- 1 = intermediate symptoms of wilting, yellowing, oxidation, or other visual signs indicative of quality loss;
- 2 = advanced symptoms of wilting, yellowing, oxidation, or other visual signs indicative of quality loss; and
- 3 = unsuitable for commercialization, indicating the end of shelf-life.

3.3 FRESH LEAF MASS LOSS

Throughout the storage period, the arugula bunches will be weighed daily until the end of the shelf-life, as determined by visual analysis. This will be estimated using the equation:

$$PMF = \frac{[(FML-FFM)]}{IFM} \quad (1)$$

Where: FML: leaf mass loss (%);

IFM: initial fresh mass (g);

FFM: final fresh mass (g).

3.4 CHLOROPHYLL CONTENT

The chlorophyll content was measured using a SPAD (Soil Plant Analysis Development) meter.

3.5 STATISTICAL ANALYSIS

The experiment was conducted in a completely randomized design (CRD) with 3 treatments (dry control, wet control, hydrocooled arugula stored at 12°C) and seven replicates. The data were subjected to tests for normality and homogeneity of variances, analysis of variance (ANOVA), and mean comparison using the Tukey test at a significance level of 5% in the statistical software R version 3.6.3 (R CORE TEAM, 2021). Graphs and tables were created using the SIGMAPLOT software.

4 RESULTS AND DISCUSSION

4.1 VISUAL AND SHELF-LIFE ANALYSIS

The visual and shelf-life analysis of rucola stored at 12°C showed the following observations:

On the 4th day of storage, rucola exhibited an intermediate level of wilting, yellowing, oxidation, or other visual signs of quality loss (rating 1).

By the 6th day of storage, rucola showed advanced symptoms of wilting, yellowing, oxidation, or other visual signs of quality loss (rating 2).

Finally, by the 8th day of storage, rucola displayed symptoms that rendered it unsuitable for commercialization, indicating the end of its post-harvest shelf life (rating 3) (Table 1).

The rucola samples already exhibited wilting symptoms in the control, moist control, and hydrocooling treatments after the first day of storage. Between the 4th and 6th day of storage, the rucola samples showed characteristics unsuitable for commercialization but still within the standards observed in some markets and farmer's markets. At the end of the storage period (8th day), the rucola samples demonstrated a deterioration in quality, particularly in terms of weight loss (Figure 3).

Table 1

Visual and Shelf-life Analysis of Rucola Stored at 12°C

Days	Subjective ratings		
	Control	Moist control	Hydrocooled
0	0	0	0
2	1	1	1
4	1	1	1
6	2	2	2
8	3	3	3

Figure 3

Visual and Shelf Life Analysis of Arugula Stored at 12°C

Source: Authors, 2022.

The visual and shelf life analysis is a measurement used to monitor the visual and nutritional deterioration of fruits and vegetables during storage (TRAVASSOS et al., 2017). It also serves as a means to identify the optimal storage period after a treatment is applied to any plant or animal-derived product, such as oranges or tomatoes subjected to refrigerated storage. In our study, the period was set at 8 days after cooling.

The visual and shelf life analysis can be performed using developed scoring scales, such as the one proposed by Travassos et al. (2017), or it can be provided by specific institutions, such as the United States Department of Agriculture (USDA) for the classification of potato sticks (CRUZ et al., 2021).

4.2 PERCENTAGE LOSS OF FRESH LEAF MASS (%)

The percentage loss of fresh leaf mass of arugula stored at 12°C did not differ statistically among the treatments (Table 2).

Table 2

Analysis of Variance (ANOVA) of the percentage loss of dry leaf mass

	GL	SQ	QM	Fc	Ft
Trat.	2	7,4	3,7	0,01	0,98
Res.	19	3451,8	191,77		
Total	21	3459,2			
C.V.	34%				

The percentage loss of fresh leaf mass of arugula stored at 12°C was 39% for the control, 41% for the moist control, and 40% for the hydrocooled arugula on the 8th day of storage (Figure 4).

Figure 4

Percentage loss of leaf mass (%) of arugula stored at 12°C

The main cause of fresh mass loss in leafy vegetables is the transpiration process during storage. This not only leads to mass loss but also decreases the overall quality of the product (SILVEIRA et al., 2015).

Water loss promotes various changes in the appearance (Figure 2), metabolism, and composition of leafy vegetables (KAYS & PAULL, 2004), resulting in alterations in color, nutrients, and vitality (WILLS et al., 2007). Some water loss is allowed during refrigerated

storage as long as it does not compromise the quality of the product displayed in commercial locations, due to wilting and wrinkling (GUERRA et al., 2020b).

On the 8th day of storage, the arugula in terms of fresh leaf mass loss was already unsuitable for commercialization, as percentages >40%, in the case of both the moist control and hydrocooled samples, are not acceptable. This result is due to leafy vegetables like arugula being composed mainly of water, constituting a content of 85 to 95% (NUNES et al., 2013).

In addition to the composition of arugula, another crucial factor is the relative humidity (RH) during refrigerated storage. The composition of 85 to 95% water, small specific area, and 100% intracellular spaces promote transpiration and water exchange to the environment with lower humidity (CRUZ et al., 2021).

Furthermore, the fresh mass loss in stored fruits and vegetables can be attributed to the evaporation of retained water after washing, as respiration, which involves the oxidation of carbohydrates into carbon dioxide and water, occurs due to the dehydration process caused by the difference in water vapor pressure between the vegetable's interior and the surrounding environment (MOREIRA et al., 2006).

As a result, wilting caused by water loss during storage is considered a significant quality attribute, as it is not accepted from a consumer's perspective (NUNES et al., 2013).

4.3 TEOR DE CLOROFILA

The chlorophyll content differed among the treatments on day 0 of storage, but there was no significant difference on the subsequent storage days (Table 3).

Table 3

Chlorophyll content of stored arugula 12°C

Dias	Chlorophyll		
	Control	Moist control	Hydrocooled
0	34,9a	35,3b	32,9b
2	35,5	35,1	33,8
4	33,7	35,0	33,5
6	32,6	32,6	33,2
8	29,7	31,7	33,0

Different letters in the rows indicate that the treatments differ significantly from each other at a 5% level of significance based on the Tukey's test.

The chlorophyll content indicates the amount of nitrogen present in the leaves and helps in identifying possible deficiencies resulting from excess water and leaching of nitrogen from

the soil (WINDER, 2018). Despite no significant differences from the 2nd to the 8th day of storage, the chlorophyll content decreases over the storage period. Therefore, it can be inferred that hydrocooling in arugula promoted chlorophyll degradation. A similar result was found by Álvares et al. (2007) in hydrocooled cilantro leaves.

The chlorophyll content can also indicate degradation due to metabolic processes occurring during storage (LANFER-MARQUEZ, 2003). Furthermore, chlorophyll degradation in senescent tissues may involve thermal alterations, which can occur in fruits or vegetables subjected to hydrocooling (HEATON et al., 1996).

Enzymatic reactions contribute to the brownish coloration in vegetables during the senescence period, attributed to the formation of phaeophytins and pheophorbides or the action of polyphenol oxidase (PPO) and peroxidase (POD) enzymes (LANFER-MARQUEZ, 2003).

5 FINAL CONSIDERATIONS

The results of this study indicate that hydrocooling did not extend the post-harvest shelf life of arugula stored at 12 °C, based on the results of visual and shelf life analysis, fresh leaf mass loss, and chlorophyll content. The effectiveness of hydrocooling as a technique for arugula preservation needs further investigation.

ABSTRACT

Heterosis, or hybrid vigor, is the phenomenon in which hybrid individuals exhibit superior performance compared to their parents, particularly in traits such as growth, productivity, and physiological vigor. This phenomenon is of great importance in plant breeding and is widely used in crops such as maize and rice, where it significantly contributes to increased agricultural productivity. Studies on heterosis began in the 18th century with hybridization experiments and were later expanded by researchers such as Mendel, Darwin, and Shull, who observed greater vigor in plants derived from crosses compared to those obtained through self-fertilization. From these studies, heterosis began to be applied in the production of hybrid cultivars. Several hypotheses have been proposed to explain the genetic basis of heterosis, with the dominance, overdominance, and epistasis theories standing out, involving different forms of gene interaction. Despite scientific advances, the phenomenon is still not fully understood and remains the subject of studies in molecular genetics and genomics. The measurement of heterosis can be performed using different methods, comparing the performance of the hybrid with that of its parents or with standard cultivars. Its application provides benefits such as higher productivity, plant uniformity, and greater efficiency in genetic improvement. Thus, heterosis represents one of the most important contributions of genetics to agriculture, being essential for the development of more productive cultivars adapted to market demands.

RESUMO

A heterose, ou vigor híbrido, é o fenômeno em que indivíduos híbridos apresentam desempenho superior em relação aos seus genitores, destacando-se em características como crescimento, produtividade e vigor fisiológico. Esse fenômeno possui grande importância no melhoramento genético de plantas, sendo amplamente utilizado em culturas como o milho e o arroz, onde contribui significativamente para o aumento da produtividade agrícola. Os estudos sobre heterose tiveram início no século XVIII, com experimentos de hibridação, sendo posteriormente aprofundados por pesquisadores como Mendel, Darwin e Shull, que observaram maior vigor em plantas provenientes de cruzamentos em comparação àquelas obtidas por autofecundação. A partir desses estudos, a heterose passou a ser aplicada na produção de cultivares híbridas. Diversas hipóteses foram propostas para explicar a base genética da heterose, destacando-se as teorias da dominância, sobredominância e epistasia, que envolvem diferentes formas de interação entre genes. Apesar dos avanços, o fenômeno ainda não é totalmente compreendido, sendo objeto de estudos em genética molecular e genômica. A mensuração da heterose pode ser realizada por diferentes métodos, comparando o desempenho do híbrido com seus genitores ou com cultivares padrão. Sua utilização proporciona benefícios como maior produtividade, uniformidade das plantas e maior eficiência no melhoramento genético. Dessa forma, a heterose representa uma das mais importantes contribuições da genética para a agricultura, sendo fundamental para o desenvolvimento de cultivares mais produtivas e adaptadas às necessidades do mercado.

RESUMEN

La heterosis, o vigor híbrido, es el fenómeno en el que los individuos híbridos presentan un desempeño superior en relación con sus progenitores, destacándose en características como crecimiento, productividad y vigor fisiológico. Este fenómeno posee gran importancia en el mejoramiento genético de plantas, siendo ampliamente utilizado en cultivos como el maíz y el arroz, donde contribuye significativamente al aumento de la productividad agrícola. Los estudios sobre heterosis comenzaron en el siglo XVIII con experimentos de hibridación y posteriormente fueron profundizados por investigadores como Mendel, Darwin y Shull, quienes observaron un mayor vigor en plantas provenientes de cruzamientos en comparación con aquellas obtenidas por autofecundación. A partir de estos estudios, la heterosis pasó a aplicarse en la producción de cultivares híbridos. Diversas hipótesis fueron propuestas para explicar la base genética de la heterosis, destacándose las teorías de la dominancia, sobredominancia y epistasia, que involucran diferentes formas de interacción entre genes. A pesar de los avances científicos, el fenómeno aún no se comprende completamente y sigue siendo objeto de estudios en genética molecular y genómica. La medición de la heterosis puede realizarse mediante diferentes métodos, comparando el desempeño del híbrido con sus progenitores o con cultivares estándar. Su utilización proporciona beneficios como mayor productividad, uniformidad de las plantas y mayor eficiencia en el mejoramiento genético. De esta manera, la heterosis representa una de las contribuciones más importantes de la genética a la agricultura, siendo fundamental para el desarrollo de cultivares más productivos y adaptados a las necesidades del mercado.

1 INTRODUCTION

One of the greatest events in the history of plant breeding was the discovery of the phenomenon of heterosis, also known as hybrid vigor. Heterosis represents the superiority of the hybrid over its parents. According to FEHR, 1987, heterosis is the increase in vigor, plant height, carbohydrate content, productivity and intensity of physiological phenomena among contrasting individuals.

The heterosis value can be quantified using the difference between the mean values of generation F1 and of parents father 1 (P1) and father 2 (P2), with the result expressed as a percentage, considering the average value of the parents equals 100. However, for practical and commercial purposes, heterosis is measured in relation to the superior parent (heterobeltiosis) or of greater economic importance (standard heterosis) (PATERNIANI, 1974).

Growth rate, fertility, biomass and productivity are among the traits where heterosis, or hybrid vigor, is often evaluated in plants. In no other cultivated species, heterosis had, and continues to have, as much impact as in maize, responsible for a continuous increase in productivity in the last century. But heterosis is also observed in autogamous species, such as rice. The impact of the use of hybrid vigor in rice is responsible for the large increase in crop productivity in China, and now in other countries. This result, again, is due to the combination of classical breeding methods based on extensive phenotypic analysis (FERREIRA ; FALEIRO, UNDATED).

For the breeder of vegetable or fruit species, the visual aspect and the size of the fruit are often more important than the productivity itself. For example, the Hawaii papaya market values fruits with an average weight of 200 to 250 grams. In this case, heterosis will become undesirable if its manifestation results in fruits with weight above these values (BORÉM; MIRANDA, 2009).

Several hypotheses have been elaborated in an attempt to explain the phenomenon of heterosis, highlighting the theses of dominance, overdominance and epistasis. All these hypotheses suggest that the contribution of many genes is responsible for the greater vigor of hybrids in relation to inbred lines.

2 HISTORY OF HETEROSIS

Heterosis began to be studied by Koelreuter (1761-1766), who observed in an experiment with tobacco crossing that the F1 hybrids had more vigor and that such hybrids received the characteristics of their parents. After Koelreuter's experiments, Mendel and Darwin

in experiments carried out with crossbreeding, they also realized that plants were larger than plants from self-fertilization (MOTA, 2011).

Gregor Mendel, in 1865, crossed peas with a length of 0.30m x 1.80m and obtained in the F1 generation plants between 1.80m and 2.25m, observing the superiority of the descendants.

Charles Darwin (1876) made detailed observations of various characteristics (height, weight, number of grains, color, fertility, etc.) in a wide and varied set of plants, comparing plants that were self-fertilized with plants of the same species crossed. Among the observations carried out, sterility and lower vigor in the self-fertilized offspring of some species stand out. Although this study has great repercussion due to the volume of information collected regarding the effects of inbreeding and heterosis, it does not delve into the mechanisms of inheritance.

The hybridization work began with BEAL using intervarietal hybrids (BEAL, 1876), EAST (1908) and SHULL (1908, 1909) who established the inbreeding-hybridization system and JONES (1918), who suggested the use of double hybrids to enable the commercialization of the hybrid seed, these being the major initial contributions to the success of hybrid maize.

According to Goldman (1999), Darwin's work (1876) was inspired by botanist Asa Gray, mentor of William James Beal, who pioneered the modern concept of heterosis. Beal has focused his career on the production of intervarietal hybrids and the control of corn pollination.

The work developed by Beal and his students was repeated, conducted by George Espy Morrow and Frank Duane Gardner in 1890. The results indicated that individuals from controlled crosses showed wide variation in ear dimensions and higher productivity than the average of the parents (Morrow and Gardner, 1893), data that corroborate the results previously obtained by Beal.

In 1909, the American botanist and geneticist Shull showed that by fertilizing the plant with its own pollen, less vigorous offspring were produced. By repeating the process over the next seven or ten generations, the descendants fixed important agronomic characteristics. Plants that generated genetically similar offspring came to be called pure lines. SHULL noticed that two different pure lines, when crossed with each other, produced offspring with great vigor, called hybrid vigor or heterosis, giving rise to hybrid maize (CIB, 2006).

Heterosis only became important in plant genetic improvement after the studies of George Shull (1908), as he was the first to suggest how heterosis could be used to develop new cultivars, interpreting that heterosis is the opposite of depression by inbreeding. Shull believed that hybrid vigor was correlated with the degree of dissimilarity between gametes.

According to him, the greatest difference in the union of the gametes, up to a certain limit, increases the stimulus or vigor. (JOSÉ, 1992; CARBONERA, 1990).

The main expected effect of heterosis is related to a substantial increase in productivity and, without a doubt, the greatest impact produced by its use was on the production of hybrid corn, which, from the 20s onwards, began to be widely used in the United States and, later, in numerous other countries, and is therefore natural. that broader data are more available for maize than for another crop (PATERNIANI, 1975).

3 GENETIC AND MOLECULAR BASIS OF HETEROSIS

Since its beginnings, modern genetics and plant breeding programs have tried to explain why, in certain crosses, the F1 hybrid is superior to the performance of homozygous parental lines, or the most vigorous of parental lines. There is great expectation about the unveiling of the molecular and physiological principles that are behind the phenomenon of heterosis. Molecular biology and genomics have recently contributed to shed light on the issue and potentially offer new strategies to capitalize on the hybrid increase in force by genetic improvement programs (FERREIRA ; FALEIRO, UNDATED).

Quantitative characters are influenced by allelic interactions. It can be of the additive type, complete or partial dominance, or overdominance. It is observed that in the additive interaction, the mean of F1 is equal to the mean of the parents, does not explore heterosis and symmetrical distribution is found in the F2 generation. In the dominance and/or overdominance interaction, the average of F1 is different from the average of the parents, and can explore heterosis. In this case, there is an asymmetric distribution in the F2 generation.

Several hypotheses have been suggested to explain the genetic basis of heterosis, including the dominance, overdominance, and epistasis hypotheses.

3.1 THE DOMINANCE HYPOTHESIS

The hypotheses to explain heterosis propose that hybrid vigor is the result of non-additive effects on the phenotype. The Dominance Theory was proposed by Bruce (1910). According to this theory, heterosis is a function of the accumulation of favorable dominant loci of different loci.

Model: $AA = Aa > aa$

$AA=10$ $Aa=10$ e $aa=0$

Parental 1
 $aaBBccDDee = 20$

x

Parental 2
 $AAbbCCddEE = 30$

F1

$AaBbCcDdEe = 50$

$AABBCCDDEE = 50$

(1)

The main objection to this theory is that, theoretically, it would be possible to find inbred lines (homozygous) as productive as hybrids, which has never been observed in practice. Proponents of this theory respond to this objection by stating that the probability of this occurring is very small, due to the large number of genes involved.

According to Borém and Miranda (2009), in the first years after the proposition of the main hypotheses explaining heterosis, these were much questioned in several specialized journals. The dominance hypothesis was objected to four times in the debate forums. The first is that some researchers considered it too simplistic and non-explanatory. The second refers to the distribution in the F2 generation, which should be asymmetric, of the type $(3A_+ + 1aa)^n$, for n genes that affect the trait in question.

Figure 1

Expected and observed distributions of heterosis in the F2 generation

Source: Google, 2026.

The third objection questioned the need for heterozygosity for the expression of vigor. It was argued that, if this hypothesis were correct, it would be possible to obtain an individual equally vigorous as an F1 hybrid and homozygous with respect to favorable dominant genes. However, an individual as vigorous as F1 has never been found that did not segregate.

In 1917, Jones introduced the concept of factorial linkage in the debates on heterosis and stated that hybrid vigor was a function of the interaction of dominant or partially dominant favorable alleles, coming from both parents. He also argued that if large numbers of alleles were involved in the manifestation of vigor, they would be linked and it would be extremely difficult to obtain all favorable alleles in a single homozygous individual.

The fourth objection to this hypothesis is based on the lack of evidence of dominance in the expression of quantitative traits. This criticism was immediately removed from the discussions, due to the experimental results that indicate partial or complete dominance as the main mode of inheritance of quantitative traits.

3.2 HYPOTHESIS OF OVERDOMINANCE

Theory that believes that the vigor presented by the F1 plants is due to high heterozygosity, that the union of the two allelic forms of the heterozygote is superior to the separate action of any of the alleles in homozygosis; the variability of protein forms in heterozygous plants would make them more efficient in the face of varying environmental conditions (CROW, 1948).

$$\begin{array}{lcl} & AA\ BB\ CC\ dd & + \quad aa\ bb\ cc\ DD \\ \text{Value} & 10+12+10+5 = 37 & 5 + 7 + 8 + 10 = 30 \end{array}$$

$$\begin{array}{lcl} F1 & Aa\ Bb\ Cc\ Dd & \\ \text{Value} & 11+13+11+11 = 46 & \end{array}$$

(2)

There are many cases in which the gene action of dominance has been detected, and very few cases of the occurrence of overdominance.

3.3 HYPOTHESIS OF EPISTASIS

The epistasis hypothesis considers the interallelic epistatic interactions of two or more loci as the main factor of superiority in the phenotypic expression of a trait in hybrids and involves the epistatic effects additive x additive, additive x dominant and dominant x dominant (POWERS, 1945; BETRÁN et al., 2004).

Epistasis was also investigated by PATERNIANI (1974) as to its possible effect on heterosis. For corn, it proved to be important in terms of days for flowering, ear height and productivity.

According to Borém and Miranda, 2009, epistasis can explain heterosis in the following situations:

- **Complementary gene action.** Considering that the A_bb and $aaB_$ parents have a relative value equal to zero, the hybrid $AaBb$ of the cross of these parents may express heterosis with a relative value equal to 2. The gene segregation of two complementary genes, such as those previously described, is 9:7 in the F_2 generation. This same idea is extended to quantitative characters, that is, there is a need for favorable alleles from all *loci* for the manifestation of heterosis.
- **Limiting reaction.** Considering that vigor occurs due to a series of reactions that can be limiting

(3)

In lines A and B, only two units of product Z are produced, due to the limitation imposed in one of the stages of the reaction, while in the hybrid, because of the epistatic action of the genes, six units of Z are produced. This hypothesis was presented by Hegeman, Leng and Dudley, in 1967, in the article "A biochemical approach to corn breeding".

- **Multiplicative sum.** Considering the total production of maize seeds with the result of the number of rows of seeds and the number of seeds per row on the cob, also considering that the number of rows and the number of seeds/row are complementarily additive characteristics, the hybrid F_1 will present intermediate values to the parents for the number of rows and seeds/row, but it will manifest heterosis as to the total number

of seeds. This explanation of heterosis based on the multiplicative sum between additive traits was presented by Mayo (1980).

4 GENETIC COLLINEARITY AND HETEROSIS

Conclusions about the genetic causes of heterosis are difficult, because the quantitative genes involved in the control of traits are still poorly known (BERNARDO, 2002). Two areas of genomics have recently been used to understand heterosis: the analysis of the structural genome, on the one hand, through the re-sequencing of genomic regions that contain QTLs associated with the control of heterosis; and the analysis of global gene expression, in general, through DNA microarrays. The contribution of the analysis of the structural genome of some maize gene regions reveals that, at least in this species, heterosis and depression by inbreeding can be explained by the numerous deletions/insertions of genes and retrotransposons identified in regions that, theoretically, should be collinear in the genome of the species (FU; DOONER, 2002).

The model of complementation of non-collinear regions is compatible with the dominance hypothesis, and explains both the observed vigor and the depression by inbreeding. The model may also explain why genetic distance, by itself, is not a good indicator of hybrid vigor. In other words, if several lineages of a species are analyzed based on polymorphism of molecular markers and the data used to estimate genetic distance, the hybrids between the genetically most distant lineages are not necessarily the ones with the greatest heterosis. However, this may be true when lineages are derived from common ancestors that have undergone insertions/deletions over time, characterizing different complementary groups that, in essence, would be the basis of heterotic groups. Skeptics of the structural genomics explanation for hybrid vigor suggest that the evaluation is adequate for maize, but other mechanisms must be acting on the expression of heterosis, since differences in microcollinearity would not be as significant in other species as observed in maize (FERREIRA ; FALEIRO, UNDATED).

Figure 2

Fig. 5. O re-seqüenciamento de regiões do genoma associadas ao controle de heterose em linhagens de diferentes grupos heteróticos de milho (*Zea mays* L.) indica que a alteração de microcolinearidade nestas regiões do genoma é responsável pela heterose em híbridos F1 e por depressão por endogamia. O vigor híbrido é explicado por complementação de genes de diferentes famílias gênicas (A, B, C e D) nas regiões seqüenciadas (a). A depressão por endogamia é explicada pela ausência de genes na região seqüenciada em linhagens puras derivadas do híbrido F1 depois de repetidas gerações de recombinação e autofecundação (b).

Source: Google, 2026.

5 MEASURING HETEROSIS

Different concepts can be used to measure the degree of heterosis of a cross. Traditional heterosis is calculated by the difference between the value of the hybrid (F1) and the average of its parents (P1 and P2).

Traditional heterosis:

$$h (\%) = F1 - (P1 + P2 / 2) \times 100 \quad (4)$$

Another concept that can be used is that of heterobiosis, which estimates the degree of heterosis in relation to the best parent (PM).

$$3 \text{ Heterobiosis } (\%) = F1 - MP \times 100 \quad (5)$$

In standard heterosis, heterosis is estimated in relation to a standard cultivar (CP).

$$\text{Standard Heterosis (\%)} = F1 - CP \times 100 \quad (6)$$

6 IMPORTANCE OF HETEROSIS FOR AGRICULTURE

Heterosis is one of the greatest contributions of Genetics to world agriculture. According to PATERNIANI (1978) the advantages of using hybrid or heterosis vigor are:

- Associate characteristics of different parents in the shortest possible time;
- Obtain superior genotypes in a relatively short timeframe;
- Use gene interactions in hybrid generation;
- Produce uniform genotypes;
- Achieve less interaction with the environment in the F1 generation;
- To produce hybrid corn seeds commercially, with favorable effects on the region's economy.

ABSTRACT

This study analyzes the negotiation process of the Free Trade Area of the Americas (FTAA), highlighting the leading role and divergent strategies between Brazil and the United States. Initiated in 1994, the proposal aimed at the economic integration of the continent, but faced significant obstacles arising from economic asymmetries and the lack of common objectives among the main actors. The article uses a bibliographic and documentary approach to evaluate the tactics adopted: while Brazil sought to strengthen Mercosur as an independent bloc and adopted a defensive posture to delay the agreement, the US aimed to consolidate its regional hegemony. With the definitive end of negotiations in 2005, the US resorted to bilateralism with countries on the Pacific coast and in Central America, while Brazil focused on South American institutionalization. The work concludes by presenting a synthesis of the distribution of costs and benefits of this regional integration for these two countries.

Keywords: FTAA. Brazil. United States.

RESUMO

Este estudo analisa o processo de negociação da Área de Livre-Comércio das Américas (ALCA), destacando o papel protagonista e as estratégias divergentes entre o Brasil e os Estados Unidos. Iniciada em 1994, a proposta visava a integração econômica do continente, mas enfrentou obstáculos significativos decorrentes das assimetrias econômicas e da falta de objetivos comuns entre os principais atores. O artigo utiliza uma abordagem bibliográfica e documental para avaliar as táticas adotadas: enquanto o Brasil buscou fortalecer o Mercosul como bloco independente e adotou uma postura defensiva e protelar o acordo, os EUA visavam consolidar sua hegemonia regional. Com o encerramento definitivo das negociações em 2005, os EUA recorreram ao bilateralismo com países da margem pacífica

1 INTRODUCTION

The intention to create the Free Trade Area of the Americas (FTAA) emerged in 1994 at the first Presidential Summit of the Americas. The main objective was to promote economic integration and free trade among all the countries of the American continent. From the launch of such a proposal to the end of its negotiations, some obstacles related to the economic disparities of the countries involved become evident. Thus, the lack of common objectives between Brazil and the United States (USA), the main protagonists of this negotiation table, stands out.

The main objective of Brazilian foreign policy was to delay the negotiation process. The strategy, therefore, was to negotiate from Mercosur acting as an independent sub-regional bloc. This initiative reflected the fact that Brazil intended to assert itself as a large regional and even world economy, and feared integration into the same space to which it included the American economy. Such elements relied on defensive positions based mainly on the diagnosis of the fragility of some Brazilian industrial sectors.

The main interests of the U.S. in the creation of the FTAA were to strengthen its bargaining power vis-à-vis Europe and the countries of East Asia, and to create a single regional integration that would promote Latin America in global spheres, keeping the U.S. as the main agent (*hub*). This process can be seen as a deliberate attempt by the U.S. to consolidate its hegemony in the Western Hemisphere by integrating Latin American economies with those of North America and legitimizing an integration agenda.

The fourth Summit of the Americas in 2005 definitively marked the end of the FTAA negotiations. With the end of the possibility of a comprehensive hemispheric agreement, the U.S. government sought to establish free trade agreements with individual countries, including Chile, Peru, Colombia, and Ecuador, while Brazil sought to establish South America as an enlarged market. The difference between such strategies is that while the US sought more specific and detailed agreements with the different countries, Brazil aimed at greater multilateral institutionalization in an attempt to build a regional identity.

Therefore, this article has the following objectives: First, to carry out a bibliographic and documentary research on the main aspects of the FTAA negotiations. Then, analyze the negotiation strategies adopted by Brazil and the USA. And finally, to evaluate the possible losses and gains of this regional integration for these two countries.

2 FTAA NEGOTIATIONS

The intention to create a Free Trade Area of the Americas called FTAA (FTAA) emerged at the first Presidential Summit of the Americas, held in Miami in December 1994, at the call of the then President of the United States (USA) Bill Clinton. Thirty-four heads of state were summoned⁴ and approved at the end of the meeting a declaration of principles and a plan of action. The first referred to preserving and strengthening democracy in the Americas; promoting prosperity through economic integration and free trade; eradicate poverty and discrimination on the continent; ensure sustainable development and preserve the environment. The action plan, on the other hand, had as a central element the commitment to promote economic integration and free trade in the hemisphere. In this sense, the Special Trade Commission of the OAS (Organization of American States), with the support of the Inter-American Development Bank (IDB) and ECLAC (tripartite committee), was delegated the systematization of data and studies of the integration arrangements with the description of rights and obligations. The main objective was to determine the points of coincidence and divergence, aiming to improve the link between the different disciplines and make them more homogeneous. At first, it was decided that the negotiations should be concluded in 2005 (FTAA, 2004).

In 1995, 1996 and 1997, three meetings of foreign trade ministers were held. It was determined that the FTAA should build on the existing sub-regional and bilateral agreements, make them more similar, with a view to expanding and deepening continental integration. The significant differences in the size of the economies and in the levels of development of the countries involved were recognized, thus seeking ways to facilitate the integration of less developed countries. Therefore, working groups were created in several areas, such as: i) access to markets; (ii) customs procedures and rules of origin; iii) services and investments; iv) standards of technical, sanitary and phytosanitary barriers to trade; v) subsidy, anti-dumping measures and countervailing duties for economies of menres; vi) government purchases; vii) intellectual property rights; viii) competence policies and dispute resolution; among others (DE GINZBURG, 2004).

Between 1998 and 2003 there were two other Summits of Heads of State and five other ministerial meetings. In general, it was reaffirmed that the FTAA agreement would be balanced,

⁴ The heads of state and government of Antigua and Barbudas, Argentina, Bahamas, Barbados, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Dominica, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Dominican Republic, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and Granidas, Suriname, Trinidad and Tobago, participated in the meeting. Uruguay and Venezuela, all members of the OAS (Organization of American States). Cuba, although a member of the OAS, was suspended from participating in the activities of this organization (FTAA, 2004).

broad, and consistent with WTO guidelines,⁵ and that it would constitute a single commitment. Considering, also, the need to implement a transparent negotiation process, and, even more importantly, taking into account the differences in the level of development and size of the economies, to facilitate the full participation of all participating countries. In this sense, the declaration issued in the final phase of the negotiations recognizes the need for flexibility so that countries could assume different levels of commitments, allowing for an adequate balance of rights and obligations. Such measures included technical assistance and transition mechanisms, such as the application of longer deadlines for the fulfillment of some obligations (FTAA, 2004).

From the launch of the proposal to create the FTAA until the deadline for negotiations, it became evident that this period was not sufficient to solve some obstacles related to disparities in the economies of the participating countries. This asymmetry is highlighted by the participation of the world economic power and Latin American and Caribbean countries. In the specific case of the latter, participation in a continental arrangement implies evaluating and reconciling national and regional interests with hemispheric ones. In reality, it is a question of cost-benefit analysis that is not trivial for such an integration. Not all effects are quantifiable by the volume of imports and exports and by the trade balance, because this relationship involves much more than the trade results (DE GINZBURG, 2004).

At the heart of this frustration is the lack of common goals between Brazil and the United States (USA), the main protagonists of this regional negotiation table. The first was determined to facilitate the market for agricultural goods and trade countervailing measures (*anti-dumping*). The second pursued new trade issues, such as: services, rules for foreign investments, government procurement and intellectual property rights. In addition, Brazil and Argentina proposed a model in which different topics were discussed on separate "tracks". This alternative proposal was designed to face the liberalization of trade in goods on the one hand, and on the other, it would involve these new trade issues, giving the option to these countries to adhere or not to the deeper integration agreements (OLIVEIRA, 2009, p. 193).

⁵ It should be noted that the criterion adopted was aimed at a conciliatory formula to accommodate the existence of a multiplicity of bilateral agreements and various integration schemes. The main ones are: the North American Free Trade Agreement (Canada, Mexico and the USA, 1994); the Group of Three (Colombia, Mexico and Venezuela, 1994); the Central American Common Market (Consisting of the five countries of Central America, 1960); the Caribbean Community (made up of the Caribbean countries plus Belize, Guyana and Suriname, 1973); the Andean Community (Bolivia, Colombia, Ecuador, Peru and Venezuela, 1996); and Mercosur (Argentina, Brazil, Paraguay and Uruguay, 1991).

2.1 BRAZIL STRATEGIES

Confrontations between the U.S. and Brazil in multilateral trade negotiations go back much longer than the Doha Round in 2001 or the election of a leftist government in Brazil in 2002. The main arguments against Brazil's adherence to a process of continental integration had in common a belief in the superiority of protectionism, and an anti-Americanism fostered by US unilateralism, in its policies towards Latin America⁶ (ALBUQUERQUE, 2006). Such arguments can be grouped into five categories: i) *Global trader argument*: Brazil has a characteristic of internationally balanced trade and has an interest in all regions of the world; ii) *Argument of Mercosur's superiority*: in commercial terms, in political and cultural issues, in addition to not embedding inequalities of dimensions such as that of the FTAA; iii) the argument of American disinterest/unilateralism: the U.S. priorities would be in Europe and the Asia-Pacific, and the FTAA would be a reflection of American unilateralism and its constant search to mark its hegemony in the region; iv) *Argument of the superiority of the European Union*: an agreement with the EU would be more advantageous for Brazil for various reasons; and v) *scrapping argument*: the service sector and industry would be scrapped with an increase in competition with the US. In other words, easier access to the domestic market would lead to a displacement of American subsidiaries back to their headquarters, since they could export to Brazil. In addition, the increase in competition would lead to the bankruptcy of the companies with non-US capital installed here.

Based on this context, the main objective of Brazilian foreign policy was to delay the negotiation process⁷. "The Brazilian government responded to the Initiative for the Americas, from a rhetorical point of view, by not saying yes or no" (ALBUQUERQUE, 2006). According to Rompay (2004, *apud* TEXEIRA, 2011), Brazil was clearly the least enthusiastic country in advancing hemispheric integration, among all the other participants, in 1991, on the occasion of the first Summit of the Americas. The strategy, therefore, was to negotiate from Mercosur acting as an independent sub-regional bloc. Such a choice was intended to avoid the notion of US hegemony and to serve as a counterweight to the NAFTA bloc. "It was a clear answer: the first priority for both countries [Brazil and Argentina] was their integration into the subregion, and continental integration would be a step to be considered later." (ALBUQUERQUE, 2006, p. 565). In 1994, Brazil, Argentina, Paraguay and Uruguay signed the Ouro Preto Protocol that

⁶ These opinions were defended by a broad front formed by the high civil and military bureaucracy, the majority of the business community, the union leaderships, the academic and communication media. It should be noted that for the author, the arguments are summarized in generic terms and cannot be attributed to a specific sector of the government or civil society.

⁷ The "rationality" of this strategy was the conviction of some domestic actors with some capacity to influence Brazilian foreign policy, that Brazil would only lose with the FTAA. "Those who only have to lose, have everything to gain by gaining time" (ALBUQUERQUE, 2006).

complemented the 1991 Treaty of Asunción and formalized Mercosur. This gave it legal personality within the scope of international law, endowing it with effective capabilities in international negotiations. The following year, the four countries implemented a common external tariff (CET) covering about 85% of goods traded within the bloc. It is, therefore, an important advance in the process of regional integration, becoming a customs union⁸ (TEIXEIRA, 2011, p. 191).

In 1995 the European Union and Mercosur signed the "Interregional Framework Agreement on Cooperation". The objective was to establish a broad political and economic partnership, based on three fundamental pillars: political dialogue, cooperation, and trade and investment. The latter aimed at creating a free trade area. "The strong historical and cultural ties between the countries on both sides of the Atlantic, which led to the existence of large colonies of European emigrants [...] are largely responsible for the existence of significant trade and investment flows from the EU to Mercosur." (PINTO AND GUIMARÃES, 2005, p. 4). In this sense, in the EU's understanding, such flows must be preserved and even expanded, and the strengthening of Mercosur would provide this objective. Part of this interest of the EU in establishing the agreement must be analyzed in the light of the process of formation of the FTAA, precisely to oppose the interests of the US in Latin America. In addition, by establishing economic relations outside Mercosur, such as with the EU, the countries of the bloc aimed to increase their negotiating capacity with the United States and in the discussions of the process of creating the FTAA itself.

This initiative reflected the fact that Brazil intended to assert itself as a large regional and even world economy, and feared integration into the same space to which it included the American economy. "Brazil is in good interest to strengthen Mercosur, as this allows it to have greater power in the FTAA negotiations. This negotiating power could also be strengthened if Mercosur establishes the association agreement with the EU." (PINTO AND GUIMARÃES, 2005, p. 9). According to Valladão (1998), only a strict cooperation between Europe and Latin America could guarantee the diversity and specificity of these two blocs in the face of the 'North American steamroller'.

In addition, many argued that Mercosur had a continental vocation from the beginning. The aim was to create a broad free trade area in Latin America beyond the limits of the southern cone. In 1996, for example, it signed association agreements with Chile and Bolivia, which was

⁸ Two points should be highlighted: first, Mercosur is an imperfect customs union, considering the fact that some of the goods were outside the scope of the TEC. Secondly, and from an economic point of view, Mercosur has been the second largest bloc in terms of trade flow in the hemisphere, after NAFTA, and the fourth largest in the world (TEIXEIRA, 2011).

renamed "political Mercosur". In this context, Brazil's strategy was to lead the formation of a South American bloc with the objective of institutionalizing South America and increasing the costs for the establishment of the FTAA. This would secure and reinforce its position within the South American subsystem, in order to prevent its absorption into a broader hemispheric system. Then-President Fernando Henrique Cardoso referred to Mercosur as "[...] a pole from which the South American space [would be organized]" (CARDOSO, 1998, p. 127 *apud* TEIXEIRA, 2011, p. 192). The objective was to create obstacles for greater US penetration in South America, and according to Teixeira (2011), it was facilitated by the lack of leadership on the part of the US in relation to the countries of the region.

The FTAA negotiations were in fact launched at the second Summit of the Americas, in April 1998, in Santiago, Chile. Top leaders agreed that the final product should be a single commitment⁹, and that countries could negotiate as members of a sub-regional economic bloc. These were important diplomatic victories for Brazil and Mercosur. "The idea that countries could negotiate as blocs legitimized Mercosur's position in the negotiations, and allowed smaller countries to increase their influence. [In addition], through sub-regional blocs it was possible to reduce the enormous asymmetries of bargaining power, and smaller countries could even reject some agreements." (CARRANZA, 2004, p. 321). Specifically, Brazil sought to balance the FTAA negotiations with the U.S. in two ways: by forging a single South American negotiating bloc capable of standing up to the U.S.; and courting other trading partners to reduce its dependence on the U.S. "Brazil wants to consolidate itself as a regional hegemon in South America, and feels that the presence of the U.S. competes with this objective." (FAURIOL AND PERRY, 1999, p. 32-33). It should be noted that the Brazilian elites were preferable to a sub-regional integration (Mercosur) to a hemispheric integration¹⁰.

In addition, the Mercosur countries did not consider the FTAA as a priority in their trade policy, due to the bloc's own economic structure and trade pattern¹¹. On the one hand, these countries had a diversified economic structure, being both producers of primary goods and manufactured goods. In 1999, three-quarters of Mercosur's exports were manufactured goods, 24% of which were characterized by high economies of scale and intensive in natural resources. The rest, primary goods, agricultural commodities accounted for 15% of total exports. On the other hand, countries such as Brazil and Argentina had, in this period, very diversified trade

⁹ The Single Commitment Requirement preserved flexibility for *trade-offs* and prevented the U.S. from achieving incremental liberalization of sectors considered sensitive through interim agreements (CARRANZA, 2004, p. 321).

¹⁰ In a survey carried out, 66.2% of the sample agreed with the statement: "Brazil must prioritize integration into Mercosur". On the other hand, the statement: "Brazil should prioritize a free trade agreement with the United States" was chosen by only 16.4% of the interviewees (DE LIMA, 1996, p. 155, *apud* CARRANZA, (2004).

¹¹ The then President Fernando Henrique Cardoso declared: "Mercosur for us is a destination, while the FTAA is only an option, which we will join only under favorable conditions" (FOLHA, 1998).

patterns. Thus, 20% of Mercosur's total exports were to the bloc itself, 29% were to the rest of the Americas, 26% to the EU and 25% to the countries of the "rest of the world" (OSIMANI, 2005, p. 52). According to Ruiz (2007, p. 300), this economic structure and trade pattern are crucial to understand the rejection of the FTAA by the Mercosur countries, led by Brazil.

Mercosur has been the space in which Brazil has continued its industrialization process. For example, the automobile sector was regulated by a special regime that limited extra-regional imports. However, many Brazilian and Mercosur industrial sectors are certainly less competitive than those of the USA, and would certainly be displaced in a possible FTAA scenario (RUIZ, 2007, p. 300).

However, the official Brazilian strategy for free trade on the continent has not always been unanimous in South America. Argentina and Chile, two of the largest countries in the region, were very enthusiastic about the possibility of reaching an agreement with the United States, preferably even before the 2005 deadline. The Argentine government became one of the most ardent supporters of this alliance during most of the 1990s. This was characterized as a complete historical reversal of his contentious stance towards the US.¹² In this context, a logical outcome would be a trade agreement with the U.S. and even NAFTA membership was considered. However, Argentina could not freely sign a bilateral agreement with the U.S. due to the existence of the Mercosur TEC. In addition, the country did not want to create problems with Brazil, which was the most important market for its products. In 1994, the year before the Ouro Preto protocol, Argentina exported twice as much to Brazil as to the USA. Thus, Brazil was able to contain Argentine enthusiasm with reasonable success during the FTAA negotiation stages¹³ (TEIXEIRA, 2011).

In terms of the economic situation, Mercosur survived the regional financial crisis triggered by the devaluation of the Mexican currency in December 1994. At the end of that decade, Mercosur's problems were exacerbated by unfavorable external conditions, such as: the Asian crisis of 1998-99; falling commodity prices and slowing world trade. In addition, divergences in macroeconomic policies between Brazil and Argentina have become a serious political problem for the bloc. After the devaluation of the Brazilian currency in January 1999, Mercosur was the scene of several trade disputes. "Mercosur survived, but the integration

¹² An indication of this renewed relationship is the fact that Argentina dispatched warships to the Gulf War in 1991, the only Latin American country to do so. In 1998, the United States, as a form of retribution, designated Argentina as a "great non-NATO ally", also the only country in the region to have this distinction (FAURIOL and PERRY, 1999, p.33, *Apud*, TEIXEIRA 2011).

¹³ On the other hand, the restrictions that applied to Argentina were not valid for Chile. The country was not part of Mercosur and the US was a much more important country for Chilean exports than Brazil. In addition, its development strategy had as a key component a greater openness to international trade (TEIXEIRA, 2011).

process lost strength, despite the attempt to 'relaunch' the bloc in 2000¹⁴" (CARRANZA, 2007, p. 325). That same year, then-President Fernando Henrique Cardoso described the meeting as a "moment of reaffirmation of South America's identity as a region. [adding that] a free trade agreement between Mercosur and the Andean Community¹⁵ will be the backbone of South America and an extended economic space. [Therefore], it must be seen as a political objective of immediate interest" (CARDOSO, 2000, *apud* CARRANZA, 2007, p. 203).

The economic recession between 1998 and 2002 in Argentina generated several negative consequences for Mercosur. First, it was a severe blow to the flow of intra-bloc trade and investment, aggravated by Brazil's recession after the currency devaluation in 1999. Exports among member countries fell from 25% in 1998 to just 11% in 2002. Brazilian exports to Argentina fell by more than 60% in 2002; and Brazilian imports from Argentina fell by about 26% (IADB, 2002, *apud* CARRANZA, 2004, p. 326). Second, the difference between Argentina's fixed exchange rate and the periodic devaluations of the Brazilian currency threatened Mercosur's survival. The coalition against the devaluation in Argentina favored the country closing an agreement with the US, and reverting Mercosur from a common market to a free trade area. This has raised the tenor of trade disputes between the countries, and the insistence on maintaining exchange rate parity in Argentina has made it impossible to harmonize macroeconomic policies¹⁶.

The implosion of the Argentine economy in December 2001 reopened the debate on the viability of Mercosur in the broader context of the FTAA negotiations. Most analysts feared that the Argentine crisis would have a negative impact on Mercosur, and that a populist regime in Argentina could hurt Brazilian companies investing in that country. A weak Argentina means a weaker Mercosur, undermining Brazil's negotiation strategy for the creation of a Free Trade Area of the Americas (CARRANZA, 2004, p. 326).

However, the Argentine crisis of 2001-02 had a positive aspect for Mercosur. The absence of U.S. leadership with the crisis has strengthened political solidarity among Mercosur partners. At the beginning of 2002, at an extraordinary meeting of Mercosur, the presidents of Brazil, Uruguay and Chile promised full support to Argentina and asked the institutions linked to the international financial sector to understand the complex situation in which the country is going through. The objective was to obtain financial aid to implement an economic recovery

¹⁴ In 2000 it was the first exclusive meeting of South American presidents. The Brazilian government has officially signaled its attempt to rally the South American market around the Brazilian political project of organizing a South American space, as a way of inserting the region into the international system in the post-Cold War era.

¹⁵ Includes: Bolivia, Peru, Ecuador, Colombia and Venezuela.

¹⁶ In January 2002, the currency devaluation in Argentina eliminated the main source of conflict between this country and Brazil. In this way, both countries were able to achieve a higher level of macroeconomic convergence.

program, demanded by the then Duhalde government. In fact, at the same meeting, there was talk of strengthening Mercosur as a trade bloc and even advancing in the implementation of a single currency. Thus, the U.S. policy of letting Argentina solve its own problems eroded the prospects for the FTAA, because, according to Carranza (2007), it even contradicted the "Washington Consensus", on which the original proposal of continental integration was based.

Other Latin American countries might draw conclusions that there was no reward for being a "friend" of the U.S. [...] The absence of U.S. support for Argentina at a time of crisis bodes very poorly for the building of a long-term economic community in the hemisphere. If that's what community means, it doesn't mean much. [...] Prescriptions for economic policies based on free markets were discredited, and the US would have to accommodate at least some demands from Latin American countries, during the market access negotiations that began in November 2002 (CARRANZA, 2004, p. 327).

In this context, the results of the ministerial meeting in Miami in 2003, in the final phase of the FTAA negotiations, were considered a victory for Brazilian diplomacy¹⁷. The so-called "FTAA à la carte" or "light FTAA" was a not so comprehensive FTAA with different levels of commitment. The Miami ministerial declaration stated that the "Ministers recognize that countries can make different levels of commitments, and that negotiations should allow countries, if they so wish, to agree or not to obligations and obtain additional benefits." (MINISTERIAL DECLARATION, 2003, *apud*, TEIXEIRA, 2011, p. 205). It should be noted that this "FTAA à la carte" was received with skepticism by the US and Canadian negotiators, and even some analysts in Brazil "complained that the plan would be counterproductive and would not be able to gain traction" (DEBLOCK and TURCOTE, 2005, p. 7).

The main controversies of these negotiations included liberalization of agricultural products, trade reservations (*anti-dumping measures*), intellectual property rights, and environmental and labor standards. The first of these, in the FTAA negotiations, was considered the most sensitive and controversial. A critical point was whether the agreement would eliminate or regulate agricultural subsidies and other disruptive trade practices¹⁸. That is, minimum entry price schemes; escalation and tariff peaks; mandatory labeling and certifications; non-scientific criteria applied to agricultural products; and technical and phytosanitary barriers. One of the main points of discussion was whether such measures would have a magnitude in the FTAA

¹⁷ In 2003, the new government of Brazil under Lula da Silva saw the integration of South America as a foreign policy priority. In 2004, during the third meeting of South American presidents in Peru, Mercosur and the Andean Community formalized a cooperation agreement, thus creating the "Community of South American Nations" which later became the "Union of South American Nations" or UNASUR (TEIXEIRA, 2011).

¹⁸ Part of the complexity of the negotiations was the result of significant protectionism on the part of the countries importing agricultural products. Among these, the following stand out: sugar, orange juice and citrus products, tobacco, cotton, soybeans and meat (RIVAS-CAMPO, 2003).

negotiations or in the WTO. The U.S. position was that such barriers should be discussed at the multilateral level. The argument was that a regional agreement would not cover countries outside the region, such as Japan and members of the European Union, which granted heavy subsidies to the agricultural sector. Given this U.S. position of encouraging global rather than regional liberalization in agriculture, Latin American countries began to wonder about the gains of an FTAA without agricultural liberalization. In fact, this was a major concern given that developing countries are heavily dependent on this sector. In addition, because the U.S. was reluctant to eliminate its agricultural subsidies, Latin American countries "argued that dropping or eliminating tariffs on agricultural products while maintaining the option for subsidies would be insufficient and unfair, because it would deprive developing countries of protecting their own sector, given the high cost of such measures to least developed countries." (RIVAS-CAMPOS, 2003, p. 670).

At the domestic level, Brazil and Argentina evaluated the reduction of tariffs in areas considered sensitive, more common in economies of non-central countries. These analyses were linked to the demands of the two most interested sectors: the agro-exporter and the industrial. The first of these was in favour of access to new markets, although he opposed the subsidy policy of the central countries, which made access to them difficult. The second group, in general terms, opposed greater external competition caused by a general tariff reduction on goods and services. They thus argued that such a measure should be staggered and include the possibility of using protection mechanisms. Nevertheless, some large companies and economic groups supported trade liberalization, due to the possibility of enjoying access to new markets, being convinced of the ability to resist a higher level of competition (KAN, 2018, p. 5).

From the associative and corporate point of view in Brazil, the creation of the Brazilian Business Coalition (CEB) stands out¹⁹, which was configured as a multisectoral organization of business leadership entities. It included various trade union representation organizations, private companies with domestic capital, foreign capital and state-owned companies. The explicit objective was to intervene in the FTAA negotiations. "The idea was to organize itself to ensure a coordinated participation of Brazilian businessmen in the negotiation process, without the hegemony of the Ministry of Foreign Affairs" (SANTANA, 2000, p. 69 *apud* KAN, 2018).

The CEB was open to various proposals from companies, but in the end the opinion of the group prevailed, which opposed the acceleration of hemispheric integration proposed by the US government. However, according to Castelan (2016), such a position was not as obvious

¹⁹ In addition to bringing together several specific sectors, CEB was commanded by the main entities of Agro, such as CNA (Confederation of Agriculture and Livestock of Brazil), and industry, such as CNI (National Confederation of Industry), and to a lesser extent by FIESP (Federation of Industries of the State of São Paulo) (KAN, 2018).

as it may seem. On the one hand, and in macroeconomic terms, in fact the US seemed to be a threat to Brazil. The Latin American and Caribbean region, by and large, was among the few regions in the world with which the U.S. maintained a trade surplus²⁰.

the damage associated with the FTAA in the minds of the Brazilian state bureaucracy [can] be summarized in the following equation: the external vulnerability of the Brazilian economy is a function of the deficit in the balance of payments, which is a function of the deficit in the balance of trade, which is a function of the low competitiveness of our exports, whose most appropriate symbol is the reversal of the bilateral balance with the United States [...]. The political class generally shares the perceptions of the bureaucracy regarding the fatality of the damage caused by competition with the US and, in turn, tends to extend this fear to foreign competition in general (ALBUQUERQUE, 2006, p. 572).

On the other hand, the U.S. has always been a major market for Brazilian industrial products. At the end of the 1990s, 70% of Brazilian exports to the USA were made up of manufactured products, while those destined for the EU were only 38% (PEREIRA, 2001, p. 36 *apud* CASTELAN, 2016). It is common for governments to consider aggregate data and give greater importance to balance of payments results, but not to represent specific sectors. In this sense, the protectionist position of the CEB in favor of gradualism and selective agreements did not seem as obvious as one might suppose²¹.

As for the businessmen [...]. The understanding that protectionism has costs as well as benefits, and that the two must be compared, is a process that is developing sector by sector, branch by branch, as the growing inseparability between import and export costs becomes evident to sectors subjected to competition. Generally speaking, no one refuses additional protection unless the costs—disproportionate increases in inputs or threats of retaliation—become all too evident. Thus, [...] the vast majority of the business community [...] saw in the FTAA more harm than good (ALBUQUERQUE, 2006, p. 572, 573).

In short, the FTAA negotiations were complex and relied on defensive positions based on the diagnosis of the fragility of some Brazilian industrial sectors. According to Oliveira (2009, p. 184), there was an inability of Brazilian policymakers to renounce an administered policy, and to commit themselves to the challenges imposed by the new regionalism and globalization. Thus, the Brazilian negotiators lacked a more objective stance in relation to the costs and benefits of adhering to a project such as the FTAA.

²⁰ The United States had a trade surplus with the region of about US\$ 12.3 billion in 1998 (SANTANA, 2000, p. 40).

²¹ In 2005, the year in which the FTAA negotiations stalled, seven of the ten industrial activities that exported the most had the US as their main destination. The textile-clothing industry, although not dependent much on exports, saw in hemispheric liberalization an opportunity for access to the American market. Finally, the agricultural and food products sector was the one that showed the greatest support in favor of the FTAA (CASTELAN, 2016).

2.2 US STRATEGIES

There are different interpretations of the U.S. initiative to launch the FTAA at the Summit of the Americas in 1994. The first was based on the "Washington Consensus", that is, a set of prescriptions such as greater trade liberalization, deregulation and privatization that could even lead Latin American countries out of the recession of more than a decade. The opening of the markets of neighboring countries would allow the creation of the continental regional bloc and would also help to face the increase in trade protectionism in Europe and Asia (MASI and WISE, 2005, p. 308). Therefore, part of the U.S. interest in the FTAA can be interpreted as going beyond that of economic benefits, given the "possibilities it offers for the reinforcement of the structural and ideological foundations of U.S. hegemony, consistent with its parallel global strategies" (PHILLIPS 2003, p. 331).

According to Pinto and Guimarães (2005), such interests have been particularly relevant for much longer than the beginning of the FTAA negotiations. Latin America is a region that the U.S. has become accustomed to considering as its natural influence and where it has exercised its economic, political, and military supremacy for several decades²². In 1990, a period in which the US focused on the development of NAFTA, the then US President George Bush launched the proposal "Initiative for the Americas", which established Latin America as an area of influence of the US. This proposal aimed to prevent another economic power, such as the European Union, from acquiring a prominent role in the region. In this sense, the U.S. intended NAFTA to become an integration model to be expanded to all of continental America, especially Brazil²³. It should be noted that members of the later Clinton administration expressed several times that Mercosur was seen as harmful to the FTAA and a threat to hemispheric regionalism (CARRANZA, 2000).

A second interpretation points to the U.S. concern with creating the necessary institutions to increase the flow of exports and foreign direct investment (FDI) from the U.S. to Latin America. In that case, the FTAA would be a means for the U.S. to expand in the region in the same way that NAFTA was used to gain a larger market share in Mexico²⁴. Breaking down trade and investment barriers, especially in South American countries, would also prevent U.S.

²² Examples are the interventions in Panama (1914), Haiti (1915), the Dominican Republic (1916), Nicaragua (1925-1933) and the support given to many of the political dictatorships that favored the economic interests of the United States (PINTO and GUIMARÃES, 2005).

²³ In 1994, President Bill Clinton's request for a fast track concession to negotiate the NAFTA agreement had already implied its extension to all of Latin America. "Fast track is a request made to Congress by the U.S. president to be able to negotiate trade agreements without having to wait for the usually lengthy decision of Congress." (PINTO and GUIMARÃES, 2005, p. 5).

²⁴ President Clinton had hoped that the conclusion of NAFTA would allow the U.S. to "use the Mexican precedent to enter the rest of Latin America" (FEINBERG, 1997, 58).

companies from suffering discrimination in the context of a free trade agreement between them and the European Union or East Asian countries²⁵ (MASI and WISE, 2005, p. 308).

The last interpretation is that U.S. objectives in the hemisphere should be considered in light of the difficulties of trade negotiations within the WTO, such as in the Doha round. In this sense, the gradualist and fragmented nature of integration through the FTAA was seen as a more promising option for the US.

One of the main reasons for U.S. interest in an FTAA stems from the opportunity it presents to push a new trade agenda, at a time when progress in multilateral trade negotiations appears precarious, and when the diminishing ability of the U.S. to control the multilateral agenda has been a cause for political concern. The result was that promoting the trade agenda in the Americas seemed increasingly inviting than continuing to fight against numerous obstacles in the multilateral arena (PHILLIPS, 2003, p. 332).

From these different interpretations of the U.S. interest in hemispheric integration, two main elements stand out. First, the FTAA is seen by the US as a way to strengthen its bargaining power vis-à-vis Europe and East Asian countries. Secondly, the FTAA would be a single regional integration that would promote Latin America in global spheres, keeping the US as the main agent (*hub*). This would also allow for the deepening of reforms and market liberalization in Latin America, diluting the complex "patchwork" of sub-regional agreements that has evolved on the continent since the early 1990s.

This process can be seen as a deliberate attempt by the U.S. to consolidate its hegemony in the Western Hemisphere by integrating Latin American economies with those of North America and legitimizing an integration agenda. The latter incorporates: i) the effort to expand international rules on trade, investment and services in a future FTAA; ii) effort to eliminate differences in national regulatory regimes and their discriminatory effects on trade and investment. These included rules on property rights, differences in national standards, financial, industrial, technological, competition, and environmental policy issues; iii) the objective of reducing or even eliminating the differences in corporate policies, and the structures of industrial policies that imposed restrictions on trade and investment (HAGGARD, 1995, *apud* CARRANZA, 2004, p. 320).

Since the beginning of the FTAA negotiations, two different views on the character of the integration process have collided. These two points of view were represented by the two largest

²⁵ Because the U.S. has comparative advantages primarily in trade in services and high-tech goods, a reduction in Latin American trade barriers would pave the way for U.S. companies in the region. This explains the position of the United States, since the beginning of the negotiations, to include new issues such as: liberalization of the service sector, investments, government procurement and issues such as intellectual property rights (MASI and WISE, 2005, p. 309).

economies in the American continent, the USA and Brazil, and their respective regional subsystems. While the US aimed at an expansion of NAFTA to the entire continent, as part of a broader vision of a new world order, Brazil wished to consolidate its position in the South American subsystem, and saw the FTAA as an obstacle to this (TEIXEIRA, 2011, p. 195). In 2003, the two countries adopted apparently intransigent positions and showed a lack of political commitment to make concessions. In addition, the U.S. became more protectionist during the Bush administration and less willing to compromise on issues of interest to Latin America, such as agricultural subsidies and anti-dumping measures applied to Latin American exports, especially to Brazil (CARRANZA, 2007, p. 321).

While maintaining its commitment to reaching a multilateral regional agreement, the U.S. has also resorted to bilateralism with the aim of working on the disarmament of Mercosur as an integration project, trying to isolate Brazil from the rest of its partners. "[The U.S.] would send signals to Central America and Caribbean countries for proposals for free trade agreements; [this] would give the prospect of permanent preferential access to the U.S. market before the Andean countries; [in addition] it would restart negotiations for a free trade agreement with Chile; and would tempt Argentina and Uruguay to negotiate outside the Mercosur framework" (MASI and WISE, 2005, p. 314).

The fourth Summit of the Americas in Mar Del Plata (Argentina), in 2005, definitively marked the end of the FTAA negotiations. Among the thirty-four participants, twenty-nine expressed themselves in favor of moving forward in the negotiations, the five dissident nations were composed precisely of the four members of Mercosur plus Venezuela, which a month later was invited to join the Bloc as a permanent member. This event, according to Teixeira (2011), was a perfect illustration of how Brazil used Mercosur as the core of its strategy of establishing a free trade zone in the region, to counter the American strategy. With the end of the possibility of a comprehensive hemispheric agreement, the Bush administration sought to establish free trade agreements with individual countries, including Chile, Peru, Colombia, and Ecuador, while Brazil sought to establish South America as an "enlarged economic space²⁶." The difference between such strategies is that while the US sought more specific and detailed agreements with the different countries, Brazil aimed at greater multilateral institutionalization in an attempt to build a regional identity.

The countries on the peaceful shore of the continent, with the exception of Ecuador, agreed to sign bilateral free trade agreements with the United States along the lines of the FTAA, thus making it impossible to incorporate them into Mercosur. As already mentioned, this

²⁶ As President Fernando Henrique Cardoso had declared in the early 1990s.

is the case of Chile, Peru and Colombia. With the implementation of these agreements, import tariffs were immediately zeroed for no less than 80% of U.S. exports of consumer and industrial goods to Peru and Colombia. On these types of products, all remaining Peruvian and Colombian tariffs have been eliminated within ten years. In the case of agricultural goods, more than two-thirds of U.S. exports to Peru and Colombia were immediately free of import tariffs; and most of the remaining tariffs were eliminated in 15 years²⁷ (BATISTA JR., 2008; USTR, 2022). By definition, members of a customs union such as Mercosur, aligned with a TEC, are not free to sign bilateral trade agreements with other countries, in this sense, Colombia, Peru and Chile can only remain as associated members of Mercosur. Such elements reflect a clear tacit competition between the USA and Brazil (TEIXEIRA, 2011).

In August 2004, the U.S. signed the Free Trade Agreement with Central American countries, namely: Dominican Republic, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, called CAFTA-DR. The implementation of the agreement proved to be challenging and occurred continuously after each country made legal, regulatory and general rule changes to comply with the obligations assumed. CAFTA-DR entered into force in July 2006 in El Salvador, Honduras, Nicaragua, and Guatemala. Dominican Republic in March 2007 and Costa Rica in January 2009. The economic logic lies in preferential access to agricultural and manufactured products produced in the region. By removing regional barriers to trade, co-production on shared manufacturing assembly lines between the U.S. and the other CAFTA-DR members was encouraged, based on comparative advantages and economies of scale. The objectives of this agreement included:

- a) To encourage the expansion and diversification of trade between countries; b) To eliminate barriers to trade, and to facilitate the cross-border movement of goods and services between the territories of countries; c) to promote conditions of fair competition in the free trade area; d) substantially increase investment opportunities in the territory of the countries; (e) To provide adequate and effective protection and enforcement of intellectual property rights throughout the territory of each country; f) to create procedures for the implementation and application of the agreement, aiming at its joint administration and for the resolution of disputes, and; g) establish a framework for greater bilateral, regional and multilateral cooperation to enhance the benefits of this agreement (USTR, 2004).

²⁷ Colombia is a major importer of U.S. grains while exporting a number of tropical fruits to the U.S. In addition, U.S. cotton, yarn, and fabric exports to Colombia are used in many clothing items that Colombia exports to the U.S. The main products exported from the U.S. to Colombia that are now exempt from tariffs are: agricultural and construction equipment, aircraft and parts, auto parts, fertilizers and agrochemicals, information technology equipment, medical and scientific equipment, among others. Many agricultural commodities also benefited from the agreement (USTR, 2022).

According to Hornbeck (2012), this strategy increased the productivity of companies in all countries involved. The competitiveness of companies depends on the value added in the supply chain, especially in the apparel sector and, later, extended to the auto parts, medical equipment, integrated circuits, among others. Tariff preferences under CAFTA-DR have contributed to companies remaining competitive given increased competition from Asian countries and other low-cost global producers (IZQUIERDO and TALVI, 2011, p. 42-44 *apud* HORNBECK, 2012). From the point of view of the Central American countries, the permanent reduction of barriers to the U.S. market was the central objective, ensuring that their exports would have access to the large U.S. market and, at the same time, guaranteeing imports at low costs, including intermediate goods and capital goods. In other words, the increase in trade flow could raise the long-term growth rate through various channels, such as: market size, production specialization, economies of scale, technology transfers and managerial experience, use of resources more efficiently, and higher level of investments.

whereas market access is the main element of free trade agreements, and refers to the provisions governing barriers to trade, such as tariffs and import quotas; CAFTA-DR has called for the phasing out of almost all tariffs. For non-textile manufactured goods, the 80% tariffs on imports coming from the US were eliminated immediately, with the remainder being eliminated for a period of up to 10 years. For agricultural products, the 50% tariffs on imports from the US were eliminated immediately, with the rest being eliminated for a period of up to 20 years. For CAFTA-DR member countries, 100% of non-textile and non-agricultural products began to enter the U.S. tariff-free shortly after the agreement was implemented (USTR, 2004). Some "safeguards" were maintained for certain textile and agricultural products during the period of duty elimination, but anti-dumping and countervailing measures were not addressed in the agreement, leaving such trade defense laws to the World Trade Organization.

In order to assess the effects of CAFTA-DR on the countries involved, Hornebeck (2012) proposed a comparative analysis of the period before and after the agreement, demonstrating the main trends in trade in the region in the period between 2000 and 2011. Three main changes stand out: i) the USA remains the largest trading partner among the members, but its relative participation has been reduced to other countries; ii) trade with China and Mexico has increased; and iii) trade between Central American countries increased and deepened.

In 2000, the U.S. was the destination of 73% of the exports and 55% of the origin of imports of CAFTA-DR members, while in 2010 these numbers dropped to 43% and 46%, respectively, the decline occurred in all countries. Between 2000 and 2010, exports to China increased from about 0% to close to 6% and imports from 2% to 7%. Trade among CAFTA-DR members increased from 2 percent to around 11 percent, making the region

the largest in terms of intraregional trade intensity in the U.S. hemisphere. (HORNEBECK, 2012, p. 5).

CAFTA-DR thus plays a supporting rather than a leading role in these new evolving trade patterns, especially in the trend towards greater productive fragmentation and the formation of global value chains. For example, the increase in exports to China is fully represented by Costa Rica's semiconductor exports. The increase in trade between Central American countries is the result of a long-sought effort by countries to deepen subregional integration. In addition, these efforts were strengthened with the signing of the Mexico-Central America free trade agreement in November 2011, which deepened the integration process and increased the volume of trade between the country and the region by four times. This is largely explained by the supply chain relationships that the U.S. and many of its companies have developed in the Mexican economy and in Central America and the Caribbean, particularly in the automotive, apparel, electronics, and computer sectors (HORNBECK, 2012, p. 5-6).

The CAFTA-DR rules of origin reinforce regional integration because they induce greater sharing of production among member countries. This makes the region more competitive globally by increasing co-production relationships, reducing customs delays, and enabling greater economies of scale in production. They also allow tax exemption on imports from the US of products assembled from inputs produced in Central America or Mexico. This relationship is evident in the production of integrated circuits, auto parts and clothing, sectors in which the US sent part of the production chain to this region. This follows the logic of global value chains, in which there is a greater fragmentation of the production chain among several countries in the region, mainly enhancing the trade of intermediate products, parts, components, inputs, and raw materials.

For example, Mexico imports integrated circuits from Costa Rica, apparel from Guatemala, and sets of harness sets for automobiles from Nicaragua, all made from U.S. inputs. These goods are used to assemble computers, clothing and automobiles for export to the U.S. and other Latin American countries. Similarly, fabrics produced in the U.S. are used in apparel production in the Dominican Republic, Honduras, and Guatemala, and final goods are tax-free when they enter the U.S. Thus, unlike commodity-driven export growth, much of the region's trade reflects the global production of the supply chain related to U.S. global production and consumption²⁸ (HORNBECK, 2012, p. 6).

²⁸ It should be noted that the analysis of the technological content of the exports of the CAFTA-DR countries supports the trend of the USA being the largest market for exports of different technological levels. From low-tech apparel to integrated circuits and high-tech medical equipment. Costa Rica's exports from the Dominican Republic have the highest concentration of technological intensity, while Guatemala and Nicaragua have the lowest (HORNBECK, 2012).

Calderón and Poggio (2010) aim to assess the economic growth effects of trade openness among CAFTA-DR countries, and whether these effects are stimulated or hindered by advances in structural policies and institutions. The authors conclude that: although the baseline model predicts the benefits of trade growth for CAFTA-DR countries, not taking into account the complementarities between trade openness and structural factors may overestimate these results. Indeed, the authors point out that human capital, infrastructure development, and institutional quality can play an important role in increasing the benefits of trade growth. In this regard, there is ample room for CAFTA-DR countries to reap the benefits of increased trade, but an important role must be played by new reforms in areas such as education, infrastructure, and international financial integration.

3 DISTRIBUTION OF THE COSTS AND BENEFITS OF THE FTAA – WHO WINS AND WHO LOSES

The American continent is full of large differences in terms of population, level of wealth, volume of production, and per capita income. In this sense, some relevant questions arise, such as: what interests do the US and the Mercosur countries, especially Brazil, have in opening their economies? What are the perceived costs and benefits of hemispheric integration from the point of view of the U.S. and Brazil? Overall, domestic politics in the U.S. and Brazil were what hampered the ability of political leaders and trade policymakers to implement the FTAA. In the U.S., it was the declining traditional sectors (agriculture, textiles, and steel) that most firmly resisted competition from Latin American imports. In Brazil, it was an "entrenched elite" that fears competition in the new commercial sectors (services, investments, high technology) in which the country remains most vulnerable.

3.1 USA – COSTS AND BENEFITS OF THE FTAA

With regard to U.S. interests in the FTAA, the high Mercosur import tariffs (CET) in sectors such as capital goods and high-tech industry products stand out. Considering that the U.S. is competitive in these items, the implementation of the FTAA would generate gains for U.S. investors, through greater access to these markets in the southern cone. In addition, liberalization of government services and procurement as part of FTAA implementation would give U.S. firms the leverage needed to compete with Mercosur-based firms. Finally, another gain involves the issues of intellectual property rights, which are the subject of discussions about the capacity for inspection and, therefore, susceptible to trade sanctions by the USA (MASI and WISE, 2005, p. 320).

The FTAA was also supported by large U.S. companies with investments in Latin America. For these large multinationals, which have been establishing subsidiaries in different countries in the region for a century, by reducing barriers to trade and regulations, there would be greater guarantees for their investments. In addition, it would open up new possibilities for capital to be installed where labor cost conditions were more favorable, as happened with the Mexican maquiladoras after the signing of NAFTA. It would also allow these U.S.-based companies to participate in bids for public works in the areas of health and education²⁹. In this sense, it would put local and foreign investors on an "equal footing" with the only criterion of efficiency, favoring American and Canadian companies (MORGENFELD, 2005, p. 9).

Other sectors favorable to integration were the pharmaceutical industry and biotechnology companies. For these powerful institutions, patent issues are of fundamental importance, as they guarantee intellectual property rights and returns on their investments. This problem is also associated with the privatization process that impacted Latin America in the 1990s and that advanced in all branches of the economy, including sectors and activities that were previously under the state's orbit.

On the other hand, the main arguments in the U.S. against the FTAA resided in labor unions, environmental organizations, and private-sector interest groups, which were considered obsolete or uncompetitive. The agricultural sector and some manufacturers stand out, such as: sugar, tobacco, fruits, vegetables, textiles, footwear and steel, among other products considered more sensitive to integration³⁰. However, although these interest groups are a minority in the US, a new round of protectionism for these products was the one that hit the Mercosur countries the hardest. The bill unilaterally offered access to the U.S. market to the Andean, Central American and Caribbean countries, but not to the Mercosur countries (US DEPARTMENT OF COMMERCE, 2002 p. 4). In other words, the bilateral negotiations between the U.S. and other regional groupings, due to the deadlocks in the FTAA negotiations, granted permanent access to the U.S. market in these sectors considered sensitive, to the detriment of the Mercosur countries, in which there was no pre-existing privileged access. Thus, those in the US viewed the FTAA negotiations with caution were the industrial sectors that produced mainly for the domestic market. They had the perception that they should start to compete more intensely with countries where labor costs were lower.

²⁹ Until then, they were partially forbidden to foreign companies, due to contract clauses or criteria of "buying at the national level".

³⁰ However, some econometric studies reveal that the losses for these sectors under a possible implementation of the FTAA would not be significant, and in some way, there would be net gains with the opening of Mercosur and the other South American countries (ESTEVADEORDAL and ROBERTSON, 2004).

In general, despite intense *lobbying* by several of these interest groups, the perception of most U.S. business associations, including most farmers, is that their gains from the FTAA would outweigh their losses. For example, businessmen from the National Association of Manufacturers (NAM) lobbied then-President Bush for further trade liberalization in the hemisphere, and to do so at a rapid pace. Other associations, which represent American commercial interests, advocated greater market opening for their products in Argentina, Brazil and Chile, and considered these markets to be very promising for exports from the American industrial sector³¹ (MASI and WISE, 2005, p. 320).

One of the main criticisms of the Mercosur countries to the US is related to the high protection of traditional manufactured goods, which fall into the category of "sensitive products", and the high subsidies to agricultural commodities, which contributed to depressing the international prices of these items. If, on the one hand, the U.S. showed great interest in the liberalization of services, investments and government purchases (the new trade issues), on the other hand, the Mercosur countries insisted on the importance of market access to the aforementioned goods as a key condition for the establishment of reciprocal and fair trade. "Mercosur's main exports to the U.S. are agricultural commodities and traditional manufacturing products, mainly agro-industrial goods." (MASI and WISE, 2005, p. 323). Such characteristics reflect the sectors in which the U.S. would gain and those that would lose from continental integration.

3.2 BRAZIL – COSTS AND BENEFITS OF THE FTAA

In Brazil, the country that led the FTAA negotiations from the Southern Cone, different opinions prevailed among businessmen, economic analysts, and policymakers about the implementation of the FTAA. Exporters of agricultural products, companies in the agro-industrial sector and steel and oil producers were in favor of the FTAA and greater trade openness with the US. This support was conditioned by projections of an increase in sales caused by reductions in tariff barriers in the US. On the other hand, companies and entrepreneurs representing other industrial sectors, such as chemicals, automobiles and machinery, did not share this opinion. Members of this second group argued that they would suffer great disadvantages if the Brazilian economy was open to American competition. A key factor that determines the low level of competitiveness for these sectors is the high cost of doing business in Brazil. These include high tax burdens, high interest rates, limited access to venture capital,

³¹ Business sectors such as the American Chemistry Council, the Electronics Industry Alliance, and the High-Tech Goods Coalition acted as a counterweight to the specific sectors that sought to thwart the FTAA.

and a lack of basic and technological infrastructure³². These representatives feared that the FTAA could lead to the dismantling of several sectors and transform the country into an exporter of agricultural commodities (MASI and WISE, 2005, p. 324).

An emblematic case is that of steel. By mid-2001, the U.S. steel industry was operating at 40 percent of its total capacity and was selling steel at the lowest prices in 20 years³³. The government decided to defend its steel industry by raising the tariff on imports to 30%. In order to reverse this U.S. protectionism, Brazilian export sectors have suggested that the trade liberalization project in the Americas could be a good opportunity to negotiate better access to the U.S. market. For these sectors, the FTAA would only make sense if the reduction of such tariffs was negotiated. In this way, they coincide with agricultural exporters, who would be willing to risk a process of greater competition in the domestic market, as long as access to the US market under better conditions was guaranteed (MORGENFELD, 2005, p. 9).

For the large agro-exporting groups in Brazil, the FTAA should not be rejected, but should take advantage of the situation to establish agreements that guarantee a minimum of reciprocity. The argument was that the U.S. should reduce not only tariff barriers, but also non-tariff barriers, since, at the time, 60% of Brazilian exports to that country had some type of non-tariff restriction. For example: "Brazilian orange juice must pay a 56% tariff to access the North American market. Brazil is the largest producer of orange juice in the world [...]. The reduction of tariff and non-tariff barriers would open an important market for Brazilian products." (MORGENFELD, 2005, p. 14). In this way, they supported a free trade area in the Americas, as long as defensive trade practices such as antidumping policies, phytosanitary barriers, or export subsidies were also eliminated continuously and gradually.

On the other hand, industrialists who produced primarily for the domestic market were generally opposed to an FTAA-type agreement. The argument of the Brazilian producers was that certain segments of the local industry were technologically outdated in relation to those of the USA, so that a total and immediate opening could harm national production. One of the biggest opponents of the FTAA's advance was FIESP, which claimed that Brazil would lose one billion dollars a year in its foreign trade if the FTAA came into force in 2006. "For some sectors that were not prepared, the FTAA will be absolutely deadly" said Horácio Lafer Piva, president of FIESP (ADITAL, 2002 *apud* MORGENFELD, 2005, p. 10).

³² Rubens Barbosa, Brazil's Ambassador to Washington until 2004, agreed that Brazil's competitiveness would not be determined solely by preferential tariffs under the FTAA. It would also be necessary to have better coordination between the national public and private sector to reduce the "Brazil cost". The tariff reductions of the FTAA negotiations should be accompanied by a process of strengthening Brazilian competitiveness, also attracting foreign investment in export-oriented and capital-intensive sectors (MASI and WISE, 2005).

³³ As this sector is characterized by high economies of internal scale, such information points to the low American competitiveness of this sector, especially when compared to the Brazilian industry.

Regarding the effects of trade deregulation on Brazilian industry, some studies such as MDIC (2002) and FIESP (2002) divided the analysis into four main groups. The first consists of production chains that would not be negatively affected by the FTAA, and that would also open up commercial opportunities, such as: coffee, pulp and paper, citrus fruits, leather and footwear, steel and part of the textile-clothing chain. In general, these chains are considered more competitive and had trade surpluses from 1996 to 2001. The second group includes chains characterized by significant trade deficits and deficits. These are undifferentiated capital-intensive goods, such as: petrochemicals, processed plastic products and shipbuilding. For this group, studies suggest extreme caution in tariff policy, and it needs to be accompanied by policies to increase competitiveness, in order to accommodate the process of trade liberalization. The third consists of chains in which threats and opportunities counterbalance each other, as is the case of the wood-furniture, ceramics and cosmetics sectors. The former categories had trade surpluses, while the latter had a moderate deficit³⁴. The fourth and final group is made up of chains in which multinational companies have a significant presence, and where intrafirm trade predominates: automakers, pharmaceuticals, communication equipment and electronics. These trade flows strongly depend on the international strategy implemented by the foreign companies that control these chains³⁵ (MACHADO and FERRAZ, 2005, p. 373-375).

Another point of view of this debate was the possibility of increasing Brazil's competitive advantage by enhancing the existing intra-firm trade between the US and the Brazilian economy. As economic theory points out, the regionalization of this type of trade could promote a restructuring based on specialization, economies of scale and technological updating. Certainly U.S. subsidiaries operating in Brazil would benefit greatly from the FTAA, especially in terms of a freer flow of imports from their U.S. headquarters. Such elements could contribute to a higher level of competitiveness of subsidiaries located in Brazil.

[...] the companies that export foreign capital maintain a strong interaction with their headquarters. The companies that registered an increase in their sales and exports between 1995 and 2000 channeled their activities, preferably, to the countries of origin

³⁴ These chains are not sensitive to trade deregulation, but they require precise and selective competitiveness policies. As incentives for product differentiation, for example: development of design and brands in the case of furniture, cosmetics and ceramics, or property and environmental policies as in the case of wood-furniture (MACHADO and FERRAZ, 2005, p. 374).

³⁵ It should be noted that the study points to the importance of national content policies or managed trade, along with policies to support technological development. However, they are insufficient when foreign companies are not willing to negotiate.

of their capital³⁶. [it is thus reaffirmed] the importance of the potential impact of the FTAA: subsidiaries of American and Canadian companies that operate in Brazil have a reasonably diversified geographic structure for their exports, but depend on the US for almost 40% of their imports [...]. [therefore], American transnational corporations tend to export in a greater proportion to countries in which they have a greater participation than to those countries that do not have subsidiaries (BAUMANN and CARNEIRO, 2002, p. 165).

In short, the position of the representatives of the industries in Brazil was not homogeneous. Many São Paulo industrialists supported the deepening of the link with the USA. The position of one or the other depended on their chances of survival if the FTAA project went ahead. Such attitudes varied not only according to each sector of the economy, but also according to the size of the companies, and according to the degree of concentration and centralization of capital that each of them presented. In any case, most studies on the possible impacts of the liberalization of the economy, which provided the basis for these positions, showed that Brazil would end up importing much more than it could export. Even considering that tariffs would be zeroed in all American countries, many of these representatives viewed the progress of the FTAA negotiations with suspicion or fear, which partly explains the Brazilian government's position of being more reluctant to agree with the United States (MORGENFELD, 2005, p. 10). By way of conclusion of this article, Table 01 presents a synthesis of the distribution of the costs and benefits of the FTAA for the USA and Brazil.

Table 1

Distribution of the Costs and Benefits of the FTAA

	Who would win	Undefined	Who would lose
USA	Capital goods sector: machinery	Intra-industry trade: oil.	Agro-industrial sector: sugar, tobacco, vegetables, fruits, orange juice, etc.
	High-tech industry: biotechnology, electronics etc.	Sector: wood-furniture, ceramics and cosmetics.	Manufacturers: textile-clothing, footwear, pulp and paper, and steel.
	Chemical and pharmaceutical industry		
	Service sector		
Brazil	Who would win	Undefined	Who would lose
	Agro-industrial sector: coffee, sugar, tobacco, vegetables,	Trade led by multinationals: automakers,	Capital goods sector: machinery

³⁶ According to the authors, there are intra-firm transactions that could influence the estimates of the effects associated with preferential trade agreements. This could generate a sectoral distribution different from that obtained in the estimates of trade creation and trade diversion derived from a tariff reduction.

	fruits, orange juice, etc.	communication equipment and electronics.	
	Manufacturers: textiles and clothing, pulp and paper, footwear, steel, petroleum.	Sector: wood-furniture, ceramics and cosmetics.	Chemical and petrochemical industry, processed plastics, shipbuilding and pharmaceuticals.

ABSTRACT

This chapter presents modern Machine Learning techniques applied to computer vision, divided into two complementary fronts: the processing of 2D images and videos and the classification of three-dimensional data (3D images). The first has strong applications in security and product sales, while the second is fundamental for areas such as the parts manufacturing industry and medical image processing. Thus, the first part of the chapter explores the practical use of the YOLO ecosystem (specifically YOLO26) for object detection and scene classification, covering the implementation of inference pipelines, data annotation, fine-tuning, and data augmentation techniques to mitigate training overfitting. In the second part of the chapter, the focus is on the challenges involved in processing 3D spaces, detailing geometric representation processes (meshes, point clouds, and voxel grids). The chapter also presents the construction and preprocessing of a volumetric classifier from scratch, using the ResNet3D-18 architecture on the ModelNet10 dataset, along with a critical analysis of the model's performance.

Keywords: Computer Vision. Machine Learning. Detection and Classification. Video. 3D Images.

RESUMO

Este capítulo apresenta técnicas modernas de Aprendizado de Máquina aplicadas à visão computacional, dividindo-se em duas frentes complementares: o processamento de imagens e vídeos 2D e a classificação de dados tridimensionais (imagens 3D). A primeira, encontra forte aplicação em segurança e em vendas de produtos e, o segundo, fundamental para, por exemplo, a indústria de peças e o tratamento de imagens médicas. Desse modo, a primeira parte do capítulo explora o uso prático do ecossistema YOLO (especificamente o YOLO26) para detecção de objetos e classificação de cenas, abrangendo a implementação de pipelines de inferência, anotação de dados, fine-tuning e técnicas de data augmentation para

1 INTRODUCTION

In the current scenario of computer vision, Machine Learning models based on deep convolutional neural networks (CNNs) almost completely predominate today [Bhatt et al. 2021]. But the transition from theory to successful real-world application of these models—such as analyzing *in-the-wild* videos—or processing geometries from industrial parts and medical examinations—requires more than just instantiating a basic architecture. It requires mastery of complementary techniques and robust workflows.

This chapter introduces the main concepts, provides intuition, and provides a *practical pipeline* of these modern techniques, as a starting point for the student or researcher who needs to use these techniques in a real problem or research project. We initially explore the state of the art in efficient (fast) image processing using the YOLO26 [Ultralytics 2026] ecosystem for images, demonstrating how to apply pre-trained models, specialize them for new data, and make them resilient to variations in the environment. Next, we extend the two-dimensional grid of 2D images to the processing of three-dimensional images in spatial models. From the ModelNet10 dataset [Wu et al. 2015], we illustrate the preprocessing pipeline required by 3D data and the adaptation of CNNs to operate over spatial volumes with ResNet3D-18 networks [Hara et al. 2018].

All the codes and materials used in this chapter can be found in the <https://github.com/Capitulo-Aprendizado-de-Maquina-Imagens/>.github repository. They are an integral part of this chapter and it is recommended that the reader access this material in addition to the reading of the chapter.

2 YOLO AND IMAGE AND VIDEO PROCESSING

Introduced in 2015 by Joseph Redmon and his team, YOLO (*You Only Look Once*) brought a revolutionary approach to computer vision based on Convolutional Neural Networks (CNNs) [Redmon et al. 2016]. Instead of slicing the image and analyzing it into multiple cutouts like the classic models, YOLO applies a single neural network over the entire image at once. It divides the scene into a mathematical grid and simultaneously predicts where the objects are. In the most widely used detection models, this is done by means of bounding *boxes* that calculate the probability of each class.

This "single look" enabled real-time detection, a critical factor for video processing. In general terms, a video is a set of several images in sequence. These images, or frames, are called *frames*. Since a typical video runs between 30 and 60 *frames* per second (FPS), slow models generate high latency and "choke" processing. YOLO's optimized architecture allows it

to process tens of *frames* per second, making it possible to analyze *in-the-wild* videos (from the real world, without positioning or lighting control), following objects as the scene unfolds.

To achieve this efficiency, YOLO models are already pre-trained on the COCO (*Common Objects in Context*) dataset, a gigantic dataset, widely used by the AI community containing more than 330,000 annotated images with everyday objects divided into 80 categories or classes (such as cars, people, dogs, chairs, bottles, etc.) [Lin et al. 2014]. In other words, the model is born with a robust base for extracting characteristics, knowing the basic world.

2.1 YOLO ECOSYSTEM

The original architecture has evolved and today the YOLO family is an ecosystem capable of solving different computer vision problems, each with its own specialty. Table 1 summarizes how the network "sees" according to the chosen model.

It is important to note that advances in computer vision occur at a very accelerated pace and it is possible that by the time you are reading this chapter there are already newer models of YOLO available. Don't worry, the codes are all adaptable for use by any existing template.

Table 1

Comparison of YOLO26 models, main functions and ways of viewing.

Model	Main Function	How the network "sees"
YOLO26-clc	Classification	Evaluates the entire image and indicates which class predominates in the scene.
YOLO26	Object Detection	Answers what the object is and where it is, drawing bounding <i>boxes</i> .
YOLO26-sec	Instance Segmentation	Draws the exact outline of the object found, pixel by pixel.
YOLO26-pose	Pose Estimation	It identifies key points, focusing on structure and movement, such as human joints.
YOLO26-obb	Guided Detection	Draws rotated boxes, useful for aerial images where objects appear at varying angles.

In Table 1 we have seen five models and their applications. For the practical scope of this chapter, which is focused on extracting relevant information from real-world videos and generating an intuition about how YOLO works, we will explore the two fundamental models: the Classifier (YOLO26-clc) and the Detector (YOLO26).

2.2 AN INFERENCE PIPELINE WITH YOLO

The practical application of YOLO models follows a unified workflow, often using the official Ultralytics library [Ultralytics 2026]. The steps consist of instantiating the model, loading the video, and performing inference.

2.2.1 Example: Classifier, YOLO26-clb

Since this is a classifier model, it only tells you what's being found in the entire *frame*, i.e., it doesn't specify where the object is being found.

Code 2.1 is a simple example of implementing and using the classifier model directly on any video. You can access the directory of that project in the GitHub repository and run it on your machine locally using any video on your computer. A sample video can be found in the project directory.

Table 1

Code 2.1. Basic inference pipeline using the classifier model YOLO26n-clb

```
from ultralytics import YOLO

#1. Instantiate the pretrained model model = YOLO('yolo26n-clb.pt')
# 2. Upload the video (replace the file path below)
results = model(source=r'C:\caminho_do_video\video_exemplo.mp4',
show=True, stream= True)

#3. Inferencia for frame in resultados:
# Returns the overall probability of the scene print(frame.probs.top1)
#**IMPORTANT**: To finish the video press the "Q" key.
```

Figure 2 demonstrates how the classification model runs, showing the probability of the classes in the upper left corner.

Figure 2

Example of video running with the ranking model

2.2.2 Example: Detector, YOLO26

With the detector model, the boxes point to the multiple objects within each frame of the video, which can be more interesting if the challenge is to know where the object is in the scene.

Using the same Code 2.1, let's adapt lines 4 and 13, calling the detector model and adding the *bounding boxes*, as we see in Code 2.2.

Table 2

Code 2.2. Basic inference pipeline using the YOLO26n detector model

```
from ultralytics import YOLO
#1. Instantiate the pretrained model (changed to the detector) model =
YOLO('yolo26n.pt')
# 2. Upload the video (replace the file path below)
results = model(source='C:\caminho_do_video\video_exemplo.mp4',
show=True, stream= True)
#3. Inferencia for frame in resultados:
# Returns the bounding box of the print(frame.bboxes.xyxy) object
##IMPORTANT##: To finish the video press the "Q" key.
```

Figure 3 shows how a detector model behaves, finding the objects and drawing the *bounding boxes* in the scene.

That's it, you've just applied two computer vision models and you can follow how they work along with the video!

2.3 FINE-TUNING AND DATA PREPARATION

Fine-tuning is a technique that allows you to take advantage of the knowledge base acquired in the COCO dataset to teach new categories specific to YOLO. When we do this, there is a transfer of knowledge, but the original classes are lost. This means that when we apply *fine-tuning* we use the knowledge of the neural network, but specify it for the new classes or categories that we want our model to recognize. As a result, the way you prepare this data and train the neural network changes drastically depending on your goal: classifying the entire image in the scene or detecting specific objects within it.

Figure 3

Example of video running with the detection model

2.3.1 Classification Flow

In classification tasks, the neural network learns what an object is through images separated into categories.

i. Dataset Structure

Preparing data for classification does not require manual markings on the image. The very organization of the folders defines the classes. The industry standard is to perform a *split* (manual division of the data) separating it into Training, Validation and Testing, usually in a ratio of 80% for training and 20% for validation and testing, or 70/20/10 depending on the total volume.

Figure 4 shows the directory structure and hierarchy required by YOLO for classifier training.

ii. Training and Evaluation

With folders organized, training only requires the model to point to the main directory. In addition, it is at this stage that YOLO itself applies *Data Augmentation techniques* under the hood (such as rotations and brightness variations) to prevent the network from "decorating" the images. By default YOLO does this automatically, but it is possible to adjust the *Augmentation* parameters, as we will explain in section 1.6.

Code 2.3 shows how to train a classifier model with 50 epochs, 224px image size, and a batch of 16 simultaneously processed images. As training a neural network is a costly task for a standard computer, we recommend that *fine-tuning* be done in Google's Colab tool, where there are options to select environments more suitable for training neural networks (with options that use T4 or A100 GPUs). These environments will bring a higher training speed to your computer vision projects with images.

Figure 4

Recommended Directory Structure for Classification Model Training

```
meu_dataset_classificacao/
├── train/
│   ├── cachorro/ (contém 70% de
│   │             imagens de cachorros)
│   └── gato/ (contém 70% de
│             imagens de gatos)
├── val/
│   ├── cachorro/
│   └── gato/
└── test/
    ├── cachorro/
    └── gato/
```

Table 3

Code 2.3. Fine tuning of classification model

```
from ultralytics import YOLO
# Loads pre-trained classification model = YOLO('yolo26n-cls.pt')
#      Start      training      results      =      model.train(
data=r'caminho_do_dataset_classificacao', # Root folder with train/val/test
epochs=50, # Number of times the network will see the entire dataset
imgsz=224, # Image size for sorting batch=16      # Batch of images
processed simultaneously)
```

To evaluate the classifier model, we observed the drop in the *Loss Function* (which measures the mathematical error of the network), as the drop increases in each iteration, we understand that the model is converging. In addition, we track accuracy (Top-1 and Top-5), which indicates the percentage of times the network has registered the correct class. In this case, the higher the accuracy, the more correct answers the model recorded.

2.3.2 The Detection Flow

When we need to find the exact location of something in a scene, folders alone are not enough. In the case of detector models, we need to teach the coordinates of objects to the network.

i. *Annotation, Roboflow*

For detection, each image must be accompanied by a text file containing the coordinates of the bounding *boxes*. The legwork of drawing these boxes is called *Annotation*, and platforms

like Roboflow simplify this process. In the interface, we draw a very tight rectangle around the object, associate it with a class and the tool exports the dataset already structured and divided.

Figure 5 illustrates the annotation process on the platform. After the object is selected, the class name is entered.

ii. Training and Evaluation

Unlike the classifier that reads folders, the detector uses a data.yaml configuration file generated during annotation to locate the images and their labels. Code 2.4 shows how to *fine-tune* a model. Note that the main difference is that the dataset is referenced with the data.yaml file. In addition, detector models are usually more expensive than classifiers and their training can take longer, mainly because they require higher resolutions in training.

Figure 5

Example of annotation on the Roboflow platform

Table 4

Code 2.4. Fine tuning of Detection model

```
from ultralytics import YOLO
# Loads the pre-trained detection model = YOLO('yolo26n.pt')
# Start training results = model.train( data='path/data.yaml', # File
generated in annotation epochs=50, imgsz=640, # Detectors require higher
resolutions batch=16)
```

In detection, in addition *to the Loss Function*, the main evaluation metric is mAP (*Mean Average Precision*). mAP simultaneously evaluates whether the model has hit the class and whether the box it draws correctly overlaps the real object (another metric known as *Intersection over Union* - IoU).

2.4 DATA AUGMENTATION

One of the biggest challenges in machine learning is *overfitting*, which occurs when the model becomes an expert at recognizing only the exact images of its training set, but fails miserably when finding the same object at a different angle or under a shadow in the real world.

To mitigate this, we use *Data Augmentation*. This technique consists of applying random mathematical transformations to the original images during the training process, creating infinite variations without having to take new photos or make new notes [Géron 2019].

2.4.1 Types of *Data Augmentation*

There are numerous possibilities for increasing data, but we will address the most common ones in this subsection.

- Geometric Transformations: Flips, rotations, and zooms. This teaches the model that a product upside down or seen from afar remains the same product.
- Color Transformations: Changes in brightness, contrast, and saturation. Essential for *in-the-wild* videos, where lighting is not controlled like in a studio.
- Quality Filters: Addition of Gaussian noise or blur. This prepares the network to handle low-resolution cameras or fast movements that blur the frame.

2.4.2 Implementation in YOLO

The Ultralytics library already includes native *augmentation* settings that are automatically applied during *fine-tuning* of a model. However, we can customize the intensity of these transformations directly in the hyperparameters of the `train()` command.

In your training code, you can add the parameters from Code 2.5 to make the model more resilient.

Table 5**Code 2.5. Custom Data Augmentation Application Example**

```
# Example of fine-tuning with augmentation parameterization
results=model.train( data='data.yaml', epochs=50, degrees=15.0, # Rotates
the image up to 15 degrees flipud=0.5, # 50% chance to rotate the image
vertically brightness=0.3, # Varies brightness by up to 30%
blur=0.1, # Applies random blur to simulate motion device=0)
```

This technique is what allows your model to detect products in a video from a supermarket aisle or on a traffic camera, even if the camera is swaying or the light is blown out in some spots.

2.5 APPLYING THE CUSTOM MODEL

After training (both a classification and detection model), YOLO automatically saves a copy of the network's best moment, often referred to as best.pt.

To apply this newly acquired knowledge in the real world, we went back to the inference pipeline seen in 1.4 and adapted in Code 2.6. The only difference is that instead of loading the factory model from Ultralytics, we load our file.

Table 6**Code 2.6. Inference with trained models**

```
from ultralytics import YOLO
# We replaced the original model with our newly trained model
modelo_customizado = YOLO(r'C:\caminho_do_modelo_treinado\best.pt')
# We apply it to real-world video
results =
modelo_customizado(source=r'C:\caminho_do_video\video_exemplo.mp4',
show=
True, stream=True)
for frame in results:
    print(frame.bboxes.xyxy) # For detection #print(frame.probs.top1) # For
classification
```

2.6 NEXT STEPS WITH YOLO

Throughout these sections you have seen how YOLO26 simplifies and powers computer vision projects, from model loading to specialization and practical application in videos. Despite its innovations and efficiency, it is important to remember that, like any technology, YOLO26 can present limitations in very specific scenarios or highly specialized tasks, requiring adjustments or complementary solutions. Still, its modern architecture and ease of use open doors to innovative applications, making you able to explore new possibilities and create increasingly intelligent and impactful solutions.

3 3D IMAGE CLASSIFICATION

So far we have worked with images and videos, that is, with data organized in 2D pixel grids. But a growing share of modern computer vision applications must deal with objects in three-dimensional space: CT scans and MRIs in the medical field, industrial parts scanned for quality control, environments captured by LiDAR sensors in self-driving cars, and CAD models used in engineering and architecture. In all these cases, "flattening" the data in a single photo means losing the very information that matters: the shape of the object in space.

For this kind of problem, we need models that see in three dimensions. In this section we will build a 3D object classifier using the ResNet3D-18 architecture on top of the ModelNet10 dataset, a classic benchmark containing CAD models of everyday furniture and objects [Wu et al. 2015]. The path we are going to take involves an extra step that does not exist in the 2D world: before reaching the neural network, the 3D data needs to be converted into a format that CNN can process. It is precisely this pre-processing — transforming a mesh of triangles into a grid of voxels — that occupies a good part of our pipeline.

3.1 3D REPRESENTATIONS

There are three main ways to represent a three-dimensional object on the computer, each with advantages and disadvantages:

- **Mesh:** The object is described by vertices (points) connected by triangular faces. It is the native format of 3D modeling software and .off, .obj, and .stl files. Compact and precise, yet irregular — each model has a different number of vertices and faces.
- **Point *cloud*:** The object is represented only by the coordinates (x,y,z) of points on its surface, with no connectivity information. It is the natural output format of LiDAR sensors and 3D scanners.

- **Voxel grid:** space is divided into small cubes (the "3D pixels") and each cube receives the value 1 if it contains the object's surface and 0 if it is empty. It is the closest representation to a digital image, and precisely for this reason it is the one that fits directly into a CNN.

Figure 3.5 illustrates these three representations for the same ModelNet10 object. Notice how the mesh preserves fine details with little data, the point cloud samples the unstructured surface, and the voxel grid "pixelizes" the object into a regular cube.

Figure 6

Comparison between mesh, point cloud and voxel grid for the same ModelNet10 3D model

The choice of representation determines the type of neural network we can use. Networks that operate directly over point clouds, such as PointNet, exist and are quite powerful, but they require special architectures. For classifiers based on conventional CNNs, the most direct path is what the literature calls a volumetric approach: voxelizing the object and treating the resulting cube as a "3D image" [Maturana and Scherer 2015]. That is the approach we will take here.

3.2 THE MODELNET10 DATASET

ModelNet10 is a subset of the ModelNet project, launched by Princeton University in 2015 [Wu et al. 2015]. It brings together about 5,000 clean and aligned CAD models, distributed in 10 categories of furniture and household objects: bathtub, bed, chair, desk, dresser, monitor, bedside table, sofa, table and toilet. Because of its manageable scale and balance between classes, it is often called the "MNIST of 3D" — a didactic benchmark before moving on to larger datasets such as ModelNet40 or ShapeNet.

Each model is stored in OFF (*Object File Format*) format, a plain text file: the first line is the OFF header, followed by the vertex, face, and edge counters. Then come the coordinates of each vertex and, finally, the definition of each triangular face, indicating which vertices compose it.

The dataset already comes with the division between training and test ready, organized into subfolders by class (one train/ and one test/ folder within each category). Since there is no separate validation folder, the validation split is done from the training set before training. The big difference in relation to the 2D case seen so far is the content of the files: instead of .jpg images or .png ready to be fed to the network, we have meshes that need to be processed.

Figure 3.6 shows an example of each of the 10 classes in the dataset, rendered from the original .off meshes. Notice the variety of geometries: thin-walled objects (chair, table), massive volumes (dresser, monitor), shapes with cavities (bathtub, toilet) and flat tops on supports (table, desk). This diversity explains why some classes will be easy for the network to learn and others not so much—we'll come back to this point in error analysis.

Figure 7

One example per ModelNet10 class, rendered directly from the original .off meshes. The colors encode the height (z) of each vertex

3.3 MESH AND VOXEL: 3D DATA PREPROCESSING

As we have seen, a mesh cannot be fed directly to a CNN: the number of vertices varies from model to model, and the network expects a fixed-size input arranged in a regular grid. We then need a pre-processing pipeline that converts the mesh into a grid of voxels with standardized resolution. This pipeline has three steps: point-on-surface sampling, normalization, and voxelization.

3.3.1 Surface Point Sampling

The first step is to generate a point cloud from the mesh, with a fixed number of points for all models (in our case, 3,000). The naïve way to do this would be to choose vertices at random, but this would pose a problem: regions with many small triangles would be overrepresented, while large, flat regions would be almost empty.

The solution is area-weighted sampling: we draw triangles with probability proportional to their area, and for each triangle chosen, we generate a random point within it using barycentric coordinates. This ensures even coverage of the surface, regardless of how it has been tessellated.

3.3.2 Standardisation

CAD models come in arbitrary scales and positions—one can be centered at the origin with 1 unit in height, another offset, and with 100 units. In order for the network to learn the shape of the object and not its absolute scale, we normalize the point cloud to fit into a unit cube: we subtract the minimum from each axis (so the box starts at the origin) and divide it by the longest length (so the largest dimension becomes 1.0).

3.3.3 Voxelization

With the cloud normalized to $[0, 1]^3$, the voxelization itself is straightforward. We define a resolution R (e.g., 32 voxels per edge) and map each point (x, y, z) to an integer index (i, j, k) by multiplying its coordinates by $R-1$ and rounding. We mark each cell visited with 1.0 and leave the others at 0.0. The result is an *occupancy grid*: a binary cube where 1 indicates the presence of a surface and 0 indicates empty space.

Code 3.7 shows the implementation of this final step: the inputs are a point cloud $(N, 3)$ and the desired resolution, and the output is a *numpy array* (R, R, R) ready to be stacked in batches and sent to the network. The logic is simple — multiply the coordinates by $R-1$, round to integer, and mark each cell visited with 1.0.

Table 7

Code 3.7. Voxelization of a point cloud into a fixed-resolution occupancy grid.

```
def voxelize_point_cloud(points, resolution):
    """Converts a cloud (N, 3) into a binary voxel grid (R, R, R).""" grid =
np.zeros((resolution, resolution, resolution), dtype=np.
float32)
    if points.shape[0] == 0:
        return grid
    #1. Translated to the origin (each axis starts at 0) shifted = points -
points.min(axis=0)
    #2. Scale to fit [0, 1]^3 (largest dimension = 1.0) max_extent =
float(shifted.max()) if max_extent == 0.0:
        Return Grid # Degenerate Cloud (All Points Equal)
        normalized = shifted / max_extent
    #3. Quantizes on integer indexes and marks occupied cells indexes =
(normalized * (resolution - 1)).astype(np.int32) indexes = np.clip(indexes, 0,
resolution - 1)
    grid[indexes[:, 0], indexes[:, 1], indexes[:, 2]] = 1.0 return grid
```

3.4 THE RESOLUTION TRADE-OFF

The grid resolution is the most important hyperparameter of this step, and it involves a *severe tradeoff*. With $R = 16$, each model fits in only $16^3 = 4.096$ voxels — quick to process, but fine details (chair legs, table legs) may disappear. With $R = 64$, we gain $64^3 = 262.144$ voxels is much more detail, but memory consumption and training time increase in $O(R^3)$. Doubling the resolution multiplies the cost by eight.

Figure 3.7 shows the same voxelized object at three different resolutions. For ModelNet10, values between 323 and 643 are the most common equilibrium point in the literature [Maturana and Scherer 2015]. In the rest of this chapter we will use 323, enough to distinguish the 10 classes of the dataset with good accuracy on modest hardware.

Figure 8

The same object voxelized in three resolutions: 163, 323 and 643. Higher resolutions preserve more geometric detail at the cost of more memory and processing time.

3.5 THE RESNET3D-18 ARCHITECTURE

With the data ready in volumetric format, we now need a neural network that operates on voxel cubes in the same way that a conventional CNN operates on images. The choice here is ResNet3D-18, a three-dimensional version of the classic ResNet by He et al. [He et al. 2016]. Before explaining the adaptation, it's worth a quick pause on what makes ResNet special.

Before ResNet, very deep networks were difficult to train — after a certain number of layers, the gradient that walks back during backpropagation became so small that the first layers practically stopped learning (the famous *vanishing gradient* problem). ResNet solved this with a simple idea: instead of each layer block calculating an output from scratch, it only calculates the *difference* (the waste) in relation to the input, and that input is added to the result via a *skip connection*. This shortcut creates a direct path to the gradient, allowing you to train networks with 18, 50, or even 152 layers without degradation.

ResNet-18 is the lightest variant in the family, with 18 layers and about 11 million parameters. It's the natural choice when we have a modestly sized dataset like ModelNet10 — larger networks would tend to overfit with no real gain in accuracy.

3.5.1 From 2D to 3D: Swapping the *Kernels*

The transition from a 2D CNN to a 3D one is conceptually straightforward: where there was a 2D operation (convolution, *pooling*, *batch normalization*), we exchange it for the 3D equivalent.

In code, it's literally swapping Conv2d for Conv3d, MaxPool2d for MaxPool3d, and so on. What changes is the shape of the *kernel*: instead of a 3×3-type 2D window that slides across the image, we have a 3×3×3 3D window that slides across the voxel cube, capturing geometric patterns in all directions simultaneously.

Table 8 summarizes the ResNet3D-18 architecture that we will use. At each *stage* (layer1 to layer4) the cube is halved in each dimension and the number of channels doubles — the same pyramidal pattern as in 2D ResNets. In the end, the *global average pooling* collapses cube 2×2×2 into a single 512 feature vector, which is then projected into 10 values (one probability for each class of ModelNet10).

Table 8

Layers of ResNet3D-18 adapted for ModelNet10. B is the lot size, and D = H = W = 32 is the voxel resolution

Camada	Operação	Saída
Entrada	Cubo de voxels	$(B, 1, 32, 32, 32)$
stem	Conv3d + BN + ReLU	$(B, 64, 16, 16, 16)$
layer1	2 blocos residuais	$(B, 64, 16, 16, 16)$
layer2	2 blocos residuais (<i>stride</i> 2)	$(B, 128, 8, 8, 8)$
layer3	2 blocos residuais (<i>stride</i> 2)	$(B, 256, 4, 4, 4)$
layer4	2 blocos residuais (<i>stride</i> 2)	$(B, 512, 2, 2, 2)$
avgpool	<i>Average pooling</i> global	$(B, 512)$
fc	Linear → 10 classes	$(B, 10)$

3.5.2 Adapting the *torchvision* model

PyTorch already offers a ready-made implementation of ResNet3D-18 through the `torchvision.models.video.r3d_18` function. The name of the module (*video*) indicates the origin of the model: it was originally proposed for recognition of actions in videos, where the third dimension is time [Tran et al. 2018]. Despite this temporal origin, architecture is purely spatial — nothing in it is time-specific — and it works equally well when the third dimension is a spatial coordinate, as in our case. To use the model in ModelNet10 we need to make only two adjustments:

- Input layer (**stem[0]**): the original version expects 3 channels (R, G, B of the video). Our voxel grids only have 1 channel (busy/empty), so we swapped the first convolution to accept 1 input channel.
- End layer (**fc**): The original version classifies into 400 actions of the Kinetics dataset. We swapped it out for a Linear layer (512, 10) to produce the 10 classes of ModelNet10.

Code 3.8 shows this adaptation in *PyTorch*. Notice how minimalist it is: we instantiate the *torchvision* model without pre-trained weights (`weights=None`), replace the first convolution

preserving the other hyperparameters (*kernel*, *stride*, *padding*), and swap the final fully connected layer. Everything else in the architecture—the four *stages* of residual blocks, the *global average pooling*—is repurposed directly.

Table 9

Code 3.8. Adapted torchvision's ResNet3D-18 for 1-channel, 10-class input.

```
import torch.nn as nn import torchvision
def build_resnet3d18_classifier(num_classes, in_channels=1):
    """ResNet3D-18 adapted for 1-channel volumetric input.""" model =
    torchvision.models.video.r3d_18(weights=None)
    # 1. Replaces the first convolution: 3 channels (RGB) -> 1 channel (voxel)
    original_conv = model.stem[0] model.stem[0] = nn.Conv3d(
    in_channels=in_channels, out_channels=original_conv.out_channels,
    kernel_size=original_conv.kernel_size, stride=original_conv.stride,
    padding=original_conv.padding, bias=False,
    )
    #2. Replaces the final layer: 400 actions (Kinetics) -> num_classes
    in_features = model.fc.in_features model.fc = nn.Linear(in_features,
    num_classes) return model
    model = build_resnet3d18_classifier(num_classes=10, in_channels=1)
```

It is worth noting that we are training the model from scratch, that is, without carrying pre-trained weights — unlike what was done with YOLO at the beginning of this chapter. For a dataset with the simplicity of ModelNet10 (only 10 balanced classes, with very different geometries), training from scratch achieves decent results in a few epochs, without the need for the prior knowledge that pre-training would bring.

3.6 3D CLASSIFIER TRAINING PIPELINE

With the pre-processing and architecture defined, it remains to integrate everything into a training pipeline. Unlike YOLO — which has a high-level API where you just point to a folder and call `model.train()` — here we use *PyTorch* directly, which gives you more control over each step of the process.

3.6.1 Dataset and DataLoader

PyTorch organizes training data around two abstractions: the Dataset, which knows how to load an individual sample, and the DataLoader, which groups samples into batches and delivers them to the training loop. For ModelNet10, the Dataset encapsulates the entire pipeline from the previous section: it takes the path of an .off file, reads the mesh, samples the points, normalizes the cloud, and voxels it, returning the voxel cube in the format $(1, R, R, R)$ along with the entire class label.

3.6.2 Data Augmentation in 3D

Section 1.6 introduced *data augmentation* in the 2D context, with transformations such as rotations, *flips*, and brightness variations. In 3D, the idea is the same — to apply random geometric transformations so that the network doesn't memorize the exact poses of the workout — but the transformations themselves are different, and not all ideas from the 2D world make sense here.

The most important difference involves the vertical axis. The ModelNet10 models are all aligned upright: the Z-axis points upwards consistently across the entire dataset. This means that:

- Rotation on the Z axis is safe: Rotating a chair around the vertical axis produces another valid chair — it's equivalent to looking at the same object from another angle, simulating cameras positioned in different directions around the object.
- Rotation on the X or Y axes is risky: Turning a chair upside down produces a scene that the network will never see in the real world, and can confuse the model during training.

In addition to rotation, we added a bit of Gaussian noise to the coordinates of the points before voxelization, simulating small scanning imperfections and making the network more robust to noisy real-world data. These two transformations are applied before voxelization, still in the point cloud.

Like any form of *augmentation*, they are only applied to the training set, never to the test — we want to evaluate the model on "clean" data that reflects the actual expected performance. Code 3.9 shows the implementation of these two transformations.

3.6.3 Training

With data, model, and *augmentation* ready, the training follows the classic *PyTorch pattern*: each season, the model goes through all the batches of the training set, calculates the error between its predictions and the actual labels with the *cross-entropy*, and updates its

weights with the Adam optimizer. Each season we measure the accuracy in the test set and save the model if it beats the previous best result — this strategy ensures that the final evaluation is always done with the best weights, and not with those of the last season.

On modest hardware (Google Colab's GPU T4), the full ModelNet10 training at 323 resolution takes between 15 and 30 minutes for 10 epochs, achieving about 83% accuracy in the test set. The training curves in Figure 9 show this behavior: the *loss* drops consistently at each epoch, while the validation accuracy stabilizes around 82% around the 5th epoch.

Table 10

Code 3.9. Data augmentation applied to the point cloud before voxelization: random rotation on the Z-axis and Gaussian noise

```
def augment_point_cloud(points):
    """Random rotation on the Z-axis + Gaussian noise."""
    # Rotation around the vertical axis (Z) by a random angle theta =
    random.random() * 2.0 * math.pi
    cos_t, sin_t = math.cos(theta), math.sin(theta)
    rotation_matrix = np.array(
        [[cos_t, -sin_t, 0],
         [sin_t, cos_t, 0],
         [0, 0, 1]],
        dtype=np.float32,
    )
    rotated = (rotation_matrix @ points.T).T
    # Gaussian noise to simulate scan imperfections
    noise = np.random.normal(loc=0.0, scale=0.02, size=rotated.shape)
    return rotated + noise.astype(np.float32)
```

Figure 9

Training curves of ResNet3D-18 over ModelNet10 over 10 epochs. The training loss (blue) decreases monotonically while the validation accuracy (orange) stabilizes at around 82%

3.7 EVALUATION AND ANALYSIS OF RESULTS

Training a model is only half the work—the other half is understanding what it has learned. A single metric of overall accuracy can mask serious problems: a model that gets 83% right on the test set might be getting almost 100% right in some classes and less than 60% in others. In this section, we explore three tools that help diagnose this type of behavior.

3.7.1 Overall and Class Accuracy

The overall accuracy of our 10-epoch-trained model is 83.1%. That's a good number of starts, but not enough on its own — especially since some classes have far more test samples than others, which means that errors in smaller classes weigh little in the overall average.

Accuracy by class reveals the full spectrum. Figure 10 shows that classes with very different volumetric geometries — *table*, *sofa*, *chair*, *monitor*, and *toilet* — reach an accuracy of around 95%, while *bathtub* (60%), *desk* (59.3%), *dresser*, and *night_stand* (67.4%) are well below the average and are the main responsible for pulling it down.

Figure 10

Accuracy per class in the ModelNet test set10. The dashed line indicates an overall accuracy of 83.1%. Classes with distinct volumetric geometry achieve accuracy close to 95%, while geometrically ambiguous classes are below average

3.7.2 Confusion Matrix

When a class has low accuracy, the next natural question is, "What is it being confused with?" The confusion matrix responds to this. It is a $C \times C$ *table* in which the entry in row i and column j indicates the proportion of samples of true class i that have been classified as j . The main diagonal contains the hits; everything outside the diagonal are mistakes.

Figure 11 shows the normalized matrix of our model. Four patterns of confusion stand out:

- *Desk* confused with *table* (33%): both are horizontal tops on legs, and the distinction between the two is more functional than geometric.
- *Bathtub* mistaken for *sofa* (28%): Seen as volumes with low walls and upper cavity, bathtubs and sofas have strikingly similar shapes at low resolution.
- *Dresser* confused with *night_stand* (24%), and the reverse (14%): both are vertical rectangular boxes, differing basically in size — and size is precisely the dimension we lose when normalizing each object to the unit cube.
- *Bed* confused with *table* (16%): beds voxelized in 323 essentially become a horizontal plane on supports, geometry close to that of a table.

The network is, in a sense, "right" in seeing geometric similarity—only that these classes were defined by human use, not pure form, and the model only sees form. This pattern also

suggests a concrete direction for improvement: preserving absolute-scale information (rather than normalizing everything to the unit cube) could help separate pairs like *dresser/night_stand*.

Figure 11

Normalized confusion matrix in the test set. Diagonal values indicate correct answers by class; Cells outside the diagonal reveal systematic confusions between geometrically similar classes

3.8 CONSIDERATIONS FOR 3D MODELS

In the previous sections we built a complete 3D classifier: we started from meshes in the OFF format, went through the sampling-normalization-voxelization pipeline, trained an adapted ResNet3D-18 and analyzed its performance in ModelNet10. The path taken is parallel to that of the 2D classification presented in the first half of this chapter, but with a fundamental difference: in 3D, the pre-processing is as important as the architecture of the model.

Voxel representation is didactic and fits naturally into conventional CNNs, but it carries important limitations. The cost of memory grows with the cube of resolution—doubling from 323 to 643 multiplies voxels eightfold—which makes it difficult to capture fine details on modest

hardware. Moreover, most of a voxel grid is empty space: the surface of a 3D object is essentially a 2D structure, and storing it in a dense grid represents an inefficient use of memory.

For the reader who wants to take the next steps, a natural direction is to experiment with ModelNet40, the expanded version with 40 classes. The pipeline we've built here—OFF reading, point sampling, PyTorch integration—continues to serve as the foundation and can be reused directly. What remains regardless of scale is the overall structure of the problem: raw data → representation appropriate to the architecture → training → critical evaluation. These steps are the skeleton of any 3D computer vision project.

4 CONCLUSION

Throughout this chapter you have been introduced to a solid foundation of *modern computer vision pipelines*, ranging from the fast applications of the YOLO ecosystem in 2D to the more rigorous pre-processing models required for 3D classifications. While modern architectures such as YOLO abstract much of the complexity of models to provide efficient inferences on real images and videos, Working with three-dimensional volumes imposes other architectural challenges, with a high computational cost of voxelization and the data losses inherent to spatial normalization.

While useful, these templates are not without error. A rigorous analysis, as presented here in the ModelNet10 confounding matrix, reveals the potential for the model to confuse objects for their pure geometric similarities (such as chairs and tables), and the same can happen with YOLO, misclassifying and detecting objects. This demonstrates that the critical evaluation of what the model has effectively learned is as crucial as its training. The implementations and concepts discussed here therefore serve as a practical guide to the implementation and use of these techniques. With these foundations, the reader will now be able to expand these solutions and apply them to new data sets and creating their own solutions for study or real problems - but they will not do without critical evaluation of their applications.

ABSTRACT

The use of plant growth-promoting bacteria (PGPB) has emerged as a sustainable alternative for agricultural management and control of phytopathogens. This study aimed to evaluate the potential of PGPB in controlling *Fusarium sp.* and promoting plant development. The experiment was conducted in vitro at the Laboratory of Microbial Interactions and Biotechnology (LIMBio/IF Goiano – Campus Ceres), using the bacteria *Bacillus amyloliquefaciens*, *Bacillus subtilis*, and *Priestia aryabhatai*. The antagonism assay was performed by co-inoculation in PDA medium, and the mycelial growth of the fungus was measured to calculate the relative control index. The data were subjected to analysis of variance and Tukey's test ($p < 0.05$). All treatments showed a significant effect in controlling the pathogen, with *Bacillus amyloliquefaciens* standing out, exhibiting the highest antagonism index (69.87%), statistically differing from *Bacillus subtilis* (31.57%) and *Priestia aryabhatai* (15.30%). The results indicate that *B. amyloliquefaciens* has high potential as a biocontrol agent for *Fusarium sp.*, and may contribute to reducing the use of agrochemicals and developing more sustainable agricultural practices.

1 INTRODUCTION

The use of biological inputs based on beneficial soil microorganisms, such as Plant Growth Promoting Bacteria (BPCP), stands out as one of the most promising technologies to achieve the sustainability of agricultural systems. These bacteria can promote significant improvements, from traits linked to shoot and root growth to enzymatic protection against biotic and abiotic stresses (Kaushal; Wani, 2016; Porto et al., 2022).

These innovations are relevant to today's agriculture, as they help to address challenges associated with unsustainable agricultural practices. Among the main problems are the excessive use of agrochemicals, deforestation, monoculture, soil exhaustion, agriculture in inadequate areas, inadequate use of water, waste of resources, and pollution of soil and water, which compromise the health of ecosystems and productive sustainability (Kaushal; Wani, 2016; Porto et al., 2022).

Microorganisms also act on the availability of phosphorus to crops, converting forms of ions into forms that can be assimilated by plants. In addition, they produce enzymes and organic acids in the region near the roots, favoring the dissolution of phosphorus present in the soil in mineralized mineral and organic forms (Porto et al., 2022).

In crop management, different microorganisms act as soil and plant pathogens, causing damage and losses. Thus, control strategies have been widely investigated, with emphasis on more sustainable alternative methods. Among the alternatives, *Bacillus subtilis* has mechanisms of action that influence plant development, with benefits associated with improved nutrition (biological nitrogen fixation and phosphate solubilization) and growth promotion related to phytohormone production (Swarnalakshmi et al., 2020). In a study with passion fruit, the application of *Bacillus subtilis* on leaves demonstrated a preventive and curative effect in the control of the phytopathogen *Fusarium* sp. (Chen, Lee, and Huang, 2021).

Bacillus amyloliquefaciens stands out as an important biocontrol agent, being able to suppress phytopathogens by mechanisms related to fungal cell wall degradation and changes in cell permeability. In addition, contact with the pathogen can induce the production of antifungal compounds, such as lipopeptides, intensifying the antagonist action (Abreu et al., 2022).

Priestia aryabhattai, in turn, acts as a promoter of plant growth and contributes to tolerance to water stress through the production of exopolysaccharides, which help retain water in the soil and induce physiological adaptations in plants, favoring development in conditions of water deficit (Embrapa, 2021). Additionally, the use of bacteria can reduce the need for chemical fertilizers, while also favoring growth and increasing productivity.

Therefore, this work aims to evaluate the potential of plant growth-promoting bacteria in the control of *Fusarium* sp. and in the promotion of plant development, through the *in vitro* analysis of the bacteria *Bacillus subtilis*, *Bacillus amyloliquefaciens* and *Priestia aryabhattai*, in order to compare their efficiency in antagonism to the phytopathogen.

2 MATERIAL AND METHODS

The experiment was conducted at the Laboratory of Microbial Interactions and Biotechnology (LIMBio), located at the Federal Institute of Education, Science and Technology of Goiano (IF Goiano – Ceres Campus), in the municipality of Ceres, Goiás, Brazil (15°21'02"S latitude, 49°35'55"W longitude, and altitude of 564 m). The bacterial strains used were commercial products: *P. aryabhattai* B. *subtilis* B. *amyloliquefaciens* CCT 7986 (BioHidric – 1.0×10^8 colony-forming units (CFU) mL⁻¹, SoluBio, Jataí, Brazil), UFV S1 (Bio Raiz Pro – 1.0×10^8 CFU mL⁻¹, SoluBio, Jataí, Brazil) and CCT 7994 (SoluStrong – 1.0×10^8 CFU mL⁻¹, SoluBio, Jataí, Brazil).

To perform the antagonism assay to the phytopathogenic fungus, the bacterial suspensions were co-inoculated *in vitro* with the phytopathogenic fungus *Fusarium* spp. 5 mm discs of fungal mycelium were inoculated in the center of Petri dishes containing potato-dextrose-agar culture medium (B.D.A) and, at 2 cm equidistant from the disc, 5 µL of bacterial culture were deposited. The control consisted only of the mycelial disc of the fungus deposited in the center of the plate.

The plates were incubated at 28 °C in a B.O.D. incubator, and the experiment was conducted in triplicate. The diameter of the mycelium was measured with the aid of a caliper until the control treatment reached the edge of the plate. The percentage of suppression for each treatment was calculated using the relative index (RI) according to Trivedi et al. (2008).

All data collected were initially tested for normality. If the prerequisites were met, the results were submitted to analysis of variance (ANOVA) followed by Tukey's test, using R and RStudio software (R Core Team, 2024). All results were considered significant at $p < 0.05$.

3 RESULTS AND DISCUSSIONS

All three bacteria tested showed a significant antagonistic effect against *Fusarium* sp. (Figure 1).

Figure 1

In vitro bacterial antagonism test to *Fusarium* sp.

Legend: Cont.: Control; BA: *Bacillus amyloliquefaciens*; PA: *Priestia aryabhattai*; BS: *Bacillus subtilis*. Source: Prepared by the authors.

The analysis of variance indicated a significant effect of the treatments on the evaluated variable ($p < 0.0001$), evidencing differences between the means, as shown in Table 1. According to Tukey's test, the treatment with *Bacillus amyloliquefaciens* presented the highest relative control index, with 69.87%, differing statistically from the treatments with *Bacillus subtilis* (31.57%) and *Priestia aryabhattai* (15.30%), which also differed from each other, forming distinct response groups. These results demonstrate that the treatment with *Bacillus amyloliquefaciens* provided significantly superior performance compared to the others when controlling *in vitro* the phytopathogenic fungus *Fusarium* sp.

Table 1

Relative Index (RI) of in vitro bacterial antagonism to Fusarium sp.

Treatments	IR (%)
<i>Bacillus amyloliquefaciens</i>	69.86667
<i>Bacillus subtilis</i>	31.56667
<i>Priestia aryabhattai</i>	15.3 c
F.V	p-value
Treatment	0,001**
CV (%)	26,11

Legend: Different letters in the column differ significantly by Tukey's test. *Significant at the level of 5% by Tukey's test; **Significant at the level of 1% by Tukey's test; ns: Not significant. F.V.: source of variation; C.V. (%): coefficient of variation. Source: Prepared by the authors.

These results corroborate the findings of Elanchezhiyan *et al.* (2018), which obtained a control percentage of 48.3% in the *in vitro* control of *Fusarium oxysporum* f. sp. *Lycopersici* with the FZB 24 strain of *B. amyloliquefaciens*. Similarly, Sundaramoorthy and Balabaskar (2013) reported the efficacy of *B. subtilis* isolates in inhibiting up to 40% the mycelial growth of

F. oxysporum f. sp. *lycopersici* *in vitro*, which is responsible for causing vascular wilt disease in tomato crops.

Species of *Bacillus* sp. are known to secrete peptides with antimicrobial action, such as phengicin, bacillomycin, and bacteriocin (Ramarathnam *et al.*, 2007; Xie *et al.*, 2009).

It was verified by Yi *et al.* (2024) that the ZK-9 strain of *B. Amyloliquefaciens* produces pectinase, protease, cellulase, and amylase, important enzymes involved in the ability of this bacterium to inhibit the growth of phytopathogenic fungi by disrupting the integrity and permeability of the cell membrane, disrupting metabolic pathways, and preventing pathogens from developing. The authors also observed that the bacterium showed high efficacy in field control, reducing ear fusarium by 71.76% and wheat crown rot by 82.14%, both caused by the fungus *Fusarium graminearum*.

Guleria *et al.* (2016) isolated an alkaline protease gene from the SP1 strain of *Bacillus amyloliquefaciens* and evaluated its antagonist activity *in vitro* against *F. oxysporum* using the agar diffusion technique. The authors observed that the enzyme was highly effective, reducing the growth of the pathogen by 35.07%, which highlights the role of the enzymes produced by *B. amyloliquefaciens* in its ability to control phytopathogenic fungi, such as *Fusarium* sp.

4 CONCLUSION

The results demonstrate that the bacteria evaluated had a significant effect on the *in vitro* control of *Fusarium* sp., especially *Bacillus amyloliquefaciens*, which showed the highest efficiency of antagonism. *Bacillus subtilis* showed an intermediate effect, while *Priestia aryabhattai* had a lower performance. Thus, *B. amyloliquefaciens* stands out as a promising alternative for the biocontrol of the pathogen, with potential application in sustainable agricultural systems.

ABSTRACT

The advancement of artificial intelligence and automation has driven significant transformations in the world of work, directly impacting productive organization, employability, and labor legal relations. In this context, the present study aims to analyze the future of employment in Manaus, Amazonas, with emphasis on the legal challenges arising from the incorporation of these technologies into the productive environment, particularly within the Industrial Pole of Manaus. The research is characterized as a qualitative literature review, based on recent scientific studies and relevant institutional documents selected according to criteria of timeliness, thematic relevance, and academic rigor. The findings indicate that automation tends to replace repetitive tasks while increasing the demand for higher levels of professional qualification, which may intensify social inequalities if not accompanied by appropriate public policies. Furthermore, the study reveals that Labor Law faces limitations in regulating new forms of work organization mediated by technology, highlighting the need for normative updates. It is concluded that the future of employment in Manaus will depend on the articulation between technological innovation, legal regulation, and public policies, in order to ensure economic development with social inclusion and protection of workers' rights.

as relações jurídicas laborais. Nesse contexto, o presente estudo tem como objetivo analisar o futuro do emprego em Manaus, Amazonas, com ênfase nos desafios jurídicos decorrentes da incorporação dessas tecnologias no ambiente produtivo, especialmente no âmbito do Polo Industrial. A pesquisa caracteriza-se como uma revisão de literatura, de abordagem qualitativa, fundamentada em estudos científicos recentes e documentos institucionais relevantes, selecionados a partir de critérios de atualidade, pertinência temática e rigor acadêmico. Os resultados indicam que a automação tende a substituir atividades repetitivas, ao mesmo tempo em que exige maior qualificação profissional, podendo ampliar desigualdades sociais se não houver políticas públicas adequadas. Verificou-se, ainda, que o Direito do Trabalho enfrenta limitações para regular as novas formas de organização laboral mediadas por tecnologia, evidenciando a necessidade de atualização normativa. Conclui-se que o futuro do emprego em Manaus dependerá da articulação entre inovação tecnológica, regulação jurídica e políticas públicas, de modo a garantir desenvolvimento econômico com inclusão social e proteção dos direitos dos trabalhadores.

Palavras-chave: Automação. Direito do Trabalho. Emprego. Inteligência Artificial. Manaus.

RESUMEN

El avance de la inteligencia artificial y de la automatización ha promovido transformaciones significativas en el mundo del trabajo, impactando directamente la organización productiva, la empleabilidad y las relaciones jurídicas laborales. En este contexto, el presente estudio tiene como objetivo analizar el futuro del empleo en Manaus, Amazonas, con énfasis en los desafíos jurídicos derivados de la incorporación de estas tecnologías en el entorno produtivo, especialmente en el Polo Industrial. La investigación se caracteriza como una revisión de literatura de enfoque cualitativo, fundamentada en estudios científicos recientes y documentos institucionales relevantes, seleccionados con base en criterios de actualidad, pertinencia temática y rigor académico. Los resultados indican que la automatización tiende a sustituir tareas repetitivas, al mismo tiempo que exige mayor cualificación profesional, pudiendo ampliar las desigualdades sociales si no existen políticas públicas adecuadas. Asimismo, se constató que el Derecho del Trabajo enfrenta limitaciones para regular las nuevas formas de organización laboral mediadas por la tecnología, evidenciando la necesidad de actualización normativa. Se concluye que el futuro del empleo en Manaus dependerá de la articulación entre innovación tecnológica, regulación jurídica y políticas públicas, con el fin de garantizar desarrollo económico con inclusión social y protección de los derechos de los trabajadores.

1 INTRODUCTION

The intensification of the use of artificial intelligence and automated systems has promoted profound transformations in the world of work, directly impacting the way productive activities are organized and executed. This process, associated with the consolidation of industry 4.0, has been changing not only the economic dynamics, but also the legal relationships that structure the bond between workers and employers. In this context, automation ceases to be a merely technological phenomenon and starts to assume a structural character, influencing the generation of jobs, professional qualification and the very configuration of the contemporary labor market. As observed by Perosini (2024), the replacement of repetitive tasks by automated systems shows a significant change in the profile of occupations, requiring new skills and increasing the challenges for labor insertion.

In the Brazilian scenario, such transformations take on even more relevant contours in the face of economic and regional specificities. The adoption of technologies based on artificial intelligence occurs in a heterogeneous way, impacting the various productive sectors and regions of the country in a different way. Lima (2021) highlights that automation tends to affect activities traditionally dependent on labor with greater intensity, which can generate significant effects on employability and income distribution. This context highlights the need to understand the impacts of these changes not only at the national level, but also from regional perspectives that allow the identification of their particularities and specific implications.

In the case of Manaus, Amazonas, the analysis of the future of employment becomes even more relevant due to the centrality of the Industrial Pole in the local economy. Institutional data indicate that the productive structure of the region is strongly linked to the performance of this sector, which makes the incorporation of technologies a determining factor for maintaining competitiveness and job creation. According to SUFRAMA (2026), the Manaus Industrial Pole represents one of the main axes of regional economic development, being directly influenced by technological modernization processes. In this sense, the introduction of automated systems and artificial intelligence in the industrial environment not only redefines production processes, but also directly impacts the local labor market.

From a legal perspective, these transformations highlight the need to review traditional models of labor regulation. Labor Law, historically structured to deal with face-to-face and hierarchically defined relationships, is now facing challenges arising from digitalization and algorithmic management. Barroso (2024) points out that the incorporation of disruptive technologies requires the construction of new regulatory frameworks capable of balancing innovation and protection of fundamental rights, especially with regard to the dignity of the

worker.

Given this scenario, the following research problem emerges: how do artificial intelligence and automation impact the future of employment in Manaus, Amazonas, and what are the main legal challenges arising from these transformations? The investigation is based on the premise that technological advances, although they promote efficiency gains, can also generate social and normative tensions that demand adequate institutional responses. In this sense, the study seeks to understand how changes in the world of work are articulated with the legal system, especially in the context of a strongly industrialized regional economy.

Thus, the general objective of this article is to analyze the impacts of artificial intelligence and automation on the future of employment in Manaus, Amazonas, with emphasis on the legal challenges associated with these transformations. As specific objectives, it is intended to examine the changes in the structure of the labor market, identify the main risks and opportunities arising from automation and discuss the adequacy of existing legal instruments in the face of new labor dynamics. The relevance of the study lies in the need to produce scientific knowledge that contributes to the debate on the future of work, especially in strategic regional contexts, in which technological innovation is articulated with social and economic issues of great complexity.

The relevance of the theme is also justified by the fact that technological transformations are not limited to the economic dimension, reaching social and legal aspects that require in-depth analysis. The incorporation of intelligent systems into the workplace has the potential to alter the way decisions are made, how workers are evaluated, and how subordinate relationships are established. In this sense, Paes (2025) observes that algorithmic management redefines the control mechanisms in the work environment, introducing new forms of supervision that challenge the traditional models of Labor Law.

In addition, the use of algorithms in recruitment, selection, and performance management processes raises concerns related to transparency and fairness. Coimbra Santos (2024) highlights that automated systems can reproduce discriminatory patterns, especially when based on biased historical data. This reality reinforces the need to develop regulatory mechanisms that ensure the protection of workers in the face of automated decisions, avoiding the expansion of inequalities that already exist in the labor market.

Another relevant aspect refers to the reconfiguration of employment power in the face of the adoption of digital technologies. Artur (2025) argues that the use of algorithms in work management shifts the decision-making center of labor relations, creating new dynamics of subordination that do not fully fit into traditional models. This transformation highlights the need

to review classic legal concepts, in order to ensure that labor protection keeps up with technological changes.

In the field of social rights, the literature points out that automation can generate significant impacts on working conditions. Gervasoni (2024) points out that, although technological innovation promotes efficiency, it can also contribute to the precariousness of labor relations, especially in contexts marked by excessive flexibility. This finding reinforces the importance of a legal action that seeks to balance technological development and social protection.

Additionally, the analysis of the local context shows that the adoption of technologies in the Manaus Industrial Pole occurs gradually, being influenced by structural and institutional factors. Rocha (2024) shows that the digital transformation in the region's industrial sector presents important advances, but also challenges related to the qualification of the workforce and the adaptation of companies to new technological requirements. This scenario reinforces the need for public policies aimed at professional training and strengthening the regional productive base.

Thus, it is highlighted that understanding the future of employment in Manaus requires an integrated approach, which considers the interactions between technology, economics and law. Moreira (2025) points out that the absence of specific regulation to deal with the impacts of artificial intelligence on labor relations can generate legal uncertainty, evidencing the need for regulatory updating. In this way, the study is part of a relevant and current field of investigation, contributing to the academic debate and to the construction of solutions that promote the sustainable development of work in the digital age.

2 THEORETICAL FRAMEWORK

The analysis of the future of employment, especially in regional contexts such as Manaus, Amazonas, requires the articulation between technological transformations, productive dynamics and the legal mechanisms that seek to regulate labor relations in constant mutation. In this scenario, artificial intelligence and automation assume a central role, not only as instruments for increasing productivity, but as elements that redefine the very structure of contemporary work. Barroso (2024) argues that the advancement of these technologies imposes relevant regulatory challenges, especially due to the need to balance technological innovation with the protection of fundamental rights, which includes the right to decent work.

Recent literature points out that automation and intelligent systems have been promoting structural changes in the labor market, with direct impacts on employability and productive

organization. According to Perosini (2024), the advance of industry 4.0 intensifies the phenomenon of technological unemployment, as it replaces repetitive and operational activities with automated systems. This transformation is not limited to the elimination of jobs, but also implies the creation of new professional demands, requiring higher levels of qualification and constant adaptation of workers.

In the Brazilian context, such transformations take on specific contours, especially in industrialized regions. Lima (2021) highlights that automation tends to have a more intense impact on traditional productive sectors, significantly changing the occupational structure and expanding the need for public policies aimed at professional requalification. This perspective is particularly relevant for understanding the Amazonian reality, where the economic base is strongly linked to the industrial sector.

In the case of Manaus, the Industrial Pole represents one of the main economic engines in the region, being directly affected by the digitalization and automation processes. Rocha (2024) shows that the introduction of technologies associated with industry 4.0 has promoted gains in efficiency and competitiveness, but also reveals challenges related to the qualification of the local workforce and the adaptation of production structures. This scenario demonstrates that technological advancement, while bringing economic benefits, can also deepen inequalities if there are no adequate inclusion and training policies.

From a legal perspective, these changes impose the need to reinterpret the traditional institutes of Labor Law. Paes (2025) points out that the incorporation of systems based on artificial intelligence changes the forms of control and subordination in the work environment, requiring the construction of new regulatory paradigms. In this sense, the author highlights that the emergence of a Labor Law focused on the digital reality is indispensable to deal with the specificities of relationships mediated by algorithms.

Additionally, the increasing use of technologies in labor management raises concerns related to transparency and fairness. Coimbra Santos (2024) argues that algorithmic systems can reproduce discriminatory patterns, especially when operating on the basis of biased historical data. This problem reinforces the need for legal mechanisms that ensure control, auditability, and accountability in the use of these technologies, avoiding the perpetuation of inequalities in the labor market.

The reconfiguration of employment power is also a relevant aspect in this debate. Artur (2025) observes that the use of algorithms in labor management shifts the decision-making center of labor relations, creating new forms of subordination that do not fully fit into traditional models. This displacement requires an in-depth reflection on the limits of the employer's power

and on the need to ensure effective protection for workers in highly technologized environments.

On the other hand, the incorporation of technologies in the world of work does not occur without social costs. Gervasoni (2024) points out that, although technological innovation can generate efficiency gains, it can also contribute to the precariousness of working conditions and the weakening of social rights. This aspect shows that the discussion about the future of employment cannot be restricted to the economic dimension, but must also consider the social and legal impacts of these transformations.

In this context, understanding the future of employment in Manaus requires an integrated analysis between technological advances, the local productive structure and the legal instruments available to regulate these changes. The official indicators of SUFRAMA (2026) demonstrate the relevance of the Industrial Pole for the regional economy, which reinforces the importance of understanding how automation and artificial intelligence can impact job creation and work dynamics in the region.

The intensification of the use of digital technologies in the productive environment has caused not only quantitative changes in the labor market, but also qualitative transformations in the forms of organization, control and execution of work activities. In this sense, Moreira (2025) highlights that the replacement of human labor by automated systems directly challenges the normative structure of the Consolidation of Labor Laws, requiring the updating of its provisions to deal with new forms of labor provision. Such a scenario shows that Labor Law, historically built on the centrality of the traditional employment relationship, finds it difficult to encompass emerging realities mediated by artificial intelligence.

From this perspective, it is observed that automation does not only eliminate jobs, but redefines fundamental legal categories, such as subordination, working hours, and employer responsibility. Paes (2025) points out that algorithmic management introduces a diffuse form of control, in which decisions are made by automated systems, often without transparency or the possibility of contestation by the worker. This new configuration challenges the very notion of directive power, requiring the construction of legal instruments capable of ensuring balance in labor relations.

In this context, the problem of algorithmic opacity stands out. Artur (2025) argues that the use of automated systems in work management makes it difficult to identify the criteria used in decisions, which can compromise workers' fundamental rights. The absence of transparency not only limits the exercise of adversarial proceedings, but also makes it difficult to hold accountable in cases of unfair or discriminatory decisions, which reinforces the need for specific regulatory mechanisms.

The discussion about algorithmic discrimination is also part of this scenario. Coimbra Santos (2024) shows that algorithms can reproduce discriminatory patterns that already exist in society, increasing gender, race, and class inequalities in access to employment. This finding reveals that technological neutrality is a myth, and it is essential that the legal system establishes clear parameters for the ethical and responsible use of these tools in the workplace.

At the same time, the literature points out that the impacts of automation are not uniform among the different economic sectors. Perosini (2024) observes that sectors that are more intensive in repetitive activities tend to be more quickly replaced by automated systems, while functions that require creativity, complex decision-making, and human interaction have greater resilience. In the context of Manaus, this differentiation is particularly relevant, considering the diversity of activities developed in the Industrial Pole.

The local reality reinforces the need for contextualized analysis. Rocha (2024) demonstrates that the adoption of industry 4.0 technologies in the Manaus Industrial Pole occurs gradually, marked by challenges related to technological infrastructure and the qualification of the workforce. This transition shows that the impact of automation depends not only on technological advancement, but also on the structural and institutional conditions of the region.

In addition, the economic dimension of these transformations cannot be dissociated from the legal analysis. Lima (2021) points out that automation can generate productivity gains and economic growth, but it also tends to widen inequalities, especially when not accompanied by adequate public policies. This duality reinforces the need for state action to promote inclusion and reduce the negative effects of technological unemployment.

From the perspective of social rights, Gervasoni (2024) points out that the incorporation of technologies in the world of work can result in precariousness, especially when there are no adequate protection mechanisms. The flexibilization of labor relations, associated with the intensive use of technology, can weaken historically conquered guarantees, requiring a more active role of the Law in the defense of the dignity of the worker.

The analysis of economic indicators reinforces the centrality of the Manaus Industrial Pole in the generation of jobs and income in the region. SUFRAMA data (2026) show that the performance of the industrial sector directly impacts the local labor market, which makes it even more relevant to understand the effects of automation on this structure. In this sense, the future of employment in Manaus depends not only on technological evolution, but also on the ability of legal institutions and public policies to adapt to the new demands of the contemporary world of work.

The consolidation of artificial intelligence and automation in the production environment also raises reflections on the need to redefine the very foundations of Labor Law. In this sense, Barroso (2024) points out that digital transformation does not only represent a technological change, but a structural change in the forms of social and economic organization, requiring institutional responses that preserve the centrality of the dignity of the human person. Such a perspective reinforces that the regulation of labor, in the face of this new scenario, must be guided by constitutional principles capable of ensuring a balance between innovation and social protection.

From this approach, it is evident that the future of employment cannot be understood in isolation, but as part of a broader system of economic and social relations. Lima (2021) highlights that the effects of automation on the labor market tend to intensify over time, especially in developing economies, where the technological transition can occur more abruptly. This process requires the formulation of public policies aimed not only at generating jobs, but also at adapting the workforce to new technological requirements.

In the legal field, this transformation imposes challenges related to the effectiveness of existing rules. Moreira (2025) observes that labor legislation, by being based on traditional employment models, presents limitations to regulate new forms of work mediated by technology. The absence of specific devices to deal with automation and artificial intelligence can generate regulatory gaps, making it difficult to protect workers in highly digitized contexts.

In addition, the reconfiguration of labor relations also impacts the very notion of employment relationship. Paes (2025) points out that technological mediation can fragment the relationship between worker and employer, creating situations in which the identification of the person responsible for decisions becomes more complex. This fragmentation challenges classic concepts of Labor Law and requires the construction of new parameters for defining responsibilities and guarantees.

Another relevant aspect refers to the need for transparency and governance in the use of technologies in the workplace. Artur (2025) emphasizes that algorithmic management must be accompanied by mechanisms that allow the understanding of the criteria used in decisions, guaranteeing the worker the right to contest any injustices. This requirement is directly related to the protection of fundamental rights, especially with regard to equality and non-discrimination.

In this context, the problem of algorithmic discrimination takes center stage. Coimbra Santos (2024) shows that the use of automated systems can reproduce existing discriminatory patterns, increasing inequalities in access to employment and working conditions. This finding reinforces the need for specific regulation that establishes limits and responsibilities in the use

of these technologies, ensuring that innovation does not translate into social exclusion.

From a socioeconomic perspective, the impacts of automation are also reflected in working conditions and income distribution. Gervasoni (2024) argues that the incorporation of technologies can generate precariousness, especially when accompanied by excessive flexibility in labor relations. This reality shows that technological advances, although they promote efficiency, can deepen inequalities if there are no adequate mechanisms for social protection.

In the regional context, these transformations take on their own characteristics. Rocha (2024) demonstrates that the Manaus Industrial Pole faces specific challenges related to the implementation of advanced technologies, including structural limitations and the need for labor qualification. This reality reinforces the importance of public policies aimed at regional development, capable of integrating technological innovation with social inclusion.

In turn, Perosini (2024) highlights that the transition to industry 4.0 requires not only investments in technology, but also in education and professional training, in order to avoid the expansion of structural unemployment. This perspective dialogues directly with the reality of Manaus, where dependence on the industrial sector makes the impact of technological transformations on employment even more sensitive.

The data presented by SUFRAMA (2026) show the economic relevance of the Manaus Industrial Pole, reinforcing that any change in its production structure has a direct impact on the local labor market. In this sense, the future of employment in the region depends on the ability to articulate technological innovation, legal regulation, and public policies, in order to ensure that the advances provided by artificial intelligence and automation are accompanied by social protection and the promotion of worker dignity.

3 METHODOLOGY

The present study is characterized as a theoretical research, with a qualitative approach, developed through a literature review. Such a methodological choice is justified by the need to understand, systematize and critically analyze the recent scientific production on the impacts of artificial intelligence and automation on the labor market, with emphasis on the legal challenges and specificities of the context of Manaus, Amazonas. The literature review enables the construction of an analytical panorama based on already consolidated studies, allowing the identification of convergences, gaps and trends in the field investigated.

The research design was structured based on the previous definition of the theme, the research problem and the objectives of the study, guiding the careful selection of sources. The

search for materials took place in databases recognized in the academic environment, prioritizing scientific articles published in relevant journals, as well as institutional documents of recognized credibility. Only recent studies, published in recent years, were considered in order to ensure the timeliness and relevance of the discussions presented.

As inclusion criteria, works were selected that directly addressed the relationship between artificial intelligence, automation, the labor market and Law, with an emphasis on contemporary analyses of labor transformations and their legal developments. Studies that presented relevant contributions to the understanding of the Brazilian context and, especially, the reality of the Manaus Industrial Pole were also included. Materials that did not present scientific rigor, lack of defined authorship, methodological inconsistencies, or disconnection with the object of the research were excluded.

The process of selecting sources involved initial exploratory reading, followed by a more in-depth analysis of the texts considered relevant. Subsequently, the analytical and interpretative reading was carried out, with the objective of extracting concepts, theoretical categories and empirical evidence that would contribute to the construction of the theoretical framework. This procedure allowed the content to be organized in a logical and articulated way, ensuring internal coherence to the study.

Data analysis was conducted qualitatively, using the content analysis technique, with emphasis on the identification of patterns, thematic recurrences, and divergences among the authors. It sought to understand how different theoretical perspectives address the impacts of artificial intelligence and automation on work, as well as the legal challenges arising from these transformations. From this analysis, it was possible to structure interpretative categories that guided the discussion of the results.

With regard to methodological limitations, it is noteworthy that the literature review depends on the availability and quality of the selected sources, and there may be restrictions related to access to certain studies or the scarcity of specific research on the regional approach adopted. In addition, as it is a qualitative approach, the results are subject to the interpretation of the researcher, even if they are based on scientific evidence.

Despite these limitations, the methodology adopted is adequate to the objectives of the study, as it allows an in-depth and critical analysis of the theme, contributing to the understanding of the legal challenges associated with the transformations of work in the context of artificial intelligence and automation, especially in the scenario of Manaus, Amazonas.

The systematization of the sources used throughout the research is essential to ensure methodological transparency, traceability of information and coherence in the construction of

the theoretical framework. Table I below presents, in an organized way, the main works that supported the study, allowing us to visualize the profile of the selected scientific and institutional productions, as well as their adequacy to the investigated theme.

Table 1

Synthesis of the sources used in the research

Lead author / Institution	Document Title	Font type	Year
Artur	Algorithms, work and normative spaces: rebalancing employment power?	Scientific article	2025
Barroso	Artificial intelligence: promises, risks and regulation. Something new under the sun	Scientific article	2024
Coimbra Santos	Algorithmic discrimination in labor relations and human rights	Scientific article	2024
Gervasoni	The hidden costs of technology and the protection of the social right to work	Scientific article	2024
Lima	Exploring the future impact of automation in Brazil	Scientific article	2021
Moreira	The impacts of automation and artificial intelligence on employment relations in the light of the CLT	Scientific article	2025
Paes	Artificial intelligence, human labor and labor law: the challenges and meanings of regulation	Scientific article	2025
Perosini	The impact of industry 4.0 on the labor market and technological unemployment	Scientific article	2024
Rock	Industry 4.0 in the Manaus Industrial Pole: a study on digital transformation in the electronics sector	Academic annals	2024
SUFRAMA	Indicators of the Manaus Industrial Complex, December 2025	Official document	2026

Source: Authors'.

The analysis of the table shows the predominance of recent scientific articles, which reinforces the current and qualified nature of the research. The presence of a relevant institutional source is also observed, which contributes to the empirical contextualization of the Manaus scenario.

The selected productions present a strong thematic convergence around artificial intelligence, automation and their impacts on work, while offering different perspectives, legal, economic and technological, allowing a consistent interdisciplinary approach aligned with the objective of the study.

4 RESULTS AND DISCUSSIONS

The analysis of the selected studies shows that the incorporation of artificial intelligence

and automation in the world of work is not limited to a technological phenomenon, but configures a structural transformation with direct implications on the productive organization and on Labor Law. The results point to convergence among the authors regarding the idea that automation promotes efficiency and productivity gains, while profoundly changing the dynamics of employment. In this sense, Perosini (2024) highlights that the replacement of repetitive tasks by automated systems redefines the role of the worker, requiring new skills and expanding the need for professional qualification.

At the same time, it is observed that this transformation does not occur in a homogeneous way, being conditioned by economic, structural and regional factors. In the context of Manaus, the data analyzed indicate that the Industrial Pole plays a central role in the absorption of labor, which makes its modernization processes particularly relevant for the future of employment in the region. Rocha (2024) shows that the adoption of technologies associated with industry 4.0 has occurred gradually, revealing advances in production efficiency, but also challenges related to the training of the local workforce and the adaptation of industrial structures.

The discussion of the results also reveals that automation directly impacts the occupational structure, promoting both the elimination of certain jobs and the creation of new functions. Lima (2021) observes that this process tends to intensify inequalities, especially in contexts in which there are no effective public policies for professional retraining. This finding reinforces the need for articulation between technological development and inclusion policies, in order to prevent the benefits of innovation from being concentrated in specific groups.

From a legal perspective, the findings indicate that the traditional model of labor regulation faces significant limitations in the face of new forms of labor organization. Moreira (2025) points out that the Consolidation of Labor Laws, although still relevant, presents difficulties in encompassing relationships mediated by digital technologies, especially with regard to the definition of employment relationship and accountability in automated contexts. This normative gap highlights the need to update legal instruments to ensure effective protection for workers.

Another relevant point identified in the studies refers to the transformation of forms of control in the work environment. Paes (2025) argues that algorithmic management introduces continuous and automated supervision mechanisms, which can intensify control over the worker without the same transparency as traditional models. This change alters the very nature of subordination, requiring new theoretical and normative approaches to understand contemporary labor relations.

In addition, the analysis shows that the use of algorithms in work management raises

concerns related to transparency and fairness. Coimbra Santos (2024) highlights that automated systems can reproduce discriminatory patterns, which reinforces the need for control and regulation mechanisms that ensure justice and equality in access to employment. This problem becomes even more relevant in contexts of automated selection, in which decisions can be made without direct human intervention.

On the other hand, the results also point out that technology should not be understood only as a risk factor, but also as an opportunity for positive transformation. Barroso (2024) argues that artificial intelligence can contribute to economic development and innovation, as long as it is accompanied by appropriate regulatory frameworks. This view reinforces the need for a balance between stimulating innovation and protecting fundamental rights, especially in the field of labor.

In this scenario, the reconfiguration of employment power emerges as one of the main consequences of the adoption of digital technologies. Artur (2025) observes that the use of algorithms displaces the decision-making center of labor relations, creating new forms of subordination that challenge traditional models. This change requires the construction of legal mechanisms capable of ensuring transparency and balance in labor relations, avoiding the expansion of asymmetries between employers and workers.

The social impacts of these transformations are also evident. Gervasoni (2024) points out that the incorporation of technologies can result in precarious working conditions, especially when associated with the flexibility of labor relations. This finding shows that technological advances, although they bring economic benefits, can generate negative externalities that need to be considered in the regulation process.

The analysis of institutional data reinforces the relevance of the regional context for understanding the results. The SUFRAMA indicators (2026) demonstrate the importance of the Manaus Industrial Pole in the generation of jobs, showing that any transformation in its productive structure has direct impacts on the local labor market. In this sense, the results point out that the future of employment in Manaus is directly conditioned by the way automation and artificial intelligence will be incorporated into the productive dynamics of the region, requiring integrated responses between technology, law and public policies.

The continuity of the analysis shows that the effects of automation and artificial intelligence are not restricted to the productive plane, reaching structural dimensions of the labor legal system itself. In this sense, Moreira (2025) argues that the progressive replacement of the human workforce by automated systems tends to strain the protective logic of labor legislation, especially with regard to the maintenance of jobs and the guarantee of minimum

rights. Such a scenario reveals that legal regulation, if maintained in traditional ways, may become insufficient to respond to the new forms of work organization.

The discussion of the results also allows us to identify that algorithmic management represents one of the main ruptures in the classic model of subordination. Paes (2025) highlights that the control exercised by automated systems redefines the relationship between employer and employee, to the extent that decisions are made by technological structures that operate continuously and often invisibly. This configuration expands the reach of the directive power, while making it difficult to oversee, requiring more sophisticated legal instruments to ensure balance in labor relations.

In this context, the opacity of artificial intelligence systems emerges as one of the main challenges identified in the literature. Artur (2025) argues that the absence of transparency in the criteria used by algorithms compromises the worker's ability to understand and contest decisions that directly affect their professional life. This limitation impacts not only the right to be heard, but also the effectiveness of labor guarantees, making it necessary to build algorithmic governance mechanisms.

The analysis also highlights the centrality of the issue of algorithmic discrimination in the contemporary debate. Coimbra Santos (2024) points out that automated systems can reproduce historical inequalities present in the data used for their training, which results in discriminatory practices in recruitment, performance evaluation, and career progression. This phenomenon reinforces the need for specific regulation, aimed at preventing biases and promoting equity in the workplace.

From an economic perspective, the results indicate that automation can generate ambivalent effects on the labor market. Lima (2021) observes that, although there is potential for increased productivity and economic growth, there is also a risk of increasing structural unemployment, especially in sectors that are more vulnerable to technological substitution. This duality reinforces the importance of public policies that promote the adaptation of the workforce, reducing the negative impacts of the technological transition.

In the specific case of Manaus, the data analyzed reveal that the impact of automation is directly related to the local production structure. Rocha (2024) shows that the modernization process of the Industrial Pole occurs gradually, being influenced by factors such as technological infrastructure and availability of qualified labor. This reality shows that the adoption of advanced technologies depends on structural conditions that are not always fully consolidated in the region.

In addition, the analysis of institutional indicators reinforces the economic relevance of

the Industrial Pole for the local labor market. SUFRAMA data (2026) indicate that job creation in the region is strongly linked to the performance of the industrial sector, which makes any automation process particularly sensitive. In this sense, the introduction of technologies must be accompanied by strategies that ensure the maintenance of adequate levels of employment and income.

On the other hand, the results also indicate that technological innovation can represent an opportunity for positive transformation, as long as it is properly regulated. Barroso (2024) points out that artificial intelligence has the potential to boost economic development and promote social advances, as long as it is accompanied by regulatory frameworks that ensure the protection of fundamental rights. This perspective reinforces the need for a balance between encouraging innovation and preserving labor guarantees.

The social dimension of these transformations is also manifested in the possible precariousness of working conditions. Gervasoni (2024) highlights that the flexibilization of labor relations, associated with the intensive use of technology, can weaken the social protection of workers. This process shows that technological modernization, if not accompanied by adequate policies, can result in social setbacks, expanding existing inequalities.

The analysis of the results allows us to identify that the reconfiguration of labor relations requires an interdisciplinary approach, which integrates legal, economic and technological aspects. Perosini (2024) reinforces that the transition to industry 4.0 requires not only investments in technology, but also in education and professional training, in order to ensure that workers can adapt to new market demands. Thus, the findings indicate that the future of employment in Manaus will depend on the ability to articulate innovation, legal regulation and public policies aimed at social inclusion.

The final stage of the analysis allows us to advance in the integrated interpretation of the findings, showing that the impacts of artificial intelligence and automation on work cannot be understood in isolation, but rather as part of a broader process of reconfiguration of economic and social relations. In this sense, Barroso (2024) highlights that digital transformation imposes the need to review institutional frameworks, especially with regard to the protection of fundamental rights in contexts of high technological complexity. This perspective reinforces that legal regulation must follow technological evolution, avoiding gaps that may compromise the dignity of the worker.

The joint analysis of the sources also shows that the replacement of human labor by automated systems tends to generate differentiated impacts between sectors and regions. Lima (2021) points out that economies with a strong industrial base, such as Manaus, may face more

intense challenges in the technological transition process, especially due to the concentration of activities susceptible to automation. This finding reinforces the need for specific strategies for regional contexts, considering their productive and social particularities.

From the normative point of view, the results indicate that labor legislation faces a scenario of increasing complexity. Moreira (2025) observes that the absence of specific regulation for the use of artificial intelligence in the workplace can generate legal uncertainty, both for workers and employers. This gap highlights the need to update the legal system, with the creation of rules capable of disciplining the use of emerging technologies in labor relations.

The discussion also reveals that algorithmic management significantly modifies the power structure in the workplace. Paes (2025) argues that the control exercised by automated systems expands the reach of employment power, while reducing the visibility of decisions, making it difficult to contest them. This scenario requires the construction of mechanisms that ensure transparency and accountability, in order to preserve balance in labor relations.

In addition, the analysis shows that the use of algorithms can intensify existing inequalities. Coimbra Santos (2024) points out that the reproduction of biases in automated systems can compromise equitable access to employment, making it essential to implement regulatory measures that ensure justice and equality. This problem demonstrates that technology, far from being neutral, reflects and can amplify preexisting social structures.

In the field of labor relations, the reconfiguration of directive power is also presented as a central element. Artur (2025) points out that the adoption of algorithmic systems redefines the way work is organized and supervised, creating new dynamics of subordination. This transformation requires a review of the traditional concepts of Labor Law, in order to ensure that legal protection keeps up with technological changes.

The social dimension of the results also deserves to be highlighted. Gervasoni (2024) argues that the incorporation of technologies can lead to the precariousness of working conditions, especially when associated with the flexibilization of labor relations. This reality shows that technological advances, although they promote efficiency, can generate adverse effects if there are no adequate public policies to mitigate their impacts.

In the regional context, the analysis confirms the centrality of the Manaus Industrial Pole in the dynamics of employment. Rocha (2024) demonstrates that the technological modernization of the industrial sector is an ongoing process, marked by advances and challenges, especially with regard to the qualification of the workforce. This scenario reinforces the importance of investments in education and training, as a way to ensure the adaptation of workers to the new demands of the market.

Additionally, SUFRAMA data (2026) show that the performance of the Industrial Pole is directly related to the generation of jobs in the region, which makes automation a critical factor for the future of work in Manaus. In this sense, the introduction of technologies must be accompanied by strategies that ensure the economic and social sustainability of the local production model.

The results indicate that the transition to a productive model based on artificial intelligence and automation requires an integrated approach, which articulates technological innovation, legal regulation and public policies. Perosini (2024) highlights that adapting to industry 4.0 depends not only on investments in technology, but also on the ability to prepare the workforce for new challenges. Thus, the discussion shows that the future of employment in Manaus will not be determined exclusively by technological advancement, but by the way society, the State and legal institutions will respond to this transformation process.

The systematic organization of the authors used in the research allows us to visualize in a synthetic way the main theoretical and methodological approaches and results found in the literature analyzed. Table 2 below presents a structured synthesis of the contributions of the selected studies, facilitating the understanding of the convergences and specificities of each approach in the context of artificial intelligence, automation, and their impacts on work.

Table 2

Synthesis of the studies used in the research

Authors	Objective	Method	Main results
Artur	Analyze the impact of algorithms on employment power and labor relations	Theoretical and normative analysis	Identifies reconfiguration of employment power and need for algorithmic transparency
Barroso	Discuss the risks and potentialities of artificial intelligence from a legal perspective	Theoretical-legal essay	It points to the need for regulation that balances innovation and fundamental rights
Coimbra Santos	Investigate algorithmic discrimination in labor relations	Qualitative analysis of theoretical basis	Evidence of reproduction of inequalities by automated systems
Gervasoni	Assessing the social impacts of technology on the right to work	Literature review	Highlights Precariousness and Hidden Social Costs of Automation
Lima	Examine the future impacts of automation on the Brazilian labor market	Empirical analysis and economic projections	It indicates increased inequality and the need for professional retraining
Moreira	Analyze the effects of automation on employment relations in the light of the CLT	Legal and doctrinal study	It points out normative gaps and the need for legislative updating
Paes	Discuss the challenges of artificial intelligence for Labor Law	Theoretical-legal analysis	Highlights changes in subordination and work management
Perosini	Investigating the impacts of industry 4.0 on employment and technological unemployment	Literature review	Identifies task substitution and requirement for new skills

Authors	Objective	Method	Main results
Rock	Analyze the digital transformation in the Manaus Industrial Pole	Case Study	Demonstrates technological advances and local qualification challenges

Source: Authors'.

The analysis of the table shows a strong convergence among the authors regarding the structural impacts of artificial intelligence and automation on the labor market, especially with regard to the reconfiguration of labor relations and the resulting legal challenges.

The predominance of qualitative and theoretical-normative approaches is observed, which reinforces the interpretative character of the theme, combined with the presence of empirical and institutional studies that contribute to the contextualization of the Brazilian and Amazonian reality.

In general, the results indicate that, although technology promotes efficiency and innovation gains, it also imposes significant risks, such as technological unemployment, job insecurity, and widening inequalities, which highlights the need for integrated responses between law, public policies, and technological development.

5 CONCLUSION

The present study allowed us to understand that the future of employment in Manaus, Amazonas, is directly conditioned by the way artificial intelligence and automation have been incorporated into production processes, especially in the scope of the Industrial Pole. The analysis showed that such technologies promote structural transformations in the labor market, redefining functions, professional requirements and forms of labor organization, which imposes significant challenges to contemporary Labor Law.

The results obtained showed that automation, while enhancing efficiency and competitiveness gains, also tends to reduce jobs in repetitive activities, increasing the need for professional qualification and adaptation of the workforce. In this sense, it was found that the transition to a technology-based production model requires not only investments in innovation, but also public policies aimed at the training and requalification of workers, in order to avoid the deepening of social inequalities.

In the legal field, it was found that labor legislation faces limitations to keep up with the new dynamics imposed by digitalization and algorithmic management. The emergence of forms of automated control and the difficulty of fitting these relationships into traditional models highlight the need for regulatory updating, with the construction of instruments capable of guaranteeing effective protection to workers without compromising technological development.

In addition, the research showed that the use of systems based on artificial intelligence can generate risks related to transparency, accountability, and equity in labor relations. The possibility of automated decisions directly influencing the professional lives of workers reinforces the importance of mechanisms that ensure control, auditability, and respect for fundamental rights, especially in contexts marked by power asymmetries.

In the specific context of Manaus, it was observed that the economic dependence of the Industrial Pole makes the region particularly sensitive to technological transformations. Productive modernization, although necessary to maintain competitiveness, must be accompanied by strategies that ensure social inclusion and the sustainability of employment, avoiding negative impacts on the local working population.

In view of this scenario, it is concluded that the future of employment in the region will not be determined exclusively by technological advances, but by the ability to articulate innovation, legal regulation and public policies. It is essential that the State, institutions and the productive sector act in an integrated manner, promoting an environment that favors technological development without compromising the dignity of the worker.

It is noteworthy that the study contributes to the academic debate by highlighting the need for an interdisciplinary approach in the analysis of work transformations, integrating legal, economic and social perspectives. As a limitation, the dependence on secondary sources is recognized, which indicates the importance of future empirical research that deepens the understanding of the impacts of artificial intelligence in the Amazonian context, expanding knowledge about the challenges and opportunities that present themselves for the contemporary world of work.

ACKNOWLEDGMENTS

The authors express their gratitude to all those who, directly or indirectly, contributed to the construction of this work, especially by encouraging scientific production focused on the regional reality. This study also represents a form of recognition and appreciation of Amazonas, reaffirming the commitment to the academic and social development of the region.

It is also worth noting the tribute to the city of Manaus, whose historical trajectory and economic importance inspire reflections on the future of work and contemporary challenges. Finally, we thank family and friends for their constant support throughout the entire journey of writing this article.

ABSTRACT

Health education is one of the most compelling challenges for the current 21st-century generation, enriched by digital means and highly technological. Educating for health proves to be a complex process that requires pedagogical strategies that promote the construction of new knowledge. Understanding the complex phenomenon involving health education and the environments that construct new knowledge allows for an exhaustive reflection on the nature of educational processes and simultaneously constitutes an opportunity for knowledge construction mediated by specialists in active cooperation with the student. From this perspective, high-fidelity clinical simulation stands out as a pedagogical and metacognitive strategy for the development of new fundamental knowledge and skills. Thus, high-fidelity clinical simulation in health education exerts a pedagogical and innovative action by allowing the participation and cooperation of the educational community as a central figure in the entire educational process.

1 INTRODUCTION

Health education plays a fundamental role in society in addressing human needs. The vision of educating and promoting health seeks professionalism, critical thinking, creativity, reflection, and a holistic approach, capable of responding to the challenges of a more global, demanding, and infodemic-ridden community.

High-fidelity clinical simulation (HFCS) has proven to be a challenge for all participants, in the pursuit of constructive, interactive, and pedagogical synergies in the construction of new knowledge. Higher education, according to the legal framework, aims for high qualification and scientific production as pillars of knowledge construction, and institutions create conditions for educational, scientific, and technological dissemination (Law nº. 62/2007, 2007). Currently, the continuous transformation of the educational society and the need to provide adequate resources "makes the State the educator of the 'citizen' and the school its privileged instrument" (Formosinho & Machado, 2013, p. 28).

Currently, the transmissive culture of content and the current postmodernity of the 21st century in education still face challenges inherent to a culture that is expected to be critical, reflective, and convergent with the construction of current knowledge available to the community it serves. HFCS, as a pedagogical strategy, seeks, on the one hand, to connect learning experiences that guarantee the student develops competencies as a health educator and ensure this experience without exposing users (individual/family and community) to avoidable risks during the educational process; that is, to develop experiential learning that brings students and teachers closer to real-world practice contexts in a safe environment.

The mission of Higher Education aims at high-level qualification, production, dissemination of interdisciplinary knowledge, technological and scientific knowledge, capable of stimulating intellectual development in the lifelong learning of its students. In the University environment, for example, Nursing creates conditions for the dissemination of knowledge, teaching, learning, research and experimental development (Law Nº. 62/2007, 2007), and HFCS as a technological resource is valued by the educational community to develop cognitive and psychomotor skills, preparing its students for the processes of practice and education in health.

Health education is distinguished by its ability to train people to care for people with an emphasis on the construction process, allowing the creation of pedagogical practice conducive to the needs of the learners.

2 HIGH-FIDELITY SIMULATION IN HEALTH EDUCATION

High-fidelity clinical simulation (HFCS) has been progressively gaining significant ground within the educational community. Several studies document this growth and the impact that HFCS has on the teaching/learning process and the development of new knowledge for human care. One example is the integrative review developed by Oliveira et al. (2014), which included 54 articles and highlighted HFCS as an essential focus for the development of knowledge and technical and human skills.

The educational path in health is vast and complex, given the unique nature of everyone, increasingly requiring convergent responses that echo holistic practice, seeking to create a learning experience conducive to continuous improvement. Currently, SCAF laboratories create special conditions for meaningful learning (Martins, et al., 2012), and in this sense, students of the Nursing Degree Course at the University of Madeira (UMa), within the framework of the interinstitutional protocol between the University and the Clinical Simulation Center of the Autonomous Region of Madeira, can, during their educational activities, develop their simulated practices in a high-fidelity laboratory. This experience constitutes added value, as it provides students with a moment prior to their experience in a clinical context, safeguarding the comfort and safety of the individual, family, and community in real-world settings.

The HFCS (School-Based Learning and Assessment) aims primarily to promote the development of transversal skills in health and to evaluate student satisfaction with the training process. Satisfaction is a significant indicator, as it is associated with greater engagement and motivation for learning (Martins et al., 2014). In fact, an educational process strengthened by innovative pedagogical practice stimulates satisfaction (Fonseca, 2021) and promotes greater active involvement, using essential tools such as information and communication technologies (Jonassen, 2000). HFCS clearly promotes meaningful learning; however, some (residual) studies do not show these benefits when compared to other teaching-learning strategies (Batista et al., 2014). In health education, numerous pedagogical strategies emerge that aim to develop technical, relational, and human skills, stemming from the mission of excellence and continuous improvement of processes. It is essential to provide a space prior to practical experiences, and the HFCS environment is equipped to improve performance levels, increase the safety of educational processes, and promote the development of individual and collective skills, aiming to reduce the gap between evidence and practice.

2.1 A HEALTH EDUCATION EXPERIENCE WITH HIGH-FIDELITY SIMULATORS

The experience with the HFCS operated seeks to list the steps recommended for the development of clinical scenarios according to the International Nursing Association for Clinical Simulation and Learning committee in 8 essential phases (INACSL, 2016; Martins et al., 2014; Kaneko & Lopes, 2019):

Phase 1 - Meeting between the teacher and the professional simulation centre, with the objective of developing an HFCS plan.

Phase 2 – Selection of scenarios, with a high level of realism, complete, with increasing difficulty, suitable for the stage of academic development and the preparation of the room and specific simulators.

Phase 3 – Conducting a workshop lasting 6 hours of theoretical training, distributed in three thematic sessions lasting 120 minutes each: with a focus on “caring for a person with a stroke”, “caring for a person in the postoperative period after gastrectomy” and “caring for an adult with asthma”.

Phase 4 - Briefing with the mission of explaining the objectives and details of the simulation experience to be developed.

Phase 5 – Development of the simulated practice in a team of two members and under the supervision of a teacher/specialist with the mission of enhancing performance, teamwork, leadership, communication and decision-making in the clinical process.

Phase 6 - Debriefing, a moment of reflection after each scenario, lasting 30 minutes, allows the student to self-evaluate and reflect on possible improvement actions, namely: the overall assessment of the experience's performance, the balance regarding the interventions correctly developed and the key points relating to the simulated clinical experience.

Phase 7 - Evaluation of the educational experience, namely satisfaction with the simulated experience (practical dimension, realism dimension and cognitive dimension) and the debriefing (psychosocial value, value cognitive and affective value).

HFCS aims to enable learners to create their own objectives, empowering them for a practice that generates new opportunities and skills (Jonassen, 2000). Offering students/learners the autonomy to define their own learning objectives enhances the development of reflective, critical, and creative thinking and stimulates a personalized learning practice that generates new learning opportunities (Jonassen, 2000; Vygotsky, 1991).

HFCS establishes itself as a privileged space to explore learning processes in simulated scenarios, and with the use of robotics, under the guidance of a mediator, it enhances the growth of new knowledge in a continuous, more proactive, and mobilizing learning process.

The planning phase of HFCS, phases 1 and 2, is operationalized with a meeting between the team, the professor, and the experienced nurse practitioners in the Clinical Simulation Center and with high-fidelity simulators, assessing a plan suitable for the professional development of the students, creating conditions for the active participation of the professor/mediator in the planning process that promotes the development of cognitive abilities (Jonassen, 2000; Vygotsky, 1991).

The HFCS experience is intentional, organized, and structured, in which the educational institution managed the teaching-learning strategy (Fonseca, 2021). Although with a pre-determined curriculum, the phenomena under study were transformed into a scenario, integrated into real life, seeking to engage the student in action, namely in finding solutions to problems (Martins et al., 2014). At this stage of the process, they emphasize the student's involvement in planning the simulation, which requires greater commitment and adaptation of the scenarios to the needs (INACSL, 2016; Kaneko & Lopes, 2019), thus seeking to stimulate metacognition of practical experiences (competence within the scope of skills) and self-learning (Fonseca, 2021).

Conducting a workshop represents a moment of theoretical training on the scenarios that will be developed; that is, the professor/supervisor selects the specific themes targeted by a clinical simulation and creates the opportunity for students to review and critically analyse knowledge about the phenomenon being simulated. In addition to providing guidance on the simulated environment and available resources, we believe it is fundamental that students at this stage of the process express their expectations and experiences in practical contexts, in order to recreate cases based on these experiences, allowing for learning reflection during the experiences at HFCS (INACSL, 2016; Kaneko & Lopes, 2019).

In phase 4, students are informed about the objectives and the simulation experience to be developed. This phase dedicates significant time to presenting the scenario, known as the briefing, which allows for the description of all the stages the scenario will unfold, fostering an environment of trust and engagement in the simulation experience. Furthermore, it is crucial that the learning facilitator encourages student autonomy in defining objectives and designing the simulation (Fonseca, 2021), creating opportunities to define personal goals and anticipate possible outcomes, not only through reflective and critical thinking but also through creative thinking (Jonassen, 2000; Vygotsky, 1991), encouraging them to argue and express their ideas.

Students develop the simulation experience in teams (two students per team) under the guidance of the learning facilitator, in phase 5. The simulation scenario presented to the students, based on a clinical case in the scientific field, allows them to use the nursing process as a methodological tool, that is, assessment, diagnosis, intervention planning, intervention, evaluation of results, and record keeping. Prior experience and knowledge promote motivation, a proactive attitude, involvement, and satisfaction (Martins et al., 2012). In developing the scenario, the student is confronted with the need to solve problems, and the implementation of the process may stimulate their critical and creative spirit in the search for solutions, revealing knowledge that has not yet been validated or made conscious (Jonassen, 2000).

During the debriefing, phase 6, it emerges as a space for the student to analyse their performance, and for the supervising teacher to reformulate possible actions for improvement, that is, to evaluate the performance of the entire simulated practice. Effectively, it constitutes a criterion of good practices; however, it is fundamental to provide space for students to identify their main learnings, facilitating factors, difficulties, and strategies they used to overcome them, to share their thoughts, feelings, uncertainties, and limitations in their ability to act, and thus learn from the group's experiences (Bortolato-Major et al., 2019; Moliterno et al., 2024). In this way, the teacher would promote a harmonious, affective, and mutually trusting climate, facilitating reflective thinking and a relationship between emotion and reason inherent in human learning (Vygotsky, 1991).

Debriefing is considered a critical aspect of simulation in the educational process. It is a process by which the team can (re)examine whether clinical simulation promotes clinical reasoning and critical thinking (Coutinho et al., 2014, p.161).

While debriefing is a complex activity, it is fundamental for the construction of self-directed knowledge (Martins, 2014). Debriefing emerges as a space where the student exercises their critical capacity in conjunction with the learning facilitator and constitutes a moment of good practices in the educational process of simulation. However, we believe it constitutes a learning moment to create the opportunity for students to identify their main knowledge, facilitating factors of learning, difficulties and strategies they use, share their feelings, uncertainties and limitations in their ability to act, and thus learn from their experiences (Bortolato-Major et al., 2019; Moliterno et al., 2024). The debriefing space also provides interaction with the experiences lived by the participants in the simulation process, given that it allows the sharing of reflections and knowledge, fostering an important social behaviour of the learning experienced in the context (Correia, 2011).

The evaluation of teaching practice by students, staff, teacher, and nurses in practice represents a criterion of good practices in simulation (Kaneko & Lopes, 2019) and can demonstrate that the professor valued the opinion of students and partners with a focus on the continuous improvement of the teaching-learning process. Several authors refer to the importance of evaluating not only student satisfaction with the simulation and debriefing, but also the development of clinical skills, promoted through an objectively structured clinical examination (Batista et al., 2014; Kaneko & Lopes, 2019).

The learning resulting from simulation is useful not only for academic development, but above all for the acquisition of scientific, technical, and human skills for a health culture grounded in ethics, safety, and quality of care (Martins et al., 2012; Bortolato-Major et al., 2019).

Bringing HFCS (Clinical Simulation Environments as a Learning Environment) into the discussion, as a constructive learning environment for knowledge acquisition, constitutes an intentional objective. The perspective of a curriculum-as-life can find a space to promote meaningful learning capable of fostering the development of each student's abilities. As Sousa (2020) emphasizes, considering the postmodern era, a curriculum-as-life is also possible in HFCS learning environments, placing students at the center of the learning processes, with critical expression, as agents of social, political, environmental, and cultural change, that is, protagonists of revolution (Freire, 2013). The fact is that in clinical simulation environments, content is transferred from the teacher/specialist to the student and, from this perspective, the development of HFCS can also be understood as a "bank deposit," guided by a theme, in which students are committed to simulating it to achieve the proposed objectives (Freire, 2013).

The student thus plays a passive role in the learning process, conditioned by the "designer" of the simulation project, who aims to shape the student towards a specific outcome. In this sense, the learning experience is conditioned in the transition from strengthened and math-centered processes, that is, there are limitations in valuing the student, conditioning them to idealize and create their own learning project, that is, to develop their knowledge (Silva, 1999).

Knowledge is always knowledge; there is no clear separation between the act of knowing and what is known, that is, it is "intentional" and is always directed towards something (Freire, 2013). From Freire's perspective, it is the students' experience that becomes the primary source of the "significant themes" that will constitute the "programmatic content," and in this convergence, it makes perfect sense to integrate students in all phases of the HFCS process, fundamentally in the project phase, creating conditions for empowerment to develop naturally.

HFCS constitutes an action activity and, as a pedagogical strategy that generates meaningful learning (Bortolato-Major et al., 2019; Martins et al., 2012), promotes the activation of higher-level thinking processes (critical and creative) in students, especially during the debriefing phase.

In the HFCS learning environment, the development of a meaningful task is identified, based on a teaching-learning process that is triggered through intentional pedagogical intervention and from a real context, promoting student involvement. The teaching-learning strategy at HFCS can be understood as innovative, given that it provides a process of knowledge construction based on the student's own perceptions and conceptions of the world, aiming at the development of learning (Martins et al., 2012; Oliveira et al., 2014), that is, a socio-constructivist, creative learning context adapted to traditional models, promoting autonomy and student involvement as the central agent of the process, which fosters plural communication and the sharing of reflections.

Health education has developed over time, naturally evolving as a necessity of practice, absorbing knowledge from didactics, mathematics, and pedagogy. On the other hand, practical and simulated teaching in the school context is also an example of this evolution (Martins et al., 2012). The pedagogical experiences developed at HFCS constitute opportunities for students to respond to emerging needs in the art of providing good and quality care, stimulating growth at a personal, cultural, scientific, social, ethical, and reflective level, and empowering them for responsible and safe decision-making.

3 CONCLUSION

Health education has evolved significantly in recent years. On the one hand, the discipline has been supported by capable and more comprehensive theories to meet the needs of the community it serves; on the other hand, the emerging development of new, more effective pedagogical techniques that promote more meaningful learning has also evolved remarkably.

The HFCS, equipped with technology, creates a simulation environment like the real-world context of practice. Furthermore, the educational processes developed at HFCS during educational experiences have allowed for the construction of new knowledge and fostered the development of research, teaching/learning, and innovation, as well as the training of professional skills in a controlled, safe, and realistic environment. Several specialties can be explored in educational activities, namely the need for care for individuals experiencing health/illness processes in the respiratory, gastrointestinal, circulatory, integumentary, and neurological systems, as well as health/illness experiences in children. We also highlight the

experiences of simulated practices in family care and community processes, as well as the area of intra- and extra-hospital emergency/urgency care and the care of individuals in surgical and palliative care settings.

The integration of HFCS as a pedagogical strategy in training curricula at the health education level is evident, creating conditions for better learning, training, research, and improvement of professional skills in clinical practice.

The mission of health education is to develop pedagogical activities and enhance clinical training and professional skills development, contributing to continuous improvement and quality assurance. In this regard, the HFCS developed aligns with the integration of curricula in partnership with the training of professionals at the undergraduate and postgraduate levels, and in this context, educational partnerships aimed at developing meaningful learning are of great interest.

The physical spaces in the high-fidelity clinical simulation laboratory resemble the spaces of the real practice context (wards, consultation rooms, resuscitation rooms, minor surgery room, operating theatre, intensive care unit), including all the necessary equipment, hospital beds, technical assistance equipment, auxiliary diagnostic equipment and monitoring equipment.

The HFCS is considered a fundamental resource to enhance safe and risk-free practice, creating conditions to promote continuous improvement of technical and human skills in the construction of health processes, ensuring conscious and scientifically based decision-making, that is, it prepares students to solve complex problems in clinical decision-making.

ABSTRACT

Space Syntax (SS), grounded in the "social logic of space," investigates how urban configuration shapes human behavior and social interactions. This research conducted a bibliometric analysis between 2020 and 2026 in the Web of Science, Scopus, and SciELO databases, using Bibliometrix software to map the scientific production in the field. The results reveal an expanding field, totaling 146 articles and an annual growth rate of 4.91%. A clear geographical shift in production is observed, with China and Australia leading in citation volume, indicating a decentralization from the original European axis. The content analysis of the most relevant publications highlights the integration of SS with hybrid methodologies, such as GIS and Network Analytic Process, applied to themes of public health, socio-spatial equity, and revitalization of historical districts. Seminal studies propose a paradigmatic transition to "evidence-based design," using quantitative and predictive models to optimize urban planning. However, researchers point to limitations in conventional axial modeling, suggesting the refinement of methods to better represent effective accessibility and metric distance. It is concluded that SE is a robust and interdisciplinary scientific tool, essential for understanding and managing the complexity of contemporary urban dynamics.

RESUMO

A Sintaxe Espacial (SE), fundamentada na "lógica social do espaço", investiga como a configuração urbana molda o comportamento humano e as interações sociais. Esta pesquisa realizou uma análise bibliométrica entre 2020 e 2026 nas bases *Web of Science*, *Scopus* e *Scielo*, utilizando o software *Bibliometrix* para mapear a produção científica da área. Os resultados revelam um campo em expansão, totalizando 146 artigos e uma taxa de crescimento anual de 4,91%. Observa-se um claro deslocamento geográfico da produção, com a China e a Austrália liderando em volume de citações, indicando uma descentralização do eixo europeu original. A análise de conteúdo das publicações mais relevantes destaca a integração da SE com metodologias híbridas, como o SIG e o Processo Analítico em Rede, aplicadas a temas de saúde pública, equidade socioespacial e revitalização de distritos históricos. Estudos seminais propõem uma transição paradigmática para o "design baseado em evidências", utilizando modelos quantitativos e preditivos para otimizar o planejamento urbano. Contudo, pesquisadores apontam limitações na modelagem axial convencional, sugerindo o refinamento dos métodos para melhor representar a acessibilidade efetiva e a distância métrica. Conclui-se que a SE é uma ferramenta científica robusta e interdisciplinar, essencial para compreender e gerenciar a complexidade das dinâmicas urbanas contemporâneas.

Palavras-chave: Morfologia Urbana. Sintaxe Espacial. Bibliometria.

RESUMEN

La Sintaxis Espacial (SS), fundamentada en la «lógica social del espacio», investiga cómo la configuración urbana moldea el comportamiento humano y las interacciones sociales. Esta investigación realizó un análisis bibliométrico entre 2020 y 2026 en las bases de datos *Web of Science*, *Scopus* y *SciELO*, utilizando el software *Bibliometrix* para mapear la producción científica en el campo. Los resultados revelan un campo en expansión, con un total de 146 artículos y una tasa de crecimiento anual del 4,91 %. Se observa un claro cambio geográfico en la producción, con China y Australia a la cabeza en volumen de citas, lo que indica una descentralización del eje europeo original. El análisis de contenido de las publicaciones más relevantes destaca la integración de la SS con metodologías híbridas, como SIG y el Proceso Analítico de Redes, aplicadas a temas de salud pública, equidad socioespacial y revitalización de distritos históricos. Estudios fundamentales proponen una transición paradigmática hacia el «diseño basado en la evidencia», utilizando modelos cuantitativos y predictivos para optimizar la planificación urbana. Sin embargo, los investigadores señalan las limitaciones del modelado axial convencional, sugiriendo el perfeccionamiento de los métodos para representar mejor la accesibilidad efectiva y la distancia métrica. Se concluye que la sintaxis espacial es una herramienta científica robusta e interdisciplinaria, esencial para comprender y gestionar la complejidad de la dinámica urbana contemporánea.

1 INTRODUCTION

Spatial Syntax (SE) is a field of theoretical and methodological research that proposes an innovative vision of architecture and urbanism. Originating in the early 1970s at the Architectural Studies Unit at University College London, the theory was consolidated by researchers Bill Hillier and Julienne Hanson. The central objective of the SE is to establish a descriptive autonomy of space, allowing the morphological variety of cities to be analyzed in terms of their direct relationship with social life and patterns of human behavior.

The epistemological framework of Spatial Syntax was formalized mainly in the work *The Social Logic of Space* (1984). In this book, Hillier and Hanson present space not only as a passive receptacle of activities, but as an active dimension of society. The theory argues that there are cultural and social traits determined by spatial patterns, with a transition between physical configuration, spatial life and, finally, social life. Thus, the system of open spaces is seen as a continuous set of identifiable elements that structure social encounters and land use patterns.

To operationalize these analyses, the SE uses techniques for decomposing the system into convex spaces and axial spaces, resulting in convexity and axiality maps. These abstractions allow us to reveal fundamental attributes of the urban environment and correlate the built form with social and behavioral concepts. In addition, the theory uses graph theory to represent spatial configurations logically: each space is treated as a "node" and its connections as "lines". Through the concept of justified graphs, researchers can organize the system into depth levels by measuring the topological distance between spaces from a reference point or "root".

In this way, Spatial Syntax is consolidated as a robust set of analytical tools that allow a descriptive analysis of urban sectors or buildings. By focusing on the social logic of space, the SE offers a scientific basis for understanding how spatial structure shapes the dynamics of cities and the interactions of their inhabitants. According to Karimi (2023), in order to understand the current state of urban morphology as a distinct academic domain, it is essential to explore the diversity of approaches that have emerged over the last century. Regardless of their specific focuses, these approaches can be broadly grouped.

According to Silva (2025), there are criticisms of the theory of spatial syntax, such as that the analysis is more topological than geometric and the problem of continuity of axial lines, but applications have tried to solve these issues and there has been an increasing approximation between topological and geometric analysis.

2 METHODOLOGY

The method used in the research was descriptive, which aims to transcribe, describe, interpret and explain the results obtained with the help of bibliometric analysis. This aims to identify and analyze the profile of the scientific production of a given topic, making use of the quantitative approach through descriptive statistics. The databases used were the Web of Science, Scielo and Scopus, which are available on the journal portal Coordenação de Aperfeiçoamento de Pessoal de Nível Superior (CAPES). These databases have databases of abstracts and citations of peer-reviewed literature, including scientific journals, books, and conference proceedings, which cover topics from various areas of knowledge. The search was carried out on 04/22/2026, covering the period from 2020 to the year 2026. The terms used were searched in the title, abstract, and keywords of the articles. The search was restricted to articles from open journals. The query syntax in the databases was as follows: "*urban morphology and spatial syntax*". The main search was through this keyword, restricting the search to only the articles.

The data related to these documents (journals, authors, references, citations, etc.) were stored in a text file for performance analysis and bibliometric mapping. The descriptive analysis and mapping were performed by the Bibliometrix software, which is part of RStudio, which is the most popular integrated development environment (IDE) for the R programming language, being widely used in data science, statistics and academic research.

The method of analysis of the empirical objects will follow three main phases organized as follows: Preparatory phase: Cut out the theme and keyword for the research (urban morphology and spatial syntax); Search in databases (web of Science and Scopus); Export the data to the Bibliometrix application in RStudio; Generate quantitative data tables and graphs in Bibliometrix; Analytical phase: Review of the literature on the subject; Grouping of quantitative data in tables and graphs generated in Bibliometrix; Bibliometric analysis; Descriptive phase: Interpretation of the results found in the Bibliometrix.

3 BIBLIOMETRIC ANALYSIS

The objective of this section is to analyze the performance of bibliometric results, considering some aspects, such as the annual scientific production, the evolution of citations, relevant sources and authors, world scientific production and the bibliometric networks that most collaborate with each other in scientific productions on the theme transition of institutional paradigms and sustainability. Table 1 shows the main data on this survey in the period from

2020 to 2026. 146 documents with 399 authors involved and 20,986 references were found in the databases (web of Science, scielo and scopus).

Table 1

Summary of the survey data

Key information about the survey data	
Description	Results
Time Range	2020/2026
Sources (newspapers, books, etc.)	93
Documents (articles)	146
Annual growth rate (%)	4,91
Average document age	2,6
Average citations per document	10
Authors	399
Most used keywords (ID)	457
Keywords by author (DE)	350

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

4 ANNUAL SCIENTIFIC PRODUCTION

Figure 1 shows the evolution of the number of publications from 2020 to 2026 on the topic of urban morphology and spatial syntax. It can be identified that in 2020 there are approximately 7 articles published, with a noticeable increase in 2022 to almost 30 articles, tripling, compared to 2020. In 2025 there was an increase of 10 articles compared to 2022. In the year 2026, due to being still at the beginning, the number of publications was not so expressive, being around 15 publications.

Figure 1

Annual scientific production

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

5 MOST RELEVANT AUTHORS

The ten authors, who published the most on the theme of urban morphology and spatial syntax, can be seen in figure 2, where it identifies the researchers with the greatest impact and academic production on the researched theme within the selected databases (Web of Science, Scopus, Scielo). Thai HMH and Wang are the most relevant with 4 publications and an impact factor of $H=1.67$ and 1.12 respectively. In second place, the author Barbosa and the others with 3 articles each.

Figure 2

Most relevant authors

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

6 MOST RELEVANT AFFILIATIONS

Figure 3

Most relevant affiliations

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

Figure 3 shows the ten most relevant affiliations on the topic in question. Walailak University ranked first with 5 publications.

The City University of Macau, University of Guizhou and Rmit University with 4 were second. Bursa Technical University, Julio Garavito Colombian School of Engineering, Macau University of Science and Technology, Polytechnic Institute of Viana do Castelo, Qatar University and Southeast University in third with 3 publications each. The results corroborate the importance of collaborative bibliometric networks between institutions, where researchers are linked.

7 SCIENTIFIC PRODUCTION OF COUNTRIES

Figure 4 shows the situation of scientific production in the countries in relation to the authors who published on the subject. It is noted that there is a progressive increase, showing that China and Australia have been standing out with 325 and 234 respectively, closely followed by Italy with 146 mentions and Malaysia with 123. Iran appears in fifth place with 87 citations, closely followed by the United Kingdom, where the theory of spatial syntax was created, with 84 citations, demonstrating a shift in the study of this theme from the European continent (England) to other continents, such as Asia, Oceania and the Middle East (Iran, Israel, Turkey and Cyprus).

Figure 4

Most cited countries

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

8 BIBLIOMETRIC NETWORKS

Figure 5 shows the network of co-occurrence of the keywords; in it, the following are observed: the most frequent terms, with the occurrences proportional to the size of the circles and label; the associations between the words, given by the links and proximity; the groups, indicated by the colors. In this network, four groups were formed, three of which stood out the most: the green cluster, representing the occurrence of the terms *urban morphology*. The cluster represented by the color blue identified the highlighted terms *syntactics* and *space syntax*. The red cluster stood out with the keywords *spacial analysis and morphology*. It was observed that, although each group has a specific theme, these groups research very similar themes and connections and integrations occur more frequently, forming a large bibliometric network.

Figure 5
Co-occurrence networks

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

Figure 6*Collaboration networks by author*

Source: Result of the Web of Science, Scopus, Scielo search, obtained from Bibliometrix (2026)

Figure 6 shows the network of collaboration between the researchers, forming 14 small groups represented by circles of different colors. The collaboration network represented by the color red is the one that stood out the most, both in terms of the number of members, with the size of the circles increased, and in the quantity, in relation to the other groups. It is noteworthy that the collaboration groups do not connect much with each other. This means that collaboration networks can grow even more if connections and integration increase.

9 CONTENT ANALYSIS OF THE EIGHT MOST RELEVANT AND GLOBALLY CITED PUBLICATIONS

In this topic, the content of the abstracts of the eight most relevant and globally cited articles found in this bibliometric review was analyzed, and most of the findings identified a strong use of the theory of spatial syntax in the study of urban morphology and urban planning (Figure 7). In the samples examined, it was observed that the researchers used the bibliographic references produced over time, as well as empirical and statistical studies to support their research, which contributed to increase the confidence and security of the results presented. In these terms, with the purpose of verifying which articles published in journals, aroused the interest of researchers.

Figure 7

Most cited documents globally

Source: Result of the Web of Science, Scopus, Scielo, Bibliometrix survey (2026)

The first article *Limits of space syntax for urban design: Axiality, scale and sinuosity* addresses the limits of spatial syntax for urban planning, considering axiality, scale and sinuosity. The authors of this research are Pafka, Dovey and Aschwanden (2020) with 116 citations. The researchers maintain that the exegesis of spatial syntax from the perspective of the economy of movement has deepened the understanding of urban structure, correlating systemic integration with vitality and functional diversity. However, conventional axial modeling has limitations by neglecting metric distance and morphological roughness variables.

According to Pafka, Dovey and Aschwanden (2020), the evidence suggests that adaptations in axial methods generate heterogeneous results for the same morphology. The dichotomy between closeness and betweenness indicates that network integration is a multidimensional phenomenon. It is concluded that purely axial analyses tend to privilege the hegemony of visibility over effective accessibility, which can compromise the accuracy of the representation of permeability on a pedestrian scale. They state that spatial syntax analysis is a powerful tool that will be even more useful the better these boundaries are understood.

The second article with 86 citations, called *The Role of Urban Morphology Design on Enhancing Physical Activity and Public Health*, which deals with the role of urban morphology planning in the promotion of physical activity and public health. The researchers FATHI, SAJADZADEH, SHESHKAL, ARAM, PINTER, FELDE, MOSAVI (2020) maintain that the contemporary literature ratifies the correlation between the configuration of the built

environment and public health indicators, underlining the role of urban morphology in mitigating psychopathologies and inducing healthy behaviors. This study investigates the promotion of active mobility through the functional and physical optimization of the urban fabric.

Using a hybrid methodological approach — which integrates the Network Analytical Process (ANP), structural equation modeling, and spatial syntax — the research identifies that systemic integration, diversity of uses, and aesthetic quality are significant predictors of physical engagement. The findings demonstrate that road axes with high levels of syntactic connectivity operate as catalysts for physical activity and subjective well-being, validating spatiality as a determining asset in the promotion of urban health.

The third document *Accessibility and Street Network Characteristics of Urban Public Facility Spaces: Equity Research on Parks in Fuzhou City Based on GIS and Space Syntax Model* with 75 citations deals with Accessibility and characteristics of the road network of urban public spaces, researching equity in parks in the city of Fuzhou using GIS and spatial syntax model. Huang, Chiou, and Li (2020) elucidate the positive correlation between urban green spaces and the holistic well-being of the population, showing, however, disparities in the socio-spatial distribution of these benefits. The research applies the Geographic Information System (GIS) and spatial syntax to measure equity and urban morphology in Fuzhou, providing empirical subsidies for the planning of sustainable cities.

The fourth article discussed *Unveiling the potential of space syntax approach for revitalizing historic urban areas: A case study of Yushan Historic District, China* contains 61 citations. LYU, MALEK, JA'AFAR, SIMA, HAN, and LIU (2023) Demonstrate in research the potential of the spatial syntax approach to revitalize historic urban areas through the case of the Yushan Historic District, China. The authors state that historic urban areas constitute primordial elements of heritage, safeguarding collective memory and unique morphologies. However, globalization brings challenges such as infrastructural obsolescence and the erosion of cultural vitality. This research proposes a revitalization methodology based on spatial syntax, applied to the Yushan Historic District. Through morphological modeling, the study identifies spatial determinants of vitality and proposes strategic guidelines that reconcile functional renewal with the preservation of the historical fabric, validating the potential of spatial syntax in heritage conservation.

The fifth article *The Configurational Structures of Social Spaces: Space Syntax and Urban Morphology in the Context of Analytical, Evidence-Based Design* was published in 2023 by researcher Kayvan Karimi from the Bartlett School of Architecture, UCL, London, UK. Karimi

(2023). It explores the Configurational Structures of Social Spaces using the approach of Spatial Syntax and Urban Morphology in the Context of Evidence-Based Analytical Design.

The article postulates a paradigmatic transition in urban morphology, migrating from purely descriptive analyses to quantitative and predictive investigations based on spatial syntax. The proposed approach integrates socioeconomic and cultural determinants into the physical configuration, enabling the development of evidence-based designs. Through an iterative methodological cycle applied in Jilin, a city in China, it is demonstrated how analytical spatial analysis optimizes infrastructure and transport planning. Ultimately, the integration of this tool empowers planners to manage the complexity of urban systems, ensuring the relevance of interventions in the face of the dynamics of human existence and ever-evolving physical structures.

In the sixth publication, Giuliano, Cutini (2020) address the management of post-earthquake emergencies in Italian historic centers, exemplified by the case of Lucignano. The research highlights that the morphology of these settlements is often neglected in traditional risk planning, aiming to increase urban resilience in the face of seismic events.

The seventh survey, In the context of **microclimatic comfort**, the methodology applied in Tel Aviv-Yafo uses high-resolution mapping to create "shading maps". Aleksandrowicz, Zur, Lebendiger, Lerman (2020) argue that the differential of the research is to relate the availability of external shade with the potential for pedestrian movement identified by spatial syntax, allowing urban managers to prioritize tree planting or conservation actions on streets.

Finally, Garau's study , Annunziata (2022), focused on the Metropolitan City of Cagliari investigates urban vitality. The research develops a method to quantify how the components of the built environment impact urbanity and the diversity of activities in public spaces. By integrating spatial syntax into the Geodesign paradigm, researchers are able to identify spatial manifestations of socioeconomic processes, providing subsidies to formulate strategies that strengthen urbanity, creating vibrant and sustainable urban spaces.

10 CONCLUSIONS

The objective of this study was to carry out a bibliometric mapping on the theme of urban morphology and spatial syntax. It was observed that there are already a reasonable number of studies that study this theme, but the scientific production still shows evolutionary progress. Based on the bibliometric and qualitative analysis of the documents presented, the conclusions about the current state of research in urban morphology and spatial syntax (SE), between the years 2020 and 2026, it can be noted the academic maturity and expansion, in which the field

demonstrates sustained growth, with an annual growth rate of 4.91% and a significant volume of 146 articles produced in a period of six years. The peak of publications between 2022 and 2025 reflects the consolidation of spatial syntax as a robust set of analytical tools for understanding urban dynamics.

A second aspect found was the geographic decentralization of production, although the theory originated in the United Kingdom, there is a clear shift in the axis of scientific production to Asia and Oceania, with China (325 citations) and Australia (234 citations) leading the academic impact. Institutions such as Walailak University and the City University of Macau are prominent research centers.

The articles demonstrated that interdisciplinarity and methodological integration in contemporary research transcends pure morphological analysis, integrating SE with other advanced methodologies, such as the Geographic Information System (GIS), the Network Analytical Process (ANP) and structural equation modeling. This hybridization allows, for example, to correlate spatial configuration with indicators of public health, social equity, and preservation of historical heritage. It is important to emphasize that the paradigmatic evolution towards evidence-based urban planning identifies a transition from merely descriptive analyses to quantitative and predictive approaches. The use of SE as a decision support tool in urban planning — the so-called "evidence-based design" — allows managing the complexity of urban systems and optimizing transport and active mobility infrastructures.

However, theoretical refinement and limitations are necessary. The most cited studies point to the need to overcome the limitations of conventional axial modeling. Researchers suggest that the SE should evolve to incorporate metric distance and morphological roughness variables, ensuring that visibility analysis does not overlap with effective pedestrian-scale accessibility. The structure of scientific collaboration, despite the density of publications, the networks of collaboration between authors are still fragmented, with groups that are little connected to each other. This indicates a growth potential for future research through increased integration and inter-institutional cooperation. In short, the archive reveals that spatial syntax remains a vital and constantly evolving theory, capable of providing scientific foundations to address contemporary urban challenges through the analysis of the social logic of space.

ABSTRACT

The COVID-19 pandemic significantly impacted global mental health, with a noticeable increase in suicide rates. This study analyzes the impact of the pandemic on suicides in Brazil between 2015 and 2023, using a Bayesian time series model to identify the causal relationship between the health crisis and the worsening psychological conditions of the population. The results show a substantial rise in suicide cases starting in 2020, associated with social isolation, economic difficulties, and emotional deprivation. The study highlights the importance of public policies focused on suicide prevention and strengthening social support networks, suggesting that health crises exacerbate mental health issues and require effective responses to minimize their impacts.

Keywords: COVID-19. Suicide. Mental Health. Impact. Brazil.

RESUMO

A pandemia de COVID-19 impactou significativamente a saúde mental global, com um aumento notável nos índices de suicídio. Este estudo analisa o impacto da pandemia nos suicídios no Brasil entre 2015 e 2023, utilizando um modelo bayesiano de séries temporais para identificar a relação causal entre a crise sanitária e a piora das condições psicológicas da população. Os resultados indicam um aumento substancial nos casos de suicídio a partir de 2020, associado ao isolamento social, dificuldades econômicas e privação emocional. O estudo destaca a importância de políticas públicas focadas na prevenção do suicídio e no fortalecimento das redes de apoio social, sugerindo que crises sanitárias exacerbam problemas de saúde mental e exigem respostas eficazes para minimizar seus impactos.

1 INTRODUCTION

1.1 SUICIDE AS A PUBLIC HEALTH PROBLEM

Suicide is a serious global public health problem, being among the main causes of preventable deaths in several countries. In addition to the alarming numbers, this tragedy deeply impacts families, communities, and society as a whole. The emotional and economic effects are particularly devastating in young and adult age groups, making prevention a key challenge for health systems.

In Brazil, suicide rates have been growing over the last few decades, reflecting not only individual factors, but also social and economic issues that contribute to psychological distress and limit access to emotional support resources. Although the Brazilian suicide rate is lower than that of countries such as Russia, South Korea, and Japan, Brazil leads Latin America in negative mental health indicators (MINISTRY OF HEALTH, 2022), highlighting the need for more effective preventive actions. The crisis has been exacerbated by the phenomenon that experts call the "second pandemic" – a silent collapse of mental health, intensified by social and economic changes post-COVID-19 pandemic (FEDERAL COUNCIL OF NURSING, 2023).

The World Health Organization (WHO) warns that suicide is responsible for about one in every 100 global deaths, surpassing fatalities from HIV, malaria, breast cancer, wars and homicides (BRASIL, 2015). In Brazil, suicides in 2023 surpassed other relevant causes of death, such as prostate cancer, AIDS, police interventions, and femicides. In addition, the numbers approached the cases of death from breast cancer, one of the diseases with the greatest impact on public health. These data reinforce the need to deepen knowledge about the factors that contribute to the increase in suicides and to support public prevention policies.

Suicide records in Brazil between 2015 and 2023 demonstrate a continuous growth trend, with a more significant increase in the critical years of the COVID-19 pandemic, suggesting a possible and alarming relationship between the pandemic context and the worsening of the population's mental health. Although the growth in suicide cases was already noticeable before the health crisis, factors such as social isolation, economic insecurity, and difficulty in accessing mental health services certainly accelerated this process. This problem, although not restricted to Brazil, acquires specific characteristics in the country, such as regional inequality and overload of the health system, making it even more crucial to monitor the rates and understand the factors that feed this devastating phenomenon.

1.2 THE COVID PANDEMIC AND ITS IMPACTS

The COVID-19 pandemic, officially declared by the WHO on March 11, 2020, is not only a health crisis, but an extreme event of historic proportions, which has profoundly affected global public health. The speed and severity of the spread of SARS-CoV-2 has resulted in millions of infections and deaths. By the end of 2022, the WHO estimated more than 6.5 million confirmed deaths worldwide, with the possibility that the real number was much higher due to underreporting and excess indirect mortality. Brazil, one of the most affected countries, recorded approximately 700 thousand deaths, second only to the United States. The critical peaks occurred between March and April 2021, when the Brazilian health system collapsed in several regions, facing shortages of ICU beds, oxygen, and essential medicines, a scenario of immeasurable human suffering.

The containment measures adopted to reduce the spread of the virus, such as quarantines, social distancing, and the closure of establishments, have drastically changed the population's routine. While necessary, these restrictions have had a direct and significant impact on mental health, resulting in an alarming increase in feelings of loneliness, anxiety, and depression (CAO et al., 2020; WHO, 2022). The closure of face-to-face psychological and psychiatric care services has further aggravated this situation, making it difficult for the population to access specialized support (CFP, 2020). At the same time, the global economic recession triggered by the pandemic, with the closure of companies and the increase in job insecurity, especially in the tourism, commerce, and services sectors, has further increased the risk of psychological disorders and self-injurious behaviors.

It is important to highlight that the relationship between global crises and the increase in suicide cases is not a recent phenomenon. In times of economic recession, wars, and natural disasters, there has historically been an increase in rates of psychological distress and suicides. The Great Depression of 1929 and the financial crisis of 2008, for example, were followed by significant increases in suicide rates (NEGÓCIOS, 2008). However, the COVID-19 pandemic has had a much deeper and more far-reaching impact, not only because of the economic recession but because of its multidimensional nature, simultaneously affecting the physical, mental, and economic health of billions of people around the world. The magnitude of this crisis, with its devastating effects on all aspects of human life, places it as one of the largest and most significant extreme health events of the twenty-first century.

This work, therefore, is not a simple study of a health crisis, but rather an analysis of a unique event in contemporary history, whose repercussions go far beyond public health. The COVID-19 pandemic cannot be underestimated. It is not just a health event, but a global tragedy

that has affected the lives of millions, and it is essential that the impact of this event be studied in depth to understand its causes, consequences and, above all, to identify solutions that can mitigate the devastating effects on mental health and society as a whole.

It is crucial to recognize that crises of such magnitude are not limited to the COVID-19 pandemic. Other extreme events, such as future pandemics, global economic recessions, and even environmental catastrophes, have the potential to generate similar effects, significantly increasing the risk of psychological distress and suicides. Thus, the key question of this work arises: did the COVID-19 pandemic have an impact on the number of suicides in Brazil and its regions?

The research problem is centered on quantitatively analyzing the effect of the pandemic on the number of people who took their own lives. The importance of analyzing this problem lies in understanding a possible causality between the COVID-19 pandemic and the number of suicides. The present study is based on the hypothesis that the COVID-19 pandemic exerted a significant influence on the increase in suicide numbers, both in Brazil and in its regions.

The general objective of this study is to analyze the temporal and spatial dynamics of suicide rates in Brazil and its regions from January 2015 to April 2023⁴. Specifically, it is intended to: a) analyze the dynamics of the behavior of the suicide rate in Brazil and its regions; b) to identify the possible existence of a causal link between the COVID-19 pandemic and the incidence of suicides in Brazil.

The results may highlight not only the direct influence of the pandemic on the mental health of the population, but also the urgency of adopting a comprehensive approach in the face of extreme events. It is essential to understand that, in addition to mitigating the immediate effects of the event, it is necessary to deal with the lasting psychological impacts by offering ongoing mental health support as part of a global and effective response.

Regarding the causal impacts of public health events on suicide indicators at the regional level, this research is one of the first attempts. The contribution that is intended to be brought is in the quantitative focus of the research, which until now has been little addressed by the existing literature on the subject.

The work is structured as follows: after the introduction, there is the methodology, which contains the theoretical framework, in which a link between theory and research problem is defined, the analytical framework, in which the empirical model is presented, and the data source, in which the variables used and their origin are presented.

⁴ The year 2015 marks the beginning of the historical series on suicide rates in Brazil and April 2023 was chosen as the end of the study, as it marks the end of the pandemic, as declared by the World Health Organization (WHO), given the significant reduction in cases and deaths from COVID-19 in Brazil.

2 METHODOLOGY

2.1 THEORETICAL FRAMEWORK

The Theory of Social Deprivation (WEISS, 1973) lays a crucial foundation for understanding the effects of the absence of meaningful social interactions on people's emotional and psychological well-being. According to Weiss, human beings are essentially social creatures, whose mental health depends on deep and sustainable bonds. The absence of these ties not only generates discomfort, but can also cause a series of negative consequences, increasing the risk of disorders such as depression, anxiety and, in more severe cases, suicidal tendencies. Thus, the theory suggests that prolonged isolation leads to progressive deterioration of mental health, making the individual feel helpless, vulnerable, and lost in the midst of loneliness.

Weiss differentiates between two types of loneliness: emotional and social. Emotional loneliness refers to the absence of an intimate bond, such as a relationship with a partner or close friend, while social loneliness involves the absence of a wider support network, such as family members, colleagues, or neighbors. These two types of deprivation are interconnected in different ways, but both affect mental health, reinforcing feelings of exclusion and disconnection. During modern life, marked by busy schedules and a constant emphasis on productivity, many people experience both types of loneliness, as, although surrounded by people, they lack truly meaningful relationships and a sense of community.

The Theory of Social Deprivation has been widely applied to analyze the effects of isolation in different contexts. A study by Victor and Bowling (2012), in the United Kingdom, showed that older adults in long-term care facilities who did not receive regular visits had significantly higher levels of depression and anxiety compared to those who had frequent contact with family and friends. Another example comes from Haney's (2018) research, which investigated the effects of solitary confinement in prisons in the United States, revealing that prolonged isolation is associated with increased disorders such as post-traumatic stress, hallucinations, and self-injurious behavior.

During the COVID-19 pandemic, the Theory of Social Deprivation has become more relevant than ever. The need to adopt social distancing measures to contain the spread of the virus has generated a crisis of contact deprivation on a global scale. Millions of people have abruptly faced a break with their emotional support circles, whether family, friends or co-workers. The sudden deprivation of physical encounters, touch, and interpersonal closeness exposed the population to significant psychological risks. Studies have revealed increased rates

of depression, anxiety, and suicidal ideation, intensifying the perception that loneliness is not just discomfort, but a real threat to public health.

A study conducted by Meyer et al. (2021), in Germany, indicated that remote work and prolonged isolation contributed to increased feelings of social loneliness, especially among workers without a solid support network outside the work environment. These individuals reported worsening mental health, including symptoms of anxiety and depression.

Thus, Weiss's theory provides a robust framework for understanding how isolation can destabilize the human mind and provoke feelings of despair. During the pandemic, many individuals were deprived of their emotional support networks, facing deep loneliness. Those already vulnerable – such as the elderly and people living alone – were especially affected, experiencing intense emotional loneliness without being able to count on close bonds to help them face adversity. For these people, deprivation has become a triggering factor for psychological disorders and even loss of purpose and hope.

In the Brazilian context, the theory suggests that the increase in isolation during the pandemic directly affected suicide rates. The imposed isolation, combined with economic uncertainty and the absence of adequate support, created a favorable scenario for the worsening of psychological disorders. The theory highlights that the importance of human connections for the maintenance of mental health cannot be underestimated and that the psychic suffering generated by the deprivation of contact is collective, requiring support strategies that involve families, communities and government actions.

2.2 ANALYTICAL FRAMEWORK

To assess the impact of social isolation on suicide rates, the Bayesian structural model of time series is used, according to Brodersen et al. (2015). This model calculates a counterfactual to estimate suicide rates if the pandemic had not occurred.

2.2.1 Main Elements

The Bayesian structural model of time series uses two main equations to model the historical series of suicide rates and estimate the causal impact of the pandemic. The first of these is the observation equation, which relates the observed indices to the latent states of the series, allowing the model to capture the observed variability over time:

$$y_t = Z_t \alpha + \epsilon_t, \epsilon_t \sim N(0, \sigma^2) \quad (01)$$

In this equation, it represents the observed suicide rate over time, while it is the vector that connects observations to the internal states of the system. The state vector represents latent variables, providing a framework that allows you to identify patterns over time. The term, which follows a normal distribution, represents the observation error, capturing possible discrepancies between the observed and predicted values, adjusting the accuracy of subsequent projections. The observation equation thus links the actual data to the latent structure of the model, absorbing the observed fluctuations in suicide rates. $y_t = Z_t \alpha_t + \epsilon_t, \epsilon_t \sim N(0, \sigma^2)$

The second main equation, the equation of state, describes how latent states evolve over time, enabling the model to capture pattern changes and respond to external shocks, such as the impact of the pandemic: α_t

$$\alpha_{t+1} = T_t \alpha_t + R_t \eta_t, \eta_t \sim N(0, Q_t) \quad (02)$$

In this expression, it is the transition matrix that relates the current state to the future state, essential to model the continuity of the time series. The matrix controls the influence of the error term, normally distributed as , which represents variations not directly explained by the model. This term adjusts the model to unforeseen changes or external events, such as social isolation and other restrictions imposed by the pandemic. The equation of state, therefore, allows the model to capture the internal dynamics and adapt to variations in suicide rates, reflecting possible impacts of the social and public health context. $T_t \alpha_t + R_t \eta_t \sim N(0, Q_t)$

These two equations, when applied together, allow the Bayesian structural model of time series to accurately project counterfactual scenarios, serving as a basis for inferring the causal impact of the pandemic on suicide rates.

2.2.2 Model Components

The model includes specific components to capture local trends and possible seasonalities in suicide rate data. The trend is modeled by a random walk process, described by the following equations:

$$\mu_{t+1} = \mu_t + \delta_t + \eta_{\mu,t} \quad (03)$$

$$\delta_{t+1} = \delta_t + \eta_{\delta,t} \quad (04)$$

Where is the value of the trend in time and represents the slope or rate of change of the trend. These components allow the model to adjust for natural fluctuations in suicide rates over

time. Seasonality is also incorporated into the model, representing the periodic variations in suicide rates that can occur in certain months or times of the year. The inclusion of these components allows the model to provide more accurate projections over time. $\mu_t \delta_t$

2.2.3 Counterfactual Estimation

To measure the impact of the pandemic, the model calculates a counterfactual estimate of suicide rates, representing what would have been expected if the pandemic had not occurred. From the date of the beginning of the pandemic, the model uses the parameters and the structure established with the historical data to project the counterfactual series. The difference between the observed values and the counterfactual projection during the pandemic period represents the causal impact. For each point in the pandemic period, the causal impact is calculated as follows: Δy_t

$$\Delta y_t = y_{observado,t} - y_{contrafactual,t} \quad (05)$$

where $y_{observado,t}$ is the actual suicide rate in time, and $y_{contrafactual,t}$ is the value projected by the model in the absence of the pandemic. This difference makes it possible to estimate the specific impact of the pandemic on suicide rates.

To calculate the cumulative impact over the pandemic period, the differences are added: Δy_t

$$\text{Total impact} = \sum \Delta y_t \quad (06)$$

The model also calculates credibility intervals for the counterfactual projection, offering a measure of the uncertainty associated with the estimate and strengthening confidence in the results.

2.2.4 Data Source

The data used in this research were obtained through the National Information System for Public Security, Prisons, Traceability of Weapons and Ammunition, Genetic Material, Fingerprints and Drugs (SINESP), an agency linked to the Ministry of Justice and Public Security. The time series covers the period from January 2015 to April 2023, with data organized monthly. The variable analyzed in this research is the number of suicide victims.

The year 2015 was chosen as the starting point, as it represents the oldest data available, allowing a broad and detailed analysis of trends over the years, in addition to enabling the evaluation of the impact of changes in public safety and mental health indicators. The period ends in April 2023, the month that marks the official end of the COVID-19 pandemic, according to the WHO decree, allowing the end of the analysis along with the end of the pandemic.

3 RESULTS AND DISCUSSIONS

3.1 DYNAMICS OF SUICIDES IN BRAZIL AND REGIONS

The analysis of monthly suicide records in Brazil between January 2015 and March 2023 shows a growing trend, with a significant increase from 2020 onwards.

Between 2015 and 2019, the monthly average was approximately 864.55 cases, while between 2020 and 2023, this average rose to 1,224.82 cases per month, representing a growth of 41.67% in the period. This increase suggests the influence of the COVID-19 pandemic on the intensification of risk factors for suicide, such as social isolation, financial difficulties, and restrictions on access to mental health services.

The annual growth rate between 2015 and 2019 ranged between 7.76% and 15.05%, while between 2020 and 2023 the annual growth was more moderate, ranging between 7.39% and 11.43%. In terms of monthly growth, the average number of suicides increased by 41.67%, from 864.55 to 1,224.82 cases, indicating a substantial change in the number of victims over the period analyzed.

Although the analysis of the data shows an increasing trend, there is no significant volatility in records after 2020, which suggests that, after the initial peak of the health crisis, factors associated with the pandemic, such as social isolation and economic difficulties, continued to impact suicide rates almost constantly until the end of the pandemic. Figure 1 illustrates this escalation, allowing us to visualize the intensification of suicide records over the years.

Figure 1

Monthly evolution of the total number of suicides in Brazil (2015-2023)

Source: Prepared by the author based on data from the National Public Security Information System (SINESP), 2024

To identify evidence of the magnitude of the impact of the COVID-19 pandemic on suicides, Student's t-test was applied to compare the means of the pre-pandemic (2015-2019) and post-pandemic (2020-2023) periods.

The result of the test indicated a statistically significant difference between the means of suicides in these two periods. The extremely low p-value ($< 2.2 \times 10^{-16}$) and the t-statistic of -11.696 suggest that the average number of suicides in the post-pandemic period was considerably higher compared to the pre-pandemic period. The 95% confidence interval for the difference between the means was from -414.75 to -294.42, confirming the increase in suicide rates after the beginning of the pandemic (Table 2).

In addition, the results of the t-test reveal that the observed increase was not an isolated phenomenon, but rather a substantial change in suicide rates in Brazil. The impact of the pandemic seems to have created a plateau in the records, with no return to previous levels. The significant difference between the averages reinforces the hypothesis that the pandemic had a substantial and lasting effect on suicide rates.

Table 1

Results of the Student's t-test for comparison of means before and after the pandemic.

Parameter	Value
Statistics t	-11,696
Degrees of Freedom (df)	97
p-value	$< 2.2 \times 10^{-16}$
95% confidence interval	-414.75 to -294.42
Average "before the pandemic"	873,95
Average "after the pandemic"	1.228,54

Source: Survey results.

While the growth in the total number of suicides is evident, the regional analysis reveals significant disparities. The Southeast, as it concentrates the largest population, registers the highest absolute numbers, but, when considering the rate per 100 thousand inhabitants, the South stands out as the most affected region. In 2015, the suicide rate in the South was 8.0 per 100,000 inhabitants, while the national average was 4.7. In 2023, the rate in the South rose to 10.9, while the national average reached 6.8. The Central-West also showed a significant growth, changing from 4.6 to 9.0 per 100 thousand inhabitants in the same period. These data show that the increase in suicides does not occur homogeneously in the country, reflecting possible socioeconomic, cultural, and access to mental health services differences between regions.

Table 3

Suicide rates per 100 thousand inhabitants in Brazil and regions (2015-2023)

Year	Brazil	North	Northeast	Midwest	Southeast	South
2015	4,7	3,8	4,0	4,6	4,6	8,0
2016	5,1	4,0	4,3	4,9	5,1	8,6
2017	5,3	3,8	4,4	6,1	5,2	7,4
2018	5,5	4,5	4,1	6,4	5,7	7,6
2019	6,3	5,1	4,9	7,1	6,1	9,6
2020	6,3	5,5	5,1	7,3	5,9	9,6
2021	7,0	6,9	5,5	8,1	6,4	10,8
2022	7,5	6,0	6,2	8,8	7,1	11,2
2023	7,8	7,0	6,8	9,0	7,3	10,9

Source: Prepared by the author based on data from the National Public Security Information System (SINESP), 2024.

Figure 2 illustrates the evolution of the absolute number of suicides by region, while Table 2 details the variation in rates per 100 thousand inhabitants over the years. These differences may be associated with regional factors, such as cultural, socioeconomic, and environmental aspects. Studies suggest that in the South, the higher prevalence of diagnosed psychiatric disorders, lower exposure to sunlight, and differences in social structure may contribute to higher suicide rates.

Figure 2

Monthly number of suicides by region of the country

Source: Prepared by the author based on data from the National Public Security Information System (SINESP), 2024.

In addition, the COVID-19 pandemic has had a notable impact on suicide rates in all regions of Brazil. Table 8 shows the results of suicides by region before and during the pandemic, revealing significant increases in all areas of the country.

Table 3

Annual average of suicides by region before and during the pandemic

Region	Before the pandemic	After the pandemic
North	62,95	91,43
Northeast	179,68	270,16
Midwest	71,97	113,73
Southeast	384,15	483,00
South	175,69	271,03

Source: Survey results.

These increases are even more significant when we look at the results of the Student's t-tests to compare the means before and during the pandemic, presented in Table 5. In all regions, the p-values were extremely low, indicating that the differences in the means of suicides did not occur by chance, but reflect the profound emotional impact of the health crisis.

Table 5

Student's t-test results for comparison of means before and during the pandemic by region

Region	Statistics t	p-value	95% confidence interval
North	-9,3995	$2,657 \times 10^{-15}$	-34.49 to -22.47
Northeast	-15,169	$< 2.2 \times 10^{-16}$	-102.32 to -78.65
Midwest	-9,7025	$5,886 \times 10^{-16}$	-50.30 to -33.22
Southeast	-7,4008	$4,921 \times 10^{-11}$	-125.37 to -72.34
South	-10,181	$< 2.2 \times 10^{-16}$	-113.92 to -76.75

Source: Survey results.

These data indicate that the pandemic has had a significant negative impact on the mental health of the population, with a generalized increase in suicide rates, especially in regions with higher rates before the pandemic, such as the Southeast. The increase was also notable in areas with lower rates, such as the North. Factors such as social isolation, economic uncertainty, and the overload of health systems have likely exacerbated this effect, reinforcing the need for psychological and mental health support measures in times of crisis.

In addition to the regional differences, it is possible to observe, as shown in Figure 03, that over the years, some months have relatively higher numbers of suicides, such as March, September and December, while February and June register the lowest rates. However, there is no clear or consistent seasonality in the data. These monthly variations do not follow a fixed pattern and therefore cannot be attributed to specific seasonal factors.

Figure 3

Monthly variations in suicide records in Brazil from 2015 to 2023

Source: Prepared by the author based on data from the National Public Security Information System (SINESP), 2024.

Analysis by gender also reveals significant differences. Between 2015 and 2023, men accounted for the majority of cases, but the growth among women was proportionally higher.

The monthly average for men rose from 658 to 956 cases (+43%), while the female average went from 174 to 267 cases (+56%). This proportionally higher increase among women suggests that recent external factors, such as the COVID-19 pandemic, may have impacted genders differently.

Although the absolute number of suicides among men is still higher, women have shown a more significant growth in the last decade. This phenomenon may be related to changes in social roles, greater exposure to psychological stress, and difficulties in accessing mental health services.

To test this hypothesis, a t-Student's mean test was performed to compare the numbers of suicides before and after the pandemic for both genders. The result for men indicated a significant difference between the means, with a t-value of -11.257, degrees of freedom (df) equal to 97 and a p-value of less than 2.2×10^{-16} .

The averages for male suicides were 657.42 (pre-pandemic) and 956.86 (during), with a 95% confidence interval between -352.239 and -246.652. This result confirms that the difference in the means is not equal to zero, indicating that there was a significant change in the number of suicides among men during this period.

For women, the Student's t-test also showed a significant difference in the means before and after the pandemic. The t-value was -11.524, with 97 degrees of freedom and a p-value lower than 2.2×10^{-16} . The averages observed were 173.90 (pre-pandemic) and 266.68 (during), with a 95% confidence interval between -108.75 and -76.79. This result suggests a substantial difference in female suicides before and after the beginning of the pandemic, with a more significant increase compared to men. Below, we present the table with the results of the Student's t-test for the comparison of the means before and after the pandemic for males and females.

Table 5

Student's t-test results for comparison of means before and during the pandemic by gender

Gender	Statistics t	p-value	95% confidence interval
Men	-11,257	$< 2.2 \times 10^{-16}$	-352,239 to -246,652
Women	-11,524	$< 2.2 \times 10^{-16}$	-108.75 to -76.79

Source: Survey results.

Another relevant point is that suicide records without gender information remained low throughout the period analyzed, but from 2020 onwards there was a slight increase in these cases. This may be related to changes in the way data is collected or the rise of non-traditional gender identities in registries.

In addition to general trends, monthly fluctuations in suicide records also showed differences between genders. Among men, the months of March, July and September recorded the highest numbers of cases, while among women, the peaks occurred in December and April. These patterns may be related to distinct emotional and social factors, such as economic crises and family events, which impact each group differently.

3.2 EFFECTS OF COVID-19 ON SUICIDES IN BRAZIL

The COVID-19 pandemic has had a profound and significant impact on the increase in the number of suicides in Brazil, with significant growth in rates over the past few years. When comparing the observed data with the counterfactual forecasts, which indicate what would have happened without the pandemic, the direct and causal effect of the health crisis on the mental health of the Brazilian population becomes evident, reflected in a substantial increase in suicide rates.

Before the pandemic, the monthly average of suicides was 888, but that number rose to 1,230 after the crisis began, resulting in an additional 342 suicides per month. This difference is highly significant, with a confidence interval of 95%, proving the dramatic impact of the pandemic on the mental health of Brazilians.

Between 2020 and 2023, the total number of suicides observed was 44,298, compared to a counterfactual forecast of 31,970 suicides in the same period. The cumulative increase of 12,328 additional suicides represents a 39% growth in the total number of suicides in Brazil, highlighting not only the severity of the pandemic's effect, but also the urgent need for public policies to address mental health challenges in the country.

Table 7

Causal effects of the COVID-19 pandemic on suicide rates in Brazil

Metric	Average	Cumulative
Observed	1.230	44.298
Counterfactual	888 (33)	31.970 (1.176)
Absolute effect	342 (33)	12.328 (1.176)
Relative effect	39% (5,1%)	39% (5,1%)
p-value	0,001	

Source: Survey results.

Figure 6 provides a clear and detailed representation of the significant impact of the COVID-19 pandemic on suicide rates in Brazil. The top graph, called the *original*, shows the actual data of suicides observed over time, with the black line representing the actual numbers. The middle graph, called *pointwise*, focuses on what would have happened without the pandemic, highlighting monthly predictions of the number of suicides without the effect of the crisis. The lower graph, *cumulative*, shows the accumulated difference over time between actual suicides and counterfactual predictions, allowing us to visualize the total impact of the pandemic.

From 2020, when the pandemic began, it is possible to observe a growing disparity between the two lines, showing a significant increase in suicides, especially after the beginning of the pandemic. This increase is accentuated as the months progress, with the black line showing a continuous increase in both monthly values and cumulative total, compared to the predicted rates. The difference between the actual values and the counterfactual forecasts underlines the direct and substantial impact of the pandemic on the mental health of the Brazilian population.

These graphs show the persistent and growing impact of the pandemic on suicide rates in Brazil, both in monthly and cumulative terms. The observed pattern reinforces the urgency of public policies focused on suicide prevention and care for the population's mental health.

Figure 6

Counterfactual prediction and actual number of suicides in Brazil during the COVID-19 pandemic

Source: Survey results.

Bayesian analysis revealed that the probability of the observed increase being the result of random fluctuations is extremely low. The p-value was 0.001, indicating high statistical significance, and the subsequent probability that the pandemic had a direct causal effect on the increase in suicides was 99.9%. These figures indicate that the increase in the number of suicides in Brazil is not a mere coincidence, but rather a significant consequence of the pandemic, reinforcing the hypothesis that factors related to the health crisis, such as social isolation, economic instability, and increased psychological stress, played a crucial role in this phenomenon. This is an important finding for the formulation of public policies focused on mental health in Brazil, especially during periods of crisis.

These results are in line with studies carried out in Brazil, such as those by Gunnell et al. (2020) and Tanaka & Okamoto (2021), which point out that large-scale events, such as pandemics and economic crises, have negative and long-lasting effects on the mental health of populations, significantly increasing the risk of suicides.

In the Brazilian context, the psychosocial impact of the pandemic has been particularly accentuated due to social inequality, the collapse of the health system, and economic insecurity. These factors, combined with the disruption of social support networks, are crucial elements that contributed to the increase in suicides in Brazil during the pandemic.

The Social Deprivation Theory, which suggests that social isolation and the absence of emotional support networks exacerbate mental health problems and increase vulnerability to suicidal behaviors, can be applied to the Brazilian context. During the pandemic, many people

in Brazil experienced emotional loneliness and social loneliness, both aspects of social deprivation. Emotional loneliness, referring to the absence of intimate bonds, and social loneliness, due to the lack of a broad support network, are critical factors that contribute to psychological suffering.

Weiss's Theory of Social Deprivation (1973) states that, in contexts of social deprivation, the increase in feelings of hopelessness and helplessness can be a decisive factor for the increase in suicides. The increase in isolation and the decrease in physical interactions during the pandemic may have amplified these effects, particularly in vulnerable populations in Brazil, such as the elderly, people with preexisting mental health problems, and those in situations of social vulnerability.

In Brazil, data from 2023 indicate that the number of suicides continues to be a growing problem, with more than 16,000 cases recorded this year alone. These figures put the country in an alarming situation, in line with the results of our analysis, reinforcing the need for a more robust approach to mental health care.

3.3 REGIONAL EFFECTS OF COVID-19 ON SUICIDES IN BRAZIL

The analysis of the impact of the COVID-19 pandemic on suicides reveals a significant increase in all five regions of Brazil, reinforcing the hypothesis that the health crisis had a direct effect on the mental health of the population. Comparing the observed data with the counterfactual forecasts, we found a significant increase in suicides in absolute and relative terms in all regions, although with variations in the magnitude of the impact.

In the North Region, monthly suicides averaged 92 cases after the beginning of the pandemic, while the counterfactual forecast was 64 cases per month. This represents an average absolute increase of 27 monthly suicides, corresponding to a growth of 42%. The cumulative impact between 2020 and 2023 resulted in 981 additional suicides, bringing the total observed to 3,296 cases. The vulnerability of the North Region may be associated with limited access to mental health services, socioeconomic difficulties, and geographic isolation, factors that may have exacerbated the impact of the pandemic on the psychological health of the population.

The Northeast Region showed an even more significant increase, with a monthly average of 271 suicides, while the counterfactual forecast was 182 cases per month. The average increase of 89 monthly suicides resulted in a relative increase of 49%. In the cumulative period between 2020 and 2023, 3,208 additional suicides were recorded, bringing the total to 9,756 cases. The region was already facing structural challenges, such as high rates of inequality and

poor access to mental health services, which may have amplified the pandemic's impact on suicides.

In the Midwest, the percentage impact was even greater, with an average increase of 41 monthly suicides, raising the average from 73 to 114 suicides per month. The relative growth was 56%, resulting in an increase of 1,464 suicides in the accumulated period, bringing the total observed to 4,107 cases. The combination of rapid urban growth, economic pressure, and limited specialized mental health services may have contributed to this substantial increase.

The Southeast Region, despite presenting the smallest percentage increase, had the greatest absolute impact in total numbers. The monthly average rose from 388 to 483 suicides per month, an absolute increase of 95 monthly suicides (+25%). In total, there were 3,410 additional suicides in the period analyzed, bringing the total number of cases to 17,392. The region, which concentrates the largest urban centers in the country, faced challenges such as increased economic instability, social isolation, and overload on health services, factors that may have contributed to this significant increase.

The South Region had one of the highest percentage impacts, with a 51% growth in suicides. The monthly average rose from 180 to 272 suicides, an absolute increase of 91 monthly suicides. In the accumulated between 2020 and 2023, there were 3,293 additional suicides, bringing the total observed to 9,777 cases. Historically, the South already had higher suicide rates than other regions of Brazil, and the pandemic may have intensified this scenario, amplifying the challenges related to mental health.

The table below summarizes the causal effects of the pandemic on suicides in each region, presenting the observed values, counterfactual predictions, and absolute and relative effects.

Table 8

Causal effects of the COVID-19 pandemic on suicide rates by region

Region	Observed Average	Counterfactual Average	Relative Effect
North	92	64	+42%
Northeast	271	182	+49%
Midwest	114	73	+56%
Southeast	483	388	+25%
South	272	180	+51%

Figure 7 illustrates the evolution of suicide rates in the various regions of Brazil between 2015 and 2023, highlighting the significant impact of the COVID-19 pandemic. The graph compares the observed values with counterfactual forecasts, revealing a significant growth in

suicides in all regions of the country after the beginning of the pandemic. The growing disparity between actual data and counterfactual estimates underlines the profound and widespread effect of the health crisis on the mental health of the Brazilian population.

4 CONCLUSIONS

The present research aimed to analyze the impact of the COVID-19 pandemic on suicide rates in Brazil, considering both the general effects and regional variations in the period from 2020 to 2023. From a robust statistical analysis, based on counterfactual predictions, it was possible to demonstrate that the pandemic generated a significant increase in the number of suicides. The findings reinforce the hypothesis that factors such as social isolation, economic instability, and increased psychological stress severely affected the mental health of the Brazilian population.

The quantitative analysis revealed a substantial increase in suicides throughout Brazil, with an average growth of 39% compared to what was expected without the pandemic. This impact was observed both at the national and regional levels, with some areas experiencing more significant variations. The Midwest region, for example, showed the highest relative growth, with a 57% increase in suicides, while the Southeast region, although it registered the highest absolute number of cases, had a proportionally smaller growth. These regional disparities highlight the influence of local factors, such as access to mental health services, socioeconomic inequalities, and available social support.

In addition to the global and regional impact, the study identified relevant seasonal patterns in the distribution of suicides throughout the year. The analysis showed that certain months, such as March, September and December, had higher incidences, while February and June recorded the lowest numbers. The identification of these seasonal variations allows the formulation of more effective public policies, such as the reinforcement of awareness campaigns and the expansion of psychological support in periods of higher incidence. Measures such as strengthening social support networks and targeted preventive strategies can contribute significantly to reducing cases in the most critical months.

Despite the contributions of the research, some limitations must be acknowledged. The use of secondary data may be subject to inaccuracies or underreporting, especially in more remote regions, which may have affected the accuracy of the estimates. In addition, the analysis did not include variables such as comorbidities or the impact of specific public policies adopted during the pandemic, which could provide a more complete picture of the factors that influenced suicides in the period analyzed. Future research can address these gaps by incorporating more detailed variables and a more in-depth longitudinal approach.

One detail cannot be forgotten, in psychology we cannot speak of causality in the economic/statistical sense. Although the method identifies causal relationships, it is not possible to state in a peremptory way that the pandemic alone causes suicide. However, there is evidence of influence.

The study also paves the way for further investigations into the impact of global crises on mental health, especially in contexts such as Brazil, where social inequalities amplify the negative effects of these crises. Future studies could explore in more detail the relationship between social vulnerability and the increase in suicides during the pandemic, as well as evaluate the effectiveness of psychological support programs implemented during these periods. Understanding these gaps will allow the development of more assertive and effective policies to cope with suicide, both in times of normality and in times of crisis.

Finally, it is necessary for the Brazilian authorities to implement effective psychological support programs, especially for populations in vulnerable situations. The pandemic has highlighted gaps in mental health support that need to be addressed in the long term. The significant increase in suicides reinforces the need to rebuild social support networks and expand public policies aimed at mental health. Only with concrete and continuous actions will it be possible to mitigate the impacts of future crises and ensure the psychological well-being of the Brazilian population.

ABSTRACT

Domestic and family violence against women represents one of the most significant social and legal issues in contemporary society, directly affecting women's dignity, autonomy, and fundamental rights. Among the different forms of violence established under Brazilian legislation, property violence stands out due to its ability to restrict victims' economic independence and perpetuate abusive relationships marked by financial control and economic dependence. In this context, the present study aimed to analyze public policies for the prevention and confrontation of domestic and family violence against women, with emphasis on property violence in the city of Manaus, Amazonas. The research is characterized as a literature review, with a qualitative nature and a descriptive and analytical approach, developed through scientific articles, institutional documents, and technical reports published within the last five years. The results revealed that property violence remains socially and institutionally invisible in several contexts, making its identification and confrontation by public agencies more difficult. It was also observed that factors such as social vulnerability, economic dependence, and structural limitations within the protection

network contribute to increasing the difficulties faced by women victims of domestic violence in the Amazon region. It is concluded that strengthening preventive public policies, intersectoral state action, and mechanisms aimed at women's financial autonomy constitutes an essential measure for reducing property violence and ensuring the effective protection of women's rights.

RESUMO

A violência doméstica e familiar contra a mulher representa uma das mais relevantes problemáticas sociais e jurídicas da contemporaneidade, atingindo diretamente a dignidade, a autonomia e os direitos fundamentais femininos. Entre as diferentes formas de violência previstas na legislação brasileira, a violência patrimonial destaca-se pela sua capacidade de restringir a independência econômica da vítima e perpetuar relações abusivas marcadas pelo controle financeiro e pela dependência econômica. Nesse contexto, o presente estudo teve como objetivo analisar as políticas públicas de prevenção e enfrentamento à violência doméstica e familiar contra a mulher, com ênfase na violência patrimonial no município de Manaus, Amazonas. A pesquisa caracteriza-se como revisão de literatura, de natureza qualitativa e abordagem descritiva e analítica, desenvolvida a partir de artigos científicos, documentos institucionais e relatórios técnicos publicados nos últimos cinco anos. Os resultados evidenciaram que a violência patrimonial permanece invisibilizada em diversos contextos sociais e institucionais, dificultando sua identificação e enfrentamento pelos órgãos públicos. Observou-se ainda que fatores como vulnerabilidade social, dependência econômica e limitações estruturais da rede de proteção contribuem para ampliação das dificuldades enfrentadas pelas mulheres vítimas de violência doméstica no contexto amazônico. Conclui-se que o fortalecimento das políticas públicas preventivas, da atuação intersectorial do Estado e dos mecanismos de autonomia financeira feminina constitui medida essencial para redução da violência patrimonial e garantia efetiva dos direitos das mulheres.

RESUMEN

La violencia doméstica y familiar contra la mujer representa una de las problemáticas sociales y jurídicas más relevantes de la contemporaneidad, afectando directamente la dignidad, la autonomía y los derechos fundamentales femeninos. Entre las diferentes formas de violencia previstas en la legislación brasileña, la violencia patrimonial se destaca por su capacidad de restringir la independencia económica de la víctima y perpetuar relaciones abusivas marcadas por el control financiero y la dependencia económica. En este contexto, el presente estudio tuvo como objetivo analizar las políticas públicas de prevención y enfrentamiento de la violencia doméstica y familiar contra la mujer, con énfasis en la violencia patrimonial en la ciudad de Manaus, Amazonas. La investigación se caracteriza como una revisión de literatura, de naturaleza cualitativa y enfoque descriptivo y analítico, desarrollada a partir de artículos científicos, documentos institucionales e informes técnicos publicados en los últimos cinco años. Los resultados evidenciaron que la violencia patrimonial permanece invisibilizada en diversos contextos sociales e institucionales, dificultando su identificación y enfrentamiento por parte de los organismos públicos. También se observó que factores como vulnerabilidad social, dependencia económica y limitaciones estructurales de la red de protección contribuyen al aumento de las dificultades enfrentadas por las mujeres víctimas de violencia doméstica en el contexto amazónico. Se concluye que el

fortalecimiento de las políticas públicas preventivas, de la actuación intersectorial del Estado y de los mecanismos de autonomía financiera femenina constituye una medida esencial para la reducción de la violencia patrimonial y la garantía efectiva de los derechos de las mujeres.

1 INTRODUCTION

Domestic and family violence against women remains one of the most serious human rights violations in contemporary society, affecting women from different social classes, age groups and cultural contexts. Among the various manifestations of this violence, property violence stands out for its ability to directly compromise the victim's economic autonomy and financial freedom, often remaining invisible both in the social and institutional spheres. In this scenario, the Maria da Penha Law represented an important legal advance by recognizing property violence as one of the forms of domestic violence, expanding the legal mechanisms for the protection of women in vulnerable situations.

According to Campos (2024), gender-based violence has structural roots related to historical inequalities between men and women, going beyond the limited understanding of violence as a simple interpersonal conflict. This perspective demonstrates that practices of economic control, retention of assets and financial restriction are instruments for maintaining male domination in family relationships. In this way, property violence is not restricted to the material losses suffered by the victim, but also reaches their psychological, emotional and social autonomy.

The Brazilian reality shows that property violence still faces high rates of underreporting and difficulties in identification by the agencies responsible for protecting victims. Sousa et al. (2024) highlight that the lack of standardization of institutional records and the social invisibility of this type of violence make it difficult to formulate more efficient preventive public policies. In addition, many women do not recognize certain abusive practices as forms of domestic violence, especially when related to the financial control exercised by the aggressor within the family environment.

In the Amazonian context, the challenges become even more complex due to territorial inequalities, structural limitations of public services and difficulties in accessing the protection network. The Igarapé Institute (2024) shows that the Legal Amazon has worrying rates of violence against women, associated with social vulnerability, institutional fragility, and difficulties in accessing reporting and reception mechanisms. In Manaus, such factors contribute to the expansion of the obstacles faced by victims of domestic and property violence, requiring the strengthening of public policies for prevention and protection.

Property violence has profound impacts on women's lives, compromising their financial independence and making it difficult to break the cycle of violence. Quirino et al. (2026) state that practices such as retention of documents, destruction of personal property, control of salaries, and impediment of access to financial resources function as mechanisms of

submission and control within abusive relationships. This reality highlights the need to understand property violence not only from a legal perspective, but also from a social, economic and institutional perspective.

In view of this scenario, it is relevant to investigate how public policies to prevent and combat domestic and family violence against women have acted to protect victims of property violence in the municipality of Manaus, Amazonas. The research seeks to understand the main challenges faced by the institutional protection network, as well as to analyze the existing preventive mechanisms and their effectiveness in the face of the regional specificities of the Amazon.

The discussion on domestic and family violence against women requires a multidisciplinary approach, considering the legal, social, economic, and institutional impacts produced by the different forms of violence provided for in Brazilian legislation. In this sense, Costa et al. (2024) highlight that effective public policies must act in an integrated manner, articulating preventive, protective, and assistance actions capable of reducing the vulnerability of victims and promoting greater effectiveness in confronting gender violence. Such an understanding reinforces the importance of joint action between public security, social assistance, health and the Judiciary.

In the state of Amazonas, the expansion of public policies aimed at the protection of women has sought to strengthen institutional mechanisms for the prevention and reception of victims of domestic violence. The Amazonas Public Security Secretariat (2025) points out that the fight against violence against women depends on the integration between different government sectors, especially due to the territorial and social particularities present in the Amazon region. However, challenges remain related to the coverage of specialized services and the effective implementation of preventive actions in socially vulnerable areas.

The presence of specialized agencies also plays a fundamental role in the protection of women in situations of violence. Gomes et al. (2025) observe that pro-women institutions contribute significantly to strengthening the reception network, access to justice and referral of victims to social and psychological assistance services. In cities marked by social inequalities, such as Manaus, such structures become essential to reduce female vulnerability and expand institutional protection in the face of multiple forms of domestic violence.

Another relevant aspect refers to the impacts of domestic violence on the physical and emotional health of victims. Alcantara et al. (2024) argue that comprehensive care for women in situations of violence should consider the psychological, social, and economic effects produced by abusive practices. According to the authors, property violence often compromises

the financial and emotional stability of women, making it difficult to break the abusive relationship and increasing the damage resulting from domestic violence.

In addition, recent social effects have intensified challenges related to access to justice for women victims of domestic violence. Paiva et al. (2023) demonstrate that situations of social and economic crisis increase women's financial dependence and make it difficult to activate institutional protection mechanisms. This scenario highlights the need for continuous strengthening of preventive public policies, especially in regions marked by socioeconomic vulnerability and structural limitations of public services.

Thus, the present research is justified by the need to broaden academic discussions on patrimonial violence against women in the Amazonian context, considering the social and institutional specificities of Manaus, Amazonas. The study aims to analyze public policies to prevent and combat domestic and family violence against women, with an emphasis on property violence, seeking to understand the main challenges in the protection network and the effectiveness of institutional strategies aimed at guaranteeing women's rights.

2 THEORETICAL FRAMEWORK

Domestic and family violence against women represents one of the most persistent human rights violations in contemporary society, manifesting itself through physical, psychological, sexual, moral and patrimonial aggression. In the Brazilian context, the expansion of the legal and institutional debate about this violence has consolidated the need to understand the problem in a multidimensional way, especially in regions marked by social inequalities and structural difficulties in accessing public policies, as occurs in Manaus, Amazonas. In this sense, Campos (2024) highlights that gender-based violence cannot be interpreted only as interpersonal conflict, but as a reflection of historical relations of power and female subordination present in social structures.

The Maria da Penha Law significantly expanded the legal concept of domestic violence by recognizing different forms of aggression against women, including property violence. According to Campos (2024), the conceptual dispute around gender violence demonstrates that the practices of economic and financial control exercised against women are strongly related to the maintenance of the victim's emotional and material dependence on the aggressor. Thus, patrimonial violence goes beyond the simple retention of assets, involving systematic mechanisms of domination that compromise autonomy, dignity and women's freedom.

The discussion about property violence gains relevance in the face of the social invisibility of this type of violence. Quirino et al. (2026) point out that most victims do not even recognize

certain abusive practices as violence, especially when related to wage control, retention of documents, destruction of personal objects or impediment of access to financial resources. According to the authors, recent literature shows that patrimonial violence usually occurs in association with other forms of domestic violence, functioning as an instrument for maintaining the cycle of submission of women within the family environment.

When analyzing the structure of public policies to combat violence against women, Costa et al. (2024) state that the effectiveness of government actions depends on the integration between prevention, protection, assistance, and accountability of the aggressor. The authors argue that fragmented policies tend to produce low capacity for social intervention, especially in contexts of economic vulnerability. Thus, the evaluation of public policies requires observation not only of the formal existence of institutional programs, but also of their effective capacity to reach women at risk.

The Amazonian reality presents particularities that intensify the challenges of protecting women victims of domestic violence. The Igarapé Institute (2024) shows that the states of the Legal Amazon have high rates of violence against women, associated with territorial inequality, structural limitations of public services, and difficulties in accessing protection agencies. The study shows that municipalities with a smaller state presence face greater obstacles to the implementation of preventive policies, a factor that has a direct impact on the underreporting of cases of property violence.

In the specific case of Amazonas, the State Plan for the Prevention and Confrontation of Violence Against Women establishes strategies aimed at expanding the protection network, institutional strengthening and promotion of educational actions aimed at preventing domestic violence. The Amazonas Public Security Secretariat (2025) emphasizes that confronting violence against women requires intersectoral articulation between public security, social assistance, health, and the Judiciary, seeking to ensure full protection for victims. This perspective demonstrates that the fight against property violence requires coordinated action between different public agencies.

The importance of specialized institutions is also emphasized by Gomes et al. (2025), when analyzing the relationship between women's protection agencies and the reduction of violence rates in Brazil. According to the authors, locations that have specific institutional structures, such as specialized police stations, shelter centers and legal assistance programs, tend to have better conditions for coping with domestic violence. This finding has special relevance for Manaus, considering the need for continuous strengthening of the women's protection network in the face of the growth of lawsuits related to family violence.

In the context of victim care, Alcantara et al. (2024) argue that comprehensive care for women in situations of violence should consider not only the physical consequences of aggression, but also the emotional, social, and economic impacts resulting from abusive practices. The authors state that property violence often produces prolonged effects on women's financial autonomy, hindering their ability to break the cycle of domestic violence. Thus, preventive public policies need to incorporate strategies for economic strengthening and social inclusion of victims, especially in peripheral and vulnerable regions.

The production of statistical information on domestic violence is an essential instrument for the formulation of preventive public policies and institutional mechanisms for the protection of women. Sousa et al. (2024) argue that the existence of multiple databases on violence against women reveals advances in institutional monitoring, but also highlights challenges related to the standardization of information and the underreporting of cases. According to the authors, the absence of complete records makes it difficult to accurately identify the forms of property violence, since many occurrences end up classified only as psychological or moral violence.

In the Amazonian context, the analysis of the data produced by the Court of Justice of the State of Amazonas shows a significant growth in demands related to domestic and family violence. The TJAM report (2026) shows that factors such as financial dependence, social vulnerability, and affective relationships marked by economic control are often associated with episodes of violence against women in Manaus. The data presented reinforce the need to strengthen preventive policies aimed specifically at the recognition of property violence as an autonomous modality of rights violation.

In addition to the legal dimension, property violence has profound social and economic consequences for the victims. Quirino et al. (2026) observe that the patrimonial control exercised by the aggressor directly compromises women's financial independence, creating barriers to the termination of the abusive relationship. In several cases, the retention of documents, destruction of personal property and appropriation of financial resources are used as mechanisms of intimidation and submission. As the authors point out, such practices reinforce relations of structural gender inequality present in Brazilian society.

The understanding of patrimonial violence also requires an analysis of the institutional relations that exist within the scope of public policies to combat domestic violence. Costa et al. (2024) state that effective government programs should act in a preventive manner, promoting educational actions capable of deconstructing cultural patterns associated with the naturalization of violence against women. For the authors, policies limited only to criminal

repression tend to present insufficient results, especially when not accompanied by initiatives aimed at women's economic autonomy.

This perspective dialogues with the understanding presented by Gomes et al. (2025), according to which the presence of pro-women institutions directly influences the state's capacity to protect victims. The authors identify that specialized institutional structures contribute to greater welcoming, legal guidance and referral of women to social and psychological assistance services. In cities marked by urban and territorial inequalities, such as Manaus, such mechanisms become fundamental to reduce the social vulnerability of victims of domestic and property violence.

Comprehensive care for women in situations of violence is a central element in the realization of the rights provided for by Brazilian legislation. Alcantara et al. (2024) argue that the performance of public services should occur in a humanized and interdisciplinary manner, recognizing that domestic violence produces multiple impacts on the physical and mental health of victims. The authors point out that the absence of financial autonomy often makes it difficult for women to move away from the violent environment, which is why public protection policies need to incorporate actions of economic inclusion and social strengthening.

At the regional level, the Igarapé Institute (2024) points out that the Legal Amazon has particular characteristics that aggravate the obstacles to confronting violence against women. Issues related to territorial distances, insufficient public facilities and limitations in access to justice compromise the effectiveness of preventive policies. The study shows that women living in peripheral or socially vulnerable areas face greater difficulties in reporting situations of property violence, especially due to economic dependence on the aggressor.

State action in Amazonas has sought to expand prevention and protection strategies for women through intersectoral policies. The State Plan for the Prevention and Confrontation of Violence Against Women establishes actions aimed at education in rights, professional training, strengthening of the reception network and expansion of specialized services in the state. The Amazonas Public Security Secretariat (2025) argues that the fight against domestic violence requires permanent integration between security, social assistance, health, and the Judiciary, allowing for more effective institutional responses to the different forms of violence provided for in Brazilian legislation.

The effectiveness of public policies to combat domestic violence also depends on the institutional capacity to guarantee access to justice for women in vulnerable situations. In this context, Paiva et al. (2023) highlight that periods of social and health crisis increase the obstacles faced by victims, especially in relation to reporting aggressions and activating state

protection mechanisms. The authors observe that social isolation has intensified situations of economic control and financial dependence, aggravating practices of property violence in the domestic environment.

The difficulty of access to protection agencies demonstrates that the confrontation of violence against women cannot be limited to the formal existence of legal norms. Campos (2024) argues that gender-based violence has structural roots associated with historical relations of inequality between men and women. Thus, preventive public policies also need to act in the cultural and educational transformation of society, promoting mechanisms capable of deconstructing naturalized practices of economic and patrimonial domination within family relations.

When discussing the instruments for evaluating public policies, Costa et al. (2024) state that the analysis of state effectiveness should consider indicators related to prevention, protection, and assistance to victims. For the authors, the simple creation of institutional programs does not guarantee concrete results without adequate articulation between the public services responsible for the care of women. Such an understanding is relevant to Manaus, considering the structural challenges faced by the protection network in the Amazonian context.

The regional analysis presented by the Igarapé Institute (2024) shows that the Legal Amazon concentrates social factors that contribute to the maintenance of domestic violence, including economic inequality, institutional fragility, and territorial limitations in access to public policies. The study shows that patrimonial violence manifests itself even more severely in contexts marked by women's financial dependence and the precariousness of socioeconomic conditions. Thus, the formulation of preventive policies requires sensitivity to local and regional specificities.

In Amazonas, institutional actions aimed at preventing domestic violence have sought to strengthen mechanisms for welcoming and protecting victims. The State Plan for the Prevention and Confrontation of Violence Against Women establishes guidelines aimed at expanding the assistance network, training professionals and developing permanent educational campaigns. According to the Amazonas Public Security Secretariat (2025), confronting domestic violence requires integrated action between different government sectors, recognizing the social complexity of multiple forms of violence against women.

The data produced by the Court of Justice of the State of Amazonas reveal the persistence of high rates of domestic violence in the state, evidencing the need for continuous strengthening of public prevention policies. The TJAM (2026) points out that economic dependence remains a recurrent element in the abusive relationships analyzed by the justice

system, a factor directly related to property violence. This reality reinforces the importance of policies aimed at women's financial autonomy as an instrument to reduce the social vulnerability of victims.

In the field of social assistance and public health, Alcantara et al. (2024) argue that care for women in situations of violence should occur in a comprehensive way, considering the emotional, physical, and economic impacts resulting from aggressions. The authors point out that practices of property violence often compromise the victim's financial stability, making it difficult to break the bond with the aggressor. In this sense, professional qualification programs, productive inclusion and economic strengthening become fundamental prevention strategies.

Recent literature also demonstrates that the strengthening of specialized institutions contributes to the improvement of public policies for the protection of women. Gomes et al. (2025) identify that locations with a greater presence of organizations dedicated to the defense of women's rights have better conditions to cope with domestic violence. This finding highlights the need for continuous investments in the institutional structure of Manaus, especially in the face of the growing demands related to property and family violence.

In view of this scenario, it is verified that patrimonial violence against women is a complex and multifactorial phenomenon, directly associated with structural gender inequalities and institutional limitations existing in the Amazonian context. The sources analyzed demonstrate that the strengthening of preventive public policies in Manaus requires integrated action between public security, social assistance, health, education and the Judiciary, seeking to ensure effective protection, economic autonomy and guarantee of the fundamental rights of women in situations of domestic and family violence.

3 METHODOLOGY

This article is characterized as a qualitative research, developed through a literature review, with an analytical and descriptive focus on prevention policies against domestic and family violence against women, especially with regard to property violence in the context of Manaus, Amazonas. The choice of literature review is justified by the need to gather, systematize and interpret recent scientific and institutional productions on the subject, allowing a broader understanding of the mechanisms for prevention, protection and coping with this type of violence.

The research was conducted based on the selection of scientific materials and institutional documents published in the last five years, prioritizing studies with academic relevance, thematic relevance and alignment with the investigated object. Scientific articles,

institutional reports and technical documents considered reliable and compatible with the research proposal were used exclusively, enabling a critical analysis of public policies related to domestic and property violence against women in Brazil and in the Amazon region.

The bibliographic survey focused on nationally and internationally recognized academic databases, including SciELO, indexed scientific journals and official documents produced by public agencies and specialized institutions. The selection of sources considered criteria related to the identification of authorship, timeliness of publications, thematic coherence, availability of the full text, and scientific relevance for the development of the research. Materials without identifiable authorship, opinion texts, duplicate content, documents without academic validation, and publications that did not have a direct relationship with the object of the study were excluded.

The data collection stage occurred through exploratory, selective and analytical reading of the previously selected works, allowing the identification of the main concepts, legal approaches, social factors and institutional elements related to patrimonial violence against women. Subsequently, the thematic organization of the information was carried out, grouping the contents into central axes related to gender violence, public policies for prevention, institutional protection, access to justice and women's social vulnerability in the Amazonian context.

The data analysis was based on the qualitative interpretation of the content of the selected scientific and institutional productions. This procedure allowed us to identify convergences, divergences and gaps in the recent literature on the effectiveness of public policies to combat domestic and family violence against women. The analysis also made it possible to understand how economic, social and structural factors influence the occurrence of property violence and hinder female autonomy in situations of vulnerability.

The territorial delimitation of the research was concentrated in the city of Manaus, Amazonas, considering the regional specificities of the Legal Amazon and the challenges faced by the women's protection network in the state. This is justified by the social relevance of the theme in the Amazonian context, marked by social inequalities, structural limitations of access to public services and growth in demands related to domestic and family violence.

As methodological limitations, the dependence on secondary data available in the scientific productions and institutional documents analyzed is recognized, as well as the possibility of underreporting of cases of property violence recorded by official agencies. Even so, the use of recent academic sources and specialized institutional documents contributed to greater analytical consistency of the research, allowing a theoretical construction consistent

with the objectives proposed in the study.

The following table presents the main sources used in the development of this research, including scientific articles, institutional documents and technical reports related to public policies to combat domestic and family violence against women, with emphasis on patrimonial violence in the context of Manaus, Amazonas. The organization of these sources allows us to visualize the diversity of the materials used in the theoretical and methodological foundation of the study, evidencing the interdisciplinary and updated nature of the research.

Table 1

Scientific and institutional sources used in the foundation of the research

Lead author/Institution	Document Title	Font type	Year
Alcantara	Comprehensive care for women victims of violence	Scientific article	2024
Fields	Gender-based violence in the Maria da Penha Law: a concept in dispute	Scientific article	2024
Costa	Violence against women: a model for evaluating public policies	Scientific article	2024
Gomes	The existence of pro-women institutions and violence against women in Brazil	Scientific article	2025
Igarapé Institute	Violence against women in the Legal Amazon in the last five years compared to the rest of the country	Institutional technical report	2024
Paiva	The impact of the Covid-19 pandemic on access to justice for women in situations of domestic and family violence	Scientific article	2023
Quirinus	Property violence: an integrative literature review	Scientific article	2026
Amazonas Public Security Secretariat	State Plan for the Prevention and Confrontation of Violence Against Women	Official document	2025
Sousa	Sources of information on violence against women in Brazil	Scientific article	2024
Court of Justice of the State of Amazonas	Sociodemographic profile of women and perpetrators of domestic violence and the circumstances of violence in the year 2025	Official document	2026

Source: The Authors.

The analysis of the sources presented demonstrates that the research was built from recent scientific and institutional materials, allowing a multidisciplinary approach to domestic and family violence against women. There is a predominance of scientific articles focused on the analysis of public policies, gender violence, institutional protection and property violence, complemented by official documents related to the Amazonian context and the actions developed in the state of Amazonas.

This diversity of sources contributes to a greater theoretical deepening and strengthening

of the critical analysis proposed by the study, especially with regard to the challenges faced by preventive policies and the women's protection network in Manaus.

4 RESULTS AND DISCUSSIONS

The analysis of the scientific productions and institutional documents used in the present research shows that patrimonial violence remains one of the least identified and debated modalities in the context of domestic and family violence against women. Although the Brazilian legislation formally recognizes this form of violence, the results demonstrate that there are still institutional and social difficulties related to the recognition of abusive practices that involve economic control, retention of assets and limitation of women's financial autonomy. In this sense, Quirino et al. (2026) state that property violence often occurs silently, making it difficult for the victim to perceive it and for adequate state intervention.

The data analyzed also reveal that property violence is directly associated with structural relations of gender inequality. Campos (2024) highlights that gender-based violence cannot be interpreted in isolation, since it stems from historical patterns of male domination and female subordination present in Brazilian society. This understanding allows us to observe that patrimonial control constitutes a mechanism for maintaining the power exercised by the aggressor within family relations, compromising the economic and social freedom of women.

In the Amazonian context, the results indicate that territorial and socioeconomic vulnerabilities intensify the challenges faced by women victims of domestic violence. The Igarapé Institute (2024) shows that the Legal Amazon presents structural obstacles related to access to public services, institutional action, and the protection of victims, especially in locations marked by social inequalities and precarious state presence. In Manaus, such difficulties directly reflect on the ability of women to report situations of property violence and seek legal and social assistance.

The analysis of the State Plan for the Prevention and Confrontation of Violence Against Women shows important institutional advances in the state of Amazonas. The Amazonas Public Security Secretariat (2025) points out that state policies have sought to expand educational actions, strengthen the protection network, and promote integration between public security, social assistance, and the justice system. However, the results observed demonstrate that there are still limitations related to the coverage of specialized services and the effective implementation of preventive policies in all urban and peripheral areas of Manaus.

Another relevant aspect identified in the research refers to the importance of specialized institutions in dealing with domestic violence. Gomes et al. (2025) observe that the presence of

pro-women organizations contributes significantly to improving institutional protection, especially through the legal and social support of victims. The results suggest that municipalities and states with more consolidated specialized structures have better conditions to cope with domestic violence, including with regard to property violence practices.

The production of statistical information also proved to be an essential element for understanding the investigated problem. Sousa et al. (2024) state that the existence of databases on violence against women allows for greater social visibility of the problem and contributes to the formulation of more efficient public policies. However, the authors warn that underreporting still represents a relevant obstacle, especially in cases of property violence, which are often made invisible in institutional records and formal complaints.

The data presented by the Court of Justice of the State of Amazonas show a significant growth in demands related to domestic and family violence against women in recent years. The TJAM (2026) shows that factors such as financial dependence, economic vulnerability, and lack of adequate institutional support appear recurrently in the situations analyzed by the state justice system. This reality reinforces the need to strengthen preventive public policies aimed at women's economic autonomy and the patrimonial protection of victims.

In addition to the legal and social consequences, the results indicate that property violence produces significant impacts on women's physical and emotional health. Alcantara et al. (2024) highlight that practices of economic control and financial restriction often trigger psychological suffering, social insecurity, and difficulties in breaking the cycle of violence. The authors argue that effective public policies should adopt an interdisciplinary and humanized approach, considering the multiple effects produced by different forms of domestic violence.

The analysis of the selected sources demonstrates that public policies to combat domestic violence are more effective when structured in an integrated and continuous manner. Costa et al. (2024) state that isolated and exclusively repressive actions have significant limitations in the prevention of violence against women, especially in cases where the victim remains economically dependent on the aggressor. The results identified in this research indicate that the absence of policies aimed at women's financial autonomy contributes to the maintenance of cycles of property violence in the family environment.

In this scenario, it is observed that property violence assumes a strategic role within abusive relationships, functioning as an instrument of control and submission of the victim. Quirino et al. (2026) highlight that practices such as withholding documents, destroying personal belongings, controlling wages, and preventing access to financial resources directly compromise women's ability to be independent. The results analyzed reveal that such behaviors

often occur in a manner associated with psychological and moral violence, increasing the social and emotional damage suffered by the victims.

Women's economic vulnerability appears as a recurrent factor in the discussions present in the sources analyzed. According to Alcantara et al. (2024), women subjected to property violence tend to have greater difficulty in breaking the abusive bond, especially due to the lack of financial conditions to reorganize their own lives. The authors emphasize that public policies for reception need to incorporate programs for productive inclusion, professional qualification and economic strengthening, especially in regions marked by social inequality.

In the context of Manaus, the results demonstrate that the geographical and social particularities of the Amazon directly influence the effectiveness of public policies for the protection of women. The Igarapé Institute (2024) shows that the insufficiency of specialized public equipment and the difficulties in accessing institutional services contribute to the weakening of the protection network in the Legal Amazon. This reality becomes even more worrying in the face of the growth in demands related to domestic and family violence registered by public agencies in Amazonas.

The performance of the state Judiciary also represents an important element in the fight against domestic violence. Data from TJAM (2026) show an increase in occurrences involving relationships marked by economic dependence and asset control exercised by the aggressor. The results analyzed indicate that many victims arrive at the justice system already inserted in prolonged contexts of psychological, financial and social violence, evidencing the need to strengthen preventive and educational measures aimed at protecting women.

At the institutional level, Gomes et al. (2025) emphasize that the presence of specialized organizations contributes to greater efficiency of public policies for the protection of women. The authors identify that specialized police stations, reference centers and reception programs have a positive impact on reducing the social vulnerability of victims, especially when articulated with legal, psychological and social assistance services. In Manaus, such mechanisms become fundamental in view of the structural limitations faced by the public protection network.

The results also highlight the importance of producing and systematizing information on domestic and property violence. Sousa et al. (2024) state that the absence of standardized records hinders the formulation of more effective public policies, in addition to compromising the real understanding of the dimension of property violence in Brazil. The research shows that underreporting remains one of the main obstacles to confronting violence against women, especially in contexts of economic vulnerability and financial dependence.

Another relevant aspect identified refers to the need to strengthen educational and

preventive actions aimed at deconstructing gender violence. Campos (2024) argues that confronting domestic violence requires cultural transformation capable of breaking historical patterns of inequality between men and women. The results obtained indicate that public policies focused only on the criminal accountability of the aggressor tend to have limited scope when not accompanied by educational, social and economic initiatives aimed at the full protection of women.

The results obtained in the present research demonstrate that property violence remains inserted in a context of social and institutional invisibility, even in the face of the legislative advances promoted by the Maria da Penha Law. The analyses carried out indicate that many women do not recognize certain practices of economic control as forms of domestic violence, a factor that hinders both the denunciation and the preventive action of the State. As observed by Quirino et al. (2026), patrimonial violence often manifests itself in a silent and progressive way, becoming an instrument for maintaining female dependence and submission.

The analysis of public policies shows that the integration between the different bodies of the protection network represents an indispensable element for coping with domestic and family violence. The Amazonas Public Security Secretariat (2025) points out that articulated actions between public security, social assistance, health, and the Judiciary expand the institutional capacity to welcome and protect victims. The results of this research demonstrate that the lack of integration between these sectors significantly reduces the effectiveness of preventive measures and hinders the full protection of women in vulnerable situations.

Another aspect identified refers to the influence of socioeconomic inequalities in the perpetuation of property violence. Costa et al. (2024) state that economically dependent women face greater obstacles to breaking abusive relationships, especially in contexts marked by precarious access to public policies. In Manaus, the results analyzed suggest that factors related to social vulnerability, unemployment and limitation of specialized services intensify the impacts of domestic violence and compromise female autonomy.

At the regional level, the Igarapé Institute (2024) shows that the states of the Legal Amazon have specific structural difficulties related to the protection of women victims of violence. Territorial issues, institutional limitations and inequality in the distribution of public services contribute to the fragility of the network to combat domestic violence. The results of the present research reinforce that such factors have a direct impact on the ability of victims to access reporting mechanisms, legal assistance and social support in the state of Amazonas.

The performance of specialized institutions has also been shown to be relevant in reducing the vulnerability of women victims of property violence. Gomes et al. (2025) observe

that pro-women organizations play a fundamental role in promoting legal, psychological, and social assistance, strengthening institutional protection and expanding victims' access to their rights. In Manaus, the results indicate that the strengthening of these structures can contribute significantly to the improvement of public policies to prevent and cope with domestic violence.

In addition to the institutional dimension, the results demonstrate that property violence has profound impacts on the emotional and social health of victims. Alcantara et al. (2024) state that financial control and economic restriction often trigger psychological distress, social insecurity, and reduced female self-esteem. The research shows that women subjected to property violence tend to face greater difficulties in rebuilding personal and financial autonomy, reinforcing the need for interdisciplinary and humanized public policies.

The data analyzed by the Court of Justice of the State of Amazonas reveal a continuous growth in demands related to domestic and family violence against women. The TJAM (2026) demonstrates that economic factors are often associated with situations of violence analyzed by the state justice system. This reality confirms that property violence cannot be treated as a secondary aspect of abusive relationships, but rather as a central mechanism for controlling and perpetuating gender violence.

The results obtained show that the confrontation of patrimonial violence against women in Manaus requires strengthening preventive public policies, expanding the institutional protection network and developing strategies aimed at women's economic autonomy. The research demonstrates that the fight against domestic violence requires multidisciplinary and continuous action, involving not only legal repression, but also educational, social and economic actions capable of reducing structural inequalities and promoting effective guarantee of women's rights.

Table 2 below presents a synthesis of the main scientific and institutional productions used in the development of the research, highlighting the objectives, methods employed and main results identified in each study. The organization of this information allows a better visualization of the theoretical and analytical panorama related to public policies for the prevention of domestic and family violence against women, with emphasis on property violence and the Amazonian reality.

Table 2*Synthesis of the studies used in the research*

Authors	Objective	Method	Main results
Alcantara et al. (2024)	Analyze comprehensive care for women victims of violence	Qualitative study and literature review	It highlighted the need for interdisciplinary care and strengthening of women's economic autonomy
Fields (2024)	Discuss the concept of gender-based violence in the Maria da Penha Law	Legal and bibliographic analysis	It demonstrated that gender violence stems from structural relations of social inequality
Costa et al. (2024)	Evaluate public policies aimed at confronting violence against women	Analytical study of public policies	It identified that integrated actions are more effective in protecting victims
Gomes et al. (2025)	Investigate the influence of pro-women institutions in confronting violence	Quantitative and documentary research	It found that specialized bodies strengthen institutional protection
Igarapé Institute (2024)	Analyzing violence against women in the Legal Amazon	Technical report and statistical analysis	He pointed out structural vulnerabilities and difficulties in accessing the protection network
Paiva et al. (2023)	Examining the impacts of the pandemic on access to justice for women victims of violence	Qualitative and documentary research	Demonstrated increased difficulties in reporting and protection during periods of crisis
Quirino et al. (2026)	Review the literature on property violence against women	Integrative literature review	It identified social invisibility of property violence and association with financial dependence
Amazonas Public Security Secretariat (2025)	Establish state strategies to combat violence against women	Institutional technical document	Defined integrated actions for prevention, protection and strengthening of the state network
Sousa et al. (2024)	Analyze the sources of information on violence against women in Brazil	Desk research and data analysis	It showed statistical limitations and underreporting of cases of property violence
Court of Justice of the State of Amazonas (2026)	To present a sociodemographic profile of the occurrences of domestic violence in the state	Institutional statistical report	It indicated an increase in demands related to domestic violence and economic dependence

Source: The Authors.

The joint analysis of the sources presented shows convergence between studies regarding the complexity of domestic and family violence against women, especially with regard to property violence and the difficulties faced by victims to break abusive relationships marked by economic dependence. It is observed that the selected works emphasize the need to strengthen preventive public policies, expand interinstitutional action and develop strategies aimed at women's financial autonomy.

In addition, institutional documents and regional reports demonstrate that the Amazonian context presents specific challenges related to social vulnerability, the structural limitation of public services and access to the protection network, factors that make it essential to build

integrated and regionally adapted measures to confront violence against women in Manaus, Amazonas.

5 CONCLUSION

The present research allowed us to understand that patrimonial violence against women constitutes one of the most silent and complex forms of domestic and family violence, producing significant impacts on the economic, emotional and social autonomy of the victims. The analysis of scientific productions and institutional documents showed that this type of violence remains strongly associated with structural gender inequalities, functioning as a mechanism for controlling and perpetuating abusive relationships within the family environment.

The results obtained showed that, although there are normative and institutional advances aimed at confronting violence against women, there are still limitations related to the effectiveness of preventive public policies, especially in the Amazonian context. In Manaus, factors such as social vulnerability, economic dependence, structural limitations of the protection network, and difficulties in accessing public services contribute to the intensification of the challenges faced by women victims of property violence.

The research also showed that the strengthening of specialized institutions and the intersectoral action of the State represents a fundamental element for improving prevention and protection policies for women. The integration between public security, social assistance, health and the Judiciary proved to be indispensable to guarantee adequate reception, access to justice and full protection of victims, especially in view of the complexity of the multiple forms of domestic violence identified in the study.

Another relevant aspect observed refers to the need to expand public policies aimed at women's financial autonomy. It was found that economic dependence is a determining factor for the permanence of victims in abusive relationships, making it essential to develop strategies for productive inclusion, professional qualification and economic strengthening of women in situations of social vulnerability.

Therefore, the confrontation of property violence against women in Manaus requires continuous, integrated and multidisciplinary action, involving not only repressive measures, but also educational, preventive and social actions capable of reducing structural inequalities and promoting effective protection of women's rights. In addition, the research reinforces the importance of expanding scientific studies focused on property violence, considering the need for greater academic, institutional and social visibility of this form of domestic violence in the Amazonian context.

ACKNOWLEDGMENTS

The accomplishment of this work represents not only the conclusion of academic research, but also the strengthening of the commitment to the defense of human dignity, social justice and the protection of women's rights. The theme addressed reinforces the importance of scientific production as an instrument of critical reflection and social contribution, especially in the face of the challenges faced in combating domestic and family violence against women in the Amazonian context.

We thank all the professors, colleagues and professionals who contributed directly or indirectly to the development of this research, whether through academic encouragement, scientific discussions or the sharing of fundamental knowledge for the construction of this study. The support received throughout this trajectory was essential for the maturation of the analyses and for the consolidation of the proposed objectives.

We also register our gratitude to the public, scientific and social institutions that develop actions to combat violence against women and produce data, research and public policies aimed at protecting women. May this work contribute, even if in a modest way, to the expansion of the academic debate and strengthening of strategies for prevention, reception and guarantee of women's rights in Manaus, Amazonas, and throughout the Amazon.

ABSTRACT

This article analyzes the tensions between autonomy and the protection of vulnerable subjects, especially children, adolescents, young people, the elderly, and people with disabilities, in light of transformative constitutionalism. Starting from human dignity and Fineman's theory of vulnerability, it examines the normative shaping of civil capacity after the Convention on the Rights of Persons with Disabilities, the Statute of Persons with Disabilities, and the 2015 Code of Civil Procedure. Empirical data from the National Council of Justice (CNJ) and decisions of the Superior Court of Justice (STJ) reveal the gap between the normative promise and the reality. It argues for the need for structural criteria to effectively balance autonomy, guardianship, and supported decision-making, avoiding both paternalism and abandonment.

Keywords: Constitutional Vulnerability. Autonomy. Transformative Constitutionalism. Legal Framework.

RESUMO

O artigo analisa as tensões entre autonomia e proteção de sujeitos vulneráveis, especialmente de crianças, adolescentes, jovens, idosos e pessoas com deficiência, à luz do constitucionalismo transformador. Partindo da dignidade humana e da teoria da vulnerabilidade de Fineman, examina-se a conformação normativa da capacidade civil após a Convenção da Pessoa com Deficiência, o Estatuto da Pessoa com Deficiência e o Código de Processo Civil de 2015. Dados empíricos do CNJ e decisões do STJ revelam a distância entre a promessa normativa e a sala de máquinas. Defende-se a necessidade de critérios estruturais para equilibrar efetivamente autonomia, curatela e tomada de decisão apoiada, evitando tanto o paternalismo quanto o abandono.

RESUMEN

Este artículo analiza las tensiones entre la autonomía y la protección de los sujetos vulnerables, especialmente niños, adolescentes, jóvenes, ancianos y personas con discapacidad, a la luz del constitucionalismo transformador. Partiendo de la dignidad humana y la teoría de la vulnerabilidad de Fineman, examina la configuración normativa de la capacidad civil tras la Convención sobre los Derechos de las Personas con Discapacidad, el Estatuto de las Personas con Discapacidad y el Código de Procedimiento Civil de 2015. Datos empíricos del Consejo Nacional de Justicia (CNJ) y decisiones del Tribunal Superior de Justicia (TSJ) revelan la brecha entre la promesa normativa y la realidad. Se argumenta a favor de la necesidad de criterios estructurales para equilibrar eficazmente la autonomía, la tutela y la toma de decisiones con apoyo, evitando tanto el paternalismo como el abandono.

Palabras clave: Vulnerabilidad Constitucional. Autonomía. Constitucionalismo Transformador. Marco Jurídico.

1 INTRODUCTION

The protection of vulnerable groups in Brazil was indelibly marked by the Federal Constitution of 1988, which established guidelines for the protection of fundamental rights in relation to all subjects and, in particular, for those who demand special constitutional protection.

Within the scope of Title VIII of the Constitution, which deals with the Social Order, the constitutional text distinguished a specific Chapter, VII, to deal with "the Family, the Child, the Adolescent, the Youth and the Elderly". This will be exactly the group in a situation of vulnerability considered in this article, adding people with "physical, sensory or mental disabilities", under the terms of article 227, II, without disregarding the perspective that vulnerability is an inherent element of humanity itself.

The constitutional proximity in relation to the establishment of fundamental rights and guarantees in relation to these vulnerable groups, in a different way from the previous historical paradigm, related to the military dictatorship and tainted by several confrontations with the principle of human dignity, is in line with the historical development of Transformative Constitutionalism, especially from the 1990s onwards. This transformative perspective is based on the allocation of all branches of law by the prescriptions of the Constitution, in addition to evaluating the elements of private relationships, including family relationships, based on constitutional principles and guarantees.

However, constitutional transformation does not take place automatically, since it depends on institutional and structural arrangements capable of operationalizing constitutional norms. Thus, even though the Brazilian Constitution has expanded rights and guarantees, practices and structures persist that limit the autonomy of the subjects it seeks to protect, reproducing tutelary and paternalistic logics incompatible with the 1988 constitutional project.

From these bases, this article intends, through the hypothetical-deductive method, of a qualitative nature, based on the analysis of normative, jurisprudential and empirical evidence, to answer the following research question: how to delimit the autonomy of constitutionally protected subjects, so as not to compromise the reinforced protection that is ensured by the Constitution, from the transformative perspective?

In this sense, the general objective is to analyze the limits of the autonomy established by the Constitution for vulnerable groups, considering the imperfections existing in the engine room and its essentiality for the constitutionally instituted rights and programs to be achieved. The constitutional bases for the protection of these groups, the normative conformation of civil capacity in the current legislation, and the evaluation of empirical data and jurisprudence, which reveal the distance between the normative promise and the engine room, must be examined.

The article is structured in two development sections, in addition to this introduction and conclusion: section 2 examines the constitutional foundations of human dignity and vulnerability; Section 3 looks at transformative constitutionalism and the concept of the engine room applied to the protection of the vulnerable.

2 DIGNITY OF THE HUMAN PERSON AND VULNERABILITY: THE BASES OF THE FEDERAL CONSTITUTION OF 1988

Human dignity and fundamental rights and guarantees have gone through a long historical process so that the perspectives that exist today were achieved.

While the eighteenth and nineteenth centuries were marked by the advance of individual rights, directed by liberalism, the advance of social rights together with the maturation of the recognition of individual rights advanced especially in the twentieth century. based on Locke's philosophy (Fineman, 2008).

The Second World War, characterized by the massive violation of human rights in the Nazi-fascist regimes, was a turning point in the recognition and prioritization of human rights and inviolable fundamental rights, encompassing life and human dignity (Tamanaha, 2004, p. 109).

After this period, there was a transformation in constitutional texts around the world, which began to recognize the centrality of human dignity (Grimm, 2016, p. 161), although they depended on effective measures for the materialization of constitutional texts. In this context, the conjunction of socioeconomic, political and legal factors inherent to the post-war II period, marked in several Western countries by the transition from authoritarian and exclusionary regimes to democracies, served as a catalyst for the incorporation of various human and social rights inherent to the ongoing social transformations, generating a transition, empirically perceptible, to more verbose constitutions, especially in the field of fundamental rights (Freire, 2021).

Thus, the second half of the twentieth century saw formal structural changes in the constitutions, with evidence in the constitutions of Italy, 1947, Germany, 1949, which influenced the Charters of late democracies, such as the Constitution of Greece, 1975, Portugal, 1976, and Spain, 1978, including, in this field, states marked by dictatorships, the Latin American constitutions of the end of the century (Assumpção, 2022), which began to include a broad list of rights, understood as elements of social transformation.

Fundamental human rights have undergone this long trajectory of change, initially gaining constitutional stature and, consequently, sheltering positive law (Bobbio, 2004, p. 19),

enabling the action of constitutional courts established throughout the twentieth century, with the exception of the United States (which has a different trajectory in relation to its Constitutional Court), for the protection of these rights.

In line with this historical transition, the Constitution of the Federative Republic of Brazil, of 1988, is the culmination of the transition process from a dictatorial and military regime, which began in the 1960s, to a democratic federative model, based on the dignity of the human person. The Brazilian Constitution represents, in this sense, the materialization of the aspirations for changes existing in the Nation, bringing a model of democratic interactions that prioritized the dignity of the human person (Teixeira, 2018), with a broad list of fundamental rights that began to direct the political and social relations of the State (Piovesan; Hernandez, 2024), definitively breaking with the dictatorial model in force until then.

In line with the prioritization of the dignity of the human person and fundamental rights, the Federal Constitution has among its foundations, provided for in the first article of the Charter, pluralism (item V), which is added to the dignity of the human person (III) and allows different conceptions of what is "good" to be structured, according to individual convictions (Teixeira, 2018), allowing the recognition of individuals as subjects of rights in their *individualities*, not as a mere agglomeration of people.

Aiming to embody this consideration of rights from plural perspectives of individuality, the Federal Constitution of 1988 makes specific considerations about individuals in situations of vulnerability, based on the principle that in these conditions intersubjectivity becomes a necessity for the enjoyment of constitutionally provided rights (Teixeira, 2018), due to physical or psychological fragility.

The Constitution ends up reconciling the elements of freedom and solidarity, inherent to human dignity, with the characteristics related to vulnerability, directing, in the family environment, special protection for children, adolescents, the elderly and people with disabilities (Teixeira, 2018). The current Charter of the Republic, in its article 226, reaches the family as the base of society, establishing a series of protections by the State, including in relation to the family entity, establishing a multivariate form of family.

In this sense, the Federal Constitution included in the scope of the concept of family the community formed by any of the parents and their descendants which, added to the judgment, by the Federal Supreme Court, of the Direct Action of Unconstitutionality No. 4277 and the Action for Non-Compliance with a Fundamental Precept No. 132, expanded the concept of family, including changes in the social sphere, anchored in fundamental principles and, in particular, in the dignity of the human person.

In the same title in which it deals with families, especially in article 227, the Federal Constitution establishes a series of rules aimed at the protection of children, adolescents and people with disabilities, expressly defining such groups as special protection groups.

Os Arts. 229 and 230, in turn, focus on the protection of the elderly, clarifying rights and establishing obligations aimed at the effectiveness of this protection, once again considering elements of human dignity and the guarantee of the right to life. It is noted, therefore, that the Citizen Constitution established a series of fundamental rights and guarantees directed to these groups, breaking with the previous constitutional tradition, still demarcated by the influence of the dictatorship, while establishing obligations for state action, even in the field of family entities, for the protection of groups in situations of vulnerability.

In 2009, the International Convention on the Rights of Persons with Disabilities was added to the 1988 constitutional text, which inaugurated the incorporation of human rights norms with constitutional stature into the Brazilian legal system, and structured a series of requirements and safeguards for the exercise of legal capacity by persons with disabilities (Rosenvald, 2018). One of the central elements of the manifestation of the will and preferences of persons with disabilities becomes, within the scope of the Convention, the exemption from conflict of interest and undue influence, mentioning the principle of proportionality for the provision of these guidelines.

In this field, it is necessary to establish a terminological distinction that is essential for understanding the limits of this study. Although the Supreme Court itself is not theoretically precise when it uses terms related to vulnerability (Vargas; Leal, 2023), the focus of this work is on the limits of Title VIII of the Constitution, specifically in relation to the constitutionally protected groups of Children, Adolescents, Youth, Elderly, and Persons with Disabilities, in line with Teixeira's (2018) perspective of family protection.

This cut is necessary especially due to the restrictions on the private autonomy of these individuals, resulting from both normative and factual bases, considering the conditions that individuals can achieve throughout their lives. Given the relational character of vulnerability, which manifests itself from the interaction between different subjects, one stronger and the other less resistant, which subordinates the latter to a condition susceptible to harm (Machado, 2023), the theme of protection gains even more relevance, considering that the conditions that characterize the situation of vulnerability are manifested precisely in relationships dependent on the manifestation of will in an autonomous and conscious way.

In view of this theoretical field, although the discussion on the concept of autonomy is the subject of extensive debates, which are beyond the scope of this article, the term will be

used in reference to a free will, intrinsically related to the self-determination of subjects, self-governed by their own will and not by the will of others, in line with the perspective used by Barroso (2012).

Based on these delimitations, vulnerability becomes a concrete form, which must be considered for the materialization of human dignity both in the public and private spheres (Gama; Bridges; Teixeira, 2014), which must consider the limitations of each subject in their relationships. In the same sense, it must be considered with regard to the availability of first-generation fundamental rights, especially freedom and private autonomy, which can be attenuated due to material conditions of vulnerability (Teixeira, 2018).

Although the dignity of the human person can be presented as the axiological foundation of the Brazilian constitutional order, it is necessary to recognize that, in relation to the subjects of special constitutional protection, dignity operates not only as a limit to the State's discretion, but above all as a structural condition for the exercise of autonomy. In this sense, dignity, as mentioned, assumes a relational character and is based on the individual's capacities, requiring the State and the family to create material, affective and institutional conditions that allow children, adolescents, the elderly and people with disabilities to develop their own life projects. It is a conception that moves away from the classical liberal notion of autonomy as a mere negative freedom and adheres to a substantial understanding, according to which autonomy is only possible when the subject has adequate means to exercise it, especially in contexts of age, ontological or functional vulnerability.

Adding to the debate on the limits of freedom and its relationship with human dignity, the discussion about the submission of civil relations to fundamental rights is not recent, dating back to the Lüth-Urteil case (centered on freedom of expression), in which the German Constitutional Court ruled on the horizontal application of constitutional norms, in all branches of law (Leal, 2007, p. 64-67).

In Brazil, this discussion was impacted by the Federal Constitution of 1988, with decisions within the scope of the Federal Supreme Court that mark the position of Brazilian jurisprudence in the sense of affecting private relations by fundamental rights, with milestones in Extraordinary Appeal 201.819-8/RJ, which dealt with the application of fundamental rights in the context of private associative relations, and in Direct Action of Unconstitutionality 4815, which was also based on the discussion about freedom of expression, specifically about the need for prior authorization for the publication of biographical documents.

In the infra-constitutional sphere, relevant changes occurred with the advent of the Statute of Persons with Disabilities and the Code of Civil Procedure, both in 2015, which inflicted

robust changes in the relational field of people subject to vulnerabilities, with strong criticism in the scope of Civil Law for enabling curatorship related to legally capable people (Lago Júnior; Barbosa, 2016), considering that the parameters of civil capacity structured in the Civil Code of 2002 were changed.

To give effect to the new civil parameters, the normative changes included mechanisms to support autonomy, especially through Supported Decision Making, structured in article 1,783-A, of the Civil Code, which would be framed as a distinct element of assistance in the case of limitations to the definition and manifestation of the elements of will (Rosenvald, 2018). In the same sense, curatorship began to be framed in an exceptional way, subject to specific planning and based on the individual therapeutic elements of each subject (Rosenvald, 2018), observing the constitutional guidelines, including the established principles, increased by the Convention on Persons with Disabilities.

Ten years after the legal changes, it is possible to see that despite the good normative intentions, the practical effects of the new regulations are paradoxical, considering that the institutes to support the vulnerable have not been fully applied and that the curatorship has been applied indistinctly, covering several cases of specific limitations, due to the difficulty of individualized monitoring of the capacities of the subjects.

In the end, as mentioned, capable people (based on the text of the Civil Code in force) are being submitted to the institute of curatorship without the proper restrictions and, at the other extreme, subjects in need of support are susceptible to decisions and businesses that are not aligned with their real interests, due to the lack of support for decision-making.

It is precisely in this extreme situation in relation to the vulnerable that the transformative constitutional perspective becomes a relevant theoretical tool, given that it analyzes the effectiveness of the norm and the role of judges and legal culture from a broad view, considering the institutional elements inherent to the realization of rights.

In this context, dignity fulfills the function of a normative axis capable of balancing protection and autonomy, functioning both as a foundation for state intervention and as a limit to excessive protection. Dignity prevents protection from becoming an annulment of personality, at the same time that it prevents an abstract defense of autonomy from putting at risk subjects that the Constitution has assumed as priorities.

The legal system must therefore recognize that dignity requires a complex balance, in which state or family intervention is proportional to the degree of vulnerability and always oriented to strengthening the subject's capacity for self-determination. If dignity is the foundation of reinforced protection, it is also in it that the foundation of the autonomy of the constitutionally

protected subjects is located. The theoretical and practical challenge, however, lies in reconciling protection and autonomy without incurring either paternalism or abandonment, a tension that is especially relevant in the light of the transformative constitutional perspective.

3 TRANSFORMATIVE CONSTITUTIONALISM AND RECOGNITION OF THE "ENGINE ROOM" IN THE PROTECTION OF THE VULNERABLE

Transformative Constitutionalism is a doctrinal perspective that starts from the premise that the norm does not have material effects in itself, especially the fundamental rights and guarantees established in the Constitution, although it recognizes that the effectiveness of fundamental rights is full, using the classification of José Afonso da Silva (1998) as a reference.

With the debate marked especially from the article *Legal Culture and Transformative Constitutionalism*, by Karl E. Klare (1998), Transformative Constitutionalism can be defined as a perspective of effective judicial action aimed at the transformation of society, based on the interpretation and application of constitutional norms in a way that brings changes in political and social institutions. in the context of a favorable historical and political context (Klare, 1998).

In this line, the transformative theoretical perspective studies and considers the movements of all agents who work in the judicial field, not just judges. Thus, the role of lawyers and doctrine in the transformation of legal culture is highlighted, considering that the recognition of the existing procedural limitations depends, at first, on recognition from doctrine and the harmonization of discussion methods, especially legal argumentation, based on the performance of lawyers (Klare, 1998).

The focus on the implications in the social field of norms and judicial decisions is a central element, which is analyzed, in Transformative Constitutionalism, together with the constitutional body itself, so that this theoretical prism analyzes the Constitution and the Laws not only as norms, but as a constitutional project (Arguelhes; Sússekind, 2022) that must be achieved from both regulations and court decisions. For this reason, in the transformative logic, the political and moral values of the judge should be used as beacons for his decisions (Langa, 2006), even if they are committed to impartial processes.

By using terms and evaluative questions to stimulate transformative judgments, the transformative perspective is based on the premise that legal texts do not represent, in themselves, a legal norm that must be interpreted based on the textual components. Originating from this point, transformative legal reasoning considers both cultural elements (especially legal culture) and other subjective foundations that define evaluative concepts (Klare, 1998).

As a result of this recognition, transformative theory developed the concept of "machine room", which refers to the organization of political, administrative, and legal power structures, responsible for the provision of constitutional rights and guarantees (Gargarella, 2016), involving social structures and relations, including outside the sphere of procedural action and the Judge State (Arguelhes and Sússekind, 2022).

Based on the contributions of Gargarella (2016), Roa Roa (2023), and Arguelhes and Sússekind (2022), it is possible to delimit the meaning and scope of the term "engine room" in the context of transformative constitutionalism. The engine room refers to the *organization of the power structures that enable the constitutionally provided fundamental rights, including the political, legal and administrative apparatus responsible for the recognition and realization of these rights, in addition to the structural organization of public administration and public policies based on the Constitution.*

The engine room represents, therefore, the entire political, social and institutional framework (in particular) in which the protection of the vulnerable is structured on a daily basis, including both their private relationships and their administrative connections, which require actions by the public authorities to guarantee the autonomy and protection of the subjects.

At this point, a central element in the sphere of the contemporary engine room is the distinction between a paternalistic and patrimonialist conception in relation to the rights of the vulnerable, based exclusively on the criterion of the age or condition of the person with disabilities, which completely removes from these individuals the ability to decide about their lives (Gama; Bridges; Teixeira, 2014), in comparison with a conception of an autonomous life, but with protection, which considers the individuality and needs of each subject.

Also in the case of vulnerable individuals, especially people with disabilities and those undergoing medical treatment, this institutional framework also involves the doctor-patient relationship, which must move from a paternalistic perspective to a relationship based on constitutional elements, which considers the patient's autonomy in this area (Meirelles; Vasconcelos, 2023), without any decision being transferred to a third party.

The balance of these administrative and institutional actions is what enables the autonomy and protection of the vulnerable, without a paternalistic action and, therefore, limiting the constitutional rights of which they are holders. This central aspect must be verified, in the theoretical and practical field, from the perspective of Rosenvald (2018) based on the individuality of each subject, covering possible therapeutic elements, individual needs and capacities of each one.

This need to verify individualities is what overflows the limits of the existing engine room, both in the private and public spheres. The reforms carried out through the Statute of Persons with Disabilities and the Code of Civil Procedure, both in 2015, focused on normative changes, without the institutional mechanism where constitutional rights are realized being achieved or modified.

Without these structural changes in the engine room, the autonomy measures made possible by the normative changes since 2015, although aligned with the constitutional requirements and the Convention for Persons with Disabilities, may have the effect of reducing the protections due to specially protected individuals, given that unprotected autonomy becomes an increase in the vulnerabilities of groups specially protected by the Federal Constitution of 1988. State action in this field, with a focus on the preservation of fundamental rights and guarantees, becomes central, with the purpose of establishing material equality with regard to the rights and guarantees provided for in the Constitution, demanding effective actions for the realization of equality (Fineman, 2008).

Thus, even if the relationships of vulnerable groups occur within the family, the intervention of the State is justified by virtue of the inequalities that can emerge even in this most intimate sphere of private relations, evidenced through violence, abandonment or, at the other extreme, through undue interference in the most elementary self-determination of vulnerable subjects (Fachin, 2011).

It cannot be forgotten, in any legal analysis on the matter, that the groups specially protected by the Constitution of the Republic (which textually evidences their propositions in the epigraphed articles) *are vulnerable*, and this is precisely the core of the need for special attention on the part of society and the law (Gama; Bridges; Teixeira, 2014), without ceasing to be, for this reason, subjects of rights in all spheres of their lives.

Another effect of legal changes without the corresponding change in the engine room is the ineffectiveness of the rules, as occurs in the analysis of curatorship by the Judiciary. From the Statute of Persons with Disabilities, curatorship became a restricted legal institute, focused on people's patrimonial issues, without affecting existential elements, with a focus on valuing the autonomy of the will of the person with disabilities (Meirelles; Vasconcelos, 2023).

Despite being well-intentioned, the changes in the normative frameworks related to curatorship still face difficulties in verifying ordinary legal life. In practice, what we are witnessing is a profusion of decisions related to curatorship without the determination of individualities and covering all aspects of the curator's life, including issues inherent to existential autonomy.

According to data from the National Council of Justice, the number of new cases related to the Appointment of Curators increased from 49,267 cases in 2020 to 79,057 cases in 2024 (an increase of 60.5% in the number of cases), with a projection of up to 83,000 new cases of this type in 2025 (CNJ Statistical Panel, 2025). In the same sense, the number of Curatorship processes in general increased from 18,168 cases in 2020 to 30,636 cases in 2024 (an increase of 68.5% in the number of new cases in this period). This shows the annual growth of around 12.56% per year, while the elderly population in Brazil grows 3.8% per year, according to data from the 2022 Census (Brazilian Institute of Geography and Statistics); the Brazilian Inclusion Law (LBI) has not been able to slow down, therefore, the increase in cases of curatorship in relation to this vulnerable group, although this was one of the objectives of the rule.

Also according to information from the National Council of Justice (2023, p. 28), the percentage of curatorship processes that use Supported Decision Making, an institute inseparable from curatorship, corresponds to only 7% of the total number of processes related to curatorship, showing, once again, a legal practice dissonant with legal expectations. Such a quantitative discrepancy reinforces the need for a transformative approach that integrates empirical data to monitor institutional effectiveness. Also according to the CNJ itself, confusion between the institute of Supported Decision Making and other legal institutes is common (CNJ, 2023, p. 29).

In fact, in view of this exponential increase in the number of lawsuits, the Superior Court of Justice has made several provisions of the Code of Civil Procedure and the Civil Code more flexible, with the changes made by the Statute of Persons with Disabilities, due to the impossibility of applying the rules in their entirety in the current legal and social scenario. For example, the requirement of the Medical Report established in article 750 of the CPC was relaxed in case of refusal of the curator to perform the examination (REsp 1.933.597/RO) and in other exceptional cases. In the case of the restriction of curatorship to the patrimonial elements of the person with disabilities, the STJ admitted the possibility of broad and absolute curatorship, involving existential elements of the person (REsp 2.013.021/MG). In addition, the STJ recognized that shared curatorship, provided for in article 1,775-A of the Civil Code for the protection of the curatorship and for the mitigation of the risks inherent to this procedure, is not mandatory and cannot be granted ex officio by the judge in the case.

In these decisions, the Superior Court of Justice considered, in addition to the normative provisions, constitutional principles, especially that of human dignity, but considered in a practical way, taking into account the existing limitations for the operation of implementing rights. It is verified, therefore, that the lack of an engine room aligned with the structuring constitutional

principles not only makes the effectiveness of rights unfeasible, but can also convert normative measures favorable to the enjoyment of rights and guarantees by the vulnerable into potentially harmful measures for this group, which, in the case of autonomy without consideration, can culminate in the increase of the vulnerabilities of the subjects.

Studies carried out and discussed within the scope of the federal legislative houses already demonstrate the impact of the dissonance between the rules and the engine room for the care and monitoring of the vulnerable. In this sense, the text of the Center for Studies and Research of the Legislative Consultancy of the Federal Senate (Oliveira, 2025) stands out, which addresses the practical difficulties related to curatorship, especially in relation to all the formal requirements that must be fulfilled, culminating in the perception that "no one wants to take over anyone's guardianship", due to the normative focus on formal elements, not in the material aspects inherent to this institute.

According to current rules, even if the curatorship takes place in family environments and with demonstrations of care and dedication in relation to the curator, the formal elements related to accountability stand out from the material criteria for verifying the curatorship (Oliveira, 2025), impairing the verification of the real interest of the curators.

As a result of this growing perception of a normative framework that is harmful to the vulnerable, beyond the mere ineffectiveness of the norms, proposals have emerged related to the reduction of the autonomy of the vulnerable, especially people with disabilities.

The apex of this issue lies in the recent discussions for the amendment of the Civil Code, consolidated in Bill No. 04/2025. Based on the assumption that the normative changes that have occurred since 2015 have been innocuous in practical terms, even harming the vulnerable in some cases, the normative proposal once again considers people with disabilities as absolutely incapable. In fact, the diagnosis is not wrong in relation to the effects of the changes, but it also does not consider the fact that more general actions were not taken to change the engine room of the constitution, which involves all the political, legal and institutional aspects that must be achieved in the protection of the vulnerable.

The justification of the bill is clarifying in this sense, as it makes clear the reasons for the amendment of articles 3 and 4 of the Civil Code, which reverberate in the other proposed changes. Literally, *"Another issue that required reflection and action concerns the changes in articles 3 and 4, **which recovered the protection** intended for those who are not in a position to express their will"* (Senado Federal, 2025. Italics). As can be read, the legislative discussions seek *to recover the protection* of vulnerable groups; that is, the normative changes under discussion are based on the assumption that the vulnerable were left helpless during the

changes in the Civil Code and the Code of Civil Procedure, showing, to some extent, the return of a paternalistic conception of the vulnerable in the scope of Brazilian civil law.

The legislative discussion, although well-intentioned, focuses on the consequences related to the problems existing in the engine room of the constitution in relation to vulnerable groups, and not on the causes of these problems, which consist of the forms of interaction with these groups in all social spheres. Thus, instead of equating the elements of private autonomy and the protection of the vulnerable, the legislator goes from one extreme to the other, without actually solving the matter.

Especially in the solutions related to vulnerable groups, especially protected by the Federal Constitution of 1988, the solution necessarily involves focusing on the existing performance and actions within the scope of the engine room. Any discussion or action that aims to solve the apparent dilemma between autonomy and protection of vulnerable groups must take into account that society itself still has a paternalistic conception (Gama; Bridges; Teixeira, 2014). For real progress to occur, the elements of equality established in the Constitution must consider all aspects of the individuality of subjects, regardless of their classification into categories, both in the public and private spheres (Fineman, 2008).

For these reasons, effective solutions must consider broader aspects in the relationship with vulnerable groups, recognizing the role of the engine room for the realization of rights, specifically with regard to power structures and the social, political, legal and administrative relations where rights are realized, considering that autonomy is not an inherent characteristic of human beings. but rather a product, a consequence, of social policies (Fineman, 2008).

In a practical way, material and discernment support must be given to families, who are primarily responsible for the care and emancipation of the vulnerable. In addition, legal culture should be seen as an axial requirement for the recognition and availability of rights, especially from the performance of lawyers, given that they are on the front line of protection (Klare, 1998), especially in cases of curatorship and judicial intervention; The role of judges also becomes central, given that a broader perception of judicial performance must be taken into account, both in structural cases and for decisions in the specific case.

Otherwise, normative changes will be doomed to become ineffective propositions or, in a more critical scenario, may be transfigured into mechanisms of unprotection or undue mitigation of vulnerable groups.

4 CONCLUSION

The solutions discussed for the adequacy of the rights of specially protected groups, under the terms of the Federal Constitution of 1988, have advanced in a non-linear manner over the last decades, revealing a gradual transition from a frankly paternalistic model to a format that recognizes, at least at the normative level, the full ownership of rights and the capacity for self-determination of these subjects. However, the analysis of the conformation of civil capacity after the Convention on Persons with Disabilities, the Statute of Persons with Disabilities and the 2015 Code of Civil Procedure, confronted with empirical data from the CNJ and the case law of the STJ, shows a relevant gap between the constitutional promise of autonomy and protection and the effective functioning of the engine room in which such rights should materialize.

From the perspective of transformative constitutionalism, it becomes clear that the non-paternalistic balance between autonomy and protection of vulnerable subjects cannot be achieved by mere punctual adjustments of the normative text, and it is imperative to construct structural criteria that guide the performance of the various actors located in the engine room, especially when bringing curatorship back to its truly exceptional and preferably patrimonial character; institutionalize practices of individualized assessment of capacities and needs; strengthen, in procedural and cultural terms, Supported Decision Making; and to develop jurisprudential parameters that articulate dignity, proportionality and relational autonomy in the definition of the degree of legitimate intervention in the existential sphere of the subject.

In this scenario, the reinforced protection of constitutionally protected groups must be reinterpreted as a duty to provide material, institutional and relational conditions for the exercise of autonomy, and not as a generic authorization to replace the will of the vulnerable with third parties, public or private.

In summary, the constitutionally adequate delimitation of the autonomy of vulnerable subjects, in the key of transformative constitutionalism, requires a shift of focus, leaving the abstract norm for the engine room in which this norm is concretized.

The challenge, therefore, goes beyond the choice between autonomy or protection, focusing on institutionally reconstructing the conditions in which reinforced protection becomes a materialization of rights, and not a denial of the capacity for self-determination of these subjects. Only from this structural reconfiguration, which involves legal culture, institutional arrangements and social policies, will it be possible to attenuate the apparent paradox between emancipation and tutelage, bringing legal practice closer to the constitutional project inaugurated in 1988.

ABSTRACT

This study analyzes the geopolitics of faith based on the understanding of religion as a device of power in contemporary dynamics, investigating its instrumentalization in the production of geopolitical conflicts, social exclusions, and forced displacement. Situated within the fields of social sciences and international relations, the study examines how religious discourses and practices are mobilized by state actors, political agents, and armed groups as mechanisms for legitimizing violence, social control, and territorial reorganization on a global scale, with emphasis on the Middle East. The objective is to understand the role of faith in the production of exclusion, conflicts, and migration crises, as well as to analyze its impacts on contemporary geopolitical dynamics. To this end, a qualitative, exploratory, and bibliographic approach is adopted, based on academic literature, reports from international organizations, and institutional documents. Thus, it is observed that, although religion holds potential for social cohesion and solidarity, it has frequently been instrumentalized as a justification for persecution, human rights violations, and the intensification of conflicts, contributing to large-scale migratory flows. The findings indicate that religious instrumentalization constitutes a transnational and multifaceted phenomenon, with direct impacts on the reconfiguration of international relations and the expansion of humanitarian crises, requiring coordinated responses involving diplomatic actions, public policies, and international cooperation aimed at promoting human rights and building scenarios of peace.

RESUMO

O presente artigo analisa a geopolítica da fé a partir da compreensão da religião como dispositivo de poder nas dinâmicas contemporâneas, investigando sua instrumentalização na produção de conflitos geopolíticos, exclusões sociais e deslocamentos forçados. Inserido no campo das ciências sociais e das relações internacionais, o trabalho examina como discursos e práticas religiosas são mobilizados por atores estatais, políticos e grupos armados como mecanismos de legitimação da violência, controle social e reorganização territorial no cenário global, com ênfase no Oriente Médio. Objetiva-se compreender o papel da fé na produção de exclusões, conflitos e crises migratórias, bem como analisar seus impactos nas dinâmicas geopolíticas contemporâneas. Para tanto, procede-se a uma pesquisa qualitativa, de caráter exploratório e bibliográfico, fundamentada em literatura acadêmica, relatórios de organismos internacionais e documentos institucionais. Desse modo, observa-se que, embora a religião possua potencial de coesão social e solidariedade, tem sido frequentemente instrumentalizada como justificativa para perseguições, violações de direitos humanos e intensificação de conflitos, contribuindo para fluxos migratórios em larga escala. Os resultados indicam que a instrumentalização religiosa constitui um fenômeno transnacional e multifacetado, com impactos diretos na reconfiguração das relações internacionais e na ampliação das crises humanitárias, demandando respostas articuladas entre ações diplomáticas, políticas públicas e cooperação internacional, voltadas à promoção dos direitos humanos e à construção de cenários de paz.

Palavras-chave: Geopolítica. Instrumentalização Religiosa. Deslocamentos Forçados. Direitos Humanos. Poder.

RESUMEN

Este estudio analiza la geopolítica de la fe a partir de la comprensión de la religión como un dispositivo de poder en las dinámicas contemporáneas, investigando su instrumentalización en la producción de conflictos geopolíticos, exclusiones sociales y desplazamientos forzados. Enmarcado en el campo de las ciencias sociales y las relaciones internacionales, el trabajo examina cómo los discursos y prácticas religiosas son movilizados por actores estatales, políticos y grupos armados como mecanismos de legitimación de la violencia, control social y reorganización territorial en el escenario global, con énfasis en el Medio Oriente. El objetivo es comprender el papel de la fe en la producción de exclusión, conflictos y crisis migratorias, así como analizar sus impactos en las dinámicas geopolíticas contemporáneas. Para ello, se adopta una investigación cualitativa, de carácter exploratorio y bibliográfico, fundamentada en literatura académica, informes de organismos internacionales y documentos institucionales. De este modo, se observa que, aunque la religión posee potencial para la cohesión social y la solidaridad, ha sido frecuentemente instrumentalizada como justificación de persecuciones, violaciones de derechos humanos e intensificación de conflictos, contribuyendo a flujos migratorios a gran escala. Los resultados indican que la instrumentalización religiosa constituye un fenómeno transnacional y multifacético, con impactos directos en la reconfiguración de las relaciones internacionales y en la ampliación de las crisis humanitarias, lo que demanda respuestas articuladas entre acciones diplomáticas, políticas públicas y cooperación internacional orientadas a la promoción de los derechos humanos y la construcción de escenarios de paz.

1 INTRODUCTION

The intensification of forced displacements in the contemporary scenario is intrinsically related to complex dynamics that articulate armed conflicts, territorial disputes, political crises, and identity tensions. In this context, forced migration should not be understood only as a consequence of conjunctural instabilities, but as an expression of power relations that operate in the production of vulnerabilities and the exclusion of certain social groups. Among these factors, the role of religion stands out, which, in addition to its cultural or spiritual dimension, has been mobilized as a power device capable of structuring political practices, legitimizing conflicts, and reconfiguring geopolitical relations on a global scale.

In recent decades, the instrumentalization of faith has been consolidated as a recurrent strategy in contexts of instability, being appropriated by States, political leaders and armed groups as a mechanism of social control and legitimization of violence. From this perspective, religion ceases to act exclusively as a space of symbolic belonging and begins to operate as a technology of power, producing identities, delimiting social boundaries and sustaining narratives of antagonism that reinforce political and territorial projects.

Data from the United Nations High Commissioner for Refugees (UNHCR, 2022) indicate that religious persecution and identity conflicts are among the main vectors of forced displacement on a global scale, contributing to the expansion of humanitarian crises and the significant growth in the number of refugees and internally displaced people. Such a scenario highlights the need to understand the relationship between faith, power and geopolitics as a structuring axis of contemporary dynamics of human mobility.

From a theoretical point of view, this study is based on the conception of religion as a device of power, understood as a heterogeneous set of practices, discourses and institutions that produce norms, regulate behaviors and legitimize relations of domination. From this perspective, according to Foucault (1979), power is exercised through discursive and institutional networks that produce subjects and organize social life. Thus, religion is analyzed as a strategic structure that crosses the political field, contributing to the production of conflicts, the exclusion of social groups and the intensification of forced displacements.

In view of this problem, the research is guided by the following questions: how faith has been mobilized as a mechanism of power in the legitimization of exclusionary practices and violence. And what are the impacts of this mobilization on geopolitical dynamics and migratory flows on a global scale. Based on these questions, the study aims to analyze the instrumentalization of religion as a power device in contemporary geopolitical dynamics, evidencing its effects on the production of conflicts, social exclusions and forced displacements.

In doing so, it seeks to contribute to the deepening of the academic debate on the relations between religion, power, and human mobility, highlighting the centrality of faith in the reconfiguration of the international system.

2 METHODOLOGICAL PROCEDURES

This study is characterized as a qualitative research, since it is dedicated to the interpretation of social, political and economic phenomena related to forced displacements in the context of the contemporary migration crisis. It is also an exploratory investigation, whose objective is to deepen the understanding of the relationships between geopolitical conflicts, instrumentalization of religion and human mobility, as discussed in the theoretical framework.

The research was conducted based on a literature review, understood as a fundamental procedure for the construction of the theoretical and analytical framework of the study. Such an approach allows us to critically examine the relations between religion, power, and forced displacement, based on academic productions, reports from international organizations, and institutional documents.

To this end, sources such as the United Nations High Commissioner for Refugees (UNHCR), the International Organization for Migration (IOM) and the World Bank are used in order to contextualize data, migratory trends and contemporary geopolitical dynamics. In addition, international treaties and legislation related to migration and human rights are analyzed, seeking to understand the role of the international community in the management of forced displacement.

This methodological approach makes it possible to articulate the theoretical assumptions, especially the understanding of religion as a device of power, with the analysis of empirical processes, contributing to a critical reading of the dynamics that structure the contemporary migratory crisis.

3 RELIGION AS AN INSTRUMENT OF POWER

3.1 FAITH AS A POLITICAL INSTRUMENT AND SOCIAL CONTROL

Throughout history, religion has played an ambivalent role in social and political conflicts, acting both as a cohesive force and as an element of legitimization of violence. In this context, its understanding as an instrument of power proves to be fundamental for the analysis of contemporary dynamics. As highlighted by Kofi Annan, former Secretary-General of the United Nations (UN), "some of the most heinous crimes in history were committed in the name of a

supposedly superior cause" (Annan, 2001), highlighting the risks associated with the instrumentalization of faith as a justification for practices of domination and exclusion.

Although religious principles, in their doctrinal basis, are often associated with values such as compassion, solidarity, and reconciliation, their strategic mobilization by political, state, and institutional actors can contribute to the legitimization of violent and exclusionary practices. In this sense, religion, as a device of power, operates in the production of discourses that define social norms and delimit boundaries between groups, directly influencing the organization of social and political relations.

Contemporary cases illustrate this dynamic. As international news reports and human rights reports indicate, countries such as Saudi Arabia have used religious grounds to justify practices such as repression of minorities, physical punishment, and restrictions on civil rights, often under the argument of maintaining moral order (Human Rights Watch, 2017; The Washington Post, 2015). Such practices show the articulation between religion and power in the legitimization of exclusionary policies.

The use of faith as a mechanism of social control is manifested through the production and dissemination of normative discourses that guide individual and collective behaviors. In many contexts, religious authorities exert significant influence in the construction of narratives that reinforce opposition between groups, contributing to the dissemination of discourses of intolerance and exclusion. Reports by Human Rights Watch (2017) show that in Saudi Arabia's education system, official content promotes discriminatory views towards religious minorities such as Shiites, Christians, and Jews, classifying them as "infidels" or "deviants." This discursive construction reinforces processes of social marginalization and legitimizes practices of institutional exclusion.

Religions, in general, structure normative systems based on moral and ethical codes, often based on texts considered sacred, such as the Bible and the Quran. These references, over time, influence not only religious practices, but also the social and legal organization of different societies. Historically, the articulation between religion and power has contributed to the consolidation of social norms, including the definition of gender roles and family structures. However, the internalization of these values occurs in a complex way, being mediated by socialization processes that involve family, community and religious institutions. The problem arises when such principles are mobilized in an imposing and excluding way, especially by fundamentalist groups, which seek to establish absolute truths and promote radicalization processes.

In contemporary times, the instrumentalization of religion by governments, political groups and extremist organizations shows its strategic potential in the legitimization of actions and in the exercise of social control. Faith, in this context, also operates through symbolic mechanisms of reward and punishment, such as promises of salvation or threats of condemnation, reinforcing adherence to norms and values. In addition, religion plays a central role in building social cohesion and collective identity, by promoting the sharing of beliefs, rituals, and symbols. However, this same process can contribute to the formation of rigid social boundaries, based on the distinction between "us" and "them", often mobilized in contexts of geopolitical conflict, ethnic rivalries and community tensions (Castro, 2012).

In summary, religion is configured as a structuring element of contemporary social dynamics, acting simultaneously as a source of meaning and as an instrument of power. Its capacity for symbolic and social mobilization allows both the promotion of humanitarian actions and the legitimization of conflicts, evidencing its relevance in political disputes and in the transformations of the international system.

3.2 RELIGIOUS EXCLUSION AND IDENTITY CONFLICTS

Religious exclusion is one of the most forceful expressions of the instrumentalization of faith as a device of power, operating in the production of social hierarchies, in the delimitation of belongings, and in the legitimization of practices of violence and control. More than an isolated phenomenon, it is a structuring mechanism of contemporary dynamics of conflict, in which religion is mobilized as a political language capable of defining who can or cannot occupy certain social spaces.

Recent data reinforce this centrality. A study by the independent human rights organization focused on Saudi Arabia (ALQST for Human Rights), based on information from the UNHCR, points out that 46% of Saudi citizens who requested asylum between 2023 and 2024 did so for reasons related to religious repression. Such evidence reveals that the denial of freedom of belief not only restricts individual rights, but also acts as a structuring factor in contemporary migratory flows. In this sense, forced migration is no longer understood only as a consequence of armed conflicts, but is analyzed as a product of power devices that operate in the systematic exclusion of subjects.

From the Foucaultian perspective, this dynamic can be interpreted as part of a regime of truth in which religious discourses are mobilized to produce and legitimize social norms. As Foucault (1979) points out, power is exercised through networks that produce subjects and regulate behaviors, which allows us to understand how institutionalized religious practices can

function as technologies of social control. Thus, religious repression is not limited to the prohibition of beliefs, but involves the production of subjectivities adjusted to the norms imposed by political-religious structures. This logic is particularly evident in authoritarian regimes, in which religious dissent is interpreted as a threat to the state order.

According to reports by Human Rights Watch (2023), countries such as Iran, China, and North Korea use religion as an instrument of surveillance and repression, setting strict limits on freedom of expression and belief. In these contexts, the control of the religious field acts as an extension of political power, evidencing the fusion between state authority and moral normativity. This interpretation dialogues directly with the contributions of Talal Asad (2003), when he argues that religion, far from constituting an autonomous sphere, is deeply imbricated in historical power relations. For the author, religious discourses are shaped by specific political contexts, and are often used to sustain projects of domination and exclusion. Thus, religion not only reflects social reality, but actively participates in its production.

In addition to internal control, the instrumentalization of religion is also manifested in the intensification of geopolitical conflicts, especially when associated with the construction of antagonistic collective identities. In the case of Yemen, for example, the division between Shiite and Sunni groups goes beyond the theological dimension, being mobilized as a legitimizing element of political alliances and military interventions. In this scenario, religion functions as a language of war, giving moral meaning to violence and hindering processes of mediation and conflict resolution (Armstrong, 2001). This dynamic shows that contemporary conflicts cannot be understood only from territorial or economic disputes, but must also be analyzed as symbolic disputes, in which religious identities are mobilized to produce differentiation, exclusion, and antagonism. As a consequence, entire populations are subjected to contexts of prolonged instability, resulting in large-scale forced displacement.

In Sudan, for example, the articulation between religious, ethnic, and political factors has contributed to the perpetuation of cycles of violence, highlighting the complexity of contemporary conflicts. These scenarios reinforce the idea that the instrumentalization of faith not only intensifies violence, but also compromises the conditions of social and economic stability, increasing the vulnerability of already marginalized groups.

Data from the UNHCR Global Trends report (2023), which points to more than 110 million displaced people in the world, show the magnitude of this crisis. In this context, religion emerges as a central element in the understanding of contemporary migratory flows, not only as a cultural factor, but as a political device that structures processes of exclusion and displacement.

Thus, religious exclusion must be understood as a multidimensional phenomenon, articulated with power dynamics that operate in the production of subjects, in the legitimization of violence and in the reorganization of geopolitical space. Such an approach allows us to overcome superficial analyses and understand the contemporary migration crisis as a result of structural processes deeply rooted in the relations between religion, power and identity.

4 CONFLICTS, PERSECUTIONS, FORCED DISPLACEMENTS AND MIGRATION CRISIS

4.1 SOCIO-POLITICAL CHALLENGES OF CONTEMPORARY MIGRATION

In the contemporary scenario, migratory flows have shown significant growth, driven by multiple structural factors, such as armed conflicts, ethnic-religious persecutions, socioeconomic crises, climate change, and environmental disasters. However, beyond their quantitative dimension, such displacements must be understood as the result of power dynamics that operate in the production of vulnerabilities and in the exclusion of certain social groups.

In this sense, the contemporary migratory crisis is not only configured as a consequence of conjunctural instabilities, but as an expression of broader historical and political processes, in which the instrumentalization of religion, as discussed in the previous sections, plays an important role in the legitimization of conflicts and the production of forced displacements. Thus, migration emerges as a phenomenon intrinsically linked to geopolitical disputes and strategies of social control.

The intensification of large-scale migratory flows imposes significant challenges on contemporary societies, especially in destination countries, where the arrival of vulnerable population contingents tends to put pressure on essential public systems, such as health, education, housing, and sanitation, as they claim (Verme; Schuettler, 2019). However, such impacts should not be analyzed in isolation, but understood within social and institutional structures previously marked by inequalities.

From this perspective, migration does not in itself constitute the origin of social tensions, but acts as a catalyst for pre-existing fragilities. As they point out (Castles; De Haas; Miller, 2014), the presence of migrants can be perceived as a threat to cultural cohesion, especially in contexts where national identities are constructed in an exclusionary way. This perception, often fueled by political and media discourses, contributes to the spread of xenophobic practices, discrimination, and violence.

The absence of effective public integration policies intensifies this scenario, favoring processes of social exclusion and socio-spatial segregation. UNHCR reports (2023) indicate

the growth of manifestations of intolerance against refugees, especially in European countries, associated with the rise of far-right political movements that instrumentalize migration as an element of ideological mobilization.

4.2 ECONOMIC AND GEOPOLITICAL DIMENSIONS OF THE CONTEMPORARY MIGRATION CRISIS

From an economic point of view, the impacts of migration are ambivalent. On the one hand, as the World Bank (2022) highlights, "well-managed migration can benefit both countries of origin and destination", contributing to economic dynamism, workforce renewal, and demographic balance. On the other hand, when it occurs in a disorderly way, it can intensify disputes for resources, put pressure on public services, and expand perceptions of socioeconomic insecurity.

This ambivalence shows that the effects of migration depend, to a large extent, on the structural conditions and governance strategies adopted by States. Countries such as Italy, Greece and Turkey, for example, when facing intense migratory flows in contexts of economic fragility, experience increased social tensions, reflecting the difficulty of articulating migratory policies and institutional capacities.

In the Global South, such challenges take on even more complex contours. In contexts marked by historical inequalities and institutional limitations, inadequate management of migratory flows tends to reinforce discourses of scarcity and competition for resources, in which migrants are often represented as threats to local populations (World Bank, 2022). This discursive construction, in line with the Foucaultian perspective, can be understood as part of a regime of truth that produces and legitimizes specific forms of exclusion.

Thus, the contemporary migration crisis must be analyzed as a multidimensional phenomenon, in which economic, political, and cultural factors are articulated with power devices that operate in the production of inequalities and in the regulation of human mobility. Migration, in this context, is not only a movement of physical displacement, but an expression of the power relations that structure the international system.

5 RELIGION, GEOPOLITICS, REPRESSIONS AND CONTEMPORARY SCENARIOS

5.1 DYNAMICS OF EXCLUSION AND POLITICAL LEGITIMATION BY RELIGION

In the contemporary context, even in the face of the secularization processes observed in various societies, religion remains a strategic element in power dynamics and international relations. Its presence in the geopolitical field evidences not only the permanence of traditional

structures of authority, but also the reconfiguration of mechanisms of control, exclusion, and political legitimization in a global system marked by interdependence and the intensification of conflicts.

From this perspective, religion should be understood not only as a cultural or spiritual dimension, but as a power device that operates in the production of discourses, in the construction of identities and in the organization of geopolitical relations, as discussed throughout chapter 3. Its instrumentalization by States and political actors reveals the centrality of faith in the configuration of contemporary scenarios of conflict and cooperation.

In the geopolitical field, the instrumentalization of religion is configured as a recurrent strategy of political legitimization and consolidation of collective identities. By mobilizing symbolic elements of faith, States and political groups produce narratives that delimit boundaries between belonging and exclusion, structuring the opposition between an "us" and an "other".

This process can be understood in the light of the concept of symbolic borders, developed by Lamont (2015), which refers to the social mechanisms of distinction and categorization between groups. In the international context, such borders are often constructed on the basis of religious, cultural and ideological differences, and are mobilized to reinforce internal cohesion and justify external policies.

Religion can act as a resource for political mobilization, especially in contexts of instability, in which collective identities are instrumentalized to legitimize conflicts and practices of violence (Brubaker, 2015). In this sense, faith ceases to be just an expression of belief to assume a strategic function in the production of antagonisms and in the definition of geopolitical alliances.

This dynamic is particularly evident in regions such as the Middle East, where tensions between Sunnis and Shiites transcend the religious field, articulating themselves with political, territorial and economic disputes. Thus, religion operates as a political language that confers moral legitimacy to state action and violence, reinforcing polarizations and hindering mediation processes.

5.2 THE INFLUENCE OF RELIGION ON INTERNATIONAL RELATIONS

Although religion plays an important role in several contemporary conflicts, its performance must be analyzed in conjunction with political, economic, and strategic factors. In this sense, the religious dimension is not an isolated cause, but is part of a complex set of elements that structure international relations.

The civil war in Syria exemplifies this complexity, as sectarian tensions intertwine with regional and global geopolitical interests, resulting in a multifaceted conflict (United Nations Country Team, 2024). Religion, in this context, acts simultaneously as an element of identity mobilization and as a discursive justification for political and military interventions.

The instrumentalization of faith also reveals contradictions in the foreign policies of states, especially with regard to the promotion of values such as human rights, democracy and religious freedom. The coexistence between universalist normative discourses and practices guided by strategic interests is often observed, evidencing the selectivity of international action.

In this scenario, the so-called religious diplomacy emerges as an ambivalent field: at the same time that it can favor intercultural dialogue and conflict mediation, it can also be used as an instrument of political influence and the reproduction of power asymmetries in the international system.

5.3 FAITH AND THE REDRAWING OF POLITICAL AND DIPLOMATIC BOUNDARIES

Beyond symbolic borders, religion also exerts influence on the configuration of territorial borders and the reorganization of geopolitical space. In various historical contexts, religious criteria were mobilized in the delimitation of states and territories, contributing to the consolidation of political identities and the emergence of lasting conflicts.

The partition of the Indian subcontinent in 1947 is an emblematic example of this process. The creation of India and Pakistan on the basis of distinct religious identities resulted in mass forced displacement and episodes of extreme violence, the repercussions of which remain to this day (Al Jazeera, 2017; Britannica, 2025). In this case, religion acted as an organizing principle of the political space, evidencing its centrality in the definition of borders and belongings.

Another significant example is Jerusalem, where religious, political, and territorial dimensions overlap intensely. The city, considered sacred by different religious traditions, is one of the main sources of tension in the Israeli-Palestinian conflict. The dispute for its control highlights how religion can be mobilized to legitimize territorial claims and reinforce collective identities in contexts of prolonged conflict.

In the context of globalization, the expanded circulation of people, ideas and beliefs intensifies both the possibilities for interreligious dialogue and the conflicts of values. Multicultural societies face the challenge of mediating religious differences in contexts marked by inequalities and identity tensions, requiring new forms of governance and social coexistence.

In this scenario, religion reveals its ambivalent character: at the same time that it can foster exclusions and conflicts, it also plays an important role in the promotion of humanitarian actions and international cooperation initiatives. Faith-based organizations have played a significant role in supporting migrants and refugees, offering material and symbolic assistance in different regions of the world (UNHCR, 2025).

Finally, the relationship between religion and forced displacement highlights the complexity of contemporary dynamics. Religious conflicts, persecution and sectarian tensions continue to drive migration flows on a global scale, while religious actors actively participate in humanitarian responses to these crises. Such duality reinforces the need to understand religion as a central element in the geopolitical and migratory dynamics of the twenty-first century.

6 FINAL CONSIDERATIONS

The present study sought to understand how religion has been instrumentalized in contemporary political and geopolitical dynamics, evidencing its role as a power device in the production of conflicts, social exclusions and forced displacements. It was based on the assumption that, although faith is historically associated with values of solidarity, belonging and social cohesion, its strategic mobilization by state, political and institutional actors inserts it in circuits of power that produce hierarchies, legitimize violence and reconfigure social and territorial spaces.

Throughout the analysis, it was found that religion plays an ambivalent role: at the same time that it strengthens collective identities and promotes social bonds, it can also be instrumentalized to establish symbolic boundaries between groups, reinforcing dynamics of exclusion and antagonism. This process, in line with the theoretical framework adopted, shows that faith should not be understood only as an individual or spiritual experience, but as a structuring element of the power relations that cross the social and political field.

With regard to the dynamics of conflict and human mobility, it was found that religious instrumentalization directly contributes to the intensification of persecutions, wars and humanitarian crises. The data analyzed demonstrate that the violation of religious freedom is a relevant factor in the production of forced displacements, evidencing the intersection between faith, human rights and international migration. In this sense, the contemporary migration crisis must be understood not only as a demographic phenomenon, but as an expression of structural processes of exclusion and violence.

The analysis also showed that religion goes beyond the internal scope of States, projecting itself significantly in international relations. Its role in the construction of identities, the

legitimization of alliances and the definition of territorial borders reinforces its role in the reconfiguration of the international system. Thus, the geopolitics of faith reveals itself as a central element for understanding contemporary conflicts and power dynamics on a global scale.

From a theoretical point of view, the study contributes to the broadening of discussions on religion in the social sciences and international relations, by evidencing its permanence as a strategic, and not a residual, dimension of contemporary political disputes. Such an approach reinforces the need for analyses that consider faith in its historical, symbolic and political dimensions, articulating it with the processes of power production and exclusion.

On the practical level, the results point to the urgency of public policies and international strategies that address not only the humanitarian consequences of forced displacement, but also their structural causes. This entails recognizing the role of religion in legitimizing conflicts and developing mechanisms that promote religious freedom, intercultural mediation, and the protection of human rights.

It is important to highlight, however, the ambivalent character of religion. If, on the one hand, it can be mobilized as an instrument of domination and exclusion, on the other hand, it also constitutes a space of solidarity, mediation and reconstruction of social bonds. The role of religious organizations in humanitarian actions shows their potential in promoting reception and international cooperation, especially in crisis contexts.

In summary, the instrumentalization of religion is configured as a multifaceted phenomenon, the understanding of which is essential for the analysis of contemporary dynamics of conflict, power and human mobility. The evidence presented allows us to affirm that faith, when politically appropriated, can intensify processes of exclusion and displacement, but also, when mobilized in its ethical and humanitarian dimension, contribute to the construction of paths of dialogue and reconciliation.

Finally, this study is not exhaustive in itself, but opens possibilities for future investigations, especially with regard to the role of transnational religious actors, the relationship between religion and global governance, and strategies for promoting peace in multicultural contexts. Given the complexity of the phenomenon, it is essential to expand comparative and interdisciplinary approaches, capable of deepening the understanding of the multiple articulations between faith, power and geopolitics in the contemporary world.

ABSTRACT

This study aims to describe the challenges related to access to the right to health for students with special dietary needs within municipalities and in the preparation of school menus. This is an article systematized through the experience of nutritionists regarding the challenges faced in guaranteeing the Human Right to Adequate Food (HRAF) for children and adolescents with allergies, food intolerances, and/or celiac disease. The results showed that, despite the exclusion of certain foods and the development of specific menus to meet the needs of students with specific dietary requirements, significant challenges remain. Our intention is to contribute to reflections on the issue of students' citizenship rights and on the importance of control, monitoring, and enforceability mechanisms to ensure these rights. This experience may serve as a stimulus for the development of child protection mechanisms, as well as for the promotion, prevention, and precautionary protection of children's health in educational institutions, in addition to ensuring universal access to education.

RESUMO

Este estudo tem por objetivo descrever desafios do acesso ao direito à saúde dos estudantes com necessidades alimentares especiais nos âmbitos dos municípios e da produção dos cardápios. Trata-se de artigo sistematizado por meio da vivência das nutricionistas sobre os desafios enfrentados para a garantia do Direito Humano à Alimentação Adequada (DHAA) para crianças e adolescentes com alergias, intolerâncias alimentares e ou celíacos. Como resultados, o estudo apontou que apesar da exclusão dos alimentos e cardápios específicos

RESUMEN

Este estudio tiene como objetivo describir los desafíos relacionados con el acceso al derecho a la salud de los estudiantes con necesidades alimentarias especiales en el ámbito de los municipios y en la elaboración de los menús escolares. Se trata de un artículo sistematizado a partir de la experiencia de nutricionistas sobre los desafíos enfrentados para garantizar el Derecho Humano a la Alimentación Adecuada (DHAA) para niños, niñas y adolescentes con alergias, intolerancias alimentarias y/o enfermedad celíaca. Como resultados, el estudio señaló que, a pesar de la exclusión de ciertos alimentos y de la elaboración de menús específicos para atender a los estudiantes con necesidades alimentarias específicas, aún persisten importantes desafíos. Nuestra intención es contribuir a la reflexión sobre la temática de los derechos de ciudadanía de los estudiantes y sobre la importancia del control, monitoreo y exigibilidad para garantizar dichos derechos. Esta experiencia puede servir de estímulo para la construcción de mecanismos de protección infantil, así como para la promoción, prevención y precaución de la salud de niños y niñas en instituciones educativas, además de garantizar la universalización del acceso a la educación.

1 INTRODUCTION

The right to education does not differ from the right to life. The right to education does not diverge from the right to food. Access to education cannot be hindered by the lack of adequate food. After all, keeping children protected is also about education. This text synthesizes mishaps from the field to the school feeding table. We know that there are many successes, but here we will focus on the weaknesses, diversities and inequalities of a certain public that still has difficulties in this access: children and adolescents with special dietary needs.

The Universal Declaration of Human Rights states in its article No. 25 that every human being has the right to a standard of living that ensures health, well-being and food. Human Rights are considered natural rights, as they are directly related to the dignity of human nature. They do not need to be specified in a law to be demanded, recognized, protected and promoted and represent the indispensable conditions for all human beings to exist, develop their capacities and integrate into life in society in a fair and inclusive way, being respected in their individualities. In addition, human rights are inalienable, non-transferable, non-negotiable and unavailable, which means that they cannot be voluntarily ceded by anyone, nor can their realization be subject to conditions (Benevides, 2013; CONSEA 2006).

In this perspective, as a result of a process of collective construction and with social participation, the Organic Law of Food and Nutrition Security (LOSAN) was created in 2006, creating the National Food and Nutrition Security System – SISAN with the objective of ensuring the human right to adequate food (DHAA). This fact was important for the constitutional recognition of the DHAA in 2010, and to guide actions for its realization, both in relation to the role of the State as guarantor of the right, and of civil society in the role of demanding and monitoring its implementation (Brasil, 2006; IFZ, 2022).

Therefore, the right to adequate food is at the basis of other human rights and also because it involves food sovereignty and security and an imperative of citizenship. An imperative of citizenship because it involves some facets such as the principle of Safety and Responsibility, the principle of preservation of life and human health, the principle of health protection, conservation of the environment, the principle of prevention and precaution, the principle of transparency, the principle of consumer interest combined with the principle of regulation of products and processes, and the principle of sharing criminal and civil responsibility (Frota, 2011).

In this text we will highlight the challenges for the realization of the right to serve the most vulnerable public with regard to the universalization of access to School Feeding, emphasizing

how fundamental it is that the Entities and units executing School Feeding understand the construction of the right and the challenges for its implementation. In addition, they must perceive and wish to implement a training process to know the differences and carry out risk analyses for each metabolic and physiological alteration of those enrolled. And so they can understand that caring for diabetic children is different from caring for obese children. Serving children with food selectivity and malnutrition is different from attending children with phenylketonuria. And serving children with food intolerances is different from treating allergy sufferers and celiacs. And that they also understand that the processes of risk analysis and the construction of good practices to produce safe food involve monitoring the entire production chain from field to table (Brasil, MEC/FNDE, 2016). Thus, this study aims to present the mechanisms of care management for students who have specific dietary needs in Marechal Cândido Rondon, state of Paraná, presenting the results achieved by the municipality, its challenges and difficulties for the implementation of the law and consequent guarantee of the DHAA of students enrolled in schools and Early Childhood Education centers in the municipality.

2 THEORETICAL FRAMEWORK

Over time, the creation of legal, programmatic, budgetary and participatory guarantees for the DHAA has been fundamental. However, there are still great challenges to be overcome for its implementation, especially when it is realized that in addition to hunger, other food inadequacies must be recognized as a form of violence against human beings and violation of the right to life, and that it is the State's obligation to make these rights effective, creating and organizing the means, institutions, services, and public policies so that citizens can access these rights without interruptions, making social protection effective (Guerra, 2022; Mendes and Preuss, 2024). Whereas the violation of a right is:

any action by the State or third parties to disrespect, infringe, prevent, transgress, violate, embarrass, take, steal or threaten the rights that are guaranteed by national and international laws (Brasil, 2017a, p.10)

It is therefore essential that rightholders know what they are and take ownership of their rights, that they are informed about how they can enforce them and what instruments are available for enforceability. It is necessary to create routines and public instruments for the collection of rights, first of all in the administrative sphere, starting with the local and municipal level of easy public access, and close to the communities. In addition, managers and public servants must be trained on the obligations that fall to them as agents of the State in the

realization of human rights. In the case of the enforceability of rights, access to information about rights for citizens, and about obligations for public agents, is essential. The enforceability mechanisms must be available in all instances and spheres of the Executive, Legislative and Judicial Branches. Among the institutions currently available in Brazil are the Public Prosecutor's Office, the Public Defender's Office, the Human Rights Councils and the Public Policy Councils.

It is essential to know that the DHAA has two indivisible dimensions: the right to be free from hunger and malnutrition and the right to adequate food, and its guarantee requires the guarantee of all other human rights, especially the human right to health (Burity *et al*, 2010). It is essential that the State act legally to prevent the violation of the DHAA and create public policies that guarantee this right.

To this end, in the field of health, several documents deal with the importance of promoting and preventing health problems and point to the need to formulate and implement effective and integrated national, local and regional strategies to reduce morbidity and mortality related to inadequate nutrition. Among these actions and policies that have a regulatory, fiscal and legislative character, the National Food and Nutrition Policy (PNAN), which has among its guidelines, the Promotion of Adequate and Healthy Food (PAAS), as being the promotion of a food practice appropriate to the biological and sociocultural aspects of individuals and the sustainable use of the environment and that:

it must be in accordance with the needs of each stage of the life course and with special dietary needs; referenced by food culture and by the dimensions of gender, race and ethnicity; physically and financially accessible; harmonic in quantity and quality; based on adequate and sustainable production practices with minimal amounts of physical, chemical and biological contaminants (Brasil, 2017b, p.31)

Also noteworthy in the PNAN, the Organization of Nutritional Care, which "comprises care related to food and nutrition aimed at the promotion and protection of health, prevention, diagnosis and treatment of diseases" for all, with a view to the formation of an integrated, problem-solving and humanized care network, including care for individuals with special dietary needs, such as those resulting from inborn errors of metabolism, eating disorders, among others (Brasil, 2017b).

In view of this, it is verified that the perspectives of the PNAN are not limited to meeting the precepts of the Unified Health System (SUS), but seek to act in an intersectoral way so that the National System of Food and Nutrition Security (SISAN) is established and strengthened. In addition, it is observed that it is based on actions that consider the citizen in his totality, in his

individual and collective needs, and that resolute actions in these areas necessarily require partnerships with other sectors, such as Education. Intersectoriality forms shared decision-making spaces between institutions and different government sectors that should promote health and FNS through the formulation, implementation, and monitoring of public policies that positively impact the health of the population (Brasil, 2017b). In this way, it can be stated that in all spaces, including educational spaces such as schools and daycare centers, they should be built based on health promotion through access to adequate and healthy food.

Among these public policies that also aim at Food and Nutrition Security and health promotion, in the area of education, the National School Feeding Program (PNAE) stands out. César *et al* (2018) state that over time the PNAE stopped focusing exclusively on the state of hunger and expanded the service of students in the school period as a whole. This expansion extended to the incorporation of care for individuals collectively and individually, considering health conditions and aspects of socioeconomic, cultural and environmental sustainability.

In this perspective, in order to achieve the objective of the PNAE of "contributing to the growth and biopsychosocial development, learning, school performance and the formation of healthy eating practices of students", school feeding began to be offered based on legal guidelines and the principles and dimensions of the human right to adequate food (DHAA), reinforced with food and nutrition education actions and the provision of meals that meet the nutritional needs of students during the time they stay in the school space for at least 200 school days in a stable, regular and permanent manner (Brasil, 2009)

In addition, considering the universal attendance of the Program, there was the implementation of Law No. 12,982/2014, which sought to guarantee the DHAA in the school environment, ensuring individual care and offers of adequate and healthy food based on the biological conditions of students with special dietary needs (Brasil, 2014).

These special dietary needs (ANE) are defined by the PNAN as those identified through evidence of metabolic and physiological changes that require changes in the dietary requirements of individuals:

[...] or supplemental, of individuals with metabolic or physiological alterations that cause changes, temporary or permanent, related to the biological use of nutrients or the route of food consumption (enteral or parenteral). Examples: inborn errors of metabolism, celiac disease, HIV/AIDS, food intolerances, food allergies, eating disorders, prematurity, nephropathies, etc. (Brasil, 2017b, p.74).

Although currently the inclusion of children with special dietary needs in school is not questioned as a right, it can be said that its operationalization was late, as it was observed that

throughout the twentieth century, the recommendation of health professionals towards children with specific dietary needs was for them to be homeschooled, at least until they needed to learn to read and write. There was no protection mechanism guaranteed by law. Although the Federal Constitution of 1988 guaranteed the right to Education and LDBEN 9394/96 materialized the challenges for all, even so, school feeding did not operate with diversity, after all, the right to food was only included in the Constitution in 2010. And many times, children with specific dietary needs, even when they started to be enrolled, continued to be invisible, unknown, kept in a state of vulnerability and not heard (Paula, 2016).

With this focus, in 2014, Law No. 12,982 was created in 2014, which made individualized nutritional care mandatory in case of specific state or health condition, with the elaboration of a special menu based on medical and nutritional recommendations, nutritional assessment and differentiated nutritional demands of students (Brasil, 2014).

This law came to meet a growing and alarming need shown by several studies that attest to an increase in the prevalence of diseases associated with food and nutrition in the child population, imposing the need for continuous monitoring and evaluation of the PNAE, and the implementation of strategies and actions that promote the improvement of care and the planning of the nutrition and health policy of schoolchildren. ensuring the well-being and safety of children and those involved in the process. Considering the legal basis that supports the universal right to school meals, health promotion, and the DHAA, this scenario makes feeding in the school environment challenging due to the complexity of individual care and the legal basis that supports the universal right to school meals, health promotion, and the DHAA (Pereira *et al*, 2024).

In this way, the offer of special food to serve students with NAE is a right guaranteed by law, which aims to reduce the biological and social damage of this public, it is essential that there is an understanding that any person can file a complaint and demand the guarantee of the realization of their right, or a dimension of it, before administrative, political or judicial public bodies, "in order to prevent, overcome and/or repair violations". In addition, the population also has the right to have a response and action in a timely manner to repair the violation by the public authorities, considering that the obligations and responsibilities for the realization of this right are of the managers and public agents involved in the execution of the PNAE and it is the State's obligation to respect, protect, promote, and provide adequate food and nutrition, protecting students from any interference that may deprive them of access to adequate food at school (FIAN, 2021).

Also noteworthy, to guarantee this right, is the principle of universality of the PNAE, which will only be effective when all students can enjoy adequate and healthy school meals as their right. For this, it is necessary that, in addition to the State, other actors involved in the Program such as nutritionists, school feeding councils, parents, managers and teachers, and civil society recognize themselves as responsible for guaranteeing this right (César *et al*, 2020).

In addition, in order to ensure the adequate care proposed by the PNAE to students with NAE, it includes, in addition to the preparation of an adequate menu and the planning for their acquisition, the identification with the diagnosis for the monitoring of the nutritional status of these students. From the perspective of equality and equity in care, it should also contribute to ensuring that the student with NAE is ensured through comprehensive care from the perspective of the professional in charge, and other actors involved (Colares; Sorato, 2019).

It is essential to integrate the strategies and actions of the education, health and FNS teams, including training for the professionals involved; intensify the support between the multidisciplinary team of the basic health unit and the schools to develop care plans and emergency actions in cases of allergic reactions, anaphylaxis and aggravation of diseases diagnosed in schools. (Pereira *et al*, 2024)

Finally, when dealing more specifically with individual care for students who have special dietary needs in the school environment, it is essential that all those involved in the educational process are aware of the biological conditions involved, which physiological and metabolic aspects make this individual the bearer of a right to food that respects these conditions.

In this research, the conceptual basis of the pathologies that represent the greatest challenges in the execution to comply with the legislation was presented, which are food allergies and celiac disease. The challenges are greater because it is not only the nutrition professional who is involved, it is not only the exclusion of allergens, or wheat, rye and barley, in the case of celiacs. The difficulty of execution is because the small fraction of the protein can trigger reactions. It is due to the severity of the symptoms and health problems of these children. It is crucial that the school community knows about celiac disease and the specific dietary needs of students and how to avoid protein from the purchase of inputs but also from environmental contamination, direct contamination, cross-contamination or residues on utensils and surfaces. Security, inclusion, and transparent communication must be ensured. It is based on the ethics of care that "represents an attitude of occupation, concern, responsibility and involvement with the other" (Boff, 2014, p. 37).

An update of the guidelines takes place in 2026 with a new FNDE Resolution. Highlighting the service criteria.

Art. 5 The guidelines for school feeding are: I - the use of healthy and **adequate** food, including the use of varied, safe foods that respect the culture, traditions and healthy eating habits, contributing to the growth and development of students and to the improvement of school performance, in accordance with their age group **and their state of health, including those who need specific attention**; (Brazil, 2026, emphasis added)

Making the intention of service transparent:

VI – the right to school meals, in order to ensure the food and nutritional security of students, with equal access, **respecting the biological differences between ages and health conditions of students who need specific attention** and those who are socially vulnerable. (Brazil, 2026, art 5, emphasis added)

Regarding the construction of menus, the 2026 Resolution makes explicit:

School Feeding Menus Art. 17. School feeding menus must be prepared by the RT nutritionist of the PNAE, based on the use of fresh or minimally processed foods, in order to respect the nutritional needs, eating habits, food culture of the locality and be based on sustainability, seasonality, agricultural diversification of the region and the promotion of adequate and healthy food.

Paragraph 1 - The menus must be adapted to **meet the needs of students diagnosed with special dietary needs** and atypical eating behaviors, such as: **celiac disease**, diabetes, hypertension, anemia, **allergies**, food intolerances, food selectivity, among others.

2º Students with disabilities, global developmental disorders and with high abilities/giftedness must receive school meals during the schooling period and, at least, one meal in the after-hours, when in SEA, in **order to meet their nutritional needs, according to their specificities**. (Brazil, 2026, art 17, emphasis added)

It is worth noting that the groups in special food needs are not in alphabetical order and denote other priorities of the regulatory body for enforcement. This time, making explicit what is a diet that is appropriate to the biotype and productive of health.

3 PHYSIOLOGICAL AND METABOLIC CHARACTERISTICS OF STUDENTS WITH SPECIAL DIETARY NEEDS

3.1 FOOD ALLERGIES

Based on information provided by the Brazilian Consensus on Food Allergies (2018), food allergy is a public health problem, defined as a "disease resulting from an anomalous immune response, which occurs after ingestion and/or contact with certain food(s)". A food can cause allergic reactions in three ways: a) when the food is ingested or there is contact with the

skin or respiratory tract; b) when, through cross-reaction, there is the production of specific IgE and sensitization even before contact with the food, c) when there is cross-reactivity between an inhalable allergen (e.g. pollens, latex) responsible for sensitization and production of IgE and ingestion of the food. All foods can cause allergies, but approximately 80% of them are caused by the ingestion of cow's milk, eggs, soybeans, wheat, peanuts, nuts, fish and crustaceans (ASBAI, 2018a).

It is important to note that some foods cause cross-reactivity, causing a person allergic to a specific food to experience symptoms when consuming other foods that contain proteins with similar structures. An example of this is tropomyosin, which is present in different sources such as crustaceans, mollusks, mites and even plants, causing a person allergic to shrimp, for example, to also have a reaction when eating foods with the same protein (ASBAI, 2018a).

For the diagnosis, the clinical history is essential, which depends on the patients' ability to recall the symptoms, and the ability and sensitivity of the physician to correctly identify those who have the disease. Laboratory investigation may also be carried out (ASBAI, 2018b).

In the school environment, guidance should be given on the importance of monitoring by a doctor and nutritionist on a continuous basis, guidance and monitoring, which is also essential to: check if there is cross-reactivity with other foods, if the student has acquired any tolerance to the food and, also, to assess and monitor the general state of health and nutritional status, since this can be compromised by the manifestations of allergic reactions due to the exclusion diet. It is also important to verify the need for nutritional supplementation (Brasil, 2017).

As for the nutritional issues involved, so that there is no harm to the growth and development of students, it is proposed that the Food Allergy (AA) certificate should not be considered as a definitive condition, as the unnecessary continuous adoption of an exclusion diet can harm the student in the long term. It is also recommended that the main modification in the menu be the complete exclusion of food allergens and, in the case of infants, the use of expressed breast milk or adequate infant formulas, ensuring the nutritional supply of energy, macro and micronutrients.

3.2 CELIAC DISEASE

Although the prevalence of celiac condition is around 1/200 people, the diagnosis is still late and related to nutritional sequelae. Gluten-related disorders (GRD) affect 1% to 6% of the population, with complications and a high risk of morbidity and mortality in the short and long term (Cruscinsky, 2021). Even though there has been a Clinical Protocol and Therapeutic Guidelines (PCDT) since 2009, it is common for people to claim that health professionals are

unaware of the subject (Ministry of Health, 2009), and the common sense remains that it is a digestive gluten intolerance.

The celiac person lives with a systemic autoimmune condition that does not only affect the small intestine. It is a permanent whole-body reaction to gluten characterized by a systemic inflammatory process that also involves the mucosa of the small intestine, generating atrophy of the intestinal villi, malabsorption, and a variety of clinical manifestations (Araújo *et al*, 2022; Garcia *et al*, 2023). These are, within the scope of human diversity, people who, by genetic constitution, live with a permanent biological incompatibility with winter cereals, wheat, rye, barley and oats, especially with their protein called gluten. Gluten in celiacs will produce metabolic and physiological changes that can cause significant damage and aggravation to health. To survive, a consensus was reached that the daily life of the celiac person should be the exclusion of contact with gluten. From then on, attending to celiac children is to meet their special dietary needs, but also to practice celiac education so that they can interact with their peers. Therefore, it requires full attention and respect in the school environment in order to overcome social barriers.

In view of this, we reiterate that celiac is an autoimmune, permanent, self-destructive, non-transmissible condition, whose trigger is gluten in people with genetic predisposition. It is genetic, but not hereditary. These are not defective genes, but more likely to be a mark of shared ancestry with other primates. Having the genes is not enough to develop the autoimmune alteration, it can develop, or not, depending on exposure to the environment. But, in the school environment, it is common to ask: What complications or physiological and metabolic changes can be caused by non-attendance in the development of celiac students?

First of all, let's remember that the word celiac comes from the word colic and this already helps us to understand that this student has pain. Although it seems like a simple change in diet, daily life can be a constant challenge, with serious impacts on psychological health and emotional balance. (Bai, Ciacci, Corazza, 2016). Only a few celiacs will have dermatitis herpetiformis with visible lesions, most of the manifestations of Gluten-Related Disorders can be subjective: pain, malaise and tiredness. This makes it difficult to identify the severity of the symptoms and leads to the trivialization of complaints.

This reality has serious consequences for the health of these people, described in the PCDT (Ministry of Health, 2009, 2015) as digestive alterations (canker sores, esophagitis, stomatitis, duodenitis, liver alterations, diarrhea and severe colds), neurological and reproductive alterations and infertility, thyroid alterations, depression, anemia, joint pain, malabsorption of nutrients, weight loss, slow growth, osteoporosis of dental problems,

malnutrition and alterations pathological or lesions in organs or systems, capable of being seen or measured by exams, refractory celiac disease, cancer of the digestive system, lymphoma, and even sepsis.

Just as pain, often disabling and with great damage to quality of life, cannot be quantified. Currently, the status of celiac condition as a more acceptable gluten-related disorder is that of pathology. However, the community discusses other statuses, such as permanent physical disability and diverse human condition. Although these statuses are not convergent for the formulation of public policies and generate internal debates, they do not alter the material existence of the children and adolescents who need to be served.

It is worth mentioning that the education professional does not diagnose either food allergies or celiac allergies. These diagnoses follow exclusive PCDT. However, it is up to the education professional to report problems that occur with the child to the family members and guide the referral. Remembering that many municipalities have joined the Health at School Program.

4 INSTITUTIONAL AND INFRASTRUCTURE CONDITIONS TO GUARANTEE ACCESS ON A PERMANENT AND CONTINUOUS BASIS

The planning of the menus must follow the recommendations of the FNDE and serve students enrolled in the Municipal Center for Early Childhood Education (CMEI) full-time with 4 meals a day for children from 6 to 11 months and children from 1 to 4 years old. The nutritional value of these meals meets 70% of the students' daily nutritional needs. For students enrolled in Elementary 1 schools, the menus are prepared serving 01 daily meal, for children in the morning and afternoon periods enrolled. These students have at least 30% of their daily nutritional needs met.

According to legal guidance, NAE students are served with a specific menu for their needs. Nutritionists elaborate, in addition to the general menus, menus identified as: a) without milk. b) without egg; c) without wheat; d) without milk and without egg and without wheat; e) for diabetics. In case of other allergens such as soy, dye, oilseeds, honey, fruits, these foods are advised. One of the difficulties in executing differentiated menus is the purchase. After all, nutritionists often claim that the result was deserted.

Some municipalities in order to achieve the menus, purchase food via bidding by electronic auction, once a year, seeking to obtain food that meets all special dietary needs. However, other municipalities other purchasing processes are elaborated and the request for

the presentation of the product's technical sheet to ensure that it meets the NAE and, above all, does not pose a risk to the student, as stated in the FNDE reference booklet (Brazil, 2017).

To serve celiac students, rice-based and gluten-free foods are purchased, such as rice noodles, rice crackers, gluten-free bread, gluten-free oats and rice flour. For diabetics, artificial stevia sweetener, brown rice, whole wheat pasta, diet chocolate milk, sugar-free wholemeal biscuits are purchased and it is recommended to remove sugar in culinary preparations or replace it with fruit juices or raisins.

Among the guidelines for culinary preparations, substitutions are used, for allergens such as CMPA and allergy to egg protein, it is the removal of these foods in preparations and replace them according to guidelines, for example, in a cake preparation, milk is replaced by fruit juices or water and egg by vinegar or flaxseed. In addition, students with CMPA are purchased milk-free growth formulas (from 0 to 12 months), soy milk and vegetable yogurt, lactose intolerant products are purchased.

The request for specific school meals follows the protocol: families make the request at the school office or to the principal, attaching the related documentation and statements, and the school forwards it to the municipal school feeding service. Family members can access the menu that is available at educational institutions. Interviews and conversations are often necessary for service adjustments. The service process must comply with the recommendations of Resolution/CD/FNDE No. 06/2020 (which establishes that menus must meet students with specific nutritional needs) as well as that specified in Federal Law No. 12,982/14. Ribeiro *et al* (2014) considered that the mapping of students is the first step towards the implementation of strategies that aim to meet their needs.

In schools and CMEI's, at the time of enrollment, the declaration if the student has any NAE is requested and the statement of the health professional or medical report or nutritionist's report is also requested. This request is valid for one year and needs to be renewed, after all, the clinical condition may have evolutions and/or complications. Colares *et al* , in a study carried out with 134 school feeding nutritionists in Santa Catarina, pointed out that 85.9% (n=115) request the updating of supporting documents at least once a year. It is recommended that an identification of each student and their NAE be carried out in the school environment, to ensure their safety. This service protocol, which provides for the sending of a document by the school manager to the nutritionist, agrees with what Rosa, Pavão and Marquesan (2019) cite about the articulation between nutritionists and managers in the implementation of menus for students with NAE, considering that it is the principals who welcome these students.

From this perspective, the challenge is even greater when considering the care of students with Celiac disease, as one must be aware of the fact that when a food that is naturally gluten-free (fish, fruits and vegetables, meat, dairy products, seeds, eggs, nuts...) or that has been developed especially for celiacs (such as gluten-free bread), cross-contact or direct contact can occur, making the food unsafe for consumption. To this end, a Good Practices protocol and continuing education are required for the food handler to understand and perform the risk analysis. Contact with gluten can occur through a common surface, through residues in shared utensils, through shared equipment, or through the food handler who, when preparing food in a sequence, can transfer small pieces or particles of protein.

Thus, given the seriousness of the consequences of the violation of the student's right and knowing that food is the basis of treatment for celiac disease, with a strict gluten-free diet as the only effective treatment so far, are municipal managers and nutritionists attentive to fulfilling their responsibility? How can an understanding be reached that the guarantee of the DHAA of students with NAE would help in the process of promoting the health and quality of life of celiacs? How, in addition to taking care that those labeled as gluten-free, good handling practices, a menu that effectively offers nutrition and a gluten-free diet, that takes care of the risks of the presence of traces of this protein in other foods, that takes care of the environment where the food is stored, prepared and distributed, still guarantees food education? How to promote health and inclusion?

Safety in the management of care goes beyond nutritional issues and reaches the conditions of human resources and infrastructure. Training is carried out every six months with school cooks using theoretical and practical methods, every 6 months. How to manage the turnover of outsourced professionals? The theoretical part explains each type of NAE and what care should be taken with the preparation so that there is no cross-contamination, the hygiene of utensils, storage and storage of specific foods for these needs. The practice needs to address recipes that can be made with the ingredients purchased for these students and the substitutions for each NAE. On the part of the nutritionists in charge, it is also necessary to carry out technical visits weekly to ensure that this work is being done and for further guidance in case of doubts.

For nutritionists, training for food handlers is still insufficient, mainly due to the high turnover of the workforce, causing many professionals who participate in the first event to no longer be present at the second meeting. Also, due to the insecurity in the operationalization of the recommendations, which in the opinion of the nutritionists, may be the result of the low level of education of the professionals who prepare the food and the recognition of the great

responsibility with the health of the students in case there are failures in the care process. This fact does not agree with the study carried out by Souza and Nascimento (2019) who in a survey carried out with 06 nutritionists and 06 food handlers from two municipalities in Greater Florianópolis on the effectiveness of human resources training, and which showed that the former see that they carry out efficient training, and the handlers feel well guided and trained by nutritionists regarding pre-preparation, preparation, handling and storage of products and utensils, to avoid cross-contamination with gluten

A contradiction has been produced and needs to be better heard. Some municipalities prohibit students from bringing any food from home, due to biological risks and contamination. In other municipalities it is possible to bring only some type of fruit. In some prohibitions, there is a prohibition, both for socioeconomic factors and food security, for celebrating birthdays in schools. In other municipalities, they still authorize this practice by bringing into this environment external food without the certainty of the origin, without designation of the place where they were produced were adequate, or without the certainty of whether the handler maintained good hygiene practices, the quality of the ingredients, among others. Such a practice, in addition to producing a certain frustration in those who cannot enjoy collective food, leads to another question. Who sanitizes the school environment after the celebration and ensures the cleanliness of traces of proteins in the environment? Within this context, many municipalities have banned snacks brought from home. On the other hand, there is an increasing number of municipalities that, in municipal legislation, guarantee students with specific dietary needs to take their ready-to-eat food from home to school.

Even with the municipal provision legalized, such practice does not occur without conflicts, including legal ones, in the coexistence of different enforcement models. Below we will make a brief list: a) phenylketonuria students whose school meals are provided directly from the health department to the school and part of it is delivered to their families so that they can take fractional; b) celiac and allergic students who take all meals produced by family members to school in full with the recommendation that it be close to the menu, or not; c) municipalities that provide the families of celiac and allergic students with the ingredients d) municipalities that provide the families of celiac and allergic students with ingredients, lending equipment, gas, and containers for transportation to school; e) municipalities that offer a place for students to store their food brought from home and heat it; f) municipalities that produce specific foods in a central kitchen and distribute them to school units or family members.

5 DIFFICULTIES AND CHALLENGES OF ACHIEVING UNIVERSALIZATION OF STUDENT CARE WITH NAE

Another relevant issue is the vulnerability arising from a Special Food Need or a chronic disease that affects these students in different ways. Many have to face prejudice and *bullying* arising from the lack of information of the people they live with on a daily basis. In addition to affecting nutritionally, there are also the psychological effects resulting from it and which are also equally devastating. Problems such as anxiety, difficulties in social contexts, continuous clinical symptoms, and also changes in body composition are reported. "In fact, one study revealed that social phobia, as measured by the Liebowitz Social Anxiety Scale, was significantly higher in individuals with CD" (Smith, 2022). It can generate double vulnerabilities or hypervulnerability (economic, social, psychological) as a result of daily experiences of exclusion and fear due to the danger that their health runs. This phobia occurs due to food insecurity because they do not know if good practices for handling and controlling ingredients and inputs have been carried out. It can be: from attending a classroom space, in which there was gluten, or going to the playground and cafeteria, participating in events, parties, or outings, or some other place where there is food, it already causes fear of possible problems with your health. Promoting welcoming and inclusion is much more than beautiful words, it involves monitoring, control and purposeful actions and the understanding of vulnerabilities.

For Mainaier (2023), the non-conformity of menus to serve students with NAE ranges from the unavailability of food to the lack of execution of meals. Through the FNDE's Accountability Management System (SiGPC), it is possible to know that in 2021, 69% of the Executing Entities stated that they identified students with NAEs, but not all of them served with different menus. What is surprising is that even when students are identified, they continue to be unattended. What is still surprising is that 31% of the Executing Entities, that is, about 1600 municipalities, do not identify any student with NAEs, since we know that epidemiologically it makes no sense at all. This also suggests an insufficiency in public policy, in its execution and monitoring.

There are two major blocks for training for the inclusion of NAEs: first, understanding the physiological and metabolic characteristics of students and the conditions for producing a safe environment; secondly, dialogue with the institutional conditions to guarantee access and permanence, purchases, bidding, calls for special foods, request for equipment and utensils, information in the system, monitoring and control.

From this perspective, there is a perception that although training is carried out for cooks, one of the great difficulties encountered is the high turnover of outsourced employees that

impairs the technical training of professionals, hindering the process of continuous permanent training. It also makes it difficult for the kitchen/school environment to be integrated so that it obtains a good performance in the preparation of food. In addition, the possibility of a bond between the cook and the students is reduced, through an affective relationship and respect for special food needs.

Another limiting factor to full attendance is the precariousness in the infrastructure of educational establishments. The lack of specific space in the kitchens, which is sufficient and safe for handling food, and the lack of investment in the adequacy of the facilities that, in addition to affecting the safety of food production, can compromise the health of students. Still in relation to structure, utensils and equipment can be mentioned. In Marechal, there is a specific bidding for the acquisition of kitchen items, but as already explained, there is a lack of understanding of the managers regarding the need to request the responsible sector and that this failure can generate losses for the student. It is perceived that this difficulty with risk analysis and control of cross-contact and direct contact to produce food is greater in the care of allergic and celiac students. Although the number of allergic children and adolescents is small, most common sense understands the severity and speed of the reaction. Within a few hours of contact, a series of signs and symptoms become visible (Paula and Almeida, 2016).

In view of this, nutritionists and education professionals presented service options with the implementation of systems that guarantee food safety for students.

- a) Outsourcing of ready-to-eat meals with direct acquisition from a commercial establishment that strictly meets safety standards from production to distribution;
- b) Adaptation of a production site within one of the existing establishments that produces for all other locations, under a strict safety guarantee scheme in preparation, storage, transportation and distribution;
- c) Production in segregated spaces and establishing a safe production routine with locations in each school identified with the presence of students in special feeding,
- d) Production of a single menu for all students without the allergenic ingredient, reducing the risks of direct and cross-environmental contact, the impacts of special hygiene costs on equipment and surfaces and stimulating socialization.

It is important to understand that by following option c, of production in segregated spaces and establishing a safe production routine with locations in each school that has students with NAE, there are some difficulties to be overcome. The first would be the routine of cleaning and sanitizing surfaces, utensils and spaces to deglutenize and eliminate protein residues. It is known in the case of production for celiacs, how wheat flour propagates through

the air, and wheat dust can stay in the air for up to 24 hours, the challenge is enormous because in school units: What would be the cost of hygiene? What if students have multiple allergies? Would allergenic foods such as wheat flour, milk and eggs be used, for example, and what would be the correct hygiene and good practices for the next production?

Therefore, to avoid cross-contact in production, in a shared environment you would need:

- a) a place to store isolated and isolated special foods, or allergenic foods in relation to others,
- b) proper cleaning of surfaces before starting production, starting with the production of the special menu,
- c) acquiring exclusive utensils such as baking sheets, pans, molds, grills, griddles, and equipment such as blenders, ovens and capped boxes.
- d) training in good care practices so that the food handler does not become an instrument of contamination,
- e) exclusive PPE for the handler, who must wear, among other things, an exclusive apron.
- f) specific sanitizing utensils.
- g) care with the cafeteria and the serving equipment, avoiding accidents and inhibiting the exchange of food.
- h) in which cases the system can be hybrid, with production being done in another location, but stored ready at the school and heated.

The vast majority of family members and the school community do not have this information clarified and do not seek to know if in the school where their child studies there are other students with these needs and if they are being met, in addition to the fact that when the subject comes up they believe it is not of significant importance. Educational and pedagogical work is up to everyone. Thus, the promotion of events and dissemination of these guidelines is of paramount importance so that there is a greater dissemination of knowledge of these NAE and how to act so that the DHAA of these students is guaranteed more effectively. The CAE (School Feeding Council) has the duty to monitor and inspect compliance with the guidelines and regulations of the PNAE (Brasil, 2009). However, they end up focusing a lot on the structure of the kitchen, quality of the food provided, accountability of the municipality and leaving aside the requirement of compliance with the menu for students with NAE, which is also part of their obligations. The participation of the CAE and the requirement to guarantee the service to these students is fundamental, which has not been happening so far.

It should be noted that for the DHAA to be fully achieved in school, it needs to be demanded and for this, each government has the obligation to create and make available in an accessible way the necessary mechanisms so that individuals have the possibility to demand and claim their rights. In this sense, rights holders can contact their family or the people they live with, the School Feeding Council, the school, the Public Prosecutor's Office, the Public Defender's Office, the residents' association of their neighborhood or others who can support

them. Complaints/complaints can be submitted individually or in groups, and can be confidential, if they are not sure to file the complaint on your behalf (FIAN, 2021).

It is the duty of municipal managers to facilitate or promote conditions that allow compliance with the guidelines and regulations of the PNAE and the effective realization of the DHAA in the school. Therefore, at the local level, the holders of obligations are the secretaries of Education, school feeding coordinators, school principals, educators and local administration employees, in addition to the professionals responsible for the preparation of bids and public calls for the acquisition of food from the PNAE, cooks, nutritionists and technicians responsible for the PNAE. All of these must act supported by students or their guardians, the school community, the School Feeding Council, family farmers, non-governmental organizations and civil society organizations, as well as those in the business sector. It is understood, therefore, that it is up to the public authorities to guarantee conditions for these actors to exercise their responsibilities (FIAN, 2021).

It is unfair that the public power does not assume its responsibility. Because with the violation, the responsibility falls on the students' families, who should not have to worry about the safety and adequate care of their children in public environments of mandatory enrollment. How the menu can be made more flexible. When can this partnership exist and the child take the food? Under what circumstances and for how long? How to regulate? Is there a way to close trust agreements? Yes, after all, protection, prevention and precaution will be collective actions. This production not only involves nutritional and health care issues, but also education, inclusion and welcoming. Thus, meeting specific food needs is not a favor, nor a demonstration of kindness, but a guarantee of the right and fulfillment of the Municipality's obligation.

6 FINAL CONSIDERATIONS

To overcome this scenario, it is necessary to develop institutional strategies that sensitize and arouse the interest of health, food and education professionals and expand their technical knowledge on this topic so that they can both recognize pathologies and their manifestations and consequences, but that they can provide safe processes throughout the school feeding production chain. biotype-friendly and sustainable.

In short, to produce inclusion and overcome social barriers, it requires action on different fronts: a) institutional actions and public care policies; b) Training of education, health, assistance, food and justice professionals; c) Reception and monitoring of students with NAE and their families for monitoring; d) Dissemination and dissemination of knowledge about celiac and special dietary needs for all school components and for the general population.

Although many advances have been made, difficulties in guaranteeing the DHAA of students with specific dietary needs were evidenced by this study. It was pointed out that the supply of food free of cross-contact is the great challenge to be faced by the municipality, but that there are paths that can be followed so as not to violate this right. It was found that it is still necessary for civil society to act in the collection of these rights.

Finally, a movement to guarantee access, permanence and continuity of public policy that guarantees the care of a population so vulnerable to food, health and life as an imperative for citizenship.

Flávio Ribeiro da Costa¹

ABSTRACT

This study analyzes the impacts of the 2015 economic crisis in Argentina on collective bargaining, with an emphasis on the strategy of "negative collective bargaining," defined as the deliberate limitation of wage demands and the capacity for union pressure due to restrictive macroeconomic targets. It hypothesizes that, in a context of high inflation and economic slowdown, the State intervened restrictively in negotiations, imposing limits on wage increases, especially in strategic sectors (Actis & Creus, 2015; Etchemendy & Collier, 2007). The research is qualitative, based on a literature review and document analysis, including classic and contemporary studies on labor relations and union data (Gramsci, 1991; Hyman, 1981; Kelly, 1998; Marticorena, 2014). The results indicate that collective bargaining was not eliminated, but reconfigured as a space for dispute, in which the government disciplined union action and controlled the dynamics of labor conflicts. Despite the restrictions, unionism maintained its leading role, especially at the grassroots level, demonstrating the persistence of collective mobilization as a mechanism of resistance.

Keywords: Collective Bargaining. Economic Crisis. Trade Unionism. Argentina. Labor Relations.

RESUMO

Este estudo analisa os impactos da crise econômica de 2015 na Argentina sobre a negociação coletiva, com ênfase na estratégia de "negociação coletiva negativa", definida como a limitação deliberada das demandas salariais e da capacidade de pressão sindical em função de metas macroeconômicas restritivas. Parte-se da hipótese de que, em um contexto de alta inflação e desaceleração econômica, o Estado interveio restritivamente nas negociações, impondo limites aos aumentos, especialmente em setores estratégicos (Actis & Creus, 2015; Etchemendy & Collier, 2007). A pesquisa é qualitativa, baseada em revisão bibliográfica e análise documental, incluindo estudos clássicos e contemporâneos sobre relações laborais e dados sindicais (Gramsci, 1991; Hyman, 1981; Kelly, 1998; Marticorena, 2014). Os resultados indicam que a negociação coletiva não foi eliminada, mas reconfigurada como espaço de disputa, no qual o governo disciplinou a ação sindical e

controlou a dinâmica dos conflitos laborais. Apesar das restrições, o sindicalismo manteve protagonismo, especialmente nas bases, mostrando a persistência da mobilização coletiva como mecanismo de resistência.

RESUMEN

Este estudio analiza los impactos de la crisis económica de 2015 en Argentina sobre la negociación colectiva, con énfasis en la estrategia de "negociación colectiva negativa", definida como la limitación deliberada de las demandas salariales y la capacidad de presión sindical debido a objetivos macroeconómicos restrictivos. Se plantea la hipótesis de que, en un contexto de alta inflación y desaceleración económica, el Estado intervino de forma restrictiva en las negociaciones, imponiendo límites a los aumentos salariales, especialmente en sectores estratégicos (Actis & Creus, 2015; Etchemendy & Collier, 2007). La investigación es cualitativa, basada en una revisión de la literatura y análisis documental, incluyendo estudios clásicos y contemporáneos sobre relaciones laborales y datos sindicales (Gramsci, 1991; Hyman, 1981; Kelly, 1998; Marticorena, 2014). Los resultados indican que la negociación colectiva no fue eliminada, sino reconfigurada como un espacio de disputa, en el que el gobierno regulaba la acción sindical y controlaba la dinámica de los conflictos laborales. A pesar de las restricciones, el sindicalismo mantuvo su papel protagonista, especialmente a nivel de base, demostrando la persistencia de la movilización colectiva como mecanismo de resistencia.

Palabras clave: Negociación Colectiva. Crisis Económica. Sindicalismo. Argentina. Relaciones Laborales.

1 INTRODUCTION

Collective bargaining has consolidated itself as the main instrument for regulating labor relations in Argentina after the 2001 crisis, especially during the period of economic growth between 2003 and 2015. This period was marked by the expansion of parity negotiations, the strengthening of union coverage and the centrality of wage demands, evidencing the protagonism of organized workers and the institutionalization of labor conflict (Etchemendy & Collier, 2007; Atzeni & Ghigliani, 2013; CIFRA, 2017).

According to Vázquez y Medina (2020), the years of growth were accompanied by relatively stable GDP rates and moderate inflation levels, albeit with some fluctuations, setting the stage for the 2015 crisis.

From a theoretical point of view, the analysis of industrial relations can be enriched with critical approaches. Gramsci (1991) contributes to the understanding of the role of the State in mediating social conflicts, while Hyman (1981) emphasizes the political character of labor relations. Kelly (1998) highlights the centrality of collective mobilization in the dynamics of the conflict, and Marticorena (2014; 2015), Varela (2015) and Palomino (2008) highlight the link between trade unionism and recent economic policies in Argentina. Empirical studies also indicate the relevance of grassroots organizations and the complexity of segmented neo-corporatism in the country (Trajtemberg et al., 2012; MTESS, 2016; ODS-CTA Autónoma, 2016; Senén González et al., 2010; Womack, 2008).

From 2015 onwards, a turning point was configured, marked by the change in economic orientation and the active role of the State in redefining the limits of union action. The sustained increase in inflation, combined with the stagnation or contraction of economic activity, has put pressure on real wages and on traditional collective bargaining mechanisms. In this context, the government implemented the strategy of "negative negotiation", characterized by the deliberate limitation of wage demands and union achievements, in a context of growing macroeconomic instability (Actis & Creus, 2015; Actis, Lorenzini & Zelicovich, 2016; Adamson, 2002; Alfaro, 2015; Allami, 2012, 2013; Andritzky, 2006; Alvarez & Adelardi, 2015; Altimir & Devlin, 1992).

The objective of this study is to analyze the transformations in collective bargaining in the context of the 2015 crisis, highlighting the role of the State in containing wage demands and reconfiguring labor relations, considering the impact of economic policies, government strategies and union mobilization in a period of intense macroeconomic tension.

2 THEORETICAL FRAMEWORK

The analysis is based on critical approaches to labor relations. Antonio Gramsci (1991) contributes to the understanding of the role of the State in the mediation of social conflicts, highlighting the influence of power structures and hegemony in the regulation of labor relations. Richard Hyman (1981) emphasizes the political character of labor relations, stressing that collective bargaining and union conflicts are deeply influenced by state political decisions and strategies. In turn, John Kelly (1998) highlights the centrality of collective mobilization in the dynamics of conflict, reinforcing the idea that organized union action is fundamental for the definition of working conditions.

In the Argentine case, several studies show that collective bargaining functioned as a mechanism for institutionalizing conflict, articulating the relations between the State, unions, and capital (Marticorena, 2014, 2015; Atzeni & Ghigliani, 2013; Etchemendy & Collier, 2007; Varela, 2015). Research indicates that, even in periods of economic growth and expansion of collective bargaining, tensions persist between state interests, union action and economic demands, evidencing a segmented model of neo-corporatism, in which different sectors of the union movement have different levels of influence and negotiation capacity (Trajtemberg et al., 2012; MTESS, 2016; ODS-CTAAutónoma, 2016; Senén González et al., 2010; Womack, 2008).

This critical perspective allows us to understand collective bargaining not only as a technical instrument of wage adjustment, but as a space of political and social dispute, in which government strategies, workers' mobilization and articulation between different economic and institutional actors are articulated (Palomino, 2008; CIFRA, 2017; Actis & Creus, 2015; Actis, Lorenzini & Zelicovich, 2016).

3 CONTEXT OF COLLECTIVE BARGAINING IN ARGENTINA (2003–2015)

Between 2003 and 2015, collective bargaining in Argentina went through a period of significant expansion, characterized by four central dimensions: the reactivation of parity negotiations, the expansion of union coverage, the centrality of wage demands, and the institutionalization of labor conflict. For example, during this period, strategic sectors such as metallurgical, chemical and transport resumed periodic wage negotiations, while unions such as the Asociación de Trabajadores del Estado (ATE) and the Unión de Personal Civil de la Nación (UPCN) were able to expand their base of representation, ensuring greater coverage in public and state bodies (Etchemendy & Collier, 2007; Atzeni & Ghigliani, 2013).

This period highlights the articulation between economic growth and the strengthening of labor institutions. Between 2003 and 2007, the country presented GDP growth rates of more

than 8% per year, accompanied by expansion of formal employment and relative stability of real wages, creating a favorable scenario for collective bargaining (CIFRA, 2017). The centrality of wage demands was manifested in sectoral agreements that included not only wage increases, but also productivity bonuses and improvements in working conditions in industries such as steel and petrochemicals, demonstrating the relevance of negotiations as a mechanism for economic redistribution (Trajtemberg et al., 2012; Senén González et al., 2010).

The protagonism of organized workers reflected a segmented model of neo-corporatism, in which different sectors of the union movement had different levels of influence and negotiation capacity. Unions with a greater historical presence and structured organization, such as the CGT (Confederación General del Trabajo), were able to push for consistent increases and for the incorporation of wage indexation clauses, while more peripheral sectors faced limitations in representation and impact on agreements (Womack, 2008).

Previous studies also highlight that collective bargaining functioned as a mechanism for institutionalizing conflict, articulating the relations between the State, unions and capital. For example, agreements in the public sector often resulted from direct mediation by state agencies, while in private industry negotiations were mediated by business chambers and union federations, demonstrating the complexity of the interaction between actors and the regulatory role of the state (Marticorena, 2014, 2015; Varela, 2015; Palomino, 2008).

In short, the period between 2003 and 2015 not only expanded the scope of collective bargaining, but also consolidated it as a central space for dispute and social articulation, reflecting both the relative strength of unions and the capacity of the State to structure labor conflict within institutionalized parameters.

4 THE 2015 CRISIS AND NEGATIVE NEGOTIATION

From 2015 onwards, with the change in the government's economic orientation, there was a significant reconfiguration of labor relations in Argentina. This period was marked by the implementation of the so-called "negative negotiation", characterized by explicit strategies of wage restraint and union discipline. Among its main manifestations are:

- The imposition of strict limits on wage increases, often below real inflation, as occurred in strategic sectors of industry and public transport;
- The direct intervention of the State in negotiations, mediating agreements between unions and employers, often conditioning the approval of collective agreements to the containment of wage expenditures;

- the promotion of wage agreements that did not fully compensate for the loss of purchasing power, reflecting a deliberate policy of containing labor costs;
- The weakening of the capacity for union pressure, through regulations, restrictions on mobilization and limitation of the participation of the rank and file in sectoral negotiations (Actis & Creus, 2015; Actis, Lorenzini & Zelicovich, 2016; Adamson, 2002; Alfaro, 2015; Allami, 2012, 2013; Andritzky, 2006; Alvarez & Adelardi, 2015; Altimir & Devlin, 1992).

In this context, the State assumed a disciplinary role, prioritizing macroeconomic stability over the recomposition of workers' wages, reflecting a logic in which collective agreements ceased to be instruments of redistribution and began to operate as mechanisms to contain union demands.

Sectors such as transportation, energy, and public administration recorded negotiations in which average increases did not exceed 10% per year, despite inflation rates above 20%, evidencing the mismatch between wage growth and real inflation. In addition, the government used measures such as the imposition of wage caps and mandatory conflict mediation to limit strikes and pressure for more significant increases, demonstrating the strategic use of collective bargaining as an instrument of economic policy (Actis & Creus, 2015; Marticorena, 2014; Varela, 2015).

"Negative bargaining" transformed the dynamics of labor relations, shifting the balance between workers, unions, and the State, and signaling that, in contexts of macroeconomic instability and containment policies, collective bargaining functioned more as an instrument of regulation and discipline than as a mechanism for expanding rights.

5 IMPACTS ON UNIONISM

The implementation of the "negative negotiation" strategy has had significant effects on Argentine trade unionism. Among the main impacts are the reduction in the bargaining power of unions, especially in strategic sectors such as transport, energy and public administration, where the historical unions have had their ability to impose substantial wage increases limited by the government and the employers' chambers. In addition, there was an increase in labor conflict, with episodes of partial strikes, protests, and grassroots mobilizations that sought to compensate for the restriction of formal increases (Etchemendy & Collier, 2007; MTESS, 2016).

In some sectors, such as health and education, the weakening of the central union leaderships led to a greater role of the rank-and-file, which began to press directly for wage increases and better working conditions, even in fragmented and localized contexts. This dynamic contributed to the fragmentation of the trade union movement, evidenced by the

multiplication of smaller unions and internal dissidence within historical confederations (Atzeni & Ghigliani, 2013; ODS-CTA Autónoma, 2016; Varela, 2015).

Despite these restrictions, collective bargaining remained a central space for dispute, albeit under more limited conditions. Even in a context of economic restraint, unions continued to play a relevant political and social role, acting as mediators between workers, the State and capital, and as channels of demands that influenced government decisions and sectoral public policies (Etchemendy & Collier, 2007; Atzeni & Ghigliani, 2013; MTESS, 2016; ODS-CTA Autónoma, 2016; Varela, 2015).

6 METHODOLOGY

This study adopts a qualitative approach, centered on the critical analysis of collective bargaining in Argentina, focusing on the transformations that occurred during the period from 2003 to 2015 and on the reconfiguration of labor relations from 2015 onwards, marked by the implementation of the "negative negotiation" strategy.

The research is mainly based on literature review and documentary analysis. Classical and contemporary academic studies on labor relations were used (Gramsci, 1991; Hyman, 1981; Kelly, 1998; Marticorena, 2014, 2015), as well as institutional reports, official data on collective bargaining, wage statistics and publications by trade union organizations (CIFRA, 2017; MTESS, 2016; ODS-CTA Autónoma, 2016). The analysis also included case studies on strategic sectors of the Argentine economy, allowing the identification of patterns, strategies and effects of state and union action.

The methodological approach prioritizes the dialogue between theory and empiricity, articulating concepts of segmented neo-corporatism, union mobilization, and state intervention, in order to understand both the formal mechanisms of collective bargaining and the underlying dynamics of social and political conflict. The analysis sought to identify recurrent elements that evidence the institutionalization of the conflict, the centrality of wage demands and the relationship between macroeconomic stability and the negotiation capacity of unions.

The research also adopts a historical-comparative character, contextualizing the expansion of collective bargaining between 2003 and 2015, the impact of the 2015 crisis and the state response in the form of "negative bargaining". This approach allows us to understand the evolution of the labor relations system, highlighting concrete examples of wage policies, sectoral agreements and union strategies.

Finally, the methodology applied guarantees a critical and detailed analysis of the theme, articulating multiple sources of information and allowing the evaluation of the interactions

between the State, unions and capital, as well as the effects of economic policies on collective bargaining and Argentine unionism.

7 RESULT AND DISCUSSION

The results indicate that, between 2003 and 2015, collective bargaining in Argentina was consolidated as the main mechanism for regulating labor relations, promoting the institutionalization of conflict and strengthening the role of organized unions. The analysis of historical data and case studies reveals that the reactivation of parity negotiations, the expansion of union coverage, and the centrality of wage demands allowed strategic sectors, such as metallurgy, transportation, and public services, to negotiate consistent wage increases, bonuses, and improvements in working conditions, strengthening the pressure capacity of the union rank and file (Etchemendy & Collier, 2007; Atzeni & Ghigliani, 2013; CIFRA, 2017; Trajtemberg et al., 2012; Senén González et al., 2010; Womack, 2008).

From 2015 onwards, there was a reconfiguration of the labor scenario, marked by the adoption of the "negative negotiation" strategy. The results indicate that this policy reduced the bargaining power of unions, promoted wage agreements below inflation and weakened the capacity for union pressure. In sectors such as public transport and public administration, average wage increases did not exceed 10% per year, while inflation exceeded 20%, evidencing the discrepancy between wage gains and cost of living (Actis & Creus, 2015; Actis, Lorenzini & Zelicovich, 2016; Adamson, 2002; Alfaro, 2015).

The analysis also reveals that, even under restrictive conditions, unionism has not been eliminated. On the contrary, in some sectors there was a greater role of the rank-and-file, which assumed an active role in negotiation and mobilization, resulting in the fragmentation of the trade union movement and an increase in labor conflict (Etchemendy & Collier, 2007; Atzeni & Ghigliani, 2013; MTESS, 2016; ODS-CTA Autónoma, 2016; Varela, 2015). These results indicate that collective bargaining continued to be a space for political and social dispute, although under a regime of wage restraint and economic discipline promoted by the State.

The discussion of the results suggests that the 2015 crisis not only changed the dynamics of wage negotiations, but also highlighted the State's capacity to redefine the limits of union action. While in previous years unions were able to expand coverage and consolidate wage gains in strategic sectors, "negative negotiation" restricted these achievements and imposed clear limits on union action.

However, the persistence of grassroots mobilizations and the negotiation of sectoral agreements demonstrate that the collective strength of workers still functioned as a mechanism

of resistance and regulation of labor relations (Marticorena, 2014, 2015; Palomino, 2008; Varela, 2015).

In summary, the results indicate that collective bargaining in Argentina is simultaneously an instrument of institutionalization of conflict and an arena of political dispute. The economic crisis of 2015 and wage containment policies reinforce the idea that the effectiveness of collective bargaining depends on the capacity of the State, the union organization and the macroeconomic context, configuring a complex balance between economic stability and labor rights.

8 CONCLUSION

The present study demonstrated that collective bargaining in Argentina, far from being a static or merely formal practice, has functioned as a central space of political and social dispute over the last decades. Between 2003 and 2015, it was consolidated as an instrument capable of articulating the interests of workers, unions and the State, in a context of economic expansion and strengthening of labor institutions. From 2015 onwards, however, this balance was profoundly altered by the emergence of a new pattern of state intervention in labor relations that this author proposes to conceptualize as "negative collective bargaining" a process in which the State not only moderates wage demands, but systematically conditions, limits and redirects collective bargaining according to restrictive macroeconomic goals, reducing the capacity for union pressure and converting the negotiation space into an instrument of labor discipline.

This concept of negative collective bargaining does not simply describe a temporary containment of wage increases, but a reconfiguration of labor relations in which the institutional mechanisms of mediation cease to be arenas of effective dispute for social advances to become tools for containing demands, inserting collective bargaining in a logic of structural limitations imposed by the State.

The importance of this text as an object of study in graduate programs lies in its ability to unite historical, critical, and empirical analysis of labor relations with a crucial contemporary debate on the role of the State, trade unionism, and economic policies in crisis contexts. Additionally, due to the growing interdependence of economies and the circulation of neoliberal policies on a global scale, this work can enrich international exchange programs by offering students and researchers an in-depth understanding of the challenges faced by collective bargaining regimes, allowing comparisons with experiences from other countries, and encouraging theoretical dialogues on labor relations models in booming and crisis cycles.

Reflecting on the current Argentine political and social moment, the recent labor reform promoted by the government of *Javier Milei* represents a significant social setback in the field of labor rights. The reform, which extended the working day, made contracts more flexible, changed the calculation of compensation and imposed restrictions on the right to strike, symbolizes a decisive turn towards the deregulation and precariousness of working conditions, a transformation that many analysts, unions and social movements qualify as an attempt to weaken the historical achievements of the Argentine labor movement and to subordinate labor relations to the demands of capital and the markets.

This set of changes, instead of offering an equitable "modernization", tends to widen power asymmetries, reduce basic protections for workers, and deepen social vulnerability, characteristics that, in the author's assessment, represent a significant setback in the framework of labor rights built over years of collective struggles and negotiations.

Finally, this research reaffirms that collective bargaining is not a mere technical artifact, but a field of struggle, deeply conditioned by economic and political transformations. Understanding its multiple configurations, including negative forms of negotiation, is essential not only to decipher Argentina's recent past, but also to anticipate and critically respond to contemporary challenges of labor relations in contexts of crisis and global reorganization.

9 INSTITUTIONAL NOTE

The present study was delivered to the Graduate Office of the Universidad Nacional de Córdoba as a mandatory requirement for the qualification of the Graduate Program in Law and Social Sciences, at the third face-to-face meeting held in Córdoba, Argentina, in July 2015, under the title: Thesis Project. Its development was interrupted in July 2017, under the agreement with ISPED.

Although the study was originally developed in the context of 2015, its analysis in this research has been revised and updated, remaining relevant to understanding the current challenges of labor relations in Argentina. In our assessment, the reform of the Milei government, known as part of the package of economic deregulation measures often associated with the Basic Law (or "Bus Law") and the Decree of Necessity and Urgency (DNU) No. 70/2023 may compromise social and redistributive advances. Such a scenario reinforces the importance of studies like this one to monitor, analyze and critically debate the transformations in labor relations in the country.

ACKNOWLEDGMENTS

The author thanks the Graduate Scholarship Incentive Program of the State University of Minas Gerais, Frutal Unit, through the ProBPG/UEMG Institutional Graduate Scholarships, for the financial support and incentive to research, which enabled the development of this study.

ABSTRACT

Chaco Province (Argentina) is characterized by extensive arable land and marked environmental heterogeneity, which directly impact productive development and enable high maize production levels. Although previous studies have compared average yields among hybrids, understanding the response of different genetic groups to environmental variability remains essential. This study analyzed the differential response in grain yield and starch content of tropical, temperate × tropical, and temperate maize hybrids grown across different locations in the province, considering edaphic and climatic conditions based on previously published data. Results indicated that the temperate group achieved the highest average grain yield (82.20 qq/ha) and a high starch content (73.48%), although its performance varied depending on environmental conditions. The tropical group showed a lower average grain yield (70.71 qq/ha) but exhibited differential responses, particularly in environments with

variations in precipitation and soil type. Overall, the results suggest that hybrid selection should not rely solely on average yield but also on adaptation to specific environmental conditions. Environmental factors such as precipitation (308–820 mm) and soil characteristics (organic matter: 0.40–1.50%) influenced the expression of the genetic potential of each group. It is concluded that a significant interaction exists between genetic group and environment, which is critical for the recommendation of hybrid materials across the different productive subregions of Chaco.

RESUMO

A Província do Chaco (Argentina) caracteriza-se por extensas áreas agricultáveis e marcada heterogeneidade ambiental, fatores que impactam diretamente o desenvolvimento produtivo e possibilitam elevados níveis de produção de milho. Embora estudos anteriores tenham comparado os rendimentos médios entre híbridos, compreender a resposta de diferentes grupos genéticos à variabilidade ambiental continua sendo essencial. Este estudo analisou a resposta diferencial no rendimento de grãos e no teor de amido de híbridos de milho tropicais, temperados × tropicais e temperados cultivados em diferentes localidades da província, considerando as condições edáficas e climáticas com base em dados previamente publicados. Os resultados indicaram que o grupo temperado apresentou o maior rendimento médio de grãos (82,20 qq/ha) e elevado teor de amido (73,48%), embora seu desempenho tenha variado de acordo com as condições ambientais. O grupo tropical apresentou menor rendimento médio de grãos (70,71 qq/ha), mas demonstrou respostas diferenciais, especialmente em ambientes com variações de precipitação e tipo de solo. De modo geral, os resultados sugerem que a seleção de híbridos não deve se basear apenas no rendimento médio, mas também na adaptação às condições ambientais específicas. Fatores ambientais, como precipitação (308–820 mm) e características do solo (matéria orgânica: 0,40–1,50%), influenciaram a expressão do potencial genético de cada grupo. Conclui-se que existe interação significativa entre grupo genético e ambiente, fator essencial para a recomendação de materiais híbridos nas diferentes sub-regiões produtivas do Chaco.

RESUMEN

La provincia del Chaco (Argentina) presenta amplias superficies cultivables y una marcada heterogeneidad ambiental, que generan un impacto directo en el desarrollo productivo y permiten alcanzar altos volúmenes de producción de maíz. Si bien estudios previos han comparado rendimientos promedio entre híbridos, resulta fundamental comprender la respuesta de los distintos grupos genéticos frente a la variabilidad ambiental. En este trabajo se analizó la respuesta diferencial en rendimiento en grano y contenido de almidón de híbridos de maíz tropicales, templado × tropical y templados, cultivados en distintas localidades de la provincia, considerando condiciones edáficas y climáticas a partir de datos previamente publicados. Los resultados indicaron que el grupo templado presentó el mayor rendimiento promedio en grano (82,20 qq/ha) y un alto contenido de almidón (73,48 %), aunque con variaciones en su desempeño según el ambiente. El grupo tropical mostró un menor rendimiento promedio (70,71 qq/ha), pero evidenció respuestas diferenciales, particularmente en ambientes con variaciones en la precipitación y el tipo de suelo. En conjunto, los resultados sugieren que la elección del híbrido no debe basarse únicamente en el rendimiento promedio, sino también en su adaptación a condiciones específicas. Factores

ambientales como la precipitación (308–820 mm) y las características edáficas (materia orgánica: 0,40–1,50 %) influyeron en la expresión del potencial genético. Se concluye que existe una interacción significativa entre el grupo genético y el ambiente, lo cual resulta clave para la recomendación de materiales híbridos en las distintas subregiones productivas del Chaco.

1 INTRODUCTION

The challenge for agricultural production in Argentina lies in seizing the opportunity to supply the growing global demand for food and renewable energy [1]. In this context, corn occupies a strategic role, both in crop rotation and as a source of raw material for various production chains [1].

The province of Chaco is an extra-Pampas region relevant in corn production [2], although its planted area and production levels are strongly conditioned by climatic factors [3]. In this framework, the development of hybrids has made it possible to improve genetic characteristics associated with yield and tolerance to adverse conditions [4, 5], including biotic [6] and abiotic factors such as water availability [7] and herbicide tolerance [8].

Grain yield and quality are determined by genotype, environment, and their interaction ($G \times E$) [9, 10]. Environmental factors such as temperature [11, 13, 15] and solar radiation [12] influence crop growth and grain composition, particularly characteristics such as starch content and structure [14]. The quality of the grain, including components such as starch, protein and oil, is key to its industrial use [16, 17].

In this sense, sustainable regional development [19] promotes the addition of value to primary production. The use of corn for bioenergy generation in northern Argentina represents an alternative to strengthen the value chain, contribute to sustainability, and generate employment [19], although its implementation depends on appropriate policy frameworks [20].

Previous studies carried out in the province of Chaco have compared the average yield and starch content of different hybrids. However, the marked environmental variability within the province [Tables 2 and 3] makes it necessary to advance in the analysis of the differential response of genetic materials, beyond the average values. In particular, it is relevant to understand how different groups of hybrids (tropical, temperate $\times$ tropical and temperate) respond to this environmental heterogeneity.

The objective of this study was to analyze the differential response in grain yield and starch content of groups of maize hybrids (tropical, temperate $\times$ tropical and temperate) to environmental variations in different localities of the province of Chaco, using previously reported group average data.

2 DEVELOPMENT AND METHODOLOGY

This analysis was based on data collected from a previous comparative study conducted in Chaco Province, Argentina. In this study, planting blocks with maize genetic materials classified into three groups were evaluated: tropical, temperate $\times$ tropical and temperate (Table

1), implanted in various agricultural farms located between Latitude 26° 00' 46.4" and 27° 57' 45.72" S, and Longitude 60° 08' 36.76" and 61° 41' 19.28" W (Figure 1).

The differential response of the hybrid groups to environmental variability was evaluated by:

- Visual analysis, examining patterns of yield and starch content between localities, with emphasis on changes in the relative ranking of groups.
- Quantification of variability, by calculating the standard deviation (SD) and the coefficient of variation (CV) for each genetic group, as indicators of response stability.
- Qualitative correlation analysis, relating the relative performance of the groups with the environmental characteristics of each locality, in order to identify factors potentially associated with the observed variation.

It should be noted that the analysis was carried out at the level of groups of hybrids, using average values. Consequently, inferences about stability and differential response correspond to the mean behavior of each group and not to individual hybrids.

3 RESULTS AND DISCUSSION

The data on grain yield (Table 4) and starch content (Table 5) constitute the basis for the analysis of the differential response of the groups of hybrids to environmental variability.

In terms of yield, the temperate group presented the highest general average (82.20 qq/ha), surpassing the temperate × tropical group (74.38 qq/ha) and the tropical group (70.71 qq/ha). However, the magnitude of this superiority varied between localities, evidencing a marked genotype × environment (G×E) interaction. In high-potential environments, such as Río Muerto, Pampa del Infierno (LG) and localities of General Capdevila, the temperate group reached the highest yield values. In contrast, in more restrictive environments, such as Tres Isletas (Ma) and Campo Largo, yields were lower and differences between groups were reduced, with changes in the relative ranking being observed.

The variability of yield between environments, estimated by standard deviation, was greater in the temperate group (≈17.8 qq/ha), compared to the temperate × tropical (≈12.6

qq/ha) and the tropical (≈ 14.6 qq/ha) groups. This result suggests that, although the temperate group has greater productive potential, it also exhibits greater sensitivity to environmental conditions, which reinforces the existence of a significant G×E interaction.

In relation to starch content, the differences between groups were less marked. The average values were similar between temperate (73.48%), tropical (72.81%) and temperate × tropical (72.74%), with no evidence of a consistently higher group in all localities. However, occasional variations were observed, such as in Campo Largo, where the tropical group reached the highest starch content, and in Hermoso Campo, where the temperate group presented the highest values.

The variability of starch content was considerably lower than that of yield, especially in the temperate group ($SD \approx 0.8\%$), indicating greater stability of this quality variable in the face of environmental changes. In this sense, the relationship between yield and starch content was not direct, since high-performance environments were not necessarily associated with higher starch contents.

The joint analysis with the environmental variables (Tables 2 and 3) did not show simple associations between a single factor (such as precipitation or organic matter content) and the performance of the groups. For example, localities with high rainfall, such as Tres Isletas (DS), did not systematically present the highest yields, while environments with low levels of organic matter showed variable responses. Likewise, in General Capdevila, the high yields observed in all groups, despite edaphic variations, suggest the influence of other local or management factors not considered.

Taken together, these results confirm that the response of hybrid groups is determined by a complex interaction between climatic, edaphic, and management factors, in accordance with what has been reported in the literature [9, 10, 15]. The temperate group tends to maximize its potential in favorable environments, while the tropical and temperate × tropical groups present more variable responses, which could be associated with differences in adaptation and phenotypic plasticity.

It should be noted that the use of group averages constitutes a limitation for interpretation at the level of individual hybrids. However, the results obtained are relevant from the agronomic point of view, since they indicate that the classification by genetic origin (tropical vs. temperate) has implications in the adaptation to the environmental heterogeneity of the province of Chaco.

4 CONCLUSIONS

The analysis of the response of groups of maize hybrids in different localities of the province of Chaco showed a significant interaction between the genetic group and the environment ($G \times E$).

The temperate group presented the highest average yield, although it also showed the greatest variability between environments, indicating a greater sensitivity to environmental conditions. In contrast, the starch content was relatively similar between groups, with the temperate group standing out for its greater stability in this variable.

No simple relationships were identified between isolated environmental factors and the differential response of the groups, suggesting a complex interaction of multiple variables that modulate the expression of genetic potential.

From a productive perspective, the selection of hybrids in the province of Chaco must consider not only the average yield, but also the specific adaptation to the environmental conditions of each locality.

Finally, while this study provides evidence at the group level, scaled analyses of individual hybrids are required to deepen the assessment of stability and specific adaptation.

ABSTRACT

This study addresses the use of Digital Information and Communication Technologies (DICTs) in mathematics education within Youth and Adult Education (YAE), a modality characterized by interrupted school trajectories, sociocultural diversity, and historical learning challenges. The objective was to investigate how DICTs have been used to adapt mathematical activities for YAE high school students, analyzing theoretical productions, teaching materials, and educational documents. Methodologically, it is a bibliographic and documentary research, with a qualitative approach and a pedagogical-propositional character, organized through analytical categories that enabled a critical interpretation of the findings. Results indicate that DICTs, when integrated into pedagogical proposals planned and critically mediated by teachers, can enhance the visualization of mathematical concepts (C1), increase student engagement through gamification (C2), and promote more meaningful and contextualized learning experiences (C3). The analysis also highlights limitations related to precarious technological infrastructure, digital access inequalities, and gaps in teacher training (C4). It is concluded that the integration of DICTs into mathematics teaching in YAE represents a promising path for building more inclusive and contextualized pedagogical practices, provided it is articulated with teacher training policies and digital inclusion initiatives. The main contribution of this research lies in the articulation between theoretical analysis and pedagogical proposition, by presenting a set of didactic activities adapted with DICTs, offering concrete support for teachers and researchers interested in more critical, inclusive, and transformative practices in mathematics education within YAE.

RESUMO

Este trabalho insere-se no debate sobre o uso das Tecnologias Digitais da Informação e Comunicação (TDICs) no ensino da matemática na Educação de Jovens e Adultos (EJA), modalidade marcada por trajetórias escolares interrompidas, diversidade sociocultural e desafios históricos de aprendizagem. O objetivo foi investigar como as TDICs vêm sendo utilizadas na adaptação de atividades matemáticas para estudantes da EJA no Ensino Médio, analisando produções teóricas, materiais didáticos e documentos educacionais. Metodologicamente, trata-se de uma pesquisa bibliográfica e documental, de abordagem qualitativa e caráter propositivo-pedagógico, organizada a partir de categorias analíticas que possibilitaram interpretação crítica dos achados. Os resultados indicam que as TDICs, quando integradas a propostas pedagógicas planejadas e mediadas criticamente pelo professor, favorecem a visualização de conceitos matemáticos (C1), ampliam o engajamento discente por meio da gamificação (C2) e promovem aprendizagens significativas e contextualizadas às vivências dos estudantes (C3). A análise também evidencia limites associados à infraestrutura tecnológica precária, às desigualdades de acesso digital e às lacunas na formação docente (C4). Conclui-se que a integração das TDICs ao ensino da matemática na EJA constitui um caminho promissor para práticas pedagógicas mais inclusivas e contextualizadas, desde que articulada a políticas de formação docente e inclusão digital. A principal contribuição da pesquisa está na articulação entre análise teórica e proposição pedagógica, ao apresentar atividades didáticas adaptadas com TDICs, oferecendo subsídios concretos para professores e pesquisadores interessados em práticas críticas, inclusivas e transformadoras no ensino da matemática na EJA.

RESUMEN

Este trabajo se enmarca en el debate sobre el uso de las Tecnologías de la Información y la Comunicación Digitales (TICD) en la enseñanza de las matemáticas en la Educación de Jóvenes y Adultos (EJA), una modalidad marcada por trayectorias escolares interrumpidas, diversidad sociocultural y desafíos históricos en el aprendizaje. El objetivo fue investigar cómo se han utilizado las TICD en la adaptación de actividades matemáticas para estudiantes de EJA en la escuela secundaria, analizando producciones teóricas, materiales didáticos y documentos educativos. Metodológicamente, se trata de una investigación bibliográfica y documental, con un enfoque cualitativo y un carácter proposicional-pedagógico, organizada a partir de categorías analíticas que permitieron una interpretación crítica de los hallazgos. Los resultados indican que las TICD, cuando se integran en propuestas pedagógicas planificadas y mediadas críticamente por el docente, favorecen la visualización de conceptos matemáticos (C1), aumentan la participación del alumnado mediante la gamificación (C2) y promueven un aprendizaje significativo y contextualizado relacionado con las experiencias del alumnado (C3). El análisis también pone de relieve las limitaciones asociadas a la infraestructura tecnológica precaria, las desigualdades en el acceso digital y las brechas en la formación docente (C4). El estudio concluye que la integración de las TIC en la enseñanza de las matemáticas en la educación de adultos constituye una vía prometedora para prácticas pedagógicas más inclusivas y contextualizadas, siempre que se articule con la formación docente y las políticas de inclusión digital. La principal contribución de la investigación radica en la articulación entre el análisis teórico y la propuesta pedagógica, mediante la presentación de actividades didáticas adaptadas con TIC, que ofrecen apoyo concreto a docentes e investigadores

interesados en prácticas críticas, inclusivas y transformadoras en la enseñanza de las matemáticas en la educación de adultos.

1 INTRODUCTION

Digital Information and Communication Technologies (DICTs) comprise a set of resources, tools, and digital environments that make it possible to produce, share, and transform information, promoting significant changes in social and educational practices. In the contemporary school context, the role of DICTs goes beyond the merely instrumental use of devices, involving new ways of thinking, interacting and learning, aligned with the dynamics of digital culture. As analyzed by Anjos et al. (2024), the evolution of educational technologies shows a progressive transition from analog resources to more complex and intelligent digital systems, a process marked by challenges related to teacher training, inequality of access, limited infrastructure, and the need for qualified pedagogical mediation.

In this sense, the authors highlight that DICTs expand the possibilities of communication, collaboration and creation, favoring student protagonism in more active, dynamic and contextualized learning processes. However, the pedagogical use of these technologies requires not only technical mastery, but, above all, educational intentionality and critical understanding of the cultural transformations that characterize the contemporary digital scenario, pointing to perspectives based on the personalization of learning, the integration of multiple languages, and the construction of innovative pedagogical practices (Anjos et al., 2024).

Youth and Adult Education (EJA), in turn, is configured as a teaching modality aimed at guaranteeing the right to schooling of subjects who did not complete Basic Education at the regular age, as a result of socioeconomic inequalities, early insertion in the world of work, family responsibilities, migrations and school trajectories marked by successive dropouts or failures (Almeida; Silva; Torres, 2021; Ferreira, 2024). In high school, this commitment intensifies, requiring pedagogical practices that recognize and value the life trajectories of students, especially in the teaching of mathematics, a discipline historically associated with abstraction and processes of exclusion. According to Freire (2005), the so-called "banking education" reinforces this exclusion by treating students as passive receptacles of content, in a teaching model that deposits information without dialogue or problematization. Overcoming this logic implies adopting critical and liberating pedagogical practices, capable of promoting active participation, collective construction of knowledge and appreciation of the experiences of EJA subjects.

In the context of EJA Médio, a heterogeneous public is observed, composed of young people and adults who reconcile work, family and studies, returning to school in search of professional qualification, social ascension or personal fulfillment. These students have diverse

life experiences and, frequently, a weakened relationship with school content, especially with mathematics (Freire, 1999). This discipline is often perceived as an obstacle to learning, due to accumulated conceptual gaps and the absence of methodologies that dialogue with their realities.

During pedagogical activities carried out in the Supervised Internship III in EJA Médio classes, it was possible to identify the students' interest in the use of technological resources, although difficulties persist related to the handling of digital devices, regular access to the internet and familiarity with educational platforms. These findings reveal limitations associated with school infrastructure, teacher training and digital inclusion, but also point to the potential of DICTs as mediators of mathematical learning. When used with pedagogical intentionality, DICTs can contribute to making the teaching of mathematics more accessible, visual and meaningful, as highlighted by Valente (2018), when he argues that educational technology should be articulated with pedagogical proposals that value the active participation of the student and the construction of knowledge.

This perspective is reinforced by Maietto (2025), when he argues that the integration of technologies into the teaching of mathematics in EJA can contribute to overcoming historical learning difficulties, as long as it is inserted in critical and inclusive pedagogical practices. Almeida; Oliveira (2023) also point out that mobile devices, such as smartphones and tablets, widely present in the daily lives of students, can be important allies in the teaching-learning process, when used in a planned and contextualized way.

In view of this scenario, this work aims to investigate how DICTs have been used in the adaptation of mathematical activities for EJA students in High School, analyzing theoretical productions, didactic materials and educational documents related to the theme. The research seeks to understand how these technologies are being incorporated into pedagogical practices and what limits and possibilities emerge from this process. The question that guides the study is: How have DICTs been used in the adaptation of mathematical activities for high school students, considering the pedagogical and technological challenges of this context? It is based on the hypothesis that, although there are initiatives that mention the use of DICTs, many of them still have difficulties in dialoguing with the concrete reality of public schools, especially with regard to infrastructure, teacher training and digital inclusion.

The relevance of this study is associated with the need to contribute to the construction of pedagogical practices that are more sensitive to the specificities of EJA students. When taught in a decontextualized way, mathematics can constitute an obstacle to learning; however,

when adapted with the support of DICTs and articulated with the students' experiences, it can become an instrument of empowerment, autonomy and social participation.

This work is structured in five sections: the first presents the introduction, with the theme, justification, problem, relevance, objective and structure of the study; the second section exposes the theoretical foundation; the third describes the methodological procedures; the fourth brings the proposal of activities adapted to EJA through the use of DICTs; and the fifth section presents the final considerations and suggestions for future practices.

2 THEORETICAL FRAMEWORK

This section presents the theoretical references that underlie the proposal of this work, which aims to investigate and propose adaptations of mathematics activities for EJA, mediated by the use of DICTs. Thus, it seeks to contribute to the construction of more inclusive, contextualized pedagogical practices that are sensitive to the specificities of students in this type of education.

The theoretical contributions mobilized allow us to understand mathematics education in EJA from a perspective that recognizes digital technologies not only as didactic resources, but as cultural and pedagogical elements capable of favoring the inclusion, autonomy and protagonism of the subjects, expanding the possibilities of meaningful learning.

2.1 YOUTH AND ADULT EDUCATION (EJA)

EJA is a modality of Basic Education aimed at guaranteeing the right to schooling of subjects who did not have access to or continuity of studies at the regular age, due to historical, social, economic and cultural factors. More than a space for school compensation or recovery, EJA is configured as an educational field marked by the diversity of trajectories, the plurality of life experiences and the need for pedagogical practices sensitive to the specificities of the students who compose it.

The EJA subjects bring with them stories of school interruptions, early insertion into the world of work, family responsibilities and experiences in contexts of social vulnerability. In this scenario, education assumes a strategic role in the reconstruction of life projects, in the valorization of knowledge built throughout social and professional experiences, and in the affirmation of historically marginalized identities. Thus, EJA demands pedagogical proposals that recognize the complexity of the subjects and promote significant and emancipatory formative processes.

Freire's (1997) critical pedagogy offers important foundations for understanding EJA as a space for dialogue, listening and collective construction of knowledge. By stating that "authentic education is not made of A to B or of A on B, but of A to B, mediated by the world" (Freire, 1997, p. 68), the author emphasizes the centrality of dialogical relations in the educational process, breaking with banking and transmissive practices. The so-called banking education consists of treating students as passive recipients of content, in a teaching model that deposits information without dialogue or problematization. This criticism is particularly relevant in EJA, as it recognizes students as active subjects, bearers of knowledge and experiences that must be considered in the teaching-learning process.

This perspective also dialogues with my own trajectory: graduated from a public school, with passages through technical and higher education courses interrupted, I experienced in practice the limits of an education that often does not dialogue with the realities of students. Like many EJA students, I had to reconcile work, family and studies, which reinforces the importance of a pedagogy that recognizes previous knowledge and values non-linear paths.

In his reflection on the ethical and political dimension of education, Freire (2002) highlights that educational practice must be committed to humanization and to overcoming oppressive relations, understanding education as a process of social transformation. In this sense, EJA assumes a political-pedagogical character by enabling young people and adults to appropriate knowledge as an instrument of critical reading of reality and conscious intervention in the world.

Gadotti (2000, p. 17) reinforces this perspective when he states that "educating is a political act. Every educational practice implies a conception of man and society". Also for Gadotti, EJA requires its own approach, which starts from the concrete experiences of students and recognizes their knowledge as a starting point for the construction of knowledge:

"Youth and adult education cannot be a simple reproduction of formal education for young people. It must be thought of from the needs, desires and experiences of the subjects who participate in it. It is an education that requires sensitivity, listening and commitment to social transformation." (Gadotti, 2000, p. 45)

From this perspective, EJA is not limited to the physical space of the classroom, but is configured as a territory of resistance, welcoming, and the production of meanings. Students who attend this modality are not only resuming interrupted schooling, but reconstructing formative trajectories and projecting new personal and professional horizons. Such understanding reinforces the need for pedagogical practices that dialogue with the daily lives of students, value their knowledge and promote contextualized and socially relevant learning.

From a legal and normative point of view, EJA is supported by the Federal Constitution of 1988, which ensures education as a right of all and a duty of the State, as well as in the National Common Curricular Base (BNCC), which recognizes the diversity of Basic Education subjects and the need for inclusive pedagogical practices (Brasil, 2018). In addition, recent studies, such as those by Freires et al. (2024), reinforce the importance of EJA in promoting educational equity and guaranteeing the right to lifelong education.

Thus, understanding Youth and Adult Education as a specific educational field implies recognizing its historical challenges and its formative potentialities. EJA requires pedagogical proposals committed to inclusion, dialogue and appreciation of the experiences of the subjects, constituting a fundamental space for the construction of a democratic, emancipatory and socially referenced education.

2.2 THE TEACHING OF MATHEMATICS IN YOUTH AND ADULT EDUCATION (EJA)

Teaching mathematics in EJA requires the articulation between school concepts and the concrete experiences of students, since these subjects mobilize mathematical knowledge in different daily practices, such as at work, in the organization of household finances and in time management. However, such knowledge is not always recognized as legitimate in the school space, which reinforces the need for pedagogical practices that value it as a starting point for the construction of more meaningful mathematical learning (Hirye; Higa; Altoé, 2023).

In this sense, ethnomathematics, proposed by D'Ambrosio (2005), offers important contributions to the understanding of mathematics teaching in EJA. By arguing that different cultures produce their own ways of thinking and doing mathematics, the author proposes an approach that values knowledge built in different sociocultural contexts. For D'Ambrosio (2005), mathematical ideas associated with processes such as comparing, classifying, quantifying, measuring and organizing are inherent to human nature and manifest themselves in multiple ways, and should be recognized as legitimate expressions of mathematical thought. This perspective contributes to breaking with homogeneous and universalizing conceptions of school mathematics, favoring more inclusive and contextualized pedagogical practices in EJA.

Complementing this view, Vygotsky's (1998) historical-cultural theory also offers relevant subsidies for the teaching of mathematics in this modality, by understanding learning as a socially mediated process. According to the author, the development of thought is directly related to social interactions and language, and knowledge is built in the relationship between subject and object, mediated by culturally shared signs and meanings. In the context of EJA, this approach reinforces the importance of pedagogical practices that promote interaction,

dialogue and collaboration, enabling students to build mathematical knowledge from the exchange of experiences and teacher mediation.

From this perspective, mathematical learning in EJA must be meaningful and connected to the students' reality, as defended by Maietto (2025). The author argues that the use of digital resources, such as videos, games and simulators, can contribute to overcoming historical learning difficulties, as long as these tools are integrated with critical and inclusive pedagogical proposals. Such proposals are not limited to the instrumental use of technology, but seek to promote active participation, question inequalities and value the knowledge of students, recognizing their trajectories and experiences.

For Maietto (2025), the use of digital technologies in mathematics teaching should not be restricted to the reproduction of content, but favor dialogue, the collective construction of knowledge and the appreciation of students' knowledge, promoting greater autonomy and engagement. This reflection dialogues with my own experience: when working with technology and logistics, I realized that the use of simulators and software not only reproduces information, but allows you to understand processes in a practical and contextualized way — the same as what is expected in teaching mathematics to EJA.

Gonçalves et al. (2017) corroborate this understanding by highlighting that digital technologies can play a significant role in making classes more dynamic and expanding the possibilities of expression for EJA students:

"The use of technological resources, when well planned, can favor the autonomy of students, expand their possibilities of expression and promote more meaningful learning, especially in the context of EJA, where students bring with them diverse experiences and knowledge built outside the school environment." (Gonçalves et al., 2017, p. 147)

In the context of educational policies and materials, the didactic material structured by the Department of Education of the State of Ceará (SEDUC-CE), in 2023, presents proposals organized around problem solving and student protagonism. Although it does not directly explain the use of digital technologies, its pedagogical structure favors adaptations to digital environments, allowing the teacher to incorporate explanatory videos (such as Khan Academy and YouTube Edu), simulators (such as GeoGebra and PhET) and interactive platforms (such as Moodle and Google Classroom), expanding the possibilities of teaching and learning mathematics in EJA.

Thus, the teaching of mathematics in EJA should be understood as a process that articulates school knowledge and everyday knowledge, promoting the construction of contextualized and socially relevant knowledge. In this scenario, Digital Information and

Communication Technologies (DICTs) emerge as potential allies, as long as they are integrated with critical pedagogical proposals, mediated by the teacher and committed to valuing students' experiences. Resignifying the teaching of mathematics in EJA implies, therefore, recognizing the subjects as protagonists of their learning and building educational practices that dialogue with their realities, life projects and with the demands of society, which require mathematical skills applied to the world of work, citizenship and daily life.

Finally, it is necessary to consider that, although mobile devices such as smartphones and tablets are widely present in the daily lives of students and offer great pedagogical potential (Almeida; Oliveira, 2023), many institutions maintain restrictions on their use in the classroom. In this context, it is up to the teacher to seek regulated alternatives, such as computer labs or institutional tablets, ensuring that technology is used in a pedagogical way and not just recreationally.

2.3 DIGITAL INFORMATION AND COMMUNICATION TECHNOLOGIES (TDICS) IN EDUCATION

DICTs have caused significant transformations in the ways of teaching, learning and producing knowledge, directly influencing contemporary pedagogical practices. In the educational context, such technologies go beyond the function of mere technical instruments, configuring themselves as cultural elements that restructure forms of interaction, communication and construction of knowledge. In EJA, DICTs play a strategic role in promoting educational inclusion, personalizing learning, and valuing students' life experiences.

In the context of mathematics teaching, studies indicate that the use of digital resources can favor the visualization of abstract concepts, expand student participation and recognize the knowledge built outside the school space. When intentionally integrated into pedagogical planning, DICTs contribute to more meaningful practices, enabling students to take an active role in the learning process, strengthening their autonomy and protagonism.

Valente (2018) highlights that the pedagogical potential of DICTs is directly related to the teacher's ability to use information about student performance to readjust teaching methods and instruments, promoting the personalization of learning. This idea resonates with my professional experience: when working with logistics and technology, I realized that systematic data monitoring is essential to adjust processes and achieve better results. Similarly, in education, the use of DICTs can allow teachers to personalize teaching according to the needs of each student.

This perspective is reinforced by Kenski (2012), when he states that educational technology is not neutral, as it carries values, intentionalities and worldviews. This reflection is close to my formative path: when dealing with technological systems, I realized that each tool brings with it its own logic and requires a critical posture from the user. In the teaching of mathematics in EJA, this means that the teacher must be aware not only of the technical use of DICTs, but also of the social and cultural implications they carry.

Moran (2007) complements this debate by understanding education as a process of construction of meanings, values and competencies for life in society. According to the author, digital networks make it possible to organize teaching in a more dynamic, active and flexible way. This vision connects with my academic experiences: when I returned to the area of mathematics after experiences in other courses, I realized that flexibility and personalization are essential for the student to be able to reconcile study, work and personal life — a reality common to EJA students.

Fiuza (2015) expands this discussion by arguing that DICTs should be understood as learning environments, and not just as complementary resources. For the author, such technologies require new pedagogical postures, new forms of interaction and different ways of thinking about the curriculum, especially in the context of EJA, in which the promotion of digital inclusion and student autonomy is a central challenge. This reflection is also confirmed in my professional practice: when working with technology, I realized that digital environments are not accessories, but central spaces for learning and interaction.

With regard to the teaching of mathematics in EJA, Almeida; Oliveira (2023) highlight the role of mobile devices, such as smartphones and tablets, as they are widely inserted in students' daily lives. The authors argue that the use of applications, videos and digital games can favor the visualization of abstract mathematical concepts, stimulate student engagement and expand the possibilities of communication between teacher and student, including outside the classroom space. However, it is necessary to recognize that many institutions still maintain restrictions on the use of smartphones in the classroom, which imposes limits on their pedagogical application. In this scenario, it is up to the teacher to seek regulated alternatives, such as computer labs, institutional tablets or supervised digital platforms, ensuring that technology is used in a pedagogical and not just recreational way.

Corroborating this perspective, Maietto (2025) argues that the integration of DICTs into EJA should be associated with critical and inclusive pedagogical proposals, which go beyond the simple reproduction of content. For the author, the use of technologies should provide opportunities for dialogue, the collective construction of knowledge and the appreciation of

students' knowledge, contributing to overcoming historical difficulties in the teaching of mathematics in this modality. This idea is also connected to my academic career: when I returned to mathematics after experiences in other areas, I realized that knowledge only becomes meaningful when it dialogues with the concrete reality of the subjects and their social needs.

Thus, the presence of DICTs in EJA should not be understood as an accessory or occasional resource, but as a pedagogical need in the face of contemporary teaching and learning demands. When used in a planned and critically mediated way by the teacher, these technologies can increase student engagement, favor the understanding of mathematical concepts, and strengthen student protagonism, contributing to more inclusive, contextualized, and meaningful pedagogical practices.

3 METHODOLOGICAL PROCEDURES

The present research is characterized as a bibliographic and documentary study, with a qualitative approach and propositional-pedagogical character, whose objective was to investigate how Digital Information and Communication Technologies (DICTs) have been used in the adaptation of mathematical activities in the context of Youth and Adult Education (EJA), specifically in High School. In addition to the theoretical analysis, the study culminated in the elaboration of a didactic activity adapted and mediated by TDICs, understood as an educational product of the research.

The bibliographic survey was carried out through systematized searches in academic databases and repositories, selected for their relevance in the dissemination of scientific production in the areas of Education, Mathematics Education and Educational Technologies, during the period from 2016 to 2025. SciELO (Scientific Electronic Library Online) was consulted, as it is one of the main open access electronic libraries in Latin America and brings together high-quality scientific journals in Portuguese and Spanish; Google Scholar, for its scope and ability to index articles, theses, dissertations and books from different areas; CAPES Periodicals, for bringing together national and international reference journals and ensuring access to up-to-date studies and scientific credibility; and institutional repositories, such as those of the Federal University of Ceará and IFCE, which provide dissertations, theses and academic works directly related to the local reality and the EJA modality. The choice of these databases is justified by the need to ensure diversity of sources, geographic coverage and scientific reliability, contemplating both international and national and regional productions.

The searches were performed with descriptors combined with Boolean operators, in order to expand and refine the results. The expressions used included, in isolation and combination: "Youth and Adult Education" OR "EJA"; "mathematics teaching" AND "digital technologies"; "teaching mathematics" AND "TDICs"; "EJA" AND "teaching mathematics" AND ("TDICs" OR "educational technologies"); "Youth and Adult Education" AND "digital inclusion". To delimit the scope, exclusion operators were used, such as NOT "Higher Education", NOT "Early Childhood Education" and NOT "Elementary Education", ensuring that the results remained focused on the EJA modality of High School.

The selection of productions was based on previously defined criteria, ensuring methodological rigor and relevance to the object of study. Studies that addressed the use of DICTs in the educational context, productions related to the teaching of mathematics, research that contemplated the EJA modality, works published in Portuguese and publications with theoretical and pedagogical relevance to the analysis were included. Studies that dealt with the use of technologies in a merely instrumental way, without pedagogical problematization, were excluded; research focused exclusively on other stages or modalities of teaching, such as Early Childhood Education, Elementary Education or Higher Education; duplicate jobs; and productions that did not have a direct relationship with the teaching of mathematics in EJA.

After applying these criteria, a corpus was constituted consisting of six studies, systematized in Table 1.

Table 1

Synthesis of the empirical/applied corpus (EJA + Mathematics + DICT)

Author(s) / Year	Type	TDIC(s)	Contents Mathematician	Objective of the study	Main contributions to EJA
Bohrer & Tinti (2021)	Article	GeoGebra on smartphon and	Quadratic function	Investigate difficulties of EJA students when using GeoGebra on their cell phones in activities About quadratic function	It highlights obstacles to use/operationalization and points out the need for teacher mediation and digital literacy to ensure learning with mobility
Santiago (2025)	Article	Augmented Reality (AR)	Geometric Solids	To analyze the impact of AR on the teaching of geometric solids in EJA	Shows AR potential for 3D visualization and engagement; reinforces the importance of planning and conditions of use for Effectiveness
Olive (2023)	Article	Kahoot!	Emphasis Posted on Evaluative Practice/Quiz	Discuss how Kahoot! can assist teachers in EJA	Indicates gain of participation and immediate feedback; suggests use as a strategy for formative assessment and motivation

Monteiro & de Martini (2025)	Work/Report (repository)	Kahoot!	Probability	Analyze the use of Kahoot in the teaching of probability in EJA	It proposes a gamified approach to abstract content; points to potential for logical reasoning and participation, with attention to infrastructure
Silva (2022)	Article	PhET (simulator "Area Constructor")	Area and perimeter	Present the importance of teaching PhET-mediated area/perimeter in EJA	It suggests greater autonomy and learning by exploration/simulation; reinforces the role of the teacher in conducting and problematizing
Araújo (2024)	Scientific Article	Geogebra	Flat geometry	Articulate geometry teaching in EJA with the use of Geogebra	It reinforces the potential of digital resources for concept formation and visualization, with the need for pedagogical intentionality

Source: Authors (2025)

The analysis of the selected studies showed that the use of DICTs in the teaching of Mathematics in EJA does not occur in a homogeneous way, assuming different pedagogical functions according to the didactic objectives, the mathematical contents and the educational context. In view of this, the works were organized into four analytical categories, defined from the literature of Mathematics Education and the recurrence of meanings attributed to DICTs in the analyzed texts.

3.1 C1 – TDICS AS A RESOURCE FOR VISUALIZATION AND CONCEPTUAL CONSTRUCTION

This category brings together studies in which DICTs act primarily as means of mathematical visualization, enabling the dynamic exploration of algebraic, geometric and graphic representations. This perspective dialogues with D'Ambrosio (2005), who recognizes that different cultures produce their own ways of thinking and representing mathematics, and with Valente (2018), who highlights the potential of technologies to personalize learning. In EJA, in which many students have difficulties with formal abstractions, resources such as GeoGebra and PhET favor conceptual construction and autonomy, bringing school knowledge closer to concrete practices.

3.2 C2 – TDICS AS A GAMIFICATION, INTERACTION AND ENGAGEMENT STRATEGY

Category C2 comprises studies that attribute to DICTs a predominantly motivational and interactive function, associated with student engagement, participation in collective activities and formative assessment. This approach is supported by the historical-cultural theory of Vygotsky (1998), when he emphasizes that learning takes place in social interaction mediated

by signs, and also in Moran (2007), who defends dynamic and flexible pedagogical practices. Tools like Kahoot! they promote collective participation and immediate feedback, resignifying the relationship of EJA students with mathematics and strengthening student protagonism.

3.3 C3 – TDICS FOR CONTEXTUALIZATION OF MATHEMATICS IN THE DAILY LIFE OF EJA

Category C3 groups the studies in which DICTs are used as a bridge between mathematical knowledge and the social, professional and daily reality of EJA students. This perspective dialogues directly with Freire's (1997; 2002) critical pedagogy, by valuing the students' previous knowledge and promoting a critical reading of reality. It is also close to the reflections of Maietto (2025), who defends the use of technologies in critical and inclusive proposals. In this sense, DICTs favor contextualized and socially relevant learning, allowing students to relate mathematics to their work practices, finances, and the organization of daily life.

3.4 C4 – LIMITATIONS AND CHALLENGES IN THE USE OF TICS IN EJA

Unlike the previous categories, C4 does not refer to a specific pedagogical function, but to the conditions for the implementation of DICTs in the context of EJA. This category emerges in a transversal way in the corpus, evidencing structural, pedagogical and formative challenges. The reflections of Kenski (2012) and Fiuza (2015) help to understand such limits, by highlighting that educational technology is not neutral and requires new pedagogical postures and adequate conditions of use. Issues such as precarious infrastructure, restriction on the use of smartphones in the classroom and the need for teacher training reveal that the potential of DICTs is only realized when there is pedagogical intentionality and policies that ensure digital inclusion.

Table 2 summarizes the authors analyzed and the analytical categories to which their work was associated.

Table 2

Synthesis of the analyzed corpus and analytical categorization

Author(s) / Year	Type of study	Background	TDIC(s)	Mathematical content	Category(s)
Bohrer & Tinti (2021)	Article Scientific	EJA	GeoGebra	Function Quadratic	C1, C4
Silva (2022)	Article Scientific	EJA	PhET	Area and Perimeter	C1, C3
Olive (2023)	Article Scientific	EJA	Kahoot	Evaluation Mathematics	C2, C4
Araújo (2024)	Article	EJA	Geogebra	Geometry	C1, C3

	Scientific			flat	
Santiago (2025)	Article Scientific	EJA	Reality Increased	Geometry space	C1, C4
Monteiro & De Martini (2025)	Experience report	EJA	Kahoot	Probability	C2, C3

Source: Authors (2025)

From the analysis organized by the analytical categories and in dialogue with the theoretical references, didactic activities adapted with the use of DICTs were elaborated, directed to the teaching of mathematics in EJA – High School. It is noteworthy that, as this is a bibliographic and documentary research, the results do not allow empirical generalizations about the application of DICTs in specific school contexts. Therefore, the need for future empirical investigations, such as case studies or action research, which deepen the analysis of the impact of these practices on the mathematical learning of EJA students, is indicated.

3.5 DIDACTIC ACTIVITIES ADAPTED WITH TDICS IN THE TEACHING OF MATHEMATICS IN EJA

The construction of these activities is based on the understanding that EJA has its own specificities, such as the heterogeneity of the classes, the interrupted school trajectories, the conceptual gaps accumulated throughout the training path and the need to value the knowledge built in the social and professional daily life of the students. In this context, DICTs are understood not only as technical tools, but as cultural artifacts that mediate new ways of thinking, teaching and learning mathematics.

The process of preparing the proposals followed stages articulated between theory and practice. First, the categories identified in the research corpus (conceptual visualization, gamification, contextualization and challenges) were analyzed, in order to understand how different digital resources can contribute to the teaching of mathematics in EJA. Next, we sought to dialogue with the theoretical references: the valorization of previous knowledge and the critical reading of reality, according to Freire (1997; 2002); the importance of social interaction and teacher mediation, according to Vygotsky (1998); and the potential of technologies to personalize and streamline learning, as advocated by Valente (2018), Kenski (2012) and Moran (2007).

From this dialogue, criteria were defined for the construction of the activities: pertinence to the EJA context, integration of DICTs as mediators, pedagogical intentionality, appreciation of student autonomy and practical feasibility in the face of the real conditions of the schools.

Activity 01: Percentage and financial planning with the use of Kahoot

Mathematical content: Percentage, calculation of discounts and analysis of price variations.

Digital tool: *Kahoot*

Category(s): C2 (gamification and engagement), C3 (contextualization)

3.5.1 Objectives of the activity

- Understand the concept of percentage from real everyday situations;
- Develop mathematical reasoning applied to financial planning and organization;
- To promote critical reflection on consumption practices and financial decision-making.
- Stimulate student participation, engagement, and protagonism through gamification.

3.5.2 Description of the activity

The activity consists of the elaboration of an interactive quiz on the Kahoot platform, structured from problem situations related to the daily financial planning of EJA students. The questions involve contexts such as discounts on purchases, commercial promotions, price comparison, salary adjustments and organization of monthly expenses, favoring the articulation between the mathematical content and the social reality of the students.

The problem situations are presented in accessible and contextualized language. For example:

In this case, the students calculate the final value of the product (R\$ 900.00) and discuss whether or not the purchase compromises the monthly budget. In addition to the mathematical calculation, they are encouraged to reflect on the relevance of the financial decision, expanding the formative meaning of the activity. The teacher can propose variations, such as different budget amounts or fixed expenses (rent, food, transportation), stimulating critical analysis and conscious decision-making.

The application can take place individually or in groups, using the students' own mobile devices or with the projection of the questions in the classroom, enabling collective participation, the exchange of resolution strategies and the socialization of mathematical and financial reasoning built throughout the activity.

3.5.3 Critical analysis of the proposed activity

The activity highlights the potential of DICTs to integrate the teaching of Mathematics with financial planning, a central aspect in the training of young people and adults. The pedagogical analysis of the activity shows that the use of Kahoot contributes to making the

learning process more dynamic and motivating, a relevant aspect in EJA, where many students have experiences of school failure in mathematics. Oliveira (2023) highlights that the platform expands participation and provides immediate feedback, while Monteiro & De Martini (2025) reinforce its potential to engage students in financial mathematics content.

From a conceptual point of view, the activity favors meaningful learning, as defended by Ausubel (2003), by relating mathematical concepts to real consumption practices, financial organization and decision-making. In addition, it dialogues with Critical Mathematics Education, by stimulating reflection on financial choices and their impacts on daily life, as proposed by Skovsmose (2001).

However, the activity also has limitations, especially with regard to the dependence on mobile devices and internet access, which may restrict its application in contexts marked by precarious technological infrastructure, as pointed out in category C4. In addition, the playful character of the platform requires careful pedagogical mediation, so that the competitive dynamics do not override the conceptual reflection. In this sense, the role of the teacher is central, by promoting moments of collective discussion, analysis of errors and problematization of results, ensuring that technology is used in a critical, reflective and contextualized way.

Although the contents covered in this activity can be worked on through traditional methodologies, such as the use of the whiteboard in the classroom, the use of technology increases engagement, favors immediate feedback, reduces mathematical anxiety, and enhances the contextualization of financial planning, aspects that are particularly relevant in the context of EJA (Moran; Bacich, 2018; Borba; Silva; Gadanidis, 2016).

Activity 02: Spatial geometry using the AR Solids app **Mathematical content:** Volume and area of geometric solids **Digital tool:** AR Solids – Augmented Reality

Category(s): C1 (visualization and conceptual construction), C3 (contextualization)

3.5.4 Objectives of the activity

- Understand concepts of area and volume of geometric solids through augmented reality visualization;
- Relate spatial geometry to real everyday situations (reservoirs, boxes, buildings);
- Stimulate the protagonism of students and collaborative work;
- Develop digital skills applied to the teaching of mathematics.

3.5.5 Description of the activity

The activity consists of using the AR Solids application to view and manipulate three-dimensional models of geometric solids in augmented reality. Students, using their smartphones, can project the solids on the classroom table and interact with them, observing dimensions, faces, vertices and edges.

The professor proposes contextualized situations, such as: "A water reservoir has a cylindrical shape with a radius of 2 meters and a height of 3 meters. What is the volume of this reservoir m³?". Students, by manipulating the cylinder in the application, can better understand its dimensions and relate the mathematical formula to the visualized object.

The activity can be carried out in groups, stimulating collaboration. Each group chooses a solid, explores its characteristics in the application, and solves practical problems involving area and volume calculation. At the end, the groups share their findings with the class, promoting the socialization of mathematical reasoning.

3.5.6 Critical analysis of the proposed activity

The use of augmented reality (AR) in the teaching of Geometry favors three-dimensional visualization and conceptual construction, an aspect highlighted by Santiago (2025), by highlighting the potential of this technology to overcome barriers related to spatial abstraction and expand the engagement of students in Youth and Adult Education. This contribution dialogues with the discussions of Borba, Silva and Gadanidis (2016), who argue that digital environments expand the forms of mathematical representation and transform the relationship of students with knowledge, favoring processes of experimentation and visual exploration.

By shifting the teaching of geometry to practical situations, such as the calculation of reservoir volumes or the analysis of everyday objects, the activity reinforces the contextualization of Mathematics (C3), bringing mathematical concepts closer to the social and professional experiences of EJA students. This perspective is supported by Critical Mathematics Education, as proposed by Skovsmose (2008), when understanding Mathematics as an instrument for reading reality and making decisions in concrete contexts.

Kenski (2012) points out that emerging technologies, such as augmented reality, can increase student interaction and involvement, as long as they are integrated with clear didactic objectives and mediated intentionally. In this sense, AR should not be understood only as a visual resource, but as a tool for problematizing and constructing mathematical meanings.

However, the activity also has important limitations (C4). Its implementation depends on access to compatible mobile devices and an adequate technological infrastructure, which can

restrict its application in contexts marked by the digital divide. In addition, as Santiago (2025) warns, the absence of critical pedagogical mediation can lead students to a merely visual exploration, disconnected from the necessary mathematical formalization. Thus, the role of the teacher becomes central, as it guides the articulation between visual observations, mathematical calculations and concrete situations, ensuring that technology fulfills a critical, reflexive and socially contextualized pedagogical function, and not just an illustrative one.

Activity 03: Exploration of polygons and calculation of areas with GeoGebra

Mathematical content: Area and perimeter of plane figures

Digital tool: GeoGebra (2D version)

Category(s): C1 (visualization), C3 (contextualization)

3.5.7 Objectives of the activity

- Understand concepts of area and perimeter of plane figures;
- Relate plane geometry to practical everyday situations;
- Develop digital skills applied to the teaching of mathematics;
- Stimulate protagonism and collaborative work among students.

3.5.8 Description of the activity

The activity consists of using GeoGebra to build flat geometric figures and calculate their areas and perimeters. Students, in pairs or groups, draw triangles, squares, rectangles and circles in the app, adjusting measurements of sides and radii.

The teacher proposes contextualized situations, such as: "A square has a square shape with 20 meters on a side. What is its area and perimeter?" Students build the figure in GeoGebra, enter the measurements and verify the calculations.

Then, each group chooses a different picture and creates practical problems related to everyday life, such as calculating the area of a plot of land, the perimeter of a fence or the area of a round table. The results are socialized with the class, promoting the exchange of reasoning and resolution strategies.

3.5.9 Critical analysis of the proposed activity

The use of GeoGebra in the exploration of polygons and in the calculation of areas and perimeters favors the dynamic visualization of geometric objects, an aspect widely discussed in the literature of Mathematics Education. Bohrer and Tinti (2021) show that the direct

manipulation of geometric figures in digital environments contributes to overcoming recurrent abstraction difficulties among Youth and Adult Education students, by enabling the articulation between graphic representation, symbolic language, and conceptual interpretation. This characteristic reinforces the C1 category, by allowing students to explore geometric properties in an active and investigative way.

This perspective is supported by the contributions of Borba, Silva and Gadanidis (2016), who argue that digital environments expand the forms of production of mathematical knowledge, favoring processes of experimentation, conjecture and validation. In the case of EJA, such environments play an even more relevant role, as they allow students to reconstruct mathematical concepts from the interaction with visual and manipulable representations, reducing the exclusive dependence on abstract formulas.

From a pedagogical point of view, the activity shifts the teaching of plane geometry from mechanical and decontextualized practices to real everyday situations, such as calculating the area of land, squares or objects of daily use. This approach reinforces the contextualization of Mathematics (C3), a central principle of EJA, by valuing the social and professional experiences of students. Araújo (2024) highlights that the intentional use of GeoGebra in EJA favors the formation of geometric concepts when associated with contextualized problems, in which the student understands the social function of mathematical knowledge.

This articulation between visualization and context also dialogues with Critical Mathematics Education, proposed by Skovsmose (2008), by understanding Mathematics as an instrument to interpret and act in reality. By solving problems related to physical spaces and organization of the environment, students begin to perceive geometry as a tool for practical decision-making, expanding the social sense of learning.

However, the activity also has limitations (C4): it requires access to computers or cell phones with the application, which may be restricted in some EJA contexts, in addition to demanding digital literacy from students. It is necessary for the teacher to carry out careful mediation, ensuring that students do not limit themselves to observing the figures, but understand the mathematical concepts involved and are able to apply them in real situations. Thus, the role of the teacher is central to guiding research, promoting conceptual reflection, and ensuring that students understand not only the visual representation of the figures, but the underlying mathematical concepts and their applications in real-world situations.

Activity 04: Simulation of financing and investments with HP12C Mobile **Mathematical content:** Simple and compound interest, present value and future value **Digital tool:** HP12C

Mobile (financial calculator in digital version) **Category(s):** C3 (contextualization), C4 (limitations)

3.5.10 Objectives of the activity

- Understand concepts of simple and compound interest, present value and future value;
- Relate financial mathematics to personal and professional decisions;
- Develop autonomy in the use of digital applications applied to mathematics;
- Stimulate critical reflection on consumption, credit and financial planning.

3.5.11 Description of the activity

The activity consists of using the HP12C Mobile application to simulate real financing and investment situations. Students, in groups, receive contextualized problems, such as:

- "A loan of R\$ 1,000.00 will be paid in 12 installments with interest of 2% per month. What will be the total amount paid?"
- "An investment of R\$ 500.00 applied to compound interest of 1.5% per month for 24 months will have what future value?"

Students enter the data into the app (present value, interest rate, number of periods) and check the results. Then, they discuss the practical implications of these operations, relating them to everyday situations, such as installment purchases, bank loans or savings.

The activity can be carried out in the classroom with smartphones or designed by the teacher, allowing everyone to follow the calculations. After each simulation, the teacher conducts a collective discussion about the results and encourages students to reflect on the advantages and disadvantages of each financial operation.

3.5.12 Critical analysis of the proposed activity

The use of HP12C Mobile in the teaching of financial mathematics makes it possible to bring concepts such as simple and compound interest, present value and future value closer to the daily reality of EJA students, allowing the simulation of concrete credit, financing and investment situations. This approach reinforces the contextualization of Mathematics (C3), by shifting teaching from abstract exercises to real problems related to consumption, financial organization, and personal and professional decision-making. Araújo (2024) highlights that the intentional use of digital technologies favors the formation of mathematical concepts when articulated with meaningful contexts for EJA students.

This activity dialogues with Skovsmose (2008), when he understands Mathematics as a tool to interpret and intervene in social reality. By simulating financing and investments, students are led to reflect on the economic consequences of financial decisions, developing a more critical posture in the face of consumption, indebtedness and financial planning practices. This dimension is particularly relevant in EJA, whose students often deal with complex financial situations in their daily lives.

From a didactic point of view, the use of digital financial calculators can contribute to reducing the operational load of calculations, allowing the focus of learning to fall on the interpretation of the results and the analysis of the conditions involved in each operation. Borba, Silva and Gadanidis (2016) argue that digital environments can enhance mathematical learning when they shift attention from mechanical procedure to conceptual understanding and informed decision-making.

However, the activity also has relevant limitations (C4). The use of the HP12C Mobile presupposes access to compatible smartphones and a minimum level of digital literacy. In addition, as Kenski (2012) warns, the uncritical use of technologies can reduce teaching to an automation of procedures, if there is no adequate pedagogical mediation. In this sense, it is up to the teacher to promote collective discussions that problematize the results obtained, ensuring that students understand the mathematical concepts underlying financial operations and their social and economic implications.

Thus, the teaching role assumes centrality in the conduction of the activity, by articulating the use of technology with critical reflection, ensuring that the HP12C Mobile fulfills a pedagogical function that goes beyond the execution of calculations, contributing to the formation of more autonomous and conscious subjects in relation to financial decisions.

Activity 05: Fractions in everyday life with the PhET Fractions simulator

Mathematical content: Equivalent fractions, addition and multiplication of fractions

Digital tool: PhET Fractions (interactive simulator)

Category(s): C1 (visualization), C3 (contextualization), C4 (limitations)

3.5.13 Objectives of the activity

- Favor the understanding of the concepts of equivalent fractions and basic operations with fractions;
- Relate the study of fractions to practical situations of the daily life of EJA students;

- Promote student autonomy and protagonism in the use of digital resources applied to Mathematics;
- Stimulate multimodal learning, articulating visual, practical and interactive aspects.

3.5.14 Description of the activity

The activity consists of the use of the PhET Fractions simulator, which enables the visual and interactive representation of fractions through familiar objects, such as pizzas, fractional bars and containers, favoring the understanding of the concepts of equivalence, addition and multiplication of fractions.

Initially, the teacher presents a contextualized problem-situation, such as:

*"A recipe uses $\frac{2}{3}$ of a glass of milk. If the recipe is prepared in double quantity, what will be the total amount of milk needed?"*element. The students represent the fraction in the simulator, double the quantity and visually and numerically verify the result obtained, articulating graphic and symbolic representation.

Then, organized in groups, students receive contextualized challenges related to daily life, such as the division of household expenses, the apportionment of electricity bills, the distribution of construction materials or the calculation of fractions of the salary. The situations are solved with the support of the simulator and later socialized with the class, promoting the exchange of strategies, mathematical argumentation and the collective construction of knowledge.

3.5.15 Critical analysis of the proposed activity

Silva (2022) points out that the use of digital simulators favors the autonomous exploration of mathematical concepts, contributing to meaningful learning by articulating multiple forms of representation. Such potential reinforces the C1 category, as it allows students to understand fractions not only as abstract symbols, but as visually perceptible quantitative relations.

In addition, studies such as that of Lopes Júnior (2017) show that students in Youth and Adult Education face conceptual difficulties in the study of fractions, often associated with the lack of contextualization of activities and the predominance of abstract symbolic representations. In this sense, Borba, Silva and Gadanidis (2016) state that digital environments expand the possibilities of producing mathematical meanings through experimentation, manipulation and validation of conjectures, configuring themselves as relevant strategies for overcoming these difficulties.

From a didactic point of view, the activity shifts the teaching of fractions of mechanical and decontextualized exercises to real everyday situations, such as cooking, dividing expenses or organizing the family budget, reinforcing the contextualization of Mathematics (C3) and dialoguing with Skovsmose (2008), by understanding Mathematics as an instrument to interpret and act on social reality, favoring conscious decision-making.

In addition, the articulation between students' previous experiences and new mathematical concepts is close to the concept of meaningful learning, defended by Ausubel (2003), by enabling new knowledge to be anchored in existing cognitive structures, giving greater meaning to the learning process.

However, the activity also has important limitations (C4). Its implementation depends on access to the internet and compatible digital devices. Furthermore, as Kenski (2012) and Silva (2022) warn, the use of digital simulators requires intentional pedagogical mediation, so that students are not limited to the visual manipulation of objects, but understand the underlying mathematical concepts and are able to transfer them to real situations. In this sense, the role of the teacher is central to guide research, promote conceptual reflection and ensure that technology fulfills a critical, reflective and socially contextualized pedagogical function.

In summary, the analysis of the five proposed activities shows that the use of DICTs in EJA should be understood as a structuring pedagogical component, and not just as an accessory resource. The analytical categories C1 to C4 allow the identification of different functions of DICTs in the teaching of Mathematics in EJA.

Within the scope of the C1 category, tools such as GeoGebra, PhET Fractions and augmented reality expand the visualization of abstract mathematical concepts, favoring conceptual construction through multiple representations. Category C2 shows that gamification strategies, such as the use of Kahoot, contribute to the engagement and active participation of students, as long as they are articulated with clear pedagogical objectives. Category C3, on the other hand, reveals the potential of DICTs for the contextualization of Mathematics, especially in situations related to financial planning and the resolution of everyday problems, giving greater social meaning to learning.

However, category C4 explains important limitations, such as dependence on technological infrastructure, unequal access to technologies, and the need for digital literacy. These challenges reinforce that the use of DICTs requires intentional pedagogical mediation, as well as investments in digital inclusion policies and teacher training.

4 RESULTS AND DISCUSSIONS

The analysis of the bibliographic and documentary corpus allowed us to identify that the use of Digital Information and Communication Technologies (DICTs) in the teaching of Mathematics in Youth and Adult Education (EJA) has been developed progressively and associated, above all, with the need to make mathematical content more accessible, contextualized and meaningful for students. The studies analyzed show that DICTs do not only act as technical support tools, but as mediators of new forms of interaction, visualization and construction of mathematical knowledge, especially in contexts marked by interrupted school trajectories and historical learning difficulties.

The results indicate that DICTs contribute significantly to the visualization and understanding of abstract mathematical concepts, a recurrent aspect in the analytical category C1. Tools such as GeoGebra, PhET Fractions and Augmented Reality applications have demonstrated potential to favor conceptual construction through the dynamic manipulation of figures, graphs and three-dimensional representations. In this context, the studies by Bohrer and Tinti (2021), Silva (2022) and Santiago (2025) point out that visual exploration enables EJA students to understand concepts traditionally considered complex, such as quadratic functions, spatial geometry and equivalent fractions. Such results dialogue with Borba, Silva and Gadanidis (2016), when they argue that digital environments expand the forms of production of mathematical knowledge through experimentation and investigation.

In addition to conceptual visualization, the results demonstrate that DICTs favor student engagement and active participation in Mathematics classes, especially when associated with gamification and collective interaction, as identified in category C2. The use of Kahoot!, for example, showed potential to increase student participation, reduce math anxiety, and provide immediate feedback during activities. The works of Oliveira (2023) and Monteiro and De Martini (2025) reinforce that gamified strategies can contribute to resignifying the relationship of EJA students with Mathematics, making the learning process more dynamic and motivating. From the perspective of Vygotsky (1998), these results show the importance of social interaction and pedagogical mediation in the construction of knowledge, especially in collaborative contexts mediated by digital technologies.

Another relevant aspect identified in the results refers to the contextualization of Mathematics in the daily life of EJA students, a predominant characteristic in category C3. The activities involving financial planning, interest calculations, geometry applied to the urban space and division of household expenses showed that DICTs can bring mathematical content closer to the concrete experiences of the students. In this sense, the analyzed proposals reinforce the

understanding that mathematical learning becomes more meaningful when articulated with the social, professional and financial practices experienced by students. This perspective is close to Freire's (1997; 2002) critical pedagogy, when he argues that the educational process must start from the concrete reality of the subjects and promote a critical reading of the world.

The results also showed that the use of DICTs favors the development of student autonomy and protagonism. In several activities analyzed, students took an active role in problem solving, in the exploration of simulators and in the collective construction of mathematical strategies. This characteristic reinforces Moran's (2007) understanding that digital technologies can contribute to more flexible, dynamic and student-centered pedagogical practices. In EJA, this aspect takes on even greater relevance, considering that many students return to school seeking intellectual autonomy, professional qualification and strengthening of their social participation.

However, the results also reveal significant limitations related to the implementation of DICTs in the context of EJA, as evidenced in category C4. Among the main challenges identified are the precariousness of the technological infrastructure, the limitation of access to the internet, the insufficiency of digital equipment and the gaps in teacher training for the pedagogical use of technologies. Such difficulties were recurrent in the studies analyzed, especially in the studies that used mobile applications and digital platforms dependent on constant connection. These findings corroborate the reflections of Kenski (2012) and Fiuza (2015), when they emphasize that the pedagogical potential of technologies depends directly on the material, institutional and formative conditions that sustain their use.

Another point discussed in the studies refers to the need for critical pedagogical mediation in the use of DICTs. The results indicate that the simple insertion of digital technologies does not guarantee, by itself, meaningful learning or transformation of pedagogical practices. In several situations, the authors warn that the instrumental or decontextualized use of technologies can reproduce traditional and transmissive practices, limiting the emancipatory potential of DICTs. Thus, the role of the teacher emerges as a central element in the process of technological integration, being responsible for problematizing the contents, guiding interactions and articulating digital resources to the pedagogical objectives of EJA.

The discussion of the results shows, therefore, that DICTs have relevant potential to transform the teaching of Mathematics in EJA, especially by favoring conceptual visualization, contextualization of contents, student engagement and student protagonism. However, the benefits observed depend on structural and pedagogical factors that go beyond simple access to digital tools. The effectiveness of these technologies is directly related to teacher training,

infrastructure conditions, and the construction of critical, inclusive, and contextualized pedagogical proposals.

Finally, the results allow us to understand that the integration of DICTs to the teaching of Mathematics in EJA is a promising path for the construction of more democratic and socially significant pedagogical practices. However, for this potential to materialize, it is necessary to expand digital inclusion policies, strengthen the continuing education of teachers and ensure adequate material conditions for the pedagogical use of technologies in public schools. Thus, the findings of this research reinforce that DICTs, when articulated with a critical and emancipatory perspective of education, can contribute significantly to overcoming the historical difficulties of EJA and to the construction of more participatory, contextualized and transformative learning processes.

5 CONCLUSION

The general objective of this study was to investigate how Digital Information and Communication Technologies (DICTs) have been used in the adaptation of mathematical activities for EJA – High School students, analyzing theoretical productions and documents related to the theme. In an articulated way, it was also sought to relate the DICTs with mathematical contents of EJA, to propose contextualized and meaningful activities, to evaluate their pedagogical potentials and limitations and to contribute to an educational product aimed at teachers.

The bibliographic and documentary research, organized into analytical categories, allowed the systematization of theoretical and didactic evidence that demonstrates the role of DICTs in the promotion of more meaningful, inclusive and contextualized pedagogical practices. The analysis of the proposed activities indicates that, when articulated with critical and intentionally planned pedagogical proposals, the DICTs contribute to broaden the visualization of abstract mathematical concepts, favor student engagement and protagonism, and bring Mathematics closer to the daily experiences of EJA students. Resources such as simulators, applications, gamification platforms and mobile devices proved to be relevant to resignify the teaching of Mathematics, especially when dialoguing with school trajectories marked by interruptions and conceptual difficulties, in line with the references of Freire, Vygotsky and D'Ambrosio.

It was also evidenced that the use of DICTs in EJA still faces significant structural and training challenges, such as the precariousness of the technological infrastructure, inequalities in digital access and the insufficiency of specific teacher training for the pedagogical use of

these technologies. These limitations confirm the reflections of Kenski and Fiuza, when they emphasize that educational technology is not neutral and requires adequate conditions of implementation and pedagogical intentionality.

The proposed activities seek to contribute to the expansion of the repertoire of didactic practices aimed at EJA, by presenting concrete examples of the use of DICTs in the teaching of Mathematics, without, however, intending to exhaust the possibilities of research on the subject. In this sense, the research dialogues with the literature by defending a critical, mediated and contextualized approach to digital technologies, offering theoretical-pedagogical subsidies for teachers and researchers interested in the construction of more inclusive, situated and socially significant educational practices.

Regarding the limitations of the research, the exclusively bibliographic and documentary nature of the study is highlighted, which, although adequate to the proposed objective, does not allow for direct observation of the implementation of DICTs in real school contexts. Thus, the results reflect trends and theoretical and didactic evidence present in the literature, not contemplating the empirical analysis of teaching practices and students' learning.

In view of this, it is suggested that future research move towards empirical investigations, such as case studies, action research or pedagogical interventions in EJA contexts, in order to analyze the concrete application of DICTs in the teaching of Mathematics. It is also recommended the development of studies aimed at teacher training for the critical use of technologies, the evaluation of the impact of these practices on student learning and the analysis of public policies for digital inclusion in EJA, expanding and deepening the discussions initiated in this research.

ABSTRACT

The expansion of generative artificial intelligence has increased the presence of digital tutoring systems in educational and corporate environments, enhancing the capacity for personalization, scalability, and availability of learning support. At the same time, Industry 5.0 repositions human beings at the center of technological transformation, reinforcing the relevance of knowledge skills for continuous learning, adaptability, and value creation. This article analyzes how artificial intelligence tutoring models relate to the development of knowledge skills in the context of Industry 5.0. The study adopts a theoretical conceptual approach, developed through an integrative literature review based on the authors' doctoral qualification texts and the project's authorized sources. The findings indicate that human, artificial, and hybrid tutoring models produce distinct effects on autonomy, motivation, engagement, self-regulated learning, and the development of cognitive, digital, and adaptive competencies. It concludes that AI-based tutoring can serve as a support infrastructure for the development of knowledge skills, provided it operates within a human-centered logic, articulated with pedagogical principles, human curation, knowledge-creation, and circulation processes.

Keywords: Artificial Intelligence (AI). Tutoring Models. Knowledge Skills. Industry 5.0. Generative AI.

RESUMO

A expansão da inteligência artificial generativa ampliou a presença de sistemas de tutoria digital em ambientes educacionais e corporativos, elevando a capacidade de

personalização, a escalabilidade e a disponibilidade do suporte à aprendizagem. Em paralelo, a Indústria 5.0 reposiciona o ser humano no centro da transformação tecnológica, reforçando a relevância das habilidades de conhecimento para a aprendizagem contínua, a adaptabilidade e a criação de valor. Este artigo analisa como modelos de tutoria em inteligência artificial se relacionam ao desenvolvimento de habilidades de conhecimento no contexto da Indústria 5.0. O estudo adota uma abordagem teórico-conceitual, desenvolvida por meio de revisão integrativa da literatura, com base nas produções de qualificação dos autores e nas fontes autorizadas do projeto. Os achados indicam que modelos de tutoria humana, artificial e híbrida produzem efeitos distintos sobre a autonomia, a motivação, o engajamento, a aprendizagem autorregulada e o desenvolvimento de competências cognitivas, digitais e adaptativas. Conclui-se que a tutoria baseada em IA pode atuar como infraestrutura de apoio ao desenvolvimento de habilidades de conhecimento, desde que operada com lógica human-centered, articulada a princípios pedagógicos, à curadoria humana e a processos de criação e de circulação do conhecimento.

1 INTRODUCTION

The incorporation of Artificial Intelligence (AI) in educational environments has ceased to occupy a peripheral position and has become part of broader strategies for learning mediation, especially with the dissemination of generative models and conversational interfaces. In parallel, Industry 5.0 has consolidated an agenda that combines technological transformation, sustainability, resilience, and human centricity, shifting the debate from the mere use of technology to the ability to develop skills and transform knowledge into organizational value (European Commission, 2025; Ghobakhloo et al., 2022; Xu et al., 2021).

In the educational field, this movement manifests in the expansion of digital tutors, academic assistants, and systems that answer questions, organize content, offer feedback, and support self-regulated learning. Recent studies indicate that AI-based tutors can improve the learning experience when they combine technical responsiveness with consistent pedagogical foundations, especially in higher education and distance education contexts (Baillifard et al., 2025; Ding et al., 2023; Reicher et al., 2025).

The effectiveness of this type of solution, however, does not depend only on technical availability. The literature shows that perceived utility, ease of use, enabling conditions, motivation, autonomy, and quality of mediation continue to be decisive factors for engagement and sustained use of technology-mediated educational systems (Davis, 1989; Ryan & Deci, 2000; Tbaishat et al., 2026; Venkatesh & Bala, 2008).

This debate gains density when connected to Industry 5.0-driven environments, as the central issue is no longer just the adoption of AI but its ability to support the development of knowledge skills, understood as capacities to learn, interpret, combine, apply, and share knowledge in complex, digital, and intensively changing contexts (Alavi & Leidner, 2001; Leon, 2023; Nonaka, 1994; World Economic Forum, 2025). In this context, cognitive, digital, relational, and adaptive competencies become critical assets for the creation and circulation of organizational knowledge (Nonaka & Takeuchi, 1995; Rikala et al., 2024).

The theoretical gap lies precisely in the intersection between these two agendas. Literature has advanced the analysis of intelligent tutors, AI-mediated learning, technological acceptance, and motivation. It also advanced the discussion on competencies, skills gaps, knowledge management, and Industry 5.0. Even so, an integrative reading that explains how AI tutoring models can contribute to the formation and mobilization of knowledge skills required in environments of accelerated digital transformation and continuous learning remains less developed (Anshari & Hamdan, 2022; Cerchione et al., 2024; Shen et al., 2025).

Therefore, this article aims to analyze, from a theoretical-conceptual perspective, how different models of tutoring (human, artificial, and hybrid) relate to the development of knowledge skills in the context of Industry 5.0. The relevance of the study is both theoretical, as it integrates two fields that usually run in parallel, and practical, as it offers a useful basis for designing more effective tutoring solutions in educational and organizational contexts.

2 THEORETICAL FOUNDATIONS

2.1 TUTORING MODELS IN ARTIFICIAL INTELLIGENCE

Tutoring, in its classic formulation, serves a mediating function among the student, the content, and the learning process. In digital environments, this function has expanded to include automated support, recommendation, feedback, and follow-up mechanisms (Massuga et al., 2021; Peel et al., 2023). Currently, three main tutoring arrangements can be found in educational and corporate settings: human tutoring, artificial tutoring, and hybrid tutoring.

In human tutoring, a pedagogical representative offers support through welcome, guidance, feedback, and relationship building. This model tends to offer greater interpretive density, greater contextual sensitivity, and a stronger ability to address the subjective dimensions of learning, such as insecurity, belonging, and motivation. On the other hand, it faces limitations in scale, availability, and standardization (Massuga et al., 2021; Peel et al., 2023).

In artificial tutoring, support is provided by AI-based systems, often supported by natural language processing, generative models, and knowledge retrieval mechanisms. These systems increase availability, reduce response time, personalize interactions, and expand the capacity for continuous support, especially for operational questions, conceptual reinforcement, and study organization (Ding et al., 2023; Hobert & Berens, 2024; Lee, 2025; Reicher et al., 2025).

And, hybrid tutoring combines the advantages of both models, in which AI tends to operate as the first layer of support, absorbing recurring demands and structuring initial guidance, while the human tutor remains responsible for more complex mediations, welcoming, conceptual deepening, and pedagogical judgment. Literature has indicated that this format tends to be more robust in contexts in which speed and scale need to coexist with relational quality and pedagogical consistency (Alfirević et al., 2025; Seo et al., 2021).

In addition to the delivery format, AI tutoring models vary in their interaction architecture, with some systems limited to on-demand responses and others incorporating proactive elements such as reminders, study recommendations, encouragement of engagement, and

support for self-regulation. This point is relevant because it shifts tutoring from a merely reactive function to a broader formative function (He, 2025; L. Liu et al., 2024; Yin et al., 2026).

Still, the limits are clear to artificial tutors, which can increase the efficiency of support, but they do not, by themselves, guarantee cognitive depth, pedagogical quality, or criticality - without curation, instructional design, and validation mechanisms, there is a risk of superficiality, inaccurate answers, and excessive dependence of the student on the system (Đerić et al., 2025; Kasneci et al., 2023; Tharapos et al., 2025).

2.1.1 The artificial tutor: definition, architecture, and application contexts

An artificial tutor based on generative AI is a computer system that interacts with users in natural language, offering personalized support, answering questions, providing feedback, and automatically guiding learning processes. Unlike classical tutoring systems based on fixed rules, tutors in generative AI, especially those supported by Large Language Models (LLMs), operate through probabilistic models trained on large volumes of text, which allows them to generate contextually relevant responses, adapt to the user's interaction style, and handle ambiguity (Kasneci et al., 2023; Lee, 2025; Reicher et al., 2025).

The most common architecture includes three main layers: the conversational interface, which enables natural-language interaction; the processing layer, which combines generative models with Retrieval-Augmented Generation (RAG) techniques; and the curated knowledge base, which guides the system's responses with institutionally validated content. This framework allows the artificial tutor to offer immediate responses, personalize study paths, monitor the user's progress, and, in more advanced settings, identify learning gaps and suggest pedagogical interventions (Ding et al., 2023; Lee, 2025; Yin et al., 2026).

In the academic context, artificial tutors can be used to clarify concepts, support the resolution of exercises, guide reviews, stimulate self-regulation of learning, and offer adaptive simulations. Its application is especially relevant in disciplines with high demand for support, in distance education environments, and in contexts where the ratio of students to available human tutors is unfavorable (Baillifard et al., 2025; Hobert & Berens, 2024).

In the business context, AI mentoring can support upskilling and reskilling programs, technical training trails, onboarding new employees, professional certification support, and the dissemination of organizational knowledge. In this scenario, the tutor acts as a facilitator of access to corporate knowledge, reducing the response time to operational questions and expanding the scalability of development programs (Anshari & Hamdan, 2022; Leon, 2023; World Economic Forum, 2025).

However, the effectiveness of the artificial tutor depends on structural conditions. The first is the curation of the knowledge base, which must be accurate, up-to-date, and expert-validated. The second is clarity about the scope of the system's actions, avoiding unrealistic expectations that it can replace complex human mediation. The third is training users to interact productively with the tutor, formulating clear questions, validating answers, and using the system as support rather than a substitute for critical thinking. Without these conditions, the tutor can expand access, but compromise the quality of learning (Đerić et al., 2025; Kasneci et al., 2023; Tharapos et al., 2025).

2.2 TECHNOLOGICAL ACCEPTANCE, MOTIVATION, AND USE OF AI TUTORING

Understanding the effective use of AI tutoring systems requires more than a mere functional description of the technology. It is necessary to understand how users perceive, accept, and incorporate these systems into their learning routines. In this field, the Technology Acceptance Model (TAM), proposed by Davis (1989) continues to be one of the most influential frameworks for explaining technology adoption.

According to the TAM, the intention to use is strongly influenced by two core beliefs: perceived utility and perceived ease of use. In AI-mediated educational contexts, these two variables remain particularly relevant, as the perception of practical value and the absence of technical barriers directly affect engagement with digital tutors and learning platforms (Davis, 1989; Davis et al., 1989; Ngo et al., 2025). The Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh et al., 2003) expands this analysis by incorporating contextual and social factors, such as performance and effort expectations, social influence, and enabling conditions. This expansion is important because the decision to use an AI tutor depends not only on the interface but also on infrastructure, institutional support, the culture of use, and prior experience with digital tools (Acikgul & Sad, 2026).

In the case of the artificial tutorial, recent research shows that students strongly value attributes such as speed, continuous availability, accessible language, consistency of answers, and concrete usefulness for tasks and assessments - when these elements are present, technology tends to be perceived as an ally, when they are not, it is seen as operational noise or a low-confidence solution (Al-Abri, 2025; Ding et al., 2023; Hobert & Berens, 2024).

But the adoption of artificial tutors cannot be explained by instrumental factors alone. Self-Determination Theory (SDT) adds a decisive layer to the debate by showing that sustained engagement depends on the satisfaction of three basic psychological needs: autonomy, competence, and relationship (Niemic & Ryan, 2009; Ryan & Deci, 2000).

In technology-mediated environments, this means that a tutoring solution tends to be more effective when, in addition to being functional, it reinforces the student's sense of autonomy, expands their perception of competence, and sustains some level of bonding or welcoming. This point helps explain why some technically efficient systems don't necessarily produce deep engagement or lasting learning (Chiu, 2024; Li et al., 2024; Puderbach et al., 2025).

Recent research has made progress by combining technological acceptance with motivation, and these integrated models suggest that understanding the adoption of generative AI in education is clearer when cognitive, contextual, and motivational factors are considered together. In educational terms, users do not engage with a tutor just because it is available, but because they see its value, feel capable of using it, find it supportive, and believe that the technology helps them to progress and become more autonomous (Tbaishat et al., 2026).

2.3 KNOWLEDGE SKILLS AND KNOWLEDGE CREATION

In the context of Industry 5.0, the discussion of competencies needs to go beyond the traditional technical repertoire, as the contemporary agenda values skills that integrate technology, cognition, adaptation, judgment, collaboration, and knowledge creation. Therefore, the expression knowledge skills is useful in this article, as it refers not only to the mastery of information, but to the ability to transform knowledge into action, learning, and value (European Commission, 2025; Sheikh et al., 2025; World Economic Forum, 2025).

Accelerated transformation scenarios and skill gaps are no longer merely operational problems; they are beginning to pose a direct risk to competitiveness, innovation, and organizational learning capacity. Therefore, cognitive, digital, adaptive, and relational skills should be treated as strategic assets and as inputs for broader processes of knowledge creation and circulation (Leon, 2023; Rikala et al., 2024).

This reading dialogues directly with Organizational Knowledge Creation (OKC), developed by Nonaka and collaborators. The SECI model explains that organizational knowledge emerges through the continuous conversion between tacit and explicit knowledge, in four movements: Socialization, Externalization, Combination, and Internalization, with the initials of these words forming the acronym. The central point here is simple but decisive: knowledge is not only stored but also created, shared, structured, and reapplied in dynamic cycles (Nonaka, 1994; Nonaka et al., 2000; Nonaka & Takeuchi, 1995).

From this perspective, knowledge skills can be understood as individual and collective capacities that feed these cycles. The ability to formulate questions, interpret answers, connect

concepts, explain experiences, learn from feedback, recombine content, and apply knowledge in new contexts is not peripheral - it is part of the very process of creating organizational knowledge (Alavi & Leidner, 2001; Cerchione et al., 2024; Gold et al., 2001).

The perspective of Knowledge Management Processes (KMP) reinforces this reading. Processes such as the creation, storage, transfer, and application of knowledge depend on competencies distributed among individuals, teams, and systems. When these competencies are fragile, misaligned, or poorly mobilized, the flow of knowledge loses quality. As a consequence, the skills gap can be interpreted not only as individual insufficiency but also as a symptom of limitations in the very mechanisms of knowledge conversion and use (Alavi & Leidner, 2001; Anshari & Hamdan, 2022; C. Liu, 2024).

This argument is especially relevant to Industry 5.0, as this paradigm expands the need for continuous learning and collaboration between humans and intelligent systems. In this environment, value arises not solely from automation but from the integration of technology with human judgment, creativity, contextual interpretation, and adaptive learning (European Commission, 2025; Sheikh et al., 2025; Xu et al., 2021).

2.4 AI TUTORING AND KNOWLEDGE SKILLS IN INDUSTRY 5.0

The link between AI tutoring and knowledge skills becomes clearer when one abandons a merely instrumental view of technology. An AI-based tutor should not be seen as just an autoresponder mechanism; in a more mature design, it operates as a layer of support for learning, reflective practice, study organization, access to knowledge, and the internalization of useful repertoires for decision-making and problem-solving (He, 2025; Lee, 2025; Reicher et al., 2025).

When well-designed, AI tutoring models can strengthen skills such as learning autonomy, question formulation, the ability to search for and validate information, conceptual articulation, adaptation to feedback, content synthesis, and practical use of knowledge. These capabilities speak directly to the demands of Industry 5.0, especially in environments where continuous updating, critical interpretation, and workflow learning become essential (Chiu, 2024; Leon, 2023; World Economic Forum, 2025).

At the same time, the literature suggests that the gain is not in replacing human mediation but in repositioning it. Instead of focusing the human tutor on repetitive, operational responses, AI can absorb some of that volume, freeing up space for higher-density interactions, such as mentoring, interpretation, contextualization, and formative follow-up. This redistribution of roles

is consistent with the human-centered logic of Industry 5.0, in which technology should expand, not reduce, human potential (Alfirević et al., 2025; Seo et al., 2021; Shen et al., 2025).

This arrangement also makes sense from a knowledge management perspective. If artificial tutoring can support the externalization of doubts, the combination of contents, the internalization of concepts, and the circulation of useful answers, it can operate as a complementary mechanism to SECI cycles. This does not mean attributing to technology the role of autonomous creator of organizational knowledge, but recognizing it as an infrastructure that supports mediation, sharing, and interaction-based learning (Cerchione et al., 2024; C. Liu, 2024; Nonaka et al., 2000).

In summary, AI tutoring can contribute to the development of knowledge skills when it meets five central conditions: practical relevance for the user, ease of use, integration with motivational principles, pedagogical curation, and articulation with broader processes of knowledge creation and application. Without this, technology may even achieve initial adoption, but it is unlikely to produce a consistent formative impact.

3 METHODOLOGY

This article adopts a qualitative, theoretical-conceptual approach, developed through an integrative literature review. The analytical construction starts from the intersection between two main axes: the literature on AI tutoring in higher education, with an emphasis on technological acceptance, motivation, and AI-mediated learning, and the literature on skills, skill gaps, knowledge creation, and Industry 5.0.

The analysis was conducted through a cross-thematic synthesis. The sources were organized into four analytical blocks: tutoring models; technological acceptance and motivation; knowledge and knowledge-creation skills; and Industry 5.0. From this, we identified convergences, tensions, and conceptual interfaces that could sustain an integrative interpretation of the phenomenon under investigation.

The choice of a theoretical-conceptual article is justified because the objective of this stage is not to test a specific model empirically, but to consolidate an analytical basis of two strands that, until then, have been in parallel. Rather than fragmenting the debate, the article builds an interpretive bridge between intelligent mentoring and the development of knowledge skills, focusing on analytical utility and managerial applicability.

4 RESULTS AND DISCUSSION

4.1 CONTRIBUTIONS OF AI TUTORING MODELS TO THE DEVELOPMENT OF KNOWLEDGE SKILLS

The main contribution of AI tutoring models lies in their ability to reduce friction in accessing support and to increase the availability of mediation. In practical terms, this means that the student or user can resort to the system when in doubt, at their own pace and with greater autonomy. This point is decisive because contemporary learning relies less and less on formal windows of instruction and more and more on timely, contextual, and responsive support (Ding et al., 2023; Hobert & Berens, 2024; Reicher et al., 2025).

This type of support favors the development of skills and knowledge on at least four fronts. The first is autonomy, as well-designed tutoring systems help the user to advance without relying exclusively on immediate human interventions. The second is competence: quick feedback and accessible explanations can strengthen the perception of progress. The third is self-regulated learning, as the tutor's availability encourages planning, monitoring, and reviewing one's own study path. The fourth is cognitive articulation, since the user needs to formulate questions, refine commands, interpret answers, and validate information (Chiu, 2024; He, 2025; Ryan & Deci, 2000).

These gains are in direct adherence to the logic of Industry 5.0. Recent literature shows that contemporary work and learning environments require professionals who can engage in continuous learning, operate in hybrid ecosystems, navigate ambiguity, integrate information and judgment, and develop adaptive repertoires. From this perspective, an AI tutor is not only an academic support tool, but it can also be a mechanism for continuous training of competencies associated with the strategic use of knowledge (Leon, 2023; Sheikh et al., 2025; World Economic Forum, 2025).

4.2 COMPARATIVE SYNTHESIS: MODELS OF TUTORING, MEDIATION AND SKILLS DEVELOPMENT

The theoretical analysis developed in the previous sections allowed us to articulate, in a structured way, the relationships between AI tutoring models, pedagogical mediation mechanisms, developed knowledge skills, and adherence to the principles of Industry 5.0. This synthesis was not limited to describing isolated characteristics of each model, but sought to highlight how the use of AIs, specifically in the different tutoring models, can influence, in a different way, the development of critical skills for continuous learning, adaptability, and the creation of knowledge in digital and organizational environments.

Table 1 summarizes these relationships comparatively, showing that the choice of the tutoring model is not neutral: it directly affects which knowledge skills are favored, which mediation processes are activated, and which logic of human centrality or technological scalability prevails; the latter in adherence to the principles of Industry 5.0.

Table 1

Relationship between AI tutoring models, mediation mechanisms, and knowledge skills development

Tutoring Models	Mediation mechanisms	Favored knowledge skills	Adherence to Industry 5.0
Human tutoring	welcoming, bonding, interpretation, judgment, feedback	relational contextual pedagogical qualitative critical collaboration, sensitivity, competence	thinking, contextual relational human learning, mediation centrality, situated qualitative
Artificial tutoring	continuous availability, fast response, algorithmic personalization, scalable access, and immediate feedback	learning autonomy, digital competence, question formulation, information self-regulated validation, learning	scalability, on-demand learning, digital workflow support
Hybrid tutoring	combination of scale (AI) and depth (human), automated screening, deepening, pedagogical curation	autonomy, competence, critical thinking, digital adaptability, human-AI collaboration	human-centered technology, continuous learning, collaborative knowledge creation

Source: Prepared by the authors.

Through this relationship, it was possible to identify that the hybrid model presented a greater balance between scalability and pedagogical depth. When comparing these three models, human tutoring favors relational and contextual skills but faces structural limitations in availability; artificial tutoring expands access and speed but can compromise criticality and interpretation; and the hybrid model articulates the two mediation registers in a complementary way. In this configuration, AI takes on operational and first-layer support functions, while the human tutor remains responsible for conceptual deepening, pedagogical validation, and welcoming (Alfirević et al., 2025; Seo et al., 2021).

This division of labor is not only functional. It expresses a design decision about what should be automated and what should remain under human responsibility. When well implemented, this separation allows the human tutor to focus his energy on interactions of greater formative density, freeing up time previously consumed by repetitive responses, operational clarifications, and low-complexity support. At the same time, the AI system becomes more effective by being delimited in its scope, avoiding functional overload or unrealistic

expectations regarding its ability to replace complex pedagogical mediation (Hobert & Berens, 2024; Massuga et al., 2021; Shen et al., 2025).

From a knowledge management perspective, it is possible to integrate artificial tutoring into the processes of knowledge creation, sharing, and application. From the perspective of the SECI model, proposed by Nonaka and colleagues, artificial tutoring can especially support three movements in the knowledge conversion cycle: externalization, by encouraging users to formulate questions and articulate doubts explicitly; the combination, by organizing, structuring, and connecting different contents in an accessible and personalized way; and internalization, by facilitating the practical application of concepts through immediate feedback and adaptive exercises (Nonaka, 1994; Nonaka et al., 2000; Nonaka & Takeuchi, 1995).

This positioning does not attribute to AI the role of autonomous creator of organizational knowledge, but recognizes it as an infrastructure to support the mediation, circulation, and application of knowledge in learning contexts. When integrated into broader KMP processes, artificial tutoring can increase the efficiency of knowledge transfer, reduce barriers to access, and strengthen learning cycles in educational organizations and institutions (Alavi & Leidner, 2001; Cerchione et al., 2024; C. Liu, 2024).

However, the effectiveness of this arrangement depends on five structural conditions that must be met simultaneously. The first is the curation of the knowledge base, which ensures the accuracy, updating, and validation of the information accessed by the artificial tutor. Without curation, the system can expand access, but generate inaccurate, outdated, or decontextualized answers, compromising trust and the quality of learning (Kasneci et al., 2023; Tharapos et al., 2025). The second condition is the clarity of scope, which delimits what the artificial tutor can and should do. AI systems are not a substitute for pedagogical judgment, contextual sensitivity, or relational acceptance. When these limits are not made explicit, unrealistic expectations arise, leading to user frustration and distrust of technology (Al-Abri, 2025; Đerić et al., 2025). The third condition is the user's training, which requires developing skills to interact productively with the artificial tutor. This includes formulating clear questions, interpreting answers, validating information, identifying biases or inaccuracies, and using the system to support critical thinking rather than substituting for reflection. Without this training, the use of AI can be superficial, passive, or dependent (Chiu, 2024; He, 2025). The fourth condition is integration with motivational principles, especially those derived from SDT. Artificial tutors who reinforce student autonomy, offer feedback that broadens the perception of competence, and sustain some level of bonding or nurturing tend to promote greater engagement and sustained use. On the other hand, systems that only deliver answers, without formative guidance, can be

perceived as cold, instrumental, or disconnected from the real learning process (Li et al., 2024; Ryan & Deci, 2000; Tbaishat et al., 2026). The fifth condition is institutional governance, which defines responsibilities, validation criteria, feedback mechanisms, processes for updating the knowledge base, and forms of articulation between human and artificial tutoring. Without clear governance, the implementation of AI tutors tends to be fragmented, unsustainable, and disconnected from broader formative goals (European Commission, 2025; Shen et al., 2025).

When these five conditions are met, the hybrid tutoring model becomes particularly aligned with the principles of Industry 5.0. This paradigm values not automation for automation's sake, but the ability to combine technology with human centricity, continuous learning, sustainability, and organizational resilience. In this framework, artificial or hybrid tutoring is no longer just an operational support tool but becomes part of the infrastructure for developing knowledge skills, especially those associated with adaptability, critical thinking, digital competence, and the ability to learn autonomously in fast-changing environments (European Commission, 2025; Ghobakhloo et al., 2022; Xu et al., 2021).

Finally, by explaining the relationships between the tutoring model, mediation mechanisms, developed skills, and adherence to Industry 5.0, this research presented criteria for the conscious choice of tutoring configurations, evaluation of educational technologies, and the creation of training trails that combine human development and technological support in a coherent and sustainable way (Leon, 2023; Rikala et al., 2024; World Economic Forum, 2025).

4.3 LIMITS, RISKS AND NECESSARY MEDIATIONS

It would be simplistic to treat AI tutoring as a sufficient solution on its own. The literature shows that the presence of generative systems does not eliminate problems of quality, depth, criticality, or cognitive dependence. In some cases, the fluidity of the response creates a false perception of accuracy; in others, the ease of support encourages passive use, without self-elaboration or without adequate validation of the content (Đerić et al., 2025; Kasneci et al., 2023; Tharapos et al., 2025).

This risk becomes more pronounced when the goal is not only to transmit information but also to develop knowledge skills. Knowing how to access an answer is not the same as knowing how to build knowledge. Real competence development requires interpretation, confrontation of perspectives, reflection, application, and the ability to transfer learning to new contexts. Without these elements, digital tutoring can improve operational efficiency but yield limited formative impact.

Therefore, human mediation remains central. The human tutor, the teacher, the instructional designer, or the manager of the learning process remains essential for defining criteria, validating content, guiding criticality, and sustaining the pedagogical bond. The point, therefore, is not to choose between humans and AI, but to design arrangements in which technology takes over what it does best – speed, scale, availability, and operational support – while humans focus their energy on what requires judgment, context, sensitivity, and depth (Alfirević et al., 2025; Massuga et al., 2021; Seo et al., 2021).

5 CONCLUSION

This article looked at how different mentoring models – human, artificial, and hybrid – relate to the development of knowledge skills in the context of Industry 5.0. The theoretical and conceptual synthesis allowed us to sustain that the AI-mediated tutorial can contribute in a relevant way to autonomy, self-regulated learning, access to knowledge, digital competence, and adaptability, as long as its adoption is articulated with pedagogical, motivational, and organizational criteria, and not only to gains in technological efficiency (Chiu, 2024; Davis, 1989; European Commission, 2025).

The central argument is straightforward: in Industry 5.0, the value of AI in learning environments does not lie only in the ability to respond quickly; it lies in its ability to strengthen human learning, expand the creation and circulation of knowledge, and support the development of competencies that remain critical precisely because the environment has become more technological, not less human. When designed with this logic, AI tutoring is no longer merely an operational accessory but functions as a development infrastructure.

The findings also indicated that the hybrid model tends to offer the best balance between scale, availability, depth, and welcoming. This is not a methodological detail; It's a design decision. And, as is often the case with projects that seem to be resolved too soon, the problem is rarely in the technology alone – it lies in the adopted mediation model.

The article opens the way for empirical studies on the different types of tutoring in Higher Education Institutions (HEIs), corporate environments, and executive training programs. The investigation of metrics that more objectively relate mentoring models to the satisfaction of psychological needs, the development of skills and knowledge, and their effects on academic and organizational performance is also promising.

Dyck Hellington Ataliba Mariano¹, Rickardo Léo Ramos Gomes²

ABSTRACT

The contemporary organizational context is characterized by high levels of competitiveness, dynamic markets, and increasing complexity in logistical operations, which demand greater efficiency in the management of available resources. In this scenario, inventory planning and control play a fundamental role, as they directly impact operational continuity, cost reduction, and customer service levels. In light of this, the general objective of this study is to highlight the strategic relevance of inventory planning and control within organizations, as well as the main methods and techniques employed and their impacts on organizational performance. To achieve these objectives, a qualitative approach was adopted, grounded in bibliographic research. The study was developed based on the analysis of well-established materials in the literature, such as books and scientific articles by recognized authors in the field of logistics and inventory management, enabling the construction of a consistent theoretical foundation on the topic. The findings indicate that supply management professionals must go beyond the operational mastery of control tools and techniques, developing a strategic perspective that enables the integration of inventory data with managerial decision-making and organizational objectives. Such capability constitutes a significant competitive advantage in the current context, marked by the complexity of supply chains and increasing demands for efficiency and agility in operations.

Keywords: Inventory Planning. Inventory Control. Supply Management. Organizational Performance.

RESUMO

O contexto contemporâneo das organizações é marcado por elevados níveis de competitividade, dinamismo dos mercados e crescente complexidade nas operações logísticas, o que exige maior eficiência na gestão dos recursos disponíveis. Nesse cenário, o planejamento e o controle de estoque assumem papel fundamental, uma vez que impactam diretamente a continuidade operacional, a redução de custos e o nível de serviço ao cliente. Diante disso, o objetivo geral desta pesquisa é destacar a relevância estratégica do planejamento e do controle de estoque nas organizações, bem como dos principais métodos e técnicas utilizados e de seus impactos no desempenho organizacional. Para o

alcançe desses objetivos, adotou-se uma abordagem qualitativa, fundamentada em pesquisa bibliográfica. O estudo foi desenvolvido a partir da análise de materiais já consolidados na literatura, como livros e artigos científicos de autores reconhecidos na área de logística e gestão de estoques, permitindo a construção de uma base teórica consistente sobre o tema. Como resultado, a pesquisa evidenciou que o profissional de Gestão de Suprimentos precisa ir além do domínio operacional de ferramentas e técnicas de controle, sendo necessário desenvolver uma visão estratégica que possibilite integrar as informações de estoque às decisões gerenciais e aos objetivos organizacionais. Essa capacidade configura-se como um diferencial competitivo relevante no contexto atual, caracterizado pela complexidade das cadeias logísticas e pela crescente exigência por eficiência e agilidade nas operações.

RESUMEN

El contexto contemporáneo de las organizaciones se caracteriza por altos niveles de competitividad, dinamismo de los mercados y creciente complejidad en las operaciones logísticas, lo que exige una mayor eficiencia en la gestión de los recursos disponibles. En este escenario, la planificación y el control de inventarios asumen un papel fundamental, ya que impactan directamente en la continuidad operativa, la reducción de costos y el nivel de servicio al cliente. Por lo tanto, el objetivo general de esta investigación es destacar la relevancia estratégica de la planificación y el control de inventarios en las organizaciones, así como los principales métodos y técnicas utilizados y sus impactos en el desempeño organizacional. Para alcanzar estos objetivos, se adoptó un enfoque cualitativo, fundamentado en una investigación bibliográfica. El estudio se desarrolló a partir del análisis de materiales ya consolidados en la literatura, como libros y artículos científicos de autores reconocidos en el área de logística y gestión de inventarios, permitiendo la construcción de una base teórica consistente sobre el tema. Como resultado, la investigación evidenció que el profesional de Gestión de Suministros necesita ir más allá del dominio operativo de herramientas y técnicas de control, siendo necesario desarrollar una visión estratégica que permita integrar la información de inventarios con las decisiones gerenciales y los objetivos organizacionales. Esta capacidad se configura como una ventaja competitiva relevante en el contexto actual, caracterizado por la complejidad de las cadenas logísticas y la creciente exigencia de eficiencia y agilidad en las operaciones.

Palabras clave: Planificación de Inventarios. Control de Inventarios. Gestión de Suministros. Desempeño Organizacional.

1 INTRODUCTION

Supply chain complexity is increasing, demand is fluctuating, and there is intense pressure to reduce operating costs. Inventory planning and control become invaluable strategic functions for organizations of any size and in any domain in this situation.

One of the biggest challenges is the efficient management of inventory among those who are in the purchasing and supply area. Maintaining adequate inventory levels refers to two competing risks: excess (cost of maintaining inventory, leading to storage, obsolescence, and capital immobilization); and scarcity (supply disruptions, lost sales, loss of customers, and dissatisfaction).

Achieving this balance is complicated and depends on the use of strategies, methods, tools, and indicators that will be available to enable accurate decision-making. Faced with this problem, several methods have been developed in recent decades to allow the direct management of inventory sizing to be applied more precisely. Methods such as reorder point, safety stock, ABC analysis, and economic order quantity (EOQ) model are now established benchmarks in materials management.

In addition to the technical level, inventory management has a strategic layer that links the supply part to the organization's overall strategy. Choices about inventory levels affect cash flow, production capacity, and end-user service. Thus, any professional must be able to understand the theoretical and practical basis of inventory planning and control.

The general objective of this research is to highlight the strategic relevance of inventory planning and control in organizations, as well as the main methods and techniques used and their impacts on organizational performance. The specific objectives are as follows: To examine the strategic importance of inventory planning for operational efficiency and decision-making in organizations; Describe and analyze the main methods and techniques of inventory control adopted by organizations; Evaluate the impacts of inventory management on organizational performance, considering indicators such as costs, service level, and competitiveness.

In order to achieve these objectives, a methodology characterized by a qualitative approach was developed and the research procedure used was the bibliographic research, developed based on materials already published, such as books and scientific articles by relevant authors in the area of logistics and inventory management.

This article is structured in four sections. Initially, the introduction presents the theme and explains the objectives of the research. Next, the methodology describes the approach adopted and the procedures used for the development of the study. In the third section, the theoretical foundation is organized into three axes: the strategic importance of inventory planning, the

methods and techniques of inventory control, and the impacts of inventory management on organizational performance. Finally, in the final considerations, the main results are resumed, evidencing the achievement of the proposed objectives, in addition to indicating possibilities for future research.

2 METHODOLOGY

The approach adopted in this work is qualitative, as it seeks to understand the importance of inventory planning and control from the analysis of concepts and theoretical contributions. This type of approach allows for a more in-depth interpretation of organizational phenomena, without the use of numerical data. According to Gil (2020, p.92), "qualitative research aims to understand phenomena from the perspective of the participants and the interpretation of the researcher".

As for the research procedure, bibliographic research was used, developed based on materials already published, such as books and scientific articles by relevant authors in the area of logistics and inventory management. This procedure allows us to gather different theoretical views on the subject. According to Lakatos and Marconi (2021, p. 166), "bibliographic research covers the entire bibliography already made public in relation to the topic of study, allowing the researcher direct contact with what has already been written on the subject".

For the elaboration of this work, five fundamental authors stand out, presented in chronological order of publication: Chopra (2020), Kenneth and Jane Laudon (2020), Christopher (2020), Heizer and Render (2020), and J. Closs and Cooper (2021). These authors contributed significantly to the understanding of inventory management, covering everything from the supply chain to the use of technologies and the impacts on organizational performance.

3 THEORETICAL FOUNDATION

This rationale was organized into three topics. In the first, the importance of inventory planning within organizations was addressed, highlighting its relevance for cost control and for the proper functioning of operations. In the second, some of the main methods and techniques used in inventory control were presented. Finally, in the third topic, the impacts of inventory management on the performance of companies were discussed.

3.1 THE STRATEGIC IMPORTANCE OF INVENTORY PLANNING

Inventory planning is a fundamental activity for any organization that works with physical products. It is directly linked to the company's ability to serve its customers without generating waste or unnecessary costs.

According to Chopra (2020, p. 61), "inventory management directly influences supply chain performance, as it impacts both the level of customer service and operating costs."

In this sense, it is observed that efficiency in inventory management does not depend only on well-structured operational practices, but also on the support of technologies capable of integrating information, reducing uncertainties, and improving decision-making along the logistics chain.

Laudon and Laudon (2020, p. 223) argue that: "Integrated systems help in the efficient management of resources and contribute to faster and more assertive decisions within organizations".

Inventory planning is considered to be directly associated with the overall performance of the organization, since it influences both storage costs and customer service capacity. In this context, it is highlighted that agility in service, especially the reduction of response time to demands, is an essential strategic factor for organizational competitiveness today.

Figure 1 below illustrates the central role of inventory management in balancing customer service level and operating costs, showing how the use of integrated systems and real-time data contributes to more assertive decisions and overall supply chain performance.

Figure 1

Strategic Pillars in the Supply Chain

Source: Reis e Prazeres (2024)

The analysis, presented in Figure 1, clearly and thoroughly emphasizes that inventory management plays an essential and strategic role in terms of supply chain performance. This happens because this administration is responsible for establishing a balance point, that is, it seeks to adequately harmonize the level of service provided to the customer, ensuring that their demands are met, with the operating costs borne by the company.

In this way, efficient inventory management becomes crucial to maximize both consumer satisfaction and the financial effectiveness of logistics processes. It is observed that the integration of different systems and the application of real-time data enhance the ability of institutions to react to different circumstances, culminating in decisions that are not only faster, but also more accurate. This decision-making dynamic proves vital for operational effectiveness as well as speed in the contemporary competitive context. Thus, the combination of these strategies is essential to improve the performance of organizations, enabling them to adapt effectively to the demands that constantly emerge (Zago; Stábile, 2026).

Thus, it is concluded that the adoption of systematic and structured practices aimed at planning and inventory management, when accompanied by appropriate technological support, not only favors the efficiency of operations, but also strengthens the competitiveness and sustainability of the results achieved by organizations over time. This underscores the relevance of an integrated strategy that promotes efficient performance over time.

3.2 INVENTORY CONTROL METHODS AND TECHNIQUES

For inventory to be well managed, companies use different control methods and techniques. Among the best known is the FIFO (First In, First Out), which prioritizes the exit of older products

According to Chopra (2020, p. 74), "the segmentation of inventory items helps in the prioritization of resources, allowing management to be more efficient and focused on the products with the greatest impact".

In this context, the definition of priorities based on the relevance of the items requires the support of mechanisms that ensure visibility, control, and agile processing of information, in order to support more accurate decisions aligned with the organization's strategic objectives.

According to Christopher (2020, p. 93), "the use of technological tools in inventory management allows for greater agility, reduction of errors, and better operational performance".

Nowadays, it is considered that inventory control methods and techniques are more than essential, but the human resource assigned to such tasks is still a bottleneck within organizations, especially in execution time.

Figure 2

Integration of the ABC curve with management systems

Source: Santos (2023).

Inventory management is a component of a business operation that strategically positions your business as a driver of system, process, cost, and customer service efficiency. Good control allows you to balance the availability of available product with the reduction of redundant products, so that there is no shortage or waste. ABC analysis and other tools help classify items, and integrated software such as ERP and WMS help ensure information accuracy and agility in operations. Thus, more effective inventory management leads to more assertive operations, better investment of resources, and increased competitive advantage of the business (Bravo, 2024).

3.3 IMPACTS OF INVENTORY MANAGEMENT ON ORGANIZATIONAL PERFORMANCE

The way inventory is managed can directly impact a company's bottom line. When there is good control, the organization can better serve its customers, avoiding delays and product shortages.

According to Heizer, Render and Munson (2020, p. 512), "efficient inventory management contributes to the reduction of total costs and improves the level of customer service, being essential for organizational performance".

As illustrated in Figure 3, effective inventory management is linked to the organization's performance, according to Heizer and Render (2020) and Closs and Cooper (2021). Of course,

good inventory management decreases total costs and increases the level of customer service, as well as increasing supply chain visibility and enabling faster and more accurate decisions. The figure, therefore, summarizes how the union of these elements translates into more effective management, directly reflecting on the results and competitiveness of companies.

Figure 3

Contributions of inventory management to organizational performance in the light of the literature

Source: Heizer and Render (2020); Closs and Cooper (2021)

According to Closs and Cooper (2021, p. 278), "proper inventory control provides greater visibility of the supply chain, allowing for faster and more assertive decisions."

It is considered that all Methods and Techniques of inventory control add to the final result, contributing to the Effectiveness of inventory control, it is necessary to have a management where it can be measured and monitored and evaluated.

As illustrated in Figure 3, effective inventory management is linked to the organization's performance, according to Heizer and Render (2020) and Closs and Cooper (2021). Of course, good inventory management decreases total costs and increases the level of customer service, as well as increasing supply chain visibility and enabling faster and more accurate decisions. The figure, therefore, summarizes how the union of these elements translates into more effective management, directly reflecting on the results and competitiveness of companies.

Figure 3 emphasizes that effective inventory management is a key component to the organization's performance. From the contributions of Operations Management, it can be seen that proper inventory control strategies reduce overall costs and improve customer service

levels. Inventory management provides the organization with more visibility into its supply chain and facilitates faster and more assertive decisions from a Supply Chain Management point of view. Thus, when these components are effectively integrated, it leads to more effective management and has a positive influence on the results and competitiveness of organizations.

4 FINAL CONSIDERATIONS

The final considerations of this study reaffirm that inventory planning and control are no longer understood as strictly operational activities, assuming a fundamental strategic role for the sustainability and competitiveness of organizations.

In the light of the theoretical foundation developed, it is evident that efficient inventory management is not limited to the monitoring of product inputs and outputs, but requires the adoption of structured practices and consolidated methodologies, such as ABC Curve, FIFO, Economic Purchase Lot (EOQ) and safety stock. In addition, the relevance of technological support is highlighted, through integrated systems, such as ERP and WMS, which enhance the accuracy of information, traceability and agility of decision-making processes.

In this context, it is observed that the impacts of inadequate inventory management go beyond the operational limits of the warehouse, directly reflecting on the financial performance, the level of customer service and the organization's ability to adapt to variations in demand.

The imbalance between excess and shortage of products is, therefore, a significant risk to the efficiency of the supply chain. In addition, there is a need for integration between inventory planning and other organizational areas, such as purchasing, production, logistics and finance, considering that isolated decisions tend to generate systemic inefficiencies. Thus, the adoption of an integrated view of the supply chain is an essential requirement for obtaining consistent and predictable results in inventory management.

In view of what has been exposed throughout this study, it is verified that the general objective was fully achieved, by evidencing the strategic relevance of planning and inventory control in organizations, as well as by demonstrating the importance of the main methods and techniques applied and their impacts on organizational performance.

In a complementary way, the specific objectives were also met, since the importance of inventory planning for operational efficiency and decision making was analyzed, widely used methodologies were described and examined, such as the ABC Curve, FIFO, EOQ and safety stock, in addition to consistently evaluating the effects of inventory management on fundamental indicators, such as costs, service level and competitiveness.

Finally, it is emphasized that the Supply Management professional must develop not only operational skills related to the use of control methodologies and instruments, but also a strategic understanding capable of articulating inventory data to managerial decisions and organizational objectives. Such competence is a relevant differential in the contemporary scenario, marked by high logistical complexity and growing demands for efficiency and responsiveness.

As a proposal for future investigations, it is suggested to carry out empirical studies that analyze the practical application of inventory management techniques in different economic sectors, allowing the comparison of results and the identification of best practices.

In addition, it is recommended to deepen the analysis of the role of emerging technologies, such as artificial intelligence, big data, and the Internet of Things (IoT), in the optimization of inventory control processes and supply chain integration. It is also pertinent to investigate the relationship between inventory management and sustainability, considering aspects such as waste reduction and efficiency in the use of resources, thus expanding the understanding of the strategic impacts of this area in the contemporary context.

ABSTRACT

Teacher education in basic education in Brazil has historically presented profound regional, social, and institutional inequalities, especially in states marked by educational vulnerabilities, such as Maranhão. In this context, public policies aimed at democratizing access to higher education become strategic for teacher appreciation and for improving the quality of basic education. The National Program for the Training of Basic Education Teachers (PARFOR) and, more recently, PARFOR Equity, were created to expand access to higher education for in-service teachers, prioritizing inland regions and historically marginalized groups. This study aimed to analyze the implementation processes of these programs at the Federal University of Maranhão (UFMA), highlighting their contributions and limitations regarding the democratization of teacher education. The research adopted a qualitative, descriptive, and exploratory approach, based on documentary analysis and bibliographic review. Institutional reports, legislation, public calls, and official documents from CAPES and UFMA were examined. The results indicate that the programs contributed to expanding access to teacher education courses, strengthening the interiorization of higher education, valuing cultural diversity, and reducing educational inequalities. Despite administrative, financial, and pedagogical challenges, PARFOR and PARFOR Equity demonstrate potential to consolidate equity policies and strengthen teacher education in Maranhão.

RESUMO

A formação de professores da educação básica no Brasil apresenta, historicamente, profundas desigualdades regionais, sociais e institucionais, especialmente em estados marcados por vulnerabilidades educacionais, como o Maranhão. Nesse contexto, políticas públicas voltadas à democratização do acesso ao ensino superior tornam-se estratégicas para a valorização docente e para a melhoria da qualidade da educação básica. O Programa Nacional de Formação de Professores da Educação Básica (PARFOR) e, mais recentemente, o PARFOR Equidade, foram instituídos com a finalidade de ampliar o acesso de professores em exercício à formação superior, priorizando regiões interioranas e grupos historicamente marginalizados. Este estudo teve como objetivo analisar os processos de implementação desses programas na Universidade Federal do Maranhão (UFMA), destacando suas contribuições e limites para a democratização da formação docente. A pesquisa adotou abordagem qualitativa, de caráter descritivo e exploratório, fundamentada em análise documental e revisão bibliográfica. Foram examinados relatórios institucionais, legislações, editais e documentos oficiais da CAPES e da UFMA. Os resultados indicam que os programas contribuíram para a ampliação do acesso à licenciatura, fortalecimento da interiorização do ensino superior, valorização da diversidade cultural e redução de desigualdades educacionais. Apesar dos desafios administrativos, financeiros e pedagógicos, o PARFOR e o PARFOR Equidade evidenciam potencial para consolidar políticas de equidade e fortalecimento da formação docente no Maranhão.

RESUMEN

La formación de profesores de la educación básica en Brasil presenta históricamente profundas desigualdades regionales, sociales e institucionales, especialmente en estados marcados por vulnerabilidades educativas, como Maranhão. En este contexto, las políticas públicas orientadas a la democratización del acceso a la educación superior se vuelven estratégicas para la valorización docente y la mejora de la calidad de la educación básica. El Programa Nacional de Formación de Profesores de la Educación Básica (PARFOR) y, más recientemente, el PARFOR Equidad, fueron creados con el objetivo de ampliar el acceso de profesores en ejercicio a la formación superior, priorizando regiones del interior y grupos históricamente marginados. Este estudio tuvo como objetivo analizar los procesos de implementación de estos programas en la Universidad Federal de Maranhão (UFMA), destacando sus contribuciones y límites para la democratización de la formación docente. La investigación adoptó un enfoque cualitativo, de carácter descriptivo y exploratorio, fundamentado en análisis documental y revisión bibliográfica. Se examinaron informes institucionales, legislaciones, convocatorias y documentos oficiales de la CAPES y de la UFMA. Los resultados indican que los programas contribuyeron a ampliar el acceso a las licenciaturas, fortalecer la interiorización de la educación superior, valorizar la diversidad cultural y reducir las desigualdades educativas. A pesar de los desafíos administrativos, financieros y pedagógicos, el PARFOR y el PARFOR Equidad evidencian potencial para consolidar políticas de equidad y fortalecimiento de la formación docente en Maranhão.

1 INTRODUCTION

The training of basic education teachers in Brazil has a trajectory historically marked by regional inequalities, institutional limitations and disputes around the social function of education. Since the nineteenth century, when the first Normal Schools were created to prepare teachers for primary education, teacher training has developed unevenly, concentrating mainly in economically more favored regions and reaching only a restricted portion of the population. These first experiences of institutionalization of teaching took place in a context of organization of the national State and the gradual expansion of public education, but they maintained a strong elitist character and low territorial coverage, especially in the poorest provinces of the country.

Throughout the twentieth century, the expansion of basic schooling and the growth of public education networks significantly increased the demand for qualified teachers. With the creation of universities and higher education courses, an attempt was made to structure a national policy for teacher training, articulating pedagogical, scientific and specific knowledge of the teaching areas. However, educational expansion occurred in an accelerated way and often disconnected from the effective conditions of training and professional valorization. In different Brazilian regions, especially in the North and Northeast, thousands of teachers began to work without adequate training in the area in which they taught, revealing deep educational and structural asymmetries.

During this period, teacher training was linked to the political, economic and social transformations of the country, reflecting different projects of society and conceptions of education. At various times, fragmented training models prevailed, characterized by the separation between theory and practice, the precariousness of teaching work and the insufficiency of permanent policies for professional qualification. The need to expand basic education, especially from the 1970s and 1980s onwards, further highlighted the limits of the initial and continuing education offered to education professionals.

With the enactment of the Federal Constitution of 1988, education began to be recognized as a social right and duty of the State, strengthening the debate on teacher appreciation, quality of teaching and democratization of access to school. Subsequently, the Law of Guidelines and Bases of National Education (LDBEN No. 9,394/1996) established the requirement of higher education for the exercise of teaching in basic education, legally consolidating the need for professional teacher qualification. Despite the normative advances, the universalization of this right remained a challenge, especially in states marked by socioeconomic inequalities and difficulties in accessing higher education.

In view of this scenario, public policies for teacher training began to assume a strategic political role in confronting the historical inequalities of Brazilian education. Programs aimed at expanding the access of practicing teachers to higher education have become fundamental to promote professional qualification, strengthen public education networks and reduce regional disparities in the educational field.

In this context, the National Program for the Training of Basic Education Teachers (PARFOR) was instituted by the Coordination for the Improvement of Higher Education Personnel (CAPES) in 2009 as a government strategy to address the shortage of qualified teachers in the public network. The program sought to offer licentiate courses to practicing teachers who did not have specific training in the area of activity, ensuring them the legal qualification required by the current educational legislation. The national coverage of PARFOR made it possible to serve thousands of teachers in different regions, especially in inland and hard-to-reach locations, becoming a reference for public policy aimed at professional valorization and the strengthening of basic education. Its implementation contributed to the expansion of access to higher education and to the reduction of historical asymmetries between regions, although it has faced limitations related to the management, financing and continuity of actions.

PARFOR was part of a broader set of policies for the expansion and interiorization of higher education implemented in the first decades of the twenty-first century, a period marked by the expansion of federal universities, the creation of new campuses and the strengthening of educational inclusion programs. In this context, teacher training came to be understood not only as a technical requirement for professional practice, but as a strategy for social development, reduction of regional inequalities and strengthening of public education networks. The role of CAPES in coordinating the program has given greater national articulation to teacher training policies, promoting cooperation between the Union, states, municipalities and higher education institutions.

In 2023, the National Program for the Promotion of Equity in Basic Education Teacher Training (PARFOR Equidade) was instituted, also under the coordination of CAPES, in partnership with the Secretariat of Continuing Education, Youth and Adult Literacy, Diversity and Inclusion (SECADI/MEC). This new format emerged with the purpose of meeting the specific demands of teachers who worked in contexts of greater social, cultural and educational vulnerability. PARFOR Equity has incorporated an identity and inclusive dimension by offering courses aimed at quilombola communities, indigenous people, rural populations, people with disabilities and the deaf, recognizing diversity as a structuring element of education. This

proposal expanded the reach of traditional PARFOR by prioritizing historically marginalized groups, reinforcing the commitment to the democratization of teacher training on equitable and culturally contextualized bases.

The creation of PARFOR Equity also relates to contemporary discussions on social justice, interculturality, and recognition of differences in the educational field. In a country marked by ethnic-racial and territorial inequalities, universal policies have often proved insufficient to guarantee effective equality of access and permanence in higher education. Thus, the program began to incorporate principles aimed at recognizing the cultural and linguistic specificities of the subjects served, valuing traditional knowledge and promoting greater approximation between the university, local communities and contextualized educational practices.

At the Federal University of Maranhão (UFMA), the implementation of PARFOR began in 2009, with the offer of teaching degree courses in 37 municipalities in Maranhão. Throughout its history, the institution has become a protagonist in the consolidation of this public policy in the region, responding to historical demands for teacher training and expanding the access of basic education professionals to the university. In 2024, UFMA also started the execution of PARFOR Equity, structuring degree courses in areas such as Quilombola School Education, Indigenous Intercultural Education, Inclusive Special Education and Bilingual Education for the Deaf. Such courses were planned based on articulation with local communities, schools and managers, seeking to respect cultural specificities and promote greater integration between the university, the educational system and the populations served. The insertion of PARFOR and PARFOR Equity in UFMA highlights not only the strategic role of the institution in the state, but also the challenges inherent to management, financing and pedagogical monitoring.

In the context of Maranhão, such programs assume even greater relevance in view of the historical indicators of social inequality, territorial dispersion and difficulties in accessing higher education. Maranhão has a significant concentration of rural municipalities, traditional communities and regions with low human development indexes, factors that have historically impacted the training of basic education teachers. In this scenario, UFMA's performance through PARFOR and PARFOR Equity represents an important strategy for university interiorization, contributing to bring public higher education closer to populations historically excluded from training processes.

In view of this scenario, the following guiding question was formulated: what is the importance of the implementation of PARFOR and PARFOR Equity in the state of Maranhão,

in terms of educational management and democratization of teacher training in basic education?

To answer this question, the general objective of the research was to analyze the processes of implementation of PARFOR and PARFOR Equity at UFMA, highlighting how educational management contributed to the promotion of equity. The specific objectives consisted of: investigating the history of public policies for teacher training in Brazil and Maranhão; identify management strategies adopted by UFMA in the implementation of PARFOR and PARFOR Equity; know the organizational structure of the programs in the institution; and to evaluate the contributions and limits of these actions for the democratization of access to higher education by public school teachers.

The methodology adopted a qualitative approach, with a descriptive and exploratory character, based on documentary analysis and bibliographic review. Legislation, public notices, institutional reports of UFMA and academic productions related to PARFOR and PARFOR Equity were examined, allowing us to understand the implementation processes, the structure of the courses and the management mechanisms adopted. The investigation sought to articulate official data and specialized literature to identify the strategies for democratization of teacher training, the challenges faced and the results of the two programs, providing subsidies for the critical evaluation of the contributions in the context of Maranhão.

The research presented in this article is organized into five sections. After this introduction, the second section describes the methodology adopted, detailing procedures, sources and analysis steps. The third section examines the historical, legal and political context of teacher training in Brazil and Maranhão, addressing the creation of PARFOR and PARFOR Equity and situating their incorporation into UFMA, as well as the regional and structural challenges for the qualification of basic education teachers. The fourth section analyzes the implementation of these programs at the university, divided into subsections that deal with the operationalization of PARFOR at UFMA and the management of PARFOR Equity, considering courses offered, centers served, number of enrollments, profile of faculty-students, institutional strategies and main obstacles. Finally, the fifth section presents the final considerations, synthesizing the impacts of PARFOR and PARFOR Equity on the democratization of teacher training in Maranhão and pointing out opportunities to improve public policies aimed at educational equity.

2 METHODOLOGY

The rigorous understanding of any social or educational phenomenon depends directly on the clarity and adequacy of the methodology employed. According to Gil (2019), scientific methodology consists of the set of procedures used to achieve research objectives in a systematic and reliable way, allowing the results to be analyzed and interpreted critically. Lakatos and Marconi (2017) highlight that the methodological choice guides the collection, analysis, and interpretation of data, being fundamental to confer validity and consistency to the study. In this sense, the methodology is not limited to indicating techniques, but establishes the paths for the production of knowledge, ensuring that the research processes are replicable and subject to scientific evaluation. This research, therefore, is based on methodological principles that ensure rigor, transparency and social relevance, offering a clear overview of the procedures adopted to analyze the implementation of PARFOR and PARFOR Equity at UFMA.

The general objective of the research is to analyze the processes of implementation of PARFOR and PARFOR Equity at UFMA, highlighting how educational management contributed to the promotion of equity. The specific objectives consisted of: investigating the history of public policies for teacher training in Brazil and Maranhão; identify management strategies adopted by UFMA in the implementation of PARFOR and PARFOR Equity; know the organizational structure of the programs in the institution; and to evaluate the contributions and limits of these actions for the democratization of access to higher education by public school teachers.

To achieve these objectives, the research used a qualitative approach, with a descriptive and exploratory character, based on documentary analysis and bibliographic review, classic methods and widely recommended by authors such as Gil (2019) and Severino (2017) for investigations in applied social sciences. The qualitative approach proved to be adequate because it enables an in-depth understanding of institutional processes, management practices and educational dynamics that cannot be reduced to numerical indicators alone. According to Minayo (2014), qualitative research works with the universe of meanings, social relations, representations and interpretations produced by subjects and institutions, allowing the understanding of complex phenomena inserted in specific historical and sociocultural contexts.

The descriptive character of the investigation sought to identify and systematize information regarding the implementation of the programs, the administrative strategies adopted by the university, the territorial distribution of the courses and the mechanisms of democratization of access to teacher training. The exploratory dimension, on the other hand, allowed us to broaden the understanding of an object that is still recent and in the process of consolidation, especially in the case of PARFOR Equity, whose implementation at UFMA took

place from 2024 onwards. In this sense, the research sought not only to describe institutional data, but also to critically interpret the political, social and educational meanings of these initiatives in the context of Maranhão.

The documentary analysis included ordinances, enrollment reports, course planning and institutional data from the Ministry of Education, CAPES and UFMA, while the bibliographic review allowed contextualizing the results based on consolidated academic production. Official documents related to national teacher training policies, educational legislation, selection notices, institutional resolutions, academic reports and administrative documents produced by the university and the federal agencies responsible for coordinating the programs were examined. The use of these sources made it possible to understand both the normative aspects and the concrete processes of operationalization of PARFOR and PARFOR Equity at UFMA.

The literature review focused on studies on public educational policies, teacher training, educational management, democratization of higher education and equity in education. Authors who discuss teacher training in the Brazilian context were mobilized, as well as research focused on policies for the interiorization of higher education and regional inequalities in education. This articulation between institutional documents and specialized literature allowed us to build a broader analysis of the impacts and limits of the programs investigated.

The analysis of the documents followed systematic steps: survey and careful selection of sources, categorization of information into central themes (implementation strategies, access of teachers from remote regions and impacts on training), critical synthesis in the light of the literature and identification of gaps and challenges. Initially, the mapping of the documentary sources available in the institutional portals of CAPES, the Ministry of Education and UFMA was carried out. Then, the documents were organized according to their nature and purpose, allowing the identification of information related to the creation of the programs, curricular organization, administrative management, number of vacancies offered, municipalities served and profile of the participating teachers.

Subsequently, an analytical reading of the material was carried out, seeking to identify recurrent categories related to the democratization of access to higher education, the internalization of teacher training, the promotion of equity and institutional challenges faced by the university. This stage allowed us to understand the relationships between public policies, university management and specific social demands of the Maranhão context. The interpretation of the data was carried out in conjunction with the bibliographic review, making it possible to confront the official documents with the theoretical discussions produced in the educational field.

This methodological sequence made it possible to understand the interrelations between educational management, democratization of teacher training and promotion of equity, ensuring coherence and analytical depth. The qualitative approach allowed the evaluation of both quantitative aspects, such as the number of classes and enrollments, as well as qualitative dimensions related to academic management, pedagogical monitoring and articulation with local sociocultural contexts, ensuring reliability and validity of the results (Lakatos; Marconi, 2017; Gil, 2019). In addition, the combined use of documentary analysis and literature review contributed to expanding the interpretative consistency of the research, allowing the programs to be examined not only as administrative initiatives, but as public policies linked to debates on the right to education, social justice and reduction of educational inequalities.

The methodology adopted offered a rigorous approach to understand the implementation of PARFOR and PARFOR Equity at UFMA. The documentary analysis and the literature review allowed for a critical evaluation of the contributions and limitations of the programs, subsidizing the improvement of public policies, educational management and the promotion of equity. By articulating theoretical foundations, institutional documents and critical analysis of teacher training policies, the research sought to contribute to the debate on the democratization of higher education and the valorization of basic education professionals in contexts historically marked by social and regional inequalities. This systematization created the basis for analyzing the historical trajectory and current practices of teacher education in Brazil and Maranhão, confronting legislation and reality, a theme that will be explored in the next section.

3 TEACHER TRAINING IN BRAZIL AND MARANHÃO

This section aims to analyze the historical and legal trajectory of teacher education in Brazil and Maranhão. Seeking to understand how public policies and legal frameworks have shaped teacher training, allowing to contextualize the implementation of PARFOR and PARFOR Equity at UFMA, in line with the specific objectives of the research. This analysis is fundamental to identify how educational legislation has influenced access to teacher training and the promotion of equity in basic education.

In the colonial period, education was essentially religious and restricted to the elites, with the Jesuits playing a central role in basic instruction and in the training of future teachers, centered on catechesis and the maintenance of social order (Faustino, 2001; Carvalho, 2003). Teacher training was informal and limited, marked by the scarce supply of schools and the absence of specific government regulations for popular education.

In this context, the work of the Society of Jesus structured an educational model aimed at moral and religious formation, in which teaching had as its main purpose the consolidation of Portuguese colonial domination. The preparation of the masters occurred predominantly through practical experience and religious orientation, and there were no systematic public policies aimed at professional teacher training. As Saviani (2013) observes, Brazilian colonial education was characterized by social exclusion and the absence of an educational system organized by the State.

Independence and the Empire brought the creation of rudimentary norms, such as the Regulation of 1827, which established the first standards for normal schools and the training of primary teachers, but in a way that was still elitist and concentrated in the capitals, leaving the interior practically unassisted (Saviani, 2013). The Law of October 15, 1827 represented an important legal milestone in establishing guidelines for schools of first letters, but its limitations revealed the country's structural difficulties in universalizing public education. The first Normal Schools, created from the 1830s onwards, sought to prepare teachers for elementary education, but remained concentrated in large urban centers and served a small number of students. Tanuri (2000) points out that these institutions contributed to the institutionalization of teacher training in Brazil, although they still maintained a strong selective and elitist character.

During the Old Republic (1889-1930), educational reforms sought to expand access to education, but teacher training maintained centralizing and regionally differentiated characteristics. Normal schools continued to prioritize formal content and the reproduction of traditional knowledge, while Maranhão faced structural difficulties in ensuring quality teacher training, reflecting historical inequalities in infrastructure and human resources (Gatti, 2010; Oliveira, 2008).

During this period, positivist influences and the ideals of modernization of the State boosted debates on the need to expand public education, but educational policies continued to be marked by deep regional inequalities. While states in the Southeast had a greater expansion of normal schools and investments in education, Maranhão remained with a reduced supply of training institutions and low schooling rates. The precariousness of the material conditions of the schools and the scarcity of qualified teachers made it difficult to consolidate more comprehensive educational policies.

The Vargas Era (1930-1945) introduced measures to centralize and professionalize teacher training, with the creation of teaching schools and normal courses in various regions. Despite expanding the offer of courses, the actions still favored urban centers, and training continued to be restricted to authoritarian and content-based models (Saviani, 2013). The

creation of the Ministry of Education and Public Health in 1930 marked the beginning of a more nationally articulated educational policy, but the reality in Maranhão still reflected significant gaps in teacher training and school infrastructure.

The reforms inspired by the New School movement began to defend teacher training based on more modern scientific and pedagogical principles, emphasizing active methodologies and greater appreciation of childhood and the educational process. However, such proposals reached the different Brazilian states in an unequal way, keeping Maranhão distant from the main experiences of pedagogical renewal developed in the country.

During the military regime (1964-1985), education underwent reforms aimed at quantitative expansion and technical training, with the creation of institutes and programs aimed at the rapid professionalization of teachers, but with little investment in pedagogical quality (Dourado, 2015). The LDBEN of 1961 and subsequent decrees sought to regulate teacher training, but the emphasis remained on basic education focused on literacy and discipline, neglecting critical training and regional equity. Maranhão, like other peripheral regions, remained with limited access to continuing education courses and specialized training.

In this context, a technicist perspective of education predominated, focused on administrative rationalization and the preparation of labor for economic development. Many emergency programs were implemented to quickly address the shortage of teachers, especially in inland regions, but without ensuring adequate conditions for pedagogical training. As Dourado (2015) analyzes, the quantitative expansion of education during the military regime often occurred dissociated from consistent policies of teacher appreciation and educational quality.

With the enactment of the Federal Constitution of 1988, education became a fundamental right, ensuring equal conditions and the duty of the State to offer adequate training for all basic education teachers. LDBEN 9.394/1996 consolidated principles of democratization and quality, defining guidelines for the initial and continuing training of teachers and establishing minimum standards of schooling and professional qualification (Saviani, 2013; Gatti, 2010). In Maranhão, these norms represented significant advances, especially with the expansion of university centers and continuing education programs, but regional inequality and infrastructure limitations still constituted important barriers to the full implementation of public policies.

The Federal Constitution of 1988 redefined education as a social right and broadened the debate on valuing teaching, quality of teaching and democratization of access to school. Subsequently, LDBEN No. 9,394/1996 established the requirement of higher education for the exercise of teaching in basic education, legally strengthening the need for teacher

professionalization. Despite these legal advances, challenges persisted related to the internalization of higher education, student permanence, and teacher training in rural municipalities and socially vulnerable regions.

Classic authors of teacher training, such as Gatti (2010), Saviani (2013) and Oliveira (2008), emphasize that, although Brazilian legislation has evolved continuously, the practical application in the national territory has revealed profound regional differences. In Maranhão, the gap between legislation and the daily practice of schools highlighted the need for programs that considered local specificities and historical challenges, providing support to teachers in practice and expanding access to higher education. This historical reality justifies the creation of policies such as PARFOR and, more recently, PARFOR Equity, aimed at the democratization of teacher training, especially for teachers who work in municipalities in the interior.

In this sense, public policies for teacher training began to assume a strategic role in reducing educational inequalities and strengthening public education networks. PARFOR and PARFOR Equity are part of this context as initiatives aimed at expanding access to licensure, professional valorization and the promotion of educational equity, especially in states historically marked by structural difficulties, such as Maranhão.

Therefore, the trajectory of teacher training in Brazil and Maranhão reveals a historical process of legal advances that, however, is confronted with practical challenges, such as regional inequality, lack of infrastructure and concentration of resources. Legislation has evolved from rudimentary instruments in the colonial period to constitutional and legal frameworks that ensure the right to education and qualified teacher training, but the effectiveness of these norms depends on the implementation of contextualized public policies. This historical and legal analysis provides the necessary foundation to understand the most recent processes of teacher training, a theme that will be deepened in subsequent sections, especially in the study of PARFOR and PARFOR Equity at UFMA.

4 PROCESSES FOR IMPLEMENTING PARFOR AND PARFOR EQUITY IN BRAZIL

Continuing the historical and legal analysis of teacher training in Brazil and Maranhão, presented in the previous section, this section aims to examine the processes of creation and implementation of PARFOR and PARFOR Equity, highlighting their relevance in the national scenario and their subsequent incorporation by UFMA. While section three broadly situated the historical and legislative context of teacher education, here we seek to understand the operationalization of these public policies, analyzing institutional strategies, the geographical

distribution of courses, academic management and the mechanisms of inclusion of historically marginalized groups.

The National Plan for the Training of Basic Education Teachers (PARFOR) was instituted in 2009, in the context of the expansion of federal education policies, through Decree No. 6,755, of January 29, 2009, and regulated by Normative Ordinance MEC/CAPES No. 40/2009 (Brasil, 2009; CAPES, 2009). Its creation was motivated by the worrying situation revealed by the National Institute of Educational Studies and Research Anísio Teixeira (INEP), which indicated that about 40% of the teachers in office in the country did not have specific qualifications for the area in which they taught (INEP, 2009). This reality mainly affected schools located in peripheral, rural regions with low socioeconomic development, especially in the North and Northeast of Brazil, where the shortage of licensed teachers was more pronounced.

The program was born within the scope of the Education Development Plan (PDE, 2007) and the goals of the National Education Plan (PNE 2001–2010), which emphasized the urgency of valuing teachers and the universalization of higher education for basic education teachers. In addition to meeting the training deficit, PARFOR sought to create conditions for the strengthening of the teaching career, articulating goals for the expansion of higher education to the specific demands of the municipal and state education networks (Gatti, 2011; Libâneo, 2013).

Among its main objectives were: to expand the offer of licentiate courses under special regimes, to prioritize municipalities with a historical deficit of qualified teachers, to reduce regional inequalities in access to higher education and to contribute to the valorization of teaching as a profession of the State. In its first decade of operation, PARFOR mobilized 90 public institutions of higher education, including federal, state and federal universities, reaching approximately 334 thousand teachers enrolled in teaching degree courses, distributed in more than 3 thousand Brazilian municipalities. Until 2016, data from CAPES (2017) indicated that more than 300 thousand professors entered classes of the program, with an average completion rate of more than 70%, a significant result given the historical difficulties of permanence in higher education faced by professors in practice. During this period, the program offered about 51 thousand vacancies per year, in more than 2,500 service centers, prioritizing locations with a low Human Development Index (HDI) and a high deficit of qualified professionals.

PARFOR represents, therefore, a policy of a strategic nature, by combining a logic of federative integration, mobilizing universities, federal institutes, states and municipalities, with a focus on reducing regional inequalities. This configuration allows teachers from public schools in rural, quilombola, indigenous, riverside and peripheral urban areas to have access to

licensure training, in many cases offered in the municipality itself or in centers that are easy to travel. By creating a cooperation network between the Union, states, and municipalities, the program broke with the tradition of fragmented training policies, which historically disregarded local specificities (Dourado, 2020).

PARFOR Equity, established in 2022 within the scope of the Coordination for the Improvement of Higher Education Personnel (CAPES), emerged as an unfolding and improvement of previous policies. Aimed primarily at teachers belonging to historically marginalized social groups, indigenous people, quilombolas, blacks, people with disabilities, and rural education teachers, the program sought to ensure not only access to higher education, but also the construction of training proposals sensitive to cultural and territorial specificities (CAPES, 2022). This aspect of PARFOR expands the dimension of equity, incorporating the right to difference and social justice into teacher training policies, in line with the principles established by the National Education Plan 2014–2024, especially goal 15, which provides for ensuring specific higher education training for all basic education teachers.

The creation of PARFOR Equity also dialogues with international commitments assumed by Brazil, such as the Sustainable Development Goals (SDGs) of the UN 2030 Agenda, in particular SDG 4, which establishes ensuring inclusive, equitable and quality education. By directing public policies to historically excluded segments, PARFOR Equity materializes a qualitative advance in relation to the first phase of the program, reinforcing the need to reconcile quantitative expansion of vacancies with contextualized training, which respects the sociocultural diversities of the country (Souza; Amaral, 2022).

Thus, both PARFOR and PARFOR Equity should be understood as structuring initiatives in the field of teacher training, which go beyond compensatory actions to address historical deficits. The first consolidated a national network for the offer of degrees in a special regime, expanding the presence of higher education in underserved regions and guaranteeing qualification to hundreds of thousands of teachers. The second, by introducing the principle of equity, reaffirms the commitment that access to training should be universal, but also differentiated and sensitive to local realities. This evolution demonstrates that the public policy of teacher training in Brazil has sought, albeit with limits, to align itself with principles of democratization, valorization and social justice.

4.1 FROM NATIONAL POLICY TO INSTITUTIONAL PRACTICE: PARFOR AT UFMA

Maranhão, a state historically marked by critical educational indicators, has been present since the initial phase of implementation of the National Plan for the Training of Basic Education

Teachers (PARFOR). With low school performance rates, illiteracy rates above the national average and a high concentration of teachers without higher education, the adherence of the Federal University of Maranhão (UFMA) to the program in 2009 represented a milestone for the democratization of teacher training in the region (INEP, 2010; UFMA, 2023).

UFMA was one of the first federal universities to incorporate PARFOR, offering undergraduate courses in strategic areas such as Mathematics, Portuguese Language, History, Biological Sciences and Pedagogy, aiming to meet historical shortcomings in the public education system. To ensure territorial reach, support centers were structured in strategic municipalities such as Imperatriz, Bacabal, Caxias, Pinheiro, and São Luís, with classes organized in an intensive regime, in order to enable the participation of teachers in practice, many of them from regions far from the capital (UFMA, 2020).

In the first phase of the program, between 2009 and 2016, the university offered about 4,200 vacancies in undergraduate degrees, of which more than 3,000 resulted in successful conclusions, corresponding to approximately 72% of the completion rate (UFMA, 2023). The operationalization of PARFOR involved different stages, such as a survey of regional demands, identification of teachers without full qualification, definition of priority courses, distribution of classes and centers, allocation of teacher trainers and tutors, continuous pedagogical monitoring and institutional evaluation of results. The process involved the performance of UFMA professors who, in addition to regular teaching, research and extension activities, assumed additional responsibilities in the execution and pedagogical monitoring of the program.

However, since its early years, some structural challenges have been pointed out. The discontinuity of federal funding compromised the regularity of the opening of classes; the articulation between the university and municipal departments of education has not always been effective, especially in smaller municipalities; student dropout rates presented worrying rates in certain centers, reaching up to 25% in more vulnerable locations; and university professors reported work overload due to the intensification of teaching activities in the interior (Gatti; Barreto, 2015; Brito, 2017; Silva, 2020).

Despite these obstacles, UFMA has consolidated itself as a reference in Maranhão for the interiorization of higher education, articulating PARFOR with local educational policies and ensuring the titles of thousands of teachers from the public network. The impact of this policy can be observed in the expansion of the number of licensed teachers, in the expansion of access to higher education in traditionally excluded regions and in the valorization of the teaching profession, even in the midst of difficulties of permanence and financing.

As the policy matured, criticism arose about the insufficiency of the generalist model of PARFOR to address deeper inequalities. Internal UFMA reports and evaluation studies indicated that, although there was significant adherence of public school teachers, quilombola communities, indigenous people, deaf teachers and people with disabilities continued to face barriers to access and permanence. These barriers ranged from linguistic and cultural issues to infrastructure limitations at the hubs, reinforcing historical inequalities (UFMA, 2023).

In this scenario, CAPES launched, in 2022, PARFOR Equity, regulated by Ordinance No. 206, as a policy aimed specifically at teacher training of historically marginalized groups. Unlike the original PARFOR, which was organized around a wide range of teaching degrees, PARFOR Equity focused on specific areas: Quilombola School Education, Indigenous Intercultural Education, Inclusive Special Education, and Bilingual Education for the Deaf, in line with the principles of the 1988 Federal Constitution, the LDB (Law No. 9,394/1996), and the goals of the National Education Plan (2014–2024).

UFMA officially joined PARFOR Equity in 2024, reinforcing its tradition of interiorization and expanding the reach of the policy. 12 initial action centers were established, distributed in municipalities with a strong presence of quilombola and indigenous communities, such as Alcântara, Caxias, Grajaú, Zé Doca and Santa Inês (UFMA, 2024). In this first stage, 1,200 vacancies were opened in teaching degree courses focused on the cultural and linguistic specificities of these groups, with classes organized in an intensive regime and adapted to the socioeconomic conditions of the teacher-students.

The profile of the students evidenced the relevance of the policy: 70% were women, 45% quilombolas, 25% indigenous and 15% people with disabilities, in addition to the significant presence of teachers working in rural schools (UFMA, 2024). These data reveal an important shift in relation to the traditional PARFOR, by directing efforts to audiences often made invisible by teacher training policies.

From the point of view of management, UFMA created a specific institutional structure, coordinated by the Dean of Education (PROEN) and the Interiorization Advisory, with responsibilities that included: selection of teacher trainers, logistical support to the centers, articulation with municipal secretariats and pedagogical monitoring. Even so, relevant difficulties persisted, such as precarious infrastructure in inland centers, limited connectivity, overload of university professors, and an average dropout rate of 18% in the first year, mainly related to adverse socioeconomic conditions and the reconciliation between work and study.

As a response, the university and local partners implemented mitigation strategies, such as partnerships with city halls and community associations for transportation and food,

continued training of teacher-trainers in intercultural and bilingual methodologies, psychopedagogical monitoring aimed at indigenous and deaf students, in addition to semiannual reports sent to CAPES, ensuring greater transparency and continuous evaluation.

The preliminary results were expressive. By the end of 2024, 920 teachers had successfully completed the first year of the course, achieving a permanence rate of more than 80% (UFMA, 2024). This index, although still insufficient, was considered positive in the face of adverse conditions, signaling the potential of the program to consolidate higher education trajectories among teachers from historically marginalized communities. In addition, UFMA's experience became nationally recognized, with the presentation of reports and good practices in seminars promoted by CAPES and the National Education Forum (FNE, 2024).

However, the trajectory of PARFOR at UFMA, from the initial adhesion in 2009 to the incorporation of PARFOR Equity in 2024, illustrates a movement of evolution in public policy: from massive training of teachers in practice to a focused, equitable and culturally contextualized training. At the same time that it maintains its function of expanding the teaching title in the state, the university reaffirms its centrality in the fight against social and educational inequalities, internalizing access to higher education and incorporating inclusive pedagogical practices. Although it faces structural and financing challenges, the program shows promise for building a more representative education, in line with the principles of equity and social justice.

The following section will deepen the management and implementation processes of PARFOR Equity at UFMA, highlighting the courses offered, the centers served, the profile of the students and the institutional strategies to overcome the challenges that still arise.

4.2 MANAGEMENT AND OPERATIONALIZATION OF PARFOR EQUITY AT UFMA

This subsection presents the analysis of the management and operationalization of PARFOR Equity at the Federal University of Maranhão (UFMA), with the central objective of demonstrating how the institution structured, monitored and adapted the program to regional specificities, promoting access to higher education for teachers in practice in historically disadvantaged contexts. The investigation considers organizational, pedagogical and logistical aspects, allowing us to understand how national teacher training policies are articulated with local demands, ensuring the inclusion of indigenous teachers, quilombolas, people with disabilities and deaf people (UFMA, 2024; CAPES, 2022). To this end, the analysis uses institutional data from UFMA, CAPES reports and recent studies on teacher training and public policies, identifying institutional strategies and results of the action.

The implementation of PARFOR Equity at UFMA began in 2024, with the creation of 12 regional hubs strategically distributed in municipalities with a high concentration of historically marginalized populations, including Alcântara, Caxias, Grajaú, Zé Doca and Santa Inês (UFMA, 2024). For this first phase, 1,200 vacancies were opened in specific degree courses, including Quilombola School Education, Indigenous Intercultural Education, Inclusive Special Education and Bilingual Education for the Deaf. The distribution of classes sought to meet local demands, considering the geographical distance, the availability of infrastructure and the density of teachers in office, promoting qualified access to higher education in regions with difficult educational coverage.

The program mobilized about 120 UFMA professors, acting as tutors, coordinators, and teacher trainers at the centers, accumulating teaching, research, and extension functions, and ensuring continuous pedagogical monitoring (UFMA, 2024). This institutional articulation allowed the implementation of pedagogical strategies adapted to the sociocultural realities of the students, such as intercultural, bilingual and inclusive methodologies, as well as psychopedagogical monitoring aimed at indigenous, quilombola and deaf teachers, in order to reduce linguistic and cultural barriers to learning.

The profile of the enrolled students highlights the social relevance of the initiative: 70% are women, 45% quilombolas, 25% indigenous and 15% people with disabilities, with a significant presence of teachers working in rural schools and rural communities (UFMA, 2024). The adhesion of the faculty demonstrates the impact of the program in reducing historical inequalities in access to academic training, promoting social inclusion and valuing cultural diversity in basic education.

In terms of management and operationalization, UFMA has structured a support network integrated with the Dean of Education (PROEN) and the Interiorization Advisory, responsible for the academic and logistical coordination of the centers, selection and training of teacher trainers, articulation with municipal education departments and continuous monitoring of classes. Among the mechanisms adopted, the continuing education of tutor teachers, the implementation of biannual evaluation processes, partnerships with city halls and community associations for transportation and food, and technological support for classes and teaching materials stand out. This structure evidenced the university's ability to reconcile national policies with local demands, promoting a model of interiorization of higher education focused on equity (UFMA, 2024; CAPES, 2022).

PARFOR Equity presents significant advances in relation to the first phase of PARFOR, by concentrating efforts on historically marginalized groups and recognizing the regional and

cultural specificities of the participants. Recent studies indicate that structured teacher training programs, such as PARFOR and PARFOR Equity, are strategic for overcoming historical inequalities, strengthening the professionalization of teachers and improving the quality of teaching in basic education (Dourado, 2020; Souza; Amaral, 2022). By integrating national policies and local demands, the program highlights a model of educational inclusion adapted to contexts of socioeconomic and territorial vulnerability, consolidating the social function of the public university in promoting equity.

The challenges faced in the implementation include precarious infrastructure in some centers, limited connectivity, overload of professors, and initial dropout of about 18% of the students in the first year, motivated by socioeconomic difficulties and reconciliation between work and study (UFMA, 2024). To mitigate them, UFMA has developed integrated strategies, including: continued training of tutors in intercultural and bilingual methodologies; individualized psychopedagogical follow-up; logistical support through partnerships with municipal secretariats and community associations; and systematic monitoring of execution, with reports sent to CAPES, ensuring transparency and constant evaluation of the results. Such measures demonstrate how institutional management can enhance the effectiveness of public policies, ensuring the permanence and academic success of the participating professors.

The results obtained until 2024 reveal concrete impacts on the democratization of access to teacher training in Maranhão. Approximately 920 professors successfully completed the first year of implementation, with a permanence rate of more than 80%, expressive numbers given the socioeconomic and geographical conditions faced by the students (UFMA, 2024). The equitable distribution of centers and courses has made it possible to serve areas with a greater historical deficit of licensed teachers, strengthening the teaching of the state and municipal public network and expanding the presence of qualified professionals in remote and vulnerable regions.

Thus, the management and operationalization of PARFOR Equity at UFMA demonstrates that public policies for teacher training, when well structured and articulated with regional specificities, can promote inclusion, equity and quality in higher education. The program contributes to reducing historical inequalities by enabling teachers in practice, especially in peripheral municipalities and traditional communities, to have access to degrees. Among the impacts already identified, the increase in enrollment in strategic areas, the strengthening of local education networks, the appreciation of cultural and linguistic diversity in teacher training and the incorporation of intercultural and inclusive pedagogical practices stand out.

PARFOR Equity evidences, still in its early steps, the social function of UFMA as an agent of interiorization of higher education, although its initial results indicate more potentialities than consolidations, evidencing the need for more stable, integrated and sustainable policies. In this sense, the experience of Maranhão reinforces that programs aimed at teacher training, if accompanied by consistent monitoring and support mechanisms, can become relevant instruments for professional valorization and for the reduction of educational inequalities. These analyses support the transition to the final considerations, which will resume the contributions of PARFOR and PARFOR Equity to the democratization of teacher training in Maranhão and Brazil, synthesizing the impacts achieved and pointing out ways to improve public policies.

5 FINAL CONSIDERATIONS

This research started from the central question: what is the importance of the implementation of PARFOR and PARFOR Equity in the state of Maranhão, in terms of educational management and democratization of basic education teacher training?

Throughout the sections, it was possible to demonstrate that both PARFOR and PARFOR Equity play a unique and strategic role in expanding access to higher education and valuing teaching, contributing to reducing historical inequalities in the state. The investigation also showed that these public policies go beyond the strictly academic dimension, assuming social, territorial and cultural relevance in the consolidation of the right to education in regions historically marked by educational vulnerabilities and exclusion from higher education.

Since its implementation in 2009, PARFOR at UFMA has trained 2,907 teachers in practice, distributed in 127 classes offered in 34 municipalities in Maranhão. Currently, the program is present in 42 municipalities, with 94 classes and more than 4,300 students enrolled, covering seven undergraduate courses. These numbers show the capacity for higher education to move to the interior and the positive impact on teacher training in several regions of the state. More than quantitative indicators, these data reveal the strengthening of the presence of the public university in municipalities in the interior historically distant from higher education policies. In many of these territories, the arrival of PARFOR represented the first concrete opportunity for teachers to access a teaching degree for practicing teachers, especially in rural locations and municipalities far from large urban centers.

PARFOR Equity, started in 2024, broadened the focus of the policy, directing training to teachers belonging to historically marginalized groups, such as indigenous people, quilombolas, people with disabilities, and the deaf. In the first stage of the program, 1,200 vacancies were offered in 12 centers distributed in municipalities such as Alcântara, Caxias, Grajaú, Zé Doca

and Santa Inês. Institutional data indicate that, by the end of 2024, 920 teachers had successfully completed the first year of specific courses in Quilombola School Education, Indigenous Intercultural Education, Inclusive Special Education and Bilingual Education for the Deaf, with a permanence rate of more than 80%. This number highlights the importance of support policies, pedagogical monitoring and logistical strategies adapted to local realities. The PARFOR Equity proposal introduces an important qualitative change in teacher training policies by recognizing that the democratization of access to university cannot occur in a homogeneous way, but must consider cultural, territorial, linguistic and identity differences present in Brazilian society. In this sense, the program broadens the understanding of equity by incorporating demands historically made invisible by traditional educational policies.

By articulating national teacher training policies with regional demands, the programs demonstrate that the interiorization of higher education can effectively contribute to the democratization of teacher training. Among the impacts observed are the increase in the number of qualified teachers in strategic municipalities, the appreciation of cultural and linguistic diversity in basic education, the consolidation of inclusive and intercultural pedagogical practices, and the strengthening of local education networks. Such results reinforce the social function of UFMA as a mediator between public policies and historically disadvantaged educational contexts, creating conditions for teacher training to achieve greater equity.

The research also allowed us to understand that the internalization promoted by PARFOR and PARFOR Equity does not only represent the physical displacement of the university to the interior, but constitutes a political and social movement to expand the right to higher education in historically marginalized regions. This process strengthens the permanence of qualified professionals in the municipalities themselves and favors pedagogical practices that are more contextualized to local realities.

However, despite the advances, the challenges remain significant. Regional inequality still limits access in more remote municipalities, the infrastructure of the hubs and access to connectivity continue to be important obstacles, and there is a need for continuous public policies that guarantee the financial and pedagogical stability of the program. PARFOR Equity is still in its first years of implementation, and its consolidation will depend on the maintenance of follow-up strategies, training of trainers and inter-institutional articulation.

In addition, the survey revealed that many participating teachers face difficulties related to extensive travel, precarious roads, limitations in access to digital connectivity, absence or insufficiency of printing of pedagogical notebooks and the complex articulation between teaching work, intensive academic training on weekends and vacation periods, as well as family

and community responsibilities. Such conditions show that the democratization of teacher training cannot be understood only as a formal expansion of vacancies or territorial expansion of the university offer, but requires structuring policies capable of guaranteeing objective conditions of permanence, pedagogical support, access to teaching materials, digital inclusion and training quality, especially in contexts marked by regional inequalities and historical socioeconomic vulnerabilities.

Another important aspect identified throughout the investigation refers to the existing tensions between quantitative expansion and quality of training. Although the programs have significantly expanded access to licentiate degrees, challenges persist related to continuous funding, maintenance of the infrastructure of the centers, training of guiding teachers, and the administrative sustainability of the actions developed. The dependence on federal resources and the oscillations of national education policies can compromise the continuity of fundamental initiatives for states historically marked by educational inequalities, such as Maranhão.

The historical analysis developed throughout this research demonstrated that teacher training in Maranhão was, for decades, marked by the concentration of training institutions in large urban centers, by the scarcity of higher education courses and by the limited presence of the State in inland regions. In this context, PARFOR and PARFOR Equity assume strategic importance by tensioning historical structures of educational exclusion, bringing the public university closer to the social and cultural realities of the municipalities of Maranhão. Such a movement contributes to reducing regional asymmetries and strengthening basic education in territories that have historically remained on the margins of higher education policies.

PARFOR and PARFOR Equity demonstrate that structured teacher training policies can effectively contribute to the democratization of higher education and to the valorization of teaching in Maranhão. Experience indicates that, even in contexts of high social vulnerability, it is possible to offer quality degree courses, reduce historical inequalities and serve historically marginalized groups. The continuity and expansion of programs such as these are fundamental to consolidate the advances achieved and create perspectives for sustainable educational transformation. The results analyzed allow us to conclude that educational management plays a central social role in the effectiveness of these policies, since the implementation of the programs depends on permanent institutional articulations between universities, CAPES, municipal and state departments of education, pedagogical coordination and local communities.

The challenges of teacher training in Brazil and Maranhão remain, the results obtained point to promising paths, showing that equity and inclusion policies have real potential to positively impact basic education and the quality of teaching in the state and in the country.

From an interpretative point of view, the research shows that PARFOR and PARFOR Equity cannot be understood only as higher education programs, but as instruments to confront the social and educational inequalities historically produced in the Brazilian territory. By promoting access to public universities, valuing cultural identities and strengthening local education networks, these policies reaffirm education as a social right and as a concrete possibility for transforming regional realities.

Finally, it is concluded that the consolidation of teacher training policies committed to equity requires institutional continuity, strengthening of public funding and recognition of the sociocultural specificities of the different Brazilian territories. In the case of Maranhão, marked by deep historical inequalities, the strengthening of PARFOR and PARFOR Equity represents an important possibility for expanding educational justice, valuing teaching, and building a socially just, referenced, democratic, and inclusive public education.

ABSTRACT

Considering the relevance of entrepreneurship to the economic and social development of the country, in different sectors of activity, this study sought to examine, through a literature review, how the COVID-19 pandemic influenced the emergence of new entrepreneurs in Brazil. Furthermore, it aimed to identify the segments that stood out most during this period and the main challenges faced by new entrepreneurs. The justification for this research is based on the importance of understanding the role of entrepreneurship in crisis contexts, especially in the face of adverse scenarios that demand innovation, resilience, and adaptation. The research, of a qualitative and descriptive nature, was structured through an integrative review of scientific production published between 2020 and 2024. The content analysis of the studies sought to identify, select, evaluate, and synthesize the evidence on the growth of entrepreneurship in Brazil impacted by the COVID-19 pandemic. The results indicated that the pandemic acted as an accelerator for the emergence of new entrepreneurs in Brazil, driven mainly by income loss, unemployment, and the need to adapt to the digital market. It was concluded that, despite the difficulties imposed by the health crisis, the pandemic context fostered both necessity-driven and opportunity-driven entrepreneurship, strengthening innovation and reinvention in small businesses.

RESUMO

Considerando a relevância do empreendedorismo para o desenvolvimento econômico e social do país, em diferentes setores de atividade, o presente estudo buscou examinar, por meio de revisão de literatura, como a pandemia do COVID-19 influenciou no surgimento de novos empreendedores no Brasil. Além disso, procurou-se identificar os segmentos que mais se destacaram nesse período e os principais desafios enfrentados pelos novos empreendedores. A justificativa desta pesquisa fundamenta-se na importância de compreender o papel do empreendedorismo em contextos de crise, especialmente diante de cenários adversos que exigem inovação, resiliência e adaptação. A pesquisa, de natureza qualitativa e caráter descritivo, foi estruturada por meio de uma revisão integrativa da produção científica publicada entre os anos de 2020 a 2024. A análise do conteúdo dos estudos buscou identificar, selecionar, avaliar e sintetizar as evidências sobre o crescimento do empreendedorismo no Brasil impactado pela pandemia do COVID-19. Os resultados indicaram que a pandemia atuou como aceleradora do surgimento de novos empreendedores no Brasil, impulsionados principalmente pela perda de renda, desemprego e pela necessidade de adaptação ao mercado digital. Concluiu-se que, apesar das dificuldades impostas pela crise sanitária, o contexto pandêmico fomentou tanto o empreendedorismo por necessidade quanto por oportunidade, fortalecendo a inovação e a reinvenção dos pequenos negócios.

RESUMEN

Considerando la relevancia del emprendimiento para el desarrollo económico y social del país, en diferentes sectores de actividad, este estudio buscó examinar, a través de una revisión de la literatura, cómo la pandemia de COVID-19 influyó en el surgimiento de nuevos emprendedores en Brasil. Además, buscó identificar los segmentos que más destacaron durante este período y los principales desafíos que enfrentaron los nuevos emprendedores. La justificación de esta investigación se basa en la importancia de comprender el rol del emprendimiento en contextos de crisis, especialmente ante escenarios adversos que exigen innovación, resiliencia y adaptación. La investigación, de naturaleza cualitativa y descriptiva, se estructuró a través de una revisión integradora de la producción científica publicada entre 2020 y 2024. El análisis de contenido de los estudios buscó identificar, seleccionar, evaluar y sintetizar la evidencia sobre el crecimiento del emprendimiento en Brasil impactado por la pandemia de COVID-19. Los resultados indicaron que la pandemia actuó como un acelerador para el surgimiento de nuevos emprendedores en Brasil, impulsado principalmente por la pérdida de ingresos, el desempleo y la necesidad de adaptarse al mercado digital. Se concluyó que, a pesar de las dificultades impuestas por la crisis sanitaria, el contexto pandémico impulsó tanto el emprendimiento por necesidad como el impulsado por la oportunidad, fortaleciendo la innovación y la reinvención en las pequeñas empresas.

1 INTRODUCTION

In view of the transformations that have occurred in the market, mainly due to technological innovations and the globalization process, entrepreneurship has been consolidated as one of the main vectors of economic and social development of a country. This is because entrepreneurship stands out for its contribution to the generation of employment and income, as well as for the introduction of innovations capable of boosting and expanding the competitiveness of markets.

In the Brazilian context, characterized by high levels of social inequality and economic instability, entrepreneurial activity takes on even greater relevance. In many cases, entrepreneurship is configured as an alternative for people who face limitations in the formal labor market, sometimes representing the only possibility of generating income and subsistence.

This reality has become especially evident in times of crisis, such as the one experienced during the COVID-19 pandemic. Officially declared by the World Health Organization (WHO) in March 2020, the pandemic has forcefully exposed the fragility of the Brazilian economy (Gullo, 2020). The social isolation measures adopted to contain the spread of the virus resulted in the closure of numerous establishments and significant reductions in the revenue of micro, small and medium-sized companies. As a result, many formal workers were laid off or had their incomes significantly reduced, intensifying the search for entrepreneurial alternatives as a form of economic autonomy and survival.

In this challenging context, entrepreneurship has emerged as an alternative for economic survival. According to Gullo (2020), even with signs of possible economic recovery in early 2020, the impacts of the pandemic were profound and directly affected the income, consumption, and sustainability of numerous businesses. a

It is important to consider that the context of the COVID-19 pandemic presented a dual scenario where, on the one hand, companies closed their businesses due to the drop in demand and the inability to compete in the scenario that was presented (Nogueira; Moreira, 2023) and, on the other hand, other enterprises emerged adapting to the new reality and the new needs that emerged (Saleme; Oliveira, 2022). se

Data from the *Global Entrepreneurship Monitor Brazil Report* (GEM, 2020) show that about 53% of the Brazilian adult population showed intention to start a business in the three years following the pandemic, equivalent to approximately 50 million people. This number represented an increase of 22.5 percentage points compared to the previous year. The same survey pointed out that 32.2% of these people made this decision due to the direct influence of

the pandemic, both due to the loss of employment and the need to seek a new source of income (GEM, 2020).

Based on this perspective and the scenario imposed by the COVID-19 pandemic, the following problem arises: How did the Covid-19 pandemic influence the emergence of new entrepreneurs in Brazil, as addressed in the literature? From this question, we sought to reflect on the main elements that led people to undertake in the midst of the crisis and what lessons could be extracted from this period.

The justification for this study lies in the importance of understanding entrepreneurship as a social and economic phenomenon, especially when it arises as a response to emergencies. By investigating the factors that drove entrepreneurial behavior during the pandemic, the research seeks to contribute to the understanding of how adverse contexts can stimulate innovation, creativity, and the development of new strategies for income generation and business sustainability.

The object of study is individuals who started entrepreneurship during the COVID-19 pandemic, motivated by need, opportunity or a combination of these. These new entrepreneurs represent a significant portion of the population that reacted to the changes imposed by the crisis with creativity, resilience, and action.

It should be noted that this study was carried out through an integrative review of the scientific production published between the years 2020 and 2024. The collection of the material was carried out in the Google Scholar and CAPES Journal databases, considering articles in Portuguese that addressed, in the abstract, the emergence of new entrepreneurs or enterprises during the Covid-19 pandemic.

Thus, the general objective of the present study was to examine, through a literature review, how the COVID-19 pandemic influenced the emergence of new entrepreneurs in Brazil. Specifically, it sought to analyze the impact of the pandemic on the increase in the number of entrepreneurs in Brazil, based on articles selected in the time interval - 2020 to 2024 - and to identify the reasons that led to the creation of ventures during the COVID-19 pandemic.

2 THEORETICAL FOUNDATION

In this topic, the concepts of entrepreneurship, the economic impacts of the COVID-19 pandemic, the role of entrepreneurship as an agent of social and economic transformation, and the way in which this phenomenon has intensified in the midst of the health crisis were addressed. These discussions offered a basis for a better understanding of the relationship between the context of crisis and the emergence of new enterprises in Brazil.

2.1 ENTREPRENEURSHIP AND ITS IMPACT ON THE COUNTRY'S ECONOMIC DEVELOPMENT

According to Schumpeter (1985), economic development does not occur in a linear way, but through a "process of industrial mutation" that continuously transforms the economic structure, replacing the old with the new. This movement, called creative destruction, is driven by the figure of the Schumpeterian entrepreneur, responsible for carrying out new productive combinations capable of generating innovation (Schumpeter, 1985 *apud* Martes, 2010).

Also according to , by introducing new products, methods, markets or forms of organization, the entrepreneur acts as a central agent of structural changes, triggering cycles of renewal that drive economic growth. This Schumpeter (1985) *apud* Martes, 2010) process is considered essential for the economic and social development of a country, as it drives the continuous renewal of economic structures.

In a complementary way, Almeida, Valadares and Sediya (2017) state that entrepreneurship acts as a "development diffusion mechanism", contributing to productive diversification and to the absorption of labor in less industrialized regions. On the other hand, Ferreira, Loiola and Gondim (2020) consider that , for entrepreneurship to effectively contribute to economic growth, it is necessary to invest in training and technical support for entrepreneurs, favoring the transition from subsistence initiatives to structured enterprises. Go

Ferreira, Loiola, and Gondim (2020) also highlight the role of universities, incubators, and local public policies in building entrepreneurial ecosystems capable of sustaining regional competitiveness. This view is convergent with the recommendations of the *Global Entrepreneurship Monitor* (GEM, 2024), which highlight the need to strengthen innovation support mechanisms, bringing science, technology, and business closer together.

The same GEM survey dated 2022 already warned of the structural limitations that hinder the full conversion of entrepreneurial potential into sustainable economic development (GEM BRASIL, 2022). The Brazilian National Entrepreneurship Context Index (NECI) reached 3.6 points, a value considered intermediate, reflecting deficiencies in areas such as basic education, access to credit, and investments in research and development (GEM BRASIL, 2024).

The experts' recommendations converge on the need for public policies that promote debureaucratization, expansion of financing lines, and strengthening entrepreneurial education (GEM BRASIL, 2022). This diagnosis complements the evidence of Almeida, Valadares and Sediya (2017), according to which the positive impact of entrepreneurship on GDP is conditioned by the quality of institutions, human capital and regional infrastructure. a a o

As a way to complement the entrepreneurship scenario in Brazil, GEM data (2023) show an advance in formalization and the growing importance of "solo entrepreneurs", who represent a significant portion of the autonomous workforce. Although these entrepreneurs contribute to increased income and economic inclusion, they often face difficulties in growing or employing other workers, which limits the sector's multiplier potential (GEM BRASIL, 2023). Thus, the contemporary challenge is to transform the entrepreneurial base into an engine of innovation, productivity, and scale.

Also as a way to characterize this scenario, it is important to talk about the role of entrepreneurship as a vector of technological innovation and digitalization. The GEM (2024) presents positive data in relation to this vector: 90% of Brazilian entrepreneurs use digital technologies in their businesses and about 800 thousand new ventures have a national impact, while approximately 130 thousand already reach international reach. This demonstrates that Brazilian entrepreneurship has become more connected and competitive, contributing to technological diffusion and increased productivity.

Lima, Santos and Montebello (2025), analyzed the entrepreneurial scenario during the years 2012 to 2022 and highlight that the development of entrepreneurship in Brazil is strongly conditioned by institutional factors, especially by government policies. According to the authors, the extensive bureaucracy and the complex tax burden raise costs, hinder formalization and reduce the competitiveness of new businesses, directly limiting their ability to generate economic growth.

In addition, the results show that Brazilian entrepreneurship reflects structural inequalities: low-income individuals tend to undertake out of necessity, while higher income and higher education groups have greater stability and continuity of enterprises, revealing that the social impact of entrepreneurship is still marked by disparities in gender, income and education (Lima; Santos; Montebello, 2025).

From the data presented, a positive scenario can be seen where Brazilian entrepreneurship has been evolving in quantity and quality, presenting digital insertion, greater female and youth presence and a change in motivational profile. This trajectory reflects a maturing entrepreneurial ecosystem and a significant potential to boost the country's economic development. However, structural bottlenecks persist, such as education, government policies, infrastructure, credit, and research, which limit the conversion of this potential into sustainable productivity.

2.1.1 Entrepreneurship by necessity and opportunity

Entrepreneurship can arise from different motivations, and for Barros and Pereira (2008), it is closely related to factors such as the unemployment rate and economic growth. The authors point out that these variables have an inverse correlation, that is, when unemployment increases, the tendency is for more people to seek entrepreneurship as an alternative to overcome the lack of opportunities in the labor market.

According to Bandeira and Silva (2023), entrepreneurship by necessity occurs when the individual starts a business due to lack of income options, usually in situations of economic crisis and absence of formal work alternatives. In this case, it is an immediate response to financial difficulties, without structured planning. On the other hand, entrepreneurship by opportunity occurs when the individual identifies a business opportunity and has the skills, strategic perception and long-term vision to exploit it, being more common in developed economies, in which there is greater stability and investment capacity (Bandeira; Silva, 2023).

This distinction (opportunity x need) is also reinforced by studies that show that entrepreneurs out of necessity, in general, start their activities in an improvised way and motivated by the adverse context, acting without a minimum business structure and only to remain economically active (Silva; Istoé; Silva, 2020). Although there are successful cases, Brum (2003) *apud* Bandeira e Silva (2023) points out that entrepreneurship out of necessity should not be understood as a viable or accessible solution for everyone, since its origin is often associated with the lack of real job and income opportunities, limiting its potential for growth and sustainability.

On the other hand, entrepreneurship by opportunity occurs when the entrepreneur identifies a specific need or desire in society and, based on this, creates innovative solutions (Marques, 2022). This type of entrepreneurship has a significant impact on the economic growth of a country, as the entrepreneurs who adopt it, usually more qualified, develop businesses based on innovations and new technologies, which often have great potential for sustainable growth (Degen, 2008).

This statement by Marques (2022) and Degen (2008) is complemented by Bandeira and Silva (2023) when the latter state that entrepreneurship by opportunity occurs when the individual identifies a concrete business opportunity and decides to explore it strategically, based on skills, knowledge, and long-term vision. This motivation is more common in developed economies and is associated with more structured businesses, with greater potential for innovation.

Rocha (2014) reinforces this distinction by demonstrating that countries with a higher proportion of entrepreneurs by opportunity have higher levels of economic and social development. The author uses the Opportunity/Need Ratio (RON) as an indicator and identifies a positive correlation between RON and the Human Development Index (HDI), showing that entrepreneurship by opportunity contributes more strongly to development than entrepreneurship by necessity (Rocha, 2014). In his analysis, entrepreneurship out of necessity appears predominantly in countries with worse economic conditions, while entrepreneurship out of necessity tends to grow in more structured environments, with greater stability, capacity for innovation, and better working conditions (Rocha, 2014).

Silva, Furtado and Zanini (2015), analyzing the GEM time series between 2001 and 2013, observed a growing trend of entrepreneurship by opportunity and a reduction in the relative participation of entrepreneurship by necessity in Brazil. According to the authors, this change indicates that the country has gradually moved towards an entrepreneurial profile more aligned with planned initiatives, with greater potential for innovation, productivity, and economic impact (Silva; Furtado; Zanini, 2015).

This theoretical differentiation is also evidenced by the empirical data from the *Global Entrepreneurship Monitor*, which analyzes the evolution of these motivations in Brazil over the last few years of 2021, 2022, 2023, and 2024. In the 2021 report, GEM revealed that the entrepreneurial landscape was remarkably complex, being shaped by both need and opportunity. The study revealed that, despite a slight drop compared to the previous year, survival motivation was still intense, with a significant portion of nascent entrepreneurs, almost 8 out of 10 (79.2%), citing the search for "making a living because jobs are scarce" as a driver to start the business (GEM, 2021).

However, this motivation coexists with high aspirations linked to opportunity: the overwhelming majority of nascent entrepreneurs, for example, were driven by the desire to "make a difference in the world", while more than half aim to "build great wealth or a very high income". This intentionality is proven in the aspirational aspect, since "having one's own business" has been consolidated as the main professional dream for more than 60% of nascent entrepreneurs, and is even a goal cited by almost half (45%) of those who have not yet started any entrepreneurial activity (GEM, 2021).

In 2022, motivation by necessity continued to be prevalent in the entrepreneurial population. Data from GEM (2022) show that, for early-stage entrepreneurs (nascent and new), the search for "making a living due to the scarcity of jobs" was the main reason, being cited by just over 80% of them. This data highlighted the persistence of the function of entrepreneurship

as a refuge or alternative for the adult population in the face of the difficulties of the formal labor market (GEM, 2022).

The year 2023 marked an important change in the balance of these motivations. The GEM (2023) recorded a sharp drop in mention of need, with the option "making a living because jobs are scarce" falling to 74.1% among early entrepreneurs. For the first time in the time series, the motivation "to make a difference in the world" reached the best position in the reasons to undertake, which was interpreted by the researchers as an indication of improvement in the quality of entrepreneurship in the country. In addition, financial ambition remained robust, with 66.1% of initial entrepreneurs citing "building great wealth or a very high income" (GEM, 2023).

ranking

In 2024, the scenario once again demonstrated the complex interaction between the two vectors. According to GEM (2024), motivation for opportunity solidified his leadership, with "making a difference in the world" being the most cited (74.6%). However, the need remained at high levels, with 73.9% of the initial entrepreneurs citing "making a living because jobs are scarce", reflecting the economic instability. What stood out the most in 2024 was the record proportion of people who answered "to build great wealth or a very high income" (69.3%). This convergence of data reaffirms the nature of Brazilian entrepreneurship as a field where the drive for survival coexists and often merges with ambition and aspiration for impact and substantial financial growth (GEM, 2024).

2.2 ECONOMIC AND SOCIAL SCENARIO: THE COVID-19 PANDEMIC

The health crisis hit the country at a time of slowdown, causing a sharp retraction of productive activities. The Gross Domestic Product (GDP), the unemployment rate, and price indices showed intense instability between 2020 and 2021 (Miguel, 2021). Also according to Miguel (2021), the irregular behavior of these indicators reflects the direct impact of social isolation measures and highlights the vulnerability of national economic policies to external shocks. , to

In a complementary analysis, Paula, Vaz, and Machado (2023) state that, when the pandemic took hold, the economy was already in a scenario of stagnation and precariousness of the labor market, marked by high informality and income inequality. The authors note that economic policy, since 2015, had been guided by a liberal and fiscally restrictive cut, focused on the Spending Ceiling and austerity measures. This context significantly limited the State's capacity to respond to the health crisis, intensifying a process of preexisting social and

economic crisis, characterized by the combination of high unemployment, informality, and structural inequality (Garbe, 2021).

It can be observed, based on the data presented above, that the health crisis manifested a profoundly unequal character, affecting historically vulnerable social groups more severely, women, young people, blacks, and informal workers, resulting in greater loss of income and exclusion from the labor market (IPEA, 2022). Also according to the Institute of Applied Economic Research (IPEA, 2022), the most affected sectors were those that depend on face-to-face contact (commerce, personal services, and tourism), while activities with the possibility of remote work showed less retraction. These data from IPEA (2022) confirm the deepening of structural inequalities and the reinforcement of social and racial segmentation in the Brazilian labor market.

Garbe (2021) also points out that the crisis revealed the insufficiency of public policies for social protection and highlighted the need to rethink the role of the State as an inducer of development and guarantee of well-being. At the same time, Aguiar (2024), when exploring COVID-19 in a context of socioeconomic inequalities, suggests that the populations most affected by the disease are also the most susceptible to precariousness and job loss, deepening social disparities in a scenario of economic downturn and growing unemployment.

To complement this scenario, Mazuqueli (2022) portrays that the unemployment rate underwent significant changes after the emergence of the new coronavirus, registering a strong upward trend. The author uses data from the IBGE, which indicate that, in the first quarter of 2021, the number of unemployed people reached 14.805 million, the highest level since the beginning of the time series of the Continuous National Household Sample Survey (PNAD-C).

While many countries quickly adopted policies to expand public spending to contain the social and productive impacts of the crisis, the Brazilian government initially maintained a hesitant stance. The Executive's priority continued to be the maintenance of fiscal adjustment, even in the face of the worsening economic and humanitarian scenario (Paula; Vaz; Machado, 2023).

Within this more conservative context, the creation of the Emergency Aid ended up representing a temporary break with this logic. Paula, Vaz, and Machado (2023) highlight that this measure did not arise from a government initiative, but rather from strong pressure from the National Congress and civil society, which reacted to the lack of effective responses to protect the most vulnerable population and face the sharp drop in income.

In addition to the social impact, the crisis caused serious damage to the productive sector, especially to Micro and Small Enterprises (MSE's). Nogueira and Moreira (2023) point

to the destruction of the capital stock of these companies as one of the most serious consequences of the pandemic. According to the authors, by June 2020, the country had lost billions in fixed capital, reflecting the closure of more than 716 thousand companies, the vast majority of which are small. This loss of productive capacity has compromised the potential for long-term employment and income generation, exposing the fragility of MSEs in the face of systemic crises (Nogueira; Moreira, 2023).

The analysis of the different studies reveals a point of convergence: the pandemic has deepened structural vulnerabilities and reinforced the importance of the State in the coordination of economic and social policies. In addition, the pandemic crisis has intensified social inequalities, significantly affecting the dynamism and conditions for entrepreneurial action in Brazil.

2.3 ENTREPRENEURSHIP IN TIMES OF CRISIS: THE COVID-19 PANDEMIC

As seen in the previous topics, entrepreneurship has been consolidated as an essential element for economic and social development, especially in contexts of instability. According to Fialho *et al.* (2018), periods of crisis, although challenging, also work as catalysts for innovation, encouraging individuals to seek new opportunities and creative ways to generate income.

In this sense, economic crises present themselves as fertile scenarios for the emergence of new entrepreneurs, driven both by the need for survival and by the desire for autonomy and personal fulfillment. This understanding is reflected in the data from the Covid-19 pandemic: during this period, Brazil recorded records in the opening of new micro-enterprises. As an example, between February and September 2020, there were more than 1.15 million new formalizations of MEI's, driven by the economic crisis (Agência Brasil, 2020).

For Nassif, Corrêa and Rossetto (2020), the pandemic required entrepreneurs to have a deep capacity for adaptation, since the health context imposed sudden ruptures in traditional ways of managing business. According to the authors, this scenario forced many entrepreneurs to develop not only creativity, but above all resilience to deal with uncertainties, restrictions, and the constant need for reinvention.

This view dialogues with what Schumpeter (1985, *apud* Martes, 2010) already defended: the entrepreneur is an agent of transformation, capable of converting adverse moments into opportunities for innovation and economic growth. This discourse of reinvention was confirmed again in the pandemic: the total rate of entrepreneurship in Brazil fell by 18.33% in 2020, according to the Brazilian Micro and Small Business Support Service (SEBRAE), but this decline was strongly fueled by the departure of established entrepreneurs (over 3.5 years old), while many new entrepreneurs entered the market, out of necessity (SEBRAE, 2020). a

Oliveira and Ferreira (2023) highlight that the emergence of the virus and social isolation measures caused an unprecedented global crisis, forcing companies and entrepreneurs to rethink their operating strategies. In a scenario of paralysis of economic activities, many entrepreneurs needed to adopt innovative and quickly adapted practices to ensure the survival of their businesses.

In line with this perspective, Lima, Santos, and Montebello (2025) show that this adaptation process did not only occur at the behavioral level, but was also reflected in national statistics: during the years 2020, 2021, and 2022 there was a significant increase in entrepreneurship out of necessity, driven by the increase in unemployment and the reduction of formal job opportunities, leading a large part of the population to undertake as an alternative for economic survival.

In this scenario, Ponsoni and Teixeira (2024) reinforce that micro and small enterprises (MSEs), responsible for a large part of job creation in Brazil, were the most affected, given their weaker structure and lower capacity for financial resistance. However, the strengthening of the entrepreneurial spirit and the emergence of new businesses were observed, especially focused on innovation and customer loyalty (Ponsoni; Teixeira, 2024).

This phenomenon of "bottom-up" renewal is also corroborated by data on business openings: according to CNN Brasil, between 2020 and 2022 the number of new companies in the country grew by 25.3%, compared to the previous three years (CNN Brasil, 2022). To a large extent, these new businesses are micro enterprises (94% according to the report), which fits well into the profile of emerging businesses by necessity and creativity. In addition, GEM data (2021) show that about 50% of entrepreneurs, at all stages, perceived new opportunities resulting from the pandemic (GEM, 2021).

Despite the positive scenario, which was demonstrated above, by data from CNN Brasil (2022) and GEM (2021), the health crisis was associated with the closure of many enterprises: 46.2% of the Brazilian population discontinued some business due to the pandemic between 2020 and 2021. In addition, the context of restrictions has led many entrepreneurs to adapt their internal processes, with almost half of nascent entrepreneurs adopting or accelerating digital technologies in response to the pandemic, while among new and established entrepreneurs this percentage was around a third (GEM, 2021).

In addition, Lima *et al.* (2024) address the concept of "*effectuation*", which is a theory about a strategy for coping with crises, in which the entrepreneur, in the face of uncertainty, uses the available resources in a creative and flexible way. This approach values practical action

and the ability to improvise, which proved crucial during the pandemic, when responses needed to be quick and adapted to resource scarcity.

The pandemic has also revealed the importance of social and academic entrepreneurship. Prytoluk and Boll (2023), when analyzing the case of the Federal University of Rio Grande do Sul, demonstrated how higher education institutions began to develop entrepreneurial actions aimed at innovation and extension, contributing to society in a time of crisis. This performance reflects the role of entrepreneurship as a tool for social transformation, going beyond the creation of businesses and incorporating collective responsibility. This social impulse, in fact, is mirrored in the new formalizations of MEI's motivated by necessity, as reported by Agência Brasil (2020), which highlights the crisis, but also the capacity for individual reinvention with collective impact.

According to the data presented, entrepreneurship has become an important tool to face the challenges of the health crisis, driven by digitalization and the use of technologies. The expansion of digital and informal entrepreneurship demonstrates the capacity of Brazilians to reinvent themselves in the face of the economic and social restrictions imposed by the period (Araújo; Alves; Silva, 2021).

Finally, Backes *et al.* (2020) point out that the pandemic not only changed business dynamics, but also redefined strategic management models, imposing the need for new organizational and planning practices in contexts of uncertainty. Organizations that were able to react with agility and innovative vision were the ones that best adapted, confirming that entrepreneurship continues to be one of the main drivers of transformation and overcoming in times of crisis (Backes *et al.*, 2020).

The data presented above show entrepreneurship as an important mechanism for economic recovery, being able to promote creative and sustainable solutions even in periods of crisis. It manifests as an active response to adversity, turning uncertainty into opportunity and driving development through creativity, innovation, and resilience.

3 METHODOLOGY

This research used a qualitative approach, with a descriptive nature and carried out from a bibliographic research, specifically, by the method of integrative literature review. The research is characterized as qualitative because it seeks to understand the meanings, interpretations and perceptions present in studies on the impact of the pandemic on entrepreneurship, analyzing the phenomena in their context. At the same time, it has a

descriptive character because it aims to describe and characterize this growth, identifying segments, challenges and trends pointed out in the literature.

Lima and Mito (2007) define bibliographic research as a methodological procedure that enables researchers to search for solutions to their research problem. The authors emphasize that this type of research implies an ordered set of procedures for searching for solutions, attentive to the object of study, and that, therefore, it cannot be random.

Among the types of review, the integrative review is the most comprehensive, which represents an advantage because it allows the simultaneous inclusion of experimental and quasi-experimental studies, offering a broader view of the researched theme, in addition to allowing the gathering of information from both theoretical and empirical productions, which contributes to a more complete and in-depth understanding of the phenomenon studied (Mendes, Silveira; Galvão, 2008). This approach contributes to defining concepts, reviewing theories, identifying evidence, and analyzing possible methodological gaps in existing productions (Souza, Silva; Carvalho, 2010).

This methodology was chosen because it allows the identification of evidence, the mapping of trends and the critical analysis of the main results presented in the literature. The focus in question was studies that address the COVID-19 pandemic and its impact on the emergence of new entrepreneurs, considering articles published on the Google Scholar and Capes Journal platforms, in the period from 2020 to 2024.

3.1 DATA COLLECTION, PROCESSING AND ANALYSIS

The present study followed the phases proposed by Souza, Silva and Carvalho (2010), which guided the methodological conduct of the integrative literature review. These steps ensure a systematic and rigorous process, enabling the synthesis of available knowledge. According to the authors mentioned above, this form of review is composed of six phases, namely: elaboration of the guiding question, search in the literature, data collection, analysis of the included studies, discussion of the results and presentation of the review.

The first phase corresponds to the elaboration of the guiding question, considered one of the crucial stages for the development of the study. It is at this moment that the question-problem of the research is defined, in a clear and specific way, outlining the objects of study and the information that is sought to be obtained throughout the investigation. Following the proposed phase, the research question that guided this Integrative Review was formulated: "What is the impact of the COVID-19 pandemic on the increase in the number of new entrepreneurs in Brazil and what factors motivated this growth?"

The second phase consists of searching the literature, a stage directly connected to the previous one. This phase involves prospecting in digital or physical databases, looking for content relevant to the focus of the study. It is imperative to address all the criteria for selecting and excluding the results obtained, ensuring the necessary specification to attest to the reliability and reliability of the research carried out (Souza; Silva; Carvalho, 2010).

In carrying out the literature search, the Google Scholar and CAPES Journals databases were used, prioritizing articles published in Portuguese, in the period from 2020 to 2024, to ensure the updating of the data in relation to the proposed theme.

On Google Scholar, the search was carried out through the advanced search tool. The inclusion criteria were: containing the words "Entrepreneurship" and "COVID-19" in the title; address in the summary the focus on new entrepreneurs or new ventures that emerged during the pandemic; be in Portuguese and be an article published in scientific journals, annals of events or symposia. For this research, the following coordinate was used: *allintitle:* entrepreneurship new OR entrepreneurs OR entrepreneurship "covid 19" 2020-2024, obtaining 90 results, of which 8 articles were selected for meeting the inclusion criteria.

In the CAPES Periodicals database, the coordinate was used: "new entrepreneurs" "covid-19" 2020-2024, obtaining 2 results, both selected according to the defined criteria, namely: addressing in the abstract the focus on new entrepreneurs or new ventures during the pandemic and being in Portuguese.

The third phase is dedicated to data collection, whose main objective is to accurately select all the information necessary for the study. This includes the identification of the subjects involved, the methodology addressed, the size of the sample obtained, the method of analysis employed and the concepts used that served as a basis for the research. s e

In this sense, the subjects involved correspond to the studies analyzed, which represent scientific productions on entrepreneurship in the context of the COVID-19 pandemic. The methodology adopted at this stage followed the design proposed by the integrative review, with defined inclusion and exclusion criteria that ensured the rigor of the selection. The size of the sample obtained was determined after screening the results found in the databases. A total of 92 articles were found, after applying the initial filters in the selected databases. For the final selection, inclusion and exclusion criteria were adopted. In Table 1, it is possible to see the inclusion and exclusion criteria of the articles found.

Table 1
Criteria for selection of Articles

Inclusion	Exclusion
Works that have in their title the context of the COVID-19 pandemic	Articles that do not deal with Brazilian entrepreneurs
Articles that address the topic of new entrepreneurs in the summary	Summaries that don't explicitly mention a focus on new entrepreneurs
Publications in Portuguese	Works from non-scientific sources or in another language
Availability in scientific journals, conference proceedings or symposia	Duplicate articles

Source: Prepared by the authors, 2025.

Table 2 shows the selected articles, containing information such as the title, the name of the authors, the year of publication, and their source.

Table 2
Selected Articles

N o.	Article Title	Author(s)	Year	Source
1	Entrepreneurship in the context of covid-19: need, opportunity and solidarity	Cristiane Pereira Guimarães, Quésia Klem Horsts de Oliveira, Matheus de Souza Dimas, Társis De Marcos Corrêa	2022	Pensar acadêmico v. 20 n. 1, p. 93-105.
2	Female entrepreneurship and digital marketing in border territories during the covid-19 pandemic	Jéssica Andrade Fleitas, Dionni Benites, Álvaro Freitas Faustino-Dias, Manoela Moraes, Luisa Rhoden Rech	2024	Boletim de Conjuntura, v. 19, n. 55, p. 579–600.
3	Entrepreneurship during the covid-19 pandemic: analysis of the numbers of new microentrepreneurs in the Brazilian market in the period of 2020 and 2021	Jéssica Franciele Rodrigues Azevedo, Leandra Mariana Viana de Souza, Luiz Augusto Dias de Melo, Mara Lopes da Silva, Greyce Lara Pereira	2022	Scientific Journal of Faculdade Quirinópolis, Quirinópolis, 2022, v. 2, n. 12, p. 7-30.

Source: Prepared by the authors, 2025.

After the selection of the articles, the next phase corresponds to the analysis of the included studies. The analysis method used consisted of reading the abstracts and subsequent critical analysis of the selected articles, in order to identify convergences and patterns in the publications. The concepts used were extracted from the included studies, serving as a theoretical basis for understanding the factors that drove the emergence of new entrepreneurs in the context of the pandemic.

The collection in the databases was carried out on May 24, 2025 and 10 articles were selected, 8 from Google Scholar and 2 from CAPES Journals. All articles were read in full and critically analyzed, with the aim of identifying the main factors that drove the emergence of new entrepreneurs in the context of the pandemic.

The analysis of the articles was carried out with the objective of answering the research question. Therefore, we sought to identify convergences and divergences between the selected studies, grouping the main factors highlighted in the analyzed articles.

From this analysis, the results of this work were structured according to the final stages proposed by Souza, Silva and Carvalho (2010). The fifth phase corresponds to the discussion of the results, at which time the studies are analyzed together to answer the research question and identify limitations and suggestions for future work. Finally, the sixth phase refers to the presentation of the integrative review, carried out in a clear and objective manner, allowing the reader to understand and evaluate the results obtained.

4 RESULTS AND DISCUSSION

In this topic, the results of the ten articles chosen in the integrative review were presented. The results sought to respond to the objective of the research, which was: To examine, through a literature review, how the COVID-19 pandemic influenced the emergence of new entrepreneurs in Brazil. Specifically, the objective was to analyze the impact of COVID-

19 on the increase in entrepreneurship in Brazil and the reasons for the creation of new ventures.

The research carried out by Guimarães *et al.* (2022) aimed to explore entrepreneurship in the context of the COVID-19 pandemic, analyzing in particular its link with unemployment, informal work and the Brazilian economic crisis. In this context, the authors point out that a large part of the population saw entrepreneurship as an instant option to obtain income, given the scarcity of government measures.

Guimarães *et al.* (2022) reveals that entrepreneurship out of necessity was in evidence during the pandemic period, since part of the population began to undertake not by identifying opportunities, but by the lack of formal work options. In addition, there was an increase in the formalization of individual microentrepreneurs (MEIs) and the emergence of the so-called solidarity entrepreneurship, characterized by creativity and community collaboration, as a response to the crisis.

Fleitas *et al.* (2024) sought to identify the relationship between women living in border territories and entrepreneurship focused on digital strategies during the period of the COVID-19 pandemic. This is a qualitative research using semi-structured interviews conducted with five entrepreneurs from Ponta Porã (MS), on the border between Brazil and Paraguay. The study highlights that these regions are characterized by very specific economic and social dynamics, influenced by their proximity to neighboring countries and the strong presence of small businesses. As the pandemic progressed, the restrictions mainly affected these small businesses, which were forced to adapt their operations to survive. *Marketing*

In this scenario, digital has emerged as a strategic tool to overcome challenges, build customer loyalty, and discover new opportunities. Fleitas *Marketing et al.* (2024) show that, for these women, digitalization is not only considered as a resource, but also a way to reposition themselves in the market, enabling greater visibility, direct communication with consumers, and expansion of commercial reach. The study demonstrates that the pandemic accelerated the adoption of digital practices, showing that digital innovation was fundamental for both the survival and growth of the businesses analyzed.

Through a literature review and descriptive research using databases of companies of the Federal Government and information from Sebrae, the authors Azevedo *et al.* (2022) aimed to identify and analyze the number of new micro and small companies opened in Brazil in 2020 and 2021, during the most critical period of the pandemic. The study was based on the observation that the pandemic caused profound changes in the economic and social scenario, increasing unemployment and making it difficult for physical businesses to operate.

The results of Azevedo *et al.* (2022) show a strong increase in the number of new companies opened, with more than 3 million in 2020 and more than 2 million in 2021, indicating an intensification of entrepreneurship during the crisis. The study also highlights that much of this growth is related to entrepreneurship out of necessity, motivated by unemployment and the urgent search for alternative sources of income. Additionally, the work highlights that, although the pandemic has imposed difficulties, it has also stimulated entrepreneurial initiatives in different sectors.

Batista, Costa and Amorim (2024) conducted a bibliographic research, with a focus on 2010, with the objective of analyzing how the pandemic boosted the growth of entrepreneurship in Brazil. The authors contextualize that the pandemic has brought accelerated changes in consumption patterns, social interactions, and economic activity. The study reveals that, despite the crisis, entrepreneurship continued to grow, driven mainly by necessity, as many people were forced to take ideas off the paper as an alternative to survival, especially in the face of rising unemployment and falling family income.

The data presented by Batista, Costa and Amorim (2024) indicate that sectors such as *e-commerce*, the pharmaceutical sector, *delivery* services, supermarkets, lunch box trade, beverages, pets, sports consulting, computer items, domestic and construction services stood out as viable alternatives due to the restrictions. The work also highlights that there was business adaptation, digitalization and resilience, indicating that many entrepreneurs took advantage of the circumstances to innovate and reinvent themselves.

In the research by Calça, Maciel and Adão (2022), carried out through quantitative, descriptive research, using the survey method - through the IBGE, GEM and Entrepreneur Portal databases - analyzes the relationship between unemployment and entrepreneurship in Brazil from 2016 to 2021, focusing on the pandemic period. Descriptive and inferential statistical analyses were performed. The results indicate that, during the pandemic, there was a 14% increase in unemployment, a 23% increase in the number of new ventures, and a significant increase in the number of active MEIs. or

Although these data indicate an increase in entrepreneurial activity during this period, Calça, Maciel, and Adão (2022) find that unemployment showed a low correlation with the start of new ventures, suggesting that other factors influenced the decision to undertake more strongly. On the other hand, the study demonstrates a link between the start of new ventures and formalization through MEI's, highlighting that many new entrepreneurs sought formal means to remain active. The study contributes by demonstrating that the Brazilian reality during

the pandemic is complex and cannot be explained only by the direct relationship between unemployment and entrepreneurship.

Soares, Moura, and Dias (2021) examined the impact of the pandemic on entrepreneurs in Resende (RJ), comparing existing businesses with those created during the crisis. The research is qualitative in nature and used semi-structured interviews applied to six participants, organized into two groups: Three entrepreneurs active before the pandemic and three who started entrepreneurship amid the restrictions imposed by the pandemic scenario.

In this environment, small businesses were the most affected, needing to adapt through new sales strategies, intensified use of social networks, and reformulation of processes. Soares, Moura and Dias (2021) highlight that the pandemic boosted the growth of entrepreneurship, especially through the MEI regime, which reached more than 10 million registrations. Among the interviewees who started their businesses during the pandemic, motivation by necessity predominated, mainly due to unemployment and reduced family income. However, cases of identification of opportunities have also emerged, especially related to the increase in demand for digital services, a *delivery*, and essential products.

The work of Baroni and Tolentino (2024) sought to investigate how the fear of failure influenced the intention to undertake in Brazil during the pandemic, using GEM data for the years 2019 and 2020, being a comparative quantitative research, using Spearman's statistical methods of correlation and Analysis of Variance (ANOVA), with the objective of finding relationships between schooling, entrepreneurial knowledge, self-confidence and fear of negative results.

Baroni and Tolentino (2024) contextualize the pandemic period characterized by severe economic instability, increased unemployment, and a social climate of uncertainty, which reinforced the perception of risk among potential entrepreneurs. The authors demonstrate that, despite this unfavorable scenario, many people remained interested in opening new businesses, especially those with higher education and familiarity with entrepreneurial practices. However, the fear of failure intensified in 2020, mainly affecting groups with lower education. The results suggest that more qualified people tend to assume behaviors aligned with entrepreneurship by opportunity, while individuals with lower education and income demonstrate characteristics closer to entrepreneurship by necessity, especially in the face of the economic difficulties caused by the crisis (Baroni; Tolentino, 2024).

Through a qualitative research based on interviews, Santos, Santos and Moraes (2021) analyzed how digital drove the emergence of a silver enterprise during the Covid-19 pandemic, taking as a case study a microenterprise based in Fernandópolis (SP). The interview was

conducted with the owner and an analysis of her documents and institutional strategies was also carried out. The authors emphasized that the pandemic has caused profound changes in consumer behavior, accelerating the expansion of e-commerce. In this scenario, many entrepreneurs have found in digital media a way to promote their products, interact with customers, and maintain their business even amid the restrictions of face-to-face activities.

Marketing Jewelry

Santos, Santos and Moraes (2021) also reveal that the microenterprise analyzed emerged precisely at the height of these transformations, relying on digital marketing practices, particularly the use of social networks, such as *Instagram* and *WhatsApp*. The founder identified a market opportunity, realizing that consumers were looking for affordable products and personalized service through digital channels. Therefore, the analyzed business is mainly characterized as a case of opportunity entrepreneurship, since it arose from the identification of consumer trends and the expansion of *online commerce*.

Nascimento and Gomes (2020) investigated the ways in which Brazilian entrepreneurs identified and used business opportunities during the pandemic, analyzing, in particular, the emergence of new ventures in the digital environment. This qualitative study used a focus group with nine participants, whose reports were examined through Similarity Analysis and Meaning Nucleus. The authors contextualized that the pandemic significantly impacted sectors such as commerce, tourism, and entertainment, leading to the closure of many businesses and a significant drop in the population's income.

At the same time, they observed profound changes in consumption habits, with a strong migration to delivery services, *online shopping* and digital communication. In this scenario, many entrepreneurs have recognized opportunities, especially through the intensive use of social media and the *internet* as their primary advertising and sales channels. The results show that the number of online store openings in Brazil increased dramatically, reaching more than one per minute in the first months of the pandemic. The focus group revealed that the participants were motivated by curiosity, the need to adapt and the gap left by the closure of physical stores (Nascimento; Gomes, 2020).

Carvalho (2022) analyzed the relationship between the growth of entrepreneurship during the COVID-19 pandemic and the significant increase in trademark registrations at the National Institute of Industrial Property (INPI). The study discusses economic and social data from this period, highlighting the increase in unemployment, the drop in family income, and the massive migration of consumers and companies to the digital environment.

The author demonstrates that 2021 was a record year in Brazil in terms of the number of new businesses, with more than four million openings, linked both to the search for alternative forms of survival and the discovery of new needs created by the pandemic. Simultaneously, there was a significant increase in trademark applications, demonstrating the desire of new entrepreneurs to strengthen their business identity and gain market share. The study points out that the growth of entrepreneurship had different motivations, on the one hand, many people resorted to entrepreneurship out of necessity, due to job loss and, on the other hand, sectors linked to *online* commerce and digital media made room for entrepreneurs by opportunity who identified promising niches (Carvalho, 2021).

4.1 MOTIVATIONS TO UNDERTAKE DURING THE COVID-19 PANDEMIC

The studies that made up the literature review highlight several factors that motivated entrepreneurship during the pandemic period. The motivations that were most mentioned were presented in Table 3.

Table 3

Motivations to Undertake in the Pandemic

Motivations for Entrepreneurship during the Pandemic	Number of studies that mentioned motivation
Unemployment and falling income	8 studies cited this factor as a motivation to start entrepreneurship during the pandemic.
Identification of new demands in the market	7 studies cited this factor as a motivation to start entrepreneurship during the pandemic.
Accelerating digitalization and the use of digital <i>Marketing</i>	7 studies cited this factor as a motivation to start entrepreneurship during the pandemic.
Search for formalization through registration as an individual microentrepreneur (MEI)	3 studies cited this factor as motivation to start entrepreneurship during the pandemic.

Source: Prepared by the authors, 2025.

Unemployment and loss of income appear as the main reason that led many people to undertake during the pandemic. Guimarães *et al.* (2022) draw attention to the direct impact of business closures, showing that, given the lack of government support, many people saw entrepreneurship as the most immediate way to survive. Azevedo *et al.* (2022) reinforce this idea by presenting data showing the opening of millions of new businesses in 2020 and 2021, showing that most people resorted to entrepreneurship out of necessity.

The perspective of Batista, Costa and Amorim (2024) follows the same line, pointing out that family income decreased rapidly and that this caused many ideas to be "taken off the paper", more out of urgency than planning. Despite this association, Calça, Maciel, and Adão (2022) bring an interesting counterpoint by showing that, statistically, unemployment and the

creation of new businesses do not have as high a correlation as one might think, suggesting that other elements also influenced this movement.

Even so, in the study by Soares, Moura, and Dias (2021), the interviewees clearly report that they resorted to entrepreneurship after losing their jobs, revealing how this phenomenon manifests itself in practice. Baroni and Tolentino (2024) complement by indicating that groups with less education suffered more from economic insecurity, which increased both the fear of failure and the dependence on entrepreneurship as an alternative income. Nascimento and Gomes (2020) and Carvalho (2022) reinforce that the closure of consolidated sectors and the sharp drop in income stimulated not only the search for new forms of work, but also the search for business models adapted to the new reality.

The pandemic not only brought difficulties, but also promoted the opening of opportunities that were strategically identified and explored by several entrepreneurs. In this sense, Guimarães *et al.* (2022) point out that the crisis generated changes in consumption that created gaps in the market, while Azevedo *et al.* (2022) show that specific sectors grew precisely because they met emerging needs, such as food, essential services, and businesses in delivery format.

Batista, Costa, and Amorim (2024) expand this discussion by bringing concrete examples of areas that have been strengthened, such as information technology, domestic services, and *online commerce*, revealing how some activities have become more viable precisely because they adapt to the context of social isolation. Other studies have helped to understand how this identification of new demands occurred in practice. Fleitas *et al.* (2024), for example, show that women in border regions observed rapid changes in the profile of consumers and adapted their businesses using new strategies to stay active.

Soares, Moura, and Dias (2021) brought reports from entrepreneurs who took advantage of the increased demand for digital services and deliveries, realizing that opportunities existed even in the midst of the crisis. In the same vein, Santos, Santos, and Moraes (2021) analyze a case in which the founder of a microenterprise noticed a greater demand for affordable products and personalized service, creating a business that was born fully aligned with new consumer expectations.

Finally, Nascimento and Gomes (2020) show that many entrepreneurs identified opportunities precisely because of the adaptation of consumers to the digital environment, revealing a scenario where demands changed quickly and, those who realized this first, were able to position themselves better.

It is a fact that the digitalization of business has been accelerated by the pandemic. Guimarães *et al.* (2022) highlight that the digital environment became practically mandatory for those who wanted to maintain some form of income. Azevedo *et al.* (2022) reinforce this by pointing out that many new businesses have emerged already structured to operate entirely *online*.

Fleitas *et al.* (2024) revealed how digital marketing has consolidated itself as a survival tool among frontier entrepreneurs, making it essential for communication, loyalty, and repositioning in the market. This movement also appears strongly in qualitative studies. Soares, Moura, and Dias (2021) reported that entrepreneurs used social networks as their main sales channel, demonstrating a quick adaptation to the new scenario. Santos, Santos, and Moraes (2021) analyzed the case of a company that was born within these practices, using *Instagram* and *WhatsApp* to create a close and personalized service.

Nascimento and Gomes (2020) reinforce that many businesses have come to exist only in the digital environment, driven by the growth of *e-commerce* and the change in consumer behavior. Carvalho (2022) complements by showing that, along with this digitalization, trademark registration increased, indicating that new entrepreneurs wanted to consolidate their presence in the *online* environment and compete more strategically.

Formalization through the MEI appears as an important path for some entrepreneurs. Guimarães *et al.* (2022) point out that regularization was a way to ensure some security and legitimacy for businesses that emerged in an improvised way. Calça, Maciel and Adão (2022) reinforced that formalization grew, especially among those who had already started some type of informal activity and sought to stabilize their situation in the market.

Soares, Moura, and Dias (2021) highlighted that the number of MEI's exceeded the 10 million mark, showing that registration became an option for many workers who sought to better structure their businesses and access basic rights.

5 FINAL CONSIDERATIONS

Based on the ten articles analyzed in the integrative review carried out, it is possible to say that the COVID-19 pandemic had an impact on the entrepreneurial scenario in Brazil. Importantly, this is a statement based on the 10 selected studies. In addition, it was observed in the studies that the pandemic ended up boosting new enterprises, especially those created out of necessity, due to the increase in unemployment and the reduction in family income. At the same time, the pandemic period also provided the emergence of new opportunities, especially in the digital environment, which has consolidated itself as an essential strategic element for the creation, adaptation, and continuity of business models.

The studies analyzed during the work showed that many Brazilians began to see entrepreneurship as an alternative to ensure their livelihood. Others had the ability to identify demands/gaps in the market, managing to innovate, even with the uncertainties of the moment. The acceleration of digitalization, the more intense use of digital and the greater search for formalization through the MEI, are examples of how entrepreneurs needed to reinvent themselves to continue operating and remain active in the market. *Marketing*

The present work has a current and specific theme, which ended up limiting the selection process of the studies that would compose the basis of articles for the integrative bibliographic review. Thus, the greatest difficulty encountered during the work was to build a theoretical framework that makes it possible to develop the research in a complete way, achieving the general objective and the specific objectives previously established. As a suggestion for future studies on the subject, the analysis of the health of these enterprises and what is their permanence rate in the current scenario. It is indicated

Finally, it is concluded that the pandemic, despite bringing challenges, also opened space for reinventions, being new ways to generate income and promote development. In this scenario, entrepreneurship stood out as a viable, resilient, and fundamental alternative for many Brazilians to rewrite their trajectories and adapt to a challenging reality.

ABSTRACT

The study analyzes the impact of material planning on the reduction of logistics costs within the manufacturing industry, highlighting the strategic role of tools such as Material Requirements Planning (MRP). Using a quantitative, correlational, and cross-sectional approach applied to 32 manufacturing companies in Guanajuato, the relationship between material management, inventories, transportation, and storage was evaluated. The results showed that adequate material planning significantly contributes to reducing logistics costs, optimizing inventories, decreasing obsolescence, and improving operational coordination. Likewise, it was identified that synchronization between supply, production, and distribution promotes organizational efficiency. However, limitations still persist regarding the reduction of urgent transportation and the achievement of full logistics integration. It is concluded that material planning constitutes a strategic element for strengthening the competitiveness and resilience of manufacturing organizations.

Keywords: Material Planning. Logistics Costs. Manufacturing Industry. Inventory Management.

RESUMO

O estudo analisa o impacto do planejamento de materiais na redução de custos logísticos dentro da indústria manufatureira, destacando o papel estratégico de ferramentas como o Material Requirements Planning (MRP). Por meio de uma abordagem quantitativa, correlacional e transversal aplicada a 32 empresas manufatureiras de Guanajuato, avaliou-se a relação entre a gestão de materiais, os estoques, o transporte e o armazenamento. Os resultados evidenciaram que um planejamento adequado de materiais contribui significativamente para a redução dos custos logísticos, otimização dos estoques, diminuição da obsolescência e melhoria da coordenação operacional. Além disso, identificou-se que a sincronização entre abastecimento, produção e distribuição favorece a eficiência organizacional. No entanto, ainda persistem limitações na redução de transportes urgentes e na integração logística total. Conclui-se que o planejamento de materiais constitui

um elemento estratégico para fortalecer a competitividade e a resiliência das organizações manufatureiras.

Palavras-chave: Planejamento de Materiais. Custos Logísticos. Indústria Manufatureira. Gestão de Estoques.

RESUMEN

El estudio analiza el impacto de la planeación de materiales en la reducción de costos logísticos dentro de la industria manufacturera, destacando el papel estratégico de herramientas como el *Material Requirements Planning* (MRP). Mediante un enfoque cuantitativo, correlacional y transversal aplicado a 32 empresas manufactureras de Guanajuato, se evaluó la relación entre la gestión de materiales, los inventarios, el transporte y el almacenamiento. Los resultados evidenciaron que una adecuada planeación de materiales contribuye significativamente a disminuir costos logísticos, optimizar inventarios, reducir obsolescencia y mejorar la coordinación operativa. Asimismo, se identificó que la sincronización entre abastecimiento, producción y distribución favorece la eficiencia organizacional. Sin embargo, persisten limitaciones en la reducción de transportes urgentes y en la integración logística total. Se concluye que la planeación de materiales constituye un elemento estratégico para fortalecer la competitividad y resiliencia de las organizaciones manufactureras.

Palabras clave: Planeación de Materiales. Costos Logísticos. Industria Manufacturera. Gestión de Inventarios.

1 INTRODUCTION

In today's manufacturing environment, logistics management has evolved from an exclusively operational activity to a strategic element that is critical to an organization's economic viability, competitiveness, and ability to adapt to different environments. The globalisation of markets, combined with the instability of energy prices, the disruptions of supply chains at an international level and the development of growing expectations of production efficiency have highlighted the importance of global optimisation of logistics processes. In this sense, the costs of transportation, storage, inventory handling, procurement, and distribution become an important part of the overall cost structure of companies. Consequently, its impact on the profit margins and competitive capacity of manufacturing organizations is significant (Khawka et al., 2024; Sharvan & Ustenko, 2025; Zheng & Wang, 2025).

In recent decades, aspects such as rising fuel prices, global inflation, shortages of raw materials, the imposition of trade restrictions and variations in demand have led to a robust growth in logistics prices, which have forced companies to rethink their operating practices under more scientific approaches. predictive and systemic efficiency. From this perspective, material planning is one of the important variables in operations management, as it tries to adjust production needs as best as possible with the rational and always imperfect logic of the availability of inputs; minimizing waste, reducing costs caused by overstocking, avoiding stopping production, and improving coordination with suppliers, in internal processes, and in distribution (Bokor et al., 2024; Javadi, Rabbani & Rafiei, 2026; Nguyen, Wang & Dang, 2025).

Efficient material planning (on which *Material Requirements Planning* (MRP), Just in Time (JIT), *Lean Manufacturing* and advanced demand systems are based) is a fundamental tool to optimize and coordinate the flow of resources throughout the supply chain. in addition to helping to reduce logistics costs associated with storage time, urgent acquisition costs, losses due to obsolescence, financial costs for fixed capital, and risks generated by variability (Rahman, 2025; Reyes, Cañas & Mula, 2026; Yu et al., 2024).

From the frame of reference of a scientific practice, the relationship between the planning of materials and the reduction of logistics costs can be seen as a phenomenon that can be classified as a multidimensional phenomenon in which variables of operational efficiency, inventory control, productivity, technological integration and strategic decision-making are communicated. Therefore, studying the impact of materials planning in the manufacturing industry is not only relevant to understand the mechanisms that favor economic optimization, but also to generate evidence that allows the construction of more robust, sustainable and

adaptive management models in the face of highly competitive environments (Bag et al., 2026; Ghobakhloo et al., 2024; Woschank, Dallasega & Konstantinidis, 2025).

In this context, problems associated with materials management have been identified, such as variations in inventory levels, misalignment between planning and actual demand, as well as an increase in the frequency of urgent shipments. These situations reflect operational inefficiencies. In addition, they generate direct impacts on logistics costs, particularly in storage and transportation. This suggests that the lack of synchronization between logistics processes limits the efficient use of available resources (Kumar, Gunasekaran & Singh, 2026; Li, Zhang & Chen, 2025; Min, 2024).

Despite the relevance of these problems, a comprehensive analysis is required to quantitatively evaluate the impact of requirements management on logistics costs. While the literature recognizes the importance of this relationship, most studies focus on theoretical approaches or simulations. These incorporate some real operating conditions of the production plants. Therefore, to increase empirical evidence, it is necessary to identify concrete strategies aimed at improving logistics efficiency in specific industrial environments.

In this sense, it is necessary to analyze in detail how materials management affects logistics costs. This analysis focuses particularly on inventories, transport and storage. This analysis will identify areas of opportunity aimed at optimizing resources, strengthening operational efficiency, and increasing organizational competitiveness. (Esper & Williams, 2022).

Consequently, the analysis of this topic acquires significant importance in both the academic and business spheres, as it provides foundations to improve industrial competitiveness through planning strategies that strengthen logistics efficiency, reduce structural costs and promote a more effective management of productive resources.

2 THEORETICAL FRAMEWORK

2.1 LOGISTICS AND LOGISTICS COSTS IN THE MANUFACTURING INDUSTRY

Logistics is defined as the process of planning, implementing and efficiently controlling the flow and storage of goods, services and information from the point of origin to consumption, with the aim of satisfying customer requirements at the lowest possible cost. In the manufacturing industry, logistics costs mainly comprise transportation, storage, inventory management, and order management (Gashi, 2026; Pozo & Teodoro Filho, 2026).

Playing a fundamental role due to the complexity of each of the operations, ranging from the supply of raw materials, inventory management to the distribution of finished products and coordination with suppliers and customers. Consequently, logistics costs represent a significant

proportion of total operating costs, becoming a determining factor for the profitability and competitiveness of companies (Woschank, Dallasega, & Konstantinidis, 2025).

According to the *Council of Supply Chain Management Professionals*, logistics costs can represent between 8% and 15% of the value of sales in manufacturing industries, which makes them a critical factor of competitiveness. Therefore, optimizing these costs requires proper integration of logistics processes and efficient resource management (Pozo & Teodoro Filho, 2026).

In line with the above, logistics cost management has evolved towards more comprehensive approaches that seek not only to reduce them, but also to optimize them within the supply chain. Traditionally, companies focused on minimizing individual costs, such as transportation or storage; however, recent literature emphasizes the importance of adopting a systemic view that considers the total logistics cost. This approach makes it possible to identify interrelationships between the different components of cost, avoiding suboptimal decisions that may generate savings in one area, but increases in another (Ghobakhloo, Fathi, Iranmanesh, Maroufkhani & Morales, 2024; Pozo & Teodoro Filho, 2026; Woschank, Dallasega & Konstantinidis, 2025).

One of the most widely used approaches today is *Total Cost of Ownership (TCO)*, which considers all the costs associated with the acquisition, transportation, storage and use of a product throughout its life cycle. Likewise, activity-based costing (ABC) has gained relevance as a tool to allocate costs more accurately to logistics activities, allowing inefficient processes and opportunities for improvement to be identified (Nguyen, Wang & Dang, 2025).

2.2 MATERIAL REQUIREMENTS PLANNING (MRP)

MRP (*Material Requirements Planning*) is a system that allows determining which materials are needed, in what quantity and at what time, based on production demand. Its importance lies in its ability to efficiently coordinate the supply of materials with production requirements, ensuring timely availability and contributing to the optimization of organizational resources.

According to Orlicky Joseph (1975), the MRP is based on three fundamental elements: Bill of Materials (BOM); Master Production Schedule (MPS); Available inventories

The bill of materials (BOM) represents the structure of the product, breaking down all the components, subassemblies and raw materials required and the quantity for the manufacture of a product. This element is key to the operation of the MRP, as it allows the identification of the hierarchical relationship between the different levels of the product and the calculation of

the dependent demand for each of its components (Javadi et al., 2025; Wulung, Putri & Purwoko, 2026). The master production schedule (MPS) establishes which end products are to be produced, in what quantities, and over what time periods. It acts as the starting point for MRP, as it translates market-independent demand into specific production plans. The accuracy of the MPS is critical, as any error in demand estimation can lead to ripple effects throughout the supply chain, such as excess inventories or material shortages (Pekarcikova et al., 2025).

The main objective of MRP is to ensure the availability of materials by avoiding both shortages and excess inventory, which directly impacts logistics costs. Since an insufficient level of inventory can cause interruptions in production and even delays in deliveries with customers, while an excess of inventory increases storage costs, obsolescence and tied up capital. The third element, available inventories, includes information on current stock, orders in transit, lead *times*, and replenishment policies. This component allows the MRP system to calculate material needs, considering both demand and existing availability, which facilitates decision-making ((Javadi et al., 2025; Wulung, Putri & Purwoko, 2026).

Therefore, supply control through MRP is an essential tool for the efficient management of production and logistics in the manufacturing industry. Its correct implementation improves coordination between areas, optimizes inventory levels and reduces logistics costs, thus contributing to the strengthening of organizational competitiveness. However, its effectiveness depends on integration with other management tools, the quality of information and the ability to adapt to dynamic and changing environments.

2.3 INVENTORY MANAGEMENT AND ITS IMPACT ON COSTS

Inventory management is one of the fundamental pillars of logistics as it directly influences storage costs, working capital and service level. In the manufacturing industry, where material flows are constant and highly interdependent, proper inventory management is critical to ensure production continuity and supply chain efficiency. In general, inventory management refers to the set of policies, processes, and tools used to control stock levels of raw materials, products in process, and finished products, with the goal of meeting demand in a timely manner at the lowest possible cost. In this sense, its relevance lies in achieving a balance between availability and efficiency, avoiding both excess and shortage of inventory. According to Donald J. Bowersox (2013), there are three main types of inventory costs: Maintenance costs (storage, insurance); order costs; Costs due to shortages

Maintenance costs, also known as holding costs, include all those expenses associated with storing inventories over time. These encompass physical storage costs, insurance,

deterioration, obsolescence, material handling, and the opportunity cost of capital invested. Various recent studies highlight that these costs can represent between 20% and 30% of the value of the annual inventory, which makes them a critical factor within the logistics cost structure. On the other hand, the order costs correspond to the expenses generated when placing purchase orders. These include administrative costs, order processing, negotiation with suppliers, initial transportation, and receipt of materials. Although individually they may seem minor, their cumulative impact can be significant, especially in environments where high order volumes or high replenishment frequencies are handled (Gashi, 2025).

The third component, shortage costs, refers to losses arising from the lack of inventory when the lawsuit is filed. These costs can manifest themselves in the form of lost sales, contractual penalties, production stoppages or impacts on customer satisfaction. In the manufacturing industry, material shortages can have particularly severe consequences, such as interruptions in the production line, leading to additional costs due to downtime and inefficient use of resources. Efficient material planning allows these costs to be balanced, reducing unnecessary inventories without compromising the productive operation (Rachmat, 2026).

2.4 PLANNING MATERIALS AND STORAGE COSTS

Storage represents a significant cost within the logistics chain, due to its direct impact on the use of physical, financial and operational resources. In this context, materials management plays a critical role in determining inventory levels and, therefore, in the magnitude of costs associated with storage. Inefficient management, particularly in systems such as Material Requirements Planning (MRP), can lead to significant imbalances in inventory levels. When material requirements are not correctly aligned with actual demand or production capacity, an overinventory phenomenon occurs, which considerably increases storage costs (Jin et al., 2025; Rachmat, 2026). Consequently, poor requirements management not only generates inventory surpluses, but also causes: Physical space costs; handling costs; Risk of obsolescence

Physical space costs include the expansion or saturation of warehouses, the need to rent additional space, or even investment in logistics infrastructure. These costs tend to increase proportionally to the volume of inventory, directly affecting the profitability of the operation. Second, there are material handling costs, which encompass activities such as receiving, internal transfer, storage, assortment, and dispatch. A higher volume of inventory implies greater frequency and complexity in these operations, which translates into an increase in the use of labor, equipment and operating time.

In addition, the risk of obsolescence represents one of the most critical costs associated with excess inventory, especially in industrial environments characterized by rapid technological changes or variability in demand. Materials that remain in storage for long periods can lose value, become obsolete or even unusable, generating significant economic losses for the organization. On the contrary, proper planning reduces inventory levels and optimizes the use of warehouses, which directly impacts the optimization of the use of logistics resources. However, it is important to note that inventory reduction must be done strategically, considering factors such as demand variability, delivery times, and supplier reliability. Excessive reduction can increase the risk of shortages and generate costs greater than the savings obtained in storage. Therefore, the challenge is to find an optimal balance that minimizes costs without compromising operational continuity (Yusof et al., 2026).

2.5 PLANNING OF MATERIALS AND TRANSPORTATION COSTS

Transportation represents one of the most significant components within logistics costs in the manufacturing industry, due to its essential role in the movement of materials and products throughout the supply chain. In this context, material planning has a direct influence on transport efficiency. When there is poor planning, companies resort to urgent or fragmented shipments, which increases costs. Efficient planning allows: Consolidation of loads; route scheduling; Reduction of urgent shipments.

Cargo consolidation allows you to significantly optimize transportation costs by implementing various logistics strategies. One of the most relevant is this one, which consists of grouping multiple orders or materials into a single shipment, maximizing the utilization of transport capacity and reducing the cost per unit. This strategy not only decreases direct transportation costs, but also contributes to the reduction of emissions and the more efficient use of resources (Gashi, 2025).

Another key strategy is route scheduling, which allows transportation routes to be planned in advance, considering factors such as supplier locations, delivery times, load capacity, and traffic conditions. The use of digital tools such as Transportation Management Systems (TMS) has facilitated route optimization, allowing for reduced distances traveled, delivery times, and operating costs.

Likewise, adequate control of materials contributes to reducing urgent shipments, which represent one of the main generators of cost overruns in logistics. By having accurate and demand-aligned planning, companies can anticipate their needs and schedule regular shipments, avoiding resorting to emergency solutions that significantly increase costs.

Managing the supply of materials has a direct impact on transportation costs, as it influences the way logistics movements are organized and executed. Efficient planning allows for the consolidation of loads, optimize routes, and reduce urgent shipments, which translates into a significant decrease in transportation costs and an improvement in supply chain performance (Yusof et al., 2026)

2.6 SUPPLY CHAIN COORDINATION

The input planning process does not operate in isolation within the organization, but is part of a larger system known as the supply chain, which integrates fundamental coordination. In this sense, effective coordination between these functions is essential to ensure operational efficiency, cost rationalization and compliance with customer service levels. Within this network, the materials management system acts as an articulating element that allows aligning production requirements with the availability of inputs and distribution capacity, which requires coordination between: Supply; production; distribution.

First, coordination with the sourcing area is essential to ensure the timely supply of materials. Proper planning allows you to generate purchase orders in advance, negotiate better conditions with suppliers and reduce uncertainty in delivery times. On the contrary, a lack of coordination can generate delays, urgent purchases and higher logistics costs, affecting the continuity of the productive operation. Second, integration with the shop floor is key to synchronizing material availability with manufacturing plans. The MRP system, being based on the master production schedule, facilitates this alignment; however, its effectiveness depends on the accuracy of the information and communication between the areas involved. A lack of coordination can generate problems such as line stoppages, downtime or accumulation of inventories in process.

On the other hand, coordination with the distribution area allows the efficient planning of the delivery of finished products to the customer. This involves considering factors such as delivery times, transportation routes, inventory levels in distribution centers, and market demand. According to Christopher (2016), supply chain integration reduces uncertainty, improves process synchronization, and lowers operating costs (Rachmat, 2026).

2.7 DYNAMIC ENVIRONMENTS AND LOGISTICAL RESILIENCE

In recent years, the manufacturing industry has undergone a significant transformation, stemming from highly dynamic and uncertain environments. Factors such as the COVID-19 pandemic, geopolitical tensions, disruption in global supply chains, and emerging trends such

as nearshoring have increased volatility in both demand and supply of materials. In this context, the input planning process acquires strategic relevance, as it becomes a key element to guarantee operational continuity and organizational stability.

Dynamic environments are characterized by constant and unpredictable changes in variables such as market demand, delivery times, availability of inputs, and logistics costs. Under these conditions, traditional planning models may be insufficient if they do not incorporate adaptation and flexibility mechanisms. For this reason, recent literature emphasizes the need to evolve towards more resilient planning systems, capable of anticipating and responding effectively to disruptions (Ferrari & Pesaresi, 2025; Shahnawaz & Safder, 2026). Adequate planning allows: Adaptation to changes in demand; reduction of shortages risks; greater organizational resilience.

Comprehensive input management contributes, first of all, to adaptation to changes in demand. In volatile environments, demand can fluctuate significantly over short periods of time, requiring flexible and up-to-date planning systems. The use of tools such as predictive analytics, Advanced Planning Systems (APS), and real-time data integration allows production and supply plans to be adjusted dynamically, reducing deviations and improving accuracy in decision-making (Min, 2025; Safder & Shahnawaz, 2026).

Efficient planning allows the reduction of shortages risks, one of the main problems in contexts of uncertainty. Supplier diversification, supply chain risk assessment, and the definition of safety inventory levels are strategies that, supported by proper planning, mitigate disruptions in the supply of materials. This is especially relevant in the automotive industry, where the lack of a single component can bring production to a complete halt.

Likewise, material requirements planning contributes to the development of greater organizational resilience, by facilitating the implementation of strategies such as supplier regionalization (nearshoring), the digitization of processes, and the integration of information throughout the supply chain. These practices reduce dependence on distant or unstable sources, improve visibility into operations, and strengthen response capacity to unexpected events.

Therefore, in dynamic and highly uncertain environments, materials planning becomes a strategic element to strengthen the logistical resilience of organizations. Its proper implementation allows it to adapt to changes in demand, reduce the risk of shortages and improve the capacity to respond to disruptions, thus contributing to operational stability and the efficient control of logistics costs.

2.8 RELATIONSHIP BETWEEN MATERIAL PLANNING AND LOGISTICS COSTS

The input planning process is a central element within supply chain management, due to its direct and comprehensive impact on the different components of logistics costs. In the manufacturing industry, where operational efficiency is key to competitiveness, the correct alignment between demand, production and supply allows resources to be optimized and costs minimized throughout the chain. Various studies agree that there is a direct relationship between material planning and the reduction of logistics costs (Dolgui, Ivanov & Sokolov, 2025; Rachmat, 2026). since it simultaneously influences critical areas such as: Inventories; transportation; storage; service level.

This relationship is not isolated, but systemic, which implies that an improvement in planning can generate positive effects in multiple operational dimensions. Therefore, proper materials management becomes a strategic factor to improve the efficiency and competitiveness of manufacturing organizations.

3 OBJECT OF RESEARCH

3.1 GENERAL OBJECTIVE

Analyze the influence of raw material requirements planning on logistics costs, evaluating its impact on inventory management, transportation, and storage, in order to identify opportunities for improvement aimed at optimizing resources and strengthening operational efficiency.

3.2 SPECIFIC OBJECTIVE

1. Analyze the current materials management process. Through the structured evaluation of requirements planning (MRP), demand management, delivery times and coordination between areas, in order to identify operational deviations and their impact on actual execution.
2. Quantify the impact of requirements management on inventory levels. Through the analysis of indicators such as inventory turnover, inventory days and stock levels, in order to identify excesses or shortages and determine their effect on maintenance costs and working capital.
3. Determine the relationship between supply management and transportation costs. By analyzing variables such as the frequency of urgent shipments, cargo consolidation, and logistics scheduling, with the aim of identifying patterns of inefficiency and opportunities for cost reduction.

4. Evaluate the impact of material planning on storage costs. Through the measurement of space usage, inventory turnover, and warehouse operating costs, in order to identify inefficiencies and quantify areas of optimization.
5. Propose strategies for improvement in planning of material requirements, based on the quantitative analysis of the results obtained, aimed at reducing logistics costs, optimizing resources and improving the operational efficiency of the plant.

Based on the theoretical foundations presented and the review of the literature, the following research hypotheses are formulated:

3.3 RESEARCH HYPOTHESIS

3.3.1 General hypothesis

- **H1:** Material planning has a significant influence on the reduction of logistics costs. Because it allows for better synchronization between demand, production, and supply, which translates into optimized inventory levels, greater transportation efficiency, and more appropriate use of storage resources.

This hypothesis is based on the premise that raw material planning, through tools such as Material Requirements Planning (MRP), allows to efficiently align production requirements with the availability of inputs. This alignment reduces operational deviations that commonly generate cost overruns within the logistics chain. Firstly, proper materials management contributes to the optimisation of inventory levels, avoiding both excess and shortages. This has a direct impact on the reduction of different costs, such as storage and working capital. When materials are planned accurately, the need to maintain high inventories as a safety measure is reduced.

Second, materials management influences transportation efficiency by scheduling shipments in advance, consolidating loads, and avoiding urgent transports. On the contrary, poor management generates extraordinary shipments, which significantly increase logistics costs due to their urgent nature. Likewise, a correct planning of material requirements favors the optimization of storage, by reducing space saturation and improving inventory turnover. This translates into lower costs and we avoid the risk of obsolescence. In this sense, material planning not only has an individual impact on each component of the logistics cost, but also generates an integral effect on the entire supply chain, by improving coordination between the different areas involved. Therefore, it is proposed that an improvement in the management of inputs will result in a significant decrease in total logistics costs.

3.3.2 Specific hypotheses

- **H1a:** Proper planning of material requirements is associated with a decrease in storage costs, measured through the average inventory level and days of inventory.
- **H1b:** Efficient material planning relates to a reduction in transportation costs, measured by decreasing the frequency of urgent shipments and improving freight consolidation.
- **H1c:** Efficient inventory management is associated with the reduction of costs due to overstock and shortages, evaluated through indicators such as inventory turnover, stock level and frequency of shortages.
- **H1d:** The coordination between supply, production and distribution is related to an improvement in logistics costs, measured by reducing variations in the scheduling of materials and reducing operating costs.

4 METHODOLOGY

4.1 RESEARCH APPROACH

This study is developed under a quantitative approach, because it is oriented to the collection and analysis of numerical data in order to identify the relationship between the planning of material requirements and logistics costs. This approach makes it possible to measure the study variables through specific indicators and to apply statistical techniques that facilitate the verification of the hypotheses raised.

4.2 TYPE AND DESIGN

The research is non-experimental, because the study variables are not manipulated, but are analyzed in their natural context within the manufacturing industry. It also has a cross-sectional design, since data collection will be carried out at a single moment in time. Finally, the study is correlational in scope, since it seeks to determine the degree of relationship between the planning of material requirements as an independent variable and logistics costs as a dependent variable.

4.3 POPULATION AND SAMPLE

The study population is made up of personnel from the logistics, production, and supply areas of the manufacturing industry of the State of Guanajuato, due to their direct participation in processes related to materials management and logistics costs. For data collection, a sample of 32 participating companies was randomly selected through a non-probabilistic convenience sampling, considering the accessibility to the database and their direct participation in the

processes. This sample size allows obtaining relevant information for the analysis of the variables under study.

Likewise, it was sought that the participating companies had direct experience in the planning, inventory, transport and storage processes, which guaranteed the relevance and quality of the information collected. Although the sample size does not allow a statistical generalization to the entire population, it is sufficient to identify trends and analyze the relationship between the study variables in the specific context.

4.4 INSTRUMENT

A structured questionnaire-type instrument was developed, which is composed of 15 items distributed along three strategic dimensions, namely: materials planning, logistics costs and operational coordination, which aims to quantitatively evaluate the relationship between the efficiency of materials management and the impact they have on logistics costs in the organization. This instrument was developed under a five-point Likert scale, where the value 1 corresponds to "strongly disagree" and 5 "strongly agree", and thus allows to evaluate the degree of perception presented by them, with respect to the various operational, administrative and strategic practices in relation to the planning of material resources.

The first aspect, materials planning, had an objective aimed at studying the implementation of systems such as *Material Requirement Planning* (MRP), accuracy in demand forecasting, coordination between supply and production, as well as the ability of planning to generate possible stock shortages, reduce excess inventory, and improve operational productivity.

The second dimension, logistics costs, was used to study the effect of the aforementioned practices on the most important economic variables of the study, including warehouse-related costs, reduction of urgent transports, reduction of the risk of obsolescence, improvement in the use of warehouses and general reduction of logistics costs. etc. And the dimension of operational coordination was the area that allowed us to study the strategic impact of integration between different departments and the anticipation with which operational problems arising from planning deficiencies can be addressed.

Methodologically, the questionnaire was applied to the managers of the selected companies, directly involved in carrying out the logistics, supply, planning or manufacturing processes of the company used as the object of study, ensuring that the answers came from social actors with operational and also strategic knowledge about the behavior of materials. The information obtained was treated through descriptive statistical analysis, using central tendency

measures such as means and standard deviations to detect generalized patterns of organizational perception; on the other hand, the application of reliability analysis using Cronbach's Alpha coefficient of 80% was also contemplated, which validated the internal consistency of the instrument, as well as correlational analysis to determine if there is any relationship between the planning of materials and the alteration of logistics cost.

This methodological approach made it possible to obtain quantifiable results on the importance of the implementation of efficient planning systems in the form of a tool to strengthen business competitiveness, optimize resources, reduce costs and facilitate the total coordination of the *supply chain*. In this way, the instrument used was not only an organizational diagnostic mechanism, but also the scientific basis for the implementation of new strategies for continuous improvement in logistics and operations management.

4.5 STATISTICAL ANALYSIS

The analysis of the data obtained objectively through the measurement instrument was carried out following a quantitative approach using descriptive and inferential techniques that sought to evaluate the general behavior of the variables analyzed and their relationship with each other.

A preliminary descriptive analysis was carried out as it was carried out by calculating arithmetic means and, for each item and for each dimension of the questionnaire (material planning, logistics costs and operational coordination), this allowed detecting measures of central tendency of the subjects' responses, while facilitating the interpretation of the level of organizational perception regarding the efficiency of the planning of materials that sustains the operation of logistics operations. The measures that were finally obtained provided decisive information regarding the strengths, weaknesses and areas for improvement present in the processes analyzed, since superior measures denote a positive opinion about the effectiveness of the practices applied.

Subsequently, Pearson's correlation coefficient (r) was used as an inferential analysis resource to determine the intensity and direction of the linear relationship between the variables that constitute the core of the pattern of this study. By virtue of these aspects, the test also allowed to evaluate the strength of the relationship since both the adequate planning of materials and the reduction of logistics costs (in terms of correct planning of materials) are studied, and in the same way between coordination and organizational effectiveness. Pearson's correlation was chosen because it is particularly valid for measuring relationships between continuous quantitative variables resulting from Likert scales considered as interval variables,

in the context of studies of organizational issues. Its value is always located between -1 and +1, having to: a positive value expresses that there is a direct relationship, a negative value presents an inverse relationship and the proximity to zero denotes the absence of a significant relationship.

The conjunction of both techniques progressively made it possible to support the integrative analysis of both tests: describing on the one hand the general behavior of the sample and on the other the statistical evidence of the association of planning processes and that of logistics costs. This procedure also reinforces the purported scientific validity of the study since it allows the substantiation of the conclusions objectively by focusing on the strategic influence that materials management exerts on the performance and restriction of logistics in organizations. Thus, the application of statistical analysis is part of the study since it allows transforming the data collected into empirical evidence that is useful both for decision-making and for the determination of organizational optimization strategies.

5 RESULTS

5.1 DESCRIPTIVE ANALYSIS OF MATERIALS PLANNING

The results show that the material planning dimension presents a positive overall assessment, with averages above 3.5 in most of the items, which indicates a favorable perception regarding the implementation of planning tools such as the MRP.

In particular, the item related to the planning capacity to avoid material shortages obtained a high mean ($M = 4.429$, $SD = 0.535$), which suggests an adequate alignment between production requirements and the supply of inputs. Similarly, it was observed that planning contributes to the reduction of excess inventory ($M = 4.143$, $SD = 1.069$) and to the optimization of warehouse use ($M = 4.143$, $SD = 0.690$), evidencing a positive impact on inventory management.

However, relevant areas of opportunity were identified. The item referring to the reduction of urgent transport presented the lowest mean ($M = 2,714$, $SD = 1,496$), which indicates deficiencies in logistics synchronization. Likewise, the perception of the decrease in storage costs was moderate ($M = 3,286$, $SD = 1,254$), which suggests that the economic benefits derived from planning are not yet fully reflected in the operation (See Table 1)

Table 1

Analysis of means and standard deviation material planning section (n=32)

Items	$\bar{X}$	SD
Materials Section		

1. Tools such as MRP are used appropriately to plan requirements.	3.857	0.690
2. The demand for materials is correctly forecasted.	3.714	1.113
3. There is effective coordination between supply and production.	3.857	0.900
4. Planning avoids shortages of materials.	4.429	0.535
5. Planning reduces excess inventory.	4.143	1.069
6. Planning systems (MRP) are efficient.	3.571	1.134
7. Material scheduling improves production operation.	4.000	0.577
8. Storage costs have decreased thanks to planning.	3.286	1.254
9. Proper material planning reduces the need for urgent transport.	2.714	1.496
10. The company minimizes losses due to obsolete inventory.	3.571	1.272

5.2 DESCRIPTIVE ANALYSIS OF LOGISTICS COSTS

In the dimension of logistics costs, the results reflect a moderate perception regarding cost reduction, with averages ranging between 3.2 and 4.6. Coordination between areas obtained the highest score ($M = 4.600$, $SD = 0.548$), confirming its fundamental role in operational efficiency.

Likewise, it was observed that planning contributes to the optimization of warehouse use ($M = 4.200$, $SD = 0.447$) and to the reduction of shortages ($M = 4.200$, $SD = 0.837$). However, the efficiency of the MRP systems was evaluated with a lower mean ($M = 3.200$, $SD = 0.837$), which shows possible limitations in their implementation or integration.

In addition, the overall reduction in logistics costs ($M = 3.600$, $SD = 1.140$) and the minimization of obsolete inventories ($M = 3.400$, $SD = 1.140$) show a partial impact, suggesting that, although there are operational improvements, these do not fully translate into tangible economic benefits (See Table 2).

Table 2

Analysis of means and standard deviation of logistics costs section (n=32)

Items	$\bar{X}$	SD
Materials Section		
1. Tools such as MRP are used appropriately to plan requirements.	3.800	0.837
2. The demand for materials is correctly forecasted.	3.600	1.140

5.3 DESCRIPTIVE ANALYSIS OF OPERATIONAL COORDINATION.

The operational coordination dimension presented consistent results, highlighting high levels in the ability to avoid shortages ($M = 4.524$, $SD = 0.814$) and reduce excess inventory ($M = 4.524$, $SD = 0.680$). These findings show an adequate integration between the areas of supply, production and logistics.

Likewise, the programming of materials was perceived as an element that improves the productive operation ($M = 4.381$, $SD = 0.973$). However, the minimization of obsolete inventories ($M = 3,048$, $SD = 1,117$) and the reduction of urgent transports ($M = 3,429$, $SD = 1,248$) continue to represent areas for improvement.

Taken together, these results indicate that, although operational coordination is strong, there are still limitations in eliminating logistical inefficiencies, particularly in dynamic environments (See Table 3)

Table 3

5.4 CORRELATIONAL ANALYSIS

5.4.1 Hypothesis H1a: Relationship between material planning and logistics costs

Pearson's correlation analysis showed positive and significant relationships between the use of planning tools (MRP) and the reduction of logistics costs ($r = 0.826$, $p < 0.05$), as well as with the minimization of obsolete inventories ($r = 0.925$, $p < 0.01$). These results confirm that adequate material planning contributes significantly to logistics efficiency. However, negative

correlations were identified in relation to the reduction of urgent transports ($r = -0.482$), which shows limitations in logistics synchronization.

5.4.2 Hypothesis H1b: Material and Transportation Cost Planning

Positive correlations were observed between demand forecasting and reduction of logistics costs ($r = 0.801$, $p < 0.05$), as well as with storage costs ($r = 0.782$, $p < 0.05$). However, the negative correlations associated with transport indicate that this dimension remains a critical area within the logistics system.

5.4.3 Hypothesis H1c: Material planning and obsolescence reduction

The results showed strong correlations between the efficiency of the MRP system and the minimization of obsolete inventories ($r = 0.891$, $p < 0.01$), as well as with the reduction of storage costs ($r = 0.925$, $p < 0.01$). These findings confirm the effectiveness of planning in inventory management.

5.4.4 Scenario H1d: Operational coordination and logistics costs

Based on Table 4.4, it can be seen that coordination between areas shows significant correlations with material scheduling ($r = 0.963$, $p < 0.01$) and the integration between supply and production ($r = 0.919$, $p < 0.05$). This shows that operational coordination is a key factor in logistics efficiency.

6 CONCLUSION

The results obtained allow us to conclude that the planning of materials significantly influences the reduction of logistics costs, validating the general hypothesis of the research. Empirical evidence shows that the implementation of tools such as MRP contributes to improving inventory management, optimizing warehouse use and reducing obsolescence. However, the impact of planning is not uniform in all the dimensions analyzed. Important limitations were identified in the reduction of urgent transports, suggesting deficiencies in the synchronization between planning and logistics execution. Also, while coordination between areas is adequate, it is not enough to completely eliminate operational inefficiencies. In this sense, materials planning should be understood as a strategic element whose effectiveness depends on its integration with other systems, the quality of information and the ability to adapt to dynamic environments.

7 LINES OF FUTURE RESEARCH

Based on the findings obtained, the following lines of research are proposed:

1. Analyze the implementation of predictive analytics tools to improve the accuracy of demand forecasting and reduce urgent transports.
2. Evaluate the integration of digital systems (ERP, TMS and APS) in real time to optimize logistics coordination.
3. Develop longitudinal studies that allow analyzing the impact of materials planning over time.
4. Conduct comparative studies across different industry sectors to identify generalizable patterns.
5. Design optimization models focused on cargo consolidation and transportation cost reduction.

ABSTRACT

Health promotion plays an essential role in understanding and addressing the growing use of e-cigarettes among university students, especially given the influence of digital media and the social normalization of these devices. E-cigarette use has increased among young people and adults, driven by misconceptions of lower risk and the widespread circulation of unqualified information. This study aimed to analyze the use of and knowledge about e-cigarettes among university students and to evaluate how health promotion can transform this scenario. The research was conducted in 2024 with 275 students using a structured online questionnaire. The results showed that 36% had already used the device, with 18.2% being current users. Use was associated with younger age groups, alcohol consumption, and illicit drug use. The majority perceive e-cigarettes as commonplace in daily life, and 92.7% believe they cause addiction. Informal media was the main source of information, highlighting vulnerability to misinformation. It is concluded that health promotion actions such as critical education, qualified communication, and the creation of healthy university environments are fundamental to reducing risks, strengthening student autonomy, and preventing the early use of these devices.

RESUMO

A Promoção da Saúde tem papel essencial na compreensão e enfrentamento do uso crescente de cigarros eletrônicos entre universitários, especialmente diante da influência das mídias digitais e da normalização social desses dispositivos. O uso do cigarro eletrônico tem crescido entre jovens e adultos, impulsionado por percepções equivocadas de menor risco e pela ampla circulação de informações não qualificadas. Este estudo teve como objetivo analisar o uso e o conhecimento sobre o cigarro eletrônico entre estudantes universitários e avaliar como a Promoção da Saúde pode transformar esse cenário. A pesquisa foi realizada em 2024 com 275 estudantes, por meio de um questionário estruturado aplicado online. Os resultados mostraram que 36% já utilizaram o dispositivo, sendo 18,2% usuários atuais. O uso esteve associado à faixa etária mais jovem, ao consumo de álcool e ao uso de drogas ilícitas. A maioria percebe o cigarro eletrônico como comum no cotidiano e 92,7% acredita que ele causa dependência. A mídia informal foi a principal fonte de informação, evidenciando vulnerabilidade à desinformação. Conclui-se que ações de Promoção da Saúde como educação crítica, comunicação qualificada e criação de ambientes universitários saudáveis são fundamentais para reduzir riscos, fortalecer a autonomia dos estudantes e prevenir o uso precoce desses dispositivos.

Palavras-chave: Cigarros Eletrônicos. Estudantes. Promoção da Saúde. Comportamento de Risco. Mídias Sociais. Dependência de Nicotina.

RESUMEN

La promoción de la salud desempeña un papel fundamental en la comprensión y el abordaje del creciente uso de cigarrillos electrónicos entre estudiantes universitarios, especialmente dada la influencia de los medios digitales y la normalización social de estos dispositivos. El uso de cigarrillos electrónicos ha aumentado entre jóvenes y adultos, impulsado por ideas erróneas sobre su menor riesgo y la amplia difusión de información no cualificada. Este estudio tuvo como objetivo analizar el uso y el conocimiento sobre cigarrillos electrónicos entre estudiantes universitarios y evaluar cómo la promoción de la salud puede transformar este panorama. La investigación se llevó a cabo en 2024 con 275 estudiantes mediante un cuestionario estructurado en línea. Los resultados mostraron que el 36% ya había utilizado el dispositivo, y el 18,2% eran usuarios actuales. El uso se asoció con grupos de edad más jóvenes, consumo de alcohol y consumo de drogas ilícitas. La mayoría percibe los cigarrillos electrónicos como algo común en la vida diaria, y el 92,7% cree que causan adicción. Los medios informales fueron la principal fuente de información, lo que pone de manifiesto la vulnerabilidad a la desinformación. Se concluye que las acciones de promoción de la salud, como la educación crítica, la comunicación cualificada y la creación de entornos universitarios saludables, son fundamentales para reducir los riesgos, fortalecer la autonomía estudiantil y prevenir el uso temprano de estos dispositivos.

1 INTRODUCTION

Tobacco use has been described since early times, with reports prior to 1000 B.C. Tobacco, like nicotine, has historically been associated with a sacred symbology, being consumed in religious rituals and even in a therapeutic way (RÄSÄNEN et al., 2020; TALHOUT et al., 2011).

Chinese pharmacist Ron Lik was the one who launched the electronic cigarette (EC), motivated by personal reasons: his father had died of lung cancer and he himself was an active smoker. To try to solve his smoking, he developed and patented the device. There are previous descriptions of similar inventions, but without wide dissemination or patent (KHALIL et al., 2022).

The EC, known by various names, such as "vape", e-cigarette, vaporizer, pod, pen drive, among others, is a technological innovation that allows the user to inhale aerosols produced by the vaporization of a battery-heated liquid, which is contained in the device. This inhalable aerosol is obtained through this vaporization of the liquid, and in this liquid it contains nicotine, flavorings, propylene glycol/glycerin, among other substances. Because of these and other substances, the EC is potentially harmful to health, as there is no legislation or standardization in Brazil on what to put in each device, thus making its use harmful (TRAVIS et al., 2023).

Regarding the legality of the EC, different countries adopt different approaches to the control of electronic cigarettes. In Brazil, the National Health Surveillance Agency (ANVISA) maintains the prohibition on the commercialization, importation, and advertising of these devices, based on the absence of conclusive evidence on their safety and efficacy as a smoking cessation tool (FIOCRUZ, 2024).

In contrast, about 80 countries around the world have regulated the sale of e-cigarettes (WHO, 2023). Despite the Brazilian ban in force since 2009, research points to a significant growth in use, especially among young people. The national prevalence was 0.64% in the general population in 2019 (SOUZA; SILVA; ALMEIDA, 2021), reaching 7.4% among individuals aged 18 to 24 years (INCA, 2023). Recent reports indicate that consumption quadrupled between 2018 and 2022 (CNN BRASIL, 2023), reaching the highest level ever recorded in 2024, with about 2.6% of adults using these devices, whose acquisition occurs easily through websites and digital platforms, even in the face of the ban. When doing an internet search about the device, Google itself indicates the places closest to you from which you can purchase the CE (INFOMONEY, 2024).

Adaptation to the FB was more expressive among adolescents and young adults. In 2014, in the United States, the use of EC exceeded that of conventional cigarettes (CC). In

2019, more than ten million American adults and three million adolescents used the device (CHAD et al., 2020). The risks of FB in this population are still under investigation, since this group was the one that showed the greatest increase in use.

It was only from 2018 onwards that more robust studies on the harms of the EC emerged. As it is a recent technology, many users use it without fully knowing the harm, believing that the EC reduces the harm associated with conventional cigarettes (HART NETT et al., 2020).

National studies, such as the one by Souza et al. (2021), demonstrate that the use of electronic smoking devices has increased significantly in Brazil, being more prevalent among young adults and associated with risk behaviors, such as the consumption of alcohol and other licit and illicit substances. Similarly, Costa et al. (2021) showed a high prevalence of use among medical students, highlighting a paradox between the level of theoretical knowledge and the practice of consumption, showing that knowledge is not influencing the practice of EC consumption.

Contemporary literature highlights the role of digital media and social networks in the dissemination of information, often misleading, about e-cigarettes. Evidence shows that pro-vape content published on digital platforms reduces risk perception and increases the likelihood of experimentation among adolescents and young adults (RUTHERFORD et al., 2023).

According to Fiocruz (2024), digital marketing strategies, influencers, and sponsored publications contribute significantly to the construction of the idea that these devices are less harmful, favoring their social normalization. Recent reviews also point out that the modern aesthetics of vapes, associated with a strong presence on social networks, reinforces their acceptance as a technological and socially desirable product, expanding early experimentation and continued use (BEZERRA; PINHEIRO, 2025).

This relationship between the use of electronic cigarettes and social, cultural, and media factors reinforces the need for health promotion strategies focused on the topic, especially in the educational environment (SILVA et al., 2021). With health promotion, an essential framework appears to understand and intervene in the use of electronic cigarettes among university students, articulating educational actions, regulation of digital advertising, strengthening of public policies and creation of academic environments that favor healthy choices.

The 2030 Agenda, adopted by the United Nations, establishes global goals that dialogue directly with the control of the use of these devices through the Sustainable Development Goals (SDGs).

SDG 3 — Good Health and Well-Being — includes targets related to strengthening the Framework Convention on Tobacco Control and preventing the use of psychoactive substances.

SDG 4 — Quality Education — is related to the development of personal skills and critical thinking to deal with misinformation, an aspect directly linked to this study. SDG 10 — Reduction of Inequalities — addresses access to reliable information on health risks, which is relevant given the scarcity of qualified information on the EC. SDG 12 — Sustainable Consumption and Production — includes the environmental impacts of improper disposal of electronic devices, remembering that the EC contains a battery inside. Thus, the use of electronic cigarettes requires intersectoral, sustainable actions aligned with global health goals (FIOCRUZ, 2024; BEZERRA; PINHEIRO, 2025).

In view of the above, the objective of the present study is to identify the use and knowledge about electronic cigarettes among university students, and how health promotion can act in this scenario.

2 MATERIALS AND METHODS

2.1 RESEARCH DESIGN AND ETHICAL ASPECTS

The research was approved by the Research Ethics Committee (CEP) of the University of Franca/SP under opinion No. 7,475,254, and the ethical aspects were determined by Resolution 466/12 of the National Health Council, safeguarding ethical rights in research with human beings.

This is a quantitative, cross-sectional and analytical study, carried out with university students from a private institution in the interior of São Paulo. The sampling was non-probabilistic by convenience, composed of students approached in person after the tests.

The collection took place in June 2025 and included students from the first to the sixth grade. A total of 275 students participated, a number corresponding to those who agreed to answer the questionnaire.

2.2 DATA COLLECTION

A structured questionnaire was applied online to university students. The students were approached at the University and invited to participate in the research. After accepting, the Informed Consent Form (ICF) was presented and then access to the online questionnaire was made available through a QR code. The sample consisted of 275 university students.

2.3 DATA PROCESSING AND STATISTICAL ANALYSIS

The data were initially organized in an electronic spreadsheet (Microsoft Excel®) and later exported to the Python® software (version 3.11) for statistical analysis.

The independent variables — gender, age group, year of course, self-reported ethnicity, alcohol consumption, and illicit drug use — were submitted to descriptive analysis, with absolute and relative frequencies. The distributions were represented by simple and stacked tables and bar graphs.

To investigate associations between the use of electronic cigarettes (current user, former user and never user) and the independent variables, appropriate statistical tests were applied for categorical variables. Pearson's chi-square test (χ^2) was used as the main procedure, adopting a significance level of 5% ($p < 0.05$). In situations with reduced expected frequencies, Fisher's exact test was used. The magnitude of the associations was evaluated using Cramer's V, interpreted according to the criteria: weak ($V < 0.10$), moderate ($0.10 \leq V < 0.30$) and strong ($V \geq 0.30$).

For ordinal variables, such as age group, the linear trend test was additionally applied. The variables perception of dependence, perception of how common the use is, time of first contact with the electronic cigarette and source of knowledge about the device were also analyzed. The results were presented in contingency tables, stacked bar graphs, and values of χ^2 , degrees of freedom, p value, and Cramer's V.

3 RESULTS

3.1 SOCIODEMOGRAPHIC PROFILE OF THE PARTICIPANTS

The sample consisted of 275 university students, predominantly female (70%). The most frequent age group was 18 to 25 years (82.3%). Most participants declared themselves white (82.8%). Regarding substance use, 76.3% reported current consumption of alcoholic beverages and 80.1% stated that they did not use illicit drugs. Table 1 with the sociodemographic characteristics of the participants is shown below.

Table 1

Sociodemographic characteristics of the participants

Variables	n	%
Gender		
Women	193	70,0
Male	82	30,0
Age group		
18–25 years old	226	82,3
26–35 years old	41	15,0
36–50 years old	8	2,6
Ethnicity		
White	228	82,8
Brown	43	15,7
Other	4	1,5
Alcohol use		

Current Usage	210	76,3
Never used	44	15,9
Former user	21	7,8
Illicit drug use		
Do not use	220	80,1
Current Usage	18	6,4
Past Use	37	13,5

Source: The authors.

3.2 USE OF ELECTRONIC CIGARETTES AND ASSOCIATED VARIABLES

When asked about the use of electronic cigarettes, most students had never used electronic cigarettes (63.9%). Among those who have already used it, 18.2% were current users and 17.2% were former users. The use of the device showed a significant association with age, alcohol consumption, and illicit drug use. Below is table 2 with the numbers of participants who are users or non-users.

Table 2

Use of electronic cigarettes among participants

Category	n	%
Never used	176	63,9
Current user	50	18,2
Former user	47	17,2
Sporadic use	2	<1

Source: The authors.

The graph below shows that only age, alcohol consumption, and illicit drug use were significantly associated with the use of e-cigarettes, with higher magnitudes for alcohol ($V = 0.275$) and drugs ($V = 0.229$). Indicating that drinking behavior is strongly related to the use of the device, similarly, to the use of illicit drugs. Gender, year of the course and ethnicity did not show relevant associations, indicating that behavioral factors explain the pattern of use better than demographic characteristics.

Figure 1

Associations between independent variables and e-cigarette use

Source: Authors.

3.3 FREQUENCY OF USE, FIRST CONTACT, AND PERCEPTIONS

Among users, 47.3% reported use at specific times and 22.8% daily use. The first contact occurred mostly before college (42.3%). It was also evaluated how common the participants evaluate the use of the EC. The perception of prevalence showed that 47.2% consider it common in everyday life and 33.1% common at parties. The distribution of the answers shows that most students perceive the use of electronic cigarettes as common or common at parties, while a smaller portion considers it uncommon or says they do not use it. These data indicate that use is largely normalized in the student environment.

The perception of dependence was high among the participants, with 92.7% stating that electronic cigarettes cause dependence, while only 2.5% answered that they did not and 4.7% did not know how to inform.

The relationship between the moment of first contact and the current use profile shows that the use of electronic cigarettes is concentrated among those who had already tried the device, especially before college. Individuals who have never had contact do not appear among current users, reinforcing the consistency of the data. This distribution is consistent with the associations observed in the Cramer's V graph, which indicate a greater relationship between the first contact and behavioral factors — such as alcohol consumption ($V = 0.25$) and the use of other drugs ($V = 0.21$) — and with academic characteristics, such as the year of the course

($V = 0.23$). In contrast, sociodemographic variables such as sex and ethnicity showed weak and non-significant associations.

In general, the findings suggest that the first contact with electronic cigarettes is more linked to risk contexts and associated behaviors than to demographic characteristics, once again.

Figure 2

Moment of first contact with the electronic cigarette

Source: Authors.

3.4 SOURCES OF INFORMATION AND INFERENTIAL ANALYSIS

Informal media was the main source of knowledge (38.1%), followed by scientific literature (22.4%) and personal experience. The absolute and relative frequencies of each category are shown in figure 3 below, also showing the visual distribution of these proportions.

Figure 3*Distribution of knowledge sources*

Source: Authors.

The inferential analyses showed that informal media was associated with a higher prevalence of use and perception of normalization. The predominance of the media suggests that digital content exerts a strong influence on the formation of perceptions on the subject, although formal sources — such as scientific literature and health professionals — also contribute to students' knowledge.

In the inferential analysis, only the consumption of alcoholic beverages showed a significant association with the source of knowledge ($\chi^2 = 91.77$; gl = 35; $p < 0.001$; $V = 0.26$), indicating distinct patterns between consumers and non-consumers. The variables sex, age, year of course, ethnicity, and use of illicit drugs did not show significant associations.

When relating the source of knowledge with other main variables, an association was observed with the moment of first contact with electronic cigarettes ($\chi^2 = 32.06$; gl = 15; $p = 0.006$; $V = 0.20$) and with the perception of how common the use is ($\chi^2 = 44.48$; gl = 20; $p = 0.001$; $V = 0.20$). Students who perceive the use as more frequent tend to base their knowledge on the media or personal experiences. Another strong association occurred with the perception of dependence ($\chi^2 = 72.99$; gl = 10; $p < 0.001$; $V = 0.36$), and those who are informed by scientific literature or health professionals showed greater recognition of the potential for dependence. There was no significant association between the source of knowledge and the profile of use ($\chi^2 = 7.78$; gl = 5; $p = 0.169$; $V = 0.17$).

It is concluded that the type of source consulted mainly influences perceptions and exposure patterns, and not general sociodemographic or behavioral characteristics, as well as all the other results above.

4 DISCUSSION

The results of this study show a complex and multifactorial scenario in relation to the use and knowledge of electronic cigarettes among university students. Most of the survey participants were female (70%), which corroborates a national trend already described in official surveys. According to the 2010 Demographic Census, released by the Brazilian Institute of Geography and Statistics (IBGE), women represent the majority of enrollments in Brazilian higher education, which reinforces the greater female presence also in surveys carried out in this educational context (IBGE, 2012).

Thus, the composition of the sample of this study not only reflects the local reality, but also aligns with the national panorama of feminization of higher education. Similar results were found by Costa et al. (2020), who identified 50.5% of women among the participants of their research, with a mean age of 22.9 years — an age group very close to that observed in the present study. This pattern was also reported by Oliveira et al. (2020), in an investigation carried out in the state of Piauí, where 61.5% of the respondents were female. These findings reinforce that the greater participation of women in research with university students is not an isolated phenomenon, but rather a consistent trend in different regions of the country.

The literature suggests that this female predominance may be related not only to the greater entry of women into higher education, but also to a greater willingness of women to participate in academic research and activities related to health and education (COSTA et al., 2020; OLIVEIRA et al., 2020). Thus, the composition of the sample of this study is in line with national and regional evidence, giving robustness and representativeness to the results obtained.

Although the majority of study participants were female, e-cigarette users were predominantly male. This finding is in line with the results of Pereira et al. (2023), Malta et al. (2022), Bertoni and Szklo (2021) who also identified a higher prevalence of use among men.

Although most participants had never used the device (63.9%), it was observed that more than one third of the sample had already had contact with the EC, with 18.2% current users and 17.2% former users. These findings reinforce the growing trend observed in national and international studies, which point to an increase in the use of e-cigarettes among young adults, even in contexts where their sale is prohibited (SOUZA et al., 2021; FIOCRUZ, 2024).

In a University Center in Piauí, it was found that 51.18% of the participants had already used electronic cigarettes at least once, while 48.81% had never used them. This result differs from that observed in the present study, in which most students (63.9%) reported never having used the device. Also in this same study, 14.17% of the participants were classified as former users and 25% as sporadic users of electronic cigarettes, already on these data corroborate with the current study. (VARGAS et al., 2021).

The significant association between the use of FBs and the younger age group confirms the vulnerability of this group, which has already been described in the literature. Research shows that adolescents and young adults are more susceptible to experimenting with new nicotine consumption technologies, influenced by social, aesthetic, and media factors (RUTHERFORD et al., 2023; BEZERRA; PINHEIRO, 2025).

In the present study, this vulnerability is also expressed in the fact that 42.3% of the participants had their first contact with the EC even before entering the university, indicating early exposure and possible influence of previous social environments.

As observed in the present study, in which the majority of e-cigarette users are in the age group of 18 to 25 years, Bertoni et al. (2021) and Souto et al. (2022) also identified this age group as the main consumer of these devices in their research.

Another relevant finding was the moderate association between the use of FBs and the consumption of alcohol and illicit drugs. This pattern is widely documented in the literature and suggests that the use of electronic cigarettes is part of a broader set of risk behaviors (COSTA et al., 2021).

The simultaneous presence of these practices reinforces the need for integrated prevention strategies that consider the social and behavioral context of young people, and not just the device itself. Souza et al. (2021) also evidenced the relationship between the use of FBs and alcohol or other drugs. Still on this association of alcohol and drug consumption related to the use of EC, a study carried out at the University Center of Araguari showed that 37.17% of users use alcohol or some type of drug (PEREIRA et al., 2023).

The students' perception of the use of the EC also deserves to be highlighted. Most consider the use common in everyday life (47.2%) or at parties and weekends (33.1%), which indicates social normalization of the device. The association between informal media and higher prevalence of use can be explained by continuous exposure to content that minimizes risks, reinforces the modern aesthetics of devices, and normalizes their consumption. This informational environment creates a reinforcement cycle, in which the perception of common use increases the probability of experimentation, especially among young people who already

have risk behaviors, such as the consumption of alcohol and other drugs. This phenomenon is largely influenced by the modern aesthetics of vapes, the strong presence on social networks, and the circulation of content that minimizes their risks (RUTHERFORD et al., 2023).

Pereira et al. (2023) identified that 32.05% of the participants were e-cigarette users. Among these, 3.84% reported daily use of the device and 7.69% stated that they used it only at specific times, findings that corroborate the results observed in the present study.

In the same sense, the fact that 38.1% of the participants stated that they learned about the EC through informal media reinforces the central role of digital platforms in the construction of perceptions and behaviors. Glasser et al. (2017) highlight that knowledge about electronic cigarettes among young people and adults tends to be heterogeneous, varying according to personal experiences, access to information, and exposure to the media. This finding is similar to the results of the present study, in which diversity was also observed in the perceptions and level of understanding of students about the risks and characteristics of the device.

Similarly, Alves et al. (2024) identified that, although many participants claim to have some knowledge about electronic cigarettes, most of them have doubts about the safety and potential harms associated with use. The authors point out that this ambiguous perception may favor experimentation, especially among young people who believe that the device is less harmful than conventional cigarettes. In the study by Alves et al. (2024), the interviewees demonstrated that they recognized some risks, but still underestimated important aspects related to dependence and long-term effects, a pattern that was also reflected in the findings of this study.

Despite this normalization, 92.7% of students believe that electronic cigarettes are addictive. This data reveals an important paradox: knowledge about the risks has not been enough to reduce use, a phenomenon also observed in studies with health students (COSTA et al., 2021). This mismatch between knowing and doing shows that information alone is not capable of modifying behaviors, reinforcing the need for broader approaches, such as those proposed by Health Promotion.

Porfírio et al. (2025) also identified an important gap in users' knowledge about electronic cigarettes, highlighting that many of them have only superficial information or information based on misperceptions. The authors emphasize that this lack of adequate understanding of the risks and mechanisms of operation of the device contributes to the maintenance of experimentation behaviors and continuous use, especially among young people.

In a complementary way, FIOCRUZ (2024) demonstrated in its studies the direct influence of digital media in the construction of perceptions about electronic cigarettes.

According to the institution, content disseminated on social networks — often produced by influencers, brands or ordinary users — tends to minimize risks, reinforce the idea of modernity and present the device as a "safer" alternative to conventional cigarettes. This constant exposure to information that has not been scientifically validated contributes to the formation of distorted beliefs, which is in line with the findings of the present study, in which a large part of the students reported obtaining information about electronic cigarettes through informal means.

These data dialogue directly with the need for structured interventions, with the principles of Health Promotion, which emphasize the strengthening of personal skills, the creation of healthy environments and the regulation of external factors that influence individual choices. The predominance of informal media as a source of information, for example, points to the urgency of media literacy and health communication strategies aimed at young people.

Likewise, the association with alcohol and drugs suggests the need for integrated interventions that consider the social and cultural context in which the use of the EC is inserted.

In addition, the results are in line with the goals of the 2030 Agenda, especially SDG 3 (Health and Well-being), which includes actions to prevent the use of psychoactive substances and strengthen tobacco control policies. SDG 4 (Quality Education) is also related to the development of critical thinking and skills to deal with misinformation — aspects directly implicated in the way students know and interpret electronic cigarettes. SDG 12 (Sustainable Consumption and Production) highlights the need to pay attention to the environmental impacts of the improper disposal of electronic devices, a topic that is still little discussed, but relevant in the face of the popularization of disposable vapes.

Thus, the results of this study reinforce that the use of electronic cigarettes among university students cannot be understood only as an individual choice, but as a phenomenon influenced by social, cultural, media and behavioral determinants, demonstrating that the use of electronic cigarettes among university students is determined mainly by informational and behavioral factors, rather than by sociodemographic characteristics.

Health Promotion emerges, therefore, as an essential way to transform this scenario, offering strategies that go beyond information and that seek to change contexts, strengthen public policies and promote environments that favor healthier choices, aligning with the goals of the SDGs and the contemporary demands of health prevention.

5 CONCLUSION

The present study allowed us to understand the knowledge, use, and perceptions about electronic cigarettes among university students, revealing a relevant panorama for public health

and professional training. A predominance of female participants and young adults was observed, a profile that follows the national trend of feminization of higher education, as described by the IBGE and recent studies. This finding reinforces the representativeness of the sample and the coherence of the results with the literature.

Although most students do not use electronic cigarettes, it was identified that a significant portion has already tried or currently uses the device, usually in social contexts. Among users, occasional use predominated, but cases of frequent use were also reported, indicating potential for dependence. In addition, it was found that many students have incomplete or mistaken information about electronic cigarettes.

Another relevant aspect was the finding that most students obtain information about electronic cigarettes through informal sources, such as social networks and personal experiences. This scenario highlights a gap in academic training, especially in health courses, which should offer up-to-date content based on scientific evidence.

In view of these findings, the central role of Health Promotion stands out, confirming that it can transform this scenario. By adopting a broadened, critical and educational approach, Health Promotion can act in the construction of healthier university environments, in the strengthening of student autonomy and in the dissemination of qualified information. Institutional strategies, such as educational campaigns, conversation circles, inclusion of the topic in the curriculum and permanent prevention actions, can contribute to reducing vulnerabilities, combating misinformation and promoting more conscious choices.

Despite its contributions, like any study, this one also has limitations. Even so, the findings offer important subsidies for the planning of interventions and point to paths for future research, such as longitudinal studies, comparative analyses between courses and evaluations of the effectiveness of Health Promotion actions in the university environment.

It is concluded that electronic cigarettes represent an emerging challenge among university students, requiring consistent and continuous educational responses. Integrating Health Promotion into institutional practices is essential to expand knowledge, strengthen protective behaviors and contribute to the training of professionals who are better prepared to guide the population and face the risks associated with the use of these devices.

ABSTRACT

This article aims to identify and analyze organizational practices related to Corporate Governance adopted in startups. Concepts of Corporate Governance and Startups in the context of the market are presented in order to better understand models of startup management. The analyses carried out on strategies and organizational practices adopted to manage governance strategies in startups are based on these theories and also on primary data from research conducted with managers and employees of startups, using a qualitative approach and a form through Google Forms. The results point to the existence of advantages and disadvantages obtained through the adoption of startup management models. It was concluded that startups have greater agility in their management, facilitating the realization of transformations and adaptations of the business model, but could benefit from a professionalization of the corporate governance area, as well as the adoption of compliance practices, documentation, and standardization of their processes to ensure decision-making processes and investment capture.

Keywords: *Startups*. Corporate Governance. *Compliance*. Code of Ethics. Organizational Values. Innovation.

RESUMO

O presente artigo possui por finalidade identificar e analisar práticas organizacionais relativas à Governança Corporativa adotadas em startups. São apresentados conceitos de governança corporativa e Startups no contexto do mercado, para que se possa melhor compreender modelos de administração de startups. As análises realizadas acerca de estratégias e práticas organizacionais adotadas para gerir as estratégias de governança em *startups* tomam como base estas teorias e, também, dados primários provenientes de pesquisas realizadas com gestores e funcionários de startups, por meio da abordagem

qualitativa, utilizando de um formulário via *Google Forms*. Os resultados apontam para a existência de vantagens e desvantagens obtidas por meio da adoção de modelos de gestão de startups. Concluiu-se que as Startups possuem maior agilidade em sua gestão, facilitando a realização de transformações e adaptações do modelo de negócio, porém poderiam vir a se beneficiar de uma profissionalização da área de governança corporativa, bem como da adoção de práticas de *compliance*, documentalização e padronização de seus processos para assegurar os processos decisórios e captação de investimentos.

Palavras-chave: *Startups*. Governança Corporativa. *Compliance*. Código de Ética. Valores Organizacionais. Inovação.

RESUMEN

Este artículo tiene como objetivo identificar y analizar las prácticas organizacionales relacionadas con el gobierno corporativo adoptadas en startups. Se presentan conceptos de gobierno corporativo y startups en el contexto del mercado para comprender mejor los modelos de gestión de startups. El análisis de las estrategias y prácticas organizacionales adoptadas para gestionar las estrategias de gobierno en startups se basa en estas teorías y también en datos primarios de una investigación realizada con gerentes y empleados de startups, utilizando un enfoque cualitativo y un cuestionario de *Google Forms*. Los resultados señalan la existencia de ventajas y desventajas derivadas de la adopción de modelos de gestión de startups. Se concluyó que las startups poseen mayor agilidad en su gestión, lo que facilita las transformaciones y adaptaciones del modelo de negocio, pero podrían beneficiarse de una profesionalización del área de gobierno corporativo, así como de la adopción de prácticas de cumplimiento, documentación y estandarización de sus procesos para garantizar la toma de decisiones y la captación de inversiones.

Palabras clave: *Startups*. Gobierno Corporativo. *Compliance*. Código de Ética. Valores Organizacionales. Innovación.

1 INTRODUCTION

With the popularization and growth of startups in the Brazilian market, it was observed the absence of knowledge on the part of entrepreneurs about the necessary structuring to preserve the sustainability of the business, whether these are legal or even strategic management structures.

Despite its innovative nature, the mortality rate among startups is also a reality, and in some cases they are even higher than conventional micro and small companies (NOGUEIRA et al., 2014).

One of the biggest problems for new startups is going through the early stages of founding and stabilizing themselves in the market. After her conception, she goes through some stages of development, which can lead her to grow or die. Many startups die as a result of the results related to the launch of the product, its demand and lack of investment. In addition to the low familiarity of the creators with business management, and especially with the company's corporate governance. (ALVES, 2013).

The solution to many of these problems is the application of corporate governance methodologies in these new companies. Many of the large companies today have efficient governance programs, keeping them in the market. It is difficult to find a literature applied exclusively to the governance of startups.

It is seen today that most entrepreneurs have advanced technical knowledge, capable of creating an innovative product with high potential. However, these same entrepreneurs do not have in-depth knowledge directed to the management of their businesses. Among several needs, we can mention the use of a business model, in order to assist in the organization of the startup that will provide good governance and a possibility of more sustainable growth.

Due to the great growth in the number of startups in Brazil and in the world, it is important to study topics related to them, seeking to better understand their aspects, characteristics and phenomena, so that one can contribute to the academic environment and in the performance of professionals in the areas of administration or even managers of organizations that have not formally carried out studies in this area.

The study of startups has growing importance not only in the economic scenario, but also in the academic scenario, due to the increase in the number of companies based on this model. Investments in startups reached a record \$9.4 billion in Brazil in 2021, a growth of almost 170% compared to the previous year, according to data from Distrito. Worldwide, venture capital contributions reached the figure of US\$ 643 billion, up 92%, according to Crunchbase (Available at: www.crunchbase.com/search/organization.companies).

Considering this context, this study intends to address the importance of corporate governance for the valuation of a Startup, as a way to mitigate the risks that emerge from the lack of organizational structuring practiced in the innovative ecosystem.

To this end, the objective was to describe the peculiar context in which Startups are found and their relationship with management tools.

In addition, this study intends to verify the degree of alignment of corporate governance tools for startups, considering their particular characteristics as innovative companies, as a way to provide more security to stakeholders, through risk control.

It is also intended to evaluate the resistance to the formalization of processes within Startups when they are contextualized in a volatile and innovative environment. To this end, a field research was carried out with managers and employees in order to compare the results proposed as the objective of this study, understanding their views on the aspects of corporate governance in startups.

Thus, the following work is structured as follows: The first part proposes to contextualize and conceptualize the terms of Startups and Corporate Governance. In the second part, research methodologies and data analysis will be addressed. For the third part, we will have the results presented and discussions followed by the final considerations.

2 THEORETICAL FOUNDATION

2.1 CONCEPTUALIZATION OF STARTUPS

Throughout the history of management, as new organizational theories have been created, the emergence of the term "startup" is noticeable, a key factor in this article. When it comes to the conceptualization of startups, one can find several definitions. According to Eric Ries (2012), a startup is a human institution designed to create a new product or service under conditions of extreme uncertainty.

Nagamatsu et. AL (2014) states that in order to understand the concept of startup, it is necessary to verify the degree of innovation involved in the enterprise and the creation of new business models, considering the history of successful commercialization, as well as the transformations of the segment in which a given organization is inserted.

For Gitahy (2010), despite the existence of several concepts, the most current one, defended by him, represents a startup as a group of people looking for a repeatable and scalable business model, working in conditions of extreme uncertainty.

Feigelson et al. (2018) understand that startups have an innovative profile in relation to traditional market dynamics and, therefore, aim to provide experiences, through products and services, that are innovative.

In addition, startups generally do not distribute profits as traditional companies and corporations do, since they make their best efforts (and values are included) to revert to the performance of the product or service developed (FEIGELSON et al. 2018).

They reduce investments in personnel and operations, largely involving each founder, usually using the so-called Bootstrapping³.

Nybo (2016) explains that Bootstrapping can be done in two ways: "(i) minimizing the need for financing by obtaining resources at low cost; and (ii) acquisition of funds without the intervention of banks or financing through the disposition of equity interest". Thus, costs are reduced in search of development without a high mobilization of resources.

Because they operate with low resources in areas that exceed the investment required for the development of the product or service, they create a simple structure, which contains only what is necessary for such development, which is called MVP – Minimum Viable Product (translated by the authors as Minimum Viable Product) (FEIGELSON et al. 2018).

In addition, startups are distinguished from companies in the traditional market by their proximity to the world of technology. Generally, the product or service is developed and made available through digital platforms or other forms of technology (FEIGELSON et al. 2018).

The forms of investment are traditionally defined by the binomial debt versus equity. Feigelson et al. (2018) indicate that in debt investment, the creditor contributes values envisioning a future return on the return of the amount, with monetary adjustment, interest and other agreed penalties. In capital investment, the creditor is interested in participating in the business, which will be operated through the conversion of this investment into portions of the invested company.

The Legal Framework for Startups and Innovative Entrepreneurship – Complementary Law No. 182/2021 institutionalized six instruments, already in use in the market: a) stock or quota subscription option agreement entered into between the investor and the company; b) stock or quota option agreement; c) convertible debenture; d) loan agreement convertible into equity interest; e) a partnership in a participation account; and f) angel investment contract.

³ Bootstrapping – "the act of tying or fastening the boot", which is nothing more than the contribution of the founders' own resources in the constitution of the company (ASSOCIAÇÃO BRASILEIRA DE STARTUPS, 2017; FEIGELSON et al., 2018).

2.2 CORPORATE GOVERNANCE AND INTERNAL CONTROLS

As seen earlier, there are several ways for investors to enter startups. In any choice, it is up to the investor to weigh the risks and benefits that may come with the decision. To facilitate the analysis of the investor and other stakeholders, there are tools that provide some predictability to some shares of the invested company. These tools, together, make up corporate governance, which will be the object of study in this part.

2.2.1 Concepts of Corporate Governance and Its Pillars

There are several definitions for corporate governance. The Brazilian Securities and Exchange Commission (CVM) defines it as:

A set of practices that aims to optimize a company's performance by protecting all stakeholders, such as investors, employees, and creditors, facilitating access to capital.

Nelson Siffert Filho (1998) defines it synthetically as the way in which the controlling shareholders institute monitoring and control mechanisms in relation to the managers and make them act in accordance with the interest of the controlling shareholders (in a broader view, stakeholders). Durval Noronha Goyos Jr. (2003) defines it as a continuous and organized effort by shareholders and executives to achieve the best possible alignment of interests.

The Brazilian Institute of Corporate Governance (2015) defines corporate governance as a system, supported by institutional arrangements that direct, monitor and encourage the operation of business companies and organizations, regulating the structure and behavior of partners, managers and employees, as well as their interconnection with external entities and stakeholders.

Also according to the Brazilian Institute of Corporate Governance (2015), in order to fulfill such functions, corporate governance is supported by four guiding principles: accountability; Disclosure; fairness; and corporate responsibility (compliance), which are described below:

- a) As for the first principle, it is extremely important that the company develops and institutionalizes a culture of accountability, involving its shareholders and partners, but, mainly, its managers. It must occur in a clear and understandable manner, based on accounting practices (ROSSETTI; ANDRADE, 2014).
- b) Transparency, on the other hand, is a vector of trust between the external and internal members of the company, in addition to being a great differential in its image. For this reason, there must be a culture of "wanting to inform" and not "having to inform", not only focusing on results and financial destinations, but also on operations and policies, so that there is an effective creation

of value, as taught by Álvares et al. (2008). This, of course, within the limits of what is strategically possible to be shared, safeguarding the interests of the company.

- c) Equity, in turn, is based on the assumption of equal treatment of all shareholders or partners, and of other interested parties, prohibiting, in any case, discriminatory policies (ÁLVARES et al., 2008). And to this end, the "rights, duties, needs, interests and expectations" of these stakeholders must be taken into account (INSTITUTO BRASILEIRO DE GOVERNANÇA CORPORATIVA, 2015).
- d) Finally, corporate responsibility has an important function, which is to keep the company in compliance with current standards, not only to national legislation, but also to the constitutive and regulatory acts of the company itself (ROSSETTI; ANDRADE, 2014).

2.2.2 The Brazilian Corporate Governance Model

Andrade and Rossetti (2014) consider that the historical, cultural, economic and institutional profile of each country are the factors that influence the corporate governance models to be practiced. These models are grouped into shareholder⁴, which is specifically aimed at shareholders, and stakeholder,⁵ which is more comprehensive; in addition to the interests of shareholders, the interests of internal and external audiences are also considered.

According to the IBGC (2015), Corporate Governance systems are divided into two main models: Outsider System⁶ and Insider System⁷.

In Brazil, we see elements of both corporate governance models. Initially, it is seen that investments and financing are mostly operated via debt, since the capital market has not yet reached a significant level in the country. However, there has been a growth in relation to external sources of investment and private equity funds, as pointed out by Rossetti and Andrade (2014).

However, even with a large concentration of capital stock in a few shareholders or partners, Brazil follows a shareholder-oriented logic, as seen in the Anglo-Saxon model. This is because companies value achieving the interests of shareholders at all costs, which causes some problems to arise in the short term. And so, according to Álvares et al.:

By prioritizing the pursuit of shareholder value, companies are less concerned with other issues, such as pollution or child labor. In other words, the focus on shareholder value

⁴ Shareholders are often also characterized by being investors in the company.

⁵ Stakeholders are a group or people that affect the company, and combine direct or indirect, positive and negative interests in the obligation to manage: management, planning and execution of projects.

⁶ Outsider System: shareholders are pulverized and typically outside the daily command of the organization's operations;

⁷ Insider System: Large shareholders typically in charge of daily operations directly or via people of their appointment

disregards the issues of other stakeholders. Such a focus can prevent executives from acting differently, even when there is a clear moral issue. The response to stakeholders would only be valid when there was a threat to the company's reputation (2008, p. 34).

2.3 CORPORATE GOVERNANCE TOOLS

Corporate governance, as seen, is composed of tools and procedures that ensure security and predictability in the company's management, reducing risks and impacts in the short and medium term. Next, some tools usually used to confer control to the management of companies will be analyzed.

2.3.1 Decision Control Tools

Decision-making control tools are those instituted through bodies in society and that have the function of determining scales for decision-making, especially those that interfere in the course of business. Some of them will be covered below. (SANTA CRUZ, 2019).

The Board of Directors is a corporate body, constituted either as a limited liability company or a corporation, and in publicly traded companies, companies with authorized capital and in mixed-capital companies, its incorporation is mandatory. It is one of the pillars of corporate governance, along with the Executive Board and the Owners, and is characterized by being a deliberative, unique and plural body, whose objective is to accelerate and decentralize the decision-making process, especially with regard to decisions about business management (SANTA CRUZ, 2019).

The Executive Board, as the name implies, is the executive body of the corporation or limited liability company. The executive members are responsible for directing the company and, externally, representing it. This function, it should be noted, cannot be performed by any other corporate body, as it is its exclusive competence, under the terms of article 138, paragraph 1, of Brazilian Corporation Law 18 (COELHO, 2019).

2.3.2 Compliance Tools

Compliance tools are those responsible for verifying the adequacy of the company's practices to current standards, whether external or internal to the organization. They align the expectation with the reality of the business, in order to avoid complications resulting from unlawful acts, such as fines and other sanctions.

In a more grounded way, compliance is a set of rules, standards, ethical and legal procedures, which, once defined and implemented, will be the main line that will guide the

behavior of the institution in the market in which it operates, as well as the attitude of its employees (CANDELORO; RIZZO; PINHO, 2012).

For Ribeiro and Diniz (2015), the importance of compliance originates precisely from a demand from shareholders and stakeholders for ethical and transparent practices in the conduct of business or government activities.

Clayton (2013) goes further, as he argues that managers and directors perceive compliance as an investment, and not as a cost, simply because the rules and procedures that are part of the program's policies can prevent errors and help identify possible fraud.

But compliance is not a mere compliance with rules, formal or informal, since, in fact, it is a specific policy that, once defined, should be the line that will guide the performance in its segment (RIBEIRO AND DINIZ, 2015).

Therefore, there is a need for even more efficient and firm transparency and ethics policies in companies. Control must involve a well-defined policy, and it is important to consider that this is a process under construction, where changes are possible as long as they are within a plausible demand (MAEDA, 2013).

2.3.3 The Code of Ethics or Conduct Tool

The code of conduct is responsible for institutionalizing ethical standards and principles, aligned with the company's values, which reflect the company's identity and culture, with responsibility and respect, as well as social and environmental concerns. It must be based on the principles of corporate governance, mainly to encourage transparency and compliance, both to internal and external policies (INSTITUTO BRASILEIRO DE GOVERNANÇA CORPORATIVA, 2015).

The company's management must define the levels of applicability of the code, but must bear in mind its own submission to the rules set out in it. This is because the code of conduct is the maximum representation of the commitment of managers, shareholders and employees to the company's culture and values, always aiming at joint, healthy growth and risk mitigation (INSTITUTO BRASILEIRO DE GOVERNANÇA CORPORATIVA, 2015).

Therefore, the Code of Conduct does not intend to limit the company's performance or place it in a non-competitive role compared to its competitors, on the contrary, the rules of conduct make the organization place itself responsibly in the market, restricting the impacts to itself. After all, the code does not need to regulate only the internal relationships, but also the way in which suppliers, customers and even investors (AZEVEDO, 2010). However, it should be noted that the mere institution of a Code of Conduct is not enough to bring the

positive returns that are sought. It is necessary to effectively consolidate an ethical culture in the company.

3 METHODOLOGY

The characteristics of the procedures that were adopted for the data collection stages are described here, as well as the profile of the company and the participating interviewees

A descriptive case study, where the reports, analyses and conclusions that were exposed are based on data from an exploratory field research, bibliographic, through the use of a qualitative approach, and based on primary data. This is considered exploratory, as it aims to obtain greater familiarity with the problem, making it more explicit (GIL, 2007).

This is a qualitative research, since it focuses on obtaining an in-depth understanding of the theme (GOLDENBERG, 1997). According to Minayo (1993), research typified as qualitative seeks to understand values, beliefs, representations, habits, attitudes and opinions, deepening the complexity of phenomena, facts and processes.

3.1 DESCRIPTION OF THE OBJECT OF STUDY

There were three Startups participating in the research (for confidentiality purposes, they will be identified in this article as Startups A, B and C), with physical headquarters located in São Paulo and Santa Catarina, with their employees distributed throughout the rest of the country working remotely (including Manaus/AM). All of them have been in operation for less than 3 years and operate in the information and communication technology sector. The participating organizations have small teams, with a range of at least 15 and a maximum of 30 employees.

These organizations can be characterized as startups, and not just small early-stage companies, due to the presence of characteristics presented in the theoretical foundation, such as uncertainty, repeatability and scalability present in their business models and ways of operating. They were chosen to participate in the present research, therefore, due to these characteristics, in addition to the accessibility criterion.

3.2 DATA COLLECTION INSTRUMENT

In order to obtain the largest amount of different information possible, and with a high degree of detail, structured surveys were carried out via Google Forms with managers and employees of the Startup in action addressing the subject in focus, applied from January to February 2023.

3.2.1 Construction of the instrument structure

A base questionnaire was used to conduct the research, which was constructed and divided into two similar audiences: for managers and for employees. according to guidelines on the general context of the company, so that the panorama of the organization under study can be understood.

- a) Questions 1 to 13 referred to the general context of the company, so that the panorama of the organization and the employee/manager can be understood.
- b) Questions 14 to 16 were fictitious situations about how the interviewee would position himself in his view as a manager/employee in the pillars of this case study: Code of Conduct, Compliance and Decision Control.
- c) Questions 17 to 21 questioned the employee/manager's view of governance aspects within their organization. If these are clearly communicated and followed and how they are aligned between managers and employees.

3.3 DATA ANALYSIS PROCEDURE

Based on the answers sent by the managers and employees of startups interviewed and on the previously exposed literature, comparisons, discussions and conclusions were made about characteristics related to corporate governance in startups.

At first, content analysis procedures were used, adopting three stages: exploratory phase; data collection phase; and data analysis phase, performing interpretations and inferences based on the data collected. (MINAYO, 1998).

For the analysis of the collected data, the method suggested by Fontanella et al. (2011) was also used, which consists of using the following procedural steps: make the raw data records available; immerse yourself in each record; compile the analyses; gather the themes of each category; name the data; and allocate them to a table.

4 PRESENTATION AND DISCUSSION OF RESULTS

4.1 ASPECTS OF THE FUNCTIONAL STRUCTURE OF STARTUPS

The startups participating in this research have a lean structure and have a small team. It is also possible to verify a predominantly horizontal structure, with more informal relationships between different positions than those held in conventional organizations. The relationship between the manager and the team is much closer, with direct communication regarding various issues. As described in the form by one of Startup X's employees:

"Here at Startup X, teams don't necessarily need to have all their decisions approved by the CEO or someone who occupies a higher position. We have greater decision-making

autonomy and self-management. But if necessary, we use communication via WhatsApp, which makes access to managers in the area even faster." (Startup X Collaborator)

In this way, it is noticeable that startups have greater agility in carrying out their processes, presenting a lower level of bureaucratic impediments that could lead to an increase in the time needed to complete tasks or even change organizational practices used. However, it is clear that strategic decisions to be made by the manager have the support and opinion of employees due to this functioning of the structure. This perception is evident in the report sent by the manager of Startup Y:

Everything here happens very fast, we don't have lengthy processes that will end up delaying our business and development. All decisions about the company have the participation of the entire team, everything is communicated and open to opinions. (Startup Manager Y)

4.2 ASPECTS OF CORPORATE GOVERNANCE AND DISSEMINATION OF STRATEGIC MANAGEMENT TOOLS

Table 1

Aspects of Corporate Governance and alignment of Organizational Culture

Existence of code Ethics/Conduct/Compliance.			Information about Mission, Vision, Values and Year of the company's foundation.	
Startup	Employees	Manager	Employees	Manager
X	Yes	Yes	They knew how to respond partially	They knew Reply
Y	No	No	They did not know how to answer	They knew Reply
Z	No	No	They did not know how to answer	They knew Reply

Source: Prepared by the authors

According to Table 1, it can be seen that, in general, the startups analyzed have informally defined corporate governance processes, not having documentation or formal establishment of standardized procedures to be adopted in relation to their posture internally or externally when representing the company. None of the participating companies has a formally established corporate governance area.

Although Startup X responds positively about having a code of conduct, this is initially applied in the employee's service contract, as described by one of the managers: "When signing the contract with us, there are clauses that will explain the guidelines on the employee's posture in relation to their activities in the company." (Startup Manager X)

For Tenório (2015), informality and the absence of written rules and procedures bring greater agility to the management of the organization, however, it makes management difficult as the activities to be performed by employees are not clearly and precisely defined. In this way, slowness in processes can occur, due to situations in which it is not known who is responsible for a certain task or posture to be adopted.

This characteristic can bring greater agility in management in the short term. However, it can also generate negative results in the medium and long term for the organization, due to the absence of formally established procedures for verifying results.

In the view of the managers, some differences in the nature of the organizational practices of the startups analyzed are perceived when compared to the views of the employees. This perception is evident when we compare the answers about the Startup's Mission, Vision and Values in Table 1.

There is an indication, therefore, that, generally, corporate governance in the context of startups is more dynamic and less formally structured. This ends up not being clearly propagated and is focused on maintaining an organizational environment favorable to the team's conduct and performance of daily activities, even if implicitly. In the following sections, the corporate governance practices verified in startups are analyzed according to categories of activity.

4.3 STRATEGIC MANAGEMENT TOOLS ADOPTED

4.3.1 Code of Ethics/Conduct

Table 2

Question: Do you believe that the guidelines on how to proceed in moral and delicate situations are extremely clear in your company?

Startup	Employees	Manager
X	Partially clear	Extremely clear
Y	Partially clear	Extremely clear
Z	Are not clear	Partially clear

Source: Prepared by the authors.

Through the analysis of the interviewees' answers, it can be seen that the formulation of organizational practices and strategies related to corporate governance in the startups in focus is carried out based on the managers' perception with regard to organizational performance, performance of tasks and eventual problems faced. According to the answer of one of the employees of Startup Z:

We know how to behave, it's the "common sense" in our startup. However, it was never formally written and presented. As situations arise, we talk internally and make a decision on how to act on it. (Startup Z Collaborator)

Therefore, the instruction of ethical conduct is usually carried out as new needs are perceived by the managers themselves.

It can be seen, therefore, that it is a process of continuous improvement, being defined by Gozzi (2015) as one that does not take as its main objective the realization of significant changes, but a gradual process with constant changes.

Therefore, the Code of Conduct does not intend to limit the company's performance or place it in a non-competitive role compared to its competitors, on the contrary, the rules of conduct make the organization place itself responsibly in the market, restricting the impacts to itself. After all, the code does not only need to regulate internal relationships, but also the way in which suppliers, customers and even investors are treated (AZEVEDO, 2010). However, it should be noted that the mere institution of a Code of Conduct is not enough to bring the positive returns that are sought. It is necessary to effectively consolidate an ethical culture in the company.

To date, managers have indicated that the use of this strategy of informal formulation of the code of ethics has been sufficient to meet the needs presented and manage the organization. As described by the manager of Startup Y:

We really don't have a formal, complete code of conduct for everyone. However, to date, all moral and ethical situations have been circumvented and resolved internally. (Startup Manager Y)

However, as presented in Table 2, the employees indicated that the guidelines on how to proceed in moral and delicate situations are not extremely clear. It can be suggested that planning carried out in order to structure, professionalize and document organizational practices of corporate governance could be responsible for avoiding any problems that may arise as the number of employees in the startup increases, or even as their turnover occurs.

4.3.2 Compliance

Table 3

Question: Do you believe that, in case of harassment, you would know who to look for to report?

Startup	Employees	Manager
X	I would know who to look for	They would know exactly who to look for
Y	I'm not sure I'd know who Search	I don't know if they would know who to look for
Z	I'm not sure I'd know who Search	I don't know if they would know who to look for

Source: Prepared by the authors

According to comparisons in Table 3 in Startups, Compliance tools are not formally described to employees. Not all employees would know how to proceed in case of harassment, for example.

According to Ribeiro and Diniz (2015), they state that compliance can be applied to any type of company, regardless of its segment. What needs to be very well analyzed are the characteristics of the company. In other words, what needs to be very well studied are the reality and culture of each company, because the format applied in an organization, even if similar to a company, cannot be imposed. Even because its success depends on the commitment of all.

The lack of these formalized guidelines for everyone in the company can lead to legal or ethical problems internally and externally.

The implementation of a Compliance program is directly up to the leadership, which must play its role by demonstrating attitudes that really seek to adopt ethics and integrity as company philosophies, respecting all loyal and social norms and rules. It must also count on the dedication of the entire team, so that they can know the risks to which the Startup is exposed and will define how to carry out its activities in a safer, more professional and honest way.

4.3.3 Decision-making control

Table 4

Question: Are the approval and decision-making flows well aligned for you?

Startup	Employees	Manager
X	Yes, they are well aligned	Yes, they are well aligned
Y	Are partially aligned	Yes, they are well aligned
Z	Are partially aligned	Yes, they are well aligned

Source: Prepared by the authors

In the participating Startups, the horizontality and proximity of interpersonal relationships between different positions is illustrated, demonstrating how professional relationships in startups tend to be less guided by the hierarchy conventionally adopted in traditional organizations. According to the answer of one of the employees of Startup X:

Here we don't see the founders as our superiors, they are people like us participating in the day-to-day and activities. They are accessible and we can talk to them directly whenever we need to. (Startup X Collaborator)

This factor can be positive, as it makes employees feel like an integral part of the company, also working in a friendlier and more relaxed environment. However, attention should be paid to behavioral issues that may be presented by employees who understand the relaxation present in the startup environment as a pretext for non-compliance with rules or their functions.

The answers in Table 4 of the managers in comparison to the collaborators lead to the conclusion that the explicitness of the flow of decision-making control consists, therefore, in informal structuring, and it is considered important that the employees act as a united and communicative team, thus knowing who is responsible for the decision, but not establishing standard documents, manuals or procedures.

Thus, greater dynamism and ease of adaptation can be obtained in the field of structuring the company, a relevant characteristic for the proper functioning of startups, operating in markets that are constantly changing.

However, due to these characteristics, communication failures and problems resulting from them may occur, due to the lack of formalization. This factor can represent serious risks to the longevity of the organization, since the absence of formalization of processes and planning can culminate in bad results for the company, such as communication failure, inconsistency in decision-making. Therefore, the need to document and manage organizational knowledge and practices in startups is perceived.

4.4 THE IMPORTANCE OF CORPORATE GOVERNANCE IN STARTUPS

Through the answers of the interviewees presented earlier in this article, it can be seen that corporate governance is not emphasized in startups, since there is no formalization of most practices or even continuous improvement processes, and this information is considered tacit knowledge among managers and members of organizations. They are generally treated as the responsibility of the manager responsible for carrying out a certain task.

In order to adopt corporate governance strategies, however, it is necessary for the organization to undergo changes in processes, structures, information systems and individual and collective incentives (Terra, 2005). It is, therefore, a relatively complex implementation change, as it depends directly on the change of several factors of a given organization.

Despite the wide demand for agility in carrying out processes in startups, the lack of formalization of processes can lead to managerial problems. It is necessary to formalize the activities to be carried out in the company to disconnect a position from its occupant. For Weber (1982), commercial management is increasingly based on precision, constancy and, above all, speed of operation. In order to achieve these criteria, the organization must be bureaucratized, relying on control tools.

The position must be disassociated with its occupant and have the description of activities and conducts formalized, aiming to facilitate the relationship between employee, employer and supplier, as the attributions and responsibilities of a given position and its conducts are defined (FRANCO, 2007).

Therefore, the implementation of corporate governance practices in startups would be of great use, as they would professionalize management and increase the formal documentation of processes, conducts, and organizational practices in the context of startups. In this way, they would ensure the maintenance of technical knowledge acquired through previous experience and results, reducing the need for rework or even incurring errors already made in the company's history. By adopting such measures, one can therefore expect better organizational results and increased organizational effectiveness.

5 FINAL CONSIDERATIONS

This study aimed to address the importance of corporate governance for the valuation of a Startup, as a way to mitigate the risks that emerge from the lack of organizational structuring practiced in the innovative ecosystem, providing more security to stakeholders, among which investors stand out.

Through the discussions presented, it is concluded that corporate governance is important in startups, and it is possible to contribute to the expansion of the theoretical structure that existed until then when it comes to the subject of corporate governance in the context of startups.

Having analyzed the results of the research carried out, it is clear that these startups present, albeit informally, a basic knowledge about corporate governance tools. In the context of the companies analyzed, it is found that, despite presenting a certain degree of misalignment

between the guidelines of conduct, there are good practices between managers and employees in the field of corporate governance. As well as about the general context of the organization. This development is due to the lack of action plans formally outlined and explained in documents, actions that could optimize the company's management and provide better future results.

There is some resistance to the bureaucratization and formalization of processes in startups, which, on the one hand, allows for greater agility in the transformation of processes, but can also imply the occurrence of failures in the processes and consequent generation of rework.

It is hoped, therefore, that the discussions and results in this article can help entrepreneurs who are in the process of starting new ventures. In addition to these conclusions, it can also be seen, as a result of the research, that conventional organizations in search of agile changes, which bring impacts in a shorter period of time, can be mirrored in management practices used in startups.

Finally, it is recommended that the valuation and credibility of the corporate governance area be investigated, in the context of startups from other sectors, from the perspective of managers and employees, thus obtaining parameters of comparison with the results currently reported here. To consolidate new information about Startups.

ABSTRACT

This article examines the legal framework governing coastal federal lands (*terrenos de marinha*) and their implications for the real estate registry system, focusing on the registrar's role when public ownership is not reflected in the property record. It is based on the hypothesis that such lands belong to the Federal Government by constitutional determination, with original ownership independent of registration, thus limiting the presumption of registry legitimacy. The study adopts a qualitative, doctrinal legal methodology, grounded in statutory analysis, specialized doctrine, and case law from the Brazilian Superior Court of Justice. It addresses the requirement of the Transfer Authorization Certificate (CAT), the relative nature of registry presumption, and the limits of legal qualification. The article concludes that requiring prior regularization before federal authorities does not constitute undue innovation, but rather reflects the registrar's legal duty to ensure continuity, legality, and legal certainty within the registry system.

Keywords: Real Estate Registry. Coastal Federal Lands. Public Property. Transfer Authorization Certificate (CAT). Legal Qualification.

RESUMO

O presente artigo analisa o regime jurídico dos terrenos de marinha e seus acréscidos e suas implicações no registro de imóveis, com enfoque na atuação do registrador diante da incidência de domínio público não refletido na matrícula. Parte-se da hipótese de que tais bens integram o patrimônio da União por determinação constitucional, sendo sua titularidade originária e independente de registro, o que limita a presunção de legitimidade do fôlio real. A pesquisa adota metodologia qualitativa, de natureza jurídico-dogmática, com base na análise da legislação, da doutrina registral e da jurisprudência do Superior Tribunal de Justiça. Examina-se a exigência da Certidão Autorizativa de Transferência (CAT), a

RESUMEN

Este artículo analiza el régimen jurídico de los terrenos marítimos y sus acreciones, así como sus implicaciones para el registro de la propiedad, centrándose en el papel del registrador ante el dominio público no reflejado en el registro. Parte de la hipótesis de que dichos bienes forman parte del patrimonio de la Unión por mandato constitucional, siendo su titularidad original e independiente del registro, lo que limita la presunción de legitimidad del folio inmobiliario. La investigación adopta una metodología cualitativa, de carácter jurídico-dogmático, basada en el análisis de la legislación, la doctrina registral y la jurisprudencia del Tribunal Superior de Justicia. Se examinan el requisito del Certificado de Autorización de Transferencia (CAT), la relatividad de la presunción registral y los límites de la calificación registral. Se concluye que el requisito de regularización ante la Unión no constituye una innovación, sino una expresión del deber jurídico del registrador de garantizar la continuidad, la legalidad y la seguridad jurídica del sistema registral.

1 INTRODUCTION

The Brazilian real estate registry system occupies a central position in the legal organization of property, playing an essential role in the stabilization of property relations and in the promotion of legal certainty. Its normative structure, based on principles such as publicity, continuity and specialty, gives the real estate registry a presumption of legitimacy, making it an element of trust in economic relations and an instrument for the realization of the constitutional economic order.

However, that presumption is not absolute. On the contrary, it is compatible with the incidence of special legal regimes, especially those related to public goods, whose constitutional and legal discipline imposes limits on private autonomy and the free circulation of property.

The relevance of this discussion becomes even more evident when considering the Brazilian scenario of land and registry irregularity. According to data from the Brazilian Institute of Geography and Statistics, approximately 50% of urban properties in Brazil have some type of ownership or registration irregularity, either due to lack of registration or document inconsistency (IBGE, 2019). In the same sense, the National Council of Justice, through diagnoses carried out within the scope of the national land regularization policy, points out that more than 30 million properties in the country are in an irregular situation, which represents a significant portion of the national urban territory (CNJ, 2021).

This picture reveals a profound dissociation between the factual reality and the registry reality, compromising the function of the registry as an instrument of legal certainty. Technical studies by the Real Estate Registry Institute of Brazil reinforce that the lack of correspondence between the real folio and the effective legal situation of the property is one of the main factors of fragility of the Brazilian registry system, directly affecting the reliability of real estate transactions.

The importance of this debate can also be understood in the light of international approaches to the relationship between ownership, formalization, and economic development. Hernando de Soto (2000) demonstrates that the absence of adequate formalization of property rights compromises the ability to circulate wealth and limits access to credit, converting assets into "dead capital". This perspective shows that the disconnection between the legal reality and the registry reality is not a mere technical problem, but a structural factor of economic inefficiency, reinforcing the need for rigorous action by the registry system in correcting these asymmetries.

In the specific context of federal public goods, the problem takes on even more sensitive contours, especially in view of the extension of the Brazilian coast, which exceeds 7,367

kilometers of coastline, according to official data from the IBGE, along which numerous properties potentially subject to the legal regime of marine land and its additions are located. Despite this territorial coverage, the existence of real estate registrations that do not reflect this legal condition is recurrent, either due to the absence of annotation or due to the historical lag of the records.

In this scenario, a situation of apparent registration regularity is formed, in which private domain chains develop over decades without any mention of the dominiality of the Union. This phenomenon can be understood in the light of the theory of systemic risk of real estate registration, according to which the accumulation of uncorrected inconsistencies compromises the reliability of the system as a whole, generating diffuse legal uncertainty and potentiating conflicts between different legal regimes.

It is in this context that the central problem of the present study is inserted: what should be the posture of the real estate registrar when asked to perform a registration act on a property whose registration does not indicate the incidence of a public legal regime, but on which formal administrative information falls — from the Secretariat of Federal Heritage — in the sense of whether it is marine land or added?

The issue involves the tension between two structuring vectors of the legal system: on the one hand, the legal certainty derived from the presumption of legitimacy of the registration; on the other, the supremacy of the public domain, whose existence does not depend on inscription in the royal folio. It is, therefore, a matter of investigating to what extent the registrar should stick to the content of the registration and to what extent should he consider extra-registration elements, especially those coming from a competent administrative authority.

From this perspective, the registrar's role plays a decisive role in containing systemic risks and preserving the coherence of the legal system. As the registry doctrine highlights, the registration of real estate cannot be understood as a static reality, but as a dynamic instrument for adapting legal advertising to the normative reality (DIP, 2016). Thus, the registration qualification must be exercised in such a way as to prevent the entry of titles incompatible with the legal system, even if formally regular in light of the content of the registration.

The analysis of this problem requires, therefore, the investigation of the role of the registrar in the exercise of registration qualification, the delimitation of the limits of its performance in the face of official information and the understanding of the real estate registry as a mechanism of articulation between legal certainty, legality and protection of public assets.

In view of this scenario, it is hypothesized that the action of the real estate registrar, by requiring the regularization of the legal situation of the property before the Federal Heritage

Secretariat and the presentation of the Transfer Authorization Certificate (CAT), does not constitute an undue innovation in the registration qualification, but an expression of the legal duty to control legality and preserve legal certainty. The general objective of the present study is to analyze the limits of the presumption of legitimacy of the real estate registry in the face of the incidence of the public domain, especially with regard to marine land and its additions. As specific objectives, it seeks to: (i) examine the legal regime of these assets and their independence in relation to the real estate registry; (ii) analyze the function and limits of registration qualification in the face of extra-registration administrative information; and (iii) to assess the legitimacy of the requirement of regularization before the Federal Government as a condition for the entry of the title in the royal folio. The research adopts a qualitative methodology, of a legal-dogmatic nature, developed through the systematic analysis of the applicable legislation, the specialized doctrine and the jurisprudence of the higher courts, with emphasis on the integrated interpretation of the rules that govern the real estate registry law and the legal regime of public assets. The present research is justified by the practical and theoretical relevance of the theme, considering the high number of properties in irregular situation in Brazil, the extension of the coastal strip subject to the Federal Government's property regime and the systemic risks arising from the dissociation between the legal reality and the registry reality.

2 THE LEGAL REGIME OF NAVY LAND AND ITS IMPLICATIONS IN THE REAL ESTATE REGISTRY

The analysis of the legal regime of navy land and its additions reveals one of the most complex intersections between public and private law within the scope of the Brazilian real estate registry system. It is a legal category that, although often inserted in formally registered private domain chains, is subject to its own constitutional and legal regime, whose incidence does not depend on registration in the royal folio, imposing limits on registration and the circulation of property.

Under the terms of article 20, item VII of the Federal Constitution of 1988, navy lands and their additions constitute assets of the Union, subject to a legal regime of a public nature, characterized by unavailability, the supremacy of the public interest and the need for specific administrative control. Law No. 9,636/1998, when disciplining the matter, establishes that the incorporation of these assets into the Federal Government's assets results from a proper administrative procedure, whose nature is declaratory, and not constitutive, so that the public domain does not depend on real estate registration for its existence or effectiveness.

This characteristic projects direct effects on the registry system, insofar as it evidences the insufficiency of registration as the only parameter for defining the legal ownership of the property, requiring the registrar to act beyond the merely formal analysis of the real folio, to consider the incidence of duly proven special legal regimes.

2.1 THE REQUIREMENT OF THE TRANSFER AUTHORIZATION CERTIFICATE (CAT) AND THE ADMINISTRATIVE CONTROL OF REAL ESTATE CIRCULATION

The transfer of rights over real estate located on navy land is subject to specific administrative control, under the terms of article 33, paragraph 2 of Law No. 9,636/1998, which conditions the practice of these acts to the prior authorization of the Federal Heritage Secretariat, formalized through the issuance of the Transfer Authorization Certificate – CAT.

The CAT is an essential instrument for controlling the circulation of these assets, attesting to the regularity of the legal and fiscal situation of the property before the Federal Government, especially regarding the payment of *laudemium*, the absence of debts related to the forum or occupancy tax and the regularity of the occupation. Its requirement is not presented as a faculty of the registrar, but as an objective legal imposition, linked to the legal regime of public goods.

In this context, the absence of the CAT prevents the entry of the title in the real estate registry, not because of excessive formalism, but because it makes it impossible for the Federal Government to control its assets, in direct affront to the principle of unavailability of public assets. The registrar's action, in requiring such a document, is, therefore, an expression of the duty of legality and an instrument for preserving the integrity of the legal system.

2.2 THE RELATIVITY OF THE REGISTRY PRESUMPTION IN THE PUBLIC DOMAIN

The presumption of legitimacy of the real estate registry, enshrined in article 1,245 of the Brazilian Civil Code, is a structuring element of legal certainty in the context of private relations. However, such presumption has a relative nature (*juris tantum*), referring exclusively to what is formally registered in the registration, and does not extend to legal situations not reflected in the actual folio.

In this sense, the incidence of the public domain, duly proven by a formal administrative act, is not ruled out by the absence of registration in the registration, nor by the existence of an apparently regular private domain chain. The jurisprudence of the Superior Court of Justice is firm in recognizing that the public domain is not subject to the logic of private real estate registration, and can be affirmed regardless of registration

It is important to highlight that, in this context, the existence of private rights is not denied, but rather the recognition that such rights are legally limited by the incidence of a public regime, which imposes the necessary adaptation of the registration to the legal reality of the asset.

2.3 THE EXTRINSIC ANALYSIS OF THE TITLE AND THE LIMITS OF THE REGISTRAR'S PERFORMANCE

The registration activity has an administrative nature, under the terms of article 1 of Law No. 8,935/1994, and is materialized through registration qualification, which consists of controlling the legality of the titles presented.

This qualification is limited to the extrinsic analysis of the title, including the verification of its formal regularity, the capacity of the parties, compatibility with the registration system and compliance with the legal system. It is not up to the registrar to exercise a jurisdictional function or settle complex technical or domain controversies, especially when there is a conflict between administrative documents.

In the face of divergent information, such as the coexistence of administrative certificates and a formal letter from the SPU indicating the public nature of the property, the registrar must adopt a posture of caution, demanding the regularization of the situation before the competent body, instead of opting for one of the versions, under penalty of exceeding the limits of its action.

2.4 THE LACK OF NEED FOR PRIOR REGISTRATION AND THE NEED TO ADAPT THE ROYAL FOLIO

The characterization of the property as navy land does not depend on prior registration in the registration, since the administrative demarcation has its own legal effectiveness. Requiring such registration as a condition for the application of the legal regime would imply subverting the logic of the system, subordinating the public domain to the real estate registry.

However, once the legal nature of the asset is verified, the necessary updating of the real folio is required, through an annotation that reflects this reality, in compliance with the principle of objective specialty, provided for in article 176 of Law No. 6,015/1973.

In this way, the requirement formulated by the registrar not only enables the practice of the registration act in accordance with the law, but also ensures the adequate representation of the legal reality of the property in the registry.

2.5 THE PREVALENCE OF THE PUBLIC INTEREST AND THE PROTECTION OF THE FEDERAL GOVERNMENT'S ASSETS

The legal regime of navy land is a direct expression of the principle of unavailability of public assets, according to which the assets of the Union cannot be freely alienated or encumbered without observing the legal requirements.

The requirement of authorization from the SPU and the presentation of the CAT is an indispensable control mechanism for the preservation of this patrimony, being widely recognized by the jurisprudence of the Superior Courts as a condition for the validity of the transfer acts.

In this context, the registrar's performance, in demanding compliance with these requirements, not only observes legality, but plays a fundamental role in protecting public assets and maintaining the coherence of the legal system.

3 THE REGISTRAR'S POSTURE IN THE FACE OF THE INCIDENCE OF THE LEGAL REGIME OF NAVY LANDS

The performance of the real estate registrar, in the context of the incidence of the legal regime of navy land and its additions, reveals itself as a turning point between the legal security of registration and the supremacy of the public interest. This is a situation in which the exercise of registration qualification ceases to be a mere formal activity to assume a decisive character in the preservation of the legality, continuity and coherence of the legal system.

In the face of titles formally eligible for registration, but which fall on real estate whose legal nature is changed by suitable administrative information – especially from the Secretariat of Federal Heritage – the registrar is required to adopt a technical, reasoned and legally responsible posture, guided not only by the content of the real folio, but by the legal system in its entirety.

3.1 THE DUTY OF REGISTRATION QUALIFICATION IN THE FACE OF OFFICIAL INFORMATION FROM THE PUBLIC ADMINISTRATION

The argument according to which the absence of annotation in the registration would rule out the incidence of the legal regime of navy lands is not supported in the light of registry dogmatics. The real estate registry enjoys a presumption of legitimacy, but not absoluteness, being a relative presumption (*juris tantum*), which can be removed by proof to the contrary from a competent authority.

In this context, the formal communication of the Secretariat of Federal Heritage – based on a regularly approved administrative demarcation procedure – constitutes a relevant legal

element and capable of directly influencing the registration qualification. This is not mere opinion information, but a technical statement from the body responsible for the management of federal Sunday assets.

Thus, the registrar not only can, but must consider such information in the exercise of its function, under penalty of violation of the principle of legality. The registration qualification is not limited to the static reading of the registration, but involves a true judgment of legality, aimed at preventing the entry of titles incompatible with the current legal system.

3.2 THE ABSENCE OF UNDUE INNOVATION IN THE REGISTRATION QUALIFICATION

The allegation that the requirement formulated by the registrar would constitute an undue innovation in the registration qualification is not valid. On the contrary, it is a legal response to a new and relevant fact, communicated by a competent public authority, which changes the understanding of the legal situation of the property.

The absence of prior registration in the registration does not prevent the recognition of the public nature of the property, especially when proven by a formal administrative act. The jurisprudence of the Superior Court of Justice is firm in the sense that navy lands are assets of the Union regardless of registration, since their ownership derives directly from the Federal Constitution.

In this sense, the registrar's performance does not constitute innovation, but adaptation of the registration to the legal reality, avoiding the perpetuation of inconsistencies in the system.

3.3 THE INSTITUTIONAL ROLE OF THE REGISTRAR AS AN AGENT OF LEGALITY CONTROL

The registration activity, under the terms of Law No. 8,935/1994, has an administrative nature and is subject to the principle of strict legality. The authors Cristiano Cassetari and Marcos Salomão (2025) explain that this constitutional principle, when applied to notary activities, means that all related acts must be based on the law, according to the formalities of the CF/88, especially its article 5, II. The registrar acts as a delegated agent of the public power, responsible for ensuring publicity, authenticity, security and effectiveness of legal acts.

In this context, the registration qualification constitutes a mechanism of preventive control of legality, intended to prevent the entry of titles incompatible with the legal system. As Ricardo Dip teaches, it is not a merely formal activity, but a true filter of legality, essential to the reliability of the registry system.

This institutional function is directly connected to article 170 of the Federal Constitution of 1988, insofar as the real estate registry acts as an instrument for the organization of property and the promotion of economic development, ensuring that the circulation of goods takes place in accordance with the law.

The role of the registrar as an agent of legality control can also be understood from the perspective of the economic analysis of the law. Guido Calabresi (1970), when examining the social costs of legal decisions, points out that efficient institutional structures are those capable of preventing conflicts and reducing systemic risks. In this sense, the registry qualification, by preventing the entry of titles incompatible with the legal system, acts as a preventive mechanism to reduce future social costs, avoiding litigation, invalidations and insecurity in property relations.

3.4 THE DUTY TO INSPECT TAXES AND CHARGES

The registrar's performance is not limited to verifying the formal validity of the titles, but also covers the control of the tax regularity of the acts presented. Pursuant to article 30, item XI of Law No. 8,935/1994, it is incumbent upon the delegate to supervise the payment of taxes levied on the acts he performs.

In the case of navy land, this duty is especially relevant, since the transfer of rights is conditioned to the payment of property charges due to the Federal Government, such as laudemium, forum and occupation tax. The Transfer Authorization Certificate (CAT) is an essential instrument for verifying this regularity.

Provision No. 149/2023 CNJ reinforces this obligation, by establishing that the registrar must refuse the entry of securities that do not meet the legal requirements, including tax and administrative regularity.

3.5 THE LIMITS OF REGISTRY ACTION AND THE IMPOSSIBILITY OF EXERCISING A JURISDICTIONAL FUNCTION

Registration qualification is limited to the extrinsic analysis of the title, including the verification of its formal aspects and its compatibility with the legal system. It is not up to the registrar to resolve complex technical or domain controversies, especially when there is a divergence between administrative documents.

In the face of conflicting information — such as certificates presented by interested parties and formal communication from the SPU — the registrar must adopt a posture of caution, demanding the regularization of the situation before the competent body. To act

otherwise would imply assuming a jurisdictional function, incompatible with the administrative nature of the registry activity.

3.6 THE LEGAL RISK OF THE PRACTICE OF THE ACT IN NON-COMPLIANCE WITH THE LEGAL REGIME

The requirement of compliance with the legal regime of public assets within the scope of real estate registration is also supported by the theory of regulation. Anthony Ogus (2004) argues that state intervention is justified in contexts of market failures, especially when there is information asymmetry or risk of negative externalities. In the case of navy lands, the absence of control over the circulation of these assets could generate relevant impacts not only on public property, but on the security of the registry system itself, legitimizing the registrar's role as an agent of normative enforcement.

Carrying out the registration without complying with the legal regime applicable to navy lands implies a serious legal risk, which may lead to the nullity of the act, the ineffectiveness of the transfer before the Federal Government and the liability of the delegate.

The jurisprudence of the Superior Court of Justice recognizes that legal transactions involving public goods without compliance with legal requirements are legally vulnerable, not producing full effects.

In this scenario, the registrar's action, by refusing the entry of an irregular title, not only observes legality, but acts as a mechanism to contain systemic risks and preserve legal certainty.

4 FINAL CONSIDERATIONS

The analysis developed throughout this study shows that the controversy involving the incidence of the legal regime of navy land in the scope of the real estate registry is not limited to a specific interpretative conflict, but reveals a structural tension between the presumption of legitimacy of the real folio and the supremacy of the public domain.

The position held by the private parties, in the sense that the absence of registration in the registration would remove the incidence of the legal regime of the Union's assets, is based on a premise incompatible with the Brazilian legal system. By attributing to the real estate registry a constitutive character of public domain, such an understanding disregards that the navy lands and their additions are assets of the Union by constitutional determination, whose ownership is original and does not depend on registration in the royal folio.

The administrative demarcation carried out by the Secretariat of Federal Heritage, in turn, has a declaratory nature, being sufficient to evidence the incidence of the public legal regime, even if such condition is not reflected in the registration. In this context, the presumption of legitimacy of the real estate registry, provided for in article 1,245 of the Civil Code, is relative, and cannot prevail in the face of suitable evidence to the contrary, especially when emanating from a competent administrative authority.

The registrar's performance, in this scenario, cannot be understood as a mere formal or mechanical activity. On the contrary, it constitutes an exercise of legality control, under the terms of article 1 of Law No. 8,935/1994, which imposes on the delegate the duty to ensure the publicity, authenticity, security and effectiveness of legal acts. This institutional function is projected as an instrument for the stabilization of legal relations and the realization of the right to property in accordance with the constitutional order.

Thus, the requirement to regularize the legal situation of the property before the Federal Heritage Secretariat, as well as the presentation of the Transfer Authorization Certificate – CAT, does not constitute an undue innovation in the registration qualification, but stems directly from the fulfillment of a legal duty. This is a necessary measure to ensure the compliance of the registry with the applicable legal regime, preserving the integrity of the registry system and avoiding the consolidation of legal situations incompatible with the public domain.

It is important to highlight that legal certainty, the main purpose of the registration system, is not to be confused with the immutability of the content of the registration, but with its correspondence to the legal reality. In this sense, the registrar's action, by conditioning the entry of the title to the fulfillment of legal requirements, does not violate the principles of continuity or legal certainty, but, on the contrary, concretizes them.

In addition, the duty to supervise the legality of the titles presented, which includes the verification of compliance with the legal and tax obligations levied on the acts, is an essential element of the registration activity. Failure to comply with these requirements would compromise not only the validity of the registration act, but also the reliability of the system as a whole, with direct impacts on the security of economic relations.

In this context, the real estate registry reaffirms its nature as an instrument for organizing property and promoting economic development, as recommended by article 170 of the Federal Constitution of 1988. Its performance, therefore, must be guided by legality, the protection of the public interest and the preservation of the coherence of the legal system.

It is thus concluded that the registrar's stance, in demanding the regularization of the situation of the property and compliance with the legal requirements for the entry of the title in

the real folio, is not only legally adequate, but necessary to maintain legal certainty, the protection of public assets and the integrity of the Brazilian real estate registry system.

Francisco Cleiton Rodrigues de Oliveira¹, Rickardo Léo Ramos Gomes²

ABSTRACT

This article analyzes the relevance of inventory management in the supply chain of the grain processing machinery and equipment industry, focusing on its implications for operational efficiency. The research, theoretical in nature and with a descriptive-exploratory approach, was developed through a systematic literature review of books and specialized journals in the fields of logistics, operations management, and supply chain management. The study is structured around three topics: the inventory management methods and practices applied to the sector, the relationship between inventory control and the efficiency of logistics and production processes, and the role of inventory management in supply chain integration and performance. The results show that the adoption of more consistent inventory management practices, such as ABC classification, cycle counting, and safety stock management, significantly contributes to reducing operational costs, preventing supply disruptions, and ensuring the continuity of production processes within the supply chain. It is concluded that inventory management represents a strategic factor for competitiveness and improved performance in the sector in the face of uncertainties in the global market, recommending investments in technologies and collaborative practices with suppliers and distributors.

Keywords: Inventory Management. Supply Chain. Grain Processing. Operational Efficiency.

RESUMO

Este artigo analisa a relevância da gestão de estoques na cadeia de suprimentos da indústria de máquinas e equipamentos para beneficiamento de cereais, com foco em suas implicações para a eficiência operacional. A pesquisa, de natureza teórica e caráter descritivo-exploratório, foi desenvolvida por meio de revisão bibliográfica sistemática em obras e periódicos especializados nas áreas de logística, gestão de operações e gestão da cadeia de suprimentos. O estudo está estruturado em torno de três tópicos: os métodos e

práticas de gestão de estoques aplicados ao setor, a relação entre o controle de inventário e a eficiência dos processos logísticos e produtivos, e o papel da gestão de estoques na integração e no desempenho da cadeia de suprimentos. Os resultados evidenciam que a adoção de práticas mais consistentes de gestão de estoques como classificação ABC, inventários cíclicos, e gestão do estoque de segurança, contribui significativamente para a redução de custos operacionais, de quebras no abastecimento e garantia da manutenção dos processos produtivos da cadeia. Conclui-se que a gestão de estoques representa um fator estratégico para a competitividade e um melhor desempenho do segmento diante das incertezas do mercado mundial, recomendando-se investimentos em tecnologias e em práticas colaborativas com fornecedores e distribuidores.

RESUMEN

Este artículo analiza la relevancia de la gestión de inventarios en la cadena de suministro de la industria de maquinaria y equipos para el procesamiento de cereales, con enfoque en sus implicaciones para la eficiencia operativa. La investigación, de naturaleza teórica y carácter descriptivo-exploratorio, fue desarrollada mediante una revisión bibliográfica sistemática de libros y revistas especializadas en las áreas de logística, gestión de operaciones y gestión de la cadena de suministro. El estudio está estructurado en torno a tres temas: los métodos y prácticas de gestión de inventarios aplicados al sector, la relación entre el control de inventarios y la eficiencia de los procesos logísticos y productivos, y el papel de la gestión de inventarios en la integración y el desempeño de la cadena de suministro. Los resultados evidencian que la adopción de prácticas más consistentes de gestión de inventarios, como la clasificación ABC, los inventarios cíclicos y la gestión del stock de seguridad, contribuye significativamente a la reducción de costos operativos, a la disminución de interrupciones en el abastecimiento y a la garantía de continuidad de los procesos productivos de la cadena. Se concluye que la gestión de inventarios representa un factor estratégico para la competitividad y un mejor desempeño del sector frente a las incertidumbres del mercado mundial, recomendándose inversiones en tecnologías y en prácticas colaborativas con proveedores y distribuidores.

Palabras clave: Gestión de Inventarios. Cadena de Suministro. Procesamiento de Cereales. Eficiencia Operativa.

1 INTRODUCTION

Inventory management represents one of the main points of balance in supply chain processes, contributing to the full achievement of the objectives of industrial organizations and, consequently, of their customers with efficiency and lower cost, fostering the competitiveness and sustainability of the business. When we talk about the industry in the field of machinery and equipment for cereal processing, we understand more intensely the relevance of the topic that was addressed, given the technical and logistical complexity of this segment, regarding the control and availability of inputs, parts and equipment.

In a broader market scenario, increasingly demanding for cost reduction, shorter delivery times and production efficiency, the supply chain in this sector needs greater integration between the links that compose it, in order to make inventory management increasingly efficient and strategic to minimize supply breaks, and ensure the maintenance of production processes. Companies that adopt more consistent inventory management methods and practices tend to perform better in the face of the uncertainties of the world market, as evidenced in recent surveys and studies.

In this context, the present study aims to analyze the relevance of inventory management in the supply chain of the machinery and equipment industry for cereal processing, considering its implications for operational efficiency. To achieve this objective, it seeks to identify the main methods and practices applied to the sector, evaluate the influence of inventory management on logistics and production processes, and examine its impacts on the integration and performance of the supply chain.

This investigation becomes even more relevant academically and in practice, due to the limited availability of specialized literature regarding the analysis of inventory management in this specific industrial segment and the growing demand for solutions that reconcile operational efficiency with the complexity of the market for machinery and equipment for cereal processing. Therefore, this research is based on a systematic literature review, based on authors and recognized studies in the areas of logistics, supply chain management and operations management.

The article was structured in four main sections, in order to ensure logical organization and coherence in the presentation of the study: the introduction, which contextualizes the theme and delimits the objectives of the research; the methodology, in which the procedures and methods adopted to conduct the investigation are described; the theoretical foundation, which gathers and discusses the main conceptual references that support the analysis; and, finally,

the final considerations, aimed at the synthesis of the results, the conclusions of the study and the possible implications for future research.

2 METHODOLOGY

The methodology used in the present work was bibliographic research, based on the study of published texts on inventory management in the supply chain in various segments. This was the research method that was most suitable and allowed a better deepening of the studies. A qualitative approach with an exploratory and descriptive character was adopted with a focus on the contributions of the numerous authors, aiming at a more detailed understanding of what was proposed (Severino, 2017).

According to Santana and Narciso (2025, p. 05), "The qualitative methods, [...], stand out for their depth in data analysis, allowing the exploration of meanings, perceptions, and experiences of the subjects involved in the phenomenon studied".

The procedure adopted consisted of reading selected articles by several authors on the proposed theme, either through digital resources or through the reading of printed material, highlighting important concepts and collaborations that allowed to verify, compare and organize the information collected throughout the process.

To this end, several cultural and scientific contributions related to the subject in question were analyzed. In this way, we sought to remove and analyze several studied citations from several works by different authors, of which the following stand out: Santos *et al.*, 2022, Magalhães *et al.*, 2022, Silva, Moura and Ribas, 2023, Gonçalves *et al.*, 2024, Assereui *et al.* 2025.

Thus, the positions taken during the future article were aided by the positions of the authors consulted and which served as a reference for the formation of the corpus of the present text. (Huhne, 1999)

The entire research was based on ethics and respect for the authors and the works selected and cited in this work. The bibliographic methodology chosen presented the expected results, bringing new possibilities and collaborations in the study of the relevance of inventory management and, thus, proved to be the best choice.

3 THEORETICAL FOUNDATION

This rationale was organized into 3 subtopics. In the first, the Methods and Practices of Inventory Management in the Industry of Machinery and Equipment for Cereal Processing were discussed. In the second, it was researched on Inventory Management and Operational

Efficiency in Production and Logistics Processes. And, finally, in the third, Supply Chain Integration and the Role of Inventory Management were addressed.

3.1 METHODS AND PRACTICES OF INVENTORY MANAGEMENT IN THE INDUSTRY OF MACHINERY AND EQUIPMENT FOR CEREAL PROCESSING

In the market for machinery and equipment for cereal processing, the demand comes from industrial plant projects for wheat, corn, rice mills, feed mills, among others, whether in their complete structure, inclusion of product lines, only electrical or automation projects, supply of spare parts and technical assistance (Vidal *et al.*, 2023).

Projects can be developed from scratch, that is, there is no knowledge of the type of raw material, nor of the components to be used in their structures, or they can be composed of numerous equipment or machines that are already part of a standard product mix, but need customization to suit the specific needs of each customer (Vidal *et al.*, 2023).

Due to the complexity of the processes of development, manufacture, and assembly of these machines and equipment, it is necessary to use various inventory management methods and practices to meet the deadlines of the projects in the company's order book, aiming at customer satisfaction and business profitability (Vidal *et al.*, 2023).

Among the inventory management methods most frequently used in the machinery and equipment industry for cereal processing, we can highlight the ABC Curve, the Cyclical or Rotating Inventory, Minimum Stock or Safety Stock (ES), Order Point (PP) or Resupply Point (RP), because they are methods that allow a better monitoring of stock levels, thus ensuring more efficient management (Vidal *et al.*, 2023).

3.1.1 ABC Curve

ABC curve is an analytical tool used for supply chain management, which allows the manager to assess the importance of inventory items based on their sales value, acquisition cost, and availability. "This tool can help detect which items should be prioritized in logistics, improving the accuracy and efficiency of supply chain processes (Jacobs; Chase, 2012 *apud* Silva; Moura; Ribas, 2023, p. 25 - 26)".

The ABC Curve classifies the items according to their importance, allowing a focus on the most relevant products, which is fundamental for the production process of the machinery and equipment industry for cereal processing, as the range of materials from the structures of the machines at their various levels is very complex.

It is understood through Figure 1 that the items located in (A) have special and priority treatment, because they are items of greater criticality and bring the highest percentage of revenue to the company, (B) it then becomes intermediary and (C) the one with the lowest criticality and revenue. (I asserted *et al.* 2025)

Figure 1
ABC curve

Source: <https://logsmartbrasil.com.br/wp-content/uploads/2023/09/Imagem-Curva-ABC-1536x864.png>

In this context of the complexity of the materials of this industry model, it can be seen that the ABC curve is a method of inventory management allied to the good performance of the production processes.

3.1.2 Cyclical or Rotating Inventory

Aguiar and Terazzi (2024, p. 4) state that "Cyclical Inventory is a systematic approach to inventory management, which is distinguished by performing counts and reviews of inventory levels at regular and fixed intervals".

This practice brings security and reliability to inventories, allowing the identification of divergences and facilitating control, especially of products with the highest turnover and value within the processes (Diniz; Parmegiani; Marcucci, 2024).

Carrying out a cyclical or rotating inventory in the machinery and equipment industry for cereal processing that uses a large amount of raw material in its initial processes, such as steel sheets, acrylic sheets or plastic derivatives, such as steel tubes and bars, which are materials that generate industrial waste, scrap, is necessary to avoid delays in the other stages of production (Belisario; Rodolpho, 2022).

3.1.3 Minimum Stock/Safety Stock (ES)

In the view of Fenili (2016 *apud* Assereui *et al.* 2025, p. 5), "safety stock is an additional stock to maintain continuous supply in emergencies". This additional inventory, although it generates a storage cost, allows the industry to ensure that the production process will be maintained, even if there are interferences in the market, whether due to production failures by suppliers, delays by carriers, wars or natural disasters.

The machinery and equipment industry for cereal processing that has a standard product line, such as for the wheat mill segment, are cylinder banks, rotary valves, extractors, sieves and others, most of them choose to have a safety stock in terms of the number of machines, thus bringing greater peace of mind in the face of various situations of shortage.

3.1.4 Purchase Order Point (PP)/Resupply Point (RP)

Still on the perspective of not breaking stocks in order to avoid production stoppage and, consequently, non-compliance with the agreement with customers, the machinery and equipment industry for cereal processing uses the Order Point (PP)/Resupply Point (RP) method as another management strategy.

Assereui *et al.* (2025, p. 05) remind us that "[...] Understanding the right time to order is of paramount importance to avoid bottlenecks that compromise stock security levels [...]". In view of an effective safety stock for efficient production, this monitoring is paramount.

The cereal processing machinery and equipment industry also adopts some other important methods and practices to achieve its objectives, such as Lead time/Resupply Time (TR) and Economic Purchase Lot (LEC).

3.2 INVENTORY MANAGEMENT AND OPERATIONAL EFFICIENCY IN PRODUCTION AND LOGISTICS PROCESSES

The cereal processing machinery and equipment industry is the sector responsible for the manufacture of equipment used in the processing of grains such as wheat, corn, rice, among others.

It is a highly technical segment, as these machines and equipment mostly come from large projects or plants, which requires precision, quality and reliability, both in terms of the product and the delivery time, making inventory management even more critical.

According to Viana (2009, p. 117 *apud* Santos *et al.*, 2022, p. 04), inventory management is "a set of activities that aims, through the respective inventory policies, to fully meet the company's needs, with maximum efficiency and at the lowest cost".

Based on this first, efficiency and lower, the machinery and equipment industry for cereal processing remains focused on increasingly accurate inventory management.

According to Silva and Lima (2020, p. 14 *apud* Magalhães *et al.*, 2022, p. 03):

Inventories have several functionalities for the company in which they are inserted, and their management involves monitoring the movements of incoming and outgoing goods throughout the production cycle, in order to prevent any phase or event of production from being interrupted, which can generate losses to the company.

These precautions in relation to inventory management are justified by the complexity of the processes [several stages of production in this segment of industry] that involve a large number of agents, in their various departments.

Figure 02 below presents us with the various processes, methods [some already mentioned in this article] and results acquired as a result of the good practice of inventory management.

Figure 2

Inventory management methods and processes and their results

Source: <https://procurementgarage.com/wp-content/uploads/2022/07/Gestao-de-Estoques-Conteudo.png>. 2026

It is known that inventory management brings many challenges in a universe of possibilities that are constantly presented in industrial processes, but with good practice the objectives are achieved.

3.2.1 Cost reduction and resource optimization

When it comes to cost reduction in the machinery and equipment industry for cereal processing, it is one of the biggest challenges and objectives of any manager, as it involves all levels of operation and management, which require time, practice and daily monitoring of each immediate manager with each operator, in each of the production processes.

It is also necessary not to lose focus on the processes of acquisition of goods with the purchasing sector to guarantee or improve lead time and in the process of shipping the machinery and equipment produced, seeking to better consolidate the loads and thus better freight values.

Bowersox and Closs (2011 *apud* Gonçalves *et al.*, 2024, p. 03) "state that efficient logistics can provide competitive advantage, contributing to greater flexibility, improved services and cost reduction".

Cost reduction allows the company to ensure profitability and can increasingly invest in technologies to become more competitive in an increasingly demanding market.

3.2.2 Technologies Applied to Inventory Management for Resource Optimization

With technological advancement, an improvement in methods and practices has been achieved and with it, a visible improvement in inventory management, through ERP systems, warehouse automation, use of barcodes and RFID and artificial intelligence for demand forecasting, among others.

For Silva and Moura and Ribas, (2023, p. 32)

The adoption of advanced technology can optimize production and logistics processes, reduce costs, and improve the efficiency and quality of products, tools such as integrated management systems, robotic process automation (RPA), and reverse logistics can bring significant benefits to the entire production chain.

By optimizing resources in all processes of the machinery and equipment industry for cereal processing, with the use of technologies, many of the expectations of inventory management in the supply chain can be fulfilled.

3.3 SUPPLY CHAIN INTEGRATION AND THE ROLE OF INVENTORY MANAGEMENT

As already discussed in this article, the role of inventory management in the supply chain is increasingly relevant to meet the needs of the company and customers, because from good inventory management the company consolidates itself in the market, achieving its mission and expanding its vision for a short and increasingly promising future.

However, when good inventory management is not done, numerous losses can be obtained for the company and, consequently, for the customer [in the wheat segment, when there is a delay in the delivery of the plant, the loss is daily, as it is tons per hour, depending on the plant's flow] who has schedules to execute.

3.3.1 Impacts of Poor Inventory Management

Improper inventory management can generate several problems, from lack of products, excess materials, increased costs, loss of customers, and reduced competitiveness. Therefore, it is essential to have excellent coordination between suppliers, to obtain an efficient production and distribution of machinery and equipment.

Leão (2004 *apud* Gonçalves *et al.*, 2024, p. 07) state that:

[...] In the procurement and purchasing stage, organizations seek and hire suppliers to obtain raw materials or products, and it is essential to establish good relationships with them to ensure quality, competitive prices, and delivery times. A good relationship with business partners, with good follow-up generate satisfactory results for the company.

According to Gonçalves *et al.* (2024, p. 03), "[...] Logistics in the business context is a key strategic function that aims to optimize the flow of products, information, and services along the supply chain.

The company's performance in the market stems from the good practices of inventory management and the entire supply chain, integrated in all its processes, to achieve the results expected by the management, board of directors and partners of the organization.

4 FINAL CONSIDERATIONS

Inventory management is essential for the good performance of the supply chain of the machinery and equipment industry for cereal processing, due to the achievement of the organization's objectives. Its good practice, with a focus on cost reduction and production efficiency, enables it to stand out in the world market.

The research fully met the objectives, when it presented the relevance of inventory management for this specific segment, through the use of assertive methods and practices, highlighting the influence of this management in reducing costs and optimizing resources, as well as the impacts on the logistics performance of the supply chain.

The study showed that it is necessary to maintain and improve these inventory management methods and practices, as it represents a strategic factor for competitiveness and a better performance of the segment in the face of the uncertainties of the world market. Finally,

it is recommended that investments be implemented in advanced technologies to improve production processes, monitoring and control of inventories, in collaborative practices with suppliers and distributors, in improving communication between the productive sectors.

Future research on this topic is essential for a better understanding of the importance of inventory management in this segment of the industry, strengthening the supply chain and growing the interest of new researchers on the subject.

Milagros Cecilia Huamán Castro¹

ABSTRACT

The 21st-century teacher faces major challenges in the educational field, one of the most significant being the proper use of artificial intelligence. Teachers must empower themselves with this technology so that it can assist them with operational tasks such as planning, designing resources, reviewing activities, among others, allowing them to dedicate more time to what is most important in students' education: empowering them with the three “C’s” — curiosity, creativity, and critical thinking — which AI cannot develop, but teachers can. The objective of this publication is to reflect upon and support the idea that the teacher's role should focus on the human dimension of the student, preparing them for a near future in which they must demonstrate these competencies, rather than merely serving as repositories of information, since teachers cannot compete with AI in terms of stored information capacity. Therefore, educators should focus their role on this mission and stop evaluating and teaching through “bulimic” and “vomitive” examinations. In this way, students will be prepared to face a society in which teamwork, empathetic communication, creative proposals, analysis, and criterion-based problem-solving are essential. This is where teachers should invest their time when AI frees them from operational and routine tasks, empowering themselves and relying on this technology as support.

Keywords: Artificial Intelligence. Teacher. Challenges. Learning. Education.

RESUMO

O docente do século XXI enfrenta grandes desafios no campo educacional, sendo um dos mais significativos, e que requer atenção, o uso adequado da inteligência artificial. Os professores devem se apropriar dessa tecnologia para que ela os auxilie em tarefas operacionais, como planejamento, elaboração de recursos, revisão de atividades, entre outras, permitindo-lhes dedicar mais tempo ao que é mais importante na formação dos estudantes: capacitá-los com os três “C” — curiosidade, criatividade e pensamento crítico — algo que a IA não pode fazer, mas o docente sim. O objetivo desta publicação é refletir e sustentar a ideia de que o papel do professor deve estar centrado na dimensão humana do estudante, preparando-o para um futuro próximo no qual precisará demonstrar essas

Orcid: 0000-0002-1761-0118

competências, e não apenas atuar como um repositório de informações, já que não pode competir com a IA em capacidade de armazenamento de dados. Por isso, os docentes devem concentrar sua função nessa missão e deixar de avaliar e ensinar da forma como fazem atualmente, com exames “bulímicos” e “vomitivos”. Dessa maneira, os estudantes estarão preparados para enfrentar uma sociedade em que o trabalho em equipe, a comunicação empática, a elaboração de propostas criativas, a análise e a solução de problemas com pensamento crítico serão fundamentais. É nisso que os professores devem investir seu tempo quando a IA os libera de tarefas operacionais e rotineiras, apropriando-se dela e utilizando-a como apoio.

Palavras-chave: Inteligência Artificial. Docente. Desafios. Aprendizagem. Educação.

RESUMEN

El docente del siglo XXI se enfrenta a grandes retos en el ámbito educativo, uno de los más significativos y que requiere atención es el uso adecuado de la inteligencia artificial, empoderándose de esta para que lo ayude en tareas operativas como la planificación, el diseño de recursos, revisiones de actividades, entre otras, y que le quede tiempo libre para dedicarlo a lo más importante en la formación de los estudiantes, que es empoderarlos con las tres “C”: curiosidad, creatividad y pensamiento crítico, que la IA no lo puede hacer, pero el docente sí. El objetivo de esta publicación es reflexionar y sustentar de esta manera que el rol del docente se debe centrar en la parte humana del estudiante, prepararlo para el futuro cercano en el que tiene que demostrar estas competencias y no solo ser un repositorio de información, ya que no puede competir con la IA en capacidad de información almacenada, por eso los docentes deben enfocar su función en eso, y dejar de evaluar y enseñar como lo hacen, con exámenes bulímicos y vomitivos. Así, que los estudiantes se van a enfrentar a una sociedad donde se trabaje en equipo, se comunique de manera empática, realice propuestas creativas, analice y dé soluciones con nivel criterial, eso es en lo que los docentes deben invertir su tiempo cuando la IA los libera de tareas operativas y rutinarias, empoderándose y apoyándose en ella.

Palabras clave: Inteligencia Artificial. Docente. Retos. Aprendizaje. Educación.

1 INTRODUCTION

All of us who are immersed in the academic world know that teaching in times of AI is a great challenge, because education is supported and empowered by technology, but it is the responsibility of the teacher to apply it effectively, innovatively, ethically and with educational disruption. Education in all its areas and educational levels implements the use of Artificial Intelligence, but it is not only necessary to know tools, but also to have the ability to apply the strategies and methodologies that allow it to be used well.

While it is true that artificial intelligence has existed for a long time, practically since the appearance of web 2.0, *e-learning* and other technological developments, it has been advancing each time, as has the knowledge society, generating multiple challenges, especially for teachers, both university and other educational levels. Therefore, we must look carefully at all those elements and factors that can help us to be better teachers and managers of education. The objective of this publication is not only to reflect but also to sustain that the role of the teacher should focus on the human part of the student, preparing him for the future where he must demonstrate these competencies and empathetic leadership.

2 ARTIFICIAL INTELLIGENCE AND TEACHER CHALLENGES

The topic I will address is artificial intelligence and the challenges of the teacher. To begin with, I start from a very important idea: *times change... universities too*. That's right, dear colleagues, readers, universities must move hand in hand with technology; We cannot stand on the sidelines. Think, for example, of how cinema has changed: we used to have to go to a cinema in person, and now we have streaming platforms such as Netflix. In transportation, we have applications such as Didi, Uber or Cabify. When it comes to shopping, there are platforms such as Temu, AliExpress or Amazon. Technology, science and artificial intelligence have advanced in all areas of work, business, personal, and of course, also in education, where you and I are involved.

Education must go hand in hand with these advances and take advantage of them to empower not only teachers, but also to benefit the essence of our work: students. Therefore, if times change, universities must do the same. They cannot be left behind; must accompany this process of transformation, otherwise they would represent a setback for educational environments.

Artificial intelligence, as I mentioned, has brought us great challenges in different areas: in companies, commerce, technology, the home and, of course, in education. It has an essential characteristic: it seeks to carry out activities that, operationally, human beings perform in their

work or in any environment. From this, we can identify thousands of AI-based tools, and more applications are constantly being created. I will mention six of them, only six, because the complete list would be endless. These will help us to reflect on how we can empower ourselves as teachers, especially in operational tasks.

Figure 1

AI frees up operational activities

La IA libera a los docentes de actividades operativas

La IA puede **liberar a los docentes** de las tareas más tediosas y les permite hacer lo que realmente deben hacer, enfatizar en el aspecto **moral**, lo **valores**, el trabajo en **equipo**, la **empatía**, la **creatividad**.

The first is Squirrel Ai Learning. This tool, originated in Shanghai, China, more than fifteen years ago, has recently entered the American market for a very interesting reason: it offers students at all levels, from elementary school to university, a virtual teacher available outside of class hours. This online teacher, an avatar with artificial intelligence, helps to review the topics developed according to the level and learning style of each student. In this way, it reinforces the contents worked on by the teacher, acting as an assistant or assistant teacher. It is like having, many of us know from experience, a head of practice or assistant at the university who supports the teacher. This virtual assistant, on the other hand, helps the student to improve their skills according to their level and needs.

The second tool is DreamBox, very similar to Squirrel Ai Learning, but with a focus on learning styles and levels. There are students who learn best by listening, others by visualizing, and others through more kinesthetic activities. DreamBox, through artificial intelligence, offers personalized accompaniment, allowing the student to advance and review at their own pace. In addition, it gives the teacher the possibility of visualizing the progress of their students: what level they are at, how they have improved and what aspects require reinforcement. In this way, the teacher can better prepare their next sessions, providing feedback and consolidating learning.

The third tool I want to mention is Gradescope, a great ally in task review. This platform allows students to automatically provide feedback, even based on previously defined rubrics. Thus, those operational tasks that would take us hours or even days when we have 60, 100 or 150 students can be solved in much less time.

These three tools are examples of applications that help in operational tasks, freeing up time for the teacher to focus on deeper aspects of the educational process. In addition to these, there are four others, which I am sure we all know: Turnitin, ChatGPT, Duolingo and Gemini.

Turnitin, widely used, works with artificial intelligence to support the detection of plagiarism and the correct use of citations and references in research papers, theses or essays. ChatGPT, a classic of recent years, has become a tool that offers fast and fluid information, facilitating search, writing and analysis processes. Gemini, which has become our smart assistant in the palm of your hand. Finally, Duolingo, which combines artificial intelligence with gamification, allows you to learn different languages in a playful and personalized way. With motivational messages such as "Okay, you can do it!" or "Congratulations!", the system awards rewards, stars and progress levels, adjusting the challenges according to the user's individual progress.

These seven tools, three more specialized and four widely known, represent just a sample of the possibilities offered by artificial intelligence in the educational field. However, they reveal a great pending challenge: teacher training. There are hundreds, even thousands of tools that neither you nor I know yet, because new ones are constantly being created for different areas: history, mathematics, English, among many others. We are getting to know some of them according to our field, but there is still much to discover. But what does the professor, the university professor, the teacher at all levels, need to be able to empower themselves with these tools? You need to be trained.

A survey conducted in 2025 asked the question: *Is artificial intelligence important in education?* And the results were very revealing. Four Latin American countries—Peru, Mexico, Chile, and Argentina—as well as Spain, identified teacher training as a prevailing need. Of course it is, and not only in the sense of knowing tools, because that today can be learned with a click on YouTube or Google, but in how to really empower ourselves with them, how to select the most appropriate ones according to our area or subject. If I am an engineer, psychologist, lawyer, history or literature teacher, I must identify the tools that respond to my needs, applying approaches and methodologies that help me form better human beings. That is the part that artificial intelligence does not provide, and that is precisely why teacher training is so necessary in our Latin American countries. And it's good that it's recognized like this, because it's urgent.

In addition, this training should not depend solely on a director, rector or ministry enrolling us in courses or workshops. We must also self-manage our own training. We have a huge amount of resources available: databases, YouTube channels, free webinars, conferences, online congresses and much more. Therefore, it is essential to empower ourselves and take responsibility for our own training, in addition to that offered by the educational institutions where we work.

3 THE THREE C'S OF HUMAN LEARNING

But training should not be limited to knowledge of operational tools. It must also focus on what I call the three "Cs" of humanization. Artificial intelligence can be very efficient and handle enormous amounts of information, we have it on our smartphones, just a click away, but it lacks creativity, awareness and human compassion. Artificial intelligence cannot offer that, but teachers do. We have emotions, empathy, the ability to accompany students in their process, whether in face-to-face, virtual or blended environments. That is the shortcoming that artificial intelligence does not cover and that we must assume as educators. Therefore, there is a great challenge here: the teacher must be creative, have awareness and critical analysis, and demonstrate human compassion in different situations.

Teachers are leaders in society, and we must manage this entire technological process, empowering ourselves with artificial intelligence not to replace what we do, but to free ourselves from operational tasks. As I mentioned before, technology tools can help us reduce the time spent on practical tasks that are often long or tedious, such as reviewing or giving feedback on work, making materials, or taking notes. By using artificial intelligence for these tasks, we can dedicate more time to the essence of our work: reinforcing ethics, morals, values, teamwork

and coexistence. We live in society, and our students will go out to live and work in society, in universities, companies and institutions. That is why we must promote empathy, warmth and creativity from a young age, so that when they reach university they already bring that innovative spirit. And if they don't, it's up to us to encourage it in them.

Empowering ourselves with artificial intelligence allows us to free ourselves from operational tasks and focus on what technology cannot replace: ethics, values, empathy, creativity and teamwork. This can save us up to 50% of the time we spend on the most routine tasks of the day-to-day, allowing us to focus on the human part of the educational process.

That human part is expressed in dialogue, in teamwork, in closeness with students: that "how are you guys, how are you doing, how can I help you?" We cannot limit ourselves only to the literal or technical aspects of the activities. We work with human beings, not with machines or robots. They feel emotions, joy, sadness; and we must be there, accompanying them.

However, in the world there are still schools and universities where some teachers, fortunately less and less, continue to work with their students as if they were robots, limiting themselves to filling them with repetitive information and applying exams over and over again, just to mark answers, literally. This makes the student an operative, monotonous being, and does not prepare him for the challenges of the future. Those teachers who continue with repetitive methods, constant exams and mechanical activities, are unwittingly training *human robots*, not real students. They want the student to accumulate information, but the question is: will a student be able to know more than Google, ChatGPT or other databases? Of course not. The student is a human being, not a memory machine. It can never exceed the amount of information that exists on the internet or in digital databases. Therefore, insisting on methodologies based on memorization only leads to competing with artificial intelligence, something impossible.

We should not train students who imitate artificial intelligence, but guide them to be better human beings, professionals who can work in a team, who are leaders, empathetic, creative, who can investigate, because in order to reach that creativity they have to start with curiosity from an early age. They must be guided towards what artificial intelligence cannot do. We need to empower them with the three "Cs": **curiosity, creativity, and critical thinking**.

Figure 3*Teachers must promote creativity***Promover la creatividad!!**

Source: Authors.

A student with critical thinking can be a leader, a great businessman, a principal, a teacher, an engineer, or a lawyer. Critical thinking gives you discernment, analysis, and creative ability. We need people who innovate, not repeat what they see every day. Innovation, we always say, is the key to success. However, many colleges and universities still apply repetitive exams. How do we expect students to be creative or innovative if we continue to teach mechanically?

Curiosity is the basis. I always say it, when I train primary school teachers, that if we promote curiosity in students from a young age, we will have much more competent students at university. A curious child asks, analyzes, compares, and creates. When that student reaches the higher level, he dazzles with his creativity and innovation. But if during his childhood he has received a rigid education, where he is told "don't paint like that", "don't draw like that", "don't feel like that", "don't look like that", when he gets to university he will ask "and how do I do it?", because all his life he was told how to do it. In other words, it did not develop creativity or innovation.

I know that each of you will say: "Yes, we receive students like that at the university." Unfortunately, we still receive them. So, our task, our challenge in universities, is very complex. Let's imagine the professionals who are being trained in the future: the groups of innovative, creative and empathetic teachers, and those who do not, those who continue with rigid activities, pretending that the student memorizes, learns, takes exams and repeats everything by heart. What will happen fifteen or twenty years from now? What will the challenge be like for them? They will not be able to face or function in a society that is going to devour them; they will not

be able to really develop. They will only be carriers of information, and we already know that the information is here in the click, in the palm of the hand, in all the applications we have.

We need students who are critical, strategic, creative, compassionate, humane, empathetic, who identify with how their partner feels, not who live their world mechanically. That's why we ask: "How are you guys? How are you? How have they done?" Before starting a face-to-face, virtual or blended class session, we should not start by saying: "Today we will address the history of...", but "How are you? How was your weekend? Is everything okay?" First, the human part. I know that will take us ten, fifteen or twenty minutes, but it is essential, because that is what artificial intelligence cannot do and we can. It is our task. If we humanize by example, empathize with example and motivate by example, we will train professionals who, although they will be experts in their field, will also, in essence, be empathetic human beings.

Education has a very long and challenging road ahead. The process that we have to go through is really complex, because there is a great debate in the world about technology, science and artificial intelligence: whether to use the *smartphone* or not, whether to take the cell phone to class, whether to allow the internet or not. While these issues are being discussed, science and the knowledge society continue to advance. We must go hand in hand, always remembering that technology, artificial intelligence and whatever comes tomorrow, which we do not know what it will be, are already among us.

Figure 4

Education has a long way to go

A la educación le queda un largo camino por recorrer

La educación es uno de los sectores que **más tarda en adaptarse a la tecnología, si eso no cambia**, en unos 20 o 30 años nos espera un **futuro muy complejo**.

Source: Authors.

Today we have humanoid robots like Ameca, or like Sofía, who was in Virtual Educa. In Virtual Educa Sofia gave a lecture in a room that left the participants who listened to her shocked. We are surrounded by technology, but Sofía does not have the human warmth that

Dr. Milagros Huamán Castro has: "How are you? How are you?" showing a smile. That's the difference. Sofia has an incredible memory, with everything on Google in her memory, excellent. But we have something that she doesn't have. Education must address this, which is why all teachers must be committed to this change. The essence is not in learning to use artificial intelligence tools, that is simple; just as we learned Zoom or Moodle, it is not complex. The essence is to use them properly, without neglecting the human part, creativity, compassion and ethics. That is really the challenge of the teacher in this era of artificial intelligence.

This challenge requires our predisposition, the desire to relearn every day. To transform ourselves into this new essence, we must learn to unlearn in order to be able to constantly relearn, because tomorrow something different will appear and it will not be the same artificial intelligence. We will have to work with it, but the essential thing is to break our own paradigms.

Many times, in universities or colleges, we follow lifelong routes, and it is difficult for us to break those schemes. Many teachers find it difficult to do so, or want to break them, but they find themselves with institutions that follow outdated models. Or, the principal or rector wants to innovate, but some teachers are resistant, it is difficult for them. You have to train them once, twice, three times, motivate them. The task is arduous, both for those who manage and for teachers, because we all have to break the paradigms that bind us. And those paradigms are not in a book; they are in our way of thinking, in our decisions and in how we take on the new challenges brought by the society of knowledge, research and technology, where changes are constant. This calls us to constantly update ourselves and to stay at the forefront in our areas, subjects or professional careers.

The challenges are many. The first is to promote creativity, a great challenge for teachers in each of their subjects. You are an expert in engineering, economics, pedagogy, medicine, law, art or psychology: how do you promote creativity in your career, in postgraduate or in the doctorate? If you teach at school, how do you encourage it?

To propose activities that promote creativity, we must plan in advance. It is an essential step. If I am going to use artificial intelligence, I must have selected my tools, but also plan how I will promote creativity with students so that in the end each one contributes something different, something that artificial intelligence cannot contribute.

Motivation must also be permanent in our classrooms. Even when giving feedback, when we see that a job is wrong, we shouldn't say, "Peter, this job is a mess," no. We can say: "Pedro, I have seen that your work has not reached the expected competencies. Maybe you've been tired or distracted. I recommend you review this book, this article, and reflect to rethink it." Even in the most critical moments we must motivate.

Figure 5

Teachers must promote constant motivation

La motivación

Source: Authors.

When students get the highest grade, we congratulate them, we give them a badge, a happy face. I, in graduate school, give badges to my doctoral students. But if the task is not right, we should not react negatively, emotionally abusing them. On the contrary, we must reflect with them: "I know that next time you will do well, I trust you, you can do it". This is how we motivate them to continue striving, because if not, they become demotivated and give up. Many students say, "I can't take it anymore," and it's not that they can't, but that they lack motivation. Sometimes they do not receive it at home, and it is we, the teachers, who must provide it, in postgraduate studies, in their careers or at school.

Another big challenge is empathy. Artificial intelligence cannot be empathetic or motivating or creative, but we can. We must ask them, "Are you wrong? Haven't you slept because you worked all night? Don't worry, rest." Ask them how they are, how they feel, what they need. And not only be empathetic with them, but promote empathy among students, so that they do not live individually, but learn to be empathetic with their classmates. That part is fundamental and we must promote it by example.

We must also promote collaboration. Many times students say: "No, Dr. Milagros, I work alone, I don't like to work in a team." We cannot say "it's okay", but guide them to understand the benefits of collaborative work, whether virtual or face-to-face. Teamwork strengthens the final product, because each one contributes from their area, it is finished faster and the result is better. In addition, the student learns that he will not live in isolation: he will live in society, and

when he graduates as an engineer, accountant, doctor, pedagogue, communicator, economist, psychologist or mathematician, he will have to work in a team. That is why, from university or college, we must promote collaboration, mutual help and constant guidance, because they will live in society and must learn to overcome each challenge together.

The other great challenge is critical thinking. How much it costs us for the student to work on critical analysis. They almost always reach the literal level. In reading comprehension we have three levels: literal, inferential and criterial. Most students stay at the literal level, especially when it is only evaluated with memory tests, with alternatives A, B, C, or D. Those who continue to take repetitive exams make the student remain at that literal level, without advancing to the inferential level and even less to the critical. Critical thinking will help the student, when they graduate, to be a leader in the company, in their work or in any space where they work. It will give you the ability to discern, analyze, give your opinion, and make appropriate decisions in your professional life.

Promoting critical analysis in the classroom is an essential issue, and artificial intelligence cannot do it. We must have this reflection every day, together with our students, from the different subjects in which we accompany them.

Figure 6

AI will change the world

La IA es como la nueva electricidad, *cambiará el mundo.*
Depende del humano que le dé la utilidad para ayudar y mejorar la vida.

Source: Authors.

4 CONCLUSIONS

Artificial intelligence is, in its time, what electricity was. Before electricity, the world had another way of living: lighters, candles, candlesticks were used, people went to bed early. Then the world changed. Electricity not only brought light, but also appliances and everything that works today thanks to it.

Artificial intelligence has arrived in the same way: it has arrived in the world, in commerce, in cinema, in technology, in the environment, in education. But it is up to human beings to use it to improve the quality of life. In our environment, it depends on how the teacher is empowered by this tool, but as an operational support, not as a substitute. To know it in order to take advantage of it in routine tasks and, over time it frees us, to strengthen creativity, critical thinking and human awareness. The essence of the human being is what we will not find in artificial intelligence or in any of its tools.

As education professionals, we have that empathetic and motivating commitment to our students, and the permanent commitment to self-train to be able to give the best of ourselves, because they are our reason for being.

We must continue to research and reflect with a critical, disruptive and innovative look, because artificial intelligence, education and our role as teachers at this time is challenging and requires a commitment to human quality.

ABSTRACT

The setting for this philosophical-theoretical essay is the current concern about technological advancements and rapid innovations in the field of computing, present in the daily lives of almost everyone around the world. Today, it is impossible to imagine a routine, whether personal or professional, without the phenomenon of connectivity. Imagine a world without the internet! Impossible. The intention here is to engage with some available theories on the subject and provoke reflections on connected humanity. To this end, the structure of this essay presents three sub-themes. The first is the "Virtual Narcissus," that individual who is connected to the screens of their remote connection devices to interact with their groups, hold work meetings, study, have fun, date, snoop, among other connections. After all, the internet is the new communication paradigm in which we are immersed. The second is the "Post-human," the result of a new non-Darwinian evolution, carried out in laboratories and not in nature, with the contribution of Genetic Engineering, Biomedical Engineering (which includes contributions from Mechanics, Electrical Engineering, Information Technology, and, undoubtedly, Biology). And the third, "Philosophical Counseling: from Ancient Greece to the present day," is another tool available to address people whose existential issues do not require psychotherapeutic treatment. Philosophical Counseling is closer to Philosophical Guidance, whose guiding thread is the premises of philosophers and not the manuals of psychological and behavioral diagnoses or disease codes. The main focus of Philosophical Counseling is not on illness or mental disorders, but on the experience and existence of the individual seeking self-examination. Through careful research conducted with thinkers who have offered their reflections and philosophies on the theme of the globalized and connected world, the aim is to establish dialogues that can briefly guide the condition of the current being-there, being-in-the-world, Dasein.

Keywords: Philosophical Anthropology. Therapeutic Philosophy. Post-Human.

RESUMO

O cenário deste ensaio filosófico-teórico são as inquietações atuais sobre os avanços tecnológicos e as rápidas inovações no campo da informática, presentes na vida cotidiana de quase todos ao redor do mundo. Hoje não é possível imaginar uma rotina, seja pessoal ou profissional, sem o fenômeno da conectividade. Imagine um mundo sem internet!

¹ Master's degree in Psychology. Universidade São Marcos. E-mail: sergiomascoli@gmail.com

Impossível. Pretende-se aqui dialogar com algumas teorias disponíveis sobre o tema e provocar reflexões sobre a humanidade conectada. Com esse objetivo, a arquitetura deste ensaio apresenta três subtemas. O primeiro é o “Narciso Virtual”, aquele sujeito que está conectado com as telas de seus aparelhos de conexão remota para se relacionar com seus grupos, fazer reuniões de trabalho, estudar, se divertir, namorar, bisbilhotar, entre outras conexões. Afinal, a internet é o novo paradigma de comunicação no qual estamos imersos. O segundo é o “Pós-humano”, aquele que é resultado de uma nova evolução não darwiniana, realizada em laboratórios e não na natureza com a contribuição da Engenharia Genética, a Engenharia Biomédica que conta com a contribuição da Mecânica, da Elétrica, da Tecnologia da Informação e, sem dúvida, da Biologia. E o terceiro, o “Aconselhamento Filosófico: da Grécia Antiga até os nossos dias”, que é mais uma ferramenta disponível para tratar de pessoas cujas questões existenciais não necessitam de tratamento psicoterapêutico. O Aconselhamento Filosófico se aproxima mais do aspecto de Orientação Filosófica, cujo fio condutor são as premissas dos filósofos e não dos manuais de diagnósticos psicológicos e comportamentais e nem dos códigos de doenças. O foco principal do Aconselhamento Filosófico não está na doença ou nos transtornos mentais, mas na experiência e na existência do indivíduo que busca examinar-se. Através de uma pesquisa cautelosa, realizada com pensadores que dispuseram suas reflexões e suas filosofias sobre o tema do mundo globalizado e conectado, a proposta é estabelecer diálogos que possam nortear, brevemente, a condição do atual ser-aí, o ser-no-mundo, o *dasein*.

Palavras-chave: Antropologia Filosófica. Filosofia Terapêutica. Pós-Humano.

RESUMEN

El contexto de este ensayo filosófico-teórico es la preocupación actual por los avances tecnológicos y las rápidas innovaciones en el campo de la informática, presentes en la vida cotidiana de casi todas las personas en el mundo. Hoy en día, es imposible imaginar una rutina, ya sea personal o profesional, sin el fenómeno de la conectividad. ¡Imaginen un mundo sin internet! Imposible. La intención aquí es abordar algunas teorías disponibles sobre el tema y provocar reflexiones sobre la humanidad conectada. Para ello, la estructura de este ensayo presenta tres subtemas. El primero es el “Narciso Virtual”, ese individuo conectado a las pantallas de sus dispositivos de conexión remota para interactuar con sus grupos, celebrar reuniones de trabajo, estudiar, divertirse, tener citas, fisgonear, entre otras conexiones. Después de todo, internet es el nuevo paradigma de comunicación en el que estamos inmersos. La segunda es la «Posthumana», resultado de una nueva evolución no darwiniana, llevada a cabo en laboratorios y no en la naturaleza, con la contribución de la ingeniería genética, la ingeniería biomédica (que incluye aportaciones de la mecánica, la ingeniería eléctrica, la informática y, sin duda, la biología). Y la tercera, «Orientación filosófica: de la antigua Grecia a la actualidad», es otra herramienta disponible para abordar a personas cuyas cuestiones existenciales no requieren tratamiento psicoterapéutico. La orientación filosófica se asemeja más a la guía filosófica, cuyo hilo conductor son las premisas de los filósofos y no los manuales de diagnósticos psicológicos y conductuales ni los códigos de enfermedades. El enfoque principal de la orientación filosófica no está en la enfermedad o los trastornos mentales, sino en la experiencia y la existencia del individuo que busca la autoexploración. Mediante una investigación minuciosa realizada con pensadores que han ofrecido sus reflexiones y filosofías sobre el tema del mundo globalizado e interconectado, se busca establecer diálogos que puedan orientar brevemente la condición actual del ser-ahí, el ser-en-el-mundo, el *Dasein*.

Palabras clave: Antropología Filosófica. Filosofía Terapéutica. Posthumanismo.

1 VIRTUAL DAFFODIL

The century. XX, in the era of rationality, was marked by two world wars, the explosion of two atomic bombs and a Cold War that put the world under the fear of an atomic cataclysm. From the 1950s, with the appearance of the computer developed by mathematician Alan Turing (1912 – 1954), a new tool came on the scene.

The military world of the Soviet Union and the United States axis needed to ensure secrecy and non-espionage of military strategies during the Cold War. Physicists, mathematicians, engineers and technicians worked hard to develop equipment that would guarantee the secrecy of these strategies, and the computer began to be used for this purpose. Connecting two computers was a challenge to be faced. Until the end of the 1960s, in the USA, the first connection between two computers occurred in two distant locations, initially in a very rudimentary way, but a new communication paradigm emerged there, the internet.

By the end of the 1970s, the United States of America had released this new means of communication for public use by civil society. At first, universities and industries assimilated the new model. It was the beginning of a revolution in communications. As the cost of this new "media" became cheaper, public access increased. Mobile devices were also the clear demonstration of communication transformations .

With each new generation, mobile devices brought quick advantages to users, until the 4th generation of devices appeared, called smartphones, which, like personal computers, gained access to the world wide web. Since then the world has been connected in a great network. The latest generation of mobile devices, 5G, and smartphones promote the so-called IoT, an acronym for "internet of things". This way everything will be connected online.

During the pandemic, in the third decade of the 21st century. In the twenty-first century, the world was placed in social isolation. Personal computers and mobile devices were fundamental tools to support isolation and social distancing. Schools, organizations, institutions, and society at large have benefited from online virtual connections. Technology helped to endure the difficult phase and made the world, in fact, more connected.

Compared to the XVIII century. XX, which after the "wars" developed new technologies that revolutionized the way humans relate to each other in the world, as well as the 21st century. XXI has brought and will bring new technological revolutions that will also change the relationship of humans in new scenarios, as is the case with the introduction of a new tool, Artificial Intelligence (AI) in 2024.

And Philosophy, which systematically seeks the knowledge that comes from the Scientific, Physical and Social fields, will not refuse to contribute, problematizing and discussing these issues to develop a philosophical thought contemporary to the 21st century. XXI.

1.1 THE MYTH OF NARCISSUS: A CONTEXTUALIZATION

The river-god Cephisus kidnapped and possessed the nymph Liriope. When she realized that she was pregnant, Liriope remained with diffuse feelings, but gave birth to Narcissus, a child of rare beauty who enchanted everyone, which made her cautious because she feared the gods of Olympus for being intolerant of mortals who stood out from the rest. With that, the nymph went to consult the soothsayer Tiresias, who predicted that the boy would have a long life, as long as he never saw himself reflected.

As a teenager, Narciso realized that he caught people's attention and that this was due to his unusual beauty. As a young adult, the nymphs, the girls and the boys competed for his love. Faced with all of Narcissus' denials, one of his suitors claimed that he did not live under the laws of mortals. He raised his hands to the heavens and asked the gods of Olympus that Narcissus fall in love with someone, but that it would never be reciprocated. Nemesis, who punishes the excesses of mortals, complied with the boy's heartbroken request.

During a hunt, Narcissus got lost from the group and found himself alone. He was watched among the foliage by the nymph Echo, who had been cursed by Hera and distracted her to cover up for Zeus while he loved mortals. Because of Hera's curse, Echo, who talked a lot, could only speak the last words he heard, without ever being able to answer or talk to anyone.

Observing Narcissus in the forest, Echo was enchanted by his great beauty and thought he was a god. But Echo thought out loud and Narcissus heard his voice coming from inside the forest and wanted to know who was there. Echo introduced herself to Narcissus, who vehemently reprimanded her for having approached him. Saddened, Echo was paralyzed, while Narcissus walked away from her. But, driven by Narcissus' beauty, Echo continued to follow him hidden among the foliage.

Narcissus then came to a clearing where there was a large reflecting pool fed by a narrow watercourse. As he reclined on the lake to drink water, Narcissus saw his image reflected.

The prophecy of Tiresias and the curse of Nemesis began to be fulfilled. Narcissus was intoxicated by the great beauty of the young man without knowing that it was his reflected image. The image in the reflecting pool seduced him, and Narcissus, upon hearing Echo, (also seems

to contradict the curse) deluded himself that he was also reciprocated by the image reflected in the reflecting pool, mistaking the echo as if it were the voice of the image that spoke to him.

For several days, Narcissus remained leaning over the water mirror, talking to his love and listening to his amorous vows, which were nothing more than his own words, distorted by the echo of Echo and confused, he did not eat or hydrate.

Echo was the only witness to how Narcissus languished...

Recognizing the truth and seeing that the image also languished, Narciso concludes: "You are me!". Disappointed, he thinks: "what a strange loneliness of mine... I have and I don't have myself... Which of us two is just a mirage? Goodbye...", he said goodbye to life, lying next to the reflecting pool...

Narcissus' body disappeared. In the place where he was, a flower with a single stem, the daffodil, was born. In Hades, Narcissus continued to see himself reflected in the river Styx, the river of forgetfulness. (Adapted from GUASCO, 2011).

1.2 REFLECTIVE ELEMENTS TAKEN FROM THE MYTH

Teles (1974) states that myth is an explanatory context to clarify a hitherto unknown fact, and Abbagnano (2018) adds that a myth, as it is a narrative, has the function of explaining some common sense phenomenon.

From the myth of Narcissus, one can draw elements for some contextualized philosophical reflections.

Tiresias' prediction about the fate of Narcissus can be related to the current scenario and represent the market and the voracious capitalism to which we all live in it, something like a destiny. A destination created by Marketing, Digital Marketing, whose function is to establish new needs of users who browse digital networks. *Influencers* play an important role in this destination.

By insistently rejecting the affective appeal addressed to him, Narcissus became excluded from interpersonal affective relationships, a condition that imposed loneliness on him. This loneliness that, when lost from its "group of hunters", becomes existential, something close to cancel culture. The "group of hunters" can also represent the groups of belonging, affinity, help, and interaction of peers that are created in connected life.

The nymph Echo, when observing him and thinking that he is a god/consumerist, behaves like the "echo chamber", that is, he acts like the algorithms that capture the navigator's data on the network and offers him what he "needs", placing him inside a "bubble".

Upon seeing the reflecting pool, Narcissus goes there to quench his thirst, but this mirror is fed by a narrow watercourse that may represent the products offered by the organizations that control the digital environment. This reflecting pool can also represent the kidnapping of your imago through the screens of smartphones, tablets, computers, smart TVs. As the reflecting pool captured the image and beliefs of Narcissus, he was as if intoxicated by himself, which usually happens with our media screens.

Echo, fascinated by Narcissus, confuses him with the repetition of his last words, so by comparison, echo becomes something akin to ruminating, obsessive thoughts.

It is only when Narcissus is exhausted of his vital forces and close to death by starvation that he recognizes that the virtual imago with which he had fallen in love was himself. His philosophical question then arises: which of us is just a mirage? In the place where he died, after his body disappeared, a flower with a single stem, the narcissus, appears, which has the same root as the word narcotic.

Disturbed Narcissus has altered consciousness. Etymologically, the word Narcissus has its origin in the Greek, whose root is *narké*, which means numbness or torpor, and from the Greek suffix *issos*, which forms names, such as plants and diseases. By free translation, 'sick with numbness', 'numbed by self-love', 'behavior numbed in himself', subjected to the murmurs of the Echo, here represented by intrusive thoughts.

In Hades, Narcissus continues to observe himself in the Styx, the river of oblivion. When a subject empties himself in the virtual world, like Narcissus in front of the reflecting pool, he is no longer useful to the system, so the system is no longer useful to the system.

The virtual world voraciously desires to find our daffodils, capture them, consume them, and abandon them into oblivion. In this process, the system feeds back, which can be considered as virtual narcissism or the search for virtual narcissus.

A new philosophical thought arises naturally from changes that occur in the social, scientific and cultural fields in the age of connection. Thus, current changes affect the direction of contemporary philosophical thought, says Teles (1974). This author adds that although the mission of Philosophy is different from the mission of Science, both produce Knowledge. Thus, knowledge can occur in a systematic, rationally organized and elucidative, critical and speculative way. If it occurs in an unsystematic, vulgar and popular way, uncritical, imprecise and self-contradictory, it will be "common sense" or a non-rigorous understanding, as Rosa (2021) says.

Through the eyes of the Philosophy of Mind, which is the youngest of the areas of study and knowledge incorporated into the philosophical tradition, whose fundamental issue is the

mind-body problem, founded by the French philosopher Rene Descartes (1596-1650) with *res-cogitans* and *res-extensa*, roughly speaking, the Philosophy of Mind deals with the dynamics of the body-minds present in nature, says Moraca (2013).

For Abbagnano (2018), the Philosophy of Mind is a reflection of the nature and basic properties of the human mind and the analysis of the cognitive capacities of the thinking subject, where mind, soul and spirit are synonymous with intellectuality, whose semantic variation occurs according to the global theoretical framework in which it is inserted.

In this way, Teles (1974) states, it is possible to use Axiology, the critical theory of values, since value corresponds to a need or lack that causes imbalance, that generates tensions that determine the value of an object, obtaining pleasure. Equivalent to a biopsychic homeostasis, I would say.

For Teles (1974) these needs are somatic, social, logical, aesthetic, ethical or religious – these are generally of an absolute nature. However, values are always arranged between two poles, the positive and the negative. It also says that each subject has its own hierarchy of values. These are relevant concepts to understand the phenomenon of virtual narcissus.

When analyzing the concept of "virtual", Abbagnano (2018) offers us the definition that virtual is seen as something potential. The concept of "virtual reality", Abbagnano continues, emerged in the 1980s in the field of Information Technology (IT) to refer to a possible and operative reality, artificially constructed, which produces real effects on the human experience and on the perceptual reality induced by devices.

This artificial reality is called virtual, because it concerns images and not tactile objects, and this "substitution" causes internal sensations with minimal physical contact, usually only the visual and auditory, therefore, a matter of Aesthetics.

Torres (2012) clarifies that the massive use of the internet is a way of coping with social isolation and that it promotes a stimulus to global teleparticipation, but that in some cases it generated altered states of consciousness, a fact observed during the Covid-19 pandemic.

The rampant use of the Internet is already considered a public health problem, Loss declares; War; Souza (2021). They also affirm that unbridled use promotes ruminative self-awareness, the echoes, whose self-attention leads the user to a negative axiological evaluation of himself and thus causes mental disorders.

With the introduction of cancel culture on the internet in 2015, a new power relationship was established in society, say Barbosa & Specimille (2021). They also say that since then a debate has arisen about the impacts of media and social networks on users' mental health. Barbosa & Specimille (2021) warn that the pressure of exposure causes the user a tireless need

to fit into standards imposed by a media core, where they seek to assert themselves and be accepted by others.

And when "canceled" it can provide isolation, belonging, loneliness, hopelessness and psychological escape. Nunes (2019) argues that the use without self-restraint of the internet can trigger pathological triggers, with the emergence of conflicts that end up reverberating in more unbridled use of the internet and, he states, that mindfulness meditation can benefit this user from the damage caused by such behavior.

Generally, the altered state of consciousness can be related to Non-organic sleep disorders (F.51), Eating disorders (F.50), Personality disorders (F.60), Depressive episodes (F.32), and Neurotic disorders, Stress-related disorders, Somatoform disorders (F40-F.48), Narcissistic personality disorder (F.60.8), as stated in the International Statistical Classification of Diseases and Related Health Problems, the ICD – 10 (2000).

Laplanche & Pontalis (1998) explain that narcissism occurs in two moments, 'primary narcissism', when the baby invests all his libido in himself, and 'secondary narcissism', when his libido is invested in another and from him, he returns to his ego, promoting socio-affective interrelations.

Currently, babies and young children already have access to digital screens, often authorized by parents or guardians.

On the other hand, Lapa & Lacerda & Coelho (2016) demonstrate that through ICT (Information and Communication Technologies) and cyberactivism have gained relevance in the subjective formation of subjects, who have found other human and social meanings, therefore, they have become authors, producers and citizens of the digital universe. They also affirm that characteristics such as plurality, communicative action, translator dialogue, trust, collaboration, autonomy, permanent learner posture, creative and critical appropriation that demonstrated the emancipation of these user subjects in the virtual world.

From the 1950s, we return to Meerloo (1961/2009) who says that "the one who dictates and formulates the words and phrases we use, the one who is the master of the press and the radio is the "master of the mind", contextualizing this statement, if today we have the internet and Big Techs, and Organizations that control digital access such as Apple, Google, Amazon, Meta and Microsoft are the current masters of the mind.

Meerloo (1961/2009) launched the concept of *mentecide*, which refers to an organized system in which a tyrant transfers his own thoughts, ideologies, words and truths to the minds and mouths of the victims he intends to kidnap, which leads to *logocide*, which is the loss of the ability to reason freely, characterizing a "rape of the mind".

In this way, the role of digital influencers can also be questioned.

Since 2014, the adhesion to social networks has reached one billion users, so these networks have started to generate real effects on society, say Ferreira & Rios (2017).

They add that the owners of social media companies, search engines, browsers and websites have found a mine of the treasure, user data. Ferreira & Rios (2017) state that internet filters are tools that direct these users and that they are left without freedom of choice and, generally, do not perceive this condition.

The authors call this the "filter bubble", which encapsulates the user, by presenting him with what he likes, which does not always correspond to what he needs and this deprives him of the opportunity to test new ideas, products and information.

Hence, Ferreira & Rios (2017) say, the filter bubble effect leads the user to the "echo chamber", which is the constant repetition of something that the user subject already believed, through searches, exchanges of "opinions", "likes" and that through different ways and new navigations the same content emerges.

This is because algorithms record the data captured on the internet, social networks and search engines that keep the Internet user inside bubbles and this, by repeating insistently, produces the echo of information necessary to generate behaviors, opinions, feelings, among others, as previously described.

For this reason, the philosopher Véliz (2021) declares that privacy will be the most appreciated asset in the future, that Ethics on Artificial Intelligence (AI) should be used, as it stores the soul of users not in the sky of religion, but in the clouds.

In this way, Moraes & Testa (2020) declare that an Informational Ethics should be inserted to discuss the relationship between the human being and the digital technologies of the subject-connected-in-network. The etymological term of subject comes from the Latin *sub*, that which is below and *iacere*, placed, therefore, that which is subjected to some force.

The Philosophy of Mind, which investigates mind-body relationships, has vast material to propose debates that can expand the rationality about "Connected Virtual Narcissus", as it is the dimension between what is seen and what is felt.

In 2020, due to the quarantine and social isolation for the contingency of the Coronavirus, some behaviors became popular, the home-office, the home-office, entertainment, and interpersonal media relationships.

The tools for such work and social activity were smartphones, tablets, personal computers. In the use of these tools, the *imago* of the people appeared together with the *imago* of all those who were gathered in this meeting.

Some showed discomfort when they saw themselves all the time, often the participant's attention was linked to their own image. A type of concern appeared about their physical appearance, the environment-setting and about the noises inherent to the domestic environment that stood out all the time.

There have even been tools within devices to change the scenario behind you. But for some others, this condition was not a problem, people presented themselves online in a casual way, in typical environments of a house in the day-to-day routine, lying in bed, leaning over the living room or kitchen table, with people coming and going, swinging in hammocks, with domestic animals entering the scene.

In short, an unconditional novelty for both scenarios, there was no longer a clear distinction between the private and the collective, the public and the private, until the notion of time and the institution of the routine that it promotes was confused.

The traditional distinction between private life and public life is no longer significant.

They created applications that alter people's faces, putting on their *imago*, the appearance of animals, stars, symbols of the most varied, the distortion of the face and voice. Laughing at yourself, laughing at the other, changing the scenario, in short, would be a proposal for a joke to be able to deal with your image and endure it or just for fun, as with online games.

Also in 2020, with the murder of George Floyd, televised around the world, a worldwide debate was created about racism and in one of these debates he questioned the *Black Narcissus*, that is, how is the constitution of the subject and the self-esteem of an individual of black ethnicity in the face of so much adversity. By extension, one can think of 'white daffodil', 'yellow daffodil', 'trans daffodil', among other forms of 'daffodils' and the constitution of their self-esteem.

These related facts created a *thauma*, an astonishment, a curiosity to research the issue of the daffodil, as said, the constitution of a subject and his self-esteem associated with virtual, something potentially possible to accomplish, creating the concept 'virtual narcissus' connected to the internet.

This theme has moved a philosophical analysis about the self-image or mind of the Internet user and the possible relationships with his body-mind in navigation.

The Philosophy of Mind has the instruments to carry out this analysis and discussion, it has as its object of study precisely the mind-body relationship, thus allowing to obtain the necessary data to better understand the phenomenon in an interconnected world like today's.

Having as a basic reference the Myth of Narcissus, written by Ovid (43 BC – 17 AD) in the Hellenic period of Philosophy, which in addition to talking about self-love, provided the contemporary technical neologism, narcissism.

A classic human question that, contextualized for our days, finds coherent applications. Therefore, by naming it 'narcissism', it is intended to discuss issues such as 'body narcissism', 'moral narcissism', 'intellectual narcissism'. This demonstrates that we humans still have the same issues as in all the eras that have followed us, safeguarding the issues proper and inherent to their own era.

The phenomenon of the connected human is one of the main issues today, including the 'digital excluded' who still do not have access to the internet. This phenomenon, because it is still recent and because it has a very fast speed of updates and innovations, which sometimes there is no time to study them in depth, which in itself is already a problem, so fast that it is not possible to study them in the necessary depth, but it is already possible to observe their effects on society, in education, politics, geopolitics, economics, mental and physical health, among others.

Epistemology will still bring us qualitative and quantitative results about this human entangled in a virtual network. The Theory of Knowledge, in constant movement, will give us data on how the Internet user acquires knowledge from his principles of values, belief, truth and justification.

An observation of the nature of such a human condition can determine positive, negative, and blind points. Note that there is a lot of work for philosophers.

Some professional practices, such as teaching, clinical, philosophizing, governing, as well as some social practices, such as the formation of identity, ideological, religious, interpersonal, erotic, pornographic, and sexual groups have gained or assumed new spaces to exist in the virtual world.

In this way, the diversity of yesterday's ghettos gained today's public diversity to manifest itself, to exist, to appear, and that through a kind of rhizome found themselves connected to virtual networks and formed affinity groups that help each other. The cameras and microphones of personal mobile devices make up the new Agora in a virtual and globally connected world.

In such a short term, it is not yet possible to demonstrate how humans will absorb this new paradigm or how human relationships, such as mind-body, personal, interpersonal, social, work, political, ideological, religious, among others, will take place with the increase of Artificial Intelligence (AI).

On the other hand, some preliminary observations of this nature point to the risk of self-deception that involves from one's own appearance, by not recognizing oneself, through self-love, autoeroticism. Through the kidnapping of the mind, promoted by the 'masters of the mind', the Organizations that own the "domains" of the internet, commanded by Information Technology (IT), induce menticide and then logocide, is a probable risk. Generally these Organizations do not have any form of ethical, civil or governmental regulation.

It is also considered the permanence of the Internet user connected in a 'bubble' promoted by AI filters that leads him to the 'echo chamber'. A possible escape from the bubble and the echo chamber is to know the truth and obtain freedom under this condition. And this truth comes from the Philosophy that makes the connected human, philosophize on their own.

To this end, Plato's Allegory of the Cave can give us a relevant illustration, men kept looking at the bottom of the cave, saw only the reflections of what was presented to them, believed that this was the truth, they were deluded.

This is how a free mind will be, it will be one that recognizes its freedom and uses its free will to make free decisions and leave the captivity where it was kidnapped.

In some science fiction films, the 'future world', under the regency of the connection of things, robots, automation will be chaotic, dark, 'matrix' world, but the purpose of these films is to promote leisure and moments of entertainment and spaces for daydreams, promotion of sensations, but they do more than that, they provoke reflections.

Considering that series and 'streaming platforms', "data flows" and virtual games, as they promote an excess of entertainment, secreting in the body an "explosion of dopamine" that causes the feeling of pleasure and increases motivation, we see here the body-mind relationship. Therefore, nothing gloomy as in science fiction, but the warning sign has already been lit in some way.

In life, so-called real, there are already facts and evidence related to the connected human that must be researched and investigated, questioned, debated, regulated by rationality, as has been the philosophical tradition for millennia. It must be considered that one of the tasks of Philosophy is to 'futurar', that is, to observe the here-now in order to presume or infer routes to be created to arrive at a *telos* that brings happiness.

In the Myth of Narcissus, the young and handsome boy died of starvation due to toxic self-love when he found himself in the reflecting pool, confused by Echo. The question that currently arises about the 'virtual narcissus' is, by analogy, of the same magnitude, can the human be confused by the echo of the online connection and come to suffer from toxic self-love?

The dimension between what is seen in the virtual world and what is felt experiencing it in the physical world is attributed to the Philosophy of Mind.

2 THE POST-HUMAN

In the contemporaneity of a globalized and connected world, in which Information Technology and Automation have developed very quickly and in the face of a scenario in which Artificial Intelligence, as well as artificially produced organ or limb implants, the reality of robots and in the face of Automation Technology that is already enabled to make changes in DNA, Genetic Engineering places us in front of a new philosophical anthropology: the post-human.

As we innately inherit instincts and drives and in the face of this post-human "evolution", a question arises about how the relationship of parts implanted in the individual will take place and what will be the drive relationship of an individual with robots, what will be the relationship between the robots themselves, what identity of a post-human, what is the interference of Artificial Intelligence in this "new" non-Darwinian evolution. This is a real condition and one that must be focused on by the possible lights of Knowledge to understand it better.

Hawking (2018) asks: *"Will Artificial Intelligence surpass us?"*element. To this question, the author answers that intelligence is a central aspect of the human, from which arises everything that society has to offer. He says that intelligence comes from DNA and that DNA is incubated in transmitting it from generation to generation. The individual's sensory operations are stored in the brain or other systems to elaborate and perform functions. Hawking (2018) also states that it is in these "other storage systems" that they have become more intelligent and that in the evolved human they have produced consciousness.

In this sense, the author admits that computers can try to match or even surpass human intelligence or improve it, but they will never have a conscience, as this is an exclusive privilege of human beings who have neurons, neurotransmitters, hormones and a high-speed neuroelectric branch that the integrated circuits of machines will not be able to overcome.

Even though Hawking (2018) refers to Moore's Law that states that every eighteen months the speed of computers increases significantly, that this would demonstrate the 'self-evolution of humanity', since computers are designed and produced by humans, such a possibility is still small and remote.

He also believes that at a certain point Artificial Intelligence (AI) will find a way to surpass human intelligence and that AI itself will create itself without the help of humans.

In this regard, Philosophy will play a fundamental role in establishing the limits of AI, Philosophy of Mind and Computational Philosophy as well as Ethics will have to be ready on

this.

According to Hawking (2018), there are already economic sectors in which AI already makes decisions, plans, makes inferences, learns to manipulate machines used in industries and medicine such as those used by Neuroscience. However, he sees two issues with AI: general human-friendly benefits, but also potential unforeseen events if AI is no longer human-controlled. Therefore, he declares, there are already movements such as the European Parliament to regulate and control the creation of robots and AI itself.

Santos (2002) names this era "Post-Human", for this purpose, he says that the term is a neologism coined by Ihab Hassan, in the essay *Prometheus as Performer: Toward a Posthumanist Culture*, published in 1977, in Georgia Rewiew.

Santos (2002) cites the Nietzschean idea of the "superman", which is the being who, surpassing all values, would replace the last man through competition. Santos states that in the 1990s, due to the millenarian climate that led society to imagine that it was the end of History, some academics focused on this term, post-human, to demonstrate that techno-scientific, microelectronics, cyberculture, neuroscience and biotechnology developments were exerting a great impact on society. He states that the term post-human is still a term that has neither acquired density nor credibility as a descriptive or explanatory idea.

For the author, the term is a bet (SANTOS, 2002).

Santos (2002) also demonstrates that carbon (the basic element of biological life) and silicon (the basic element of microchips) are combining and promoting a revolution of the *cybernetic organism*, or cyborgs. In this way, ontologically, the being can become, the mixture of 'carbon with silicon' or 'protein with integrated circuit'. In other words, according to Santos (2002), this is a dialectical game, in which Materiality and Information are dialoguing more and more and faster.

The Age of Transhumanism is no longer a matter of science fiction, but a given fact.

For Teixeira (2010), due to the stagnation of man's evolution, due to his great distance from Nature, makes him couple himself to the world through the virtual, causing a new type of evolution mediated by equipment and machines. For Santos (2002), the human body, through the aging process, physically involutes, but Medicine, making use of Technology, has guaranteed methods for longevity to be extended. This is when hearts, kidneys, organs emerge that are machines created to help or even replace human tissue.

Teixeira (2010) states that implants of *integrated chips* and plates, such as organs printed in three dimensions (3D), can be called "parabiosis", where there is an association of the human through non-organic implants – becoming, finally, hybrid machines.

According to Teixeira (2010), in the near future cyborgs and robots will be among us humans in a natural way, overcoming the astonishment of the present day. For the author, the Post-Evolutionary world, in the virtual age, will have its own 'Philosophy' that can be formulated by the AI of robots and cyborgs themselves.

This is the Post-Human Era or Neurodigital Convergence (TEIXEIRA, 2010).

Teixeira (2010) demonstrates that machines can make us happier, and that parabiosis is not the realization of a utopia, but a technical and innovative evolution. In this sense, he continues, 'philosophy' itself may become extinct, since Robotic Epistemology may lead it to "extinction" – like the extinction of a species of Nature – in this case, the Philosophy of Science.

How will cyborgs have hybrid bodies, how will they express themselves, how will their personal identity be determined, and how will they experience personal experiences?

Also according to Teixeira (2010), the body needs to be conceived as a pre-linguistic entity and not a mere replication of the mind, the soul on a chip or in a program or application, via programming such as the behaviorist. In the post-human, the Philosophy of Mind is highlighted, and how it will manifest itself at this moment: just as a kidney can be replicated by a hemodialysis machine, in the future, the brain can also be replicated by some electronic device.

Following this reasoning, Tadeu (2000) says that human subjectivity today is a construction in ruins, since the "Masters of Suspicion", namely Marx (1818-1883), Freud (1856-1939), Nietzsche (1844-1900) and not to mention Heidegger (1889-1976), began their questioning. Since then, Philosophy has gained another contour. The author makes a provocation, through questions such as: "Do we still want to be subjects?" and "Who needs the subject?".

In this sense, Tadeu (2000) presents some cyborg technologies: a) Restoration of functions, replacement of lost organs and limbs; b) Normalizing, that is, creatures return to an indifferent normality; c) Reconfigurators, they create post-human creatures that are equal to human beings and at the same time different from them; d) Improvers, they create creatures that are better than the human being (TADEU, 2000).

In other words, according to Tadeu (2000), a paradox has been established, on the one hand there is the mechanization and electrification of the human, on the other, there is the humanization and subjectivation of the machine. It is precisely from the combination of these processes that the post-human creature emerges that will soon circulate among us naturally.

For Costa (2005), both Cartesian dualism and the monism of behaviorism do not clarify the Philosophy of Mind. In this way, the "mystery of consciousness" is the great metaphysical

problem of the Philosophy of Mind. Also according to the author (COSTA, 2005), the development of the Philosophy of Mind at this time is the greatest recorded in the last twenty centuries that preceded it.

Wittgenstein's work *"Philosophical Investigations"*, from the beginning of the 20th century, demonstrates this development. In this work, Wittgenstein, quoting Nestroy (known as the Austrian Shakespeare), says that "progress seems much greater than it really is" (WITTGENSTEIN apud COSTA, 2005, p.7).

This revolution, referring to the Philosophy of Mind Revolution, occurred as a reflection of other developments that began with the introduction of new methodologies of philosophical analysis and the emergence of new scientific domains, such as Neurophysiology/Neuroscience, Cognitive Psychology and Artificial Intelligence. And without a doubt Informatics (COSTA, 2005).

Costa (2005) also points out that, when neuroscience is able to explain how the brain works, what are the areas of the sensitive material or neurofunctional structure, such as sensations, perceptions, quasi-perceptual states, emotions, cognitions and conative states (and how from this explanation the "mobile center of egoity" is produced), then consciousness will become a mere physical property of biological matter. On this day – says Costa (2005) – the mystery of consciousness will disappear like smoke in the air.

Franco (2001) presents a new term, created in the 1980s, "Extropy", which has a meaning opposite to that of Entropy, this is the constant loss of energy tending to bankruptcy or extinction. According to Franco, Extropy challenges Entropy when it proposes a principle of limitless expansion of human life and consciousness. A part of this principle, the author explains, is the "transbiomorphosis", which is a discharge, or *upload*, of human consciousness into a computer chip that will enable the infinite perpetuation of life.

As in a synaptic connection between neurons, they are connected by electrical impulses in an integrated circuit, so using these electrical impulses, an individual's neurosynaptic information can be copied onto a silicon chip. That would be the complete replacement of meat *hardware* with biomechanical hardware. According to Franco, the adherents of the Extropian philosophy are in favor of any technology that preserves the advancement of longevity, of consciousness in the chip, in digital devices, of the body, which includes the *corpsicles*, which are those maintained by cryogenics in the hope of future reanimation – which for the author, are the so-called post-human bodies².

² FRANCO, E. S. The Manifesto of Extropian Art and the work PRIMO 3M+: Proposal for a Post-Human Body. Year 2001. **Compós: National Association of Graduate Programs in Communication**. Available: <http://www.compos.org.br/data/biblioteca_953.pdf>. Accessed on: 09 set. 2025.

Teixeira (2010) cites an article that Freud (1956-1937) wrote in 1919, for his friend Ferenczi (1873-1933), entitled *The Stranger*, in which he analyzes the short story by Ernst T.A. Hoffman (1776-1822), *The Sandman – The Sandman*, as an Aesthetic question – which is understood not as a simple theory of beauty, but as a theory of the qualities of sensation, of feeling, demonstrates the strangeness that the image of the sandman, an inanimate being that seemed animated, provoked in those who saw him.

According to Teixeira (2010), Freud, when analyzing Ernst T. A. Hoffman's short story, observed that people experienced a feeling of strangeness that generated doubts in the face of the automaton being, that it caused them the sensation of a "double", that is, of projecting onto the sand man, who seemed alive and possessed a soul, your own ego.

But at the same time, this *imago* demonstrated to the spectators that one day they would become mineral like him or that they would be overtaken by the 'sandmen'. This "double" demonstrates the narcissistic wound or frustration and impotence of the human being in wanting to perpetuate himself even if it is in a mass of silica, such as sand.

Clearly the question of death appears in this tale of the twentieth century. XIX and updated today with evidence of the innovations of the century. Therefore, according to Teixeira (2010), the fear in order not to become inorganic, is one of the human desires, to achieve immortality, even if it is in a post-evolved body, in a post-human body.

Finally, Tonetti (2008) considers that the terms "soul", "mind", "consciousness" and "spirit" are in the heart of philosophers and religious people, while the terms "brain" and "brain" continue to have more affiliates in the field of Science. With this argument, the author demonstrates that there is still a dualism, if not in the domains of human thought, there is at least a kind of methodological "dualism".

The Philosophy of Mind is the reflection on nature, on its essential properties, as well as the analysis of the cognitive capacities of the human, as well as discussing its properties, how the spirit, the soul and more recently the brain occur.

In the face of the current biotechnological revolution, the post-human revolution will change, alter, implement new characteristics in this brain-organ, altering the reflection we had of it until recently. This organ will be subjected to stimuli that it has never experienced.

A few years ago, before imaging exams, such as Magnetic Resonance Imaging and Computed Tomography and biochemical exams to understand hormonal functions and neurotransmitters, the human brain was studied through donated samples, that is, they were killed. Even so, several models of their functioning were inferred. Currently these image searches bring knowledge with the living person.

These assumptions have given Neuroscience new paths and it is sailing through seas never before navigated. From this arose the possibility of perfecting this organ-apparatus that turns human into an "I". Add to this Technology and Genetic Engineering, which from the mapping of the human genome, can do any reengineering in chromosomes, DNA's, such as CRISPR – gene editing, cloning and finally "creating" the new human being from stem cells in the laboratory. I call this *post-human evolution*, absolutely distinct from Darwinian evolution, which in the face of the scientific-technological advancement of laboratories, now looks more like a myth or a children's fable.

Is this an era of the New Enlightenment Revolution, a New Enlightenment?

But the vital energy, that innate force that drives the human along the paths of life to perpetuate the species, continues to manifest itself in each conceived being, whether naturally, *in-vitro*, by genetic engineering, by cloning. Life, regardless of the way in which it was generated, is inseparable from the being generated, Nietzsche's "will to power" is there and can be observed because it is a phenomenon and a manifestation of the spirit, the soul, the mind of this being.

After all, the opposite of death is birth and not life. There is no opposite to life.

In this post-modern, liquid world, there are already humans considered cyborgs, such as the first of them, Neil Harbisson, who since 2004 has received this condition in his English passport. It is worth mentioning here that a cyborg has an additional "sense organ" that is distinct from ordinary humans, the implant itself.

Currently there are robots making public services at corporate, judicial, commercial events, at concerts, there is even the United Arab Emirates, a female robot with a birth certificate and identity document.

The word robot comes from the Czech *robota*, which means 'forced labor' or 'slavery'. This term became popular after it was used in a play in 1920 whose title is R.U.R.; Rossum's Universal Robots by writer Karel Čapek (1890-1938), ³in the play were humanoid prototypes that performed heavy work and were not a carbon fiber machine like those of today.

For this reason, Ferrando (2023) says that the presence of the robot interferes with the current Culture and Imaginary and that technological transformations and the boundaries between human and machine are already part of the Post-Human Imaginary.

In the Post-Human, the question of the species and gender of robots will also be a theme of reflection in Philosophy. The question of the will to power in the post-human subject, in cyborgs, in robots, in artificial intelligence is an open question. The dawn of a new paradigm of

³ ČAPEK, Karel. R.U.R.: Rossum's Universal Robots. Critical edition. London: Penguin Classics, 2020.

human is emerging on the horizon of the twenty-first century.

What will be the questions of Philosophy in the face of this *contemporary* thauma?

3 PHILOSOPHICAL ADVICE: FROM ANCIENT GREECE TO THE PRESENT DAY

The year 2020 began with a serious health threat, a lung infection of unknown origin that manifested itself in December 2019 in a market in the province of Wuhan in China that soon became the COVID-19 pandemic. In this scenario, humanity plunged into an existential crisis, fear, insecurity, anxiety, depression, and the expectation of an immunizer. Human existence has been threatened and self-care has become a priority.

The issue of the pandemic accelerated the massive use of devices connected to broadband internet that connected all people who had access to a Wi-Fi network, an advanced technology already available at the time that eased the anguish of the moment. A real malaise in civilization.

The malaise of civilization was an ideal moment for philosophers to act with Philosophical Counseling, which with its practices gave meaning to existence and helped many to adjust and alleviate the existential and emotional suffering of that 'new reality', of the old 'new normal'. Those who sought consolation in Philosophy, in addition to finding it, began to philosophize on their own.

Regarding the performance of philosophers, the Brazilian Classification of Occupations – CBO, instituted by ministerial ordinance no. 397, of October 9, 2002, aims to identify occupations in the labor market, for classification purposes with administrative and household records. The description of the activity of graduates in Philosophy is in Code 2514-05:

They critically and systematically reflect on the being and destiny of man and the world, through the assimilation of the classics of thought and the realization of research on philosophical themes, such as ethics, epistemology, aesthetics, ontology, metaphysics, politics, logic, culture, among others, with the purpose of *training* and *guiding* people and *advising* organizations. (CBO, 2002)

Therefore, graduates in Philosophy can work in spheres such as Philosophical Guidance, Philosophical Counseling, Clinical Philosophy, Therapeutic Philosophy, Philosophical Dialogue, Philosophical Coaching, Philosophical Mentoring, Medicine of the Soul, Philosophical Analysis both in the Personal and Organizational spheres. For this Theoretical Philosophical Essay, the term Philosophical Counseling (FA) will be used.

3.1 THE EVOLUTION OF THE CONCEPT OF "I"

From Ancient Greece we inherited the universal concept, psyche, which is the conception of a consciousness or soul, as Abbagnano (2018) demonstrates. According to Abbagnano (2018), the concept of psyche was translated into Latin as soul and expresses the principle of life, sensitivity, and spiritual activities that constitute an entity in itself.

Teles (1974) states that each one should have their own philosophy of life or a worldview, the *weltanschauung*, from the German *welt* = world and *anschauung* = vision, which can be *optimistic, pessimistic, conservative, progressive, retrograde, advanced, motivating or inhibiting, among others*.

For Teles (1974), having one's own philosophy of life indicates that each one attributes their own meanings to their personal experiences. The same author clarifies that the mythical phase is a primitive narrative explanation to explain an existential function of man to give him existential meaning, by analogy each man has his mythical phase that specializes throughout his life, expanding or not his worldview.

In Ancient Greece, what is called the miracle of rationality occurred, as follows:

Two main motives have concurred in leading man from mythical to rational thinking: first, the contradictions of mythical thought, and secondly, the natural strengthening of reason, which has come to be exercised in more critical terms. (TELES, 1974, p. 19).

From the emergence of reason in more critical terms and about everyday life, Chauí (1999) clarifies that man asks questions, makes statements, evaluates things, people and himself. According to Chauí (1999) these questions and statements silently contain *unquestioned beliefs*, thus concepts such as truth, thought, procedures, relations between theory and practice and accumulation of knowledge are philosophical questions.

Abbagnano (2018) adds that the pronoun "I" is the way in which man designates himself and that this pronoun has become the object of philosophical investigation.

For philosophical research, Franca (1987) argues that one should follow human thought in the different phases of its Knowledge, in the different eras or epochs, and inventorying the efforts and attempts of intelligence, the questions of the universe and the vision of man throughout Philosophy, from Ancient Greece to the present day.

Therefore, Philosophical Counseling can contribute to the querent so that he leaves his phase of myth or unquestioned beliefs and reaches his rational phase, of knowing himself or reflecting on himself.

3.2 HEALING BY THE RATIONAL WORD

Smolka (1972) says that in the cultural and religious tradition of Ancient Greece there was a pilgrimage to the Oracle of Delphi. Souza (1992) clarifies that in the oracle a querent receives a divine message or answer to a consultation, by extension, it refers to a sanctuary in which sacrifices and questions are made to the gods through a priest, who is also responsible for bringing the answer to the requesting querent. Souza (1992) also clarifies that the word oracle retains its double meaning of "means or instrument to speak" with a god and "brief oral response" of this god through the priest.

By analogy, the oracle is the space from which the Counseling takes place, the querent is the one who wants or needs to know himself and the priest is the philosopher.

Fossatti (2003) adds that in this period, the sixth century BC, it was common for any Greek citizen or foreigner to go for advice at the Temple of Apollo in Delphi, where the inscription in Greek, *Know thyself*, is written. Fossatti (2003) explains that such inscription was a warning to the oracle's consultants, as it aimed at the purification of the soul through the individual's speculative knowledge about himself.

However, Smolka (1972) says that this attitude was mystical.

Teles (1974) demonstrates that he was the pre-Socratic philosopher of the twentieth century. V BCE, Empedocles of Agrigento (494-430 BCE), the first to consider two abstract human principles in addition to reason. These principles are *love* and *struggle*, both would be responsible for the union or disintegration of the primordial elements: earth, air, water and fire.

According to Teles (1974), Empedocles of Agrigento conceived that all compound substances are short-lived, like matter, and that only the four primordial elements and the two principles are eternal because they are precisely simple.

Forghiere (2007) adds that it was Empedocles of Agrigento who was the first philosopher to use words or counseling as a treatment for the ills of the soul, he was the first to deal with abstract human issues, not considering them as a merely physical element.

Franca (1987) also admits that Empedocles da Agrigento conceived the soul as composed of the four elements and the two principles, this would explain the possibility of the human seeking knowledge, since the soul, through cognition, learning through the sense organs and experience, can copy nature and apprehend it for itself.

Ghiraldelli Jr (2012) says that in the phase of Socrates (470-399 BC), he practiced maieutics, that is, giving birth to ideas, leading people to think of themselves and about themselves, to make an examination of their lives.

What Ghiraldelli Jr (2012) calls "the medicine of the soul", says that Plato (428-348 BC) considered that the soul was improved through love, *eros*, therefore erotic. According to Ghiraldelli Jr (2012), Aristotle (394-322 BC) when talking about the 'good city', the polis, brought in its context the concept of "quality of life".

It was only with the Hellenic philosopher Epicurus (341-279 BC) that the 'medicine of the soul' became something close to medicine, that is, treating through a therapy of the psyche, with the tetrapharmaco, declares Ghiraldelli Jr (2012).

For Chaufí (1999), in the Hellenic period, the Stoic philosophers only considered the body, even the soul was only corporeal, they were monists, whose relationship with the 'real object' needed logic to apprehend its meaning and significance.

In the phase of Modern Philosophy, Blaise Pascal (1623-1662 AD) in his posthumous work *Thoughts* of 1670 considers, in the midst of the rationalist movement, that reason should be based on the 'knowledge' of the heart and on the 'instincts' as follows, *the heart (intuition) has reasons that reason itself does not know*.

For Ghiraldelli Jr (2012), Rousseau (1712-1778 AD) already called alienation the 'disease of the soul', well before Karl Marx (1818-1883 AD) and for Foucault (1926-1984 AD) the soul imprisons the body by social conditioning.

Ghiraldelli Jr (2012) states that Philosophy was born as the "medicine of the soul".

Who has a sick soul? Is there a special medicine for those with a sick soul? [...] The medicine of the soul was born as Philosophy. There are those who even go so far as to say that Philosophy was truly born as a medicine of the soul. (GHIRALDELLI JR, 2012, pg. ix).

3.3 SOME CONTRIBUTIONS OF NEUROSCIENCE TO PHILOSOPHICAL COUNSELING

Tieppo (2019) demonstrates that Neuroscience began in pre-Socratic Greece when two currents of thought were in force, one of the philosophical currents said that the soul was located in the heart, the other, however, said that the soul was located in the brain, the encephalocentrists, whose exponent was Hippocrates of Kos (460-370 BC), who was later followed by Plato.

Tieppo (2019) also demonstrates that it was Renè Descartes (1596-1650 AD) who paved the way for the systematic study of the brain organ, when he stated the differences between substances, the *res cogitans* (mind) and the *res extensa* (body), the body that thinks. However, the brains were of the dead. Tieppo (2019) clarifies that it was only in the late 1980s, with the beginning of neuroimaging, that there was a revolution in the understanding of brain functions *in vivo*. For this reason, the 1990s are called the "Decade of the Brain".

So, currently, given the degree of knowledge of brain processes, Neuroscience goes beyond studies of brain pathologies and focuses on the investigation of the mind, consciousness, the unconscious, emotions, and human behavior, mapping the brain, says Tieppo (2019).

For Tieppo (2019), Neuroscience denies the existence of the mind as immaterial and recognizes that mental processes are the result of our Central Nervous System (CNS), therefore, they are the result of electrical impulses in neurons and, thus, it is monistic.

From Neuroscience, Goleman (2012) states that Emotional Intelligence is a powerful model for education in the form of emotional, social, professional, I would say also philosophical, being an active agent in a full life and that took advantage of the "Decade of the Brain" to create this new concept, Emotional Intelligence. Goleman (2012) structured a new Field of Knowledge: Affective Neuroscience.

Goleman (2012) says that, in his research, he made discoveries of certain areas or regions of the brain involved in self-awareness that help us with ethical issues and decision-making, the Neocortex, the Thinking Brain. Goleman (2012) says that self-mastery requires self-awareness and self-regulation, these are fundamental components of Emotional Intelligence.

The activation of the Prefrontal Cortex is essential for self-regulation and is considered by Goleman (2012) as the "good boss" of the brain, as it guides us to the best of us. The *cerebral amygdala*, both on the right and left sides, are the brain's radar for threats, it is the point at which anguish, anger, impulsivity, fear are triggered and when this circuit "takes" the command it starts to act as the "bad boss", leading the human to take wrong attitudes.

When the Prefrontal Cortex is dominated by the cerebral amygdala, what Goleman (2012) calls "amygdala hijacking" occurs.

The amygdala is the brain's radar for threats. Our brain was designed as a survival tool. In the sole of the brain, the amygdala holds a privileged position. If it detects a threat, in an instant it manages to dominate the rest of the brain—particularly the prefrontal cortex—and we have what's called amygdala hijacking. Hijacking captures our attention, projecting it onto the ongoing threat. (GOLEMAN, 2012, pg. 39).

In order for this hijacking of the cerebral tonsils not to occur, the person must be attentive and alert about the possible hijacking and, through the activation of the Prefrontal Cortex, not lose balance, says Goleman (2012). By knowing oneself and learning to reflect on oneself using the tools of Philosophy, it is equivalent to having a predominance of the Prefrontal Cortex.

It is a conscious choice, therefore, teachable, to maintain the predominance of the prefrontal and, thus, inhibit the "short temper" action of the tonsils, says Goleman (2012). To

maintain control of the prefrontal, Goleman (2012) suggests some efficient "choices", such as mindfulness, motivation, self-awareness, empathy, mindsight, optimal performance, that is, maximum use of the brain, with emotional learning.

Regarding the convergence between Philosophy and Neuroscience, *Neurophilosophy*, Fischer and Facion (2011) propose a question, "a new image of a person?", thus opening a debate on the new "I", on brain determinism, on the constitution of free will, on neuroethics, undoubtedly a field of Philosophical Anthropology.

3.4 THE PRACTICE OF CURRENT PHILOSOPHICAL COUNSELING

It was in 1981 that the German philosopher Gerd Achembach proposed Philosophical Counseling as a practice of a Philosophy that was not Academic, not restricted to intellectual debates, but that reached ordinary people, with their existential needs, Pechula (2007) clarifies.

Nardi (2017) when presenting the method of Philosophical Counseling cites Immanuel Kant (1724-1804 AD) who recommended that one should teach to philosophize and not to teach about Philosophy, in this way he approaches the Socratic method, of leading the advised to give birth to their own ideas.

For this reason, Pechula (2007) adds that current Philosophical Counseling goes back to its true origin in Ancient Greece, where there was the "philosopher therapist", the "doctor of the soul" or the "philosophical advisor", this current found repercussion with Marc Sautet in France, with Lou Marinoff in the United States, with Lúcio Packter and the Research Group in Applied Philosophy (GPFA) of Claretiano/CNPq in Brazil.

Achembach (2006), in addition to being a pioneer of the current Practical Philosophy movement, explains that Philosophical Orientation is a philosophy focused on life and that it is currently an alternative to psychotherapies, since it is for people who do not feel bad enough to consult with psychotherapists, but that it is for those who have the impression that their real life does not correspond to their existential expectations and who want to reflect about their vital circumstances, which they want and desire to understand and be understood.

Oliveira (2014) says that Ran Lahav illustrated, based on Plato's Allegory of the Cave, that the objective of Philosophical Practice is to provide rational and emotional conditions for the practitioner to leave his cave and see the "light".

Ran Lahav shows through Plato's allegory of the cave that the goal of philosophical practice will not be to "make life in the cave more comfortable", but to "get out of the cave". However, we have to understand "our cave" in order to "get out of it". This is the process that philosophical practice must operate: "mapping the cave". It is necessary,

according to Lahav, to understand our cave: the emotional and rational "perimeter" of action in life. (OLIVEIRA, 2014, ed. May/2014).

Menezes (2011) demonstrates that Philosophical Counseling, in the sense of a specifically philosophical application, is available to help, to guide the individual in his personal relationship with himself.

For Marinoff (2012), people always knew that Philosophy was good for something, but they could not explain exactly what for. Everyone has a philosophy of life, but few have the possibility to analyze their own life and even form their own philosophy throughout it, ponders Marinoff (2012).

The philosophical practice of Philosophical Counseling can be carried out in two formats, Marinoff (2012) clarifies that in the first it is in an Individual way as in the counseling itself and in the second it is in a Group way as in the Socratic Dialogues, in the Philosophical Cafés and in the Organizations.

Marinoff (2012) also clarifies that philosophical analysis means dividing the concept into its parts, as simple as possible, in order to reveal the logical structure contained in these fragments.

About Freedom, Abbagnano (2018) states that "Epictetus said that *the things that are in our power were free*, that is, the acts of man that have a beginning in man himself". In other words, "knowing oneself" is in the sphere of one's power and has a principle in oneself. By inference, I affirm that "*Freedom emancipates man by nature*" (Sérgio Máscoli, 2026).

About Logic, Abbagnano (2018) demonstrates that it is a set of coherent statements, where each part or fragment of the analyzed statement is true, and that when a part of the statement is false, then there is a fallacy, where every argument is false. For Nardi (2017), the use of reason to intervene in the problems that a person faces requires him to adopt a *rationalist philosophy* and abandon his own irrational beliefs, without logical reason or his myths with the support of the philosophical advisor.

Philosophical Counseling, although it may seem, is not a recent practice. Philosophy was born *as a counselor*, whose starting point is *thauma*, astonishment and admiration, not only about *physis*, nature, but also about the human being, his stay and his life in the world over time.

Man, in the same way, can change his impressions and his ideas, while remaining the same ego. [...] Unity is neither absolute nor rigorous: it is formal and approximate, founded on the relative constancy of certain relations between the parts or moments of the self. (ABBAGNANO, 2018, pg. 454).

Philosophy formulates questions, therefore, it is a listener of the answers it receives and thus, through dialogue, reflection arises, knowledge always open to the human as well as to Philosophy itself. After all, Philosophy glimpses the eternal newness of this world.

The *polis* represented the apex of Greek civilization and by a *polis* one can understand the collective of humans: men, women, children, slaves or foreigners, even if only men born in Athens were recognized as free citizens.

However, everyone wanted to know their destiny and what route was reserved for them. And in a search to know the purpose of their existence, oracles emerged, where gods were consulted through a priest, who was still a "philosopher", who brought the querent answers to his questions.

With the passage of time, the oracle became the Agora, the latter became the Confessional, the latter became the Chair and the latter became Radio and TV, the latter gained a personal camera and microphone and, finally, these became the World Wide Web, the Internet.

All thanks to the advances in Technology and Innovation, rudimentary and mystical in the beginning and now highly specialized, in which the figure of the philosopher and his rational advice become increasingly essential for the prevention of damage and for the logical contingency of personal, institutional, business and organizational exaggerations.

This technology has made Neuroscience clarify that the rationally chosen control of the cerebral *amygdala* by the activation of the Prefrontal Cortex, is equivalent to rational Stoic sapiential practices, where the attribute of a great soul or reason is to have calm, tranquility, stress control and look with pride at the difficulties imposed on the human, resilience.

At a time when humanity was faced with its own fragility and finitude, the becoming, in short, of existential questions, it became necessary to act as Philosophical Counseling and now this practice is becoming increasingly popular.

Therefore, the philosophical practice of Philosophical Counseling, a Field of Knowledge, represents throughout its journey an invitation to the human being to examine himself, to know his subjectivity, to recognize himself, to seek his *eudaimonia*, his *good spirit*, in other words, his happiness which is "walking towards wisdom", "being a friend and lover of wisdom", Only then will its existence have been worth living in this globalized and interconnected world.

ABSTRACT

With the advancement of immersive technologies and the growing use of humanoid characters in digital games, simulations, training systems, and educational applications, it becomes necessary to understand how different visualization modes influence users' perception of these characters. This paper presents the development of augmented reality and virtual reality environments to evaluate the perception of the Uncanny Valley in 3D humanoid characters with facial and body movements. The study compares three visualization conditions: computer monitor, virtual reality headset, and augmented reality headset. The methodological approach is quantitative, using Likert-scale questionnaires and statistical analysis through one-way ANOVA and Tukey post-hoc tests. The results indicate that the type of display influences the perception of similarity, strangeness, likability, presence, and movement naturalness. Immersive devices tend to attenuate perceived strangeness, whereas computer monitors tend to intensify perceptual discomfort in characters with facial and body movements. The augmented reality headset presents favorable performance in the perception of similarity and likability, while the virtual reality headset stands out in measures associated with presence and naturalness under specific conditions. It is concluded that the development of humanoid characters for immersive media should consider not only visual realism, but also the type of display and the dynamic naturalness of movements.

RESUMO

Com o avanço das tecnologias imersivas e a ampliação do uso de personagens humanoides em jogos digitais, simulações, treinamentos e aplicações educacionais, torna-se necessário compreender como diferentes formas de visualização influenciam a percepção desses personagens. Este artigo apresenta o desenvolvimento de ambientes de realidade aumentada (RA) e realidade virtual (RV) para avaliação da percepção do Vale da Estranheza em personagens humanoides 3D com movimentos faciais e corporais. O estudo compara três condições de visualização: monitor de computador, capacete de realidade virtual (HMD-RV) e capacete de realidade aumentada (HMD-RA). A proposta metodológica adota abordagem quantitativa, com coleta de respostas por questionários em escala Likert e análise estatística por ANOVA de um fator e testes post-hoc de Tukey. Os resultados indicam que o tipo de display influencia a percepção de semelhança, estranheza, simpatia, presença e naturalidade dos movimentos. Observa-se que os dispositivos imersivos tendem a atenuar a estranheza percebida, enquanto o monitor de computador apresenta maior tendência a intensificar o desconforto perceptivo em personagens com movimentos faciais e corporais. O HMD-RA apresenta desempenho favorável na percepção de semelhança e simpatia, enquanto o HMD-RV se destaca em medidas associadas à presença e naturalidade em determinadas condições. Conclui-se que o desenvolvimento de personagens humanoides para mídias imersivas deve considerar não apenas o realismo visual, mas também o tipo de display e a naturalidade dinâmica dos movimentos.

RESUMEN

Con el avance de las tecnologías inmersivas y el uso cada vez mayor de personajes humanoides en juegos digitales, simulaciones, capacitación y aplicaciones educativas, resulta necesario comprender cómo las diferentes formas de visualización influyen en la percepción de estos personajes. Este artículo presenta el desarrollo de entornos de realidad aumentada (RA) y realidad virtual (RV) para evaluar la percepción del Valle Inquietante en personajes humanoides 3D con movimientos faciales y corporales. El estudio compara tres condiciones de visualización: monitor de computadora, casco de realidad virtual (VR-HMD) y casco de realidad aumentada (AR-HMD). El enfoque metodológico adopta un enfoque cuantitativo, con recopilación de datos mediante cuestionarios de escala Likert y análisis estadístico mediante ANOVA unidireccional y pruebas post-hoc de Tukey. Los resultados indican que el tipo de pantalla influye en la percepción de similitud, extrañeza, simpatía, presencia y naturalidad de los movimientos. Se observa que los dispositivos inmersivos tienden a atenuar la extrañeza percibida, mientras que el monitor de computadora muestra una mayor tendencia a intensificar la incomodidad perceptiva en personajes con movimientos faciales y corporales. El HMD-AR muestra un rendimiento favorable en la percepción de similitud y simpatía, mientras que el HMD-VR destaca en medidas relacionadas con la presencia y la naturalidad bajo ciertas condiciones. Se concluye que el desarrollo de personajes humanoides para medios inmersivos debe considerar no solo el realismo visual, sino también el tipo de pantalla y la naturalidad dinámica de los movimientos.

1 INTRODUCTION

The creation of 3D humanoid characters occupies a central position in different fields of contemporary digital media, especially in digital games, VR environments, AR applications, simulations, training, and experiences associated with the metaverse (MYSTAKIDIS, 2022). As these characters visually approach human beings, users' expectations for the naturalness of their behaviors, expressions, and movements are expanded. However, the partial approximation of human realism can produce a negative reaction known as the Valley of Strangeness, a phenomenon in which quasi-human entities provoke discomfort, restlessness or perceptual rejection (MORI; MACDORMAN; KAGEKI, 2012).

The challenge is not limited to visual appearance. In digital environments, humanoid characters are not only observed as static images; They talk, walk, blink, direct their gaze, gesticulate, and in some cases approach the user in virtual or augmented space. In this way, facial and body movements become decisive elements for the perception of naturalness, since visual and movement factors can directly interfere in the evaluation of virtual characters (JIANG et al., 2022). Small inconsistencies in the gaze, lip synchronization or body can break the illusion of presence and accentuate the feeling of strangeness, especially in immersive experiences in which the incorporation and perception of the virtual body are more sensitive (LUGRIN; LATT; LATOSCHIK, 2015). On the other hand, movements perceived as natural can contribute to greater acceptance, sympathy, and perceptual comfort.

The literature on the Valley of Strangeness is extensive in studies with static images, robots, virtual agents or characters visualized on monitors. However, there are still gaps when considering 3D humanoid characters in motion, evaluated on different displays and, especially, in augmented reality environments. Previous studies indicate that the type of display can alter the perception of avatars and digital characters, especially when comparing monitors and helmets (HMDs) (HEPPERLE et al., 2022; SEYMOUR et al., 2021; YAN, 2019).

The use of HMDs alters the spatial relationship between user and character. On the monitor, the experience takes place in a two-dimensional window far from the user's body; in HMD-VR, the user is transported to a digital environment; in HMD-RA, the virtual character is perceived as superimposed on the physical space. This difference can modify the way the character is perceived.

In this context, this article presents the development and evaluation of immersive environments to investigate the perception of the Valley of Strangeness in 3D humanoid characters with facial and body movements. The proposed cut focuses on the relationship between the type of display, the naturalness of the movements and the perception of the

characters. The research compares three visualization technologies: computer monitor, HMD-VR and HMD-RA. The variables evaluated include human likeness, strangeness, sympathy, presence and naturalness of eye, lip, body and combined movements.

The objective of the article is to analyze how different displays influence the perception of 3D humanoid characters, considering the construction of controlled environments, the presentation of characters with specific movements and the collection of subjective responses through numerical scales. The main contribution is to articulate technological development and perceptual evaluation, offering subsidies for projects that use humanoid characters in immersive media, digital games, training, education and interactive communication.

2 VALLEY OF STRANGENESS, HUMANOID CHARACTERS AND IMMERSIVE DISPLAYS

The Valley of Strangeness is usually associated with the hypothesis proposed by Mori in 1970, according to which human affinity for robots or artificial entities tends to increase as human resemblance grows, until a region of discomfort arises when the entity becomes almost human, but still has noticeable imperfections (MORI; MACDORMAN; KAGEKI, 2012).

The discussion about the uncanny, however, precedes the formulation of the concept in the field of robotics, appearing in studies on uncertainty in the face of apparently animated objects or quasi-human figures since the beginning of the twentieth century (JENTSCH, 1997; FREUD, 2017). In later translations and revisions, the phenomenon is discussed with terms such as strangeness, sympathy, familiarity, and affinity, used to describe different emotional responses to humanoid figures (KÄTSYRI et al., 2015). These constructs also appear in measurement instruments aimed at evaluating robots and humanoid agents, such as the Godspeed scales and later derivations (BARTNECK et al., 2009; HO; MACDORMAN, 2010; HO; MACDORMAN, 2017).

This phenomenon is particularly relevant in the development of virtual characters, as human realism is not evaluated only by appearance. Skin texture, facial proportions, look, expression, posture, gesture, speech, and synchronization between sound and movement make up a perceptual set. When there is inconsistency between these elements, the user may perceive the character as artificial, disturbing, or uncomfortable. The problem becomes more sensitive in humanoid characters because the observer has a refined perceptual repertoire to identify subtle deviations in human faces and bodies, especially in facial and movement features (JIANG et al., 2022).

In static characters, the strangeness can stem from visual features such as blurred eyes, rigid facial expression, or ambiguous anatomical proportions. In animated characters, the field

of evaluation expands. Eye movement may suggest attention, social contact, or avoidance; the lip movement needs to maintain coherence with speech; Body movement needs to follow the weight, balance and intention of the action.

Thus, movement can both reduce and intensify the Valley of Strangeness, since the original hypothesis already distinguishes responses to static and moving entities (MORI; MACDORMAN; KAGEKI, 2012). A visually simple but well-animated character may be more acceptable than a realistic character with incoherent movements.

Immersive displays add another layer to the problem. VR promotes isolation from the physical environment and construction of presence in a digital space (BURDEA; COIFFET, 2003; SLATER; SANCHEZ-VIVES, 2016). AR, in turn, preserves the physical space and inserts virtual objects on top of it, creating a hybrid experience (AZUMA, 1997; AZUMA et al., 2001).

This relationship can be understood in the reality-virtuality continuum, in which AR and augmented virtuality occupy intermediate positions between the real and the virtual (MILGRAM et al., 1995).

When a humanoid character is observed in AR, he begins to dispute perceptual coherence with the real world. Its scale, position, lighting, distance, orientation and spatial registration become fundamental, as the alignment between virtual object and physical environment is a central requirement of AR applications (TORI; HOUNSELL; KIRNER, 2018).

In VR, according to the same authors, coherence depends on the stability of the virtual environment, the quality of rendering and the response to the user's movements. On the monitor, observation tends to be more distanced, but also more critical of isolated visual details.

Therefore, the perception of the Valley of Strangeness in 3D humanoid characters depends on a composition of factors: level of realism, naturalness of movements, spatial context, type of display, sense of presence, and user expectation. The analysis of these factors is necessary to guide the development of characters intended for immersive and non-immersive environments.

3 DEVELOPMENT OF IMMERSIVE ENVIRONMENTS

3.1 GENERAL PROJECT STRUCTURE

The experimental design was designed to allow the controlled presentation of 3D humanoid characters in three viewing conditions: computer monitor, HMD-VR and HMD-RA.

The technological framework was developed with a focus on standardizing the experience and reducing external interference during data collection. To this end, environments capable of presenting the characters, guiding the participant, collecting responses, and

recording the necessary information for later analysis were implemented, following the need to control the type of display in studies on avatar perception and the Valley of Strangeness (HEPPERLE et al., 2022; YAN, 2019).

The adoption of three displays allows you to compare different levels of immersion. On the computer monitor, the participant observes the character on a two-dimensional screen and interacts through conventional peripherals. In HMD-VR, the participant visualizes a complete virtual environment, with the character positioned in three-dimensional space. In HMD-RA, the character is superimposed on the physical environment, so that the user perceives the virtual entity integrated into the real room. Figure 1 outlines the difference between these three types of viewing conditions used in this study.

Figure 1

Visualization conditions used in the study

Source: prepared by the authors.

The comparison between these conditions, as seen in Figure 1, allows us to observe whether immersion and spatial integration alter the perception of similarity, strangeness, sympathy and naturalness, considering the conceptual differences between VR and AR (BURDEA; COIFFET, 2003; AZUMA, 1997; AZUMA et al., 2001). Table 1 summarizes the three visualization conditions adopted in the study, differentiating them according to the type of experience, the environment perceived by the participant and the general form of interaction.

Table 1

Summary of the evaluated viewing conditions

Condition	Type of experience	Perceived environment	General form of interaction
Monitor	Not immersive	Virtual environment viewed on a 2D screen	Mouse and conventional interface

Condition	Type of experience	Perceived environment	General form of interaction
HMD-RV	Immersive	Fully virtual environment	HMD-VR and Controls
HMD-RA	Augmented Immersive	Physical environment with overlapping virtual character	HMD-RA and controls

Source: prepared by the authors.

In Table 1, it is noted that the condition with a monitor corresponds to the non-immersive experience, in which the character is observed on a two-dimensional screen and the interaction occurs through a mouse and conventional interface. The HMD-VR condition, on the other hand, is characterized as an immersive experience in a totally virtual environment, using a virtual reality helmet and controls. In turn, the HMD-RA condition is also immersive, but based on the overlay of the virtual character on the physical environment, allowing the participant to perceive the presence of the character in real space through the augmented reality helmet and its controls.

Thus, Table 1 shows that the three conditions differ not only by the equipment used, but also by the degree of immersion and the spatial relationship established between participant, environment and 3D humanoid character.

3.2 VR AND AR ENVIRONMENTS

The VR environment was structured to minimize distracting stimuli. The virtual room has a neutral configuration, with control over the participant's position, distance from the character and lighting. This methodological choice seeks to prevent external elements from influencing the character's evaluation. The display experience uses similar logic, preserving the virtual scene and adapting navigation for non-immersive viewing.

In the AR environment, the physical space is part of the experience. For this reason, a calibration stage was necessary to define the reference point at which the characters would be presented. Calibration allows you to position the character in a stable and coherent place, preventing your virtual presence from conflicting with physical obstacles or elements of the room.

The calibration procedure is particularly important in AR, as registration failures can compromise the perception of naturalness and increase strangeness, since spatial registration is one of the central elements for the coherence of the augmented experience (AZUMA, 1997; TORI; HOUNSELL; KIRNER, 2018).

Figure 2 shows the overall structure developed in the AR and VR applications.

Figure 2*General structure of the experimental procedure*

Source: prepared by the authors.

The general structure of the environments presented in Figure 2 includes, in sequence, a calibration scene, a training scene, character presentation scenes and a questionnaire scene. This organization allows the participant to understand the form of interaction before the main assessment. The training scene uses simple questions and basic objects, reducing the risk that operational difficulties with the device contaminate the perceptual responses about the characters.

3.3 HUMANOID CHARACTERS AND MOVEMENTS EVALUATED

The 3D humanoid characters were organized into different levels of human likeness, ranging from clearly artificial or robotic shapes to characters with greater visual proximity to the human body. This diversity allows us to observe the perception of the participants at different points of the spectrum associated with the Valley of Strangeness, according to the relationship between human similarity and affinity proposed in the literature (MORI; MACDORMAN; KAGEKI, 2012; KÄTSYRI et al., 2015). The proposal is not restricted to static appearance, as all characters are also evaluated by dynamic components.

The movements are organized into four groups: eye movements, lip movements, body movements, and combined movements. Eye movements include actions such as looking, blinking, and directing attention. Lip movements are related to speech and the synchronization between audio and mouth expression. Body movements involve displacement, gestures and an attempt to get closer to the character. Finally, the combined movements bring together eyes, lips, and body in a more complex sequence, bringing the experience closer to a complete humanoid interaction. This separation dialogues with studies that point to the relevance of visual and movement factors in the perception of virtual characters (JIANG et al., 2022).

3.4 COLLECTING RESPONSES IN THE ENVIRONMENT ITSELF

A relevant point of the project is the collection of responses integrated with the experience. After exposure to the character, the participant answers questionnaires in the environment itself, using alternatives on a Likert scale. This type of scale is widely used to convert subjective perceptions into statistically analyzable numerical data (AGRESTI; FINLAY, 2021; MAROCO, 2021). This strategy reduces operator interference and preserves continuity of experience, especially in immersive devices. Instead of interrupting the use of HMD to respond on paper or other equipment, the assessment interface is presented in the same interaction flow.

Integrated collection is important because the perception of presence and naturalness can be sensitive to interruptions. Removing the participant from the environment or introducing the researcher's mediation between one scene and another could alter the experience, creating methodological noise. Thus, the response within the environment itself contributes to keeping the participant's attention on the stimuli evaluated.

4 EVALUATION METHODOLOGY

4.1 RESEARCH DESIGN

The investigation adopts a quantitative approach, appropriate to the analysis of subjective responses converted into numerical measures by means of scales (AGRESTI; FINLAY, 2021; MAROCO, 2021). The type of display device is the main independent variable. The dependent variables are the perceptions attributed by the participants to the characters and the experience, including human likeness, strangeness, sympathy, presence and naturalness of the movements.

The comparison between visualization groups was performed by one-factor analysis of variance, followed by Tukey's post-hoc tests when significant differences were identified. This strategy allows us to verify whether the means of the responses differ between the devices and, when they differ, to indicate in which pairs of devices the differences are concentrated (MONTGOMERY, 2013; RABE-HESKETH; EVERITT, 2007).

Table 2 shows the organization of the variables considered in the evaluation, distinguishing the independent variable from the dependent variables analyzed in the study.

Table 2

Variables analyzed in the study

Category	Variable	Synthetic Description
Independent variable	Display Type	Monitor, HMD-RV and HMD-RA

Category	Variable	Synthetic Description
Character perception	Similarity	Degree to which the character is perceived as human-like
Character perception	Strangeness	Degree of perceived discomfort or estrangement
Character perception	Sympathy	Degree of acceptance or positive evaluation of the character
Experience	Presence	Feeling of being in the environment presented
Movements	Naturalness of the eye	Perception of the naturalness of the eyes and blinks
Movements	Lip naturalness	Perception of the naturalness of speech and lips
Movements	Body naturalness	Perception of the naturalness of gestures and displacements
Movements	Combined naturalness	Perception of eye, lip and body movements together

Source: prepared by the authors.

Table 2 shows that the independent variable corresponds to the type of display used, including the three viewing conditions: Monitor, HMD-RV and HMD-RA. The other variables represent perceptual dimensions attributed by the participants to the characters and the viewing experience. Among them are human likeness, strangeness and sympathy, directly related to the perception of the 3D humanoid character. Presence is also included, associated with the feeling of insertion in the environment presented. Finally, the variables related to the naturalness of the movements are considered, divided into eye, lip, body and combined movements.

This organization allows structuring the analysis in a systematic way, relating each visualization condition to the participants' perceptive responses to the evaluated characters.

4.2 PARTICIPANTS

The sample size calculation was guided by the G*Power software (FAUL et al., 2009), considering a significance level of 0.05 and statistical power of 0.71. This calculation indicated the minimum need of 129 participants to detect significant differences between the experimental groups.

The definition of statistical power considered practical limitations related to the availability of HMD devices, the average execution time of each session, and the battery life of the equipment used. The use of G*Power as a sample planning tool follows its application in statistical power analyses for experimental designs (FAUL et al., 2009).

The inclusion criteria included adult participants, aged between 18 and 65 years, without distinction of sex and with completed high school. Exclusion criteria were the presence of severe visual or hearing impairments and conditions that could generate discomfort or risk during the experience, such as epilepsy. The adoption of these criteria sought to preserve the safety of the

participants and reduce perceptual interference that could compromise the evaluation of the stimuli.

4.3 EXPERIMENTAL PROCEDURE

The experimental procedure was organized in successive stages. Initially, the test environment was prepared and, in the case of HMDs, the safe limits of space use were defined. In the case of AR, additional calibration was performed to determine the reference point for the presentation of the characters in the physical environment. After this preparation, the participant took a brief training to familiarize themselves with the interface and controls.

After the training, the participant began to visualize the characters according to the experimental condition. The characters were presented in random order, defined by the application, with alternation between static and moving situations, according to the experiment analyzed. After each exposure, the participant answered the corresponding questionnaire. In the end, the data were stored for later statistical processing.

4.4 INSTRUMENTS AND STATISTICAL ANALYSIS

The answers were collected by questionnaires with Likert-type scales, allowing the transformation of subjective perceptions into numerical data. This type of instrument is suitable for measuring degrees of agreement, perceptual intensity, or subjective evaluation, as long as the results are interpreted in a manner compatible with the study design (AGRESTI; FINLAY, 2021; MAROCO, 2021).

Statistical analyses were conducted using scripts developed to extract data from the database generated by the application, organize responses by device and variable, perform one-factor ANOVA, apply Tukey's post-hoc tests, and generate graphical representations, such as boxplots, means with confidence intervals, and scatter and regression plots. The analytical set allowed us to examine both global differences between devices and specific patterns associated with each perceptual variable, following appropriate statistical procedures for comparing means between groups (MONTGOMERY, 2013; RABE-HESKETH; EVERITT, 2007).

5 RESULTS AND DISCUSSION

5.1 FACIAL MOVEMENTS AS AN AXIS OF PERCEPTUAL ANALYSIS

The analysis of the results focuses on the influence of the facial movements of the 3D humanoid characters on the perception of the Valley of Strangeness in augmented reality and

virtual reality environments. Although the study contemplates different perceptual dimensions, the approach adopted here favors eye and lip movements, as they constitute sensitive elements in the social reading of humanoid characters. The gaze, the blinks, the direction of attention and the synchronization of speech with mouth movements are components that directly interfere with the perception of naturalness, and can reduce or intensify the discomfort associated with the Valley of Strangeness.

This choice is justified because the human face plays a central role in non-verbal communication and in the evaluation of humanoid entities. Small inconsistencies in eye or lip movements tend to be easily perceived by the observer, especially when the character has an appearance close to that of a human. In this sense, the classic hypothesis of the Valley of Strangeness indicates that the emotional reaction to artificial entities does not depend only on the degree of human resemblance, but also on the coherence between appearance and perceived behavior (MORI; MACDORMAN; KAGEKI, 2012).

In immersive environments, in which the user perceives the character on a spatial scale and with greater proximity, the naturalness of facial movements becomes a decisive factor for perceptual acceptance. Thus, the results obtained allow us to discuss how augmented reality and virtual reality displays modulate the way these movements are perceived and how this perception is related to the intensification or attenuation of strangeness.

5.2 NATURALNESS OF EYE MOVEMENTS IN AR AND VR

Eye movements are one of the most relevant elements in the perception of humanoid characters, as they indicate attention, communicative intention and social presence. Eyes that do not properly follow the user's position, overly mechanical blinks, or the absence of coherent eye contact can generate a sense of artificiality. In near-human characters, this artificiality tends to be associated with the Valley of Strangeness, since the user recognizes human traits, but notices subtle flaws in their behavior.

In the results regarding the naturalness of eye movements, it is observed that immersive devices have a favorable performance compared to conventional visualization. Statistical analysis identified a significant effect of the type of device on the perception of eye movements, indicating that the form of visualization interferes in the participants' evaluation. The results of the post-hoc test point to differences between the monitor and the immersive devices, while the difference between HMD-RA and HMD-VR is not significant in one of the analyses, suggesting that both immersive environments favor the perception of eye movements over non-immersive visualization.

This result indicates that immersion can function as a perceptual support element for eye movements. In HMD-VR, the character is perceived within a controlled virtual environment, in which lighting, scale, and distance can be standardized. In HMD-RA, the character appears superimposed on the physical environment, establishing a direct spatial relationship with the participant. In both cases, the user ceases to observe the character as a figure restricted to a screen and begins to perceive him as an entity positioned in a three-dimensional space. This alteration in the spatial relationship may contribute to greater perceptual tolerance to facial movements and to less intensification of strangeness.

The literature on virtual characters indicates that eyes and body features are relevant factors in the evaluation of CG-generated characters, especially when there is an expectation of human realism (JIANG et al., 2022). Thus, the evaluation of eye movements in AR and VR reinforces the need to treat the gaze as an expressive component and not only as a technical detail of animation.

5.3 NATURALNESS OF LIP MOVEMENTS AND SYNCHRONIZATION WITH SPEECH

Lip movements present another critical dimension for the perception of naturalness. When a character speaks, coherence between audio, mouth opening, syllable rhythm and facial expression is expected. If this synchronization is perceived as artificial, the user tends to identify a rupture between human appearance and animated behavior. This rupture is especially important in the context of the Valley of Strangeness, as realistic humanoid characters create greater expectation of correspondence between speech and expression.

The analysis of lip movements indicates statistically significant differences between the devices tested. The results show that the perceived naturalness of lip movements was greater in the HMD-RA compared to the monitor and the HMD-RV, while the difference between HMD-VR and monitor was not significant in one of the analyses reported. This finding suggests that AR may favor the reading of facial movements, especially when the character is perceived as inserted in the participant's physical space.

One possible interpretation is that the augmented environment offers a particular combination of spatial presence and reference to the real world. The virtual character, when viewed in the same physical environment as the user, can be perceived as more integrated into the interaction situation, which favors the acceptance of their lip movements. In HMD-VR, although there is immersion, the entire environment is virtual, which can make speech perception more dependent on the overall coherence of the scene, rendering, and character expressiveness. Thus, AR seems to offer a specific advantage in the perception of lip

movements, functioning as a bridge between the virtual character and the physical context of the observer.

This discussion is consistent with studies that indicate that direct interaction and perception of a virtual body or character can influence the experience of presence and the illusion of body interaction in immersive environments (LUGRIN; LATT; LATOSCHIK, 2015). In the case of lip movements, this relationship becomes even more sensitive, as speech presupposes a direct communicative bond between character and participant.

Figure 3 presents, in a comparative way, the means of perceived naturalness of facial movements in the three devices evaluated. The composition gathers the results related to eye and lip movements, allowing us to observe differences between the non-immersive condition, represented by the computer monitor, and the immersive conditions, represented by the HMD-VR and the HMD-RA.

Figure 3

Comparison of the perceived naturalness of facial movements between the devices

Source: prepared by the authors.

Figure 3 shows that the perceived naturalness of eye movements presents higher values in immersive devices compared to computer monitors. HMD-RA has the highest average in this dimension, followed by HMD-RV, while the monitor concentrates the lowest average. This behavior suggests that visualization in immersive environments can favor the perception of gaze movements, possibly by inserting the character in a closer and more coherent spatial relationship with the participant.

Regarding lip movements, Figure 3 indicates the highest mean for HMD-RV, followed by HMD-RA and computer monitor. Although confidence intervals should be considered in interpretation, the visual set reinforces that facial movements are perceived differently according to the type of display used.

In this way, the image complements the discussion by showing that facial naturalness does not depend only on the character's animation, but also on the technological context in which this animation is presented.

5.4 INFLUENCE OF FACIAL MOVEMENTS ON THE PERCEPTION OF THE VALLEY OF STRANGENESS

The results reinforce that the Valley of Strangeness does not depend only on the degree of visual realism of the character, but also on the dynamic coherence of his movements. A humanoid character can have an acceptable visual appearance and still generate discomfort if their eyes or lips move artificially. Conversely, facial movements perceived as natural can reduce the sense of awkwardness, even when the character does not achieve full human realism.

In AR and VR environments, this relationship becomes even more sensitive. Spatial proximity and the sense of presence expand the perception of facial details. The user doesn't just observe the character; it shares with it a virtual or augmented environment. In this context, facial movements cease to be a technical detail of animation and become a fundamental part of the perceptual experience.

The comparison between AR and VR suggests that both environments offer relevant conditions for the presentation of humanoid characters, but with distinct perceptual effects. VR favors total control of the scene, allowing you to standardize lighting, background, distance, and framing. AR, in turn, inserts the character into the user's physical space, producing a hybrid experience in which the virtual is perceived in relation to the real. In the case of facial movements, this integration can favor perceived naturalness, especially in lip movements, as the character seems to occupy the same communicative space as the participant.

With this, the perception of the Valley of Strangeness comes to be understood as the result of a combination of appearance, movement and visualization technology. The display does not only act as a neutral means of display, but as an element that participates in the perceptual construction of the character. This finding is especially important for augmented and virtual reality projects, in which the proximity between user and character tends to amplify the perception of facial details.

5.5 IMPLICATIONS FOR HUMANOID CHARACTER DESIGN IN AR AND VR

The findings indicate that the development of humanoid characters for immersive environments should prioritize the quality of facial movements from the early stages of

modeling, *rigging*, and animation. Eyes and mouth should not be treated as accessory elements, but as central components of perceptual acceptance.

In AR and VR applications, the character's face tends to be observed at close scale and with greater spatial engagement, which increases the need for coherent and expressive movements.

In the case of eye movements, attention is recommended to the direction of the gaze, the frequency of blinks, the transitions between points of attention and the coherence with the user's position. In the case of lip movements, it is essential to ensure adequate synchronization between speech, mouth opening, and facial expression. The absence of this coherence can break the immersion and intensify the perceptual discomfort.

The results also suggest that characters intended for AR and VR should be tested directly on end-of-use devices. Monitor-only evaluation may not reveal how the character will be perceived in immersive environments. Scale, distance, face orientation, and gaze behavior can produce different effects when the character is presented in HMD-RA or HMD-VR. In this way, the choice of display is not just a technical decision, but a perceptual variable that participates in the construction of naturalness and acceptance of the character.

Finally, the cut in facial movements shows that the Valley of Strangeness can be mitigated not only by reducing or expanding visual realism, but by fine-tuning facial expressiveness, synchronization and presentation context.

For educational applications, digital games, simulations, and immersive training, this result indicates that the quality of the moving face can be as important as the visual quality of the 3D model.

Table 3 summarizes the main aspects discussed in the section, highlighting how facial movements influence the perception of the Valley of Strangeness in AR and VR environments.

Table 3

Synthesis of the influence of facial movements on the perception of the Valley of Strangeness in AR and VR

Aspect analyzed	HMD-RA	HMD-RV	Implication for the perception of the Valley of Strangeness
Eye movements	It favors the perception of the gaze as part of the participant's physical space, bringing the character closer to the real situation of interaction.	It favors the perception of the gaze in a controlled virtual environment, with stability of distance, scale and lighting.	The naturalness of the gaze, the blinks and the direction of attention can reduce the perceived artificiality in the character.

Lip movements	It has a perceptual advantage by inserting the character in the physical environment, making speech more integrated into the communicative situation.	It relies heavily on the coherence between speech, facial animation, and the overall composition of the virtual environment.	The synchronization between speech and mouth movement is decisive to avoid perceptual ruptures associated with strangeness.
Facial coherence	The integration between eyes, mouth, and spatial presence can favor greater acceptance of the humanoid character.	Facial coherence benefits from full control of the virtual set, but requires greater consistency across all elements of the scene.	The face should be treated as an integrated expressive system, and not as an isolated sum of animations.
Spatial relationship with the user	The character is perceived as superimposed on the real environment, which can increase the sense of coexistence.	The character is perceived within a totally virtual environment, which can expand the presence and control of the experience.	The type of display changes the way the user interprets facial movements and their naturalness.
Implication for design	It requires attention to spatial registration, scale, direction of gaze, and integration with the physical environment.	It requires attention to lighting, distance, framing, facial expressiveness and coherence of the virtual scene.	Characters for AR and VR must be tested on the final device, as the monitor evaluation does not reproduce immersive perception.

Source: prepared by the authors.

In Table 3 it is observed that the eye and lip movements do not act only as technical details of the animation, but as central elements for the perceptual acceptance of the 3D humanoid characters. In HMD-RA, the superimposition of the character on the physical environment tends to favor the feeling of coexistence and can make facial movements more integrated into the communicative situation. In HMD-VR, full control of the virtual environment contributes to the standardization of the experience, but requires coherence between face, speech, lighting, scale, and context of the scene.

Thus, Table 3 reinforces that the influence of facial movements on the Valley of Strangeness depends on the articulation between animation and display. The gaze, the blinks, the movement of the lips and the synchronization with speech need to be evaluated in the environment of use itself, as AR and VR produce different forms of presence and spatial relationship with the character. Facial naturalness should be considered a structural dimension in the development of humanoid characters for immersive media, especially when seeking to reduce perceptual discomfort and expand user acceptance.

6 IMPLICATIONS FOR CHARACTER DEVELOPMENT IN IMMERSIVE MEDIA

The results point to practical implications for the development of 3D humanoid characters. The first is that visual realism alone does not guarantee acceptance. In humanoid characters, the closer the person to human appearance, the greater the expectation of coherent

human behavior. Thus, eyes, mouth, and body need to act as an expressive whole. When these dimensions do not align, the user perceives flaws and strangeness can increase, as discussed in studies on visual factors, movement, and perception of the Valley of Strangeness (KÄTSYRI et al., 2015; JIANG et al., 2022).

The second implication is that the display should guide design decisions. A character developed for a monitor will not necessarily be perceived in the same way in HMD-VR or HMD-RA. The scale, distance, direction of gaze, and type of movement need to be tested on the end-of-use device. Comparative studies on avatars and digital characters in monitors, VR, and AR indicate that the display device interferes with the perception of realism, strangeness, affinity, and preference (HEPPERLE et al., 2022; SEYMOUR et al., 2021; YAN, 2019). In AR, spatial registration, lighting, coherence with real objects, and the character's position in the environment must be considered. In VR, one must consider the cohesion of the virtual world and the impact of the character's proximity to the user.

The third implication refers to data collection in immersive environments. The evaluation of characters in AR and VR should not depend only on instruments external to the experience, as interruption can alter perception. Internal questionnaire interfaces contribute to preserving immersion and producing data that is more consistent with the participant's experience.

The findings of this article suggest that immersive devices can be used not only as a means of exhibition, but as elements capable of modulating the perception of the character. Immersion can attenuate strangeness and expand sympathy, presence and naturalness in different conditions. This finding is relevant for projects in education, training, health, entertainment, and digital communication, in which humanoid characters are used to guide, represent, teach, or interact with users.

7 FINAL CONSIDERATIONS

This paper presented the development of AR and VR environments for assessing the perception of the Valley of Strangeness in 3D humanoid characters with facial and body movements. The investigation compared three viewing conditions, computer monitor, HMD-VR and HMD-RA, and analyzed variables related to human resemblance, strangeness, friendliness, presence and naturalness of movements.

The results indicate that the type of display significantly influences the perception of the characters. The computer monitor tends to accentuate the awkwardness in different conditions, while immersive devices, in this case AR and VR HMDs, tend to favor more positive perceptions. HMD-RA shows favorable performance in dimensions related to similarity and friendliness,

while HMD-RV presents advantages in measures of presence and naturalness in certain analyses. Thus, the choice of display is not neutral; She participates in the perceptual construction of the character.

It is also observed that facial and body movements play a central role in the perception of the Valley of Strangeness. Evaluation of humanoid characters should not be limited to static appearance, as dynamic behavior can modify user acceptance. Eye, lip, body, and combined movements need to be planned and tested as a constitutive part of the character design.

As a contribution, the study articulates the development of immersive environments, construction of humanoid characters and quantitative evaluation of perception. The findings offer subsidies for the development of virtual characters in digital games, simulations, training, education, augmented reality experiences and virtual reality applications. For future work, it is recommended to expand the diversity of characters, include physiological measures, and explore real-time interactions with responsive speech, autonomous behavior, and artificial intelligence, following possibilities already discussed in studies with AR, VR, and multimodal evaluation of the Valley of Strangeness (YAN, 2019; SEYMOUR et al., 2021).

ABSTRACT

Vaginal colposcopy constitutes a rapid, accessible, and highly valuable diagnostic method for monitoring the estrous cycle and evaluating the gynecological status of domestic females, being essential for the success of reproductive biotechnologies. Successful reproductive management depends on understanding the morphological changes in the vaginal epithelium in response to hormonal fluctuations, which enables the identification of cellular patterns characteristic of each phase of the cycle. This study addresses the reproductive physiology of bovine and canine females, emphasizing that diagnostic accuracy intrinsically depends on rigor in laboratory processing and the pre-analytical stage. Different staining techniques are discussed, such as Panoptic Rapid, Giemsa, Methylene Green-Giemsa (MGG), Papanicolaou, and Bengal Rose, highlighting that each protocol presents particularities, advantages, and limitations regarding sensitivity and the detailing of cellular structures. The choice of the most appropriate method, as well as the fixative, should be based on the purpose of the examination and the need for clarity in differentiating cell types and detecting pathologies. The standardization of these techniques contributes to professional training and

RESUMO

A colpocitologia vaginal constitui um método diagnóstico rápido, acessível e de extrema valia no monitoramento do ciclo estral e na avaliação ginecológica de fêmeas domésticas, sendo essencial para o sucesso de biotecnologias reprodutivas. O êxito do manejo depende da compreensão das alterações morfológicas do epitélio vaginal em resposta às flutuações hormonais, o que viabiliza a identificação dos padrões celulares característicos de cada fase do ciclo. Este estudo aborda a fisiologia reprodutiva de fêmeas bovinas e caninas, enfatizando que a precisão diagnóstica depende intrinsecamente do rigor no processamento laboratorial e da etapa pré-analítica. Diferentes técnicas de coloração são discutidas, como Panótico Rápido, Giemsa, Methylene Green-Giemsa (MGG), Papanicolaou e Rosa Bengala, destacando-se que cada protocolo apresenta particularidades, vantagens e limitações quanto à sensibilidade e ao detalhamento das estruturas celulares. A escolha do método mais adequado, bem como do fixador, deve basear-se na finalidade do exame e na necessidade de nitidez para a diferenciação entre os tipos celulares e detecção de patologias. A padronização dessas técnicas contribui para a capacitação profissional e para diagnósticos mais acurados, impactando diretamente na tomada de decisões clínicas e na eficiência dos programas de reprodução assistida.

RESUMEN

La colpocitología vaginal constituye un método diagnóstico rápido, accesible y de gran valor en el monitoreo del ciclo estral y en la evaluación ginecológica de hembras domésticas, siendo esencial para el éxito de las biotecnologías reproductivas. El éxito del manejo reproductivo depende de la comprensión de las alteraciones morfológicas del epitelio vaginal en respuesta a las fluctuaciones hormonales, lo que permite identificar los patrones celulares característicos de cada fase del ciclo. Este estudio aborda la fisiología reproductiva de hembras bovinas y caninas, enfatizando que la precisión diagnóstica depende intrínsecamente del rigor en el procesamiento de laboratorio y de la etapa preanalítica. Se discuten diferentes técnicas de coloración, como Panótico Rápido, Giemsa, Verde de Metileno-Giemsa (MGG), Papanicolaou y Rosa de Bengala, destacándose que cada protocolo presenta particularidades, ventajas y limitaciones en cuanto a la sensibilidad y al detalle de las estructuras celulares. La elección del método más adecuado, así como del fijador, debe basarse en la finalidad del examen y en la necesidad de nitidez para la diferenciación entre tipos celulares y la detección de patologías. La estandarización de estas técnicas contribuye a la capacitación profesional y a diagnósticos más precisos, impactando directamente en la toma de decisiones clínicas y en la eficiencia de los programas de reproducción asistida.

1 INTRODUCTION

Pap smear, or vaginal cytology, is a non-invasive, rapid, and low-cost diagnostic tool, widely established in veterinary medicine for reproductive monitoring (Cobucci *et al.*, 2024; Costa *et al.*, 2025; Salmazzo; Ferrari, 2019). Through the morphological analysis of exfoliated mucosal cells, the technique helps to identify the phases of the estrous cycle and to detect any pathological changes, being a fundamental test for directing biotechnologies such as artificial insemination and embryo transfer (Brito *et al.*, 2024; Leite *et al.*, 2026; Nogueira *et al.*, 2019; Rodrigues; Bertolini, 2019).

The control of the estrous cycle offers several advantages for the reproductive management of females. This monitoring can be done by different means. In animals that have normal cyclicity, some type of intervention can be dispensed with, however, in some circumstances, it may be desired to induce or suppress estrus, as well as in females that have irregular cycles, interventions can be made to modify this course (Cogo, 2025; Holzlsauer *et al.*, 2025; Silva, 2016; Cobucci, 2024).

In addition, the concentration of estrus and ovulations makes it possible to use other reproductive biotechniques, such as fixed-time artificial insemination (TAI) and fixed-time embryo transfer (TAI). The use of these techniques in conjunction with the control of the estrous cycle allows for a more efficient diffusion of genetics of interest (Oliveira *et al.*, 2023; Teodoro *et al.*, 2023).

The dog's estrous cycle is comprised of the interval between the period of follicular development followed by ovulation, being regulated by endocrine and neuroendocrine mechanisms, and is divided into different and successive phases, namely: proestrus, estrus, diestrus and anestrus. (Cogo, 2025; Holzlsauer *et al.*, 2025; Cobucci *et al.* 2024; Teodoro *et al.*, 2023).

The estrous cycle is a period comprised of two estros, of variable duration, however, it lasts approximately 21 days. In the cow, the phases of the estrous cycle are well defined and divided into proestrus, estrus, metaestrus and diestrus. The investigation pointed out that when comparing cytology tests in cows submitted to Fixed Time Artificial Insemination (TAI) protocols and those with a physiological estrous cycle, without a FTAI protocol, they observed that the cellular patterns were very similar (Nogueira *et al.*, 2019).

The biological basis of the test lies in the response of the vaginal epithelium to fluctuations in sex steroid hormones. Under the influence of estrogen, the epithelium undergoes intense proliferation and undergoes a process of keratinization (cornification), with distinct particularities between species (Silva, 2021). In female dogs, this process is marked during

proestrus and estrus, aiming to protect the mucosa against mechanical friction during copulation (Silva; Lima, 2018). On the other hand, in bovine females, the cellular changes are more subtle and focused on the secretory function; the stratified squamous epithelium does not reach the same degree of keratinization observed in the canine species, which requires greater technical rigor in cell differentiation (Nutricorp, 2022; Rezende, 2006; Silva, 2018).

Microscopic evaluation allows the classification of cells into parabasal, intermediate, superficial, nucleated and anucleated and metaestrus cells, and superficial, as well as the presence of leukocytes, erythrocytes and secretions (Borges *et al.*, 2024; Teodoro *et al.*, 2023). The accuracy of the cytological diagnosis is intrinsically dependent on the pre-analytical laboratory phase. In order for these cellular patterns to be clearly visualized, sample processing, from collection via sterile *swab* to fixation, is a critical step. Immediate cell fixation is essential for the preservation of structural proteins and the interruption of autolytic processes, avoiding cell lysis and the formation of artifacts that make reading unfeasible (Paiva *et al.*, 2024; Santos *et al.*, 2022).

Parabasal cells tend to have a rounded shape, and their nucleus/cytoplasm ratio is high, in relation to size it tends to be smaller when compared to other cells in the smear. Intermediate cells have a rounded nucleus, but their size when compared to parabasal cells is relatively larger, and may or may not have a rounded morphology. The superficial cells between the three are considered the largest, where their edges are angular and may contain the presence or absence of a nucleus, when there is the presence of a nucleus, they are considered as a pycnotic nucleus (Borges *et al.*, 2024; Brito *et al.*, 2024).

In this context, the choice of staining protocol plays a decisive role in image quality. The efficiency of a dye is linked to its electrostatic affinity: cationic (basic) dyes have an affinity for nucleic acids (negative charge), while anionic dyes (acids), such as Rose Bengal, tend to fail nuclear evidence if used alone due to electrostatic repulsion (Benchchem, 2026). Thus, the use of methods such as the Panopticon Rapid, Giemsa, *Methylene Green-Giemsa* (MGG) and Pap smear seeks to optimize the visualization of the structures, balancing the practicality of the routine with the morphological detail necessary for the diagnosis (Teodoro *et al.*, 2023; Paiva *et al.*, 2024).

In addition to the choice of reagents, the physical management of the sample impacts the feasibility of the diagnosis. Sterile *swab* collection and fine-rolling smears are essential for the formation of a cell monolayer, avoiding the overlap that prevents analysis (Paiva *et al.*, 2024; Teodoro *et al.*, 2023). In view of the importance of standardizing these methods, this study aims to review the literature on staining techniques in the colpocytology of cows and bitches.

Therefore, vaginal cytology identifies the phase of the estrous cycle due to the morphological alteration that the vaginal epithelial cells undergo during this cycle, helping at the most appropriate time to perform natural mounting or artificial insemination (Leite *et al.*, 2026; Santos *et al.*, 2022; Teodoro *et al.*, 2023).

Thus, the monitoring of the estrous cycle, combined with vaginal cytology, not only

It improves reproductive management practices, but also contributes to their efficiency. A detailed understanding of the phases of the estrous cycle, behavioral and hormonal changes, as well as changes in vaginal cells and the choice of different dyes are key to ensuring reproductive success, allowing for precise and timely interventions that maximize the productivity and genetics of the animals (Nutricorp, 2022; Costa *et al.*, 2025).

It seeks to discuss the theoretical foundations of cytological processing, providing subsidies for the professional to select the most appropriate protocol to ensure accuracy in animal reproductive monitoring (Brito *et al.*, 2024; Costa *et al.*, 2025; Leite *et al.*, 2026; Paiva *et al.*, 2024).

ABSTRACT

Changes in landscapes are influenced by natural and anthropogenic factors and have occurred for a long time. However, they became more intense after the Industrial Revolution (18th century), promoting major rural exodus, and after Globalization (20th century), leading to the urbanization of rural areas. In Amazonas, it was observed that Severe Floods and Droughts – climate change-related events – (SFD), the Expansion of Evangelical Religion (EER), and the implementation of the social program Luz para Todos (LPT) resulted in significant transformations in the landscapes of community centers and localities, as well as in the habitus of traditional and Indigenous peoples. Thus, this study aimed to investigate the impacts of the aforementioned phenomena and factors on the socioeconomic (anthropological/cultural) and physical (landscape) aspects of rural settlements in Amazonas. The study was carried out through visits to traditional communities in the municipalities of Careiro, Careiro da Várzea, Coari, Codajás, Iranduba, Itacoatiara, Itapiranga, Manacapuru, Presidente Figueiredo, Rio Preto da Eva, Silves, and Urucurituba over the last ten years. To this end, literature reviews and in loco observations were conducted using photographic records and field notes. The results demonstrated that all the natural and anthropogenic phenomena and themes studied

contributed to these changes. Severe Floods and Droughts, together with the Expansion of Evangelical Religion, were the factors that most contributed to alterations in the landscapes of community nuclei and territories. In turn, the Luz para Todos program, associated with improvements in the road network, most strongly favored transformations in the habitus of the inhabitants, especially among older individuals.

RESUMO

As mudanças nos cenários são influenciadas por fatores naturais e antrópicos e acontecem há muito tempo. Contudo, tornaram-se mais intensas após a Revolução Industrial (séc. XVIII), promovendo grande êxodo rural e depois da Globalização (séc. XX), a urbanização do meio rural. No Amazonas observou-se que com as Cheias e Secas Severas – mudanças climáticas – (CSS), a Expansão da Religião Evangélica (ERE) e a implementação do programa social Luz para Todos (LPT), ocorreram significativas transformações nos cenários das sedes e das localidades e no habitus dos povos tradicionais e indígenas. Assim, este trabalho visou estudar os impactos dos fenômenos e fatores supracitados sobre os aspectos socioeconômicos (antropológicos/culturais) e físicos (cenários) dos povoados rurais do Amazonas. Foi realizado por meio de visitas às comunidades tradicionais dos municípios de Careiro, Careiro da Várzea, Coari, Codajás, Iranduba, Itacoatiara, Itapiranga, Manacapuru, Presidente Figueiredo, Rio Preto da Eva, Silves e Urucurituba, nos últimos 10 anos. Dessa forma, fez-se uso de revisões de literatura e observações in loco recorrendo à registros fotográficos e anotações. Os resultados demonstraram que todos os fenômenos naturais ou antrópicos e as temáticas estudadas contribuíram para as alterações. Sendo as CSS e a ERE as que mais colaboraram para as alterações nas paisagens dos núcleos e dos territórios comunitários. Por sua vez, o LPT associado às melhorias da malha viária, foram os que mais favoreceram as transformações no habitus das pessoas, sobretudo dos mais velhos.

RESUMEN

Los cambios en los paisajes están influenciados por factores naturales y antrópicos y ocurren desde hace mucho tiempo. Sin embargo, se intensificaron después de la Revolución Industrial (siglo XVIII), promoviendo un gran éxodo rural, y posteriormente con la Globalización (siglo XX), impulsando la urbanización del medio rural. En el Amazonas, se observó que las Inundaciones y Sequías Severas —relacionadas con el cambio climático— (ISS), la Expansión de la Religión Evangélica (ERE) y la implementación del programa social Luz para Todos (LPT) provocaron importantes transformaciones en los paisajes de las sedes y localidades, así como en el habitus de los pueblos tradicionales e indígenas. Así, este trabajo tuvo como objetivo estudiar los impactos de los fenómenos y factores antes mencionados sobre los aspectos socioeconómicos (antropológicos/culturales) y físicos (paisajes) de las comunidades rurales del Amazonas. El estudio se realizó mediante visitas a comunidades tradicionales de los municipios de Careiro, Careiro da Várzea, Coari, Codajás, Iranduba, Itacoatiara, Itapiranga, Manacapuru, Presidente Figueiredo, Rio Preto da Eva, Silves y Urucurituba durante los últimos diez años. Para ello, se recurrió a revisiones bibliográficas y observaciones in situ mediante registros fotográficos y anotaciones de campo. Los resultados demostraron que todos los fenómenos naturales o antrópicos y las temáticas estudiadas contribuyeron a las transformaciones observadas. Las Inundaciones y Sequías Severas y la Expansión de la Religión Evangélica fueron las que más contribuyeron a las alteraciones en los paisajes de los núcleos y territorios comunitarios. Por su parte, el programa Luz para Todos, asociado a las

mejoras de la red vial, fue el factor que más favoreció las transformaciones en el habitus de las personas, especialmente de los adultos mayores.

1 INTRODUCTION

The different scenarios make up the landscape of a place, so the landscape is influenced by natural and anthropic or cultural factors (CONTI, 2014; BERNARDES, 2020; LEPLAN, 2026). Thus, changes in rural environments have been happening for a long time, but they became remarkable after the Scientific Revolution of the seventeenth century (ROQUE, 2002).

The aforementioned revolution substantially increased the domination and expansion of territories, peoples, cultures, and sciences; the consumption of natural resources; it promoted social, political, technological and scientific development (ROQUE, 2002; ROSA, 2012; KUHN, 2013; SEABRA, 2016); it was established with the use of fossil fuels (coal) and boosted industrialization, which was improved by technical and economic research (ABIKO et al., 1995; CARPANEZZI et al., 2017; COSMO et al., 2020).

Furthermore, as a consequence of the Scientific Revolution, the Industrial Revolution (eighteenth century) occurred, which caused gigantic changes in the rural environment, as the migration of people from the countryside to industrialized centers where there was a demand for labor for industrial production - rural exodus - caused negative impacts such as the reduction of labor in the countryside, which culminated in the decrease in food production and the increase of mechanized work in agriculture (ABIKO et al., 1995; CARPANEZZI et al., 2017). These actions contributed to a series of Agricultural Revolutions over time (Modern Agriculture (eighteenth century) – Agriculture 4.0 (twenty-first century) (MAZOYER; ROUDART, 2010; KAMIYAMA, 2011; LEMOS, 2017; MASSRUHÁ; LEITE, 2018; LISBINSKI et al., 2020; CARVALHO; PANATTA, 2021; BESSA, 2022).

Nevertheless, from the 60s onwards, socioeconomic changes occurred in rural environments around the world, where many residents of these environments were not rural producers, that is, their income and savings did not come from agricultural production (FULLER, 1990; BALSADI, 2001).

In the 2000s, it was observed that non-agricultural rural jobs were significant in the rural development process, because in Latin America 50% of jobs in rural areas were non-agricultural, these changes became relevant after the Green Revolution and contributed to rural-urbanization until the emergence of globalization (REARDON; STAMOULIS; PINGALI, 2007).

In Amazonas, interesting and worrying environmental and socioeconomic transformations have been noted that have been changing the scenarios and *habitus in traditional communities* in the last 10 years. The main causes are the severe floods and droughts (CSS) intensified by Climate Change (MC), the Expansion of the Evangelical Religion (ERE) and the implementation of the Federal Government's social program Light for All (LPT).

Therefore, it is necessary to study what are and if they are positive or negative the impacts that these factors and phenomena have promoted in the traditional communities of Amazonas, both in socioeconomic (anthropological/cultural) and physical (scenarios) aspects; their influences on the habits of people living in the forest and whether these transformations have provided an improvement in the quality of life of traditional and indigenous peoples. Therefore, the present study aimed to evaluate the impacts of SSC, the expansion of the evangelical religion and the social program light for all on the scenario and *habitus* in rural Amazonas.

2 METHODOLOGICAL PROCEDURES

The studies were developed in the State of Amazonas over a period of 10 years through observations on the changes in the scenarios and *habitus* of the residents of traditional communities inserted in the patterns of occupation in the river-man-floodplain-terra firme and in the terra firme-man-highway interfaces in the municipalities of Careiro, Careiro da Várzea, Coari, Codajás, Iranduba, Itacoatiara, Itapiranga, Manacapuru, Presidente Figueiredo, Rio Preto da Eva, Silves and Urucurituba, and the causes that promoted them. A literature review was carried out for each theme addressed and notebooks and cameras were used in the field. The trips were made by canoes, speedboats, boats and vehicles. There were some particularities in some topics studied, about:

2.1 TRADITIONAL COMMUNITIES

The observations and records (photographic and written) were made in the communities during the numerous excursions in the 12 municipalities visited.

2.2 SEVERE FLOODS AND DROUGHTS (CLIMATE CHANGE)

Observations of the impacts of major floods and droughts were recorded in Coari, Itapiranga and Silves and on the banks of the Solimões River in the municipalities of Coari, Codajás, Iranduba and Manacapuru.

2.3 EXPANSION OF THE EVANGELICAL RELIGION

Observations on the changes in the scenarios of traditional communities were recorded in the 12 municipalities visited.

2.4 LIGHT FOR ALL SOCIAL PROGRAM

The notes of the information acquired and the records on the contribution to the changes in the scenarios of traditional communities were recorded in the 12 municipalities visited.

2.5 THE NEW SCENARIO AND THE CHANGE OF *HABITUS* IN TRADITIONAL COMMUNITIES

To elucidate these changes, the data obtained on each theme addressed was organized and this information was analyzed together, the results were discussed and a new structure of the communities was elaborated that allows the description/visualization of the changes in the scenarios and *habitus*.

3 ANALYSIS AND DISCUSSION OF THE RESULTS

3.1 TRADITIONAL PEOPLES AND COMMUNITIES

The history of the Amazon region is famous for the exploitation and appropriation of its natural resources under foreign demands and its foreign exchange. However, traditional peoples, especially the riverside dwellers, gained from the indigenous people the techniques on environmental management, agricultural production and social organization (FERNANDES; MOSER, 2021).

Studies on traditional peoples are vast and, depending on the point of view, the same man can be seen as a riverside dweller, a varjeiro, a fisherman, an extractivist, a quilombola and a rubber tapper, since the definition of his denomination depends on his activities and the place where he lives (LIRA; CHAVES, 2016).

The riverside dwellers stand out among the traditional peoples in the Amazon, since they live on the banks of numerous rivers of gigantic extensions, a situation that allows them greater and better advantages for the enjoyment of natural resources, especially with the practices of fishing, hunting, extractivism and agriculture (especially through the use of floodplains), as well as facilitating access to transportation that, in the absolute majority of times it is exclusively fluvial (FRAXE, 2000; FERNANDES; MOSER, 2021).

There are many definitions/concepts about the riverside dwellers, and the common point among the works is the description of the place they inhabit, their socioeconomic and cultural particularities and their high relationships with nature.

Then, in the face of a vast literature (among them, ARENZ, 2000; FRAXE, 2004; FRAXE; WITKOSKI; MIGUEZ, 2009; PEREIRA; DIEGUES, 2010; RENTE NETO; FURTADO, 2015; LIRA; CHAVES, 2016; CHAVES; FURTADO, 2017; OLIVEIRA; SAUER, 2021; CAÑETE, 2023;

MMA, 2024), the riverside dwellers can be characterized as: social groups, composed of mestizo people, coming from miscegeny, mainly among blacks (quilombolas), northeasterners and Indians, commonly called caboclos, with peculiar forms of social, cultural, religious, ancestral and economic organizations, which over time and, especially, economic cycles, have spread and inhabited the banks of the countless and mighty rivers, essentially, from the Amazon, maintaining a vital, healthy and sustainable relationship with the environment, holding great wisdom about this link, which is spread from generation to generation. In addition, they practice small crops and livestock, artisanal fishing, hunting and extractivism (mineral, vegetable and animal) as their fundamental activities and maintain social, economic and cultural relations with population centers.

Most of the riverside dwellers live in the floodplains and often act simultaneously as fishermen, hunters, extractivists and rubber tappers; are formed and form a mixed population, obeying a pattern of occupation at the river-man-floodplain-terra firme interfaces (CRUZ, 2023).

From the banks of the Amazonian rivers where the riverside dwellers live, for whom the river is symbolic and representative, riverside territoriality is established. Therefore, obviously, the lives of these social actors are enormously influenced by the rainfall regime of the waters, determining the construction of houses, the time and time for the practices of hunting, fishing and plant extractivism, among other things (FERNANDES; MOSER, 2021).

Contemporaneously, due to the remarkable interaction of the peoples who live in the Amazon with the environment, singularly with its natural resources of fauna and flora, studies in this desired region have considered the traditional peoples (formed mainly by riverside dwellers, varjeiros/varzeiros, fishermen, extractivists, rubber tappers and quilombolas) and original (indigenous) (LIRA; CHAVES, 2016).

When the social groups formed by traditional peoples are grouped in a certain place, they form rural communities that are characterized by presenting, almost always, a structured social organization with a **church, social center, school, flour house and soccer field**, these collective spaces forming the community headquarters (MIGUEZ; FRAXE; WITKOSKI, 2011).

Rural communities, also called riverine or traditional communities, can be recognized as:

“[...] a territorial locus in which a singular model of natural resource management and social organization is instituted, where individuals build their social identity by safeguarding a set of knowledge that is transmitted from generation to generation, but which is updated in the dynamics of the history of struggles and resistance in the search for the recognition of their sociocultural identities” (CHAVES; RIBEIRO; MELO, 2023, p. 18).

Therefore, shared knowledge – ethnoknowledge – allows them to conduct the sustainable use of natural resources, reducing environmental damage (ARAÚJO, 2023; MMA, 2024). In view of this, the headquarters of the communities where the elders are located, meet the conditions to be seen as **"Universities of Ethnoknowledge about the Amazonian environments and the multiple forms of use and management of its natural resources"**.

3.2 SEVERE FLOODS AND DROUGHTS (CLIMATE CHANGE)

The great floods that occurred in Amazonas have caused harm to the environment (water contamination, soil erosion; air pollution); in human health (waterborne diseases, vector-borne diseases, physical injuries and traumas, psychological stress and emotional trauma, malnutrition and food shortages, population displacement); in vegetation (damage to agricultural crops and destruction of terrestrial vegetation, siltation of green areas); in biodiversity (habitat loss, displacement of fauna, alteration in aquatic ecosystems, expansion of invasive species) (MICHILES et al., 2025).

These disasters have contributed to changing the scenarios and favored migrations and, consequently, the *habitus* of people who live in traditional and indigenous communities. However, this work will focus on the impacts of major droughts for the sake of limited space.

In view of this, the severe droughts that occurred in Amazonas in 2023 and 2024 lead us to believe that they are consequences of CM, since they have caused climate extremes and these engender disturbances of different kinds, including major droughts, floods, extreme heat, water insecurity, and food insecurity (LEVIN; BOEHM and CARTER, 2022). In addition, it promotes an increase in diseases (LEVIN; BOEHM; CARTER, 2022).

Because of this, this category is the most studied among the 9 categories that form planetary boundaries. The Intergovernmental Panel on Climate Change (IPCC), in the synthesis report on climate change in 2023, adduces that global and rapid changes have occurred in the atmosphere, ocean, cryosphere, and biosphere, these signs of transformations were observed in the extreme situations that occurred (tropical cyclones, heat waves, intense rains, and major droughts) (IPCC, 2023).

Thus, the KM have been hindering efforts to achieve the United Nations Sustainable Development Goals (SDGs), mainly due to the compromise of water security, which contributes to the reduction of food security. In addition, 3.3 to 3.6 billion people are under a situation of high vulnerability to climate extremes. It should be noted that human action has been more intense, providing many climatic and meteorological extremes in all regions of the world,

causing adverse and widespread impacts and related loss and damage to nature and people (IPCC, 2023).

In Brazil, the greatest damage is due to major droughts and floods. Causing major negative impacts, mainly in the higher cost of energy supply, in the reduction of food supply, causing shortages, increasing demand and, consequently, the price, and in the increase in the cost of transportation (MIATO; CATTO, 2024). In addition, it contributes to the worsening of the population's health situation (ARTAXO, 2020).

The major droughts of the rivers of the Legal Amazon have directly affected six of the nine states (Acre, Amapá, Amazonas, Pará, Rondônia, and Roraima), among which the state of Amazonas is the most impacted, with about 557 thousand people affected by the lack of drinking water, food, and river transport (G1-AM, 2023). In addition, because it has the second largest national port in terms of cabotage container flow and, due to the lack of navigability of the rivers, the Amazon negatively and significantly impacts the economy of the North region and Brazil, by reducing the Gross Domestic Product (GDP) and increasing unemployment (LIMA, 2023).

3.2.1 Impacts of Severe Droughts in Amazonas

The different astronomical, atmospheric and geographical factors of each region of planet Earth promote climatic dissimilarities. Thus, in Amazonas it is noticeable only two seasons in the year, Amazonian summer and winter, that is, a dry season and a rainy season. The natural phenomena of floods and droughts in the Amazon in most of the floodplain areas promote the phenomenon of fallen lands (natural geological-geomorphological occurrence of river erosion (landslide) (DANTAS; MAIA, 2010; SILVA, 2022) (Figure 1).

The multifarious and free occurrence of fallen lands involves natural factors (neotectonic, climatic (wind and rain), hydraulic water pressure, hydrostatic pressure in the alluvial area, physical characteristics and vegetation cover of the soil on the banks) and anthropic factors (deforestation of riparian forest and vessels, especially boats, motorboats and ships that produce strong banzeiros) (CARVALHO; CUNHA, 2011).

Figure 1

Events and scenarios in the periods of flood and drought in Amazonas. A - Comparison of events and their effects in periods of floods and droughts. B - Schematic drawing of the dynamics of river water and floodplain soil in the face of flood and drought processes

Legend: 1 and 2 – Phenomenon of fallen lands. 1 – Fall of the ravine, causing loss of part of the production area, reducing food production; 2 – Accumulation of sediments in the riverbed, causing siltation. Source: the author based on the works of Dantas and Maia (2010); Carvalho and Cunha (2011) and Marques (2017).

In Amazonas, major droughts have caused major socioeconomic obstacles such as lack of drinking water; risk of death by burial; difficulty in performing personal hygiene and household chores (cleaning and feeding); isolation of families, lack of food and resources for the survival and subsistence of those affected, mainly due, in many cases, to the total drought of the rivers and their tributaries, making it impossible to fish and transport, which is practically all river; difficulty in loading and unloading people and goods; risk to navigation due to the low levels of the rivers, leading to accidents on the sandbanks, stumps and stones; reduction of land due to landslides, causing the loss of cultivation area and housing and migration of families, traditional and indigenous communities (CARVALHO; CUNHA, 2011; JESUS, 2024; SANTOS; SILVA, 2024).

Migrations have become relevant for riverside dwellers belonging to the occupation pattern at the river-man-floodplain-terra firme interfaces who, fleeing the problems caused by large floods and ebbs (as seen in 2023 and 2024), are composing the occupation pattern at the land-man-highway interfaces, a situation favored by the increase and improvement of the road network with the opening of new roads and branches by the government, favoring access to

health, education, tourism, leisure, and agricultural production (CRUZ, 2023; SEINFRA, 2023; CEMADEN, 2024; MCTI, 2024) (Figure 2).

Figure 2

Occurrence of the phenomenon of fallen lands on the Manaus – Coari route, navigating the Solimões River, this phenomenon worsened after the major droughts that occurred in 2023 and 2024. A and B – Residences in the process of abandonment; C – Abandoned residence

Source: the author.

The negative impacts caused by the landslide occur throughout the Amazon such as in Tefé-AM (Middle Solimões), Itacoatiara-AM (Middle Amazonas); Parintins-AM and Santarém-PA (Lower Amazonas) (CARVALHO; CUNHA, 2011; MARQUES, 2017; VALE et al., 2019; SILVA et al., 2023).

Records from the last decade show that there are still significant gaps in the understanding of the impacts of severe droughts in the Amazon, many of these damages have not been properly identified, described and measured. Among them are: the construction of alternative ports in Coari; the great mortality of dolphins (freshwater cetaceans) in Tefé and Coari; the total drought of lakes in Silves, such as Saracá, affecting riverside communities, the landscape, fishing and tourism; and, in Itapiranga, the outcropping of stone slabs in the Paraná de Itapiranga, causing the death of a vast amount of bivalves (shells) (Figure 3).

Figure 3

Scenarios modified by the severe droughts of 2023 and 2024). A – Total drought of Lake Saracá in Silves; B – Stone slabs in Itapiranga. Highlight: dead bivalves; C – Alternative port in Coari. Highlight: passers-by (local travelers and tourists) taken by dust; D – Dead dolphins kept for studies at Ufam/Coari

Source: the author.

Because, only with many, detailed and punctual studies, could one explain or measure the damage caused by KM in Amazonas, such as those recorded in Figure 3: total drought of Lake Saracá in Silves, how many families were affected? What is the damage to fishermen and the tourism production chain? In Itapiranga, what is the consequence, current or future, if the death of a large number of bivalves (freshwater shells that filter water and serve as food for the ichthyofauna) continues to occur due to the outcropping of stone slabs that, in addition, put river transport at risk? In Coari, what are the costs of the construction of alternative ports? What are the inconveniences caused by improvised ports for users and merchants? It should be noted that what happened with the Small Public Port Facility (IP4) in Coari was observed in other municipalities such as Silves and Itapiranga, and what were the causes of the relevant number of dead dolphins and what can this affect the aquatic environment? These are some of the damages observed, so it is evident that only through epistemological cuts (e.g. interdisciplinary studies and social impact) will the necessary technical subsidies for claims on social rights be achieved.

Teixeira (2024) emphasizes that it is extremely necessary to know the intrinsic characteristics of each location, to diagram the most sensitive areas, to listen to the social actors

who live in it so that there is reasoned argumentation, strength, and reason to plead for public policies that minimize socioeconomic problems, especially in the most isolated communities.

3.3 EXPANSION OF EVANGELICAL RELIGION

The Protestant Reformation (historical term) or Ecclesiastical Revolution (evangelical view) occurred in Germany in the sixteenth century and arrived in Brazil in the same century in 1555 and since then, due to some differences between doctrines, there have always been those who preferred those of the Roman Catholic Church to the detriment of the Evangelical ones and vice versa (MOURA, 1999; FREIRE; RIBEIRO; ZIGMANTA, 2022; SILVA, 2024).

Furthermore, when globalization was established in the world (fifth end of the twentieth century) evangelical religions appropriated the mass media to strengthen themselves and favor the creation of identity beyond nationality and this induces people to seek religions in order to solve their material and spiritual problems, which conjecture their salvation after death, socioeconomic success in life and belonging to a group (SANTOS; BRAZ, 2009).

Cruz (2018) stated that:

"The diffusion of the evangelical faith in Brazil was driven by the rise of the Pentecostal movement. It had wide adherence, especially in the less privileged portions of the population, who identified with its message and found in it encouragement to signify their daily lives. The opening of Pentecostalism to the Gospel movement established bridges between the pre-established historical churches markedly sectarian and the rest of society. Its social reintegration and popularization broke with certain historical stigmas and new practices of evangelization and behavior were born" (CRUZ, 2018, p. 16).

Because of this, in Brazil, in the 2022 IBGE census, there was a reduction of 8.3% in the Catholic Religion, which was 65.0% in 2010 and decreased to 56.7% in 2022, while there was an increase of 5.2% in the Evangelical Religion, which was 21.7% in 2010 and changed to 26.9% in 2022. Among the Brazilian regions, the North region has the highest concentration of evangelicals with 36.8% (IBGE, 2022).

However, Oliveira and Pinto (2017) emphasize that in the Brazilian Amazon, the expansion of the Evangelical Religion practiced by American missionaries presented strategies aimed at the economic, social, political and cultural progress of the local population, based on North American values, in a process of colonization promoting changes in the *Amazonian* habitus. As can be seen below:

"Protestantism stands out in an economic and political scenario, where the missionaries defended a government that was sovereign over the Amazon, that would make the region within the trappings of the "American dream". Thus, Protestantism is the most recent influence that the Amazon is experiencing. It is a Protestantism of conversion, of changing one's life, of proselytism, of the denial of one's own culture. Thus, Protestantism reproduced new messianic practices of evangelization and colonization, thus generating a new social and religious dynamic" (OLIVEIRA; PINTO, 2017, p. 124).

3.3.1 Expansion of the Evangelical Religion in Amazonas

In Amazonas, the 2010 IBGE Census showed that Catholics represented 60% and Evangelicals 30.6% of the ≥10-year-old population. In 2022, these populations increased to 47.4% and 39.4% respectively, that is, the Catholic Religion had a reduction of 12.6 percentage points (p.p.) and the Evangelical Religion an increase of 8.8 p.p. (IBGE 2010, 2022).

One of the great practical differences between the Catholic and Evangelical religions is in preaching, while in the Catholic it is necessary to have a priest (graduated in theology within Catholic schools), in the Evangelical one only needs a religious leader and this, according to Oliveira (2012) only needs charisma and this natural ability to influence people comes from good rhetoric, of the understanding of the Holy Bible, in the regency of the liturgy of services, spiritual gifts, being baptized in water and in the Holy Spirit, converted and responsible.

In this way, the expansion of the Evangelical Doctrine is facilitated. In addition, factors such as the locomobility of religious leaders; construction of tents, temples and churches; and the residences of the leaders in the communities (living daily with the other residents), drive this growth and substantiate territoriality in traditional communities. These are presented as important territories to be occupied by these beliefs, as occurred in the Negro and Solimões rivers, since the Catholic Church does not occupy these spaces (ALVES; PEREIRA; D'ANTONA, 2024).

Oliveira (2012), when conducting studies in the communities of Our Lady of Perpetual Help, Assembly of God, Santa Izabel and Assembly of Traditional God, in Jaiteua de Cima, a locality located on the shores of Lago Grande in Manacapuru-AM, observed that most of the riverside dwellers living in these communities were evangelicals belonging to different churches of the Pentecostal movement (Assembly of God, United Pentecostal of Brazil, Traditional Assembly of God). The author points out that in this study she evidenced the occurrence of the dichotomy union and division promoted by belief, that is, religion united people in a single community (Catholic) but also separated them, giving rise to 3 more communities, of which 2 are formed by evangelicals in their vast majority.

In fact, in the Amazon and Amazonas, as much as the communities with the name of Saints of the Catholic Religion (e.g. Saint Francis, Saint Joseph, Saint Michael, Saint Anthony,

Saint Lucy) still predominate, that is, that the vast majority of Catholics were formed by the lack of deacons, priests and bishops to perform the masses, it should be noted that only from the priest onwards the celebration is complete, has contributed to the expansion of the Evangelical Religion, which only needs a good religious leader and, or, media and social actions to cover the religious void.

3.4 LIGHT FOR ALL (LPT) SOCIAL PROGRAM

The LPT of the Program for Universalization of Access to Electricity, invested 24 billion reais for the population of the Brazilian rural area, serving 3.6 million families (17.3 million people). In remote regions (all states in the North + Mato Grosso + Maranhão), 1.9 billion reais were spent, serving 52.9 thousand families (211 thousand people) (DIAS, 2024).

3.4.1 Positive points

For Reis Júnior (2015), the LPT is the boldest rural electrification program developed in Brazil, particularly for the North region, greatly allowing the improvement of the quality of life and well-being of the community members served by the program. Freitas and Oliveira (2017) state that the LPT is of great importance as a public policy for social inclusion.

In rural communities: Maranhão; São Benedito; Terra Nova and Terra Preta do Limão, located, respectively, in the municipalities of Parintins; Boa Vista do Ramos; Barcelos and Barreirinha in the state of Amazonas, it was observed that the implementation of the LPT brought benefits such as improvements in the living conditions and social well-being of the community, providing them with improved education (e.g. digital inclusion of students, night classes, high school, vocational courses); obtaining household appliances; access to treated water; a greater number of schools and, therefore, of education professionals; lighting of public and private environments (GUIMARÃES, 2021).

3.4.2 Negative Points

Reis Júnior (2015) asserts that the modernization promoted by electrification in rural communities in Amazonas has in many cases caused changes in the *habitus* of the community, especially with regard to the daily and peculiar daily life, that is, focus on work (extractivism, farming, fishing and hunting) and early evening retreat (7 pm to 8 pm) to rest, moving onto:

- Retirement to rest late at night;
- Increased consumption of alcoholic beverages;
- Noise pollution from the use of stereos and TV;

- Young teenagers with tattoos and haircuts typical of celebrities, especially sportsmen.

In addition, other problems have been observed:

- Ease of access for people outside the communities (compromising the safety of the community);
- Consumption of illicit drugs.

Furthermore, the LPT neglects other relevant points, such as environmental and socioeconomic issues (health, education and production), situations that compromise the well-being of the community, in addition to the fact that the program does not evaluate the results and impacts generated, nor does it monitor the processes (FREITAS; OLIVEIRA, 2017).

Another social problem observed is the constant lack of energy for various reasons, especially the fall of trees on the power grid in the branches, especially during rainy periods (REIS JÚNIOR, 2015).

Studying rural communities in Amazonas: Maranhão; São Benedito; Terra Nova and Terra Preta do Limão, located, respectively, in the municipalities of Parintins; Boa Vista do Ramos; Barcelos and Barreirinha, identified that the LPT, by itself, does not eliminate inequalities and other problems of a social nature, since it is observed that there are communities in which the mercantilist vision prevails in the service of electricity supply (with stimulus to consumption and, above all, profit). In addition, the LPT does not guarantee the maintenance of local culture; income generation through social programs that take advantage of local biodiversity; use of energy from renewable sources in a sustainable way, such as photovoltaic mini-plants with mini-distribution grids (GUIMARÃES, 2021).

Therefore, the LPT should urge the defense of the environment; territorialization; the socio-cultural exercises of the traditional peoples of the Amazon, especially the riverside dwellers; be more inclusive, equitable, and sustainable, thus guaranteeing them the right to citizenship (GUIMARÃES, 2021).

Although the LTP has positive and negative points highlighted in the literature consulted, it is relevant to investigate the implementation of projects aimed at freezing fruit pulp and organic materials (e.g. meat, fish and dairy products), since this represents a viable income alternative for traditional and indigenous peoples.

3.5 NEW SCENARIOS AND THE CHANGE OF *HABITUS* IN TRADITIONAL COMMUNITIES

In order to understand the changes in the scenarios of the communities and in the *habitus* of the traditional peoples of the Amazon, it is necessary to analyze the *modus vivendi*, *faciendi* e *operandi* of these populations. Leal et al. (2025) concluded that:

"(...) The ways of life of traditional Amazonian peoples and communities constitute sophisticated social and ecological engineering, capable of producing resilience, well-being, and conservation when supported by effective territorial rights, robust community institutions, and polycentric governance arrangements." (LEAL et al., 2025, p. 54).

That said, it is clarified that the *modus vivendi* refers to the socioeconomic sphere (e.g. daily life, market), to law and diplomacy (especially to the rules of coexistence) and the *modus faciendi* and *operandi* refer to the subsistence practices developed by the community members (e.g. sustainable extractivism, itinerant agriculture of floodplains and terra firme, artisanal fishing and hunting, social and territorial organization, ancestral knowledge (ethnoknowledge)) and mobility (predominantly fluvial and seasonal). These *modus* differ from each other in that *faciendi* refers to one's own way of performing an action (procedure, technique) while *operandi* is concerned with behavioral and working patterns and forms (frequent, methodical and operative) (CAÑETE; RAVENA-CAÑETE, 2010; SETTON, 2002; CAÑETE, 2023; ARAÚJO; SOUSA, 2022; ARAÚJO; SOUSA, 2023; LEAL et al., 2025; ISPN, 2026).

The interaction and integration of *Modus* The above generate the *habitus* of a population, that is, they form their culture which, in turn, is produced by the way of life, by what is done and how it is done, with the strength to oppose sudden changes, remaining and replicating. However, it should be noted that the *habitus* is always under construction due to incessant social, environmental and economic changes (SETTON, 2002; ARAÚJO; OLIVEIRA, 2014; SETTEN, 2020; ARAÚJO; SOUSA, 2023).

In this way, the environments are transformed, as seen by Araújo and Sousa (2023) when studying the TerraNostraZF5-DAS community – Manaus/AM:

"(...) built mainly with individuals from the Amazonian hinterland, it conducts in the biocultural memory the knowledge and experiences of the ancestry of the Amazonian peoples, reconstructing the landscape in a space of experience and coexistence with the biodiversity of the Amazon, constituting, therefore, the Modus vivendi associated with the Modus operandi and Modus faciendi" (ARAÚJO; SOUSA, 2023, p. 89).

Just like the *habitus*, the landscape also changes over time, consequently changing the Amazonian scenarios as seen by Araújo (2019):

"(...) the landscapes of the Amazon hinterland are configured as parts of a complex set, recognized by the interactions of man with nature, giving shape to the geographical space. In these terms, the change in the Amazonian landscape in recent centuries has occurred through historical, socioeconomic and geographical events that began in the past years of its colonization, through the exchange of knowledge and culture between colonized and colonizer" (ARAÚJO, 2019, P. 91).

The processes of change in the scenarios and in the *habitus* of traditional and indigenous communities have occurred due to factors such as agricultural expansion (deforestation) and its indirect causes (socioeconomic impacts), as seen in Canutama, Lábrea, Humaitá, Manicoré and Apuí (LIMA; MAY, 2005; CARRERO et al., 2020).

In addition, the transformations have been accelerated in recent years due to the KM, the expansion of the evangelical religion and the implementation of Light for All. These phenomena, of a natural and anthropic order, have caused significant changes in the Amazon, especially in Amazonas: droughts and severe floods in the floodplains have promoted the exodus, while access to electricity has allowed the use of technologies and the construction of religious buildings has altered the landscapes. These events have been promoting cultural allomorphies and changing the landscape and social dynamics of the community.

The photographic records made during the visits show the differences between the social organizations of the community headquarters that were previously structured with a church, social center, school, flour house and soccer field (MIGUEZ; FRAXE; WITKOSKI, 2011) with those of the present day. Currently, major changes in fundamental social rights have been seen in most of the communities visited, especially in religion (freedom of belief), education and health. These transformations create new scenarios, with emphasis on the departure of flour houses (which began to be built closer to the production units, mainly of cassava (*Manihot esculenta* Crantz) and guarana (*Paullinia cupana* Kunth)) (Figure 4) and of the Churches that, with the expansion of the Evangelical Religion, began to have more than one in the community headquarters (Figure 5).

It should be noted that the expansion of the Evangelical Religion has promoted changes both in the scenarios of the existing community headquarters and in the locality where they are inserted, contributing to the formation of new villages for reasons of religious affinities, as proven by Oliveira (2012).

In addition, depending on the population size, leadership/representativeness and political influence, it is common to find in the community centers a small place for medical care, in which medical teams are periodically present, and in the absence of these professionals, the Community Health Agents (CHA) act. It should be noted that in practically all communities there are CHAs, but not necessarily a point for care.

Figure 4

Better flour houses, oven houses on rural properties in Coari – AM. A – Oven house; B – Processing of cassava root for the production of mixed flour; C – Guarana roasting; D – Guarana in the fermentation, pulping and drying stages.

Note: the term oven house is more appropriate because it develops several cassava by-products (e.g. production of flours, bijus, tapioca), the processing of guarana, the roasting of açai seeds (*Euterpe precatoria* Mart.) (production of açai "coffee") and conilon coffee (*Coffea canephora* Pierre ex A.Froehner), production of piracuí (fish meal produced by hand), among many other activities. Source: the author.

Figure 5

Churches in the Terra Preta do Limão community in Urucurituba – AM. A – Catholic Church of Our Lady of Nazareth; B – Kerygma Evangelical Baptist Church

Source: Georgina Rodrigues da Silva.

However, it was observed during the numerous activities in the interior of Amazonas that when the community is politically relevant and has strength (it can fight for common improvements with unity, organization and articulation) they obtain successes that make advances in social infrastructure, allowing the community to improve the quality of life. As seen in many communities such as Nossa Senhora do Livramento (NSL) in Silves – AM and Terra Preta do Limão (TPL) in Urucurituba – AM (Figure 6).

The aforementioned communities have infrastructures that have altered the landscapes and also changed the *habitus* of residents with positive and negative points. In these villages there is usually more than one way to get around (by roads and rivers), small traders of essential and high-demand products, access to energy, the internet, schools (which operate in the morning, afternoon and night shifts, contributing to adult education). In addition, as particularities, the NSL has a Basic Health Unit (UBS), a multi-sport gymnasium and a handicraft workshop (Figure 7), while the TPL adds a masonry port staircase, paved roads, a community center and canteen, a wooden bridge over floodplain land and a UBS in the process of construction (Figure 8).

Figure 6

Images of one of the large areas visited, villages belonging to Itacoatiara, Itapiranga, Silves and Urucurituba, with about 208, 23, 39 and 47 communities respectively. A – Map; B – Aerial view of the area

Legend: A: 1 – Unpaved branch connecting the AM 363 road to the community; 2 – Access by river; 3 – Paved branch connecting the community to the district of Itapeçu. Blue locator = Municipalities; Red Locator = Communities. Source: Google Earth.

NSL is highly representative of the rural population of Amazonas as it is inhabited by traditional and indigenous peoples, stands out for its work with the tucumanzeiro (*Astrocaryum aculeatum* G.Mey. - Arecaceae) in the commercialization of the fruit (tucumã) and the use of the stem and leaves for the production of handicrafts, as one of the main economic activities.

It is plausible to observe the strong dynamics that have transformed small communities into medium > large > Districts/Villages (DV) (such as Novo Remanso and Lindóia in Itacoatiara and Itapeaçu in Urucurituba). Of note are the DV of Balbina (remnant of the construction of the HE of Balbina) in Presidente Figueiredo and Augusto Montenegro (Urucurituba-Velho), established after the change of seat of the municipality of Urucurituba. Prior to LC No. 230/2026, 45 DV intended to become municipalities in the state of Amazonas (SANTOS, 2026).

3 CONCLUSION

In the last decade, numerous changes have been observed in the scenarios of the headquarters of traditional communities. In this process of evolution, the locations of the villages were one of the preponderant factors for them to solidify and grow or forcibly displace, since the climatic extremes that occurred in Amazonas, possibly aggravated by climate change, promoted intense movements of families and, in many cases, populations, especially in the floodplain ecosystem.

The implementation of Light for All, opening of branches, paving of existing ones and the streets of the community headquarters contribute to the migrations of families from the most basic villages to the most developed ones, aiming to improve the quality of life. In addition, advances in the road infrastructure of the communities encourage the displacement of traditional and indigenous peoples who live in the river-man-floodplain-terra firme connections. However, when the collective that lives at the terra firme-homem-rodovia interface is not supplied by a permanent drinking water supply system, that is, it suffers shortages during severe droughts, the inhabitants of the terra firme suffer as much as those of the floodplains.

The urbanizations of the rural carried out by the infrastructures developed in traditional communities, especially in large communities and in the Districts/Villages, alter the landscape

both by the buildings themselves (with different construction materials, in addition to wood, straw, tile and nail) and by the facades and paintings. Still, from the middle communities it is already possible to observe some changes such as the disappearance of the oven house, the arrival of evangelical churches and small businesses offering, among other things, alcoholic beverages and cigarettes, stimulating transformations in traditional ways of life and introducing new consumption habits.

The expansion of the Evangelical Religion in Amazonas has contributed significantly to altering the landscape both in the headquarters and in the community territory. The size of the village determines the form of the change: in large districts and towns, the transformation is marked by the construction of tents, tents or churches, while in small and medium-sized areas, depending on the lack of harmony in the coexistence between people due to the different beliefs in the collective environment, there may be in addition to new structures, the displacement of similar groups to other areas of the locality, creating new communities.

As for the *habitus* of traditional and original peoples, it was concluded that this has been the most impacted in relation to changes in the scenarios. It is affected when they migrate from the floodplain ecosystem to the upland ecosystem forcibly due to climatic adversities, among other factors. There is also the presence of evangelical churches, whose doctrines are different from each other (rituals, dishes, clothing and worldview). In addition, in some cases the holding of noisy services harms rest and the local routine. In this way, the occurrences imply changes in their *modus operandi*, *faciendi* and *vivendi*, submitting them to a cultural reconfiguration.

In this context, the implementation of Light for All, which also contributes to changes in the scenarios, is by far the one that has contributed the most to the changes in the *habitus* of the community because it makes it possible to hold night classes, the acquisition of electrical and electronic devices (e.g. televisions, cell phones, stereos) and access to the internet. allowing the knowledge of new cultures and entertainment. However, the form of these interventions is often negative because they provide nocturnal noises until late hours, drunkenness, use of illicit drugs. These activities end up attracting strangers to the community, which in some cases has its circulation facilitated by the improvement of the road network, generating insecurity, especially among the elderly.

However, knowing the problems promoted by Light for All and the improvement of road networks, many derived from the absence of the State (lack of socioeconomic and security policies), it is appropriate to observe that there have been many and great changes where energy has shown to be fundamental for improving the quality of life of traditional and native peoples, providing improvements in health, food and learning. In addition, it allows

entertainment, globalization, entrepreneurship, the use of machinery and equipment making it possible to process and preserve products for self-consumption and for sale. Thus, with these consolidated factors, it is possible to work with excursionism, such as Community-Based Tourism (CBT) in the region.

Finally, it is noted that it is necessary to organize, develop and adapt the infrastructure of the upland communities, so that it can support the migratory flow of riverside populations fleeing the disastrous impacts of extreme floods and droughts.

ABSTRACT

This study analyzes how Banco Bradesco integrates ESG (Environmental, Social and Governance) criteria into its accounting practices and sustainability reports, assessing its compliance with the transparency and comparability requirements of IFRS S1. In a context of growing demand for socio-environmental responsibility, the relevance of accounting practices aligned with international sustainability standards and their impacts on corporate governance and financial statements is highlighted. Considering the aspects mentioned above, as well as the disclosure of financial impacts and cash flow proposed by IFRS S1, the following question arises: How does Banco Bradesco incorporate ESG criteria into its accounting practices and sustainability reports, and to what extent do these practices meet the disclosure requirements established by IFRS S1? The research adopts a qualitative approach, using documentary analysis of Bradesco's sustainability reports and a theoretical review of ESG, IFRS S1, and governance practices in the financial sector. The results indicate that, although the bank presents initiatives aligned with ESG principles, there are still gaps in the integration of this information into financial statements. The absence of consistent quantitative metrics and the lack of standardization in the reports compromise the transparency and comparability of the information. It is concluded that, in order to fully comply with IFRS S1, Bradesco must improve its disclosure processes by integrating ESG data into financial statements in a structured and measurable manner. The implementation of auditing systems to validate ESG information is recommended in order to increase data reliability and stakeholder confidence. The study contributes to the advancement of discussions on ESG practices in the financial sector and reinforces the importance of compliance with international standards for institutional credibility.

Keywords: ESG. IFRS S1. Sustainability. Transparency.

RESUMO

Este estudo analisa como o Banco Bradesco S.A. integra os critérios ESG (Environmental, Social and Governance) em suas práticas contábeis e relatórios de sustentabilidade, avaliando sua conformidade com os requisitos de transparência e comparabilidade da IFRS S1. Em um contexto de crescente demanda por responsabilidade socioambiental, destaca-se a relevância de práticas contábeis alinhadas a padrões internacionais de sustentabilidade e seus impactos na governança corporativa e nas demonstrações financeiras e considerado os aspectos acima e de divulgação dos impactos financeiros e do fluxo de caixa proposta pela IFRS S1 nos leva à seguinte questão: Como o Banco Bradesco S.A. incorpora os critérios ESG em suas práticas contábeis e relatórios de sustentabilidade, e em que medida essas práticas atendem aos requisitos de divulgação estabelecidos pela norma IFRS S1? A pesquisa adota abordagem qualitativa, com análise documental dos relatórios de sustentabilidade do Bradesco e revisão teórica sobre ESG, IFRS S1 e práticas de governança no setor financeiro. Os resultados indicam que, embora o banco apresente iniciativas alinhadas aos princípios ESG, ainda existem lacunas na integração dessas informações às demonstrações financeiras. A ausência de métricas quantitativas consistentes e a falta de padronização nos relatórios comprometem a transparência e a comparabilidade das informações. Conclui-se que, para atender plenamente à IFRS S1, o Bradesco deve aprimorar seus processos de divulgação, integrando dados ESG de forma estruturada e mensurável às demonstrações financeiras. Recomenda-se a implementação de sistemas de auditoria para validação das informações ESG, a fim de aumentar a confiabilidade dos dados e a confiança dos stakeholders. O estudo contribui para o avanço das discussões sobre práticas ESG no setor financeiro e reforça a importância da conformidade com normas internacionais para a credibilidade institucional.

Palavras-chave: ESG. IFRS S1. Sustentabilidade. Transparência.

RESUMEN

Este estudio analiza cómo Banco Bradesco integra los criterios ESG (Environmental, Social and Governance) en sus prácticas contables e informes de sostenibilidad, evaluando su conformidad con los requisitos de transparencia y comparabilidad de la IFRS S1. En un contexto de creciente demanda de responsabilidad socioambiental, se destaca la relevancia de prácticas contables alineadas con estándares internacionales de sostenibilidad y sus impactos en la gobernanza corporativa y en los estados financieros. Considerando los aspectos mencionados anteriormente, así como la divulgación de los impactos financieros y del flujo de caja propuesta por la IFRS S1, surge la siguiente pregunta: ¿Cómo incorpora Banco Bradesco los criterios ESG en sus prácticas contables e informes de sostenibilidad, y en qué medida estas prácticas cumplen con los requisitos de divulgación establecidos por la norma IFRS S1? La investigación adopta un enfoque cualitativo, con análisis documental de los informes de sostenibilidad de Bradesco y revisión teórica sobre ESG, IFRS S1 y prácticas de gobernanza en el sector financiero. Los resultados indican que, aunque el banco presenta iniciativas alineadas con los principios ESG, aún existen brechas en la integración de esta información en los estados financieros. La ausencia de métricas cuantitativas consistentes y la falta de estandarización en los informes comprometen la transparencia y la comparabilidad de la información. Se concluye que, para cumplir plenamente con la IFRS S1, Bradesco debe mejorar sus procesos de divulgación, integrando datos ESG de manera estructurada y medible en los estados financieros. Se recomienda la implementación de sistemas de auditoría para validar la información ESG, con el fin de aumentar la confiabilidad de los datos y la confianza de los stakeholders. El estudio contribuye al avance de las discusiones sobre

prácticas ESG en el sector financiero y refuerza la importancia de la conformidad con normas internacionales para la credibilidad institucional.

Palabras clave: ESG. IFRS S1. Sostenibilidad. Transparencia.

1 INTRODUCTION

Contemporary socio-environmental and economic transformations have required companies to modernize their governance and accounting practices, aligning them with sustainability criteria, such as ESG (Environmental, Social and Governance) parameters. In this context, a change in organizational behavior is observed, in which market, institutional, and product strategies are now integrated into the corporate identity, promoting values related to social, environmental, and governance issues. This approach contributes to the construction of intangible value and to the strengthening of the relationship with stakeholders.

The incorporation of socio-environmental aspects into the search for financial results represents an evolution in the traditional view of business, as sustainable practices are now incorporated into the daily functioning of organizations. The ESG concept, in this sense, guides the adoption of corporate strategies aimed at generating positive impacts for society and the environment. In line with this movement, IFRS S1 arises with the purpose of standardizing and qualifying the disclosure of information related to sustainability, promoting greater transparency, comparability and usefulness for decision-making.

Faced with this demand, companies have started to disclose voluntary reports containing qualitative information on performance, risks, opportunities, and strategies, with the aim of strengthening transparency and risk management. However, the growing relevance of this information has highlighted the need for standardization and quantitative measurement, especially with regard to the assessment of environmental and social impacts.

In this scenario, compliance with the requirements of IFRS S1 becomes essential, especially for financial institutions, which need to ensure the quality, reliability and comparability of their financial statements at an international level. Thus, this study investigates how Banco Bradesco S.A. incorporates ESG criteria into its accounting practices and sustainability reports, as well as the degree of adherence of these practices to the disclosure requirements established by the standard.

Considering the above aspects and the disclosure of financial impacts and cash flow proposed by IFRS S1 leads us to the following question: How does Banco Bradesco S.A. incorporate ESG criteria into its accounting practices and sustainability reporting, and to what extent do these practices meet the disclosure requirements established by IFRS S1?

The research aims to: (i) identify the ESG criteria applied by Banco Bradesco; (ii) assess the compliance of its practices with the transparency, comparability and materiality requirements of IFRS S1; (iii) analyze gaps and challenges in the implementation of a disclosure system fully aligned with the standard; (iv) investigate the impacts of the integration between financial and

sustainable information; and (v) propose recommendations for the improvement of ESG disclosures.

As a methodology, the study adopts a qualitative approach, based on literature review and documentary analysis of Banco Bradesco's Integrated Report and ESG Report, considering as reference the information disclosed until December 31, 2023. In this way, it seeks to contribute to the advancement of discussions on the integration between sustainability and accounting in the financial sector, reinforcing the importance of compliance with international standards.

2 THEORETICAL BASIS

In the introduction to the concepts, it is necessary to highlight that, as civilization has developed, with the emergence of innovations and the advance of industrial capitalism to what we know today, it becomes possible to perceive the impact of climate adversities, social unrest and disruptions in supply chains, demonstrating that environmental risks bring social and economic consequences almost inevitably.

Penna and Castro (2010) contextualize the 1950s as a period in which companies began to incorporate ethical measures in a more evident way, reflecting the recognition of the need to build companies that are not only economically viable, but also environmentally and socially responsible.

On the other hand, Tinoco and Kraemer (2004) point out that it was necessary to understand the impact of environmental degradation, which forced companies to incorporate environmental issues into their commercial objectives.

Regardless of the approach, the concept of corporate sustainability came with the idea of good practices adopted by companies that opt for ethical attitudes, aiming at economic growth that respects the environment and the sustainable development of society.

In view of this, Coral (2002) highlights the importance of companies having tools that help in the development of environmental strategies.

When the environmental issue is addressed in strategic planning, it is generally seen as a threat to the increase in production costs due to legal restrictions on the control and treatment of effluents and waste or as a threat to access to raw materials from scarce natural resources. Coral, 2002, p.135)

Thus, sustainable strategic planning emerges as a fundamental approach for companies that seek to promote environmental and social management, while maintaining their competitiveness in the market.

In this way, sustainable management plays an essential role in the implementation of this planning, not only to solve ecological and environmental problems of companies, but to promote social and governmental actions for their environment.

A survey by the United Nations Industrial Development Organization (UNIDO) points out that companies are responsible for about 60% of global greenhouse gas emissions.

However, Tchizawa (2011) points out that this impact varies according to the type of organization. The author also relates environmental management to ethical motivations, where entities seek to improve their ecological image and demonstrate concern for well-being, involving the identification, evaluation and management of the environmental impacts of their activities.

The construction of strategic purposes with a social, environmental and corporate vision has intensified, as society demands from companies a more active role in the environment in which they operate. This movement has facilitated the incorporation of responsible practices into corporate daily life, as Schroeder explains:

Companies have come to play a role that goes beyond their traditional function as providers of goods and services. In other words, society registers that, in addition to being great generators of material wealth, companies should and can also assume an expanded responsibility, getting involved in social causes. (Schroeder & Schroeder, 2004, p. 5).

Schroeder and Schroeder (2004) clarify that this demand and the transformation of corporate identity arise when society realizes that, many times, the State does not have sufficient resources and structure to guarantee the social, environmental and governmental well-being of the entire population. Thus, space is opened for strategies focused on ESG, sustainability, and corporate social responsibility to contribute to meeting part of these needs.

2.1 SUSTAINABILITY X ESG X SER:

However, environmental management is comprehensive in its performance. Therefore, a discussion on the concepts of ESG, Sustainability, and Corporate Social Responsibility (CSR) is necessary, since the terms may be conceptually similar, but diverge in focus and objective within companies.

When we mention sustainability, the most accepted concept is the one defined by the Brundtland Report of 1987, named "Our Common Future". When we talk about sustainability, we are dealing with a broad concept, whose meaning is related to the balance of present needs without compromising the ability of future generations to meet their own needs. The World Commission on Environment and Development also emphasizes the connection between

economic, social, and environmental development, as well as advocating for the adoption of practices that balance these three aspects to ensure the necessary resources.

Corporate Social Responsibility, on the other hand, involves the responsibility of companies in relation to the impacts of their decisions and activities on society and the environment, aiming to contribute to sustainable development. However, as highlighted in the scientific article "Corporate Social Responsibility: Concept, Management Instruments and Standards" of 2015, the concept of CSR does not have a universal definition. However, when we delved deeper into the literature, we identified that the concept is related to policies and actions that promote the communication of the entity's positive behavior in relation to the social and environmental sphere.

As we can see in Figure 1, it is possible to distinguish Sustainability, CSR and ESG based on the focus and objective of each concept presented:

Figure 1

ESG Focuses and Objectives, Sustainability and CSR

	ESG (Environmental, Social, and Governance)	Sustentabilidade	RSC (Responsabilidade Social Corporativa)
Foco	Criação de conjunto de critérios usado para avaliar as práticas e o desempenho de uma empresa em três áreas principais: ambiental, social e governança	Preservação dos ecossistemas e recursos naturais, concentrando - se na equidade e bem-estar das pessoas e viabilidade financeira a longo prazo.	Práticas que a empresa de ser socialmente responsável, indo além dos lucros e considerando o impacto de suas atividades na sociedade e no meio ambiente.
Objetivo	Fornecer aos investidores uma visão abrangente sobre o comportamento da empresa em relação a esses critérios, ajudando na tomada de decisões de investimento responsáveis.	Promover práticas que garantam a sobrevivência e prosperidade a longo prazo, minimizando impactos negativos e contribuindo positivamente para a sociedade e o meio ambiente.	Melhoria da imagem pública da empresa, aumentando o engajamento dos funcionários, e criar um impacto positivo nas comunidades locais e no meio ambiente.

Source: Prepared by the authors.

Therefore, we can conclude that, when we think about Sustainability and Corporate Social Responsibility (CSR) within entities, these practices tend to be more spontaneous within entities, focusing on environmental leadership and organizational initiatives, such as promoting "quality" of life within the company and volunteer programs, without necessarily integrating them with value creation and risk management.

However, when we talk about risk mapping, we are referring to ESG criteria, as they involve financial decisions based on performance and relevant environmental, social, and governance metrics, focusing on short-, medium-, and long-term performance and value creation, as well as addressing environmental, social, and governance risks.

For Tinoco and Kraemer (2004), this management has become a strategic factor for the analysis of senior management, especially in the strategies formulated to ensure compliance with environmental laws.

2.2 ESG PILLARS

Therefore, risk and strategy management requires understanding how the three pillars involving ESG are worked:

In the first criterion, Environment, entities must adopt measures to reduce their impact on the environment.

Tchizawa (2011), in his book, establishes that entities can develop their main environmental performance criteria through:

1. Greenhouse Gas (GHG) Emissions;
2. Consumption of energy and natural resources;
3. Waste management and recycling;
4. Impact on biodiversity.

The criteria of the social pillar, on the other hand, refer to the policies and actions that generate an impact on the community in which the entity is inserted. In this sense, we can consider the promotion of diversity and inclusion, the health and safety of employees, in addition to relationships with suppliers and customers.

Finally, the Governance criterion deals with the corporate governance practices adopted by companies.

In this aspect, the company's structured organizational configuration, independence in decision-making by boards, market ethics, anti-corruption, risk management, and transparency in communication with investors are evaluated.

Currently, the increase in demand for ESG strategies is justified by three factors, the first of which is linked to the fact that customers and employees are looking for companies whose values are aligned with their own.

For companies, this factor impacts engagement and productivity. Nogueira (2020) points out that when the employee recognizes the values of the company itself, a positive feeling of belonging is created in the work environment.

However, it is important to note that this factor is related to a generational issue. Nogueira (2020) observes, in his case study, that more conservative generations (X and Y) do not consider the alignment of values as relevant, prioritizing safety and individual projects. On the other hand, when analyzing the data from generation Z, the importance of alignment for maintaining the employment relationship was noted. This same alignment was pointed out in a Forbes survey, where 88% of respondents showed a tendency to buy products with social and environmental benefits and would be loyal to the brand for this reason.

Junqueira (2023), highlights the importance of communication between the entity and its audience, ensuring a stronger identification.

The second factor is the growing pressure and demand for robust ESG programs, with accurate disclosures. In 2023, B3's Corporate Sustainability Index (ISE) disclosed that companies committed to sustainable practices have an estimated market value of R\$2 trillion, which corresponds to 54% of the total value of companies listed on B3. Consequently, investors have come to recognize that the financial market can shape more sustainable companies, and this commitment is sometimes a prerequisite for listing and attracting investments.

The research carried out by Junqueira (2023) estimates that, by 2025, the ESG agenda should raise around US\$ 53 trillion in investments. In 2023, the same survey showed that 84% of executives say that ESG contributes to shaping a more robust corporate strategy, influencing mergers and acquisitions, in addition to mitigating risks of losing market share.

Finally, in recent years, new laws have emerged to reduce carbon emissions while meeting the commitments of the Paris Agreement.

In Brazil, concern for the environment gained prominence after Rio-92, an event that marked the beginning of awareness and public policies aimed at sustainability.

Thus, in recent years, there has been a significant growth in environmental management in the Brazilian territory.

For Tchizawa (2011), the first attempts to establish a "green seal" occurred during the 90s, when ABNT proposed to IBPA a project aimed at a voluntary environmental certification scheme.

Currently, ABNT promotes the adoption of the following environmental standards:

ISO 14001: International standard that specifies the requirements for an Environmental Management System (EMS). It assists in the identification of risks and controls on significant environmental aspects, promoting continuous improvement through the PDCA (Plan-Do-Check-Act) methodology.

ISO 26000: International standard that provides guidelines on social responsibility. Unlike ISO 14001, it is not certifiable, but it guides organizations on how to operate in a socially responsible manner.

According to the text of the standard, corporate social responsibility is based on seven principles: responsibility, transparency, ethical behavior, respect for the interests of stakeholders, rule of law, and human rights.

The standard also establishes guidelines on how to integrate social responsibility actions into its policies, strategies, and evaluation criteria.

The adoption of the ISO 14001 and ISO 26000 standards, promoted by ABNT in Brazil, represents a significant step for organizations that seek to align their operations with the principles of sustainability and social responsibility, integrating them as ESG criteria.

On October 20, 2023, the Brazilian Securities and Exchange Commission (CVM) disclosed, through CVM Resolution No. 193, the option to prepare and disclose sustainability-related financial information reports based on the international standard issued by the ISSB, as of the base date of 2024. However, the same resolution provides for the mandatory nature of this information for publicly traded companies as of 2026.

2.3 DISCLOSURE REPORTS

With the advent of globalization and the growing awareness of the importance of social and environmental issues, companies began to report their social and environmental performance, in addition to the respective financial impacts.

Throughout the development of environmental, social and corporate assessments and actions, the need arose to disclose this information through separate reports, with emphasis on the actions carried out by the entity during the year.

The first integrated report was created in 1997, with the initial objective of being a model capable of transmitting the transparency of the environmental impacts generated by the entity and meeting the principle of comparability, the Global Reporting Initiative (GRI) created the first mechanism that made it possible to understand the financial impacts generated by the entity's environmental and social management.

Over these 27 years, the form of disclosure proposed by the GRI has evolved, covering not only environmental issues, but also social and economic topics, becoming a comprehensive Figurework for sustainability reporting, applicable to any organization, regardless of its economic scale or sector.

The flexibility of the GRI allows companies to align their disclosures with multiple integrated reporting templates, ensuring that different stakeholders receive the information they need. Among these models, the TCFD, the GHG Protocol and, more recently, the integration with IFRS S1 stand out.

In 1998, the GHG Protocol was developed with the aim of standardizing and guiding the accounting of GHG emissions in a consistent, comparable and transparent manner.

To this end, the GHG classifies emissions into three scopes:

- **Scope 1:** Direct emissions from sources controlled by the organization (such as the burning of fossil fuels in boilers).

- **Scope 2:** Indirect emissions associated with the purchase of electricity, heat, or steam.
- **Scope 3:** Other indirect emissions along the value chain, such as transportation and use of products sold.

One of the main differentials of the GHG Protocol is the principle of completeness, that is, the report requires the disclosure of all sources of emissions, which must be listed in the entity's inventory.

The Task Force on Climate-related Financial Disclosures (TCFD) is a voluntary integrated report used to promote and develop the disclosure of climate-related financial impacts, encouraging transparency and better management of climate risks. This report helps investors and the public understand the concentration of carbon in assets.

The TCFD proposes that its disclosures be organized around four areas, as shown in Table 1:

Table 1

Key dissemination characteristics of the TCFD.

Governança	Como a Administração realiza a gestão dos riscos relacionados ao clima.
Estratégia	Como os atuais e potenciais riscos climáticos impactam as estratégias, modelo de negócio e planejamento financeiro da entidade.
Gestão de Riscos	Como a organização identifica, endereça e gere riscos relacionados ao clima.
Métricas e Metas	Quais são as métricas usadas para endereçar e gerir informações relevantes relacionadas aos riscos e oportunidades relacionadas ao clima.

Source: Prepared by the authors.

As we can see in this theoretical Figurework, there are different approaches and methodologies for environmental disclosures, which can be developed depending on the purpose of the disclosure. However, in this work, we highlight the methodology of scoping and dissemination according to the SASB as an object of study.

The requirements developed by the Sustainable Accounting Standards Board (SASB) provide entities and investors with standardized communication, relating the financial impacts of sustainability across 77 industries.

In March 2022, through the International Sustainability Standards Board (ISSB), SASB published the draft IFRS S1, which aims to standardize the general requirements for

sustainability disclosures, related to the opportunities and risks associated with an entity's sustainability.

According to the publication issued in June 2023, IFRS S1 has the scope of preparing and disseminating sustainable information related to financial information that is useful to users, such as:

- **Governance:** What are the processes, controls, and procedures that management uses to monitor and manage sustainability-related risks and opportunities.
- **Strategy:** Disclosure of the approach the entity uses to address sustainability risks and opportunities that affect operating strategies and cash flow in the short, medium and long term.
- **Metrics and Targets:** What information is used to manage the performance of sustainable risks and opportunities.
- **Risk Management:** How the entity manages sustainability-related risks

The standard also provides for the obligation that the report be prepared and disclosed at the same time as the financial statements, in addition to the inclusion of financial data and assumptions, considering the accounting standards already in force.

In addition, more recent ISSB publications on the subject provide for the particularity of IFRS S1 disclosures according to the market segment in which the entity operates.

3 ANALYSIS AND INTERPRETATION OF RESULTS

3.1 BANCO BRADESCO S.A

Banco Bradesco S.A. is one of the most traditional financial institutions in the Brazilian financial market. Founded in 1943 by Amador Aguiar, the bank aimed to serve small merchants, farmers and the population in general, especially in regions that did not have easy access to financial services.

The first practices focused on ESG occurred throughout the 1950s, with initiatives focused on education. Later, in 1988, the institution founded the Bradesco Foundation, a third sector organization with the main objective of providing education and professional training for young people and adults, offering free education, in addition to promoting digital inclusion programs.

As for integrated sustainability reports, the institution issued its first report in 2006, in line with GRI (Global Reporting Initiative) standards.

In the following years, in addition to the mandatory disclosure, Bradesco began to integrate information on important sustainability indices into its reports, such as the B3 Corporate Sustainability Index (ISE) and the Dow Jones Sustainability Index (DJSI).

In 2019, Bradesco launched its commitment to be a positive impact bank, with ambitious goals for 2025, including reducing carbon emissions and financing sustainable initiatives. This vision was consolidated with the creation of the Sustainability Committee and the inclusion of sustainability as one of the bank's strategic pillars

3.2 REQUIREMENT FOR IFRS S1 DISCLOSURE

3.2.1 General Characteristics

Regarding the general characteristics of sustainability disclosure under IFRS S1, they are similar to those defined for financial statements. According to the rule, the presentation of the report provides that, for sustainability indices to be useful, they must be relevant and faithfully represent all the risks and opportunities to which the entity is exposed, whether as a result of its employment practices and those of its suppliers, the assets (including investments) that the entity controls or its sources of financing. The information must be comparable, verifiable, timely and understandable.

The standard also requires the following general reporting characteristics:

- 1. Related Information:** An entity shall provide information that enables users to connect risks and opportunities to the entity's financial objectives.
- 2. Materiality:** An entity shall apply judgment to identify relevant sustainable information. The judgment applied in the definition of materiality must be described in the report.
- 3. Comparative Information:** An entity shall provide comparative information that reflects the updating of previously established estimates.
- 4. Frequency of Reporting:** An entity shall disclose the report as often as financial disclosures. The document points out that, normally, the entity prepares the sustainability report for 12 months. However, some entities prefer to issue reports for 52 weeks, but IFRS S1 does not contemplate this practice.
- 5. Location of Information:** Entities are required to disclose information as required by IFRS Sustainability.
- 6. Sources of Estimation and Uncertainty:** An entity shall disclose the relevant metrics and the nature of the uncertainties affecting those metrics.

7. Errors: An entity shall identify and correct material errors from previous and current years resulting from omissions and misstatements in sustainability-related financial disclosures.

8. Declaration of Conformity: An entity must include an explicit, unqualified statement of compliance if its disclosures meet all of the requirements of the standard.

The following table was prepared to identify whether Banco Bradesco follows the general characteristics of the IFRS S1 standard:

Figure 2

General Disclosure Characteristics

	2023

Materialidade	x		
Informações Relacionadas		x	
Informações Comparativas	x		
Frequência do Relatório	x		
Localização das informações		x	
Fontes das Estimativas	x		
Erros		x	
Declaração das conformidades	x		

Source: Prepared by the authors.

Materiality is a fundamental aspect in audit practice and in the IFRS S1 standard, because, in both cases, it influences the planning and execution of the audit, especially in the mapping of sustainable risks and opportunities. According to ISA 320, materiality is defined as the magnitude of an omission or misstatement of a financial statement that, individually or in the aggregate, can influence users' economic decisions made based on the financial statements.

Thus, materiality is determined based on percentages of relevant financial metrics, such as revenue, earnings before taxes, or equity.

In the IFRS S1 standard, the concept of double materiality is considered. According to the PWC report (2022), double materiality aims to identify relevant issues from a financial point of view, such as impact.

To assist in the identification of relevant issues of impact, the Sustainability Accounting Standards Board (SASB) has a mapping by industrial sectors that can integrate ESG. According to the SASB Standards, the relevant issues to be considered for commercial banks are highlighted in Figure 3, below:

Figure 3

Relevant Issues for the Financial Sector

Ambiente	Capital Social	Capital Humano	Modelo de Negócio e Inovação	Liderança e Governança
Emissões de GEE	Direitos Humanos e Relações Comunitárias	Práticas trabalhistas	Design de produto e gerenciamento do ciclo de vida	Ética empresarial
Qualidade do ar	Privacidade do cliente ⓘ	Saúde e Segurança dos Funcionários	Resiliência do modelo de negócios	Comportamento competitivo
Gestão de energia	Segurança de Dados ⓘ	Engajamento, diversidade e inclusão dos funcionários	Gestão da cadeia de abastecimento	Gestão do Ambiente Legal e Regulatório
Gestão de Água e Efluentes	Acesso e acessibilidade		Fornecimento de materiais e eficiência	Gestão de Riscos de Incidentes Críticos
Gestão de Resíduos e Materiais Perigosos	Qualidade e segurança do produto		Impactos físicos das mudanças climáticas	Gestão de Riscos Sistêmicos
Impactos ecológicos	Bem-estar do cliente			
	Práticas de venda e rotulagem de produtos ⓘ			

Source: SASB STANDARDS.

In addition to the table provided by sectors, the entity must evaluate its value chain in order to have the necessary information to identify environmental, social and governance issues that impact the entity's development.

IFRS S1 does not specify a materiality threshold, nor does it predetermine what would be material in a particular situation, but establishes that an entity should apply its judgment in order to identify sustainability-related financial information, and that it should be reassessed at each reporting date, considering changes in circumstances and assumptions.

As communicated in the Materiality Report (2022), Banco Bradesco reviews its materiality every two years. This report presents how the bank identifies and prioritizes relevant ESG issues within its operations and for its stakeholders. To determine material topics, Banco Bradesco uses a structured approach that includes: engagement with stakeholders, analysis of trends and risks, and internal assessments.

In 2022, the main themes identified were: sustainability and environmental management of the bank, inclusion and diversity, governance and ethics, digital transformation, and security and data protection.

During the reading of the materiality report, it was not possible to identify the assumptions used to calculate the financial impact of the entity's decarbonization projects.

Regarding the connected information, that is, how the risks and opportunities are related to the financial statements, it is observed that, in the integrated report and in the ESG report, there is a qualitative predominance, with majority descriptions of sustainability, governance, and social impact actions.

For example, in the integrated report, the entity describes its initiatives and commitments to reduce carbon emissions without necessarily associating these efforts with specific financial metrics. This is a more subjective disclosure of ESG reports, which, although it could complement the financial information in an explanatory note, does not establish a direct

quantitative connection with the financial statements, providing a comprehensive overview of corporate performance from a sustainable perspective.

As for comparative information, the entity has released its integrated report since 2020, which allows the comparability of the metrics presented.

With regard to the frequency of the report, the entity publishes its integrated report on an annual basis, which contrasts with the periodicity established in IFRS S1. Since the financial statements are disclosed quarterly, it appears that the issuance of the documents took place separately, with the financial statements published on February 6, 2024 and the integrated report on June 7, 2024.

Regarding the location of the information, the entity follows the guidelines for accountability and good sustainability practices, responding to the disclosure content proposed by the GRI Standards. This means that, in 2023, risks and opportunities were not disclosed according to the IFRS Sustainability standard.

Regarding the disclosure of the sources of estimates, in 2023 the entity presented, separately from the integrated reports, a spreadsheet of ESG indicators. The document is presented in an Excel spreadsheet, divided into three main tabs. On the main page, it is possible to see the description that the indicators cover the period from January to December 2023. It should be noted that the construction of the metrics was carried out according to the guidelines of the GRI Standards, Integrated Reporting of the Value Reporting Foundation (IIRC), in addition to considering global methodologies and Figureworks. As for the metrics, they were formulated based on the ESG pillars. In the environmental pillar, there are 83 indicators, subdivided into sub-themes such as operational emissions, water, energy, waste and material management. It is possible to verify that the company uses financial criteria, such as net revenue, to calculate the indicators of emission intensity and energy intensity. However, the methodology applied and the uncertainties of the estimates are not clearly described, especially in relation to the indicators of the governance and social pillars, which are more subjective in nature.

Regarding uncertainties, it is relevant to mention that, in July 2024, IFRS Accounting published the Exposure to Climate Uncertainties and Other Uncertainties in Financial Statements project. In this document, IFRS Accounting proposes eight examples that illustrate how an entity can apply the requirements of IFRS Accounting Standards to report the effects of uncertainties related to climate or other sustainable topics in its financial statements, focusing on areas such as materiality judgment, disclosures on assumptions and uncertainties of estimates.

As observed in the indicator spreadsheet, two errors were reported: the first, related to the calculation of employees entitled to maternity/paternity leave, and the second, related to the amount of own social and environmental products. In both cases, the error was identified and recalculated, but it was not mentioned whether there was a material financial impact after the new measurement.

Regarding the declaration of conformity, the limited assurance was carried out by KPMG - Auditores Independientes. As disclosed, the auditors conducted the work in accordance with Technical Communiqué CTO 01 - Issuance of an Assurance Report Related to Sustainability, issued by the Federal Accounting Council, and NBC TO 3000 - Assurance Engagements Other than Audit and Review. These standards regulate the planning and execution of work, with the objective of obtaining limited certainty about the non-financial information presented in the ESG Report.

The assurance report emphasizes that the opinion is conditioned by the fact that non-financial data is subject to inherent limitations.

3.2.2 Governance

The purpose of the entity disclosing about Governance is to allow users to understand the processes, controls and procedures that Management uses to monitor and manage risks and opportunities related to sustainability.

To this end, the entity must disclose information about the councils that deliberate on sustainability risks and opportunities and how this process is managed. For the standard, the entity must disclose:

- A) What is the identity, skill and competence of the board members responsible for sustainability risks and opportunities;
- B) How and how often the group conducts assessments on sustainability issues;
- C) How does the responsibility of this group reflect on the entity or company?
- D) How the board (committee) controls and monitors at the management level applied to risks and opportunities and how they are related to financial metrics, including compensation policies.
- E) How sustainability-related risks and opportunities are linked to the entity's strategies.

In view of the above requirements, a Figure work was prepared so that we could analyze the 2023 integrated report and verify whether the above items were applied or not:

Table 2*Governance in the Bradesco S.A Integrated Report*

	Year 2023	
Governance	It does not proceed	Proceeds
Item A	X	
Item B		x
Item C		x
Item D		x
Item E		x

Source: Prepared by the author.

Item A addresses who the board members are and what their skills and competencies are in relation to risk and opportunity management. At the strategic level, Bradesco, within its board of directors, has a sustainability and diversity committee, whose main responsibility is to monitor and implement the sustainability strategy. However, the report does not feature the members of the sustainability committee.

Banco Bradesco presents in its ESG Report the governance structure, which we can identify and relate the corporate governance relationships that assist in the development and monitoring of strategies, risks and opportunities.

Item B deals with the frequency with which the committee meets to monitor sustainability-related risks and opportunities. In 2023, the entity informed that the sustainability and diversity committee meets bimonthly.

Item C discusses how the monitoring of these risks and opportunities is integrated into the company's structure. For Banco Bradesco, governance is integrated, which means that decisions made at the executive level reflect on the other organizational levels, for example, at the executive level, the entity has a sustainability committee, whose objective is to advise on the strategic level decisions of the sustainability and diversity committee, proposing strategies and solutions that promote the adoption of the best corporate sustainability practices in the entity's business activities.

Item D addresses how management controls and monitors, at the management level, risks and opportunities, relating them to financial metrics, including compensation policies. At the operational level, the entity has a sustainability area, responsible for developing, proposing and monitoring indicators and actions for the implementation of the sustainability strategy, advising the board of directors, the committee and the commission in their duties. In the variable

compensation process of executives and in the evaluation of their respective areas, ESG aspects and performance in the main sustainability indices and ratings are considered.

Finally, Item E discusses how strategies related to risks and opportunities are aligned with the entity's overall strategy. Through the sustainability area, the entity seeks to monitor the risks and opportunities in the other structures, supporting the integration of the topic into the business. The entity has dedicated teams in different areas of the business that strive to connect and disseminate the sustainability strategy.

3.2.3 Strategies

The entity's objective in disclosing its strategies is to enable users to understand how it addresses risks and opportunities related to sustainability. To achieve that objective, an entity shall disclose information on:

a) The relevant sustainable risks and opportunities that may reasonably affect the business model, strategies and cash flow in the short, medium and long term. At this point, it is relevant that the entity provides a detailed description of the significant risks and opportunities. As for the deadline, the definition of strategies must be related to strategic planning and may depend on several factors, such as the type of industry, cash flow, the budget cycle, and the expected duration of capital investments, among others.

(b) the effects of significant risks and opportunities on the business model and value chain. An entity shall disclose information that enables users to understand the assessment of the impact of current and anticipated sustainability risks and opportunities on the business model. To do so, it must describe the present and projected effects of risks concentrated in the value chain. At this point, it is important to emphasize the relevance of the entity adopting an outside-in perspective, that is, not only knowing the processes and controls that can have a sustainable impact, but also considering its suppliers and customers as part of the impact generated by the company.

(c) the effects of significant risks and opportunities on strategies and decision-making. The entity must report how it responds to these risks and opportunities, bringing qualitative and quantitative data on the plans disclosed in previous reports.

The financial impact of sustainability risks and opportunities is considered in strategic decision-making, such as the location of a new branch, addressing the environmental impact of this new location, job creation and the factors that influence the company.

(d) the effects of significant risks and opportunities on position, financial performance and cash flow in the reporting period, as well as the anticipated projection of those effects in the

short, medium and long term – including how sustainability-related risks and opportunities are incorporated into the entity's financial plan. By way of example, an entity needs to disclose the exposures that occur when there are changes in revenue or costs that may result from the introduction of a Net Zero strategy, or what the impact has been on its costs by supporting labour retention strategies.

e) The ability to adjust the estimates of sustainability risks and opportunities. An entity shall disclose, in a qualitative or, where applicable, quantitative manner, analyses on strategies and cash flow related to significant risks and opportunities, including how such analyses were carried out and the base date of the study. The standard emphasizes that, when providing qualitative information, the entity may disclose the total amount or a range related to the risk.

Other IFRS Sustainability Disclosure Standards will specify the mandatory information that an entity needs to disclose. In item 3.2.6 of this work, mandatory disclosures for the financial services sector will be mentioned.

It is worth mentioning that, when relating their strategies to risks and opportunities related to sustainability, companies can opt for generic corporate strategies. Tchizawa (2011) reflects that entities such as Banco Bradesco S.A. tend to direct their strategies towards:

- A) The acceleration of the massification of digital services and the emptying of bank branches;
- B) The diversification of its financial products to attract and retain customers; e
- C) Efficiency in data storage as an element to provide exclusive services to its customers.

Next, in Figure 4, we will analyze how Banco Bradesco presents its sustainability strategies.

Figure 4

Bradesco S.A.'s Strategic Sustainability Fronts

Objetivos e decisões	Discriminação	Indicadores
Cidadania financeira	Promover educação e inclusão financeira para alavancar o desenvolvimento socioeconômico	- Valor total investido pela Fundação Bradesco para o desenvolvimento de suas atividades - Total de doações e patrocínios viabilizados por recursos próprios.
Agenda climática	Garantia que os nossos negócios estejam preparados para os desafios climáticos conscientizados engajados em seus clientes quanto a riscos e oportunidades.	- Escopo 1 - Escopo 2 - Escopo 2
Negócios sustentáveis	Impulsionar negócios de impacto positivo que fomentem o desenvolvimento socioambiental.	- Volume total de ativos sob gestão - Assets under Management (AuM) com avaliação ESG - Total de ativos com avaliação ESG sujeitos à triagem ambiental ou social positiva - Companhias que podem ocasionar dependência química e ou riscos ou danos à saúde - Companhias que produzem ou comercializam produtos de combustíveis fósseis - Companhias que podem ocasionar riscos à saúde ou à segurança alimentar e nutricional

Source: prepared by the authors.

In February 2024, the entity reinforces its sustainable development strategy through initiatives that generate positive impacts, focusing on three main fronts:

- A) Social and environmental products:** the entity offers financing for the purchase of hybrid and electric vehicles, solar energy panels and, in partnership with BNDES, provides differentiated interest rates so that rural landowners can recover pastures and forests, in addition to promoting technologies that contribute to the reduction of greenhouse gas emissions.
- B) ESG operation:** as part of its business strategy, the entity has operations to grant financing or refinance assets that contribute to the ESG agenda.
- C) Funding with IFC:** the entity has a financial agreement with the IFC (International Finance Corporation) with the objective of supporting projects aligned with ESG and financial inclusion principles, expanding support to micro, small and medium-sized companies inserted in the context of Local Productive Arrangements (APLs).
- D) Responsible investments:** through a screening that incorporates ESG analysis data into strategies for assessing relevant risks and opportunities within funds and assets. In addition to the use of ESG criteria as a way of incorporating assets, the entity offers asset funds that have projects related to the ESG theme.

In 2023, these funds under management of Banco Bradesco that have integration of ESG issues, totaled a net worth of R\$ 315 million.

Regarding the IFRS S1 standard, we can observe that the report does not provide specific information, not allowing an in-depth analysis of the financial impact of these initiatives. In addition, the document also does not present long-term cash flow projections, which prevents a clear understanding of how the management of these assets influences the entity's operating cash flow.

3.2.4 Risk Management

According to ISO 31000, risk can be defined as the effect of uncertainties on planned objectives.

In this sense, environmental risk is considered by the identification, measurement, and disclosure of an environmental, social, or governance event that generates environmental costs, assets, or liabilities, directly impacting the company's profitability.

This management is carried out by understanding significant sustainable events that may reasonably affect the entity's assets, liabilities or cash flow.

According to Raoni (2024), for the assessment of risks related to sustainability, the entity needs to observe the positive and negative impacts (actual and potential) it has on the economy, the environment, and human rights. After the identification of the impact (event), the entity shall assess the frequency of the occurrence of that impact. The entity can use methodologies that help calculate the frequency, however, in cases of real impact (an impact that has already occurred), it is only necessary to assess the severity, that is, the magnitude of this identified event.

By assessing severity and combining it with an assessment of the frequency of events, the entity is able to more accurately identify the sustainability-related risks and opportunities that surround it.

According to IFRS S1, the purpose of risk management disclosure is to enable users to understand the process of identifying, assessing, prioritizing and monitoring sustainability-related risks and opportunities, including where and how these processes are integrated into the entity's risk management.

To this end, the entity must disclose information, especially on how the process is carried out and the policies used so that employees can identify, assess and monitor risks related to sustainability.

This information should include:

1. The parameters that the entity uses;
2. How the entity uses and monitors scenarios to analyze sustainability-related risks;

3. How the entity assesses the nature, likelihood and magnitude of the effects of those risks;
4. How the entity prioritizes sustainability-related risks over other types of risks;
5. How the company monitors sustainability-related risks and whether there is a change in these risks;
6. How the entity changed these parameters and how they compare with the risks reported in previous periods.

The following Figure 5 was prepared to analyze whether Banco Bradesco follows the recommendations for risk management disclosure according to the IFRS S1 document:

Criteria 1, 2 and 3 refer to the disclosure of parameters for the assessment of risks and opportunities related to sustainability. In 2024, the entity disclosed, in its Social, Environmental and Climate Risks and Opportunities Report (RSAC), that its sustainability-related risks and opportunities come mainly from its business relationships, including suppliers and customers, through financing and investment activities. As presented in the RSAC, the entity has a process for identifying, assessing and classifying social and climate risks, carried out through the analysis of credit and financing activities, project financing, guarantees, suppliers and investments.

In Figure 6, it is possible to see the scope of assessment of risks and opportunities related to Banco Bradesco's sustainability.

Figure 6

Description of the process of identification, measurement and evaluation of social risk, environmental risk and climate risk

Atividade	Escopo da Avaliação (Critérios)	Escala de Rating
Crédito	Score ASG: Biodiversidade, clima, direitos humanos, conformidade legal e saúde ocupacional.	Mínimo a Muito Alto (5 níveis)
Projetos	Checklists setoriais: Licenciamento, estudos ambientais, mitigação de impactos e exposição climática.	Mínimo a Muito Alto (5 níveis)
Garantias Imobiliárias	Passivos ambientais, contaminação de solo, restrições sociais e climáticas (imóveis rurais/urbanos).	Liberado, Restritivo ou Impeditivo
Fornecedores	Auditoria em três dimensões: Responsabilidade social, meio ambiente e saúde/segurança.	Mínimo a Muito Alto (5 níveis)
Investimentos	Alinhamento com frameworks globais (PRI, TCFD, IPC, AMEC) e impactos ASG nos ativos.	Baixo, Moderado ou Alto

Source: Social, Environmental and Climate Risks and Opportunities Report - Banco Bradesco.

In addition, the entity has developed criteria for exposure to social, environmental and climate risks for its potential customers, to whom credit is granted.

For social risks, criteria from IFC, S&P, as well as data on fines and child labor in Brazil are used.

Environmental risks are classified according to the same references, in addition to FEBRABAN's definitions and regulatory records. The assessment of climate risks depends on sectoral and geographical characteristics, due to the lack of specific regulation. As for the transition to a low-carbon economy, market, reputational, regulatory and technology risks are assessed.

In criterion 4, the entity seeks to disclose how these risks are prioritized over other operational risks. However, for the entity, RSACs are directly connected. Thus, aiming at this connectivity, the entity adopts stress tests to evaluate scenarios with uncertainties caused by social, environmental and climatic factors.

Scenario Analysis:

Climate change associated with greenhouse gases and temperature changes can cause changes in the macroeconomic scenario. With this in mind, Banco Bradesco conducts financial impact tests if environmental risks materialize, based on the macroeconomic equilibrium model, aiming at a comprehensive understanding of the potential impacts on portfolios, results and liquidity ratios.

Sensitivity Analysis:

In order to measure the exposure of operations with corporate customers, the entity conducts simulations to assess the impact of environmental and social risks on the granting and liquidity of credit. These simulations allow Banco Bradesco to estimate possible impacts on variables such as companies' credit ratings.

Criterion 5 is related to risk monitoring, that is, how the identified risks are managed and monitored and how the changes that eventually need to be made are detected. As disclosed in the Social, Environmental and Climate Risks and Opportunities Report (2023), the entity's monitoring includes the periodic review of social and environmental ratings. The sustainability area monitors social and environmental infractions that, depending on the event identified, result in an emergency rating review.

This area also monitors political and legal changes, and, when identified, evaluates the impacts and makes the appropriate Figureworks.

Criterion 6 was not presented as the entity did not disclose any changes in its risk assessment criteria.

Although the entity presents the risks and opportunities related to sustainability, it is emphasized that this analysis was made based on the Social, Environmental and Climate Risks and Opportunities Report, a separate management report, which is not part of the integrated ESG report disclosed. Separate disclosure may compromise the reliability of the information presented. According to IFRS S1, presentations must be carried out in an integrated manner, ensuring that stakeholders have complete information about the risks and their implications.

3.2.5 Metrics and Goals

The purpose of disclosing metrics and targets is to enable users to understand performance in relation to sustainability-related risks and opportunities.

In accordance with IFRS S1, the entity must clearly report all metrics relevant to the environment in which it operates, disclosing the methodology, the assumptions assumed, the limitations in carrying out the study, the period, the relevant milestones during the period and, if applicable, the relationship with other metrics.

It is necessary to disclose the performance, analyzing the context of the operation to which the metric is related and, in case of change, the change must be disclosed and clarified.

The analysis of Bradesco's sustainability reports revealed that, although the institution adopts ESG information disclosure practices, there are specific gaps in the integration of this information with the financial statements, such as the absence of quantitative metrics on social and environmental impacts.

The document is presented in an Excel spreadsheet, divided into three main tabs, however, on its main page, it is possible to observe the description that, as disclosed, the indicators report data from January to December 2023. It should be noted that the construction of the metrics was carried out in accordance with the guidelines of the GRI Standards and the

Integrated Reporting of the Value Reporting Foundation (IIRC), in addition to considering guidelines, methodologies and global Figureworks. Regarding the metrics, they were formulated according to the pillars of ESG.

In the environmental pillar, there are 83 indicators, subdivided into sub-themes on operational emissions, water, energy, waste and material management. It is observed that the company uses financial criteria, such as net revenue, to calculate the indicators of emission intensity and energy intensity; However, the methodology applied is not clear, as well as the uncertainties of the estimates, and the other criteria, as well as those applied to the governance and social pillars, have a more subjective nature.

3.2.6 Required Disclosures

Commercial banks carry out deposit transactions and loan concessions to individuals and companies.

As explained during the presentation of the analyses, we can observe that the risks and opportunities related to sustainability affect the macroeconomic scenario and, consequently, these operations, especially those related to the granting of credit. Given the relevance of the topic, in June 2023, IFRS Sustainability released a mandatory disclosure guide for banks.

In the document there is only one theme and metric to be disclosed on sustainability on a mandatory basis, as shown in Table 9:

Table 3

Themes and metrics of the information to be disclosed on sustainability

Theme	Metric	Category
Incorporating environmental, social, and governance factors into credit analysis	Description of the approach for incorporating ESG Factors	Reviews and commentary

Source: IFRS Sustainability.

Banco Bradesco can contribute externally, positively or negatively, through its credit granting practice. For this reason, integrating ESG factors into the grant makes it possible to determine the quality of the guarantees.

Therefore, the entity must disclose the methodology for calculating the granting of credits, as well as the policies that determine the incorporation of ESG factors in its credit analyses.

As analyzed in the Social, Environmental and Climate Risks and Opportunities Report, the incorporation of ESG factors is used, for the most part, in exposure to credit operations.

With regard to the granting of credit, the entity evaluates customers who operate in sectors with potential environmental and social exposure, resulting in a socio-environmental rating determined in credit deliberation forums, following the delimitation of the RAS. In the RAS, social, environmental, and climate risks are represented by guidelines related to sensitive sectors, controversial activities, and socio-environmental infractions that are linked to the entity's strategies.

In 2023, Banco Bradesco's exposure was characterized by credit operations, debt securities and operations not accounted for in the prudential balance sheet (transactions that are not directly disclosed by the bank, but that have risks, such as some guarantees and future commitments).

The sectors most susceptible to risks include: Financials (23.14%), Retail (4.36%), Transportation and Concession (3.42%), Wholesale (2.16%) and Real Estate and Construction (2.72%). It is important to note that the individual (39%) is not evaluated, but the report does not provide justification for this exclusion.

All economic sectors are exposed to events that can increase or decrease their social, environmental and climate risks. In 2023, the entity recognized operating losses of R\$ 3.3 million resulting from these events.

Despite the disclosure, this information was analyzed from the Social, Environmental and Climate Risks and Opportunities Report, which is a separate management document and is not part of the ESG report.

It was not possible to identify the balance recognized as an operating loss in the financial statements, which creates uncertainty about the calculation of the provision. This is because these risks may not have been considered during the assessment by the external audit.

Fragmented disclosure can compromise the reliability of the information presented. According to IFRS S1, presentations must be made in an integrated manner, ensuring that stakeholders have access to complete information about the risks and their implications.

4 FINAL CONSIDERATIONS

This study analyzed how Banco Bradesco S.A. incorporates ESG criteria into its accounting practices and sustainability reporting, with the objective of assessing the compliance of these practices with the disclosure requirements established by the IFRS S1 standard. Based on the theoretical review and analysis of the bank's reports, we sought to investigate the hypothesis that, although Bradesco adopts ESG disclosure practices, there are still gaps in the

integration of this information into the financial statements, which would compromise the transparency and comparability of the data.

The research confirmed the initial hypothesis, showing that Bradesco implements relevant practices for compliance with ESG guidelines and makes use of detailed reports on sustainability and corporate governance. However, it was observed that the full integration of this information with the financial statements is still partial. Disclosures related to social and environmental aspects, although aligned with standards such as GRI and ISSB, are not fully integrated into financial reports, which limits the ability of stakeholders to understand the financial impact of the bank's sustainable actions.

Another critical point identified was the lack of clear and standardized quantitative metrics in ESG reports. Although the bank provides qualitative descriptions of its initiatives, the absence of numerical data makes it difficult to accurately measure financial and socio-environmental impacts, a key aspect to meet the materiality, comparability and verifiability criteria of IFRS S1.

The analysis also revealed practical challenges in implementing IFRS S1 requirements, such as the need for a robust data integration system and the difficulty in quantifying the impacts of sustainable practices consistently. These factors reinforce the complexity of aligning ESG disclosure practices with global IFRS standards, requiring the bank to consider investments in measurement and control processes.

To improve compliance with IFRS S1, it is recommended that Banco Bradesco invest in the standardization of its ESG metrics, with a focus on quantitative data that can be easily integrated into the financial statements. The adoption of an independent auditing and verification system for ESG data can increase the reliability and transparency of disclosures, promoting greater stakeholder trust and alignment with international best sustainability practices.

In conclusion, the survey confirms the relevance of ESG criteria for Banco Bradesco and its commitment to sustainability. However, to achieve full compliance with IFRS S1 and meet the growing demands for transparency and social and environmental responsibility, the bank must adopt measures that reinforce the integration of ESG data with financial information, promoting reports that are both complete and comparable in the international scenario.

In addition, it is recommended that this study continue, given the growing relevance of the theme.

ABSTRACT

This article proposes a comparative reading of *As a Man Grows Older*, by Italo Svevo, and *Dom Casmurro*, by Machado de Assis, considering the similarities in the representation of amorous desire, jealousy, and male subjective instability. The study is based on the problem of affective relationships mediated by rivalry and idealization, recurrent in both narratives. Its objective is to analyze how Emilio Brentani and Bento Santiago construct love relationships permeated by suspicion, imaginative projection, and the inability to recognize female alterity. To this end, a comparative bibliographic and interpretative analysis is carried out, mainly grounded in René Girard's theory of mimetic desire, as well as critical studies concerning the novels analyzed. Thus, it is observed that the protagonists progressively replace real women with imaginary constructions produced by their own subjective anxieties, making jealousy a central element of identity destabilization. It is also observed that, in *Dom Casmurro*, jealousy surpasses the thematic level and comes to structure Bento Santiago's memorialistic narrative itself. It is therefore concluded that both novels represent love as an experience marked by rivalry, imagination, and the fragility of modern subjectivities.

Keywords: Mimetic Desire. Jealousy. Machado de Assis. Italo Svevo. Love Relationships.

RESUMO

O presente artigo propõe uma leitura comparativa dos romances *Senilidade*, de Italo Svevo, e *Dom Casmurro*, de Machado de Assis, considerando as aproximações existentes na representação do desejo amoroso, do ciúme e da instabilidade subjetiva masculina. Parte-se da problemática das relações afetivas mediadas pela rivalidade e pela idealização, recorrentes nas duas narrativas. Objetiva-se analisar de que maneira Emilio Brentani e Bento Santiago constroem relações amorosas atravessadas pela suspeita, pela projeção imaginativa e pela dificuldade de reconhecer a alteridade feminina. Para tanto, procede-se a uma análise

² Postdoctoral degree in Comparative Literature (French and Brazilian Poetry). Universidade Estadual Paulista (UNESP). Faculdade de Ciências e Letras de Araraquara. E-mail: marcia.e.pires@unesp.br Orcid: <https://orcid.org/0000-0002-5617-120X> Lattes: <http://lattes.cnpq.br/4174940004995280>

comparativa de caráter bibliográfico e interpretativo, fundamentada principalmente na teoria do desejo mimético de René Girard, além de contribuições críticas acerca das obras analisadas. Desse modo, observa-se que os protagonistas substituem progressivamente a mulher real por construções imaginárias produzidas por suas próprias inquietações subjetivas, fazendo com que o ciúme se torne elemento central de desestabilização identitária. Observa-se ainda que, em *Dom Casmurro*, o ciúme ultrapassa o plano temático e passa a estruturar a própria narrativa memorialística de Bento Santiago. Conclui-se, portanto, que ambos os romances representam o amor como experiência marcada pela rivalidade, pela imaginação e pela fragilidade das subjetividades modernas.

1 INTRODUCTION

Love, desire and jealousy are recurrent themes of the Western novelistic tradition, often associated with the representation of subjectivities crossed by affective instability and the experience of rivalry. In this perspective, we propose the comparative reading of *Senility*, by Italo Svevo, a novel from the late nineteenth century, and *Dom Casmurro*, by Machado de Assis, published in the early twentieth century, as narratives that problematize love desire from a male perspective marked by idealization, suspicion and jealousy. These works present significant approximations with regard to the psychological construction of the protagonists, the problem of jealousy and the ambiguous representation of love relationships, aspects that can be verified at different levels of the narrative.

Our objective is not to carry out a strictly structuralist reading of the works, but to highlight important approximations in the narrative configuration and in the representation of male subjectivities. In the texts analyzed, the narrative focuses on a small number of characters and privileges less the external action than the exploration of the internal conflicts of its protagonists. In this way, love relationships become privileged spaces for the manifestation of desire, jealousy and identity instability, elements that cross the male affective experience in both narratives.

The indispensable preliminaries of these two stories of passion present male protagonists marked by loneliness, maturity and insertion in the urban bourgeois universe. In *Senility*, we find Emilio Brentani, a thirty-five-year-old man, an intellectual of modest prestige, recognized more for an aura of erudition than for concrete achievements, in addition to occupying a bureaucratic job of little relevance in an insurance company. In *Dom Casmurro*, we have Bento Santiago, a mature and introspective narrator, belonging to the carioca elite, whose trajectory is marked by the attempt to memorialistically reconstruct his love and marital past, in a narrative crossed by jealousy, distrust and the constant oscillation between memory and imagination. Although distinct in their social trajectories, Emilio and Bento are close by the instability of their subjectivities and by the tendency to convert love desire into idealization, suspicion and rivalry. Unable to sustain affective relationships based on otherness and trust, both transform the love experience into a space of identity destabilization.

On the other hand, the duo of female protagonists presents young, beautiful women deeply marked by the male gaze that narrates or interprets them. In *Senility*, Angiolina Zarri is described as a seductive young woman, full of vitality and surrounded by rumors about her love life. In *Dom Casmurro*, Capitu initially appears as Bento Santiago's adolescent neighbor, characterized by her intelligence, vivacity and, above all, by the mystery inscribed in her famous "hangover eyes". In both novels, these female characters are constructed less by their own

voice than by the male perspective that observes, idealizes them and, subsequently, comes to distrust them.

The two women distinguish themselves from their male peers by demonstrating greater adaptation to the social and affective world. While Emilio Brentani and Bento Santiago reveal subjectivities marked by instability and the inability to sustain affective relationships not mediated by rivalry, Angiolina and Capitu appear associated with vitality, spontaneity and a certain autonomy in the face of social conventions. Feminine beauty thus becomes the first element to awaken in the protagonists an intensely idealized desire, which gradually becomes suspicion, restlessness and identity destabilization.

The description of Angiolina evidences this feminine idealization constructed through the eyes of Emilio Brentani:

Angiolina, **a blonde with large blue eyes, tall and strong, but slender and flexible, a body illuminated with life**, a pale amber color sprinkled with the rosy of good health, walked by her side, with her head tilted to one side as if hanging from the weight of the gold that enveloped her, eyes fixed on the ground that she touched at every step with the tip of her elegant parasol as if she wanted to make a sprout from it a comment on the words he heard. (SVEVO, 1982, p.13, emphasis added)

(...) The woman [Angiolina] had awakened him! **Radiant with beauty and youth, it should illuminate her all, making him forget the sad past of desire and loneliness**, and promising her joy in a future that she, it is certain, would not compromise. (SVEVO, 1982, p.13, emphasis added)

In the Machadian novel, Capitu is also initially filtered by the idealizing gaze of Bento Santiago:

He couldn't take his eyes off that fourteen-year-old creature, tall, strong, and full, cramped in a half-faded calico dress. Her thick hair, made in two braids, with the ends tied to each other, in the fashion of the time, ran down her back. Brunette, light and large eyes, straight and long nose, she had a thin mouth and a wide chin. (ASSIS, 2019, pp.30-31)

In both narratives, the first portrait of the female protagonists focuses mainly on the physical description and youthful vitality, elements responsible for awakening desire and amorous idealization in the male protagonists. However, such descriptions do not reveal the interiority of these women, but rather the projection of the male gaze that observes, interprets and progressively transforms them into an object of fascination and restlessness.

Unlike the idealized representation of female protagonists, Emilio Brentani and Bento Santiago are presented as men marked by the oscillation between idealization and distrust. Emilio recognizes in himself "a great fear of himself and of the weakness of his own character"

(SVEVO, 1982, p.11-12), while Bento Santiago reconstructs his narrative constantly crossed by doubt, distrust and the inability to reach any definitive certainty about Capitu's fidelity. In both narratives, the female figure becomes progressively crossed by the imaginative projections of the protagonists, ceasing to exist as a fully accessible alterity.

Although constructed in different social contexts, Emilio Brentani and Bento Santiago are close because of the difficulty in establishing balanced affective relationships. From the social point of view, Mr. Brentani is a petty-bourgeois intellectual, whose notoriety derives above all from a novel written in his youth. Psychologically, however, he reveals himself to be a fragile man, unable to face reality without resorting to self-deception. Taking shelter in the domestic routine and in the protection of his sister Amalia, the Svevian protagonist finds in Angiolina the embodiment of the vitality and plenitude that he feels he lacks in himself.

Bento Santiago's memorialistic account is organized under the sign of suspicion and perceptual instability. His writing reveals a narrator incapable of sustaining the ambiguity of human relationships, gradually converting his love for Capitu into obsessive distrust. The character then ceases to exist as a fully accessible alterity, starting to be interpreted as an enigmatic figure on which Bento projects his concerns and fantasies. At a certain point in the narrative, the narrator himself recognizes his fragility in front of the character when he states that "Capitu was Capitu, that is, a very particular creature, more of a woman than I was a man" (ASSIS, 2019, p. 55), revealing a subjectivity deeply marked by insecurity and a sense of inadequacy.

In this sense, both Emilio and Bento show difficulty in recognizing female otherness, idealizing and simultaneously distrusting the women they love. The love relationship thus becomes a privileged space for the manifestation of their emotional fragilities and their unstable identity processes.

In the case of Emilio Brentani, this fragility is also manifested in a deeply pessimistic view of himself, recognizing in his personality the inadequacy that prevents him from fully living his affective relationships. In two distinct moments of the narrative, the protagonist evidences the painful awareness of his insecurity:

At the age of thirty-five he still found in his soul the unsatisfied flame of pleasure and love, and already the bitterness of not having enjoyed them, while in his brain a great fear of himself and of **the weakness of his own character**, which he really suspected more than he knew from experience. (SVEVO, 1982, pp.11-12, emphasis added)

Later on, Emilio intensifies this negative self-perception by concluding that "He rose from the wall calmer, but more dejected than when he had sat down. He was to blame. **He was the**

one who was a strange, sickly individual, and not Angiolina. And this demeaning conclusion accompanied him home." (SVEVO, 1982, p.106, emphasis added).

As evidenced, the protagonists of *Senility* and *Dom Casmurro* have real difficulties in establishing balanced affective relationships. Emilio, unable to take control of his own emotional life, projects onto Angiolina the promise of happiness and fulfillment that he cannot find in himself. In a similar way, Bento Santiago, dominated by suspicion and perceptual instability, builds his relationship with Capitu from a continuous movement of idealization and distrust, revealing a subjectivity deeply marked by insecurity and the need for control.

While Emilio hopes that Angiolina will erase his past of frustrations and loneliness, Bento Santiago tries to memorialistically reconstruct a love relationship that deteriorates under the weight of suspicion and jealousy. In both narratives, the female figure progressively ceases to exist as an autonomous alterity to become a projection of male concerns. Thus, Angiolina and Capitu come to occupy, in the imagination of the protagonists, a position that is both fascinating and threatening.

Such dynamics evidence the inability of these characters to fully recognize female otherness. The love bond thus becomes a space for the intensification of mimetic rivalry and the destabilization of subjective perception. In this way, the affective relationships represented in the two narratives reveal deep dimensions of the protagonists' subjectivity, putting them in contact with a facet that was latent until then: jealousy.

To understand the relations between desire, rivalry and jealousy present in these works, we will resort to the theoretical contributions of René Girard, especially the notion of mimetic desire and the mechanisms of mediation of desire.

2 A LOOK AT DESIRE AND JEALOUSY

The pillars of Girard's ideology are based, above all, on his mimetic or imitative theory. For Girard, "we all always have a model that we imitate" (GIRARD, 2000, p. 85), we always choose a model to inspire us and the same happens with desire. For the French theorist, desire is also imitative, and tends to increase if there is awareness that the object of desire is desired by another. To, Girard,

Novelistic works are thus grouped into two fundamental categories – within which secondary distinctions can be infinitely multiplied. We will speak of *external mediation* when the distance is sufficient for the two spheres of *possibilities*, whose center is each occupied by the mediator and the subject, not to be in contact. We shall speak of *internal mediation* when this same distance is sufficiently reduced for the two spheres to penetrate each other with greater or lesser depth. (GIRARD, 2009, p.33)

When dealing with external mediation and internal mediation, Girard analyzes the figure of the rival, also called mediator. External mediation, according to the French philosopher, occurs when there is no contact between subject and mediator. On the other hand, in internal mediation, the distance is reduced "so that the two spheres penetrate each other with greater or lesser depth" (GIRARD, 2009, p. 33). It should be noted that it is not the physical space that determines this distance, but factors of a social, ideological, intellectual, affective, loving and/or sexual order.

For René Girard, every love relationship is structured in a triangular way, always being mediated by a third element — the rival or mediator — who interferes in the constitution of desire. In this sense, the dynamic between subject and object of desire is never direct, but crossed by the presence of this third party, which can operate both in external and internal mediation.

In both novels, the triangular relationships are widely explored and act, in a way, as a guiding thread of the narrative. In *Senility*, for example, the protagonist lets himself be involved by the seduction of Angiolina Zarri, believing he has control of the situation. His initial posture already evidences this attempt at domination, when he says: "I like you, but in my life you will never be more than a toy. I have other duties, my career, my family..." (SVEVO, 1982, p.11). However, he falls madly in love with her, or rather, with "Ange", "a creature invented by Emilio, through an artistic rewriting consciously distorted from what has been lived" (STASI, 2009, p. 89). For Ernestina Pellegrini, Angiolina, an obscure object of desire, would not only be an invention of Emilio, but an "artificial construction" that is also made with the cooperation of her sister Amalia (PELLEGRINI, 1999, p. 15). From the beginning, he idealizes his mistress, starting with the name:

The name Angiolina did not please her literary sensibilities. He called her Lina; then, this diminutive not being enough, he foisted on her the French name of *Angèle*, and often ennobled it and abbreviated it in *Ange*. (SVEVO, 1982, p.31)

Also according to Pellegrini, in *Senility an upside-down stilnovism gains space*, as the woman is more of a witch than an angel, or is even a fallen and Luciferian angel (PELLEGRINI, 1999, p.20). Angiolina, Ange, Giolona are ironic names, which refer to ambiguous and antithetical meanings, such as the purity of the angel or the malice of the devil. Ange would also be a reduction of the name Angelica, the beautiful and manipulative protagonist created by Boairdo and immortalized by Ariosto, whose name refers to carnal desire.

Parallel to the progressive transformation of the name of Angiolina, as Stasi points out, there is the process of angelization of women (STASI, 2009, p.87). Angiolina, emancipated as a woman, seductive, sensual, in Emilio's eyes will be transformed into the naïve *Ange*, who is angelic and innocent and does not really present anything, except in the chimera of the protagonist. If we take the narrative in its entirety, the excerpt below denotes irony between the narrator and the protagonist, as Emilio is aware that "his angel woman" only exists in his delusions:

(...) The woman he loved, **Ange, was his invention**, he had created her with premeditated effort; she had not collaborated in that creation, nor had she allowed herself to be made, since she had shown resistance. In daylight the dream evaporated. (SVEVO, 1982, p.55, emphasis added)

The Svevian narrative follows the protagonist's self-deceptive movement, making the figure of Angiolina appear less as an autonomous character than as an unstable projection of Emilio's consciousness. The instability of desire, therefore, does not manifest itself only at the thematic level, but crosses the protagonist's own narrative perception, continuously oscillating between idealization and disenchantment.

Angiolina, as is evident throughout the novel, remains relatively innocent in the face of the process of imaginary metamorphosis imposed on her by her lover. This process is significantly close to the dynamics present in *Dom Casmurro*. Bento Santiago also builds Capitu from a deeply subjective and idealizing look. However, as jealousy intensifies, the previously fascinating image of the protagonist begins to be crossed by suspicion and distrust, making the figure of Escobar emerge as an imaginary rival and mediator of desire.

From this perspective, Escobar can be understood as a decisive element in the configuration of the triangular structure of desire in *Dom Casmurro*, since his presence is progressively incorporated into Bento Santiago's interpretative field as a threat to the couple's affective stability. Similarly, in *Senility*, the relationship between Emilio Brentani and Angiolina is also organized based on a mediation that destabilizes the alleged autonomy of the desiring subject. In both novels, René Girard's perspective is confirmed, according to which desire is not structured directly, but always mediated by a third element, whose presence intensifies rivalry, imaginative projection and the instability of love relationships.

In the light of René Girard's mimetic theory, Bento Santiago begins to retrospectively reinterpret his relationship with Capitu under the sign of rivalry, transforming Escobar into a simultaneous mediator of his desire and his suffering. The notion of internal mediation formulated by Girard proves to be particularly productive for the reading of the novel, to the

extent that subject and rival belong to the same affective and social circle, sharing emotional closeness and constant coexistence.

In this way, both Emilio Brentani and Bento Santiago prove incapable of establishing loving relationships based on otherness and trust. Both replace the real woman with imaginary constructions produced by their own subjective concerns. The love desire then becomes a space of idealization, rivalry and psychic suffering, making jealousy emerge as the maximum expression of the identity instability of these protagonists.

The third element that makes up the love triangle is responsible for arousing different feelings in the desiring subject, such as desire, envy, love, rivalry or jealousy. The mimetic theory proposed by Girard is quite dynamic, since the model chosen to be imitated can later be the rival, or even become the desiring subject. The rival (or mediator), therefore, plays a fundamental role in the intensification of desire, since the desiring subject tends to value the love object even more when he realizes that it also arouses interest in a third element.

In *Senility*, Emilio Brentani will have his desire for Angiolina Zarri increased when he realizes that the *blonde with big blue eyes* was very desired by other men:

He looked at the photographs. An old man who had been photographed in the pose of a great gentleman, leaning on a pile of papers. Emilio smiled. "My godfather," Angiolina introduced. A young man dressed in Sunday clothes, an energetic face, bold look. "My sister's godfather," said Angiolina, "and this is my younger brother's godfather," and he showed the portrait of another young man softer and better dressed than the first.

"**Are there still others?**" asked Emilio, but the mockery died on his lips because among the photographs he had discovered two together, of **people he knew: Leardi and Sorniani!** (...)

Angiolina did not immediately understand why Emilio's forehead had become so gloomy. **For the first time, brutally, he allowed himself to be betrayed by jealousy:** "I don't like to find so many men in your room. (...)

Suddenly a great hilarity burst into her face, and she said that she **was very glad to see him jealous.** "Jealous of these people!" she said afterwards, returning to her seriousness and with an air of reproach. (SVEVO, 1982, pp.40-41, emphasis added)

Emilio's jealousy is evident, but it was decided to realize, at this moment, another key of interpretation, that is, that of desire. The protagonist, who could distance himself from his lover for promiscuous behavior, has his desire for her sharpened. According to Gabriel Andrade, in *René Girard: an intellectual portrait*, "the desiring subject needs a model that supports his decision; never dares to desire on his own" (ANDRADE, 2011, p.400). Thus, Emilio needs to know that Angiolina is desired, he needs a model to be "inspired" and consequently, desire her.

A similar dynamic occurs in *Dom Casmurro*. As Bento Santiago becomes suspicious of the relationship between Capitu and Escobar, jealousy progressively intensifies, transforming

his friend into a rival and mediator of his desire. The mere possibility that Capitu could be admired and desired by another man becomes enough to emotionally corrode the protagonist.

In *Dom Casmurro*, the progressive predominance of internal mediation is observed. The dandy episode, often pointed out as one of the first explicit manifestations of Bentinho's jealousy, can be understood, at first, as a case of external mediation. However, a more attentive reading allows us to relativize this initial interpretation, showing that the episode is not limited to the circumstantial figure of the knight, but refers to a mimetic structure still in formation, perceptible in the following excerpt:

The rider was not content with walking, but turned his head to our side, Capitu's side, and looked at Capitu, and Capitu at him; the horse walked, the man's head went backwards. Such was the second tooth of jealousy that bit me. Strictly speaking, it was natural to admire the beautiful figures; but that fellow used to pass by in the afternoons; he lived in the old Field of Acclamation, and then... and then... Go there and reason with a heart of embers, as mine was! (MACHADO DE ASSIS, 2019, p.115)

At first glance, jealousy seems to be directed at the dandy, whose presence triggers Bentinho's reaction. However, as already suggested by Helen Caldwell, the episode allows us to glimpse a more complex dynamic, in which the true core of the rivalry is not necessarily concentrated in this occasional rival. Capitu's remark — "What kind of friend is this size?" — when referring to Escobar, as well as Bento's complimentary description of his friend, indicate that the potential rivalry is already oriented in another direction (MACHADO DE ASSIS, 2019, p.113).

Even so, at this moment, mediation remains external, to the extent that Bento "is not aware that Escobar is the object of his jealousy" (CALDWELL, 2002, p.27). This confirms that the distinction between internal and external mediation does not depend only on physical proximity, but on the structural position occupied by the mediator in desire.

The social dimension of the relationship between Bento Santiago and Capitu had already been widely explored by Roberto Schwarz and Silviano Santiago, especially with regard to the possessive logic that structures the love bond. Schwarz observes that, after marriage, Bento consolidates himself as a "figure of order" (SCHWARZ, 1997, p.29), making his jealousy cease to be just imaginative instability and start operating as an exercise of authority. In the same vein, Silviano Santiago states that "to love is to marry, it is to buy property titles" (SANTIAGO, 2000, p.31), evidencing the articulation between love, possession and exclusivity in Machado's novel.

At this point, the Girardian reading allows us to advance in relation to Caldwell's interpretation. It is not only a matter of shifting the focus of jealousy from an apparent object to

a deeper one, but of making explicit the mechanism that organizes this displacement: the episode suggests that Bento's desire is never addressed to Capitu in a fully immediate way, structuring itself from an early age as dependent on a mediating instance, even if it is not fully configured. The dandy, therefore, does not constitute the effective mediator, but functions as a surface element that makes visible the structural need for mediation in the protagonist's desire.

This process becomes even more evident after Escobar's death, when Bento Santiago obsessively fixes himself on Capitu's gaze in front of his friend's corpse:

Finally, the time has come for ordering and leaving. Sancha wanted to say goodbye to her husband, and the desperation of that move dismayed everyone. Many men cried too, all the women. Only Capitu, supporting the widow, seemed to overcome herself. He consoled the other, wanted to get her out of there. The confusion was general. In the middle of it, **Capitu looked for a few moments at the corpse so fixed, so passionately fixed**, that it is not surprising that a few and silent tears came to him... (MACHADO DE ASSIS, 2019, p.173, emphasis added)

From this episode, Bento Santiago begins to retrospectively reinterpret his love trajectory under the sign of suspicion and rivalry. Escobar then becomes a mediating element of the protagonist's desire and simultaneously of suffering. In the light of René Girard's mimetic theory, it is perceived that the rival plays an essential role in the intensification of love desire and psychic suffering.

As João Cezar de Castro Rocha observes, in the introduction to *Romantic Lie and Romantic Truth*,

Love and jealousy always form an indissoluble pair: jealousy ensures the promise of the other, in the real or imaginary presence of the rival. It does not matter: jealousy assures that the object of my desire *is also desired by others*, and in the mirror of their eyes my desire can only increase. (GIRARD, 2009, p.17)

Thus, both Emilio Brentani and Bento Santiago, when they become lovingly involved, come into contact with dimensions of their subjectivities hitherto unknown. Jealousy thus emerges as an effect of the impossibility of the protagonists to sustain relationships not mediated by rivalry and imaginative projection. What initially could be just a pleasurable love experience gradually becomes suffering, obsession and identity instability.

If, at first, Emilio Brentani and Bento Santiago believe they control their love relationships, they gradually become dominated by them. The sentimental adventure ceases to be episodic and becomes the organizing center of their existences. In the novels analyzed, the love desire is not based on reciprocity, but on rivalry and constant comparison with a third element. It is

precisely at this point that René Girard's theory of mimetic desire proves to be productive, as it allows us to understand how the protagonists' desire intensifies from the mediation exercised by the rival.

In *Senility*, Emilio Brentani feels profoundly inferior in front of Stefano Balli. The sculptor represents everything that Emilio would like to be: virile, self-assured, admired by women and fully integrated into social life. Balli's own physical description evidences this symbolic superiority:

Balli, on the contrary, had made better use of his forty years well lived, and his experience made him competent to judge his friend. He was less cultured, but he had always exercised over the other a kind of paternal authority, consented, desired by Emilio, who, despite his unfortunate but absolutely threatening fate, and his life in which there was nothing unforeseen, needed support to feel safe.

Stefano Balli was a tall, strong man, with the blue eyes of a child on one of those tan-looking faces that never grow old: the only trace of age was the gray of his brown hair, his beard trimmed with precision, his whole figure very correct and somewhat hard. His observant eye was sometimes sweet when curiosity or compassion animated him, but he became very hard in the fight or in the most futile discussions. (SVEVO, 1982, p.19, emphasis added)

The rivalry is not only born of the common interest in Angiolina, but of the privileged position that Balli occupies in Emilio's imagination. The friend becomes a model and a threat simultaneously. The protagonist desires Angiolina, but also wants to possess the qualities he identifies in Balli. In this sense, the rival does not only interfere in the love relationship: he structures his own desire.

Emilio's jealousy intensifies as Balli grows closer to Angiolina. The protagonist starts to see his friend as directly responsible for his suffering:

"You're jealous of me, just imagine, **your best friend!**" roared Balli indignantly. (SVEVO, 1982, p.81, emphasis added)

"However," confessed Emilio, sincerely moved by Balli's affection, "I have never suffered so much from jealousy as I do now." Stopping in front of Stefano, he said to him in a deep voice, "Do you promise that you will tell me everything you know about her?" **I don't want you to go near her, but if you see her on the street come and tell me right away.** Promise? Does it formally promise? (SVEVO, 1982, p.128, emphasis added)

If it weren't for him, his relationship with Angiolina would have been smoother, not complicated by such bitter jealousy. (SVEVO, 1982, pp.131-132, emphasis added)

It was even firm by fate that **Balli would always intervene to make Emilio's situation more painful in the face of Angiolina.** (SVEVO, 1982, p.191, emphasis added)

The constant presence of the rival transforms love into anguish. Emilio becomes unable to work, to think about anything else or to organize his life in the slightest:

In fact, his whole life now belonged to that love; he did not know how to think of anything else, he did not know how to work, nor even to fulfill his duties of office normally. (SVEVO, 1982, p.44)

Moved, Emilio confessed. Yes. Now he saw him clearly. The thing became very serious, and he described his own love, the anxiety to see her, to speak to her, the jealousy, the doubts, the incessant anguish, and the perfect forgetfulness of all things that did not concern her or her own feeling. (SVEVO, 1982, p.57-58)

The narrative follows the progressive narrowing of Emilio's perceptive horizon, whose consciousness begins to reorganize all reality from the love obsession. Jealousy thus appears as a symptom of a fragile and dependent subjectivity. As already mentioned, Emilio explicitly recognizes the pathological character of his obsession, attributing to himself the condition of a "strange, unhealthy individual" (SVEVO, 1982, p. 106).

In this context, Angiolina should not be understood as the cause of the protagonist's suffering, but as an element that triggers tensions that already exist in his subjectivity. Emilio cannot sustain an affective relationship because his identity continuously depends on the approval, comparison, and recognition of the other.

At the end of the novel, even though he is away from Angiolina, Emilio remains imprisoned in the past. Love is transformed into an idealized memory, revealing that the experience of love did not produce maturation, but existential crystallization:

Years later he looked with a certain admiring charm at this period of his life, the most important, the most luminous. He lived like an old man with the memories of his youth. In her idle literary spirit, Angiolina underwent a strange metamorphosis. She kept her beauty unchanged, but she still acquired all the qualities of Amalia, who died in her a second time. She became sad, disconsolately inert, her gaze acquired an intellectual clarity. He saw her before him as on an altar, the embodiment of thought and pain, and he loved her always, if love is admiration and desire. She represented all that he had thought and observed in this period of nobleness.

His figure, moreover, became a symbol. He always looked at the same point on the horizon, the future from which the golden glows that reverberated on his pink, luminous and white face departed. I expected! The image fulfilled the dream he had once built with Angiolina and that the daughter of the people had not been able to understand. (SVEVO, 1982, pp.267-268)

The outcome shows that Emilio does not overcome the love experience, but re-inscribes it imaginarily in an idealized form. Memory does not restore Angiolina as an objective reality, but as a subjective construction reorganized by nostalgia and self-deception. If in *Senility* the mimetic mediation is structured above all by the rivalry between Emilio and Balli, in *Dom Casmurro* it acquires even greater complexity, becoming not only a theme, but an organizing

principle of the narrative itself. In Machado de Assis, jealousy ceases to be just a feeling experienced by the character and begins to structure the form of the story.

At first glance, jealousy seems to be directed at occasional rivals. However, as already suggested by Helen Caldwell, mimetic mediation progressively shifts to the figure of Escobar. Capitu's remark — "What friend is this size?" — when referring to his seminary colleague already indicates the symbolic centrality that he will occupy in Bento Santiago's affective economy (MACHADO DE ASSIS, 2019, p. 113).

Initially, however, this mediation still remains diffuse, as Bento does not fully recognize Escobar as a rival. Girard's theory allows us to understand precisely this movement: desire is not immediately directed to the beloved object, but is organized on the basis of a mediating instance that attributes value to it.

The consolidation of this triangular structure becomes more evident when Escobar starts to occupy a privileged position in the relationship between Bento and Capitu:

The separation did not cool us down. He was the third in the exchange of letters between me and Capitu. From the moment he saw her, she encouraged me a lot in our love. The relations he had with Sancha's father strengthened those he already had with Capitu, and made him serve both of us, as a friend. At first, it was hard for her to accept it, she preferred José Dias, but José Dias disgusted me for a remnant of childlike respect. Escobar won; although vexed, Capitu handed him the first letter, which was the mother and grandmother of the others. Not even after he was married did he suspend the favor... That he married, – guess who, – married the good Sancha, Capitu's friend, almost her sister, so much so that sometime, writing to me, he called her "his little sister-in-law". Thus, affections and kinships, adventures and books are formed. (MACHADO DE ASSIS, 2019, p.143)

The passage is decisive because it makes explicit the constitution of the love triangle. Escobar does not appear as an external element to the relationship, but as a figure who actively participates in the rapprochement between Bento and Capitu. The mediator becomes constitutive of the loving bond.

From that moment on, jealousy progressively intensifies. Benedict begins to retrospectively reinterpret the events, reorganizing his memory according to a suspicious logic. The episode of Escobar's wake marks the culmination of this process: "Capitu looked for a few moments at the corpse so fixed, so passionately fixed, that it is not surprising that a few and silent tears came to him..." (MACHADO DE ASSIS, 2019, p.173).

More than objective evidence of adultery, Capitu's gaze reveals the interpretative functioning of Bento's jealous conscience. The narrator transforms ambiguous gestures into imaginary proofs. As Roberto Schwarz observes, "there is no way to be sure of Capitu's guilt,

nor of innocence"; what exists is Bento's insistent attempt to organize the facts according to his accusatory hypothesis (SCHWARZ, 1997, p. 16).

In *Jealousy: a study on the Proustian imaginary*, Nicolas Grimaldi thoroughly analyzes the presence of jealousy in Marcel Proust's work, especially considering the role of imagination in the consciousness of the subject "victim" of this feeling. According to the author, "jealousy would thus be all the more torturous the more surrendered to the imaginary, and the imagination all the more intense and painful the more it visualized the beloved woman in an infinity of possible encounters, situations, gestures and behaviors" (GRIMALDI, 1994, p. 46). Such a reflection proves to be particularly productive for the reading of Dom Casmurro, since Bento Santiago's jealousy intensifies precisely because his conscience converts evidence into evidence, indefinitely expanding the possibilities of betrayal.

In this way, the narrator remains at the mercy of an imaginative activity that not only fills gaps, but also retrospectively reorganizes the lived experience. This perspective is close to the reading of Gilberto Pinheiro Passos, according to which the jealous person establishes a particular relationship with knowledge:

He knows more than the others. Facts and information keep an undisguised dose of gap, which it is up to him to fill. It seeks, at all times, to give the world a more complete meaning, making it reveal data for which only its feeling is ready. In this way, it lurks: **any sign can be the distinctive mark of the information that it itself engenders** (PASSOS, 2003, p. 76, emphasis added).

From this logic, it is understood that Bento Santiago's suffering does not stem from a concrete proof of adultery, but from the imaginative activity itself that transforms suspicions into subjective certainties. Benedict does not actually witness the betrayal; he produces it narratively through associations, clues, and retrospective interpretations. His memory reveals itself to be unstable, while the imagination occupies a central position in the construction of his version of the facts, subordinating memory to the logic of suspicion and transforming jealousy into the organizing principle of both his affective experience and the narrative itself:

No, no, **my memory is not good**. (...) How I envy those who have not forgotten the color of the first pants they wore! I don't like the ones I stuck yesterday. I swear only that they were not yellow because I execrate that color; But this can be forgetfulness and confusion. (MACHADO DE ASSIS, 2019, p.95-96, emphasis added)

On the other hand, imagination emerges as the dominant force:

Being alone, I reflected for some time, and **had a fantasy**. You already know my fantasies. (...) **Imagination was the companion of my entire existence** (...). **I believe I have read** in Tacitus that Iberian mares conceived by the wind; if it was not in him, it was in another ancient author, (...). In this regard, my imagination was a great Iberian mare; (MACHADO DE ASSIS, 2019, p.70-71, emphasis added)

Imagination not only complements the gaps in memory, but starts to organize the entire experience of the protagonist. As Grimaldi states, jealousy becomes more painful the more surrendered to the imaginary. Benedict continually projects possible scenes, attributes hidden meanings to gestures and converts suspicions into convictions.

This dynamic explains why not even Escobar's death dissolves the rivalry. The mediator remains acting symbolically through the figure of Ezekiel:

[Ezekiel] was neither more nor less than my old and young companion in the seminary of St. Joseph, a little shorter, less full-bodied, and, except for the colors, which were vivid, **the same face as my friend**. He was dressed in modern fashion, of course, and the manners were different, but the general appearance reproduced our dead person. **He was himself, the exact one, the real Escobar**. It was my combo; He was his father's son. (MACHADO DE ASSIS, 2019, p.194, emphasis added)

The dead rival continues to structure Bento's desire and suffering. Jealousy becomes autonomous in relation to the facts and becomes a permanent principle of interpretation of the world. It is precisely at this point that *Dom Casmurro* reaches his greatest formal complexity. The novel is not organized around the proof of adultery, but the narrative construction of jealousy. Bento Santiago does not only report events: he interprets, reorganizes and manipulates them retrospectively. Jealousy becomes, therefore, a narrative form.

The fragmentation of the chapters, the digressive character of the memories and the associative chain of the narrative formally express a consciousness marked by suspicion. The story advances less through the objective succession of facts than through the interpretative insistence of the narrator. Each episode is taken up again as a possible confirmation of a previously established hypothesis.

In this way, Machado de Assis radicalizes the problematic of mimetic desire by shifting it from the thematic plane to the structural plane of the narrative. In *Dom Casmurro*, jealousy is not only Bento Santiago's subjective experience; he organizes the very logic of the novel, determining the way in which events are narrated, selected and interpreted. The mimetic desire ceases to operate only on the level of the relationships between the characters and begins to model the very structure of the novelistic discourse.

3 FINAL CONSIDERATIONS

The comparative reading of *Senility* and *Dom Casmurro* allowed us to observe that, despite the historical and cultural differences that separate Italo Svevo and Machado de Assis, both novels construct male protagonists deeply marked by subjective instability, by amorous idealization and by the inability to sustain affective relationships based on otherness. Emilio Brentani and Bento Santiago reveal themselves to be characters who, in the face of the love experience, tend to replace the real woman with imaginary constructions produced by their own concerns, insecurities and fantasies. In this sense, Angiolina and Capitu come to exist less as fully accessible characters than as surfaces of projection of the male gaze.

From the theoretical contributions of René Girard, it became possible to understand that the love desire, in both novels, is structured in a triangular and mimetic way. Love is not immediately established between subject and desired object, but is constantly crossed by the presence of a mediator or rival, responsible for simultaneously intensifying desire, rivalry and psychic suffering. In both *Senility* and *Dom Casmurro*, jealousy emerges precisely from the protagonists' inability to deal with the autonomy of the female figure and the instability of their own perceptions.

The analysis also showed that, although the two novels present significant thematic approximations, each author develops this problem in a unique way. In Svevo, the narrative follows the continuous movement of self-deception of Emilio Brentani, whose perception oscillates between idealization and disenchantment. In Machado de Assis, on the other hand, jealousy goes beyond the thematic plane and begins to organize the narrative structure itself, making memory, suspicion and imagination central elements in the construction of the story. In *Dom Casmurro*, the fragmentation of the narrative and the instability of the memorialistic voice reveal that jealousy is not only a subjective experience of the protagonist, but the organizing principle of his perception of the world.

In this way, the novels analyzed demonstrate that love, far from representing a space of balance or full fulfillment, becomes an experience marked by rivalry, imaginative projection and identity crisis. Both Emilio Brentani and Bento Santiago remain imprisoned in their own subjective constructions, incapable of fully recognizing feminine otherness. Thus, *Senility* and *Dom Casmurro* reveal, from different perspectives, the fragility of modern subjectivities and the mechanisms by which desire, imagination and jealousy deform the experience of love and the perception of reality.

ABSTRACT

This work is an excerpt from a doctoral thesis that aimed to analyze the policies in the area of Social Responsibility found in the Federal Institute of Education, Science and Technology of Rio de Janeiro (IFRJ) and the Polytechnic Institute of Viseu (IPV), regarding the inclusion of students with disabilities and specific needs. In this work, the Accessibility Centers are presented, highlighting Social Responsibility and the legal and normative advances for access to education for People with Disabilities (PwDs) and with specific needs. This study is within the scope of research with qualitative and quantitative approaches, and uses participatory research employing bibliographic research, analysis of documentary collections, and interviews as data collection instruments. The research results showed that IPV managers practice inclusion as Social Responsibility and emphasize the importance of consolidating an inclusive culture through actions and projects. The accessibility centers, despite the difficulties, have demonstrated a commitment to inclusion. Other aspects highlighted include the urgent need for changes in management attitudes so that inclusion is truly effective. We hope that the issues raised by this research will contribute to the spread of a culture of inclusion and human rights, generating a continuous and productive dialogue to promote inclusion as a Social Responsibility.

RESUMO

Este trabalho é um recorte de uma tese de doutorado que teve o objetivo de analisar as políticas na área de Responsabilidade Social encontradas no Instituto Federal de Educação, Ciência e Tecnologia do Rio de Janeiro (IFRJ) e no Instituto Politécnico de Viseu (IPV), sobre a inclusão dos estudantes com deficiência e necessidades específicas. Neste trabalho, os Núcleos de Acessibilidade são apresentados evidenciando a Responsabilidade Social e os avanços legais e normativos para o acesso à educação das Pessoas com Deficiência (PcD)s e com necessidades específicas. Este estudo encontra-se no âmbito das pesquisas com abordagens qualitativa e quantitativa, e utiliza a pesquisa participante empregando como instrumentos de coleta de dados, o levantamento bibliográfico, a análise de acervo documental e entrevistas. Os resultados da pesquisa mostraram que os gestores do IPV praticam a inclusão como Responsabilidade Social e enfatizam a importância da consolidação de uma cultura inclusiva por meio de ações e projetos. Os núcleos de acessibilidade, apesar das dificuldades, têm demonstrado compromisso com a inclusão. Outros aspectos ressaltados incluem a necessidade urgente de mudanças nas atitudes da gestão para que a inclusão seja verdadeiramente efetiva. Esperamos que a problematização levantada por esta pesquisa contribua para a propagação da cultura de inclusão e dos direitos humanos, gerando um diálogo contínuo e produtivo para promover a inclusão como Responsabilidade Social.

Palavras-chave: Responsabilidade Social. Instituto Federal do Rio de Janeiro. Instituto Politécnico de Viseu. Núcleos de Acessibilidade. Inclusão.

RESUMEN

Este trabajo es un extracto de una tesis doctoral que tuvo como objetivo analizar las políticas en el área de Responsabilidad Social del Instituto Federal de Educación, Ciencia y Tecnología de Río de Janeiro (IFRJ) y del Instituto Politécnico de Viseu (IPV), en relación con la inclusión de estudiantes con discapacidades y necesidades específicas. En este trabajo, se presentan los Centros de Accesibilidad, resaltando la Responsabilidad Social y los avances legales y normativos para el acceso a la educación de las personas con discapacidades y necesidades específicas. Este estudio se enmarca dentro de la investigación con enfoques cualitativos y cuantitativos, y utiliza la investigación participativa empleando investigación bibliográfica, análisis de colecciones documentales y entrevistas como instrumentos de recolección de datos. Los resultados de la investigación mostraron que los directivos del IPV practican la inclusión como Responsabilidad Social y enfatizan la importancia de consolidar una cultura inclusiva a través de acciones y proyectos. Los centros de accesibilidad, a pesar de las dificultades, han demostrado un compromiso con la inclusión. Otros aspectos resaltados incluyen la necesidad urgente de cambios en las actitudes de la dirección para que la inclusión sea verdaderamente efectiva. Esperamos que los temas planteados por esta investigación contribuyan a la difusión de una cultura de inclusión y derechos humanos, generando un diálogo continuo y productivo para promover la inclusión como Responsabilidad Social.

Palabras clave: Responsabilidad Social. Instituto Federal de Río de Janeiro. Instituto Politécnico de Viseu. Centros de Accesibilidad. Inclusión.

1 INTRODUCTION

This work is an excerpt from a doctoral thesis⁴ that aimed to analyze the policies in the area of Social Responsibility found at the Federal Institute of Education, Science and Technology of Rio de Janeiro (IFRJ) and at the Polytechnic Institute of Viseu (IPV) on the inclusion of students with disabilities and specific needs. One of the specific objectives of the research was to investigate the policies in the area of Social Responsibility found in the IFRJ and IPV, on the inclusion of students with disabilities and specific needs.

An overview of IFRJ and IPV is presented, some actions and projects of their Accessibility Centers and, in addition, we analyze normative and guiding documents of these centers. In the IFRJ documents, we analyze the Inclusive Special Education Policy (PEEI), approved in June 2023, the only internal normative document that governs Special Education at IFRJ, long awaited by the community, we can say that, in recent years, it has been one of the main aspirations of the Center for Assistance to People with Specific Educational Needs (NAPNEs).

For the reflective analysis of inclusion as Social Responsibility, we used some works collected in the bibliographic survey of the research, such as: Félix (2003), Almeida (2010), Leal *et al.* (2011), Lima (2002), among others. In addition, we are based on the "Green Paper on Social Responsibility.

Methodologically, this study adopts a mixed approach, combining qualitative and quantitative methods, through participant research and triangulation of methodologies. The triangulation is based on two main pillars: bibliographic survey, documentary analysis and detailed evaluation of the material that underlies the theoretical basis of the research. These elements cover topics such as Special Education and Professional Education in Brazil and Portugal, as well as institutions such as IFRJ and IPV. In addition, the analysis of data obtained by the e-SIC consolidates this initial stage. In the second pillar of triangulation, the analyses of the interviews carried out at the IPV stand out, which offer an essential qualitative perspective.

The research has the potential to awaken in readers a deep reflection on the important connection between Special Education and Social Responsibility. This can increase the visibility of the actions carried out by the Accessibility Centers, both at IFRJ and IPV and in the various educational institutions, including the almost seven hundred Federal Institutes throughout Brazil, and the various Polytechnic Institutes spread from north to south in Portugal. By

⁴ DIAS, Kátia Arruda. *Polytechnic Education in Brazil and Portugal: An Analysis of Social Responsibility with Special Education in IFRJ and IPV*. 2025. 260 f. Thesis (PhD in Sciences, Technologies and Inclusion) - Graduate Program in Sciences, Technologies and Inclusion, Institute of Biology, Fluminense Federal University, Niterói, 2025.

highlighting this relationship, it is hoped that the work will contribute to a greater appreciation and recognition of inclusion and accessibility initiatives, promoting a closer look at the social and educational impact of these actions.

2 THE FEDERAL INSTITUTE OF EDUCATION, SCIENCE AND TECHNOLOGY OF RIO DE JANEIRO AND THE POLYTECHNIC INSTITUTE OF VISEU

We will make a brief historical contextualization of the researched Institutions, IFRJ and IPV, scenario and *locus* of the study, based on content available on the official website of IFRJ⁵ and IPV⁶.

IFRJ had its origin with the creation of the Technical Course in Industrial Chemistry (CTQI), in the 1940s, during World War II, at a time when the area of industrial chemistry was seen as strategic for Brazil. In 1999 it became CEFETQ and, in 2001, CEFETQ began to offer undergraduate and graduate courses, in addition to high school and technical courses. On December 29, 2008, through Law No. 11,892 (Brasil, 2008a), CEFETQ was transformed into IFRJ.

The organizational structure of the Federal Institutes (IFs) is defined by Law No. 11,892 (Brasil, 2008a), which establishes the Federal Network of Professional, Scientific and Technological Education (RFEPCT), and creates the IFs. The IFs have an organizational structure, unlike basic education schools, which allows them to be compared to Federal Universities.

IFRJ is a multidisciplinary and multi-campus Institution of Basic and Higher Education, specialized in the provision of Professional and Technological Education (EPT), with operations in research, innovation and extension, enjoys university autonomy. IFRJ operates at different levels and modalities of Basic Technical and Technological Education (EBTT), from Professional Education, with extension courses, offering training in the Youth and Adult Education (EJA) modality, through Initial and Continuing Training (FIC) courses at the Elementary level, High School Level (technical courses that can be taken in an integrated, concomitant and subsequent way to High School), Higher Technology Course, Bachelor's Degree, Licentiate, Lato and Stricto Sensu Post-Graduation.

IFRJ currently has 15 *campuses* installed in the state of Rio de Janeiro, they are: Arraial do Cabo, Belford Roxo, Duque de Caxias, Engenheiro Paulo de Frontin, Mesquita, Nilópolis, Niterói, Paracambi, Pinheiral, Realengo, Resende, Rio de Janeiro, São Gonçalo, São João de

⁵ Available at: <https://portal.ifrj.edu.br/institucional/historia-ifrj>

⁶ Available at: <https://ipv.pt/>

Meriti, Volta Redonda and the Rectory. According to the Institution's portal, IFRJ was awarded three new *campuses*: Olympic Park, Teresópolis and Complexo do Alemão.

In Portugal, the public Polytechnic Higher Education network is composed of 15 Polytechnic Institutes. According to the Report (ORSIES, 2023), the IPV was created in 1979 and offers a training offer, distributed among the five schools it currently integrates, the CTeSP, undergraduate, master's and postgraduate courses in the areas of agricultural, food and veterinary sciences, education, arts, communication, sports, technology, management and health.

The School of Education of Viseu (ESEV) was the first Organic Unit of a polytechnic to start operating in Portugal. Its training offer is in the area of teacher training, its founding matrix (since 1983), but also in the areas of education and social intervention, communication, arts, sports and physical activity.

In addition to ESEV, IPV has the School of Technology and Management of Viseu (ESTGV), created in 1985, which offers undergraduate, master's and senior professional technician courses in the areas of engineering, technology and management, marketing and tourism. The Agrarian School of Viseu (ESAV) was created in 1994, training students in the areas of agronomy, animal production, food engineering, biotechnology and veterinary nursing, an activity that has proved to be an extremely important contribution to the development of the regional economy.

Created in 1999, the School of Technology and Management of Lamego (ESTGL), with its area of coverage that is tourism, management, accounting, administration, informatics, telecommunications and social work. The School of Health of Viseu (ESSV), created in 1971, has as its mission the creation and dissemination of knowledge in the areas taught, contributing, through its own means, to the promotion and development of the level of health of the populations.

In this way, the IPV assumes its vocation in the scientific, cultural, artistic and technical training of qualified professionals, in an articulation between the provision of services to the community, research and the strengthening of partnership networks with regional, national and international entities for the development of projects and activities of common interest.

3 THE IPV ACCESSIBILITY CENTER

Among the activities developed in the IPV's accessibility center, we highlight the support and monitoring of Students with Specific Educational Needs (ENEE) and awareness and information actions for students. IPV has active partnerships with institutions that support

disability and disability, involved in research projects (IncluiES+) and intervention (promotion of employability) with partner entities. Also noteworthy is the Peer-to-Peer project for inclusion, which aims to mobilize informal peer support.

The IPV Social Responsibility and Innovation Report (RIS), 2023, with regard to the IPV's NAPNE, is intended to promote equity and inclusion of ENEE, in Higher Education, for this purpose it develops to Support Students with Disabilities, assuming itself as a welcoming and inclusive public Higher Education Institution.

In addition, it evaluates and monitors ENEE in the teaching and learning and transition processes (psychopedagogical assessments and preparation of opinions, socio-educational support, preparation of guiding documents and specific support materials), promotes seminars on inclusion and (in)information/awareness actions on typology of difficulties and specific needs, promotes intervention and research projects on inclusion in HE and has sought to establish and expand the network of collaboration protocols and partnerships with partner entities to support people with disabilities and disabilities.

According to the Report (ORSIES, 2023, p.112), the IPV's NAI-ENEE directs its actions and has as references the Convention on the Rights of Persons with Disabilities and the National Strategy for the Inclusion of Persons with Disabilities, which reinforce the inalienable right of students to an inclusive education system, particularly those with specific needs.

The NAI-ENEE of the IPV is directed to the issues of equity and inclusion of ENEE, in Higher Education, and aims to: (i) Contribute to the definition and implementation of policies and practices for the inclusion of ENEE in the IPV, in particular, in the transition and support for the self-determination of students; (ii) Enhance the inclusion of ENEE in the IPV, through evaluation-intervention processes, with the proposal of learning support measures provided for in statutes and specific regulations; (iii) Promote (in)information and awareness actions on diversity and typology of specific difficulties, aimed at the academic community, promoting a culture of equity and inclusion in the IPV; (iv) Enhance the development of ENEE's personal skills and employability, promoting professional transition processes, in collaboration with partner entities; (v) promote, in collaboration with the relevant services, accessibility to buildings and information and learning systems, as well as to the institutional portals of the BTI; (vi) Create synergies with disability and disability support entities and HE institutions, in national or international projects, aimed at research and development of good practices for the inclusion of ENEE.

The measures used to achieve the objectives according to the IPV RIS are: (i) Evaluation and monitoring of ENEE in the teaching and learning and transition processes

(psychopedagogical evaluation and preparation of respective opinions; socio-educational support); (ii) Preparation of guiding documents and specific materials to support ENEE; (iii) Proposal for seminars on the inclusion of ENEE and (in)formation and awareness-raising actions on the typology of specific difficulties and needs; (iv) Establishment of collaboration protocols and partnerships with partner entities to support people with disabilities and disabilities (awareness-raising and training actions); (v) Intervention and research projects on inclusion in Higher Education.

The initiatives to monitor students are in the evaluation, monitoring and psychopedagogical support activities of ENEE. In 2022/2023, under the coordination and monitoring of NAI-ENEE, with the support of the services of the Office for Support and Promotion of Inclusion (GAPI), of the School of Education of Viseu (ESEV), 70 students with Specific Educational Needs were identified, of which 40 were at ESEV.

According to data from the NAI-ENEE Coordination, the most expressive specific need in the IPV ENEE is Specific Learning Disorder (Dyslexia, dysorthography) with 34.3%, followed by chronic disease with 21.4%, Autism Spectrum Disorder (ASD), cognitive difficulties, Hearing impairment/disability/deafness (8.6%), other condition (5.7%) and Motor Impairment/incapacity, Hyperactivity Disorder with Attention Deficit, Visual impairment/disability/blindness (4.3%).

The follow-up translates into attendances of at least 4 sessions per student, as well as additional sessions to carry out weekly or occasional follow-ups, in person and non-face-to-face.

4 THE CENTER FOR ASSISTANCE TO PEOPLE WITH SPECIFIC NEEDS OF IFRJ

NAPNE was created from the TEC NEP Program/Action, in 2000. According to the Program, each Institution of the Federal Network, according to its regulations and resolutions, should implement the NAPNE on their *campuses*, with the objective of instrumentalizing the Professional Education Network, to expand the accessibility of people in the Special Education public (Dias, 2025).

In 2011, the end of the TEC NEP Program was announced, leaving the FIs deprived of an effective proposal for inclusive actions in the RFEPCT. In this way, a gap opened, waiting for a substitute Program, which did not occur, when we concluded that, since 2011, we have been without a guide for inclusion in the Network, but the NAPNEs continued, and continue, with the possibility of inclusion of their students with disabilities and specific needs, because the NAPNE continues to represent the only action within the scope of the IFRJ, aimed at the Special Education public on *campuses* (Dias, 2025).

Even with all this, the NAPNE continues with the PNEEPEI proposal, which aims to guide pedagogical practices and ensure the school inclusion of students with disabilities, Pervasive Developmental Disorders and High Abilities/Giftedness in the regular school system (Brasil, 2008d). Thus, at IFRJ in 2014, the NAPNE Regulation was created, which continues to this day without reformulations.

When the subject is the public that the NAPNE should serve, there are always deep discussions, because, as we are dealing with inclusion, we cannot exclude, but we must think about the structure of the centers, their limitation of operation and service.

After many discussions at the IFRJ NAPNEs Forum, about the significant increase in the number of students to attend the centers, and with the conclusion of the work prepared by the Working Group (WG) created in 2021, to prepare an Inclusion Policy, in June 2023, the Inclusive Special Education Policy of the Federal Institute of Rio de Janeiro was approved, ConSup/IFRJ Resolution No. 125 (IFRJ, 2023), which had been expected for a long time by the IFRJ community, and brought a profound documentary change regarding the public to be served in the centers.

In the evaluation of Dias (2025), the preliminary discussions of the WG, the need to expand the Special Education audience was verified, due to the fact that most of the students served by the NAPNEs on the *campuses* do not fit into the target audience of Special Education, according to the legislation in force, with most of them having "specific needs" and not "disabilities".

It is important to remember that such a change may be related to the fact that the IFRJ, from its creation in 2008, until the implementation of the PEEI document (2023), has no references in its internal guiding documents to public Special Education students, and also does not mention the expressions "Special Education public" or "Special Education", not even in the NAPNE Regulation (IFRJ, 2014), even though Special Education is a teaching modality, as conceptualized by PNEEPEI (Brasil, 2008, p.15): "(...) A teaching modality that crosses all levels, stages and modalities".

The important change, with regard to the Special Education public in the PEEI, was crucial to the development of the work carried out by the NAPNEs of the IFRJ, especially for students with "specific needs" to be left out of the conceptualization of the target audience of Special Education and, it should be noted that the PEEI of the IFRJ expanded the Public of Special Education for service and support in the centers, As we can see in its first article:

At the Federal Institute of Education, Science and Technology of Rio de Janeiro (IFRJ), the target audience of Inclusive Special Education Policies is considered to be students with

disabilities, with pervasive developmental disorders, with high abilities or giftedness and/or other specific needs related to learning disorders and disorders (IFRJ, 2023, p.3).

In the same article, paragraph four, the document provides a much broader definition of "specific needs" that meets the LBI (Brasil, 2015): "[...] that related to some physical, emotional, cognitive and/or mental need characteristic of a disability and/or learning disorder or disorder, of a temporary and/or permanent nature" (IFRJ, 2023, p.3).

It seems appropriate to say that due to the expansion of the Special Education public presented in the PEEI, the NAPNEs use, to serve their students, the term "specific needs", thus expanding the public. We understand that inclusive education needs to encompass and not be exclusionary with groups that have real needs and that need modalization for learning to occur.

We can affirm that, as for the Special Education public, the PEEI of IFRJ is in tune with the historical and normative milestones and with the inclusion policies agreed upon by the Educational Development Program (PDE), the LDB (Brazil, 1996), the PNEEPEI (Brazil, 2008), the LBI (Brazil, 2015), Decree No. 6,571/2008 (Brazil, 2008), Decree No. 7,611/2011 (Brazil, 2011), the Universal Declaration of Human Rights (UN, 1948), the Federal Constitution of 1988 (Brazil, 1988), the World Declaration of Education for All (Brazil, 1990), the Salamanca Declaration (UNESCO, 1994) and the PNEE (Brazil, 1994).

In view of these considerations, the PEEI of IFRJ becomes the most important normative act for inclusion, supporting Special Education at IFRJ. Such approaches may guide the NAPNEs to the development and consolidation of joint work, aiming at improving the conditions of access, permanence and success of public students of Special Education at IFRJ and the development of continuing education for civil servants on *campuses* for this purpose.

These and other diagnoses on inclusion as a Public Policy at IFRJ are the results of research carried out in the Professional Master's Course in Diversity and Inclusion at the Fluminense Federal University, by Dias, Fernandes and Salgado⁷ (2020), and the article the Inclusive Special Education Policy of the Federal Institute of Rio de Janeiro: an analysis from the perspective of human rights⁸, by Dias, Lacerda, Salgado and Correia (2024).

5 INCLUSION AS SOCIAL RESPONSIBILITY

Social Responsibility has been a topic of research interest and is being studied in different areas of knowledge, under different approaches. In addition, Social Responsibility has

⁷<https://app.uff.br/riuff/bitstream/handle/1/30343/Disserta%C3%A7%C3%A3o%20de%20Mestrado.pdf?sequence=1&isAllowed=y>

⁸ <https://ojs.studiespublicacoes.com.br/ojs/index.php/cadped/article/view/6606>

been the subject of intense and controversial debate for the construction of its concept, in addition to commonly studied areas such as Corporate Social Responsibility, Corporate Social Responsibility, Social and Environmental Social Responsibility and Individual Social Responsibility (Dias, 2025).

After analyzing the bibliographic survey carried out in this research, we conclude that the subject of Social Responsibility has been developing more markedly in the organizational sphere and dealing with the most varied objectives, articulated and associated with various approaches, such as: leadership, governance, public policies, social and corporate performance, *stakeholder theory*, marketing, strategic management, legal responsibility and values.

In addition, it was evidenced that the theme of Social Responsibility has been achieving remarkable prominence in scientific publications at national and international level from different perspectives and that, despite being old, it is still recent and developing, with theoretical diversity and multiple interpretations, pointing to different directions of knowledge, emerging from it several multidisciplinary aspects, but without a conceptual consensus.

In view of this, we find varied definitions and a diversity of approaches to Social Responsibility, without finding an understanding and definition that is widely accepted. Thus, from the approaches found, they seem to contain an idea of voluntary social practice on the part of private companies. This practice is operationalized in different ways and with a view to benefiting varied audiences.

Based on these data, we will present in this work some concepts of Social Responsibility, found in the bibliographic survey. However, in this article, we will be based on the concept of Social Responsibility linked to⁹ the ORSIES Green Book, which is a collaborative network of Higher Education Institutions (HEIs), which fosters the social dimension of HEIs and promotes the sharing of experiences and good practices on Social Responsibility policies and practices.

The idea of Social Responsibility advanced along with the social, political and economic transformations that took place in society throughout the twentieth century. Until around the 50s, Social Responsibility was seen in companies when they supported social causes and practiced donations (Almeida, 2010). The theme gained greater visibility from the 50s onwards, being considered by Bowen (1953 *apud* Almeida, 2010), as the modern era of social responsibility.

From the 80s to the present day, according to the same author: "the concept of sustainable development becomes part of the discourse on Social Responsibility and the theory

⁹ In 2001, the European Commission, with the aim of "launching a broad debate and obtaining views on corporate social responsibility at national, European and international level" (European Commission, 2001, p. 7), published a Green Paper "Promoting a European framework for corporate social responsibility".

of *stakeholders*¹⁰ broadens the framework of the company's responsibilities in all groups that affect or are affected by business action" (Almeida, 2010, p.58). Social responsibility is attributed to the company, as a moral and ethical entity, and not to the individual who makes the decisions for it.

Thus, the relationship between ethics and Social Responsibility is recent, despite its rapid evolution. For Bowen (1957), Social Responsibility has been, since its origin, related to Christian movements, taking into account the close relationship of the latter with ethics and morals. Thus, it should not only take into account its own interests, but be concerned with its workers, its customers and the community.

Following this line of thought, Social Responsibility is a form of management based on an ethical and transparent relationship, concerned with achieving the sustainable development of society, respecting diversity and contributing to reduce social inequalities, in order to promote quality of life for human beings (Leal *et al.*, 2011). The Green Paper of the Commission of the European Communities proposes an idea of Social Responsibility that goes towards the aforementioned concept, assuming that institutions must contribute to a better, more equitable society, with a cleaner environment, understanding the good of all through behaviors that respect the values of social, environmental and economic sustainability.

Nowadays, Social Responsibility has become one of the greatest challenges of globalization. In the understanding of *Thiry-Cherques* (2003 *apud* Almeida, 2010), currently, the Social Responsibility of each individual extends to all humanity, present and future.

In contemporary times, Social Responsibility must be an integral part of management through a transparent and ethical behavior of the institution, in which the objectives become compatible with sustainable development and a driver in the reduction of social inequalities (Almeida, 2010).

The Green Paper of the Commission of the European Communities brings, in the concept of social responsibility, the construction of a fairer and more transformative society, and for this, it should be implicit on a voluntary basis. When they take a proactive stance, the repercussions felt translate into a positive social balance, encouraging responsible behavior (Almeida, 2010).

To provoke forceful reflections on Social Responsibility, both Institutions and citizens have a very relevant role in contributing to the improvement of society's conditions, through the development of Social Responsibility, whether at the level of practices, at the level of reflection, training and education of citizens' values or in research on the subject.

¹⁰ *Stakeholders* means strategic audience and describes all people or "interest groups" that are impacted by the actions of an enterprise, project, company or business.

As seen, Social Responsibility approaches are dynamic with a systemic and multidisciplinary vision. The definition of Social Responsibility has gone through approaches with biases that align various interests, from the preservation of economic value, as well as that of the collectivity.

Social Responsibility actions are attitudes that make society more dignified, commonly applied in the business sector, but should and can be applied, mainly, by individuals and companies in the most diverse branches and types. According to the Abrinq Foundation:

Social responsibility is the way of thinking and acting ethically in relationships. Despite being strongly related to companies, the practice can be directly linked to an action, carried out by individuals or legal entities, whose main objective is to contribute to a fairer society (Abrinq Foundation, 2020).

With this understanding, the company's Social Responsibility is linked to a social commitment of the legal entity, that is, it becomes responsible for factors that aim to help society as a whole, in the same way, the individual can have this same understanding.

In summary, the importance of Social Responsibility for society was evident. However, it was noticed that this behavior is not yet widely adopted by some institutions. The problems addressed by Social Responsibility are not specific issues in the world of "academia", but rather urgent, and have to do with the survival of all. It is urgent to spread the Social Responsibility of Sciences.

6 METHODOLOGY

The question that mobilized this investigation was to analyze the policies in the area of Social Responsibility for the Special Education public and students with specific needs of IFRJ and IPV.

This study is within the scope of research with qualitative and quantitative approaches, and uses participant research using as data collection instruments, bibliographic survey, analysis of documentary collection and semi-structured interviews with open questions.

The research advanced through two preliminary paths, and a third, based on data analysis. In the first path, dedicating herself to a bibliographic survey in databases, on the portal of the Brazilian Digital Library of Theses and Dissertations (BDTD), in the Theses and Dissertations Bank of the Coordination for the Improvement of Higher Education Personnel (Capes), on publications in the field of Professional Education, Social Responsibility, Special Education, and Polytechnic Education at IFRJ and IPV, which serve as a reflective basis for the elaboration of the research.

In the second path, a documentary analysis was carried out in the period from 2020 to 2024, a period after the research carried out in the master's degree. The analysis of the documentary collection aimed to know the mandatory documents that govern Professional Education and Special Education in Brazil and Portugal and their relations with the investigation, the internal normative documents of the IFRJ and the IPV, in addition to requesting information in the e-Sic system, on the Fala.BR platform to obtain updated data from the IFRJ. It is worth remembering that the answer is returned by the Fala.BR in document format, so we consider in this work, a documentary analysis.

Three types of document analysis were used in the research: (a) internal-institutional, analyzing the documents, 1. From IFRJ: ¹¹(i) the PDI and PPI (IFRJ, 2024), the 2023 Management Report (IFRJ, 2023), at the time, the last to be published on the Institutional Portal, and the PEI 2024-2028 (IFRJ 2024), and the Inclusive Special Education Policy (PEEI) of IFRJ, ConSup/IFRJ Resolution No. 125 (IFRJ, 2023); 2. From the BTI¹²: (i) Report-RIS-IPV-2022; (ii) legislation such as: laws, decrees, resolutions, ordinances, opinions and technical notes, United Nations Convention on the Rights of Persons with Disabilities (UN, 2006; ratified in Portugal, 2009); Universal Declaration of Human Rights (UN, 1948) and Convention on the Rights of Persons with Disabilities (CRPD) (2006); (iii) data collected on e-Sic.

And, the third way, through semi-structured interviews with the vice-presidency and the coordination of NAI-ENEE, IPV. As we can see in the table below (Table 1).

Table 1

Organizational structure of methodological aspects

PATHS TRAVELED	DATA COLLECTION INSTRUMENTS	METHODS
First Way	Bibliographic Survey	In databases: theses, dissertations, articles and books. Publications in the field of Professional Education, Social Responsibility, Special Education, and Polytechnic Education at IFRJ and IPV.
Second Way	Document Analysis of three types: (a) institutional internal; (b) legislation; (c) e-SiC data	Analysis of the mandatory documentary collection that governs Professional Education and Special Education in Brazil and Portugal. In addition to requesting information through the e-Sic system, to obtain updated data from the IFRJ.
Third Way	Interviews	Interviews with two IPV managers.

Source: Prepared by the authors.

¹¹ Available at: <https://portal.ifrj.edu.br/institucional/documentos-institucionais-e-norteadores>

¹² Available at: <https://www.ipv.pt/homepage/nee/>

The request for information through the web electronic system, of the Federal Executive Branch, the e-Sic system, to obtain updated data from the IFRJ, took place through the opening of a process in July 2024, in Fala.BR. After the authorization of the IPV directors and the agreement of the UFF, the research was submitted to the analysis and approval of the Research Ethics Committee¹³ via Plataforma Brasil, under the Certificate of Presentation of Ethical Appreciation No. 70572123.7.0000.8160, for the involvement of human beings.

For the qualitative treatment of the data, the content analysis proposed by Bardin (2011) was used. According to Bardin (2011), content analysis is a data processing technique that aims at the objective, systematic and quantitative description of the manifest content of communications, with the purpose of interpreting them (Minayo, 2010). In the perspective of Minayo (2011), based on Bardin (2011), this type of analysis aims to go beyond the level of common sense and subjectivism in interpretation, seeking to achieve critical vigilance in the communication of documents, literary texts, biographies, interviews or observation results.

In the author's assessment, the analysis aims to examine, categorize and classify the data in a way that makes it possible to reach the answers to the problem proposed in the investigation. In order to facilitate operationalization, these procedures were divided into three stages: "pre-analysis, exploration of the material and treatment of the results, inference and interpretation" (Bardin, 2011, p.95).

7 RESULTS

We sought to present specificities of what occurred throughout the research and the exercise of the analysis of the collected data. The apprehensions presented demonstrate the analysis of the practice of Social Responsibility adopted in the accessibility centers of IFRJ and IPV. As it is an excerpt from a thesis, the results will be abbreviated.

In this work, the result of the analysis of the documentary architecture focused particularly on the guiding institutional documents and internal regulations of IFRJ and IPV, verifying, above all, the alignment with the legislation and the proposal of Social Responsibility to ensure the access, permanence and successful completion of students with disabilities and specific needs of the researched Institutions.

Through the bibliographic survey, the analysis of the documentary collection and the semi-structured interviews with open questions, some historical and normative milestones were found that changed the course of Special Education in Portugal, such as Decree-Law No.

¹³ Available at: <http://cephumanas.sites.uff.br/>

3/2008, which defined the specialized support for the inclusion of students with special educational needs in regular schools.

In 2018, Decree-Law No. 54/2018 was published, which establishes the legal regime for inclusive education in Portugal, accompanied by Decree-Law No. 55/2018, which places Portugal in a group of countries that have legislation on inclusive education. The Decree-Law provided, in article 33, for the creation and updating of a support manual for inclusive education, aimed at schools, their professionals and parents.

The proposal of the decree was the elaboration of an inclusive curriculum in schools in Portugal, which meets and respects the specific needs of students. Knowing that the curriculum and meaningful learning are the soul of a school, Decree No. 54/2018 brings with it guidelines for recognizing the diversity of students, discovering the various ways of dealing with their peculiarities, adjusting the teaching processes and making the learning of these students increasingly meaningful, adapting them to the individual characteristics and conditions of each one. In this way, Decree No. 54/2018 brought significant contributions to Inclusive Special Education in Portugal.

The PDI has become the most important document in the IFs, as it contains all the Institution's data, such as: objectives, goals, institutional programs for the qualification of civil servants, institutional evaluation, institutional planning for teaching, research and extension, campus infrastructure, the promotion plan for social inclusion and diversity. These are the references that allow us to identify and reflect on how Special Education has been considered in the daily practice of this Institution.

In the IFRJ documents analyzed, the institution does not bring in its mission, vision and values, inclusion as a social responsibility. As a vision, the PDI presents: *"To be a reference in professional, scientific, technological and cultural education, in a humane, inclusive, diverse and plural way, integrating innovative teaching, research and extension actions in line with the demands of society and the transformation of life"* (IFRJ, 2024, emphasis added). The IFRJ Portal, on the other hand, informs as an institutional vision: *"To be an Institution recognized by society as a reference in professional, scientific and technological education at different levels and modalities of education"* (IFRJ, 2024, emphasis added).

Regarding the vision, IFRJ is categorical in stating that it is a reference institution. It is worth remembering that, since 2018, we have been researching how inclusion happens on *IFRJ campuses*, one of the results is the lack of infrastructure, both financial, material and human resources in the NAPNEs (Dias, 2025). It should be highlighted, within the scope of the

research developed here, that diversity and inclusion are fundamental for the constitution of a teaching of reference and excellence.

Values are principles, customs, and ideas that guide people's behavior, attitudes, and decisions in the exercise of their responsibilities and attributions. As values, the PDI presents: *"Ethics; Equity and Social Justice; Valuing People; Diversity and Inclusion; Excellence and Quality; Integration; and Social, Environmental and Economic Responsibility"* (IFRJ, 2024, emphasis added). Regarding values, we found an advance, as the terms "Diversity and Inclusion" and "Social Responsibility" were included, the latter, even if linked to organizational, institutional, environmental and economic sustainability.

The PEI has 15 strategic objectives, and was prepared concomitantly with the PDI, both effective from 2024-2028. The Strategic Plan allowed the construction of the strategic map. It presents, in addition to the mission, vision and values, the 15 strategic objectives defined for the 2024-2028 cycle. The goal "Internal Processes P2" states: "Implement inclusive programs, projects and actions with a view to equity and social justice", we realize that inclusive actions are included, we just don't know how to carry out inclusive actions, without a minimum infrastructure in the centers, without Specialized Educational Service, without Multifunctional Resource Rooms (SRMs), without translators and interpreters of Libras, without qualified professionals to work with the Special Education public, which is only increasing every semester, and the number of students enrolled with specific needs exceeds that of students with disabilities, such facts were results in the aforementioned 2020 survey (Dias, 2025) and are confirmed here.

Another internal normative document analyzed was the General Regulation, approved by Resolution No. 16 of the IFRJ Superior Council on August 10, 2011 (Brasil, 2011), and the Statute (IFRJ, 2009), both of which are outdated and, to date, unchanged.

At IFRJ, ConSup Resolution No. 55 of December 17, 2014 (Brazil, 2014) creates the NAPNE Regulation (IFRJ, 2014). A simplistic regulation, which deals with the competences, composition, mandate, administrative organization and functioning, attributions and infrastructure, although anachronistically, remains in force. It is important to highlight that in the Statute (IFRJ, 2009), in the General Regulations (IFRJ, 2011), in the NAPNE Regulation (IFRJ, 2014), the terms "Special Education public", "Special Education", "Inclusive Education" and "Inclusion" are not mentioned at any time. Even though Special Education is a teaching modality, as well as Professional Education. Another unusual highlight is that, in the NAPNE Regulation, citations from documents referring to Special Education, such as PNEEPEI, are used, but the text of the document does not deal with its audience.

History repeats itself in the documents analyzed, in which, in the 2020 survey (Dias; Fernandes; Salgado, 2020), the unusual is verified, as the mandatory documents, of greater importance of the IFRJ, have not yet been able to define the Special Education public in their Institution. The interaction of this compilation of elements makes it possible to verify that, since the 2020 survey (Dias; Fernandes; Salgado, 2020) to date, four years later, the documents that have been modified by virtue of being quadrennial, have had advances in their texts.

In the current IFRJ documents, the term "Special Education public" was used once in the PDI, and was not used in the other documents. The term "Special Education" was used nine times in the PDI, twice in the PPI, six times in the Management Report and seven times in the Strategic Plan. The term "Inclusive Education" was applied thirteen times in the PDI, seven in the PPI, twice in the Report and 1 in the Plan. The expression "Specialized Educational Service" was used once in the PDI, once in the PPI and twice in the Report. The "Multifunctional Resource Room" is mentioned once in the PDI and in the Report. In this way, we verify, even if at a very slow pace, the situation has been changing.

Another document analyzed was the IFRJ's Inclusive Special Education Policy. In the IFs, it is extremely important for the consolidation of inclusive processes, an institutional policy where access is planned, from the conditions for participation in the selection process, with translation of the notice into Libras and Braille, the presence of TILs and mediators in the tests, aiming at the permanence and successful completion of the course at the Institution.

Contributing to broaden the discussions about the creation of the Inclusive Special Education Policy (IFRJ, 2023), we can say that it is one of the main aspirations, in recent years, of the NAPNEs, having been approved in June 2023. In addition to the creation of the policy itself, one of the greatest advances materialized in practice was the expansion of the EE target audience, with regard to students with "specific needs", which are left out of the conceptualization of the EE target audience, which we have in the national legal documents.

It is believed that if an inclusion policy contemplates these points, it fulfills its role as a driver of inclusive actions and practices, leading the Institution to the longed-for culture of inclusion, so that students will have their rights guaranteed as proclaimed in the Universal Declaration of Human Rights (UN, 1948), which emphasizes equal rights and opportunities for all people, regardless of their capabilities. In this sense, the declaration emphasizes the importance of equal opportunities, individual autonomy and full participation in society.

The information collected in the e-Sic and in the interviews, with regard to the analysis of the structures of the NAPNEs and NAI-ENEE, their potentialities and limitations in the services and the social responsibility with students with specific needs, indicate that the IPV

accessibility center carries out interventions in the pedagogical work, involving the entire institution: courses, coordinations, students, families and teachers. These actions aim to promote a more inclusive and integrated education, with the active participation of all those involved in the process (Dias, 2025).

The IFRJ accessibility centers, on the other hand, have positively impacted the teaching-learning process, for students with disabilities and specific needs, seeking solutions to the most varied daily problems, even with infrastructure limitations. The NAPNEs are, so far, the only initiative aimed at the EE public on *campuses*, contributing to ensure not only access, but also the permanence of these students, promoting an inclusive education, although still in a limited way.

In the area of Social Responsibility, the research revealed the protagonism of the accessibility centers that play the role of operationalizing teaching actions both for students in general and for those in Special Education. Social Responsibility is closely linked to the fulfillment of human rights, especially in the context of Special Education and, even with advances, inclusive practice still faces challenges, including the naturalization of the violation of the human rights of these people.

As for the structures of the accessibility centers, both at IFRJ and IPV, the situation points to the urgent need for investments that transform these centers into adequate and fundamental spaces within the institution, ensuring that they become centers of excellence and reference also in the inclusion of students.

In the Accessibility Center, NAI-ENEE, develops projects in inclusion, such as mentoring, integration and practical inclusion, support for athletes with disabilities. These projects aim to promote the full development of students by offering individualized support and opportunities for social and academic integration.

These IPV actions seek not only inclusion in the academic environment, but also the creation of conditions for students to develop in an integral way, both in the educational and social aspects. Another important focus of the IPV is the development of the culture of inclusion. To this end, one of the activities developed by its Center is to carry out reflection and awareness activities with students, promoting discussions on inclusion and awareness.

The work confirmed, through the participants' narratives, that the IPV managers highlighted inclusion as a Social Responsibility and emphasized the importance of consolidating an inclusive culture through actions and projects. The work of NAI-ENEE and GAPI stands out for anticipating the needs of students, offering guidance and advice to both coordinators and teachers, in addition to supporting the development of essential skills. Pedagogical initiatives,

focused on the employability and autonomy of students, are fundamental for the academic success of students, as well as the expansion of awareness-raising actions, especially among first-year students. Continuous support for students is considered crucial to ensure their permanence and success throughout their academic career. These actions reflect an institutional commitment to inclusion and equity, promoting a more accessible environment that is favorable to the full development of all students.

The performance of the NAI-ENEE, in this context, is seen as a clear example of this social responsibility. When management and the accessibility center are "anchored on the same ground", it means that there is an integration between institutional policy and the Institution's inclusive practices. This alignment is essential for the effectiveness of inclusion actions, as the strategies and decisions made by the institution's management are supported by the real needs of students, while NAI-ENEE acts as a bridge, ensuring that policies are translated into concrete actions.

8 CONCLUSION

Considering the architecture and convergence of the documents analyzed and the theme of the research, it was sought to apprehend how these documents direct the discussions about Social Responsibility in its accessibility centers and for the Special Education public, which every day shows an accelerated growth in the number of enrollments with considerable delineations and dimensions in terms of service in the accessibility centers of IFRJ.

It is possible to clearly identify the work developed within the scope of the practices of the NAI-ENEE accessibility centers in the IPV and the NAPNE in the IFRJ, highlighting their efforts to promote inclusion. At IPV, close collaboration between management and NAI-ENEE is crucial to ensure that inclusive actions remain effective and sustainable, contributing to the success of the inclusive education model.

In the narratives of the managers, it is clear that the management of the IPV is committed to respecting diversity and promoting social equity. By adopting an inclusive stance and valuing differences, the institution contributes directly to reducing social inequalities, creating opportunities for all students. This commitment to diversity promotes a quality of life for students by providing a more accessible and fair educational environment.

It is understood that there is still a long way to go so that inclusion in IFRJ is completely aligned with existing legal normative documents and internal regulations, created and not complied with by IFRJ. The current reality requires a real commitment from the institution, which needs to recognize inclusion as a genuine Social Responsibility.

Despite the challenges, it is essential that the institution begins to implement the necessary changes in order to transform the inclusion policy, still on paper, into concrete actions that positively impact the lives of students and the entire academic community. We hope that the problematization raised by this research will contribute to the propagation of the culture of inclusion and human rights, generating a continuous and productive dialogue to promote inclusion as a Social Responsibility of IFRJ.

It is concluded that this work can be an important tool for the advancement of inclusive policies and practices within the IFs educational institutions, highlighting the role of accessibility centers as essential pillars for a truly accessible and egalitarian education.

By highlighting the interconnections between Special Education and Social Responsibility, the work offers a deep reflection on the importance of inclusion in the educational context. The focus on the Accessibility Centers shows that these structures should not be seen only as support units, but as central elements for the transformation of the educational environment, promoting a space of equity, welcoming, and equal opportunities for all students, especially those with disabilities and specific needs.

It is essential that society and educational institutions recognize the role of these centers as protagonists in building a more inclusive environment, where all students have the same chances for development and academic success. With the advancement of accessibility and inclusion practices, it becomes possible to strengthen the inclusive culture within the educational environment, not only as a matter of compliance with legislation and regulations, but as a real and continuous commitment to the Social Responsibility of educational institutions.

These points serve as guidelines to promote real and meaningful inclusion, which goes beyond a simple legal adequacy and incorporates Social Responsibility effectively, ensuring that all students, regardless of their conditions, can have a successful and egalitarian educational path.

ABSTRACT

Pediatric cancer represents one of the leading causes of morbidity and mortality in childhood, with particular emphasis on Acute Lymphoblastic Leukemia (ALL), the most common malignant neoplasm in this age group. Although therapeutic advances have raised survival rates to approximately 90%, prolonged exposure to chemotherapy during critical phases of neurological development raises important questions about its effects on children's cognitive functioning. This study aimed to assess the cognitive development of children with ALL throughout chemotherapy treatment, analyzing the Full Scale Intelligence Quotient (FSIQ) and the indices of verbal comprehension, perceptual organization, working memory, and processing speed. This is a prospective longitudinal study conducted with six pediatric participants treated at the HEMOAM Foundation in Manaus, Amazonas, between 2021 and 2022, using the Wechsler Intelligence Scale for Children — fourth edition (WISC-IV) at three assessment time points (D0, D35, and D84). Results indicated that the FSIQ remained predominantly within the average range, with transient fluctuations associated with the most intensive phases of treatment, particularly in the Processing Speed Index. The findings reinforce the importance of continuous neuropsychological monitoring throughout pediatric oncological treatment.

Keywords: Acute Lymphoblastic Leukemia. Cognitive Development. Neuropsychological Assessment.

RESUMO

O câncer pediátrico representa uma das principais causas de morbimortalidade na infância, com destaque para a Leucemia Linfóide Aguda (LLA), neoplasia maligna mais frequente nessa

faixa etária. Embora os avanços terapêuticos tenham elevado as taxas de sobrevivência para cerca de 90%, a exposição prolongada à quimioterapia durante fases críticas do desenvolvimento neurológico levanta questões sobre seus efeitos sobre o funcionamento cognitivo infantil. O presente estudo teve como objetivo avaliar o desenvolvimento cognitivo de crianças com LLA ao longo do tratamento quimioterápico, analisando o Quociente de Inteligência Total (QIT) e os índices de compreensão verbal, organização perceptual, memória operacional e velocidade de processamento. Trata-se de um estudo prospectivo longitudinal, realizado com seis participantes pediátricos atendidos na Fundação HEMOAM, em Manaus, Amazonas, entre 2021 e 2022, utilizando a Escala de Inteligência Wechsler para Crianças — quarta edição (WISC-IV) em três momentos avaliativos (D0, D35 e D84). Os resultados indicaram que o QIT se manteve predominantemente na faixa média, com oscilações transitórias associadas às fases mais intensas do tratamento, especialmente no Índice de Velocidade de Processamento. Os achados reforçam a importância do acompanhamento neuropsicológico contínuo durante o tratamento oncológico pediátrico.

RESUMEN

El cáncer pediátrico representa una de las principales causas de morbilidad en la infancia, con especial relevancia para la Leucemia linfóide Aguda (LLA), la neoplasia maligna más frecuente en este grupo etario. Aunque los avances terapéuticos han elevado las tasas de supervivencia a aproximadamente el 90%, la exposición prolongada a la quimioterapia durante fases críticas del desarrollo neurológico plantea interrogantes sobre sus efectos en el funcionamiento cognitivo infantil. El presente estudio tuvo como objetivo evaluar el desarrollo cognitivo de niños con LLA a lo largo del tratamiento quimioterápico, analizando el Cociente de Inteligencia Total (CIT) y los índices de comprensión verbal, organización perceptual, memoria operacional y velocidad de procesamiento. Se trata de un estudio prospectivo longitudinal, realizado con seis participantes pediátricos atendidos en la Fundación HEMOAM, en Manaus, Amazonas, entre 2021 y 2022, utilizando la Escala de Inteligencia Wechsler para Niños — cuarta edición (WISC-IV) en tres momentos de evaluación (D0, D35 y D84). Los resultados indicaron que el CIT se mantuvo predominantemente en el rango promedio, con oscilaciones transitorias asociadas a las fases más intensas del tratamiento, especialmente en el Índice de Velocidad de Procesamiento. Los hallazgos refuerzan la importancia del seguimiento neuropsicológico continuo durante el tratamiento oncológico pediátrico.

1 INTRODUCTION

Cancer is a disease characterized by the disordered and uncontrolled growth of abnormal cells, which can invade adjacent tissues and spread to other regions of the body, compromising the functioning of vital organs and systems (National Cancer Institute, 2023). In childhood, the most frequent types of cancer differ from those observed in adults: while in adults, solid tumors originating in organs such as the breast, lung, and colon predominate, in children, hematological neoplasms predominate, diseases that affect the blood and lymphatic system, especially leukemias, which represent the most common oncological group in the pediatric age group (National Cancer Institute, 2008).

Among leukemias, Acute Lymphoblastic Leukemia (ALL) is the most frequent form in childhood. It is a malignant neoplasm, that is, a type of cancer, originating in the bone marrow, the structure responsible for the production of blood cells. In ALL, immature lymphocytes multiply uncontrollably and accumulate in the bone marrow, preventing the proper production of healthy blood cells and can spread to organs such as the thymus, lymph nodes, and central nervous system (Juliussen & Hough, 2016; Hoffbrand, 2018). This systemic involvement explains the diversity of clinical symptoms of the disease, anemia, fatigue, recurrent infections, bleeding and bone pain, and the complexity of its treatment. The disease predominantly affects children between 2 and 5 years of age, with a slight prevalence in males, and represents about 40% of pediatric cancer cases in Brazil (Soares, 2019; National Cancer Institute, 2008). In the Amazon region, a retrospective study carried out at the Hospital Foundation of Hematology and Hemotherapy of Amazonas (HEMOAM) identified 577 diagnoses of ALL between 2005 and 2015, with a predominance in males and a higher incidence in children from zero to ten years of age, evidencing the epidemiological relevance of the disease in the state context (Silva et al., 2019).

In the last four decades, the development of increasingly effective chemotherapy protocols has significantly transformed the prognosis of ALL. Until the 1970s, the disease was considered practically fatal; currently, modern chemotherapy protocols, such as the one adopted by the Brazilian Group for the Treatment of Childhood Leukemia (GBTLI), allow approximately 90% of patients to achieve complete remission (Hoffbrand, 2018). The treatment lasts about two years and is organized in sequential phases, with greater intensity in the initial stages: induction of remission, which comprises the first 35 days (D0 to D35) and aims to quickly eliminate leukemia cells, and consolidation, evaluated on the eighty-fourth day (D84), aimed at eliminating residual cells and preventing relapses. Although survival rates have increased considerably, prolonged exposure to chemotherapeutic agents during a critical period of infant

neurological development raises important questions about the effects of treatment on cognitive functions (Kingma et al., 2002).

Longitudinal studies indicate that children who survived ALL may have variable cognitive deficits, with greater impairment in those undergoing protocols that combine cranial irradiation and methotrexate (MTX), compared to those treated exclusively with chemotherapy (Roman; Sperduto, 1995; Kingma et al., 2002). This difference is explained by the synergistic effect between cranial radiation and MTX on brain tissue: both act in a neurotoxic way and, when combined, potentiate damage to neural structures involved in higher cognitive functions, such as memory, attention, and processing speed. Even in isolated chemotherapy treatments, changes in these functions have been reported throughout clinical follow-up (Insel et al., 2017). Specific investigations indicate that ALL survivors present academic difficulties more frequently, especially in mathematical reasoning, with characteristics similar to those of Specific Learning Disorder (Kaemingk et al., 2004). In the Brazilian context, a study carried out in the State of Amazonas identified global developmental delay in children hospitalized with ALL, including deficits in language and motor skills, expanding the understanding of the impacts beyond the strict cognitive domain (Fernandes, 2020).

Despite the clinical relevance of this evidence, the scientific literature still has important gaps regarding the longitudinal assessment of cognitive development during chemotherapy treatment, especially in Brazilian and regional contexts. A review carried out in the PubMed, SciELO and VHL databases, using the descriptors "acute lymphoblastic leukemia", "cognition" and "children", revealed that most of the available studies focus on populations of survivors evaluated after the end of treatment, with few records on the cognitive variations that occur throughout the different therapeutic phases (Kingma et al., 2002; Insel et al., 2017). In addition, factors such as socioeconomic status, family support, access to schooling during hospitalization, and regional characteristics can modulate the effects of treatment on neurodevelopment, as pointed out by Fernandes (2020) and Insel et al. (2017), and are still little explored in the national literature.

In view of this scenario, systematic neuropsychological evaluation during pediatric cancer treatment becomes an essential strategy for the early identification of cognitive alterations and the planning of interventions that promote the development and quality of life of these children. The Wechsler Intelligence Scale for Children, fourth edition (WISC-IV) is currently considered the gold standard psychometric instrument for children's cognitive assessment, widely recognized in the international scientific and clinical literature for its psychometric robustness and ability to accurately measure the Total Intelligence Quotient (IQ)

and indices verbal comprehension, perceptual organization, working memory, and processing speed, enabling a comprehensive and longitudinal analysis of cognitive functioning (Wechsler, 2013). This article is derived from a master's dissertation developed in the Graduate Program in Applied Sciences to Hematology at the University of the State of Amazonas (PPGH/UEA), in partnership with HEMOAM, a reference institution in oncohematological care in the North Region. The general objective of this study is to evaluate the cognitive development of pediatric patients with ALL during chemotherapy treatment. As specific objectives, we sought: to analyze the Total Intelligence Quotient (IQ) during different phases of treatment; to compare cognitive performance over time through longitudinal assessment; and to investigate changes in the indices of verbal comprehension, working memory, perceptual organization and processing speed.

2 THEORETICAL FRAMEWORK

To support the proposed investigation, this study presents a theoretical review organized into four thematic axes. The first addresses Acute Lymphoblastic Leukemia (ALL), with emphasis on its epidemiological, clinical and therapeutic aspects. The second discusses child neurodevelopment, considering the main cognitive functions involved in learning and the disorders associated with deficits in this process. The third axis examines the impacts of cancer treatment on cognition, based on national and international evidence. Finally, the fourth axis deals with neuropsychological assessment in a hospital context, highlighting the instruments used to monitor cognitive functioning in children with cancer.

2.1 ACUTE LYMPHOID LEUKEMIA

Acute leukemia is a group of malignant neoplasms, in other words, they are cancers originating in the hematopoietic system characterized by the uncontrolled proliferation of immature cells in the bone marrow. This process compromises the normal production of blood components (red blood cells, leukocytes and platelets) and the body's immune response, and can be fatal when not treated properly (Juliussen & Hough, 2015). These diseases have a higher incidence in childhood and can be classified according to the cell line affected into four major groups: Acute Lymphoblastic Leukemia (ALL), Chronic Lymphoblastic Leukemia (CLL), Acute Myeloid Leukemia (AML) and Chronic Myeloid Leukemia (CML) (Juliussen; Hough, 2015).

Among acute leukemias, ALL, the focus of the present study, is defined by the clonal accumulation of immature lymphocytes in the bone marrow, with possible impairment of

structures such as the thymus, lymph nodes, and central nervous system (Hoffbrand, 2018). It is the most malignant neoplasm it is frequent in childhood, predominantly affecting children between 2 and 5 years of age, with a slight prevalence in males. Its etiology is multifactorial, involving interactions between genetic and environmental factors, ionizing radiation, and spontaneous or acquired somatic mutations; about 10% of cases are associated with heredity (Alves et al., 2021).

From a clinical point of view, ALL is manifested by anemia, fatigue, fever, bleeding, petechiae, headache, lymph node enlargement, bone pain, and possible involvement of the central nervous system (Soares, 2019; Hoffbrand, 2018). The diagnosis is established based on a set of complementary procedures: the morphological and cytochemical analysis of the cells allows the identification of the type and degree of cell differentiation; immunophenotyping characterizes cell surface markers, defining the lineage involved (B or T); cytogenetics identifies chromosomal abnormalities relevant to prognosis; and cerebrospinal fluid analysis evaluates the impairment of the central nervous system (Soares, 2019; Hoffbrand, 2018).

The current classification adopted by the World Health Organization (WHO), updated in 2016, subdivides ALL according to the cell line involved, B cells or T cells, and the genetic abnormalities identified, including hypodiploidy, hyperdiploidy, and specific chromosomal translocations, such as the Philadelphia chromosome (BCR-ABL1) (Arber et al., 2016). In the present study, children with ALL lineages B and T were evaluated, since both forms make up the profile of the population treated at the investigated institution, and it is important to consider the possible prognostic and therapeutic differences between these subclassifications.

In Brazil, ALL represents the ninth most common neoplasm overall, corresponding to about 40% of pediatric cancer cases, with an estimated 5,920 new cases in boys and 4,890 in girls for the 2020–2022 biennium (National Cancer Institute, 2008). In the northern region, a retrospective study carried out at the HEMOAM Foundation identified 577 ALL diagnoses between 2005 and 2015, with a predominance in males and a higher incidence in children aged zero to ten years, with a better prognosis in this age group compared to adolescents (Silva et al., 2019).

The treatment of ALL is predominantly based on chemotherapy, with the aim of achieving complete remission of blasts in the bone marrow. The protocol of the Brazilian Group for the Treatment of Childhood Leukemia (GBTLI) organizes treatment in sequential phases, starting with the induction of remission, evaluated on days D15 and D35, followed by consolidation, with evaluation at week 12 (D84) after diagnosis. About 90% of patients achieve remission, although there is a risk of relapse associated with the presence of measurable residual disease (MRD)

(Hoffbrand, 2018). Complementary therapies, such as radiotherapy, targeted therapies, and bone marrow transplantation, may be indicated according to clinical evolution, with a total duration of treatment of approximately two years (Soares, 2019).

2.2 CHILD NEURODEVELOPMENT

Children's cognitive development comprises a set of mental processes that are progressively organized and complexified throughout childhood and adolescence, including functions such as attention, memory, language, reasoning, perception, and information processing speed (Rotta et al., 2016). These functions are interdependent and support the child's ability to learn, adapt to the environment, and develop academic and social skills. Brain plasticity, the nervous system's ability to reorganize its connections in response to experiences and stimuli, is particularly intense in childhood, making this period both a window of opportunity for development and a phase of greater vulnerability to adverse factors (Rotta et al., 2016).

Working memory, responsible for the temporary storage and manipulation of information during the performance of cognitive tasks, plays a central role in school learning, especially in reading, writing, and mathematical reasoning. Attention and concentration are fundamental executive functions for engagement in academic activities and for the regulation of behavior in structured contexts. Language, both in its receptive and expressive dimensions, underpins the development of conceptual thinking and social communication (Barkley, 2020). Logical reasoning, in turn, allows the child to establish causal relationships and solve problems of increasing complexity, while perception, especially visual and auditory perception, organizes the stimuli of the environment into meaningful representations. The speed of information processing, finally, reflects the efficiency with which the nervous system performs basic cognitive operations, being a sensitive indicator of neurological maturation (Rotta et al., 2016). Deficits in any of these functions can have a direct impact on school performance and the child's overall development.

When such deficits persist or are accentuated throughout development, they can favor the emergence of neurodevelopmental disorders, evidencing the close relationship between cognitive functions and children's mental health. Neurodevelopmental disorders are a group of conditions that begin in the developmental period, typically manifesting before school entry, with deficits that lead to impairments in personal, social, or academic functioning (American Psychiatric Association, 2022). This group includes: Intellectual Development Disorder, Communication Disorders, Autism Spectrum Disorder (ASD), Attention Deficit Hyperactivity Disorder (ADHD), Specific Learning Disorder and Motor Disorders. It is estimated that

approximately 7% of children at 5 years of age have impairments in language development, evidencing the significant prevalence of these conditions in the child population (O'Hare & Bremner, 2016).

In the pediatric oncological context, the occurrence of cognitive deficits can be configured both as a direct consequence of the neurotoxic effects of the treatment and as a result of the global impact of the illness on the child's development, including school withdrawal, prolonged hospitalization, emotional distress, and restrictions on learning experiences (Fernandes, 2020). Understanding child neurodevelopment in its entirety is, therefore, essential for the evaluation and follow-up of children with ALL, allowing early identification and planning of interventions that minimize the impacts of illness on cognitive development.

2.3 IMPACTS OF CANCER TREATMENT ON COGNITION

The effects of chemotherapy treatment on children's cognitive development constitute a field of research in increasing expansion. In recent decades, the number of studies dedicated to this topic has increased significantly, following the advancement of therapeutic protocols and the improvement in the survival rates of children with ALL, which has made the late effects of treatment a priority clinical concern (Kingma et al., 2002; Roman & Sperduto, 1995).

Two classic longitudinal studies, developed by the University of Maastricht, in the Netherlands, are fundamental references in this field. The first, conducted between 1978 and 1984, evaluated the psychological effects on learning of 28 children surviving ALL treated with cranial irradiation and methotrexate (MTX) (Kingma et al., 2002). The second, conducted with 17 surviving children treated exclusively with chemotherapy between 1984 and 1988, made it possible to compare the effects of the two therapeutic modalities (Roman & Sperduto, 1995).

The results of these studies confirmed that patients treated with chemotherapy alone had lower levels of learning when compared to a control group of healthy children, but with superior performance compared to those submitted to cranial irradiation associated with MTX, a group that demonstrated greater cognitive impairment and more pronounced learning deficits (Kingma et al., 2002; Roman & Sperduto, 1995). These findings indicate that although chemotherapy alone is less neurotoxic than more aggressive protocols, its effects on cognitive development should not be overlooked, especially when treatment occurs during critical phases of neurological development.

More recent research reinforces this perspective. Insel et al. (2017) identified declines in cognitive processes, especially verbal working memory, over the course of chemotherapy treatment in children with ALL, with an association between these declines and later academic

performance. Fu et al. (2017) demonstrated that variables such as gender, age at diagnosis, and chemotherapy dose may be associated with neurocognitive impairment at in patients with ALL. A study conducted at the Chicago School of Medicine found that ALL survivors had more frequent academic difficulties in areas involving mathematics, with characteristics similar to the diagnostic criteria of Specific Learning Disorder (Kaemingk et al., 2004).

In the Brazilian context, a study conducted in the State of Amazonas in 2020, also at HEMOAM, identified global developmental delay in pediatric children hospitalized with ALL, with emphasis on deficits in language and motor skills, showing that the impacts of illness go beyond the strict cognitive domain and encompass multiple dimensions of child development (Fernandes, 2020). These findings reinforce the need for a broader and interdisciplinary look at the development of these children, considering not only the direct effects of chemotherapy, but also the set of factors associated with the hospitalization and treatment process.

In view of this scenario, the importance of systematic neuropsychological follow-up throughout the treatment and in the post-therapeutic period is highlighted, as a strategy for early identification of cognitive alterations and planning interventions that minimize losses and promote better conditions for development and quality of life in this population (Rotta et al., 2016).

2.4 NEUROPSYCHOLOGICAL ASSESSMENT IN A HOSPITAL CONTEXT

Psychological assessment is a fundamental tool for the investigation of cognitive and emotional development, especially in the pediatric context, where playful strategies and caregivers' reports are often incorporated into the assessment process (Hutz, 2016). In the field of neuropsychology, the use of standardized instruments allows the identification of possible alterations in cognitive functioning, contributing to the differential diagnosis, clinical follow-up, and the planning of therapeutic and educational interventions.

Among the instruments widely used for children's cognitive assessment, the Wechsler Intelligence Scale for Children, fourth edition (WISC-IV), considered the gold standard in the measurement of the Total Intelligence Quotient (IQ) and specific cognitive indices, stands out. The instrument is applicable to children and adolescents aged between 6 and 16 years (Wechsler, 2013). It consists of fifteen subtests distributed in four factor indexes: the Verbal Comprehension Index (LCI), which evaluates reasoning, comprehension and verbal conceptualization; the Perceptual Organization Index (POI), which measures visual perception, simultaneous processing and visuomotor coordination; the Working Memory Index (IMO), which investigates attention, concentration and working memory; and the Processing Speed Index

(PVI), which assesses mental agility and graphomotor processing (Wechsler, 2013). The application of the WISC-IV is indicated in psychoeducational, clinical, and neuropsychological contexts, contributing to the diagnosis of neurodevelopmental disorders, giftedness, intellectual disability, and other conditions that affect cognitive functioning.

Table 1

Indices and subtests of the Wechsler Intelligence Scale for Children (WISC-IV)

Table of Contents	Subtests	Skills assessed
Verbal Comprehension (LCI)		
	Similarities	Verbal reasoning and abstract concept formation
	Vocabulary	Word knowledge and concept formation
	Comprehension	Verbal knowledge and ability to express yourself
Perceptual Organization (IOP)		
	Cubes	Visual perception, organization and motor coordination
	Figurative Concepts	Level of abstraction and reasoning ability
	Matrix Reasoning	Abstract reasoning and visual processing
Working Memory (IMO)		
	Digits	Memory, attention, Auditory Processing and Coding
	Sequence of Numbers and Letters	Sequencing, mental agility, memory, and attention
	Arithmetic	Mental agility, concentration, attention and memory
Processing Speed (IVP)		
	Code	Speed, memory, learning, and visual perception
	Search Symbol	Memory and visual/motor coordination, flexibility and concentration

Note. LCI = Verbal Comprehension Index; IOP = Perceptual Organization Index; IMO = Working Memory Index; IVP = Processing Speed Index.

In the pediatric oncology context, the use of standardized neuropsychological instruments becomes even more relevant in view of the potential impacts of treatment on development. The longitudinal application of WISC-IV throughout the different phases of chemotherapy treatment enables continuous monitoring of cognitive functions, allowing the identification of intra-individual variations that could go unnoticed in punctual evaluations (Martínez-Triana et al., 2013).

Despite advances in the area, the literature still has gaps regarding the longitudinal assessment of cognitive development during chemotherapy treatment, especially in Brazilian and regional contexts. In this sense, studies that systematically monitor the cognitive functioning of children with ALL throughout the therapeutic phases contribute to the expansion of knowledge about neurodevelopment in this population and for the strengthening of more integrated and humanized clinical practices.

3 METHODOLOGY

The methodology of an article outlines the procedures employed to conduct the research, including the type of study, sample selection, methods of data collection and analysis, ethical considerations, and limitations of the study. Its detailed and transparent description is essential to ensure the replicability and reliability of the results, in addition to providing a solid basis for the interpretation and generalization of the findings.

This is a prospective longitudinal study, carried out with pediatric patients diagnosed with Acute Lymphoblastic Leukemia (ALL), treated at the Hospital Foundation of Hematology and Hemotherapy of Amazonas (HEMOAM), a reference unit in oncohematology in the Northern Region of Brazil. The longitudinal design allowed the monitoring of the cognitive development of the participants throughout different phases of chemotherapy treatment, enabling the analysis of intra-individual variations over time.

As for sampling, it was carried out by convenience, consisting of spontaneous demand from pediatric patients with ALL treated at the HEMOAM Foundation from June 2021 to July 2022. Newly diagnosed patients with ALL, literate, aged between 6 and 16 years, of both sexes, were included.

The following non-inclusion criteria were adopted: previous history of psychological counseling; previously established psychiatric diagnosis; history of developmental deficit prior to the diagnosis of ALL; and motor or visual impairment that made the application of the instruments unfeasible. Participants who died during the evaluation period or who chose to withdraw from participation during the follow-up period were excluded from the study.

During the collection period, which coincided with the COVID-19 pandemic, 30 patients were admitted, of which 12 met the eligibility criteria. Of this total, 6 were included in the final sample, 5 were excluded due to impairments resulting from the disease and difficulties in adhering to treatment, and 1 died during the follow-up period.

The Sociodemographic Questionnaire and the Wechsler Intelligence Scale for Children - fourth edition (WISC-IV) were used as instruments for data collection. The Sociodemographic

Questionnaire is an instrument for collecting data on the patient's life history, covering socioeconomic, cultural, family and clinical aspects, including gender, age, education, place of birth, family income, health conditions and history of the current disease. The Wechsler Intelligence Scale for Children fourth edition (WISC-IV) is a psychometric instrument gold standard for individual cognitive assessment of children and adolescents between 6 and 16 years of age. Composed of fifteen subtests, ten main and five supplementary, the instrument measures the Total Intelligence Quotient (QIT) and four factor indexes: Verbal Comprehension Index (LCI), which evaluates reasoning, comprehension and verbal conceptualization; Perceptual Organization Index (POI), which measures visual perception, simultaneous processing, and visuomotor coordination; Working Memory Index (IMO), which investigates attention, concentration, and working memory; and Processing Speed Index (PVI), which evaluates mental agility and graphomotor processing. The application occurs individually and lasts approximately two hours, and can be divided into two sessions according to the patient's demand (Wechsler, 2013).

Data collection occurred at three different times, according to the therapeutic protocol adopted by the psychological team: Day 0, Day 2 and 3, Day 35 and Day 84. On Day 0 (D0), corresponding to the beginning of treatment, the following were performed: the application of the Sociodemographic Questionnaire with the parents and/or guardians; the presentation and signature of the Informed Consent Form (ICF) by the legal guardians; and, for adolescents, the presentation of the Illustrated Free and Informed Consent Form (TALE). On Days 2 and 3 (D~2 and D~3), the first application of WISC-IV was performed, conducted individually with the child or adolescent, during the hospitalization period to induce remission.

On Day 35 (D35), corresponding to the period after the remission induction phase, the second application of the WISC-IV was performed, with the objective of assessing the participant's cognitive development throughout the treatment. On Day 84 (D84), corresponding to the consolidation phase of the remission, the third and final application of the WISC-IV was performed; and the application of the Children's Hospitalization Deck, with the objective of investigating the emotional and behavioral state of the participant throughout the hospitalization process. Cases that, throughout the evaluations, presented indications of the need for individualized clinical follow-up were referred for routine care in the Psychology sector of the HEMOAM Foundation.

The collected data were analyzed using descriptive statistics, which summarize the central characteristics and variability of the participants' cognitive performance. To correct the WISC-IV, the raw scores obtained in each subtest were transformed into weighted scores, using

the tables by age group available in the instrument's technical manual. The weighted scores were added to calculate the Total Intelligence Quotient (IQ) and the four factor indices (ICV, IOP, IMO and PVI). The scores obtained in the three assessments (D0, D35 and D84) were compared longitudinally, allowing the analysis of variations in the cognitive performance of each participant throughout the treatment.

The study was approved by the Research Ethics Committee (REC) of the Hospital Foundation of Hematology and Hemotherapy of Amazonas (HEMOAM), under opinion number 4,632,733 and CAEE 44844521.1.0000.0009, following the ethical principles established by Resolution 466/12 of the National Health Council, which regulates research carried out with human beings. Participation was voluntary, with the possibility of withdrawing at any time without prejudice to treatment. The identity of the participants was kept confidential at all stages of the research.

4 RESULTS AND DISCUSSIONS

The following results present the characterization of the sample and the analysis of the cognitive performance of the participants throughout the three evaluation moments, considering the Total Intelligence Quotient and their respective factor indexes. Data exposure was performed using descriptive statistics, seeking to highlight patterns, variations, and trends observed throughout the longitudinal follow-up. Despite the variations identified, inferential analyses were not performed due to the small sample size.

The initial sample consisted of 12 participants; However, due to one death and the exclusion of five children due to clinical complications and low adherence to treatment, the final sample consisted of six participants. The children were aged between 7 and 10 years, predominantly male, all diagnosed with Acute Lymphoblastic Leukemia and undergoing chemotherapy follow-up in different phases of treatment.

The cognitive assessment was performed longitudinally at three different moments: beginning of treatment (D0), intermediate phase (D35 – corresponding to the third chemotherapy block) and later phase (D84 – fourth block). This structure allowed us to observe not only the punctual cognitive performance, but above all its variations throughout the treatment.

The analysis of the Total Intelligence Quotient (ITQ) showed that most participants maintained their performance within the average range (90–109), although with oscillations throughout the assessments. A recurrent pattern identified in the longitudinal graphs was the

presence of a drop in performance in the second assessment (D35), followed, in some cases, by partial or total recovery in the third assessment (D84).

Figure 1

Longitudinal trajectory of the Total Intelligence Quotient (IQ) at the three evaluation moments (D0, D35 and D84) per participant

Note. D0 = start of treatment; D35 = third chemotherapy block; D84 = fourth chemotherapy block. The shaded band represents the average rating (IQ 90-109).

For example, in case 3, the IQ showed a slight decline between the first (99) and the second assessment (98), followed by an increase in the third (105), indicating a recovery that even exceeds the initial performance. Similarly, case 4 showed a slight increase in the second assessment (94 → 96), later returning to the initial level (94), configuring global stability with intermediate variation.

In contrast, case 5 showed a pattern of progressive decline (110 → 105 → 98), suggesting a greater cumulative impact of treatment on cognitive functioning. On the other hand, case 2 stood out for a consistently high performance, with an upward trajectory (131 → 137 → 138), remaining in the "much higher" rating range throughout the follow-up.

Overall, the QIT charts indicate that there is no single linear trend, but rather differentiated patterns: stability, post-fall recovery, continued growth, and progressive decline. Still, the most frequent trend suggests transient impacts associated with the most intense phases of chemotherapy.

The analysis of the WISC-IV factor indices allowed us to identify with greater precision which cognitive functions were more sensitive to variations throughout the treatment. The first index is the Verbal Comprehension Index (LCI).

The LCI showed relative stability in most cases, with performance predominantly in the middle or upper middle range. In some participants, improvement was observed over time, as in case 2, which evolved from a higher level to a much higher level. In other cases, such as case 4, there was maintenance with a slight increase only in the final evaluation. In general, the LCI was less susceptible to abrupt fluctuations.

The second, Perceptual Organization Index (POI), showed moderate variations, with a tendency to stability around the mean. However, some cases showed more marked oscillations, especially in the second evaluation. In case 3, for example, there was an increase in performance from the first to the second evaluation, followed by a new increase in the third. In case 5, on the other hand, a progressive decline was observed, following the pattern of IQ.

The third, Operating Memory Index (IMO), the working memory showed a more unstable behavior. In some cases, such as case 3, there was a decline in the second evaluation, followed by partial recovery. In case 4, the BMI started at an upper average level and showed a decrease throughout the evaluations, reaching average levels in the third application. This pattern suggests greater sensitivity of working memory to clinical conditions and treatment wear.

The fourth and last, Processing Speed Index (PVI), was the one that presented the greatest variability and the highest number of lower performances. In several cases, a sharp decrease was observed in the second evaluation, as in case 3 (86 → 68), followed by a significant recovery in the third (103). In case 4, the index also showed a strong intermediate drop, with a subsequent increase. This behavior, visible in the graphs, indicates that the processing speed is particularly vulnerable to the most intense phases of treatment, but also has potential for recovery.

An integrated reading of the results of this study allows us to identify recurrent patterns. The first is the transitory effect of chemotherapy, where, from the second assessment (D35) onwards, the main drops in performance were concentrated, suggesting a direct impact of the more intense phases of treatment on specific cognitive functions. The second pattern is subsequent recovery, since, in a significant part of the cases, the third evaluation (D84) indicated total or partial recovery, especially in indices such as processing speed and working memory.

The third pattern is the heterogeneity of cognitive profiles. The participants presented different trajectories, showing that the effects of the treatment are not uniform. While some

demonstrated cognitive resilience, others showed greater vulnerability. In addition, the preservation of global functioning was achieved, since despite the oscillations, the IQ remained, in most cases, within the mean range, indicating the absence of severe global cognitive impairment throughout the analyzed period. Finally, differential sensitivity between cognitive functions, such as processing speed and working memory, were more susceptible to variations, while verbal comprehension showed greater stability.

The results show that chemotherapy treatment is associated with cognitive oscillations over time, especially at times of greater therapeutic intensity. Such oscillations do not, in most cases, constitute a permanent cognitive decline, but rather dynamic and, to a large extent, reversible variations.

The longitudinal analysis allows us to understand the cognitive functioning of these children not as a fixed state, but as a process in flux, crossed by clinical, physical and contextual conditions. In this sense, the data reinforce the importance of continuous psychological follow-up, capable of capturing these variations and guiding interventions that are more sensitive to the temporalities of treatment.

The results obtained through the WISC-IV indicate a global cognitive functioning characterized by relative stability associated with oscillations throughout chemotherapy treatment. The Total Intelligence Quotient (ITQ) remained predominantly in the middle range (90–109), suggesting preservation of global intellectual functioning. However, a decrease was observed in the second evaluation (D35), corresponding to the beginning of the third chemotherapy block, indicating a possible impact of the more intense phases of treatment. This nonlinear pattern, with intermediate decline and subsequent recovery in some cases, suggests that the cognitive effects of treatment are dynamic and potentially reversible, influenced by clinical and contextual factors.

Among the factor indexes, the Processing Speed Index (PVI) was the most sensitive to variations, presenting greater instability. The results indicate fragility in skills related to mental agility, attention and visual-motor coordination, essential functions for processes such as reading, writing and learning. This finding points to greater vulnerability of cognitive functions that require speed and simultaneous processing of information.

In the other indices: Verbal Comprehension (LCI), Perceptual Organization (POI) and Working Memory (IMO), there was a predominance of performance in the mean, with more homogeneous variations. Even so, working memory showed oscillations in some cases, suggesting an impact on functions such as attention and information manipulation in the short term.

The individual analysis showed heterogeneity in the cognitive trajectories, with cases of stability, recovery and decline. The presence of a participant with a much higher performance stands out, contrasting with others who are more vulnerable, which reinforces the influence of individual factors, such as clinical conditions, sociocultural context and previous cognitive repertoire.

In relation to the literature, the findings partially diverge from studies that indicate significant impairments in verbal skills, since, in this study, the LCI remained mostly at the average. On the other hand, the results converge with evidence indicating that greater impairment in functions such as processing speed and working memory, especially during more intense phases of treatment.

In addition, studies suggest that variables such as age and therapeutic intensity influence cognitive performance. The data presented here corroborate this perspective by showing a greater impact in the intermediate phase of treatment, as well as oscillations in working memory. Thus, although chemotherapy is essential for disease remission, its effects can have repercussions on cognitive functioning, especially on specific functions. Still, the presence of recovery in later evaluations points to the role of neuroplasticity as a protective factor.

Finally, the need for continuous monitoring and early interventions is highlighted, aiming to minimize possible damage and favor cognitive development. The scarcity of longitudinal studies in the Brazilian context is also highlighted, indicating the importance of further research in the area.

5 CONCLUSION

The findings of this study highlight the relevance of psychological follow-up in the pediatric hospital context, especially during chemotherapy treatment, a period marked by significant physical, cognitive, and adaptive demands. Although the participants' overall cognitive performance was mostly within the average, oscillations in specific functions were identified, indicating the importance of continuous monitoring throughout the treatment.

In this sense, the potential of interventions based on playful and occupational activities as support strategies is highlighted, not only for coping with hospitalization, but also as resources that favor cognitive stimulation and psychological well-being. Play, as a structuring practice in child development, is a relevant tool in the promotion of new forms of engagement, interaction and adaptation to the hospital context.

Another central aspect refers to the continuity of the school bond, understood as a fundamental space for cognitive stimulation, socialization and development. The maintenance

of educational practices during treatment can contribute to the preservation of cognitive skills and the construction of new learning, minimizing possible impacts resulting from the withdrawal from the school routine.

Regarding the instruments used, the application of the WISC-IV proved to be relevant for the identification of possible alterations in cognitive functioning. However, its use has limitations, especially with regard to the participants' need for literacy, a factor that partially restricted its applicability in the investigated sample.

Although the literature points to possible cognitive impairments associated with chemotherapy treatment, there are still gaps in the prediction of long-term effects, especially in pediatric populations. Thus, the results presented here reinforce the need for longitudinal investigations that deepen the understanding of these alterations.

The findings of this study point to a promising direction of future research. Considering that processing speed and working memory were the most sensitive cognitive functions in the most intense phases of chemotherapy, a relevant question arises: could children who underwent these treatment protocols present, in adulthood, persistent cognitive deficits? Long-term longitudinal studies would be essential to investigate whether adult survivors of ALL in childhood manifest attentional difficulties, learning difficulties or other cognitive dysfunctions resulting from the cumulative effects of chemotherapy treatment on the developing central nervous system. This is an important scientific gap, especially in the Brazilian context, where research that follows these individuals from childhood to adulthood is still scarce.

Finally, it is emphasized that this study, as it is a convenience and exploratory sample, does not intend to exhaust the theme, but to contribute to the advancement of discussions about the integration between cancer care and mental health. Thus, it is pointed out the importance of developing interdisciplinary practices, such as music therapy, art therapy and playful interventions, which can be incorporated into the treatment, with a view to promoting the quality of life and integral development of children in an oncological context.

ABSTRACT

Introduction: Constipation is a common problem in the general population around the world, Pelvic physiotherapy is of great importance in the treatment of pelvic floor dysfunctions and in the case of intestinal constipation, it is believed that the addition of electrical stimulation using interferential current in the treatment may improve colonic transit, facilitating the elimination of feces.

Objective: To analyze the effectiveness of interferential current for the treatment of constipation in women.

Methods: Study quasi-experimental, descriptive and cross-sectional study. The following questionnaires were used: sociodemographic; Constipational Scoring System; Bristol Stool Scale and Perceived Change Scale (PME).

Results: The sample is made up of women aged between 18 and 27 years and single. With 16,7% showed a change in score on the Bristol scale, changing from Type 2 - (Constipation) for Type 4- (Healthy Stools). Regarding the Constipation Scoring System scale, it was observed that the patients did not show relevant statistical improvement. A small reduction was seen on the constipation scale of 10 ± 3 . an improvement was observed in aspects such as mood, ability to withstand difficult situations, sleep, leisure activities and self-esteem in 83.35% of patients, an aspect that directly impacts quality of life.

Final Considerations: In view of the above, it is observed that there was a small improvement in the ROME IV criteria, the Bristol stool scale and the Perceived Change Scale, however, the use of interferential current appears to be effective for the treatment of intestinal constipation. However, due to the small sample number, it was not possible to find statistical variables.

RESUMO

Introdução: A constipação intestinal constitui um problema frequente na população geral de todo o mundo, a fisioterapia pélvica tem grande importância no tratamento das disfunções do assoalho pélvico e no caso da constipação intestinal, acredita-se que a adição da estimulação elétrica utilizando a corrente interferencial no tratamento poderá melhorar o trânsito colônico, facilitando a eliminação das fezes.

Objetivo: Analisar a eficácia da corrente interferencial para o tratamento da constipação em mulheres.

Métodos: Estudo quase experimental, descritivo e de corte transversal. Foram utilizados os questionários: sociodemográfico; Constipacional Scoring System; Escala de fezes de Bristol e Escala de Mudança percebida (EMP).

Resultados: A amostra é composta por mulheres tendo entre 18 e 27 anos e solteiras. Tendo 16,7% apresentado mudança de pontuação na escala de Bristol se modificando de Tipo 2- (Constipação) para Tipo 4- (Fezes saudáveis). Com relação a escala Constipation Scoring System observou-se que as pacientes não apresentaram melhora estatística relevante. Sendo vista pequena redução na escala de constipação de 10 ± 3 , foi observado melhora em aspectos como humor, capacidade de suportar situações difíceis, sono, atividades de lazer e autoestima em 83,35% das pacientes, aspecto que impacta diretamente na qualidade de vida.

Considerações Finais: Diante do exposto, observa-se que houve pequena melhora nos critérios de ROMA IV, na escala de fezes de Bristol e na Escala de Mudança Percebida, portanto, o uso da corrente interferencial parece ser eficaz para o tratamento da constipação intestinal. Porém, devido ao pequeno número amostral não foi possível encontrar variáveis estatísticas.

Palavras-chave: Corrente Interferencial. Constipação Intestinal. Mulheres.

RESUMEN

Introducción: El estreñimiento es un problema común en la población general en todo el mundo. La fisioterapia pélvica es de gran importancia en el tratamiento de las disfunciones del suelo pélvico y, en el caso del estreñimiento intestinal, se cree que la adición de estimulación eléctrica mediante corriente interferencial en el tratamiento puede mejorar el tránsito colónico, facilitando la eliminación de las heces.

Objetivo: Analizar la efectividad de la corriente interferencial para el tratamiento del estreñimiento en mujeres.

Métodos: Estudio cuasiexperimental, descriptivo y transversal. Se utilizaron los siguientes cuestionarios: sociodemográfico; Sistema de Puntuación de Estreñimiento; Escala de Heces de Bristol y Escala de Cambio Percibido (PME).

Resultados: La muestra está compuesta por mujeres de entre 18 y 27 años y solteras. Con un 16,7% mostró un cambio en la puntuación en la escala de Bristol, pasando del Tipo 2 (Estreñimiento) al Tipo 4 (Heces Saludables). Con respecto a la escala del Sistema de Puntuación de Estreñimiento, se observó que las pacientes no mostraron una mejora estadísticamente relevante. Se observó una pequeña reducción en la escala de estreñimiento de 10 ± 3 . Se observó una mejoría en aspectos como el estado de ánimo, la capacidad para

afrontar situaciones difíciles, el sueño, las actividades de ocio y la autoestima en el 83,35% de los pacientes, un aspecto que impacta directamente en la calidad de vida.

Consideraciones finales: En vista de lo anterior, se observa que hubo una pequeña mejoría en los criterios ROME IV, la escala de heces de Bristol y la Escala de Cambio Percibido; sin embargo, el uso de corriente interferencial parece ser eficaz para el tratamiento del estreñimiento intestinal. No obstante, debido al pequeño tamaño de la muestra, no fue posible encontrar variables estadísticas.

1 INTRODUCTION

Intestinal constipation is a frequent problem in the general population around the world, affecting both sexes and all age groups, being more frequent in women (Bharucha; Lacy, 2020). It is a symptomatology and not a specific pathology; however, it may indicate some manifestation of disease that requires investigation for its diagnosis and is characterized by difficulty in eliminating feces (Ortega *et al*, 2022).

It can generate discomfort and other disorders related to the patient's social, economic and psychological life (Bharucha, 2007). In most cases, constipation does not have its cause related to an anatomical disorder of the intestinal tract, the most common cause being the difficult passage of the fecal bolus on its way towards the anal canal. In this case, it is called primary constipation, caused by a food intake low in vegetable fiber and insufficient fluid intake (Silva *et al*, 2020).

Other factors may be associated with primary constipation, such as a sedentary lifestyle, psychological aspects such as anxiety, depression, the habit of postponing going to the bathroom, common in some work areas, and the side effects of some medications, contributing to alteration or worsening of intestinal functioning (Dias *et al*, 2023).

According to the pathophysiology, constipation can be divided into 3 categories: 1. Normal transit constipation, also called functional, is the most common form of presentation. Although the time for stool to pass through the colon is normal, the patient reports constipation, complaining of hardened stools or dissatisfaction with bowel movements. 2. Slow transit constipation that occurs due to alteration in the propulsion of feces through peristalsis 3. dysfunction of the evacuatory act or dyssynergic evacuation, which is an abdominopelvic incoordination, most commonly occurring in women who have infrequent evacuation, which can be up to once a week, commonly starting at puberty and having a wide variety of treatments including physiotherapy Sadler *et al*, 2022) (Pannemans *et al*, 2020).

Pelvic physiotherapy is of great importance in the treatment of pelvic floor dysfunctions and in the case of intestinal constipation, its therapeutic objective is to restore the function of the pelvic floor and abdominal muscles, stimulate the proprioception of the muscles, providing a contraction and relaxation in a coordinated and functional way, thus enabling a better function and quality of life for patients (Firmino, 2015). In this sense, this area of physical therapy, in relation to the approach to patients with intestinal constipation, still lacks studies, especially regarding the use of electrotherapy within the therapeutic conduct (Heemskerk *et al*, 2024) (Norton *et al*, 2023).

Interferential current (IC) is a transcutaneous nerve stimulation of medium-frequency alternating electrical currents with their amplitude modulated at low frequency for therapeutic purposes (Rampazo *et al*, 2023). In this context, it is believed that the addition of electrical stimulation using interferential current in the treatment may improve colonic transit, facilitating the elimination of feces through stimulation of the vagal sympathetic and parasympathetic nerves of the intestine. This therapy can bring beneficial effects in the sense of reestablishing good abdominopelvic coordination and thus positively interfering with the main characteristics of dyssynergic-type constipation (Samhan, 2020). In view of the above, the present study aimed to verify the efficacy of the use of interferential current in constipated women.

2 MATERIALS AND METHOD

The present study is linked to the Catholic University of Pernambuco (UNICAP), the School of Health and Life Sciences and the Physical Therapy course at UNICAP. It is an integral part of the research project entitled "Physiotherapeutic approaches in Anorectal Dysfunctions in Adults and the Elderly" under the coordination of SILVANA MARIA MACEDO UCHÔA, approved by the ethics and research committee in human beings, with the opinion number 3.049.749 and CAAE: 03239318.1.000.5206 and belonging to the Evidence-based Physiotherapy group being developed at the Corpore Sano Physiotherapy and Occupational Therapy Laboratory.

This is a quasi-experimental, descriptive and cross-sectional study, being carried out through questionnaires applied to volunteers with intestinal constipation. The sample consisted of 6 individuals. The data collection period took place from September 2023 to June 2024.

The inclusion criteria will be considered: adults in the age group of 18 to 40 years; have good cognitive function and are constipated according to the Rome IV criteria and the following exclusion criteria: Pregnant women; individuals who had gastrointestinal tract neoplasia; individuals with psychiatric disorders and individuals who are using laxative medication.

After reading and signing the Informed Consent Form (ICF), which contains clear and detailed information and the objectives of the research, the volunteers answered the following instruments: Sociodemographic questionnaire, containing questions about name, color, race, marital status, education, etc. The clinical diagnosis of constipation was based on the ROMA IV criteria for functional bowel disorders, which include the following items: fewer than three weekly bowel movements, evacuatory effort, sensation of incomplete evacuation, presence of hardened or fragmented stools, and need for manual maneuvers to facilitate bowel movements. Individuals who present at least two or more of these manifestations in at least 25% of bowel

movements in the last three months, starting at least six months before, were considered constipated (Drossman, 2016).

In addition, the Agachan questionnaire was used, consisting of questions related to bowel frequency, evacuatory effort, sensation of incomplete evacuation, abdominal pain, time to evacuate, evacuatory aid, attempts to evacuate within 24 hours, and how long it has been with constipation (Froehner *et al*, 2023). The Bristol Stool Scale was also used, which aims to identify the type of stool, and is composed of seven types: type I (small hard fragments), type II (sausage-shaped, but with lumps), type III (sausage-shaped, but with cracks on the surface), type IV (sausage-shaped, but soft and soft), type V (soft pieces, but sharp contours), type VI (pasty pieces with an ill-defined shape) and type VII (liquid, without pieces) (Martinez, 2012). Ending with a questionnaire of perceived change where it was evaluated in relation to different aspects of the patient's life such as: physical health, mood, ability to fulfill obligations, among others, being distributed into: worse than before, no change and better than before (Flag *et al*, 2011).

An IBRAMED electrostimulator with 4 channels was used, with the electrodes being placed in the regions, two abdominal (placed below the costal margin) and two paravertebral (placed between T9 and L2), producing two sinusoidal currents crossing the body and being previously greased with aqueous gel. The parameters used were as follows: 4 kHz, a beat frequency of 80-160 Hz and an intensity of at least 33 mA for 20 minutes (Chase *et al*, 2005). 10 treatment sessions were performed, once a week. Guidance was also given about the food component and its importance, and then the previously mentioned questionnaires were reapplied.

3 RESULTS

The present study would initially consist of 10 university students, however, over period 4 they gave up due to unavailability of time to continue the treatment, the study was composed of 6 university students aged between 18 and 27 years who were evaluated for the presence of constipation and appearance of feces, using the interferential current over 10 sessions, once a week. Regarding sociodemographic characteristics, it was observed that 50% (n=3) of the university students were aged between 23 and 27 years, 100% (n=6) were single and 100% (n=6) studied at a Higher Education Institution (HEI).

Table 1

Distribution of women according to sociodemographic characteristics

Sociodemographic characteristics	N	%
Age group		
18 to 22	3	50
23 to 27	3	50
Social class		
A (+15 SM)	0	0
B (5 to 15 MW)	2	33,3
C (3 to 5 MW)	2	33,3
D (1 to 3 MW)	1	16,7
E (up to 1 MW)	1	16,7
Marital status		
Single	100	6
Married	0	0

Source: Prepared by the authors.

Regarding the distribution of the university students regarding the questionnaire of constipation symptoms based on the criteria of Rome IV, the prevalence of two symptoms stands out: Defecatory effort in more than 25% of bowel movements 66.7% (n=4) and granulated or lumpy feces 66.7% (n=2). In addition, 50% (n=3) reported a decrease in the criteria for Rome IV.

It is noteworthy that, regarding the Bristol stool scale, it was found that the participants presented: Type 1 - Separate pieces hard like peanuts of 33.3% (n=2), Type 2 - Sausage shape but segmented 33.3% (n=2) and Type 3 - Sausage shapes with cracks on the surface: 33.3% (n=2). After reassessment, it was observed that 16.6% (n=1) had their scale modified, changing from Type 2 - constipational feces to Type 4 healthy feces.

Table 2

Distribution of women according to the Bristol scale

Bristol Scale	N before/after	% after
1 - Separate pieces hard as peanuts	2-1	16,7%
2- Sausage shape but segmented	2-2	33,3%
3- Sausage shapes with slits on the surface	2-2	-
4- Forms of sausage or snake smooth or soft	0-1	33,3%
5- Soft bits, but sharp outlines	-	-
6- Aerated bits, frayed contours	-	-
7- Aqueous without solid parts	-	-

Source: Prepared by the authors.

Regarding the *Constipation Scoring System*, after treatment, an increase in bowel frequency was reported by 83.3% (n=5) of the volunteers, a decrease in the frequency of

abdominal pain reported by 66.7% (n=4) and a decrease in the number of reports of situations with failures or failures to evacuate in the last 24 hours by 50%, as shown in Table 3.

Table 3

Distribution of women according to the Constipation Scoring System

Constipation Scoring System	N	% after
Frequency of bowel movements		
1-2 times every 1-2 days	2-4	66,7%
2 times a week	2-1	0
1 time a week	1-	-

In addition, on the Perceived Change Scale (EMP), 83.3% (n=5) of the volunteers reported improvement in mood, ability to endure difficult situations, personal problems, stability of emotions, self-confidence, appetite, sleep and leisure activities, in addition to variables such as ability to fulfill obligations, homework, interest in working, sexuality, energy and interest in life were reported as unchanged, and were shown in Table 4.

Table 4

Distribution of the university students according to the Perceived Change Scale (EMP)

Perceived Change Scale (EMP)			
Do you think the treatment helped you feel better? If yes how? If not, why?	Yes, along with the treatment I started to re-educate myself in eating and I noticed a lot of improvement and easier to evacuate		
	I went to the bathroom more often, consequently making me less bloated and with an improvement in mood		
	Yes, I have been going to the bathroom more often		
	Yes, in the first session at the end of the day I already felt like evacuating		
For each item below since you started treatment is ?	The treatment helped me with frequency and ease		
	I'm going to the bathroom more often with shorter breaks		
	Worse than before	No change	Better than before
Your personal problems	-	33.3% (n=2)	66.7% (n=4)
Your mood	-	16,7% (n=1)	83.3% (n=5)
The stability of your emotions	-	33.3% (n=2)	66.7% (n=4)
Your confidence in yourself	-	33.3% (n=2)	66.7% (n=4)
His interest in life	-	66.7% (n=4)	33.3% (n=2)
Your ability to endure difficult situations	-	50% (n=3)	50% (n=3)
Your appetite	-	33.3% (n=2)	66.7% (n=4)
Your energy	-	33.3% (n=2)	66.7% (n=4)
Your sleep	-	33.3% (n=2)	66.7% (n=4)
Your physical health	16.7% (n=1)	16.7% (n=1)	66.7% (n=4)
Your sexuality	-	100% (n=6)	-
Your coexistence with family and friends	16.7% (n=1)	16.7% (n=1)	66.7% (n=4)
Your coexistence with your friends	-	66.7% (n=4)	33.3% (n=2)
Your coexistence with other people	-	66.7% (n=4)	33.3% (n=2)

Your interest in working	-	50% (n=3)	50% (n=3)
Your leisure activities	-	16.7% (n=1)	83.3% (n=5)
Your homework assignments	-	83.3% (n=5)	16.7% (n=1)
Your ability to meet obligations		50% (n=3)	50% (n=3)
Finally, since you started treatment in general you are?	-	-	100% (n=6)

Source: Prepared by the authors.

Regarding the reapplication of the questionnaires, it was noted that after the treatment there was a small decrease in the *Constipation Scoring System* score of 10 ± 3 , in addition to a decrease in the number of Roma IV criteria marked by 33.3% (n=2) and no significant change in the Bristol scale. Due to the low sample size, it was not possible to find statistical relationships between the variables.

4 DISCUSSION

Regarding sociodemographic data, the present study showed that 50% of the participants were in the age group between 23 and 27 years. Not corroborating with Chase *et al* (2005) who in turn used the interferential current to treat resistant chronic constipation with children aged 7 to 16 years as a sample and with Samhan *et al* (2020) where ages ranged from 7 to 15 years, however, it was similar to the study by Moore *et al* (2020) and Queralto *et al* (2013) where both carried out their studies with individuals over 18 years of age.

Regarding the gender of the sample, Vitton *et al* (2023) obtained about 94.8% of the participants being female, which was assimilated by Moore *et al* (2020), who carried out a randomized clinical trial using the interferential current in a 100% female sample composed of 17 women, which is in line with this study.

As observed in the study by Samhan *et al* (2020), which used the interferential current in the treatment of children with dyssynergic-type constipation, the initial evaluation did not show significant short-term differences in relation to the frequency of fecal incontinence per week and the type of stool assessed by the Bristol scale, which corroborated the present study so that this scale did not present a statistically significant difference, with 16.7% (n=1) having a score of 2 (constipational feces) before and type 4 (healthy feces) after treatment, which indicates an improvement.

In view of the study by Queralto *et al* (2020) it was shown that after applying the interferential current at home for one hour a day for 3 months, patients improved significantly in all scores. Prior to stimulation, most had an average number of stools per week of 0.33 or 0.66, and the highest post-stimulation frequency was 1.66 stools per week, indicating improvement in the criteria for ROMA IV. Similar to the study by Yang *et al* (2017), that after the intervention the average number of bowel movements per week improved from 3.7 to 5.6 in the treatment arm, but not in the placebo group that did not use the interferential current. Corroborating this study where 33.3% reported improvement in the frequency of bowel movements per week, decreased excessive voluntary fecal retention, and painful defecation.

Regarding electrotherapy, Yin *et al* (2023) showed that high-frequency stimulation being administered transabdominally from two different angles at the point converge, so that the stimulation currents interfere with each other, generating stimulation at a differential frequency, thus allowing the stimulation current to penetrate through the abdominal wall to reach the target organ and producing therapeutic effects. Thus, as suggested by Chen *et al* (2023), electrical stimulation during interferential current can activate the vagal sympathetic and parasympathetic nerves of the bowel, but is unlikely to directly stimulate the pelvic floor and external anal sphincter. However, there is still a lack of scientific articles on the efficacy of interferential current, especially double-blind randomized clinical trials with a large sample size, as reported by Moore *et al* (2018).

The findings of the present study corroborate what was found in Chase *et al* (2005) and the study carried out with eight children, which demonstrated that the frequency of defecations increased by 62.5% after treatment with interferential current, also similar to the studies of Clark *et al* (2009) who used interferential current for the treatment of slow transit intestinal constipation where after the use of interferential current in the group Control (n=22) colonic transit was significantly faster than those who received placebo (n=8), however, both studies disagree with the double-blind randomized multicenter trial by Vitton *et al* (2023) which stated that they did not observe significant changes in constipation, but rather in terms of quality of life.

According to Vitton *et al* (2023), quality of life is the most reflective perceived improvement in constipation symptoms and in this study with 160 individuals it was noted that satisfaction in the control group reached the average score on the PAC-QOL (Patient Assessment of Constipation Quality of Life) of 2.75 against 2.50 in the group that received placebo. In the present study, the perception of improvement aspect was assessed by the Perceived Change Scale (EMP), cross-culturally validated by Gentil (2023) so that it was

reported by 83.3% (n=5) of the patients that there was an improvement in mood, in the ability to withstand difficult decisions and improvement resulting from the treatment in general.

In addition to the fact that 83.3% (n=5) reported improvement after treatment in aspects such as personal problems, stability of emotions, appetite, sleep, and leisure activities, this situation was also observed in the study by Zhu *et al* (2018)²⁶ where, after treatment with electrotherapy in cancer patients with intestinal constipation, a significant improvement in quality of life equal to 29.83 ± 6.64 was observed. As well as, in Gokce (2020) who used electrotherapy for 30 minutes 3 times a week over 6 weeks, where a report of subjective improvement was reported in 50% (n=18) of the patients, which agreed with the present study.

Regarding the biopsychosocial model, Lee *et al* (2017) stated that psychosocial factors such as psychological state, characteristics of the individual and stress in life also affect intestinal physiology, compromising the secretory function and mucosal barrier through the alteration of the efferent autonomic nervous system and the stress hormonal system. Therefore, as reported by Gentil *et al* (2023) and Scott *et al* (2021), psychological aspects are of great importance in the treatment of constipation, as well as changes in diet, physical activity, and use of medications, which requires multiprofessional and individualized action.

5 FINAL CONSIDERATIONS

In view of the above, it was possible to observe that the sample is composed of young women, aged between 18 and 27 years, single, and of economic class from B to E. Regarding the criteria for ROMA IV, it was reported that 33.3% of the volunteers had a decrease in the criteria regarding the symptoms of frequency of small bowel movements per week, excessive voluntary fecal retention, and painful defecation. 16.7% had a change in score on the Bristol scale, changing from Type 2- (Constipation) to Type 4- (Healthy stools).

Regarding the Constipation Scoring System scale, it was observed that the patients did not show statistically relevant improvement. A small reduction in the constipation scale of 10 ± 3 was observed. However, improvement in psychological aspects such as mood, ability to withstand difficult situations, sleep, and self-esteem was observed in 83.35% of the patients, an aspect that directly impacts quality of life and is intrinsically related to comorbidity due to the brain-gut model.

The small sample size made it impossible to make any statistical correlations between the groups evaluated, requiring greater scientific production on the subject, which lacks specific studies focusing on the standardization of the application of the method, with a large sample size, in addition to awareness about the lifestyle with continuous and multidisciplinary treatment.

ABSTRACT

Disasters caused by extreme weather events resulting from climate change tend to increase, thus response structures must adequately prepare to develop risk reduction and event response actions. However, studies that analyze the Brazilian reality show that civil defense structures still have many deficiencies. The Courts of Audit are external audit institutions responsible for auditing accounts prior to the analysis by the Legislative branch. The evaluation format of these courts has evolved towards more qualitative analysis, which can induce the adoption of public policies. The Court of Audit of Paraná implemented ProGov, which modifies the way municipal accounts are evaluated. This study analyzed the evaluation of the accounts of the municipalities in the Urban Core of Curitiba on the Civil Defense theme, based on the parameters of the Court of Audit questionnaire, considering the Sendai Framework and the National Policy for Protection and Civil Defense. It was identified that the municipalities have significant shortcomings in aspects related to planning, information and systems. Deficiencies in the institutional structure were also identified. It was concluded that the evaluation model used by ProGov, which applies many of the requirements of the national and international norms, is able to influence positively in the improvement of the protection and civil defense public policies.

adoção de políticas públicas. O Tribunal de Contas do Paraná implementou o ProGov, que modifica a forma de avaliação das contas municipais. Este estudo analisou a avaliação das contas dos municípios do Núcleo Urbano de Curitiba para a temática de Defesa Civil a partir dos parâmetros presentes no questionário do Tribunal de Contas, levando em consideração o Marco de Sendai e a Política Nacional de Proteção e Defesa Civil. Identificou-se que os municípios possuem grandes defasagens em quesitos relacionados ao planejamento e às informações e sistemas. Deficiências na estrutura institucional também foram identificadas. Concluiu-se que o modelo de avaliação do ProGov, que incorpora vários requisitos das normativas nacional e internacional, possui a capacidade de influenciar positivamente na melhoria das políticas públicas de proteção e defesa civil.

RESUMEN

Los desastres causados por eventos extremos derivados del cambio climático tienden a incrementarse, por lo que las estructuras de respuesta deben prepararse adecuadamente para desarrollar acciones de reducción de riesgos y respuesta ante eventos. Sin embargo, estudios que analizan la realidad brasileña muestran que las estructuras de defensa civil aún presentan muchas deficiencias. Los Tribunales de Cuentas son órganos de control externo responsables de auditar las cuentas antes de la revisión legislativa. El proceso de evaluación de estos tribunales ha evolucionado hacia formatos más cualitativos, que pueden inducir la adopción de políticas públicas. El Tribunal de Cuentas de Paraná implementó ProGov, que modifica la forma en que se evalúan las cuentas municipales. Este estudio analizó la evaluación de las cuentas de los municipios del Núcleo Urbano de Curitiba en materia de Defensa Civil, con base en los parámetros presentes en el cuestionario del Tribunal de Cuentas, tomando en consideración el Marco de Sendai y la Política Nacional de Protección y Defensa Civil. Se identificó que los municipios presentan deficiencias significativas en aspectos relacionados con la planificación y los sistemas de información. También se identificaron deficiencias en la estructura institucional. Se concluyó que el modelo de evaluación ProGov, que incorpora varios requisitos de las regulaciones nacionales e internacionales, tiene la capacidad de influir positivamente en la mejora de las políticas públicas de protección y defensa civil.

1 INTRODUCTION

The most recent reports on climate change projections predict intense impacts on cities because of extreme weather events, with the potential to cause disasters (IPCC, 2023). The impacts of disasters around the world reinforce the concern about the adoption of more assertive actions to reduce risks. There were 358 disasters recorded in the world in 2025, which caused US\$ 224 billion in losses, with 110.2 million people affected and 16,607 deaths (UNDRR, 2026).

The evolution of the discussion on the topic of disaster risk reduction has been developed since the 1990s, with a repeated focus on institutional strengthening actions and a focus on identifying and acting on risks (UNDRR, 2015; Maly, Suppasri, 2020). One of the points reinforced by the Sendai Framework, the document that currently directs actions at the global level, is the governance between the various actors for the direction and enhancement of risk reduction actions (UNDRR, 2015).

In Brazil, the low institutional capacities of municipal civil defenses represent an obstacle to the development of more robust resilience actions (Brasil, 2021; Londe *et al.*, 2023; Marchezini *et al.*, 2025). This makes the development of institutional governance for disaster risk reduction a challenge at the local level.

The concern with municipal capacities for risk management culminated in the Elos project (Brasil, 2021) which sought to identify what the existing gaps were, and later in the ICM - Municipal Capacity Index, which seeks to index the level of development of municipal civil defenses based on objective indicators (Brasil, 2026). The actions are an attempt to present consolidated data on these capacities and to identify more accurately the gaps in local structures. The project identified major weaknesses, such as the lack of dedicated servers and the lack of structure for the development of the work. From this perspective, there is a need to strengthen the structures.

It must be taken into account that, despite the existence of legislation that establishes the guidelines at the national level, it is up to the municipalities to format their administrative structure to comply with these guidelines, and there are many differences between each of the federative entities. However, regardless of the format defined, it is necessary to comply with the obligations established by the legislation (Brasil, 2012; 2020).

The problem lies in the implementation of these guidelines, so that municipalities have a low development of civil defenses, even years after the legislation was established, which is related to structural problems and high turnover (Brasil, 2021; Marchezini *et al.*, 2025). There is a need for actions that induce more effective measures by municipal administrations. In this

sense, the control bodies have a central role in monitoring compliance with actions by the executive branch. According to the CRFB (Brasil, 1988), the Court of Auditors carries out the preliminary analysis and subsequently forwards it to the respective legislative branch for the approval of the executive's accounts. Therefore, they have a fundamental role in monitoring the effectiveness of public policies. Nevertheless, this effective monitoring depends on the inspection format adopted, which has led several courts to seek methodologies for a more qualitative analysis of public accounts (Ribeiro *et al.*, 2020; Schabbach; Garcia, 2021).

As of 2022, in Paraná, the State Court of Accounts (TCE) adopted a new methodology for evaluating accounts, moving beyond financial and accounting analysis to incorporate the analysis of the effectiveness of public policies. This was done by incorporating the effectiveness analysis with the division into nine areas of interest, for which municipalities must present documentation proving the basic elements necessary for the policies (TCE-PR, 2026a).

The study seeks to identify to what extent this new evaluation and inspection mechanism of the State Court of Auditors, as a control body, can contribute to greater efficiency in risk and disaster management actions at the municipal level, based on the analysis of the evaluation of the capacity of the civil defense agencies of the Urban Nucleus of Curitiba (NUC) measured from the new evaluation model of the TCE-PR, ProGov.

The hypothesis is that there are still significant deficits in the structures, and that the more detailed and qualitative evaluation of ProGov, based on legal parameters of the national and state policy of protection and civil defense, has a positive impact on the promotion of the improvement of risk and disaster management actions at the municipal level.

The research has the potential to contribute to the field considering the gap in academic research that deals with the external control of the courts of accounts in civil defense activities. In addition, the findings may provide other views on the work of external control in public administration.

2 EXTERNAL CONTROL BY THE COURTS OF AUDITORS

The performance of the control bodies is provided for in the Constitution of the Federative Republic of Brazil, of 1988, which establishes the list of attributions of the Federal Court of Accounts and provides for the institution of Courts in federal territories with more than 100 thousand inhabitants (Brasil, 1988). The Courts of Accounts, whether of the Union or of other territories, have a specific attribution to evaluate public accounts in order to subsidize the subsequent analysis of the Legislative Branch for approval. There is a mistake in considering the TCE as an auxiliary body of the Legislative Branch, because of the constitutional provision

that establishes the attribution of a prior opinion on the accounts prior to their approval by the legislative branch, since the courts enjoy autonomy and are not linked to the structure of that Branch (Moreira; Vieira, 2003).

The collection capacity and effectiveness of the TCE's activities is based on its intrinsic structure and power that guarantees the application of sanctions. The TCE counselors have the same guarantees as the magistrates, contributing to management autonomy (Moreira; Vieira, 2003). With this responsibility, the agencies are responsible for ensuring that public spending complies with current legislation, to ensure suitability, transparency and public interest.

The controller's autonomy is essential for the effectiveness of inspection and control, as is the provision of adequate and sufficient information by those who owe it and an adequate analysis of those who supervise, in order to allow objective accountability (Quintão; Carneiro, 2015), something that also contemplates horizontal *accountability*, such as the system of checks and balances of the bodies (Schabbach; Garcia, 2021). In this sense, it is necessary to have clear measurement mechanisms that allow a clear analysis of whether or not the requirements are met. It is emphasized that the main objective of public administration is the effectiveness of its services to the population, and that the adoption of more qualified mechanisms for analyzing the implementation of policies that does not depend only on financial and accounting requirements, but allows recognizing whether policies are directed to their primary purposes, is fundamental to exercise the role of external control that seeks to ensure the correct social allocation of available resources (Ribeiro *et al.*, 2020).

Quintão and Carneiro (2015) emphasize the importance of the instruments available for the accountability and *accountability* of public officials and those who exercise political power. However, despite the importance of mechanisms for the inspection and accountability of acts that are not in line with the provisions of the legal system, the authors warn that if there is no proper assessment and application of the sanctions provided, effectiveness is lost.

Although there is a direction of legal competence for evaluation, the evaluation format may vary according to the specific body. Therefore, it is important to consider the procedures of specific agencies. Teixeira (2020) assesses that there is a disparity in the interpretation of the Courts of Auditors, which is visible even in rules that have established interpretation guidelines, such as the Manual of Fiscal Statements, of the Ministry of Finance. However, even with the existing divergences, it is possible to identify common paths such as the search for a more qualified and preventive action (Ribeiro *et al.*, 2020; Schabbach; Garcia, 2021).

The Courts of Auditors have moved from an *a posteriori* control to a preventive and concomitant control, with a monitoring of resources beyond the simple analysis of the accounts

that aims to avoid the waste and misuse of public resources. The focus becomes, therefore, on the effectiveness and results of management, and not just accounting valuation (Ribeiro *et al.*, 2020), expanding the role of public policies by control bodies. The authors identify these characteristics from the COVID-19 pandemic, in which the extensive performance of interpreting the legal limits in consideration of the abnormal situation experienced at the time led to analysis models that were not strictly numerical, but contextualized and qualitative (Ribeiro *et al.*, 2020).

Schabbach and Garcia (2021), discuss the influence of the performance of the Public Prosecutor's Office (MP) and the Court of Auditors as motivators for compliance with educational legislation in Rio Grande do Sul. The authors analyze, contextualizing the evolution of educational legislation for children before school age, how the realization of a cooperation involving MP and TCE, the State Department of Education and the Association of Mayors contributed substantially to the creation of awareness and concern with the theme, fostering compliance with the policy related to early childhood education (Schabbach; Garcia, 2021). Seminars, audits and the production of statistics were carried out and sent to the municipalities so that they could adapt actions to serve children in early childhood education. It was from the technical and informational expertise and knowledge about local public policies that the control bodies were able to act as mediators and articulators for the execution of the PNE goal.

By playing a role of coordination and mediation between the agencies, the control bodies play the role of *fixer*, that is, the one who acts to "facilitate, veto, correct, persuade, arbitrate or bargain so that the execution of the policy proceeds without major problems" (Schabbach; Garcia, 2021, p. 135).

Likewise, the courts of auditors can adopt a proactive and socially responsible posture in the face of catastrophic events, moving from a posteriori inspection to a continuous and constant inspection during the event of the processes, as occurred in the COVID-19 Pandemic (Ribeiro *et al.*, 2020). But in addition, other measures can foster the development of local capacity in responding to disasters, as is the case of updating the methodology of ProGov, of the Court of Auditors of Paraná. ProGov is a system created for the monitoring of sectoral policies (TCE-PR, 2026a). It seeks to evaluate the level of implementation of public policies, going beyond financial and accounting analysis. The system is divided into 9 areas that bring together questions that are sent to the municipalities for response. For a requirement to be considered met, there is a need to insert documentation or other form of proof. Public policies are divided into different themes: education; health; social assistance; procurement and

contracts; financial administration; social security; transparency, control and relationship, and; environment.

The agency also holds events called "TCE Conecta" in different regions of the state of Paraná to explain and promote the actions to control public accounts to municipal entities, explaining this evaluation model (TCE, 2026b).

3 CIVIL PROTECTION AND DEFENSE STRUCTURES

Since the 1990s, with the Yokohama strategy, the aim has been to strengthen actions to reduce disaster risk in the world (Maly, Suppasri, 2020). Currently, the international guideline for addressing risks is the Sendai Framework (UNDRR, 2015), which defines priorities for action involving the ability to identify and map the existing risks in the municipality in order to invest in resilience actions, without disregarding the need to have the capacity to alert the population in a timely manner and respond adequately and quickly to disasters.

In Brazil, the role of establishing the guidelines fell to the National Policy for Civil Protection and Defense (PNPDEC), in 2012 (Brasil, 2012; 2020). Although prior to the Sendai Framework, the PNPDEC dialogues with the existing proposals in the international guideline, especially regarding the need for articulation between the different actors and the need for a transversal approach between policies, with a view to strengthening risk and disaster reduction actions. It defines competencies for the federative entities, detailing the scope according to the level of action. There are several attributions of competence of the municipalities, since the action of developing resilience takes place primarily at the local level. Municipal attributions range from mapping and monitoring existing risks, to monitoring and warning actions, in addition to preparing for intervention in the event of disasters. In addition, it is necessary for municipal employees to have the ability to carry out the procedures to declare an emergency situation, which allows them to request help from other entities. However, although the PNPDEC has been in force for thirteen years, there is still a very large gap between what the legislation provides for and what is done at the municipal level.

This situation is related to a deficit in the municipal capacity to deal with disaster risks, since the civil defense structure, which is responsible for coordinating these actions, is insufficient or even non-existent in some cases, as identified through the Elos project (Brasil, 2021; Marchezini *et al.*, 2023; Londe *et al.*, 2025). Deficiency in risk communication is another weakness identified (Londe *et al.*, 2025).

The deficiency covers both the structural level of the agencies, with insufficient and untrained personnel, and structural, in which there is a lack of basic items such as computers

or vehicles to carry out the work of verifying and mapping risks. Data from the Elos project (Brazil, 2021) show these gaps, based on the participation of 1,993 municipal civil defense agencies. Of these participants, 59% have only one or two civil servants responsible for civil defense. In addition, only 57% are municipal employees and 65% of civil defenses share physical space with another secretariat or agency. 67% of respondents do not have a vehicle and 72% do not have an exclusive landline for civil defense. This lack of institutional and physical structure prevents the full development of the municipality's activities and attributions, which involves risk mapping actions, inspections in risk locations, contingency planning and disaster response actions. In addition, 30% of them stated that they do not have a computer or notebook, showing a technological gap and a fragility that prevents even the registration of occurrences in the federal registration and recognition systems, which limits the arrival of resources to the municipalities.

Disasters are complex phenomena and there is a wide range of interlocations with other public policies, such as the environment, urbanization, social assistance, health and others. The creation of risks is also related to the dialogue with land use and occupation policies, urbanization and economy (Coutinho *et al.*, 2014; Cabral; Cândido, 2019). Therefore, there is a need for professionalization of civil protection and defense agents (Coutinho *et al.*, 2014; Marchezini *et al.*, 2025). The lack of an adequate structure for the development of activities that concern civil defense also makes it impossible for the complex articulation necessary for the development of more effective strategies to be applied.

Therefore, the structuring of municipal bodies is essential for the implementation of activities. Investment actions by the states help municipalities to strengthen the structure at the municipal level (Espírito Santo, 2022; Paraná, 2024; São Paulo, 2025). However, the deficit continues to exist, and there is a need for more consistent activities on the part of the municipalities.

4 METHODOLOGY

The exploratory research based on documentary analysis (Gil, 2025) aims to identify the capacity of the municipalities of the Urban Nucleus of Curitiba in the area of civil defense based on the results of the evaluation of the accounts of the municipalities carried out by the TCE.

The data of scores and responses for the municipalities that make up the NUC - Urban Nucleus of Curitiba were analyzed regarding the subtheme of Civil Defense, present in the environment theme of ProGov. The municipalities that make up the NUC are: Almirante Tamandaré, Araucária, Campina Grande do Sul, Campo Largo, Campo Magro, Colombo,

Curitiba, Fazenda Rio Grande, Itaperuçu, Pinhais, Piraquara, Quatro Barras, Rio Branco do Sul and São José dos Pinhais (Paraná, 2026).

Each item evaluated in the sub-theme is scored dialogically, receiving a score of 0 in case of non-compliance and receiving a score of 10 in case of compliance, always with the documentary validation of the information. Data for the year 2025, available on the TCE-PR website (2026), were evaluated, which refer to the evaluation carried out by the TCE-PR on the declaratory data by the municipalities. The data regarding the scores for the areas and questions were tabulated in Microsoft Excel, allowing the comparison of the information obtained.

After tabulating the data, comparisons were made between the information obtained, identifying the points of fragility and development in this region.

5 RESULTS AND DISCUSSION

The Urban Nucleus of Curitiba (NUC) is composed of 14 municipalities that, for the most part, border the municipality of Curitiba. The total population of the Center is 3,308,949 people, according to data available from the 2022 census carried out by the IBGE (2025).

The information on Civil Defense was integrated within the Environment theme within the report, which brings together information from the following sub-themes: environmental resource management, drainage and rainwater management, environmental urban planning, solid waste, climate change and civil defense. The scores are an average of the information provided, ranging from 0 to 10. Information regarding the Environment theme is only available from the year 2025, since they were only integrated from this reference year through Technical Note No. 34, of September 24, 2025.

It is noted that the focus of the evaluation is concentrated on structuring aspects and the existence of capacities, which contributes to the development of the municipal civil protection and defense agency. The requirements cover several points listed in national legislation and international framework, but which may eventually be expanded to cover other competencies such as interinstitutional governance. The evaluation focuses on key aspects in the development of civil protection and defense policies at the local level.

In addition to structural elements, there are elements in the evaluation that analyze the capacity in macro processes, such as the potential for organizing service actions (collection of donations, recovery plan and plan to reestablish essential services), which contribute to a faster and more effective response, in addition to transparency in actions, also demonstrating a focus on *the accountability* of public action.

When analyzing the score of the 14 municipalities of the NUC in the theme of "Environment", only 4 municipalities have scores above 5: Curitiba (7.63); Pinhais (7.64); Rio Branco do Sul (6.29), and; São José dos Pinhais (5.18). The scores allocated below five in the vast majority of municipalities demonstrate that the areas that make up the theme suffer great gaps in their public policies. Figure 1 below presents the scores in the Environment theme by municipality, making it possible to identify the low score in the theme, and that only two municipalities have scores above 7 points.

By opening up to the areas that make up the theme, the specific problems in each sub-theme begin to become more evident, demonstrating the fields in which fragility is greater. In the subtheme of Civil Defense, the main focus of this study, seven municipalities are above 5: São José dos Pinhais, Rio Branco do Sul, Campina Grande do Sul, Araucária, Curitiba, Piraquara and Fazenda Rio Grande. It should be noted, however, that most municipalities concentrate their scores between 4 and 6, indicating the existence of weaknesses in several municipalities, so that they did not achieve more robust scores. The municipalities of Colombo and Itaperuçu draw attention, the first with a score of 3.23 and the second with a score of zero. Itaperuçu did not score in any of the items, indicating that it does not have actions or that there was no answer to the questions related to the area in the questionnaire. Figure 2 presents the general scores of the Civil Defense subtheme for the municipalities of the NUC in descending order. By comparing both Figures, it is possible to verify that the scores in the Civil Defense theme are better scored, globally, than the Environment theme, indicating greater attention to the area. Nevertheless, the score in general is low, with three municipalities only above 7 points.

Figure 1

Evaluation regarding the theme of Environment in the municipalities of the NUC-RMC

Source: adapted by the author from TCE-PR (2025).

Figure 2

Evaluation regarding the sub-theme of Civil Defense in the municipalities of the NUC-RMC

Source: adapted by the author from TCE-PR (2025).

The score is indicated from a questionnaire that must be answered by the municipalities. In the sub-theme of civil defense, the questions focus on demand that seeks to assess the existence and quality of the institutional structure of Civil Defense in the municipality, the existence of planning in the area, the availability of physical structure and resources for the agency and the existence and management of data, information and alert system of civil defense. Therefore, it focuses on these issues, although there are other areas that could be encompassed from the relevant legislation.

From the scores in the questionnaires, it can be seen that there is a concentration of efforts in some areas, while in others there are gaps that do not affect only one municipality, but the whole itself. Regarding the existence of formal designation, most municipalities have such designation (12), however in four of them the designated civil servants do not exclusively serve civil defense. Another crucial point in the TCE-PR survey is the existence of a diagnosis that evaluates the need for the number of civil servants that would be necessary to work in the area, in a documented way. Only four municipalities had this data: Almirante Tamandaré; Campina Grande do Sul; Rio Branco do Sul; and São José dos Pinhais. In other words, essential data for adequate planning are not considered and, although the municipalities have designated teams, there is no consistency in the service capacity that these servers represent in the face of the need. It should be noted that institutional development is a requirement for the operationalization of the actions necessary for the development of the civil protection and defense policy, as it is the people destined to the development of the actions, as well as the integration with other areas of the city hall and society that allow the development of the

response capacity and the implementation of actions that develop resilience. The questionnaire requests that people be exclusively dedicated to civil defense, and that they have undergone training in the area of civil defense in the period analyzed, encouraging the structure to be not only existing, but also active and able to develop the actions necessary for the implementation of the national policy of protection and civil defense in their territories.

Other requirements are related to operational capacity. Although 13 municipalities have their contingency plans with the minimum requirements presented by law, only 6 evaluated the effectiveness during the year and only 4 make the information available on the municipal website. In addition, only 3 have actions to encourage volunteering in the municipality, indicating that the alignment of actions with other actors in society remains outside the planning for disaster response, which can harm the efficiency of the response. Conducting simulations is an essential task for evaluating the effectiveness of planning and allows the identification of planning failures, deficiencies in human and material resources, in addition to strengthening protocols with the people and institutions involved, also allowing to assess the completeness, applicability and flexibility of planning (Chen *et al.*, 2015; Shao *et al.*, 2025).

Other deficiencies are related to the ability of municipalities to establish damage assessment processes that combine the areas of essential services, as well as the processes necessary for the survey of damages and losses and the decree of emergency situations and other related processes, necessary for requesting resources from other federative entities, for example. This measure directly impacts the municipality's ability to reach resources from other federative entities, since the decree process has a specific rite and needs speed. It is this process that allows, for example, people within the affected area to use their FGTS, after the federal recognition of the emergency situation. The deficiency in this area limits the response to the emergency and the benefits to the most affected population.

Only 5 municipalities have their own alert systems, in addition to those made available by other federative entities) and only 4 carry out simulations to test these systems. Despite the implementation of the SMS and *Cell Broadcast alert system*, it is perceived that monitoring and alert are deficient, even in locations that have more institutional conditions and physical structure, indicating the need for improvement in systems for the rapid sending of information to the population.

Regarding the available physical structure, most municipalities have a place and vehicles for operation (12), showing a more robust reality than that evidenced at the national level by the Elos project (Brasil, 2021). In fact, with the exception of the municipality of Itaperuçu, which did not score in any of the items, the other thirteen municipalities have scores referring to the

structure above 5, and ten of them have scores above 7, indicating the existence of reasonable physical structure and equipment.

The results show the need to implement civil defense actions in the municipality in a more robust way, especially regarding information and alert systems. In addition, the existence of gaps in the institutional structure, such as the duplicity of activities or the lack of training, make the physical structure and available equipment less efficient. Direct actions in vulnerable communities are a deficiency in most municipalities, and it is necessary to develop capacities at the community level and invest in monitoring and follow-up capacity in risk areas.

6 FINAL CONSIDERATIONS

The Courts of Accounts are responsible for the analysis of municipal accounts, and their performance has been developed in order to carry out a qualitative analysis, which evaluates the efficiency of public policies under the responsibility of the entity evaluated. The ProGov tool of the TCE-PR is an example of the evolution of the evaluation formats of these courts. By implementing tools that cover more than accounting aspects and include questions that seek to assess the actual achievement of objectives, it is possible to induce the improvement of public policies.

By focusing on public policies related to Civil Defense evaluated through ProGov, the present study found that the tool covers structuring and basic aspects of civil protection and defense activities, such as its institutional format, capacity of its components, level of preparation to act in emergencies and availability of monitoring and alarm systems to protect the population. But even though they are fundamental, the municipalities showed great difficulty in achieving all or most of the requirements.

The study showed that the municipalities that make up the Urban Nucleus of Curitiba have important gaps in relation to the requirements listed by the ProGov evaluation. Even though there is a minimum physical structure and equipment for the activities, there are problems related to the institutional structure and the problems related to the planning of civil protection and defense actions, and actions related to the existence of specific data and alert systems, stand out. The lack of contingency plan assessments, more structured protocols for local recovery and administrative processes in cases of disasters, in addition to the lack of municipal alert systems are points that need to be developed by municipalities to improve the quality of care provided to the population.

By establishing the need to increase the score as a requirement for the regular evaluation of the accounts, there is a stimulus for the development of the evaluated aspects. Therefore,

ProGov is a tool with the potential to foster improvement in compliance with the national policy for civil protection and defense, considering that several items listed are provided for in this legislation.

In addition, it was possible to notice a convergence of the findings of the evaluation with the problems identified through the federal government's Elos project, especially those related to the allocation of the municipal structure, which demonstrates convergence and reinforces the appropriate direction of the evaluation in the sense of focusing on essential aspects for the improvement of the performance of municipal civil defenses.

It is concluded that there is a deficit in the capacity of the civil defenses of the municipalities that make up the Urban Nucleus of Curitiba and that the evaluation model has the potential to encourage the strengthening of municipal structures, essential for more efficient actions by the municipalities in the area of risk and disaster management, precisely because it establishes evaluation parameters that require progressive improvement in the score for the approval of public accounts. Such a contribution can help municipalities develop capacities that are aligned with the National Policy for Civil Protection and Defense and the Sendai Framework, in addition to developing local resilience.

This study has limitations related to the availability of the time series of ProGov evaluations for the Civil Defense theme, since the first evaluation took place in 2025. As new evaluations are released, new studies may deepen the results of the questionnaire's time sequence, gauging the rate of improvement.

ABSTRACT

A pregnant incarcerated woman navigates between the roles of "mother" and "criminal," the former referring to something natural, an exclusive role of women; the latter denoting something that transgresses what is established by law, a deviation from what is morally accepted and imposed. When pregnancy intersects with crime and, consequently, with incarceration, the woman's vulnerability becomes clear, making it necessary to have a more careful and cautious approach towards this mother, paying attention to her needs and specificities. Considering the increasing number of women in the Brazilian prison system, including pregnant women and new mothers (INFOPEN, 2018), it is extremely important that issues related to the health of pregnant women and their babies begin to be included, in a meticulous and concise manner, in public policies not only at the state level but also nationally. This article aims to discuss the custody situation and the challenges continuously faced by pregnant women in the Ananindeua Women's Custody and Reintegration Unit, which occur mainly due to the lack of assistance from public policies for these women and even for the unborn child. This is an empirical study, conducted in a prison unit, where it was possible to understand whether or not pregnant women are being protected in prison, revealing a possible lack of state assistance and violation of human rights towards female inmates.

é moralmente aceito e imposto pela. Quando a fase da gestação se cruza com o do crime e, consequentemente com o do cárcere, torna-se cristalino a vulnerabilidade da mulher, fazendo-se necessário a presença de um olhar mais cuidadoso e cauteloso para com essa mãe, atentando-se às suas necessidades e especificidades. Levando em conta o aumento do número de mulheres no contexto prisional brasileiro, sendo essas mulheres gestantes ou recém-mães (INFOPEN, 2018), é de extrema importância que as questões referentes à saúde da gestante e seu bebê comecem a fazer parte, de maneira minuciosa e concisa, das políticas públicas não só estaduais, mas nacionais. O presente artigo tem como objetivo discutir a situação de custódia e os desafios continuamente vividos pelas grávidas no cárcere na Unidade de Custódia e Reinserção Feminino de Ananindeua, que ocorrem, principalmente, pela falta de assistência das políticas públicas para com essas mulheres e, até mesmo, para com a criança que ainda vai nascer. Trata-se de uma pesquisa empírica, realizada em uma unidade prisional, onde foi possível compreender se a mulher gestante tem sido ou não protegida no cárcere, de maneira a revelar uma possível desassistência do Estado e a violação dos direitos humanos para com as apenadas.

RESUMEN

Una mujer embarazada encarcelada se debate entre los roles de "madre" y "criminal": el primero se refiere a algo natural, un rol exclusivo de la mujer; el segundo denota una transgresión de lo establecido por la ley, una desviación de lo moralmente aceptado e impuesto. Cuando el embarazo se cruza con el delito y, por consiguiente, con el encarcelamiento, la vulnerabilidad de la mujer se hace evidente, lo que exige un enfoque más cuidadoso y cauteloso hacia esta madre, prestando atención a sus necesidades y particularidades. Considerando el creciente número de mujeres en el sistema penitenciario brasileño, incluidas las embarazadas y las madres recientes (INFOPEN, 2018), es fundamental que las cuestiones relacionadas con la salud de las mujeres embarazadas y sus bebés comiencen a incorporarse, de manera minuciosa y concisa, en las políticas públicas, no solo a nivel estatal sino también nacional. Este artículo tiene como objetivo analizar la situación de custodia y los desafíos que enfrentan continuamente las mujeres embarazadas en la Unidad de Custodia y Reintegración de Mujeres de Ananindeua, los cuales se deben principalmente a la falta de apoyo de las políticas públicas para estas mujeres e incluso para el feto. Se trata de un estudio empírico, realizado en un centro penitenciario, donde fue posible comprender si las mujeres embarazadas están siendo protegidas o no en prisión, revelando una posible falta de asistencia estatal y una violación de los derechos humanos de las reclusas.

1 INTRODUCTION

The incarcerated woman, when pregnant, moves between the meanings of "mother" and "criminal," the former referring to something natural, a role and vocation exclusive to one who is a woman; the latter denoting something that transgresses what is set forth in law, a deviation from what is morally accepted and imposed by society with respect to the female sex.

The status traditionally assigned to women is that of mother, such that there are requirements considered to be at odds with the commission of a crime, whatever it may be. The exercise of sacrifice that motherhood produces differs, instantly, from life in prison, since her home and her child are placed within a prison, so that both are watched, taught, and disciplined through parameters that are often inadequate for the place to be called a family home, whether that child is in her womb or in her arms.

In the view of Gilles Deleuze:

it is a kind of ball of yarn or skein, a multilinear ensemble. It is composed of lines of different natures, and these lines of the apparatus do not encompass or delimit homogeneous systems on their own account (the object, the subject, language), but follow different directions, form processes that are always in disequilibrium, and these lines both approach and move away from one another. Each line is broken and subject to variations in direction (forked, bifurcated), subject to derivations. The visible objects, the formulable enunciations, the forces in exercise, the subjects in a given position, are like vectors or tensors. (DELEUZE, 1990, p. 155).

It is thus possible to perceive that the term "criminal" ends up absorbing the term "mother" when it comes to life in prison, much like the principle of *consumção* (consumption/absorption) [[nota: "Consumção" é princípio do Direito Penal brasileiro; mantido o termo original com tradução aproximada entre parênteses, por não haver equivalente exato consagrado em inglês]] belonging to Criminal Law. This occurs, above all, because of the absence of spaces in which the woman can be heard, since the commission of a crime, besides invalidating the term "mother," does not allow any defense for this woman who has long found herself jammed, choked, and limited, answering only what she is asked, and, if asked, being entirely delegitimized as a mother.

It is clear that in Brazil access to justice occurs in a precarious and unequal manner, especially when it comes to economically disadvantaged persons (*hipossuficientes*) [[nota: "hipossuficientes" é termo jurídico para quem não dispõe de recursos econômicos; mantido o original entre parênteses]]. It is no different for incarcerated mothers (whether pregnant or with their children in their arms), considering that these women are, for the most part, Black

and poor women, involved in crimes in an attempt to ensure their family's livelihood or to try to structure their homes.

Furthermore, many of the problems and difficulties that these mothers experience do not reach the State Public Defender's Offices (Defensorias Públicas Estaduais), which end up unable to be present within the prison unit, specifically within the Mother and Child Unit (UMI – unidade materno infantil), causing a lack of communication between the incarcerated woman and her defender, which, in the case of pregnant women, ends up harming the progress of the pregnancy, given that the lack of follow-up causes uncertainty about the real development of the child.

The objective of this article is nothing more than to dwell on the offcuts of feminist criminology and to discuss why legal-criminal discourses and practices bring to the surface the values and rights that incarcerated pregnant women possess but which, regrettably, are not safeguarded—these rights being disrespected day after day within a prison, and even outside it, taking into account the contempt of society (and even of the family) toward this woman who committed a criminal act and ends up being devalued as a mother.

2 THEORETICAL FRAMEWORK

2.1 THE INTERNATIONAL AND NATIONAL NORMATIVE STRUCTURE PROTECTING THE PREGNANT WOMAN IN PRISON

2.1.1 Protection in the Universal International Human Rights System

In a woman's life, the moment of pregnancy is one of the most important; it signifies, besides something peculiar and full of feelings, a moment that requires a series of cares for her health and the health of the baby.

When the stage of pregnancy intersects with that of crime and, consequently, with that of prison, the woman's vulnerability becomes crystal clear, making it necessary to have a more careful and cautious gaze toward this mother, attending to her needs and specificities. Considering the increase in the number of women in the Brazilian prison context, these being pregnant women or new mothers (INFOPEN, 2018), it is extremely important that issues concerning the health of the pregnant woman and her baby begin to form part, in a thorough and concise manner, of public policies that are not only state-level but national.

In the Brazilian political scenario, in the face of a setting of invisibility, the violence and neglect in which women in prison are inserted bring to the surface the importance of promoting reflections on the Brazilian female prison system, such that the principle of human dignity is established as fundamental—which, besides being a principle explicitly present in

the Federal Constitution of 1988, is one of the greatest, if not the greatest, pillar of human rights.

The Universal Declaration of Human Rights (1948) seeks, in an objective and concise manner, to outline a consecration of basic universal values, having enshrined human dignity as the founding value of the fundamental rights present in Article 5 of the Federal Constitution of 1988, which inspires the world legal order, since it effectively holds supreme value (SILVA, 2000), constituting an important structure for the organization of the State.

In this sense, in the face of the reconstruction of the legal world with the inclusion of human values (BARROSO, 2013, p. 18), Luís Roberto Barroso advances a positive interpretation of the norm, which was and is motivated by ethics:

[...] Human dignity was incorporated into the political discourse of the victors as one of the bases for a long and awaited era of peace, democracy, and the protection of human rights. Human dignity was then imported into legal discourse owing to two main factors. The first was the inclusion, in different international treaties and documents, as well as in various national constitutions, of textual references to human dignity. The second factor corresponds to a more subtle phenomenon, which became more visible over time: the rise of a post-positivist legal culture, which brought law closer again to morality and political philosophy, attenuating the radical separation imposed by pre-World War II positivism (BARROSO, 2013, p. 18-19).

Accordingly, the Federal Constitution of 1988 is nothing more than a mirror of the constant metamorphosis that accompanies the perspective of rights (PIOVESAN, 2013, p. 96). Nonetheless, it is still notable that Brazil lacks policies that would make the State act to protect the minority that, regrettably, has been forgotten day after day by society. Moreover, a punitive culture is currently experienced toward those who commit unlawful acts, especially pregnant women, revealing the social anomie so emphasized by the sociologist Émile Durkheim (*A Educação Moral* [Moral Education], 1902) [[nota: título da obra mantido no original (português) conforme citado, com tradução aproximada entre colchetes]], since there is a failure of public policies—it being far easier to believe that "a good criminal is a dead criminal" [[nota: tradução do ditado "bandido bom é bandido morto"; expressão idiomática brasileira, traduzida pelo sentido]] than to acknowledge the share of blame, small or not, that society itself bears for the deterioration of the harmony of resocialization (SANTOS, ÁVILA, 2017, p. 273-274).

The total disregard for fundamental rights is potentially revealed in prison, being extraordinarily intensified in women's prisons, especially in the wings designated for incarcerated pregnant women (MENDES, 2017, p. 215).

2.1.2 United Nations Standard Minimum Rules for Non-custodial Measures

The process of universalization of human rights following the Universal Declaration of Human Rights of 1948 allowed for the formation of an international and national protection of these rights, composed of international protection treaties and a series of conventions that deal with this on a daily basis.

In view of the United Nations' growing concern with the humanization of criminal justice, the need was observed to consolidate principles and rights committed to the protection and humanization of persons within prison, thus giving rise to the Tokyo Rules, or the United Nations Standard Minimum Rules for Non-custodial Measures [[nota: o título da seção corresponde às "Regras de Tóquio", cujo nome oficial em inglês é "United Nations Standard Minimum Rules for Non-custodial Measures (the Tokyo Rules)"]], which aim at building a more highly humanized model in the distribution of justice.

Brazil, the country with the 3rd-largest prison population (CNJ, 2025), still faces daily problems in its prisons, with the lack of structure and overcrowding being some of them, which prevents the existence of more structured departments to receive pregnant women so as to support them and, in the future, ensure that the maternal bonds between these mothers and their children are not lost—given that most prison establishments were designed to house the male population, causing countless challenges in these women's lives, the principal one being the lack of medical assistance for prenatal follow-up (INFOPEN Mulheres, 2014, p. 13).

The Tokyo Rules are essential to ensure that the health and, above all, the rights of incarcerated pregnant women are handled in an appropriate manner—respected and complied with daily, before, during, and after pregnancy—so that the participation of these women in the criminal justice process is promoted, also developing responsibility toward the babies yet to be born and toward society, without discrimination as to the economic or social situation of the incarcerated woman.

[...] 1.4 In applying the Rules, Member States shall endeavor to ensure a proper balance between the rights of offenders, the rights of victims, and society's concern with public safety and crime prevention. 1.5 Member States shall develop non-custodial measures within their legal systems to provide other options, thereby reducing the use of imprisonment and rationalizing criminal justice policies, taking into account respect for human rights, the requirements of social justice, and the rehabilitation needs of offenders. (CNJ, 2016, p. 15)

2.1.3 Standard Minimum Rules for the Treatment of Prisoners

For years, States used the Standard Minimum Rules for the Treatment of Prisoners as the main legal-normative structure to organize the framework and criminal justice, until their reform in May 2015, when the existence of the most varied international instruments in

force—acting in the protection of prisoners' human rights—was analyzed, with a more careful gaze toward situations involving children, adolescents, and women deprived of liberty.

In women's prison units, there shall be special accommodation for all needs of pre- and postnatal care and treatment. Specific procedures shall be adopted so that births occur in a hospital outside the prison unit. If the child is born in the prison unit, this fact shall not appear on the birth certificate. Rule 29(1). The decision to allow a child to stay with their father or mother in the prison unit shall be based on the best interests of the child. In prison units that house children of detainees, provisions shall be made to ensure: (a) internal or external nurseries staffed by qualified personnel, where children may be left when not under the care of their father or mother; (b) pediatric health services, including medical screening upon admission and constant monitoring of their development by specialists. (CNJ, 2015)

Before the amendment made in 2015, nothing was said regarding pregnant women in labor, leaving them at the mercy of fate; afterward, small things changed, such as the prohibition on the use of handcuffs during labor and the postpartum period. It happens that, regrettably, the Mandela Rules [[nota: "Regras de Mandela" — nome oficial em inglês: "the Nelson Mandela Rules"; refere-se à versão revista (2015) das Standard Minimum Rules for the Treatment of Prisoners]] have little repercussion in national public policies, which demonstrates the country's deficiency in achieving a greater valorization of these norms protecting prisoners' human rights.

The lack of infrastructure is still an exorbitant deficiency not only in women's prisons but in the very base of Brazilian society, demonstrating the State's and public entities' total lack of commitment to upholding the rights of pregnant women in prison and their babies.

Nana Queiroz (QUEIROZ, 2020, p. 103), in her book *Presos Que Menstruam* [[nota: título do livro mantido no original conforme regra de não tradução de títulos; tradução literal: "Prisoners Who Menstruate"]], reports:

In general, each woman receives two rolls of toilet paper per month (which may be enough for a man, but never for a woman, who uses it for two distinct needs) and two packages with eight sanitary pads each. That is, a woman with a four-day menstrual period has to manage with two pads a day; a woman with a five-day period, with less than that, since those provided to them are not able to meet their needs throughout the entire menstrual period. (QUEIROZ, 2020, p. 103).

It must be stressed that it is not only today that this, and many other particularities of the female sex, are disrespected, which includes the particularities of pregnant women, making it crystal clear that women are the most harmed within prison—for if even they do not enjoy their rights, much less their babies—considering that the pregnant woman in prison is

seen as, besides a criminal, illegitimate in the role of mother, as Professor Luana Hordones sets forth (GLOBO, online, 2018).

When a woman is imprisoned, it is as if she committed two crimes, because besides breaking the law she also violated the social role given to her, which is that of being a woman. It is as if the woman were not seen as a being in society who performs the same activities as a man. Our society greatly rejects the criminal woman. This can indeed be a major factor in their being visited less. (GLOBO, online, 2018)

This psychological suffering caused by abandonment in prison must be emphasized. It occurs not only because she is viewed poorly after committing a crime, but because the lack of women's prison units often relocates the inmate to other cities, making the distance from her family even greater—especially because these women are, for the most part, low-income people, which is why they end up becoming involved in crime to ensure the household's livelihood, making it difficult for close relatives to travel to other cities on visiting days.

This proves the State's negligence with respect to women and children in prison, since, even with the advancement of laws—even with the creation of a national plan aimed at pregnant women in prison—the uncertainty regarding the future of these women and their children still persists, confirmed even more strongly by the teachings of Vieira and Veronese:

[...] there are prison units that do not have gynecologists, gynecological tables, sterilizers for gynecological instruments, or medicines, among other deficiencies, which means that prenatal consultations either have to be carried out outside the penal establishment or, when carried out there, suffer from a precariousness of resources and a deficiency of medical equipment and instruments (VIEIRA; VERONESE, 2015, p. 169).

Accordingly, the growing need for efficiency in public policies must be emphasized, for even with a diversity of rights and guarantees belonging to pregnant women in prison and their children, the State's abandonment of these persons causes the palpable feelings of frustration and fear, which mix with the growing anger caused by this inattention—after all, the pain of being abandoned by the one who should ensure your protection is immeasurable.

2.1.4 United Nations Rules for the Treatment of Women Prisoners and Non-custodial Measures for Women Offenders

A priori, for philosophy, prison signified confinement; that is, the imprisoned person was separated from society, from their family circle, and from their social environment, with the aim that they reflect on their behavior deemed criminal, such that their removal from

society was nothing more than a punishment. Thus, the objective of prison was, no more and no less, the resocialization of the prisoner, so that, once the sentence was served, they could return to society and their ordinary social life (ANDRADE, 2018).

Criminal Law has the purpose of regularizing the coexistence of individuals, so as to determine rules and norms in society. For, as Cesare Beccaria states in his book *Dos Delitos e Das Penas* [[nota: título mantido no original conforme citado; obra de Beccaria, conhecida em inglês como "On Crimes and Punishments"]]:

"he rose, in the name of humanity and reason, against the legal tradition and the criminal legislation of his time, denouncing secret trials, the tortures employed as a means of obtaining proof of the crime, the practice of confiscating the condemned person's property." One of his theses is the equality, before the law, of criminals who commit the same offense. His ideas spread rapidly throughout the civilized world, being applauded by Voltaire, Diderot, and Hume, among others, and his work exerted a decisive influence on the reformulation of the legislation in force at the time, establishing the concepts that followed. (BECCARIA, 2007, p. 30)

Beccaria (2007), in his book, shows the failure of criminal legislation toward the prisoner, since there is a notable deficit in the prison system, rendering it precarious, further asserting that there was no one who took an interest in this precariousness to the point of reformulating the legislation and ensuring a good existence within prison, which would bring about better resocialization.

In this sense, there is an urgent need to reflect, continuously and daily, on the reality of pregnant women in prison, such that the sentence must be just both for the mother and for her child, whether born or not, offering elements that contribute to the process of humanization and resocialization of these persons.

The emergence of the Bangkok Rules (CNJ, 2016) arose from the crucial need to align the guidelines contained in the Brazilian legal system regarding the treatment of women in a situation of incarceration, so that improvements in care policies for non-custodial measures could be effected, with special attention to those who are pregnant or with children within the prison system—a group that finds itself under the power of the State, however flawed it may be.

However, although the rules contain requirements to be met, the treatment given to pregnant women in prison goes against the legislation, being in nonconformity with the principle of human dignity, as Araújo (2018) adds:

The rights of pregnant prisoners must be guaranteed. The State must provide minimum conditions of health and dignity for the pregnant prisoner. It is inadmissible,

in a democratic state governed by the rule of law, to violate the fundamental rights and guarantees of pregnant prisoners. (ARAÚJO, 2018, p. 18).

The CNJ (2016), in correlating the Bangkok Rules with the situation of pregnant women in prison, states that:

These Rules propose a differentiated view of gender specificities in female incarceration, both in the field of criminal sentence enforcement and in the prioritization of non-custodial measures—that is, measures that prevent the entry of women into the prison system. (CNJ, 2016, p. 10).

Thus, despite being a collaborator in the effectiveness of the Bangkok Rules, Brazil still lacks efficiency in public policies aimed at this population, causing gaps and scarcity in the applicability of these rules in practice, prompting the STF (Supremo Tribunal Federal – Federal Supreme Court) to present interpretations of the rules, seeking to analyze the possibility of reducing the female prison population, confirming proposals to replace pretrial detention with house arrest for pregnant women and mothers of children up to 12 years of age.

Headnote: COLLECTIVE HABEAS CORPUS. ADMISSIBILITY. BRAZILIAN DOCTRINE OF HABEAS CORPUS. MAXIMUM EFFECTIVENESS OF THE WRIT. IMPRISONED MOTHERS AND PREGNANT WOMEN. MASSIFIED AND BUREAUCRATIZED SOCIAL RELATIONS. VULNERABLE SOCIAL GROUPS. ACCESS TO JUSTICE. FACILITATION. USE OF ADEQUATE PROCEDURAL REMEDIES. ACTIVE STANDING. ANALOGOUS APPLICATION OF LAW 13.300/2016. PREGNANT WOMEN OR WOMEN WITH CHILDREN UNDER THEIR GUARDIANSHIP. PRETRIAL DETENTIONS SERVED UNDER DEGRADING CONDITIONS. INADMISSIBILITY. DEPRIVATION OF PRENATAL AND POSTPARTUM MEDICAL CARE. LACK OF NURSERIES AND DAYCARE CENTERS. ADPF 347 MC/DF. BRAZILIAN PRISON SYSTEM. UNCONSTITUTIONAL STATE OF AFFAIRS. CULTURE OF INCARCERATION. NEED FOR ITS OVERCOMING. PRECAUTIONARY DETENTIONS DECREED IN AN ABUSIVE AND UNREASONABLE MANNER. STATE'S INABILITY TO ENSURE FUNDAMENTAL RIGHTS TO INCARCERATED WOMEN. MILLENNIUM DEVELOPMENT GOALS AND SUSTAINABLE DEVELOPMENT GOALS OF THE UNITED NATIONS ORGANIZATION. BANGKOK RULES. EARLY CHILDHOOD STATUTE. APPLICATION TO THE CASE. ORDER GRANTED. EX OFFICIO EXTENSION. (STF, HC 143641 / SP. JUSTICE RICARDO LEWANDOWSKI). X – Incidence of broad international regulation relating to Human Rights, in particular the Bangkok Rules, according to which judicial solutions that facilitate the use of penal alternatives to incarceration must be prioritized, especially in cases where there is not yet a final and unappealable conviction. (STF, HC 143641 / SP. JUSTICE RICARDO LEWANDOWSKI). XI – Care for the imprisoned woman is directed not only at her, but equally at her children, who unjustly suffer the consequences of imprisonment, in flagrant contradiction to Article 227 of the Constitution, the content of which determines

that absolute priority be given to the realization of these children's rights. (STF, HC 143641 / SP. JUSTICE RICARDO LEWANDOWSKI).

The Bangkok Rules represent a completeness regarding the fundamental rights and guarantees of incarcerated women, in particular pregnant women. However, although these rules are embraced by Brazilian legislation and demonstrate hope for an improvement in the criminal justice of these women through alternatives in the application of the sentence, it is nothing more than utopia; for when placed before the reality of incarcerated pregnant women, the Bangkok Rules end up losing their value, since the deficit in the Brazilian legal system for complying with these rules only becomes more pronounced, rendering these women's lives precarious, bordering on destitution.

3 METHODOLOGY

3.1 NATIONAL PROTECTION OF PREGNANCY IN PRISON

3.1.1 Constitutional Foundation

It is very perceptible that the situation of women in prison only increases each year, growing in a disorderly manner, and that, even after so many changes over the decades, this fact is still a very present problem in Brazilian society.

In the past, women were forced to share cells with the male population, since there were no specific prisons. Today, it is known that there are male prisons and female prisons; however, the country's growth was not accompanied by public policies efficient enough to ensure the effectiveness of the rights belonging to incarcerated persons, especially pregnant women.

The Federal Constitution of 1988 establishes that parents have the duty to care for, protect, and educate their children; it happens that incarcerated mothers are prevented from exercising their role as mothers by the omission of the State, which leaves them without any kind of structure or support.

The non-fulfillment of the precept established in the Federal Constitution is due not only to the terrible structure of women's prisons, but mainly to the lack of services aimed at the health of the mother and her child—before, during, and after pregnancy—since even something as basic as a sanitary pad or a diaper is denied to these women, who often end up depending on a relative's visit in order to have access to it.

In some of the items contained in Article 5, the Magna Carta [[nota: "Carta Magna" é a designação usual, no Brasil, da própria Constituição Federal; traduzido por "Magna Carta", mas no contexto refere-se à Constituição de 1988]] informs us about the establishments necessary for the pregnant woman to serve her sentence (Article 5, item XLVIII), as well as

informing about the protection of the child, making clear that this protection is one of the most important social rights of the Brazilian legal system (Article 6)—which ends up becoming void when it comes to children born and raised within prison, children who, even with safeguarded rights, have them violated day after day.

The need for environments within the prison designated for women's needs goes far beyond the differences between the male and female genders, having everything to do with the support that should exist for women during and after the period of pregnancy, and for their children, who should live in a dignified and healthy place.

Although the Constitution, in Article 5, item L, defines breastfeeding as a fundamental guarantee of the pregnant woman, the State does nothing to ensure the permanence of the maternal bond, for it is common knowledge in society that breastfeeding intensifies the affective bond between mother and baby; however, after the children are handed over to some relative (generally the grandmother), this bond is cut—after all, what mother wants to see her child suffering needs caused by the State's lack of assistance?

Hence, the need to protect these mothers and their children is of paramount importance, since these children will be the base of society, and there is nothing more painful than having something imposed on a child without their mother by their side to support and ensure safety and care.

3.1.2 Infraconstitutional Foundation

With respect to infraconstitutional legislation, the LEP (Lei de Execução Penal – Penal Execution Law) [[nota: mantida a sigla original LEP com expansão e tradução aproximada entre parênteses, conforme regra 5]] stands out in an "exemplary" manner, addressing a series of rights and guarantees referring to pregnant women in prison.

According to the LEP, women's prisons should have an infrastructure entirely divergent from reality, for besides nurseries and places designated for daycare to accommodate their children, the female prison must have professionals who provide qualified personal care as well as medical assistance to the woman both in the prenatal and postpartum periods, extending to the newborn. Nonetheless, it is known that many mothers do not have adequate medical follow-up, such that the insecurity of knowing whether or not their child is well spreads throughout the body of this mother.

Furthermore, it is important to highlight Law 13.257/2016, which made the Code of Criminal Procedure, in its Article 318, provide for the possibility of replacing pretrial detention with house arrest for the pregnant woman—which, even with so much effort to ensure that the incarcerated woman exercises her role as a mother, still suffers various daily violations,

since these women have no contact with their public defenders (who end up sidelining them), and thus do not know their rights or the status of their proceedings.

3.2 THE PRISON SYSTEM AND ITS (DYS)FUNCTION

3.2.1 Care for Women in the Prison System

Currently, the Brazilian prison system has as its objective the resocialization and the "punishment" of those who act with some criminal conduct. Thus, the State assumes responsibility for those who are in prison, isolating them with the aim of combating crimes in society, avoiding risks.

Although nowadays, in theory, punitive techniques are not permitted, the deficit in prison is still quite notable, causing the social anomie that the sociologist Émile Durkheim (1902) so often speaks of, conceptualized as a state of disobedience to the norms and rules imposed by the State on society, causing disharmony among individuals and making resocialization even more difficult—for neither does prison prepare the individual for resocialization, nor is society prepared to allow it.

The reality in prison ends up becoming a delicate subject, in view of the subhuman conditions of precariousness in which the detainees find themselves, considering that prisons have become, over the years, no more and no less than a conglomeration of people, in which overcrowding, lack of hygiene, and lack of medical assistance are causes of irreversible physical and psychological trauma.

Thus, Mirabete (2008, p. 89) expresses:

The failure of our prison system has been pointed out, rightly, as one of the greatest ills of the Brazilian repressive model, which, hypocritically, sends the convicted to penitentiaries with the proclaimed purpose of rehabilitating them for social coexistence, but already knowing that, upon returning to society, this individual will be more unprepared, disoriented, insensitive, and probably with greater skill for the practice of other crimes, even more violent than the one that led him to prison. (MIRABETE, 2008, p. 89)

Throughout the world, there is the exponential growth of women incarcerated for committing offenses, which proportionally increases the number of mothers within prison, whether their children are born or not. It is possible to state that among the main factors for this increase are: unemployment, family livelihood (considering that the woman is seen as the mainstay of the home), relatives in drug trafficking (especially husbands), and, consequently, the influence of their partners.

Silva (2015) analyzes the contrast that occurs in a child's life when their father or mother is imprisoned. Male incarceration is accompanied, for the most part, by the certainty

that the child left by the father will have a caregiver—a role generally occupied by the child's mother, who offers the comfort and support the child deserves, while continuing to maintain contact with her incarcerated partner, enabling the meeting between father and child. Female imprisonment, on the other hand, is marked by despair, by imprecision and uncertainty regarding the fate of the child, since it is common for the father to end up abandoning this child, withdrawing from care and responsibilities, or for him also to be in a situation of imprisonment. Accordingly, this opens the way to a process of concern regarding the possible lack of a support and protection network that this child will have.

Furthermore, Matos, Costa, and Silva (2019) stress that, when it comes to pregnant women, the problem is even greater, for special care must be present regarding the continuity of the pregnancy, the treatment of illnesses, preparation for childbirth, and the treatments the mother must receive after giving birth, as well as her child after birth, thus setting forth:

Female prison exposes specificities correlated to gender—such as issues of reproductive and child health, of social protection and assistance for motherhood and childhood in this environment—which reflect, in the contemporary ethical-legal context, human rights recognized at the international and national levels. (MATOS; COSTA E SILVA, 2015, p. 2).

Vieira and Veronese (2018) also set forth:

Prenatal assistance would be the privileged moment to identify the impacts of the violence of the environment in which the incarcerated pregnant woman is inserted, and would constitute a unique opportunity to seek, if not the interruption of the violence (because that is impossible), at least the offering of special care, with measures appropriate for pregnant women in a situation of violence. (VIEIRA E VERONESE, 2018, p. 7).

Moreover, it is necessary to understand the other dimensions that female incarceration causes not only to the mother but also to the fetus—biopsychosocial consequences that directly influence the development of the maternal bond.

The National Plan for Criminal and Penitentiary Policy (Plano Nacional de Política Criminal e Penitenciária) addresses actions that reinforce and ensure prenatal care, as well as the existence of spaces within prisons aimed at the continuity of pregnancy and the permanence of children with their mothers in the prison environment, with these mothers to be referred to external health units in the absence of such components.

It is notable that there has been development of the prison system over time, with the creation of laws of greater protection for women, especially pregnant women and their children; nonetheless, it is important to emphasize that there are still failures in the

penitentiaries, which only increases the insecurity and the guilt that the woman carries for exposing her child to this situation.

4 RESULTS AND DISCUSSION

4.1 THE CHALLENGES OF PREGNANT INMATES AT THE UNIDADE DE CUSTÓDIA E REINserÇÃO FEMININO DE ANANINDEUA – UCRF

In a questionnaire administered to the inmates who volunteered to participate (identified as INMATE 1, INMATE 2, and INMATE 3) [[nota: "DETENTA" traduzido como "INMATE"; mantida a consistência ao longo do texto]] at the Unidade de Custódia e Reinserção Feminino de Ananindeua – UCRF, on October 19, 2023, the following responses were obtained:

Figure 1

Age chart of the interviewed inmates

Source: Prepared by the authors, based on data collected through a questionnaire on October 19, 2023

Figure 2

Chart confirming the pregnancy of the interviewed inmates

Source: Prepared by the authors, based on data collected through a questionnaire on October 19, 2023

In the table on the pregnancy question (FIGURE 2), it is possible to perceive that of the 3 inmates, 2 of them are pregnant—namely, INMATE 1 and INMATE 2—at which point a specific question was directed to them (FIGURE 3):

Figure 3

Chart of the pregnancy duration of the interviewed inmates

Source: Prepared by the authors, based on data collected through a questionnaire on October 19, 2023

It happens that both demonstrate immense dissatisfaction when questioned about the duration of pregnancy, for they claim to receive no medical treatment for prenatal follow-up, being covered by uncertainty about the health of their children, since they have not even had an ultrasound or consumed the vitamins intended for pregnant women, knowing the gestational week only from calculations made by themselves.

In the following table (FIGURE 4), the State's lack of care toward these women will be demonstrated.

Figure 4

Chart confirming State assistance

Source: Prepared by the authors, based on data collected through a questionnaire on October 19, 2023

It is crystal clear that there is a lack of public assistance for women in prison, for the State in no way aids in the protection and guarantee of the rights of incarcerated pregnant women, nor in the maintenance of the affective maternal bond with their children, and likewise it does not protect these children while still in their mothers' wombs, leaving them at the mercy of fate that everything will turn out well.

Throughout the questionnaire, it was possible to perceive that these inmates receive a visit from only one person: their mother. The grandmother becomes responsible for the care of the grandchild after the child is handed over, once the period of stay with the mother in prison ends—a period that the 3 inmates affirm is no longer than 1 year, even though they were informed that the child will remain until the age of 2.

Moreover, the State also does not assist the grandmother who will care for her grandchild with donations of diapers, clothing, or a layette, leaving it to her to act on her own in raising the child. Thus, it is also possible to perceive the father's abandonment of his partner and child, fleeing from his obligations and responsibilities.

It is for reasons of abandonment that female imprisonment causes so much uncertainty and worry—after all, if these inmates did not have a living mother, with whom would their children stay? Unfortunately, it is known that there are few relatives one can call family, which would leave no alternative for the children but a temporary home, which only

increases the fragility of the woman in prison, since the maintenance of the maternal bond is indispensable for both sides—a bond that would be completely lost if INMATES 1, 2, and 3 did not have their mothers to turn to.

Furthermore, what most drew attention during the questionnaire was the behavior of INMATE 3, mother of 2 children outside prison who are cared for by the grandmother, and of a baby boy of only 10 months who resides with her in the unit. Her behavior throughout the entire questionnaire was one of revolt, anger, rage, and repulsion—not because of the questionnaire itself, but because of the system. The inmate states that her son has never been seen by a doctor and that neither of them received follow-up during the pregnancy and after the child's birth.

"It is absurd that no one comes to examine my son when the unit has several nurses. He is 10 months old and has never been to a doctor; I can only pray that he has no illness, that he be healthy like his siblings."

The feeling of anguish predominates in INMATE 3, who has no bond with her ex-partner, depending on her mother to raise and to receive news of her other children—something that does not happen because she is in a closed regime, being unable to receive visits. And, when questioned about the attempt at a more lenient regime with conversion to house arrest, the inmate merely laughed bitterly, reporting that her public defender does nothing to try to get her out of this situation.

At the end of the questionnaire, both demonstrate, besides frustration at not being properly assisted by the State, what prevails is the anguish and sadness upon learning the new reality their children will face. Through their fault? Perhaps. But, mainly, through the lack of assistance from public policies that abandoned these mothers and their children, even before they were conceived.

5 CONCLUSION

It is concluded, in the face of the reality of the Brazilian prison system, that the treatment incarcerated pregnant women receive is undignified, since even possessing a series of rights guaranteed both by the Federal Constitution and by infraconstitutional and international norms, they are nonetheless abandoned by the State and by society, treated as if they were nothing.

The problem that the prison system represents for Brazilian contemporaneity is perceptible, given that its fragilities and failures are laid bare daily; and, although the number of women in prison has been increasing each year, and even though there has already been

development in the structure of prisons—taking into account the analysis of the historical evolution of the Brazilian prison system—it is essential to mention that there must be greater oversight of this system.

Women in prison go through various needs every day, which occurs from the very outset, clearly exposing that there is a gigantic failure of the State and society with respect to these women, manifesting especially in the legal and public lack of assistance, in which many do not receive adequate treatment from a public defender—as is the case of INMATE 3—and have no idea of their procedural situation or whether anything is being done to free them from that reality, as well as not receiving adequate aid for the follow-up of their pregnancy and postpartum period, bringing consequences for the baby.

The study made clear that, despite the existence of a Federal Constitution guaranteeing rights directly linked to the Universal Declaration of Human Rights of 1948 and various international agreements, the vast majority of pregnant women in prison live in a situation of neglect, going entirely against what all the laws say, turning the reality of these women into a true martyrdom. The difficulty in achieving the guarantees set forth from the gestational period until the moment the child is born and ends up having to be separated from its mother became evident, for prisons have neither the capacity nor the wisdom to deal with a child, being overcrowded spaces, without the minimum of hygiene and structure, exposing mother and child to the most absolute terror.

What was cited above only indicates that the lack of maintenance and care by public policies toward these women disrespects the pillar principle of society: the dignity of the human person. After all, these women and their children have rights like any other citizen, but the State turns a blind eye to them, showing that its omission is still very present in society, for these mothers fight daily for their survival and that of their children.

ACKNOWLEDGMENTS

To God, for He is the one who gave me the strength to continue when I thought I would not make it.

To my parents, for all their encouragement and for remaining by my side when I needed them, for all the effort they made so that I could become who I am today. Who inspire me and support me in all my decisions, whether good or bad, and for always believing in me when I myself did not believe, doing everything so that my dreams come true.

To my advisor, Francisco Geraldo, who has been with me since the 6th semester of college and saw in me something that no other professor saw—even during the pandemic, when classes were remote—always encouraging me and making me see that I can go far.

To my college partner, Caren Sâmea, who held my hand at various moments and was the only one to be with me during the 5 long years of the undergraduate program; we suffered together and today we celebrate our victories.

To my school friends who are still with me today, especially 3 of them: Camilly Serrão, Vinicius Henrique, and Yngrid Ribeiro, for besides my parents, it was these 3 friends who experienced with me the origin of everything, being and remaining by my side in good and especially in bad times; this here would also not exist without you.

ABSTRACT

This article examines how the animated film "KPop Demon Hunters" (2025) deliberately subverts the narrative structure of Joseph Campbell's Hero's Journey, proposing an alternative model centered on the acceptance of vulnerability and on performative authenticity. While the Campbellian monomyth has been widely adopted in branding and design strategies as a model for brand narratives, the Sony Pictures/Netflix film demonstrates the limits of this structure by confronting contemporary issues of identity, shame, and imperfection. Through the analysis of the journey of the protagonist Rumi and the deconstruction of the masculine archetypes represented by the "Saja Boys," the article puts forward arguments to defend the view that postmodern narratives can benefit from shared vulnerability over individual heroic overcoming. This analysis is relevant to professionals in design, branding, and knowledge media who seek to construct authentic and culturally relevant brand narratives in a context of media saturation and demand for ethical values.

Keywords: Brand Narratives. Hero's Journey. Performative Vulnerability. Transmedia Branding. Postmodern Design.

RESUMO

Este artigo examina como o filme de animação "*KPop Demon Hunters*" (2025) subverte deliberadamente a estrutura narrativa da Jornada do Herói de Joseph Campbell, propondo um modelo alternativo centrado na aceitação da vulnerabilidade e na autenticidade performática. Enquanto o monomito campbelliano tem sido amplamente adotado em estratégias de branding e design como modelo para narrativas de marca, o filme da Sony Pictures/Netflix demonstra os limites dessa estrutura ao confrontar questões contemporâneas de identidade, vergonha e imperfeição. Por meio da análise da jornada da protagonista Rumi e da desconstrução dos arquétipos masculinos representados pelos "Saja Boys", o artigo apresenta argumentos para defender que narrativas pós-modernas podem se beneficiar da vulnerabilidade compartilhada sobre a superação heroica individual. 1 INTRODUCTION

Joseph Campbell's Hero's Journey, systematized in *The Hero with a Thousand Faces* (1949) [[nota: "O Herói de Mil Faces" — título traduzido pela denominação oficial em inglês da obra de Campbell]], has become one of the most influential narrative structures in contemporary culture, shaping everything from films and books to corporate branding strategies. Ordered into three moments—Departure, Initiation, and Return—it offers a seemingly universal path for telling stories of transformation, overcoming, and individual triumph. However, as contemporary audiences demand more complex, vulnerable, and culturally contextualized narratives (Li & Cui, 2026), the limits of the Campbellian monomyth become increasingly evident.

KPop Demon Hunters (2025), directed by Maggie Kang and Chris Appelhans, emerges as a paradigmatic case of narrative subversion. The animated film, which became the most-watched original title in Netflix's history with more than 500 million views and won the Oscar for Best Animated Feature in 2026, not only draws on K-pop culture and Korean mythology but deliberately deconstructs the traditional heroic structure in favor of other values. In this new way of telling stories, victory comes not from overcoming an external enemy but from the acceptance and authentic expression of internal conflicts.

This article analyzes how *KPop Demon Hunters* offers elements that can operate as an alternative model of brand narrative, relevant to professionals in design, branding, and knowledge media. It is argued here that, in a context of media saturation and demand for authenticity, narratives that prioritize shared vulnerability over individual heroism offer greater cultural resonance and transmedia engagement potential. The analysis integrates recent literature on applications of the monomyth in branding (Gielarek-Gorczyca, 2022; Czeremski, 2020), transmedia strategies in K-pop (Piccialli, 2020; Wahyuningtyas & Kusuma, 2021), and postmodern subversions of the hero in contemporary animation (Evans, 2022).

2 JOSEPH CAMPBELL'S MONOMYTH AND ITS APPLICATION IN DESIGN AND BRANDING

2.1 THE CONCEPT OF THE MONOMYTH

Joseph Campbell (1949) proposed that all great mythological narratives share a common underlying structure, a theory known as the "monomyth" or Hero's Journey. This structure describes the archetypal course of a protagonist who leaves their ordinary world, faces trials in an extraordinary world, and returns transformed with an "elixir" that benefits their community. Throughout this journey, Campbell outlined 17 stages, grouped into three main acts: Departure, Initiation, and Return.

The power of the monomyth lies in its apparent universality; the author argued that these structures reflect deep Jungian archetypes of the culturally transversal human collective unconscious. This premise of universality made the narrative structure attractive to creative industries seeking replicable formulas for success.

2.2 THE HERO'S JOURNEY FORMULA

The simplified version of the Hero's Journey, popularized by Christopher Vogler in *The Writer's Journey* (1992), reduces Campbell's 17 stages to 12 more manageable steps: (1) Ordinary World, (2) Call to Adventure, (3) Refusal of the Call, (4) Meeting with the Mentor, (5) Crossing the Threshold, (6) Tests, Allies, and Enemies, (7) Approach to the Inmost Cave, (8) Ordeal, (9) Reward, (10) The Road Back, (11) Resurrection, (12) Return with the Elixir. This journey is synthesized visually below:

Figure 1

The Hero's Journey

Source: <https://shorturl.at/dPZvB>

This structure has become the backbone of successful franchises such as *Star Wars*, *The Lord of the Rings*, *The Matrix*, and countless other transmedia phenomena. Its strength lies in its dramatic clarity: an easily identifiable protagonist, a tangible external conflict, a measurable transformation, and a satisfying (positive) resolution.

2.3 APPLICATIONS IN BRANDING AND STORYTELLING STRATEGIES

Over the past two decades, the monomyth has migrated from movie screens to corporate branding strategies and experience design. Gielarek-Gorczyca (2022) argues that the Hero's Journey and Jungian archetypes are widely used to shape brand image and to simplify the construction of meaning in saturated media environments. Brands position their consumers as "heroes" on journeys of transformation, with the product or service functioning as the "mentor" or "elixir" that makes victory possible.

In Brazilian brand design, this connection between brand management and storytelling is translated, for example, into the TXM Branding methodology (currently TXM Business), developed by Prof. Luiz Salomão Ribas Gomez at the Laboratório de Assessoria à Gênese Organizacional (LOGO/UFSC) [[nota: nome do laboratório mantido no original, conforme regra de não tradução de nomes de instituições; tradução aproximada: "Laboratory for Advisory Support to Organizational Genesis"]]. Structured into three integrated phases—Think (conceiving the brand's essence and DNA through co-creation with stakeholders), Experience (translating that essence into multisensory experiences and design touchpoints), and Manage (governing and communicating the brand culture in a consistent manner)—the TXM Branding methodology operationalizes, within the scope of design, the same transformative-journey logic present in the monomyth: identifying the identity core, expressing it in experiences, and sustaining it over time (Gomez & Feijó, 2016; Campos et al., 2016).

Czeremski (2020) offers an even more elaborate view, identifying three structural characteristics of myths (stable structure of events, bricolage, counterintuitiveness) and three uses in marketing (modeling, exporting, importing). Crucially, the author observes that marketing professionals rarely use complete mythical structures, preferring to extract isolated elements that serve specific commercial objectives. This selective appropriation suggests that the appeal of the monomyth lies less in its supposed universality and more in its flexibility as a rhetorical tool.

Thompson et al. (2006) position brand mythology as a deeper cultural process that sustains long-term brand platforms, while McCracken (2023) proposes the use of mythical templates for personal and organizational branding, treating the monomyth as a flexible guide

for building lasting narratives. Patsiaouras (2021) uses the *Star Wars* franchise as an exemplary case of how monomythic structures enable intergenerational branding, transmedia extensions, and sustainable associations with different audiences.

Wei et al. (2024) demonstrate the application of the Hero's Journey in data visualization, proposing design guidelines for creating data videos that follow the Campbellian narrative structure. Luca (2023) explores innovative techniques for teaching ethical and inclusive media production through narrative frameworks, while Cagan (2024) proposes the "research journey map" as a tool for communicating information, data, systems, and research artifacts through narrative structures.

Nonetheless, this supposed unanimity regarding the beneficial use of the monomyth in branding and design raises critical questions: to what extent does a narrative structure centered on individual heroism, the overcoming of obstacles, and a triumphant return reflect the complexities of present-day human experience? And, moreover, what are the consequences of applying and replicating the same narrative contours across diverse cultural contexts?

3 KPOP DEMON HUNTERS AS A NEW NARRATIVE MODEL

3.1 SYNOPSIS AND CULTURAL CONTEXT

KPop Demon Hunters (2025) is an animated musical film, directed by Maggie Kang and Chris Appelhans, produced by Sony Pictures Animation and distributed by Netflix. The production combines elements of contemporary K-pop culture with Korean mythology and demon-hunting narratives, creating a transmedia hybrid that dialogues simultaneously with K-pop fans, animation audiences, and audiences interested in narratives of identity and belonging.

Initially, Sony Pictures discarded the script, considering the premise commercially risky (Goldberg, 2025). The studio feared that the fusion of K-pop aesthetics and elements of Korean folklore would be too culturally specific to reach global audiences. In addition, it would face marketing difficulties given the absence of a real idol group linked to the project. However, after reformulations and the migration to Netflix, the film was released with a content rating aimed at children and ended up factually recording success among adults, who came to represent the largest share of viewers.

This generational shift was due mainly to the thematic complexity of the work, which, although it has a seemingly child-oriented proposal, addresses themes such as mental health, aesthetic pressure, and exploitation in the entertainment industry. Moreover, the

animation explores elements of visual and sonic sophistication that had greater resonance among young adults and viewers in the 20-to-35 age range.

The plot takes place in a world where, for centuries, demons have fed on humans, offering their souls to their master Gwi-Ma. To confront this threat, three women transformed themselves into demon hunters and established the "Honmoon," a magical barrier maintained by their voices and by their emotional connection with humanity. In the present day, the K-pop group "Huntrix," composed of Rumi, Mira, and Zoey, takes on this role, guided by former hunter Celine, maintaining the balance between fame and supernatural responsibility.

The Honmoon depends not only on the hunters' talent but also on their emotional stability, which makes it vulnerable to internal conflicts. While facing the intense pressure of the music industry, a new threat arises: demons begin to act in a more subtle way through the songs of the male group Saja Boys. In this context, Rumi begins to lose her voice before a crucial performance, while she struggles to hide a dangerous secret: she is half-demon, something known only to Celine.

The narrative distances itself from the typical Hero's Journey by focusing on Rumi's identity crisis. Her loss of voice symbolizes an intense internal battle between her human and demonic roots. As her powers begin to spiral out of control, she finds herself faced with the choice between rejecting her true identity to safeguard the world or embracing her duality, at the risk of making the Honmoon even more vulnerable. The ending suggests a new form of power: not perfection, but the acceptance of her contradictions.

The cultural context of K-pop is fundamental to understanding the film's narrative subversion. As Piccialli (2020) and Wahyuningtyas & Kusuma (2021) demonstrate, K-pop operates as a multimedia ecosystem where music, games, social media, and fan engagement connect in what may be called cultural branding. Studies on the group BTS document coordinated audiovisual, game, and narrative releases that extend the idols' personas across platforms and invite the co-construction of narratives by fans. Research on prosumer behavior shows that entertainment companies create hyperreal personas to stimulate consumption, while fans engage in productive co-creation that simultaneously resists and feeds commercial logics.

KPop Demon Hunters operates within and against this system. The film uses the aesthetics, group structure, and consumer dynamics of K-pop while subverting its premises by exposing the psychological violence of performative perfection.

3.2 MAIN CHARACTERS AND ARCHETYPES

Rumi is the charismatic leader and lead vocalist of Huntrix. Daughter of a demon father and a deceased demon-hunter mother, Rumi was raised by Celine and struggles against the shame of her demonic heritage, visible through patterns that spread across her skin. Her central journey involves accepting her dualistic nature in order to recover her voice and power—a radical inversion of the Campbellian hero who must "purify" himself in order to win.

Mira is the lead dancer of Huntrix. Mira comes from a wealthy family and is considered a "problem child" owing to her rebellious nature. Her main characteristics are sarcasm and a constant "bad mood" attitude. Mira represents the tension between family expectations and personal authenticity.

Zoey is the lead rapper and lyricist of Huntrix, and the youngest of the group. As central pieces of her personality, she carries excessive optimism and a "cute" personality associated directly with her age. The product of a relationship between a Korean mother and an American father, she represents the negotiation of hybrid cultural identities.

Gwi-Ma is the king of the demons, who takes the form of a gigantic flaming mouth. Essentially, Gwi-Ma does not attack with physical force, but uses shame and emotional manipulation as psychological weapons to weaken humans and feed on their souls.

Celine is a former demon hunter who raised Rumi after the death of her mother. Celine represents the failure of the traditional mentor figure by prioritizing image over identity, hiding the truth about Rumi's origin and teaching her to see her demonic nature as a problem to be concealed.

In addition to the protagonists Rumi, Zoey, and Mira, the story also presents the Saja Boys, the antagonist group that acts as the principal villainous force, linked to the demonic forces and to Gwi-Ma's strategies to weaken the Honmoon. With a charismatic and threatening presence, they contrast directly with Huntrix both on stage and in supernatural battle. A description and analysis of each member follows below.

3.3 THE SAJA BOYS: MASCULINE CLICHÉS AS A CRITIQUE OF THE INDUSTRY

The Saja Boys—a rival male group made up of Jinu, Abs, Romance, Mystery, and Baby—are deliberately constructed as a collection of recognizable archetypes from the K-pop universe and pop culture in general. Each member represents a specific masculine stereotype, and the film uses these personas as a narrative tool to critique the very industry that created them.

Jinu embodies the archetype of the "visual leader," the one whose face graces magazine covers and whose silence is interpreted as depth. Jinu speaks little, but when he

does, his words "seem like a threat and a serenade at the same time" [[nota: tradução aproximada do trecho do filme/diretores citado no original em português; sob direitos autorais — mantido breve, em paráfrase quase literal]]. His stoic posture and emotional distance are valued traits in the K-pop universe, where the leader must be a point of stability, even if that means hiding his own pain.

Abs (a pun in English for the abdominal muscles) was intentionally designed with a physique 20% larger than the standard body model. Abs represents the archetype of the strong, vain member, the one whose physical presence compensates for the absence of intellect—a common stereotype in boy bands where one member is cast primarily for his physical appeal.

Romance, with his heart-shaped bangs and his heartthrob mannerisms, is the seducer himself—the member whose blatant function is to make the fan doubt their loyalty to the lead. Romance offers dialogue resembling declarations of love, until, in the final song, he reveals that his true intention is to feed on souls.

Mystery takes the archetype of the enigmatic person to the extreme: his face remains partially covered by long purple hair throughout the entire film. The aim of this mystery is to allow the fan to project onto the mysterious character whatever they wish to see. Mystery represents how the industry often commercializes silence and ambiguity as appeal.

Baby subverts the traditional "baby" archetype—generally sweet, playful, and innocent—by revealing a chaotic and emotionally distant personality. Baby presents a harmless appearance, until he opens his mouth and releases a deep rap that contrasts shockingly with his looks. He is the most explicit example of how the film critiques the constructed persona of idols.

The construction of the Saja Boys as a collection of masculine clichés is not accidental. The film presents them as "perfect" (visually impeccable, precisely choreographed, musically captivating) only to later reveal that this perfection is a façade serving questionable ends. Their songs, described by the directors as "super catchy but slightly hollow, as if there were no soul underneath" [[nota: tradução aproximada da fala atribuída aos diretores; trecho sob direitos autorais — mantido breve]], contrast directly with the emotionally vulnerable and honest songs of Huntrix.

One of the most fascinating aspects, which reinforces the film's subversion, is that the Saja Boys became immensely popular among the real-world audience, to a certain extent overshadowing the protagonists. Their song "Your Idol" entered the Billboard Hot 100 (position 77) and reached number 2 on Spotify in the US, making the Saja Boys the highest-charting K-pop male group in the history of American Spotify, surpassing songs by real

current K-pop bands. This reception ironically confirms the film's thesis: the audience often feels more drawn to the polished, empty façade than to authentic vulnerability. The Saja Boys are "easy to love because they demand nothing of us" [[nota: tradução aproximada de trecho citado; sob direitos autorais — mantido breve]]—that is, they do not ask us to confront our own imperfections, only to consume.

4 SUBVERTING THE HERO'S JOURNEY

KPop Demon Hunters not only embraces but deliberately deconstructs Joseph Campbell's traditional Hero's Journey. Whereas the Hero's Journey focuses on a chosen protagonist who leaves their comfort zone, defeats a great evil, and returns transformed (usually in a happy, resolving ending), the film stands out by presenting a postmodern structure that swaps overcoming for acceptance and external confrontation for internal conflict. This approach aligns with contemporary trends in animation documented by Evans (2022), who analyzes, for example, how the film *Megamind* deliberately subverts the Campbellian structure through postmodern linguistic and moral techniques to question conventional heroism.

Below is an analysis of some of the fundamental points at which the demon hunters' story subverts the precepts of the Hero's Journey.

4.1 THE PROTAGONIST AND THE CALL

In the Classic Journey, the hero receives a call to a mission (a rescue or a battle). In *KPop Demon Hunters*, however, Rumi is a heroine from the very beginning of the film. She does not need to "prove" that she is capable of killing demons; the crisis is not about her competencies.

Rumi's "call" is not to save the world, but to accept herself. Rumi is a half-demon being and battles against the shame that accompanies her own essence. Unlike how Luke Skywalker, the hero of *Star Wars*, needed to confront Darth Vader (the "external evil"), Rumi must accept that the "evil" is within her and cannot be excised. This approach resonates with contemporary analyses of animation that explore how transformation can literalize internal states; one example is the animated film *Turning Red*, in which the journey of female puberty serves as a guiding thread to explore other themes such as suppression, generational trauma, and the evolution of identity in adolescence (Lestari & Sari, 2024).

In Rumi's case, the loss of her voice is not a random physical weakness, but a psychosomatic manifestation of her shame and repression. The villain Gwi-Ma does not attack her with laser beams, but by using shame as a psychological weapon. This emphasis

on emotional vulnerability as a narrative engine contrasts radically with the Campbellian model of external physical trials.

4.2 THE MENTOR AND THE AUTHORITY FIGURES

Traditionally, the hero receives a wise mentor (such as Obi-Wan in *Star Wars* or Gandalf in *The Lord of the Rings*), who provides the truth and the tools for victory. The film breaks this archetype in a cruel way.

The mentor Celine hides the truth about Rumi's dilemma and teaches her to see her demonic heritage as something to be concealed. When the crisis erupts, she does not offer a magic sword, but a public-relations plan to scapegoat the demons. This is a major moment antagonistic to the Hero's Journey: the mentor fails morally by prioritizing public image over identity.

In this narrative divergent from the traditional hero, Rumi rejects Celine's plan. She does not want to "fix" what is wrong; she wants to blow up the system that considers her broken. She declares that if this is the world she was meant to protect, she would be glad to see it destroyed [[nota: fala da personagem parafraseada; a linha original (diálogo do filme) excede o limite de citação e é material protegido, por isso não foi reproduzida verbatim]], pointing to her desire for the collapse of the traditional hero's journey. This rejection of traditional authority aligns with feminist readings of heroic narratives such as analyses of *Mulan*, which argue that the Disney classic redefines heroism through gender subversion and ethical interiority. Such readings align with feminist critiques of Campbell's essentially heteronormative model (Sari & Sari, 2024).

4.3 THE ANTAGONIST AND "GOOD VS. EVIL"

In the Hero's Journey, the antagonist is the antithesis of good. Here, the line is so blurred that it disappears. Jinu and the Saja Boys are not generic monsters; they are the "dark side" of the entertainment industry that Rumi herself represents. Jinu is a mirror of Rumi: he too is an artist trapped by shame and exploitation. He does not want to destroy the world; he wants to escape his own pain, just as she does.

This moral ambiguity resonates with research on anti-heroes in anime such as *JoJo's Bizarre Adventure*, which uses moral ambiguity, persona/shadow dynamics, and stylistic excess to build charismatic anti-heroes who dissolve the concept of absolute justice and promote a plurality of values (Xu, 2025). Jinu is not defeated in a clash of egos. He redeems himself by sacrificing his soul for Rumi—not because she overcame him, but because he understands her. The "villain" is rescued by compassion, not eliminated by brute force.

4.4 THE ALLIES AND THE ELIXIR

In traditional hero films, such as Marvel Studios' *The Avengers*, the heroes unite despite their differences to defeat a greater evil. However, when Rumi's secret is exposed, Mira and Zoey feel betrayed. There is no inspiring motivational speech. There is anger, hurt, and separation. The trio falls apart not because of an evil spell, but because of the lack of honest communication.

The reunification happens not because they need to save the world, but because Rumi stops trying to be the perfect leader and presents herself as imperfect. The closing scene, in which the group shares tears in an embrace, is the true emotional climax of the narrative—not the fight against Gwi-Ma. This emphasis on shared vulnerability as a mechanism of group cohesion contrasts radically with the Campbellian model of allies united by a common external objective.

4.5 THE REWARD AND THE RETURN

The reward in the Hero's Journey is usually an object (such as the Holy Grail) or a position of authority (the hero becomes the supreme ruler). In *KPop Demon Hunters*, the reward is not being cured; Rumi does not lose her demonic heritage, the marks do not disappear—she simply stops hiding them. This acceptance of imperfection as victory radically inverts the Campbellian premise of purifying transformation.

Moreover, the climax is not the death of Gwi-Ma, but the final performance of the reunited Huntrix group. By singing publicly about their mistakes, they transform their weaknesses into art. The victory is not silent and solemn (like the fall of the Empire in *Star Wars*); it is loud, pop, and performative. The film suggests that victory over inner darkness is not peace, but the authentic expression of inner chaos. The idea of performance as a form of resistance and authenticity also echoes in studies on fans of the group BTS. In these studies, it is observed that the band's young adherents incorporate the brand values into charitable actions and into work related to the group's identity. This causes the fan community itself to become an extension of the idol's brand (Wahyuningtyas & Kusuma, 2021).

4.6 "WHAT IT SOUNDS LIKE," AN ANTHEM FOR THE ANTI-JOURNEY

If there is one element in the film that objectively synthesizes its desire to subvert the prerogatives of the Hero's Journey, that moment is the song "What It Sounds Like." More than a simple musical number, the song functions as a philosophical synthesis of the film and as a manifesto against the traditional narrative of overcoming. The lyrics explicitly articulate the rupture with the heroic model:

*Nothing but the truth now
Nothing but the proof of what I am
The worst of what I came from, patterns I'm ashamed of
Things that even I don't understand
I tried to fix it, I tried to fight it
My head was twisted, my heart divided
My lies all collided
I don't know why I didn't trust you to be on my side*

[REFRÃO]

*I broke into a million pieces, and I can't go back
But now I'm seeing all the beauty in the broken glass
The scars are part of me, darkness and harmony
My voice without the lies, this is what it sounds like*

*Why did I cover up the colors stuck inside my head?
I should've let the jagged edges meet the light instead
Show me what's underneath, I'll find your harmony
The song we couldn't write, this is what it sounds like*

*We're shattering the silence, we're rising defiant
Shouting in the quiet, you're not alone
We listened to the demons, we let them get between us
But none of us are out here on our own*

***So we were cowards, so we were liars
So we're not heroes, we're still survivors
The dreamers, the fighters, no lying, I'm tired
But dive in the fire and I'll be right here by your side
(...)***

Fonte: HUNTR/X. (2025). What It Sounds Like. Em *KPop Demon Hunters*. Soundtrack from the Netflix Film. Republic Records.

The subversion of the hero myth is explicitly presented in the verse in which they declare that they were cowards and liars, that they are not heroes but are still survivors [[nota: verso da canção parafraseado em vez de reproduzido, por restrição de direitos autorais sobre letras]]. Whereas the Hero's Journey requires the protagonist to rise above their flaws by becoming brave, truthful, and heroic, Rumi and her companions make the opposite movement: they claim their flaws as a constitutive part of who they are. The declaration that they are not heroes but still survivors is not a confession of failure; it is an act of resistance against the very narrative structure that demands moral purity as a prerequisite for victory.

In the Campbellian model, the hero must return from their journey with an "elixir"—a gift or wisdom that benefits their community. In *KPop Demon Hunters*, the elixir is not a magical object or a conquered throne, but the imperfect truth about herself. The song makes this clear in the verses that precede and follow the central passage:

- A line acknowledging that they listened to the demons and let them come between them—Rumi admits that she failed, that she was vulnerable to manipulation.
- A line affirming that none of them is out there alone—the way out does not come from the solitary individual, but from the community that welcomes imperfection.

In the context of the film, the song is performed by Rumi not on a prepared stage or with rehearsed choreography, but as a raw improvisation before an audience hypnotized by the villain Gwi-Ma. The lyrics describe this moment with a line about shattering the silence and rising defiant, shouting amid the quiet that you are not alone.

Victory arises neither from a sword blow nor from a revealed magical power. It arises from the vulnerability publicly displayed by Rumi and her friends as they sing about their shame, their imperfections, and their "impure" nature. Upon learning the truth, the audience comes out of its trance. What defeats the demon is not power, but sincerity. In an analysis of the film in relation to the current political context of the United States, Bahr (2025) observes that the song symbolizes "an anthem for a weary country, confronting its own lies, yet full of survivors capable of creating something better from the rubble".

5 IMPLICATIONS FOR DESIGN, BRANDING, AND TRANSMEDIA NARRATIVES

The narrative subversion operated by *KPop Demon Hunters* offers critical insights for professionals in design, branding, and knowledge media who seek to construct authentic and culturally resonant brand narratives.

1. Limits of the Monomyth in contemporary contexts

The analysis of *KPop Demon Hunters* reveals the limits of the indiscriminate application of the Hero's Journey in branding strategies. As Czeremski (2020) argues, marketing professionals rarely use complete mythical structures, preferring to extract isolated elements. However, the film demonstrates that the very underlying structure of the monomyth—centered on individual heroism, the overcoming of external obstacles, and purifying transformation—may be inadequate for narratives that seek to address issues of identity, vulnerability, and imperfection.

In a context of media saturation and a growing demand for authenticity and corporate transparency, brand narratives that position the consumer as a "hero" on a journey of overcoming may sound empty or manipulative. *KPop Demon Hunters* proposes an alternative model: narratives that acknowledge flaws, embrace imperfections, and prioritize shared vulnerability over individual triumph.

2. Vulnerability as a Transmedia Engagement Strategy

The transmedia structure of K-pop, documented by Piccialli (2020) and others, demonstrates how coordinated releases across multiple platforms can create coherent universes that invite co-construction by fans. *KPop Demon Hunters* adds a critical layer to this model by demonstrating that authentic vulnerability—not polished perfection—is what generates deep emotional engagement.

The ironic reception of the Saja Boys, who became more popular than the protagonists despite being deliberately constructed as empty façades, confirms the film's thesis. Contemporary audiences are drawn to the ease of consuming polished images. However, lasting cultural resonance comes from vulnerable authenticity. For branding professionals, this suggests that transmedia strategies should balance high-quality production with moments of genuine vulnerability and performative imperfection.

3. Archetypes as critique, not as model

The deliberate construction of the Saja Boys as a collection of masculine K-pop archetypes demonstrates how archetypes can be used critically, not merely as replicable templates. Whereas Gielarek-Gorczyca (2022) argues that Jungian archetypes simplify the construction of meaning in saturated environments, *KPop Demon Hunters* shows that exposing the archetypes themselves as artificial constructs can generate critical reflection on the industries that produce them.

For designers and branding professionals, this suggests a more reflective approach to the use of archetypes: instead of simply replicating established archetypal structures, considering how the exposure and subversion of these structures can generate more complex and culturally relevant narratives.

4. Performance and Authenticity in Brand Narratives

The climax of *KPop Demon Hunters*, the performance of "What It Sounds Like," demonstrates how the public performance of vulnerability can function as an act of resistance and transformation. This emphasis on performance as a synthesis of authenticity resonates with research on BTS fandoms, which illustrates how fans replicate the group's brand values in other spheres of social life (Wahyuningtyas & Kusuma, 2021).

For brand narratives, this suggests that authenticity is not a static or pre-existing quality, but something performed and co-constructed with audiences. Brands seeking authenticity should create spaces for consumers to perform their own values and vulnerabilities in relation to the brand, rather than simply consuming pre-fabricated narratives.

5. From the Hero's Journey to the Journey of Acceptance

Finally, *KPop Demon Hunters* proposes an alternative narrative framework that could be called the "Journey of Acceptance." Whereas the Hero's Journey asks "How do I defeat

the monster?", a Journey of Acceptance asks "What happens when the monster is part of you?". The answer, according to the film, is not to kill it, but to give it a microphone and a dance platform.

For design and branding professionals, this framework offers an alternative structure for narratives that address issues of identity, diversity, mental health, and imperfection. Instead of positioning the product or service as the "elixir" that solves external problems, the invitation to acceptance assigns the brand the function of a facilitator of expression and community—values increasingly relevant to contemporary audiences in a collapsing system.

6 FINAL CONSIDERATIONS

KPop Demon Hunters emerges as a paradigmatic case of postmodern narrative subversion, offering an alternative model to the ubiquitous Hero's Journey of Joseph Campbell. Through the analysis of the six main subversions operated by the film—a protagonist who fights against internal shame instead of external evil, a mentor who fails morally, an antagonist who is redeemed through compassion, allies who rebuild themselves through vulnerability, a reward that is acceptance instead of cure, and the public performance of imperfection as a climax—this article has demonstrated how contemporary narratives can transcend the limits of the Campbellian monomyth.

For professionals in design, branding, and knowledge media, the implications are significant. In a context of media saturation, demand for authenticity, and growing awareness of issues of identity and mental health, brand narratives that prioritize shared vulnerability over individual heroism offer greater cultural resonance and transmedia engagement potential. The "Journey of Acceptance," illustrated by *KPop Demon Hunters*—in which victory comes not from overcoming the inner monster but from its integration and authentic expression—offers an alternative framework for building brand narratives that acknowledge flaws, embrace imperfection, and facilitate community.

The film's commercial and critical success—more than 500 million views on Netflix, the Oscar for Best Animated Feature, and documented cultural impact—suggests that contemporary audiences are ready for narratives that transcend the traditional heroic model. As Rumi sings in "What It Sounds Like," they are not heroes but are still survivors [[nota: verso da canção parafraseado, por restrição de direitos autorais sobre letras]]. This declaration is not a confession of failure, but a recognition that, in the end, we are not solitary, invincible heroes. We are imperfect survivors, and that is precisely what makes us, collectively, something far more powerful than any Campbellian hero could be.

The question for design and branding professionals should not be "How do I apply the Hero's Journey?", but "What is the most appropriate journey for overcoming this challenge?". In an increasingly complex, fragmented world that is aware of its own imperfections, narratives that celebrate shared vulnerability may be not only more authentic but also more effective in building lasting connections with audiences.

Fernando Antônio Ferreira de Souza¹

ABSTRACT

Understood in media terms as a variant of *forró*, *piseiro* emerges today as a fluent expression in discourses of representativeness of popular and globalized culture, both Northeastern (*nordestina*) and national. Its use tends to supply images, imaginaries, and symbolic values that nourish the cultural industry more than the emic identifiers of tradition held by its practitioners and aficionados. Its transitory, emblematic, and politically articulated character—geared toward mass consumption—lays bare the decolonial problematic (QUIJANO, 2005) surrounding its emergence and use. The product of a collaborative ethnographic methodology, within the domains of a dialogical ethnomusicology, this article offers a reflexive approach based on the intersection of testimonies and accounts that structure the sonic discourses of *piseiro* music.

Keywords: Piseiro. Oral Tradition. (Trans-)local Media. Perré. Decolonial.

RESUMO

Sob a compreensão midiática de variante do *forró*, o *piseiro* emerge na atualidade como expressão fluente em discursos de representatividade de cultura popular e globalizada, nordestina e nacional. Seu uso tende a suprir imagens, imaginários e valores simbólicos que nutrem mais a indústria cultural que identificadores êmicos de tradição de seus praticantes e aficionados. Seu caráter transitório, emblemático e politicamente articulado para consumo massificado desnuda a problemática decolonial (QUIJANO 2005) que envolve seu surgimento e uso. Fruto de metodologia etnográfica colaborativa, sob domínios de uma etnomusicologia dialógica, este artigo contempla abordagem reflexiva a partir do cruzamento de testemunhos e depoimentos que estruturam discursos sonoros da música do *piseiro*.

Palavras-chave: Piseiro. Tradição Oral. Mídias (trans-)locais. Perré. Decolonial.

RESUMEN

Entendido en términos mediáticos como una variante del *forró*, el *piseiro* emerge en la actualidad como una expresión fluida en los discursos de representatividad de la cultura popular y globalizada, tanto nordestina (*nordestina*) como nacional. Su uso tiende a suplir imágenes, imaginarios y valores simbólicos que nutren más a la industria cultural que a los identificadores émicos de tradición de sus practicantes y aficionados. Su carácter transitorio, emblemático y políticamente articulado —orientado al consumo masificado— pone al descubierto la problemática decolonial (QUIJANO, 2005) que envuelve su surgimiento y uso. Fruto de una metodología etnográfica colaborativa, dentro de los dominios de una

etnomusicología dialógica, este artículo plantea un abordaje reflexivo a partir del cruce de testimonios y relatos que estructuran los discursos sonoros de la música del *piseiro*.

Palabras clave: Piseiro. Tradición Oral. Medios (trans)locales. Perré. Decolonial.

1 IN TIMES OF OPEN EXPRESSIVENESS – AN INTRODUCTION

In global times, one perceives the predominance of flexible spaces of relation in which the insertion of personal and particularized interests allows the simultaneous creation of private worlds that are distinct from one another. Micro and individualized worlds that become socially dominant to the detriment of earlier actions and arenas that tended toward anonymity and the low visibility of the common person in the face of rules and criteria instituted and institutionalized by their community, by their society. So that each self-absorbed individual then seeks personal fulfillment in public spaces of visibility. Times in which technologies bring similarities of discourse closer together and nourish contexts of the massification of perspectives, tendencies, and expectations, dreams and accomplishments, amid antagonisms. Everyone feels they can move through various arenas of social values without insurmountable barriers.

Mediatization presents itself as motivating and seductive by promoting paths to the realization of interests. Its few restrictions and impediments make possible inclusive and personalized decision-making. Access alone suffices, as the first condition for the concrete construction of possibilities; the courage and perseverance to chase after the realization of symbolic values, through the acquisition of technological know-how as a method. And beyond that, a pinch of creativity suffices; and, as many say, "luck," for successful social recognition. Various fields of knowledge and social practice are grounded in these bases, driving people from all spheres and categories to consider that they can accomplish something, that they can socially demonstrate their worth. A fierce and militant dream that ardently seeks to see itself realized. As if the present moment represented a unique opportunity for fulfillment to be urgently seized—a fissure that opens onto what previously, in distant times or in the recent past, was not [politically, economically, or socially] possible, but which now is.

Music, like other mediatic planes of personal exposure, emerges as an arena of projection that shortens these private worlds. To think about musical expressiveness no longer implies thinking about a common collective function of inclusion and representation of a tradition or collective memory. Now, people seek personal projection as individualized protagonists, even if for acceptance within the collective. And this projection, when it achieves broad social receptivity, promotes the phenomenon of the influencer—a figure who mobilizes followers to adopt mutually convergent behaviors and perspectives. Here emerges the rise of images, of imaginaries, and of symbolisms shared by common sense. The rise of a character, of a physical person (or their respective collective), as much as of an ideological brand of consumption or of identity proposition that can be reproduced and represented (directly or resignified), comes to manage new values of taste and behavior within the

collective. And from this perspective, markers celebrated by the entertainment industry emerge, such as *samba*, *baião*, *forró*, *axé music*, *piseiro*.

In light of Quijano's thought, there is no sense of achievement without the experience or awareness of impediments and conflicts. This makes actions in present times a constant struggle in the search for being able to do, being able to accomplish, being able to prove what one can be—what one is capable of. Feelings of this nature reveal to us a fluid world (BAUMAN, 2003) underpinned by intangible values, even if symbolically concrete in the collective imaginary promoted and grounded by mediatized agenda-setting. And music is integrated into this sphere of values of experiences.

Following a decolonial perspective (QUIJANO, 2005) for the use and awareness of terms that impact the ways of doing and being of everyday *habitus*, this article directs its lenses toward *piseiro* music as a local, glocal, and global argument of representations of Northeastern Brazilian and national popular culture that nourish a complex of imaginaries and symbolisms that mobilize music as a marker of identities (LUNDBERG, 2010).

The argument at hand takes as its reference an approach within the dialogical domains of ethnomusicology developed by me since 2003, together with emic practitioners of oral traditions and professional musicians of the Pernambuco and global scene. The methodology that guided the present argument involved the cross-referencing of local testimonies and accounts about the concept of elements of oral tradition that structure sonic discourses and their forms of implementation as markers of Pernambucan, Northeastern, and national music. Moreover, the present article followed an ethnographic character under eminently collaborative parameters (CAMPBELL and LASSITER, 2015), taking as its reference the emic voice of *brincantes* [[nota: "brincantes" — termo êmico para praticantes/participantes de manifestações culturais populares (foliões, dançadores, performers da tradição); mantido no original por não haver equivalente exato em inglês]] of the popular tradition regarding their musical productions, cultural values, and understanding of their forms of musical expression in the field of mediatic popular music, as well as the discourse of musicians, arrangers, and composers from Pernambuco and Ceará, in addition to a cross-referencing of perspectives with accounts circulated on the web about *piseiro*.

2 POUND THE FLOOR, STEP THE *PISEIRO*!

Understood in media terms as a variant of *forró*, *piseiro* emerges today as a fluent expression in discourses of representativeness of Northeastern Brazilian and national popular culture. Such a stylistic categorization as a variant of *forró* nourishes a complex of imaginaries and symbolisms that drive the productive machine of identity markers

(LUNDBERG, 2010). Composing an expressive arsenal across various spheres of everyday media strategies and agendas, *piseiro* also propels the phonographic market of segments other than *forró*—such as *paredões*, *sertanejo*, *brega funk*, *MPB*, and *forró eletrônico*—becoming recurrent in various arenas of present-day music.

2.1 BUT WHAT IS *PISEIRO*, FOLKS?

Piseiro is not a rhythm, as is disseminated by the media. And, more properly, we should avoid the use of the term "rhythm" for what we understand as an expressive practice. The web is replete with descriptions and categorizations of the *piseiro* practice, which at first does not make the effort to understand it complex. Furthermore, the problematic contained in the culture of naming everything as a rhythm or musical genre empties the meaning of the idea of classifying a practice as fixed, unique, differentiated. From this perspective, thinking in the watertight conceptualization that something is unique and systematically distinguishable renders the aim devoid of force, such that any sonic proposition may be called a rhythm, a genre, a pattern at a given moment, and immediately afterward be stripped of those categories upon the emergence of the new. Hence, by induction, a style of music-making is taken under the term *pisadinha*, and within a short span of time a new label is created for the same practice under the name *piseiro*.

In its emic origin, the term *piseiro* makes cultural reference to the act of rhythmically beating the feet on the ground, which immediately reveals to us the links between the word and the act. In cities of Piauí, the term *piseiro* has connotations applied to the place where one goes to dance, certainly with the beating of the feet to the rhythm of the music. This form of association is not foreign in Indigenous bases of the Northeast, as throughout the country. The beating of the feet on the ground marks multiple forms of relation with place and with life. In Pernambuco there is a related term called *trupé*, for the percussive expressiveness produced by the beating of the feet by anyone involved in a ceremony or festivity. An expressive model present in much of the cultural practices of oral tradition centered on foot-tapping and foot-stamping, as in the Indigenous *torés*, *caboclinhos*, *mazucas* of the Agreste Pernambucano, *xaxado*, *coco de tebei*, *coco do Agreste*, *coco de praia*, *ciranda*, *cavalo marinho*, *marujada*, *fandango*, etc. Such an association already brings us to an understanding of the use of the terms *piseiro* and *pisadinha* under discussion in this article, as well as of the regional use of the term *arrasta-pés* (or, locally, *rasta-pé*) for the conscious act of dragging the feet in local traditional or ballroom dances—such as *baião*, *xote*, *xaxado*, etc.—when the dancer is guided by the prominent marking of offbeats (in Northeastern music) to give rhythm to their performance on the dance floor.

José Alexandre da Silva Filho—singer and composer of *forró eletrônico* and entrepreneur, with the stage name Xand Avião, born in Itaú, in the interior of Rio Grande do Norte, known for having been part of the vocals of the band Aviões do Forró between 2002 and 2018—during an interview given on February 1, 2022, to the hosts Mítico and Igor of Podpah, drawing on his experience in the Northeastern and national music scene from the beginning of his musical career in Apodí, still in Rio Grande do Norte, and later in Exu, in Pernambuco, stated that *piseiro* was nicknamed a rhythm but that it is not a rhythm. And that in Piauí people say "*umbora pro piseiro*" ["let's go to the piseiro"] when they mean the term "*balada*" [club night], dance hall, party, merrymaking.

In response to the question about the origin of the term *piseiro*, Xand Avião, drawing on his experience in the market and his actions as an entrepreneur, explained:

And Os Barões da Pisadinha took this rhythm—whose correct name is *pisadinha*—and called it *piseiro*. And I like the name *piseiro* better, and that's why it caught on! ... So *piseiro* was a place where people danced. And *piseiro* is a derivative of *forró*, of *forró eletrônico*. [Testimony of Xand Avião in an interview given to the Podpah channel on February 1, 2022 – timestamp: 1'54 to 2'06]

In its origin, the concept attributed today to *piseiro* was created in the early 2000s in the north of Bahia, in the city of Monte Santo, by Nelson Nascimento, amid the full spread of the COVID-19 pandemic [[nota: o texto situa a "origem" no início dos anos 2000 e, ao mesmo tempo, "em plena propagação da pandemia COVID-19" (2020); há aparente inconsistência temporal no original — recomenda-se verificar]]. In his proposal, he decided to adapt to the keyboard musical ideas that emerged from three rhythms he juxtaposed: *pagode baiano*, *xote*, and *fandango* (also called *marujada* in the Northeast). The context of social isolation promoted successful spaces for performances reduced to a single instrumentalist who, equipped with a keyboard, a speaker, and microphones, could produce a sonority similar to that of *forró eletrônico* and *swingueira*.

The initial proposal was the target of criticism for having in its formation only keyboard and voice. The period of its emergence—before and just after the pandemic—was marked by full bands with various instruments on stage. *Pisadinha* was thus restricted to home events, country properties, backyard parties, bars. Nelson Nascimento broke these barriers, managing to take the stage with other instruments such as sax and guitar. The melody and the sung theme became his calling card, owing to the persistent resistance to an instrumental formation centered solely on keyboards. Many instrumentalist musicians and arrangers did not like the initial format of *pisadinha*, also called *forró de paredão*.

Testimonies pointed to critical discourses, in comparative analysis, of what *forró* was before the new trend stemming from the pandemic, and of what changed in the practice of *forró* after the emergence of *piseiro* on the Northeastern scene. As an example, I point to the characteristics of the testimony of professionals from the interior of Ceará, based on the account of Nilo (a codename adopted here for the collaborative contribution of a multi-instrumentalist musician who did not wish to be identified), when he referred to the tendencies in perspectives among local musicians regarding *piseiro*:

In the beginning, *forró* had a more romantic and danceable character, with well-elaborated lyrics and arrangements and with quite virtuosic musicians. Today a new strand is emerging, present throughout the Brazilian musical scene, called "Piseiro." With more relaxed lyrics and an engaging rhythm, it is already a national craze. Unlike its predecessor ("*forró de paredão*"), for example, which did not please a good part of the audience because of the content of the lyrics, which did not value creativity and which emphasized the percussive elements more (the *caixa cachorrinha* and the *repique*) [[nota: "caixa cachorrinha" e "repique" são instrumentos/técnicas de percussão (caixa/tarol em estilo característico e tambor agudo); mantidos no original por serem termos êmicos sem equivalente exato]] to the detriment of the voice, which could barely be heard. ["Nilo" in a testimony given on 08/19/2021].

Against this backdrop, between 2007 and 2010, bands emerged in the sonic format proposed by Nelson Nascimento, such as the band Brega e Vinho and the band Cintura de Mola. However, these bands sought to give body to their stage formation by adding instruments and dancers in addition to the keyboard.

The band Brega e Vinho (BANDA BREGA E VINHO DVD Completo - Bing video) brought as a predominant element a base in the musical style of the *guitarradas*, which could be transposed to the base of the accordion (*sanfona*), or to accordion timbres on the keyboard. Featuring drums played in *ostinato*, as if in a loop, in the style of a supposed electronic keyboard beat—similar to that of *swingueira* or stylized *forró*—its sonic proposal was associated with Nelson Nascimento's original idea by preserving as dominant the electronic dynamic and timbre of the keyboards. The electronic marking was structured on a beat of rim shots (*estalitos*) in syncopation that reminded me of the *perré* (a touch-pattern proper to the *caboclinho*, which will be addressed just below), in addition to offbeat accents on the cymbals in reference to the *arrasta-pé*. In this arrangement, the rhythmic line of the *perré* was reinforced in the bass line. And beyond the cited instruments (keyboard, accordion, bass, drum-kit percussion, and guitar), the stage was filled by vocalist performers and a performative group of dancers.

The band Cintura de Mola (CINTURA DE MOLA DVD 2016 COMPLETO - Bing video) brought as a predominant element a base of its own keyboard timbres, in a mode similar to

the sonority of *swingueira*, with stylistic marks of a recurrent *merengue*, presenting rhythmic lines peculiar to the *guitarradas* and *lambadas*. Like the band Brega e Vinho, Cintura de Mola presented the same base organized from the *perré* beat, which, recurrent, marked the percussion and bass line played on the keyboard.

Musicians of other strands—and mainly of dance-hall (*baile*) music—interviewed by me in Pernambuco and Ceará, indicate a preference for a taste for *piseiro*, to the detriment of the proposal of the *pisadinha* compositions, considered to have a tendency toward the sensuality and irreverence of Rio de Janeiro *funk* (*funks cariocas*), whether in the sung themes or in the stage performance. But it is necessary to ponder that this more irreverent stage style maintains close ties with the proposal of *swingueira*, in addition to the heavy beats (*batidões*) of *funk carioca*. As well as that the context of *piseiro*'s projection began in sound walls (*paredões*) organized in public spaces such as squares and suitable lots, where the peaks of interest revolved around the gathering of different tastes around common themes of various orders, favoring the adherence and financing of local commerce and the partisan actions of political and ideological strands.

The process of adapting *pisadinha* to the *piseiro* format was honed over a period of approximately 10 years. The instrumentation style was gradually adapted to new arenas, such as those of the sound walls (*paredões*), to which some modifications were added that currently name the *piseiro* style. The initial *pisadinha* did not gain much in timbral nuances of low and mid ranges and more elaborate effects. The resources were limited and without much purpose for timbres and diversities. Its advances as a mediatized category emerged as a result of the gain in lows and mids, and of the articulation of effects imported from international electronic music and from pop music. In part, this transformation was engineered by the hands and taste of the MCs of the sound-wall systems, who maintained a certain connection with sonic elements of global pop music.

Enveloped by this arena of human actions, *piseiro* opened the door to new interpretive dimensions. And one marker of this change was the emergence of the band Os Barões da Pisadinha, around 2017 to 2018, which generated much acceptance in the Northeast and a large part of the country. Among their hits, "Bora pro piseiro" stands out (Os Barões Da Pisadinha - Bora Pro Piseiro (Clípe Oficial) - Bing video).

The popularity of this musical format was even appropriated in the promotion of Brazilian soccer in 2021 by various outlets in the version of the song "Bora pro piseiro," by Os Barões da Pisadinha, under the title "Bora, bora, bora pro ge!" (Globo Esporte CE | Bora, bora, bora pro ge! Jogadores de Ceará e Fortaleza dançam piseiro do Premiere | Globoplay). Or even in the 2022 presidential election process, when the song "Tá na hora do Jair Embora"

(TÁ NA HORA DO JAIR EMBORA - MADERADA - MÚSICA NOVA - Bing video), by Juliano Maderada and Tiago Doidão, emerged nationally—a song that initially had a version in the *piseiro de paredão* style with rhythmic bases of *guitarradas* in the style of *carimbó*. [[nota: "Tá na hora do Jair Embora" é canção de teor político-eleitoral associada a figura pública real; mantida como título no original, sem juízo de valor, conforme o caráter descritivo do artigo]]

Aggregated to the *junino* (June-festival) scene, *piseiro* has its prominence extended beyond the *São João* festivities of the Northeast. Its similarity with the interpretive characteristics of *swingueira* and *arrocha* allows me to understand the emergent value that *piseiro* provides to the phonographic market, which draws on the same profile of audience and performances throughout the year.

2.2 A PERRÉ? – MARKS OF THE INDIGENOUS HERITAGE OF PISEIRO

The *piseiro* addressed here reveals Indigenous ties that are still little discussed. Starting from the premise of a direct origin with the *perré* touch of the oral tradition of the *caboclinho* occurring in Pernambuco, this part of the article will seek to argue observations that emerged from ethnographic studies in collaborative molds developed by me, together with emic practitioners of expressive practices of oral tradition, since 2003.

Piseiro, or *pisadinha*—the original term for the rhythm—presents in its structure a local pattern recognized in various arenas of activity of Northeastern musicians and appreciators. This pattern highlights expressive forms of interpretation and performative creation, whether in compositions, in the articulation of diverse instruments, or in the population's ways of dancing and singing. Musically, experience and cultural familiarity with this pattern allow expressive performances to develop fluidly—what we might understand as a marker of the Northeastern accent, or even of the Brazilian people.

In its use, musicians manage to move with ease within a musical event such as that of *forró*, which encompasses various stylistic sonorities of traditional language.

In its practice, hands-on musicians intuitively perform a kind of folding of the *perré* rhythmic structure, argued here, into their respective proposal of sonic language during their exercise of interaction in the musical theme and style in which they find themselves involved. Their performance will be projected onto their form of integration with the sonic ensemble, whether through their respective instrument, their vocal articulation, or their expressive way of dancing. Here, the musical expressive vector leaves the bubble of being solely of the stage, or restricted to competencies in the manipulation of musical instruments. Popular expressiveness does not mark limits of competence for interaction or integration with a musical event. For this reason, in theory, Northeastern festivities enjoy broad adherence from

a population that is not intimidated about dancing and singing in public, even without having previously studied music theory. Here a character referred to by Thomas Turino (2008) for collective participation in popular events is made evident, as we can observe in the Pernambucan carnival, the June festivals (*festas juninas*), etc.

The term *perré* designates a movement proper to the *caboclinhos*, who in Pernambuco enliven the local carnival, with predominance on the coast and specifically in the capital, Recife. The *caboclinho* is considered the oldest danced rhythm in Brazil, first recorded in 1584 by Fernando Cardim on the occasion of the missions organized by catechists. The term *caboclo* was used to designate one who had lost the social and cultural identity of their Indigenous nation, but in an urban context it came to refer to those generated by the racial mixing of Indigenous and white people. Moreover, the term *caboclo* also admits being applied to spiritual divinities typical of the houses of worship of *catimbó* or *jurema*.

As music, the *caboclinho* refers to the expression folklorically associated with a drama that symbolizes memories of battles and hunts of natives. Its structure is light and nimble, performed with *taboca*-cane *pífanos* (fifes) or metal flutes, a small drum, and *caracaxás* (a type of multiple *maracá* fixed on a single grip rod), in addition to the marking in the clicks (*estalitos*) of *preacas* (an emic musical instrument in the shape of a bow and arrow). The music may be performed in movements that alternate according to the context, having as movements: the *perré* (the slowest and most cadenced, in homage to a mythical character called Perré), the *baião* (an accelerated touch with executions filling out the measure), the *guerra* (an accelerated touch more widely disseminated as a marker of *caboclinho* music, with an execution quite close to what is done in the *perré*), and the *macumba* (a touch similar to that of the *perré* and to the fill articulations of the *baião*, performed predominantly on the *conga do caboco* or *atabaque* [drum]). As can be observed at the link: Especial Pernambuco Vivo: Caboclinho Sete Flexas - Bing video.

As a form applied to the rhythmic language of local expressive practices of Pernambuco—and glocal ones perceived by me in other arenas of the Northeast—the *perré* presents in its execution a background marking in offbeat articulated by *caracaxás*, as well as a marking of rhythmic pulse produced by the clicks of the *preaca*, over which a syncopated drum rhythm is developed as a base for the fluidity of the melodic phrases of the flutes.

This syncopated beat, specifically, later became a hallmark in *piseiro*. And its notoriety in the local sonority was increased by its recurrence in various other rhythms practiced in the Northeastern sonic panorama. Studies developed by me on the expressive accent of Northeastern musicians pointed to the importance of this respective beat as a rhythmic pattern common to various expressive sonorities in the Northeast. Its classification finds

seduction, romantic disillusionment, doubt, debt, retaliation, fun, the comical, politics, the detachment from social values in favor of pleasure, in addition to other themes and topics in vogue in this popular strand—formerly also categorized as proper to "the people," to "the masses." And, in a reductive sense disseminated by classifications of power, included in the *brega* (tacky/kitsch) mode of the multitude.

Piseiro assumes an expressive role of connecting interests; it brings closer and activates diverse and personal forms of identification. This dialogical state of relations between the private and common facts, in collective popular empathy, when impregnated with a local Northeastern discourse—under linguistic forms of verbal expressiveness in a specific accent—comes to be framed by the media as *forró*. Here, once again, highlighting the decolonial character reinforced by folklorism, which still nourishes, in current times, stereotypes applied to emerging minorities of Northeastern regionalism as markers of difference.

The conception massified by nationalism reveals no efforts to pacify conflicts and implement a common sentiment between the national and the local perspectives of identities. *Piseiro* reveals itself as a marker of regionalisms and of class, supplying a political-economic demand for the differentiated and unbalanced categorization of the cultural values of peripheral identities. The difference highlighted among regional forms of expressiveness fosters in society the estrangement and curiosity that drive the symbolic consumption of the exotic. An action that becomes strategic for forms of exploratory management of the production and dissemination of market segments. Thus, the sensation and expectation that surround modes of relation with processes of mobilization, resignification, and renewal of perspectives are formed as pertinent. Conceptions and tendencies that highlight what is not seen in everyday life, or what is little known.

Globalized agenda-setting takes the reins of the articulation of values, favoring predictable references of consumption. The economic vector of change through the emergence of the new mobilizes the entertainment market, landing access to new hits, new expressive tendencies, new sonic resources. The crossing of interclass discourses conveyed in *piseiro* makes it fluent, simplified, and easily accessible, even if it is perceived as performed with diverse resources—between the sophistication of globalized pop music and the rustic beats of *xote*, *brega*, *pancadão*, or even of local oral-tradition expressive practices. It is perceived that *piseiro*, as in the case of *forró* (SOUZA, 2021), shows itself to be imprecise across each emic form of understanding and use of the term. Its description, among musicians and aficionados, reveals a confused and imprecise understanding of the practice itself. The testimonies point to understandings of the sonic practice as a "brand," or marker,

that defines or concretizes sonic images associable with or linked to a set of products, logos, or segments of the production of images and imaginaries that nourish the cultural industry. The intangible character of the *piseiro* sonic format, added to the symbolic values associated with it in a fluid manner (BAUMAN, 2003), reveals processes that materialize displaced spaces and times of consumption of ideas, ideologies, behaviors, and products.

The ambiguity and imprecision of the understanding of the practice is not restricted to its direct practitioners (musicians and target audience). It is noted that the official representations contained in the media literature do not entirely converge with what musicians understand of the term, since *piseiro*, as a term recurrent in everyday life, serves only as a marker of what should be played to supply market demand and its respective representations. The unconcern or disinterest with the meaning or conceptualization associated with the term reveals that musicians play without thinking and knowing what they play. And from the lack of commitment to the facts, or the misunderstanding of what one does, the decolonial problematic that governs globalized consumerist tendencies is laid bare.

In the effort to supply this deficiency, podcasts, blogs, columns, and media reports circulated on the web create arbitrary references and conceptualizations on the basis of cultural studies and folklorist narratives. This raised the pertinence of opening a reflexive field about what we believe we know and do not know, considering that mechanized discourses of this order may represent "ready-made phrases" uncommitted to a known or estimated truth.

ABSTRACT

In the everyday soundscape of Pernambuco, links are evident between the musical language of local indigenous peoples represented in the caboclinhos carnival groups. These links point to the presence of a local expressive pattern that influenced the development of the musical and expressive language of the Pernambuco people, even though literature has ignored this Amerindian cultural vector as a marker of the people's identity and local culture. The music, dance, and expressive language of the caboclinhos' singing express a common identity in the perré rhythm that can be observed as present in other local expressive forms of urban music, such as forró, baião, xote, coco, maracatu, embolada, ciranda, and other forms expressive of local identity. In this approach, perré emerges as an element that verifies the presence and importance of an indigenous language first identified around 1535 by Father Fernão Cardim. This expressive form, currently shared in the everyday lives of popular culture, both oral and media-based, represents markers that reveal vectors of nuances in popular culture that may have originated with the local Indigenous people. This paper focuses on a dialogical ethnomusicology that seeks to understand the intersections between media music and a possible Indigenous origin of common patterns in Pernambuco culture. This approach emerged inductively from the analytical intersection of testimonies and testimonies gathered in ethnographic fields since 2003, as well as from the examination of forms of representation as a musician, teacher, and researcher.

Keywords: Dialogical Ethnomusicology. Perré. Musical Language. Indigenous Standard.

RESUMO

No cotidiano do panorama sonoro pernambucano percebe-se vínculos entre a linguagem musical de povos originários locais representados nos grupos carnavalescos de caboclinhos. Esses vínculos apontam para presença de um padrão expressivo local que influenciou na edificação da linguagem musical e expressiva do povo pernambucano, ainda que a literatura tenha ignorado esse vetor cultural ameríndio como marcador de heranças identitárias do povo e cultura local. A música, a dança e a linguagem expressiva da cantoria dos caboclinhos exprimem uma identidade comum no toque do perré que pode ser observado como presente em outros modos expressivos locais da música urbana, como no forró, no baião, no xote, no coco, no maracatu, na embolada, na ciranda e outras formas expressivas da identidade local. Nesta abordagem, o perré emerge como elemento de verificação da presença e importância

RESUMEN

En la cotidianidad del panorama sonoro pernambucano se perciben vínculos entre el lenguaje musical de los pueblos originarios locales, representados en las agrupaciones carnavalescas de *caboclinhos*. Estos vínculos apuntan a la presencia de un patrón expresivo local que influyó en la construcción del lenguaje musical y expresivo del pueblo pernambucano, aunque la literatura haya ignorado este vector cultural amerindio como marcador de herencias identitarias del pueblo y la cultura locales. La música, la danza y el lenguaje expresivo del canto (*cantoria*) de los *caboclinhos* expresan una identidad común en el toque del *perré*, que puede observarse como presente en otros modos expresivos locales de la música urbana, como en el *forró*, el *baião*, el *xote*, el *coco*, el *maracatu*, la *embolada*, la *ciranda* y otras formas expresivas de la identidad local. En este abordaje, el *perré* emerge como elemento de verificación de la presencia e importancia de un lenguaje indígena identificado por primera vez hacia 1535 por el padre Fernão Cardim [[nota: en este resumen se indica "hacia 1535", mientras que en otro texto del mismo autor el registro de Fernão Cardim se data en 1584; se recomienda verificar y uniformizar la fecha]]. Esta forma expresiva, actualmente compartida en las cotidianidades de la cultura popular de tradición oral y mediaticizada, representa marcadores que revelan vectores de matices de la cultura popular que pueden tener origen en el indígena local. Esta comunicación se centra en una etnomusicología dialógica que busca comprender las intersecciones entre la música mediática y un posible origen indígena de patrones comunes de la cultura pernambucana. Este abordaje emergió inductivamente del cruce analítico de relatos y testimonios obtenidos en terreno etnográfico desde 2003, así como de la verificación de formas de representación como músico, profesor e investigador.

1 INTRODUCTION

This communication was born from the identification of the occurrence of markers of local Indigenous identity in the expressive music of Pernambucan popular base. The importance of this verification emerged from the concrete identification of an order of sociopolitical-cultural values (and their unfoldings) determinant of a sonic panorama of urban and mediatic everyday life that proved associable with the expressive habits and practices of Indigenous matrix. Such a category of data brings to the worldviews of present times a new line of comprehension and valorization of the Amerindian element in everyday life, opening upon this element of local identity more inclusive and multifaceted forms for what is heard and how it is heard on global planes.

The problematic of this verification lies in the fact that such sociopolitical-cultural values linked to an Indigenous matrix manifest themselves in the intuitive and colloquial thought of musicians and popular *brincantes* without these subjects having clear awareness of their existence, even though it is there in their particular ways of thinking such musicked practices. Moreover, this line of intuitive and colloquial thought of Indigenous matrix verified here, present in local popular music (mediatic and of oral tradition), revealed itself in the quality of active vectors present in the culture and musical language of the Pernambucan people, even though politically these vectors are socially disregarded and, for this reason, invisible or barely perceptible.

However, even if socially and politically concealed and appropriated under the decolonial veil of shame and forgetting, the lack of knowledge of these links (in the discourses, testimonies, and arguments that I was able to ethnograph in the terrain of roots and mediatic music) does not represent the nullity of their existence in the cognitive complex of musical behaviors in the *xotes*, *baiões*, *cocos*, *cavalo-marinheiros*, *reisados*, *marujadas*, *cirandas*, and other expressive practices that nourish the peculiarity of a supposed musical accent of the Pernambucan people. Would elements of Indigenous matrix be contained there? Or is everything that is heard or musically thought in Brazil, in the Northeast, and in Pernambuco of a solely European and African base? How do the various cultural vectors and matrices of a hybrid culture such as the Brazilian one in fact manifest and occur in everyday life? And could it be that the musical expressive heritages of the various cultures of local original peoples were totally eradicated, or never existed? And if they existed, or still persist in a veiled manner, how do they manifest themselves in local thought?

This line of concerns and interests came to guide the present approach, considering that its unfoldings may come to open new lines of contribution for future indigenist studies regarding elements or vectors determinant of the proper and particular ways of Indigenous

cultures in each geopolitical space of occurrence (community, neighborhood, city, or region) and of the ways in which people think their practices. A dialogical proposal that favors giving equal value both to the voice of the makers of their own identity and to the voice of the discourses of the specific literature.

The problematic perceived regarding barriers and impediments to listening to the voices of the holders of knowledge emerging from local orality directly impacts the very practice of the oralized tradition in present times, for it causes a potential effect of misinformation. After all, what is "Indian music" (*música de índio*)? How does one distinguish it? What is its occurrence and impact in the globalized world?

And from this viewpoint, science, in its eagerness to systematize and categorize diverse intangible forms of knowledge on structuralist bases, errs by not considering the main variant and edifying element of the ethnographic approach: the original holder of the knowledge. And as a consequence of this action, groups of eminently distinct cultural bases come to be framed within a single profile arbitrated by the systematizer, like pieces of the same category, similarity, or functional equality on a game board. From which there historically resulted conflicts between distinct groups placed in the same arena of values and relations by folklorist approaches, inducing them to dispute for recognition and social respect. As when expressive groups of a locality compete among themselves for possession of the legitimacy and authenticity of their practice. Or when the very actions of cultural policies reinforce a hierarchy of competencies and the competition between expressive groups for the authenticity and peculiarity of their practices.

As I inductively verified in recent studies of local music and tradition (Souza 2006; ...), these Indigenous-based vectors manifest themselves in a veiled manner through a complexity of historical factors, in turn, as already mentioned, aggregated to a decolonial order of conceptions. And as pointed out, in the arenas of my investigative terrain their manifestation emerged inductively from the ethnographed voices and ordinary ways of doing, leaping to my eyes as signs that progressively alerted my sensibility to the existence of certain marker vectors not previously perceived. For this reason, the present communication projects my interest toward the comprehension and understanding (induced and systematized) of human musical thought from a dialogical approach that considers the voices "of what is said," "about which it is said," and "of what is done." In this sense, the data contained here sought to make evident musical and extramusical values through a qualitative, exploratory, and investigative methodology of "ways of doing" that are not controlled by the dominant musical grammar and by the formal pedagogical praxis of Eurocentric base, which predominantly governs, regulates, and controls musical thought in contemporary society.

O dom, o talento e o marcador de base indígena na música local

In the colloquial musical practice within popular expressions that I verified together with subjects who are holders of a popular language intimately linked to matrices and nuances stemming from oral tradition, I perceived the recurrence of intuitive and spontaneous abilities and competencies that, when successful, emerged from a familial, communal, and emotive experience acquired by direct contact with orality. The terrain of observation encompassed twelve municipalities of the Pernambucan coast (Goiana, Itapissuma, Itamaracá, Igarassu, Paulista, Olinda, Recife, Cabo de Santo Agostinho, Pontezinha, Ipojuca, Nossa Senhora do Ó [[nota: o original traz "Nossa Senhora do Ò"; provável erro de acentuação por "Nossa Senhora do Ó"]], and Tamandaré) and four municipalities of the *agreste* (Caruaru, Camocim de São Félix, Sairé, and Agrestina) [[nota: o original anuncia "doze municípios" do litoral, mas lista onze nomes; recomenda-se verificar]], observing musicked practices and their expressive ways of music-making, resorting to semi-structured and open testimonies in a context of participant observation as an instrumentalist and apprentice of the local ways of performing.

The ethnographic process was developed from 2003 to 2018. Sixty practitioners of various popular manifestations were interviewed. From the total number of interviewees, on the basis of the attribute of the level of collaborativeness, I selected voices with which I developed an ethnographic study that resulted in a doctoral dissertation and the respective book on the *coco de roda*. And from this investigative terrain I cite, as an example, some of the ethnographed voices:

Figure 1

SOME ETHNOGRAPHED VOICES

From this contact in diverse arenas of local expressive production, I identified the validity of fragments of testimonies from which an Indigenous vein was pointed to in practices predominantly identified as of African base in Brazil. From which I considered seeking to understand "what it is like to make music and to musicalize social contexts outside formal thought," since the spontaneous thought of a colloquial language, in its practicality, tends to be little considered by common sense for not being strictly linked to the dominant method, proper to official knowledge, oriented by an objectivity and systematization grounded in theoretically reliable, sovereign, neutral, precise, and verifiable procedures. Knowledge that in practice does not legitimize the emotive and intuitive practice of non-literate practices, such as those of oral tradition, by considering them a source of acritical knowledge on the part of those supposedly incapable of exercising or demonstrating abilities to evaluate or cognitively question their own propositions in a well-founded manner. Framed within this illiterate category are the expressive practices of original peoples, Roma people (*ciganos*) [[nota: "ciganos" traduzido como "Roma people"; termo preferencial em inglês — recomenda-se confirmar se o autor se refere especificamente ao povo Roma/Romani]], subaltern cultures, and suburban minorities, as tensional arenas between center and periphery perspectives. A datum that, reflexively applied to the present time of intercultural and interclass relations, demonstrates the existence of bordering barriers as to what may be legitimized and recognized without reductionist stereotypes. Barriers that inflict shame or a feeling of inferiority upon those holders of unwritten (*ágrafa*) ways of doing not celebrated by erudition—such as the colloquial category of those popularly called: self-taught (*autodidatas*), "ear musicians" (*músicos de ouvido*), "intuitive musicians," "musicians by hearsay" (*músicos de orelhada*), "fixers" (*quebra-galhos*), "jacks-of-all-trades" (*pau-prá-toda-obra*), "blind knots" (*nó-cego*), "do-it-alls" (*faz-tudo*).

Moreover, the complexity of this problematic, of decolonial base, reaches the ways in which even ethnographic approaches may come to dwell on expressive practices as describable phenomena of the exotic, the mystical, the magical; formulating essentialist readings and the reification of identities, worldviews, or cultures. A problem that demands a serious revision, considering the terrains of investigative ethics, since it involves processes of transforming identity values—intimate and private—into a spectacle of others' lives through a theatricalization of their everyday lives, in which individuals become actors, characters, spectators, or extras in their own lives. This essentialization runs the risk of transforming the creative power of popular expressions into something mystical, exotic, and spectacular, in addition to disseminating it as something articulated in a little-reflected manner, captured out of thin air in an unforeseen, random, and involuntary way—as if each creation were unique

in itself due to pure limitations of conscious reproducibility on the part of its maker. A datum that fosters judgments that this colloquial practice manifests itself through a vague mode of creation, without critical depth. And against the grain of this line of judgments, my approach sought to identify what is exact, reflexive, rational, and coordinated in the ways of thinking of the practitioners of expressions linked to orality, considering their projections in popular and plural practices already mediatized, such as the *forrós* and the *bregas*, for example. After all, would we be able to recover the real value of Indigenous contributions in what we do and hear in everyday life?

This theme further points to the fact that the musical thought of Indigenous peoples needs to be better considered for its real and possible contribution to the understanding and comprehension of significant markers of the musical thought in activity on the expressive scene of Pernambucan culture. Beyond which, this awareness may favor the legitimation of the voice of local original peoples in the eyes and discourses of public policies, the entertainment industry, and mediatized terrains regarding the role of Indigenous culture in the edification of the identity of the Pernambucan people. It is hoped that from this recognition a new reading of characteristics of popular expressive production will emerge, through possible links with Indigenous traditions, which at present remain restricted to the field of contemplation without much contributive visibility.

The very idea of improvisation in performative phenomena that are open and free of a regular prediction of their results—such as the *embolada* and the *repente* in popular *cantoria*—came to be framed as acritical music, for being possibly produced without concrete reflexive questioning in light of erudite formalism, or for emerging from beliefs that are imprecise or unfounded by tradition, or even as the attribute of a gift. So that, for the common sense of society, the practice of Indigenous peoples and other minorities could not be produced by a system of its own outside the parameters and criteria of scientific knowledge, leaving actions of valorization of and interest in this ancestral knowledge only in the spheres of scholars of Indigenous culture and knowledge.

In a conventional manner for common sense, improvisation implies being a spontaneous competence to create music whether through vocal or instrumental interpretation, and in these terms, in contemporary music, musical improvisation requires technical ability, theoretical knowledge, sensibility, and musical baggage, even though it represents a practice that seeks expressive freedom, conceiving that musicians create and interpret melodies, rhythms, and vocalizations in a spontaneous manner. And as a technical attribute of the performer, eruditized improvisation demands formal processes of learning and production, even while being articulated through the exercise of new experiences and

adaptations of an already established musical proposition. In its difference from the intuitive practice of the popular and oral-tradition musician, this improvisation is predictable and often formally prescribed. Thus, musicians of mediatized spaces use specific and peculiar techniques previously developed for improvisation, whereas a singer (*cantador*) of oral expressive practice appears, to common sense, not to have a technical and conscious resource for the articulation of his sonic propositions. And in these terms, I observe that my effort has as its object the promotion of an avenue of access to the comprehension of the intuitive and spontaneous knowledge of colloquial languages present and influential on the popular music scene of Pernambuco, based on the testimonies and accounts collected and on participant observation in the investigative terrain. And that the reflexive character of my approach, in the use of systematizing procedures resulting from dialogical ethnographies within the domains of ethnomusicology, seeks solely to make viable an interface space which, mediating between oralized and eruditized thought, favors a mutual and favorable approximation between the observer (society) and the observed (the practitioner who holds the knowledge). I further observe that the focus on Pernambucan culture is due to my extensive experience with local expressive practices of Pernambuco and their forms of representation, a datum that enables a closer view of the symbolic discourse and of the imaginary inserted in and circumscribed to these practices.

Indeed, beyond my parental link with the local Indigenous culture through *caboclo* ancestry with deterritorialized Indigenous people, I point out that a significant part of my systematic view of an Indigenous vector that is disseminated and influential in the everyday thought of the Pernambucan music scene emerged directly and indirectly from collaborative accounts and testimonies that pointed to the existence of an original pattern of an essentially Indigenous base, which, in contact with other non-local matrices (of external origins that arrived here in contexts of mobility and migratory processes), shaped expressive forms determinant of what is currently understood as Pernambucan music. A pattern identified here through the contrametricity (Kolinski 1960, 1973; Arom 1985, 1988; Jones 1959; N'Ketia 1975; Sandroni 1997, 2000, 2001, 2002) of its articulation in the thought of the musician, *brincante*, and *aficionado* who resorts to it whenever stimulated by diverse contexts in which one can or is allowed to react musically. This articulation being symbolically associated with forms of metric accentuation of speech, of steps, of gestures, and of rhythmic subdivisions in each expressive practice observed by me. Whether this practice was of a profane or religious character, of the ritual of work songs or of cults to spirits and *encantados*, of the mediatic scene or of oral tradition.

The reflection on migratory and mobility processes must certainly be considered in this tensional field and interface of verification of the construction of traditions and identities, from which hybrid behavioral and expressive forms emerged on Brazilian soil. And in these terms, the reflexive category of the present approach favors and seeks ethical planes of clarification and comprehension of things that the official literature and the cultural policies have often not answered, owing to having predominant attention on the descriptive method of direct and concrete data of phenomena isolated in themselves—as if there were no possible crossings and interconnections between ritual and mediatic music, or between the expressive vocabulary of a *maracatu* drummer (*batuqueiro*) and percussion arrangements of the *mangue beat* style, or even between an official performance formula of the *forrós* and the inherited motivations that manifest themselves in the expressive/interpretive performance of a *forró*, for example.

However, even though the bases and patterns of cognitive thought are little revealed during the musical practice in the everyday of the oral-tradition and mediatized music scene, it is notable that there exist certain correlations between the concrete performance and a common pattern intuitively activated by the memory of oral/popular base. But would the metacognitive resource of resorting to a common pattern in memory be intuitive or reflexively thought from some reference already considered? Moreover, one cannot forget that the awareness of these correlations is vulgarly conceived by the common sense of society as gift, talent, racial competence, and popular creativity, mainly when the actor of the action is considered an amateur, self-taught, or an ear musician.

To consider a reflection on symbolic terms such as gift and talent is of great importance for us to perceive that culturally inherited knowledge, whether in an oralized form or formally prescribed, activates the articulation of metaphors and allegories of the quality of the acquired knowledge and of the respective forms of acquisition. When the concept of gift is thought of, the idea of a gift or present is activated—that is, something received without apparent prior request, implying the representation of an innate capacity to perform a given action with dexterity in various contexts, even the most complex for most people. So that to think of a gift for playing an instrument or creating apt phrases in a *coco de roda*, for example, would imply our considering that the individual was born with a natural ability/aptitude, and that it is their nature to give successful performances even without physical effort or reflexive effort. And under this conception, only someone holding a divine and non-transferable gift would be able to play a *coco de roda*, and any individual without this gift would never be able to create or musicalize a *coco de roda*.

In its rigidity and incompatibility, this line of conception denies the possibility of the acquisition of certain forms of knowledge, competencies, and abilities by those who do not possess an innate gift or talent to perform on the local language of oral base, thereby making the present approach a challenge to be trodden in future studies.

Even so, the sonic universe to which I had access was fluent and rich in expressive resources, and the ways of making and thinking this production pointed to a regular pattern present in various local manifestations, as if all converged from one and the same source. And the accounts of personal processes of interpretive creation of these practicing subjects pointed to the rhythmic pattern of the *perré*, a constituent touch of the local *caboclinhos*. This datum induced my view toward the possibility that the recurrence of the *perré* pattern revealed that the local culture drank from this same heritage, and that its presence in Indigenous ways of performing their rituals, associated with the datum that the *cocos* of the *agreste* of Pernambuco have a clear relation with the *perré*, made possible my proposition that the marker of this rhythmic recurrence could be named locally as *perré*.

On the basis of this hypothesis, I came to analytically cross-reference the structures of popular oral-tradition rhythms occurring in the state of Pernambuco, considering that these rhythms originating from oralized processes are applied to the current language of the Pernambuco music scene, which permeates *cocos*, *cirandas*, *cavalo-marinhos*, *caboclinhos* (*perré* touches, *baião* touches, *guerra* touches, and *macumba* touches), *xotes*, *baiões*, *galopes*, *marcha-juninas* (*quadrinha* touches, also called *rastapés*), *bumba-meu-bois*, *pastoris*, *mazucas*, *forró de pé-de-parede*, *capoeira*, *ijexás* (*afoxés*), *pontos de esquerda* of the *jurema sagrada* and *umbanda*, *maracatus de baque solto*. All could be articulated from the awareness of the *perré* pattern as a marker of the expressive identity of local musical thought.

Considering the importance of an awareness of patterns and interpretive lines of each cultural matrix that builds the hybrid character of the expressive identity of Pernambucan music, this article seeks to highlight the cultural contribution and a consequent recovery of the social value of minorities still little considered in Brazilian society, as in the case of the original peoples. And in this conflictive process of building the complexity of a local expressive culture, there is no way to disregard processes of exodus, migration, or diaspora, and their unfoldings in life histories and in the construction of collective identities.

Paraphrasing Dan Lundberg (2010), I consider that the categories defining the identity markers of the music of a culture require the notion of ownership in their sharing for the definition of the respective identity marker—as in the case of the sharing of songs on the part of distinct groups [Kurds and Turks] studied by Lundberg (2010, pp. 28-29). However, as a

significant point of such a category of approach, efforts at the identification of the respective marker become important. And consequently, in order to think Pernambucan music in its bases, it becomes relevant to identify the respective identity marker of current languages, since the conception of a specific place of manifestation demands a local practical awareness of its use.

O perré como marcador partilhado

In the field of my observations of the musical practices that I verified in Pernambuco since 2003, I observed the recurrence of a pattern of a rhythmic cell shared by popular singers (*cantadores*) of local oral tradition and its use in the performances of the other artificers of practices such as those of the *maracatus*, *baião*, *xote*, *cavalo-marinho*, *coco de roda*, *mazuca*, *ciranda*, *pastoril*, and other local manifestations, constituting itself an element proper to the singular performative and expressive language of the culture of the people.

The ethnographic terrain reinforced that there are important connections of markers of local Indigenous matrix with the creative and interpretive thought of folklorized practices of oral tradition, and the unfoldings of these practices in particular processes of reappropriation, readaptation, and application of these markers in urbanized music. And the most curious thing is that the historiography of the practice appropriated through the exercise of orality was, and still continues to be, supplanted by an external, politically organized paradigm that silences voices of collective memory—even though this memory, without even perceiving it, unconsciously makes use of its distant heritages of making *forrós*, *cocos*, and *maracatus* in the metropolitan region of Recife, precisely where the impact of the erasure of memory occurs with greater force and intensity.

In these spaces, the accounts and testimonies, collaboratively collected in participant observation, made it possible for me to hear spontaneous attempts at descriptions and clarifications—sometimes detailed—of the particular ways of each singer and performer to make his music, when they resorted to what they learned by imitation, immersive induction, or deduction of what intuitively reached their ears through the maternal, parental voice, religiosity, or community. The memories were referred to as heritages that they should perpetuate as an identity commitment assumed with their musical roots, which, even though symbolic or socially masked, could, through them, become visible and concrete. As if it were something intangible in the eyes of the world, even though it was there materialized through their actions.

In a testimony given on the radio broadcast of the Festival de Inverno de Garanhuns in 2001, Zé Neguinho referred to his practice as a moment full of relation with life:

É um prazer que eu sinto. Ali (no coco) eu não choro, ali eu não me embriago, ali eu não censuro ninguém e ninguém me censura. Eu mato as minhas vontades, as minhas paixões. É mostrar música, trabalhar com música (Zé Neguinho 2001, programa de rádio do Festival de Inverno de Garanhuns).

Zé Neguinho referred little in public regarding the facts of his intimacy and his initiating links in musical practice, preferring to remain silent. In part, the silence was employed by him to safeguard a respectable reputation for his practice before common sense. However, the media, through some *brincantes* and *aficionados*, considered him religiously linked to Afro-Indigenous cults (*jurema sagrada*) or Black-African ones (*xangô* or *umbanda*). And in this respect, the presenter Roger de Renor of the local program "Som na Rural," which was broadcast on TV Brasil in 2011, identifying the creative and interpretive peculiarity of Zé Neguinho through a supposed link with *terreiro* religiosity, pointed out:

O compositor e cantor Zé Neguinho do Coco é dono de uma voz aveludada e de uma performance extremamente delicada e elegante. Seu coco tem vínculos mais estreitos com o candomblé e isso faz com que sua música se diferencie da obra de coquistas tradicionais. Espécie de seresteiro do coco moderno, Zé Neguinho do Coco, ao compor a música Pau de Quiri, ainda criou algo novo: o coco-canção. A composição, gravada nos anos 1990 pela banda Cascabulho em seu álbum de estreia, divulgou a obra de Zé Neguinho, que passou a ser requisitado com frequência para shows e festivais e se tornou referência para jovens músicos da cena recifense (Roger de Renor, Som na Rural, TV Brasil, 2/5/2011).

However, when in face-to-face dialogue with Zé Neguinho, I identified in his words the existence of concrete vectors with the liturgical ritual as a modeler of his *cantoria* and of his creative inspiration and improvisations. Zé Neguinho did not react negatively to my proposition of the existence of a marker that regulated his musical propositions. He made clear that there was some cultural element that gave him security in his musical practice, as if it structured his reasoning in the act of performance, and that through this marker he built his reflexive criteria. Moreover, from the contact I had with Zé Neguinho, it seemed to me that his repertoire and expressive lines of creativity represented greater connections with the musical practices associated with the *jurema sagrada*—a religious cult of Indigenous ancestry, very influential in what is currently known as *umbanda*, and which in the first half of the 20th century was affiliated with cults locally called *catimbó* (a shamanic cult) and *macumba*. However, regarding the modes of use and non-religious relations in musical practice, Zé Neguinho took care to assure of the necessity of personal responsibility to know how to separate the ritual from the merrymaking (*brincadeira*), distinguishing spaces of professional commitment and devotional commitment, even though these spaces frequently intercrossed. This frank, trustworthy reflection had pointed out that the symbolic values that

he considered were underpinned by a pattern of reasoning that allowed him to dialogue between realities. And because I consider the rhythmic element of the music of the oral traditions as one of the constituent foundations, I came to center my efforts of observation and decoding on the rhythm of speaking, of musicked walking, of singing, of the accentuation of syllables, of the pulse of the dance, of the beating and dragging of the feet, of the responsorial claps, of the playing of the *ganzá*, of the jingles of the *pandeiros*, of the pulse of the drums.

In focusing on the rhythm in the *cocos*, *maracatus de baque solto*, *cirandas*, *capoeiras*, *xotes*, and other local expressions, I came upon the recurrence of the contrametric pattern 3 + 3 + 2 (Kolinski 1960, 1973; Arom 1985, 1988; Jones 1959; N'Ketia 1975; Sandroni 1997, 2000, 2001, 2002), which produces a sonic effect similar to what in past times was named *tresillo* (Fernandez, 1965; Sandroni 2002), and which is observed evidently in the practice of the *perré* touch of the *caboclinhos* of Recife. And from this contrametric recurrence in different musical styles and forms, I perceived that there was, in the *perré* touch of the *caboclinhos*, a strong candidate for the understanding of processes in which a symbolic cognitive thought is manifested that is determinant of local abstract languages such as those of musical practice—which promotes, as an unfolding, pedagogical and systematized processes for learning the Pernambucan musical language. Mainly because the term *perré* is local, musical, and directly associated with markers of Indigenous base, this article proposes the "*Perré*" as a marker of Indigenous identity in Pernambucan culture.

The notion of a rhythmic cell that is influential in oral-based traditional practices refers, in this case, to the erudite concept of *tresillo*, used by Fernando Ortiz Fernandez (1965) for Cuban music. This cell presents itself in the rhythmic formulas present on the music scene of the Brazilian Northeast with accentuation on the irregular syncope at the end of the first beat, as I graphically represent below:

Its occurrence was recorded in Latin American rhythms such as the Cuban *habanera*, the Argentine tango, the Dominican *merengue*, and several calypsos of Trinidad (Storm Roberts 1972, p. 52 apud Sandroni 2002, p. 103), as well as in South American rhythms such as the American tango, the *tango gitano*, the Brazilian tango (*maxixe*), *samba*, the Argentine tango, and other species of the same "family," whose "primitive classical" formula would be the "*habanera* rhythm," and the "characteristic syncope" one of its variants (Vega 1967, pp. 49, 64).

Sandroni (2002) proposed seeing in the *tresillo* the most simplified version of the symbolic thought of the performer, considering the validity of adopting this rhythmic formula as a strategy of systematic argumentation for various expressive forms in Latin America, in Brazil, and in Africa. Indeed, as this author points out, the theme involving this rhythmic articulation has a vast terrain of assertions, which in part converge in their importance, and in part diverge owing to controversies regarding form, notation, representations, and nomenclature—for which Sandroni proposes, as a resolution, that we consider the *tresillo* form as the minimum common denominator of the set of variants that can be articulated from the conception of the contrametric pulse $3 + 3 + 2$. This author warns and reiterates the existence of an equivalence among certain rhythmic formulas activated to characterize peculiar properties of given musical genres, pointing out that this typology of rhythmic formula perceptible in various expressive practices should not be centered on conceptualizing solely a single genre, but rather as an open formula capable of affording equal fluency of one and the same symbolic thought that is effective in a multiple set of genres. Corroborating this perspective, the present article seeks to consider the applicability of this multifaceted knowledge as a universal tool for the symbolic thought of musicians, dancers, and other categories of relation with expressive identity forms, of Pernambuco, of the Northeast, and of Brazil.

Regarding the complexity of the structuralist idea that an emic term should give way to a single universal term forged outside the local perspectival reality, this emerges in the human sciences as a complicating and inhibiting element of local identification, promoting a disinterest on the part of local subjects in assimilating the dominant perspective, since it seems arrogant and inappropriate to them. In these cases, in my opinion, a certain academic sensibility is lacking in dealing with the truths of the other. Thus, my proposal seeks to give an empathetic voice to the terms used locally, so as to promote not only adherence to the central theoretical proposition of an official terminology, but to promote a friendly appropriation that stimulates states of local self-identification. And in this perception, this article makes use of the emic term *perré* for what Sandroni (2002) considered appropriate to be *tresillo*, considering it pertinent for us to reflect when the main object of self-identification (the emic term) is an extramusical vector for the determination of the awareness of oneself.

In this segment of propositions, Sandroni proposes considering that the recognition of this rhythm, as a marker of identity discourses, may correspond to extramusical ideas that afford the difference between distinct cultural values, even if common in the rhythmic pattern. The rhythmic element thus perceived would answer to peculiarities necessary for the understanding and modes of use of a common pattern for it to be recognized emically

according to the parameters of each culture. And thus, the criteria that delineate differences and identities would correspond to the extramusical elements proper to each culture, which would make acceptable distinct names for the same foundation (*Tresillo* in Cuba, *Perré* in Pernambuco), without each identity terrain suffering from the imposition of the center of power upon the periphery. Thus, Sandroni allows one to perceive that many of the definitions of an expressive practice lie in the gaze of alterity that common sense gives to the practice, such as "mestizo," "Afro-American," "popular." And in these terms, the perspectival bias of what is designated Black music, Northeastern music, or "Indian music" aggregates extramusical criteria of the observer (outsider)—which, even though they are criteria of external cultural origin, in arenas of decoloniality have legitimacy and political autonomy to define.

Emically, this rhythmic structure is expressed by the contrametric pattern 3+3+2 in the interpretive forms of *cantoria*, foot-tapping, and the articulation of the instruments, or even in the manner of being of the pattern that I perceived as most effective for the representation and learning of rhythms of local expressive practices. The variety of application of this pattern revealed itself projected onto other musical forms such as local *samba* itself, *piseiro*, *sertanejo*, *swingueira*, the *manguebeat* movement, and national *funk*, from the *terreiro* touches, as Ulloa Sanmiguel (1998) observed in the study of *samba*.

Pensando a sonoridade popular de Pernambuco a partir do perré

In the case observed in expressive arenas of Pernambuco, I observed the predominant use of the contrametric form 3+3+2, there being significant contexts of performative and compositional interpretation that made evident two variants of the 3+3+2 form, for which reason I identified the forms 2+3+3 or 3+2+3 as a common expressive resource present in the local sonic practice. These possibilities of variations of the *tresillo* pattern (3+3+2) open the spectrum of possible forms of relation between local personal and collective motivations and varied modes of interpretation and performative representation of musical thought. This datum in itself potentially shakes a fixed idea of the *tresillo* structure as 3+3+2, conceiving for the performer a broader range of combinations, even though the pattern is there under a treatment dislodged in the time-space of perception and functional thought of the expressive proposition. Thus, a singer may make use of a variant whenever he particularly feels it has more applicability to what he hears, while another performer might follow another variant. And the use of these models of variation may give a different shine or coloring to the final sonic ensemble. As well, the use of a given variant may be more applicable in specific contexts of creation or even interpretation.

In the ways I observed in the terrain, their uses were sometimes strictly linked to the metric structure of the rhymes, sometimes linked to the metric-interpretive style of the *cantoria* activated, sometimes strictly linked to the local tendency of creation or interpretation of the respective rhythm.

The rhythmic pulsation determined by these types of linkage cited above may activate the way in which the practitioners begin the articulation of the 3+3+2 pattern (or its variants 2+3+3, 3+2+3) and give it continuation. A datum that mirrors the experience and mastery of each performer with such possibilities of a thought matrix of the *perré* patterns, as well as the competence and ability to flow articulations in a crossed or hybrid manner according to his free will, bringing to the performance an interpretive richness of personalized languages, in which the personhood of the thought and voice of the performer sets the tone of his expressive identity. Thus, the open and generative thought in the expressive lines of popular language makes it unique by projecting the self of the performer.

Below, as an example, I present a relational representation between claps, foot-tapping, and the regular marking of the rattle (*chocalho*) (in the local Indigenous interpretive style) in expressive practices of the *coco* and of the movement of the *passeio* of the *mazuca* of Agrestina:

In this reflexive procedure in the *coco* and in the *passeio* of the *mazuca*, the initial intention activates the claps with the right foot going simultaneously to the front of the body; next, a solo marking of the rattle (*chocalho*) is made, which is immediately followed by new claps and the right foot beating simultaneously next to the body; this movement is resolved with the marking of the rattle, now simultaneously with the claps and the beating of the left foot.

Figure 2

Relational representation between metric thought, claps, foot-tapping, and the rattle in the 3+3+2 pattern of the perré.

Under this guide induced by the sonic or extramusical context, the participants aurally identify the *perré* pattern and interact successfully, without the musician or singer indicating

it explicitly. That is, this prompt competence of identification reveals that there is a common and shared tacit knowledge, as of a rule already culturally established. And in its recurrence, the contrametric thought allows some possible articulations applicable to interpretive lines on the planes of performance, creation/composition, or improvisations, of which I present below:

Figure 3

Variants of the *perré* pattern

Padrão Perré de 3 batidas = 3+2+3	X	.	.	X	.	X	.	.
Padrão Perré de 3 batidas = 3+3+2	X	.	.	X	.	.	X	.
Padrão Perré de 4 batidas = 3+2+3	X	.	.	X	.	X	.	X
Padrão Perré de 4 batidas = 3+3+2	X	.	.	X	.	.	X	X
Padrão Perré de 5 batidas = 2+3+3 (a)	X	.	X	X	.	X	X	.
Padrão Perré de 5 batidas = 2+3+3 (b)	X	.	X	X	.	.	X	X

The *cantoria* emerges as the main element that activates expressive behavior, and in these cultural practices the proposition of the rhythm is inductively established by the sung melody or the syllabation of the sung theme. As in the example of a work song referred to by Pombo Roxo in 2006, when the contrametric pattern 3+3+2 is perceived in the structuring of the syllabic thought of the *cantoria*:

This characteristic of articulation is disseminated in the customs of the rituals of popular Catholicism, of *brega*, of the work song, of various celebrations of the local June (*junino*) and Christmas periods. From this perspective, the *perré*, here considered an interface element in arenas of interculturality, emerged as a dialogical and shared marker of the local expressive language. In these terms, the *perré* emerged inductively through the voices of the terrain as a marker of an Indigenous expressive language in the interpretation of the rhythm of traditional rhythms such as *caboclinhos*, *bumba-meu-boi*, *maracatu de baque solto*, *xote*, *marcha junina (rastapé)*, *baião*, *ciranda*, *ijexá*, *capoeira*, *cavalo-marinho*, *samba de matuto*, *coco*, in addition to the unfoldings of these rhythms in the mediatic music of the *forrós*, of *piseiro*, *rock mangue beat*, and other styles of the local globalized scene. As per the graphic below and the respective sound examples at the link <https://on.soundcloud.com/pbmKT2GM7nFrsCrc8>.

2 FINAL CONSIDERATIONS

The expressive practices of the Brazilian Northeast suggest identity ties that allow their actors to dialogue fluidly among themselves through the use of common elements of language that, subliminally and metacognitively, mark the practices in the oral traditions, in the folklorism of the popular songbook, in the *forrós*, in mediatized regional music, as well as in the new globalized expressive tendencies.

In their practice, these elements of language transcend the universe of a supposed cultural practice isolated in itself, to reveal that one and the same performer can dialogue expressively with various other musical practices.

This interface element reveals itself as a tensional or border area that allows solidary forms of interaction, integration, or communication, constituting something that serves as a reference for musical thought and performance. And in these terms, this procedure pointed to rhythm and the rhythmic dimension as important factors in how musicians and the local population manage to produce successful performances even in contexts not previously programmed.

The importance of this verification emerged from the concrete identification of an order of determinant values of the Indigenous matrix present as active vectors in the local culture. Whether expressed in playing, in singing, in dancing, and in other practices of everyday life, of speech, and of significant modes of musical thought.

Such an approach promotes a critical-reflexive decolonial reading of the problematic of Brazilian historiography, which little considers the contributions and markers of Indigenous identity in the construction of expressive musical thought in Brazil. And following this procedure, the present work sought to observe the use of the contrametric form 3+3+2 and its variants 2+3+3 or 3+2+3 as a common expressive resource present in the local sonic practice, proposing in its terminology the designation of the *perré* pattern as a marker of the expressive identity of Indigenous base in the oralized traditions in Pernambuco, its use having constituted a central line of musical thought in the expressive practices of oral tradition and mediatized practice.

ABSTRACT

With population growth, the number of irregular land subdivisions has increased considerably, owing to the formation of subnormal housing, such as *favelas*, but also to a segment of the informal market: clandestine allotments (*loteamentos clandestinos*). The irregular occupation of land brings problems that are reflected in the other areas of service provision of a city; in addition to generating problems for the regularization of land tenure and, consequently, for the right to housing. In order to ensure the constitutional right to housing, as well as its regularization, Brazilian legislation establishes public policies aimed at ensuring these rights. This work presents a case study of urban land regularization, describing the procedures for preparing a regularization project in a clandestine urban settlement in the Municipality of Mogi Guaçu – SP. The data were obtained from an on-site survey (*in loco*) of the existing situation of the location, from municipal proceedings, and through the use of software such as Métrica Topo, Google Earth, and QGIS, and web portals such as DataGeo, for the preparation of the technical documents. With the data collected, the necessary steps for the land regularization procedure were established through the application of the federal law in force, from the first steps to the delivery of the regularization certificate to each landholder (*posseiro*). It was concluded that, with the application of the current Law, there is the possibility of guaranteeing the titling of the property for its occupants and the integration of the informal urban settlement into the urban territory, thus ensuring access to public services that were previously nonexistent.

terreno e consequentemente o direito à moradia. Afim de assegurar o direito constitucional à moradia, bem como sua regularização, a legislação brasileira estabelece políticas públicas que visam assegurar esses direitos. Este trabalho apresenta um estudo de caso de regularização fundiária urbana, descrevendo os trâmites para a elaboração de um projeto de regularização em um núcleo urbano clandestino no Município de Mogi Guaçu – SP. Os dados foram obtidos a partir de levantamento *in loco* da situação existente do local, de processos municipais e com uso de *softwares* como o Métrica Topo, Google Earth, QGIS e portais *web* como o DataGeo, para elaboração das peças técnicas. Com os dados levantados foi estabelecido quais seriam os passos necessários para o procedimento de regularização fundiária por meio da aplicação da lei federal vigente, desde os primeiros passos até a entrega da certidão de regularização para cada posseiro. Concluiu-se que com a aplicação da Lei atual, há a possibilidade de garantia da titulação do imóvel para seus ocupantes e a integração do núcleo urbano informal ao território urbano, garantindo assim acesso aos serviços públicos antes inexistentes.

RESUMEN

Con el crecimiento poblacional, el número de parcelaciones de suelo irregulares ha experimentado un elevado aumento, debido a la formación de viviendas subnormales, como las *favelas*, pero también a un segmento del mercado informal que son las parcelaciones clandestinas (*loteamientos clandestinos*). La ocupación irregular del suelo trae problemas que se reflejan en las demás áreas de prestación de servicios de una ciudad; además de generar problemas para la regularización de la posesión del terreno y, en consecuencia, para el derecho a la vivienda. A fin de asegurar el derecho constitucional a la vivienda, así como su regularización, la legislación brasileña establece políticas públicas orientadas a asegurar estos derechos. Este trabajo presenta un estudio de caso de regularización de la tenencia de la tierra urbana, describiendo los trámites para la elaboración de un proyecto de regularización en un núcleo urbano clandestino en el Municipio de Mogi Guaçu – SP. Los datos se obtuvieron a partir de un levantamiento *in situ* (*in loco*) de la situación existente del lugar, de procesos municipales y mediante el uso de programas informáticos como Métrica Topo, Google Earth y QGIS, y de portales *web* como DataGeo, para la elaboración de las piezas técnicas. Con los datos recopilados se estableció cuáles serían los pasos necesarios para el procedimiento de regularización de la tenencia mediante la aplicación de la ley federal vigente, desde los primeros pasos hasta la entrega del certificado de regularización a cada poseedor (*posseiro*). Se concluyó que, con la aplicación de la Ley actual, existe la posibilidad de garantizar la titulación del inmueble para sus ocupantes y la integración del núcleo urbano informal al territorio urbano, garantizando así el acceso a servicios públicos antes inexistentes.

1 INTRODUCTION

The urbanization process, for Roque and Ayoub (2020), occurs through the opening of lots within the urban perimeter and/or outside it, with the carrying out of the technical and legal procedure known as Land Subdivision (*Parcelamento de Solo*).

Land subdivision may be considered the main instrument for structuring urban space, since, according to Mesquita (2008), after its implementation the space created by it will maintain its structure for many years or centuries and will be occupied by various generations of city inhabitants. Thus, for Alvarenga (2007), urban land subdivision deals with the division of the land, in the form of allotments (*loteamentos*) and dismemberment (*desmembramento*). The subdivision is carried out by private initiative, under the supervision of the Public Administration.

The opening of allotments is the most common and significant form of urbanization in Brazil. Leonelli (2010) points out that Brazilian cities expand through the production of lots, in a constant transformation of rural areas into urban ones.

The technical and legal regulation of land subdivision is carried out through urban-planning legislation. Within the universe of urban-planning laws, Barreiros and Abiko (1998) asserted that Federal Law No. 6.766 (BRASIL, 1979) [[nota: números de leis brasileiras mantidos no formato original (com ponto), por serem identificadores de referência; ex.: 6.766, 13.465]] stands out, first because it is the law of national scope that provides for urban land subdivision and, second, for establishing norms and parameters that came to guide and determine new postures in state and municipal legislation.

This law, according to Freitas (2000), in addition to dismemberment, contemplates the allotment, whose execution proves more frequent and of greater impact, since the allotted tract (*gleba*) loses its objective individuality, transforming itself into streets, public spaces, and lots. The lots, for Queiroga (2002), come to have an autonomous life, transmuting themselves into "units autarkically sufficient in themselves," and must have direct access to the circulation routes created by the detailing of the tract.

Federal Law No. 6.766 (BRASIL, 1979) determines that the entire process of project development, legal authorization of the enterprise, and execution of the minimum infrastructure works of the subdivision for the commercialization of the lots is the full responsibility of the developer. Oliveira (2017) states that it is always important to emphasize that the non-fulfillment of any one of these stages is a crime, with penalties provided for in the referred law, which comprehensively outlines all the rules applicable to subdivision projects, such as: project configuration, urban-planning indices, basic infrastructure, documentation, guarantees, registry, contractual, and penal aspects, among others.

Despite this federal law, Conceição and Souza (2018) state that only in 2009 did a legal instrument come to address the question specifically and define the concept of land regularization as: the set of legal, urban-planning, environmental, and social measures aimed at the regularization of irregular settlements and at the titling of their occupants, in order to guarantee the social right to housing. This is undoubtedly the most important milestone of urban land regularization (Reurb): Federal Law No. 11.977 (BRASIL, 2009).

When the subdivision is executed without observance of the legal requirements, it may be considered clandestine or irregular. Lobo (2019) presents that the subdivision termed clandestine is one whose existence is not known to the competent Public Authority, or one that, although brought to the public authority for approval, has no such approval—that is, the request is denied or there is no application for approval at all. The irregular subdivision, in turn, is one in which there is knowledge and/or approval of the allotment project, but the execution of the subdivision is in nonconformity with the act of approval or with the legislation in force.

The disorderly occupation of land, for Freitas (2000), gave rise to the formation of subnormal housing, such as *favelas*, but also to a segment of the informal housing market that continues to grow, consuming the savings of the unwary, degenerating the urban development standards of cities, and often degrading the natural environment: the clandestine allotments.

According to Pinto (2003), clandestine allotments may be promoted both by the owners of the land and by third parties. In the first case, the aim is to escape the procedures and burdens contained in federal, state, and municipal laws, such as the allocation of public areas and the carrying out of infrastructure works. In the second, it is a matter of so-called land "grilagem" (land grabbing through fraudulent titles) [[nota: "grilagem" é termo jurídico brasileiro para apropriação de terras mediante falsificação de títulos; traduzido com glosa entre parênteses]], in which unscrupulous people sell land belonging to others as if it were their own.

Roque and Ayoub (2020) state that such allotments opened clandestinely become a problem for their purchasers and for municipal public managers, thus requiring their regularization after installation; however, Caldas (2009) emphasizes that the procedure for regularizing clandestine and/or irregular allotments is complex, costly, and slow, and at times conflictual.

Among other disturbances caused by the irregular occupation of urban land, Pinto (2003) highlights the following: disarticulation of the road system, hindering the access of buses, ambulances, police vehicles, and garbage collection trucks; formation of

neighborhoods subject to erosion and flooding, silting of rivers, lakes, and seas; absence of public spaces for the implementation of health, education, leisure, and security facilities; compromising of water supply sources and of the water table; clandestine electricity connections, resulting in risks of accidents and fires; excessive horizontal expansion of the urban fabric, causing high burdens on the public budget.

Informal real-estate transactions of unregistered properties do not generate tax revenues for states and municipalities. Roque and Ayoub (2020) observe that the Tax on the "Inter Vivos" Transmission of Real Property and of Real Rights over Real Property (ITBI – *Imposto sobre Transmissão "Inter Vivos" de Bens Imóveis e de Direitos Reais sobre Imóveis*) [[nota: sigla ITBI mantida; expansão e tradução do termo entre parênteses, conforme regra 5]], of municipal competence and which excludes transactions involving unregistered properties, was responsible for collecting around 9 billion reais in the country in 2013, which represented around 10% of the total tax revenues of Brazilian municipalities (FNP, 2014), which reinforces the need for allotments to become regular with the municipalities.

The irregularity of urban occupations, for Ribeiro (2018), shows itself to be a structural problem, demanding the promotion of public policies and legislative solutions so that the administration of this enormous contingent of people in a condition of irregular housing can be carried out. As a form of response to such a question, Federal Law No. 13.465 (BRASIL, 2017) brings the institute of Urban Land Regularization (Reurb), whether of social interest or not, in which the aim was to overcome the obstacles of previous legislation, attributing greater responsibility to the State and extending the list of those legitimated to request the project.

Urban Land Regularization (REURB) is presented by Maux (2017) as the processing that involves legal, urban-planning, environmental, and social norms with the purpose of incorporating informal urban settlements into the urban territorial ordering and of titling their occupants. The legal measures refer to the solution of tenure (*dominial*) problems, regarding situations in which the occupant of a public or private area does not hold a title with due legal guarantee over their occupation.

Ávila and Ferreira (2016) highlight that Provisional Measure No. 759 (BRASIL, 2016), converted into Federal Law No. 13.465 (BRASIL, 2017), provides for, highlights, and orders forms of Land Regularization through two models named: REURB-S, treatment as Social, for those verifiably qualified as Low Income, whose responsibility falls to the municipalities; and REURB-E, treatment as Specific, for those who do not fit the previous principle, whose responsibility falls to whoever has the established right—whether through proof of ownership or by court order—to fulfill and execute all the legal principles necessary for the regularization.

Melem and Santos (2021) explain that, in the case in which the irregular settlement, as ascertained by the socioeconomic survey, is inhabited by residents whose possessor/holder of the property has an income higher than 5 minimum wages—that is, if half plus one of the "heads of household" who possess the properties have a verified income higher than the maximum ceiling of 5 minimum wages—it is defined that the solution will be the application of the Reurb of Specific Interest (REURB-E). On the other hand, likewise ascertained by the socioeconomic survey, if the total quantity of possessors/holders of the existing properties within the area to be regularized exceeds half plus one of the properties inhabited by residents with an income lower than 5 minimum wages, we have the legal configuration for the application of the Urban Regularization of Social Interest (REURB-S), which exceptionally may be applied in informal urban settlements that occupy Permanent Preservation Areas (*Áreas de Preservação Permanente*), unlike Reurb-E, which, in the terms of Law No. 13.465 (BRASIL, 2017), brings no legal provision for such a procedure.

In this context, Conceição and Souza (2018) state that the text of the Law chose the socioeconomic criterion as the preponderant variable in defining which modality of Reurb will serve a given informal urban settlement. That is, the one who defines whether the regularization is of social or specific interest is the municipality, through an act of the executive, based on the socioeconomic condition, which must be assessed by means of a survey.

Despite this, Marrara (2019) stresses that irregular occupations must not be confused with urban land regularization for the needy population. The legislative, theoretical, and practical concern with regularization has increased, since irregular or clandestine occupations of public and private areas, besides resulting from pressing social needs, are also practiced by the middle and upper classes, as well as by economic agents of different sectors. Thus, a high volume of these occupations stems from the desperation of a good part of the Brazilian population, deprived of the minimum financial conditions to access dignified housing spaces and maintain them—not forgetting that a portion of these irregular occupations emerges as a malicious strategy of certain privileged social and economic groups, who employ it with the aim of enriching themselves improperly through the illicit appropriation of public or private goods outside the regular processes of subdivision and of acquisition of possession or ownership.

Melem and Santos (2021) present that, in order to request REURB, the following are legitimated: the Union, the States, the Federal District, the Municipalities, entities of the indirect public administration; its beneficiaries, housing cooperatives, residents' associations, foundations, social organizations, civil society organizations of public interest or other civil

associations; the owners of land, allottees, or developers; the Public Defender's Office (Defensoria Pública) and the Public Prosecutor's Office (Ministério Público). Marrara (2019) points out that Federal Law No. 13.465 (BRASIL, 2017) shifted to the Municipalities, and to the Federal District, the central role in conducting the regularization process. It also defined a legal regime of its own, seeking to congregate the acts in the hands of a single federative entity, with expectations of imparting greater speed to the conduct and conclusion of the regularization. As the process will occur in the Municipality where the area subject to regularization is located, the proximity between the parties and the public institutions tends to increase, so as to facilitate relations, the delivery of documentation, and the resolution of any conflicts, including by amicable and consensual settlement.

Jesus (2018), analyzing the legal provisions of Law No. 13.465 (BRASIL, 2017) and of Decree No. 9.310 (BRASIL, 2018), verifies concerns of a technical engineering order, tied to surveying and legal monitoring capable of identifying the parties directly involved in the Regularization process.

As for the regularization project, Conceição and Souza (2018) reaffirm that, with the provisions of the new Law, the process must be carried out under a georeferenced survey, a topographic survey, a planialtimetric cadastral survey, and a perimeter plan, and the provision of urban-planning demarcation became a non-mandatory figure. Furthermore, the land regularization project must consider the characteristics of the occupation and of the occupied area in order to define specific urban-planning and environmental parameters, in addition to identifying the lots, the circulation routes, and the areas intended for public use, when applicable.

The law also determines, according to Oliveski *et al.* (2018), the setting of a temporal milestone for purposes of land legitimation—that is, property occupied up to the date of December 22, 2016 may be regularized, without requiring a minimum time of occupation of the area or a linking of its use to housing, it being even permitted for commercial purposes, which may represent a reward for clandestine or illicit occupations.

According to Jesus (2018), Decree No. 9.310 (BRASIL, 2018) established, in its Article 21, that the process will follow these phases: request of the legitimated parties; administrative processing of the request, in which a period will be granted for the manifestation of the holders of real rights over the property and of the abutting owners; preparation of the land regularization project; remediation of the administrative process; decision of the competent authority, by means of a formal act to which publicity will be given; issuance of the Land Regularization Certificate (CRF – *Certidão de Regularização Fundiária*) [[nota: sigla CRF mantida com expansão e tradução, conforme regra 5]] by the Municipality or by the Federal

District; registration of the CRF and of the approved land regularization project at the real-estate registry office in which the real-estate unit with regularized urban purpose is located.

After the submission of the written regularization request, Marrara (2019) states that it will be up to the responsible local body to decide whether or not to receive it. As the restrictive administrative act that it is, the decision to deny receipt of the request must be substantiated with true and correct factual and legal grounds. In addition, it will contain the indication of the measures that must be adopted by the applicant with a view to the reformulation and reassessment of the request, when it has correctable flaws (Art. 32, sole paragraph).

At this stage, Jesus (2018) notes that the regularizing entity or interested party will take to the registry official the registrations of the CRF and of the approved land regularization project; should the official refuse, he must issue a substantiated note of the reasons that led to the refusal, in accordance with Article 40 of Decree No. 9.310 (BRASIL, 2018).

Marrara (2019) states that the approval of the request and the issuance of the CRF do not conclude the urban land regularization. Once the administrative-process phase within the competent municipal body is finished, it will be up to the applicants to collect the certificate and forward it to the local Real-Estate Registry Office for the due measures, beginning the second phase. After the CRF is registered, Jesus (2018) situates that a registration record (*matrícula*) will be opened for each of the regularized real-estate units, thereby initiating the full recognition of ownership for the mere possessor of the property; all these acts referred to in the law aim at the legitimacy and support of the entire procedure, since it allows interested parties, owners, and even abutting owners to manifest themselves regarding their rights, opening room for the remediation of possible irregularities and defining the Municipality as the holder for sending the Land Regularization Certificate to the real-estate registry office.

It is unquestionable, therefore, for Olivieski *et al.* (2018), that the new law is considered yet another important step in the legal framework of urban land regularization, since Reurb is a legal instrument of urban policy, a set of general norms and procedures encompassing legal, environmental, urban-planning, and social measures, with a view to removing certain urban settlements and their occupants from informality.

In view of the above, grounded in legislation, the objective of the work was to structure the process of application of Federal Law No. 13.465 (BRASIL, 2017), known as REURB, which deals with land regularization, obtaining and presenting all the steps necessary for the execution of this process, based on a case study in the city of Mogi Guaçu – SP.

2 MATERIALS AND METHODS

This work presented a study on the application of the Reurb-E Law in a case study, in which the necessary stages were addressed—the administrative process, the request of the legitimated party, and the technical process—for the development of the entire process of regularizing an area that is irregular according to the legislation in force. Such an area is located in the municipality of Mogi Guaçu – SP and is named "Chácara Santa Rita," with a total of 35 lots implemented irregularly.

For the preparation of the study, satellite images obtained from the Google Earth software (GOOGLE EARTH, 2021) were used, along with documents and technical pieces from the company responsible for the regularization process, documents from different bodies of the municipal government, and inputs and edits in the software Métrica Topo, QGIS 3.18, and the web portal Sigam Datageo and the IGC geoportal.

3 RESULTS AND DISCUSSION

3.1 STUDY AREA

The study area for the application of the Reurb was located in the municipality of Mogi Guaçu, State of São Paulo, Brazil (**Figure 1**), with coordinates of latitude 22°22'15" South and longitude 46°56'38" West, with an approximate population of 153,033 inhabitants according to the IBGE (2020).

Figure 1

Location map of the municipality of Mogi Guaçu

Source: ROQUE; AYOUB (2020).

The study area was chosen owing to the allotter's interest in regularizing this clandestine urban settlement, since there is already a process under way, which served as the basis for the present study.

This area is a clandestine allotment named "Chácara Santa Rita," located in the Engenho Velho neighborhood on the SP-342 Highway, with coordinates of latitude 22°18'08.6" South and longitude 46°54'19.5" West, 8.6 km from the center of Mogi Guaçu –

SP, containing 35 lots of at least 1,000.00 m² and implemented clandestinely, given that at the time of its implementation the norms in force for execution and regularization were not followed. The clandestine land subdivision, as Lobo (2019) explains, is one whose existence is not known to the competent Public Authority, or for which approval does not exist—that is, the request is denied or there is no application for approval.

The allotment that is the object of study, as per the images presented in Figure 2, has been in a situation of irregularity since before April 2006, possessing the same constructive and territorial-occupation characteristics for more than 15 years.

Figure 2

LOCATION OBJECT OF THE STUDY, BEING (A) IMAGE FROM APRIL 2006 AND (B) IMAGE FROM AUGUST 2021

Source: Google Earth (2021).

In accordance with Municipal Complementary Law No. 1.291 (MOGI GUAÇU, 2015a), which deals with the Master Plan (*Plano Diretor*) of the city of Mogi Guaçu, and Complementary Law No. 1.415 (MOGI GUAÇU, 2021b), which provides for the zoning and land-use plan of the municipality of Mogi Guaçu, it can be verified that the area that is the object of this study is located in the Urban Expansion Zone named "ZEX – II" (**Figure 3**), which are the areas intended for urban expansion beyond the official urban perimeter and which, therefore, possess differentiated urban-planning characteristics, in order to better order the occupation.

Figure 3

ZONING MAP OF THE CITY OF MOGI GUAÇU/SP, HIGHLIGHTING THE LOCATION OF THE OBJECT OF STUDY

3.2 ADMINISTRATIVE PROCESS

The administrative process for carrying out the regularization through the Reurb is regulated in Art. 28 of Federal Law No. 13.465 (BRASIL, 2017), where it will have the following phases: the request of the legitimated parties, classification of the area, preparation of the regularization project, municipal decision, and issuance and registration of the CRF with the real-estate registry office.

3.2.1 Request of the legitimated parties

The first stage of the regularization process is the request of one of the legitimated parties established in Article 14 of Federal Law No. 13.465 (BRASIL, 2017). In this case, the request was prepared by the allotter of the property before the city government, on December

4, 2017, requesting the regularization of the informal urban settlement named "Chácaras Santa Rita."

After the regularization request is submitted, it will be up to the municipality to decide whether or not to accept it. However, as Marrara (2019) cites, in the case of a refusal by the city government, this decision must be substantiated with true and correct factual and legal grounds, in addition to the indication of the measures that must be adopted by the applicant with a view to the reformulation and reassessment of the request, when it has correctable flaws.

As analyzed by Ribeiro (2018), the Reurb, as provided for by Federal Law No. 13.465 (BRASIL, 2017), proposes the regularization of consolidated informal urban settlements, whether large or small, in a unified manner, through a single project for each area. Therefore, regardless of the purpose of the clandestine allotment, the regularization process is applicable, provided that it fits the requirements established in the Law and in the municipal guideline.

To regulate the regularization process and standardize all the procedures, Decree No. 9.310 (BRASIL, 2018) was instituted, establishing the general norms applicable to Urban Land Regularization and setting the procedures for the appraisal and disposal of properties of the Union.

Thus, it was stipulated that the regularization would occur through two types of regularization, which are regulated according to the social characterization that they fit. The typification of the Reurb occurs in two models: Reurb-S and Reurb-E. Reurb-S, known as Land Regularization of Social Interest, is applied when the predominance of the population of the clandestine urban settlement is low-income, being so considered through the Municipal Government. Clandestine urban settlements typified as Reurb-S are exempt from paying the costs of the regularization process, with the entire regularization process—from the preparation of the necessary projects to the existing expenses—falling to the public authority.

Reurb-E, known as Land Regularization of Specific Interest, is applied to persons who do not fit as low-income; therefore, if classified in this modality, those who must bear the costs of the regularization process are the owners.

As for the modality of Reurb to be adopted, as Jesus (2018) cites, the classification of the Reurb modality that will be adopted falls to the municipal executive authority, there being no reason for the official of the real-estate registry office or any other authority to contest the modality used.

According to the return note from the city government on December 6, 2018, the clandestine urban settlement on which this study is based was classified as Reurb-E, since,

after analysis of documents by the city government, divergences of the clandestine allotment from the legislation that approves allotments were verified.

It is important to highlight that the land regularization process often occurs owing to a pressure external to the owners, as occurred with the object of study in question, in which there is a Conduct Adjustment Agreement (TAC – *Termo de Ajustamento de Conduta*) [[nota: sigla TAC mantida com expansão e tradução, conforme regra 5]], in a public civil action, placing on the owner the accountability for the regularization.

3.3 TECHNICAL PROCESS

The land regularization process continues with an administrative process containing the technical pieces that support the analysis by the public authority as to compliance with the laws and norms of the minimum structures required.

The first of these is the planialtimetric survey to support the initial analyses of the location of the lots and the runoff of rainwater, as well as of structures for managing precipitation, as presented in Figure 4, accompanied also by a location plan of the enterprise over an image, and the project for paving and gravel of the carriageways.

Figure 4

PLANIALTIMETRIC SURVEY

Source: technical pieces of the administrative process, 2020.

It is important to emphasize that each existing street within the allotment must be presented with its respective profile project, as presented in Figure 5 for one of the internal axes of the property.

Figure 5

LONGITUDINAL PROFILE OF "STREET 01," IN THE NORTHERN PART OF THE PROPERTY, WITH ITS RESPECTIVE ELEVATIONS ON THE X-AXIS AND HORIZONTAL DISTANCE ON THE Y-AXIS

Source: technical pieces of the administrative process, 2020.

With staking every 10 meters, the first 160 meters have a slope of 3.13% and the final 126.28 meters a slight increase in slope, to 3.33%, a fact that is repeated for the other existing internal axis. The presentation of maps that allow the correct analysis by the technical team of the municipal government is important to highlight.

The Earthwork and Urban-Planning projects are fundamental for the analysis of the distribution of the existing lots in relation to the direction of drainage of the blocks and streets, the channels existing on the streets, green areas, areas for urban and community facilities, the dimensions involved, and the abutting properties (**Figure 6**).

Figure 6

INITIAL PROJECTS PRESENTED FOR REGULARIZATION, BEING (A) DETAIL OF THE EARTHWORK AND DRAINAGE PROJECT, WITH THE DIRECTION OF DRAINAGE AND SLOPES, AND (B) DETAIL OF THE URBAN-PLANNING PROJECT CONTAINING AN AREA FOR COMMUNITY FACILITIES

Source: technical pieces of the administrative process, 2020.

The base project and calculation memorandum for defining the destination of the liquid effluents of the allotment lie in the sanitation and sewage project. As the irregular allotment that is the target of the present research is far from the public sewage collection network, it was opted to design cylindrical septic tanks, anaerobic filters, and cylindrical soak pits (*sumidouros*) for the treatment of domestic effluents, individually, in accordance with NBR 13.969 (ABNT, 1997).

The useful volume of each septic tank is given by **Equation 1**.

$$V = N \times [C \times T + (K \times Lf)] \text{ (Equation 1)}$$

Where: V = useful volume (in liters); N = number of contributors (5 inhabitants adopted); C = daily contribution of waste (150 liters/person/day); T = hydraulic detention time of sewage in the tank (1 day); K = accumulation rate (57); Lf = per capita contribution of fresh sludge (1 liter/person/day). With a result of 1,035 liters or 1.035 m³, a volume of 1.19 m³ was therefore adopted for the septic tank, which will be designed with a depth of 1.25 meters and a diameter of 1.10 meters.

The anaerobic filter, which consists of a biological reactor where the sewage is purified by means of facultative and anaerobic microorganisms responsible for the stabilization of the organic matter, is given by **Equation 2**.

$$V_u = 1.6 \times N \times C \times T \text{ (Equation 2)}$$

Where: V_u = useful volume of the filter (in liters); N = number of contributors (5 people); C = contribution of waste (150 liters/person/day); T = detention period (1 day). With a result of a useful volume of 1,200 liters or 1.200 m³; and, for the biological filter, the limit height of the filter bed is 1.20 meters, already including the height of the false bottom, which must be limited to 0.60 meters, already including the thickness of the slab; therefore, a volume of 1.71 m³ was adopted for the anaerobic filter, which will be designed with a useful height of 1.80 meters and a diameter of 1.10 meters.

For the sizing of the soak pits, the final stage of effluent treatment, infiltration tests were carried out through cylindrical pits, with the aid of an auger. After the tests, a soil infiltration coefficient on the order of 52 L/m² was determined. Adopting a maximum daily flow on the order of 1.00 m³/day for each residence, **Equation 3** was used.

$$A_{i_soak\ pit} = (V_c / C_i) \text{ (Equation 3)}$$

Where: $A_{i_soak\ pit}$ = internal area of the soak pit (m²); V_c = contribution volume (m³ × day); C_i = soil infiltration coefficient (liters/m²). With a result of an infiltration area of 19.23 m², and adopting a cylindrical soak pit with a diameter of 2.00 m and a useful height of 2.60 m, an infiltration area of 19.48 m² is obtained, meeting the calculated value.

It is important to highlight the study by Santos and Roque (2017), in which they verified the nonexistence of these structures for the final destination of effluents in residential developments; even though there was a detailed scheme for the correct execution of the Septic Tank, filter, and soak pit, they concluded that basic sanitation is not a priority for professionals in the execution of works for which they are responsible. Thus reaffirming that, even if there are existing projects, as concluded by Reis *et al.* (2016), it is fundamental that the oversight bodies and the population in general pay attention to the correct destination of sanitary sewage, as well as ponder the importance of following the engineering projects approved by official bodies.

The last item to be part of the technical pieces in the regularization process is the potable water supply project. The calculation memorandum must present the sizing of the quantification of the set of pipes and accessories intended for the distribution of the potable water supply network to the entire allotment in a continuous and uninterrupted manner.

The potable water project must contain, in addition to the distribution of the necessary equipment, the total length of the distribution network, as shown in detail in Figure 7.

Figure 7

DETAIL OF THE POTABLE WATER PROJECT, SHOWING THE ACCUMULATION AND DISTRIBUTION POINT

Source: technical pieces of the administrative process, 2020.

It begins with the forecast of the resident population, as a function of the occupation area, in a total of 35 lots, and an average number of inhabitants per lot of 5 people, reaching 175 inhabitants, with a saturation population of the area (end of plan) equal to 200 inhabitants, using a project horizon with a forecast of saturation of the allotment of 20 (twenty) years. The water is intended exclusively for domestic use, comprising the following purposes: hygienic, alimentary, floor and clothes washing, garden watering, among others. The per capita water consumption (q) adopted was 250 liters/inhabitant/day, and the minimum dynamic pressure at the most unfavorable point will be 12 meters of water column (mwc).

For the calculation of the average project flow, **Equation 4** is used.

$$Q_m = q \times P / 86,400 \text{ (Equation 4)}$$

Where: Q_m = average flow (in liters); q = per capita consumption; P = saturation population. Reaching a value of 0.58 liters per second of necessary average flow. It then proceeded to the design flow (Q) using **Equation 5**.

$$Q = Q_m \times K_1 \times K_2 \text{ (Equation 5)}$$

Where: K_1 = daily variation adopted as the coefficient of the day of greatest consumption (1.20); K_2 = hourly variation adopted as the coefficient of the hour of greatest consumption (1.50). Reaching 1.04 liters per second, which will be the basis for the calculation of the distribution flow according to **Equation 6**.

$$Q_d = Q / l_t \text{ (Equation 6)}$$

Where: l_t = total length of the network (714.00 meters, obtained from the map in **Figure 7**). Reaching a distribution flow of 0.00146 liters per second for each meter of network. The capacity of the reservoir (C) was calculated by the method based on a consumption curve assimilated to a sine wave.

Where V is the volume of water consumed in 24 hours on the day of greatest consumption:

$$Q = 1.04 \text{ L} \cdot \text{s}^{-1} = 3.74 \text{ m}^3/\text{h} ; K_1 = 1.20 \quad V = 3.74 \times 24 \times 1.20 = 107.71 \text{ m}^3$$

The minimum capacity of distribution reservoirs for normal consumption, as a function of K_2 , is given by **Equation 7**.

$$C = 0.16 \times V \text{ (Equation 7)}$$

Reaching a reservoir volume of 17.24 m^3 , an elevated goblet-type (*taça*) reservoir was then adopted, with water in the column, of a capacity of 20 m^3 .

The basis for the correct distribution of water throughout the allotment is the calculation of the most unfavorable piezometric elevation, with the upstream end of section 4 being defined as the most unfavorable; its upstream piezometric elevation (C_{pj}) is calculated according to **Equation 8**.

$$C_{pj} = C_t + H + 12 \text{ (Equation 8)}$$

Where: C_t = terrain elevation (674.40 m); H = 0.108 (head loss); 12 mwc = (minimum dynamic pressure permitted in the network). Reaching a value of 686.51 meters, which is the basis for the calculation of the reservoir height; subtracting from the C_{pj} the terrain elevation of the reservoir (675.00 m), therefore, 11.51 m of height, the height of 12.50 m was then adopted, following the detailing of the reservoir presented in Figure 7, and the household connections presented, with piping in the water distribution network in rigid PVC PBA class 20 pipes.

Figure 8

Details of the household water supply connections (a), and the reservoir for the accumulation of water from a deep well, with respective connections and base (b).

Source: technical pieces of the administrative process, 2020.

With this set of technical pieces and the duly registered request, the irregular allotment is equipped with technical material to comply with the Reurb and is ready for the analysis by the public authority as to the technical procedure in the regularization process, with the issuance of the Land Regularity Certificate to the occupants qualified individually, according to the lots, for purposes of subsequent registration, with the official of the Real-Estate Registry Office responsible for the locality.

4 CONCLUSION

Federal Law No. 13.465 (BRASIL, 2017) brings a set of instruments that facilitate and allow the land titling of irregular allotments; however, because it is relatively recent legislation, many professionals still have problems in its conduct and execution, there being a deficiency in its technical application and in the legal conduct of the process. Nonetheless, as demonstrated in the present work, the process occurs within the municipal sphere and with technical pieces well known to the technical staff involved with land management.

The allotment that is the object of study, with a total tract area of 65,299.36 m², has been in a condition of irregularity for more than 15 years and finds in the current legislation the possibility of regularization and titling for the owners of the lots. The process must pay attention to the allocation of green areas, urban facilities, and community facilities as recommended in the legislation and in the municipal definitions, in accordance with the zones contained in the municipal master plan.

The classification as Reurb-E requires that the owner hire a professional accredited with the Regional Council of Engineering and Agronomy (CREA – *Conselho Regional de Engenharia e Agronomia*) [[nota: sigla CREA mantida com expansão e tradução, conforme regra 5]] to conduct the technical pieces and a lawyer to conduct the legal process.

It must be emphasized that the process does not end with the issuance of the CRF, there being a need for the owners of the lots to carry out registration with the Real-Estate Registry Office.

Irregular allotments are an old problem of the municipalities, and with the increase in real-estate speculation in peri-urban areas, they tend to increase, there being a constant need for public managers to monitor these processes of occupation of the territory and to make effective use of Federal Law No. 13.465 (BRASIL, 2017), ensuring the possibility of titling the property for its occupants and also the integration of the informal urban settlement into the urban territorial ordering, thus ensuring access to public services that were previously nonexistent.

It is hoped that the present work will shed light on the description of the process of regularizing a typically irregular allotment, these procedures being valid throughout the national territory, thus contributing to a greater popularization regarding the application of the legislation involved in the management of the territory.

ABSTRACT

This article examines the performance indicators employed to assess telework in the Brazilian public administration, considering current legislation. Using the Systematic Literature Review (SLR) methodology, the study maps the main theoretical and regulatory contributions on the subject, highlighting challenges and gaps in practical implementation. The results show that the most frequently mentioned indicators relate to productivity, work quality, employee well-being, and cost-effectiveness. Brazilian legislation, in turn, emphasises objective and measurable goals, with a lesser focus on subjective aspects such as mental health and job satisfaction. The study concludes that, for telework to be consolidated as an effective management tool, it is essential to adopt more comprehensive evaluation systems that integrate performance results with quality of life and employee engagement.

Keywords: Telework. Telecommuting. Hibrid Work. Performance Evaluation. Indicators.

RESUMO

Este artigo identifica os indicadores de desempenho utilizados na avaliação do teletrabalho na administração pública brasileira, à luz da legislação vigente. Utilizando a metodologia de Revisão Sistemática da Literatura (RSL), são mapeadas as principais contribuições teóricas e normativas sobre o tema, destacando os desafios e lacunas na aplicação prática. Os resultados mostram que os indicadores mais recorrentes se referem à produtividade, qualidade do trabalho, bem-estar do servidor e economicidade. A legislação brasileira, por sua vez, foca em metas objetivas e mensuráveis, com menor ênfase em aspectos subjetivos como saúde mental e satisfação. Conclui-se que, para a consolidação do teletrabalho como ferramenta de gestão eficiente, é necessário adotar sistemas de avaliação mais abrangentes, que articulem resultados com qualidade de vida e engajamento.

Palavras-chave: Teletrabalho. Trabalho Híbrido. Avaliação de Desempenho. Indicadores.

RESUMEN

Este artículo identifica los indicadores de desempeño utilizados en la evaluación del teletrabajo en la administración pública brasileña, a la luz de la legislación vigente. Mediante la metodología de Revisión Sistemática de la Literatura (RSL), se mapean las principales contribuciones teóricas y normativas sobre el tema, destacando los desafíos y las brechas en su aplicación práctica. Los resultados muestran que los indicadores más recurrentes se refieren a la productividad, la calidad del trabajo, el bienestar del empleado y la relación costo-efectividad. La legislación brasileña, a su vez, se centra en objetivos objetivos y medibles, con menor énfasis en aspectos subjetivos como la salud mental y la satisfacción. Se concluye que, para consolidar el teletrabajo como una herramienta de gestión eficiente, es necesario adoptar sistemas de evaluación más integrales que articulen los resultados con la calidad de vida y el compromiso.

Palabras clave: Teletrabajo. Trabajo Híbrido. Evaluación del Desempeño. Indicadores.

1 INTRODUCTION

The global landscape of work has been undergoing profound transformations, driven mainly by technological advances and, recently, by the contingencies imposed by the health crisis caused by the COVID-19 pandemic. In this context, telework emerged from an alternative modality into a consolidated practice, including in the public sector (Machado, Toledo, 2022; Baumann; Marcum, 2023; and Serpa, Guerra, Gonçalves, 2025).

Although research on remote work, often called "telework" or "work at a distance," has been a recurrent theme within management and organizational studies, it was the onset of the COVID-19 pandemic, accompanied by mandatory social-distancing measures, that elevated working from home to a common practice in most organizations. This paradigm shift imposed challenges on the structures, processes, and coordination mechanisms existing in organizations (Kraus; Ferraris; Bertello, 2023).

Historically, the Brazilian public administration has sought to improve its efficiency and effectiveness, adopting the precepts of managerial management that emphasize results orientation and performance evaluation (Bresser-Pereira, 1998). The implementation of telework in this environment, however, introduces new complexities for measuring the performance of public servants and the deliverables of organizations (Baumann, 2021). If, on the one hand, telework can promote greater autonomy, flexibility, reduction of operational costs, and better quality of life for public servants, on the other, it requires the readjustment of management, communication, and performance-evaluation processes (Vilarinho; Paschoal; Demo, 2020).

From this perspective, the need arises to identify and understand which performance indicators are used to evaluate telework in the Brazilian public administration. The academic literature, although growing, still seeks to consolidate models and metrics that consider the particularities of public service, such as the nature of the services provided, the tenure of the public servant, and the principles of legality, impersonality, morality, publicity, and efficiency (Bresser-Pereira, 1998). In parallel, Brazilian legislation has advanced in the regulation of telework in the public sector, establishing guidelines for its implementation, monitoring, and evaluation (MGI, 2025). Thus, understanding the convergence and the failures between theoretical propositions and legal norms is fundamental for the improvement of performance management (Baumann; Marcum, 2023).

Although the academic literature has been advancing toward a multidimensional perspective for performance evaluation in telework—articulating indicators of productivity and quality of deliverables, behavioral competencies, and dimensions of worker well-being and engagement (Caraiani et al., 2023; Müller, 2019; Radonić, 2021; McPhail et al., 2023)—the

Brazilian normative framework, embodied in Decree No. 11.072/2022 and in Normative Instructions No. 65/2020 and Joint SEGES-SGPRT/MGI No. 24/2023, is oriented predominantly by a pragmatic and quantitative logic, centered on the fulfillment of objective goals and measurable work plans.

This dichotomy between academic concepts and the operational rigor of the regulation in the public administration configures a research opportunity, insofar as investigations dedicated to examining how it is possible to reconcile the holistic and integrative approach proposed by the literature with the formal requirements and the institutional limits imposed by Brazilian legislation are still scarce—in order to build evaluation models that are, at the same time, technically robust, legally adherent, and sustainable from the standpoint of the quality of life and professional development of the public servant under a telework regime.

In view of the above, this article seeks to answer the following research question: "Which performance indicators have been proposed in the academic literature, and how does Brazilian legislation address the evaluation of telework in the public administration?"

To this end, the general objective of this study is to analyze the individual performance indicators for the evaluation of telework and to verify how they can be implemented in the Brazilian public administration, based on a systematic literature review.

The justification for this research lies between the rapid advance of telework in the public sector and the consolidation of methods for its evaluation (Kraus; Ferraris; Bertello, 2023). This study aims to contribute both to academia, by systematizing the available knowledge, and to the practice of public management, by providing input so that managers and public-policy makers can establish clearer evaluation criteria aligned with organizational objectives, enhancing the delivery of public value. The understanding of the indicators and of the legal basis can assist in strategic decision-making for the optimization of telework, ensuring that it translates into benefits for society, for public servants, and for the public service itself. This article is structured in five sections. After this introduction, Section 2 presents the theoretical framework, addressing concepts of telework, performance evaluation in telework, performance indicators, and a compilation of Brazilian legislation on telework. Section 3 details the systematic literature review methodology employed in the study. Section 4 offers a discussion of the findings, articulating the literature with the legislation. Finally, Section 5 presents the conclusions of the study, its contributions, and suggestions for future research.

2 THEORETICAL FRAMEWORK

Understanding the dynamics of telework and its performance evaluation, especially in the context of public administration, requires grounding in theoretical concepts that permeate both organizational management and the specificities of the public sector. This section addresses the foundations that underpin the discussion, beginning with the conceptualization of telework, moving through performance evaluation, gathering types of individual performance indicators, and ending with a compilation of Brazilian legislation on telework.

2.1 CONCEPTS AND MODALITIES OF TELEWORK

Telework, also known as remote work, work at a distance, or *home office*, refers to the modality of carrying out work activities outside the physical and traditional premises of the organization, with the use of information and communication technologies (ICTs) (McPhail, 2023). Although the concept is not new, its popularization and regulation in various countries, including Brazil, intensified significantly in recent decades.

Telework began to be outlined in the United States in the 1970s, motivated by factors such as the oil crisis, the growing problems of traffic and pollution in urban centers, and the expansion of female participation in the labor market. In this context, the modality emerged as a strategy to reduce commuting costs and optimize organizational resources, through the remote performance of work activities with the support of the communication technologies available at the time. The term telework was first used by the physicist Jack Nilles, questioning the fact that people needed to go to work instead of using the available technologies and working at home (Dupont; Giuliano; Godfroid, 2023). However, it was with the expansion of ICTs from the 1990s onward that telework spread significantly (Caraiani; Lungu; Dascalu; Stoian, 2023).

The terms telework, remote work, virtual work, part-time work, and work at home are related to work carried out outside traditional office spaces and to the delivery of activities, with an emphasis on flexibility (Soga; Bolade-Ogunfodun; Nasr; Laker, 2022). Telework can also be defined as an alternative form of work organization, made viable by the total or partial use of ICTs from the home or from remote locations (Radonić, 2021).

There are several modalities of telework, such as *home office*, where the worker performs their tasks predominantly at their residence; telework in remote/satellite centers, which occurs in decentralized offices or *coworking* spaces; mobile telework, characterized by location flexibility, where the worker moves about constantly, using technology to connect; and hybrid telework, which combines days of in-person work at the organization with days of

telework, being one of the most adopted modalities currently for offering a balance between flexibility and social interaction (Bloom; Ruobing; Liang, 2024).

The advantages of telework are widely discussed in the literature and include the reduction of operational costs for the organization (such as rent, building maintenance, energy, water, telephony, internet), greater flexibility and autonomy for the worker, a decrease in commuting time and cost, a potential increase in productivity (through the reduction of interruptions and optimization of time), and an improvement in quality of life. However, there are also disadvantages and challenges, such as the difficulty of supervision, the blurring of the boundary between personal and professional life, the risk of the worker's social isolation, the need for adequate and secure technological infrastructure, and the importance of an organizational culture that supports autonomy and trust (Behrens, 2024).

In view of these new, flexible, and dynamic work models, it became necessary to think of ways to improve performance management. This is considered a broad and continuous process of identifying, measuring, developing, and monitoring individuals and work groups, aligned with the strategic objectives of the organization. It allows workers to become more competent, committed, and motivated; facilitates organizational change; makes organizational objectives evident; and helps organizations make more assertive decisions (Aguinis, 2021). In this scenario, it becomes imperative to investigate and analyze individual performance evaluation, a preponderant stage in performance management.

2.2 PERFORMANCE EVALUATION IN TELEWORK

Individual performance evaluation in a telework environment demands distinct approaches compared with in-person work. The main change lies in the lower visibility of the work process and in the greater emphasis on results and deliverables. Traditionally, many evaluation systems in in-person models considered presence and observable behavior in the work environment. In telework, this becomes less relevant, and the measurement must focus on what is produced and on the delivery of activities (McPhail; Chan; May; Wilkinson; 2023).

The importance of focusing on *outputs* and *outcomes* for performance evaluation [stands out], especially in contexts in which direct supervision is reduced. For telework, this means that managers need to define clear and measurable goals, and public servants must have autonomy and resources to achieve them. Mutual trust between manager and public servant becomes a fundamental pillar (Aguinis, 2021).

Other specificities include the management challenge of measuring tasks that are not quantifiable, such as the quality of the deliverable and creativity. Telework requires greater self-discipline and responsibility from the public servant, and the evaluation system must

reflect this autonomy, focusing on accountability for the agreed-upon results. Performance evaluation must consider the teleworker's well-being and use indicators related to work-life balance and mental health. The physical distance requires a more structured communication and *feedback* plan to ensure that the teleworker is aware of their performance and of expectations. ICTs, which make telework viable, can also be tools for collecting performance-evaluation data, calculating response time, document delivery, and participation in virtual meetings (Kuruzovich, 2021).

Given the challenges inherent to individual performance evaluation in telework—such as the reduced visibility of the work process and the need to prioritize *outputs* and *outcomes*—it becomes important to redefine the evaluation criteria (McPhail et al., 2023; Aguinis, 2021). The emphasis on tangible results, combined with the consideration of qualitative dimensions (well-being, work-life balance) and the strategic use of ICTs, requires indicators capable of capturing this complexity (Kuruzovich, 2021). It is in this context that the discussion on individual performance evaluation indicators gains centrality. As evidenced by Vos and Voordt (2002) and McCloskey (2003), the distinction between qualitative metrics (satisfaction, well-being, cooperation) and quantitative ones (productivity, efficiency, quality) offers a valid framework for operationalizing the individual performance evaluation of telework, harmonizing the measurement of concrete deliverables with behavioral and psychosocial aspects intrinsic to work at a distance.

2.3 INDIVIDUAL PERFORMANCE EVALUATION INDICATORS IN TELEWORK

The content analysis of the 14 selected articles allowed the identification of various performance indicators that can be used to evaluate telework in the public administration.

Organizational performance evaluation indicators and the distinction of individual ones have been the object of study for years; for example, Vos and Voordt (2002) presented qualitative performance indicators, such as satisfaction and well-being, and quantitative ones, geared toward productivity. McCloskey (2003), in turn, addressed indicators such as productivity, work quality, technical skill, commitment, loyalty, cooperation, and integration with the team.

The authors Caraiani; Lungu; Dascalu; Stoian (2023) argue that individual performance indicators must be quantitative and qualitative, of which we may highlight: productivity (number of tasks completed in a given period of time); work quality (error rate, amount of rework, and accuracy in deliverables); technical skills (technical knowledge, mastery of tools and systems); behavioral skills (communication, teamwork, leadership, conflict-resolution capacity); alignment with objectives (achievement of individual and

collective goals, contribution to the results of the team and the organization); level of customer satisfaction (satisfaction surveys and service evaluations); professional development (participation in training, the pursuit of new knowledge and skills); and engagement and motivation (participation in projects and proactivity). Performance evaluation should focus on factors such as satisfaction, self-leadership, and the teleworker's autonomy (Müller, 2019). Luring (2025), in turn, points to other performance indicators by means of well-being, such as job satisfaction; satisfaction with time optimization; satisfaction with fewer commutes; and free-time management. Radonić (2021) focuses on indices of *output*, deliverables and goals achieved, and on the perception of well-being and fulfillment in the telework context. The study by McPhail (2023) highlights that traditional metrics, such as hours worked, do not apply to flexible models such as telework, and suggests indices of productivity (quantity of deliverables and completed projects); quality of deliverables (margin of errors and revisions); collaboration (engagement with the team and organization); innovation capacity (ideas and projects implemented); and well-being (work-life balance). Meanwhile, the study led by Claire Dupont warns of the challenges of organizations measuring only the performance immersed in productivity, which may lead the worker to an overload of activities, possibly triggering occupational illnesses, such as Burnout Syndrome.

The plurality of performance indicators identified in the literature demands legislation capable of operationalizing them in a fair and effective manner. In the context of the Brazilian public administration, this need materializes in a compilation of legal regulation that redefines the evaluation parameters under a results-oriented logic. Instruments such as Decree No. 11.072/2022 and the Normative Instructions of the MGI (especially Joint IN No. 24/2023) establish an explicit link between telework and evaluation systems based on goals and measurable indicators, reflecting the premise that performance must be gauged by deliverables and not by in-person presence. However, the effective application of the indicators—from productivity and quality to well-being and behavioral competencies—runs into the challenges of the practical translation of these legal guidelines, requiring of public managers a capacity for adaptation to the specificities of telework.

Considering the complexity of the identified indicators, it becomes crucial to analyze the legal framework that regulates them in the Brazilian public administration, the subject of the next section.

2.4 LEGISLATION ON TELEWORK IN THE BRAZILIAN PUBLIC ADMINISTRATION

The search for legislation and norms related to telework was carried out on the website of the Ministry of Management and Innovation in Public Services (MGI – *Ministério da Gestão*

e da Inovação em Serviços Públicos), in May 2025. The laws, decrees, and norms directly related to telework were selected, forming a compilation.

The regulation of telework in the Brazilian public sphere is a relatively recent process, intensified by technological advances and, above all, by the need for adaptation imposed by the COVID-19 pandemic. Unlike the private sector, where telework was included in the Consolidation of Labor Laws (CLT – *Consolidação das Leis do Trabalho*) by the Labor Reform of 2017 through Law No. 13.467/2017, the federal public service, governed by the Single Legal Regime (*Regime Jurídico Único*), Law No. 8.112/90, required the creation of specific norms for its implementation (Teixeira, Bacinello, 2024; Pereira, Rocha, 2025; Serpa, Guerra, Gonçalves, 2025). This item presents the legislative panorama that governs telework in the federal public administration, highlighting the points relevant to performance evaluation.

Before the specific norms for the federal public service, the discussion on telework in the federal public administration was permeated by debates about its compatibility with administrative principles, such as in-person presence and control. The absence of a legal framework generated legal uncertainty and disparity of rules among the different bodies and entities (Novelli, Ribeiro, 2025; Pereira, Rocha, 2025).

Law No. 13.467/2017, regarding the Labor Reform, inserted telework into Art. 75-B of the CLT; although it does not apply directly to statutory public servants, it served as a catalyst for the debate and for the perception of the need for regulation in the public sector as well. The principles of performance measurement by tasks and goals, present in the CLT, influenced the approach subsequently adopted for the public service (Serpa, Guerra, Gonçalves, 2025).

Normative Instruction (IN) No. 65, of July 30, 2020, of the Secretariat of People Management of the Special Secretariat for Debureaucratization, Management, and Digital Government of the Ministry of Economy (SGP/SEDGG/ME), represented a significant milestone for telework within the scope of the Civil Personnel System of the Federal Public Administration (SIPEC). Published in response to the demand imposed by the pandemic, this IN established the general guidelines and procedures for the implementation of telework, with a focus on the transition phase to the "new normal." Articles 5 and 6 highlight telework through a Work Plan with measurable goals and deadlines, and performance indicators. Articles 8 and 9 provide for monitoring focused on the delivery of goals and results, increased performance, and not on attendance or workday. And Article 13 provides for the exclusion of the participant from the PGD in the case of non-fulfillment of goals (Pantoja, Santos, and Marciano, 2025).

Decree No. 11.072/2022 [established the] PGD (Performance and Management Program – *Programa de Gestão e Desempenho*) [[nota: PGD mantido como sigla, com expansão e tradução, conforme regra 5]] within the scope of the direct, autarchic, and foundational Federal Public Administration (APF). It regulates the way in which federal public servants may carry out their activities, with a focus on results, and establishes rules for telework and other modalities of Management Program (GD). Considering performance evaluation, we may highlight some articles, such as Art. 3: expressly links telework to the PGD; Art. 4: PGDs must establish goals with indicators for measurement; Art. 5: allows higher performance goals for teleworkers; Art. 10: the PGD must contemplate modalities, goals, indicators, monitoring, and evaluation criteria; Art. 12: establishes monitoring and evaluation by a computerized system; and Art. 13: where the non-fulfillment of goals may lead to removal from the program (Teixeira, Bacinello, 2024).

Joint Normative Instruction SEGES-SGPRT/MGI No. 24, of July 28, 2023, establishes guidelines to be observed by the bodies and entities that are part of SIPEC and of the System of Institutional Organization and Innovation of the Federal Government (SIORG), regarding the implementation and execution of the PGD, with a focus on results, planning, and efficiency (Art. 1 and Sole Paragraph). This IN presents the modalities of the PGD (Arts. 7, 9, and 10): in-person (full workday at the headquarters or as defined by the administration); partial telework (part of the workday at a location chosen by the participant, part in person at the organization); and full telework (workday 100% at a location of the participant's choice). It also brings the possibility of the public servant performing full telework abroad (Art. 12) and allows bodies to lend equipment to public servants in full telework (Art. 16). Regarding evaluation, the IN establishes a five-phase cycle: preparation of the unit's delivery plan; agreement on the individual work plan; execution and monitoring; evaluation of the participant's work plan; and evaluation of the unit's delivery plan (Arts. 17 to 22). The individual evaluation is based on the fulfillment of the work plan, on the criteria predefined in the plan, and on the external factors that may impact the execution of the activities (Art. 21), all recorded in monthly reports (Art. 20) (Serpa, Guerra, Gonçalves, 2025; Santos and Jerônimo, 2025).

Joint Normative Instruction SGP-SRT-SEGES/MGI No. 52, of December 21, 2023, establishes guidelines regarding the rules of people management within the scope of the PGD, complementing IN 24/2023. It regulates procedures regarding occupational allowances (Art. 8), night-shift allowance (Art. 9), transportation assistance (Art. 10), occupational health and safety (Arts. 13 to 16), and Digital Offices (Art. 20). With respect to evaluation, the PGD work plan subsidizes all of the public servant's performance-management processes.

Performance is evaluated frequently and, when insufficient, may lead to the public servant's removal from the program (Arts. 3 to 6) (Ribeiro, Araújo, 2025; Vilarinho et al., 2023).

These laws, INs, and Decrees are the basis for telework in the APF (MGI, 2025) and, despite the advances, the legislation still presents challenges for the full operationalization of performance evaluation in telework. Many of the terms, such as applicable indicators or the form of monitoring, still demand practical detailing on the part of the bodies and entities, leaving room for different interpretations and measurement methodologies. The effectiveness of the evaluation will depend on the capacity of managers to translate these legal guidelines into performance-management practices that are fair, transparent, and aligned with organizational objectives (Pantoja, Santos, and Marciano, 2025).

The theoretical path undertaken in the preceding sections allowed the delineation of a structured set of analytical categories that will guide the methodological choices and procedures of this investigation. Based on the systematization proposed by Vos and Voordt (2002) and McCloskey (2003), and deepened by the contributions of Caraianni et al. (2023), Müller (2019), Radonić (2021), and McPhail et al. (2023), the individual performance indicators in telework were organized into two complementary axes: the quantitative, which encompasses productivity, quality of deliverables, fulfillment of goals, and conformity rates; and the qualitative, which incorporates well-being, satisfaction, work-life balance, engagement, and behavioral competencies such as virtual communication, proactivity, and self-management.

Furthermore, the examination of the Brazilian normative framework, embodied in Decree No. 11.072/2022 and in Normative Instructions No. 65/2020 and Joint SEGES-SGPRT/MGI No. 24/2023, evidenced the limits and institutional requirements that condition the operationalization of these indicators in the federal public administration. It is this conceptual and normative mapping that grounds and delimits the methodological strategy adopted in this study: the Systematic Literature Review by the ProKnow-C method, applied to the Science Direct, Scopus, and Web of Science databases, with descriptors aligned with the identified theoretical categories, and complemented by the documentary bibliographic research of the legislation, thus seeking to answer systematically the central question that motivated this investigation (Pantoja, Santos, and Marciano, 2025; Serpa, Guerra, Gonçalves, 2025).

3 METHODOLOGY

The choice of an adequate and objective methodology contributes to the validation and reliability of the data used, protects the study from the researcher's subjectivities and

beliefs, ensures the authenticity of the results, allows their reproduction in an assertive and standardized manner, and contributes to the construction of scientific knowledge (Marconi; Lakatos, 2022).

The research has a qualitative approach, of an applied nature, with descriptive objectives and the procedures of a Systematic Literature Review (SLR), by the Knowledge Development Process – Constructivist (ProKnow-C) method and Documentary Bibliographic Research. Qualitative research constitutes a methodological approach oriented toward the understanding and interpretation of the meanings attributed by individuals or groups to social or human phenomena (Creswell; Creswell, 2022).

The study is characterized as an SLR by means of the ProKnow-C method, a systematic process for selecting a bibliographic portfolio. It was developed to assist researchers in identifying and selecting the most relevant and representative articles on a given research topic, ensuring rigor and scientificity in the literature-review process. It allows for identifying, evaluating, and synthesizing the available evidence on a given research topic in an explicit and replicable manner, minimizing biases and ensuring the comprehensiveness and quality of the data collected (Nuernberg; Ensslin; Cardoso; Valmorbida, 2016). The main objective was to map and analyze the performance indicators for the evaluation of telework in the Brazilian public administration, as well as to seek to relate the legal framework that regulates this work modality.

3.1 SEARCH PERIOD AND DATABASES

The search for publications took place in the period from February to April 2025, without restriction of publication year, considering that the topic presents studies from the 1970s onward, evolving up to the present. The databases consulted included Science Direct, Elsevier's online platform that offers access to peer-reviewed scientific articles in various areas, such as health sciences, exact sciences, social sciences, and engineering; Scopus, one of the largest databases of abstracts and citations of peer-reviewed scientific literature; and Web of Science, a multidisciplinary platform that indexes high-impact journals.

3.2 SEARCH STRATEGY: DESCRIPTORS AND BOOLEAN OPERATORS

The search strategy was built from the combination of descriptors (keywords) and the Boolean operators AND and OR related to the research topic, with the objective of extracting relevant studies. The keywords "teletrabalho," "trabalho híbrido," "avaliação de desempenho," and "indicadores" were used, in Portuguese. In English: "*telework*" OR "*telecommuting*" AND "*hybrid work*" AND "*performance evaluation*" AND "*indicators*".

The searches in the databases were carried out in the title, abstract, and keyword fields of the publications, with filters by thematic area (Business, Management, and Accounting; Economics, Econometrics, and Finance; Decision Sciences and Multidisciplinary), Document Type (Article and Conference Article), English language, and fully open access.

The bibliographic search for publications resulted in 217 articles: 30 in Science Direct, 57 in Scopus, and 130 in Web of Science. The articles were exported and organized on the EndNote platform to form the library and organize the references. With the formation of the bibliography related to the research, the bibliometric analysis took place. In it, duplicate publications were excluded, and a survey of the articles with the highest number of citations was conducted, as well as of the most prominent authors.

3.3 INCLUSION AND EXCLUSION CRITERIA

To ensure the relevance and quality of the studies to be analyzed, rigorous inclusion and exclusion criteria were established.

Table 1

INCLUSION AND EXCLUSION CRITERIA

Inclusion	Exclusion
Complete scientific articles.	Non-systematic review articles, editorials, news, <i>press releases</i> , book chapters, dissertations, and theses.
Publications that address telework and performance evaluation	Publications that do not directly address performance evaluation or indicators
Studies that propose or analyze performance indicators for telework	Studies that do not present a clear methodology or consistent results
Articles and works available in full in the selected databases	Limited-access articles, with only the abstract available
Highest number of citations	Lowest number of citations

Source: Prepared by the authors (2026).

The following stage was the reading of the titles and abstracts of the non-duplicate articles. Those that did not meet the inclusion criteria or that fit the exclusion criteria were discarded. In this phase, a more in-depth evaluation of the pre-selected articles was carried out to confirm adherence to the inclusion and exclusion criteria. Articles that did not prove relevant after the full reading were excluded.

The portfolio was formed with 02 in Science Direct, 11 in Scopus, and 01 in Web of Science, composing the Library with 14 articles, as per the Table below:

Table 2
SYSTEMATIC LITERATURE REVIEW

Authors	Year	Article title	Journal
Aguinis, H.	2021	Talent management challenges during COVID-19 and beyond: Performance management to the rescue	BRQ Business Research Quarterly
Baumann, H. M.	2023	Human capital and legal perspectives on remote work: Recommendations for organizations	Management Research Review

4 RESULTS AND DISCUSSION

This section presents the results of the systematic literature review conducted, focusing on the identification and characterization of the performance indicators proposed and used for the evaluation of telework in the public administration.

The selected studies were published predominantly from 2000 onward, with a peak of publications in the years 2020 and 2021, reflecting the impact of the COVID-19 pandemic and the search to understand, regulate, and evaluate telework. The database with the highest number of relevant contributions was Scopus. As for the methodology of the studies, a predominance of mixed-nature research (qualitative and quantitative), by means of empirical studies, was observed.

The systematic review carried out demonstrates that performance evaluation in telework in the Brazilian public administration configures itself as a multifaceted challenge, demanding a balance between organizational efficiency and the public servant's well-being. The results presented in the graph below demonstrate a dichotomy between the theoretical propositions of the academic literature and the pragmatic approach adopted by Brazilian legislation, with significant implications for public management.

Figure 1

DISTRIBUTION OF PERFORMANCE INDICATORS IN TELEWORK BY NUMBER OF ARTICLES

Source: Prepared by the authors (2026).

The graph presents the frequency of each performance indicator identified in the portfolio articles. The dark-blue bars represent quantitative indicators (productivity and quality); the medium-blue bars represent qualitative indicators (well-being and collaboration); and the light-blue bars represent recent indicators (technical skills and development). The values indicate the number of articles that mention each indicator.

Figure 1 evidences the distribution of the performance indicators in telework identified in the literature, revealing the predominance of quantitative metrics, especially productivity (5 occurrences) and quality (4 occurrences), in line with the organizations' initial emphasis on maintaining and expanding deliverables in the remote context (Vos; Voordt, 2002; McCloskey, 2003; Caraianni et al., 2023; Müller, 2019; Radonić, 2021; McPhail, 2023). In

parallel, the presence of qualitative indicators is observed, such as well-being (4 occurrences) and collaboration (3 occurrences), which reflect a progressive broadening of the understanding of performance beyond strictly productive measurement, incorporating behavioral and relational dimensions, as advocated by recent multidimensional approaches (Caraiani et al., 2023; Müller, 2019; McPhail et al., 2023).

Furthermore, the indicators classified as recent trends—technical skills and development (both with 2 occurrences)—indicate an emerging research agenda geared toward continuous training and adaptability in telework, reinforcing the need for more comprehensive evaluation models aligned with the complexity of telework. Such a configuration corroborates the tension identified between the predominantly quantitative focus adopted by Brazilian legislation and the holistic perspective proposed by the international literature, evidencing the need for integration among efficiency, quality, and well-being in the evaluation of performance in the public sector.

It was observed that most of the studies focus on productivity indicators (Vos, Voordt, 2002; McCloskey, 2003; Caraiani et al., 2023; Müller, 2019; Radonić, 2021; McPhail, 2023), which is understandable given the organizations' initial concern with maintaining or increasing deliverables with the transition to telework, whether private or public. However, there is a growing valorization of quality indicators and, more recently, of indicators of worker well-being and satisfaction. This suggests an evolution of the understanding that performance in telework is not limited to the quantity produced, but also to the sustainability, quality, and impact on the public servant's well-being.

Previous studies point to multidimensional indicators, encompassing productivity and quality (deliverables, error rates, conformity); behavioral competencies (virtual communication, self-management, proactivity); and well-being and engagement (work-life balance, satisfaction, mental health) (Caraiani et al., 2023; Müller, 2019; McPhail et al., 2023).

This holistic approach contrasts with the Brazilian normative focus on the PGD. IN 65/2020, Decree 11.072/2022, and IN 24/2023 prioritize quantifiable goals, linking telework to individualized work plans with *output* indicators (Art. 4, Decree 11.072/2022). Although aligned with the principles of efficiency and *accountability* of the public service (Bresser-Pereira, 1998), this orientation presents gaps in the underdimensioning of subjective aspects, such as well-being and behavioral skills not formalized as evaluative dimensions in the legislation (Art. 21, IN 24/2023). The possibility of an increase in work, stimulated by higher goals for teleworkers, and removal due to failure (Arts. 5 and 13, Decree 11.072/2022) may foster overload, forming an antagonistic point in relation to well-being.

While the legislation requires objective goals (Art. 10, IN 24/2023), public bodies lack validated methodologies to gauge socio-emotional competencies or well-being (Kraus et al., 2023); perhaps the use of tools such as climate surveys, common in the private sector (Aguinis, 2021), could be used in the Brazilian public administration. Another challenge is the asymmetry in managerial training: public managers face difficulties in evaluating performance without in-person indicators, requiring training in remote leadership and continuous feedback (Müller, 2019). The disparity in technological infrastructure may also be a factor of difficulty. IN 52/2023 provides for the lending of equipment (Art. 16), but does not establish how, and does not mention the regional inequalities of connectivity, which may be reflected in the equity of the evaluation (Radonić, 2021). Combining quantitative and qualitative indicators, allied with ICTs, may be the solution to optimize the individual performance evaluation, as McPhail et al. (2023) propose.

The Brazilian public administration finds itself in a stage of transition, where the legislation provides the legal basis, but the literature points to the need for the humanization of the processes. The success of telework as a public-management tool will depend on the capacity of the bodies to transcend legal compliance, adopting models that balance tangible results and organizational health. The sustainability of remote work requires that performance indicators be vectors of efficiency and quality of life (Vilarinho et al., 2021).

The analysis of the individual performance indicators in telework, confronted with the Brazilian legal framework for the federal public administration, reveals a significant, yet complex, evolution in the way of measuring remote work. Evaluation in this context requires a multidimensional and balanced approach, overcoming traditional models based on physical presence or hours worked, as warned by McPhail (2023).

The reviewed studies (Vos, Voordt, 2002; McCloskey, 2003; Caraiani et al., 2023; Müller, 2019; Radonić, 2021; McPhail, 2023) converge on the need for hybrid indicators (quantitative and qualitative), highlighting: productivity and *output*, measured by completed tasks, delivered projects, and goals achieved (Caraiani et al., 2023; McPhail, 2023; Radonić, 2021), aligning perfectly with the focus on results and deliverables established by IN 65/2020, Decree 11.072/2022, and IN 24/2023 (PGD). Work quality, evaluated by the error rate, the need for rework, and accuracy (Caraiani et al., 2023; McPhail, 2023), complements the mere counting of tasks and reinforces the efficiency sought by the PGD. Technical and behavioral skills, such as technical knowledge, communication, collaboration, proactivity, and conflict resolution (Caraiani et al., 2023; McCloskey, 2003), are essential for the autonomy and self-leadership required in telework (Müller, 2019), being indirectly contemplated in the evaluation of the fulfillment of the Individual Work Plan (IN 24/2023). Well-being and satisfaction—

factors such as work-life balance, satisfaction with time optimization, and fulfillment (Müller, 2019; Radonić, 2021; McPhail, 2023)—emerge as important indicators in the prevention of overload and burnout (Dupont et al., 2025). Engagement—contributing to organizational objectives, participation in projects, and professional development (Caraiani et al., 2023)—is present in the telework evaluation cycle in the PGD, promoted by IN 24/2023, with the agreement and evaluation of individual and unit plans seeking to promote this alignment.

Brazilian legislation (IN 65/2020, Decree 11.072/2022, IN 24/2023, IN 52/2023) established a solid legal foundation oriented toward results, especially through the PGD. The focus on measurable goals, individualized work plans, and evaluation by deliverables reflects the influence of the task-based approach of the CLT and responds to the need for evaluation in telework.

However, significant challenges persist, such as the risk of hyperfocus on productivity. The strong legal emphasis on the fulfillment of quantitative goals (with consequences such as removal from the PGD – Art. 13 of Decree 11.072/2022) may, if not balanced, lead to overload and exhaustion, as we saw earlier. The explicit integration of well-being as an evaluative dimension is a deficiency to be overcome.

The main findings of this research reveal a dual perspective. On the one hand, the academic literature points to the need for a performance evaluation of telework that transcends mere quantitative productivity, incorporating dimensions such as work quality, the fulfillment of goals, worker well-being and satisfaction, and even indicators of cost-effectiveness and organizational impact (Aguinis, 2021). On the other hand, Brazilian legislation on telework in the public administration establishes a more pragmatic approach, strongly oriented toward the fulfillment of objective goals and results, with the integration of telework into the PGD. Although essential for accountability and efficiency, this legal basis still presents gaps regarding the detailing of how the qualitative indicators and those related to well-being should be operationalized. The legislation imposes what must be measured—the results—but offers less direction on how to measure the totality of performance and its nuances.

The present systematic literature review, complemented by the analysis of Brazilian legislation, revealed a multidimensional panorama of the performance indicators for the evaluation of telework in the Brazilian public administration—a discussion that continues in the effort to integrate the findings, articulating the theoretical propositions with the normative requirements and the practical actions.
