018; ANVISA, 2018).

According to the Embrapa Agency for Technological Information (2020) and Spatolo et. al (2004), Brazil is a tropical country and has several crops and crops throughout the year of various agricultural products, which favors the incidence of pests and diseases; along with this, the inappropriate use of chemical products, the lack of technical preparation to adopt an integrated management resulting in products that can generate health and environmental risks. Consequently, it is necessary to point out a managerial solution that involves a change in the coordination relations in part of the production chain.

Therefore, this work aims to suggest the possibility of Vertical Integration in the application and administration of agrochemicals in the field.

2 METHODOLOGY

2.1 STUDY DESIGN

This study adopted an exploratory and qualitative approach, combining a review of narrative literature with a comparative method, with the objective of analyzing how different governance models associated with the use and application of agrochemicals can influence health and environmental risks and productive/economic implications.

The comparative method allows us to examine similarities and differences between institutional and economic arrangements, highlighting relevant relationships between analyzed elements, with the potential for analytical generalization when applied systematically (GIL, 2008; MARCONI; LAKATOS, 2003). Thus, the study structured the study through empirical evidence and available institutional references.

2.2 UNITS OF COMPARISON: GOVERNANCE MODELS ANALYZED

Governance models of the use and application of agrochemicals in the Brazilian context were analyzed in a comparative way:

1. Direct sales to producers;
2. Outsourcing of the application by individuals or legal entities, provided for in Law No. 7,802/1989 and related regulations.
3. Vertical integration downstream by the industries, as a managerial proposition, in which the supply of the input is articulated with the provision of technical service of application and monitoring in the field.

The comparison was guided by the recurring challenges pointed out in the literature and in the public debate, including aspects such as the use of PPE, handling and disposal, training/technical assistance, resistance management, regulatory compliance, and risks of contamination in workers, food, and the environment.

2.3 NARRATIVE LITERATURE REVIEW: SCOPE AND SELECTION OF MATERIAL

A narrative review was carried out (CORDEIRO et al., 2007; ROTHER, 2007) in order to map national and international empirical evidence related to:

- health and occupational risks associated with the use of agrochemicals;
- environmental risks (soil, water, ecosystems) and operational factors that increase exposure;
- recurrent failures in the application (training, reading of labels and package inserts, PPE,

- disposal of packaging, inadequate handling);
- residue monitoring and compliance in food.

As it is a narrative review, the selection of the material was intentional and not exhaustive, guided by the pertinence to the research problem and by the contribution of the studies to describe risk mechanisms and operational conditions associated with the application.

Within this scope, empirical studies such as those by Schmidt and Godinho (2006), Veiga et al. (2007), Malaspina et al. (2011), Bedor et al. (2009), Casali et al. (2015) and Petermann et al. (2019) were mobilized, among others, as they address complementary dimensions of the problem (poisoning/underreporting, PPE, epidemiological profile, social vulnerabilities, training and food residues).

2.4 SECONDARY DATA AND INSTITUTIONAL SOURCES

In addition to the academic literature, the study used secondary data and information from institutional databases for contextualization and analytical support of the Brazilian scenario, including sources such as:

- 2017 Agricultural Census (IBGE, 2019 publication);
- databases and reports from agencies and institutions related to regulation and monitoring (e.g., ANVISA, including waste monitoring programs);
- agricultural production and productivity bases and sectoral context (e.g., CONAB, FAO, Embrapa).

These sources were used to support the characterization of the productive and regulatory context and to reinforce the interpretation of the evidence discussed in the literature review, without pretense of causal statistical inference.

2.5 STUDY LIMITATIONS

This study has limitations inherent to the adopted design:

- as it is a narrative review, there is no claim of exhaustiveness or formal synthesis goals;
- the comparison between models configures a conceptual and interpretative analysis, based on secondary evidence and selected literature;
- Primary collections (e.g., interviews, surveys, or case studies) were not conducted, which restricts inferences about operational feasibility, costs, and measurable impacts in specific contexts.

Even so, the design is adequate to the exploratory objective of discussing governance alternatives and their possible implications for the reduction of health and environmental risks.

3 RESULTS AND DISCUSSION

3.1 VERTICAL INTEGRATION

According to Zylbersztajn and Neves (2000), market competition is the necessary stimulus for companies to seek to reduce costs in an Economic System. For this, companies belonging to a competitive market structure adopt several strategies, such as competition strategies (price formation, collusion, price war, sunk costs); growth strategy (acquisition, mergers, market segmentation, differentiation, diversification and vertical integration).

These authors state that vertical integration is a particular type of diversification of a company's growth strategy. The company's objective in adopting this strategy is to acquire greater control in the production chain to reduce costs, employ strategic actions against rival companies and better explore the market for products downstream in the production chain.

Vertical integration within the agro-industrial context is defined as a set of activities of the links in the production chain, assuming previous and/or subsequent stages of some process within the agricultural production chain. In Brazil, the most common integrations are the chain of poultry, pork, seeds, vegetables (industrial tomatoes and peas), silks, flowers addressing various systems or part of the production process (ARAÚJO, 2013).

According to Batalha (2014), vertical integration becomes attractive to sectors that identify cost reduction, appropriate market profits, favor the company's main activity, obtain greater control of operations and strategies to be adopted. However, according to the author, it can increase the risk of the integrating company, and it can also bring greater concerns about bureaucratic dysfunctions and divert the main focus from the company's management.

Vertical integration can reduce or save expenses with taxes, uncertainties, that is, it aims to reduce exchange relationship costs, migrating this market transaction relationship into the company. Vertical integration can be done upstream (e.g., a company that acquires a distributor of inputs, machinery, and equipment) or downstream (e.g., a company acquires logistics control or networks of companies oriented to the end consumer), for this type of strategy to be efficient, it is necessary to establish contracts and conduct agreements with customers and key partners to sustain minimum levels of products and inputs (ZYLBERSZTAJN; NEVES and CALEMAN, 2015).

Vertical integration can be done downstream or upstream in the production chain. When the company seeks forward integration, it seeks to differentiate the product, have better access

to marketing channels, better access to market information, improve distribution and take advantage of higher prices of products or services. In the case of backward integration, the company seeks to patent inputs, replace inputs purchased from other companies and start to supply its own input with the desired standard and quality, differentiating itself in the market (PORTER, 2004; KON, 2017).

Integration contracts are provided by Federal Law No. 13,288, of May 16, 2016, which aims to guarantee contracts and relationships of obligations and responsibilities between integrated producers and integrators. Its 14 articles establish the relationships, permissions, prohibitions, technical parameters, deadlines, rights and duties of the contract and procedures that each interested party must correspond to (BRASIL, 2016).

According to Stern et al. (1996), there are several reasons for companies to seek the vertical integration strategy, such as the complex characteristics of buying inputs or selling products; the high cost of changing suppliers or partners; the need for chain coordination to ensure product quality; uncertain environment; Transactions flow easily and with high frequency.

As an example of research that developed empirical studies of this market strategy, we find the works of Kilmer, Andre and Stevens (2001) who analyzed the relationship between vertical integration and pesticide residues in strawberries and tomatoes in the state of Florida-USA. Sologuren (2004) sought to identify the advantages of soybean processing companies in adopting vertical integration in the acquisition of fertilizer companies as a form of competitive advantage.

Lima et. al. (2009) sought to understand the strategy adopted by a pulp and paper company and identified the possible advantages and risks associated with the strategy employed. Lima (2011) identified the competitive challenges for the family oilseed agroindustry in the semi-arid region of Bahia by adopting verticalization. Marques, Souza and Machado Júnior (2015) sought to describe the arrangement determined in the Microregion of Anápolis - GO for the integrated production of chicken under the competitive strategy of verticalization of operations.

Araújo (1996) calculated the profitability of broiler chicken production that had vertical integration contracts in the State of Minas Gerais. De Souza (2007) investigated the reasons for the agro-industrial sector of grain processing in Brazil to adopt as a vertical integration strategy. Proença (2012) analyzed, from the 2000s onwards, the growth of the sugarcane sector in the mesoregion of Araçatuba and ascertained the possibility of increased industrial concentration in the sector and whether companies were strategically adopting vertical and horizontal integration.

Souza (2007) elaborated a synthesis (Table 1) that shows the advantages and disadvantages of vertical integration as a result of the presence of high transaction costs.

Table 1

Advantages and Disadvantages of the Vertical Integration strategy

Advantages of Vertical Integration	Disadvantages of Vertical Integration
• Ensure savings in combined operations; information; coordination and internal control; • Avoiding the market • Ensure supply and/or demand • Eliminate bargaining • Increase barriers to entry and mobility • Enter a high-return business • Defend against market closure • Facilitate adaptation in sequential decision-making • Mitigating opportunism • Promote convergent expectations (reduce uncertainties) • Dominate and promote information gain • Achieve an atmosphere of greater satisfaction • Rationalize inventory levels • Savings in operations arising from technological interdependence; elimination of risk premium; reduced transaction costs; economies of scale; stable relationships and resource retrieval; • Achieve product and price differentiation	• Costs of Going Through Mobility Barriers • Increased operating leverage • Reduced flexibility to change partners • High global exit barriers • Need for capital investments • Closing access to the market research provider or know-how • Need to provide incentives • Different administrative needs • Predisposition to favor maintenance or extension of internal operations • Distortion in communication • Internal opportunism • Bounded rationality • Adding bureaucracy • Loss of moral engagement • Capital imbalance • Reduced flexibility • Loss of specialization • Lack of savings with unbalanced stages of integrated operations; Administration and lower returns • Increased operating leverage

3.2 BENEFITS OF VERTICAL INTEGRATION IN THE APPLICATION OF AGROCHEMICALS

3.2.1 The Pesticide "Concessionaire" Model: A Proposal for Technical and Safe Application

At the heart of this proposal is the formation of a network of service and application centers, managed or supervised directly by the agrochemical producing companies. responsible for the entire product cycle in the process: from the technical recommendation, based on precise diagnoses, through the application carried out by highly trained and certified teams, to the post-application follow-up and the proper disposal of the packaging. structure goes beyond a simple logistical change; It is, in fact, an essential restructuring of responsibilities and incentives, harmonizing the interests of the manufacturer with those of the producer and, consequently, of society.

3.2.2 Guarantee of Technicality in Application and Optimization of Resources

The main highlight of this model is the increase in the technical level of the applications. Currently, the lack of technical knowledge among several rural productions, combined with the lack of assistance, results in inadequate applications and improper use of equipment (SILVA; OLIVEIRA, 2020). In this new model of vertical integration, the application teams would be composed of specialists: agricultural technicians, agricultural technicians and machine operators trained and constantly updated with the latest practices and technologies available. We consider protective equipment, such as GPS sprays, drones, and remote sensing systems, which act in constant permanence and real-time weather monitoring, all with the aim of reducing drift and avoiding contamination of adjacent areas (EMBRAPA, 2022).

Manufacturers, who have the most in-depth knowledge about their products, will establish standardized usage protocols to ensure maximum efficacy and minimize negative effects. In addition, a systematic collection of data on application and performance in the field would generate a virtuous cycle of learning and constant improvement. With the big data generated, it would be feasible to adjust dosages, improve recommendation algorithms, and consider success or failure patterns, converting the use of agrochemicals into an authentic science of applied data (CHEN et al., 2021).

The producer would not only maximize their investment, but also have a rationalization in the use of inputs – a double benefit for the economy and the environment. Consider the practical benefits: reduced machine passes result in less fuel consumption, less soil compaction, and more time for the producer to focus on strategic decisions for his property (SANTOS; PEREIRA, 2023).

3.2.3 Resistance Management and Product Longevity: An Economic Sustainability Perspective

The application made with the proper technique and proper use without the risk of accelerated development of resistance in pests, diseases and weeds (NEVES et al., 2018; SHAW; LEWANDOWSKI, 2019). Insufficient doses or applications at the wrong times end up selecting the most resistant individuals, which, over time, makes agrochemicals ineffective. This forces them to look for new molecules, a very expensive and time-consuming process, with diminishing returns (GAO et al., 2020). The loss of effectiveness of an agrochemical, due to resistance, not only causes direct losses to the producer – who needs to resort to more expensive or less efficient alternatives – but also represents a significant loss of intellectual and financial capital for the industry that developed it.

In the proposed model, the strict control of the application, added to a constant monitoring of the effectiveness in the field, would allow the implementation of much more effective and proactive resistance management strategies. Manufacturers have a direct interest in extending the life of their products. This would encourage it to promote the distribution of active ingredients, the use of mixtures, and the application only when necessary, following the principles of Integrated Pest Management (IPM) (MAPA, 2021). This alignment of interests between the manufacturer and agronomic sustainability is a critical differentiator.

Instead of focusing only on the sale, the manufacturer would focus on the solution and the longevity of the effectiveness. This translates into lower selection pressure, greater sustainability of the available chemical arsenal, and ultimately less need for heavy R&D investments for new molecules, benefiting the industry in the long run. The ability to obtain data on efficacy in different regions and crops would allow manufacturers to adjust their recommendations and develop customized resistance management programs, strengthening the resilience of agricultural systems (FERREIRA; GOMES, 2022).

3.2.4 Impact on Public and Occupational Health: From Exposure to Active Prevention

The use of agrochemicals by specialized teams, under the direct supervision of manufacturers, would result in a significant change in public and occupational health. The focus shifted from harm mitigation to proactive prevention. Applicators received constant and rigorous training on the proper use of state-of-the-art Personal Protective Equipment (PPE), safety procedures, related to concentrated products (including external transfer systems) and first aid. The direct responsibility of the manufacturer in promoting full adherence to occupational safety standards, the implementation of occupational health programs, and the continuous monitoring of employee health, considerably avoiding cases of acute and chronic poisoning among rural workers (FIOCRUZ, 2019; PEREIRA et al., 2022).

The standardization of processes and rigorous internal inspection would be key elements to ensure the safety of operators, who would become highly qualified and valued professionals.

The standardization of procedures and strict internal supervision will be fundamental to ensure the safety of operators, highly competent and recognized and valued professionals. A more technical application would lead to a reduction in agrochemical residues in food for the final consumer. The precise application of chemical substances, strictly respecting the withdrawal periods and recommended doses, reducing exposure to these substances. The full traceability of the application, ensured by the "concessionaire" and digitally registered, would enable a more efficient control of the quality of food "from the door to the inside". This would

increase consumer confidence in food safety and make it easier to identify potential problems (ANVISA, 2023).

This strict control would help certify products with less environmental and health impact, adding value and highlighting Brazilian production in the global market, especially in export markets with high sanitary standards. Transparency in the production chain, made possible by this model, could become a competitive factor for Brazilian agribusiness, responding to the growing demand for safe food and production in a sustainable way (UN, 2021).

3.2.5 Environmental Benefits and Ecological Sustainability

An optimized application of agrochemicals, with an emphasis on precision, and the reduction of losses, would result in considerably lower environmental impacts. A reduction in the contamination of soils, water resources (both surface and dense) and adjacent ecosystems would represent a direct and easily measured benefit (RODRIGUES; ALVES, 2021).

The reduction of the total amount of agrochemicals applied, maintaining effectiveness, helping to preserve biodiversity and fundamental ecosystem services, such as pollination and natural biological control. In addition, the centralized and professional management of the disposal of empty packaging and leftover products, under the responsibility of the manufacturer, would reinforce reverse logistics and considerably reduce environmental contamination by hazardous waste (IBAMA, 2020).

The search for greater efficiency and lower environmental impact would be perfectly in tune with the growing sustainability standards of modern agriculture and with the global sustainable development goals. This model has the capacity to place Brazil at the forefront of sustainable agricultural practices, not only by implementing new technologies, but also by a systemic restructuring that incorporates the negative externalities associated with the use of agrochemicals, fostering cleaner food production and a healthier rural environment. The reduction of the carbon footprint related to agricultural production, obtained through the optimization of the use of inputs and reduction in the demand for new cultivation areas due to higher productivity per hectare, would also represent a very positive result (IPCC, 2022).

3.2.6 Challenges, Implications and Perspectives for Implementation

While it brings clear benefits, adopting this model would not be free from complex and varied challenges, which required detailed analysis and well-designed mitigation strategies.

- **Economic Feasibility and Business Structuring:** Market restructuring would require manufacturers to make a significant initial investment in building the entire infrastructure

of the "dealerships" (service centers, equipment, vehicles) and training personnel. The main question is: how would this cost be transferred and what would be the pricing model for the farmer? Would there be a cost for use? A tariff per hectare? Or maybe a subscription model that encompasses the product and the service? The attractiveness for the farmer will depend on the perception of added value in relation to the direct cost, considering aspects such as higher productivity, lower risk, regulatory compliance, time and labor savings for the farmer will depend on the perception of added value in relation to the direct cost, considering aspects such as higher productivity, lower risk, regulatory compliance, time and labor savings. For small producers, government subsidies, special credit lines or cooperative models can be essential to guarantee access to technology and avoid exclusion, ensuring that benefits are distributed equitably (COSTA; LIMA, 2023).

- **Regulation and Competition:** It would be important to develop a robust regulatory framework that encourages fair competition, ensures transparency in pricing and services, and avoids monopolistic or oligopolistic practices. The creation of specific regulatory agencies or the adaptation of existing ones (such as CADE and consumer protection agencies) would be essential to monitor this new market, protecting the interests of producers and society (CADE, 2024). A clear definition of legal responsibilities in case of application failures or environmental damage would also be essential.
- **Acceptance and Autonomy of the Rural Producer:** The acceptance by rural producers, who would have to adapt to a new way of acquiring and applying agrochemicals, is a critical factor. Many farmers value autonomy in their management decisions and may initially resist the idea of outsourcing such an important step in their production process. The transition would require a significant effort of communication, demonstration of concrete results (increased productivity, long-term cost reduction, greater security) and, above all, the building of trust. Flexible models, which allow different levels of producer involvement – perhaps with assisted self-management options or specialized consulting – could facilitate the transition, respecting the farmer's culture and experience (EMATER, 2020).
- **Logistics and Infrastructure:** Brazil, with its continental dimensions and vast agricultural area, often in remote regions and with precarious infrastructure, presents an immense logistical challenge. The creation of a network of "concessionaires" with sufficient capillarity to serve all producers would require robust logistics planning and

massive investment in transportation, storage and communication infrastructure. Digitalization and connectivity would be essential to manage this network efficiently, allowing for service scheduling, remote monitoring, and real-time data collection. Public-private partnerships could be explored to enable the expansion of infrastructure in hard-to-reach areas (CNT, 2023).

- **Social Aspects and Equity:** It is essential to ensure that this model does not accentuate the inequalities that already exist in the countryside. Smallholder farmers and traditional communities, which often already face limited access to technologies and technical assistance, cannot be marginalized. Public policies of inclusion, differentiated financing programs and the adaptation of the model to meet these realities would be imperative. The formation of producer cooperatives to access the services of the "concessionaires" or the creation of itinerant service models could be solutions to ensure that no producer is excluded (MDA, 2022). The training of local labor to work in the "concessionaires" would also generate jobs and regional development.

However, the gains in safety, efficiency and sustainability are so significant that they justify in-depth exploration of this topic. Overcoming these challenges will require constructive dialogue and strategic collaboration between the government, the agrochemical industry, rural producers, academia and civil society. The transition to a more responsible system of agrochemical use is not just a technical issue, but a social and environmental demand that requires an innovative vision and the courage to redefine paradigms.

4 CONCLUSION

This study proposed and debated an innovative model for the application of agrochemicals in Brazil, based on the vertical integration of manufacturers. These manufacturers would become directly responsible for the application service in the field, similar to the model of dealership deliveries. The results suggest that this strategy can transform the risk management linked to these inputs, fostering a safer, more effective and sustainable agriculture.

The creation of agrochemical "concessionaires", managed by specialized technical teams and under the direct supervision of manufacturers, is proposed as a multifaceted solution. It is expected that this encourages the model of technicality in the application, leading to a more efficient control of the resistance of sentences and diseases and increasing the durability of the products.

This model is expected to promote technicality in application, resulting in more effective management of pest and disease resistance, extending the shelf life of products and optimizing resources.

In addition, a significant improvement in the occupational health of those applied is expected through specific training and proper use of PPE, as well as in the food safety of the final consumer, due to the reduction of residues in food and increased traceability. The environmental benefits, resulting from precise application and responsible disposal, are important, helping to preserve biodiversity and natural resources.

Although challenges related to investments, regulation, competition, accessible by rural producers, logistics and heritage need to be approached with caution, the idea of vertical integration in the use of agrochemicals indicates a promising path for safer, more effective and sustainable agriculture in Brazil.

It is recommended that future research investments in in-depth economic forecast studies for various scales of production, governance models for governance as "concessionaires" that ensure competition and producer protection, in addition to the regulatory impact necessary for the transition to this new paradigm. For Brazil to become an example in sustainable agricultural practices, it is essential that government, industry, the productive sector and civil society work together to transform this vision into a reality that benefits everyone.

ABSTRACT

This research aims to conduct a bibliometric mapping of institutional change related to sustainability. To this end, a search was carried out in the Scopus, SciELO, and Web of Science databases using the keywords "institutional change and energy and environmental science." The search was limited to scientific journals from the last five years. The objective

was to perform a bibliometric mapping on the topic of institutional change and sustainability, and to analyze the performance of the bibliometric results, considering several aspects. The method used in the research was descriptive, which aims to transcribe, describe, interpret, and explain the results obtained with the aid of bibliometric analysis. This aims to identify and analyze the profile of scientific production on a given topic, using a quantitative approach through descriptive statistics. From the point of view of bibliometric networks, it was observed, through the mapping of keywords, that the researched topic is inserted in different contexts, separated into three aspects: 1 – institutional change, 2 – institutional structure, and 3 – sustainability. All the selected articles point to institutional change as one of the mitigating actions in relation to sustainable development. This change involves the restructuring of institutions. The process is slow and gradual because there are resistance mechanisms, mainly from the economic sector, but also partly from the academic sector. Researchers argue that the Sustainable Development Goals (SDGs) have a limited and inadequate conceptualization, which hinders their practical application. Although they aim to promote sustainable patterns, the SDGs fail to provide clear targets and effective guidance for the necessary institutional changes. The authors report that a holistic view of the challenges is important and describe the blockchain-based micro-network model, proposing changes in institutions as well as in the scientific and academic environment.

Keywords: Institutional Change. Sustainability. Bibliometrics.

RESUMO

Esta pesquisa tem como objetivo realizar um mapeamento bibliométrico a respeito da mudança institucional relacionada à sustentabilidade. Para isso, foi realizada uma pesquisa nas bases de dados Scopus, Scielo e Web of Science, usando a palavra-chave “institutional change and energy and environmental science”. A pesquisa foi delimitada considerando apenas os periódicos científicos de 2018 a 2022. O objetivo foi analisar o desempenho dos resultados bibliométricos, considerando alguns aspectos. O método utilizado na pesquisa foi o descritivo, que objetiva transcrever, descrever, interpretar e explicar os resultados obtidos com o auxílio da análise bibliométrica. Esta visa identificar e analisar o perfil da produção científica de um determinado tema, fazendo-se uso da abordagem quantitativa através da estatística descritiva. Do ponto de vista das redes bibliométricas, observou-se, por meio do mapeamento das palavras-chave, que o tema pesquisado está inserido em diferentes contextos, separados em três vertentes: 1 – mudança institucional, 2 – estrutura institucional e 3 - sustentabilidade. Todos os artigos selecionados apontam a mudança institucional como uma das ações mitigadores em relação ao desenvolvimento sustentável. Essa mudança passa pela reestruturação das instituições. O processo é lento e gradual, porque existem mecanismos de resistência principalmente por parte do setor econômico, mas também em parte do setor acadêmico. Pesquisadores argumentam que os Objetivos de Desenvolvimento Sustentável (ODS) possuem uma conceituação limitada e inadequada, o que prejudica sua aplicação prática. Embora busquem promover padrões sustentáveis, os ODS falham em oferecer metas claras e orientações eficazes para as mudanças institucionais necessárias. Os autores relatam que é importante uma visão holística dos desafios e descrevem o modelo das micro redes baseado em blockchain, propondo mudanças nas instituições assim como no meio científico e acadêmico.

Palavras-chave: Mudança Institucional. Sustentabilidade. Bibliometria.

RESUMEN

Esta investigación tiene como objetivo realizar un mapeo bibliométrico del cambio institucional relacionado con la sostenibilidad. Para ello, se realizó una búsqueda en las bases de datos Scopus, SciELO y Web of Science, utilizando la palabra clave "cambio institucional y energía y ciencia ambiental". La búsqueda se limitó a revistas científicas publicadas entre 2018 y 2022. El objetivo fue analizar el desempeño de los resultados bibliométricos, considerando diversos aspectos. El método empleado fue descriptivo, con el fin de transcribir, describir, interpretar y explicar los resultados obtenidos mediante el análisis bibliométrico. Esto busca identificar y analizar el perfil de la producción científica sobre un tema determinado, utilizando un enfoque cuantitativo a través de la estadística descriptiva. Desde la perspectiva de las redes bibliométricas, se observó, mediante el mapeo de palabras clave, que el tema investigado se inserta en diferentes contextos, divididos en tres aspectos: 1) cambio institucional, 2) estructura institucional y 3) sostenibilidad. Todos los artículos seleccionados señalan el cambio institucional como una de las acciones de mitigación en relación con el desarrollo sostenible. Este cambio implica la reestructuración de las instituciones. El proceso es lento y gradual debido a la existencia de mecanismos de resistencia, principalmente del sector económico, pero también, en parte, del sector académico. Los investigadores sostienen que los Objetivos de Desarrollo Sostenible (ODS) presentan una conceptualización limitada e inadecuada, lo que dificulta su aplicación práctica. Si bien buscan promover estándares sostenibles, los ODS no ofrecen metas claras ni una guía eficaz para los cambios institucionales necesarios. Los autores señalan la importancia de una visión holística de los desafíos y describen el modelo de microred basado en blockchain, proponiendo cambios tanto en las instituciones como en el entorno científico y académico.

Palabras clave: Cambio Institucional. Sostenibilidad. Bibliometría.

1 INTRODUCTION

In 2015, the United Nations established the Sustainable Development Goals (SDGs), creating a political guide to address global socio-environmental crises. The so-called 2030 Agenda focuses on the urgent transformation of consumption and production patterns, especially in the face of a world population that is moving towards eight billion people and demands more sustainable urban solutions. However, the implementation of these changes is hampered by the rigidity of bureaucratic systems, which are not yet accustomed to adaptive and flexible management models in the face of climate variations.

A central point of sustainability is the diversification of the energy matrix. Historically based on large hydroelectric plants and biomass, renewable energy now needs to explore untapped potential and adopt alternative sources. For this transition to occur in a practical way, it is essential to have specific government regulations and incentives, responding to the exhaustion of models based on non-renewable sources.

To understand how these transformations occur, sources define institutions as enduring norms, rules, and procedures that shape social and political behavior. Some key features of these structures are:

- **Stability:** Generally, institutions do not change instantaneously; their evolution is usually **slow and gradual**.
- **Interconnection:** Changes in an institution often have repercussions on other entities and public policies.
- **Rules of the Game:** They work as the guide for the actions of individuals and organizations, and can be formal or informal.

Institutional change can be triggered by internal or external shocks. From the perspective of historical institutionalism, the "critical junctures" stand out, which are gaps in periods of crisis that allow for a lasting change in the trajectory of a policy or institution.

The article in question seeks to map the profile of scientific production on this topic in the Web of Science, Scopus and Scielo databases. The focus is to analyze how new norms and regulatory procedures are restructuring the sustainability paradigm and how the behavior of social groups can influence or even create new institutions.

2 METHODOLOGY

The method used in the research was descriptive, which aims to transcribe, describe, interpret and explain the results obtained with the help of bibliometric analysis. This aims to

identify and analyze the profile of the scientific production of a given topic, making use of the quantitative approach through descriptive statistics.

The databases used were the Web of Science, Scielo and Scopus, which are available on the journal portal Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES). These databases have databases of abstracts and citations of peer-reviewed literature, including scientific journals, books, and conference proceedings, which cover topics from various areas of knowledge.

The search was carried out on 03/09/2026, covering the period from 2018 to the year 2023. This period was defined, due to the greater availability of open articles. The terms used were searched in the title, abstract, and keywords of the articles. The search was restricted to articles from open journals. The syntax of the databases was as follows: "institutional change and energy and environmental science". The main search was through the keyword "institutional change", restricting the search to the keywords: energy and environmental science".

The data related to these documents (journals, authors, references, citations, etc.) were stored in a text file for performance analysis and bibliometric mapping. The descriptive analysis and mapping were performed by the Bibliometrix software, which is part of RStudio, which is the most popular integrated development environment (IDE) for the R programming language, being widely used in data science, statistics and academic research.

The method of analysis of the empirical objects will follow three main phases organized as follows:

Preparatory phase: Cut out the theme and keyword for the research (institutional change and energy and environmental science); Search in databases (web of Science and Scopus); Export the data to the Bibliometrix application in RStudio; Generate the quantitative data tables and graphs in Bibliometrix.

Analytical phase: Review of the literature on the subject; Grouping of quantitative data in tables and graphs generated in Bibliometrix; Bibliometric analysis.

Descriptive phase: Interpretation of the results found in the Bibliometrix.

3 BIBLIOMETRIC ANALYSIS

The objective of this section is to analyze the performance of bibliometric results, considering some aspects, such as the annual scientific production, the evolution of citations, relevant sources and authors, world scientific production and the bibliometric networks that most collaborate with each other in scientific productions on the theme transition of institutional

paradigms and sustainability. Table 1 shows the main data on this survey in the period from 2018 to 2023. 298 documents were found in the databases (web of Science, scielo and scopus) with 1030 authors involved and 20,986 references.

Table 1

Summary of the survey data

Key information about the survey data	
Description	Results
Time Range	2018/2023
Sources (newspapers, books, etc.)	129
Documents	298
Annual growth rate (%)	-36,9
Average document age	2,83
Average citations per document	12,54
References	20986
Authors	1030
Most used keywords (ID)	1346
Keywords by author (DE)	1130

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

4 ANNUAL SCIENTIFIC PRODUCTION

Figure 1 shows the evolution of the number of publications from 2018 to 2023 on the topic of transition of institutional paradigms and sustainability. It can be identified that in 2018 there are 40 articles published, with a noticeable increase in 2019 to 70 articles, almost doubling compared to the previous year. Until 2022, the situation of the average number of publications remains unchanged, but in 2023, due to being still at the beginning, the number of publications was not so expressive.

Figure 1

Annual scientific production

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

5 MOST RELEVANT AUTHORS

Figure 2

Most relevant authors

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

The ten authors, who published the most on the theme of institutional change and renewable energy, can be seen in figure 2. Patterson is the most relevant with six publications. In second place, the author Beunen (2019) with 5 articles. In third place was the researcher Haller with 4 publications. Chen and Wolsink (2018) were in fourth position in publications, both with 3 articles. The others with two publications each completed the list with 2 articles each.

6 MOST RELEVANT AFFILIATIONS

Figure 3 shows the ten most relevant affiliations on the topic in question. Utrecht University was the most relevant with 13 articles, the University of Bern in second place with 11 publications. In third place were the universities Arizona State University and the Delft University of Technology, both with 8 publications. In fourth place with 7 articles each were the following universities: Michigan State University, Stockholm University, University of California and the University of Groningen. In fifth place was the University of Oxford, which published 6 articles. Finally, in sixth place we had Leuphana University Luneburg with 5 publications.

Figure 3*Most relevant affiliations*

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

7 SCIENTIFIC PRODUCTION OF COUNTRIES

Figure 4*Most cited countries*

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

Figure 4 shows the situation of scientific production in the countries in relation to the authors who published on the subject. It is noted that there is a progressive increase, showing that the USA, the Netherlands and the United Kingdom have been standing out, closely followed by China and Germany. It is observed that the number of citations and correspondences confirm what was previously said, that is, the Netherlands with 426 citations, Japan with 309 citations and India 293, demonstrate the predominance in the scientific production on the subject studied

of the European countries, the USA and Asia, represented by Japan and China. Countries like Brazil still participate with a small scientific production, compared to the others.

8 MOST CITED DOCUMENTS GLOBALLY

Figure 5

Most cited documents globally

Source: Result of the Web of Science, Scopus, Scielo search, at Bibliometrix (2023)

Figure 5 shows the most cited documents globally. The article *Challenges and strategies for effective plastic waste management during and post COVID-19 pandemic* published by Vanapalli and other authors (2021) in the journal *Science of The Total Environment*, this was the most cited document with 209 citations. In second place is the publication: *Review of blockchain-based distributed energy: Implications for institutional development*, published by researcher Amanda Ahl together with other researchers (2017) with 160 citations, in the journal *Renewable and Sustainable Energy Reviews*. The article *Climate change and agriculture in South Asia: adaptation options in smallholder production systems* occupies the third position, participating with 151 citations. The research of the author Arial developed together with other researchers in the year 2020. The other documents participated with an average of approximately 100 citations.

9 BIBLIOMETRIC NETWORKS

Figure 6 shows the network of co-occurrence of the keywords; in it, the following are observed: the most frequent terms, with the occurrences proportional to the size of the circles and label; the associations between the words, given by the links and proximity; the groups,

indicated by the colors. In this network, four groups were formed, three of which stood out the most: the red cluster, representing the occurrence of the terms *institutional change* and *economics*. The cluster represented by the color blue identified the highlighted terms *institutional framework* and *institutional reform*. The lilac cluster stood out with the keywords *governance approach* and *sustainability*. It was observed that, although each group has a specific theme, these groups do not distance themselves much because the themes are very close and the interconnections occur more frequently.

Figure 6

Co-occurrence networks

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

Figure 7

Collaboration networks by author

Source: Web of Science search result, Scopus, Scielo, obtained from Bibliometrix (2023)

Figure 7 shows the collaboration network between the researchers, forming 11 small groups represented by circles of different colors. The collaboration network represented by the color green is the one that stood out the most, both in terms of the number of members, with

the size of the circles increased, and in the quantity, in relation to the other groups. It is noteworthy that the collaboration groups do not connect with each other. This means that collaboration networks can grow even more if connections and integration increase.

10 CONTENT ANALYSIS OF THE FIVE MOST RELEVANT PUBLICATIONS

In this topic, the content of the abstracts of the five most relevant articles found in this bibliometric review was analyzed, and most of the findings identified a strong tendency to use sustainability to enhance the process of institutional change. In the samples examined, it was observed that the researchers used the bibliographic references produced over time, as well as empirical and statistical studies to support their research, which contributed to increase the confidence and security of the results presented. In these terms, with the purpose of verifying which articles published in journals aroused the interest of researchers, this research includes the five most cited articles, with their respective titles and DOI, which showed that sustainability and environmental issues are beneficial to the field related to the transition of institutional paradigms as a whole.

The first article *Challenges and strategies for effective plastic waste management during and post COVID-19 pandemic*, studies conducted by Vanapalli & Al. (2021), the researchers published on the increased complexity of plastic waste management during the COVID-19 pandemic, due to numerous aspects, either because demand has increased or because of the maintenance of hygienic care. The article demonstrates the inadequacies and inefficiencies of our current waste management system in addressing this problem, further increasing dependence on plastic and exacerbating environmental problems. Therefore, the suggestion of the research is to reduce pollution with waste management, prioritizing policies, changing social and individual behaviors through government and corporate action.

Ahl & Al. (2019) published the second article, called *Review of blockchain-based distributed energy: Implications for institutional development*, where they recognize the complexity of the energy situation, in which the distribution of its sources is essential. The aim of the paper is to holistically explore the potential challenges of blockchain-based microgrids and propose implications for the institutions involved, as well as the academic world. In this sense, the research is distributed according to the following analytical structure: 1) Technological, 2) Economic, 3) Social, 4) Environmental and 5) Institutional dimensions. Hence, gradual institutional changes that leverage regulatory and community-building sandbox approaches are proposed as potential avenues to incorporate this multidimensionality.

Aryal and Al. (2020) present in their publication *Climate change and agriculture in South Asia: adaptation options in smallholder production systems*, in the journal *Environment, Development and Sustainability*, a systematic review of the impacts of climate change on agricultural production and the main options in this sector, making them available and adapting to such changes. The research concluded that agricultural practices exist and are helping to adapt to climate change, however, the institutional configuration has not been sufficiently mature for the implementation and dissemination of technical solutions. The researchers say it is important to examine how to implement the necessary institutional change, as well as to encourage the generation of investment funds in these changes and to design policies to adapt to climate change in the long term, rather than focusing only on the technological aspect.

In the fourth article discussed, *Transforming systems of consumption and production for achieving the sustainable development goals: moving beyond efficiency*, Bengtsson & Al. (2018) analyzed the Sustainable Development Goals (SDGs), which aim to ensure sustainable consumption and production patterns. The researchers maintain that, although these goals were developed in 2015 and the scientific evidence and importance of the theme, the SDGs do not establish very clear goals or efficient guidelines regarding the operationalization of institutional changes to this agenda. They conclude that the SDGs offer a partial and inadequate conceptualization, making it difficult to implement the goals. As such, the survey offers not only analytical results, but also suggestions on how governments and other stakeholders could effectively pursue Sustainable Consumption Patterns (HCPs).

Pfenninger & Al. (2018) published in the *journal Energy Strategy Reviews* the article *Opening the black box of energy modelling: Strategies and lessons learned* about the great transition in the global energy system, in government and academic planning and decision-making. The researchers give importance to transparency and the open availability of energy models and data to the detriment of current models, which are closed. The research proposes a practical how-to guide based on the collective experience of the members of the *Open Energy Modelling Initiative (Openmod)*.

11 CONCLUSIONS

The objective of this study was to carry out a bibliometric mapping on the theme of transition of institutional paradigms and sustainability. It was observed that there are already a reasonable number of studies that study this theme, but the scientific production still shows evolutionary progress. This shows the importance of co-evolution of economic variables on the

one hand and conventional or state planning and, on the other, those of institutional change to establish a virtuous circle of development.

From the point of view of bibliometric networks, it was observed, through the mapping of keywords, that the researched theme is inserted in different contexts, separated into three strands: 1 – *institutional change*, 2 – *institutional structure* and 3 – *sustainability*.

All selected articles point to institutional change as one of the mitigating actions in relation to sustainable development. This change involves the restructuring of institutions. According to Ahl & Al. (2019), the process is slow and gradual, because there are resistance mechanisms mainly on the part of the economic sector, but also on the part of the academic sector. The authors report that a holistic view of the challenges is important and describe the blockchain-based microgrid model, proposing changes in institutions as well as in the scientific and academic environment. Another example of a model is the one proposed by researchers Cleaver & Whaley (2018), who defend adaptive governance, in which it has gained space in academic and political circles. Warneryd (2020), in his research on community microgrids, reports that formal institutions influence informal institutions, although their objectives are different.

Researchers who have examined the Sustainable Development Goals (SDGs) — focused on ensuring sustainable production and consumption patterns — point to critical flaws in their framework. According to the study, despite the relevance of the theme and the scientific basis available since 2015, the SDGs lack clear and effective guidelines to transform institutions in practice. The conclusion is that the conceptual definition of these objectives is limited and insufficient, which creates real obstacles for the goals to be successfully achieved.

Beunen & Patterson (2019) argue that there is a critical need to pay attention to the fundamentally political character of institutional work, the cumulative effects of action carried out by multiple actors, and the communicative and discursive dimensions. These researchers argue that the concept of institutional work opens up new possibilities to unravel the long-standing challenge of understanding institutional change in environmental governance.

In general, it can be said that the more developed countries are more articulated or are more visible with the institutional change linked to the environmental aspect. This is justified because publications with scientific impact are located in these countries. In countries such as Brazil, it is also expressed in the three strands mentioned above, in which the *co-occurrences* of networks on the themes and the most relevant affiliations between universities were identified, but the impact of the publications occurs in a localized way, not reaching international journals.

ABSTRACT

Based on the concepts of dark matter and dark energy, I present a hypothesis that all the universal energy that organizes and sustains the cosmos is manifested in macrocircular gravitational motion, as a driving force behind the movements of galaxies, which do not represent an expansive linear motion, but rather the macrocircular motion of the gravitational center. The gravitational center energy, therefore, is the organizing principle that maintains the cohesion and structure of the universe, exerting a powerful influence on everything that exists through macrocircular motion. Not necessarily in a perfect circle, but in a centrally attractive pattern. It is concluded that macrocircular gravitational motion reveals itself in a universal dynamic of circuits and patterns that we observe at all levels of reality, from stellar, planetary, and satellite orbits to the movements of subatomic particles.

Keywords: Dark Matter. Dark Energy. Universal Energy. Cosmos. Macrocircular Gravitational Motion. Driving Force. Organizing Principle. Centrally Attractive Pattern. Universal Dynamics.

RESUMO

Tomando por base os conceitos de matéria e energia escuras apresento uma hipótese de que toda a energia universal que organiza e sustenta o cosmos é manifestada no movimento gravitacional macrocircular, como uma força motriz por trás dos movimentos das galáxias, que não representam um movimento linear expansivo, mas o movimento macrocircular centro gravitacional. A energia centro gravitacional, portanto, é o princípio organizador que mantém a coesão e a estrutura do universo, exercendo uma influência poderosa sobre tudo o que existe por meio do movimento macrocircular. Não necessariamente em círculo perfeito, mas no padrão centralizadamente atrativo. Conclui-se que o movimento gravitacional macrocircular revela-se numa dinâmica universal de circuito e padrões que observamos em todos os níveis da realidade, desde as órbitas estelares, planetárias, satelitais até os movimentos das partículas subatômicas.

Palavras-chave: Matéria Escura. Energia Escura. Energia Universal. Cosmos. Movimento Gravitacional Macrocircular. Força Motriz. Princípio Organizador. Padrão Centralizadamente Atrativo. Dinâmica Universal.

RESUMEN

Basándome en los conceptos de materia oscura y energía oscura, presento la hipótesis de que toda la energía universal que organiza y sustenta el cosmos se manifiesta en un movimiento gravitacional macrocircular, como fuerza impulsora de los movimientos de las galaxias, los cuales no representan un movimiento lineal expansivo, sino el movimiento macrocircular del centro gravitacional. La energía del centro gravitacional, por lo tanto, es el principio organizador que mantiene la cohesión y la estructura del universo, ejerciendo una poderosa influencia sobre todo lo que existe a través del movimiento macrocircular. No necesariamente en un círculo perfecto, sino en un patrón de atracción central. Se concluye que el movimiento gravitacional macrocircular se revela en una dinámica universal de circuitos y patrones que observamos en todos los niveles de la realidad, desde las órbitas estelares, planetarias y satelitales hasta los movimientos de partículas subatómicas.

Palabras clave: Materia Oscura. Energía Oscura. Energía Universal. Cosmos. Movimiento Gravitacional Macrocircular. Fuerza Impulsora. Principio Organizador. Patrón de Atracción Central. Dinámica Universal.

RESUMEN

Esta investigación tiene como objetivo realizar un mapeo bibliométrico del cambio institucional relacionado con la sostenibilidad. Para ello, se realizó una búsqueda en las bases de datos Scopus, SciELO y Web of Science, utilizando la palabra clave "cambio institucional y energía y ciencia ambiental". La búsqueda se limitó a revistas científicas publicadas entre 2018 y 2022. El objetivo fue analizar el desempeño de los resultados bibliométricos, considerando diversos aspectos. El método empleado fue descriptivo, con el fin de transcribir, describir, interpretar y explicar los resultados obtenidos mediante el análisis bibliométrico. Esto busca identificar y analizar el perfil de la producción científica sobre un tema determinado, utilizando un enfoque cuantitativo a través de la estadística descriptiva. Desde la perspectiva de las redes bibliométricas, se observó, mediante el mapeo de palabras clave, que el tema investigado se inserta en diferentes contextos, divididos en tres aspectos: 1) cambio institucional, 2) estructura institucional y 3) sostenibilidad. Todos los artículos seleccionados señalan el cambio institucional como una de las acciones de mitigación en relación con el desarrollo sostenible. Este cambio implica la reestructuración de las instituciones. El proceso es lento y gradual debido a la existencia de mecanismos de resistencia, principalmente del sector económico, pero también, en parte, del sector académico. Los investigadores sostienen que los Objetivos de Desarrollo Sostenible (ODS) presentan una conceptualización limitada e inadecuada, lo que dificulta su aplicación práctica. Si bien buscan promover estándares sostenibles, los ODS no ofrecen metas claras ni una guía eficaz para los cambios institucionales necesarios. Los autores señalan la importancia de una visión holística de los desafíos y describen el modelo de microred basado en blockchain, proponiendo cambios tanto en las instituciones como en el entorno científico y académico.

Palabras clave: Cambio Institucional. Sostenibilidad. Bibliometría.

1 INTRODUCTION

Based on the concepts of dark matter and dark energy introduced by the Swiss astronomer Fritz Zwicky (1933) and the astrophysicist Michael Turner (1998), respectively, which exert a strong influence on cosmic bodies, in theory, as a gravitational glue that holds galaxies together and structures the universe, whose theses are fundamental to explain why galaxies are nothing more than organized structures to chaos, as well as explaining the accelerated expansion of the universe, among others, being the biggest enigmas of modern physics. Certainly it cannot be ignored that there is a colossal force of energy provided with inscrutable glory.

In this way, I present a hypothesis of universal reality without pretense of imposing an ultimate and/or absolute reality, but only as an expression of the restlessness of thought. I apologize in advance for the technicalities and misused terms, considering the lack of expertise in specific areas to infer such theories, however, the conceptions that disturb the soul generate the necessary boldness to share this alternative reality focus.

2 THE MACROCIRCULAR MOVEMENT

All the universal energy that organizes and sustains the cosmos is manifested in the macrocircular motion of the celestial bodies, as a driving force behind the motions of the galaxies, whose motions, in fact, do not represent an expansive linear motion, but the macrocircular motion of the center of gravitation, thus revealing the constant transformation and flux of the cosmos. Therefore, I suggest that there is a single, fundamental source of energy that drives movement and transformation across the entire expanse of the universe.

This gravitational center energy is responsible for the macrocircular motions of galaxies and underscores the dynamics and interconnectedness of the cosmos on its broadest scale. The patterns observed in the movement of galaxies are expressions of this energy that permeates the entire universe, shaping its evolution and structure throughout the cosmic moment.

The cosmos is an integrated and constantly moving whole, where each part is in dynamic interaction with all other cosmic units, although uniquely distinguished by the circular movement around its focal points (black holes) and existential momentum.

The interaction of all existential matter is sustained by the continuous macrocircular movement that predominates over all existence, this movement being the very pillar of existence, highlighting its dynamic and omnipresent nature. The gravitational center energy, therefore, is the organizing principle that maintains the cohesion and structure of the universe,

exerting a powerful influence on everything that exists through macrocircular motion. Not necessarily in a perfect circle, but in the centrally attractive pattern.

Without the continuous interaction of this universal movement, everything that came into existence would dissolve like smoke dissipated in the wind, which reveals the fragility and dependence of physical reality on this primordial force. This dependence suggests the transitory and ephemeral nature of material existence, contrasting it with the perennial presence of the gravitational center energy that sustains it. Without it, nothing that has been done would be done and, therefore, nothing would exist.

Thus, among the structures of the celestial bodies, what seems to be distancing itself at a given moment of existence will give the impression of approximation or stability of position, as can be observed with the impression of approximation of the Andromeda galaxy. This is due to the variation of imperfect circular movements throughout the cosmos, similar to what occurs with the translation of the planets and satellites of our Solar System, noticeable, because it occurs in a smaller amplitude of space and time.

That said, the end of interaction in circular motions is the end of all things. It would be the immediate resublimation of everything to nothingness, when existence would dissolve into nothingness of nothing, because even the nothingness of the cosmos is nothing without such constant and circular interaction of the influence of the gravitational center energy that translates into gravitational and organizational force.

Thus, within the thesis of the macrocircular motion of the cosmic structure, there is no distinction between the concepts of dark energy and dark matter, both energies coming from one, namely, the gravitational center energy. Such a circular force gravitational center, despite sustaining the gear of existence, is not represented by anything imaginable or detectable in physical perspective, such as a large black hole in the non-existent center of the universe or anything like that, even though its effects are undeniable on the structure of the universe, translated by dark energy and matter. Only what is existent moves in a circle around this gravitational center (the focal point still needs to be observed), revealing itself in a universal dynamic of circuits and patterns that we observe at all levels of reality, from stellar, planetary, satellite orbits to the movements of subatomic particles.

3 CONCLUSION

It is concluded, therefore, that there has not been a universal explosion, nor is there a linear expansion of the celestial bodies, but an imperfect macrocircular trajectory of the entire cosmic mass around the non-existent focal point of the gravitational center energy persists,

taking over all cosmic matter, similar to what is observable in the spirals of galaxies, which form their own circular motion by themselves. where the same principled movements and patterns manifest themselves in different scales that act in a constant and infinite force on all existing matter, whose levels of matter, from the subatomic to the astronomical, in all of them the interactive circle is replicated as a gear of existence.

Therefore, macrocircular motion is not just an observable phenomenon, but a basic principle that governs the interaction between energy and matter. This implies that this movement can be considered a fundamental characteristic of existential nature, present in all aspects of reality. Each part of the universe is interconnected and interdependent, contributing to the harmonious functioning of the whole. In this sense, macrocircular motion is not just an isolated feature, but an essential component of the complex web of interactions that sustain life, existence, and the organization of the universe. "Somehow, everything goes around."

Berg Francisco Alves de Souza¹

ABSTRACT

This study investigates the transition of the construction industry to the Construction 4.0 paradigm, focusing on overcoming productivity stagnation and the sector's technological slowdown. The global scenario, driven by the Fourth Industrial Revolution, requires the integration of technologies such as BIM, drones, the Internet of Things, and cloud computing. However, the literature indicates that implementation is challenging, especially for small companies in developing countries, due to high costs, cultural resistance, and the lack of clear roadmaps. The case study conducted in a small construction company in Pernambuco highlights real issues, such as failures in façade inspection and critical incompatibilities between decentralized projects. To address these bottlenecks, an eleven-step methodology is proposed, using Revit software for BIM coordination, the OnSafety platform for digital occupational safety management, and the strategic use of drones for technical monitoring. The results demonstrate that digitalization is feasible and essential for small organizations, leading to greater operational efficiency, error reduction, and increased competitiveness in the regional market.

RESUMEN

Este trabajo investiga la transición de la industria de la construcción hacia el paradigma de la Construcción 4.0, con foco en superar el estancamiento de la productividad y la lentitud tecnológica del sector. El escenario global, impulsado por la Cuarta Revolución Industrial, exige la integración de tecnologías como BIM, drones, Internet de las Cosas y computación en la nube. Sin embargo, la literatura señala que la implementación es desafiante, especialmente en pequeñas empresas de países en desarrollo, debido a los altos costos, la resistencia cultural y la falta de rutas claras. El estudio de caso realizado en una constructora de pequeño porte en Pernambuco evidencia problemas reales, como fallas en la inspección de fachadas e incompatibilidades críticas entre proyectos descentralizados. Para solucionar estos cuellos de botella, se propone una metodología en once etapas que utiliza el software Revit para la coordinación BIM, la plataforma OnSafety para la gestión digital de la seguridad laboral y el uso estratégico de drones para el monitoreo técnico. Los resultados demuestran que la digitalización es factible y esencial para pequeñas organizaciones, resultando en mayor eficiencia operativa, reducción de errores y aumento de la competitividad en el mercado regional.

Palabras clave: IR4.0. Construcción 4.0. Soluciones Digitales. Drones. Computación Móvil. BIM.

1 INTRODUCTION

The global industrial scenario has changed radically in recent years, as a result of continuous technological innovations (SCHMIDT *et al.* 2015). While the first three industrial revolutions leveraged productivity through disruptive technologies (SCHUH *et al.* (2013), Industry 4.0 (I4.0) introduced the concept of smart factories. This new paradigm encompasses advances such as Cyber-Physical Systems, Internet of Things (IoT), Robotics, Big Data, Cloud and Augmented Reality (WEYER *et al.* 2015), driven by the intense convergence between the digital, physical and biological worlds (LI *et al.* 2017).

In the field of civil construction, this concept gave rise to Construction 4.0. The literature extensively maps its applications: Oesterreich and Teuteberg (2016) point out 16 areas integrated into the sector, while Balasubramanian *et al.* (2021) reference at least 23. In a convergent way, Silva, Simão and Menezes (2018) summarize that the insertion of tools such as drones, cloud, augmented reality, 3D printing and BIM are promoting profound transformations in the work dynamics in civil construction (CC).

Although digitalization facilitates the construction and maintenance processes (MUSARAT *et al.* 2022), the sector has traditionally been slow to assimilate innovations (CAO; LI; WANG, 2014), failing to take advantage of technological opportunities capable of combating the productive stagnation of the workforce (MASKURIY *et al.* 2019). Aggravating this scenario, Menegon and Da Silva (2023) point out the difficulty of implementing Construction 4.0 in small companies in developing countries. The authors warn of a scientific gap, highlighting the urgency of adapting research to the local reality of emerging markets and their specific barriers.

The construction industry is highly fragmented, dominated by small and medium-sized companies with restricted budgets to invest in innovation, has obstacles such as high startup costs, training expenses, resistance to change, and technological immaturity often restrict I4.0 to purely experimental stages.

Similar to the panorama of general stagnation of the sector (MASKURIY *et al.* 2019), the construction company object of this study has a cultural aversion to change. The non-adoption of digital advances has generated severe bottlenecks, such as operational inefficiency, slow decisions, failures in project management, and consequent loss of competitiveness in the market.

However, the literature proves that these barriers can be mitigated. The application of I4.0 ensures greater efficiency on construction sites (MUSARAT *et al.* 2022), and the use of intelligent tools in supply management generates time savings and cost reduction (DARDOURI,

2022). Therefore, the adoption of these technologies presents itself as a viable and promising way to solve the problems of the company in focus.

The article presents a structure organized as follows: section 2 presents the theoretical framework with concepts and elements of IR4.0 and digital transformation in CC; Section 3 consists of a case study, with a proposal for the company studied; Section 4, finally, contemplates the conclusions of the study and final considerations of the work.

2 THEORETICAL FRAMEWORK

2.1 INDUSTRY 4.0 IN CIVIL CONSTRUCTION

IR4.0 created a paradigm shift in the construction industry towards digital transformation, this transition of the sector to a more advanced digitalization resulted in an innovative concept called Construction 4.0. The term Construction 4.0 was derived from the concept of Industry 4.0, which has its roots in the German manufacturing sector (OSUNSANMI; AIGBAVBOA; OKE, 2018). According to Musarat *et al.* (2022), digitalisation in the construction sector, has facilitated construction and maintenance processes. Not only in the execution phase, but digitalization is also in all other phases of construction projects, providing greater ease to builders. Musarat *et al.* (2022) also bring in their studies that the advent of IR 4.0 is essential for the smooth transformation of the construction industry towards digitalization.

Construction 4.0 adapts to the Industry 4.0 framework by incorporating cyber-physical systems and advanced digital technologies into its practice according to Sawhney *et al.* (2020). To align with Industry 4.0, CC needs to transform significantly, deploying technologies (SHAFEI *et al.*, 2022).

Information from the World Economic Forum (WEF, 2016) points out that the adoption of digital technology increases productivity, streamlines project management and procedures, and increases quality and safety; also in this line and as highlighted by CBIC (2016), the adoption of innovations is a viable option to better meet the demands of the civil construction sector. The use of innovations has several advantages, such as reducing labor costs, increasing productivity, and decreasing production costs.

According to Simão *et al.* (2019), to make this smart industry model viable, some crucial aspects are necessary, such as adaptability, optimization of the use of resources, and connection between all participants, from value generation to strategic implementation.

2.2 DIGITAL TRANSFORMATION IN THE CONSTRUCTION INDUSTRY

Digital transformation aims to improve an entity, generating significant changes in its characteristics through the use of information technology, computing, communication, and connectivity (VIAL, 2019). Digital transformation is unavoidable in the era of Industry 4.0. According to Brynjolfsson and Hitt (2000), digital transformation can improve organizational performance by providing products or services that adapt to customer preferences, increasing customer satisfaction and reducing costs. Change and transformation are driven by and built on digital technology.

According to Morakanyane *et al.* (2017), one of the effects of digital transformation on an organization is the development of competitive advantage. They also say that digital transformation should be viewed as a comprehensive organizational approach, rather than simply changing the way of operating from online to analog or from analog to digital. Digital transformation is seen as a continuous and never-ending process.

Verhoef *et al.* (2021) identify three main reasons why companies should digitally transform: evolution in digital technology, increased digital competition, and changes in consumer behavior in response to the digital revolution.

2.3 CONSTRUCTION 4.0

According to Musarat *et al.* (2022), digitalization is the new norm in the construction industry, following the adaptability of the fourth Industrial revolution. In the construction industry, digital transformation requires a variety of technologies, newly proposed methods utilizing digital technology for the development of the construction sector, energy optimization, sustainable environment, smart construction to deliver a better quality of life, economic and architectural growth, wireless technology for effective communication, and building maintenance (MUSARAT *et al.*, 2021).

Similar to the manufacturing sector, the construction sector can also be a major beneficiary of I4.0. The implementation of I4.0 will ensure that production efficiency is achieved through the utilization of advanced technologies, such as mechanized automation, to operate without human intervention. The benefits are quite obvious, as this implementation not only improves product quality, but also reduces distribution time, which will further increase the performance of the operation (NAWI *et al.*, 2021).

The transition to more advanced digitalization has resulted in an innovative concept called Construction 4.0. The term Construction 4.0 was derived from the concept of Industry 4.0, which has its roots in the German manufacturing sector (OSUNSANMI; AIGBAVBOA; OKE,

2018). Construction 4.0 adapts to the Industry 4.0 framework by incorporating cyber-physical systems and advanced digital technologies into its practice, according to Sawhney *et al.* (2020).

According to the World Economic Forum (WEF, 2016), the adoption of digital technology increases productivity, streamlines project management and procedures, and increases quality and safety. To align with Industrial 4.0, the CC industry needs to transform significantly, deploying technologies (SHAFEI *et al.*, 2022). The advent of I4.0 is essential for the smooth transformation of the construction industry towards digitalization (SUBRAMANIAN, 2022).

Digitalization in construction has transformed construction projects from planning to closure (WIJAYASEKERA, 2022) due to the involvement of various technologies such as automation, cybersecurity, Internet of Things, drones, Building Information Modeling (BIM), 3D printing, Augmented Reality, etc (MUSARAT *et al.*, 2022). Silva, Simão and Menezes (2018) summarize that the insertion of several technologies that are bringing significant changes in the way CC works are drones, cloud computing, augmented and virtual reality, additive manufacturing, BIM and automatic tracking.

While the construction industry has immense potential, the only way forward to achieve maximum efficiency and production is through the incorporation of new technologies, digitalization, and innovation for the construction industry. The incorporation of newly evolved industry tools that have already established themselves as successful aids to the construction industry, such as three-dimensional digitalization, the use of drones, and information modeling, should be incorporated into current practices and perceptions of the construction business, the path chosen to address these difficulties will be significantly improved (NAWI *et al.*, 2021).

The literature is broad regarding the concepts and applications of the various areas of IR4.0, such as the approach of the authors Tondelo and Barth (2019), Dos Santos, Mota and Zanlucas (2021) and Zhang *et al.* (2016), which in general address the areas of IR4.0 applied in CC with the themes: use of drones, BIM and mobile computing, respectively, whose areas were worked on in the case study below. Some authors and researchers bring important concepts and explain in the literature the various areas of construction 4.0, some relevant are:

Drones ₁ which are aircraft capable of flying without a human operator on board (FALORCA; LANZINHA, 2018) and that according to Mosly (2017), the use of this equipment can help reduce the time of activities, increase the quality of work, improve safety standards and reduce costs. Studies developed in the area by Nwaogu *et al.* (2023) bring a review of the literature corroborating and expanding these concepts.

The Internet of Things (IoT) which, according to Pataca (2021), is related to the ability of objects to communicate and transmit information about their state and operation. Filho (2016)

says that IoT technology consists of connecting objects of daily use in the real world with the Internet, transforming them into smart objects. Mishra, Lourenço and Ramana (2022) and Elghaish *et al.* (2021) review the literature delving into the topic.

According to Paz and Loos (2020), cloud computing allows the creation of new business models based on the data available in the cloud. This information allows users to predict the closure of production lines, schedule add-on lines remotely, and make adjustments in real time. Bello *et al.* (2021) and Ali *et al.* (2020) through their literature reviews bring other contributions to their studies in the area.

Building Information Modeling (BIM) offers tools to transform and improve project performance and productivity, decreasing inefficiencies and decreasing unproductivity, as well as increasing collaboration between different groups of project stakeholders (BURGESS; JONES; MUIR, 2018). Through a digital platform, BIM enables the teams involved in the project to share information, visualize the interactions between the project disciplines in an integrated way, and make decisions that improve project performance (MAHALINGAM; YADAV; VARAPRASAD, 2015). Recent research by Ramly, Mohamad and Noor (2023), Wang and Chen (2023), Caldart and Scheer (2022) and Avendaño *et al.* (2022) bring a relevant literature review on the tool.

Mobile computing is a computing paradigm that allows users to access and interact with data, applications, and services through handheld devices without the need for a physical connection to a fixed network or infrastructure. Andrade, Assis and Brochardt (2015) highlight the importance of using mobile devices, such as smartphones and tablets, to improve the flow of information on the construction site. Marques *et al.* (2020) and Nazir *et al.* (2019) also present research in the area.

According to Kirner and Kirner, (2011), computer interface techniques that incorporate three-dimensional space, such as virtual reality, augmented reality and their variations, allow the user a multisensory experience. Li *et al.* (2023), Muthalif, Shojaei, and Khoshelham (2022), and Cárdenas-Robledo *et al.* (2022) bring important research today in their literature reviews.

Finally, Additive manufacturing, which, according to Ngo *et al.* (2018), 3D printing consists of an additive manufacturing method used in the production of a wide range of complex structures and shapes, originating from information from three-dimensional models. This technique involves printing consecutive layers of materials to create the desired object. Other definitions and studies are characterized in the research of Gardner (2023), Pajonk *et al.* (2022), Raza and Zhong (2022) and Coelho *et al.* (2021), through their literature reviews.

3 CASE STUDY

3.1 PRESENTATION OF THE COMPANY

Despite a slow implementation, the construction industry has sought more support from technological innovations, recognizing the value of technology as a competitive differentiator. However, the fragmentation of the sector, with many small and medium-sized companies, as well as the challenges of implementing Industry 4.0, currently limit the application of technologies and keep the sector at an experimental stage. Digitalization of the construction industry, coordinated with high-level strategies and initiatives, can increase the competitiveness of the sector, improve operational efficiency, and generate significant benefits.

In this context, the company studied, in view of its problems and limitations, seeks greater competitiveness in the market, adopting technological solutions of construction 4.0. The company in focus is a small company, operating in the interior of the State of Pernambuco in the field of civil construction, has approximately 100 employees, routinely works with subcontractors, having its activity in the market since 2013. The company has 6 works in progress, in the cities of Paudalho, Buenos Aires and São Vicente Férrer, from the construction of multi-storey buildings, renovations of public buildings, paving in cobblestone and interlocked, basic sanitation, among other services.

It is a family business, culturally averse to change and that has not kept up with digital advances or adopted solutions that improve its construction, management or planning processes, as the scenario of recent years has required it to do, remaining stagnant in this sense. The situation of non-implementation of digital advances in the sector generates problems in the company such as: low operational efficiency, delays in decision-making, difficulties in project management and reduced competitiveness in the market due to lack of investment in digital solutions.

3.2 PROBLEMS FACED IN THE COMPANY

- Services with difficult access and inspection on facades

Image 01 shows past situations in which there was difficulty in relation to the inspection of various services. Image 01 shows the execution of a roof in a construction site in São Vicente Férrer-PE, whose access to the service is difficult and the engineer responsible for the visual inspection was unable to perform a satisfactory analysis of the services.

Figure 1*Installation of purlins in a roof*

Source: Author, 2023

As the company studied, it does not have the use of drones for inspection and inspection of these services. The use of drones would facilitate real-time monitoring of the execution of covering services and the inspection of employees in compliance with regulatory standards for work safety. It would also be possible to carry out visual inspection on building facades in order to identify possible pathological manifestations or construction defects.

- Incompatibility between projects

In 2020, the company in this study started the construction of a 3-story mixed building with a built area of 1115.00 m² in the city of Paudalho-PE, according to plans (Figures 02 and 03), the elaboration of the projects took place in a decentralized way, with different authors from the areas of architecture, structural calculation, electrical installations and hydrosanitary installations. Even after the critical analysis of the respective projects by the company's technical staff, during the execution of the work some incompatibilities between projects emerged, such as:

I. Compatibility between architectural and structural design

Conflict: BWC Soc. window positioned entering Pillar P07.

Location: apartments 01, 03 and 05.

Procedure performed: Move the window back facing the pillar.

II. Compatibility between the design of electrical installations and hydrosanitary installations

Conflict: Intersection between conduit and air conditioning drain pipe in the wall

Location: apartments 01 to 06.

Procedure performed: Conduit repositioning.

III. Compatibility between structural and plumbing installations

Conflict: Crossing between sewer pipe and V50 beam, in which its section height did not allow the passage of the DN100 sewer pipe.

Location: ground floor.

Procedure performed: Change in the structural design with adjustment in the height of the beam.

Figure 2

Ground floor plan Figure 03 – Upper floor plan

Source: Author, 2023.

This situation confirms the studies by Dos Santos, Mota, and Zanlucas (2021) that during the execution of projects (hydraulic, structural, and electrical), many elements end up generating physical and functional conflicts, due to the constraints of each system. These unresolved interferences in the design phase caused interruptions in construction for project review, or the need for sudden decision-making on site, disfavoring work and the optimization of time and resources.

- Mechanical processes in the management of workers' safety and health

The company studied uses mechanical processes on paper for all its management of workers' safety and health (OSH), such as: control and delivery of personal protective equipment (PPE), employee training, reports and records of evidence and non-conformities and the safety inspection checklist.

This methodology, already outdated, generates delays, does not bring effectiveness in the decision-making process, as well as limits and delays access to information.

3.3 PROPOSAL FOR SOLVING THE PROBLEM IN THE COMPANY

Considering the size of the company under study and the problems it faces in its projects, a proposal was prepared for the adoption of digital tools and solutions for the company, such as: use of drones, implementation of BIM and use of mobile computing.

The use of BIM technology will take place with the use of Autodesk's Revit software (2023), to make projects compatible, on a multidimensional platform, also adding to the *software* the OrçaBIM plugin from the company 3F Ltda – OrçaFascio, obtaining more expressive results in combination with the budget of works.

The company will be offered drone equipment for monitoring the works, services where there is difficult access and inspection of facades, the company will be proposed the acquisition of an intermediate-sized, long-range model, flight time duration over 30 minutes and a high-definition camera.

The use of mobile computing for the OSH management area will be carried out by a mobile solution tool that facilitates integration, collection and communication in the area of Occupational Safety. The company's engineering, occupational safety and management team opted for the adoption of the *OnSafety* platform from Lean Tecnologia e Engenharia LTDA. With the implementation of this tool, it will be possible to digitize the area of worker safety and health management in the company. Obsolete mechanical processes will be replaced by a set of digital solutions, such as: digital PPE sheet, issuance of inspection reports, CIPA documentation, Registration Control for Employees, among others. The software allows everyone involved to use the same *workflows* to monitor the workplace, required training, the control and delivery of PPE, health monitoring, among other documents and requirements. It also allows the management of OSH audits carried out in the work environment, ensuring more effectiveness in the decision-making process and access to information and reports on different devices.

With the adoption of established digital tools and solutions and the objectives of implementing these solutions in the company defined in: Increased operational efficiency; Improved decision-making; Improvement of project management; Innovation and competitiveness and Training and professional development, it is possible to propose a sequencing of steps for the implementation of these solutions in the company studied with the proposals:

- 1) Acquisition of equipment and software;
- 2) Internal and external training and training in the areas addressed;
- 3) Implementation and use of technology;
- 4) Communication and engagement: Monthly meetings with teams to discuss advances, challenges, and results. Internal newsletters highlighting the benefits and improvements achieved with digital solutions and dissemination of innovations and results on the company's social networks and communication channels.
- 5) Evaluation and continuous improvement: Conduct quarterly evaluations of the results obtained with digital solutions. Identify areas for improvement and promote adjustments and optimizations in the processes and solutions implemented. Establish partnerships with specialized companies and institutions to stay up-to-date on new technologies and trends

4 CONCLUSIONS

As shown in the literature explained, IR4.0 brings several aspects, concepts and new technologies to the construction industry. Digital transformation in civil construction is inevitable.

The case study addressed here shows that it is feasible to implement digital solutions in the company through the problem solving proposals presented here. The adoption of drones for façade inspection can be an efficient and economical tool for the early detection of problems in buildings, as well as their use in services where there is difficult access, being possible and beneficial their implementation in the company.

It is also feasible to implement the BIM tool in the company, given that as Dos Santos, Mota and Zanlucas (2021) show, there are several advantages that the use of this technology includes, such as agility in compatibility, automatic analysis of problems between elements, effective communication between processes and the significant reduction of errors in the project. Matching helps prevent problems from being discovered during construction, which can result in unplanned costs and delays in correcting these flaws.

On another point, similarly to Zhang *et al.* (2016), addressed in their research that an innovative IT-based solution for site safety inspection approach not only eliminates redundant paper-based systems, but also improves the coordination and integration of information between safety inspection procedures and other safety management strategies, today intelligent mobile computing software and tools are possible to implement in construction companies, such as the *OnSafety* platform, presented.

The effective adoption of these digital solutions proposed for the construction company under study will put into practice the company's quest to incorporate areas of construction 4.0, reaping benefits that can be raised in future studies.

During the process of preparing this article, some limitations were identified, such as the lack of similar case studies in the researched literature and the scarce application of the IR4.0 areas addressed here in small construction companies. As a limitation of the study, the analysis of this study is valid only for the case that was investigated, and cannot be generalized to other situations.

The development of this article encourages the exploration of other areas of IR4.0 that could not be implemented or proposed in the company studied. It is therefore suggested that future studies develop similar studies in small companies in the CC sector with other adoptions of digital solutions.

ABSTRACT

This article examines the external oversight of police activity as a constitutional function assigned to the Public Prosecutor's Office, analyzing its normative foundations, structural limits, and the recurring problem of effectiveness in the Brazilian context. It starts from the understanding that effectiveness is not to be confused with mere procedural compliance, but rather with the institutional capacity to produce verifiable results, prevent violations of fundamental rights, and break structural patterns of state violence. The study identifies central bottlenecks in the traditional model, such as informational dependence on police corporations, the fragmentation of diffuse oversight, structural insufficiency, and the bureaucratization of institutional practices, all of which contribute to the reproduction of impunity and penal selectivity. In light of the Inter-American Human Rights System, with particular emphasis on the case of Favela Nova Brasília v. Brazil, and of the case law of the Brazilian Federal Supreme Court in ADPF 635/RJ, the article argues that external oversight is an indispensable institutional guarantee for reducing police lethality, protecting the right to life, and strengthening the democratic legitimacy of justice institutions.

Keywords: Public Prosecutor's Office. Police Lethality. Human Rights. Institutional Effectiveness. External Oversight.

RESUMO

Examina-se o controle externo da atividade policial como função constitucional atribuída ao Ministério Público, analisando seus fundamentos normativos, seus limites estruturais e o problema recorrente da efetividade no contexto brasileiro. Parte-se da compreensão de que

RESUMEN

Se examina el control externo de la actividad policial como función constitucional atribuida al Ministerio Público, analizando sus fundamentos normativos, sus límites estructurales y el problema recurrente de la efectividad en el contexto brasileño. Se parte de la comprensión de que la efectividad no se confunde con la mera observancia procedimental, sino con la capacidad institucional de producir resultados verificables, prevenir violaciones de derechos fundamentales y romper patrones estructurales de violencia estatal. Se identifican obstáculos centrales del modelo tradicional, tales como la dependencia informacional respecto de las corporaciones policiales, la fragmentación del control difuso, la insuficiencia estructural y la burocratización de las prácticas institucionales, factores que contribuyen a la reproducción de la impunidad y de la selectividad penal. A la luz del Sistema Interamericano de Derechos Humanos, con especial énfasis en el caso *Favela Nova Brasília vs. Brasil*, y de la jurisprudencia del Supremo Tribunal Federal brasileño en la ADPF 635/RJ, se sostiene que el control externo constituye una garantía institucional indispensable para la reducción de la letalidad policial, la protección del derecho a la vida y el fortalecimiento de la legitimidad democrática de las instituciones de justicia.

Palabras clave: Ministerio Público. Letalidad Policial. Derechos Humanos. Efectividad Institucional. Control Externo.

1 INTRODUCTION

Police action occupies a central place in the conformation of the contemporary State, as it represents one of the most intense expressions of State power over bodies, territories and individual freedoms. In the Brazilian context, marked by deep social, racial, and territorial inequalities, police activity has historically developed under permanent tensions between the constitutional promise of the protection of fundamental rights and institutional practices that naturalize the excessive use of force, criminal selectivity, and low accountability for abuses (Vieira, 2025).

The 1988 Constitution, by instituting the Democratic Rule of Law, broke with authoritarian models of public security and enshrined mechanisms of legal-institutional control of police action, among which the external control exercised by the Public Prosecutor's Office stands out, conceived as a structural guarantee of legality, democracy, and protection of human rights (Camelo, 2025).

The scientific and social relevance of this article, therefore, stems from the persistence of high rates of police lethality, the recurrence of violations of fundamental rights, and the historical difficulty of implementing effective accountability mechanisms in the context of public security. Despite the express constitutional provision for external control of police activity, there is a mismatch between the normative design of the institute and its practical implementation, often limited by structural, institutional and cultural obstacles.

In view of this scenario, the following problem emerges: why is external control of police activity, although constitutionally guaranteed and internationally required, low effectiveness in containing police violence and holding abuses accountable in Brazil?

In view of this question, the general objective of this article is to critically analyze the effectiveness of the external control of police activity exercised by the Public Prosecutor's Office, in the light of the 1988 Constitution and the parameters of the Inter-American Human Rights System. As specific objectives, it seeks to examine the constitutional and institutional foundations of the external control of police activity in the Brazilian legal system, to identify the main structural, informational and organizational bottlenecks that empty the effectiveness of this control and to evaluate the contribution of inter-American jurisprudence and ADPF 635/RJ in the redefinition of normative and institutional parameters aimed at reducing police lethality and strengthening the democratic accountability.

A qualitative methodology is then adopted, of a bibliographic and documentary nature, based on the analysis of doctrinal works, scientific articles, institutional documents, national and international judicial decisions duly referenced.

By problematizing the limits and challenges of external control of police activity, its main intention is to contribute to the deepening of the academic and institutional debate on the democratization of public security in Brazil, based on the premise that the effectiveness of external control is not a mere administrative requirement, but an indispensable condition for the realization of the right to life, of the dignity of the human person and the legitimacy of the Democratic Rule of Law itself, requiring critical reflection, institutional commitment and structural transformation of control and accountability practices.

2 CONSTITUTIONAL AND CONCEPTUAL FOUNDATIONS OF EXTERNAL CONTROL OF POLICE ACTIVITY

Understanding the constitutional foundations of external control of police activity requires, as an inescapable starting point, the systematic reading of the 1988 Constitution of the Republic as a normative project committed to overcoming authoritarian practices historically rooted in the exercise of state power, especially in the performance of coercive apparatuses.

The 1988 Charter was not limited to reorganizing institutional competencies or listing fundamental rights in the abstract, but promoted a profound reconfiguration of the State model, erecting the Democratic Rule of Law as the structuring axis of the Brazilian legal and political order.

Under this prognosis, police activity is no longer conceived as a space of broad discretion or institutional self-sufficiency and is now legally conditioned by a complex system of normative limits, constitutional principles and control mechanisms, since the Constitution recognizes public security as a duty of the State and a fundamental right of the collectivity, but does so in a manner that is inseparable from the protection of the dignity of the human person. due process of law and the full submission of state action to constitutional legality (Pinho; Chaves; Cruz 2024).

This constitutive tension between security and freedom, far from being a defect of the constitutional model, represents precisely its essential democratic trait, as highlighted in the specialized literature when dealing with the political and legal need to control police activity in democratic societies (Ávila, 2014).

It is in this context that article 129, VII, of the Federal Constitution is inserted, by attributing to the Public Prosecutor's Office the function of exercising external control of police activity (Brasil, 1998). The original constituent's option to expressly enshrine this attribution cannot be understood as a merely symbolic or redundant gesture, nor as a simple unfolding of the ownership of the public criminal action.

On the contrary, it is a conscious normative choice, guided by the perception that the police power, due to the nature of its functions and the intensity of the restrictions it imposes on fundamental rights, demands permanent, institutionalized external control endowed with functional autonomy.

The normative density of the expression "external control", then, is denoted precisely in the distinction that the Constitution establishes between generic control of legality and specific mechanisms of containment and accountability of armed organs of the State. As Sousa Júnior (2015) observes, the external control of police activity stems directly from the constitutional mission of the Public Prosecutor's Office to defend the legal order, the democratic regime and the inalienable social and individual interests, and is not limited to formal practices of procedural monitoring or episodic interventions. In fact, external control assumes a structural nature, aimed at correcting deviations, preventing arbitrariness, and promoting state accountability.

Regarding this type of control, Ávila (2014), in his Thesis, initially highlights attributions and tools of the Public Prosecutor's Office to exercise them through Complementary Law No. 75/1993, which:

The specific tools for the Public Prosecutor's Office in the exercise of external control of police activity are regulated in LC No. 75/1993, 9, which provides for free entry into police establishments, **access to any documents related to the police core activity**, the possibility of representing the competent authority for the adoption of measures to remedy the undue omission, or to **prevent or correct illegality or abuse of power, power to request the competent authority to initiate a police investigation into the omission or lawful fact that occurred in the exercise of police activity and also to promote criminal action for abuse of power**. The provision indicates that the exercise of external control can occur through judicial or extrajudicial measures (Ávila, 2014, p. 543, emphasis added).

This reading is reinforced when one considers the place occupied by the Public Prosecutor's Office in the constitutional design of 1988, since, instituted as a permanent body, essential to the jurisdictional function of the State and endowed with functional, administrative and financial autonomy, this important body is not subordinated to any of the Powers of the Republic, which gives it a unique institutional position for the exercise of the aforementioned control functions. Such autonomy is not justified as a corporate privilege, but as an institutional guarantee aimed at protecting society from abuses of state power, especially in contexts in which police action has a more intense impact on vulnerable populations (Morais Júnior, 2022).

The constitutional provision for external control of police activity must, therefore, be interpreted in conjunction with the structuring principles of the Democratic Rule of Law, notably legality, the separation of powers, the protection of fundamental rights and the republican

principle of the responsibility of public agents, and there is, therefore, no room to conceive of the police as an instance immune to external controls or as a neutral technical body whose action would be legitimized exclusively by internal efficiency criteria (Basilio; Basílio, 2023).

Thus, the Constitution breaks with this logic by stating that all state activity, including police activity, is subject to mechanisms of legal and institutional control, especially when it involves the legitimate use of force, and it can be clarified that practices of police arbitrariness cannot be explained only by individual deviations or moral failures of isolated agents.

There are, as Ávila (2014) and Vieira (2025) point out, sociological and organizational factors that make police activity particularly susceptible to abuses, such as the valorization of authority, the naturalization of violence as an instrument of efficiency, and the existence of institutional subcultures resistant to transparency and accountability, and it is precisely in this scenario that external control assumes the status of indispensable as a mechanism for the structural containment of deviance, and not only as a subsequent response to consummated violations.

In these terms, the external control of police activity is not to be confused with undue interference in the functional autonomy of police corporations, nor does it imply hierarchical subordination, since it is a legal-institutional control that preserves the technical autonomy of the police, but submits it to constitutional legality and the democratic parameters of state action. As Braga (2023) points out, the effectiveness of external control is directly related to the ability of the Public Prosecutor's Office to act independently, including through the adoption of its own extrajudicial and investigative instruments, especially in contexts in which police action is the object of suspicion.

The constitutional density of external control is also evident when one observes its connection with international commitments assumed by the Brazilian State in the field of human rights and, although this dimension will be deepened in its own chapter, it is important to recognize from the outset that the 1988 Constitution was open to international human rights law, incorporating standards of independent investigation, diligent and impartial in cases of serious violations. The external control of police activity, therefore, operates as a bridge between the internal constitutional order and the international obligations of the State, reinforcing its qualified legal nature and its centrality in the system of guarantees.

In view of this, the reading of article 129, VII, of the Constitution cannot be reduced to a minimalist or bureaucratic understanding of external control, but as a constitutional function endowed with its own normative density, whose purpose is to ensure that the exercise of police power remains compatible with the values of the Democratic Rule of Law (Corrêa; Coutinho,

2019). The performance of the Public Prosecutor's Office, in this field, must be understood as an expression of a control model that seeks to prevent abuses, correct illegalities, promote accountability and, above all, preserve the democratic legitimacy of state action.

This understanding opens the way for the examination, following this chapter, of the role of the Public Prosecutor's Office as an institution external to the police apparatus and an institutional guarantee of fundamental rights, as well as the distinction between merely formal supervision and corrective legality control, and it is from this constitutional basis that it is possible to critically evaluate the limits and potentialities of external control of police activity in the contemporary Brazilian context.

The relevance of external control of police activity, from the perspective of the defense of constitutional rights, is projected even more clearly when one examines the role of the Public Prosecutor's Office as the institutional guardian of these rights in the daily life of social relations, since the 1988 Constitution attributed to the Public Prosecutor's Office not only the function of promoting criminal prosecution, but, more broadly, the task of ensuring the effective respect of the public authorities for the rights guaranteed by the constitution, even more so when it comes to selective, discriminatory police stops and cases of lethal police violence, that is, with situations with deaths, as pointed out by Morais Júnior (2022).

Morais Júnior (2022), still under the constitutional molds, highlights that:

The framework proposed by the Public Prosecutor's Office by the original constituent power, therefore, enshrines the notion that the external exercise of the activity must be guided by the strengthening of citizenship and the dignity of the human person, as the foundations of the Federative Republic of Brazil, as well as by the presumption of a just, free and solidary society, as well as by the promotion of the good of all, without prejudice of origin, race, sex, color, age and any other forms of discrimination. [...] Thus, it follows the importance of police agencies being subject to effective supervision by the Public Prosecutor's Office, in view of the existence of multiple mechanisms for balancing state powers, within a Democratic State of Law [...] (Morais Júnior, 2022, p. 64-65).

This attribution gives external control a dimension that goes beyond the strictly repressive logic, placing it as an instrument of preventive and corrective protection of fundamental rights in the face of the exercise of police power, especially in contexts of social asymmetry and structural vulnerability, in which state action tends to have a selective and unequal impact (Morais Júnior, 2022).

Therefore, the defense of constitutional rights, in the context of external control, is not limited to the subsequent reaction to consummated abuses, but involves permanent vigilance over patterns of police action that may compromise the dignity of the human person, equality

before the law and due process of law. The performance of the Public Prosecutor's Office thus assumes a structural character, aimed at containing institutional practices that naturalize the violation of rights under the argument of efficiency or maintenance of order.

As Sousa Júnior (2015) points out, external control should be understood as a mechanism of collective guarantee, capable of stressing administrative routines, investigative procedures and forms of police approach that, although formally legitimized, produce material effects incompatible with the democratic constitutional project.

For society, this action has relevance that transcends the technical-legal sphere, as it contributes to the construction of a public security model committed to legality, transparency and accountability. The external control exercised by the Public Prosecutor's Office operates as an instrument of institutional mediation between the coercive power of the State and the fundamental rights of the population, reinforcing social trust in institutions and reducing the risk that police action will become a factor in the reproduction of inequalities and state violence. By assuming this function, the Public Prosecutor's Office reaffirms its constitutional vocation as an agent of social transformation, whose legitimacy derives not from the arbitrary exercise of power, but from the intransigent defense of the constitutional order and the rights that give it material meaning (Ávila, 2014).

2.1 THE PUBLIC PROSECUTOR'S OFFICE AS AN EXTERNAL INSTITUTION OF GUARANTEE IN THE CONSTITUTIONAL SYSTEM

The centrality of external control of police activity in the Brazilian constitutional design leads, logically, to the analysis of the institutional role of the Public Prosecutor's Office as an external instance of guarantee in the constitutional system, but this condition does not result only from the express provision of article 129, VII, of the Constitution, but from the very configuration of the Public Prosecutor's Office as an independent body, permanent and essential to the jurisdictional function of the State, responsible for the defense of the legal order, the democratic regime and the inalienable social and individual interests. The role of the Public Prosecutor's Office in the control of police activity, therefore, cannot be understood as an accessory or derivative function, but as a direct expression of its structuring constitutional mission, as already described.

The idea of an external institution of guarantee presupposes the existence of an organ endowed with sufficient autonomy to exercise control over state structures that concentrate coercive power, without hierarchical subjection or functional dependence. In the case of police activity, this requirement is particularly important, since it is a state apparatus authorized to

restrict fundamental rights in an immediate and concrete way, including through the legitimate use of force (Ávila, 2014; Padilha, 2020).

Padilha (2020, p. 845) shifts attention to a socio-legal attribution of the Public Prosecutor's Office regarding external control over police activities, since this important body was appointed "*ombudsman*" of Constitutional Law, with the obligation to act in a strictly impartial manner in defense of citizens, citing the understanding of the Supreme Court, which:

The Federal Supreme Court has already stated, more than once, that the Public Prosecutor's Office has the legitimacy to promote investigative acts, thanks, among other grounds, to the **theory of implicit powers, that is, when the Constitution grants the ends to certain bodies, it implicitly grants them the means to fulfill the constitutionally proposed objectives**. Translating: if the Constitution grants the Public Prosecutor's Office powers to promote criminal action, it must implicitly grant him the means to form his *opinio delicti* (Padilha, 2020, p. 846-847, emphasis added).

The 1988 Constitution, by removing the Public Prosecutor's Office from organic links with the Executive, Legislative and Judiciary Branches, created the institutional conditions necessary for the control of police activity to be exercised by an agency external to the police corporations and immune to direct political-administrative pressures, reinforcing the democratic rationality of the system of checks and balances (Sousa Júnior, 2015).

On the other hand, this external position does not entail institutional antagonism, but translates a logic of republican control based on responsibility and accountability. The Public Prosecutor's Office does not replace the police in their constitutional functions, nor does it assume the day-to-day management of public security, given that its performance focuses on the legality, legitimacy and constitutional conformity of the acts performed, functioning as an instance of containment of excesses and correction of deviations that, if not addressed, compromise the legitimacy of the entire security policy.

As Ávila (2014) observes, external control is an indispensable element to prevent police activity from developing in a space of institutional self-sufficiency, in which illegal or abusive practices are naturalized as inevitable costs of repressive efficiency.

The condition of the Public Prosecutor's Office as a guarantee institution is not limited to subsequent repressive action, but involves the ability to intervene in a preventive and structural manner. This means that external control must focus on standards of action, workflows, operational protocols, and repeated practices that affect fundamental rights, and not just on isolated cases of abuse.

From this perspective, the Public Prosecutor's Office acts as an institutional mediator between the police power and society, translating social demands for legality, equality, and

respect for human rights into legal parameters required within the scope of state action (Braga, 2023).

The notion of institutional guarantee is also articulated with the collective dimension of fundamental rights. The role of the Public Prosecutor's Office in external control is not only aimed at the protection of individual rights violated in specific situations, but also at the protection of legal assets of a diffuse and collective nature, such as the democratic legitimacy of police action and social trust in public security institutions.

When selective, discriminatory or violent police practices are perpetuated without effective control, the damage produced is not restricted to the direct victims, but reaches society as a whole, eroding the credibility of the State and deepening structural inequalities, and it is in this scenario that the external control exercised by the Public Prosecutor's Office assumes the function of defending the constitutional order in its material sense, by preventing the exercise of coercive power from moving away from the values that legitimize its existence (Morais Júnior, 2022).

In addition, the condition of the Public Prosecutor's Office as an external guarantee institution is projected on its ability to articulate judicial and extrajudicial instruments in an integrated manner, not exhausting external control in the provocation of the Judiciary, and comprising the use of administrative mechanisms, recommendations, inspections, requests and its own investigative procedures, always guided by the purpose of ensuring the constitutional conformity of police activity (Greco, 2022).

This multifaceted performance reinforces the idea that the Public Prosecutor's Office does not operate only as an organ of prosecution, but as an institutional agent dedicated to the protection of rights and the induction of state practices compatible with the Democratic Rule of Law (Sousa Júnior, 2015).

Consequently, the relevance of the Public Prosecutor's Office as an external institution of guarantee is particularly noticeable in contexts of social vulnerability and historical marginalization, in the aspect that police action tends to have a more intense impact on certain social groups, reproducing selective and discriminatory patterns that challenge the constitutional promise of equality (Morais Júnior, 2022; Vieira, 2025).

In these scenarios, external control remains essential in the containment of practices that, although formally justified under the discourse of security, produce systematic violations of fundamental rights and, by exercising this function, the Public Prosecutor's Office reaffirms its constitutional vocation as a defender of society and a promoter of social justice, consolidating

itself as a key piece in the institutional architecture for the protection of constitutional rights in contemporary Brazil.

3 STRUCTURAL LIMITS OF THE TRADITIONAL MODEL AND THE PROBLEM OF EFFECTIVENESS: INSTITUTIONAL AND OPERATIONAL BOTTLENECKS

The discussion about the effectiveness of external control of police activity requires, first of all, a conceptual shift that moves away from merely formal or procedural readings of the institute. At the constitutional level, the attribution conferred on the Public Prosecutor's Office is not limited to the ritual observance of administrative flows, the episodic issuance of recommendations or the simple establishment of follow-up procedures.

Effectiveness, understood here in a material sense, must first be measured by the concrete capacity to produce verifiable institutional results, capable of preventing violations, correcting deviant patterns of police action and inducing structural transformations in the way state force is exercised in everyday social life, referring, therefore, to a notion that is directly linked to the idea of democratic accountability, in which control is not legitimized by its normative statement, but by its real ability to impact practices, reduce arbitrariness and strengthen public confidence in the institutions of justice (Cavallazzi; Suxberger, 2019).

Cavallazzi and Suxberger (2019) understand accountability as a result of the ministerial focus given to the body dimensioned here due to the extension of existing social relations in daily life and the indispensability of greater transparency and improvement of the institutions that are linked to the justice system, which will also lack the confidence of citizens about the way in which the society in which they live is governed, that is, in the laws in force. Furthermore, it is important to consider, according to the authors, that:

The idea of *accountability*, brought to the current context, can be understood as the set of elements indicative of transparency and social control over state action. It is possible to number that the sense of *accountability* involves responsibility (objective and subjective), control, transparency, accountability obligation, justification for actions that were or left understood, reward and/or punishment. It is clear that there are advances in the field of external control, but changes of a greater scope, of a cultural nature, still pending realization, after all, *accountability*, more than a desired characteristic or attribute of state action, is the result of an *institutional culture* that is still distant from the Brazilian reality (Cavallazzi; Suxberger, 2019, p. 231).

That said, the effectiveness of external control cannot be confused with the mere existence of formal competences or with the multiplication of instances of abstract inspection, insofar as it presupposes an institutional action capable of breaking with the defensive and self-

centered logic that historically marks public security systems, especially in contexts of high police lethality and criminal selectivity.

The production of verifiable results thus generates the ability to access qualified information, to formulate consistent diagnoses on patterns of police action and to adopt corrective measures endowed with sufficient institutional strength to change repeated conducts. When control is limited to reacting to isolated cases, without reaching the structural dynamics that produce state violence, it tends to assume a symbolic character, which preserves the appearance of legality without facing the root causes of ineffectiveness (Cavallazzi; Suxberger, 2019).

However, it is important to point out that one of the main bottlenecks that empty external control lies in the informational dependence of the Public Prosecutor's Office in relation to the police corporations themselves, given that, to a large extent, the exercise of control is still structured from data produced, filtered and systematized by the institutions that should be inspected, which compromises the cognitive autonomy necessary for effective inspection (Pedrosa Júnior; Monteiro; Nascimento, 2023).

This informational asymmetry then goes from a technical problem to a structural obstacle that limits the ability of the control body to identify hidden patterns of abuse, underreporting of occurrences or statistical distortions. Let us imagine, then, that when the flow of information remains under the monopoly of the controlled entity, the control tends to operate in a reactive, fragmented and often late manner, unable to anticipate risks or to intervene preventively in scenarios of systematic violation of rights.

The fragmentation of diffuse control is another central element in understanding the ineffectiveness of the traditional model. Although the Constitution has assigned to the Public Prosecutor's Office a leading role in the external control of police activity, institutional action is often dispersed in isolated initiatives, dependent on the individual actions of members, without the consolidation of integrated strategies and long-term institutional policies (Cavallazzi; Suxberger, 2019; Camelo, 2025).

The aforementioned dispersion can also hinder the construction of a robust institutional memory, as well as the definition of clear priorities guided by objective criteria of risk, social impact and severity of violations, as evidenced by Ávila (2014). As a consequence, control tends to oscillate between periods of greater activism and phases of retraction, without achieving the continuity necessary for the structural transformation of police practices.

No less important to discuss, the overload of attributions, the scarcity of specialized technical teams, and the absence of systematic investments in institutional intelligence

compromise the agency's ability to exercise qualified and permanent control, a point raised by Ávila (2014) and Braga (2023), and the authors collaborate in understanding that, in many contexts, Ministerial action is tensioned between immediate repressive demands and the need for structural oversight of police activity, which ends up prioritizing punctual responses to the detriment of medium and long-term strategic actions. This material limitation reinforces the tendency towards the bureaucratization of control, converting inspection procedures into administrative routines that are not very sensitive to the concrete dynamics of state violence.

The bureaucratization of institutional practices, in turn, represents a paradox in the exercise of external control, since, although the formalization of procedures is indispensable for legal certainty and the predictability of state action, the excess of administrative rituals can produce a progressive distancing between the control exercised and the social reality that it should transform (Ávila, 2014; Vieira, 2025).

When the focus of action shifts to meeting deadlines, standardizing forms, and producing reports detached from concrete impacts, control loses its critical and emancipatory dimension. With this, formal legality is preserved, but material effectiveness remains compromised, reproducing the social sensation of impunity and the absence of real accountability for abuses committed in the exercise of police function.

The impacts of this ineffectiveness are not restricted to the institutional level, but are projected in a profound way on the structure of the penal system and on the legitimacy of justice institutions. The inability to adequately control police activity contributes to the reproduction of selective practices, which disproportionately affect historically vulnerable groups, reinforcing patterns of racial, territorial and socioeconomic discrimination (Viegas; Loureiro; Abrucio, 2022; Vieira, 2025).

Criminal selectivity, in this context, represents a systemic effect of a control model incapable of breaking with the logic of exception that guides certain forms of police action, where the absence of consistent institutional responses to abuses reinforces the perception that certain lives are less protected by the law, eroding the egalitarian foundations of the Democratic Rule of Law (Vieira, 2025).

The crisis of legitimacy of justice institutions thus emerges as a direct consequence of the ineffectiveness of external control. When society realizes that the inspection mechanisms do not produce real changes, a diffuse feeling of discredit is installed that affects not only the Public Prosecutor's Office, but the entire criminal justice system.

This discredit weakens the normative authority of law, encourages informal responses to violence and compromises the State's ability to mediate conflicts in a legitimate way, and it is

expected to reflect that external control, when it ceases to fulfill its transformative function, becomes part of the very problem it should face, becoming part of an institutional mechanism that normalizes the exception and trivializes the violation of rights (Ávila, 2014; Padilha, 2020).

In view of this situation, overcoming the structural limits of the traditional model of external control requires a profound reconfiguration of institutional practices, guided by a substantive conception of effectiveness. Such a reconfiguration presupposes the strengthening of the informational autonomy of the Public Prosecutor's Office, the construction of integrated strategies of action, the investment in specialized technical capacities, and the adoption of a logic of control aimed at transforming structural patterns of police action (Corrêa; Coutinho, 2019).

The notion of effectiveness, in the context of the external control of police activity, requires a relevant conceptual shift, not limiting itself to assessing only the formal existence of procedures, ordinances, reports or recommendations issued by ministerial bodies, but to examine whether such instruments are capable of generating measurable institutional impacts, altering repeated patterns of police action and consistently reducing, abusive, illegal or incompatible practices with the Democratic Rule of Law, such as in cases that also involve human and international rights. Effectiveness, therefore, is close to the idea of the transformative capacity of institutional action, linked to the production of results and not to the mere ritualistic observance of normative competences (Camelo, 2025).

The external control of police activity, although constitutionally ensured, often becomes a model of low material density, marked by strong procedural adherence and reduced structural incidence, as a kind of phenomenon that manifests itself when the Public Prosecutor's Office limits its action to the formal monitoring of investigations, the issuance of official letters or *ex post* analysis of records produced by the police corporations themselves, without effective capacity to interfere in the logic of information production, in the definition of investigative lines or in the concrete accountability of the agents involved (Ávila, 2014; Basílio; Basílio, 2023).

Police activity, especially in cases of use of lethal force, is marked by significant informational asymmetry, in which the initial elements of factual reconstruction remain under the control of the investigated corporation itself. Occurrence records, preliminary reports, testimonial reports collected in the heat of the facts and initial expert reports are produced, as a rule, by agents belonging to the same hierarchical structure involved in the event, which compromises the impartiality and completeness of the information available to the control body (Pedrosa Júnior; Monteiro; Birth, 2023; Camelo, 2025).

It so happens that such dependence is not only a technical obstacle, but also a structural problem of governance, because when the external controller does not have autonomous means of producing evidence, immediate access to the scenes of the facts or independent technical teams, the control tends to operate in a reactive, late and fragmented manner. The direct consequence is the reduction of the Public Prosecutor's Office's ability to question official versions, identify narrative incongruities, or reconstruct events in a minimally reliable way, especially in contexts of police violence involving vulnerable populations (Fernandes, 2023).

Thus, the persistence of abusive practices without an adequate institutional response compromises the legitimacy of justice institutions, as already well discussed, and social trust in the ministerial body, the police and the Judiciary itself is gradually eroded when repeated episodes of violence do not result in a serious, transparent and independent investigation. Based on this assumption, the perception of institutional connivance, even if unintentional, weakens the democratic pact and feeds discourses of discredit in relation to the rule of law (Fernandes, 2023; Pedrosa Júnior; Monteiro; Nascimento, 2023).

From the perspective of International Human Rights Law, the ineffectiveness of external control takes on even more serious contours, which will be highlighted with greater attention in the following chapter, which will seek to discuss emblematic cases that had the support and action of the Public Prosecutor's Office in this regard.

International jurisprudence has repeatedly affirmed that the absence of diligent, independent and effective investigations in cases of police violence constitutes an autonomous violation of human rights, especially the right to life and judicial guarantees. It is based on the understanding that external control is not a political faculty of the State, but an internationally enforceable legal duty (Camelo, 2025).

Therefore, the effectiveness of external control depends on a broader institutional reconfiguration, and such reconfiguration involves the structural strengthening of the Public Prosecutor's Office, the creation of autonomous mechanisms for the production of information, the integration of databases, the adoption of results-oriented performance indicators, and the systematic incorporation of international standards of police accountability (Fernandes, 2023; Basílio; Basílio, 2023).

Without these transformations, external control tends to remain imprisoned in a formalistic logic, incapable of facing the structural challenges of police violence in Brazil, given that effectiveness is not presented as an automatic attribute of the constitutional provision, but as a continuous institutional construction, dependent on political choices, organizational

arrangements and normative commitments to democracy and human rights (Corrêa; Coutinho, 2019; Pine; Chaves; Miranda, 2024).

In this line, a denser reflection on the role of the Public Prosecutor's Office in the contemporary constitutional system is proposed, since, more than a reactive supervisory body, the Public Prosecutor's Office is called upon to act as a guarantor institution, capable of articulating control, prevention and institutional transformation. The effectiveness of external control, therefore, becomes a central element for the legitimacy of the justice system itself and for the consolidation of a public security model compatible with constitutional values.

The permanence of ineffective external control is not neutral, producing concrete effects on lives, territories and social trajectories, feeding cycles of violence and exclusion. Recognizing these structural limits does not mean delegitimizing the ministerial function, but rather highlighting the urgency of its improvement, under penalty of external control remaining as a normative promise not fulfilled within the Democratic State of Law.

4 THE INTER-AMERICAN HUMAN RIGHTS SYSTEM AS AN EVALUATION PARAMETER: THE NOVA BRASÍLIA FAVELA CASE VS. BRAZIL (ADPF NO. 635/RJ)

The examination and discussion of the external control of police activity, when it is moved beyond the strictly internal normative plane, requires the incorporation of international parameters for the protection of human rights as hermeneutic and evaluative instruments of state action. In view of this premise, the Inter-American Human Rights System is central, not limited to a subsidiary instance of international accountability and being a true space for the construction of structural standards of democratic legality, capable of bringing to light possible persistent systemic flaws in the national models of public security and criminal prosecution.

The jurisprudence of the Inter-American Court of Human Rights, over the last decades, has played a decisive role in identifying repeated patterns of state violence, investigative insufficiency, and the absence of independent control mechanisms, especially in countries marked by authoritarian legacies and deep structural inequalities, as is the case in Brazil (Camelo, 2025).

It is considered that the incorporation of these parameters is not limited to a formal commitment assumed by the Brazilian State when ratifying international treaties, since it projects direct effects on the interpretation of the constitutional and infra-constitutional norms that govern the performance of justice institutions.

In this vein, the external control of police activity, constitutionally attributed to the Public Prosecutor's Office, must be understood in the light of international obligations to prevent,

investigate, punish, and repair human rights violations, under penalty of perpetuating a merely symbolic accountability model, incapable of facing the complexity of the violations recognized at the inter-American level (Camelo, 2025).

The condemnations imposed on Brazil by the Inter-American Court of Human Rights in cases involving police violence, extrajudicial executions, torture and investigative failures reveal the existence of structural patterns of state ineffectiveness that transcend isolated episodes. Paradigmatic cases such as *Favela Nova Brasília vs. Brazil*, *Ximenes Lopes vs. Brazil* and the *Araguaia Guerrilla vs. In Brazil*, they show not only the occurrence of serious violations of fundamental rights, but, above all, the persistent inability of the State to conduct independent, swift and effective investigations, capable of breaking cycles of institutionalized impunity (IACHR Court, 2017).

That said, as an element and jurisprudential understanding relevant to the present discussion, there is the case "*Favela Nova Brasília vs Brazil*", in which the Court recognized that violent police action, associated with the absence of impartial investigations and the systematic archiving of procedures, configured a structural practice of state tolerance to police lethality in territories marked by social vulnerability. Being a decision that has exposed the dependence of investigations on the police corporations involved in the facts, it compromises the impartiality and credibility of the investigative process, reinforcing the need for external and autonomous control and inspection mechanisms (IACHR, 2017; Vieira, 2025).

This international pronouncement dialogues directly with the doctrinal criticism of the fragmentation and fragility of external control in Brazil, and it is possible to point out that the performance of the Public Prosecutor's Office, although constitutionally robust, is still limited by structural obstacles, such as the informational dependence on the police, the scarcity of specialized teams and the absence of standardized protocols for investigating serious human rights violations (Ávila, 2014; Vieira, 2025). Such limitations favor the reproduction of a model of selective accountability, in which state violence remains, to a large extent, invisible or naturalized.

The Inter-American Court has reiterated that the obligation to investigate is not satisfied with the formal initiation of proceedings, but requires concrete results capable of identifying individual and institutional responsibilities. The absence of such results, as pointed out in several decisions, constitutes in itself an autonomous violation of the rights enshrined in the American Convention, especially the right to judicial protection and judicial guarantees (Camelo, 2025).

This understanding broadens the concept of effectiveness, shifting it from the procedural to the substantial level, in which state action is evaluated based on its real impacts on the protection of human dignity. In the Brazilian context, international condemnations also show the persistence of an institutional culture marked by distrust of human rights, often perceived as obstacles to police efficiency, and it is essential to verify that this logic, inherited from authoritarian periods, contributes negatively to the trivialization of violence and to the legitimization of practices incompatible with the Democratic Rule of Law. disproportionately affecting black, peripheral, and historically marginalized populations (Macedo Júnior, 2019).

The structural dimension of state failures is also manifested in the racial and territorial selectivity of police violence, an element widely recognized in inter-American decisions. The Inter-American Court of Human Rights has highlighted that the disproportionate incidence of police lethality against young black people and residents of the peripheries cannot be dissociated from historical patterns of discrimination and marginalization, and the absence of effective investigations in these cases reinforces the idea that certain lives are less protected by law, which constitutes a violation of the principle of equality and the prohibition of discrimination enshrined in the American Convention (Camelo, 2025; Vieira, 2025).

Therefore, international condemnations function as a critical mirror of the internal justice system, revealing the inability of the Brazilian State to break with deep-rooted institutional practices, where the repetition of similar violations over time indicates the existence of structural flaws, demanding responses that go beyond individual accountability and achieve profound institutional reforms (Basilio; Basilio, 2023).

According to Basilio and Basilio (2023), the IACHR, in judging the case, came to the conclusion that the Brazilian State had international responsibilities for several human rights violations, such as those shown in Table 1, below, for a better view:

Table 1

Violations recognized within the inter-American system

Breached Devices	International instrument	Type of violation	Group of victims
Art. 4.1 c/c art. 1.1	American Convention on Human Rights	Violation of the right to life by excessive use of police force	Adult victims of lethal police operations
Arts. 4.1 and 19 c/c art. 1.1	American Convention on Human Rights	Violation of the right to life of children and adolescents	Victims of sexual violence by state agents
Arts. 5.2 and 11 c/c art. 1.1	American Convention on Human Rights	Torture, sexual violence and violation of personal integrity	Victims of sexual violence by state agents
Arts. 5.1, 8.1 and 25.1 c/c art. 1.1	American Convention on Human Rights	Investigative failures and absence of	Direct victims and family members

		effective judicial protection	
Art. 7	Convention of Belém do Pará	Gender-based violence	Women and girls

Source: Prepared by the author, based on Basilio and Basilio (2023).

The recommendations after the entire investigative phase and judgment before the Inter-American System, also according to Basilio and Basilio (2023), were within the scope of the need to improve investigations, and should be independently, impartial, effective, unrelated to politics, once again reinforcing the essentiality of the external control defended and unraveled so far. Other points raised refer to reparation through full compensation for material damage to victims and relatives, greater transparency with the end of the automatic registration of deaths as "resistance to arrest", accountability through the creation and strengthening of internal and external controls with a gender and race perspective, as well as institutional reform as a whole, for the modernization, professionalization and accountability of the police forces, also having, specifically, the regulation of the use of force as a last resort, according to principles of necessity and proportionality.

The lack of strengthening of external control of police activity, in this scenario, emerges as one of the main factors in maintaining these failures, since the body constitutionally charged with exercising this control does not have, in many cases, the material and institutional conditions to do so fully (Camelo, 2025).

The Court's decisions also highlight the importance of the participation of victims and their families in the investigative processes, as an essential element for the effectiveness of the investigation. However, in Brazil, state action is often characterized by the exclusion of victims from the investigative process, limiting their access to information and restricting their ability to question official versions. This practice contributes to institutional opacity and reinforces the asymmetry of power between the State and citizens affected by police violence, deepening the democratic deficit of the justice system (Vieira, 2025).

The persistence of ineffective investigations, the informational dependence of the police, the fragmentation of external control and the absence of consistent preventive policies make up a complex picture of state failures that feed back on each other and, under this scope, the external control of police activity assumes centrality as an instrument capable of breaking with this logic, as long as it is endowed with autonomy, resources and strategic orientation compatible with international human rights standards.

The Federal Supreme Court also expressed itself on the aforementioned case, through the Allegation of Non-Compliance with a Fundamental Precept No. 635/RJ, which is consolidated as one of the most relevant jurisprudential frameworks of contemporary Brazilian

constitutionalism with regard to the articulation between public security policy, external control of police activity and structural protection of fundamental rights, going so far as to expressly recognize the existence of a chronic picture of human rights violations resulting from police lethality, highlighted in the Summary, associated with a structural omission by the Government in the adoption of effective prevention, investigation and accountability measures, shifting the debate from the merely episodic level to an institutional and systemic approach (Supreme Federal Court, 2025).

It is based on the recognition that the high police lethality in the State of Rio de Janeiro does not objectively represent a historical pattern of action, marked by the normalization of the excessive use of lethal force, the fragility of accountability mechanisms, and the reproduction of administrative and investigative practices that favor impunity (Supreme Federal Court, 2025).

Now, such elucidation is fundamental to understand the role attributed to the Public Prosecutor's Office in the trial, since the external control of police activity is now conceived not only as a formal attribution provided for in Article 129, VII, of the Constitution, but as a structuring instrument of the democratic constitutional order itself.

Furthermore, the Supreme Court explains that external control is not to be confused with undue interference in police activity or with the replacement of the administrative functions of corporations, but constitutes an institutional guarantee aimed at the protection of the civilian population and the security agents themselves, moving away from corporatist or defensive readings of the constitutional model, criticizing the large bureaucracy in Brazil that governs such oversight of police activities (Supreme Court Federal, 2025).

By stating that there is no necessary antagonism between police efficiency and respect for fundamental rights, the Court breaks with the binary logic that has historically opposed public security and human rights, reaffirming that the legitimacy of police action depends, precisely, on the strict observance of the constitutional principles of legality, proportionality and necessity, and there is, therefore, "[...] opportunity for institutional maturation and improvement of police activity, and its external control, based on the principles of transparency, democratic participation and accountability" (Supreme Federal Court, 2025, p. 4).

The decision also highlights that police lethality does not produce a relevant deterrent effect in reducing crime, based on relevant data presented in the records that demonstrate the coexistence between high rates of deaths resulting from police intervention and the persistence of structural violence (Supreme Federal Court, 2025), which is especially relevant for the external control exercised by the Public Prosecutor's Office, because it shifts the focus of

institutional action from the simple formal monitoring of operations to the critical evaluation of their real impacts, requiring action guided by evidence, data and verifiable results.

It is important to report after analysis of the judgment that, by partially approving the plan to reduce police lethality presented by the State of Rio de Janeiro, the Federal Supreme Court establishes a model of dialogical jurisdictional control, in which the Judiciary recognizes institutional advances, but imposes complementary determinations aimed at correcting persistent deficits (Supreme Federal Court, 2025).

Among these determinations, the centrality given to the external control function of the Public Prosecutor's Office stands out, especially with regard to the production of detailed reports at the end of each police operation, the requirement to share georeferenced data and microdata, and the standardization of investigation protocols (Supremo Tribunal Federal, 2025).

The requirement for subsequent accountability of police operations, with technical and legal details of the grounds for the action, represents a significant inflection in relation to historical practices marked by opacity and administrative self-legitimation. On this point, the Court explains that the accountability of police activity is not a mere bureaucratic formality, but a condition for the democratic legitimacy of state action, directly linked to the principles of publicity, efficiency, and administrative morality provided for in Article 37 of the Constitution (Supreme Federal Court, 2025, p. 27).

The investigative competence of the Public Prosecutor's Office in cases of suspected involvement of security agents in intentional crimes against life is unequivocally reaffirmed, qualifying this action as a true institutional power-duty, being one of the measures mentioned so that new attitudes on the part of the police forces can be built, even if gradually, striving for the principle that governs accountability. In this case, of their accountability, as in the adaptation and realization of "[...] communications and reports, especially addressed to the Public Prosecutor's Office, a body entrusted by the Constitution with the power-duty to investigate and denounce possible abuses" (Supreme Federal Court, 2025, p. 93). By rejecting the understanding that direct investigation by the Public Prosecutor's Office would be a discretionary power, the Federal Supreme Court establishes the guarantor dimension of external control, linking it to the need for functional independence and technical autonomy, in line with the international standards established by the United Nations Principles on the Use of Force and Firearms.

Another aspect of high constitutional density lies in the determination of strict preservation of the traces of crimes that occurred in police operations, with prohibition on the improper removal of corpses under the pretext of help and the requirement of detailed expert

documentation, as measures that dialogue directly with the history of violations recognized by the Inter-American Court of Human Rights in the Favela Nova Brasília case. incorporating into Brazilian domestic law a conventionalized reading of the state's duty to investigate diligently, impartially, and effectively (Supreme Federal Court, 2025).

On the symbolic and normative level, ADPF 635/RJ thus projects a conception of the Public Prosecutor's Office as an external institution of guarantee, whose legitimacy derives not only from its constitutional provision, but from its effective capacity to intervene in contexts of structural violence, racial inequality, and criminal selectivity.

By requiring that external control be exercised from a gender, ethnic-racial, and territorial perspective, this Court recognizes that police lethality disproportionately affects historically marginalized populations, imposing on the Public Prosecutor's Office the duty to act sensitive to the social asymmetries that cross the criminal justice system (Supreme Federal Court, 2025).

The reduction of police lethality is not a political concession or discretionary administrative choice, being, therefore, a constitutional and conventional imperative, directly linked to the protection of the right to life, personal integrity and access to justice, with an important contribution to the external control of police activity as a structuring axis of the effectiveness of fundamental rights, requiring from the Public Prosecutor's Office not only formal vigilance, but institutional protagonism, technical capacity and continuous democratic commitment to the transformation of public security practices in the light of the 1988 Constitution.

Based on everything discussed so far, Brazil's condemnations within the scope of the Inter-American System should not be understood only as external sanctions, but as qualified diagnoses of the limits of the internal model of control and accountability, such as the case "Favela Nova Brasília vs Brazil", as they bring to light that the effectiveness of external control is not merely an administrative matter. but an essential requirement for the protection of fundamental rights and for the consolidation of the Democratic Rule of Law.

The inability to address these structural flaws keeps the country in a cycle of repeated violations, compromising its international legitimacy and, above all, its internal capacity to ensure justice and dignity for all citizens.

5 CONCLUSION

The external control of police activity, as provided for in the 1988 constitutional design, is, in fact, a structuring element of the Democratic Rule of Law, and cannot be reduced to a merely formal or accessory attribution of the Public Prosecutor's Office, as it represents a

function endowed with its own normative density, directly linked to the protection of fundamental rights, the limitation of state coercive power and the preservation of the democratic legitimacy of justice institutions.

The Federal Constitution, by expressly attributing to the Public Prosecutor's Office the exercise of external control of police activity, recognized that the action of the armed apparatuses of the State requires permanent, independent and qualified inspection, due to the direct and immediate impact it produces on the freedom, integrity and life of people, as a constitutional choice broke with self-referential models of public security and inserted police activity in a broader system of checks and balances counterweights, in which legality, proportionality and accountability do not present themselves as obstacles to efficiency, but as conditions of their legitimacy.

However, the critical investigation undertaken demonstrated that, despite the normative robustness of the constitutional model, the external control of police activity faces significant structural limits that compromise its material effectiveness. The informational dependence on police corporations, the fragmentation of control initiatives, the insufficiency of specialized technical resources and the excessive bureaucratization of institutional practices contribute to the consolidation of a model of low transformative incidence, incapable of confronting structural patterns of violence and criminal selectivity.

That said, the effectiveness of external control cannot be measured by the mere existence of formal procedures, reports or recommendations issued, but by the concrete capacity to produce verifiable institutional results, capable of changing repeated practices, preventing abuses and inducing structural changes in police action, where the absence of these results deepens the social perception of impunity, weakens trust in justice institutions and erodes the foundations materials of the Democratic Rule of Law.

The incorporation of the parameters of the Inter-American Human Rights System is also essential for understanding these structural flaws. The convictions imposed on Brazil, especially in the case of *Favela Nova Brasília v. Brazil*, show that the ineffectiveness of the investigations and the absence of independent control mechanisms constitute autonomous violations of human rights, projecting international responsibilities to the State, functioning as a qualified diagnosis of persistent systemic problems, which cannot be faced by punctual or symbolic responses.

The jurisprudence of the Inter-American Court reinforces the idea that the duty to investigate is not satisfied with the formal initiation of proceedings, requiring diligence, independence, impartiality, and concrete results. Thus, the external control of police activity

assumes the nature of a legal obligation, both domestic and international, and is inseparable from the state's duty to prevent, investigate, punish and repair violations of fundamental rights.

At the domestic level, ADPF 635/RJ has consolidated itself as a decision-making framework of high constitutional density by recognizing the existence of a structural framework of police lethality and by attributing centrality to the role of the Public Prosecutor's Office in the adoption of control, transparency and accountability measures. It so happens that the decision of the Federal Supreme Court shifted the debate from the episodic level to a structural approach, reaffirming that the reduction of police lethality is a constitutional and conventional imperative, and not a mere discretionary administrative option.

By requiring the production of data, reports, standardized protocols, and evidence-based accountability mechanisms, the Supreme Court conferred concrete normative content to the function of external control, reinforcing its guarantor dimension and its direct link to the protection of the right to life, personal integrity, and access to justice. In this context, the Public Prosecutor's Office is called upon to act not only as a formal inspector, but as an external guarantee institution, endowed with institutional protagonism and democratic commitment to the transformation of public security practices.

It is understood, therefore, that overcoming the structural limits of external control of police activity requires a profound reconfiguration of institutional practices, guided by a substantive conception of effectiveness, and such reconfiguration involves strengthening the informational autonomy of the Public Prosecutor's Office, integrating action strategies, investing in specialized technical capacities, and systematically incorporating international standards of law humans.

Finally, it is reaffirmed that the strengthening of external control of police activity is not only in the interest of the Public Prosecutor's Office or the justice institutions, but of society as a whole, insofar as it is an indispensable requirement for the consolidation of a public security model compatible with the constitutional and conventional values assumed by the Brazilian State. The effectiveness of this control represents, ultimately, the concrete affirmation of the Democratic Rule of Law and the centrality of fundamental rights in the organization of social life.

ABSTRACT

This article analyzes digital dependence in contemporary culture from the perspective of its articulation with emotional regulation processes, with an emphasis on the outsourcing of these functions to smartphones. It starts from the premise that, in the age of hyperconnectivity, these devices have been incorporated as mediators of emotional experience, playing regulatory roles in the face of negative affective states. In this context, their use is configured as a coping strategy, highlighting the displacement of emotional mediation from human interactions to digital environments. The objective is to understand the impacts of this pattern on mental health, social relations, and educational processes, paying attention to the weakening of human mediation and the vulnerability of children and adolescents. Methodologically, this is an analytical bibliographic research, based on a critical review of the literature and the analysis of normative frameworks, with emphasis on the Digital Statute of Children and Adolescents (Law No. 15.211/2025). The results indicate harm to cognitive, emotional, and social development, as well as impairment of family interactions. It is concluded that digital addiction is a multifactorial phenomenon that requires the integration of psychological, sociocultural, and normative dimensions, with qualified mediation being

central to a balanced relationship with digital technologies. The development of educational practices that promote the critical and conscious use of digital technologies is recommended.

Keywords: Digital Addiction. Emotional Regulation. Smartphones. Educational Mediation. Hyperconnectivity.

RESUMO

Este artigo analisa a dependência digital na cultura contemporânea a partir de sua articulação com processos de regulação emocional, com ênfase na terceirização dessas funções para smartphones. Parte-se do pressuposto de que, na era da hiperconectividade, esses dispositivos têm sido incorporados como mediadores da experiência emocional, desempenhando funções regulatórias diante de estados afetivos negativos. Nesse contexto, seu uso configura-se como estratégia de enfrentamento, evidenciando o deslocamento da mediação emocional das interações humanas para ambientes digitais. O objetivo é compreender os impactos desse padrão na saúde mental, nas relações sociais e nos processos educativos, com atenção à fragilização da mediação humana e à vulnerabilidade de crianças e adolescentes. Metodologicamente, trata-se de pesquisa bibliográfica analítica, baseada na revisão crítica da literatura e na análise de marcos normativos, com destaque para o Estatuto Digital da Criança e do Adolescente (Lei nº 15.211/2025). Os resultados indicam prejuízos ao desenvolvimento cognitivo, emocional e social, além do comprometimento das interações familiares. Conclui-se que a dependência digital é fenômeno multifatorial que exige integração de dimensões psicológicas, socioculturais e normativas, sendo a mediação qualificada central para uma relação equilibrada com as tecnologias digitais. Recomenda-se o desenvolvimento de práticas educativas que promovam uso crítico e consciente das tecnologias digitais.

Palavras-chave: Dependência Digital. Regulação Emocional. Smartphones. Mediação Educativa. Hiperconectividade.

RESUMEN

Este artículo analiza la dependencia digital en la cultura contemporánea desde la perspectiva de su articulación con los procesos de regulación emocional, con énfasis en la externalización de estas funciones a los teléfonos inteligentes. Parte de la premisa de que, en la era de la hiperconectividad, estos dispositivos se han incorporado como mediadores de la experiencia emocional, desempeñando roles reguladores ante estados afectivos negativos. En este contexto, su uso se configura como una estrategia de afrontamiento, lo que resalta el desplazamiento de la mediación emocional de las interacciones humanas a los entornos digitales. El objetivo es comprender los impactos de este patrón en la salud mental, las relaciones sociales y los procesos educativos, prestando atención al debilitamiento de la mediación humana y la vulnerabilidad de niños y adolescentes. Metodológicamente, se trata de una investigación bibliográfica analítica, basada en una revisión crítica de la literatura y el análisis de marcos normativos, con énfasis en el Estatuto Digital de Niños y Adolescentes (Ley n.º 15.211/2025). Los resultados indican daños al desarrollo cognitivo, emocional y social, así como un deterioro de las interacciones familiares. Se concluye que la adicción digital es un fenómeno multifactorial que requiere la integración de dimensiones psicológicas, socioculturales y normativas, siendo la mediación cualificada fundamental para una relación equilibrada con las tecnologías digitales. Se recomienda el desarrollo de prácticas educativas que promuevan el uso crítico y consciente de las tecnologías digitales.

Palabras clave: Adicción Digital. Regulación Emocional. Smartphones. Mediación Educativa. Hiperconectividad.

1 INTRODUCTION

The intensification of the use of smartphones and other digital technologies has promoted significant transformations in the forms of social interaction, daily habits, and emotional regulation processes. In this context, nomophobia stands out, characterized by the fear of being without access to a cell phone, a phenomenon associated with an increase in symptoms of anxiety and depression (ELHAI; DVOŘÁK; HALL, 2020).

In contemporary digital culture, digital technologies, particularly smartphones, are not limited to the expansion of instrumental capacities, but operate as structuring devices that reconfigure modes of perception, cognitive processes, and forms of constitution of subjectivity. By continuously mediating everyday experience, these technological artifacts begin to influence not only access to information, but also the way individuals interpret the world, organize attention, and construct meanings about themselves and others, evidencing their centrality in the reorganization of sociocultural and psychic dynamics in contemporary times (SANTAELLA, 2020).

From this perspective, the growing mobilization of smartphones as emotional regulation devices is observed, especially in the face of negative affective states, such as anxiety, boredom and frustration. This movement indicates that such technologies cease to perform a merely instrumental function and start to act as mediators of coping processes, being incorporated as immediate responses to emotional demands. As a result, there is a progressive shift from traditional regulation mechanisms, historically anchored in human interactions, to strategies mediated by digital devices, reconfiguring the ways of dealing with the affective experience in contemporary times (NICOLACI-DA-COSTA, 2006).

This study, situated in the field of human and social sciences, aims to analyze digital dependence from its articulation with emotional regulation processes, with emphasis on the outsourcing of these functions to smartphones. It seeks to understand the role of these devices, in the context of nomophobia, as coping strategies, as well as their impacts on mental health, social relationships and the weakening of human mediation, especially among children and adolescents. Its relevance stems from the advancement of the effects of technology on mental health, as well as the growing need for regulation in the digital environment, expressed, in Brazil, by Law No. 15,211/2025.

Methodologically, this is a bibliographic research based on a critical review of the literature. The article is structured in three axes: fundamentals of digital dependence, analysis of the use of smartphones as a strategy for emotional regulation and discussion of its psychological and social impacts. It is based on the hypothesis that the incorporation of digital

devices as mediators of emotional experience configures a process of outsourcing emotional regulation, with direct implications in the weakening of human mediation and in the reorganization of social bonds in contemporary times.

2 THEORETICAL FOUNDATION

Digital addiction, also called problematic use of digital technologies, especially smartphones, is configured as a multifactorial phenomenon located at the intersection between socio-technical transformations and subjective processes. It is a persistent pattern of use characterized not only by frequency or intensity, but above all by its psychological function, producing impairments in emotional functioning, social relationships, academic performance and quality of life (BUSCH; MCCARTHY, 2021; MONTAG; WALLA, 2021).

In this sense, digital addiction can be understood as a form of maladaptive emotional regulation, in which smartphones and other digital devices are mobilized as coping strategies in the face of negative affective states.

The scientific literature has consistently shown the association between the intensive use of mobile devices, especially smartphones, and a decrease in subjective well-being, accompanied by an increase in symptoms of anxiety, stress, and dissatisfaction. This body of evidence suggests that such impacts are not restricted to the frequency of use, but are related to the functions that these devices assume in daily life, particularly when mobilized as strategies for emotional regulation and immediate response to affective demands, contributing to the intensification of patterns of dependence and psychological vulnerability (ELHAI; DVOŘÁK; HALL, 2020).

However, this relationship should not be interpreted exclusively in quantitative terms, as a simple excess of time of use, but in the light of the structural, cultural and psychological conditions that sustain the centrality of technologies in contemporary daily life.

Thus, the analytical focus shifts from how much is used to why and how it is used, highlighting the role of smartphones as central mediators of emotional experience. On the sociotechnical level, hyperconnectivity emerges as a structuring element of contemporary social life, characterized by permanent connectivity that redefines the forms of interaction and establishes continuous availability as a social norm (CASTELLS, 2015; VAN DIJCK, 2013).

This phenomenon is integrated into the cultures of connectivity, which operate as normative devices, guiding practices, expectations, and forms of engagement in the digital environment. Constant presence on the networks is no longer a choice and becomes a

sociocultural requirement, producing a scenario in which disconnection can generate anxiety, discomfort and a feeling of exclusion.

Among the factors that support this pattern, the fear of missing out (FOMO), digital multitasking, and the internalization of continuous connection habits stand out. FOMO, in particular, acts as an important psychological mechanism, by producing a persistent sense of incompleteness and urgency, leading individuals to turn to digital devices as a form of immediate emotional regulation (PRZYBYLSKI et al., 2013).

Such practices are not homogeneous, being modulated by sociocultural factors, so that family, educational and institutional contexts can both intensify and mitigate patterns of problematic use.

The understanding of this phenomenon is deepened in the light of the Theory of Self-Determination, which postulates that human behavior is guided by the continuous search for satisfaction of basic psychological needs, such as autonomy, competence and belonging. In this context, such needs constitute essential foundations for healthy development and well-being, so that their frustration tends to trigger compensatory strategies of emotional regulation, often mediated by digital devices, which contributes to the consolidation of problematic use patterns (RYAN; DECI, 2017).

In this context, the use of digital technologies can assume an adaptive character when it contributes to the fulfillment of these needs, or maladaptive when it starts to operate as a compensatory strategy in the face of their frustration. Thus, the use of smartphones as an emotional regulation strategy can be understood as a response to deficits in the conditions for satisfying these needs, configuring itself as a coping mechanism that, although functional in the short term, tends to produce negative effects on psychological development and social relationships over time (RYAN; DECI, 2017).

In this sense, digital dependence should not be reduced to deviant individual behavior, but understood as an expression of a broader socio-technical ecology, in which technologies, social structures, and subjective processes are articulated in the production of new forms of emotional regulation. Such a perspective requires analytical approaches that integrate psychological, cultural, and normative dimensions, especially in the face of the advancement of regulatory frameworks that recognize the impacts of the digital environment on human development.

2.1 CONCEPTS OF DIGITAL DEPENDENCE

Digital dependence is epistemologically consolidated as a persistent and profoundly unregulated behavioral pattern in the consumption of technologies, culminating in acute psychic suffering or systemic functional impairments in the multiple spheres of the subject's life. In contrast to restrictive methodological approaches, this construct transcends the mere fixation on specific platforms, also encompassing engagement in daily practices of neutral appearance, such as the obsessive checking of messages and notifications, whose volume and functionality denounce the automation of habit and the failure of self-regulation mechanisms (BUSCH; MCCARTHY, 2021; MONTAG; WALLA, 2021).

From an analytical perspective, the phenomenon is aligned with the taxonomy of behavioral dependencies, being diagnosed by the presence of clinical markers such as tolerance, withdrawal syndrome, collapse of inhibitory control, and perpetuation of use despite deleterious externalities. In this scenario, the instrumentalization of technology as a *coping strategy stands out*, in which the digital apparatus is phagocytosed as a way to access instant gratification or as a shield against aversive affective states, such as anxiety, boredom and loneliness (RYAN; DECI, 2017; ELHAI; DVOŘÁK; HALL, 2020).

Consequently, interaction with smartphones and application ecosystems is detached from its purely instrumental purpose to assume a central regulatory function, operating as the main prosthesis for mediating emotional states.

In view of this framework, there is a rigorous need to delineate the epistemological boundary between quantitatively frequent and qualitatively problematic use. Intensive immersion, in isolation, does not typify dependence, since the diagnosis requires the unequivocal verification of the loss of agency, the obsessive centrality of the behavior in the subject's routine and the outbreak of latent structural damage (MONTAG; WALLA, 2021).

It is evident, therefore, that the measurement of digital dependence does not tolerate reductionism centered strictly on screen time, demanding an exegesis based on its psychological functionality, notably with regard to the capture of smartphones as vectors of maladaptive emotional regulation.

Empirical incursions dedicated to the phenomenon have mobilized a diversified methodological arsenal, encompassing validated psychometric scales, behavioral screening, and the measurement of mental health markers. The scrutiny of these data reveals a robust convergence indicating that high rates of digital dependence are unmistakably linked to the corrosion of subjective well-being and the proliferation of psychiatric symptoms, with the

consumption of social networks as one of the most striking predictors of this deterioration (ELHAI; DVOŘÁK; HALL, 2020; PRZYBYLSKI et al., 2013).

Such evidence consolidates the premise that the problematic use of sociotechnical arrangements is umbilically intertwined with processes of frankly maladaptive emotional regulation, in which the incessant hunt for ephemeral psychic relief culminates in the severe impairment of psychological homeostasis in the medium and long term.

2.2 HYPERCONNECTIVITY AND CONNECTIVITY CULTURES

Hyperconnectivity is erected as one of the ontological pillars of contemporaneity, transcending the mere technical infrastructure to consolidate itself as a pervasive integration of subjects into digital networks. This phenomenon is characterized by the intensification of mediated sociabilities, configuring a sociocultural condition that reorients the coordinates of time, attention and presence. Under this aegis, permanent connectivity ceases to be a contingency to become a structuring norm, redefining the grammars of social interaction (CASTELLS, 2015; VAN DIJCK, 2013).

In this scenario, uninterrupted availability is stripped of its elective character and begins to operate as an implicit imperative, engendering new regimes of engagement and exogenous modalities of social pressure. The so-called "cultures of connectivity" act, therefore, as normative devices that guide behaviors, expectations, and subjectivities in the digital ecosystem. Such devices institutionalize tacit patterns about the frequency and nature of being connected, naturalizing omnipresence on networks by linking it to symbolic capitals of belonging, visibility, and social validation. Consequently, practices such as digital multitasking and reactive surveillance of notifications are internalized not only as habits, but as prerogatives for the maintenance of intersubjective recognition (VAN DIJCK, 2013; CASTELLS, 2015).

Among the psychosocial constructs that sustain this dynamic, the *fear of missing out* (FOMO) stands out — the persistent and diffuse apprehension that potentially rewarding experiences of others are occurring without the subject's knowledge. This phenomenon precipitates a state of chronic urgency and ontological incompleteness, compelling individuals to a digital hypervigilance in which mobile devices start to act as prostheses of immediate emotional regulation (PRZYBYLSKI et al., 2013).

From this perspective, hyperconnectivity not only circumscribes social practices, but also organizes affective economies, reinforcing the dependence on informational flows for the stabilization of internal states.

Simultaneously, the sociocultural ecosystem exerts a determining influence on the vectors of use of technologies, outlining factors of vulnerability and resilience. Cohesive family environments, face-to-face interactions endowed with symbolic density, and robust emotional support systems operate as protective instances, enabling a relationship of agency and balance with the digital. On the other hand, scenarios marked by bonding weaknesses, lack of symbolic mediation, and unprocessed affective demands tend to catalyze the use of technologies as compensatory mechanisms for coping with and regulating affects (LEMOS, 2021; RYAN; DECI, 2017).

Teleological analysis of the use of digital technologies demonstrates that the underlying motivations determine the impact of digital on subjective well-being. While the use of expressiveness and dialogic communication tends to foster positive experiences, the use driven by normative pressures, the need for external validation, or emotional avoidance schemes has a high deleterious potential. This differentiation underlines that pathogenicity does not reside in technology *per se*, but in the psychic function it assumes in the subject's economy, reiterating the urgency of investigating the qualitative dimension of digital use, especially in its interface as a strategy of emotional regulation.

2.3 PSYCHOLOGY OF TECHNOLOGICAL DEPENDENCE

The psychology of technological dependence offers a robust theoretical framework for understanding the mechanisms underlying the problematic use of digital technologies, allowing us to analyze it not only as excessive behavior, but as a process of emotional regulation mediated by technological systems. Among the explanatory models, the reinforcement theory stands out, according to which behaviors followed by rewards tend to be reiterated (AINSLIE, 2001; ALTER, 2017).

In the digital environment, this dynamic is intensified by systems structured based on intermittent reinforcements, such as notifications, likes, and messages, which enhance the maintenance of continuous engagement and make it difficult to interrupt use. In addition, cognitive approaches, such as the time preference theory, contribute to explain the human tendency to privilege immediate rewards over long-term benefits (AINSLIE, 2001).

Such predisposition favors the consolidation of patterns of compulsive use, since digital devices offer quick and accessible responses to the regulation of affective states, even when associated with progressive impairments in psychological functioning. From a neuropsychological point of view, the intensive use of smartphones and digital platforms is associated with the activation of brain reward systems, particularly the release of dopamine, a

central neurotransmitter in the processes of motivation, learning, and habit formation (MONTAG; WALLA, 2021).

Continuous exposure to highly responsive digital stimuli can lead to desensitization processes, requiring increasing levels of stimulation to obtain similar effects, which contributes to the escalation of use and the loss of behavioral control. At the same time, the absence of these stimuli can trigger stress responses, associated with the release of cortisol, configuring a cycle that articulates the search for pleasure with the avoidance of psychic discomfort. In this configuration, digital devices begin to operate as strategies for immediate emotional regulation, albeit of a transitory and potentially maladaptive nature, being mobilized in the face of states such as anxiety, boredom and loneliness (RYAN; DECI, 2017).

The consequences of this process are widely documented in the literature, including reduced attention span, impaired self-control, mood swings, sleep disturbances, and increased feelings of social isolation. Such evidence indicates that digital addiction should not be understood as an isolated phenomenon, but as an expression of a complex socio-technical ecology, in which technologies, cultural structures, and subjective processes are articulated in the production of new forms of emotional regulation (SANTAELLA, 2020).

In view of this socio-technical configuration, the enactment of Law No. 15,211/2025, which establishes the Digital Statute of Children and Adolescents, represents a relevant milestone in recognizing that the architecture of digital environments and their engagement mechanisms are not neutral and can directly interfere in the processes of cognitive, emotional, and social development (BRASIL, 2025).

By establishing full protection in the digital environment and co-responsibility between family, school, State, and technological platforms, the legislation shows that the processes of emotional regulation mediated by digital devices cannot be understood only as individual choices, but must be analyzed in the light of their structural conditions and their impacts on human development.

3 FAMILY MEDIATION AND DIGITAL REGULATION: IMPLICATIONS FOR DEVELOPMENT AND THE FORMATION OF VALUES

The delegation, by families, of emotional and behavioral mediation functions to smartphones and other digital devices is one of the most emblematic phenomena of the contemporary reconfiguration of educational practices in the sphere of private life. In this context, the consolidation of technological devices as substitute mediators of emotional regulation is observed, evidencing a significant shift in the forms of care and socialization. What

was traditionally carried out through presence, listening, dialogue and symbolic mediation is, in many cases, transferred to smartphones and other technologies that operate as immediate emotional support, reducing the centrality of human mediation in the formative processes (BAUMAN, 2001; ALVES, 2025a).

This configuration can be understood in the light of the transformations in the forms of interaction mediated by technology, in which permanent connectivity tends to reconfigure social bonds, making them more fluid, immediate, and sometimes less profound (BAUMAN, 2001). In a complementary way, Alves (2025a) highlights that the intensive use of digital devices in the educational and family context can compromise emotional and social development processes, especially when these devices assume regulatory functions that should be exercised in the context of human relationships.

Such a process reveals a transformation in family dynamics, in which the device ceases to be just a tool and starts to operate as an affective mediator, reorganizing both the childhood experience and the family's own educational function. This transformation can also be understood from Han's (2017) critique, which indicates that contemporary society, marked by the logic of performance and hyperstimulation, tends to weaken experiences of interiority, reflection, and bonding, favoring immediate and superficial responses to emotional states.

In this scenario, the use of smartphones as a strategy for emotional regulation can be interpreted as a response to the acceleration of daily life and the growing difficulty of sustaining relationships based on presence and listening. In the educational field, Alves (2025a) recognizes that digital technologies have significant potential for learning, expanding access, personalization, and flexibility. However, the author emphasizes that unmediated and unregulated use can compromise essential training processes, defending the need for guidance, supervision and balance between technological use and face-to-face interactions.

This perspective is close to the analyses of Turkle (2011), for whom digital technologies, although expanding the possibilities of connection, can produce forms of emotional distancing, replacing deep interactions with mediated bonds. Under this logic, the replacement of the caregiver's presence by digital devices can compromise the constitution of secure bonds and the capacity for symbolic elaboration. This displacement is part of the broader context of the culture of connectivity, characterized by continuous digital presence and the standardization of permanent availability (VAN DIJCK, 2013; CASTELLS, 2015).

In this logic, family mediation tends to be reconfigured according to principles of immediacy, efficiency and quick response, shifting the axis of the relationship to technological functionality.

The consequences of this process are particularly relevant in the field of moral and socio-emotional formation, since the family constitutes the privileged space for the transmission of values, norms and ethical references. When fundamental experiences such as coping with boredom, waiting, and frustration are systematically mediated by screens, the possibility of developing skills such as emotional self-regulation, empathy, and tolerance for the immediate is reduced.

Alves et al. (2025b) reinforce this concern by analyzing nomophobia from a pedagogical perspective, evidencing its impacts on students' attention, behavior, and social interaction. The authors defend the construction of educational practices that promote the conscious and responsible use of technology, highlighting the importance of joint action between family and school.

This position finds resonance in contemporary analyses that problematize the effects of digital hyperstimulation on cognitive and emotional processes, indicating that continuous exposure to intense flows of information tends to reduce attention span, hinder reflection, and compromise the construction of deeper experiences (TWENGE, 2017; CARR, 2011).

Recent evidence indicates that digital environments structured by quick rewards and constant stimuli favor patterns of immediate and superficial engagement, to the detriment of reflective processes and emotional self-regulation, contributing to increased impulsivity, mental fatigue, and fragmentation of subjective experience (TWENGE, 2017; CARR, 2011).

From the point of view of human development, the replacement of dense interactions by continuous digital stimuli compromises the construction of psychic autonomy and impoverishes the relational experience. The child learns to deal with emotions, limits and conflicts through interaction with significant adults; When this mediation is replaced by technology, there is a change in the very structure of subjective experience. Alves (2025c), when discussing Education 5.0 from the perspective of neuroscience, emphasizes that the use of smartphones and digital platforms must be subordinated to the integral development of the subject, integrating cognitive, emotional, and social dimensions, and not only to instrumental efficiency.

The relevance of this problem is reinforced in the legal field by the enactment of Law No. 15,211/2025, which establishes the Digital Statute of the Child and Adolescent. By establishing the protection of children in the digital environment as a normative principle, the legislation recognizes that early and unassisted exposure to technologies is not neutral, but directly interferes with biopsychosocial development. In this sense, the mediation of technological use is no longer just a private practice and becomes part of a field of co-responsibility between family, school, State and digital platforms.

Thus, the use of smartphones as a strategy for emotional regulation can be understood as a symptom of a structural tension of contemporaneity, marked by the acceleration of time, the centrality of technologies and the reconfiguration of family relationships.

The challenge that is imposed does not consist in the rejection of technology, but in the construction of a conscious, ethically and pedagogically oriented mediation. As Alves (2025a; 2025b; 2025c) argues, the use of smartphones and digital technologies must be linked to educational processes that promote autonomy, criticality, and integral development, preserving the irreplaceable role of human interactions in the formation of family and social values.

4 CONSEQUENCES OF DIGITAL ADDICTION

Digital addiction is configured, in contemporary times, as a highly complex phenomenon, whose repercussions go beyond the individual scope and are projected on social, educational and organizational dimensions, assuming contours of an emerging public health problem and a central challenge for education. More than a simple excess of use of technological devices, it is an unregulated relationship with digital ecosystems and platforms marked by compulsiveness, difficulty in self-control, and significant damage to mental health, quality of life, and human performance (ELHAI; DVOŘÁK; HALL, 2020; MONTAG; WALLA, 2021).

In this analytical framework, the logic of hyperconnectivity, articulated with contemporary digital culture, marked by the immediacy of responses and continuous hyperstimulation, operates as a vector for the reorganization of daily practices and modes of experience. Such a configuration tends to compromise fundamental cognitive processes, such as sustained attention and time management, while hindering the construction of denser, more reflective, and symbolically elaborated experiences, evidencing the effects of technological mediation on the quality of psychic life and social interactions (SANTAELLA, 2020; HAN, 2017).

The effects of digital addiction manifest themselves significantly at the individual level, especially through the increase in symptoms of anxiety, depression, and stress, associated with continuous exposure to digital stimuli and the recurrent search for validation and immediate rewards. This dynamic reveals that digital environments, structured by logics of engagement and social recognition, operate as reinforcement systems that intensify sensitivity to external feedback, contributing to emotional instability and dependence on quick gratification mechanisms, with direct impacts on psychological well-being (TWENGE, 2017; PRZYBYLSKI et al., 2013).

From a cognitive point of view, a set of alterations is observed associated with reduced sustained attention, impaired self-control, and difficulty engaging in activities that require

prolonged effort and continuous concentration. Such effects indicate that recurrent exposure to fragmented digital stimuli tends to reconfigure the modes of information processing, favoring more dispersed and immediate attentional patterns, with direct impacts on academic and professional performance and on the ability to perform complex and reflective tasks (CARR, 2011).

In addition, the use of digital devices as a resource for immediate psychic relief, understood as the use of *coping*, tends to reinforce cycles of dependence by consolidating patterns of emotional regulation based on the avoidance of negative affective states, such as boredom, frustration and loneliness. In this process, technology starts to be mobilized as a recurrent strategy of emotional compensation, which, although it produces momentary relief, compromises the development of psychic autonomy and self-regulation, favoring the maintenance of maladaptive coping patterns and the intensification of psychological vulnerability (RYAN; DECI, 2017; ALVES, 2025a).

However, the consequences of digital addiction are not restricted to the individual, extending significantly to social and family relationships. The constant mediation of interactions by digital devices produces a paradox characteristic of contemporary society: the expansion of the possibilities of connection accompanied by the impoverishment of the quality of bonds (TURKLE, 2011).

As a consequence, there is a decrease in empathy, a weakening of social skills, and the fragmentation of face-to-face interactions. In the family environment, mobile devices begin to compete and, in many cases, monopolize the attention of individuals, reducing the spaces for dialogue, coexistence and shared construction of values, which directly impacts the ethical and emotional formation of children and adolescents (NICOLACI-DA-COSTA, 2006; ALVES, 2025b).

This problem acquires even more critical contours when considering the specific vulnerability of children and adolescents in accessing digital platforms, social networks and electronic games. Due to their developmental condition, this audience has less capacity for self-regulation, greater susceptibility to the influence of content, and greater exposure to intensive engagement dynamics based on intermittent rewards (ALTER, 2017).

Digital environments and games are conceived from design architectures oriented to maximizing engagement and dwell time, operating through reinforcement mechanisms that encourage behavioral repetition and make it difficult to interrupt use. Such systems, often structured based on intermittent rewards and continuous stimuli, tend to intensify patterns of prolonged use, with significant impacts on sleep, school performance and mental health,

evidencing the effects of persuasive design logics on the modulation of users' behavior (MONTAG; WALLA, 2021).

In addition, unassisted access to digital environments exposes children and adolescents to relevant risks, such as inappropriate content, *cyberbullying*, data exploitation, and practices of symbolic violence. The culture of connectivity, as analyzed by Van Dijck (2013), establishes implicit norms of continuous participation, reinforcing the need to always be connected and intensifying phenomena such as *fear of missing out* (FOMO), which contributes to dependence and social anxiety (PRZYBYLSKI et al., 2013).

Under this logic, early and intensive exposure to digital technologies can be profoundly harmful, since it interferes with fundamental development processes, such as the construction of identity, the formation of values, and the development of socio-emotional skills.

At the organizational level, digital dependence also has significant implications, by introducing dynamics of continuous interruption, reducing productivity and compromising the quality of professional relationships. Permanent connectivity, associated with the overlap between personal and professional life, contributes to increased mental fatigue, anxiety, and burnout (HAN, 2017).

Paradoxically, digital technologies, associated with increased flexibility and efficiency, can, when used in an unregulated way, produce inverse effects, compromising cognitive performance and psychological well-being. Such impacts result less from their instrumental potentialities and more from the way they are incorporated into daily practices, especially when mobilized as strategies for emotional regulation. In this context, the problematic use of smartphones is associated with fragmentation of attention, cognitive overload, and difficulty in self-regulation, contributing to reduced productivity and increased stress symptoms (BUSCH; MCCARTHY, 2021).

In view of this scenario, the enactment of Law No. 15,211/2025, which establishes the Digital Statute of Children and Adolescents (ECA Digital), is a relevant regulatory framework by recognizing, at the legal level, the centrality of the digital environment in the constitution of contemporary childhood and adolescence experiences. By incorporating socio-technical dynamics as a legitimate sphere of normative incidence, the legislation not only broadens the scope of the principle of full protection, but also signals an inflection in the way in which the Law comes to understand the risks, vulnerabilities and forms of mediation implied in digital interactions.

In this sense, the Digital ECA shifts the protection of children from a strictly territorial perspective to an approach that contemplates the complexity of digital ecosystems, reaffirming

the need for regulation, supervision and co-responsibility between the State, platforms and families in guaranteeing rights in the context of hyperconnectivity (BRASIL, 2025).

By establishing the principle of the best interest of children and adolescents in the use of technologies, the legislation recognizes that digital exposure is not neutral, but involves risks that require qualified regulation. In this sense, the ECA Digital reinforces the need for active mediation, continuous supervision and co-responsibility between family, school, State and digital platforms, showing that full protection, in contemporary times, depends on the articulation between legal normativity and educational practices in the context of hyperconnectivity (BRASIL, 2025).

This perspective converges with the analyses of Alves (2025c), who advocate an educational approach aligned with Education 5.0, in which the use of technologies should be subordinated to the integral development of the subject, integrating cognitive, emotional and social dimensions.

From an analytical point of view, it is essential to understand that digital dependence does not result from the technology itself, but from the absence of qualified mediation and educational practices that guide its use.

The contemporary challenge is, therefore, to build a balanced relationship with digital environments, which recognizes their potential without neglecting their risks. This implies promoting the conscious, critical, and ethically oriented use of technologies, especially among children and adolescents, ensuring that digital innovation is at the service of human development, the preservation of social bonds, and the formation of autonomous, reflective, and emotionally healthy subjects.

5 ECA AND DIGITAL ECA: REGULATION, POWER AND MEDIATION IN THE DIGITAL ENVIRONMENT

Law No. 15,211/2025, which institutes the ECA Digital, is an offshoot of the Statute of the Child and Adolescent (Law No. 8,069/1990), by incorporating the digital environment as a space for the incidence of the principle of full protection. By recognizing that digital experiences participate in the subjective and social constitution, the legislation expands the reach of the ECA, shifting protection to a context marked by algorithmic dynamics and the centrality of platforms in the mediation of relationships. Such a movement is pointed out by recent studies as a necessary regulatory advance in the face of the insufficiency of traditional frameworks to deal with the contemporary risks of the digital environment (COMISSÃO GESTÃO DA INTERNET NO BRASIL, 2024).

In the field of social networks, ECA Digital assigns direct responsibilities to the platforms, establishing measures such as linking minors' accounts to those responsible, prohibiting behavioral profiling, and requiring control and verification mechanisms. These obligations reflect a structural change in digital governance, shifting user accountability to the technological systems themselves, which are now conceived as regulable agents. Such a perspective is consistent with the understanding that digital platforms operate as structures for capturing, analyzing, and modulating behaviors, exercising forms of power based on the extraction and processing of data and the organization of social interactions in the context of surveillance capitalism (ZUBOFF, 2019).

The sanctioning regime instituted, by providing for the application of significant fines, the suspension and even the prohibition of activities, reinforces this displacement by directly affecting the economic logic that sustains the operation of digital platforms. By affecting their monetization and operating models, the legislation introduces structural accountability mechanisms that strain the logic of maximizing engagement and data capture.

In this context, recent analyses indicate that Law No. 15,211/2025 inaugurates a new regulatory level by requiring the review of internal processes, business models, and governance strategies of technology companies, evidencing an inflection in the relationship between state regulation and the digital economy (BRASIL, 2025; ANPD, 2025).

In this context, the limitation of profiling and targeted advertising can be understood, in the light of Han (2017), as an attempt to contain the logic of the attention economy, based on the exploitation of emotional vulnerabilities and the intensification of continuous engagement.

On the other hand, although it does not provide for direct sanctions to parents or guardians, the legislation reaffirms the role of the family as a central instance of mediation. This normative choice shows that protection cannot be reduced to technical or legal mechanisms, but depends on the articulation with educational and relational practices. Recent studies highlight that the effectiveness of the Digital ECA is directly linked to the joint action of platforms, the State, and families, consolidating a model of shared responsibility (Brasil, 2025; National Data Protection Authority [ANPD], 2025).

In light of these considerations, the ECA Digital can be understood as a regulatory framework that responds to the limitations of the self-regulation of platforms, recognized as insufficient in view of the risks associated with the digital exposure of children and adolescents (BRASIL, 2025; ANPD, 2025). By imposing structural obligations and expanding institutional accountability, the law tensions the prevailing logic of hyperconnectivity, while highlighting the

limits of regulation in the face of a digital ecology guided by the capture of attention and the externalization of emotional regulation processes.

Thus, the articulation between the ECA and the ECA Digital consolidates an expanded model of full protection, in which the digital environment is recognized as a territory of rights. However, the effectiveness of this model depends not only on normative imposition, but on the ability to reconfigure the social and educational practices that sustain the use of smartphones and digital technologies, especially in the face of the growing outsourcing of emotional regulation to digital devices.

6 CONCLUSION

The analysis shows that digital addiction should be understood as an expression of structural transformations in the ways of living, learning and relating in contemporary times, marked by the growing outsourcing of emotional regulation to technological devices. In this context, the results of the study corroborate the literature by demonstrating that the use of smartphones as a strategy to cope with negative affective states significantly impacts mental health, social relationships, and educational processes.

The findings dialogue directly with Elhai, Dvořák, and Hall (2020), by confirming the association between problematic smartphone use and increased symptoms of anxiety and depression, especially when these devices are mobilized as emotional regulation resources. In a convergent way, Ryan and Deci (2017) contribute to the understanding of this phenomenon by indicating that such practices can emerge as compensatory responses to the frustration of basic psychological needs, such as belonging and autonomy.

In addition, the results reinforce the analyses of Turkle (2011) and Bauman (2001), by showing that the growing mediation of interactions by digital devices is associated with the impoverishment of social bonds and the weakening of human relationships. In this sense, it is observed that the replacement of face-to-face emotional mediation by digital strategies compromises fundamental developmental processes, especially among children and adolescents, whose vulnerability is amplified in contexts of unmediated access to technologies (BAUMAN, 2001).

From a sociotechnical perspective, the contributions of Castells (2015) and Van Dijck (2013) allow us to understand that such dynamics are not restricted to individual choices, but are inserted in a culture of connectivity that normalizes the constant presence in the digital environment. This condition is enhanced by mechanisms such as the *fear of missing out*, which

intensify the dependence on devices as a form of immediate emotional regulation (PRZYBYLSKI et al., 2013).

Additionally, the cognitive and behavioral effects observed are supported by the analyses of Carr (2011) and Twenge (2017), which point to the reduction of attention capacity, increased impulsivity, and impairment of psychological well-being resulting from continuous exposure to digital stimuli. Such evidence reinforces the understanding that digital dependence is not reduced to the time of use, but to the function that technology assumes in the subject's life.

In view of these findings, digital addiction should be understood as an expression of socio-technical dynamics that reconfigure the processes of emotional regulation, as defended by Alves (2025a; 2025b; 2025c), based on conscious, critical, and ethically oriented mediation of the use of technologies. More than restricting access, it is about qualifying the relationship with the digital environment, reaffirming the central role of human interactions in emotional regulation and integral development. This perspective is also supported by the normative framework established by Law No. 15,211/2025, which recognizes the need for protection and mediation in the use of technologies by children and adolescents.

In this context, it is necessary to adopt educational approaches that prioritize qualified mediation and the development of self-regulation skills and critical use of technologies. Thus, the promotion of a balanced relationship with digital environments depends less on restrictive strategies and more on the construction of formative practices that articulate cognitive, emotional and social dimensions in the conscious and functional use of digital technologies. The outsourcing of these functions to digital devices implies relevant shifts in the management of affective states, with impacts on psychological autonomy and socio-emotional skills.

ABSTRACT

In low-demographic contexts, low traffic volume makes the interpretation of standardized landing page metrics more unstable. This article analyzes a real local retail campaign based on the reanalysis of data from Google Analytics 4, Microsoft Clarity, heatmaps, and interface logs. Methodologically, it is an exploratory case study, with elements of A/B experimentation in a natural environment, guided by Media Ecology, Software Studies, the discussion on platformization, and usability literature. The reanalysis suggests that CTA performance depends on the interface environment, the device, and the funnel stage; that dwell time and scroll depth are useful metrics, but insufficient when interpreted in isolation; and that performance interpretation becomes more aligned with the page's objective when articulated with signals closer to the payment flow. As a contribution, the article proposes a situated interpretation of performance metrics and derives a lightweight test governance protocol for landing pages in information-scarce contexts.

Keywords: Landing Pages. Low Demographics. Platformization. Usability. Local Retail.

RESUMO

Em contextos de baixa demografia, o baixo volume de tráfego torna mais instável a leitura de métricas padronizadas em *landing pages*. Este artigo analisa uma campanha real de varejo local com base na reanálise de dados do Google Analytics 4, Microsoft Clarity, mapas de calor e registros de interface. Metodologicamente, trata-se de um estudo de caso exploratório, com elementos de experimentação A/B em ambiente natural, orientado pela Ecologia da Mídia, pelos Software Studies, pela discussão sobre plataformação e pela literatura de usabilidade. A reanálise sugere que o desempenho do CTA depende do ambiente de interface, do dispositivo e da etapa do funil; que tempo de permanência e profundidade de rolagem são métricas úteis, porém insuficientes quando interpretadas

RESUMEN

En contextos con baja demografía, el escaso volumen de tráfico dificulta la interpretación de las métricas estandarizadas de las páginas de destino. Este artículo analiza una campaña real de venta minorista local a partir del reanálisis de datos de Google Analytics 4, Microsoft Clarity, mapas de calor y registros de interfaz. Metodológicamente, se trata de un estudio de caso exploratorio, con elementos de experimentación A/B en un entorno natural, guiado por la ecología de los medios, los estudios de software, el debate sobre la plataformización y la literatura sobre usabilidad. El reanálisis sugiere que el rendimiento de la llamada a la acción (CTA) depende del entorno de la interfaz, el dispositivo y la etapa del embudo de conversión; que el tiempo de permanencia y la profundidad de desplazamiento son métricas útiles, pero insuficientes si se interpretan de forma aislada; y que la interpretación del rendimiento se alinea mejor con el objetivo de la página cuando se articula con señales más cercanas al flujo de pago. Como contribución, el artículo propone una interpretación contextualizada de las métricas de rendimiento y deriva un protocolo de gobernanza de pruebas ligero para páginas de destino en contextos con escasez de información.

1 INTRODUCTION

This article analyzes a local retail landing page in a context of low demographics, based on a real campaign carried out in Barra do Corda, Maranhão, between June 3 and August 31, 2024. In markets of this type, the low volume of traffic makes each visit more relevant and makes it more sensitive to read the performance of the interface. In this scenario, the landing page is no longer just a promotional piece and starts to function as a privileged object to observe how metrics, interface elements, and local conditions are articulated in the production of results.

The analysis is based on operational data from Google Analytics 4 (GA4), Microsoft Clarity heat maps and behavioral logs, as well as simple interface variations tested throughout the campaign. The central problem of the article lies in the fact that, in low-traffic environments, small oscillations in layout, access source, device, and local seasonality can produce disproportionate effects on metrics such as clicks, dwell time, and scroll depth. In these contexts, the automatic reading of standardized indicators tends to be insufficient, as the scarcity of signals makes the interpretation of performance more unstable and requires greater attention to the context in which the interaction occurs.

This question gains relevance because a significant part of the literature on *landing pages*, optimization, and digital performance was produced based on scenarios of abundant traffic and relatively stable patterns of user behavior. Such a framework does not always correspond to the reality of local retail in smaller municipalities, in which the availability of data is reduced and analytical decisions have to deal with more noise, greater sensitivity to conjunctural variations, and stronger dependence on the digital infrastructures that organize measurement. The originality of the study lies, therefore, in shifting the debate to an environment in which measuring does not only mean recording interactions, but interpreting scarce signals in a situated way.

Given this scenario, the article aims to analyze how the reading of the performance of a landing page is organized in a context of low demographics. More specifically, it seeks, first, to examine the conditionality of the *Call To Action* (CTA), considering its relationship with the funnel, the device and the interface environment; second, to discuss the limits of attention metrics, such as dwell time and scroll depth, when mobilized in low-sampling scenarios; and, third, to propose a lightweight protocol of situated reading and test governance, Able to guide analytical decisions in contexts of information scarcity.

The contribution of the article is twofold. On the empirical level, it examines a real local retail campaign in a low-demographic market, contributing to broaden the repertoire of studies on digital performance in peripheral and underexplored contexts. On the methodological level,

it proposes a situated reading of performance metrics in *local retail landing pages*, articulating the empirical case with the discussion on platformization, usability and informational scarcity, and deriving from this path a lightweight protocol of test governance.

2 THE ECOLOGY OF THE MEDIA AND THE INTERFACE ENVIRONMENT

Media ecology shifts the analytical focus from isolated content to the environment that makes communication possible, intelligible, and socially operable. From this perspective, the media do not function only as transmission channels, but as structures that organize perception, modulate attention and condition the action of the subjects. Applied to the study of digital interfaces, this approach allows us to understand the landing page not only as a promotional piece or information support, but as a technical and symbolic environment that frames the user's behavior and guides their navigation (McLuhan, 1995).

This framing is especially relevant for the analysis of *landing pages*, as their performance does not depend only on the content offered, but on the articulation between the position of the elements, visual hierarchy, density of stimuli, loading temporality, and clarity of the action path. Elements such as the CTA, the order of the blocks, the presence of fixed components above the fold, and the proximity between information and payment do not operate in isolation. Their effect is relational, that is, it emerges from the interface environment in which they are inserted.

In contexts of low demographics, this perspective gains additional analytical strength. When traffic volume is reduced, small environmental changes can produce proportionally more visible oscillations in observed behavior. In these scenarios, the environment ceases to be a backdrop and becomes a central variable of interpretation. Media ecology, therefore, offers a useful key to understanding why, in small markets, metrics and behaviors need to be read in light of the concrete conditions of interface and circulation.

In dialogue with this axis, *software studies* allow us to observe how such conditions are technically operationalized. If media ecology emphasizes the environment, software studies help to understand how this environment is structured by systems, dashboards, event taxonomies, and ways of visualizing data. Dashboards, APIs, and analytical tools don't just record experience: they define which actions will be visible, which relationships can be compared, and which problems will be recognized as amenable to optimization (Manovich, 2013). In other words, the user experience is simultaneously lived and modeled in a technical grammar that conditions its interpretation.

2.1 PLATFORMIZATION, METRICS, AND LOCAL VALUE

The discussion about platformization allows us to broaden this reading by situating the landing page within a broader ecosystem of infrastructures, metrics, and forms of governance. In Van Dijck, Poell and de Waal (2018), platformization refers to the expansion of digital platforms as structures that organize social, economic and cultural practices through logics of datafication, monetization and regulation. More than hosting interactions, these infrastructures define visibility standards, measurement criteria, and legitimate forms of circulation and conversion.

In the case of *landing pages*, this means that performance is now read through a vocabulary strongly stabilized by platforms and analytics tools: time engaged, click-through rate, scroll depth, conversions, and other similar metrics. These indicators are useful because they make campaigns comparable and offer relatively standard operating parameters. However, they also function as normative artifacts: by privileging certain events and making others invisible, they help define what counts as success. In this key, measuring is not just describing; it is also to frame value.

This issue becomes even more sensitive in contexts of low demographics. When the volume of data is reduced, the effects of seasonality, variation in traffic origin, differences between devices, and sampling instabilities increase. Under such conditions, standardized metrics preserve comparative utility, but tend to lose strength when mobilized in isolation as evidence of performance. The reading of the panel now requires greater caution, since small oscillations can represent both relevant indications and simple contextual noise.

It is at this point that the notion of local value becomes decisive. Instead of taking success only as what the platform measures in a more visible way, it becomes necessary to put the concrete purpose of the interface in its context of use back at the center. On a local retail landing page with a payment-oriented flow via QR/Pix, for example, the interpretation of performance cannot depend only on generic attention proxies. It also needs to consider signs closer to the effective progression of the desired action. The problem, therefore, is not to abandon standardized metrics, but to articulate their comparability with indicators that are more adherent to the local objective of the interaction.

This perspective dialogues with Nieborg and Poell (2018), by showing that platforms not only host content, but co-produce their own evaluation objects by stabilizing taxonomies, events, and optimization formats. In peripheral markets and smaller-scale operations, this implies additional asymmetries: teams tend to rely on externally defined analytical repertoires, often without control over criteria for visibility, modeling, or data suppression. Grohmann's

(2019) critique helps to situate this problem as a matter of power and analytical capacity: the smaller the local structure, the greater the dependence on ready-made metric grammars. Therefore, a situated reading of metrics is not opposed to platforms, but seeks to prevent them from defining on their own what should be understood as a relevant result.

2.2 USABILITY AND EXPERIMENTATION IN THE CONTEXT OF SCARCITY

The usability literature contributes to this debate by offering a procedural framework for the interpretation and improvement of interfaces. Instead of treating usability only as a set of good visual practices, it is interesting here to understand it as a process discipline: a way to reduce friction, qualify paths, and make the relationship between interface and user behavior more readable. In Nielsen (1993; 1994), the evaluation of usability is built through inspections, tests and systematic observation, based on the principle that basic interaction problems need to be treated before decisive effects are attributed to small variations in layout, color or *microcopy*.

This principle is particularly important in low-traffic environments. In contexts of informational scarcity, each interface change operates on a reduced set of signals, which makes it more difficult to distinguish what results from a specific change and what results from contextual noise. For this reason, experimentation cannot be conducted as a simple succession of visual tests, but must start from minimum conditions of legibility, hierarchy, clarity of flow and operational stability. In other words, before testing for fine differences, you need to make sure that the page isn't producing elementary friction that distorts the reading of the behavior.

This approach is close to the formulations of Marketing 4.0 and 5.0, especially when these works emphasize the centrality of experience, continuous learning, and data-driven adaptation (Kotler, Kartajaya, and Setiawan, 2017; 2021). In local retail operations, however, this logic needs to be calibrated to the size of the market and the actual availability of analytical signals. Rather than relying on extensive cycles and large volumes of observations, experimentation tends to work best when guided by small hypotheses, minimally stable observation windows, and explicit reading and decision criteria.

From this perspective, usability and experimentation converge on the same point: the need to build responsible interpretations in environments of scarcity. This entails not only testing interface elements, but doing so with analytical parsimony, recognizing that attention metrics such as dwell time and scroll depth can be useful, though insufficient when taken in isolation. In low-demographic markets, reading performance requires combining observation of the

interface environment, understanding the context of use, and selecting indicators closer to the specific purpose of the page.

Thus, the dialogue between media ecology, platformization, and usability provides the conceptual basis of this article. Media ecology allows us to understand the landing page as an environment of perception and action; platformization shows how metrics and infrastructures condition what can be seen as value; and usability provides a procedural horizon for thinking experimentation and decision making in low-traffic contexts. Together, these axes support the proposal of a situated reading of performance, suitable for local operations in which measuring well depends less on accumulating large volumes of data than on rigorously interpreting scarce and contextually marked signals.

3 METHODOLOGY

3.1 RESEARCH DESIGN AND EMPIRICAL CONTEXT

This article adopts a methodological design of an exploratory case study, with reanalysis of a real landing page campaign conducted in a context of low demographics. The mobilized data were originally collected and analyzed within the scope of a master's dissertation presented to the Graduate Program in Communication of the Federal University of Maranhão (PPGCom/UFMA), being reinterpreted here in the light of a new theoretical and analytical framework, centered on the articulation between media ecology, platformization, usability and informational scarcity.

The empirical case corresponds to a local retail campaign carried out in Barra do Corda (MA), between June 3 and August 31, 2024, with a landing page oriented to conversion and payment via QR/Pix. Although the corpus dialogues with elements of A/B experimentation in a natural environment, especially with regard to simple interface variations throughout the campaign, the article does not claim robust statistical demonstration of causality. Its objective is, rather, to produce a situated interpretation of the page's performance in conditions of low traffic volume, taking the available metrics and records as empirical evidence to be read in articulation with the interface context and with the inferential limits of the case.

The choice of this design stems from the nature of the problem investigated. In low-demographic markets, the scarcity of signals, the greater sensitivity to local seasonalities, and the relative instability of some metrics make an analytical approach guided by triangulation and contextualization more productive than by universalizing pretensions. Thus, the case study allows us to observe, in depth, how interface elements, standardized metrics and payment flows are articulated in a concrete empirical environment of local retail.

3.2 DATA SOURCES AND ANALYTICAL CORPUS

The analytical corpus was composed of different types of operational and documentary records. The main database gathered data from Google Analytics 4 (GA4) and Microsoft Clarity, including navigation metrics, dwell time, scroll depth, useful clicks, heatmaps, and recorded sessions. To these materials were added variants of the landing page, screenshots and interface configuration notes produced throughout the campaign, used to document changes in layout, block order, microcopy, CTA chromia and payment flow position.

The campaign's consolidated data indicated 1,698 users, 23 clicks on CTA, 56 interactions with Pix/QR and 79 clicks classified as conversion, in addition to an average scroll depth of 26.79% and an average dwell time of 29 seconds. These numbers were treated, in this article, not as sufficient evidence to prove causal relationships between interface variations and conversion outcomes, but as empirical indicators of the user journey and the way performance was captured by the available analytical tools.

For interpretation purposes, it is important to distinguish three levels of registration present in the corpus. CTA clicks correspond to direct interaction with the main action command of the page; interactions with Pix/QR are about the user's progression towards the payment flow; and clicks classified as conversion bring together events treated operationally, in the original corpus, as signs of relevant progress in the journey. As this is a reanalysis of data already collected, the equivalence between these levels is not automatically assumed, but carefully examined, recognizing that each record expresses a distinct layer of the observed behavior. This distinction is methodologically important because it avoids taking every interaction as a synonym for completed conversion.

In addition, the article starts from the recognition that the corpus is conditioned by the very logic of visibility of the analytical platforms used. This means that the available data does not exhaust the user experience, but translates it according to taxonomies, filters, and registration criteria technically defined by GA4 and Clarity. In this way, the corpus is understood simultaneously as an empirical source and as a product of a specific metric grammar, whose reading needs to be contextualized.

3.3 OPERATIONAL DEFINITIONS

The analysis was structured based on some operational definitions aimed at making the criteria for reading the observed behavior more explicit. The main one is the notion of "qualified visit", mobilized in this article as an analytical operator to identify situations in which there was minimal evidence of attention and/or progression in the flow of the interface. Instead of taking any visit as a homogeneous unit, the category seeks to distinguish accesses with more consistent indications of engagement or purpose.

For this classification, the occurrence of at least one of the following criteria was considered as a qualified visit: (a) combination of minimum attention, expressed as a dwell time equal to or greater than 12 seconds and scroll depth equal to or greater than 60%; (b) presence of informational microinteraction, understood as an action indicative of active search for content or progression in the path; or (c) a sign of progress in the payment flow, ideally associated with the display of the QR code and staying in its area long enough to indicate action-oriented attention.

However, in the empirical case reanalyzed here, not all of these events were fully instrumented at the desirable level for a closed demonstration. In particular, the display of the QR code and the time spent in its area appear in the article less as variables fully measured in the corpus and more as analytical operators and methodological propositions derived from the observed limitation itself. For this reason, the definition of qualified visit should be understood in two ways: as an interpretative resource applied to the available material and, simultaneously, as a more robust methodological formulation for future applications in similar contexts.

A minimum observation window of 14 days was also assumed as parameters for reading the corpus, designed to cushion weekly variations and conjunctural oscillations, and the

adoption of explicit criteria for analytical decision, such as distinction between relevant advance, absence of interpretable gain and occurrence of error or collection noise. These parameters do not operate, here, as a fully validated experimental protocol, but as principles of methodological organization coherent with the proposal of a situated reading of performance.

3.4 ANALYSIS PROCEDURES AND INFERENTIAL LIMITS

The reading of the material was organized into three analytical axes, corresponding to sectors of the user journey on the landing page: (1) interface and CTA, including color, contrast, microcopy, visual hierarchy, and competition of stimuli above the fold; (2) engagement and scrolling, with attention to the interpretive limits of dwell time and scroll depth; and (3) payment flow, taking as a reference the available indications of progression towards QR/Pix and the need for metrics that are more adherent to the local purpose of the interface. This sectorization was not thought of as rigid compartmentalization, but as an analysis strategy to relate different layers of recorded behavior.

The analytical procedure combined quantitative reading and contextual interpretation of the records. Aggregated metrics of attention and interaction were examined in conjunction with heat maps, documentation of page variants, and observation of friction or visibility points in the user journey. Instead of taking time, scrolling, or clicks as self-evident indicators, the analysis sought to triangulate them with the organization of the interface, the position of the relevant elements, and the context of circulation of the campaign. In this sense, the reanalysis sought to shift the focus from a merely descriptive reading of the numbers to a situated interpretation of the available signs.

The analysis also considered stratification by device and stage of the funnel, especially in the distinction between colder accesses and return situations, whenever the corpus allowed this type of reading. However, such stratifications were treated with caution, since the low volume of traffic and the platforms' own modeling and privacy rules can reduce the stability of finer segmentations. Thus, the inferences produced throughout the article are deliberately moderated: it is less a matter of asserting universal effects and more of understanding how the empirical case illuminates recurring problems of measurement in low-demographic markets.

Among the main inferential limits of the study are the reduced volume of data, the sensitivity of metrics to local seasonality, the dependence on analytical tools with their own criteria for recording and visualization, and the absence of more precise instrumentation for some events considered central to the progression in the payment flow. For this reason, the results presented in the following sections should be read as situated inferences, supported by

triangulation between different registers, and not as robust generalizations about causality on *landing pages*. Such delimitation does not diminish the relevance of the case; on the contrary, it reinforces its usefulness as an empirical basis for thinking about test analysis and governance practices in contexts of information scarcity.

4 RESULTS AND DISCUSSION

4.1 CTA, VISUAL HIERARCHY, AND CONTEXT OF USE

The analyzed campaign registered 1,698 users and 23 clicks on the CTA, which corresponds to 1.35% of the observed accesses. Taken in isolation, this percentage does not allow us to conclude, in a direct way, whether the button is effective or ineffective as a conversion device. However, when read in conjunction with the interface configuration and navigation logs, it suggests that the CTA did not operate as a universal trigger for action, but as an element dependent on the environment in which it was inserted.

Observing fixed elements above the fold, such as header and floating icons, reinforces this reading. In low-demographic contexts, where each access has greater analytical weight and competition for attention becomes more sensitive, the effect of isolated attributes—such as color, contrast, or button shape—tends to be diluted when the navigation path has high visual competition. In these cases, the position of the CTA in the flow of the page, its relationship with the informational blocks, and its proximity to the moment of payment seem more relevant than chromatic adjustments considered separately.

The reanalysis also suggests that microcopy participates decisively in this conditionality. More specific and task-oriented labels, such as those that clearly indicate the transition to payment via QR, tend to reduce ambiguity and produce greater adherence to the purpose of the page than generic statements. This does not mean attributing to microcopy a linear or universal effect, but recognizing that, in low-traffic environments, the clarity of the path can have more weight than small isolated visual variations, especially when the user already has some previous familiarity with the offering.

From a theoretical point of view, this result reinforces the ecological reading of the interface. The CTA should not be understood as an autonomous unit of conversion, but as part of a technical and perceptive environment that organizes the user's action. Its effectiveness, therefore, depends on the articulation between visual hierarchy, stimulus density, funnel context, and concrete navigation conditions. Rather than looking for a "pure effect" of the button, the case suggests that call-to-action performance needs to be interpreted as a relational

phenomenon, situated and sensitive to the scarcity of signals conditions typical of low-demographic markets.

Figure 3

Heat map of clicks and scrolling depth of the landing page, evidencing interaction patterns and distribution of users' attention throughout the interface

Source: Microsoft Clarity

4.2 TIME, SCROLLING, AND INTERPRETIVE NOISE

In the campaign as a whole, the average scrolling depth was 26.79%, while the average time spent on the page was 29 seconds, totaling approximately 13 hours and 42 minutes of aggregate dwell. These indicators are relevant to reading browsing behavior, but cannot be taken by themselves as automatic equivalents of interest, intent, or progress in the conversion path.

First, dwell time can include situations in which the page remains open without effective interaction, either due to interrupted browsing or by staying in the background. Second, the low average scroll depth should not be automatically interpreted as page bounce, especially when information central to the action — such as price, payment terms, or the actual access to the purchase flow — is positioned in the first sections of the interface. In this case, less scrolling can mean both disinterest and quick access to the point considered most relevant by the user.

The case, therefore, suggests that attention metrics need to be read in a situated key. In low-demographic contexts, small changes to traffic source, device, local calendar, and page

organization can produce disproportionate swings in timing and scrolling. For this reason, these indicators preserve descriptive and comparative usefulness, but become insufficient when mobilized in isolation as proof of performance. The attention observed in the analytical tools does not necessarily coincide with intention, just as the scanning of the interface does not in itself equate to the rejection of the content.

It is at this point that triangulation is methodologically necessary. Instead of treating time and scrolling as self-evident proxies of success, the analysis proposes to interpret them in conjunction with informational microinteractions, documentation of page variants, and clues closer to the payment flow. Such a movement does not invalidate the standardized metrics of the platforms, but it reduces the risk of their fetishization, that is, the risk of taking as a result what the panel shows in a more visible way, and not necessarily what comes closest to the concrete objective of the interface.

4.3 PAYMENT FLOW AND INTENT SIGNALS

For interpretation purposes, the corpus was read in three levels of registration. The first corresponds to clicks on CTA, understood as direct interaction with the main action command of the page. The second concerns interactions with Pix/QR, taken as signs of progression in the payment flow. The third group includes the 79 clicks classified as conversion, that is, events operationally treated in the original corpus as relevant advances in the user's journey, although not equivalent, by themselves, to the completion of the payment.

This distinction is methodologically necessary because it prevents taking every interaction as a synonym for effective conversion and makes the reading of the different layers of the observed behavior more accurate.

This data is especially relevant because it occurs in a scenario of low average scroll depth. This suggests that, even without going through long stretches of the page, a portion of users were able to access the payment flow, which replaces the visibility and organization of this journey as decisive factors for analysis.

In other words, the case indicates that the efficiency of the landing page does not depend only on retaining attention for longer, but on making the shift between information, decision, and payment readable and accessible. When that short flow — CTA, payment block, and QR — is well-placed, conversion can lean more on the clarity of the journey than the length of the navigation.

At the same time, the analysis itself highlights a decisive limitation of the corpus: the absence of specific instrumentation for events such as effective display of the QR code and

time spent in its area. This restriction prevents conclusive affirmation of the empirical superiority of these signals in relation to the generic metrics of attention in the case studied. What the article can sustain more rigorously is something slightly different and, methodologically, stronger: the reanalysis shows that traditional indicators alone do not capture the progression in the payment flow and, therefore, points to the need to instrument signals that are more adherent to the local purpose of the interface in future applications.

In this key, the payment flow emerges less as the final step of a linear funnel and more as a critical operator for reading performance. By shifting analytical attention to events closer to the transaction, the study proposes a shift in focus: in contexts of informational scarcity, it is less important to multiply general engagement proxies and more to identify which signals are, in fact, closer to the action that the interface intends to enable. Thus, the contribution of the case is not to demonstrate in a closed way the strength of indicators such as QR rendering and dwell time, but to highlight their analytical relevance and their methodological necessity.

4.4 WHAT THE CASE SHOWS ABOUT LOW DEMOGRAPHICS AND SITUATED METRICS READING

Taken together, the case study shows that the measurement problem in low-demographic markets is not limited to the existence of less data, but to the presence of more context-sensitive data. In campaigns with low traffic volume, variations in layout, access source, device, and local seasonality can significantly alter aggregate metrics, making it more difficult to distinguish what corresponds to a consistent interface effect and what results from conjunctural noise. In these scenarios, scarcity is not just quantitative limitation; it constitutes a specific analytical condition.

This condition reinforces the need to articulate two complementary reading lenses. The first is the platform's lens, which offers standardized metrics, comparability, and monitoring basis. The second is the lens of local value, which puts the concrete purpose of the page back at the center and requires attention to signs closer to the desired action. In the case examined here, this means recognizing the usefulness of clicks, timing, and scrolling, without allowing such indicators to define on their own what should be understood as success.

From the point of view of theoretical discussion, the empirical case sustains three movements. First, it reinforces the ecological reading according to which elements such as CTA, blocks of information and payment can only be understood in their relationship with the interface environment. Second, it confirms the criticism of the naturalization of the metrics prescribed by the platforms, showing that they frame the perception of performance, but do not exhaust their

intelligibility. Third, it suggests that usability, understood as a process, needs to function as a precondition for experimentation, especially in contexts in which low traffic makes it more difficult to interpret fine changes in behavior.

In summary, the reanalysis indicates that the reading of the performance of *landing pages* in low-demographic markets should be guided less by supposedly stable metric truths and more by situated interpretations, capable of combining standardized indicators, observation of the interface environment, and signals more adherent to the local purpose of the interaction. It is in this shift that the case gains relevance: not as a basis for strong generalizations, but as applied evidence that, in peripheral and low-scale contexts, measuring well depends less on accumulating large volumes of data than on accurately interpreting scarce and contextually marked signals.

5 PROPOSED TEST GOVERNANCE PROTOCOL

The reanalysis of the campaign allows us to derive, from the empirical case, a methodological proposition aimed at conducting tests on *local retail landing pages* under conditions of low demographics. Instead of taking the case as a basis for the formulation of retroactive hypotheses, this section uses it as a foundation to propose a lightweight test governance protocol, guided by traceability, analytical parsimony, and adherence to the local value of the interface. The objective of the protocol is to provide minimum parameters for conducting and interpreting experiments in contexts in which the volume of traffic is low, sensitivity to contextual factors is high, and standardized metrics, although useful, are not enough to support decisions in isolation.

The proposal is based on the recognition that, in markets with low demography, experimentation cannot depend on an ideal of informational abundance that is rarely realized in practice. Under these conditions, decision-making tends to be more consistent when supported by simple, explicit, and stable procedures, capable of reducing interpretative noise and preventing episodic oscillations from being confused with robust evidence. The suggested protocol, therefore, does not seek to replace the metric grammar of the platforms, but to discipline its use from a situated framework, in which the canonical metrics are read in articulation with signs closer to the concrete purpose of the page.

In this sense, three analytical axes are proposed to guide the governance of the tests:

- **The conditionality of the CTA**, that is, the recognition that the performance of the call to action should not be evaluated as an autonomous and universal effect, but in relation

to the context of use, the stage of the funnel, the access device and the organization of the interface environment.

- **The insufficiency of attention metrics taken in isolation**, considering that dwell time and scroll depth, although relevant, can become noisy in low-sampling scenarios and, therefore, need to be triangulated with microinteractions and signals that are more adherent to the payment flow.
- **The need for a lightweight decision protocol**, based on prior rules and explicit reading criteria, to reduce interpretation biases and increase the consistency of analytical choices.

Based on these axes, the protocol recommends, first, the adoption of a **light pre-registration** for each test, containing the operational hypothesis, the variation applied, the main monitoring metric, the minimum observation window, and the decision rule. This pre-registration does not need to reproduce the formalization of large-scale statistical experiments, but it should be sufficient to establish, before execution, what is expected to be observed and under what conditions a variation will be interpreted as promising, inconclusive or problematic. The function of this procedure is to reduce the possibility of interpretative adjustments made a posteriori, preserving greater traceability in the decision-making process.

Secondly, the protocol proposes to define a **minimum observation window**, preferably of two weeks, in order to buffer oscillations associated with specific days, irregular traffic flows and local seasonalities. In contexts of low demographics, periods that are too short tend to amplify noise and make any variation more vulnerable to hasty readings. Observation by minimal windows does not eliminate data instability, but it improves comparability between different moments of the campaign and favors decisions less dependent on occasional fluctuations.

Thirdly, it is recommended to **freeze the other relevant variables during the test**, avoiding simultaneous changes in layout, traffic origin, offer or positioning of central elements of the page. As the volume of accesses is reduced, competing changes make interpretive attribution even more difficult and make the experiment less readable. From this perspective, governing the test also means constraining parallel interventions, so that the observed variation can be read in relation to a minimally stable environment.

The fourth component of the protocol is the adoption of a **minimal event dictionary**, which allows distinguishing different layers of user behavior in the page path. Instead of treating every interaction as equivalent, the proposal is to separate at least four levels: interaction with

the CTA, visibility of the payment block, progression towards QR/Pix, and signals closer to the effectiveness of the intended action. In the specific case analyzed in this article, the absence of finer instrumentation for displaying the QR code and staying in its area was identified as an important limitation; Therefore, the protocol now explicitly recommends that these events be incorporated into future applications, whenever technically feasible.

The fifth element concerns the **decision criteria**. Instead of pursuing an ideal of statistical significance that is difficult to sustain in low-scale operations, the protocol proposes to work with three decision-making categories: interpretable gain, absence of relevant gain, and execution error or noise. The first category corresponds to situations in which the tested variation shows consistent signs of improvement in relation to the local objective of the interface; the second covers cases in which the observed difference does not justify a practical change; and the third includes collection failures, instability of the experiment or external interference that makes reading unfeasible. This typology does not solve the problem of scarcity by itself, but organizes the decision in a more transparent way that is compatible with the real conditions of the field.

Finally, the protocol recommends maintaining a **synthetic record of the tests performed**, bringing together the execution period, observed variant, main metrics, decision made, and any incidents. This turns the experiment into cumulative analytical memory, allowing local operations to learn from their own variations instead of relying solely on generic prescriptions offered by external dashboards and models. In peripheral environments and lean teams, this cumulativeness is particularly important, because knowledge about public behavior tends to be built less by the abundance of data and more by the rigorous systematization of scarce signals.

Thus, the proposed protocol should not be understood as a closed, universal model or fully validated by this research, but as a methodological proposition derived from the reanalysis of the case, aimed at guiding decisions in contexts of low demographics.

Its central function is to put the local purpose of the interface back at the center of interpretation, articulating standardized metrics, observation of the use environment, and explicit analytical governance criteria.

Table 1 summarizes, in a propositional key, the operational components of this protocol, understood as an initial formulation to be refined in future applications:

Table 1

Lightweight test governance protocol for landing pages in low-demographic contexts

Dimension	Description
Objective	Standardize the conduct of tests on <i>local retail landing pages</i> under traffic scarcity, ensuring reproducibility, transparency and alignment of metrics with local value (payment via QR code).
Hypothesis	Objective formulation, in a single sentence, indicating the relationship between the variation applied and the expected result (e.g., increase of qr_render and qr_dwell_s ≥ 6 s).
Benchmark Metrics	QR code display rate (qr_render, %) and time spent in the QR area (qr_dwell_s, in seconds).
Observation window	Minimum period of 14 days, including weekly variations in behavior.
Decision criteria	Vitória: $\geq +2$ p.p. in qr_render and $\geq +3$ s in qr_dwell_s; Futility: absence of relevant gain; Error: Collection or execution failures.
Monitored events	Interaction with CTA; payment block visibility (≥ 1 s); display of the QR code; length of stay in the QR area; optional: copy of the Pix key.
Qualified visit	Occurrence of at least one of the following criteria: (i) time ≥ 12 s and rollover $\geq 60\%$; (ii) informational microinteraction; (iii) QR displayed permanently ≥ 6 s.
Usability (control)	Readability, CTA contrast, visible focus, and mobile-friendliness.
Performance (control)	Page loading stability (e.g., proper LCP and TBT).
Ethics (control)	Availability of a user-accessible privacy policy.
Experimental control	Absence of simultaneous changes to the interface or traffic sources during test execution.
Follow-up	Periodic checks of the stability of the experiment, the correct triggering of events and the integrity of the interface.
Reporting of the results	Period record, variant distribution, key metrics (qr_render and qr_dwell_s), decision (win/futility/error), verification of controls and incidents.
Attachments	Inclusion of empirical evidence (screenshots, data logs, change logs).
Context and traceability	Prior registration of hypotheses, metrics, interface freezing, seasonality factors, and analytical segmentation (device and funnel stage).

6 CONCLUSION

This article analyzed the performance of a local retail landing page in the context of low demographics, from a campaign carried out in Barra do Corda (MA), based on records from Google *Analytics* 4, Microsoft Clarity, heat maps and documentation of interface variations. By shifting the discussion about *landing pages* to an environment with low traffic volume, the study sought to understand not only the user's behavior in front of the page, but above all the limits and possibilities of measurement in contexts marked by scarcity of signals, infrastructural dependence, and strong sensitivity to contextual variations.

The reanalysis suggests, firstly, that the CTA cannot be understood as an autonomous element of conversion. Its performance appears conditioned by the organization of the interface environment, the stage of the funnel, the access device and the articulation with elements such as visual hierarchy, clarity of the path and microcopy. Second, the study indicates that attention

metrics such as dwell time and scroll depth remain useful as descriptive indicators, but become noisy when mobilized in isolation as evidence of intent or performance. Thirdly, the case reinforces the need to approximate the analytical reading of signals that are more adherent to the specific purpose of the page, especially those related to the payment flow, even though the reanalyzed corpus does not allow conclusively demonstrating the empirical superiority of these indicators in the specific case.

In this sense, the main empirical contribution of the article is to show that, in markets with low demography, the problem of measurement does not arise only from the existence of less data, but from the presence of data that are more sensitive to seasonality, traffic origin, device, and interface organization. Scarcity, therefore, is not just a quantitative limit; it constitutes an analytical condition of its own. This requires that the reading of performance be done with greater interpretive caution and with less dependence on standardized metrics taken as self-evident truths.

From a methodological point of view, the article contributes by proposing a situated reading of performance metrics in *local retail landing pages*, articulating media ecology, platformization, and usability to interpret scarce signals in a way that is more adherent to the local value of the interaction. From the case analyzed, a lightweight test governance protocol is derived, guided by simple pre-registration, minimum observation window, explicit decision criteria, and attention to indicators closer to the purpose of the interface. This proposal should not be understood as a universal model or as a fully validated protocol in a statistical sense, but as an initial methodological arrangement, compatible with local operations and with conditions of information scarcity.

The limits of the study need, however, to be kept in the foreground. The low volume of traffic, the sensitivity of metrics to contextual factors, the constraints imposed by analytics platforms, and the absence of finer instrumentation for events such as QR code display and staying in your area prevent strong generalizations and recommend that findings be read as situated inferences. In addition, the absence of explicit warning of experimentation in the original campaign constitutes a relevant ethical limitation, which should be considered in future applications of the proposed protocol.

Still, precisely because it operates under these restrictions, the case offers an important contribution to the field of communication and applied digital marketing. By examining a real campaign in a peripheral and low-scale context, the article shows that measuring well in these environments depends less on accumulating large volumes of data than on rigorously interpreting limited, contextually marked, and technically framed signals by the platforms. It is

in this displacement that its central contribution lies: to put the local purpose of the interface back at the center of the analysis and to demonstrate that, in markets with low demographics, the quality of the analytical decision depends on the ability to articulate standardized metrics, interface environment and concrete context of use.

PRODUCTION AND CHARACTERIZATION OF STILL-DISTILLED RUM
PRODUÇÃO E CARACTERIZAÇÃO DE RUM DESTILADO EM ALAMBIQUE
PRODUCCIÓN Y CARACTERIZACIÓN DEL RON DESTILADO EN ALGO

<https://doi.org/10.56238/sevened2026.019-035>

Marcelo Teixeira Leite¹, Sandryelle Luciana Bezerra Monteiro²

ABSTRACT

The global rum market was valued at US\$15 billion in 2020 and is projected to reach US\$21.5 billion in 2025 at a compound annual growth rate of 5.5% during the period. This growth expectation is due to the global increase in demand for high-quality, intensely flavored rum (Market Data Forecast, 2020). The rum market in Brazil follows the global trend, registering significant growth in consumption in recent years, driven by a public seeking products with more sophisticated and differentiated flavor profiles (Businesscoot, 2020). Thus, rum distilled in copper stills stands out for its fuller-bodied and more complex flavor compared to rum produced in distillation columns, achieving a prominent position in the market. This scenario motivated this study, which aimed to investigate the production and characterization of rum distilled in copper stills, in accordance with current Brazilian legislation. The raw material used was sugarcane molasses. Fermentation was carried out in a fed-batch system using CA-11 yeast, a commercial strain of *Saccharomyces cerevisiae*. The resulting wine was distilled in a copper still, and rum was produced by diluting the heart fraction of the distillate to 40 °GL. Physicochemical analyses confirmed that the rum produced meets the requirements established by legislation, demonstrating adequate parameters that guarantee its conformity and quality. Furthermore, the product obtained presented a visual aspect, aroma, and flavor characteristic of excellent beverages, demonstrating that the processes adopted were effective in obtaining a well-crafted distillate.

RESUMO

O mercado global de rum foi avaliado em US\$ 15 bilhões em 2020, e deverá atingir US\$ 21,5 bilhões em 2025 a uma taxa de crescimento anual composta de 5,5% durante o período. Esta expectativa de crescimento é devido ao aumento global da demanda por rum de alta qualidade e sabor intenso (Market Data Forecast, 2020). O mercado de rum no Brasil acompanha a tendência global, registrando um expressivo crescimento no consumo nos últimos anos, impulsionado por um público que busca produtos com perfis de sabor mais sofisticados e diferenciados (Businesscoot, 2020). Desse modo, o rum destilado em

alambique de cobre destaca-se por seu sabor mais encorpado e complexo em comparação ao rum produzido em colunas de destilação, conquistando uma posição de destaque no mercado. Esse cenário motivou a realização deste estudo, que teve como objetivo estudar a produção e caracterização do rum destilado em alambique de cobre, em conformidade com a legislação brasileira vigente. A matéria prima utilizada foi o melaço de cana. A fermentação foi realizada em sistema de batelada alimentada utilizando a levedura CA-11, uma cepa comercial da *Saccharomyces cerevisiae*. O vinho resultante foi destilado em alambique de cobre e o rum foi produzido diluindo-se a fração coração do destilado a 40 °GL. As análises físico-químicas realizadas comprovaram que o rum produzido atende aos requisitos estabelecidos pela legislação, evidenciando parâmetros adequados que garantem sua conformidade e qualidade. Além disso, o produto obtido apresentou aspecto visual, aroma e sabor característicos de bebidas de excelência, demonstrando que os processos adotados foram eficazes na obtenção de um destilado bem elaborado.

RESUMEN

El mercado mundial del ron se valoró en 15.000 millones de dólares en 2020 y se proyecta que alcance los 21.500 millones de dólares en 2025, con una tasa de crecimiento anual compuesta del 5,5% durante el período. Esta expectativa de crecimiento se debe al aumento global de la demanda de ron de alta calidad y sabor intenso (Market Data Forecast, 2020). El mercado del ron en Brasil sigue la tendencia global, registrando un crecimiento significativo en el consumo en los últimos años, impulsado por un público que busca productos con perfiles de sabor más sofisticados y diferenciados (Businessscoot, 2020). Así, el ron destilado en alambiques de cobre destaca por su sabor más completo y complejo en comparación con el ron producido en columnas de destilación, alcanzando una posición prominente en el mercado. Este escenario motivó el presente estudio, que tuvo como objetivo investigar la producción y caracterización del ron destilado en alambiques de cobre, de acuerdo con la legislación brasileña vigente. La materia prima utilizada fue melaza de caña de azúcar. La fermentación se realizó en un sistema de lotes alimentados utilizando levadura CA-11, una cepa comercial de *Saccharomyces cerevisiae*. El vino resultante se destiló en un alambique de cobre, y el ron se produjo diluyendo la fracción central del destilado a 40 °G. Los análisis fisicoquímicos confirmaron que el ron producido cumple con los requisitos establecidos por la legislación, demostrando parámetros adecuados que garantizan su conformidad y calidad. Además, el producto obtenido presentó un aspecto visual, aroma y sabor característicos de bebidas excelentes, demostrando que los procesos adoptados fueron efectivos para obtener un destilado de alta calidad.

1 INTRODUCTION

1.1 CONCEPTS AND DEFINITIONS

Rum is an alcoholic distillate obtained from sugar cane. It is produced in several subtropical regions of the world, where sugarcane is grown. Although the most well-known rums are from Caribbean countries, rum is also produced in Australia, Fiji, India, Indonesia, Mauritius, Réunion, Sri Lanka, and other countries (Buglass, 2011).

The etymological origin of the word "rum" is uncertain. Some authors suggest that the term derives from "*Saccharum*", the genus of sugarcane (*Saccharum officinarum* L.). Another possibility is that it originates from the word "*rumbustion*", British slang for "great turmoil or uproar". A more likely origin is "*rumbullion*," a term used to describe a beverage boiled from sugarcane stalks. However, both terms were first reported at about the same time as the emergence of the word "rum", which makes it difficult to reach a consensus on its origin (Lieberman, 2010).

Rum is a beverage whose definition and classification are very diverse, varying according to the country or region of the world in which it is produced. Regarding the raw material, its manufacture can be made from sugarcane juice, molasses from the sugar industries or a combination of these. In Brazil, rum is produced from molasses. In the French overseas territories, there are specific distinctions: rum is called "agricultural" when produced from sugarcane juice and "industrial" when made with molasses (Fernández, 2016).

Similarly, the criteria used to classify rum as "white", "golden", "dark", "light", "heavy", etc. vary depending on the place of manufacture. These classifications are directly related to the distillation method, the aging time and the color of the product, which can result either from aging in wooden barrels or from the addition of dyes, or even from a combination of both (Murtagh, 2003).

1.2 THE RUM MANUFACTURING PROCESS

The manufacture of rum comprises the stages of clarifying the molasses, making the must, fermentation, distillation and finally the storage of the product.

Clarification aims to remove gums, waxes and colloidal substances present in molasses, which interfere with the fermentation and distillation stages. This process is carried out with the use of flocculation agents, at a pH between 5.0 and 5.5, at 80 °C, followed by filtration or centrifugation. The clarified molasses is then diluted to a °Brix of 14-16, which is the ideal sugar concentration range for the fermentation stage. Fermentation wort is made from clarified and

diluted molasses, supplemented with nutrients such as ammonium sulfate, vitamins, minerals, cornmeal, and rice bran, among others (Mangwanda, 2021).

From the fermentation stage, the production of rum follows a process similar to that of other beverages derived from sugarcane, brandy and cachaça. Fermentation is carried out with the use of the yeast *Saccharomyces cerevisiae*, which converts the sugars present in the must into ethanol, resulting in a sugarcane wine. Several other compounds are formed in smaller amounts, such as organic acids, methanol, esters, aldehydes, and higher alcohols. Such compounds contribute to the formation of the aroma and flavor of the drink.

After fermentation, the wine is then distilled, obtaining rum. Distillation can be carried out discontinuously, using copper stills, or continuously, by means of distillation columns. Generally, small producers opt for stills, while medium and large distilleries use columns.

In distillation in pot stills, the distillate is collected and separated into three distinct fractions. The first fraction is called the "head", which corresponds to the first condensed vapors and contains high concentrations of alcohol, usually above 60% (v/v). The volume of this fraction represents 1.0% to 2.0% of the volume of the wine, or approximately 10% of the total volume distilled. Next, the fraction called "heart" is distilled, which corresponds to an average of 16% of the volume of the wine, or 80% of the total volume distilled. This is the fraction that will give rise to rum. Finally, the fraction called "tail" or "weak water" is distilled, which corresponds to approximately 3.0% of the total volume of the wine, or 10% of the volume of the distillate. The "head" and "tail" fractions should not be used in the rum production process, as they present undesirable compounds that depreciate the quality of the product. However, these fractions can be mixed and distilled again in a column for the manufacture of fuel alcohol (Souza *et al.*, 2013).

In column distillation of rum, there is no sequential separation of the distillate into fractions. The feeding of wine to the column, the separation of the more volatile components, such as methanol, and less volatile, such as higher alcohols, and the removal of the distillate happen simultaneously and throughout the process.

The product obtained in the distillation stage is diluted until it reaches the alcohol concentration determined by the manufacturer. After this adjustment, the liquid can be subjected to maturation, being stored for a period of 2 to 4 months in inert containers, such as stainless steel, or it can go on to the aging process, where it remains for at least one year in wooden barrels, acquiring unique characteristics of flavor and aroma.

1.3 BRAZILIAN LEGISLATION: STANDARDS OF IDENTITY AND QUALITY OF RUM

In Brazil, the standards of identity and quality of rum are established by Decree No. 6,871, of June 4, 2009. According to this legislation, rum is defined as a beverage with an alcohol content of thirty-five to fifty-four percent by volume, at twenty degrees Celsius, obtained from the simple alcoholic distillate of molasses, or from the mixture of distillates of sugar cane juice and molasses, aged totally or partially in an oak or equivalent wood container, conserving its peculiar sensory characteristics. The product can be added sugars up to a maximum amount of six grams per liter and the use of caramel for color correction is allowed. The coefficient of congeners, which is the sum of the concentration of the substances formed during the manufacturing process, cannot be less than forty or more than five hundred milligrams per hundred milliliters of anhydrous alcohol.

Rum may be called:

- I. Light rum or light rum when the coefficient of congeners of the beverage is less than two hundred milligrams per hundred milliliters in anhydrous alcohol;
- II. Heavy rum or heavy rum when the coefficient of congeners of the beverage is two hundred to five hundred milligrams per hundred milliliters in anhydrous alcohol, obtained exclusively from molasses; e
- III. Aged rum or old rum is a beverage that has been aged, in its entirety, for a minimum period of two years.

1.4 MARKET AND CONSUMER TRENDS

Rum is the second most consumed distilled beverage in the world, with 1.6 billion liters per year, second only to vodka, with 4.5 billion liters (Market Data Forecast, 2020).

Depending on the country where it is produced, rum can be obtained from sugarcane juice, molasses or a mixture of these, in addition to having a diversity of classifications regarding color, flavor and aging time. As for the distillation method, rum falls into two categories: alembic rum, when distilled in copper stills, and column rum, when distilled in distillation columns (Fernández, 2016). Copper pot still distillation provides a drink with a more intense aroma and flavor, while column distillation provides a drink with a milder aroma and flavor.

The global rum market was valued at \$15 billion in 2020, and is expected to reach \$21.5 billion by 2025 at a compound annual growth rate of 5.5% during the period. This growth expectation is due to the global increase in demand for high-quality, intense-tasting rum (Market Data Forecast, 2020). The increase in rum consumption is already consolidated in several countries around the world. India and the United States record strong growth in the premium

rum market (Grand View Research, 2023). Other markets, such as China, Japan, the Philippines, and Australia are also expected to have a significant impact on the market growth due to the large consumer base and demand for quality rum, with a fuller taste (Market Data Forecast, 2020).

The rum market in Brazil is in line with the global trend, with a notorious increase in consumption in recent years. This increase is due to a growing group of consumers who are looking for products in a higher category, with a striking and differentiated flavor profile (Businesscoot, 2020). In this context, alembic rum, because it has a richer flavour than rum produced using distillation columns, is expected to occupy a prominent position in the market.

The growing consumer interest in alembic rum and the low supply of this product in the domestic market represent an opportunity to generate revenue for small and medium-sized producers of cachaça and brandy throughout the country, who use distillation in copper stills in the manufacture of their products. The equipment already installed and the experience acquired in the manufacture of cachaça and brandy greatly favor the production of alembic rum by these producers.

Another important factor is that the manufacture of rum can contribute to optimizing the operation and use of the productive capacity of a mill that already produces cachaça and/or brandy. Sugar cane, the raw material for cachaça and brandy, deteriorates quickly and cannot be stored. Therefore, the production of these beverages occurs only during the sugarcane harvest period, underusing the machinery and increasing maintenance costs. The manufacture of rum, in addition to increasing the company's product portfolio and revenue, allows the mill to operate practically all year round, since molasses, the raw material for rum, can be stored for long periods. In this way, it is possible to produce cachaça during the harvest, and rum in the sugarcane off-season.

Therefore, the study of rum manufacturing, in addition to contributing to technical and scientific knowledge, also values the economy and sustainable development of sugarcane-producing regions. The synergy between rum, cachaça and brandy optimizes production and increases the economic sustainability of the mills, which adds even more value to this study.

2 METHODOLOGY

2.1 RAW MATERIAL

The raw material used for the manufacture of rum was molasses, whose physicochemical characterization was carried out through the analysis of Brix, Pol, Purity and Total Reducing Sugars (ART), according to the methodology described by Caldas (2012).

2.2 FERMENTATION MUST

The must consisted of eight liters of molasses diluted to 16° Brix and supplemented with forty grams (5g/L) of corn meal. To minimize bacterial contamination during fermentation, the pH was adjusted to values between 4.0 and 4.5 by adding citric acid.

2.3 YEAST

For the preparation of the yeast, the selected yeast CA11, a commercial strain of *Saccharomyces cerevisiae*, was used.

Initially, eight grams of the yeast were hydrated in 250 mL of water for 15 minutes. Subsequently, 250 mL of diluted molasses was added and supplemented, as specified in item 2.2. Once the Brix of this mixture was halved, an additional 500 mL of molasses was incorporated. When the Brix of the new mixture reached 4%, the yeast was transferred to the fermentation vat.

2.4 FERMENTATION

Fermentation was conducted in a fed-batch system, as illustrated in Figure 1.

Figure 1

Fed batch fermentation scheme

Source: Authored by the author.

The process began with the introduction of the yeast into the vat, which was then filled with the fermentation wort, prepared as described in item 2.3. The peristaltic pump was configured to fill the vessel in a period of five hours, a time commonly adopted in distilleries. After the end of filling, the pump was turned off, and the fermentation evolution was monitored by measuring the Brix of the fermentation medium, at twelve-hour intervals, using a Brix saccharimeter. Fermentation was considered complete when the Brix of the must remained constant between two consecutive measurements.

2.5 DISTILLATION

The distillation was carried out in a copper still with a useful volume of eight liters, heated over direct heat and equipped with a dephlegmator (Figure 2). The separation of the head, heart and tail fractions was carried out according to the estimated volume of the distillate, calculated according to the methodology reported by Chaves (2007):

$$V_{\text{dest}} = V_{\text{vinho}} * (\text{Brix}_{\text{mosto}} - 2)/100 \quad (1)$$

Where:

V_{dest} = Estimated volume of distillate, in liters;

V_{vinho} = Volume of wine (fermented must), in liters;

$\text{Brix}_{\text{mosto}}$ = Concentration of soluble solids of the wort, before fermentation.

According to this method, the head and tail fractions each correspond to ten percent and the heart fraction to eighty percent of the estimated volume of the distillate.

Figure 2

Copper still equipped with dephlegmator and condenser

Source: Authored by the author.

2.6 ADJUSTMENT OF ALCOHOL CONTENT

According to current legislation, rum can have an alcohol content ranging from 35 to 54 °GL. In this project, it was decided to produce a drink with 40 °GL, as this is a very common value in rums available on the market.

To obtain the rum with the desired alcohol content, the heart fraction of the distillate was diluted with a volume of water calculated by the solution dilutions equation (Brown et al., 2005), as described below:

$$C_1 * V_1 = C_2 * V_2 \quad (2)$$

Where:

C1 = Alcohol content of the heart fraction;

V1 = Volume of the heart fraction;

C2 = Alcohol content of the rum;

V2 = Volume of rum with alcohol content C2.

2.7 REVIEWS

The quality control of the rum produced was carried out according to the standards of identity and quality established in Normative Instruction No. 15/2011, of MAPA. Analyses were performed to determine the alcohol content and concentrations of volatile acidity, aldehydes, higher alcohols, esters, furfural, methanol and the congener coefficient. The alcohol content (% by volume) was initially determined by measuring the density of the sample, using a

pycnometer. Next, the relative density at 20°C was converted into alcohol content, using a conversion table, according to the official method of the Adolfo Lutz Institute (2008).

The other analytical parameters were determined using a Shimadzu gas chromatograph, model QP-2010 Pro, with flame ionization detector (GC-FID), Stabilwax-DA capillary column and automatic injection system of 1.0 microliter sample.

3 RESULTS AND DISCUSSION

3.1 MOLASSES

The result of the molasses quality control analyses is shown in Table 1. The results of all parameters are within the characteristic ranges of molasses considered to be of good quality (Mangwanda, 2021).

The origin of the molasses exerts a significant influence on the quality of the rum. This was proven in experiments that used beet molasses in the production of the drink, demonstrating that it was not possible to obtain the same aroma profile present in rum made from sugarcane molasses (Arroyo, 1948). Fresh sugarcane molasses, with low viscosity and high total sugar content, such as the one used in this study, is ideal for the production of rum, providing superior quality aromas and flavors (Delevante, 2004).

Table 1

Molasses quality control parameters

Parameter	(%) w/m
Brix	77,5
Pol	44,34
ART	63,55
Purity	57,21

Source: Authored by the author.

3.2 MUST PREPARATION AND FERMENTATION

To obtain the wort at the desired Brix concentration, 1,500 mL of molasses were diluted in 6.5 L of water. These proportions were calculated through a mass balance, using as calculation bases the Brix of molasses (Table 1) and the volume and Brix intended for the must. After dilution of molasses and supplementation with forty grams of cornmeal, eight liters of must with a concentration of 16 °Brix and an initial pH of 5.64 were obtained. To reduce the growth of contaminating bacteria, citric acid was gradually incorporated until the pH of the wort was adjusted to the range of 4.0 to 4.5. At the end of the addition of 10 grams of citric acid, the pH was stabilized at 4.38 and therefore considered suitable for fermentation.

Fermentation was carried out in a fed-batch system, as illustrated in Figure 1. Initially, a liter of yeast was placed in the vat. Then, the pump was turned on, and the fermentation time began to count. The pump flow was programmed to add the eight liters of wort to the vessel over a five-hour period. The evolution of fermentation was followed by measuring the concentration of sugars in the fermentation medium, at twelve-hour intervals, using a Brix saccharimeter. The results are presented in Table 2.

Table 2

Concentration of sugars as a function of fermentation time

Fermentation time (h)	Brix (%)
0	16
12	14,5
24	12
36	9
48	6
60	3
72	3

Source: Authored by the author.

Alcoholic fermentation is considered complete when all of the fermentable sugar is consumed, resulting in a Brix value of zero. However, molasses may contain different proportions of non-fermentable sugars, those that are not metabolized by yeast. As a consequence, at the end of the fermentation of these molasses, the Brix will not reach zero. Thus, the process is considered to be finished when the value of the Brix remains stable for an extended period. In this study, as no reduction in Brix was observed between 60 and 72 hours, fermentation was considered finished after 60 hours, and the resulting wine went to the distillation stage.

3.3 DISTILLATION AND ADJUSTMENT OF ALCOHOL CONTENT

The distillation process has a significant impact on the characteristics of the rum and can be carried out in copper stills or distillation columns. The first method results in a more aromatic drink with a pronounced flavor, while the second produces a rum with a lower concentration of congeners, giving it a milder aroma and flavor. Both systems have variations, both in equipment and in the mode of operation. In this study, aiming at the production of a more full-bodied rum and in line with the global consumption trend, it was decided to distill in a copper still.

Initially, the estimated volume of the distillate was calculated, according to the methodology described in item 2.5:

$$V_{\text{dest}} = V_{\text{vinho}} * (\text{Brix}_{\text{mosto}} - 2)/100 \quad (3)$$

$$V_{\text{dest}} = 8,0 * \frac{(16-2)}{100} = 1,12 \text{ litros ou } 1220 \text{ mL} \quad (4)$$

According to this method, the "head" and "tail" fractions correspond to 10% each, while the "heart" fraction represents 80% of the volume of the distillate. Therefore, during the distillation process, the first 122 mL collected were classified as the "head" fraction and discarded. Then, the subsequent 976 mL were considered as the "heart" fraction and properly stored. Distillation was interrupted after this step, since the "tail" fraction had no applicability in this study.

The alcohol content of the "heart" fraction was measured with a Gay-Lussac alcoholmeter, and the result was 45 °GL. To obtain rum with an alcohol content of 40 °GL, the heart fraction was diluted with a volume of water calculated by the solution dilutions equation (Brown *et al.*, 2005), as described in item 2.6. Starting from 976 mL of a heart fraction with an alcohol content of 45 °GL, 122 mL of water were added, thus obtaining 1098 mL of rum at 40 °GL.

3.4 PHYSICOCHEMICAL ANALYSES

Table 3 presents the results of the physicochemical analyses of the rum produced in this study. The values obtained for all the parameters analyzed are within the limits established by the Brazilian legislation.

Table 3

Analytical parameters of rum

Parameter	Value	Minimum threshold	Maximum limit
Alcohol content, in %, in v/v, at 20 °C	39,1	35	54
Volatile acidity, in acetic acid, in mg/100 mL of anhydrous alcohol	10,6	-	150
Superior alcohol (sum of n-propyl alcohol, isobutyl alcohol and iso amyl alcohol), in mg/100 mL of anhydrous alcohol	96,2	-	260
Aldehydes, in acetic aldehyde, in mg/100 mL anhydrous alcohol	17,6	-	20
Esters, in ethyl acetate, in mg/100 mL anhydrous alcohol	25,4	-	200
Sum of furfural and hydroxymethylfurfural, in mg/100 mL of anhydrous alcohol	-	-	5
Congener coefficient, in mg/100 mL of anhydrous alcohol	149,8	40	500

Methyl alcohol, in mg/100 mL anhydrous alcohol	3,04	-	200
--	------	---	-----

4 CONCLUSION

The methodology used in this study allowed a detailed analysis of the production and characterization of rum distilled in copper stills, in accordance with the current Brazilian legislation. The characterization of the molasses used provided essential information about its composition and quality, ensuring its suitability to be used as raw material.

The physicochemical analyses carried out proved that the rum produced meets the requirements established by the legislation, evidencing adequate parameters that guarantee its compliance and quality. In addition, the product obtained presented a visual aspect, aroma and flavor characteristic of excellent beverages, demonstrating that the processes adopted were effective in obtaining a well-prepared distillate.

ABSTRACT

This article discusses the construction system of communities in floodplain regions and over water, analyzing vernacular architecture, the form of houses, their structure, enclosures, and the cultural relationship embedded in this process, especially in the Brazilian Amazon, while drawing parallels with international works. It introduces the historical issues of dwelling on and within floodplains. Therefore, it examines the relationship between riverside populations, housing, and the environment. The methods are based on a literature review and field study

with site visits. The study identifies traditional stilt houses alongside floating constructions. Another relevant aspect in the Brazilian Amazon is that houses over the river accommodate not only domestic space, but also productive activities, commerce, transportation, and social practices. It is observed that riverside communities employ local materials, reuse components, and promote ecological integration, making these constructions practical examples of empirical sustainability.

RESUMO

Este artigo discute o sistema construtivo das comunidades em regiões das várzeas e sobre as águas, analisando a arquitetura vernacular, a forma das casas, a sua estrutura, vedações e a relação cultural deste processo, em especial da Amazônia brasileira, e faz paralelos a obras internacionais. Introduz as questões históricas do habitar sobre e as suas várzeas. Portanto, discute a relação entre os ribeirinhos, a moradia e o meio ambiente. Os métodos partem da revisão da literatura e estudo de campo com visitas. O estudo identifica as moradias palafíticas tradicionais às construções flutuantes. Outro aspecto relevante na Amazônia Brasileira é que as casas sobre o rio abrigam não apenas o espaço doméstico, mas também as atividades produtivas, o comércio, o transporte e as práticas de sociabilidade. Observa-se que as comunidades ribeirinhas aplicam materiais locais, a reutilização de componentes e a integração ecológica fazem dessas construções exemplos práticos de sustentabilidade empírica.

1 INTRODUCTION

The history of dwelling on water is, above all, the history of the human capacity for adaptation. Since ancient times, communities around the world have developed ways of living in aquatic or seasonally floodable environments, responding with ingenuity to the conditions imposed by the natural environment. In each geographical context, water presents itself not only as a physical obstacle, but also as a symbolic, cultural, and spiritual element — an essential component of the relationship between society and territory.

The first records of constructions on water date back to the Neolithic period. Archaeological excavations in Alpine regions of Europe — especially in Switzerland and Italy — have revealed the presence of lake villages erected on wooden stilts, dating to around 5,000 B.C. These dwellings, known as *pile dwellings* or stilts, consist of platforms suspended above the surface of lakes, accessed by walkways and protected from flooding and animals (Anderson, 2014).

Similarly, Southeast Asian civilizations, such as those of Indonesia, Thailand, and the Philippines, developed stilt buildings on the banks of rivers and deltas, using bamboo, teak, and other light woods. In these contexts, the technique was not only a response to humidity or floods, but also a way of occupying mobile territories, where the boundary between land and water is constantly transformed.

On the American continent, palatines appear in different cultural expressions. In South America, the most notable example is that of the Amazonian communities, which for centuries have used wood as a structural basis for elevated or floating houses, adapted to variations in river levels. In Chile, the *stilt houses* of Chiloé have become architectural icons, combining traditional construction knowledge with a unique aesthetic (Oliveira Junior, 2009; Anderson, 2014). These diverse experiences — European, Asian or South American — converge in the use of wood as a mediator between the natural environment and the inhabited space. Its lightness and versatility make it possible to face water cycles without disrupting the ecological balance, giving rise to a constructive tradition that, in many places, remains alive today.

The relationship between human beings and water transcends the functional aspect. In many cultures, water is perceived as the origin of life, a source of purification, and a symbol of transformation. This imaginary permeates the way of building and living with her. In the Amazon, for example, the river is not only a natural resource or transport route, but an extension of the domestic space itself. As Oliveira Junior (2022, p. 37) observes, "the house is a continuation of the canoe, and the river is the street of everyday life". This conception transforms the riparian habitat into a form of existence deeply integrated into the aquatic environment.

Figure 1*Canoe house*

Source: Diego Peres, Arthur Castro: Secom

The symbology of water is also manifested in other traditions. In Southeast Asian communities, proximity to rivers is associated with spiritual values, while in European coastal cities dominance over the sea has historically been linked to prosperity and territorial expansion. In all of these cases, the act of building on or next to water reflects a balance between reverence and pragmatism—between the need for protection and the recognition of water as a constitutive part of the territory.

This symbolic dimension explains, in part, the persistence of aquatic dwellings even in the face of urban modernization. Living on water carries a logic that is not limited to functionality: it expresses a philosophy of coexistence with the environment, in which architecture is an extension of the natural cycle and not its negation.

2 OBJECTIVE

The objective of this article is to study the vernacular construction techniques in the Amazon and to make parallels with international works.

3 METHODOLOGY

This article is based on a literature review and field study carried out in riverside communities of the Solimões River floodplains, particularly in Manacapuru (Amazonas).

The literature review covered academic publications on construction techniques on water in the world, with an emphasis on experiences in the Netherlands, Canada, and Southeast Asia, as well as literature on Amazonian vernacular architecture, often already developed by the

author himself in his master's dissertation (OLIVEIRA JUNIOR, 2009) and doctoral thesis (OLIVEIRA JUNIOR, 2022).

The field study consisted of visits, direct observation and photographic documentation of the dwellings, emphasizing: constructive typologies (stilt houses, floating houses, stevedoring houses), materials used (native wood species), traditional construction processes, and the relationship between spatial organization and ways of life. Semi-structured interviews with residents and local builders allowed us to understand the transmission of knowledge and cultural practices associated with the constructions.

The comparative analysis established parallels between Amazonian technical solutions and international experiences, highlighting patterns of environmental adaptation and sustainability. This study also benefited from the author's previous research presented to the International Seminar on Research in Urbanism — SIU (OLIVEIRA; MEIRELLES; FEHR, 2020).

4 LITERATURE REVIEW

4.1 CONSTRUCTION TECHNIQUES ON THE WORLD'S WATERS

The relationship between architecture and the aquatic environment is not exclusive to the Amazon. In various parts of the world, communities and professionals have developed wooden construction solutions for housing in areas subject to floods, tides and extreme climatic variations. These experiences, although diverse in scale and technology, share the same principle: the adaptation of the built space to the water cycle.

International studies allow us to identify a conceptual evolution that goes from traditional stilt houses to floating constructions and, more recently, to amphibious housing, which combines conventional foundation techniques with controlled flotation systems.

According to Anderson (2014), it is possible to classify constructions on water into four major categories, according to the degree of interaction with the liquid medium:

1. Terps (raised embankments) – dwellings erected on earthen platforms or artificial embankments, common in coastal regions of the Netherlands and northern Europe;
2. Houses on stilts (stilts)—supported by foundations driven into the submerged soil, typical of wetlands and river deltas;
3. Houseboats – buildings that rest entirely on flotation systems, usually composed of rafts, concrete coffins or metal drums;
4. Amphibious houses – which remain supported on fixed foundations, but are able to rise and return to the original level according to the variation of the water level.

This typology allows us to understand the diversity of strategies adopted around the world, despite all of them present in the Amazonian regions surveyed. Each model expresses a specific response to environmental, cultural and technological conditions, but they all share the same search: to ensure safe and continuous habitability in environments subject to water instability.

4.2 NOTABLE EXPERIENCES ON THE INTERNATIONAL SCENE

Several countries have stood out in the development of projects aimed at housing on water. Just to name a few examples, the Netherlands, Canada and Southeast Asia present representative approaches, which combine tradition, innovation and sustainability.

- **Netherlands: amphibious architecture and aquatic urbanism**

The Netherlands is a world reference in amphibious architecture and resilient urbanism. Due to its flat topography and the constant threat of flooding, the country has historically developed advanced water control techniques and adapted housing. The **Maasbommel project**, designed by Dura Vermeer in partnership with **Factor Architecten**, is considered the world's first amphibious housing development. Completed in 2005, the development consists of 46 homes built in laminated timber, set on floating foundations of lightweight concrete. In periods of flooding, the houses rise gently, guided by metal pillars, returning to their original position when the water level drops (Anderson, 2014).

Figure 2

Amphibious houses – Maasbommel – Netherlands

Source: Dura Vermeer, 2006.

Another notable example is the **IJburg district** in Amsterdam, planned as an urban sprawl on the IJmeer lake. The project combines flotation techniques with principles of sustainable urbanism, employing engineered timber and flexible anchoring systems. According

to Anderson (2014), these experiences demonstrate the feasibility of large-scale amphibious urbanism, in which water is no longer seen as a threat and is integrated into the public space.

- **North America: Amphibious Resilience and Retrofit**

In North America, the highlight is the **Buoyant Foundation Project (BFP)**, developed by researcher **Elizabeth English** at the University of Waterloo, Canada. The project came about in response to Hurricane Katrina, which devastated New Orleans in 2005, destroying thousands of wooden homes. English (2009) proposed an amphibious retrofit system that allows the conversion of existing residences into floating buildings. The solution is based on a set of polyethylene floats installed under the foundation, coupled to a system of vertical guides. During a flood, the house rises gently and returns to the ground without sustaining structural damage.

Lac's house was renovated and floated during the 2018 seasonal flood – Vietnam – Mekong River Delta

Figure 3

Source: <https://www.buoyantfoundation.org/vietnam-amphibiation-in-the-mekong-river-delta>

- **Southeast Asia: Continuity of the Stilt Tradition**

Southeast Asia represents perhaps the most continuous and widespread form of dwelling on water. Countries such as Vietnam, Cambodia and Indonesia maintain extensive stilt houses built entirely of wood and bamboo. In these regions, the technique is not limited to housing: schools, temples, markets and even entire cities — such as **Kampong Ayer**, in Brunei — are built on stilts. The construction system is simple and efficient: hardwood piles driven into the floodable soil support light platforms on which bamboo walls and straw or wooden roofs are erected.

According to Anderson (2014), the durability of these structures depends on constant maintenance and periodic replacement of parts in contact with water. Although rudimentary, these buildings have sophisticated constructive logic: flexibility, natural ventilation and total integration into the ecosystem. Such principles have even inspired contemporary sustainable architecture projects in the region, such as those of **Vo Trong Nghia Architects** in Vietnam, which reinterpret the stilt tradition with modern techniques of laminated wood and treated bamboo.

4.3 THE FORMATION OF RIVERINE COMMUNITIES IN THE AMAZON

In the Amazonian context, water habitation is a direct result of the ecological and economic relationship between man and the river. In the case of the populations living on the banks of the Solimões, Negro and Amazonas, they have developed forms of settlement that seek to keep up with the annual floods and ebbs, adjusting their way of life to the rhythm of the waters. Wood, abundant and diversified, has become the main construction material, giving rise to typologies that vary according to the degree of flooding and the type of soil. As Oliveira Junior (2009) points out, the stilt, floating and stevedoring houses form an adaptive system that reflects both the material culture and the environmental intelligence of the riverside dwellers. These constructions are erected collectively, in joint efforts that reinforce community bonds and the exchange of knowledge.

Meirelles *et al.* (2018) point out that, in contemporary riverside cities, such as Manacapuru and Coari, traditional typologies still persist, even with the introduction of industrialized materials, as these meet the conditions of the terrain and the variations in river levels.

In addition to responding to environmental demands, riverside architecture reveals a specific social structure. The houses on the river shelter not only the domestic space, but also productive activities, commerce, transportation and sociability practices. The built environment extends into the liquid space, forming what Oliveira Junior (2022) describes as a "living landscape", where inhabiting and nature coexist in an organic way.

4.4 THE ROLE OF WOOD IN WATER CROP

The recurring presence of wood in aquatic constructions throughout history is no coincidence. It is a material that brings together unique characteristics for this type of environment: **availability**, lightness, flexibility, tensile strength and a good relationship between weight and load capacity. In addition, wood offers ease of repair and replacement — an essential aspect in contexts where the wear and tear caused by humidity and aquatic organisms is constant.

In the Amazon, the species traditionally used — such as itaúba, angelim, acacu and maçaranduba — are chosen for their natural durability and local availability (Hermes, 2014). Over time, wood consolidates itself as a symbolic mediator between man and water: it is the element that allows us to be on the river without moving away from it, to float without breaking the bond with the land. Even in the most technological experiences — such as contemporary amphibious houses — the choice of wood carries this ancestral heritage, associating lightness and resistance, nature and culture.

The historical study of living on water, therefore, shows a remarkable constancy: regardless of the time or the continent, wood remains the material that translates the human search for balance with the liquid environment. This permanence attests not only to the technical effectiveness of this resource, but also to its role as a cultural language, capable of uniting tradition and innovation around the same principle: living with water, not against it.

4.5 RIVERINE VERNACULAR ARCHITECTURE IN THE AMAZON

The vernacular architecture of the Amazon represents one of the richest expressions of the interaction between culture and nature. It is an architectural production that does not impose

itself on the environment, but develops from it, responding to variations in the water regime, the availability of materials and the social organization of communities.

On the banks of the great Amazonian rivers, wood constitutes the physical and symbolic foundation of this relationship, acting as a mediator between man and the aquatic environment. Each dwelling is, at the same time, shelter, workshop, viewpoint and extension of the landscape.

The shape of the riverside dwellings is a direct result of environmental conditions and the accumulated experience of local populations. According to Oliveira Junior (2009), these constructions translate an "empirical ecological knowledge", transmitted orally and improved for generations, which guides decisions about the place of implantation, the type of foundation and the structural proportions. In general, the riverside house is light, demountable and adaptable to floods — qualities that guarantee both the survival and cultural permanence of the communities.

The most widespread typology is the **stilt house**, supported by wooden stakes driven into the floodable soil. The raised floor allows the house to remain above the water level during the flood period. Its structure, composed of spikes, beams and boards, is simple, modular and built with hand tools, favoring maintenance and reconstruction when necessary.

Figure 5

Other variations include **houseboats**, erected on rafts or hollow wooden logs, and **stevedoring houses**, common in lowland areas, partially supported and partially suspended. They all share the same logic: to follow the water cycle without resisting it (Meirelles *et al.*, 2018).

4.6 MATERIALS AND CONSTRUCTION SYSTEMS IN WOOD FROM THE AMAZON

The predominant material is still native woods, used in all parts of the building: foundation, structure, fence and roof. The species used vary according to the region and local availability. Among the most common, the "itaúba (*Mezilaurus itauba*), the red angelim (*Dinizia excelsa*), the acapu (*Vouacapoua americana*), the andiroba (*Carapa guianensis*) and the maçaranduba (*Manilkara huberi*) stand out, recognized for their durability and natural resistance to humidity" (Hermes, 2014).

The construction follows a predominantly artisanal process, carried out in a community collective effort. This practice reinforces social ties and keeps the transmission of technical knowledge alive. Hermes (2014) observes that the construction method is rational and efficient: "houses can be disassembled, transported and assembled with the same set of materials", which ensures mobility in the face of floods.

From a structural point of view, the traditional Amazonian stilt house is based on pillars driven directly into the clay soil, on which the sleepers and the plank floor rest. The walls can be made of wood or woven straw, and the roof, with gables, is traditionally covered with buriti and babassu straw – they are replaced by metal tiles and are now more common. This technical simplicity, far from representing precariousness, translates a refined constructive logic, adjusted to the environment and the economy of available means.

4.7 ENVIRONMENTAL LOGIC AND THE WATER CYCLE

Living on the banks of the Amazon rivers means accepting the alternation between periods of flood and ebb as part of daily life. This constant oscillation requires constructive

solutions that do not oppose nature, but that accompany it. Meirelles et al. (2018) point out that riverside populations living at lower levels face months of isolation during floods, when access is only by canoe. The house, therefore, needs to assume multiple functions — housing, work shelter, warehouse, and even dock.

Figure 7

Two-story floating house and maromba (deposit in periods of drought and stable in periods of flood) Manacapuru – AM

Source: Jair Oliveira.

The observation of Oliveira, Meirelles and Fehr (2020), in a study presented to the International Seminar on Research in Urbanism (SIU), is instructive: "the floating houses of the Solimões River floodplain configure adaptive architectures in constant negotiation with the water landscape". The water level determines the type of foundation, the access system and even the internal organization of the spaces. This dynamic character makes riverside architecture an example of resilient design, in which construction is an extension of the ecosystem.

The notion of the "water cycle" structures not only the physical space, but also the way of life of the communities. The time to build, fish, plant or move depends on the tides and the regimes of the rivers. Architecture, therefore, is not static: it is a temporal and cyclical expression of the relationship between man and the environment. For the riverside dweller, the house is not only a physical shelter: it is also a space for sociability, work and culture, as Fraxe (2000) argues. The construction involves the community in collective efforts, where knowledge is shared and solidarity reinforces the collective bond. This social dimension gives architecture a participatory and pedagogical character. According to Oliveira Junior (2009), "the house is the

center of the social landscape and the river, the public space par excellence". Everyday life unfolds between land and water, and the act of building is also the act of belonging.

Wood, in this context, assumes a symbolic role. It carries the memory of the forest and the ancestral knowledge of the management of available resources. Its texture, smell and sound are part of the sensory experience of living, giving identity and cultural continuity to riverside communities. Amazonian architecture, therefore, goes beyond the technical domain: it is a language that translates a way of existing in harmony with the liquid territory. As Oliveira Junior (2022) observes, understanding this architecture means understanding an ethics of coexistence with the environment — a wisdom that manifests itself not only in technique, but in the very way of living.

Hermes (2014) reinforces that riverside dwellings anticipate central principles of modern sustainable architecture: the efficient use of resources, community self-construction, structural reversibility, and climate adaptability. Recent academic and institutional projects, inspired by these models, have been proposing prefabricated modular systems in engineered wood for regions of difficult access, combining local tradition with new construction technologies (Hermes, 2014; Oliveira Júnior, 2009, 2022).

5 FINAL CONSIDERATIONS

This set of practices, materials, and values makes riverside vernacular architecture an example of how tradition can offer concrete answers to contemporary challenges. Far from representing an obsolete model, it inspires new design possibilities, capable of articulating technology, culture and sustainability.

Sustainability, often treated as a contemporary concept, is already inscribed in the logic of Amazonian vernacular architecture. The use of local materials, minimal waste generation, reuse of components and ecological integration make these constructions practical examples of empirical sustainability. Thus, Amazonian vernacular architecture reveals itself not as a vestige of an artisanal past, but serves as a support and concrete reference for the development of sustainable contemporary solutions. However, it is important to note that, in this context, the term *sustainability* is closer to the notion of survival capacity than to the concept widely disseminated by the so-called *green marketing*, often associated with merely promotional strategies.

ABSTRACT

This essay, presented in the form of a letter, proposes a critical reflection on the limits of biological reductionism in contemporary science, taking as its starting point the need to rearticulate different forms of knowledge. Based on a formative trajectory situated in the field of health sciences, the author questions the predominance of a technical-productivist logic that tends to privilege already stabilized answers, often at the expense of formulating questions. This shift is not trivial, as it contributes to the impoverishment of scientific reflection and widens the gap between science and society. It is in this context that the movement toward the humanities appears less as a rupture and more as an attempt at epistemological and formative expansion, albeit marked by persistent resistance. Throughout the text, references from philosophy, literature, and the history of science are mobilized to challenge the persistence of a mechanistic and dualistic matrix, historically associated with modern thought, and its effects on the fragmentation of knowledge. At the same time, it is argued that many contemporary initiatives aimed at humanizing science end up being limited to compliance with normative frameworks, without implying a deeper transformation of scientific practices. In this scenario, literature is presented as a privileged space for the exercise of critical reflection, insofar as it enables engagement with dimensions of human experience that escape strictly technical logic.

1 INTRODUCTION

1.1 IT IS CHARACTERISTIC OF THE HUMAN WANTING TO LEAVE AND OF SCIENCE, TO RELEARN THIS GESTURE

Like so many other scientists, what first moved me was the desire to understand the human being from its biological dimension. I started with anatomy; And when it no longer offered me enough answers, I moved on to smaller and smaller structures, to progressively more complex systems, invisible to the naked eye, but central to what we understand as life. There was, in this movement, a clear logic: the deeper the look, the greater the possibility of understanding. However, it was precisely when I got closer to this microscopic universe that something unexpected happened. I was led to leave. This movement was not abrupt. There was no rupture, no founding crisis. Just like Ulysses in his crossing, the exit imposed itself almost as a natural unfolding of the path itself. From the micro, I was led to the macro not out of abandonment, but out of necessity. It is from this experience that I propose this reflection, inspired by the work *It is proper to the human*, by Dante Gallian, which describes human movement as a constant coming and going between interiority and exteriority. Entry, exit and return: three gestures that, more than stages, constitute the very condition of being. In my case, the realization that biology would not account for the totality of the human was not devastating. There was no disenchantment, there was recognition. As if, from the beginning, something already knew that this would not be the only way. So I did what I learned to do as a scientist: I looked for what was missing. And it was in this gesture that I found the humanities. The approach, however, was not only due to intellectual curiosity, it also emerged from a discomfort. All around me, I noticed signs of exhaustion: exhausted colleagues, unmotivated teachers, trajectories marked by a fatigue that seemed to exceed the limit of the physical. There was something that could not be explained only by the data, the techniques or the institutional requirements.

Gallian offers us a powerful image to think about this state:

Just as the constriction of a growing organism can lead to its death (imagine a fetus that refused to leave the mother's womb), the closure or limitation of the soul also ends up compromising its vitality, its health. The soul wants to go out, it needs space, and everything that hinders its growth dwarfs it; and a small soul is a sick soul. (p.37)

This idea echoed in me strongly. I began to recognize, in the academic experience, subtle forms of enclosure. Not because of a lack of intelligence or sensitivity, but because of structural constraints that limit movement. It is often said that it is necessary to expand, that there is life beyond the university, however, little is taught about how to carry out this displacement. And, if

it were indeed an accessible path, perhaps we would not witness so many processes of illness within the academy itself. It is not a question of incapacity. Many see, understand, intuit the need to go out. But there is a lack of conditions: material, institutional and, above all, training. The very logic of scientific production contributes to this. The scarcity of resources and the constant pressure for productivity create an environment in which staying in the already established becomes not only easier, but safer.

When I began my movement toward the humanities, I heard over and over again that I had chosen the simplest path. As if reflecting were less demanding than executing; as if thinking were a spontaneous and uncompromising exercise. But there is something profoundly wrong in this perception: having your own idea is perhaps one of the most difficult tasks that exists. In science, we are trained to answer questions; rarely to formulate them. We learn to look for references, to support arguments, to validate hypotheses. All of this is fundamental. However, the origin of science: astonishment, questioning, restlessness is gradually being silenced. It was in this context that I sought, during my doctorate, a discipline focused on poetic writing, offered by the Center for History and Philosophy (CeHFi) at UNIFESP. Initially, I just wanted a breather. A space that, even if accounted for in credits, would give me back some kind of pleasure. What I found, however, was a deeper displacement. I realized that my writing had become automatic. In healthcare, the production of articles is often structured as a repeatable model: efficient but predictable. Over time, one writes without thinking about the act of writing. And, in this process, something is lost.

Writing ceases to be creation and becomes execution.

The contact with poetry produced a strangeness in me. For the first time, it was not enough to know how to do it. It was necessary to have something to say and I didn't. This observation was, at the same time, disconcerting and revealing. I, who considered myself creative within science, could not produce an idea outside its molds. It depended on directions, themes, external stimuli. What I thought was creativity was, to a large extent, a response. In sharing this experience, I encountered predictable reactions: the discipline was seen as easy, almost irrelevant. His interest in the humanities aroused strangeness, sometimes even distrust. But, over time, I realized that this was not an objective evaluation of difficulty. It was the discomfort in the face of the displacement. Going out is uncomfortable. It bothers those who leave, but also those who remain. Because the movement of the other can be perceived as an invitation and we are not always willing to accept it. This tension is accurately expressed in "The Tale of the Unknown Island", by José Saramago. In it, the desire to leave comes up against

fear, self-indulgence and the absence of means. The crossing is not impeded by impossibility, but by resistance.

In science, this scenario is repeated.

Many feel the impulse to go further, to seek new ways of thinking, to integrate knowledge. However, few actually carry out this movement. Not for lack of desire, but for the costs it implies: more work, more uncertainty, more need for justification. Thus, contemporary science tends to focus on technical improvement. We refine methods, speed up processes, optimize results. This advance is undeniably important. But it is accompanied by a silent impoverishment: the reduction of the ability to formulate new questions. We are becoming experts in answers, but less and less accustomed to questioning. This distancing is not only epistemological; it is also social. By moving away from people's concrete experiences, we become less able to dialogue with them. And when this dialogue breaks down, there is room for mistrust. It is not surprising, therefore, that movements to question science are gaining strength. They arise not only from ignorance, but also from the absence of bonding. In view of this, a recurrent discourse emerges: the need to humanize science. However, this humanization often remains on the surface. It is recognized that there is a subject behind the object of study, but it is not deepened what this means. There is a lack of density, a lack of training, a lack of experience. In healthcare, we are highly qualified to understand the body, but when we go beyond this dimension, our tools become limited. Even the most expanded approaches rarely escape a logic that is still centered on the biological. And here lies a fundamental contradiction: in order to humanize science, it is necessary to allow the scientist to leave the "pedestal" and find experience based on reality. But the way of doing science does not favor and has never favored this possibility.

On the contrary, it requires continuous productivity, absolute neutrality and the erasure of subjectivity. Living, the experience, the singular look, everything that could enrich the construction of knowledge, is often delegitimized; If, on the one hand, science has theoretical knowledge of phenomena, practice in its entirety only occurs when there is a union of theoretical knowledge, technique and experience in the real world, since no protocol contemplates the subjectivity of life. In this process, the movement to leave is abandoned. However, this movement, this need to go out, although it may be ignored for some time, does not remain forgotten indefinitely. At some point, something erupts, something displaces, tenses, pushes; Whether on the individual or collective level, the impulse returns. Human beings can resist, science can postpone, but the way out, sooner or later, is imposed. And perhaps what we are witnessing today is precisely one of these impositions. The growth of anti-science movements does not arise in a vacuum. It is, in part, the consequence of a prolonged estrangement; We

have distanced ourselves from society, and now we see this distancing reverberating back, putting at risk the very sustainability of scientific activity. Because science does not exist without society. And that's something that, for a long time, we allow ourselves to forget. Even in its most technical view, in the biological and health sciences, there is an implicit direction towards human well-being. Even if we study animals, cells or abstract systems, ultimately, the question returns: what does this mean for the human being? We produce knowledge, to a large extent, focused on ourselves. There is, in this gesture, a certain "structural selfishness", not necessarily negative, but rarely problematized and, even so, paradoxically, we distance ourselves from people. It is in the encounter with the world, with the other and with the unknown that we recognize ourselves. Not just in thought, but in action. Not only in theory, but in experience. And, in the case of science, this experience requires concrete displacement, it is not enough to produce knowledge within the limits of the laboratory, it is necessary to cross these borders. Stepping into the real world, entering social spaces, living with those who are outside the academy. Because it is in this encounter that knowledge gains meaning.

Within the university, the logic of scientific production is already known. A graduate student knows what he needs to do to become a researcher. He masters the codes, understands the paths, recognizes the rules. The problem is not in the absence of knowledge, but in its circulation, knowledge remains retained. We produce a lot, but little of it crosses institutional walls, little reaches society, little seems to directly impact the lives of those outside this circuit, since few are capable of understanding scientific articles, which can lead to questioning their validity; What is the use of work that can only be understood by scientists? And, in view of this, a predictable perception is built: that science is inaccessible, distant, ultimately irrelevant. People don't see what we do, and what you don't see easily becomes what doesn't exist. If scientific work is not presented in concrete form, if it is not translated into perceptible experiences, then it is not difficult to understand why, for many, it seems to have no value. In this sense, returning to a formulation dear to Gallian, the central question may no longer be or not to be. In science, it is about something more direct: to do or not to do. And here, doing is not reduced to the internal production of knowledge. Doing implies making visible, sharing, transforming. As long as we remain restricted, formulating questions and answering them among ourselves, we will continue to be perceived as a closed circuit. And if no one sees what we do, the conclusion, even if mistaken, becomes understandable: that we do nothing. And from there, the leap is short: that science is useless.

2 ONE DOES NOT RETURN FROM WHERE ONE HAS NEVER LEFT: SCIENCE AND THE IMPASSE OF RETURN

If you're a scientist, you probably recognize the scenario I've been describing. Unless you inhabit a space where knowledge itself is taken for granted, it is not difficult to perceive that something is in tension. We live in a moment in which discourses about humanization, about appropriate language, about more sensitive practices are multiplying. Advisors remember the past, emphasizing how much worse it used to be, as if the simple comparison with harder times was enough to validate the present. And, in fact, it cannot be denied: there have been changes. Over time, part of the scientific community began to recognize flaws in the way science was done. And, within the possibilities they had, many researchers tried to transform their immediate spaces; creating more welcoming environments, less violent relationships, more conscious practices. I do not assume that scientists are, in essence, cruel. I prefer to understand this process as historical. Science itself, at different times, has been stressed to review its limits.

An important milestone in this movement is the Nuremberg Code, which establishes fundamental principles for research involving human beings, such as:

- The voluntary consent of the human being is absolutely essential
- The experiment must be such as to produce results advantageous to society, which cannot be sought by other methods of study, but cannot be done on a case-by-case basis or unnecessarily
- Special care should be taken to protect the experiment participant from any possibility of harm, disability, or death, even remotely.
- The experiment participant should be free to withdraw during the course of the experiment.

These principles were, and continue to be, essential, they represent a civilizational achievement. They delimit an ethical minimum necessary for research not to reproduce historical violence, but it is precisely here that a crucial point arises: this minimum is not enough. Comply with protocols, obtain approval from ethics committees, follow institutional regulations; All this ensures that abuses are not committed, but it does not guarantee, by itself, that science is, in fact, humanizing. If that were enough, we would not be facing so much criticism today. What is observed, in practice, is that many health professionals understand this set of rules as the humanization movement itself, as if, by complying with ethical requirements, the exit had already been carried out, but it was not. What happened was, in many cases, a premature return, a return to the interior of the area itself, with the feeling of accomplishment, it is at this point that criticism needs to be made, not to deny the advances, but to highlight their limits.

To make more concrete what I argue when I say that a set of norms is not, by itself, sufficient, I use an example. I argue that such regulations are fundamental to guarantee basic rights, which already represents a significant advance in the history of science. However, this does not necessarily equate to the production of a science that is truly committed to society. In this sense, the case presented in the documentary *Three Identical Strangers* is illustrative. The work portrays the true story of triplets who were separated at birth and sent to different adoptive families, without their parents knowing of each other's existence. Throughout the narrative, the siblings discover that they were part of a scientific study conducted without consent, whose objective was to investigate the impact of environmental conditions, especially different socioeconomic contexts, on the development of individuals with a family history of mental disorders.

The study, which involved several children in addition to the three siblings, consisted of separating biological siblings and inserting them into families with different social profiles, in order to compare their developmental trajectories. When the case came to light, it became a scandal, highlighting serious ethical flaws. A particularly significant aspect is the absence of clear accountability on the part of the researchers involved, who often justified their actions based on the context of the time or the lack of stricter regulations. This example clearly shows why the institutionalization of ethical norms is indispensable. However, it also allows us to advance the reflection I propose: the mere existence of protocols and their formal observance do not guarantee, by themselves, an ethical scientific practice in the full sense. What is at stake is not the need for norms, which is undeniable, but the contemporary tendency to reduce ethics to bureaucratic compliance with guidelines, as if this were enough to ensure the humanizing character of science.

It is precisely this reduction that needs to be problematized. Ethics, in this context, cannot be understood only as normative conformity, but as a broader commitment to the subjects involved and to the human implications in the production of knowledge.

[...] the success of humanization initiatives is intrinsically linked to the ability to integrate technical and socio-emotional skills, with alterity as a central element of this transformation (Dias, L., p. 5857).

The issue that arises, and with which I agree, is that it is not possible to restrict ethics to the observance of previously established technical protocols. These protocols are fundamental as guidance instruments, as they delimit, in a more controlled way, what can or cannot be done in the scope of the research. However, the definition of what effectively constitutes a humanizing

practice is not limited to compliance with these guidelines. In other words, although ethical protocols are necessary, they are not enough, ethics cannot be reduced to a technical procedure or a normative *checklist*. It is necessary to recognize that there is a dimension that escapes formalization, requiring sensitivity, critical reflection and responsibility towards the subjects involved. Thus, the challenge is not only to follow norms, but to sustain an ethical-humanist commitment that goes beyond them.

In view of this, an inevitable question arises: what to do, then?

The proposal I bring does not come in the form of an absolutist rhetoric, but comes from a reflection, when it comes to the health area, based on biological knowledge and ethical protocols are not enough to guarantee a so-called "humanizing" practice, because they exclude what makes human beings, humans, subjectivity, it would then be necessary to bring the practice and reflection on it. Knowing that the end if a person is death is totally different from witnessing it, lacks the dimension of reflective practical experience aimed at understanding subjectivity. And, for this, literature presents itself as a privileged path; as Dante Gallian states:

Literature, therefore, is not only art, but, precisely because it is art, it is also a form of knowledge. (p.75)

This idea was subsidized by Gregorio Marañón, a physician and scientist, who debated a greater possibility of learning about human love through reading Shakespeare than in philosophical treatises or biological writings. To illustrate this perspective, I turn to the poem "*Education through Poem II*", by Gisele Wolkoff, whose composition offers a sensitive way of approaching the idea developed here.

Postpone the verb in the name of time: Tie the threads of discord in a single knot of forgetfulness; to bind the sweet grains and unique flour of encounter and tenderness, to sew the threads of the famous mesh of sitaxis, even if in rupture, to thicken the wheat chaff with mild rye and postpone the departure: the vowel emotioned, the reticent interjection to transform the ellipsis into light exclamations of euphoria and to integrate the soft body of the entire field

At first glance, this statement may cause strangeness or even rejection. The initial feeling may be one of discomfort: what do you mean literature would occupy this place? Literature does not require, in its most basic access, specialized training. It is available, open, accessible. And, precisely for this reason, it can work as a gateway, a first displacement. An exit movement that does not impose itself as a rupture, but as an approximation. In my own training, I had contact with a proposal that illustrates this path well. In disciplines such as bioethics and biophilosophy,

the approach was not exclusively based on concepts, but also through literature. The starting point was, perhaps unexpectedly, Mary Shelley's *Frankenstein*. I say unexpected because, when I started my search for an undergraduate course, I never imagined that there would be room to learn through literature. For me, reading occupied other places: it was, above all, a form of entertainment or, at certain times, a requirement linked to the entrance exam. At that stage, still with an immature view, I could not conceive that literature could also be a relevant source of reflection and knowledge applied to the health area.

For a semester, we read him not as literary critics, but as students in the health field. The objective was not to analyze the work itself, but to use it as a tool to think about scientific practice. There, in the face of the narrative, we were confronted with issues that hardly emerged only through protocols or articles: responsibility, reflection, and ethics beyond what is described in the norms. Literature, in this context, does not replace scientific knowledge, but expands it. It introduces layers of meaning that escape purely technical logic, although it is recognized, in theory, that the human being is not limited to his biological dimension, in practice there is often a lack of integration on the part of the scientist himself. Like Victor Frankenstein, the researcher may find himself taken by the impulse of curiosity and a certain duty to do, without fully reflecting on the consequences of his actions. And here I sympathize with a character who has a beginning so close to mine:

The natural sciences were the compass of my life [...] I opened the book with apathy. But as I went deeper into the reading, the theory he tried to demonstrate and the wonderful facts he related ended up transforming that feeling into enthusiasm. A new light seemed to dawn in my mind (Shelley, M., p.38).

And here is the expression of a more primitive desire: I believe that no one chooses science without at some point having been deeply fascinated by it. One does not follow this path without something, at some point, having touched and impressed in a remarkable way. And the more one reads, understands and discovers, the more this impulse intensifies, continuously feeding a primordial desire to go further, to always seek more.

Sir Isaac Newton is said to have once confessed that he felt like a child picking up shells on the shores of the great and uncharted ocean of truth. (Shelley, M., p.40)

So far, while reading, I could only think about how deeply I understood Victor in his essence. In this first chapter, his impulses were entirely clear to me, almost as if I saw in him a mirror of myself. However, as I read it, I began to realize how these impulses, which arose from

such a legitimate and pure place, a place I recognized, were gradually transformed. Little by little, in the midst of arrogance and lack of direction, that young scientist ended up getting lost.

[..] having as an ally only the unbridled thirst for knowledge. Under the direction of my new masters, I threw myself, nothing more, nothing less, into the discovery of the philosopher's stone and the elixir of long life. Between the two, this last objective prevailed. Wealth was a secondary purpose, but what glory would be crowned by the discovery that would allow the banishing of disease from the human organism, making man invulnerable to all deaths, except that caused by violence! (Shelley, M., p. 40)

I remember that, at first, it was very difficult for me to understand at what point Victor "distorted" himself, when he lost this luster for science and at what point his thirst for knowledge transformed him into something that no longer seemed properly human. When, after all, did that scientist so promising meet his doom? Now, rereading and reflecting on this letter, on this outburst, I begin to realize that the deviation was perhaps present from the beginning. When considering the passage mentioned, in which he expresses the desire to discover the Philosopher's Stone and the elixir of long life, it becomes evident that he lacked basic foundations of scientific practice. There was an impulse to do for the sake of doing, sustained by an unshakable conviction that he was right. This ties in with something we discussed earlier: we learned that, to some extent, all knowledge needs to return to our own plane. We are so self-centered that knowledge needs to be appropriated, transformed, and somehow serve our interests as a species, not necessarily starting from a point that questions the impact of our actions.

It may seem easy to judge Victor precisely because his experiment sounds extreme: to create a complete and perfect human being. However, this distance may be illusory. To some extent, are we not, in our drive to heal or save humanity, trying to accomplish something similar, albeit on a smaller scale? The understanding that there is a subtle threshold that differentiates the understanding of phenomena, the construction of methods that aim to bring quality of life and the impulse to eliminate morphological imperfections; Doesn't the search to correct, improve and, ultimately, get closer to an ideal of perfection echo, in a way, the same movement? It is at this point that literature becomes truly formative: by confronting us with these questions, it expands our capacity for critical reflection and invites us to rethink the meaning and limits of scientific practice. The Arts attend to emotions and make room for the reinvention of the human, whenever it is uselessly necessary...

The Humanities have long claimed space in health education. And this claim seems to compete with the truth of the demands. But perhaps it is necessary to rethink the ways of

approaching. I speak here not as a researcher in the Human Sciences, but as a biomedical doctor. As someone who crossed, even partially, this outgoing movement, and who could perceive, in practice, the impact of this crossing. Literature is not a magic solution, nor is it a single path. But it opens up a field where we so often close ourselves, opening is, in itself, a radical gesture. It is necessary to understand this process not as the creation of a "hierarchy" where only one of the "sides" presents definitive answers, but to understand that the combination of knowledge opens up the possibility of admiring the subjectivity of the concept of "doing health" from different perspectives.

3 BETWEEN RUPTURES AND CONTINUITIES: REVISITING MODERN REASON

When reflecting on this movement that presents itself as a radical way out towards the humanities, my starting point was precisely philosophy, in dialogue with literature. At this initial moment, a decisive question arose: is this gesture of rupture, which today seems so innovative, in fact something new? Or are we just going back to previous ways of producing knowledge? This question displaces the problem and invites us to look historically at the ways in which science and knowledge have been constructed over time. It is in this sense that I turn to the work *The History of Western Civilization, as a way of situating this debate. Before directly addressing Descartes' so-called error, it seems essential to understand the logic that guided his thinking and the reverberations that still structure our way of understanding the world today.*

René Descartes has consolidated himself as one of the main exponents of modern rationalism, although he was not the first to value reason as a way of access to knowledge, his proposal is distinguished by a systematic refusal of authority and tradition as criteria of truth; in opposition to the medieval Scholastics, Descartes proposed a method based on doubt and deductive construction, inspired by mathematics. Their procedure consisted in starting from principles considered self-evident and, from them, deducing particular conclusions. In this context, the famous principle "I think, therefore I am" emerges, conceived as an undoubted foundation of knowledge. From this base, Descartes believed it was possible to build a coherent and universal system, capable of demonstrating, for example, the existence of God and the distinction between mind and body. In addition to rationalism, his contribution also involves the formulation of a mechanistic view of the universe. From this perspective, all natural phenomena could be explained in terms of matter in motion, governed by universal laws; The world, organic and inorganic, came to be understood as a great mechanism. Even so, Descartes maintained a fundamental dualism: while the body belongs to the material order, thought constitutes a distinct substance, not reducible to matter.

After Descartes, different thinkers dialogued with his ideas, whether they deepened them or criticized them. This path leads us to the Enlightenment, which represents a decisive moment in the history of Western thought. Emerging in England at the end of the seventeenth century and widely spread throughout Europe, especially in France throughout the eighteenth century, the Enlightenment consolidated the centrality of reason as a criterion of truth.

Reason is the only infallible guide to wisdom. All knowledge has its roots in sensory perception, but the impressions of our senses are nothing more than the raw material of truth, which needs to be purified in the crucible of reason before we can use it to explain the world or to indicate the way to a better life (Burns, E., 1968, p.549).

At this point, I make a brief, more personal inflection. The writing of this text did not follow a linear path, but was configured as a movement of comings and goings. I started from the proposed reflections, I incorporated new readings and theoretical references. Although it is a letter, and not a scientific article, it has become necessary to build a consistent argumentative ballast. In this process, the reading of works caused important shifts in my understanding. The experience was, in many ways, similar to a crossing: a journey that required revisiting knowledge that was apparently already consolidated. When I returned to the Enlightenment, for example, I had the initial feeling of being in front of something new, when, in reality, it was a content that had already been studied. This perception highlighted not only gaps in my training, but also the effects of an educational model that often hierarchizes knowledge. During my school career, the disciplines of the exact sciences received greater attention, in part because of the difficulties they imposed on me, while the humanities were, albeit involuntarily, relegated to the background. Therefore, to take up these ideas relegated to the scope of this less brief epistolary reflection is like collecting all the instruments of navigation and gathering them in front of me, before embarking on deep seas...

Resuming the thread of argument, it is important to highlight that the Enlightenment was deeply influenced by both rationalism and the scientific advances of the time. In this context, Isaac Newton played a central role in formulating laws capable of mathematically describing the workings of nature. His theory of universal gravitation exemplifies the idea that the universe is governed by invariable principles that can be precisely formalized. Alongside Newton, John Locke contributed to the valorization of experience as a source of knowledge, articulating it with rational activity. The result of this set of transformations was the consolidation of a worldview in which natural phenomena came to be understood as governed by universal laws, moving away from teleological interpretations typical of medieval thought. The universe is no longer

conceived as oriented by intrinsic purposes and is now described as a system regulated by causal relations, comparable to the precise functioning of a machine.

4 MIND AND BRAIN IN SCIENCE: BETWEEN REDUCTIONISM AND LOSS OF MEANING

And it is at this point that we finally reach the core of this reflection. Throughout this letter, I insistently return to the tension between fragmentation and integration in the production of scientific knowledge, as well as mechanistic knowledge. And not by chance: those who work in the area know how challenging it is to sustain, in practice, a truly interdisciplinary movement. Integrating knowledge is not only a theoretical guideline, but a concrete, everyday difficulty. In recent years, this challenge has been explicitly recognized in the Brazilian context. Law No. 13,005/2014 inaugurates an important movement by proposing greater articulation between university and society, later consolidated by guidelines that, as of December 18, 2018, with Resolution CNE/CES No. 7, sought to make this integration effective. Having joined the university in 2020, I followed the beginning of this process and witnessed up close the effort of professors to build new methodologies that would take knowledge beyond institutional walls. This movement, already complex in itself, was further strained by the context of the pandemic, which made its implementation especially challenging. Given this, an inevitable question began to impose itself: have we always done science in this way? Is this fragmentation an intrinsic and immutable characteristic of scientific knowledge? A reading of *Descartes' Error* by scientist Antonio Damasio suggests not.

It is at this moment that the figure of Descartes comes in, not only as an author, but as a symbol of a set of ideas that profoundly shaped Western thought. His dualistic proposal, which separates mind and body into distinct substances, had a lasting impact on both the sciences and the humanities. The famous formulation "I think, therefore I am", presented in *Discourse on Method* (1937), crystallizes this separation by suggesting that thought constitutes the foundation of existence. However, the criticism proposed by Antônio Damásio points to a central problem: this inversion ignores the fact that, from the biological and evolutionary point of view, existence precedes thought. Before thinking, organisms exist; Before complex consciousness, there are more elementary forms of life regulation. In this sense, thought is not the origin, but the consequence of a living, structured and functional organism. The so-called Descartes error, therefore, is not reduced to specific misunderstandings about the functioning of the body, many of which have already been overcome, but concerns a deeper and more persistent separation: the dissociation between mind and body. This division supports the idea that processes such as reasoning, moral judgment, or emotional experience could be understood independently of

the biological organism that makes them possible. The consequences of this perspective are wide-ranging. In medicine, for example, she has contributed to an approach that often dissociates body and mind, treating biological and psychological aspects as separate domains. In the cognitive sciences, it manifests itself in the idea that the mind could be understood as a software, relatively independent of the brain hardware, a metaphor that, although useful in certain contexts, reveals limitations when confronted with the complexity of the living organism. Damasio does not deny the centrality of the brain in mental processes, on the contrary, he recognizes that thought emerges from brain activity. However, he argues that this formulation is insufficient if it disregards the body and the environment in which this brain is inserted. The organism is not only a support, but an active condition of the mind. Body, brain, and world form an integrated and dynamic system.

In this sense, the criticism is directed not only at classical dualism, but also at its more subtle contemporary versions, which maintain, albeit implicitly, the separation between mind and body. The problem is not in recognizing analytical distinctions, but in absolutizing them to the point of losing sight of the articulation between the parts. Perhaps the current movement of science can be understood precisely as an attempt to revise this legacy. If, at a certain moment, it was necessary to separate in order to know, today we are faced with the opposite challenge: to integrate in order to understand, and this integration is still under construction, there is no finished model, nor definitive answers. What we can say, with some certainty, is that strict separation has not been enough and recognizing this does not mean abandoning the path taken, but understanding it as part of a broader process. Fragmentation was, and remains, a fundamental strategy, but it is not enough on its own. Thus, what I propose is not to solve the mind-brain dilemma, nor to exhaust its implications. It is, rather, to situate it historically and use it as a starting point for a broader reflection: that understanding the human being inevitably requires the effort to articulate what, for a long time, we have learned to separate.

5 REFLECTING AND DISCERNING: WHAT IS PROPER TO THE HUMAN AND FOUNDS SCIENCE

There is something curious and, why not, disturbing at the moment when we realize that terms such as reflection and discernment are no longer immediately associated with scientific practice, especially in the health sciences. I remember a conversation with a colleague, to whom I explained the procedures of statistical analysis of my work, developed from the methodology of thematic oral history. As I described the process, he interrupted me, surprised: Wow, I thought it was just philosophizing. The only thing that did not go unnoticed.

Since when did reflecting become synonymous with something smaller? At what point was reflection reduced to an expendable, almost ornamental exercise in the face of what is conventionally called the science of truth? In the biomedical sciences, we are used to valuing what is statistically significant. We transform biological data into numbers, submit them to statistical tests and, from them, build interpretations. There are questions that only the number answers, but there are others that only reveal themselves to those who are capable of reflecting. And reflecting, here, is not an automatic gesture. It requires method, yes, but it also requires sensitivity, listening and the ability to sustain the complexity of what the other presents to us. Above all, it requires the courage to connect what, at first sight, seems irreconcilable: the biological datum and the lived experience. And how could this seem simple?

It is at this moment that I turn once again to literature, this space where the human experience reveals itself in its deepest density. In *Grande Sertão: Veredas*, João Guimarães Rosa presents us with a fundamental concern: the search for a path that, although it exists, does not show itself in an evident way. Each person, the work suggests, carries with them a kind of script of existence, a possible direction, even if hidden. And to live would be, in some way, to try to find it. If we take this image as a starting point, it becomes difficult to sustain a health science that does not understand, at least, what a person is.

How can we talk about health without considering the complexity of those who live there?

Before any protocol, before any method, there is a previous and unavoidable question: what constitutes a human being? Without this understanding, any attempt to produce knowledge about health runs the risk of becoming incomplete, if not mistaken. In this sense, achieving what we could call a fair measure requires breaking with the mediocrity of automatism, which arises as a result of an education based on following technological trends in an impractical way.

In recent decades, the increase in the production and incorporation of new technologies has been associated with improved prevention, diagnosis, and treatment of diseases, which has had an impact on an increase in quality of life and a decrease in mortality in general. However, this situation has generated a considerable increase in costs in the health sector [...] Among the possible explanations for this phenomenon, the fact that new health technologies are more expensive and have a cumulative aspect is justified, unlike other sectors where the inclusion of a new technology tends to replace previous ones (AMORIM, F., 2011, p. 344)

Here it is not a matter of denying that these technological advances do not bring any benefit, but of understanding that we are very focused on the uncontrolled production of new techniques/technologies, but that we often do not think about their real application in the clinical

or even scientific context, demonstrating a clear absence of a deep reflection on doing in science. It is for this reason that this context requires abandoning the security of ready-made recipes and opening up to experience, not as an uncontrolled error, but as a legitimate space for learning. Science does need technical rigor, method, theoretical foundation. Without this, it dissolves into opinion, but there is something equally indispensable: the awareness that the knowledge produced is only a part of a greater whole. When we recognize that biology does not offer all the answers, we make room to reintegrate into science what should never have been excluded: experience. And, in a way, we already do this, albeit silently. When a protocol indicates the use of a certain amount of a reagent, but laboratory practice teaches us that it is possible to adapt it, we are, in fact, operating from experience. The question, then, is not to introduce experience into science, it is already there. The point is to recognize that it must also inhabit the way we think, interpret and question our objects of study.

In this path, reflection arises as a response to a kind of revelation: that a health science restricted to the biological is not enough to produce care, neither ethics nor humanity. And, once crossed by this perception, we are summoned to another movement: that of discernment. To discern is to judge, distinguish, evaluate; it is to recognize the origin and quality of what crosses us, whether data, theories or discourses. In times marked by the overvaluation of a narrow rationalism and, paradoxically, by the growing inability to think critically, this skill becomes even more urgent. We live surrounded by ready-made speeches, simplified interpretations, and an avalanche of information that requires, more than ever, the ability to separate what is consistent from what is just convincing. In the scientific field, this becomes particularly delicate; The authority of scientific discourse is often used to legitimize superficial, sensationalist or even mistaken statements. And so, little by little, we run the risk of becoming what we criticize the most: subjects who accept without question.

The excessive protocolization of science is one of the symptoms of this process. How can a health scientist claim to understand the human being and reduce his definition to the biological dimension? How can you accept a protocol without questioning its limitations? There is an evident contradiction here: while we denounce the uncritical adherence to the so-called fake news, we reproduce, to a certain extent, a similar logic when we stop questioning what is presented to us under the seal of science. The difference is that, in this case, the risk is even greater, because it is accompanied by the legitimacy of scientific discourse. Perhaps the central point is this: it is not possible to understand the complexity of a human being from a single axis. No protocol, no matter how sophisticated, is capable of encompassing the totality of human experience, and recognizing this does not weaken science, on the contrary, it strengthens it.

Because it is precisely in this space of tension, between what we know and what still eludes us, that science becomes, in fact, human.

And here, reader, I need to tell you: on this point, perhaps you disagree with me. Perhaps he has come this far moved by the desire to refute each of these ideas, to organize, in his own angle, an answer. Or, perhaps, some of what was said had, however uncomfortably, found resonance in you. Be that as it may, there is something that cannot be ignored. It's easier to stay. It is easier to produce work that fits the expected pattern. It is easier to sustain a line of research that is already legitimate, to obtain funding, to be recognized by peers, to have one's own work promptly classified as useful. There is comfort in this place and there is also reward, but that is precisely where the risk lies.

I evoke here Fernando Pessoa, in his poem *The Fifth Empire*: Sad for those who live at home, content with their home. Because doing science, in its deepest dimension, requires courage. To get out of the comfort zone, to get out of ready-made answers, to get out of structures that, although safe, also limit. No line of research can be sustained intact forever. One can even keep the same object of investigation, but the way of approaching it will inevitably need to be transformed. Science that does not move, stagnates. You may disagree with me when I say that the humanities are a path to a more structured science. This disagreement is legitimate and, in a way, necessary. But there is one point that remains unavoidable: it is not possible to do science without breaking, to some extent, with self-indulgence. Because it is in displacement, and only in displacement, that something truly new can emerge.

6 THE SCIENTIST'S ODYSSEY: BETWEEN LITERATURE AND SCIENTIFIC PRACTICE

It is possible that, at this point, reader, you have the impression that, by criticizing the structures of science as they are, I not only expose their weaknesses, but also make even more arduous a trajectory that is already proving to be exhausting in itself. And in this regard, I must be honest with you: yes, it is difficult. I say not from a distant place, but from the interior of the crossing itself. I walk through it now, as do I dare suppose many of those who read me. Entering academic life, aspiring to a place in it, building oneself as a professor or researcher: all this already carries a considerable weight in itself. And it is no secret how much this path has sickened those who follow it. For us, who still seek to enter this space, the landscape is sometimes even more arid. To the competition and suffering are added the urgencies of the concrete world: financial limitations, external pressures, the life that insists on happening beyond the walls of academia. None of this can be ignored.

I do not write, however, to condemn or prescribe immediate changes, as if it were enough to name the problems for them to be solved. I only hope that I have made it clear that any transformation, whether in the way of producing science or in the way of inhabiting it, is far from simple. I speak of what I know: of what I live. There is, indeed, a devaluation of science, and it is felt even more acutely when one chooses to walk through the Humanities. It was, perhaps, for this reason that I found a certain encouragement in literature.

When I pored over *The Odyssey*, especially in more attentive readings, I realized something that goes beyond the practical demands of life, even if these are unavoidable. After all, it is necessary to live: to pay rent, to feed oneself, to support oneself. Science, however lofty, does not exempt us from these needs. And yet, between one page and another, a concern emerged: was I, like so many others, not looking for a safer, more direct, more predictable path than academic life itself allows? Wouldn't I want a trajectory that offered guarantees? But the truth, little by little, imposed itself: there is no path that promises this. I remember a passage that crossed me:

Would Ulysses have been the Ulysses of the Odyssey if his return to Ithaca had occurred like that of the other heroes of the Iliad, without so many setbacks, adventures and sufferings? If that were the case, his story would not deserve a poem of his own. (Gallian, D., p.168)

I do not bring this passage to glorify suffering, but it has led me to an uncomfortable and, at the same time, profoundly human understanding: pain, error, deviation, everything we have learned to avoid, also constitutes us. We live under the ideal of an existence without pain, without loss, without death. Science itself, in many of its efforts, is guided by this horizon: to cure, to prolong, to preserve. And this is undoubtedly necessary. But there is a silent paradox, because in trying to eliminate everything that hurts us, wouldn't we also be trying to erase part of what makes us human? As someone trained in biomedical sciences, I cannot ignore this desire to overcome limits, it also inhabits me. Still, I recognize: there are dimensions of experience that will not be eradicated. The biology of the human is not dissociated from pain; on the contrary, he walks with it. And, at this point, I allow myself a reflection that I do not extract from books, but from my own experience: Ulysses did not face his obstacles in search of glory. He did not sail rough seas wondering if his name would echo through the centuries. His desire was another, simple, intimate one: to return home, to meet his wife again, to see his son, to recover his place in the world. Perhaps therein lies a question that often escapes us: what, after all, are we fighting for?

In the academic environment, it is easy to confuse purpose with recognition. Publishing in a certain journal, entering a certain university, winning scholarships and titles, all this becomes a metric of value. But in the middle of this race, there is a risk of losing something essential: genuine curiosity, the true link with what is being investigated. What moves you? Was it prestige or interest that brought you here? Was it the opportunity or the discovery of meaning? There is a subtle but decisive difference between those who only transit through a theme and those who inhabit it. The latter speak with propriety because, at some point, they made that object their own. They did not arrive by chance; they arrived by choice or, at least, stayed by it. When the focus is fixed exclusively on the goal, on the path already traced, on what must be done, something is lost. Individuality is diluted, curiosity is weakened. One starts to produce not by desire, but by adequacy. And, yes, it's true: that's often exactly what the system requires.

I remember an advisor who, with remarkable lucidity, once said to me: it is possible to disagree with the system, but to transform it, it is first necessary to be inside it. Perhaps this is the task: to understand the space we occupy, to recognize its limitations and, even so, to find gaps, small but real, to sustain what moves us. No path is without pain. No choice completely spares us from suffering. What remains for us, then, is to choose what, despite everything, brings us closer to some meaning. If Ulysses had given up in the first adversity, his story would have ended there: silent, without memory. Each of us needs to decide, along the way, how far we are willing to go and why. If the choice is to remain, and it will not always be, let it be at least a conscious permanence. And, along the way, I allow myself a simple piece of advice: read.

Literature keeps what, little by little, we have forgotten. Works like *Frankenstein* or the *Odyssey* don't just narrate journeys, they return us to the axis, reminding us of what we are made of. Because if we forget that we are human, there will be no science, no knowledge, and no place we can truly inhabit. And so I close these lines: not as a conclusion, but as a record. A small fragment of my own odyssey.

Wendel Saymon Batista da Silva¹

ABSTRACT

Family farming is one of the most outstanding activities in Brazilian agribusiness. In addition to productive contributions, family producers, among other economic and social contributions, collaborate especially in income distribution and maintenance of men in the countryside. However, family farmers face challenges in developing their activities, such as the restriction on obtaining rural credit. With this, the present study sought to analyze the factors that restrict rural credit for family producers in the credit cooperative Sicoob Centro, in the city of Ji-Paraná in the state of Rondônia. In addition, the study also endeavored to analyze the profile of family producers who take out rural credit, survey the main lines of credit used by rural family producers and investigate with Sicoob Centro credit analysts the actions that can minimize credit restrictions. For that, descriptive research with a quantitative approach was used through the deductive method. As for data collection, bibliofigureical research, documentary research and field research were used, using a questionnaire with open questions, with 13 responses being collected from credit analysts at Sicoob Centro. As a result, it was noticed that the majority (14.52%) of family producers who take credit from the cooperative are aged between 44 and 48 years old; 67.16% of family farmers work in beef cattle; and 91% of the credits taken are in the PRONAF Costing and Pre-Costing modality. In addition, it was also found that, according to the interviewees, the main factors restricting rural credit for family farmers are the high indebtedness of producers, lack of information about the borrower, delay in granting credit and the lack of guarantees.

homem no campo. No entanto, os agricultores familiares encontram desafios para desenvolver suas atividades, a exemplo da restrição na captação de crédito rural. Com isso, o presente estudo buscou analisar os fatores de restrição ao crédito rural destinado aos produtores familiares na cooperativa de crédito Sicoob Centro, na cidade de Ji-Paraná no estado de Rondônia. Além disso, o estudo também diligenciou analisar o perfil dos produtores familiares que contratam o crédito rural, levantar as principais linhas de créditos utilizadas pelos produtores familiares rurais e apurar junto aos analistas de crédito da Sicoob Centro as ações que podem minimizar a restrição ao crédito. Para tanto, utilizou-se a pesquisa descritiva com abordagem quantitativa por meio do método dedutivo. Quanto à coleta de dados utilizou-se a pesquisa bibliográfica, pesquisa documental e a pesquisa de campo, está com utilização de questionário com questões abertas, sendo coletadas 13 respostas dos analistas de crédito da Sicoob Centro. Como resultados, percebeu-se a maioria (14,52%) dos produtores familiares que tomam crédito na cooperativa possuem idade entre 44 a 48 anos; 67,16% dos produtores familiares atuam na bovinocultura de corte; e 91% dos créditos tomados são na modalidade PRONAF Custeio e Pré-Custeio. Ademais, também foi constatado que, de acordo com os entrevistados, os principais fatores de restrição ao crédito rural destinado aos agricultores familiares são o endividamento elevado dos produtores, falta de informações a respeito do tomador do crédito, demora nas concessões do crédito e a falta de garantias.

RESUMEN

La agricultura familiar es una de las actividades más destacadas del agronegocio brasileño. Más allá de sus contribuciones productivas, los agricultores familiares, entre otras contribuciones económicas y sociales, contribuyen especialmente a la distribución del ingreso y a la permanencia de la población en las zonas rurales. Sin embargo, enfrentan desafíos para desarrollar sus actividades, como las restricciones para acceder al crédito rural. Por lo tanto, este estudio buscó analizar los factores que limitan el acceso al crédito rural para los agricultores familiares en la cooperativa de crédito Sicoob Centro en la ciudad de Ji-Paraná, estado de Rondônia. Además, el estudio también tuvo como objetivo analizar el perfil de los agricultores familiares que contratan crédito rural, identificar las principales líneas de crédito utilizadas por los agricultores familiares rurales y determinar, a partir de la información proporcionada por los analistas de crédito de Sicoob Centro, las acciones que pueden minimizar las restricciones crediticias. Para ello, se empleó una investigación descriptiva con un enfoque cuantitativo mediante el método deductivo. En cuanto a la recolección de datos, se utilizó investigación bibliográfica, documental y de campo, empleando un cuestionario con preguntas abiertas, del cual se obtuvieron 13 respuestas de los analistas de crédito de Sicoob Centro. Los resultados mostraron que la mayoría (14,52%) de los agricultores familiares que solicitan préstamos a la cooperativa tienen entre 44 y 48 años; el 67,16% se dedica a la cría de ganado vacuno; y el 91% de los préstamos se otorgan bajo las modalidades de Costo y Precosto de PRONAF. Además, se constató que, según los entrevistados, los principales factores que limitan el acceso al crédito rural para los agricultores familiares son el alto endeudamiento de los productores, la falta de información sobre el prestatario, las demoras en la aprobación de los préstamos y la falta de garantías.

Palabras clave: Análisis de Crédito Rural. Líneas de Crédito Rural. Pronaf.

1 INTRODUCTION

Brazilian Agribusiness is one of the main sectors of the country's economy, having a large share in Brazil's Gross Domestic Product (GDP). In 2020, agribusiness had a share of 26.6% in the national GDP, according to data from the Confederation of Agriculture and Livestock of Brazil (CNA, 2021). As a consequence of the growth of agribusiness, there is, for example, a significant increase in job creation and income distribution in the rural context. According to data from the General Register of Jobs and Unemployed (CAGED), in the first half of 2021, 152,496 new formal jobs were generated in the sector.

Due to the great growth of Brazilian agribusiness, producers seek to invest in increasing production, as well as investing in better structures and equipment. Rural producers, when they need resources, either to invest or to fund their production, resort mainly to financial institutions, whether they are commercial banks or credit unions.

Currently, credit unions are receiving significant demand for credit, as they have the capacity to offer better conditions to their members, even subject to risks. For this reason, a careful analysis is necessary, which reduces the risks in granting credit. Rural credit collaborates with the development of the country's economy, influencing national development. Rural credit favors producers, making it possible to invest in their properties, invest in inputs or buy new machinery (JONAS *et al.*, 2015).

Thus, rural credit can be understood as economic resources that are offered by financial institutions following the rules of the National Rural Credit System (SNCR), as provided for in Law No. 4,829, of November 5, 1965. The SNCR guarantees the granting of rural credit with rates, grace periods and payments different from other credit lines offered by financial institutions. Rural credit is considered one of the most important mechanisms of the country's agricultural policy (BACHA *et al.*, 2005). For Ziger (2013), rural credit acts as a generator of new opportunities, as it encourages producers to obtain new technologies, provides improvement in structures and modernization of the rural area, strengthening the permanence of farmers in the activity.

In 1995, the Brazilian government, aiming to promote rural development, created the National Program for the Strengthening of Family Agriculture (PRONAF), which aims to serve family farmers in order to strengthen their developed activities. In 2021, the Brazilian government made R\$ 39.34 billion available for family farming in the 2021/2022 Crop Plan (VALENTE, 2021). For the 2022/2023 Crop Plan, R\$ 53.61 million were made available (VILELA, 2022). In the years 2020 and 2021, the credit cooperative Sicoob Centro made

available R\$ 111,998,305 for PRONAF credit, totaling more than 1,272 credit contracts, in its branches operating in the state of Rondônia².

Prior to the creation of the National Program for the Strengthening of Family Agriculture (PRONAF), rural credit was predominantly directed to large rural producers, but after its constitution there was an expansion of access and inclusion of family farmers in rural credit (SILVA, 2006). With the creation of PRONAF, family farmers had access to the services offered by the national financial system, so PRONAF has presented itself as a more effective alternative for Brazilian family production (MATTEI, 2015).

In certain situations, family producers are unable to have their own resources to subsidize their rural activity, and it is necessary to resort to financial institutions. With the implementation of PRONAF, it facilitated access for producers to rural credit, with the benefits of reduced rates and annual payment periodicity. In this way, family workers who work in rural areas obtain resources to maintain or expand their activities.

However, there is a possibility that the required credit may be denied when the producer requests the resource, as it is up to the institutions that grant PRONAF to evaluate the proposals according to their internal rules and resolutions. In addition, PRONAF credit is usually limited, and it is not possible to meet all the needs of small producers. Therefore, it is also common for financial institutions, such as credit unions, to have their own specific lines of credit for this audience. However, the own lines are also subject to prior analysis and restriction.

Thus, in view of the possibility of the required credits being denied by the financial institutions that operationalize the resources, the following problem needs to be clarified: *from the perspective of the credit analysts of the Sicoob Centro cooperative, what are the main factors restricting rural credit that family producers experience?*

Thus, this work aims to analyze from the perspective of credit analysts of the Sicoob Centro cooperative, what are the main factors of restriction to rural credit that family producers experience. With specific objectives, it is expected to analyze the profile of family producers who contract rural credit at Sicoob Centro, survey the main credit lines used by rural family producers at the Sicoob Centro Credit Cooperative and ascertain with Sicoob Centro's credit analysts the actions that can minimize the restriction on PRONAF credit.

It should be noted that this is all pertinent in view of the growth of agribusiness and its relevance to the country. Thus, rural producers tend to seek more investments and resources to maintain and expand their activities and meet market demands. According to the Center for

² The Sicoob Centro credit cooperative operates in the Rondônia municipalities of Ariquemes, Governador Jorge Teixeira, Jarú, Ji-Paraná, Machadinho do Oeste, Mirante da Serra, Ouro Preto do Oeste, Presidente Médici, Urupá and Theobrama.

Advanced Studies in Applied Economics (CEPEA, 2021), in partnership with the Confederation of Agriculture and Livestock of Brazil (CNA), in the first quarter of 2021 there was a 5.35% increase in GDP growth in the sector compared to 2020. This indicator demonstrates the strong growth of agribusiness in the national economy.

With the growth of agribusiness, family producers feel the need to take rural credit to maintain or invest in their activities, but these producers in some situations encounter difficulties when they need these resources, whether due to lack of information, lack of knowledge in the field, lack of knowledge in the use of the resource, among others. However, research on this topic is scarce, however, of great relevance, since it has a great impact on GDP, income distribution and the generation of direct and indirect jobs.

Thus, it is expected that the information from this research will contribute to other researchers as a source of content for future projects, as well as to the professionals who work in rural areas. In addition, the study of the granting of rural credit to family producers will also show the main credit lines used, the profile of these professionals and will provide the development of strategies for better access to resources, thus minimizing credit restriction events.

2 THEORETICAL FOUNDATION

2.1 CONTEXTUALIZATION OF BRAZILIAN AGRIBUSINESS

According to Arieira (2017), agribusiness can be understood as all economic activities that contribute, directly or indirectly, to the processes of production, industrialization and commercialization from agricultural products. Thus, agribusiness comprises from activities that produce or develop goods, products and services for the field to the final agricultural product, with a view to maximizing profit in the context of the agri-food system (VILELA; MACEDO, 2000). Similarly, Gasques *et al.* (2004, p. 8) state that:

Agribusiness is seen as the production chain that involves everything from the manufacture of inputs, through production in agricultural establishments and its own. Transformation, until its consumption. This chain incorporates all support services: research and technical assistance, processing, transportation, marketing, credit, export, port services, dealers, stock exchanges, industrialization and the final consumer. The added value of the agro-industrial complex necessarily passes through five markets: the supply market; that of production itself; processing; distribution; and that of the final consumer.

According to Taliarine and Ramos (2015), due to the increase in the world population, there is also a need to increase food production, as a consequence of this population increase,

it gradually reduces the arable areas in the world. In this way, Brazil is strengthened on the world stage as a major food supplier. In this way, agribusiness has great economic relevance for Brazil, moving millions of reais in resources, producing direct and indirect jobs.

Jank *et al.* (2005) state that national agribusiness has potential worldwide in the production of agricultural commodities, with the capacity to expand supply, union of factors of investments in technology and research, which allow a significant increase in productivity.

The increase in agricultural productivity in recent years is noticeable throughout the country. With the increase in population, there is a need to increase agricultural production, thus expanding the trade in the agricultural sector. Brazilian agribusiness has been growing, due to the competence of farmers, the availability of affordable cultivable soils, the generation and aggregation of new technologies that are more productive and efficient (PINTO, 2006).

According to Lourenço and Lima (2009), on the world stage, Brazil is seen as a world leader in agribusiness. Hamann *et al.* (2010) state that Brazilian agribusiness is stable in the (inter)national context, but the country has a deficit of managerial qualification of some professionals who work in the agricultural sectors, especially in family farming.

Brazil is currently the world's fourth largest exporter of agricultural goods, exporting an average of USD 100.7 billion, behind the European Union, the USA and China. With this, it is noted that agribusiness is extremely important for the economic development of the country. In 2020, agribusiness totaled R\$ 1.98 trillion, representing 27% of the Brazilian GDP, according to data from CNA (2021).

2.1.1 Family Farming

In Brazil, family farming is the main activity responsible for generating products for consumption. Law No. 11,326, of July 24, 2006, in summary, defines that the family producer is one who performs activities in rural areas, does not have an area larger than four fiscal modules and the management of the establishment and the labor of the activity is the family's own.

According to Souza (2019), family farming, despite being extremely necessary for the turnover of the local and national economy, still suffers enormous disadvantages compared to the employer economy. From there, through the family farming producers themselves, the need to form cooperatives and associations that strengthen their business arises, which has as its main objective to provide technical assistance and incentive policies for the movement of agribusiness. Therefore, some advantages may not only be available to large producers, but also to those who are responsible for generating income and developing the local economy.

As for the profile of producers, in the last census of the Brazilian Institute of Geography and Statistics (IBGE) carried out in 2017, of the total rural properties in Brazil (5,073,324 properties), about 76.8% represented family farming (3,897,408 properties), comprised in an area of 23% of the total land dedicated to the exploitation of agricultural activities in the country. In the same year, about 66.3% of the workers in agricultural activities referred to family farmers. In addition, approximately 81% of family farming producers were rural landowners. In a survey carried out by Oliveira (2016), the profile of family farmers 79% represented the male sex and 21% the female sex, and the age groups distributed 59% over 40 years old, 26% between 31 and 40 years old and 15% between 21 and 30 years old.

As for access to capital, family farmers have public subsidies to promote agricultural production. To have access to public policies to encourage production and income generation, family farmers need to issue the Declaration of Aptitude for the National Program for the Strengthening of Family Agriculture (DAP), which is a mechanism used to identify and qualify Family Units of Agrarian Production (UFPA). The DAP presents personal data of the landowners, productive data of the property, territorial data and family income. For family farmers to have access to PRONAF rural credit, for example, it is essential to present the DAP, as it presents relevant information that will give confidence to financing transactions (BRASIL, 2022).

2.2 GRANTING OF CREDIT

For Meirelles (2008), credit aims to provide resources for the development of business or investments by productive organizations. In addition, Lemes *et al.* (2002) define credit as an instrument to improve and contribute to the realization of investments in the branches of organizations. According to Castro Neto and Sérgio (2009, p. 21) "credit plays an important economic and social role, as it enables the circulation of wealth and meets the needs of economic agents".

Therefore, credit can be defined as the assignment of capital to third parties, the resource assigned through remuneration (interest) required from the debtor for its use, which can be made available to individuals and legal entities (CAMARGOS *et al.*, 2010).

Thus, the granting of credit consists of the provision of a present value, through a commitment to pay, similarly to the value, in the future. The debtor is obliged to make payments on the dates agreed upon at the time of negotiation. Credit risk is the risk of loss that occurs when the borrower is unable to pay in a credit granting operation. Therefore, institutions must

carry out credit assessments to mitigate losses in operations, which may or may not be detailed (FRANCISCO, 2007).

2.3 RURAL CREDIT AND CREDIT ANALYSIS

Rural credit is a financial resource offered by financial institutions aimed at the rural segment. Rural farmers benefit from the resources provided by financial organizations in this line of credit in numerous ways in their property and rural businesses. These credits have four main purposes: costing, investments, commercialization and industrialization, as described in table 1:

Table 1

Types and purposes of rural credit

TYPES OF CREDIT	PURPOSES OF RURAL CREDIT
Funding credit	It is intended to cover normal expenses of production cycles, from the purchase of inputs to the harvest phase.
Investment credit	It is intended for applications in goods or services whose benefit extends over several production periods. For example, in the acquisition of a tractor.
Marketing credit	It is intended to provide rural producers or cooperatives with the necessary resources to sell their products in the market.
Industrialization credit	It is intended for the industrialization of agricultural products, when carried out by cooperatives or by the producer on his rural property.

Source: Bacen (2022), adapted by the author 2022

In this context of rural credit purposes, Lopes *et al.* (2016) highlight that rural credit has especially financed the cost of production in recent decades, helping producers with grain production and/or livestock costs, soil preparation, seed planting, area cleaning and harvesting, among others. According to Alves (2018) Pronaf costing, it is clear the importance for food production and consequently increasing the income of family farmers who took this type of rural credit, highlighting that there were improvements in production after the implementation of the credit.

Also according to Lopes *et al.* (2016), these credit lines also helped in the promotion of products by enabling the financing of fees and costs related to the Rural Product Note (CPR). For Stoffel *et al.* (2015) credit as a public policy creates opportunities for farmers to fund their activity, increase and improve production, consequently increasing the producer's income.

Verlich and Costa (2013) show that the credit analysis process especially includes: creation of a rural project or a credit plan; later the registration of the borrower is carried out or

updating if it exists in the financial institution; after registration the proposal is registered generating a risk classification, taking into account the current restrictions, as well as the time in the field of activity; After the rural credit proposal is generated, it is immediately submitted to the competent authority. Also for Santos *et al.* (2020) The process to obtain rural credit is divided into 3rd stages, as shown in Table 2:

Table 2

Stages to obtain rural credit

STEPS TO OBTAIN RURAL CREDIT	DESCRIPTION
Step 01 - Documentation	At this stage, the credit contracting process begins and the requested documents are presented. According to the authors, the main documents requested are: personal documents (RG, CPF, Marriage Certificate, Proof of Income, Producer's Card and Proof of Residence.), property documents (Rural Property Registration, DAP, Lease Agreement, Rural Territorial Tax (ITR), Rural Property Certificate (CCIR), documents of real estate and movable property.), and Technical documents that prove the activity that the producer carries out (Agricultural or livestock production and sanitary record.)
Stage 02 - Preparation of the rural project	The authors address in this step the step-by-step of how to proceed with the elaboration of the rural project.
Step 03 - Formalization of the proposal	At this stage, the signature of the banknote, approval of the credit, receipt of the resource and application in the activity occurs.

Source: Santos *et al.*, (2020), adapted by the author (2022)

Credit lines are financial limits made available to individuals and companies through loans or financing, and are commonly granted for a specific purpose (UNIFOR, 2020). Each financial institution can join the credit lines to be worked on by financial institutions.

According to Santos (2019), specifically in the context of rural credit, financial agents can impose conditions for granting credit, such as: having the DAP form; not have restrictive annotations; and maintaining a good relationship with the financial institution can be a factor that influences obtaining higher credit limits. In this sense, Ferreira (2010) expresses that income, bank credit lines, commercial operations, terms of operations and investments should be highlighted for the decision to grant rural credit.

Wojciechowski *et al.* (2014) highlight that the granting of credit tends to be more accessible to producers who present their ecologically correct techniques, thus demonstrating commitment to sustainable development. According to the authors, the process of granting credit should be done in a sustainable way (better rates, grace period and longer terms) to producers who are committed to the socio-environmental issue.

According to table 3, it presents the commercial lines that family farmers can access in the Sicoob Centro cooperative.

Table 3

Sicoob center commercial credit lines

COMMERCIAL CREDIT LINES	DESCRIPTION
Small Producers Credit	The "Small Producers Credit" is a credit intended for individuals who carry out rural activities and who have a valid Declaration of Aptitude for Pronaf (DAP) certificate. This credit is granted under the condition of growth of the activity with an interest in the development of the agribusiness chain.
Agro Credit	Credit intended for the group of individuals who work in rural activity or professionals who provide services to agribusiness. The credit is granted under conditions for the growth of the activity with an interest in the development of the agribusiness chain.
Rural Promissory Note (NPR) Advance	Credit line intended for anticipation of credit sales to rural producers who have their own production, through the promissory notes that the producer issues when they make credit sales
Women in the Countryside	Line intended for female rural producers, to purchase items to improve the activity they perform. It has the purpose of purchasing inputs or production items, such as: machinery, tools and irrigation.
Revolving Credit	Line of credit whose limit is pre-approved for the borrower who can apply as needed.

Source: Sicoob Centro (2022), adapted by the author (2022)

In addition to commercial lines, producers also have Pronaf as an option for financing rural activity in several financial institutions (such as Sicoob Centro) in Brazil.

2.3.1 Pronaf

The National Program for the Strengthening of Family Agriculture (PRONAF) is a public policy adopted in Brazil. Several financial institutions in the country operate PRONAF, including Sicoob Centro.

According to Crisa *et al.* (2014, p. 324):

Created in 1995, the National Program for the Strengthening of Family Farming (Pronaf) marks the Brazilian State's recognition of family farming. From regional programs that little recognized the economic importance of the social category – historically treated as subsistence producers, small farmers or low-income producers – family farmers now have a national policy aimed exclusively at them.

PRONAF has numerous classifications regarding credit. According to the Rural Credit Cooperative with Social Interaction (CRESOL, 2021), there are several subdivisions of Pronaf that can meet the needs of each producer, as shown in table 4:

Table 4

PRONAF modalities

PRONAF modalities	Description
Pronaf Costing	Divided into agricultural and livestock. In the agricultural sector, the financing is intended for the productive period of the crops, in the livestock sector, the cost is used for the exploitation of livestock.
Pronaf Investment	Intended to finance rural agricultural and non-agricultural activities, aiming at increasing income generation and better use of family labor.
Pronaf More Food	Specifically aimed at permanent improvements, such as construction, renovation and expansion of machinery.
Pronaf Woman	Specific financing for production companies, specifically aimed at permanent improvements, such as construction, renovation and expansion of machinery.
Pronaf Bioeconomy	Financing for environmental adaptation projects, implementation of nurseries, construction or expansion projects, renewable energy technologies.
Pronaf Agroindustry	Aimed at family farmers and cooperatives, for application in processing, agricultural marketing, artisanal and forest products.
Pronaf Agroecology	Intended for funding related to the implementation and maintenance of agricultural production systems.
Pronaf Youth	Its purpose is to invest in production activities, the beneficiaries are young people between 16 and 29 years old.
Pronaf Microcredit	Destined for rural producers, who had a gross income of up to 23 thousand.
Pronaf Shares	Financing for the payment of shares for producers associated with credit cooperatives.
Pronaf Forest	Credit That has for the purpose of ecologically sustainable extractive exploitation.
Pronaf Semi-arid	Used in semi-arid regions, to finance water infrastructure projects.
Pronaf Industrialization of Family Agroindustry	Its objective is to finance storage, acquisition of packaging and acquisition of inputs. Financial institutions have different lines of credit, which small producers can use depending on their activity in rural areas, whether to use in costing, investment, commercialization or industrialization.

Source: Cresol (2021), adapted by the author (2022)

Through the Pronaf modalities, family farmers can choose the credit modality based on the need for application, which can be in costing, investment or marketing.

2.3.2 Credit Restriction

Rural producers, when seeking access to rural credit, go through an analysis process, thus being able to have their credit approved or denied by the financial institution. According to Assunção and Alves (2007), one of the main bottlenecks in credit analysis is the lack of registration information on the part of the credit applicant. There is a major obstacle related to credit rationing, which relies on the scarcity of data to measure the real condition of those who use it (ASUNÇÃO; ALVES, 2007). For Schroeder (2021), the factors that influence the granting of credit, based on the criterion of priority in the granting of credit, are especially those evidenced in figure 1:

Figure 1

Importance of registration queries

Source: Schroeder (2021)

According to data collected by Schroeder (2021), it can be seen that the degree of indebtedness is the main factor that influences the granting of credit, followed by financial restrictions and payment capacity.

Other common problems for small rural farmers are the lack of knowledge about rural credit and the absence of collateral, with the lack of information to financial institutions that do not feel safe and make it difficult to access credit. For Mundo Neto and Souza Filho (2015), the costs of operations of special rural credit programs tend to increase when financial institutions are not interested in operating with family farmers, making it difficult for farmers to access them by requiring real guarantees for loan or financing approval.

The main problems related to credit operations can be described as shown in table 5:

Table 5

Problems related to credit operations by family farmers

Problems Related to Credit Operations
Lack of information about credit.
Difficulty in evaluating the assets, considering the risks and payment conditions.
Meet the requirements linked to each credit.
Lack of relationship with financial agents.
Risk aversion.
Opposition between financial agents and borrowers.
High costs for formalizing the contract, due to the time spent and travel to the financial institution.

Source: Mundo Neto (2004), adapted by the author (2022)

According to data from the research by Lima *et al.* (2019), the main factors restricting PRONAF credit are: lack of technical assistance, excess of documents to be forwarded, registration restriction, lack of information from family farmers about the credit and default by the family farmer.

Also according to research carried out by Mundo Neto (2004), there are some factors in the lack of understanding between institutions and borrowers, as shown in table 6:

Table 6

Problems related to credit operations by family farmers

Reason for Lack of Understanding Between Institutions and Borrowers
Lack of knowledge about credit lines, especially those aimed at Family farming
High banking requirements
Scarcity of information on the part of the government, for not informing the possibilities of Funding
The bank's lack of interest in working with family farmers
Farmers' fear of taking credit and losing their assets to banks

Source: Mundo Neto (2004), adapted by the author (2022)

The concession is extremely important for the small farmer, but the factors that can lead to a credit restriction must be observed when seeking a resource from a financial institution.

2.4 COOPERATIVISM

For the Organization of Cooperatives of Brazil (OCB, 2022), cooperativism is a doctrine of life that aims to change the world, making it a fairer, more balanced and happier place with better opportunities for all. The principles of cooperativism are divided into seven pillars, namely: Voluntary and free membership; Democratic management; Economic participation of members; Autonomy and independence; Education, training and information; Education, training and information and Interest in the community.

For Costa (2006), cooperativism is a social movement that occurred at the time of capitalism, when terrible working conditions were at their peak, caused the conflicts between capital and the working class to give rise to a new model of organization, thus giving rise to cooperatives.

Cooperativism emerged in the middle of 1844, in the city of Rochdale-Manchester, England, when 28 workers came together to create their own warehouse. Four years after its creation, the cooperative had more than 140 members. The cooperative adopted moral principles that guide it to this day, including solidarity, honesty, equity, and transparency (OCB, 2022).

2.4.1 Credit Unions

Gradually, individuals and companies are looking for services provided by credit unions, especially because of the rates offered and lower service costs than banking services. Cooperatives are financial institutions regulated by the National Monetary Council (CMN) and supervised by BACEN (BRESSAN et al., 2010).

According to Law No. 5,764, of December 16, 1971 (CONGRESSO NACIONAL, 2022), cooperatives are partnerships of people, with their own corporate aspects, of a civil nature, developed to provide services to members and are not subject to bankruptcy. Specifically as financial institutions, credit unions have the following main characteristics: Voluntary adhesion; Share capital represented by shares; Singularity of vote; Return of leftovers at the end of the net year; Provision of assistance to cooperative members.

For Pesente (2019), cooperatives are non-profit institutions that can result from the association of professionals in the same field, joining companies, employees of the same company, and must have at least 20 cooperative members. Regarding operations, credit unions especially capture demand and term deposits (only for members), loans and financing. In this way, the credit union can only provide services to member members.

As for the classification of credit unions, according to the National Cooperative Policy described by the National Congress (2022), they can be classified as:

Singular: formed by individuals, excessively relating to organizations that have the same objective or establish economic or non-profit relations;

Central Cooperatives or Federations of Cooperatives: They must be constituted by at least 3 individuals, and may admit individual members;

Confederations of Cooperatives: made up of at least three federations of cooperatives or central cooperatives.

Cooperativism provides a viable alternative for those who seek to reduce costs, be able to compete with other companies or seek better alternatives for access to credit.

2.4.2 Sicoob Credit Cooperative

The Credit Cooperative System of Brazil (Sicoob) is made up of credit cooperatives, as well as qualified technical assistance companies. Through the cooperative's organizational model, divided into singular, central and Sicoob Confederation cooperatives, cooperatives have access to technological infrastructures, auditing, communication and marketing services, ombudsman and relationship with the cooperative. Through this model, Sicoob cooperatives share policies, standards, conducts, technologies, products, services and brands, thus standardizing the process and gaining efficiency throughout the Sicoob system (SICOOB NACIONAL, 2022). The Systemic structure that integrates Sicoob, according to Sicoob Nacional (2022) is: Cooperative Bank of Brazil (Bancoob) and Regularizing Companies: electronic means of payment companies, consortium entities, insurance and pension companies, entities that provide products and services.

According to the Sicoob Nacional system (2022), the Sicoob credit cooperative operates in 350 Brazilian municipalities, with 351 singular cooperatives and more than 6.5 million active cooperative members.

In addition, financial cooperatives have the protection of the Credit Cooperativism Guarantee Fund (FGCoop). The objective of this fund is to ensure the protection of depositors and investors of credit unions, thus equalizing the conditions of competitiveness with commercial banks (SICOOB COOPERCREDI, 2019).

3 METHODOLOGY

Methodology is the process by which the researcher demonstrates the processes that will be used in his research. Therefore, in this section the methodological characteristics of the study will be presented.

The present research is characterized by the descriptive type, as it aims mainly to analyze the main factors of credit restriction experienced by family producers in the cities where the credit cooperative Sicoob Centro operates. According to Prodanov and Freitas (2013), descriptive research aims to characterize a certain population or phenomenon, or to establish relationships between variables.

The work adopted the deductive method for the analysis of the research, so logical reasoning was used for the interpretation and verification of the data. According to Descartes

(2003), the deductive method presented a modern way of carrying out scientific research, denying oneself from the supernatural and dedicating oneself to the maximum through reason when seeking knowledge that is titled as true.

As for the approach, qualitative research was used, as it was necessary to understand the reason for certain behaviors. For Bauer and Gaskell (2002), qualitative research is the diversity of representations of people in their experiential world. For Deslauriers (1991), the researcher is the element and object of his own research.

Regarding the data collection techniques used, in this study we used bibliofigural, documentary and field research. Gil (2002) comments that the bibliofigural research constitutes materials already prepared on the subject by other scientists, such as published books, articles and magazines.

As for documentary research, for Cellard (2008), this technique is used by original manuscripts. Helder (2006) says that it is an indisputable technique for research in the social sciences. According to Sá-Silva *et al.* (2009) documentary research uses materials that have not received analytical treatment, while bibliofigural research refers to works by different authors who have already studied the subject.

For Vieira and Lugli (2015), field research aims to understand and clarify the researched problem, based on a theoretical basis. Research acts through the observation of events and phenomena exactly as it happens in reality, proceeding from the analysis and interpretation of these data.

The bibliofigural research was elaborated through scientific articles, books, magazines and websites of financial institutions, considering the reliability of the sources and data. The documentary research was carried out with the credit union, as it followed the use of manuals and internal regimes regarding credit lines, as well as spreadsheets with the registration information of rural producers made available by the credit cooperative Sicoob Centro.

For the field research, a questionnaire (APPENDIX A) was used, containing 14 questions, which were open questions, which were filled out without the presence of the researcher. The questionnaire was applied from September to November 2022, with credit analysts, managers, and employees who worked for at least one year in the aforementioned functions of the institution. According to Parasuraman (1991), the questionnaire is composed of questions, aiming to collect data necessary to solve the problem.

The research subjects were 13 employees of the Sicoob Centro institution who work in the credit and credit analysis committee, and the employees who worked for at least one year in these functions of the institution. In this way, because the investigation is carried out with all

the members of the credit committee, the survey will be of population, or also known as census. In census research, it is essential to verify all the data of 100% of the participants (KHAN ACADEMY, 2022).

According to Flick (2009), ethics is the set of principles and convictions that guide the behavior of the individual in a given time or society. All participants signed the Informed Consent Form (ANNEX A), and they were not identified, and could be coded from A1 (Credit Analyst 1) to A13 (Credit Analyst 13).

The research also includes the Disclaimer (ANNEX B) in which the researcher completely exempts the Federal University of Rondônia Foundation (UNIR) - Professor Francisco Gonçalves Quiles Campus in Cacoal, the advisor and the professors indicated for composing the act of face-to-face defense, of full responsibility for all content or idea expressed, being able to respond civilly, or criminally in case of proven plagiarism.

The present research was carried out at the Sicoob Centro Credit Cooperative, with administrative headquarters in the city of Ji-Paraná, state of Rondônia. Currently, the cooperative operates in 10 municipalities in the state of Rondônia, with 17 physical branches and one digital branch. Thus, the research was carried out in the municipalities of Ji-Paraná and Jaru, cities in Rondônia where the members of the credit and credit analysis committee work.

According to the IBGE (2020), the city of Ji Paraná has a population of 130,009 people, with a territorial area of 6,897 km² and a demofigureic density of 18.7 inhabitants/km². Also according to the IBGE (2021), the city of Jaru has a population of 51,469 people with a territorial area of 2,944,128 km² and 17.66 inhabitants/km². The employees of the concession and credit analysis of Sicoob Centro are the targets of this research.

4 RESULTS AND DATA ANALYSIS

In this topic, the results obtained during the research carried out through a form with the credit analysts of Sicoob Centro will be presented, with the purpose of achieving the objectives of this work, in particular to analyze the main factors of credit restriction experienced by family producers in the cities where the Sicoob Centro credit cooperative operates.

4.1 PROFILE OF SICOOB CENTRO'S BORROWERS

Analyzing the survey data, it was found that 100% of the participants stated that family producers are part of the institution's credit policy, being one of the main audiences served, as it is the majority in rural credit concessions carried out by the Sicoob Centro cooperative. Based

on this statement, initially the survey collected data on the profiles of rural producers, through the active credit portfolio of the Sicoob Centro cooperative. Therefore, the main results are the data presented in table 7, as follows:

Table 7

Profile of family producers

ITEM INVESTIGATED	MAIN RESULTS	ANALYSIS/COMPARISON
Age producers	14,52% have Age between 44 and 48 years old, 13.88% from 39 to 43 years old and 12.96% from 34 to 38 years old.	According to data from the IBGE survey, in 2017 it was found that the predominant age group of producers is over 55 years old.
Main areas of activity	67.16% work in beef cattle, 22.71% in dairy cattle and 1.67% in beef cattle farming. coffee, 3.46% other modalities.	According to Pfeifer et al. (2021), agriculture and livestock are central axes of the Rondônia economy, with coffee, corn, rice and soybeans being highlights in agriculture and livestock the production of beef and dairy cattle.
Average monthly income	R\$ 17.443,22	According to the survey by the Supply Company (CONAB) in 2019, family farming suppliers in the northern region had an average income of R\$ 6.833,11.
Main lines active credit cards	91% represents PRONAF Costing and Pre-Costing, while 9% of the active portfolio represents Pronaf Investment, Capital of Giro and Agroindustry.	In an investigation carried out by Dornelles (2019), regarding the purpose of the credit, it was identified that 50% of the credits are granted for investment, 45% for funding and 5% for commercialization.

Source: data from the survey itself, 2022.

Reaffirming what was exposed by Alves (2018), Pronaf costing is of significant importance for food production and consequently increased the income of family farmers who took this type of rural credit, and it is highlighted that there were improvements in production volumes after the implementation of the credit.

The data made available by the financial institution also point out that currently (2022) they have about 1736 active contracts, of which 86.69% are taken by male producers, while 13.31% are female. Regarding the gender of the borrowers, it is clear that the data found in this research are similar to the data obtained in the research by Oliveira (2016).

4.2 MAIN CREDIT LINES OFFERED AND DEMANDED AT THE SICOOB CENTRO CREDIT COOPERATIVE

Table 8 shows the main lines of credit offered by the Sicoob Centro cooperative to family farmers, as reported by the research participants.

Table 8

Main credit lines offered

CREDIT LINES	NUMBER OF TIMES MENTIONED BY RESPONDENTS
PRONAF COSTING	10
AGRO CREDIT	9
PRONAF INVESTMENT	9
NPR ANTICIPATION	3
BNDES BUSINESS CARD	3
FREE OWN RESOURCE (RPL)	3
WORKING CAPITAL	2
REVOLVING CREDIT	2
WOMEN IN THE COUNTRYSIDE	2
PRONAF	2
CPR-F – RURAL PRODUCT NOTE FINANCIAL	1
SMALL PRODUCERS CREDIT	1
SOLAR FINANCING	1
VEHICLE FINANCING	1
SMALL PRODUCER LINES	1
PCA - CONSTRUCTION PROGRAM AND EXPANSION OF WAREHOUSES	1

Source: data from the survey itself, 2022.

As obtained through the registration information made available by SICOOB Centro (table 1), according to the interviewees, PRONAF Costing is the main line of credit made available to family farmers. This information, therefore, is in line with the statement of Lopes *et al.* (2016), which explains that in recent decades rural credit has uniquely financed costing credit, helping producers with production costs, cleaning of the area and harvesting, among others.

It is noted that other lines of credit mentioned by the interviewees are not rural credit lines offered with state subsidies, such as Crédito Agro, a commercial line of the Sicoob Centro cooperative itself. Pronaf allowed farmers to have access to rural credit, thus presented as a more effective alternative for Brazilian family production, but not all farmers can access this credit, due to the amount made available by the government in the crop plan being insufficient to serve all producers. When the family producer is unable to access credit, he resorts to the commercial lines of financial institutions, which in turn present rates, payment terms and other attractive factors for the producer to take this credit, but not always as attractive as those

available through PRONAF. Another situation mentioned by the interviewees is when the family farmer needs the resource immediately. In this case, it is common to use the NPR Anticipation and Revolving Credit credit lines, viable alternatives for the producer who needs the resource more urgently.

In addition to determining the main rural credit lines operated by the cooperative, it was also investigated which are the credit lines most demanded by producers, in the perception of the interviewees. Therefore, it was questioned which would be the credit lines most requested by family producers, and in figure 2 the results obtained are shown:

Figure 3

Main credit lines made more expensive by family producers

Source: survey data, 2022.

It can be seen that the three most demanded credit lines, in the perception of the interviewees, are the same ones most offered by the credit union. When asked why these credit lines are the most requested, A1 points out that "because it is an incentivized credit line and is a resource for passing on, interest rates and the term are more attractive". The A6 also adds that "those with government funding due to low rates, but when the concession limit is exceeded to the agro credit line". It is observed that the Agro Credit is used as a second alternative when the producer cannot access the lines encouraged by the government. A12 also reinforces that "the main demand of rural producers is funding and revolving credit to maintain emergency

expenses". Both agro credit, NPR anticipation, revolving credit, are more accessible lines to small producers, even with divergent rates from rural credit lines.

Also asked if the credit lines, volumes and conditions available meet the needs of family producers, the interviewees answered as shown in table 9:

Table 9

Conditions provided by financial institutions

INTERVIEWEES	ANSWERS
A1	I believe that if a greater amount of resources were made available, producers would be better served.
A2	Yes.
A3	Yes, since most of our focus is directed to rural producers.
A4	Yes.
A5	Attendant perfectly and we managed to do financial justice.
A6	Yes.
A7	Yes, they are lines designed properly in the financial lives of producers, considering the instabilities of the market.
A8	Yes.
A9	Yes.
A10	Yes.
A11	More or less, because the policy until the release of the resource is very bureaucratic, where some producers are somewhat prevented from securing a resource
A12	No response.
A13	Yes. The main impediment is the documentary issue because our state is very lacking in environmental and land regularization, there is also a lack of competence, inspection of the public and federal agencies responsible for issuing Mandatory rural credit documents.

Source: survey data, 2022.

The results obtained reaffirm what Mundo Neto (2004) expressed about the high banking requirements.

According to Crisa *et al.* (2014) small farmers were treated as subsistence or low-income producers, but after the creation of Pronaf, family farmers began to have an exclusive credit policy, which has contributed to the promotion of rural activity. Pronaf guarantees improvements in the quality of life and generates opportunities for family farmers.

4.3 CREDIT ASSESSMENT PROCESS

Subsequently, he was investigated about the documents required by the credit union during the credit assessment process. The result on the question about which documents or data is required by the institution for credit evaluation/analysis are presented in table 02, below:

Figure 4*Documents/data required in the credit analysis*

Source: survey data, 2022.

The data in figure 02 shows a high demand in relation to the documents to be presented when the family farmer seeks access to credit. Mundo (2004) comments that high banking requirements make it difficult to access rural credit. It can be seen that the DAP form is the main document required, in accordance with Brasil (2022), which mentions that family farmers need to issue the DAP to have access to public rural credit policies. The importance of DAP in the process of access to rural credit is in line with the statement made by Santos (2019). The results shown in Table 3 are also in line with those described by Santos *et al.* (2020) when they address the documentation required to access rural credit.

Another question raised was whether family farmers were able to meet the demands of the cooperative, among the main answers according to the interviewees are: interviewee A1 stated that "producers can deliver documentation easily.". On the other hand, interviewee A11 states that "in certain situations producers do not have all the documentation of the property, and do not have a real guarantee to offer in the proposal". Also according to interviewee A13 "many producers do not have these documents due to the lack of land and environmental regularization in our state".

In general, according to the interviewees there is no distinction in the credit analysis, regardless of the size of the producer, they all went through the same analysis, what will change

is the documentation required for each size according to the rural credit manual, the rates in each type of credit and especially the payment conditions of the borrower, because the credit will only be granted if the producer is able to honor the commitment to settle the rural credit operation.

When asking the interviewees about the credit analysis process of a family farmer in the institution, it is possible to divide the process into 6 (six) stages, as shown in table 10:

Table 10

Stages of credit analysis according to interviewees

STEPS OF CREDIT ANALYSIS	DESCRIPTION
STEP 01	Producer Search Assists Techniques or cooperatives and presents its demand.
STEP 02	It is necessary to create a feasibility project and present it to the cooperative.
STEP 03	The branch manager registers the proposal, technical data, uses the credit manual to define rates, operating conditions, payment frequency, among other relevant factors.
STEP 04	Subsequently, the data is passed on to the credit analysis sector, which will gather all the data (financial, personal, income, assets, among others) in a single document, identifying if there is any divergence according to the rules of the credit manual.
STEP 05	After the conclusion of the credit analysis, the proposal arrives at the credit committee sector, which will analyze all the data delivered by the analysis and decide whether to grant credit to the borrower.
STEP 06	When deciding to proceed with the proposal, it is forwarded to the release sector responsible for formalizing the credit (signing the contract).

Source: survey data, 2022.

The process of analysis of rural credit carried out at the credit cooperative Sicoob Centro is similar to the process of credit analysis exposed by Verlich and Costa (2013). However, it should be noted that the steps of the credit analysis process adopted by Sicoob Centro differ from what was proposed by Santos *et al.* (2020), where they present more objective stages.

When asked if they believed that there could be another valid process(es) for credit analysis of family producers, interviewee A1 replied that "I believe that there may be other means, but I do not know the process". A3, on the other hand, replied that "yes, photofigureic reports, and field visits". Respondents A6, A8, A9 and A11 stated that there are no other valid processes for the analysis. Other interviewees did not respond.

When asked what are the most relevant points for the evaluation of the credit of a family farmer, figure 5 presents the answers of the interviewees.

Figure 5

Main points analyzed in the rural credit assessment

Source: survey data, 2022.

According to the data obtained, the main points to be analyzed when a family farmer seeks credit at the Sicoob Centro credit cooperative are: Payment capacity, History in the National Financial System, Purpose of Credit and the producer's income. It is also possible to highlight the verbalization extract of interviewee A13 who states "many cases of losses in rural credit are due to the misuse of credit and deviation of purpose". The data obtained are in line with the results obtained by Schroeder (2021). The author identifies that the degree of indebtedness is the main factor that influences the granting or not of credit, followed by financial restrictions and payment capacity.

Next, the main factors restricting rural credit by the credit union during the credit evaluation process were investigated. The result of the questioning was shown in table 11, below:

Table 11

Main factors restricting rural credit

INTERVIEWEES	ANSWERS
A1	Sometimes the delay in granting credit makes producers give up.
A2	No response.
A3	Lack of information about the performance of the cooperative, and also their high indebtedness, in view of the low @ of cattle.
A4	No response.
A5	Lack of formality.
A6	Lack of knowledge about the credit conditions offered by Sicoob.
A7	Without financial capacity, relevant restrictions in the financial system and without technical capacity (does not have assets with the capacity to supply the operation).
A8	High indebtedness. And with restrictions in force.
A9	High indebtedness.

A10	To be a borrower, to already have other loans.
A11	The requirement of some documentation.
A12	No response.
A13	No response.

Source: survey data, 2022.

According to the data obtained in table 08, it can be highlighted that high indebtedness, lack of information about the borrower, delay in granting credit, the requirement of some documentation and not having assets to supply the operations, are pointed out as the main factors restricting rural credit with the credit cooperative Sicoob centro. Based on the answers of the interviewees, it is noted that the results are similar to data from the research by Lima *et al.* (2019), regarding the main factors restricting PRONAF credit. According to Lima *et al.* (2019) lack of technical assistance, excess of documents to be forwarded, registration restriction, lack of information from family farmers about credit and default by family farmers may also be factors that restrict credit. It can be concluded that in addition to the factors exposed by the interviewees, there are other factors that can lead to restriction of rural credit.

It is also worth highlighting the considerations made by Mundo Neto (2004). According to the author, the lack of understanding between institutions and borrowers can be explained through the following factors: lack of knowledge about credit lines, especially those aimed at family farming; high banking requirements; scarcity of information on the part of the government, for not informing the possibilities of financing; the bank's lack of interest in working with family farmers; farmers' fear of taking credit and losing their assets to the banks.

4.4 QUALITIES OF THE INFORMATION PROVIDED FOR TAKING CREDIT

When asked if cooperatives, unions, government or other entities could take other actions by family producers to favor access to credit and reduce financial costs, the following result was obtained as shown in table 12:

Table 2*Actions to promote access to credit*

INTERVIEWEES	ANSWERS
A1	Yes, credit policies aimed at the small producer, more humble and less educated.
A2	Yes, partnerships could be made with a view to greater dissemination of the lines of credit.
A3	No response.
A4	Yes, with several projects and offers.
A5	No.
A6	Yes, the agricultural area is constantly changing and in the same way institutions must change aiming at the benefit of the producer based on the moment wherever he is.
A7	No.
A8	Yes.
A9	Yes.
A10	Yes, to give more credibility to the small producer, where he would have a Greater ease when setting up a project.
A11	No response.
A12	Yes. Creating a unification of documents such as a single register of rural producers that already includes all the data of family producers and including their production, and that meets the requirements of the credit manual rural, facilitating the gathering of documents.
A13	No response.

Source: this research, 2022.

Next, figure 6 presents the data according to the interviewees, when they were asked about the level of reliability (high, medium or low) of the information in the data provided by family producers.

Figure 6*Reliability of information*

Source: survey data, 2022.

Still when asked if there is any information(s) with a low level of reliability, what would this data be, interviewee A3 answered that "there are situations in which we cannot trust the data received, for example, the cattle file, there is a very high ease of transferring cattle from one file to another." While A13 reported "the DAP is a document of paramount relevance, but which, however, is not in the vast majority reliable, due to the agents of the responsible entities manipulating the producer's data for the proper framing of the rules". Although regulatory bodies have data protection laws, internal rules, it may happen that documents are fraudulent by those who have the power to change it.

5 FINAL CONSIDERATIONS

The research sought to highlight the main factors that restrict the granting of rural credit to family farmers by the Sicoob Centro cooperative. In addition, it was sought to describe the profiles of the borrowers, the characteristics of the main credit lines taken, the credit process and evaluation, and to describe the quality of the information provided for taking credit. Therefore, it is noted that the objectives of the work were achieved.

The study found that the profile of the producers was 86.69% male and 13.31% female, with a predominant age between 44 and 48 years, working with 67.16% mainly in beef cattle farming, 22.71% in dairy cattle farming.

The main rural credit lines offered by Sicoob Centro are Pronaf Costing, investment and Agro Credit, which are the same most demanded by family farmers in the perception of the interviewees, taking into account the rates available and payment conditions. Crédito Agro is being used as a second alternative for producers who cannot access the lines made available by the government.

The survey also pointed out that for the interviewees, the main documents required in the credit analysis are: DAP form, rural property deeds, semoventes form, CAR, sales invoices and rural project, among others. Therefore, it is noted that the cooperative has a high requirement regarding documentation. Another point observed, for the interviewees, is that there is no distinction regarding credit analysis, regardless of the size of the rural producer, what differs is the documentation required according to the rural credit manual.

When the credit analysis process begins, it is noted that the first step is for the producer himself to seek the cooperative or technical assistance, then the feasibility project is created, because it will be through this project that analysts can analyze whether it will be feasible to grant credit. For the credit analysis, the interviewees say that photofigureic reports and field visits can help facilitate access to rural credit.

Another point immensely identified is the main points analyzed in the evaluation of rural credit, where the main points cited by the interviewees were the ability to pay with 15%, with 11% history in the SFN, 11% purpose of credit, 11% income, 11% time of operation and 11% of branch of activity. The survey found that when credit losses occur, it is due to misuse and deviation from the purpose.

During the study, it can be concluded, according to credit analysts at Sicoob Centro, that the main factors restricting credit are high indebtedness with the current restrictions, lack of information about the borrower, delay in granting credit, the requirement of some documentation and not having assets to supply the operations.

When asked what actions could be taken by family producers to favor access to credit and reduce financial costs, the analysts said that field visits, keeping documents up to date and more clarity in the information granted to the cooperative, are actions that can facilitate access to credit, but the family farmer will go through all stages of credit analysis.

Still asked about the level of reliability of the information provided by the producers, 15.4% of the interviewees stated that the level is high, 76.9% medium and 7.7% low. It can be concluded that family farmers need to have more transparency in the data made available to credit unions.

After compiling all this information, it can be concluded that keeping the registration updated in financial institutions, being transparent in the documents requested, using credit for the proper purpose, having financial control so as not to have a high indebtedness and not having restrictions in force in the SNF, are actions that can overcome the main restrictions on access to credit.

For future work, it is suggested that the research be carried out considering the point of view of family farmers, demonstrating the difficulties they have to access the credit lines encouraged by the government. In this way, the cooperative will be able to identify bottlenecks in the credit analysis developed by the Sicoob Centro cooperative.

ANNEX A: FREE AND INFORMED CONSENT FORM

You are being invited to participate, as a volunteer, in the research on **THE FACTORS OF RESTRICTION TO RURAL CREDIT FOR FAMILY FARMING**. And if you agree to participate, please sign at the end of the document. Your participation is not mandatory, and at any time you may withdraw from participating and withdraw your consent. Your refusal will not cause any harm to your relationship with the researcher or the institution.

You will receive a copy of this **term** with the researcher's telephone number and address, and you can ask questions about the project and your participation.

PROGRAM: Degree in Business Administration at UNIR – Federal University of Rondônia Foundation.

RESEARCHER IN CHARGE: Wendel Saymon Batista da Silva. **ADDRESS:** Av. Espírito Santo, 719. Novo Horizonte neighborhood. Cacoal-RO. **PHONE:** (69) 9 9245-8652

OBJECTIVES:

Analyze the profile of family producers who contract rural credit at Sicoob Centro;

Survey the main credit lines used by rural family producers in the Sicoob Centro Credit Cooperative;

Identify the factors that contribute to access and restriction of credit for small rural producers in the Sicoob Centro Credit Cooperative;

To ascertain together with Sicoob Centro's credit analysts the actions that can minimize the restriction on PRONAF credit.

STUDY PROCEDURES: If you agree to participate in the survey, you will have to complete an electronic form. The collected data will be tabulated and analyzed for the conclusion of the undergraduate article of the Administration course at the Federal University of Rondônia – UNIR.

RISKS AND DISCOMFORTS: the research does not offer any risk or harm to the participant.

BENEFITS: to provide improvements in the process of granting rural credit to small farmers.

COST/REFUND TO THE PARTICIPANT: There will be no expense or payment with their participation.

RESEARCH CONFIDENTIALITY: Guarantee of secrecy that ensures your privacy regarding the confidential data involved in the research. The data and your name will not be disclosed.

Participant's Signature

ANNEX B: DISCLAIMER

Eu, **Wendel Saymon Batista da Silva**, DECLARO, para todos os fins de direito e que se fizerem necessários que isento completamente a Fundação Universidade Federal de Rondônia – Campus Professor Francisco Gonçalves Quiles em Cacoal, o orientador e os professores indicados para comporem o ato de defesa presencial, de toda e qualquer responsabilidade pelo conteúdo e ideias expressas no presente trabalho de conclusão de curso. Estou ciente de que poderei responder administrativa, civil e criminalmente em caso de plágio comprovado.

APPENDIX

APPENDIX A - QUESTIONNAIRE ON RURAL CREDIT GRANTING INTERVIEW SCRIPT - FINANCIAL INSTITUTIONS

- 1) Are small rural producers part of the credit policy of this financial institution? Are you one of the main audiences served?
- 2) What are the main lines of credit – working capital, investment – offered/made available to small rural producers by the cooperative?
- 3) In your perception, what are the main lines of credit – working capital, investment – demanded/needed by small rural producers?
- 4) Do you believe that the volume, credit lines and conditions made available by financial institutions (not only by this cooperative) meet the needs of small rural producers?
- 5) Commonly, what data/documents are required by the financial institution for credit assessment/analysis of small rural producers? Are small rural producers always able to meet the requests?
- 6) In your perception, can the size of the producer favor, harm or be independent of access and cost of credit? Is there a distinction in credit analysis from small producers to large producers?
- 7) In summary, how is the credit analysis process of a small rural producer at the institution?
- 8) Do you believe that there may be another valid process(es) for credit analysis of small rural producers? If there is, what would it be like in your opinion?
- 9) Which point(s) is/are most relevant for the credit assessment of a small producer, in your opinion?
- 10) What are the main factors, in your perception, that restrict access to credit and/or increase financial costs in operations with small rural producers?
- 11) Therefore, in your opinion, what actions could be taken by small producers to favor access to credit and reduce the financial cost?
- 12) Do you believe that the cooperative, unions, government or other entities could take other actions to facilitate access to credit for small producers? If so, what stocks would they be?
- 13) What is your judgment on the level of reliability of the information provided by the data provided by small rural producers - high, medium or low? If there is any information(s) with a low level of reliability, what would it be?

14) If there is, what else is missing from general information from small producers for credit analysis?

INCREMENTAL AND RADICAL INNOVATIONS IN MICRO AND SMALL ENTERPRISES: EVIDENCE FROM THE ALI PROGRAM IN PERNAMBUCO

INOVAÇÕES INCREMENTAIS E RADICAIS EM MICRO E PEQUENAS EMPRESAS: EVIDÊNCIAS DO PROGRAMA ALI EM PERNAMBUCO

Marcos Roberto Gois de Oliveira Macedo¹

ABSTRACT

This article analyzes the impacts of technological and managerial innovations — classified as incremental or radical — on the productivity and survival capacity of micro and small enterprises (MSEs), based on the experience of the ALI (Local Innovation Agents) Program in Pernambuco, Brazil. Given the growing need for innovation strategies tailored to the profile of MSEs, an analytical model was proposed based on the adaptation of the Sectoral Innovation Degree (GIS), which led to the creation of the Incremental Innovation Degree (G²I). The study evaluated 48 companies using the Sebrae Innovation Radar, classifying 18 themes into technological and managerial axes according to their diffusion in the sector. The results show that approximately half of the indicators analyzed represent radical innovations, highlighting an untapped potential for disruptive practices. The G²I model proved to be a useful tool for diagnosing innovation maturity, guiding the prioritization of strategies, and supporting public innovation policies based on empirical and contextualized evidence.

Keywords: Radical Innovation. Incremental Innovation. Sectoral Innovation Degree. Micro and Small Enterprises. ALI Program.

RESUMO

Este artigo analisa os impactos das inovações tecnológicas e gerenciais — classificadas como incrementais ou radicais — sobre a produtividade e a capacidade de sobrevivência de micro e pequenas empresas (MPEs), a partir da experiência do Programa ALI (Agentes Locais de Inovação) em Pernambuco. Diante da crescente demanda por estratégias de inovação adaptadas ao perfil das MPEs, foi proposto um modelo analítico baseado na adaptação do Grau de Inovação Setorial (GIS), que deu origem ao Grau de Inovação Incremental (G²I). A pesquisa avaliou 48 empresas por meio do Radar de Inovação do Sebrae, classificando 18 temas em eixos tecnológicos e gerenciais, conforme sua difusão no setor. Os resultados revelam que aproximadamente metade dos indicadores analisados representa inovações radicais, o que evidencia um potencial subexplorado para práticas de ruptura. O modelo G²I demonstrou ser um instrumento útil para diagnosticar a maturidade

RESUMEN

Este artículo analiza los impactos de las innovaciones tecnológicas y gerenciales — clasificadas como incrementales o radicales— sobre la productividad y la capacidad de supervivencia de las micro y pequeñas empresas (MYPE), a partir de la experiencia del Programa ALI (Agentes Locales de Innovación) en Pernambuco, Brasil. Ante la creciente necesidad de estrategias de innovación adaptadas al perfil de las MYPE, se propuso un modelo analítico basado en la adaptación del Grado de Innovación Sectorial (GIS), que dio origen al Grado de Innovación Incremental (G²I). El estudio evaluó 48 empresas mediante el Radar de Innovación de Sebrae, clasificando 18 temas en ejes tecnológicos y gerenciales según su nivel de difusión en el sector. Los resultados revelan que aproximadamente la mitad de los indicadores analizados representan innovaciones radicales, lo que evidencia un potencial subutilizado para prácticas disruptivas. El modelo G²I demostró ser una herramienta útil para diagnosticar la madurez innovadora de las empresas, orientar la priorización de estrategias y respaldar políticas públicas de innovación basadas en evidencia empírica y contextualizada.

Palabras clave: Innovación Radical. Innovación Incremental. Grado de Innovación Sectorial. Micro y Pequeñas Empresas. Programa ALI.

1 INTRODUCTION

Innovation is widely recognized as an essential factor for the competitiveness and sustainability of companies, regardless of their size (Santos, 2020; Rajapathirana & Hui, 2018). However, micro and small enterprises (MSEs) face specific challenges to identify, absorb and apply innovative practices that are aligned with their stage of maturity and management capacity. In this context, it becomes crucial to distinguish between incremental innovations—which improve existing practices—and radical innovations—which represent significant disruptions in organizational or technological models.

The literature on organizational innovation has evolved from a unitary approach to a dichotomous view, recognizing different types and intensities of innovation (Dewar & Dutton, 1986; Lennerts et al., 2020; Johnson, 2020). Despite this theoretical evolution, there is still a gap in the empirical operationalization of indicators that allow objectively classifying the type of innovation implemented in MSEs, especially in the context of public programs to foster innovation.

In addition, although there are several studies on innovation in micro and small companies, most adopt descriptive, qualitative or subjective perception-based approaches, without advancing in the objective measurement of the type of innovation implemented (Demircioglu & Audretsch, 2017; Kato-Vidal, 2019; Valladares et al., 2014). Previous research on the ALI Program, for example, has highlighted advances in innovative practices (Nogueira et al., 2017; Silva et al., 2018), but did not deepen the differentiation between incremental and radical innovations based on empirical and sectoral criteria. There are still few models that integrate consolidated diagnostic tools with quantitative metrics capable of guiding the strategic planning of MSEs according to their innovative maturity (Oliveira et al., 2014; Novais, 2024). In this sense, this work contributes by proposing a replicable and reasoned methodology that advances the understanding of the innovative behavior of these companies, filling a relevant gap in the national literature.

This study proposes a quantitative methodology to classify and analyze incremental and radical innovations in MSEs, based on the adaptation of the Sector Innovation Degree (GIS), originally developed by Oliveira et al. (2011). The approach was applied to 48 companies participating in the ALI Program (Local Innovation Agents), promoted by Sebrae-PE in 2022. The classification of innovations is based on the application of the Innovation Radar, a diagnostic tool that evaluates maturity in 18 topics related to management and innovation.

The main contribution of this study lies in the proposition and application of the Incremental Innovation Degree (G²I), a quantitative indicator derived from the Sectoral

Innovation Degree (GIS), adapted to the context of micro and small enterprises. This metric makes it possible to distinguish, on an empirical and sectoral basis, which innovative practices are considered incremental — widely disseminated and accessible — and which are configured as radical, as they require greater capacity for organizational or technological disruption. This is an important methodological advance compared to the more qualitative or generic approaches predominant in the literature.

In addition, G²I enables an individualized diagnosis of the innovative maturity of companies, functioning as an instrument to support strategic decision-making, both for MSE managers and for development agents and public policy makers. By integrating consolidated diagnostic tools (such as the ALI Radar) with an objective and scalable analytical logic, the study contributes to the construction of an operational framework that qualifies the process of prioritizing actions in environments with low installed capacity for innovation. This approach can be replicated in different sectoral and territorial contexts, expanding its potential for impact in the formulation of strategies aligned with the reality of Brazilian MSEs.

2 THEORETICAL FRAMEWORK

The advancement of discussions on innovation in MSEs demands an integrated theoretical approach, articulating different dimensions of innovation as a study phenomenon. In this context, this theoretical framework is structured in such a way as to contemplate three complementary axes. Initially, the relationship between innovation and productivity from the technological and managerial perspectives is discussed. Then, the distinction between incremental and radical innovations is deepened, highlighting their theoretical and operational implications. Finally, empirical studies related to the ALI Program, the database used, are presented, with the objective of positioning the present research within the scope of the existing literature and evidencing its contribution and limitations.

2.1 PRODUCTIVITY AND INNOVATION: MANAGERIAL AND TECHNOLOGICAL PERSPECTIVES

The relationship between innovation and productivity is one of the pillars of the economic and organizational literature, and is central to understanding the competitive performance of companies. This debate gains special relevance from Solow's Paradox, which evidences the apparent dissociation between technological advances and effective productivity gains, observed especially from the 1970s onwards in developed economies (TEIXEIRA, 2001).

In the context of this paradox, Macedo et al. (2024) argue that the gap between technological adoption and performance can be explained by the absence of organizational mechanisms capable of converting innovation into concrete results, especially in environments with structural constraints, as is the case of micro and small enterprises (MSEs). Empirical evidence from the study applied to the context of Pernambuco indicates that exogenous managerial innovation — such as that promoted by institutional programs — has a positive impact on the probability of productivity gains, significantly increasing the expected performance of these organizations.

This interpretation shifts the understanding of the paradox from a supposed limitation of technology to a problem related to the diffusion, assimilation, and complementarity between different types of innovation. Corroborating this perspective, recent studies show that innovations in products, processes, and technologies have a positive impact on the performance of firms, both in isolation and in an integrated way (MULOLLI et al., 2024). However, in the case of MSEs, this relationship takes on specific contours, since structural limitations, resource constraints, and organizational capacities condition the way innovations are incorporated and transformed into efficiency gains (GARRIDO-PRADA et al., 2024; ZHANG, 2025).

From this debate, the literature began to be structured in two main analytical approaches: macroeconomic and microeconomic (AUDRETSCH; BELITSKI, 2020). At the macroeconomic level, studies investigate the aggregate effects of innovation on the economic performance of countries, with an emphasis on technological diffusion and institutional capacity (GRIFFITH et al., 2006; DE NEGRI et al., 2021). On the other hand, the microeconomic approach focuses on the firm level, analyzing how organizational characteristics, business strategies, and internal capabilities influence productivity generation, both in developed and developing economies (MOHNEN et al., 2018; ROPER et al., 2017; NASSIF et al., 2017).

In general, these approaches converge in indicating that the simple adoption of technologies does not guarantee productivity gains, and that it is necessary to articulate them with innovations of a managerial nature. In this sense, recent literature emphasizes that productivity results from the interaction between technological innovation and organizational innovation, especially in contexts of resource constraints, as is the case of MSEs (ASAME et al., 2025). In addition, it is argued that saturation of incremental improvements can reduce the marginal impact of innovation on performance, reinforcing the importance of more disruptive strategies to sustain gains over time.

Thus, as argued by Macedo et al. (2024), overcoming the paradox depends on the integration between technological and managerial innovation, as well as on the ability of organizations to internalize and explore these complementarities. Although the literature recognizes the importance of innovation for productivity, this relationship is not homogeneous, varying according to the nature and intensity of the innovations implemented. In this sense, it is essential to distinguish different types of innovation, especially with regard to incremental and radical innovations, a topic that will be deepened in the next subsection.

2.2 INCREMENTAL AND RADICAL INNOVATION: CONCEPTS, DISTINCTIONS AND ANALYTICAL IMPLICATIONS

The distinction between incremental innovation and radical innovation is one of the central axes of the innovation management literature, allowing us to understand not only the degree of novelty of the changes implemented, but also their impacts on organizational performance. Since the classic studies of Dewar and Dutton (1986), this differentiation has been used to explain variations in the results of innovation, especially in terms of risk, complexity, and potential return.

Traditionally, this distinction has been strongly associated with the technological dimension, being defined from the level of disruption in products and processes (CHANDY; TELLIS, 1998; LENNERTS et al., 2020). However, more recent studies indicate that this classification is less objective than it seems, since different approaches use different criteria to characterize the degree of novelty, which generates conceptual ambiguities and difficulties in empirical measurement (KUSIAK, 2023; SI et al., 2022).

In this context, the Oslo Manual consolidates a multidimensional view of innovation, classifying it into four main categories: product, process, organizational, and marketing. This typology reinforces that innovation is not limited to the introduction of new technologies, but also involves transformations in the way organizations structure their activities, manage resources, and position themselves in the market.

Based on this expanded perspective, incremental innovation can be understood as the introduction of gradual improvements in products, processes or organizational practices, based on the recombination or adaptation of existing and widely disseminated knowledge in the sector. This type of innovation tends to present a lower degree of uncertainty and risk, being particularly relevant for companies with resource constraints, such as micro and small enterprises (MSEs), as it allows progressive gains in efficiency and competitiveness.

On the other hand, radical innovation refers to the introduction of substantial changes that imply a break with established practices, often associated with the incorporation of new knowledge, technologies or business models that are still not widespread in the market. These innovations have the potential to redefine technological and organizational trajectories, creating new frontiers of performance and competitive advantage (SHENG; CHIEN, 2016).

However, the distinction between incremental and radical innovation should not be understood as dichotomous, but rather as a continuum, in which different innovative practices can present varying degrees of novelty and impact. This perspective is particularly relevant in the context of MSEs, in which decisions related to innovation involve trade-offs between risk, cost and implementation capacity, and are often conditioned by structural limitations and low absorptive capacity.

In view of this, an important gap in the literature emerges: the difficulty of objectively operationalizing the distinction between incremental and radical innovation in empirical contexts. Several studies have sought to address this challenge through different measurement strategies. For example, classical approaches use the degree of perceived novelty in relation to the market or the firm as a classification criterion (DEWAR; DUTTON, 1986; CHANDY; TELLIS, 1998), while other studies adopt indicators based on technological intensity, investments in R&D or the introduction of new products (OECD, 2018; MOHNEN et al., 2018). There are also attempts at measurement based on surveys and managerial self-assessment, such as those derived from the use of the Innovation Radar and similar instruments applied in small companies.

However, these approaches have significant limitations. Perception-based measures tend to introduce subjective biases and difficulties in comparability between companies and sectors. Indicators based on R&D or technological intensity, in turn, are poorly suited for micro and small companies, which often innovate without formal structured investments. Survey-based instruments, on the other hand, face problems of standardization and methodological consistency, especially in heterogeneous contexts. As recent studies highlight, there is no consensus in the literature regarding the operational criteria that define the degree of novelty of an innovation, which compromises the comparability of empirical results (KUSIAK, 2023; SI et al., 2022; CROSSAN; APAYDIN, 2010).

In addition, contemporary systematic reviews point out that the absence of standardized metrics to classify innovations as incremental or radical constitutes one of the main limitations of the field, hindering both the replicability of studies and their practical application in public policies and business management (GARCÍA-SÁNCHEZ et al., 2024; DEMIRCloglu;

AUDRETSCH, 2017). This gap is even more critical in the context of MSEs, where innovation occurs in a diffuse, informal and strongly dependent way

It is in this context that the proposal of this study is inserted, by introducing the Degree of Incremental Innovation (G^2I) as a quantitative indicator capable of classifying innovative practices based on their sectoral diffusion. Considering that widely disseminated practices tend to reflect incremental innovations, while less widespread practices indicate a greater degree of novelty and disruptive potential, the proposed model allows for the operationalization, in an objective and comparable way, of the distinction between incremental and radical innovation. In this way, G^2I contributes to overcoming methodological limitations in the literature, offering an approach applicable to the context of MSEs and aligned with the need for empirical measurement of innovation.

2.3 EMPIRICAL STUDIES ON INNOVATION IN MSES AND THE ALI PROGRAM

The empirical literature on innovation in micro and small companies has been strengthened by studies applied to institutional development programs, such as the Local Innovation Agents Program (ALI), coordinated by Sebrae. In general, these surveys use diagnostic instruments, such as the Innovation Radar, to assess the innovative maturity of companies in different dimensions.

Studies carried out in different regional contexts show that the program contributes to the adoption of innovative practices and improvement of organizational performance (NOGUEIRA et al., 2017; VIRGENS et al., 2016; SILVA et al., 2018). However, most of these investigations adopt descriptive or qualitative approaches, focusing on the evolution of innovation indicators, without advancing in the distinction between different types of innovation implemented.

In this sense, there is a gap in the literature regarding the use of metrics capable of objectively classifying innovations in terms of their degree of novelty or rupture. The present study advances in this field by proposing the Incremental Innovation Degree (G^2I), allowing the differentiation of innovative practices based on their sectoral diffusion and contributing to a more accurate analysis of the nature of innovation in MSEs.

3 METHODOLOGY

This research adopts a quantitative, descriptive and analytical approach, with the objective of classifying and analyzing the nature of innovations implemented by micro and small enterprises (MSEs), distinguishing between incremental and radical practices based on a model based on empirical data.

3.1 POPULATION AND DATA SOURCE

The study population is composed of 48 micro and small companies participating in the 4th edition of the Local Innovation Agents Program (ALI), conducted by Sebrae-PE in 2022, in the Metropolitan Region of Recife. The companies are distributed in the sectors of commerce (22), industry (11) and services (15), reflecting the structural diversity of the universe of small businesses served by the program.

The data were obtained with authorization from the state coordination of the program, and came from the application of the diagnostic instrument called Innovation Radar. The ALI Program aims to stimulate innovation and increase productivity in small businesses through the performance of trained agents, who accompany companies throughout structured intervention cycles.

The Innovation Radar is the main methodological tool of the program, allowing the evaluation of the innovative maturity of companies in six dimensions: Management by Indicators, Sustainable Practices, Operations Management, Innovation, Marketing and Digital Transformation. Each dimension is subdivided into three themes, totaling 18 indicators evaluated, which enables a multidimensional analysis of innovation capacity.

3.2 DATA COLLECTION INSTRUMENT: THE ALI RADAR

Data collection was carried out through the application of the ALI Radar by trained local innovation agents, following a standardized protocol. For each of the 18 topics evaluated, a score was assigned based on an ordinal scale of five maturity levels, according to criteria established by Sebrae (2020).

This instrument allows measuring the company's stage of development in different dimensions of innovation, providing a structured and comparable basis for analysis. The standardization of the application process and the training of agents contribute to the consistency and reliability of the data collected.

3.3 CLASSIFICATION OF THEMES INTO TECHNOLOGICAL AND MANAGERIAL AXES

The 18 themes of the Innovation Radar were classified into two analytical axes: technological innovation and managerial innovation. This categorization was carried out based on the predominant nature of each theme, distinguishing practices related to the adoption of technologies and operational processes from those associated with management, organizational culture and decision-making.

This distinction allows analyzing not only the level of innovation of companies, but also the predominance of different types of innovation, contributing to the understanding of the relationship between technological innovation, managerial innovation and organizational performance.

3.4 CONSTRUCTION OF THE INCREMENTAL INNOVATION DEGREE (G^2I)

To assess the nature of the innovations implemented, this study adapts the Sector Innovation Degree (GIS) model, originally proposed by Oliveira et al. (2014), based on the innovation frontier logic inspired by Sawhney et al. (2006).

Consider a set of companies and dimensions (or themes) of innovation evaluated by the ALI Radar. Let the score assigned to the company in the dimension i , with $i = 1, \dots, n$ and $k = 1, \dots, K$, $D_{ik} \in [0, 5]$.

The company's Incremental Innovation Degree is defined as:

$$G^2I_i = \sum_{k=1}^K p_k D_{ik} \quad (1)$$

where p_k represents the weight associated with the dimension, subject to the restriction: $p_k \geq 0$ and $\sum_{k=1}^K p_k = 1$.

The weights are estimated from an optimization problem that seeks to maximize the average degree of incremental innovation in the set of companies, as follows:

$$\max_{p_k} \left(\frac{1}{n} \sum_{i=1}^n \sum_{k=1}^K p_k D_{ik} \right) \quad (2)$$

subject to: $\sum_{k=1}^K p_k = 1$ and $p_k \geq 0, \forall k$

This formulation implies that more widespread dimensions among companies — that is, those with a higher average contribution — tend to receive greater weight, being characterized as **incremental innovations**. On the other hand, dimensions that do not contribute to the maximization of the objective function (i.e., with $p_k = 0$) are interpreted as **radical innovations**, as they reflect practices that are not widely disseminated in the sector.

In addition, the Degree of Sectoral Incremental Innovation (G^2IS) is defined as:

$$G^2IS = \frac{1}{n} \sum_{i=1}^n G^2 I_i$$

This approach allows interpreting G^2I as a relative and endogenous measure of the structure of the sector analyzed, capturing the degree of diffusion of innovative practices and enabling the empirical distinction between incremental and radical innovation.

3.5 INTEGRATION WITH THE ALI PROGRAM AND DATA VALIDITY

The link to the ALI Program reinforces the robustness of the methodology adopted, since the Innovation Radar provides structured, comparable data directly associated with the interventions carried out in the companies. The actions developed by the agents aim to strengthen the absorptive capacity of entrepreneurs, according to the concept of Cohen and Levinthal (1990), expanding the ability of companies to recognize, assimilate and apply new knowledge.

In addition, the assisted application of the instrument, combined with the continuous monitoring of companies, contributes to the reduction of measurement biases and increases the reliability of the data. In this way, the institutional environment of the program acts as a methodological mediator, ensuring greater consistency in the collection and interpretation of information.

3.6 METHODOLOGICAL LIMITATIONS

Despite the consistency of the proposed model, some limitations must be considered. First, the sample is restricted to companies participating in the ALI Program in a specific region, which may limit the generalization of the results to other territorial or sectoral contexts.

In addition, the data used come from a diagnostic instrument applied by external agents, which, although standardized, may incorporate biases associated with the evaluators' interpretation and the degree of interaction with the entrepreneurs.

Another relevant point refers to the very nature of the G^2I model, which classifies innovations based on their relative diffusion in the analyzed set. Thus, the characterization of an innovation as incremental or radical depends on the empirical context considered, not being an absolute classification, but rather relational and dependent on the structure of the sector.

Finally, it is noteworthy that the model does not directly incorporate external variables, such as market conditions or financial performance, which opens space for future investigations that integrate G^2I into more comprehensive explanatory models.

4 RESULTS

The analysis of the data obtained from the application of the Innovation Radar allowed the identification of relevant patterns regarding the nature of innovations — technological and managerial — in micro and small companies in the Metropolitan Region of Recife. The results are presented from the logic of the Incremental Innovation Degree (G^2I), which allows empirically distinguishing incremental and radical practices based on their diffusion in the analyzed set.

4.1 CLASSIFICATION OF INNOVATION THEMES

Chart 1 presents the 18 themes evaluated, classified according to their nature (technological or managerial) and the type of innovation (incremental or radical), according to the weights estimated in the G^2I model.

In general, there is a relatively balanced distribution between incremental and radical innovations. However, the analysis of the data reveals that incremental innovations are associated with themes with higher average and lower dispersion, indicating wide diffusion among companies. Among these practices are management by indicators, monitoring, pricing, and customer satisfaction.

On the other hand, innovations classified as radical have lower averages and greater variability, showing that their adoption is not homogeneous and depends on specific capabilities of companies. Themes such as culture of innovation, product innovation, digitalization and digital presence stand out in this group, revealing relevant structural gaps in the innovative behavior of MSEs.

Table 1*Classification of sectors according to type of innovation*

		Inovação Gerencial ou Tecnológica?	Inovação Incremental ou de Ruptura?		
Dimensão	Temas		Comercio	Indústria	Serviço
Gestão por indicadores	Indicadores Chave	Gerencial	Incremental	Incremental	Incremental
	Estabelecimento de Metas	Gerencial	Incremental	Radical	Incremental

Source: Prepared by the authors.

This result reinforces the consistency of the G²I model by showing that sectoral diffusion is a valid empirical criterion to distinguish different types of innovation.

4.2 SECTORAL BEHAVIOR OF INNOVATIONS

The comparative analysis between the sectors of industry, services and commerce reveals relevant structural differences in the pattern of innovation.

In the industrial sector, greater heterogeneity is observed among the companies, with an arithmetic mean of 2.09 (SD = 0.53) and a weighted average of 2.85 (SD = 0.78). This pattern indicates the coexistence of companies with different levels of innovative maturity, suggesting that innovation relies heavily on internal and structural capabilities.

In the services sector, the results indicate greater homogeneity, with an arithmetic mean of 2.08 (SD = 0.31) and a weighted average of 2.26 (SD = 0.40). This behavior suggests a more uniform pattern of adoption of innovative practices, but with less intensity in the dimensions considered strategic.

The trade sector, on the other hand, has an arithmetic average of 2.14 (SD = 0.31) and a weighted average of 2.30 (SD = 0.35), showing an intermediate level, but with a higher concentration of companies at higher levels of innovation.

Table 2

Descriptive statistics of the sectors analyzed

Industry	Arithmetic Mean	DP	Weighted Average	DP	Average G ² I	DP
Industry	2,09	0,53	2,85	0,78	0,85	0,22
Services	2,08	0,31	2,26	0,40	0,89	0,23
Trade	2,14	0,31	2,30	0,35	0,97	0,22

Source: Prepared by the authors

Table 1 shows structural differences between the sectors, highlighting greater dispersion in industry and higher average level of innovation in trade.

In general, the results indicate that innovation does not occur homogeneously across sectors: while industry has greater dispersion and potential for radical innovation, trade shows greater diffusion of innovative practices, and services show intermediate and more homogeneous behavior.

4.3 FRONTIER OF INNOVATION AND TYPOLOGY OF RADICAL INNOVATIONS

The analysis of the mean scores and the dispersion of the themes classified as radical allowed us to identify three distinct patterns of innovative behavior:

- (i) Low medium and low dispersion. Topics such as energy management and water management have low levels of adoption and little variability between companies. This pattern indicates a relatively low innovation frontier, suggesting adoption opportunities with low risk and potential for immediate impact.
- (ii) Medium high. Topics related to digital transformation have high averages, indicating that its implementation requires deeper structural changes. In this case, radical innovation is associated with a higher degree of complexity and risk.
- (iii) Intermediate medium with high dispersion. Topics such as product innovation and innovation culture show high variability among companies, with some already operating at advanced levels. This pattern suggests an environment conducive to the

dissemination of knowledge among peers, with potential for learning and replication of good practices.

4.4 DEGREE OF INCREMENTAL INNOVATION (G^2I) OF COMPANIES

Table 3 presents the G^2I values for the companies analyzed, allowing the level of innovative maturity to be evaluated individually.

Table 3

Degree of Incremental Innovation (G^2I) of companies by sector

Company	Commerce	Industry	Service	Company	Commerce	Service
Company 01	1,1	1,1	1,1	Company 12	1,1	1,1
Company 02	0,7	0,7	0,7	Enterprise 13	1,1	1,1
Company 03	0,8	0,8	0,8	Company 14	0,7	0,7
Company 04	0,9	0,9	0,9	Company 15	1,2	1,2
Company 05	0,6	0,6	0,6	Company 16	1,2	
Company 06	0,6	0,6	0,6	Company 17	1,2	
Company 07	0,6	0,6	0,6	Enterprise 18	1,2	
Company 08	0,8	0,8	0,8	Company 19	1,2	
Company 09	1,1	1,1	1,1	Enterprise 20	1,1	
Enterprise 10	0,9	0,9	0,9	Enterprise 21	1,1	
Enterprise 11	1,2	1,2	1,2	Enterprise 22	0,9	

Source: Prepared by the authors based on the calculation of G^2I

Based on the results, it is observed that there are three distinct profiles of companies:

Low G^2I (≤ 0.7): companies with low innovative maturity, for which prioritizing incremental innovations is more appropriate, due to lower risk and greater ease of implementation.

Intermediate G^2I (0.8 – 1.0): companies in transition, with the potential to gradually move towards more sophisticated practices.

High G^2I (≥ 1.1): companies with greater innovative capacity, able to implement radical innovations and explore opportunities for greater competitive impact.

This segmentation reinforces the applied character of the G^2I model, allowing differentiated innovation strategies to be guided according to the stage of maturity of the companies.

The analysis of specific cases reinforces the practical applicability of the model. Companies with high G^2I have a greater capacity to incorporate more sophisticated managerial and technological practices, while companies with low G^2I tend to focus efforts on incremental improvements of less complexity.

These results show that G^2I can be used as an instrument to support decision making, allowing to guide innovation strategies according to the stage of maturity of the companies.

5 DISCUSSION

The results obtained in this study allow us to advance in the understanding of the nature of innovation in micro and small enterprises (MSEs), especially by integrating empirical evidence with the theoretical debate on incremental and radical innovation. In general, the findings reinforce the idea that innovation in MSEs occurs in a heterogeneous way, being strongly conditioned by structural, organizational and sectoral factors.

First, the identification that incremental innovations are concentrated in widely disseminated managerial and operational practices — such as monitoring, process management, and pricing — corroborates the literature that highlights the role of incremental innovation as the main mechanism of adaptation in resource-constrained environments. This result is consistent with studies indicating that MSEs tend to prioritize low-risk continuous improvements, to the detriment of more disruptive innovations.

On the other hand, the finding that dimensions associated with technological and strategic innovation — such as digitalization, culture of innovation and development of new products — remain not widespread highlights the existence of a structural gap in the innovative behavior of these companies. This finding dialogues directly with the literature on limitations of absorptive capacity in MSEs, suggesting that the difficulty is not in the availability of innovative solutions, but in the ability to assimilate and implement these practices.

In this sense, the results contribute to reinterpret Solow's Paradox in the context of MSEs. Rather than indicating an inefficiency of the technology, the data suggest that the limitation lies in the low diffusion and complementarity between technological and managerial innovation. Thus, the absence of significant productivity gains can be explained by the predominance of incremental innovations and the low incorporation of more disruptive practices.

The comparative analysis between sectors reinforces this interpretation. The industry showed greater dispersion in the indicators, evidencing the coexistence of companies at different stages of innovative maturity, which suggests greater potential for radical innovation, albeit unevenly. On the other hand, the services and trade sectors showed greater homogeneity, with emphasis on trade, which had a higher average of G²I, indicating a greater diffusion of innovative practices.

This industry pattern suggests that innovation in MSEs is not only a function of the internal capabilities of companies, but also of the competitive environment and characteristics of the sector in which they operate. While more structured sectors can favor the emergence of more complex innovations, more dynamic and market-oriented sectors tend to stimulate the diffusion of incremental practices.

Additionally, the typology proposed from the analysis of the mean and dispersion of the themes contributes to the conceptual advancement of the literature by demonstrating that radical innovation is not a homogeneous phenomenon, but presents different patterns of diffusion and complexity. The identification of topics with high dispersion indicates the existence of "islands of excellence", in which some companies already operate at advanced levels of innovation, creating opportunities for learning and dissemination for the rest of the sector.

Finally, the results show the robustness of the G²I model as an analytical instrument. By classifying innovations based on their sectoral diffusion, the model overcomes limitations of subjective approaches or those based exclusively on technological intensity, offering an objective and contextualized metric. This characteristic expands its applicability both for academic purposes and for practical use in innovation support programs.

6 CONCLUSION

This study aimed to analyze the nature of innovations in micro and small companies, distinguishing between incremental and radical practices from a quantitative approach based on the Incremental Innovation Degree (G²I). From the application of the model to companies participating in the ALI Program in Pernambuco, it was possible to advance in the empirical measurement of innovation, contributing to overcome a relevant gap in the literature.

The results show that innovation in MSEs is predominantly incremental, concentrating on widely disseminated managerial and operational practices. On the other hand, radical innovations, associated with technological and strategic transformations, have a lower level of diffusion, indicating a potential that is still little explored.

The sectoral analysis revealed that innovative behavior varies significantly between industry, services and commerce. While industry presents greater heterogeneity and potential for radical innovation, trade demonstrates greater diffusion of innovative practices, and services present an intermediate and more homogeneous pattern. These results reinforce the importance of considering the sectoral context in the formulation of innovation strategies.

From a theoretical point of view, the study contributes by proposing and validating the G²I model as a tool capable of operationalizing the distinction between incremental and radical innovation in an objective and data-based way. By using sectoral diffusion as a classification criterion, the model offers an alternative to traditional approaches, often limited by subjectivity or inadequacy to the context of MSEs.

In practical terms, the results indicate that innovation strategies must be aligned with the maturity level of companies. For organizations with low G²I, it is recommended to prioritize

incremental innovations, with a focus on operational and managerial improvements. Companies with greater maturity, on the other hand, can move on to more complex innovations, exploring opportunities for differentiation and competitive advantage.

In addition, the findings suggest that public policies and development programs, such as the ALI, should act not only in the promotion of innovation, but also in the expansion of the absorptive capacity of companies, favoring the diffusion and internalization of more advanced practices.

Finally, limitations related to the scope of the sample and the relational nature of the model are recognized, which opens space for future research. Further studies can explore the application of G²I in different regional and sectoral contexts, as well as its integration with economic performance indicators, expanding the understanding of the relationship between innovation and productivity.

ABSTRACT

The Palatal Memory Plate (PMP) is a transdisciplinary therapeutic resource aimed at early intervention in infants with Trisomy 21 (T21) and in cases of marked orofacial hypotonia. Indicated from two months of age, the PMP promotes the balance of the stomatognathic system, favoring vital functions such as nasal breathing, sucking, swallowing, chewing, and phonation, positively impacting the individual's overall development. Children with T21 frequently present orofacial characteristics such as hypoplasia of the midface, relative pseudomacroglossia, delayed tooth eruption, malocclusions, and labial and lingual hypotonia, which can compromise breastfeeding, swallowing, breathing, and sleep. Early intervention with PPM (Positive Myofunctional Therapy), combined with myofunctional therapy, acts on the postural reorganization of the tongue and lips, stimulates lip seal, automates nasal breathing, and strengthens the orofacial musculature, promoting harmonious development of the face and stomatognathic functions. Ten infants with Down syndrome (T21) were evaluated, and this study demonstrates that the application of PPM, accompanied by speech therapy and pediatric dentistry guidance, resulted in significant improvement in the habitual posture of the tongue and lips, muscle adaptation, and feeding functions. The effectiveness of PPM depends on adequate supervision and multidisciplinary integration, representing an effective therapy when the intervention is early, contributing to the reorganization of the orofacial musculature, prevention of future alterations and malocclusions, and improvement in the quality of life of people with T21.

Keywords: Down Syndrome. Orofacial Hypotonia. Myofunctional Therapy. Stomatognathic System.

RESUMO

A Placa Palatina de Memória (PPM) constitui um recurso terapêutico transdisciplinar voltado à intervenção precoce em bebês com Trissomia do Cromossomo 21 (T21) e em casos de hipotonicidade orofacial acentuada. Indicada a partir de dois meses de idade, a PPM promove o equilíbrio do sistema estomatoglossognático, favorecendo funções vitais como respiração nasal, sucção, deglutição, mastigação e fonação, impactando positivamente no

¹ Specialist in Functional Orthopedics. E-mail: drakelydalapicola@gmail.com

² Dr. in Zoology. Universidade Estadual da Paraíba. E-mail: analuciavendel@servidor.uepb.edu.br

desenvolvimento global do indivíduo. Crianças com T21 frequentemente apresentam características orofaciais como hipoplasia do terço médio da face, pseudomacroglossia relativa, atraso na erupção dentária, maloclusões e hipotonia labial e lingual, que podem comprometer a sucção do leite materno, a deglutição, a respiração e o sono. A intervenção precoce com PPM, aliada à terapia miofuncional, atua na reorganização postural da língua e dos lábios, estimula o selamento labial, automatiza a respiração nasal e fortalece a musculatura orofacial, promovendo desenvolvimento harmônico da face e das funções estomatoglossognáticas. Foram avaliados dez bebês com T21 e demonstra-se aqui que a aplicação da PPM, acompanhada de orientação fonoaudiológica e odontopediátrica, resultou em melhora expressiva na postura habitual da língua e dos lábios, adaptação muscular e funções alimentares. A eficácia da PPM depende de supervisão adequada e integração multidisciplinar, representando uma terapia eficaz quando a intervenção é precoce, contribuindo para a reorganização da musculatura orofacial, prevenção de alterações e maloclusões futuras e melhoria da qualidade de vida de pessoas com T21.

RESUMEN

La Placa de Memoria Palatina (PMP) es un recurso terapéutico transdisciplinario dirigido a la intervención temprana en lactantes con trisomía 21 (T21) y en casos de hipotonía orofacial marcada. Indicada a partir de los dos meses de edad, la PMP promueve el equilibrio del sistema estomatognático, favoreciendo funciones vitales como la respiración nasal, la succión, la deglución, la masticación y la fonación, impactando positivamente en el desarrollo general del individuo. Los niños con T21 frecuentemente presentan características orofaciales como hipoplasia del tercio medio facial, pseudomacroglosia relativa, erupción dental tardía, maloclusiones e hipotonía labial y lingual, que pueden comprometer la lactancia materna, la deglución, la respiración y el sueño. La intervención temprana con PPM (Terapia Miofuncional Positiva), combinada con terapia miofuncional, actúa sobre la reorganización postural de la lengua y los labios, estimula el sellado labial, automatiza la respiración nasal y fortalece la musculatura orofacial, promoviendo un desarrollo armónico de la cara y las funciones estomatognáticas. Se evaluaron diez lactantes con síndrome de Down (T21), y este estudio demuestra que la aplicación de la terapia miofuncional orofacial (TMO), acompañada de terapia del habla y orientación odontológica pediátrica, resultó en una mejora significativa de la postura habitual de la lengua y los labios, la adaptación muscular y las funciones de alimentación. La eficacia de la TMO depende de una supervisión adecuada y una integración multidisciplinaria, lo que la convierte en una terapia eficaz cuando la intervención es temprana, contribuyendo a la reorganización de la musculatura orofacial, la prevención de futuras alteraciones y maloclusiones, y la mejora de la calidad de vida de las personas con T21.

Palabras clave: Síndrome de Down. Hipotonía Orofacial. Terapia Miofuncional. Sistema Estomatognático.

1 INTRODUCTION

The memory palatal plate (MPP) represents a transdisciplinary therapeutic resource of early intervention for use in infants with Trisomy 21 (T21), formerly known as Down Syndrome, as well as in cases of marked hypotonocicity of the orofacial muscles, many of which are idiopathic. Such an opportunity for intervention, very early, occurs from two months of life, takes the focus off the teeth and mouth and broadens the vision of the professionals involved, namely pediatric dentist and speech therapist, in the search for the balance of basic and vital functions, rebalancing the entire stomatoglossognathic system. As such, the focus should be on the potentialities and interventions made to contribute to the child's development and not on the limitations that Trisomy 21 and other disabilities often represent in an initial contact.

Trisomy 21 is not a disease, but a genetic condition, with its nomenclature associated with the presence of 1 more chromosome in pair 21. It is currently referred to as T21, a term used here.

The gold standard for the diagnosis of Trisomy 21 is to perform the karyotype with an extra copy of the long arm of chromosome 21 (Lejeune et al., 1959), naturally it is the most common human aneuploidy among live births. However, it can be diagnosed clinically based on the characteristic appearance (facial gestalt) and behavior of affected individuals Radhakrishnan et al. (2018). The facial gestalt characteristic of Trisomy 21 is an important clinical tool for syndromic recognition, especially in the first moments of neonatal and pediatric evaluation. This concept refers to the global set of observable phenotypic characteristics, especially craniofacial, which, when analyzed together, allow for a strong diagnostic suspicion. Among the most frequently described findings are a flat face, flattened nasal bridge, superior oblique palpebral fissures, small ears, and relative protrusion of the tongue. As described by Radhakrishnan et al. (2018), facial gestalt represents an essential resource in the clinical identification of Trisomy 21, aiding diagnosis and early indication for cytogenetic confirmation, whose blood collection must occur even before leaving the maternity hospital, as ensured by law (Municipal Law 13.548/2017), in force in João Pessoa, Paraíba, Northeast Brazil.

Among the typical characteristics in neonates with Trisomy 21 are hypotonia and hyperextension, associated with a smaller maxilla, due to hypoplasia of the middle third of the face (Ferreira et al., 2023) and this affects breathing, speech, dental arch, and auditory processing (Abbeduto et al., 2015). This often causes difficulty in sucking and swallowing breast milk and the consequent search for adequate guidance to prioritize breastfeeding (Dantas et al., 2022).

There is also a compromise in the quality of sleep of people with T21, hence the need for early intervention in the baby (Guilleminaut; Eldridge; 1976; Gonçalves et al., 2011; Jayaratne et al., 2017). Sleep disturbances in individuals with Trisomy 21 have been associated with differences in facial morphology assessed in 3D and specific changes reported include adenotonsillar hyperplasia, mesofacial and mandibular hypoplasia, hypotonia, macroglossia, choanal atresia, an acute angle of the cranial base, and small upper airways (Jayaratne et al., 2017). Fernandez et al. (2017) describe that overall sleep quality was poor and efficiency scores were lower in infants with Trisomy 21 than in children with neurotypical development. Infants with Trisomy 21 exhibited greater sleep fragmentation, although sleep efficiency and consolidation increased with age, the authors highlight a high prevalence of sleep apnea, up to 50% in preschool-aged children with T21 (Fernandez et al., 2017). Thus, the importance of balance and muscle tone for the quality of life of individuals with T21 is clear and evident. This ensures them a better development and execution of basic functions such as breathing, sucking, swallowing and, subsequently, chewing and articulating a comprehensive oral expression.

In T21, some oral characteristics are found and can be observed very early (Table 1). They are:

Late tooth eruption, which favors the use of the memory palatal plate, as the late and asynchronous dentition will be complete around 4 to 5 years.

Babies have midface hypoplasia, that is, a smaller maxilla due to the middle third of the face being reduced. The skull is slightly microcephalic and brachycephalic with a flat occipital. The fontanelles tend to be large, a third fontanelle may be palpable, and close late. The face is round in the newborn and in the nursing mother. Usually the nostrils are small, the mouth is facing downwards and a small oral cavity generates a tendency to protrude the tongue and breathe through the mouth. The growth of the jaw tends to overtake the palate leading to prognathism.

Tooth wear is twice as common in T21 when compared to the neurotypical population, which is supported by a high rate of bruxism and has repercussions on the increase in cases of gastric reflux. Pseudomacroglossia refers to the condition in which the tongue is normal in size, but appears to be enlarged due to anatomical or functional factors of the oral environment, such as reduction of the intraoral space, resulting from narrow dental arches, mandibular retrognathism, or hypertrophy of adjacent structures (Proffit; Fields; Sarver, 2013). It is a relative macroglossia and a greater hypotonicity of the muscles of the oropharynx, which, as well as

excessive salivation and a shortened and thick lingual frenulum, represent factors that contribute to the difficulties in feeding, breathing, swallowing and speaking.

Table 1

Oral characteristics found in T21

Delay in tooth eruption
High susceptibility to periodontal disease
Excessive salivation
Conoid teeth
Aresic jaw
Dental Agenesis
Malocclusions
Mouth breathing
Shortened and thick lingual frenulum
Impaired sleep quality

Source: Authors.

The memory palatal plate is a great ally in this initial development process of people with Trisomy 21, because through this therapeutic resource, an early intervention correctly organizes and stimulates stomatoglossognathic functions. As demonstrated, the partnership between speech therapist and pediatric dentist is essential.

All these characteristics are common in T21, but we also notice them in typical children, not making it impossible for them to be treated in the same way.

Within the scientific community there is a consensus that we cannot assign degrees to Trisomy 21 (Down Syndrome), that is, there are no degrees, although each child expresses the genes in a specific way. Some with more pronounced hypotonia on the face, others not, so the attentive and personalized look must exist.

The etiology of the characteristic appearance and associated specific features of Trisomy 21 are presumed to be related to the effects of dosing chromosome 21 genes, but epigenetic effects may also contribute.

The guiding principle when it comes to development is called stimulus. Early and correct stimulation during the first year of life, a period of greater development of the central nervous system and the baby's oral cavity, makes all the difference for a good global development of the individual, whether with T21 or a typical person. Therefore, the Memory Palatal Plate is an option that allows for early stimuli.

From birth, nasal breathing is a vital situation for human beings. This is physiological respiration, which favors the growth and good anatomical and functional development of the

most diverse structures of the body. It directly influences the maintenance of skeletal, dental and muscular organization of the stomatoglossognathic system, orofacial functions, as well as physical and intellectual development. When this breathing starts to occur orally, it forces the stomatoglossognathic system to promote structural changes in its functionality. This endangers the existing balance between masticatory functions, the position of the tongue at rest, swallowing, breathing and phonation, conditions that contribute to good development and orofacial growth. The muscles of the face must work in a balanced way so that the growth and development of the bones of the face happen in a correct and symmetrical way (Carvalho, 2010).

The child, when breathing through the mouth, needs to adapt the posture of the head to be able to breathe better, forwarding it so that the air reaches the lungs more quickly, flexing the neck forward, rectifying the path of the airways. This movement causes changes in the posture of the mandible, the hyoid bone and the tongue, bringing consequences for facial growth and occlusion, interfering with eating functions (sucking, chewing and swallowing). Therefore, some interventions can start in babies as young as 2 months old.

2 PRESENTATION OF CLINICAL CASES

The research participants consisted of ten children diagnosed with T21, aged between 02 and 24 months. None of them had other associated syndromes, craniofacial malformations, cardiac or respiratory disorders. These participants were recruited from among those treated at the clinic where the study was conducted. Because the children were diagnosed with T21, they were evaluated by a pediatric dentist and a speech therapist at the first meeting. The myofunctional and orofacial evaluation included the verification of tone, habitual posture of lips and tongue, lingual frenulum, as well as anamnesis to investigate the food provided by the caregiver and the presence of oral habits.

All of them had decreased lips and tongue tone and altered habitual posture, with increased salivation and unaltered frenulum of the tongue. Then, after explaining to the family about the proposed therapy, the speech therapist proceeded with the desensitization to the mold and subsequent use of the PPM, with the number of sessions appropriate to each case, and the pediatric dentist made the mold of the upper arch of each participant to make the PPM, which was delivered the following week. to those responsible for the child. The PPMs used can be seen in Figure 1. From then on, the participants received the PPM and the parents were instructed to insert it into the child's oral cavity at least four times a day, with a minimum period of 30 supervised minutes. They were also instructed to increase the use according to the

evolution of the child's adaptation and comfort. Those responsible were also instructed on the hygiene of the plate and not to use it during feeding, nor during sleep or away from an adult's observation.

3 RESULTS AND DISCUSSION

The memory palatal plate (Figure 1) is defined as a removable intraoral device, made of acrylic, initially designed by Castillo-Morales (1991), with the objective of assisting the correct positioning of the tongue and stimulating lip sealing, encouraging nasal breathing. It is indicated for babies with lip hypotonia, absence of lip sealing, and tongue protrusion, contributing to myofunctional balance, nasal breathing, and the harmonious growth and development of facial bones and muscles (Furlan et al., 2022; Carvalho et al., 2025).

The memory palate plate is a great ally in this initial development process of people with Trisomy 21, because through this therapeutic resource, it is possible to correctly organize and stimulate the stomatoglossognathic functions in the baby at an early age. As demonstrated, the partnership between speech therapist and pediatric dentist is essential.

Figure 1

Palatal memory plates with expander screw used in the study

Source: Dalapicola, K.

The alterations mentioned above (Table 1) favor the malfunction of the stomatoglossognathic system, because for the functions of this system to be carried out effectively, it is necessary that the responsible structures work in harmony, which will favor its development, using a minimum expenditure of energy by the child (Medeiros, 2016). However, when any constituent of this system operates inadequately, imbalances may occur that have

repercussions on the other stomatognathic functions, compromising the functional harmony of the system (Marchesan; Krakauer, 2011).

In clinical practice, there is a prevalence of teeth with morphological anomalies, the most common being the conoid shape, characterized by being narrow and tapered. Dental crowns are smaller and shorter, and this can contribute to the instability and susceptibility to tooth loss associated with periodontal disease. In addition, there is atresia in the maxilla and deep palate, which require attention in the exercises instructed by the speech therapist. The occurrence of agenesis or supernumerary dentition also shows a higher than expected record in the population with T21 when compared to neurotypical children.

Among the consequences, mouth breathing, snoring, and respiratory apneas during sleep stand out. In turn, the high incidence of periodontal disease may be due to hypotonia, laxity of the dentoalveolar joint, poor dental hygiene, and immune system deficiencies.

Regarding malocclusions, the most common in this study was anterior crossbite, due to the tongue resting on the oral floor. Occlusal problems, most often in the central, lateral, and canine incisors, are common and result from mouth breathing, chewing difficulty, dental agenesis, shortening and asymmetry of the upper arch, and temporomandibular problems.

After a combination of techniques, Dr. Fabiane Bittar (CFO, 2023) innovated by adding the expander screw, used in functional jaw orthopedics appliances and developed the memory palate plate used here, whose mold is made with dental molding material, addition silicone, heavy paste and catalyst in personalized acrylic trays

A first and important step in conducting the process of using PPM is the desensitization of the baby's oral cavity for molding and use of the plate itself. In this process, the speech therapist and the pediatric dentist work together (Figure 2a-c). After the initial intervention, periodic follow-up is followed so that the determined objectives are achieved and the plate is adjusted and even discontinued when the goal defined in that baby is met (Figure 3a-c).

a) Speech therapy with extraoral stimuli; b) Baby with T21 with the plate in the mouth showing adaptation and acceptance; c) Palatal plaque being relieved in the region of 51 and 61 so as not to prevent the eruption of the teeth

Source: Dalapicola, K.

The sooner the treatment begins, the greater the baby's acceptance, the better the muscle memory and its conditioning to use; therefore, PPM is indicated from 2 months of age.

The use of the plate seeks to minimize the existing orofacial changes, correcting the tongue posture from an early age, working on lip sealing with the objective of returning nasal breathing, training the muscles of the face, developing swallowing, chewing and later speech. This was evidenced as soon as the children with T21 used the plate for the first time (Figure 4).

Technological advances in the health area have enabled the development of increasingly aesthetic and minimally invasive therapeutic approaches. In this context, the importance of integrating functionality and aesthetics is emphasized, as long as such association does not imply risks or discomfort to the patient. Thus, the elaboration of the therapeutic plan should consider the particularities of the family routine, including aspects such as the responsible caregiver, adherence to the use of the device, time of use and availability for clinical follow-up. Such factors are determinant for the effectiveness of treatment, especially in interventions that require continuous use of intraoral devices, such as PPM (CFO, 2023 p. 28).

Figure 4

Before and after: evidence of immediate lip sealing after use of the memory palate plate in children with T21

Source: Dalapicola, K.

It has been confirmed that hypotonia of the orofacial muscles is evident in Trisomy 21, since there is a global hypotonia (Mustacchi; Rozoni, 1990), which can limit basic and vital functions such as breathing, sucking and swallowing. Later, it can compromise chewing and speech. Dentistry can be a great ally, enabling early intervention through these therapeutic resources. Evaluating the applicability of PPM as early as possible was also recorded by Ferreira et al. (2023) in babies with Trisomy 21, the authors concluded that the Memory Palatal Plaque associated with myofunctional therapy was more effective when started early, between 1 and 2 months of age, with records of advances in the usual posture of the tongue and lips, especially in patients who had more altered postural conditions in the initial evaluation.

Decreased tone in the perioral muscles, lips, and masticatory muscles, as well as decreased tongue movements, can lead to sucking difficulties in infants with Trisomy 21. They tend to breastfeed for less time, have more respiratory infections, and develop non-nutritive sucking habits, such as increased dependence on bottle-feeding, finger sucking, and pacifier use (Abbeduto et al., 2015). Understanding the specificities in the development of Trisomy 21 represents a look at the most diverse fronts of action and should encompass all children, not only those with T21.

4 CONCLUSION

In view of the above, it is concluded that the use of PPM brings clear benefits to babies with T21, such as stimulating the tongue to be in the correct position, that is, on the palate, adequate stimulation for better lip sealing, automating nasal breathing, improving maxillary development and avoiding mandibular protrusion. Emphasizing that PPM is an auxiliary means of treatment, its use alone, in isolation, does not imply satisfactory results in the face of the challenges of global hypotonia, innate at T21.

Treatment with the memory palatal plate ideally begins with the baby at two months of age and monthly follow-up in general for a period of one year to a year and a half, depending on the tooth eruption and evaluating the improvement in the functions of the orofacial muscles.

The control of the plate must be done by competent and properly trained professionals. The use of the splint without the respective orofacial treatment with a multidisciplinary team is considered, totally meaningless. Performed early, treatment can avoid more invasive interventions and severe malocclusions in the future.

Early intervention and finely tuned partnership between pediatric dentist and speech therapist achieve very satisfactory results in the orofacial development of children with T21, as they allow significant improvement in hypotonia, re-educating and strengthening the oral

muscles, correcting tongue protrusion, normalizing and returning nasal breathing, factors that reflect an improvement in the quality of life of these patients.

ABSTRACT

Access to potable water in Brazil is significantly unequal, a reality that intensifies in the state of Pará, located in the Amazon region of Pará. This study aims to quantitatively analyze water accessibility in the state, with an emphasis on comparing the municipality of Paragominas-PA with other municipalities in Pará. The methodology was based on the analysis of secondary data from the National Sanitation Information System (SNIS), the National Basic Sanitation Survey (IBGE), and reports from the National Water Agency (ANA), in addition to the application of perception questionnaires to 40 participants from the municipality of Paragominas. The results show that, although the overall coverage rate is low, Paragominas stands out with a high percentage of service (95.75%), similar to the capital Belém. User perception indicated a high level of satisfaction (ISA = 1.00), but low confidence in direct water consumption (ICC = 0.3), revealing a contradiction between the regularity of supply and confidence in direct consumption. It is concluded that, despite some progress, significant social inequalities related to service reliability persist, requiring integrated public policies,

structural investments, and communication strategies to strengthen public trust. Thus, this study contributes to the water supply in Pará, ensuring the human right to access water.

Objective: The objective of this study is to analyze access to potable water in the state of Pará, based on data from official sources, by comparing water supply indicators in the municipality of Paragominas-PA, the capital city of Belém, and other municipalities in Pará, aiming to assess the percentage of the population served and identify challenges and possibilities for expanding access to treated and safe water.

Theoretical Framework: Access to treated water and basic sanitation was recognized in 2010 by the United Nations (UN) as a fundamental human right, indispensable to guaranteeing the dignity, health, and well-being of the population. This recognition represents a significant normative milestone, guiding the formulation of public policies aimed at reducing inequalities in access to water supply and basic sanitation services. Within this context, the role of the Sustainable Development Goals (SDGs) stands out, especially SDG 6, which establishes as a goal ensuring the availability and sustainable management of water and sanitation for all. This guideline reinforces the importance of studies that analyze the conditions of access to drinking water, especially in the Amazon region, which is still marked by social inequalities. The unequal distribution of social services remains a major difficulty. Equity in access is a condition for the well-being of the population. At this point, it is possible to assess the importance of water governance, playing a significant role in Brazil and in the State of Pará, in a way that can guide the organization of supply systems and the formulation of new public policies focused on water resources, so that social justice can begin to bear fruit related to equal access. Currently, water resource governance in Pará relies on the National Basic Sanitation Policy (Law 11.445/2007); the National Water and Basic Sanitation Agency (ANA); the State Secretariat for the Environment (SEMAS-PA); the State Water Resources Commission; the Basin Committee; and the Pará Sanitation Company (COSANPA). Therefore, this study is of paramount importance for contributing to public policies, with improvements focused on access to water and water governance in the state as a whole. It is also an important topic to be discussed in the academic world.

Method: This study is characterized as a mixed-methods research (quantitative and qualitative), with exploratory and descriptive objectives, focused on access to drinking water in the state of Pará. The quantitative phase was based on the collection and analysis of secondary data from official databases, including the National Sanitation Information System (SNIS), the National Basic Sanitation Survey (PNSB), conducted by the Brazilian Institute of Geography and Statistics (IBGE), and reports from the National Water and Basic Sanitation Agency (ANA). Additionally, a documentary analysis of Ordinance GM/MS No. 888/2021, which establishes the potability standards for drinking water in Brazil, was carried out to support the discussion on the quality and safety of distributed water. The qualitative phase consisted of conducting field research in the municipality of Paragominas-PA, through the application of a structured questionnaire to the local population. The sample consisted of 40 participants selected by convenience in a public place with high traffic. The instrument included questions related to the perception of water quality, regularity of supply, and level of satisfaction with the services provided. Quantitative data were analyzed using descriptive statistics, with calculation of frequencies and percentages, allowing for comparison between the evaluated indicators. For the analysis of qualitative data, a descriptive approach was adopted, seeking to identify patterns of user perception. In addition, two synthetic indicators were developed: the Supply Satisfaction Index (ISA) and the Consumption Confidence Index (ICC), with the objective of measuring, respectively, the level of user satisfaction with the service provided and confidence in the direct consumption of water. These indicators range from 0 to 1, with values closer to 1 indicating better evaluation conditions.

Results and Discussion: The results obtained show a predominantly positive perception on the part of the participants regarding the quality and

distribution of water supplied in the municipality of Paragominas-PA. Most respondents expressed satisfaction with the services provided by the municipal authority, indicating that the water supply has generally met basic demands. Research Implications: The research presents relevant implications for basic sanitation and water resource management by highlighting inequalities in access to drinking water in the state of Pará. The results indicate the need to improve public policies, both in terms of expanding coverage and strengthening public confidence in the quality of the distributed water. The proposed indicators, such as the Water Supply Satisfaction Index (ISA) and the Consumption Confidence Index (ICC), prove to be useful tools for monitoring and decision-making, contributing to more efficient and appropriate strategies for the local reality. Originality/Value: The study contributes to the literature by offering an updated quantitative analysis of accessibility to treated water in the State of Pará through official data and theoretical references on the human right to water, social justice, and water governance.

Keywords: Accessibility. Treated Water. Human Rights. Water Resources.

RESUMO

O acesso a água potável no Brasil possui uma desigualdade significativa, realidade que se intensifica no estado do Pará, inserido na Amazônia Paraense. Este estudo tem como objetivo analisar, de forma quantitativa, a acessibilidade à água no estado, com ênfase na comparação entre o município de Paragominas-PA e outros municípios paraenses. A metodologia baseou-se na análise de dados secundários provenientes do Sistema Nacional de Informações sobre o Saneamento (SNIS), da Pesquisa Nacional de Saneamento Básico (IBGE) e de relatórios da Agência Nacional de Águas (ANA), além da aplicação de questionários de percepção com 40 participantes do município de Paragominas. Os resultados evidenciam, que embora os resultados apresentem baixo índice de cobertura de abastecimento, Paragominas destaca-se com elevado percentual de atendimento (95,75%), semelhante a capital Belém. A percepção dos usuários indicou alto nível de satisfação (ISA = 1,00), porém baixa confiança no consumo direto da água (ICC = 0,3), o que revelou uma contradição entre regularidade do abastecimento e confiança no consumo direto. Conclui-se que, apesar dos avanços pontuais, persiste desigualdades sociais significativas relacionadas a confiabilidade do serviço, sendo necessárias políticas públicas integradas, investimentos estruturais e estratégias de comunicação para o fortalecimento da confiança da população. Desta forma o estudo contribui para o abastecimento hídrico do Pará, de maneira que assegure o Direito Humano de acesso à água. Objetivo: O objetivo deste estudo é analisar a acessibilidade à água potável no Estado do Pará, com base em dados de fontes oficiais, por meio da comparação entre os indicadores de abastecimento de água do município de Paragominas-PA, da capital de Belém e de outros municípios paraenses, visando avaliar o percentual da população atendida e identificar desafios e possibilidades para ampliação do acesso a água tratada e segura. Referencial Teórico: O acesso a água tratada e o saneamento básico foi reconhecido, em 2010, pela Organização das Nações Unidas (ONU) como direito humano fundamental, indispensável, à garantia da dignidade, da saúde e do bem-estar da população. Esse reconhecimento representa um marco normativo relevante, ao orientar à formulação de políticas públicas, voltadas a redução das desigualdades no acesso aos serviços de abastecimento de água e saneamento básico. Dentro desse contexto, destaca-se o papel dos Objetivos de Desenvolvimento Sustentável (ODS), especialmente a ODS 6, que estabelece como meta assegurar a disponibilidade e a gestão sustentável da água e do saneamento para todos. Esta diretriz reforça a importância de estudos que analisem as condições de acesso à água potável, sobretudo na região Amazônica, que ainda é marcada por desigualdades sociais. A distribuição desigual de

serviços sociais ainda é uma grande dificuldade. A equidade em acesso é uma condição para o bem-estar populacional. Neste ponto é possível aferir a importância da Governança da água, desempenhando um importante papel no Brasil e no Estado do Pará de maneira que pode orientar a organização dos sistemas de abastecimento e a formulação de novas políticas públicas voltadas aos recursos hídricos, para que de certa forma a justiça social comece a trazer frutos relacionados ao acesso igualitário. Atualmente a governança dos recursos hídricos no Pará contam com a Política Nacional de Saneamento Básico (lei 11.445/2007); a Agência Nacional de Água e Saneamento Básico (ANA); Secretaria de Estado de Meio Ambiente (SEMAS-PA); A Comissão Estadual de Recursos Hídricos, o Comitê de Bacia e a Companhia de Saneamento do Pará (COSANPA). Dessa forma este estudo é de suma importância para a contribuição para políticas públicas, com o aprimoramento voltado ao acesso à água e Governança Hídrica no Estado como um todo. Também é um importante tema a ser discutido no mundo acadêmico. Método: O presente estudo caracteriza-se como uma pesquisa de abordagem mista (quantitativa e qualitativa), com objetivos exploratórios e descritivos, voltado ao acesso à água potável no estado do Pará. A etapa quantitativa baseou-se coleta e análise de dados secundários provenientes de bases oficiais, incluindo o Sistema Nacional de Informações sobre Saneamento (SNIS), a Pesquisa Nacional de Saneamento Básico (PNSB), realizada pelo Instituto Brasileiro de Geografia e Estatística (IBGE), e relatórios da Agência Nacional de Águas e Saneamento Básico (ANA). Adicionalmente, foi realizada análise documental da Portaria GM/MS nº 888/2021, que estabelece os padrões de potabilidade da água para consumo humano no Brasil, a fim de subsidiar a discussão sobre qualidade e segurança da água distribuída. A etapa qualitativa consistiu na realização de pesquisa de campo no município de Paragominas-PA, por meio da aplicação de questionário estruturado junto à população local. A amostra foi composta por 40 participantes selecionados por conveniência, em local público de grande circulação. O instrumento contemplou questões relacionadas à percepção da qualidade da água, regularidade do abastecimento e nível de satisfação com os serviços prestados. Os dados quantitativos foram analisados por meio de estatística descritiva, com cálculo de frequências e percentuais, possibilitando a comparação entre os indicadores avaliados. Para a análise dos dados qualitativos, adotou-se abordagem descritiva, buscando identificar padrões de percepção dos usuários. Além disso, foram elaborados dois indicadores sintéticos: o Índice de Satisfação do Abastecimento (ISA) e o Índice de Confiança no Consumo (ICC), com o objetivo de mensurar, respectivamente, o nível de satisfação dos usuários com o serviço prestado e a confiança no consumo direto da água. Esses indicadores variam de 0 a 1, sendo que valores mais próximos de 1 indicam melhores condições de avaliação. Resultados e Discussão: Os resultados obtidos evidenciam uma percepção predominante positiva por parte dos participantes em relação a qualidade e distribuição de água fornecida no município de Paragominas-PA. A maioria dos respondentes demonstrou satisfação com os serviços prestados pela autarquia municipal, indicando que o abastecimento, tem atendido, de forma geral, às demandas básicas. Implicações da Pesquisa: A pesquisa apresenta implicações relevantes para o saneamento básico e a gestão de recursos hídricos ao evidenciar desigualdades no acesso à água potável no estado do Pará. Os resultados indicam a necessidade de se aprimorar as políticas públicas, tanto no âmbito da expansão da cobertura, como no fortalecimento da confiança da população quanto à qualidade da água distribuída. Os indicadores propostos, como o Índice de Satisfação do Abastecimento (ISA) e o Índice de Confiança no Consumo (ICC), mostraram-se ferramentas úteis para o monitoramento e a tomada de decisão, contribuindo para estratégias mais eficientes e adequadas à realidade local. Originalidade/Valor: O estudo contribui para a literatura ao oferecer uma análise quantitativa atualizada sobre a

acessibilidade à água tratada no Estado do Pará por meio dos dados oficiais e referências teóricas sobre o direito humano à água, justiça social e governança hídrica.

Palavras-chave: Acessibilidade. Água Tratada. Direitos Humanos. Recursos Hídricos.

RESUMEN

El acceso al agua potable en Brasil es significativamente desigual, una realidad que se intensifica en el estado de Pará, ubicado en la región amazónica de Pará. Este estudio tiene como objetivo analizar cuantitativamente la accesibilidad al agua en el estado, con énfasis en la comparación del municipio de Paragominas-PA con otros municipios de Pará. La metodología se basó en el análisis de datos secundarios del Sistema Nacional de Información Sanitaria (SNIS), la Encuesta Nacional Básica de Saneamiento (IBGE) e informes de la Agencia Nacional del Agua (ANA), además de la aplicación de cuestionarios de percepción a 40 participantes del municipio de Paragominas. Los resultados muestran que, si bien la tasa de cobertura general es baja, Paragominas se destaca con un alto porcentaje de servicio (95,75%), similar al de la capital, Belém. La percepción de los usuarios indicó un alto nivel de satisfacción (ISA = 1,00), pero baja confianza en el consumo directo de agua (ICC = 0,3), lo que revela una contradicción entre la regularidad del suministro y la confianza en el consumo directo. Se concluye que, a pesar de algunos avances, persisten importantes desigualdades sociales relacionadas con la fiabilidad del servicio, lo que requiere políticas públicas integradas, inversiones estructurales y estrategias de comunicación para fortalecer la confianza pública. Por lo tanto, este estudio contribuye al suministro de agua en Pará, garantizando el derecho humano al acceso al agua. Objetivo: El objetivo de este estudio es analizar el acceso al agua potable en el estado de Pará, con base en datos de fuentes oficiales, comparando los indicadores de suministro de agua en el municipio de Paragominas-PA, la capital Belém y otros municipios de Pará, con el fin de evaluar el porcentaje de la población atendida e identificar desafíos y posibilidades para ampliar el acceso a agua tratada y segura. Marco teórico: El acceso al agua tratada y al saneamiento básico fue reconocido en 2010 por las Naciones Unidas (ONU) como un derecho humano fundamental, indispensable para garantizar la dignidad, la salud y el bienestar de la población. Este reconocimiento representa un hito normativo significativo, que guía la formulación de políticas públicas dirigidas a reducir las desigualdades en el acceso al suministro de agua y a los servicios básicos de saneamiento. Dentro de este contexto, destaca el rol de los Objetivos de Desarrollo Sostenible (ODS), especialmente el ODS 6, que establece como meta asegurar la disponibilidad y la gestión sostenible del agua y el saneamiento para todos. Esta directriz refuerza la importancia de los estudios que analizan las condiciones de acceso al agua potable, especialmente en la región amazónica, que todavía está marcada por desigualdades sociales. La distribución desigual de los servicios sociales sigue siendo una dificultad importante. La equidad en el acceso es una condición para el bienestar de la población. En este punto, es posible evaluar la importancia de la gobernanza del agua, que juega un rol significativo en Brasil y en el estado de Pará, de manera que puede guiar la organización de los sistemas de suministro y la formulación de nuevas políticas públicas enfocadas en los recursos hídricos, para que la justicia social pueda comenzar a dar frutos relacionados con el acceso igualitario. Actualmente, la gobernanza de los recursos hídricos en Pará se basa en la Política Nacional de Saneamiento Básico (Ley 11.445/2007); la Agencia Nacional de Agua y Saneamiento Básico (ANA); la Secretaría de Estado del Medio Ambiente (SEMAS-PA); la Comisión Estatal de Recursos Hídricos; el Comité de Cuenca; y la Compañía de Saneamiento de Pará (COSANPA). Por lo tanto, este estudio es de suma importancia para contribuir a las políticas públicas, con mejoras enfocadas en el acceso al agua y la gobernanza del agua en el estado en su

conjunto. También es un tema importante para ser discutido en el mundo académico. **Método:** Este estudio se caracteriza como una investigación de métodos mixtos (cuantitativos y cualitativos), con objetivos exploratorios y descriptivos, enfocados en el acceso al agua potable en el estado de Pará. La fase cuantitativa se basó en la recolección y análisis de datos secundarios de bases de datos oficiales, incluyendo el Sistema Nacional de Información Sanitaria (SNIS), la Encuesta Nacional de Saneamiento Básico (PNSB), realizada por el Instituto Brasileño de Geografía y Estadística (IBGE), e informes de la Agencia Nacional de Agua y Saneamiento Básico (ANA). Adicionalmente, se realizó un análisis documental de la Ordenanza GM/MS No. 888/2021, que establece los estándares de potabilidad para el agua potable en Brasil, para respaldar la discusión sobre la calidad y seguridad del agua distribuida. La fase cualitativa consistió en realizar una investigación de campo en el municipio de Paragominas-PA, mediante la aplicación de un cuestionario estructurado a la población local. La muestra consistió en 40 participantes seleccionados por conveniencia en un lugar público con mucho tránsito. El instrumento incluyó preguntas relacionadas con la percepción de la calidad del agua, la regularidad del suministro y el nivel de satisfacción con los servicios prestados. Los datos cuantitativos se analizaron mediante estadística descriptiva, con cálculo de frecuencias y porcentajes, lo que permitió la comparación entre los indicadores evaluados. Para el análisis de los datos cualitativos, se adoptó un enfoque descriptivo, buscando identificar patrones de percepción del usuario. Además, se desarrollaron dos indicadores sintéticos: el Índice de Satisfacción con el Suministro (ISA) y el Índice de Confianza en el Consumo (ICC), con el objetivo de medir, respectivamente, el nivel de satisfacción del usuario con el servicio prestado y la confianza en el consumo directo de agua. Estos indicadores varían de 0 a 1, con valores más cercanos a 1 que indican mejores condiciones de evaluación. **Resultados y Discusión:** Los resultados obtenidos muestran una percepción predominantemente positiva por parte de los participantes respecto a la calidad y distribución del agua suministrada en el municipio de Paragominas-PA. La mayoría de los encuestados expresó satisfacción con los servicios prestados por la autoridad municipal, indicando que el suministro de agua ha satisfecho en general las necesidades básicas. **Implicaciones de la investigación:** Esta investigación presenta implicaciones relevantes para el saneamiento básico y la gestión de los recursos hídricos, al destacar las desigualdades en el acceso al agua potable en el estado de Pará. Los resultados indican la necesidad de mejorar las políticas públicas, tanto en términos de ampliar la cobertura como de fortalecer la confianza pública en la calidad del agua distribuida. Los indicadores propuestos, como el Índice de Satisfacción con el Suministro de Agua (ISA) y el Índice de Confianza en el Consumo (ICC), demuestran ser herramientas útiles para el monitoreo y la toma de decisiones, contribuyendo a estrategias más eficientes y adecuadas a la realidad local. **Originalidad/Valor:** Este estudio contribuye a la literatura al ofrecer un análisis cuantitativo actualizado de la accesibilidad al agua tratada en el estado de Pará, a través de datos oficiales y referencias teóricas sobre el derecho humano al agua, la justicia social y la gobernanza del agua.

Palabras clave: Accesibilidad. Agua Tratada. Derechos Humanos. Recursos Hídricos.

1 INTRODUCTION

International Organizations, known worldwide, such as: United Nations (UN), Food and Agriculture Organization of the United Nations (FAO) and the United Nations Educational, Scientific and Cultural Organization (UNESCO), warn that water scarcity tends to intensify in the coming decades. Estimates indicate that by 2025, approximately 1.8 billion people will live in regions with characteristics of water scarcity. It can lead to more than two-thirds of the world's population facing water stress.

According to information from UN-Water, water scarcity has become a growing problem in several regions of the world. Some of the reasons are demand exceeding supply, population growth and climate change that has been directly impacting. Water is a finite resource whose availability varies according to geographic location and according to the pressures for use, this is a factor that aggravates the problem when the quantity and quality of available water decreases, which contributes to situations of water stress.

Water, as it is a finite resource, requires proper management. Population growth on a global scale, combined with continuous economic development, has intensified the pressure on water resources, resulting in the inability of several countries to meet the growing demand for water.

Water is essential for the maintenance of life on earth. However, their distribution on the planet is uneven: approximately 97% are found in the ocean; 2.2% are stored in glaciers; and only 0.8% correspond to available fresh water. Of this 0.8% of freshwater available, 97% of this water is underground and 3% is available superficially (Von Sperling, 2022).

It is noteworthy that surface water resources are, in general, more easily accessible, while groundwater requires greater technical and operational complexity for its collection.

According to the report of the United Nations Conference on Water, approximately 26% of the world's population does not have access to safe drinking water, and about 46% do not have adequate basic sanitation services.

Ordinance No. 888 of the Ministry of Health establishes guidelines for the control and surveillance of the quality of water that will be destined for human consumption. The ordinance defines potability standards that must be met, specifying parameters that characterize drinking water with compliance with microbiological criteria for this (Brasil, 2021).

These potability standards must be met so that there is no damage to human health, since it is important to regulate the internal temperature and the very functioning of the body.

In Brazil, especially in the Amazon region, high water availability can convey a perception of water abundance. However, it is important to emphasize that quantity does not translate

quality, the current risks are made up of its potability (Sottili, 2022).

Water quality can be affected by several factors such as natural phenomena, through atmospheric precipitation and runoff (climatic, geological and hydrological characteristics) and through human action such as land occupation, agricultural practices, industrial and domestic waste (Brasil, 2005).

Currently there are three distinct conceptions about water quality: the desired quality, necessary to meet a certain use; the actual quality available, which corresponds to the current conditions of that water resource; and the intended quality, which represents the quality standard that is desired for that water through management and control actions.

The management of water resources within the country faces several structural challenges, we can first talk about the territorial extension, which results in a broad complex monitoring of resources. Along with this factor, economic and population growth intensifies the demand for water, which results in pressure on supply systems. Finally, the lack of priority attributed in the political sphere to the implementation of public policies makes everything more difficult.

The objective of this study is to analyze data from official sources to verify the accessibility of water in the State of Pará in a quantitative way. It seeks to evaluate the percentage of the population served with access to treated and safe water in Pará, in addition to comparing the water supply indicators in the state capital with the municipality of Paragominas-PA and how it would be possible to expand access. Additionally, it is intended to analyze the perception with an interview in a public place of easy access and without identification to acquire information about the Paragominas Sanitation Agency (SANEPAR).

2 THEORETICAL FRAMEWORK

The quality of water and drinking standards need concreteness so that society in general does not suffer losses. For each use intended for water, there are standards to be followed. In Brazil, the National Council for the Environment (CONAMA) establishes the classification of water bodies and the guidelines for their classification. As provided for in article 3 of CONAMA Resolution No. 357/2005:

"Art.3 - The fresh, brackish and saline waters of the National Territory are classified, according to the quality required for their preponderant uses, into thirteen quality classes."

Basic sanitation is essential, as proper sewage treatment prevents domestic, industrial,

and hospital waste from being thrown directly into contact with rivers and lakes. According to the World Health Organization (WHO), about 80% of diseases in developing countries come from contaminated water, that is, from diseases arising from waterborne water. In addition, the better the water is collected, the lower the expenses with its treatment. A better water supply reduces the incidence of waterborne diseases.

The absence of adequate water supply and sanitation services disproportionately affects women and children, as it compromises hygiene practices and increases exposure to waterborne diseases, especially diarrheal diseases. Studies warn that the use of water sources and sanitation systems that are not improved are associated with a higher occurrence of childhood diarrhea, evidencing the direct relationship between poor health and the health impacts of these population groups (Asgedom et al., 2023).

The United Nations (UN), through General Assembly Resolution A/RES/64/292 of 2010, formally recognized access to drinking water and basic sanitation as a fundamental human right, indispensable to the guarantee of human dignity, health and well-being. However, despite the efforts for this recognition at the international normative level and the commitments assumed by Brazil, there is still a distance between the legal consecration of this right and its practical implementation. The evidence appears with the permanence of inequalities in access to quality water and basic sanitation services.

The Sustainable Development Goals (SDGs), especially goal 6, highlight water and sanitation as one of the goals to achieve sustainable development in the country. To achieve this goal, the availability and sustainable management of water and sanitation for all must occur.

When it comes to the Amazonian context, this contradiction between the objective and reality is evident. Although the Amazon is home to one of the largest water availability in the country and on the planet, the population encounters difficulties in relation to access to water and adequate sanitation, with the most affected being rural, riverside and urban periphery populations

The difficulty in implementing this objective in the Amazon reveals not only technical and economic obstacles, but also challenges related to water governance, territorial equity and socio-environmental justice, reinforcing the need for public policies that consider regional specificities for the effective realization of the human right to water. All of this causes socio-environmental vulnerability.

Studies indicate that this reality is due to socio-spatial inequalities, precarious infrastructure and failures in the governance of supply services, which in fact forms the paradox between water abundance and social exclusion in access to water (Castro, 2007; Hellerr;

Castro, 2013).

The Northern Region of Brazil has a total population of approximately 17.3 million inhabitants, according to data from the Brazilian Institute of Geography and Statistics (IBGE).

According to data from the National Sanitation Information System (SNISA), 64.2% of the population in the northern region is served with water supply, while only 14.7% have sanitary sewage service.

These data show that almost half of the population in the northern region has not had access to water supply and 85.3% of the population does not have sanitary sewage. Within this statistic, the treatment of this generated sewage has 19.8% of treatment.

The rate of service of the population with water supply in the state of Pará is 55.4%, for sanitary sewage the service is 9.2% of the population, and almost the entire population (90.8%) without service for sanitary sewage. Of this estimate, treated sewage in the state is 8.7%

The lack of service when it comes to basic sanitation is remarkable, the reality needs to change urgently so that there is a better quality of life for all the state population.

Access to drinking water is intrinsically linked to the principle of the dignity of the human person, being indispensable for health, especially when it comes to the minimum condition for the existence of a dignified life. It is an essential factor for meeting the basic needs of the individual such as drinking, preparing food, and having personal hygiene.

In this sense, Luís Roberto Barroso, in his work *The Dignity of the Human Person in Contemporary Constitutional Law*, highlights dignity as a structuring principle of the Constitutional State, from which other fundamental rights radiate, comprising dimensions that involve the intrinsic value of the human person, individual autonomy and the social dimension of dignity (BARROSO, 2012).

The principle of human dignity is a pillar for the protection of several other fundamental rights such as the right to life, health, education, housing and food. It is unfeasible to enforce all other rights without the minimum, that is, access to drinking water and basic sanitation services.

In this way, the research becomes relevant given the insufficiency in access both for coverage and for the quantity and quality of water and sanitation. This reality compromises other rights that are guaranteed in the Universal Declaration of Human Rights and in the Federal Constitution of 1988 itself, evidencing the distance between the norm and the practical realization of these rights.

The municipality of Paragominas has distanced itself from state statistics, being notoriously one of the municipalities that seek to advance more and more in access to water. Currently, the municipality has an estimated population of 105,550 inhabitants, the total water

service in the municipality is 95.75%.

The municipality is one of the few in the state that is closer to the capital (Belém) that has total access to water at 95.52% and has distanced itself from the little access to other municipalities such as Portel with access of 12.07%; Altamira with 49.8%; São Felix do Xingu, with 4%, among others.

What has been evidenced as the main difference is the water supplier in which it is a municipal autarchy - SANEPAR, distancing itself from the current provider in most of the municipalities in the state that use COSANPA. The Municipality of Paragominas-PA is the focus of this study to obtain a perspective of accessibility to drinking water.

2.1 CHARACTERIZATION OF THE STUDY AREA

The study area covers the municipality of Paragominas, in the state of Pará, as shown in Figure 1. This municipality is located in the North of Brazil, belonging to the region of the Capim River and according to the regional geographic division, prepared by the Brazilian Institute of Geography and Statistics (IBGE) of 2023 it is located in the southeast region of Pará. It has an approximate area of 19,341.9 km² and a population of 105,538 inhabitants (IBGE, 2024).

Figure 1

Location of the Municipality of Paragominas, State of Pará

Source: Prepared by the authors based on data obtained from IBGE (2022).

3 METHODOLOGY

The present study is characterized as a mixed approach research (quantitative and qualitative), with exploratory and descriptive objectives. The methodology adopted is structured in four stages:

3.1 BIBLIOGRAPHIC AND DOCUMENTARY RESEARCH:

A bibliographic, jurisprudential, documentary and legislative survey on basic sanitation was carried out. Thus, it based the legal analysis of the right to water on current legislation and doctrine.

3.2 DATA COLLECTION (SNIS):

Data were extracted from the National Sanitation Information System (SNIS). The analysis was based on indicators of coverage of water supply in the state of Pará, so that a direct comparison with the municipality of Paragominas was established.

3.3 FIELD RESEARCH:

Data collection took place in January 2026, through a satisfaction survey on the water supply at Praça Célio Miranda, downtown Paragominas-PA. The research instrument was applied in accordance with the ethical precepts of research with human beings; The anonymity of the participants was fully preserved, and participation occurred on a voluntary basis.

A structured questionnaire consisting of nine questions was applied, as shown in Table 1, focusing on the perception of quality, regularity and satisfaction with the services provided by the Paragominas Sanitation Agency (SANEPAR).

The sample was composed of 40 (forty) participants who passed through the place, and the approach was based on accessibility criteria, due to the large flow of citizens from different neighborhoods.

Initially, the application of the instrument to a universe of approximately 100 respondents was estimated. However, due to operational limitations, the final sample consisted of 40 participants. The sample allowed the analysis to be carried out in a consistent manner, providing the necessary support regarding the users' perception of the service provided.

Table 1

Satisfaction questionnaire of the Paragominas Sanitation Agency

What age, gender and place of residence?
What was the water supply like before the creation of SANEPAR?
How do you currently perceive the water supply by SANEPAR?
Is there an interruption in supply? If so, how often?
What is your opinion about water quality?
Do you feel any unpleasant taste or odor?
Do you trust the use of water for food production?
Do you trust the use of water for human consumption?
Do you identify the presence of color in the water?

Source: Authors.

3.4 ANALYSIS OF THE DATA OBTAINED:

The collected data will be analyzed in two descriptive stages, through the direct counting of the number of responses in each response category and the conversion of this value into a percentage so that it allows the proportional comparison between the different items of the questionnaire.

These data were treated manually, following the rule of three, where the total number of interviewees (N=40) corresponds to 100%; identification and "n" as the number of people who chose the option.

In addition, two indicators were developed with the objective of systematizing the perception of users regarding water supply services and the proportion of confidence for direct consumption.

4 SANEPAR SATISFACTION QUESTIONNAIRE

During the study, a field research was carried out to understand the population's perception of population satisfaction with the municipality responsible for the supply and sanitation of the municipality, as shown in Table 2.

The collection took place in a public space with a large circulation of people so that data could be collected so that we could get the largest possible number of perceptions.

Table 2

Satisfaction questionnaire of the Paragominas Sanitation Agency

Number	Question	Response Category	Number of responses
1	What is the Age, Gender and Neighborhood of Residence?	18 to 29 years old 30 to 44 years old 45 to 59 years old 60 years or older Gender: Female; male; another; I prefer not to inform	40

2	What was the water supply like before the creation of SANEPAR?	Terrible Using wells in an alternative way He did not know how to inform	40
3	How do you currently perceive the water supply by SANEPAR?	Very Satisfied Good Bad	40
4	Is there an interruption in supply? If so, how often?	Frequent interruption Eventual interruption There is no interruption	40
5	What is your opinion about water quality?	Very Satisfied Good Bad	40
6	Do you feel any unpleasant taste or odor?	Yes No	40
7	Is the water supplied suitable for food production?	Yes No	40
8	Do you consider the water supplied fit for human consumption?	Yes No	40
9	Do you identify the presence of color in the water?	Yes No	40

5 ANALYSIS OF RESULTS AND DISCUSSIONS:

Graph 1 shows the comparison between the water supply service indexes between the North Region, the state of Pará and selected municipalities. It is observed that the city of Paragominas has a high coverage rate (95.75%), above the state average of 55.4% and the regional average of 64.2%, approaching the indicators of the state capital.

Figure 2

Comparison of access to water supply in the North Region, Pará and selected municipalities.

Source: SNIS (2023), prepared by the authors (2026).

The contrast with the other municipalities located in the interior such as Portel (12.07%) and São Felix do Xingu (4%) have low levels of coverage, which demonstrates the inequalities of access within the state of Pará itself.

The following equation was used to analyze the questionnaire data:

$$P = \frac{n \times 100}{N} \quad (1)$$

Where **P** stands for the percentage; **n** the response group in a response category; **N** total number of respondents.

Among the individuals who answered the questionnaire, 4 (four) were between the ages of 18-29 years; 20 (twenty) between the ages of 30-44 years; and 16 (sixteen) between the ages of 45-59 years.

Figure 3

Users' perception of water supply before the implementation of SANEPAR in Paragominas-PA

Source: Prepared by the authors, 2026.

Before the implementation of SANEPAR, 40% of the respondents classified the supply as very poor, while 30% reported the use of alternative sources, such as wells, evidencing the precariousness of the previous system. And 30% did not know how to inform, as shown in Figure 3.

Figure 4

Users' perception of the water supply by SANEPAR in the municipality of Paragominas-PA

Source: Prepared by the authors, 2026.

Faced with the question about how the water supply is currently perceived by the current supplier SANEPAR, 80% of the participants evaluated the service as "good" and 20% classified the supply as "very satisfied", with no record of negative evaluations, as shown in Figure 4. These results indicate a significant improvement in the perception of the service.

Figure 5

Frequency of interruptions in the water supply in the municipality of Paragominas-PA

Source: Prepared by the authors, 2026.

In view of the questioning about the interruption in supply, evidenced in Figure 5, it reinforces the positive perception of users regarding the regularity of the service. However, when analyzed together with the Consumption Confidence Index (CCI), it is observed that the

continuity of supply does not necessarily translate into confidence for intake, evidencing the need for actions aimed at transparency and education about water quality.

Figure 6

Water quality

Source: Prepared by the authors, 2026.

Faced with the questioning about the quality of the water, many claimed that it was a good quality. As shown in Figure 6, however, some reported that in rainy periods they notice a certain bleaching in the water, which may be the use of chemicals to maintain the standard required by the Ministry of Health ordinance No. 888.

Figure 7

Taste and odor of water

Source: Prepared by the authors, 2026.

The perception of the interviewees regarding the presence of unpleasant taste or odor in the water supplied by SANEPAR demonstrates a totally favorable result. As shown in Figure 7, 100% of the participants stated that they did not perceive any sensory alteration related to odor or taste.

This result reinforces the positive evaluation of users regarding water quality, especially with regard to organoleptic parameters, which are directly perceptible by the population. The absence of unpleasant odor and taste is a relevant indicator of service acceptance, since such characteristics directly influence the population's confidence and water consumption.

Figure 8

Population's perception of water quality

Source: Prepared by the authors, 2026.

When it comes to the confidence for the use of water in food production, all of them answered that they consider water suitable for this purpose. As shown in Figure 8, however, some, as we will see in the next graph (Figure 9), also consider it good enough for their own consumption.

Figure 9

Perception of the potability of water for human consumption

Source: Prepared by the authors, 2026.

Regarding those questioned about the adequacy of the water supplied for human consumption, 70% of the interviewees stated that they did not trust its use for direct ingestion, while 30% stated that they trusted the use of water for this purpose.

Figure 10

Population's perception of the presence of color in the water

Source: Prepared by the authors, 2026.

70% answered that they did not identify the presence of color in water, but 30% stated that they identified a whiter color at some times of the year, even compared to fruit salt, as shown in Figure 10.

The data collected are important and present a positive way in relation to the perception of water supply, especially when compared to other municipalities in the state.

It is possible to observe a predominantly positive perception on the part of the participants in relation to the quality and distribution of water in the municipality of Paragominas-PA.

Most respondents showed satisfaction with the services provided, showing that the supply has been meeting the basic needs of the population. The data show a good starting point for the perception of users of the services provided by SANEPAR.

Expanding the application of this questionnaire is essential so that it enables data collection on a larger scale, increasing the representativeness of users' perceptions. Even so, the present study constitutes an important starting point, being an initial model the current model of water supply by SANEPAR for the improvement in the quality of water distribution in the state of Pará.

With the data obtained, the Supply Satisfaction Index (ISA) was elaborated. Its objective is to measure the general level of satisfaction of users in relation to the service provided, considering the positive responses of good and satisfied. The ISA result will vary between 0 and 1, in which values closer to 1 indicate a higher level of user satisfaction.

Formula:

$$ISA = \frac{(\% \text{ positive responses})}{100} \quad (2)$$

From the participants' answers, 80% were considered good and 20% were very satisfied. Applying it to the formula, we will have the ISA of 1.00. This result indicates a high level of satisfaction of users of the services provided by the current supplier in the water supply.

The second indicator developed refers to the Consumer Confidence Index (CCI). Here it is possible to see that 30% of the answers say they trust the use for consumption of the water supplied and the others do not trust for such use.

Formula:

$$ICC = \frac{(\% \text{ who trust in consumption})}{100} \quad (3)$$

The CCI in this case had the result at 0.3 where it is visible that the population's confidence in self-consumption is still low, when compared to the portion that does not trust the use for ingestion.

In a joint analysis of the indicators elaborated: Supply Satisfaction Index (ISA) and Consumption Confidence Index (CCI), it is evident that the ISA presented the maximum (1.0),

being a high level of satisfaction. This results in aspects of regularity in the provision of services and attendance to basic demands.

The CCI, which presented a value of (0.3), shows the low level of confidence of the population in the direct consumption of water. It is evident that there is a contradiction between satisfaction with the service provided and the perception of the quality of the water for ingestion.

The explanation may be based on sensory perceptions such as the change in color at certain times and lack of information about the treatment process of the water itself. Thus, they are indicators that demonstrate the evaluation of efficiency in the provision of the service, but fragility in terms of safety in consumption.

6 CONCLUSION

Water must be treated as a scarce resource, it is possible to see that even today many think that it is an infinite resource.

A very important step towards good management is an Integrated Water Resources Management that provides a framework in which governments can align water use patterns and the needs and demands of different users, as well as their priorities.

This scenario, despite efforts in Brazil by Law No. 9,433/1997 (Water Law), is still occurring in an incipient way to materialize, given the difficulty in collecting and systematizing data, as well as the lack of interest and priority given to the theme by political managers.

It is interesting to observe the approval of the respondents in front of the service provider company in the municipality of Paragominas-PA, which is a different metric in contrast to the other municipalities in the state of Pará that do not obtain an adequate supply and a considerable population failure. It would be a model to follow, or at least, an initial model for changes, because although the municipality stands out, there is still a lack of improvements that serve the population as it deserves.

These results suggest that the perception of quality and supply is linked to the regularity of supply and reliability of the service. Even if initially, the regulations pertaining to drinking water and other regulations have been in line with the regulations. In addition, any discrepancies in the answers indicate that in the future, it will be necessary to deepen future studies, with expansion on a larger scale, in order to obtain a more comprehensive and representative analysis of the population's perception.

Although the indicators point to a positive initial scenario for the provision of the service, it is also evident the need for actions aimed at strengthening the population's confidence, through transparency, environmental education and dissemination about water quality.

The results show that satisfaction with the service does not necessarily imply the confidence of this water for consumption, and it is important to integrate operational management and transparent public communication.

ABSTRACT

The increasing incorporation of technologies based on artificial intelligence has generated remarkable transformations in logistics management, especially regarding the application of predictive models used in functions related to purchasing, inventory management, and demand analysis. These changes have enabled improvements in logistics processes, optimizing operations and bringing greater efficiency to the execution of these essential

activities. In this context, the use of data and the adoption of analytical algorithms have allowed a significant increase in forecasting accuracy, while also improving the coordination of different operations within an organization. Consequently, this has favored decision-making processes that are more consistent, particularly in an organizational environment that is becoming increasingly dynamic and integrated, reflecting the complexity and interaction among various areas and processes. The general objective of this research is to analyze the application of predictive models based on artificial intelligence in the management of purchasing, inventory, and demand, aiming at the optimization of logistics processes and the improvement of decision-making. Regarding the methodology, a qualitative approach was adopted, focused on a detailed understanding of the implications of using artificial intelligence in logistics. As a research procedure, a literature review was conducted through the systematic analysis of relevant scientific publications, enabling the construction of a consistent theoretical basis for the development of the study. In summary, the research demonstrated that the application of predictive models based on artificial intelligence in the management of purchasing, inventory, and demand contributes to the optimization of logistics processes and to improved decision-making by promoting greater forecasting accuracy, better resource allocation, and higher operational efficiency throughout the supply chain.

Keywords: Artificial Intelligence. Predictive Models. Inventory Management. Logistics.

RESUMO

A crescente incorporação de tecnologias que possuem como fundamento a inteligência artificial tem gerado transformações notáveis na administração logística, principalmente no que diz respeito à aplicação de modelos preditivos, os quais são utilizados nas funções relacionadas a compras, gerenciamento de estoques e análise de demandas. Essas mudanças têm possibilitado um aprimoramento nos processos logísticos, otimizando as operações e trazendo uma maior eficiência na condução dessas atividades essenciais. Nesse cenário, a aplicação de dados e a adoção de algoritmos analíticos têm permitido um aumento significativo na precisão das previsões, ao mesmo tempo em que melhoram a coordenação das diferentes operações dentro de uma organização. Isso, conseqüentemente, tem favorecido a realização de decisões que se mostram mais consistentes, especialmente em um contexto organizacional que se torna cada vez mais dinâmico e integrado, refletindo a complexidade e a interação entre diversas áreas e processos. O objetivo geral desta pesquisa consiste em analisar a aplicação de modelos preditivos baseados em inteligência artificial na gestão de compras, estoques e demandas, visando à otimização dos processos logísticos e à melhoria da tomada de decisão. No que se refere à metodologia, adotou-se uma abordagem qualitativa, voltada à compreensão detalhada das implicações do uso da inteligência artificial na logística. Como procedimento de pesquisa, utilizou-se a revisão bibliográfica, desenvolvida por meio da análise sistemática de produções científicas relevantes, o que possibilitou a construção de uma base teórica consistente para o desenvolvimento do estudo. Em síntese, a pesquisa evidenciou que a aplicação de modelos preditivos baseados em inteligência artificial na gestão de compras, estoques e demandas contribui para a otimização dos processos logísticos e para a melhoria da tomada de decisão, ao promover maior precisão nas previsões, melhor alocação de recursos e maior eficiência operacional ao longo da cadeia de suprimentos.

Palavras-chave: Inteligência Artificial. Modelos Preditivos. Gestão de Estoques. Logística.

RESUMEN

La creciente incorporación de tecnologías basadas en inteligencia artificial ha generado transformaciones notables en la gestión logística, especialmente en lo que respecta a la aplicación de modelos predictivos utilizados en funciones relacionadas con compras, gestión de inventarios y análisis de demandas. Estos cambios han posibilitado una mejora en los procesos logísticos, optimizando las operaciones y aportando una mayor eficiencia en la ejecución de estas actividades esenciales. En este contexto, la utilización de datos y la adopción de algoritmos analíticos han permitido un aumento significativo en la precisión de las previsiones, al mismo tiempo que mejoran la coordinación de las diferentes operaciones dentro de una organización. Esto, en consecuencia, ha favorecido la toma de decisiones más consistentes, especialmente en un entorno organizacional cada vez más dinámico e integrado, reflejando la complejidad y la interacción entre diversas áreas y procesos. El objetivo general de esta investigación consiste en analizar la aplicación de modelos predictivos basados en inteligencia artificial en la gestión de compras, inventarios y demandas, con el propósito de optimizar los procesos logísticos y mejorar la toma de decisiones. En cuanto a la metodología, se adoptó un enfoque cualitativo, orientado a la comprensión detallada de las implicaciones del uso de la inteligencia artificial en la logística. Como procedimiento de investigación, se utilizó la revisión bibliográfica, desarrollada mediante el análisis sistemático de producciones científicas relevantes, lo que permitió la construcción de una base teórica consistente para el desarrollo del estudio. En síntesis, la investigación evidenció que la aplicación de modelos predictivos basados en inteligencia artificial en la gestión de compras, inventarios y demandas contribuye a la optimización de los procesos logísticos y a la mejora de la toma de decisiones, al promover una mayor precisión en las previsiones, una mejor asignación de recursos y una mayor eficiencia operativa a lo largo de la cadena de suministro.

Palabras clave: Inteligencia Artificial. Modelos Predictivos. Gestión de Inventarios. Logística.

1 INTRODUCTION

The increasing digitalization that has been taking place in supply chains has provided a specific impetus for significant transformations in the way various organizations structure and organize their logistics-related operations. This appearance of modernization has been changing not only internal processes, but also impacting the way companies interact with suppliers and customers, leading to a new configuration in resource management and product delivery. In this specific context, the adoption of technologies that use artificial intelligence has facilitated the manipulation and processing of large amounts of data. This, in turn, has contributed to analyses that are not only more accurate, but also to the decisions made being significantly more consistent and reasoned. The use of predictive models fits perfectly into this picture. They are very useful analytical tools that can predict behaviors related to market demand in advance. In addition, these models allow for precise adjustments to inventory levels and improve purchase planning. Thus, its use results in a significant contribution to the operational efficiency of organizations.

At the same time, the complex dynamics of contemporary logistics environments reveal a panorama marked by market fluctuations, the demand for agility in operations and a deeper integration between the various processes involved. This situation requires the implementation of solutions that effectively reduce uncertainties and, at the same time, improve the responsiveness of organizations to these challenges. Thus, the use of artificial intelligence in the processes of purchase management, inventory control, and demand forecasting has become a strategy that is aligned with the new dynamics of the business world. This approach allows for actions that are more data-driven, making them less likely to be based on assumptions that may be wrong, which in turn makes operations more efficient.

The general objective of this research is to analyze the application of predictive models based on artificial intelligence in the management of purchases, inventories and demands, aiming at the optimization of logistics processes and the improvement of decision making. While the specific objectives planned are these: Understand the theoretical and operational foundations of predictive models applied to logistics and supply management; Analyze the application of artificial intelligence in demand forecasting and procurement planning; Evaluate the impacts of predictive models on inventory management and supply chain operational efficiency.

With regard to the aspects related to the methodology used, it is important to emphasize that the approach chosen for this research is qualitative. This methodological choice aims to thoroughly analyze the various nuances and implications that the application of artificial

intelligence can have in this specific field. Regarding the procedure adopted, the decision was made to carry out a bibliographic review, which was carried out through the methodical and systematic analysis of scientific works and productions that are relevant and pertinent to the theme in question. This choice made it possible to develop a solid and consistent theoretical basis, which is fundamental for the proper development of the study itself.

The article in question has been organized in such a way as to contain four distinct sections, each with a specific purpose. The first section is the Introduction, in which both the context related to the topic addressed and the objectives that guided the research are presented. Next, we have the Methodology section, which is dedicated to describing in detail the procedures that were adopted throughout the study. The third section, called Theoretical Foundation, is responsible for discussing and analyzing the main conceptual references that support the research. Finally, the last section is the Final Considerations, where a synthesis of the most relevant results obtained throughout the study is made and referrals based on these findings are also presented.

2 METHODOLOGY

The logistics management of various sectors of the economy has been undergoing significant transformations due to the growing adoption of predictive models based on artificial intelligence in purchasing, inventory, and demand management operations. This innovative model is changing the way companies organize and manage their logistics operations, offering new perspectives and techniques to optimize their processes. This is because an industry that requires a high level of precision in decisions, whether operational or strategic, cannot afford to let variability or competitiveness shape its actions. Institutions need to perform their functions with a precision that adapts to the constant changes and challenges that the market imposes, which highlights the importance of speed and accuracy in the decisions made (Sousa et al., 2026). Therefore, it is essential to conduct a survey on the use of these analytical tools, since such research allows a deeper understanding of how different organizations have structured their logistics processes based on concrete and informational data. The objective of this procedure is, first of all, to make strategic decisions more effective and to ensure greater uniformity between them.

The approach selected and implemented throughout this research is classified as qualitative, aiming mainly to achieve a comprehensive and meticulous understanding of the various phenomena associated with the application of artificial intelligence in the context of logistics. This methodological choice reflects the intention to explore intensively and analytically

the nuances and implications of this technological use in the mentioned sector. This approach enables an in-depth analysis of meanings, interpretations, and relationships that could not be fully understood or evidenced by quantitative analysis methods. Lakatos and Marconi (2017) state that qualitative research allows for an in-depth exploration of the intricate complexity of social phenomena. This approach not only offers a more detailed perspective, but also enhances the analysis by situating it in a broader, more contextualized framework. In the scientific context, this methodology has been widely adopted in several disciplines, facilitating the development of coherent understandings of emerging topics. This use, in turn, enables new forms of analysis and interpretation, which deepens our understanding of current and important phenomena that are emerging in many fields of knowledge.

Regarding the methods, a literature review was carried out as a research procedure. This method involves the thorough research of productions already carried out on the subject, which enables the recognition of concepts, theories and important results. Gil (2022) states that the literature review is an essential step in the preparation of scientific research, as it provides a theoretical and methodological basis for the study and positions the researcher in relation to the current state of knowledge.

The bibliographic review carried out was based on a thorough and rigorous analysis of different categories of sources. These sources include monographs, as well as scientific articles that have been disseminated at relevant academic events. Widely recognized scientific journals were also considered, as well as literary works that deal with specialized themes and that have significant relevance within the scope of the research area. This diversified strategy ensured that the review was thorough and grounded in consistent references. The diversity of sources employed plays an essential role in offering a comprehensive and cohesive perspective on the topic under analysis. This variety of information makes it possible to compare and intersect different perspectives and methodologies, thus enriching the analysis carried out. Lakatos and Marconi (2017) emphasize in a relevant way that the use of multiple sources of information contributes substantially to increasing the credibility of the research carried out. Gil (2022), emphatically emphasizes that the careful and judicious selection of bibliographic material is an essential and decisive factor that directly impacts the quality of the results obtained at the end of the research process.

3 THEORETICAL FOUNDATION

The theoretical foundation was structured in order to ensure a logical and articulated approach to the main elements that support the study. To this end, it was organized into three

complementary topics: 3.1 Fundamentals of predictive models and artificial intelligence in logistics, in which the conceptual and technical bases that guide the application of these tools are discussed; 3.2 Artificial intelligence in demand forecasting and procurement optimization, which examines the use of predictive algorithms in supporting decisions related to procurement planning; and 3.3 Data-driven inventory management and logistics efficiency, aimed at analyzing the impacts of artificial intelligence on cost reduction, balancing inventory levels, and improving operational efficiency. This organization favors the progressive understanding of the theme and ensures coherence in the development of the research.

3.1 FUNDAMENTALS OF PREDICTIVE MODELS AND ARTIFICIAL INTELLIGENCE IN LOGISTICS

The predictive models used in logistics in recent years have been meticulously structured and elaborated from the fusion of various techniques from the field of artificial intelligence. These techniques are highly competent and have the ability to examine and process large volumes of data, as well as being effective in detecting relevant patterns that can support decisions. In this way, this strategy enables companies to operate more efficiently and accurately in their logistics activities. In Logistics 4.0, an innovative concept that is revolutionizing conventional logistics practices, the combination of digital systems with sophisticated analytical algorithms makes it possible to predict behaviors associated with the demand for products and services. In addition, this collaboration results in the optimization of supply flows, which makes operations more efficient. This process also results in the reduction of uncertainties that normally surround logistics operations. As highlighted by the authors Batista, Ikeziri and Freitas (2021), the adoption of artificial intelligence-based tools in the internal logistics operations of companies enhances the analytical capacity of these organizations. This adoption of new technologies also allows decisions to better adjust to market dynamics.

The development of these strategies is closely linked to the progress of Industry 4.0, which has brought new technological paradigms to supply chains. According to De Oliveira Moraes and Alves Moraes (2024), integrating artificial intelligence into a company's logistics operations results in significant efficiency increases, particularly in the areas of demand forecasting and inventory control. From this perspective, predictive models work as analytical tools that integrate past data and current variables, enabling faster reactions that are aligned with fluctuations in the economic scenario.

In technical terms, logistic predictive models are supported by machine learning and time series analysis techniques, which allow the formulation of forecasts from structured and

unstructured data. As stated by Gonzalez et al. (2021), when machine learning algorithms are applied in the supply chain, increased accuracy in forecasting translates into greater integration between the various logistics steps. In this context, Table 1 summarizes the main fundamentals, techniques and applications of these models in the scope of supply management.

Table 1

Fundamentals and applications of predictive models in logistics

Dimension	Description
Theoretical foundations	Based on statistics, data science, and artificial intelligence, with a focus on pattern analysis and predictions
Main techniques	Machine learning, neural networks, regression, time series
Applications in procurement	Demand forecasting, definition of procurement volumes, selection of suppliers
Applications in stocks	Optimization of stock levels, reduction of stockouts and excesses
Applications in distribution	Route planning, deadline forecasting and delivery management
Operational benefits	Greater accuracy in decisions, cost reduction and increased logistics efficiency

Source: Adapted from Gonzalez et al. (2021); Murray et al. (2023); Breviário et al. (2025).

Recent literature also highlights the combination of predictive models and optimization techniques as a promising approach to inventory management. Breviário et al. (2025) propose the integration between linear programming and machine learning algorithms, highlighting that this articulation allows not only to predict demands, but also to define more efficient operational strategies. This perspective expands the role of predictive analysis, which is no longer just descriptive or estimative and starts to guide structured decisions in the logistics context.

In addition, the application of advanced predictive analytics in inventory management has contributed to the refinement of decision-making processes. Murray et al. (2023) point out that the use of more robust analytical models enables more accurate management of inventory levels, reducing waste and improving customer service. These models operate based on real-time data, which favors continuous adjustments and greater adherence to market conditions.

Finally, the incorporation of predictive systems into logistics also involves the ability to monitor and correct operational failures in an automated way. Causin (2021) observes that the artificial intelligence systems used in Logistics 4.0 not only anticipate problems, but also indicate corrective actions, contributing to the continuity and stability of operations. This approach reinforces the strategic role of artificial intelligence in supply management, consolidating its use as an integral part of contemporary logistics practices.

3.2 ARTIFICIAL INTELLIGENCE IN DEMAND FORECASTING AND PROCUREMENT OPTIMIZATION

Demand forecasting through artificial intelligence has generated a profound and significant transformation in the way companies structure and organize their procurement processes and the logistics planning they carry out. This change is not only modifying strategies, but also the way these activities are carried out, which affects the internal dynamics and agility of companies in meeting market demands. In the context of Logistics 4.0, it is already possible to observe the application of advanced analytical models, which are capable of processing large volumes of data and generating much more reliable forecasts. This technological evolution plays a crucial role in reducing operational uncertainties, making the logistics environment more stable and efficient. According to Intermodal (2026), models that use machine learning techniques are able to detect various consumption patterns and can also predict changes in demand more accurately and efficiently. This methodology offers a detailed analysis that helps to understand and manage variations in consumer behavior in the market. In this scenario, Table 2 presents a systematization of the main predictive models applied to logistics.

Table 2

Predictive Models Applied to Logistics

Model	Description
Linear regression	"simple and interpretable, for linear relationships between variables and demand";
ARIMA	"effective for time series with seasonality and linear trends";
Decision trees	"interpretable, they capture non-linear interactions";
Random Forest	"robustness and reduction of overfitting with multiple decision trees";
Gradient Boosting Machines (GBM)	"high accuracy, ideal for tabular data";
Support Vector Machines (SVM)	"effective for high-dimensional and nonlinear data";
Artificial Neural Networks (ANN)	"capture complex relationships in large data sets";
Recurrent neural networks (RNN) and LSTMs	"ideal for sequential data and time series";
Convolutional neural networks (CNN)	"applicable to time series to capture local patterns";
Prophet	"developed by Meta, handles seasonal components and irregular events well";
Temporal Convolutional Networks (TCN)	"capture long-term dependencies on temporal data";
XGBoost	"efficient gradient boosting often outperforms other algorithms";
Stacking	"combines multiple models to improve forecast accuracy";
Model Combination	"uses the strengths of different methods, such as combining ARIMA for seasonal patterns with neural networks for nonlinear relationships."

Source: INTERMODAL (2026).

The use of these models improves procurement planning by aligning procurement volumes with real market demands. According to Souza et al. (2026), artificial intelligence in the procurement process increases the analytical capacity of companies, leading to more informed choices in the selection of suppliers, the definition of quantities, and the management of contracts. This minimizes errors caused by inadequate forecasts and increases synergy between key areas.

In addition, the literature shows that using predictive algorithms in demand forecasting results in significant operational gains. Rustice et al. (2024) indicate that the application of artificial intelligence tools in logistics makes it possible to optimize processes, reduce costs, and improve the performance of supply chains as a whole. In this scenario, demand forecasting is no longer a mere exercise based on data from the past, but rather a tool that takes into account real-time variables, increasing the agility of companies.

With regard to demand planning, both Senhori and Gottardo (2023) and Julianelli (2023) point out that machine learning models increase the accuracy of forecasts, especially in volatile and seasonal contexts. According to these authors, the fusion of historical data, external variables, and sophisticated algorithms results in more informed decisions.

Table 3

AI and ML-Based Solutions for Monitoring and Tracking

Solution	Description
IoT devices	"IoT sensors installed in goods and vehicles collect real-time data, such as GPS location, temperature, humidity, and handling conditions";
Sensor Networks	"transmit data continuously to central systems, allowing constant monitoring of the conditions and location of assets";
IoT integration	"TMS systems integrate data from IoT sensors to provide real-time visibility into the status and location of goods during transportation";
Predictive analytics	"use ML algorithms to predict delays, optimize routes, and improve transportation efficiency";
Software Platforms	"platforms like Luft Digital offer end-to-end visibility, tracking shipments in real-time and providing continuous updates on the status of goods, occurrences, and even POD (proof of delivery)";
Alerts and notifications	"platforms send proactive alerts about delays, route deviations or inadequate conditions, allowing companies to respond quickly to problems";
Integration with RFID devices, barcodes and IoT sensors	"used to track the location and movement of items within the warehouse in real time";
Inventory Optimization	"ML algorithms analyze inventory data to optimize product disposition, reduce search times, and improve operational efficiency";
Route optimization	"analyze real-time data on traffic, weather conditions and transport restrictions, optimizing routes for faster and more efficient deliveries";
Data analysis	"advanced analytics tools that use ML to process large volumes of supply chain data, identifying patterns and anomalies";

Solution	Description
Demand and inventory forecasting	"predictive models that help predict future demand and adjust inventory levels in real time, avoiding excess or lack of products";
Last mile optimization	"platforms that use AI to optimize last-mile deliveries, considering factors such as customer locations, time windows, and delivery preferences";
Delivery tracking	"mobile apps, such as Luft Delivery, and real-time tracking systems that allow customers to track the status and location of their deliveries."

Source: INTERMODAL (2026).

The integration and use of these technologies demonstrate that artificial intelligence goes beyond its previous limitations, which focused only on demand forecasting, as now its application extends, in a significant way, to the real-time monitoring of operations and the integrated management of logistics activities in a more efficient and complete way. Artificial intelligence, according to Toledo and Camargo Filho (2025), has been one of the main responsible for influencing purchasing decisions, as it advances and is applied. This impact is especially evident in e-commerce, where technology has facilitated a more agile buying process that is adapted to consumer preferences and behaviors. Thus, artificial intelligence not only simplifies transactions but also adjusts to the needs and habits of users, making the shopping experience more efficient and enjoyable. The interconnection between forecasting and monitoring with logistics execution, without a doubt, strengthens a management model based on real data. This model brings greater operational transparency and, consequently, improves the efficiency of the purchasing processes and availability of products in the market. When these components are connected, a constant flow of information and faster decisions are ensured, resulting in a significant improvement in inventory management and customer satisfaction.

3.3 DATA-DRIVEN INVENTORY MANAGEMENT AND LOGISTICS EFFICIENCY

Data-based inventory management has established itself as one of the transformative axes of logistics operations, especially by integrating artificial intelligence techniques. In this sense, the use of automatic systems enables a more effective control of inventory levels, minimizing the uncertainties caused by demand variation. In e-commerce, process automation, enabled by artificial intelligence, leads to more assertive decisions about replenishment and inventory control, according to Freitas (2024).

The use of predictive models also transforms the way companies balance excess and stockouts. Peterson (2021) states that artificial intelligence is capable of predicting consumption trends based on past data and context variables, helping to keep inventories at optimal levels. This results in lower storage operating costs and increased product availability for the end consumer.

In analytical terms, the international literature has shown consistent progress in the implementation of artificial intelligence in inventory management. According to Albayrak Ünal et al. (2023), in a systematic review, machine learning algorithms have been used, in general, to predict demands, optimize inventory levels, and assist in strategic decision-making. These models increase data processing power and enable more detailed analysis, which results in greater efficiency in logistics operations.

Inventory forecasting, driven by artificial intelligence, becomes crucial for the coordination of supply chains in e-commerce. According to Çayli and Oralhan (2024), systems based on artificial intelligence enable more agile decision-making that is in tune with market fluctuations, especially in contexts of high volatility. These models are able to minimize operational failures and improve logistics performance comprehensively.

In addition, the use of artificial intelligence in warehousing operations has generated significant increases in operational efficiency. Favaro (2023) highlights that the use of sophisticated algorithms makes it possible to optimize the arrangement of products, minimize movement times, and make better use of physical space. These improvements have a direct effect on the productivity of operations and promote more integrated inventory management.

Finally, the use of artificial intelligence solutions for inventory management has increased the ability of companies to deal with demands that are, by nature, dynamic and complex. According to Gemniczak et al. (2025), the adoption of these technologies results in decreased logistics costs, increased accuracy of forecasts, and greater efficiency in processes. Thus, data-driven inventory management becomes a pillar of today's logistics efficiency.

4 FINAL CONSIDERATIONS

The use of predictive models with artificial intelligence in the management of purchases, inventories, and demands is transforming modern logistics, especially in organizations that need more agility in decisions and more detailed analysis. The growing availability of data, combined with the improvement of computational techniques, has enabled companies to create more integrated and evidence-based processes, which increases the consistency of operations and reduces uncertainties related to market dynamics.

In view of the analysis carried out, it is found that the research fully complied with what was proposed by investigating, in an articulated way, the theoretical aspects and practical applications of predictive models in logistics. Therefore, the general objective was achieved by exposing how artificial intelligence collaborates with the improvement of logistics processes and

the strengthening of managerial decision-making. Likewise, the specific objectives were fulfilled throughout the sections that form the theoretical foundation.

Regarding the first topic of the theoretical foundation, the research showed that the fundamentals of predictive models and artificial intelligence in logistics are anchored in analytical techniques capable of processing large volumes of data and identifying relevant patterns for scenario prediction. These models expand the ability of organizations to anticipate demands and adjust operations more consistently. Regarding the second topic, it was observed that the application of artificial intelligence in demand forecasting and purchase planning contributes to decisions more aligned with market needs, reducing estimation errors and promoting a greater balance between supply and demand. In the third topic, it was found that data-driven inventory management favors the reduction of operating costs, avoids both excesses and stockouts, and contributes to logistics efficiency, by allowing greater control and precision in the management of inventory levels.

A development that occurs naturally from this study is the recommendation for more empirical studies, especially focused on the application of predictive models in different segments of the economy. This expansion of studies is crucial to deepen and enrich the understanding of the effects that these models can cause in organizational contexts that are, by their nature, diverse and distinct. Therefore, it is hoped that these studies will help to elucidate the effectiveness and impact of predictive models in various work environments and sectors of the economy. In addition, it is pertinent and opportune to deepen the comparisons between the artificial intelligence techniques that were analyzed. It is important that this study also thoroughly evaluates the impacts that these techniques may have in specific management and administration contexts. Also investigate the interaction and synergy between predictive systems and the new technologies that are emerging, as this union can accelerate and favor the advancement of understanding about digital transformation processes in the logistics sector.

ABSTRACT

The article proposes that humanity is undergoing a civilizational transition in which geopolitical and health crises act as catalysts for overcoming an anthropocentric and unequal model. It is argued that exacerbated individualism and predatory exploitation have reached their limits, revealing the collapse of structures that prioritize competition over cooperation. The solution lies in Spiritual Intelligence (SQ), a capacity that enables individuals to reframe suffering and act as agents of ethical transformation. From a systemic perspective, society is described as an interdependent organism; therefore, environmental balance and social justice are inseparable from inner reform. The text emphasizes the ethics of otherness and humility as pillars of a new paradigm, urging conduct guided by sustainability and compassion to ensure survival in the Anthropocene and collective moral evolution.

Keywords: Civilizational Transition. Spiritual Intelligence. Systemic Interdependence. Ethics of Otherness. Planetary Sustainability.

RESUMO

O artigo propõe que a humanidade atravessa uma transição civilizatória, onde crises geopolíticas e sanitárias atuam como catalisadores para a superação de um modelo antropocêntrico e desigual. Argumenta-se que o individualismo exacerbado e a exploração predatória atingiram seu limite, evidenciando a falência de estruturas que priorizam a competição em detrimento da cooperação. A solução reside na Inteligência Espiritual (QS), capacidade que permite ao indivíduo ressignificar a dor e agir como agente de mudança ética. Sob uma visão sistêmica, a sociedade é descrita como um organismo interdependente; logo, o equilíbrio ambiental e a justiça social são indissociáveis da reforma íntima. O texto enfatiza a ética da alteridade e a humildade como pilares para um novo paradigma, urgindo por uma conduta pautada na sustentabilidade e na compaixão para garantir a sobrevivência no Antropoceno e a evolução moral coletiva.

RESUMEN

El artículo propone que la humanidad atraviesa una transición civilizatoria en la que las crisis geopolíticas y sanitarias actúan como catalizadores para superar un modelo antropocéntrico y desigual. Se argumenta que el individualismo exacerbado y la explotación depredadora han alcanzado su límite, evidenciando el colapso de estructuras que priorizan la competencia en detrimento de la cooperación. La solución reside en la Inteligencia Espiritual (IE), capacidad que permite al individuo resignificar el dolor y actuar como agente de transformación ética. Desde una visión sistémica, la sociedad es descrita como un organismo interdependiente; por lo tanto, el equilibrio ambiental y la justicia social son inseparables de la reforma interior. El texto enfatiza la ética de la alteridad y la humildad como pilares de un nuevo paradigma, instando a una conducta guiada por la sostenibilidad y la compasión para garantizar la supervivencia en el Antropoceno y la evolución moral colectiva.

Palabras clave: Transición Civilizatoria. Inteligencia Espiritual. Interdependencia Sistémica. Ética de la Alteridad. Sostenibilidad Planetaria.

1 INTRODUCTION: THE CRISIS AS A CATALYST FOR CHANGE.

This reflection proposes an analysis of the lessons arising from socio-structural conflicts, understanding the current scenario as a period of civilizational transition. This historical interval is characterized by deep socio-structural antitheses, which have been intensely evidenced and catalyzed by the global geopolitical crisis.

It is observed, primarily, the persistence of an anthropocentric and hierarchical paradigm, in which the belief in human supremacy over the ecosystem is replicated in interpersonal relationships, manifesting itself in forms of domination based on gender, race, color and nationality. Such structural prejudices fuel latent conflicts that prevent the consolidation of a perennial global peace.

In the economic sphere, the indicators reveal a critical conjuncture: paradoxically to technological advances, we currently observe the emergence of hundreds of millions of new individuals in situations of extreme vulnerability. The geographical disparity accentuates this imbalance, evidencing a nutritional and developmental dichotomy between the Northern Hemisphere — marked by pathologies resulting from overconsumption — and the Southern Hemisphere, notably the African continent, which faces serious subsistence crises.

Data from Credit Suisse's *global wealth report* (2021) corroborate the magnitude of this inequality, indicating that only 1% of the world's population (the stratum of billionaires) holds about 46% of accumulated global wealth. This concentration of capital is reflected locally in the coexistence of opulence and pockets of abject poverty. Ultimately, the contemporary scenario exposes the failure of a model of exacerbated individualism, highlighting the urgency of a transition to thoughts and policies of a collective and integrating nature.

2 SYSTEMIC INTERDEPENDENCE: FROM INDIVIDUALISM TO THE SOCIAL ORGANISM

The universality of suffering imposed by the contemporary crisis requires a review of ethical conduct and the understanding of humanity as an integrated and interdependent system. From a sociological and systemic perspective, the individual must be understood as a constituent unit of a collective social organism, in which the commitment of one of its parts inevitably has repercussions on the system as a whole. This interconnection is not limited to interpersonal relationships, but extends in a visceral way to the ecosystem balance, involving fauna, flora, and the environment as indispensable variables for human survival.

However, an intrinsic duality is observed in human agency. The same subject capable of ecocentric and unethical behaviors — promoters of exclusion and inequality — holds the potential for the mobilization of virtues such as altruism, a sense of justice, and creativity in

favor of social progress. This dichotomy suggests that social pathologies are not merely exogenous; Often, human behavior itself acts as the vector for "illness" in relationships. Consequently, the resolution of global crises lies less in external interventions and more in the ethical reorientation of human behavior.

The severe social isolation resulting from the management of the pandemic, for example, acted as a forced psychosocial experiment, exposing the fragility of pre-existing relational structures. The statistical increase in the rates of marital dissolution, generational conflicts, and the alarming growth in suicide rates and mental disorders show a crisis of adaptation and psychological support.

Furthermore, the period revealed a transfer of pedagogical responsibility: the excessive dependence of school institutions for the mediation of the basic education of children became evident when families were compelled to live together uninterruptedly. In short, the pandemic scenario not only tested the biological resilience of the species, but also worked as a catalyst for reflection on the need for a more robust collective conscience and mental health based on the quality of human bonds.

3 EPISTEMOLOGICAL ANALYSIS OF COLLECTIVE SCOURGES AND THE LAW OF PROGRESS

The understanding of war conflicts and other collective scourges requires an analysis that transcends instincts, entering the field of natural laws and human moral development. From this perspective, such events are configured as mechanisms of improvement, which impel the individual to exercise intelligence, resilience and otherness. The crisis acts, therefore, as a catalyst for virtues such as self-denial and love of neighbor, counteracting the tendencies of selfishness and vanity that often stagnate social progress.

The interpretation of these phenomena is based on the understanding of a law of cause and effect, of a universal and ethical nature. According to this principle, for every imbalance or abuse committed — whether through ignorance or deliberation — a proportional correction is manifested in the opposite direction. Such failures, although committed individually, often aggregate in collective dimensions, involving families, peoples and entire populations. Consequently, the ethical infractions of a society in relation to its environment and its fellow human beings require reparation supported by the same natural legislation that governs life.

The destructive scourges are, therefore, reflections of this corrective dynamic. As we have been taught in spiritual traditions, the perception of "evil" or "harm" is due to a strictly personal and immediate vision. From the perspective of the Law of Progress, such upheavals

are necessary instruments to accelerate the transition to a higher social order, allowing moral and organizational advances, which would take centuries, to be consolidated in a few years.

The contemporary scenario reflects the past actions of man in relation to the environment and relational structures. When projecting the post-pandemic period, it was observed that the notion of a "return to normality" was conceptually fragile, since the previous model of life proved to be dysfunctional. History, marked by events such as the Black Death and the Spanish Flu, reiterates that renewal is an evolutionary constant. In the face of the impact of the current crisis, the central issue shifts from mere biological survival to the need to open new ethical paths, fundamental for the construction of a new global reality.

4 SPIRITUAL INTELLIGENCE AS A PATH TO RESILIENCE AND COMPASSION

In the face of the deep humanitarian and political crisis that characterizes contemporaneity – manifested in warlike conflicts, geopolitical instabilities and collective tragedies – the need to identify ways to build a new global paradigm is imposed. The search for a transformed world requires a holistic understanding of the difficulties faced, based not only on technical solutions, but on a profound ethical and moral reform.

In this context, Danah Zohar's work on Spiritual Intelligence (QS) offers a relevant theoretical basis. QS is defined as the human ability to give meaning and value to actions, allowing the individual to transcend the condition of victim of circumstances to become an active agent of change. The transformation of the social structure depends intrinsically on the modification of the units that compose it: the individual. By reorienting personal values, the subject alters the family microenvironment and, consequently, the macrostructural relations in his community, acting as a vector of moral regeneration.

The recent health crisis and the imposed social isolation and the current belligerent litigation have served as catalysts for this reflection. The distancing from affections and the vulnerability of risk groups showed that collective challenges are opportunities for the exercise of resilience and the review of priorities. The civilizational ideal lies in the transition from a self-centered love to a conscious altruism, although it is observed that a majority of the global population has not yet awakened to this need for systemic cooperation.

Unlike the logic of classical natural selection, which favors competition and the survival of the fittest, the evolution of human relations in the twenty-first century points to cooperation as a requirement for sustainability. Achieving common global goals requires a synergy that eliminates predatory competition between nations and individuals. Viktor Frankl corroborates this thesis by stating that the perception of meaning in life is linked to mutual utility. Human

survival is essentially a process of interdependence: the modern individual is sustained by an invisible network of other people's labor, which provides everything from food subsistence to the technological apparatus.

Therefore, overcoming existential emptiness, which often leads to despair in moments of social conflict, depends on the discovery of a higher purpose. Self-discovery and epistemological humility are essential tools in this process. Recognizing oneself as an integral part of a complex system requires the acceptance of otherness and the multiplicity of perspectives. Just as visual perception phenomena admit different interpretations, social and moral realities demand the understanding that there are several legitimate points of view, with humility being the only path to peaceful coexistence and humanitarian integration.

5 THE ETHICS OF ALTERITY AND THE PHENOMENOLOGY OF THE NOW IN SPIRITUAL INTELLIGENCE

The development of humility in all spheres of existence is a fundamental pillar for the health of human relationships and collective progress. From the perspective of Spiritual Intelligence, it is understood that knowledge is not a static or hierarchical structure; on the contrary, it is a dynamic system of exchange. In the social fabric, the contribution of each individual — regardless of his or her technical function or socioeconomic *status* — has intrinsic value. The exchange of experiences in community reveals that wisdom is omnipresent: both the holder of high academic degrees and the operational worker have knowledge that, when integrated, promotes the evolution of the group.

The main obstacle to this integration is the persistence of egocentric traits, such as pride and vanity. Such characteristics are counterposed by the principles of Christian ethics, which, interpreted as a treatise on humanistic psychology, points to humility as the basis of blessedness and balance. The historical figure of Christ exemplifies the reversal of traditional power paradigms: while the logic of the physical plane reveres authority based on command and subordination, spiritual ethics proposes that true greatness lies in the attitude of service. The transition from "I" to "we" requires the overcoming of manipulative behaviors, whether conscious or unconscious, in favor of a conduct based on social utility and cooperation.

With regard to temporal perception, the existential mistake of inhabiting anachronistic dimensions is observed: guilt associated with the past and anxiety projected into a hypothetical future. Spiritual Intelligence advocates valuing the present moment as the only viable space for action and transformation. The past must be re-signified as a process of learning through trial and error, devoid of punitive burdens, while the future is understood as a construction resulting

from immediate choices. This "conscious presence" allows the individual to take responsibility for building his own destiny.

Furthermore, the intrinsic connection between beings and the environment emphasizes individual responsibility over the collective psychosphere. According to the principles of Zohar, the emotional and ethical state of the individual directly affects the network of connections in which he is inserted. States of negativity or hope are not isolated; they spread and contaminate or elevate the work environment and the family nucleus.

The search for truth requires a critical and investigative posture in the face of the saturation of contemporary information. The passive acceptance of digital narratives without due intellectual questioning compromises the integrity of knowledge. Autonomous thinking, supported by research and diligent study, is the essential requirement for the awakening of consciousness and for the consolidation of a society based on real and verifiable values.

6 INTELLECTUAL ETHICS, EXISTENTIAL PURPOSE, AND THE PHENOMENOLOGY OF COMPASSION

The maintenance of ethical and intellectual principles must be dissociated from arrogance, behavior that proves to be particularly deleterious in the political environment. Erudition and eloquence, when used as instruments of superiority, often act as defense mechanisms to hide vulnerabilities and uncertainties intrinsic to the subject. From the perspective of Spiritual Intelligence, intellectual maturity is manifested in the celebration of diversity and in the acceptance of otherness without a priori value judgments. Diplomatic dialectics must prioritize the debate of ideas and ideals to the detriment of personal disqualification, recognizing the limitation of human judgment, which is invariably partial because it does not know the totality of the existential trajectory of the other.

The investigation of the purpose of life and the individual vocation is an imperative for overcoming mass behavior and social conformity. The relevance of an ideal is measured by the resilience and equanimity demonstrated by its proponents in the face of adversity. Historically, the introduction of disruptive paradigms has been accompanied by resistance and social stigma. Notable examples include Giordano Bruno, whose cosmological model challenged geocentrism; James Watt, whose steam technology was initially underestimated; and Horace Wells, who faced skepticism from the medical community by proposing the feasibility of anesthesia. Such trajectories demonstrate that scientific and social progress often requires personal sacrifice for the sake of an ulterior collective benefit.

In this sense, the experience of compassion — understood etymologically as the ability to internalize the pain of others — is established as the foundation of a new planetary consciousness. The practice of humility, exemplified by the self-perception of one's own finitude in the face of the magnitude of the cosmos, is essential to mitigate the anthropocentric vision that subordinates nature and animals to human interests.

The consolidation of this new paradigm requires a revolution in contemporary thought, transcending the political sphere and reaching the educational base. The insertion of philosophy in the curricula of elementary and secondary education presents itself as a fundamental pedagogical strategy for the development of individuals capable of valuing others and understanding the power of the mind in the construction of an integrated and ethical reality.

7 PLANETARY SUSTAINABILITY AND THE ETHICS OF HUMAN CONDUCT: AN EVOLUTIONARY SYNTHESIS

The understanding that human existence occurs in a global community system imposes the imperative need for environmental preservation. Since the Rio+20 conference, the global agenda has been guided by the 17 Sustainable Development Goals (SDGs), which aim to eradicate poverty and biospheric protection by 2030. In the current stage, called the Anthropocene, human activity has altered the geological and biological balance of the Earth in a century more drastically than in the last four millennia.

According to researcher Johan Rockström, humanity has already exceeded several of the nine Planetary Boundaries, including biodiversity loss and ocean acidification. In this context, the law of action and reaction manifests itself as a systemic correction to environmental abuses. An effective response to this scenario lies in changing consumption patterns, specifically in the transition to plant-based diets. The production of animal protein is responsible for the massive emission of methane and the disproportionate consumption of water and territorial resources. The adoption of vegetarianism is, therefore, presented as a strategy of double efficacy: it mitigates environmental degradation and acts in the prophylaxis of chronic non-communicable diseases.

The lessons we must draw from the current crisis need to transcend the economic sphere, challenging society to modernize interpersonal relationships and humanize the very spirit of collectivity. The centrality of the problem lies in human conduct; As Socratic thought postulates, the negative consequences we reap are the result of the causes we plant. Moral virtue, in this perspective, is understood as a consequence of habit. The individual and collective

character is consolidated through the repetition of just and courageous acts, making conduct the main determinant of human destiny.

Regarding the challenge of maintaining humility in a competitive and self-centered global environment, Spiritual Intelligence suggests that arrogance functions as a psychological compensation for inferiority complexes. Overcoming this state requires the recognition of otherness — seeing one's neighbor as a peer. Tools such as meditation and mindful consumption help develop compassion and reduce human reactivity.

The transition to a more just and compassionate world resembles historical processes of generational renewal: just as new generations inherit and transform cultural values, today's children grow up under a new environmental and social ethic. Although religion acts as a mediating social experience, the ultimate goal must be the modification of the individual moral core. The preservation of the environment for future generations requires more than superficial actions; It demands a deep awareness of the impact of daily habits. The conclusion of this study reiterates that human evolution is inseparable from the practice of love, the continuous search for knowledge, and the understanding that systemic justice governs all phenomena of life.

ABSTRACT

This article analyzes the process of translating into Portuguese the novel *Solo queda saltar* (2018), by María Rosa Lojo, which has not yet been published in Portuguese within the Brazilian literary system, from a perspective that articulates ethics, form, and cultural mediation. Grounded in the contributions of Antoine Berman (2007), Lawrence Venuti (2008), Gideon Toury (1995), and Eugene Nida (1964), the study discusses the construction of a translation project oriented toward preserving alterity, the plurality of narrative voices, and the formal density of the source text. The adopted methodology integrates hermeneutic reading, stylistic analysis, and systematic recording of translation decisions throughout the process, configuring a practice-based approach. Based on the analysis of concrete choices—such as the translation of the title, the treatment of temporal regimes, and the use of paratextual resources—the study examines dilemmas, losses, and mediation strategies involved in transferring the novel into Portuguese. It argues that literary translation, understood as an interpretative, ethical, and situated practice, also constitutes a form of knowledge production. The study thus contributes to the debate on translational authorship, applied methodology, and translation as rewriting within the Brazilian context.

Keywords: Literary Translation. Translation Process. Memorial Novel. Memory. Alterity. María Rosa Lojo.

RESUMO

Este artigo analisa o processo de tradução para o português do romance *Solo queda saltar* (2018), de María Rosa Lojo, ainda sem tradução para o português publicada no sistema literário brasileiro, a partir de uma perspectiva que articula ética, forma e mediação cultural. Fundamentado nas contribuições de Berman (2007), Venuti (2008), Toury (1995) e Nida

RESUMEN

Este artículo analiza el proceso de traducción al portugués de la novela Solo queda saltar (2018), de María Rosa Lojo, aún sin traducción publicada en el sistema literario brasileño, a partir de una perspectiva que articula ética, forma y mediación cultural. Fundamentado en los aportes de Antoine Berman (2007), Lawrence Venuti (2008), Gideon Toury (1995) y Eugene Nida (1964), el estudio discute la construcción de un proyecto traductor orientado a la preservación de la alteridad, de la pluralidad de voces narrativas y de la densidad formal del texto fuente. La metodología adoptada integra lectura hermenéutica, análisis estilístico y registro sistemático de las decisiones traductorales a lo largo del proceso, configurando un enfoque basado en la práctica. A partir del análisis de elecciones concretas —como la traducción del título, el tratamiento de los regímenes temporales y el uso de recursos paratextuales—, se examinan dilemas, pérdidas y estrategias de mediación involucradas en la transposición de la novela al portugués. Se argumenta que la traducción literaria, comprendida como una práctica interpretativa, ética y situada, constituye también una forma de producción de conocimiento. El estudio contribuye, así, al debate sobre la autoría traductora, la metodología aplicada y la traducción como reescritura en el contexto brasileño.

1 INTRODUCTION

Literary translation is configured as a complex practice in which linguistic, aesthetic, historical and ethical dimensions are articulated. Unlike other translation modalities, its object is not limited to the transmission of informational content, but involves the recreation of forms, rhythms, voices, and effects of meaning that constitute the text as a literary work. In this sense, as Berman (2007, p. 17) states, "translation is an experience of alterity", insofar as it implies an ethical confrontation with the foreigner and with the materiality of the other's language. Translating literature, therefore, does not consist only of transposing meanings, but of assuming a reflective position in front of the source text, recognizing that every translation is crossed by choices, losses and negotiations.

The translation experience, in the meantime, implies a work of attentive listening to the materiality of the text, guided by the refusal of the so-called "deforming tendencies" (Berman, 2007, p. 48), which tend to domesticate the foreigner and neutralize its formal singularity. This perspective finds resonance in the reflections of Venuti (2008, p. 15-20), for whom the excessive search for fluency and the consequent invisibilization of the translator contribute to the systematic erasure of cultural alterity in the receiving literary system. In this sense, both are focused on the ethical dimension of translation, understood as a practice that involves choices in the face of the linguistic and cultural Other.

However, by situating such choices within concrete literary systems, one cannot disregard the role of institutional norms and expectations that condition translation behavior. This is because, as Toury (1995, p. 56) observes, all translation is carried out under the influence of norms operating in the receiving system, which guide decisions regarding acceptability and adequacy. In this way, the translator works in a field tensioned between ethical principles and systemic conditioning, where it becomes necessary to seek instruments to think about the pragmatic, emotional and affective effects of the translated text on the reader and his or her cultural community. In this process, it is necessary to emphasize that, although the notion of dynamic equivalence must be mobilized in a critical way when applied to literary translation, the formal density of the source work cannot be reduced to the production of immediate communicative effects.

From this perspective, this article aims to scrutinize the production of the translation project into Portuguese of the novel *Solo queda salto* (2018), by María Rosa Lojo, a work still unpublished in the Brazilian literary system. Taken as a memorial novel, this narrative mobilizes specific discursive procedures, in which testimony, silence and temporal fragmentation play a central role, bringing unique challenges to translation, especially with regard to the preservation

of the rhythm, significant opacity and ethical dimension of the story. Built from the articulation between individual memory, collective history and migratory experience, through female voices marked by affective restraint and reflective density, the work requires the formulation of a translation project capable of preserving the memorialistic voice, historical density and stylistic restraint, without resorting to excessive domestication or the neutralization of the marks of otherness.

For this reason, this study investigates the registration, analysis and justifications in the face of the decisions made throughout the translation process, transforming it into an object of systematic and conceptual reflection. Thus, it seeks not only to present results, but to explain the methodological path that supports the choices made.

To this end, the process of translation of the novel is critically analyzed, emphasizing the dilemmas, strategies and negotiations involved in the passage of the text from Spanish to Portuguese. More specifically, it seeks to: (a) describe the construction of the translation project adopted; (b) examine decisions related to voice, rhythm, syntax, metaphors and cultural references; (c) to discuss the limits and potentialities of the theoretical categories mobilized in the face of a concrete corpus; and (d) to reflect on translation authorship as a mediating practice between languages, cultures and temporalities.

From the methodological point of view, the study adopts a qualitative and reflective approach, based on the hermeneutic reading of the source text, on the stylistic analysis and on the systematic recording of translation decisions throughout the process. In line with proposals that defend practice-based research, this procedure articulates stages of interpretation, experimentation, revision and critical evaluation, configuring a path in which translation and investigation interpenetrate. The analysis is based on selected excerpts from the novel, confronted with their respective solutions in Portuguese, in order to highlight the criteria that guided the choices made.

Thus, by making visible the stages, impasses and decisions involved, the article seeks, in a parallel way, to contribute to the debate on the devices that articulate and shape literary networks and communities contemporaneously, showing, as Venuti (2008, p. 1-5) points out, the role of the translator as a cultural agent.

2 ETHICS, ALTERITY AND MEDIATION IN LITERARY TRANSLATION: THE QUESTION OF TRANSLATOR'S VISIBILITY, FOREIGNIZATION AND CULTURAL RESPONSIBILITY

Based on the assumption that literary translation is an interpretative, historically and ethically situated practice – also crossed by aesthetic and political relational dimensions –

Berman (2007) confronts the translator with the challenge of welcoming the text of the Other without reducing it to the standards of the target culture. This experience is not restricted only to the thematic level, but is manifested in the relationship with the materiality of the language, with the rhythm, syntax and discursive organization of the source text.

By systematically criticizing translation practices that tend to erase this otherness through processes of normalization and excessive adaptation, Berman (2007, p. 48–72) identifies a set of "deforming tendencies", such as rationalization, clarification, embellishment, and homogenization, which operate in the sense of domesticating the foreign text. These tendencies, often naturalized, produce translations that are formally correct, but impoverished from an aesthetic and cultural point of view. For this reason, in proposing an "ethics of translation", Berman does not advocate a mechanical literalism, but a rigorous attention to what he calls the "letter" of the text. This notion refers to the singular articulation between form and meaning, to the materiality of language and to the author's stylistic choices. Translating according to the letter implies, therefore, preserving the productive strangeness of the text, its irregularities, its silences and its zones of opacity.

This perspective guides, therefore, a systematic refusal of excessive rationalization and stylistic simplification, conceiving translation as a practice of listening, in which the translator places himself in a position of openness in the face of textual alterity. In this sense, the mediating role of the translator and his centrality in the process of circulation of the work are evidenced. Translation is thus configured as a space of mediation between languages, cultures, temporalities and reading regimes, in which the translator assumes the responsibility of negotiating differences without neutralizing them. Far from functioning as a neutral instance, this mediation involves interpretative choices, ethical positions and contextual evaluations, which situate the translated text within a specific literary system. In this way, the ethics of alterity proposed by Berman (2007) is articulated with a conception of critical mediation, in which the preservation of the singularity of the source text is combined with the construction of conditions of legibility in the culture of arrival.

In this context, by situating translation within power relations and cultural asymmetries, the dominant tradition in literary systems privileges fluency as a supreme value, producing translations that "give the illusion of transparency" (Venuti, 2008, p. 01) and hide the translator's work. This ideal of transparency – associated with what the author calls "translator's invisibility" – constitutes a phenomenon in which translation is presented as a text originally written in the target language, erasing its condition of cultural mediation. This practice, however, contributes to the domestication of the foreigner and to the reproduction of cultural hierarchies. For this

reason, Venuti proposes strategies of foreignization, understood as ways of inscribing marks of its linguistic and cultural otherness in the translated text. Foreignization does not aim at the exoticization of the text, but at the production of a displacement effect that invites the reader to recognize the difference. It is, therefore, an ethical and political stance, which attributes to the translator the role of cultural agent.

This notion, however, must be mobilized in a critical and contextualized way, so as to avoid both the systematic neutralization of the historical, geographical, and discursive marks of the novel and the transformation of foreignization into an empty formal procedure. As Venuti himself warns (2008, p. 18-20), the visibility of the translator is not to be confused with the subjective display of his presence in the text, but with the explicitness of the cultural and ideological conditions that cross the translation.

In this sense, visibility manifests itself less as a self-referential mark of the translator and more as an interpretative responsibility towards the work, the reader and the literary system of arrival. It is a matter of making the mediating character of translation perceptible, without shifting the focus from the aesthetic experience of the text. The translator's performance, therefore, is not guided by the affirmation of an autonomous individual voice, but by the conscious construction of a space for dialogue between cultures, temporalities and regimes of meaning.

In this way, foreignization, understood as an ethical strategy, does not imply an artificial rupture with the norms of legibility, but a critical negotiation with them. The visibility of the translator is configured, therefore, as a mediating practice, in which formal fidelity, historical responsibility and commitment to the qualified circulation of the work in the target culture are articulated.

In this horizon, the responsible visibility of the translator and the critical use of foreignization are articulated with an expanded conception of cultural responsibility. Translating a literary work, especially when it is a first insertion in the arrival system, implies intervening in the ways of reading, interpreting and valuing that work. The translator thus participates in the processes of canonization, circulation, and symbolic legitimation, contributing to the construction of the author's image and the literary tradition to which he or she belongs.

In this way, translation choices cannot be understood only as technical or stylistic solutions, but as culturally situated acts, crossed by power relations, institutional expectations and regimes of sensitivity. Assuming cultural responsibility means, in this context, recognizing that each decision — whether related to lexicon, syntax, rhythm or historical references — interferes in the way alterity will be perceived, negotiated or eventually neutralized in the target culture.

From this perspective, the ethics of alterity formulated by Berman (2007) and the critique of invisibility proposed by Venuti (2008) converge to a conception of translation as a practice of committed cultural mediation. The translator does not act as a simple transmitter or as an autonomous author, but as an interpretative agent who responds simultaneously to the source text, to the reader's horizon and to the historical conditions of reception. The cultural responsibility of translation lies, therefore, in the ability to articulate formal fidelity, historical awareness and critical commitment to the qualified circulation of the work.

3 NORMS, SYSTEMS AND INSTITUTIONAL CONDITIONINGS: REFLECTIONS ON EQUIVALENCE, EFFECT AND PRAGMATICS

If Berman (2007) and Venuti (2008) emphasize the ethical and cultural dimension of translation, Toury's (1995, p. 54-58) contributions allow us to shift reflection within the concrete literary systems in which translation takes place. According to the author, translation is not an isolated act of individual will, but a standardized activity, guided by historically and culturally determined conventions. In this sense, translation choices are crossed by institutional expectations that define what is considered acceptable or appropriate in a given reception context.

By distinguishing between preliminary, initial and operational norms, Toury (1995) shows that the translation process is regulated at multiple levels: from the selection of works to be translated to microtextual decisions regarding syntax, lexicon and style. These norms and devices, although not always made explicit, are internalized throughout the translator's training and professional practice, configuring a horizon of possibilities within which the choices become intelligible.

In the context of the present study, this perspective is fundamental, as it allows us to reflect and understand the pressures exerted by the literary system of the cultural community that receives the work to be translated, particularly with regard to the valorization of fluidity, legibility and stylistic transparency. The expectation of a text that "sounds natural" in the target language tends to favor solutions that attenuate marks of estrangement and reduce the formal complexity of the original. In this scenario, the translation project adopted for the memorial novel *Solo queda ssalto 1* (2018) does not ignore such conditionings, but seeks to negotiate them critically, assuming, when necessary, a counter-normative stance, in line with the ethical principles formulated by Berman (2007) and with the criticism of invisibility defended by Venuti (2008).

It is at this point that Nida's (1964) formulations become pertinent, albeit under careful use. In proposing the distinction between formal equivalence and dynamic equivalence, Nida (1964, p. 159) argues that translation should seek to produce in the reader of the target language a response that is "essentially similar" to that experienced by the reader of the original text. This notion, by emphasizing the pragmatic effect and reception, contributes to problematizing the relationship between form, meaning and emotional/affective impact.

However, it should be noted that the indiscriminate application of dynamic equivalence can lead to stylistic simplification and a reduction in the symbolic density of the text. This is because the exclusive emphasis on the immediate effect tends to privilege fluid reception to the detriment of formal complexity, approaching the same domesticating tendencies criticized by Berman (2007) and Venuti (2008). For this reason, in this work, the notion of equivalence is mobilized in an instrumental way and subordinated to the aesthetic and ethical project of the translation of a memorialistic text. Therefore, we seek a situated translation practice, crossed by institutional norms, but which, concomitantly, intends to make choices attentive to the effects produced on the reader, without giving up the preservation of the formal and cultural alterity of the source text.

It is understood, in this sense, that the translation activity is not neutral and that it implies a constellation of factors among which stylistic coherence, the stability of choices and interpretative responsibility orbit. It is, therefore, a relational practice, situated between the source text, the arrival system and the interpretative horizon of the translator.

From this conceptual framework, a theoretical framework is outlined that integrates the ethics of alterity and attention to form as a central axis, while systemic norms and pragmatic effects operate as complementary dimensions. This framework sustains the translation project analyzed, guided by the preservation of the memorialistic voice, historical density and stylistic containment of *Solo queda sar* (2018). Far from functioning as a normative prescription, it is still important to highlight that the theory is mobilized as an instrument for problematizing the choices made, allowing us to understand the translation process as a space for permanent negotiation between ethical principles, institutional conditionings and aesthetic requirements.

4 METHODOLOGY AND ANALYSIS OF THE TRANSLATION PROJECT CONSTRUCTION PROCESS

This study adopts a qualitative and reflective approach, guided by the understanding of literary translation as an interpretive, historical, and ethically situated practice. In line with proposals that defend practice-based research, the investigation articulates the translation

exercise itself with the systematic analysis of the decisions made throughout the process, conceiving translation simultaneously as an object and as a research instrument.

In this direction, the methodological path developed in this work is based on the articulation between hermeneutic reading, stylistic analysis and reflective registration of translation choices. This procedure allows us to understand the translation process not as a mechanical application of theoretical models, but also as a space for permanent negotiation between ethical principles, institutional conditionings and aesthetic requirements.

4.1 CHARACTERIZATION OF THE CORPUS

The corpus analyzed corresponds to the novel *Solo queda salto* (2018), by María Rosa Lojo, an Argentine writer, essayist and researcher whose literary work is recurrently dedicated to the problematization of memory, identity and migratory heritage in the historical context of the twentieth century. of the political ruptures and experiences of displacement that cross the Argentine cultural formation. In this horizon, *Solo queda salto* is inserted as a memorial narrative that revisits, from an intimate and intergenerational perspective, processes of exile, silencing and transmission of memory.

Structurally, the novel is organized into two distinct parts, configured in the form of two diaries. The first part, entitled *Celia's Diary* (1948), consists of twenty-three chapters in which the narrator records events, reflections and reminiscences from her present writing. The second part, corresponding to *Isolina 's Diary* (2018), brings together ten chapters and presents a significant change in narrative voice, establishing another temporal regime, another interpretative horizon and a perspective mediated by historical distance.

This bipartition is not a mere formal resource, but organizes the novel from two distinct enunciative positions, which structure the narrative progression and guide the construction of meanings throughout the work. The coexistence of these two diaries establishes an intergenerational dialogue in which different historical and affective experiences are articulated, without producing discursive homogenization.

The narrators of each part are self-diegetic, but occupy different enunciative positions within the narrative. This alternation of voices contributes to the complexity of the novel and to the pluralization of the modes of elaboration of memory, configuring a narrative field crossed by temporal and affective displacements.

From the formal point of view, one can observe a prose marked by lexical economy, syntactic precision and affective restraint. In graphic-structural terms, the alternation between regular and italic font functions as a structural device for the organization of memory,

differentiating diaristic registration, reflection and sensory reminiscence. Discrete metaphors, semantic fields linked to displacement, home, land, heritage and Galician landscape contribute to the construction of a dense memorial atmosphere, in which silence and ellipse play a central role.

By simultaneously combining individual memory, collective historicity, and rigorous formal elaboration, *Solo queda salto* requires a translation project capable of recognizing and preserving the singularity of its enunciative regimes. The coexistence of two narrators, two historical times and multiple layers of memory imposes specific challenges to translation, especially with regard to maintaining the internal coherence of the voices, preserving temporal fragmentation and mediating cultural references. In this sense, the novel offers a privileged field to investigate translation as a situated interpretive practice, crossed by decisions that articulate form, ethics and cultural responsibility.

4.2 STAGES OF THE TRANSLATION PROCESS

Based on the interpretative reading and the theoretical framework mobilized, an explicit translation project was elaborated, understood as an articulated set of guiding principles for the choices made. This project is based on the valorization of formal and cultural alterity, the refusal of excessive domestication and the search for a moderate foreignization, according to the propositions of Berman (2007) and Venuti (2008). On the macrotextual level, the project sought to theoretically consolidate the criteria related to the preservation of narrative rhythm, temporal fragmentation and memorialistic voice. On the microtextual level, the theoretical constellation guided decisions regarding the lexicon, syntax, the translation of metaphors, the reproduction of oral marks and the treatment of cultural references. At both levels, it was sought to maintain internal coherence and stylistic stability.

Throughout the work, the systematic recording of translation decisions was carried out through reflective notes, successive versions of the text and analytical comments. This material constituted a secondary corpus, used for the analysis of the process. The record allowed the identification of recurrences, impasses, hesitations and reformulations, evidencing the non-linear character of the translation practice. From this material, representative excerpts were selected, in which dilemmas related to voice preservation, opacity management, cultural mediation and negotiation with systemic norms are manifested. The excerpts brought/listed for analysis in this article were analyzed in the light of the theoretical framework adopted, establishing relationships between concrete decisions and conceptual categories, without reducing the process to normative schemes. The analysis was guided by qualitative criteria,

among which the following stand out: (a) stylistic coherence; (b) preservation of formal density; (c) maintenance of relevant cultural brands; (d) adequacy to the translation project; and (e) interpretative consistency. The validation of the choices was not based on abstract notions of correctness, but on the evaluation of their pertinence within the arrival system and their fidelity to the interpretative horizon constructed in the initial stage. This procedure allowed us to recognize both the limits and the potentialities of the solutions adopted.

4.3 HERMENEUTIC READING AND AESTHETIC AND INTERPRETATIVE ANALYSIS

The interpretative stage constituted the foundation of the translation process, guiding the construction of the horizon of meaning from which the subsequent decisions were elaborated. This phase consisted of the complete reading of the work, with special attention to its structural organization, enunciative variations, and the different memory regimes that configure its narrative architecture.

As already described, the novel is organized into two distinct parts and this bipartition implies not only a chronological displacement, but a change of perspective, narrative voice and discursive regime. Each diary establishes its own temporal, affective and interpretative horizon, requiring the translator to pay differentiated attention to the modulations of the enunciation.

In the first part, Celia's account articulates multiple temporal layers. Initially, the present of the diaristic narrative in 1948 is observed, from which the narrator organizes her experience. To this plane are added, in a recurrent way, fragments of the family past remembered, often marked by the use of italics, in which memory erupts as a sensorial and affective experience. In addition, the narrative incorporates moments of conscious reflection on past events, in which the narrator interprets, reorganizes and reelaborates the past in the light of her present.

This distinction proved to be central to the hermeneutic reading, since not every return to the past takes the form of involuntary reminiscence. In passages such as "Desde la venta de la casa volvieron las viejas pesadillas..." (Lojo, 2018, p. 72) , the narrator reconstructs her trajectory through an organized retrospective narrative, marked by causal connections and temporal metaphors — "una zanja cavada entre dos tiempos" — that make explicit the reflective work of memory. It is, therefore, a discursive elaboration of the past, distinct from the fragmentary sensorial irruptions present in other moments of the work.

On the other hand, in the passages marked in italics, one can observe the abrupt emergence of traumatic memory, often associated with bodily perception and spatial disorientation, as in: "todavía lejanos, se oyen los gritos de los hombres que cazan..." (Lojo, 2018, p. 18). In these passages, language privileges sensory accumulation, syntactic

fragmentation and the juxtaposition of images, configuring an enunciative regime distinct from that of retrospective reflections.

The interpretative reading thus favored the analysis of these different modalities of relationship with the past — sensory reminiscence, reflexive elaboration and the present of writing — as structuring operators of the narrative. The alternation between regular and italic fonts, far from being an ornamental resource, functions as a formal device for the organization of memory and the construction of meaning.

In the second part of the novel, corresponding to *Isolina's Diary* (2018), a significant displacement of the narrative voice is observed. The enunciation is marked by greater temporal distance, by an investigative posture and by a logic close to the documentary record, in which the narrator articulates information, documents, family accounts and historical data. In passages such as those in which "informaciones que llegan..." are mentioned, one can perceive the centrality of the circulation of information and the rational reconstruction of the past, in contrast to the fragmented sensory experience that characterizes Celia's writing. This discursive regime brings *Isolina's* writing closer to an interpretative practice aimed at mediating between inherited memory, research and historical elaboration. The text thus takes on a more analytical tone, with a greater presence of explanatory structures, enumerations and external references, requiring the translator to pay specific attention to changes in rhythm, register and information density.

The aesthetic analysis also included the examination of the recurrent use of toponyms and geographical references. The explicit mention of spaces, cities and regions does not operate only as a referential data, but as an identity and cultural marker, inscribing the narrative in concrete historical territories and reinforcing the transnational dimension of the narrated experience. These elements function as indices of alterity, calling on the reader to recognize other cultural communities and other regimes of belonging.

From the translation point of view, the preservation of these toponyms and proper names in Spanish proved to be fundamental to avoid processes of spatial and cultural neutralization, in line with the ethics of alterity formulated by Berman (2007) and with the defense of foreignization proposed by Venuti (2008). The interpretative reading thus allowed us to identify such references as sensitive points of the text, which demand specific mediation strategies.

Inspired by Berman's (2007) reflections on attention to the letter, this stage sought to apprehend the materiality of writing — rhythm, syntax, image chaining and distribution of pauses — as inseparable dimensions of meaning. At the same time, in line with Venuti (2008), the

homogenization of the different narrative regimes was avoided, preserving the internal asymmetries of the work.

In this way, the interpretative stage was configured as a privileged space for the construction of the translation project, in which reading, analysis and reflection interpenetrated. By establishing a hermeneutic horizon attentive to enunciative variations, to the modalities of memory, to the circulation of information and to the territorial inscription of the narrative, this phase grounded the later choices in an in-depth understanding of the aesthetic, historical and ethical singularity of *Solo queda salto*.

4.4 RECORDING THE PROCESS AND ANALYZING THE DECISIONS: THE TITLE AS A SYNTHESIS OF THE TRANSLATION PROJECT

The translation confrontation began with the problematization of the very title of the work, *Solo queda salto*, understood as a condensing nucleus of the aesthetic and ethical tensions that run through the novel. Far from constituting a peripheral element, the title synthesizes the affective regime of the narrative, anticipating its atmosphere of limit, displacement and survival. Its translation, therefore, could not be treated as a merely lexical operation, but as an inaugural gesture of cultural mediation.

The Spanish construction "ground fall" mobilizes a semantic field that articulates remainder, permanence and irreversibility. The verb *quedar* refers to that which subsists after the loss, to that which remains when other possibilities have already been exhausted. It is a formulation that looks retrospectively at an experience crossed by ruptures, placing the enunciator in front of a horizon already marked by absence. The gesture of "jumping", in this context, emerges as an extreme consequence of a previously established condition – not as a voluntary choice, but as a last resort in the face of the impossibility of return.

In view of this scenario, several translation possibilities were considered. The form "*Só resta salto*" was presented as the final solution, as it preserves the impersonal structure of the original and maintains relative syntactic proximity. However, the hypothesis of pluralization was also evaluated – "We can only jump" – an alternative that would emphasize the transgenerational dimension of the narrative and the collective experience of family memory. Although semantically defensible, this solution explicitly introduces a collective subject that does not exist in the source text, stabilizing a reading that the original keeps in suspension and reducing the enunciative ambiguity that constitutes part of its expressive force.

Another possibility examined was the replacement of *quedar* by the verb "*faltar*", resulting in formulations such as "*Só falta salto*" or "*Só falta falar*". At first glance, such solutions present

fluidity and naturalness in Brazilian Portuguese. However, the semantic analysis revealed a significant displacement of the temporal and affective regime. While falling mobilizes a retrospective logic — associated with the residue of experience, permanence after loss and irreversibility — "lacking" projects the statement into the future, suggesting pending, almost completion or final stage to be fulfilled. In the first case, the enunciator is situated in front of a world already crossed by rupture; in the second, the expectation of something yet to be accomplished is established. This reconfiguration alters the symbolic axis of the title, bringing it closer to a pragmatic logic incompatible with the restraint and suspension that characterize the poetics of the novel.

The choice of the verb that translates jump was also discussed. Although "jump" is more frequent in Brazilian Portuguese, its everyday and less metaphorical connotation could reduce the ambiguity of the gesture, bringing it closer to a concrete and literal action. The maintenance of "jump", although less common in colloquial use, preserves greater symbolic density and maintains a slight lexical friction that echoes the strangeness of the original.

The final decision, therefore, was guided by the preservation of the impersonal structure and the maintenance of the verb "to jump", resulting in the formulation "Only one remains to jump". This choice sought to balance intelligibility and formal fidelity, preserving the syntactic indeterminacy and interpretative openness of the title in Spanish. By avoiding both the explanatory pluralization and the prospective reorientation introduced by "lacking", we sought to maintain the tension between individual experience and collective memory that runs through the narrative.

This decision, however, did not come without impasse. The title highlights the central ethical dilemma of the translation project: between the domestication that favors fluidity in the arrival system and the preservation of the author's poetics, marked by ambiguity, restraint and symbolic density. Translating the title implied negotiating between editorial expectations, legibility and cultural responsibility, recognizing that each possible solution reorganized the temporal and affective regime of the work.

The process thus showed that the translation of the title to "Só resta salto" is not configured as a simple linguistic transposition, but as a relational activity, situated between languages, literary systems and different cultural horizons. The choice of the title thus became an example of the translation gesture itself: a conscious mediation between formal fidelity, listening to otherness and insertion in the new system of reception. By assuming this tension as constitutive, the translation project reaffirms literary translation as an ethical and

interpretative practice, in which each decision participates in the construction of the meaning and circulation of the work.

4.5 METHODOLOGICAL LIMITS: CULTURAL MEDIATION, PARATEXT AND INTERPRETATIVE SCOPE

It is recognized that the mediating character of the translation process implies specific limits to the generalization of the results presented here. The analyses developed reflect a situated experience, conditioned by the translator's training, intellectual path and interpretative horizon, as well as by the theoretical choices that guided the translation project. In this sense, the study does not intend to establish universalizable procedures, but to critically reflect on concrete decisions taken within a specific process.

In addition, the corpus layout and the qualitative emphasis adopted favor analytical depth to the detriment of quantitative coverage. The work focuses on representative excerpts from the novel, in which the ethical, formal and cultural dilemmas of translation are more evidently manifested. Such a choice necessarily implies the exclusion of other possibilities of analysis, without, however, compromising the methodological rigor of the investigation.

One of the most evident limitations of the translation process concerns the translation of cultural references strongly rooted in the historical and geographical context of the work, whose full intelligibility cannot be guaranteed only by intratextual solutions. In Chapter 1, for example, the mention of gorse flowers — a thorny plant with intense yellow flowers, extremely resistant and characteristic of the Galician landscape — highlights the difficulty of transposing into Brazilian Portuguese an element that simultaneously carries botanical, symbolic and identity value. The simple lexical translation of the term does not ensure the recognition of its cultural load, nor of its recurrent presence in the imagination of the region of Galicia. In this case, translation mediation proved to be limited, requiring the use of footnotes as a paratextual strategy to preserve cultural alterity without resorting to the substitution or neutralization of the referent.

A similar situation occurs in later passages of the work, such as the reference to "mica pieces" (Lojo, 2018, p. 97), an expression that refers to shiny mineral fragments, associated with the landscape and the narrator's sensory memory. Although the term "mica" exists in Portuguese, its recognition and connotations are not necessarily shared by the Brazilian reader. The maintenance of the term, accompanied by paratextual clarification, constituted, also in this case, a mediating solution that recognizes the limits of intratextual translation in the face of specific cultural and material references.

These examples show that certain dimensions of the text — especially those linked to the materiality of the space, the local flora, and geological or cultural elements unfamiliar to the reader of the target culture — pose challenges that cannot be fully resolved in the body of the translated text. The punctual use of footnotes, far from representing a translation failure, is configured as an ethical mediation strategy, allowing the preservation of the author's poetics and guaranteeing the reader access to layers of meaning that would otherwise be lost or distorted. Reflection on such limits thus contributes to understanding the translation process not as the application of rules, but as a situated, ethical and interpretative practice, whose reach is built precisely on the recognition of its own borders.

5 FINAL CONSIDERATIONS

The present study aimed to analyze the process of translation into Portuguese of the novel *Solo queda salto*, by María Rosa Lojo, from a perspective that articulates ethics, form, system and cultural mediation. By understanding literary translation as an interpretive, historical and situated practice, we sought to show that translation decisions are not configured as isolated technical operations, but as responsible gestures, crossed by aesthetic, institutional and political choices.

From the dialogue with the contributions of Berman (2007), Venuti (2008), Toury (1995) and Nida (1964), it was possible to build an integrated theoretical framework, in which attention to the letter, the criticism of invisibility, the analysis of systemic conditioning and the reflection on pragmatic effects operate in a complementary way. This framework allowed us to sustain a translation project guided by the preservation of otherness, by the refusal of excessive domestication and by the valorization of the formal singularity of the work.

The analysis of the structure of the novel, organized in two diaries and two distinct narrative voices, evidenced the complexity of the regimes of memory and enunciation that cross the narrative. The distinction between sensory reminiscence, reflective elaboration and historiographical mediation proved to be central to guide the construction of the translation, especially with regard to the preservation of the rhythm, temporal fragmentation and affective restraint that characterize Lojo's writing.

The examination of concrete decisions — such as the translation of the title, the treatment of italics, the preservation of toponyms and the use of explanatory notes — demonstrated that the translation process develops through permanent negotiations between formal fidelity, expectations of the arrival system and cultural responsibility. The problematization of these

choices made it possible to make the processual character of translation visible, evidencing its impasses, hesitations and reformulations.

In this sense, the study reaffirms the centrality of the translator as an interpretative agent and cultural mediator, whose role is not limited to the transfer of meanings, but actively participates in the construction of the horizon of reception of the work. The visibility assumed in this work is not configured as a self-referential statement, but as a critical responsibility before the source text, the reader and the historical conditions of circulation.

By explaining the methodological limits and the mediation strategies adopted, the article is inserted in the field of practice-based research, valuing the knowledge produced from the translation experience. Far from proposing universalizable normative models, the study offers a situated reflection, which recognizes the uniqueness of each process and the historicity of the decisions involved.

Finally, it is hoped that this work will contribute to the deepening of the debate on translation authorship, applied methodology and translation as rewriting in the Brazilian context. By dealing with a first translation of a work not yet published in the national literary system, the study reaffirms the role of translation in the expansion of the cultural repertoire and in the circulation of marginalized or little-known literary voices.

As a future development, it is intended to expand the analysis to other novels by María Rosa Lojo, as well as to deepen the investigation on the relationship between memory, writing and translation in narratives of migratory heritage. In addition, the systematic recording of the translation process can support new reflections on the training of translators and on the articulation between research, teaching and professional practice.

In this way, the translation of *Solo queda salto* is understood, in this work, not only as a textual result, but as a reflective, ethical and relational path, in which the listening to otherness, the negotiation with literary systems and the commitment to the qualified circulation of the work are simultaneously inscribed.

ABSTRACT

Arugula is appreciated as a food. Hydrocooling promotes the reduction of respiration, transpiration and promotion, promoting quality and extending shelf life. The objective of this work was to analyze the influence of hydrocooling and refrigerated storage on post-harvest arugula conservation. As variable variables were: visual and shelf fresh, loss of leaf mass analysis and byl content. The experiment was fully developed in hydrores design, wet control, experimented in fully developed design (control, wet control, experimented in design) with seven procedures. Data were selected using the normality and homology of variances test, analysis of variance (ANOVA) and mean test (Tukey 5%) in software R version 3.6.3. Visual and shelf analysis on the 8th day of storage showed that arugula was not suitable for commercialization in treatments. The weight loss of fresh leaves was 39% without control, 41% without wet control and 40% without hydrocooling. The chlorophyll content differed only on day 0 of storage. The shelf life hidrolagors do not extend the shelf life 12 °C after arugula or arugula.

armazenamento refrigerado na conservação pós-colheita da rúcula. As variáveis avaliadas foram: aparência visual e vida útil de prateleira, análise da perda de massa fresca das folhas e teor de clorofila. O experimento foi conduzido em delineamento inteiramente casualizado, com sete tratamentos. Os dados foram submetidos aos testes de normalidade e homogeneidade das variâncias, análise de variância (ANOVA) e teste de médias de Tukey a 5%, utilizando o software R versão 3.6.3. A análise visual e de vida útil no 8º dia de armazenamento demonstrou que a rúcula não era mais adequada para comercialização em nenhum dos tratamentos. A perda de massa fresca das folhas foi de 39% no controle, 41% no tratamento sem controle úmido e 40% no tratamento sem hidrorresfriamento. O teor de clorofila diferiu apenas no dia 0 de armazenamento. O hidrorresfriamento não prolongou a vida útil da rúcula armazenada a 12 °C.

RESUMEN

La rúcula es apreciada como alimento. El hidrogenfriamiento promueve la reducción de la respiración y la transpiración, contribuyendo al mantenimiento de la calidad y a la extensión de la vida útil poscosecha. El objetivo de este trabajo fue analizar la influencia del hidrogenfriamiento y del almacenamiento refrigerado en la conservación poscosecha de la rúcula. Las variables evaluadas fueron: apariencia visual y vida útil comercial, análisis de la pérdida de masa fresca de las hojas y contenido de clorofila. El experimento fue realizado en un diseño completamente al azar, con siete tratamientos. Los datos fueron sometidos a pruebas de normalidad y homogeneidad de varianzas, análisis de varianza (ANOVA) y prueba de medias de Tukey al 5%, utilizando el software R versión 3.6.3. El análisis visual y de vida útil en el octavo día de almacenamiento mostró que la rúcula ya no era apta para la comercialización en ninguno de los tratamientos. La pérdida de masa fresca de las hojas fue del 39% en el control, 41% en el tratamiento sin control húmedo y 40% en el tratamiento sin hidrogenfriamiento. El contenido de clorofila difirió únicamente en el día 0 de almacenamiento. El hidrogenfriamiento no prolongó la vida útil de la rúcula almacenada a 12 °C.

1 INTRODUCTION

1.1 PROBLEMATIC

Arugula (*Eruca sativa* M.) is a leafy vegetable with a short post-harvest shelf life, small size, and tender leaves with a pungent flavor. It originated from the Mediterranean region and belongs to the Brassicaceae family (BARREIROS et al., 2021). Arugula is highly appreciated as a food, particularly in raw salads, due to its mineral content, such as calcium, sulfur, iron, and potassium (YANG et al., 2021). It is also a source of omega-3 fatty acids and possesses medicinal properties in combating diseases like cancer (TRAKA et al., 2016; WILSON et al., 2017). However, one of the main limitations in arugula production and post-harvest is high temperature, which causes changes in its morphology, metabolism, and preservation (BARREIROS et al., 2021).

Leafy vegetables like arugula are sensitive to high temperatures and prone to dehydration due to their smaller surface area (ÁLVARES et al., 2007). Temperature is the most important factor in the preservation of harvested fruits and vegetables (REES; FARREL; ORCHAD, 2012), once that regulating biochemical and physiological processes, affecting consequently preservation of the nutritional and sensory characteristics of fruits and vegetables (CENCI, 2006). Lower temperatures reduce respiration, preserving aroma, color, flavor, texture, and other quality attributes. Refrigerated storage is recommended as it delays water loss, undesirable metabolic reactions, and decomposition caused by fungi and bacteria (CHITARRA & CHITARRA, 2005).

Various techniques are used in the preservation of fruits and vegetables, such as modified atmosphere packaging with films and waxes, controlled atmosphere storage, refrigerated storage, growth regulators, and irradiation (CARVALHO, 1994). Refrigerated storage aims to reduce the biological activity of the product, inhibit the growth of unwanted microorganisms, lower the ambient temperature, reduce transpiration through the temperature difference with the product, and increase the relative humidity of the environment (CHITARRA & CHITARRA, 2005). Pre-cooling techniques prior to refrigerated storage are employed to rapidly reduce respiration, transpiration, senescence, and ethylene production in harvested produce, thus promoting higher quality for commercial purposes. These techniques delay physiological and biochemical processes that are directly influenced by temperature (FRANÇA et al., 2015; TRAVASSOS et al., 2017; MOREIRA et al., 2019; GUERRA et al., 2020a). Hydrocooling is a pre-cooling technique that utilizes chilled water to lower the temperature of harvested vegetables before transportation, storage, packaging, and marketing. Hydrocooling is a simple, efficient, fast, inexpensive, and beneficial method as it reduces losses

and moisture during the cooling process (GUERRA et al., 2020a). Hydrocooling has proven to be effective in extending the post-harvest shelf life of fruits and vegetables, such as lychee, peach, asparagus, sweet corn, cherry, lettuce, and parsley (ALIQUE et al., 2006; ÁLVARES et al., 2007; AGUILA et al., 2009). Given the context, hydrocooling is a viable and cost-effective alternative as it reduces the "field heat" and leaf dehydration by absorbing water throughout the storage process (TRAVASSOS et al., 2017; MOREIRA et al., 2019).

Pre-cooling techniques prior to refrigerated storage are employed to rapidly reduce respiration, transpiration, senescence, and ethylene production in harvested produce, thus promoting higher quality for commercial purposes. These techniques delay physiological and biochemical processes that are directly influenced by temperature (FRANÇA et al., 2015; TRAVASSOS et al., 2017; MOREIRA et al., 2019; GUERRA et al., 2020a). Hydrocooling is a pre-cooling technique that utilizes chilled water to lower the temperature of harvested vegetables before transportation, storage, packaging, and marketing. Hydrocooling is a simple, efficient, fast, inexpensive, and beneficial method as it reduces losses and moisture during the cooling process (GUERRA et al., 2020a). Hydrocooling has proven to be effective in extending the post-harvest shelf life of fruits and vegetables, such as lychee, peach, asparagus, sweet corn, cherry, lettuce, and parsley (ALIQUE et al., 2006; ÁLVARES et al., 2007; AGUILA et al., 2009). Given the context, hydrocooling is a viable and cost-effective alternative as it reduces the "field heat" and leaf dehydration by absorbing water throughout the storage process (TRAVASSOS et al., 2017; MOREIRA et al., 2019).

Harvested vegetables retain field heat, which needs to be rapidly removed before transportation and storage to maintain their quality. Failure to do so can lead to quantitative losses (mass loss), qualitative changes (flavor, aroma, texture, and appearance), and nutritional losses (GUERRA et al., 2020a). Furthermore, improper management of temperature and air humidity in storage facilities can reduce their shelf exposure time in supermarkets, grocery stores, or farmers' markets, resulting in higher prices and impacting consumers' expenses (TRAVASSOS et al., 2017). Fruits and vegetables are perishable due to their high water content in plant tissues, resulting in a short postharvest shelf life (COELHO et al., 2015). In an attempt to maximize the postharvest shelf life of fruits and vegetables and reduce postharvest losses, it is necessary to understand appropriate practices and technologies for managing each phase, including harvesting, postharvest handling, storage, transportation, distribution, marketing, and consumption (FREITAS-SILVA & VENANCIO, 2010). Knowledge derived from postharvest physiology provides technical insights that can be obtained and applied to extend the storage time without altering their physical, chemical, nutritional, and organoleptic characteristics

(ABREU et al., 1998; ANTUNES et al., 2003). The objective of this study was analyze the influence of hydrocooling and refrigerated storage on the post-harvest preservation of arugula. The hypothesis of the study consisted that hidrocolling reduces.

2 THEORETICAL FRAMEWORK

2.1 HYDROCOOLING

The high perishability and susceptibility of fruits and vegetables to water loss, intensified by high temperatures and improper temperature and humidity management in storage facilities, necessitate the use of post-harvest techniques aimed at reducing metabolic activity and extending the shelf life of the products, both at the shelf and in refrigeration (SOUZA et al., 2017).

Hydrocooling is performed through the application of water spray onto the product or by immersing it in chilled water (water mixed with ice), immediately after fruits and vegetables are harvested and prior to the processes of packaging, storage, and distribution (BETIN et al., 2018). This technique represents a simple, efficient, and cost-effective alternative for vegetable preservation, as its objective is to remove field heat, thereby reducing the metabolic processes that lead to senescence (TEXEIRA et al., 2016).

Post-harvest control methods are employed to minimize or delay deterioration processes in products through storage, transportation, and other techniques, with hydrocooling being one of the most advantageous methods for fresh vegetables (TEXEIRA et al., 2016).

The application of this pre-refrigeration cooling technique is viable in reducing the temperature of harvested fruits and vegetables, which would otherwise occur slowly in a cold storage room. Hydrocooling enables rapid control of temperature and transpiration in harvested fruits and vegetables. Moreover, it can reduce microbial activity, respiratory rates, senescence, and ethylene production (KALBASI-ASHTARI, 2004).

Studies conducted with hydrocooling have shown that this method yields satisfactory results in leafy vegetables by delaying visual wilting, increasing shelf life, and reducing water loss in lettuce (FRANÇA et al., 2015), scallion (TRAVASSOS et al., 2017), and basil (TEXEIRA et al., 2016).

In addition to these vegetables, hydrocooling has proven to be efficient in the post-harvest conservation and extension of shelf life in lychee, peach, asparagus, sweet corn, cherry, lettuce, and parsley (ALIQUE et al., 2006; ÁLVARES et al., 2007; AGUILA et al., 2009; OLIVEIRA et al., 2015).

In lychee fruits, hydrocooling promotes the maintenance of fruit glossiness and delays fruit darkening (AGUILA et al., 2009). In parsley, hydrocooling is effective in reducing temperature, fresh matter loss, and water loss (ALVAREZ et al., 2007).

Fruits and vegetables that are insensitive to excessive moisture or unaffected by it, such as melon, kiwi, leek, spinach, and scallion, can use hydrocooling with refrigerated water as a post-harvest treatment due to its simplicity, practicality, efficiency, and low cost (BETIN et al., 2018).

2.2 POST-HARVEST CONSERVATION

Fruits and vegetables are perishable due to their high water content in plant tissues, resulting in a short postharvest shelf life (COELHO et al., 2015). In an attempt to maximize the postharvest shelf life of fruits and vegetables and reduce postharvest losses, it is necessary to understand appropriate practices and technologies for managing each phase, including harvesting, postharvest handling, storage, transportation, distribution, marketing, and consumption (FREITAS-SILVA & VENANCIO, 2010).

Knowledge derived from postharvest physiology provides technical insights that can be obtained and applied to extend the storage time without altering their physical, chemical, nutritional, and organoleptic characteristics (ABREU et al., 1998; ANTUNES et al., 2003).

Various techniques are used in the preservation of fruits and vegetables, such as modified atmosphere packaging with films and waxes, controlled atmosphere storage, refrigerated storage, growth regulators, and irradiation (CARVALHO, 1994).

Refrigerated storage aims to reduce the biological activity of the product, inhibit the growth of unwanted microorganisms, lower the ambient temperature, reduce transpiration through the temperature difference with the product, and increase the relative humidity of the environment (CHITARRA & CHITARRA, 2005).

2.3 REFRIGERATED STORAGE

Maintaining relative humidity below the ideal range for fruits and vegetables leads to water loss and alters their quality. On the other hand, relative humidity above the maximum saturation limits (98 to 100%) promotes the development of postharvest rot-causing fungi and bacteria (CHITARRA & CHITARRA, 2005).

Finger & Vieira (2007) recommend that regulating relative humidity should be coupled with a reduction in storage temperature.

Fruits and vegetables have a minimum temperature threshold, and temperatures below the tolerated range can cause injuries. This physiological alteration is known as chilling, which leads to poor ripening, sensory changes, and darkening of the pulp and epidermis. Several factors should be considered before choosing the storage temperature, such as ripeness stage, cultivar, and exposure time (ROSA et al., 2018).

The success of storage depends on certain precautions, such as storing high-quality and healthy fruits and vegetables, as refrigerated storage alone does not prevent the action of pathogens. Temperature should be regulated immediately after harvest, and the ideal temperature for each fruit or vegetable should be determined. Furthermore, the cold chain should not be interrupted until consumption (LUENGO et al., 2007).

2.4 ARUGULA (*ERUCA SATIVA* M.)

The Brassicaceae family is the botanical family with the largest number of vegetable species, and among these, arugula (*Eruca sativa* M.) stands out, being highly appreciated as a food (Figure 1) (FILGUEIRA, 2008). Additionally, arugula is a vegetable of interest due to its hardiness, early maturity, and popular acceptance (VENZON & PAULA JÚNIOR, 2007).

Figure 1

Arugula (E. sativa M.)

Source: Authors, 2022.

Arugula is native to Southern Europe and Western Asia, and in Brazil, it was introduced by the Italians. It possesses a pungent taste and pleasant aroma, along with rapid development and a short life cycle (FERRO et al., 2013; PÉLA et al., 2017). Arugula is predominantly consumed in the form of salads (VENZON & PAULA JÚNIOR, 2007).

In Brazil, the most cultivated species is *Eruca sativa* Miller, represented by the cultivated and broadleaf cultivars. Additionally, there are other smaller-scale crops of the species *Diplotaxis tenuifolia* (L.), known as wild arugula. Harvesting of arugula is done 30 to 40 days after sowing. The leaves should have a length of 15 to 20 cm, be well-developed, green, and

fresh (MINAMI & TESSARIOLI NETO, 1998). In commercial cultivation, arugula is harvested all at once by uprooting the entire plants with leaves and roots. However, it can also be harvested multiple times through leaf cutting, always above the apical bud, promoting regrowth (MINAMI & TESSARIOLI NETO, 1998).

The Southern and Southeastern regions are the major producers of arugula in the country. Arugula can be sown year-round, but satisfactory development occurs only in mild temperatures (FILGUEIRA, 2008). High temperatures stimulate the reproductive phase, resulting in premature flowering and the development of tough and pungent leaves. Despite being a temperate climate vegetable, arugula meets the requirements for cultivation in regions such as the Northeast, as its cycle and cultivation methods resemble those of lettuce and coriander (FILGUEIRA, 2008). Physicians and nutritionists recommend the consumption of arugula due to its essential role as a vegetable in human nutrition. This is attributed to its content of vitamins A and C, minerals such as calcium, sulfur, iron, and potassium, as well as being a source of omega-3 fatty acids and dietary fibers (BARREIROS et al., 2021), all of which are vital for the proper maintenance of the human body (LAURETT et al., 2017).

Furthermore, arugula has a low caloric value, with only 12 calories per cup, making it suitable for inclusion in most diets. It can stimulate the appetite due to its bitter and strong flavor, often added to heavier dishes. However, arugula can also be consumed sautéed, in salads, or as a pizza topping. The combination of arugula and watercress juice promotes detoxification of the body (TRANI et al., 1992). The commercialization of arugula is done in bunches, which are determined by the product packaging, containing 100 to 150 g for plants in conventional cultivation systems and 250 to 300 g in hydroponic systems. The weight and quality of the product depend on the seasonality of production, meaning that during hotter periods, the product has lower quality and availability, while during colder periods, it has higher quality and availability (LIMA, 2018).

The consumer market for arugula in Brazil is small but has the potential for expansion with regular supply and low prices. Arugula prices can reach over R\$ 4.00 in supermarkets in the northern region of the country. In Alagoas, arugula can cost R\$ 1.00 in open markets and R\$ 2.00 in supermarkets (PURQUERIO et al., 2007).

Leafy vegetables undergo senescence due to rapid water loss and catalytic enzymatic action (WILLS et al., 1981). During harvest, the water supply from irrigation and the soil to the plant is interrupted, resulting in transpiration and a reduction in water content in the leaves due to exchange with the environment (SANTOS et al., 2001).

The loss of water accelerates deterioration, primarily through increased catabolic reactions such as chlorophyll degradation (FINGER & VIEIRA, 1997). Senescence in lettuce, as well as in arugula, can be indicated by the degradation of chlorophyll (SANTOS et al., 2001).

3 METHODOLOGY

3.1 RAW MATERIAL, EXPERIMENTAL LOCATION, AND DETERMINATION OF THE HYDROCOOLING TIME PERIOD FOR ARUGULA

The arugula plants were sourced from a local producer and harvested in the early morning hours. They were immediately transported to the laboratory and classified into bunches weighing 80-112g. The temperature of the bunches was then measured using an infrared thermometer (TRAVASSOS et al., 2017).

The bunches were immersed in a bucket containing a 3:3 (v/v) ratio of water and ice at 4°C. Every 5 minutes, two bunches were removed, and their temperature was measured. The hydrocooling time was determined when the temperature stabilized (TRAVASSOS et al., 2017).

The temperature stabilized after 25 minutes, with the bunches reaching 8°C.

The treatments applied were: I - dry control; II - wet control (submerged in distilled water at room temperature); III - hydrocooled arugula (TRAVASSOS et al., 2017). Finally, the plants were stored at 12°C (Figure 2).

3.2 VISUAL ANALYSIS AND SHELF-LIFE EVALUATION

The arugula bunches were evaluated from the moment of harvest and treatment application until the end of the shelf-life period using subjective scores ranging from 0 to 3 (TRAVASSOS et al., 2017), as follows:

- 0 = no symptoms of wilting, yellowing, oxidation, or any other visual sign indicative of quality loss;
